| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router(config-if)# <b>end</b>                                                                                                                                         | Exits interface configuration mode and returns to privileged EXEC mode.                                                               |

## Configuration Examples for Filtering of DHCP Leasequery

This section provides the following examples on how to configure the DHCP leasequery filtering feature:

### Example: DHCP Leasequery Filtering

The following example shows an excerpt from a typical configuration of a bundle interface that is configured for filtering DHCP leasequery requests on both its upstream and downstream interfaces:

**Note** If an alternate server has been configured to receive leasequery requests, the **cable source-verify dhcp server ipaddress command** would display in place of the **cable source-verify dhcp** command below.

```

.
.
.
cable source-verify leasequery-filter downstream 5 20
.
.
.
interface bundle 1
.
.
.
cable source-verify dhcp
cable source-verify leasequery-filter upstream 1 5
no cable arp
.
.

```

## Example: Unitary DHCPv6 Leasequery Filtering

The following example shows how to display the total number of DHCPv6 leasequery requests that have been filtered on the router in Cisco IOS Release 12.2(33)SCF1:

```

Router# show cable leasequery-filter
IPv4 Lease Query Filter statistics for Unknown Sid
 Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Unknown Sid
 Requests Sent : 0 total. 0 unfiltered, 0 filtered

```

## Feature Information for Cable DHCP Leasequery

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release,

feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 150: Feature Information for Cable DHCP Leasequery**

| Feature Name          | Releases                 | Feature Information                                                                                            |
|-----------------------|--------------------------|----------------------------------------------------------------------------------------------------------------|
| Cable DHCP leasequery | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 57

# Layer 3 CPE Mobility

---

Layer 3 CPE Mobility feature is introduced to allow the mobility CPE devices to move between cable modems with as little disruption of traffic as possible.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Layer 3 CPE Mobility

No special equipment or software is needed to use the Layer 3 CPE Mobility feature.

## Restrictions for Layer 3 CPE Mobility

- Layer 3 CPE Mobility feature allows CPE devices to move only in the same bundle or sub-bundle interface.
- The IPv4 or IPv6 subnets that are configured with mobility must match with the IPv4 or IPv6 subnets already configured on bundle or sub-bundle interface. Otherwise, configuration will not be accepted and the following message will be displayed:

Please remove the previous online CPEs or reset CMs,

- If you remove the IPv4 or IPv6 address on bundle or sub-bundle interface, it also removes the relative mobility subnets at the same time.
- Multicast packets will not trigger the Layer 3 CPE Mobility feature.

- VRF configured under bundle or sub-bundle interface is not supported for CPE mobility feature.
- In Layer 3 CPE Mobility feature, the packet lost time period during mobility will be unpredictable, depending on how many CPE devices move at the same time and system loading conditions.
- For CPE devices, which have multiple IPv4 or IPv6 addresses, all of IPv4 or IPv6 addresses will be rebuilt with new source information.
- Layer 3 CPE Mobility may be failed during line card or SUP HA and the trigger upstream packet will be dropped.
- If CPE mobility is turned on, mobility behavior will become effective before cable Ipv4 or IPv6 source verify.
- If Layer 3 CPE Mobility is enabled, some of the security checks will be skipped for the mobility subnets to achieve faster movement of the CPE devices.

## Information About Layer 3 CPE Mobility

The Layer 3 CPE Mobility feature allows CPE devices to move from cable modem to other by trigger of any unicast upstream packets of IPv4 or IPV6.

Each cable modem would be situated at a business hotspot location and the CPE devices move from one business location to another, where the service provider is the same and the head end CMTS is the same. This mobility is allowed for selected IP subnets.

The IPv4 or IPv6 subnets that are configured with mobility must match with the IPv4 or IPv6 subnets already configured on bundle or sub-bundle interface. Otherwise, configuration will not be accepted and the following message will be displayed:

```
Please remove the previous online CPEs or reset CMs,
```

When you remove mobility subnets under bundle or sub-bundle interface. The following warning message will be displayed after mobility subnets is configured or removed.

```
Warning: Please remove the previous online CPEs or reset CMs, to make the mobility scope change works for every device !!!
```

---

**Note** If you have enabled mobility configuration for a subnet, the existing online CPE devices will be updated to aware of the mobility subnets, and the CPU usage will rise up during that time. So it's better to configure the mobility subnets before CM and CPE come online.

Enabling the Layer 3 CPE Mobility feature may, in certain situations, cause excessive punted packets. By default, the Source-Based Rate-Limiting (SBRL) feature rate-limits these punted packets to avoid CPU overload.

---

## Benefits of Layer 3 CPE Mobility

The feature provides the movement of CPE devices from one cable modem to another without change in the IP address and the TCP or UDP sessions established are maintained.

# How to Configure Layer 3 Mobility

## Configuring CPE Mobility

This section describes how to enable mobility on a particular IP subnet on a interface or subinterface bundle.

### Before you begin

Mobility subnets should match the IPv4 or IPv6 address configured on the bundle or sub-bundle interface.

### Procedure

|        | Command or Action                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                       |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                                                                                                                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                                                                                                                                                                                              | Enters global configuration mode.                                                                                                             |
| Step 3 | <b>interface bundle bundle number  bundle-subif-number</b><br><b>Example:</b><br>Router(config)# <b>interface bundle 1</b><br>or<br>Router(config)# <b>interface Bundle 1.1</b>                                                                                                                                                                                | Enters interface configuration or subinterface mode.                                                                                          |
| Step 4 | <b>cable l3-mobility IP-address mask   IPv6 prefix</b><br><b>Example:</b><br>Router(config-if)# <b>cable l3-mobility</b><br><b>2001:DB:22:1::1/64</b><br><b>Example:</b><br>Router(config-subif)# <b>cable l3-mobility 192.0.3.1</b><br><b>255.255.255.0</b><br><b>Example:</b><br>Router(config-subif)# <b>cable l3-mobility</b><br><b>2001:DB:22:1::1/64</b> | Enables mobility for a particular IPv4 or IPv6 subnet.<br><b>Note</b> This command can be configured on a interface or a subinterface bundle. |
| Step 5 | <b>exit</b><br><b>Example:</b>                                                                                                                                                                                                                                                                                                                                 | Exits interface configuration mode.                                                                                                           |

|  | Command or Action              | Purpose |
|--|--------------------------------|---------|
|  | Router(config-if)# <b>exit</b> |         |

**What to do next****Troubleshooting Tips**

If the mobility IP address does not match with the mobility subnet, the following warning message is displayed:

```
Mobility IP should match the IDB subnet!
```

If you remove the IPv4 or IPv6 address from the interface, the mobility scope is removed for the IP address and the following warning message is displayed.

```
IPv6 2001:DBB:3:111::1 removed from Mobility subnets on Bundle1
```

## Configure Source-Based Rate Limit (SBRL) for L3-mobility

This section describes how to configure Source-Based Rate Limit (SBRL) for the L3-mobility feature. This procedure is optional and if not configured, the default SBRL configuration will apply.

**Note** SBRL for L3-mobility is enabled by default, so this configuration is optional.

Subscriber-side SBRL has a global and per-punt-cause configuration. L3-mobility punts are only subject to the per-punt-cause configuration. Traffic streams are identified by hashing the punt-cause and the source-MAC-address. This value is used as the index for rate-limiting. There is no special processing for hash-collisions, so hash-colliding streams are treated as if they are the same stream.

The default rate for L3-mobility punts is 4 packets per second.

**Before you begin**

**Note** All punted packets are subject to CoPP and the punt-policer.

**Procedure**

|               | Command or Action                                         | Purpose                                                        |
|---------------|-----------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                                          | Purpose                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b>                                                                                                                      | Enters global configuration mode.       |
| <b>Step 3</b> | <b>platform punt-sbri subscriber punt-cause</b> <i>punt-cause</i><br><b>rate</b> <i>rate</i><br><b>Example:</b><br><br>Router(config)# <b>platform punt-sbri subscriber</b><br><b>punt-cause 99 rate 8</b> | Configures Subscriber-MAC-address SBRL. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><br>Router(config-if)# <b>exit</b>                                                                                                                                       | Exits global configuration mode.        |

## Disabling CPE Mobility

This section describes how to disable mobility on a particular IP subnet.

### Before you begin

The CPE mobility should be enabled on a particular IP subnet before you complete this procedure.

### Procedure

|               | Command or Action                                                                                                                                                                                  | Purpose                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <b>enable</b>                                                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b>                                                                                                              | Enters global configuration mode.                              |
| <b>Step 3</b> | <b>interface bundle</b> <i>bundle number</i>   <i>bundle-subif-number</i><br><b>Example:</b><br><br>Router(config)# <b>interface bundle 1</b><br>or<br>Router(config)# <b>interface Bundle 1.1</b> | Enters interface configuration or subinterface mode.           |
| <b>Step 4</b> | <b>no cable l3-mobility</b> <i>IP-address mask</i>   <i>IPv6 prefix</i>                                                                                                                            | Disables mobility for a particular IPv4 or IPv6 subnet.        |

|               | Command or Action                                                                                                                                                 | Purpose                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Router(config-if)# cable l3-mobility 192.0.3.1 255.255.255.0</pre> <pre>Router(config-if)# cable l3-mobility 2001:DB:22:1::1/64</pre> | <p><b>Note</b> This command can be configured on a interface or a subinterface bundle</p> |
| <b>Step 5</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-if)# exit</pre>                                                                                      | Exits interface configuration mode.                                                       |

## Verifying Layer 3 Mobility Configuration

To verify the layer 3 mobility configuration, use the **show cable bundle** command.

## Configuration Examples for Layer 3 Mobility

This section provides the following configuration examples:

### Example: Configuring CPE Layer 3 Mobility

The following example shows how to configure the layer 3 CPE mobility on a interface bundle:

```
Router#show running interface bundle 10
Building configuration...
Current configuration : 1247 bytes
!
interface Bundle10
ip address 192.0.3.1 255.255.255.0 secondary
ip address 192.2.21.1 255.255.255.0 secondary
ip address 192.3.23.1 255.255.255.0
ip pim sparse-dense-mode
ip igmp static-group 231.1.1.1
no cable arp filter request-send
no cable arp filter reply-accept
cable l3-mobility 192.0.3.1 255.255.255.0
cable l3-mobility 192.2.21.1 255.255.255.0
cable l3-mobility 192.3.23.1 255.255.255.0
cable l3-mobility 2001:DB:26:1::1/64
cable l3-mobility 2001:DB:27:1::1/96
cable dhcp-giaddr primary
cable helper-address 20.1.0.3
ipv6 address 2001:DB:26:1::1/64
ipv6 address 2001:DB:27:1::1/96
ipv6 enable
ipv6 nd reachable-time 3600000
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp relay destination 2001:DB:1:1:214:4FFF:FEA9:5863
end
```

## Example: Configuring SBRL for L3-mobility

The following example shows how SBRL is configured for L3-mobility:

```
Router# show run | i punt-sbrl
platform punt-sbrl subscriber punt-cause 99 rate 8
```

## Additional References

The following sections provide references related to Layer 3 CPE Mobility feature for the Cisco CMTS routers.

## Feature Information for Layer 3 CPE Mobility

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 152: Feature Information for Layer 3 CPE Mobility**

| Feature Name     | Releases                 | Feature Information                                                                                           |
|------------------|--------------------------|---------------------------------------------------------------------------------------------------------------|
| Layer 3 Mobility | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on theCisco cBR Series Converged Broadband Routers. |

## CHAPTER 58

# DOCSIS 3.0 Multicast Support

The Cisco cBR Series Routers support multicast improvements based on Data-over-Cable Service Interface Specifications (DOCSIS) 3.0. DOCSIS 3.0 multicast support improves bandwidth efficiency and allows service providers to offer differentiated quality of service for different types of traffic.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for the DOCSIS 3.0 Multicast Support

- DOCSIS 3.0-compliant Cisco CMTS and DOCSIS 3.0-enabled cable modems are required.
- Cisco CMTS must be MDF-enabled by default.
- Quality of service (QoS) parameters must be configured for various multicast sessions.

## Restrictions for the DOCSIS 3.0 Multicast Support

- You cannot disable explicit tracking.
- For multicast QoS, you must define three objects and templates, Service-Class, Group-QoS-Config (GQC), and Group-Config, and associate them to a particular bundle or forwarding interface.
- You must define a default service class and GQC before defining objects and templates.
- Static multicast feature is always enabled and you cannot disable it.

- The service flow attribute-based selection will be ignored if the group configuration is configured on the default forwarding interface.
- The multicast DSID feature is supported only on DOCSIS 3.0-compliant cable modems.
- The cable multicast mdf-disable wb-incapable-cm command disables multicast downstream service identifier (DSID) forwarding capability on the cable modem, which impacts the DSID capability between the Cisco CMTS and the cable modem.
- The multicast traffic to CPE increases two-fold after changing the multicast QoS configuration or the service-flow attribute during an active session. The traffic replication will continue till the default session timeout period (180 seconds). After the session timeout, the multicast DSID is removed from both Cisco CMTS and CM, and normal multicast traffic flow is resumed.
- For the DOCSIS 3.0 Multicast support feature to function properly, the CPE and the CM must be in the same virtual routing and forwarding (VRF) interface.

## Information About the DOCSIS 3.0 Multicast Support

IP multicast, an integral technology in networked applications, is the transmission of the same information to multiple recipients. Any network application, including cable networks, can benefit from the bandwidth efficiency of multicast technology. Two new technologies—Channel Bonding and Single Source Multicast (SSM)—are expected to dramatically accelerate multicast deployment.

The channel bonding and SSM technologies dramatically increase the operational efficiency of the existing hybrid fiber-coaxial (HFC) network. Using the multicast improvements, the cable operators can seamlessly deliver advanced services like video on demand (VoD), internet protocol television (IPTV), and facilitate interactive video and audio, and data services.

The following sections explain the benefits of DOCSIS 3.0 Multicast Support:

### Multicast DSID Forwarding

DOCSIS 3.0 multicast support introduces centralized control at the Cisco CMTS to provide flexibility and scalability to support a large array of multicast protocols. It replaces the Internet Group Management Protocol (IGMP), version 2 snooping infrastructure, which was part of the DOCSIS 1.1 and 2.0 models. Now, the Cisco CMTS allocates a unique Downstream Service Identifier (DSID) to identify every multicast stream. These DSIDs are sent to the CMs that use these DSIDs to filter and forward Multicast traffic to the CPEs.

The multicast DSID forwarding (MDF) provides the following benefits:

- Unique identification of packet stream across bonding group within a MAC domain.
- Designation of packet stream as either Any Source Multicast (ASM) or Source Specific Multicast (SSM) per multicast channel.
- Implementation of multicast DSID management on the Route Processor (RP) makes it operate on a standalone basis.
- Snooping of all upstream signal control packets by the Cisco CMTS to find the customer premises equipment (CPE) on the Multicast DSID-based Forwarding (MDF) enabled CM and allocates DSID from the pool.
- Transmission of allocated DSIDs to the CM through Dynamic Bonding Change (DBC) message.
- Reuse of DSIDs on other MDF-enabled CMs in the same bonding group, joining the multicast session.

- Removal of DSIDs from the CM through a DBC message by the Cisco CMTS after a multicast session leave event.
- Release of DSID to the pool by the Cisco CMTS when the last member leaves the bonding group.
- The following DSIDs are preallocated for each primary downstream (modular and integrated cable interfaces) to forward general query messages. These DSIDs form part of the multicast group signaling protocol. Other multicast groups, do not use these DSIDs.
  - IGMPv2 general query (IPv4)
  - IGMPv3 general query (IPv4)
  - MLDv1 general query (IPv6)
  - MLDv2 general query (IPv6)
  - Preregistration of DSID (IPv6)
- Allocation of DSID ensures traffic segregation between virtual private networks (VPNs) for DOCSIS 3.0 MDF-enabled CMs. For example, two clients from two VPNs joining the same multicast will get two distinct DSIDs.

## Multicast Forwarding on Bonded CM

Multicast packets to the DOCSIS 3.0-enabled CMs are transmitted as bonded packets with DSID extension header on the primary bonding group if the Secondary Multicast Bonding Group is disabled. Multicast packets for MDF-disabled or pre-DOCSIS 3.0 CMs are transmitted as non-bonded without DSID extension header. For more information on this feature, refer to [Multicast Secondary Bonding Group, on page 877](#).

In a network, where only MDF-enabled or MDF-disabled CMs exist, the traffic is segregated using field types. The MDF-enabled CM forwards the frame with the field type and the MDF-disabled CM drops it. The DSID labeling ensures that MDF-enabled CM gets a copy of the multicast session to prevent “cross talk”.

For hybrid CMs (MDF-enabled and MDF-disabled CMs) that do not support field type forwarding, you should configure per session encryption or security association identifier (SAID) isolation to ensure traffic segregation. DOCSIS 3.0 mandates that if the hybrid CM fails to forward field type frames, the Cisco CMTS should employ multicast security association identifier (MSAID) isolation. This isolation is achieved by assigning different MSAID to each replication, one to bonded CM and another to the non-bonded or hybrid CM. This helps to prevent CMs from receiving duplicate traffic.

## Static TLV Forwarding

As per DOCSIS 3.0 specifications, the Cisco CMTS must support Static Multicast. When the CM tries to register with the Cisco CMTS, the Cisco CMTS checks whether Static Multicast Encoding is present in the CM configuration file. If the Static Multicast Encoding is present, the Cisco CMTS sends a DSID corresponding to each Static Multicast channel in the Registration-Response (REG-RSP) message.

The Multicast DSID management is located at Supervisor and the interface card has to contact the Supervisor for proper DSID assignment. The interface card also caches the response from Supervisor to eliminate the need to communicate to the Supervisor for subsequent Static Multicast encoding.

## Explicit Tracking

The Cisco CMTS can perform explicit tracking with IGMPv3 support. The IGMPv3 removes the report suppression feature associated with the IGMPv2 specification enabling the Cisco CMTS to get the complete

information on session and host information. This benefits the IGMP Fast Leave processing and DSID management for each CM.

A host or session database is used to track hosts (IP/MAC) joining a particular multicast session. From the host, you can track the CM based on the SID and cable downstream interface. This database also helps to determine whether the Cisco CMTS should remove the DSID from a particular CM when the multicast session is over.

## Multicast Quality of Service Enhancement

DOCSIS 3.0 mandates that the CMTS should not admit any flow exceeding the session limit. Though the current Multicast QoS (MQoS) session limit admits the session, it fails to provide any QoS for sessions exceeding the session limit.

---

**Note** Multicast packets are sent using the default Group Service Flows (GSF) when the Multicast QoS feature is disabled.

---

As part of DOCSIS 3.0 requirements for Multicast QoS, Group Classifier Rules (GCR) is supported. The Cisco CMTS determines the set of Group Configurations (GCs) whose session range matches the multicast group address. For SSM, the source address is also used to identify the matching GCs. A GCR is created for each matching GC and linked to the multicast session. The GCR is assigned also with a unique identifier, SAID, and Group Service Flow (GSF).

The following conditions are used to select the GC entries:

- The GC entry with the highest rule priority is selected, if more than one GC entry matches.
- All matching GC entries are selected, when multiple GCs have the same highest rule priority.

The GCR classification is done based on type of service (TOS) fields. The TOS specifier in the GCR is used to choose the correct GCR when multiple GCRs match a single multicast session.

---

**Note** When two multicast group configurations (GCs) have the same session range and configuration (under global or bundle configuration), then the same forwarding interface selection is not guaranteed.

---

Non-IP multicasts and broadcast packets use GSF. They are similar to individual service flows and are shared by all the CMs on a particular Digital Command Signal (DCS) matching the same GCR. A single GSF is used for multicast sessions matching different GCs using the same aggregate GQC.

## Multicast Secondary Bonding Group

The DOCSIS 3.0-compliant CM can receive multicast packets from non-primary (or bonded) channels using the MDF support at the CMTS.

The multicast secondary bonding group is defined as a shared bonding group or RF channel that feeds more than one fiber node through an optical split. This allows CMs from different primary bonding groups and channels to listen to one or more shared sets. The multicast packets are replicated only to the shared downstream channel set, which helps conserve the downstream bandwidth.

DOCSIS 3.0 defines attribute-based service flow creation, which allows the Cisco CMTS to make more “intelligent” decisions on the selection of bonding group or individual channel for unicast and multicast forwarding.

The Multicast Secondary Bonding Group provides the following benefits:

- New MQoS and attribute-based forwarding for Multicast Secondary Bonding Group.
- The primary downstream interface acts as a forwarding interface for narrowband CMs.
- The following algorithm is used to select a forwarding interface for wideband CMs:
  - A primary bonding group is selected if a group-config matching the session is present in it. MQoS parameters are taken from the group-config.
  - A primary bonding group is selected if a group-config is not present at the bundle level or at the global level.
  - A group-config found at the bundle level or global level is used to find the Group-QoS-Config (GQC) and eventually the attribute and forbidden bit-masks, which are then used to find the interface.
  - All Wideband Cable Modems (WCMs) in a bundle use the same secondary bonding group if a bundle-level group-config or global-level group-config is configured.
- The IGMP report ignores a source if the given source address fails to find a matching interface.
  - If a matching interface is found, that interface is used for forwarding and the MQoS parameters are taken from the matching group-config from the forwarding interface or bundle interface or global level.
  - If a matching interface is not found, then the IGMP report is ignored.
- For a static join, attribute-based forwarding is not supported, and only the primary downstream is used.

## Load Balancing

The Load Balancing feature does not load balance a CM while a multicast stream is going on for that particular CM. It utilizes the Explicit Tracking Database, which holds complete information on the CM subscription to achieve this.

## Multicast DSID Forwarding Disabled Mode

For any application that needs the cable modem to perform IGMP snooping, the MDF on the cable modem must be disabled. Cable modems registered in MDF-enabled mode by the Cisco CMTS do not perform IGMP snooping because MDF forwarding is based on DSID filtering. The **cable multicast mdf-disable** command disables the MDF capability on the cable modem.

This command is configured on the route processor and is downloaded to the cable line card via the configuration update. The configuration does not change the Cisco CMTS forwarding mechanism or DSID allocation. The Cisco CMTS allocates the DSID and the multicast packet is encapsulated with the DSID header. This does not affect traffic forwarding on the MDF-disabled cable modem. According to DOCSIS3.0 specification, pre-DOCSIS2.0 or MDF-disabled cable modems ignore the DSID header and continue multicast forwarding based on the Group Media Access Control (GMAC) from IGMP snooping. When the cable modem runs in MDF-disabled mode, only IGMPv2 is supported and the Cisco CMTS drops IGMPv3 and MLD messages.

Multicast encryption based on BPI+ is not supported on non-MDF cable modems, if IGMP SSM mapping is used. A non-MDF cable modem is either a pre-DOCSIS 3.0 cable modem or a DOCSIS 3.0 cable modem running in MDF-disabled mode.

## MDF1 Support for DOCSIS 2.0 Hybrid Cable Modems

The Cisco CMTS router enables MDF capability for DOCSIS 2.0 hybrid cable modems, IPv6, and other cable modems that advertise MDF capability to allow IPv6 packet forwarding. The **wb-incapable-cm** keyword in the **cable multicast mdf-disable** command disables MDF on all DOCSIS 2.0 hybrid cable modems including DOCSIS Set-Top Gateway (DSG) hybrid embedded cable modems to support IGMP snooping.

## DSG Disablement for Hybrid STBs

The **cable multicast mdf-disable** command with the **wb-incapable-cm** keyword prevents all DOCSIS 2.0 DSG embedded cable modems from receiving DSG multicast traffic besides disabling MDF support.

The **wb-incapable-cm** keyword disables MDF capability only on non-DSG DOCSIS 2.0 hybrid cable modems. To disable MDF capability on all DSG embedded cable modems (DOCSIS 3.0 DSG and DOCSIS 2.0 DSG hybrid), a new keyword, DSG, is introduced.

---

**Note** After disabling MDF capability, you must run **clear cable modem reset** command to bring all DSG embedded cable modems online.

---

## Benefits of MDF1 Support

- Supports IPv6 on different known cable modem firmware types.
- Disables the MDF capability on the Cisco CMTS.
- Supports In-Service Software Upgrade (ISSU) and line card high availability.

## Dynamic Multicast Replication Sessions

When users enable IPTV service on the Cisco cBR routers, to enhance the performance, the following features are supported on Cisco cBR.

- Supports 8000 SIDs per bundle interface:

The Cisco cBR supports 8000 SIDs per bundle, because each MQoS need one SID for each multicast session.

- Provides faster and efficient IP Communicator messages.
- Provides faster multicast forwarding.
- Enables caching of dynamic multicast sessions.

## Cache Multicast Replication Sessions

Creating a new multicast replication session takes most of the CPU cycles when compared to joining an existing multicast replication session. Most resources associated with a multicast replication session can be cached after the session ends.

Hence, when a new IGMP join request is received later, these resources can be reused.

The multicast session replication cache is available only on an active SUP. When SUPSO happens, all cached sessions are lost, and are then recreated on the new active SUP when an IGMP/MLD join request is received.

When LCSO happens, all cache sessions of this LC are cleared and are recreated on the new active LC when an IGMP/MLD join request is received.

## How to Configure the DOCSIS 3.0 Multicast Support

This section describes the following tasks that are required to implement DOCSIS 3.0 Multicast Support on Cisco CMTS Routers:

### Configuring Basic Multicast Forwarding

To configure a basic multicast forwarding profile that can be applied to a DOCSIS 3.0 multicast configuration, use the **ip multicast-routing** command. You must configure a multicast routing profile before you can proceed with a multicast group.

#### Procedure

|        | Command or Action                                                                                | Purpose                                                                                                                                                                                                                                                                                                     |
|--------|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                       | Enters global configuration mode.                                                                                                                                                                                                                                                                           |
| Step 3 | <b>IP multicast-routing [vrf]</b><br><b>Example:</b><br>Router(config)# IP multicast-routing vrf | Enables multicast routing globally or on a particular virtual routing and forwarding (VRF) interface.                                                                                                                                                                                                       |
| Step 4 | <b>interface bundle <i>number</i></b><br><b>Example:</b><br>Router(config)# interface bundle 1   | Configures the interface bundle and enters interface configuration mode.                                                                                                                                                                                                                                    |
| Step 5 | <b>IP pim sparse-mode</b><br><b>Example:</b><br>Router(config-if)# IP pim sparse-mode            | Configures sparse mode of operation. <p><b>Note</b> The Cisco CMTS router must have a Protocol Independent Multicast (PIM) rendezvous point (RP) configured for the PIM sparse mode. The Supervisor is configured using the <b>ip pim rp-address</b> command or Auto-Supervisor configuration protocol.</p> |

|        | Command or Action                                                                                                                                  | Purpose                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>IP pim sparse-dense-mode</b><br><b>Example:</b><br><pre>Router(config-if)# IP pim sparse-dense-mode</pre>                                       | Configures the interface for either sparse mode or dense mode of operation, depending on the mode in which the multicast group is operating. |
| Step 7 | <b>IP igmp version version-number</b><br><b>Example:</b><br><pre>Router(config-if)# IP igmp version 3</pre>                                        | Configures the interface to use IGMP version 3.                                                                                              |
| Step 8 | <b>IP igmp v3-query-max-response-time response_time</b><br><b>Example:</b><br><pre>Router(config-if)# IP igmp v3-query-max-response-time 500</pre> | Configures the maximum query response time for igmp version 3.                                                                               |

## Configuring Multicast DSID Forwarding

The multicast DSID forwarding is enabled by default. You cannot configure this feature.

## Configuring Explicit Tracking

The Explicit Tracking feature is enabled by default. You cannot configure it.

## Configuring Multicast QoS

To configure a Multicast QoS profile that can be applied to a DOCSIS 3.0 configuration, use the **cable multicast group-qos** command. You must configure a Multicast QoS profile before you can add a Multicast QoS profile to a QoS multicast group.

### Procedure

|        | Command or Action                                                                    | Purpose                                                                                                            |
|--------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configureterminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre> | Enters global configuration mode.                                                                                  |
| Step 3 | <b>cable service class class-index name service-class-name</b><br><b>Example:</b>    | Configures the name of the cable service class.                                                                    |

|                | Command or Action                                                                                                                                                                            | Purpose                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Router (config) # <b>cable service class 1 name MQOS_DEFAULT</b>                                                                                                                             |                                                                                                                                                              |
| <b>Step 4</b>  | <b>cable service class <i>class-index</i> downstream</b><br><b>Example:</b><br>Router (config) # <b>cable service class 1 downstream</b>                                                     | Configures the downstream for the cable service class.                                                                                                       |
| <b>Step 5</b>  | <b>cable service class <i>class-index</i> max-rate <i>maximum-bandwidth-allowed</i></b><br><b>Example:</b><br>Router (config) # <b>cable service class 1 max-rate 1000000</b>                | Configures the maximum allowed bandwidth for the cable service class.                                                                                        |
| <b>Step 6</b>  | <b>cable service class <i>class-index</i> min-rate <i>cir</i></b><br><b>Example:</b><br>Router (config) # <b>cable service class 1 min-rate 1000000</b>                                      | Configures the minimum committed information rate for the cable service class.                                                                               |
| <b>Step 7</b>  | <b>cable multicast group-qos default scn <i>service-class-name</i> aggregate</b><br><b>Example:</b><br>Router (config) # <b>cable multicast group-qos default scn MQOS_DEFAULT aggregate</b> | Specifies the default service class name for the QoS profile.                                                                                                |
| <b>Step 8</b>  | <b>cable multicast qos group <i>number</i> priority <i>value</i></b><br><b>Example:</b><br>Router (config) # <b>cable multicast qos group 20 priority 1</b>                                  | Configures a multicast QoS group and enters multicast QoS configuration mode, and specifies the priority of the cable multicast QoS group.                   |
| <b>Step 9</b>  | <b>application-id <i>app-id</i></b><br><b>Example:</b><br>Router (config-mqos) # <b>application-id 10</b>                                                                                    | Specifies the application identification number of the multicast QoS group. This value is configured to enable admission control to the multicast QoS group. |
| <b>Step 10</b> | <b>session-range ip-address ip-mask</b><br><b>Example:</b><br>Router (config-mqos) # <b>session-range 230.0.0.0 255.0.0.0</b>                                                                | Specifies the session range IP address and IP mask of the multicast QoS group. You can configure multiple session ranges.                                    |
| <b>Step 11</b> | <b>cable multicast qos group <i>number</i> priority <i>value</i> [global]</b><br><b>Example:</b>                                                                                             | Specifies the multicast QoS group identifier.                                                                                                                |

|  | Command or Action                                                         | Purpose |
|--|---------------------------------------------------------------------------|---------|
|  | <pre>Router(config)#cable multicast qos group 20 priority 63 global</pre> |         |

## Selecting a Forwarding Interface Based on Service Flow Attribute

The Service Flow Attribute feature allows a bonded CM to listen to multiple bonding groups, and using the interface-specific bit-masks, the CM can select the best route to receive multicast traffic.

The Service Flow Attribute feature allows selection of a forwarding interface based on the DOCSIS 3.0 construct named “service flow attribute mask.” Every interface has an attribute bit-mask depicting attributes of that interface. The multicast service class specified in the group QoS configuration contains required and forbidden attribute bit-masks. If a bonded CM can listen to multiple bonding groups (wideband interfaces), using specific bit-masks in the service class as well as on the bonding group, then one of these bonding groups can be selected for forwarding of multicast traffic.

### Procedure

|               | Command or Action                                                                                                                                                           | Purpose                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                                                                                    | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                                                                               | <p>Enters global configuration mode.</p>                                                                                  |
| <b>Step 3</b> | <p><b>cable service class <i>class-index</i> name <i>name</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# cable service class 10 name mcast10</pre>                 | <p>Configures the service class name.</p>                                                                                 |
| <b>Step 4</b> | <p><b>cable service class <i>class-index</i> downstream</b></p> <p><b>Example:</b></p> <pre>Router(config)# cable service class 10 downstream</pre>                         | <p>Configures the downstream for the selected service class.</p>                                                          |
| <b>Step 5</b> | <p><b>cable service class <i>class-index</i> max-rate <i>maximum-rate</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# cable service class 10 max-rate 1000000</pre> | <p>Configures the maximum rate for the selected service class.</p>                                                        |

## Selecting a Forwarding Interface Based on Service Flow Attribute

|                | Command or Action                                                                                                                                                                                      | Purpose                                                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <b>cable service class</b> <i>class-index</i> <b>min-rate</b> <i>minimum-rate</i><br><b>Example:</b><br>Router(config)# <b>cable service class 10 min-rate 100000</b>                                  | Configures the minimum rate for the selected service class.                                   |
| <b>Step 7</b>  | <b>cable service class</b> <i>class-index</i> <b>req-attr-mask</b> <i>required-attribute-mask</i><br><b>Example:</b><br>Router(config)# <b>cable service class 10 req-attr-mask 800000F</b>            | Configures the required attribute mask for the selected service class.                        |
| <b>Step 8</b>  | <b>cable service class</b> <i>class-index</i> <b>forb-attr-mask</b> <i>forbidden-attribute-mask</i><br><b>Example:</b><br>Router(config)# <b>cable service class 10 forb-attr-mask 7FFFFFF0</b>        | Configures the forbidden attribute mask for the selected service class name.                  |
| <b>Step 9</b>  | <b>cable multicast group-qos</b> <i>number</i> <b>scn</b> <i>service-class-name</i> <b>aggregate</b><br><b>Example:</b><br>Router(config)# <b>cable multicast group-qos 1 scn 10 mcast10 aggregate</b> | Configures the cable multicast group QoS identifier, service class name, and multicast value. |
| <b>Step 10</b> | <b>cable multicast qos group</b> <i>group</i> <b>priority</b> <i>priority</i><br><b>Example:</b><br>Router(config)# <b>cable multicast qos group 1 priority 1</b>                                      | Configures the cable MQoS group and enters MQoS configuration mode.                           |
| <b>Step 11</b> | <b>session-range</b> <i>session-range</i> <i>mask</i><br><b>Example:</b><br>Router(config-mqos)# <b>session-range 230.1.1.1 255.255.255.255</b>                                                        | Specifies session range.                                                                      |
| <b>Step 12</b> | <b>group-qos</b> <i>qos</i><br><b>Example:</b><br>Router(config-mqos)# <b>group-qos 1</b>                                                                                                              | Specifies the group QoS.                                                                      |
| <b>Step 13</b> | <b>exit</b><br><b>Example:</b><br>Router(config-mqos)# <b>exit</b>                                                                                                                                     | Returns to global configuration mode.                                                         |

|         | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                   |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 14 | <p><b>interface bundle</b> <i>number</i></p> <ul style="list-style-type: none"> <li>• <b>ip address</b> <i>ip mask</i></li> <li>• <b>ip pim sparse-mode</b></li> <li>• <b>ip helper-address</b> <i>helper-address</i></li> <li>• <b>cable multicast-qos group</b> <i>group</i></li> </ul> <p><b>Example:</b></p> <pre>Router(config)# interface Bundle1 Router(config-if)# ip address 40.1.1.1 255.255.255.0 Router(config-if)# ip pim sparse-mode Router(config-if)# ip helper-address 2.39.16.1 Router(config-if)# cable multicast-qos group 1</pre>                                                                                                                                                                                                               | Configures the interface bundle with the IP address, helper address, and MQoS group.                                      |
| Step 15 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-if)# exit</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Returns to global configuration mode.                                                                                     |
| Step 16 | <p><b>interface wideband-cable</b><br/><i>slot/subslot/port:wideband-channel</i></p> <ul style="list-style-type: none"> <li>• <b>description</b> <i>description</i></li> <li>• <b>cable bundle</b> <i>number</i></li> <li>• <b>cable rf-channel channel-list</b> <i>grouplist</i><br/><b>bandwidth-percent</b> <i>bw-percent</i></li> <li>• <b>cable downstream attribute-mask</b> <i>attribute-mask</i></li> </ul> <p><b>Example:</b></p> <pre>Router(config)# interface Wideband-Cable1/0/0:0 Router(config-if)# description cable rf-channels channel-list 0-7 bandwidth-percent 20 Router(config-if)# cable bundle 1 Router(config-if)# cable rf-channels channel-list 0-7 bandwidth-percent 20 Router(config-if)# cable downstream attribute-mask 800000F</pre> | Selects the interface for forwarding based on the bit-masks specified in the service class and on the wideband interface. |
| Step 17 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config-if)# end</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Returns to privileged EXEC mode.                                                                                          |

## Configuring Multicast DSID Forwarding Disabled Mode

To disable MDF on the cable modem, use the **cable multicast mdf-disable** command in global configuration mode.

**Note** Multicast encryption based on BPI+ is not supported on non-MDF cable modems, if IGMP SSM mapping is used.

### Procedure

|               | Command or Action                                                                                                                 | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                             | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>cable multicast mdf-disable [wb-incapable-cm]</b><br><b>Example:</b><br><pre>Router(config)# cable multicast mdf-disable</pre> | Disables MDF capability on the cable modem.                                                                        |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config)# exit Router#</pre>                                                         | Exits the global configuration mode.                                                                               |

## Configuring Multicast Replication Session Globally

Use the following command to configure the maximum number of multicast replication sessions globally and the value is configured per L2 forwarding interface.

If the operator does not configure a value for the maximum number, by default, is set to 0 for all L2 forwarding interfaces, and the cache function is not valid. Cisco cBR does not cache the multicast replication sessions.

If the value is changed from a number such as 10 to 0, all current caches is cleared. The value range is from 0 to 500.

The following example shows how to set the maximum number of cache to 0:

```
enable
configure terminal
cable multicast ses-cache 0
```

The following example shows how to change the current value:

```
enable
configure terminal
```

```
[no|default] cable multicast ses-cache <0-500>
```

## Configuring Multicast Replication Sessions on Forwarding Interface

Use the following command to enable the multicast replication session on each L2 forwarding interface.

The value range for the maximum number is 0 to 500. If the value is changed from a number such as 10 to 0, all current caches is cleared.

The configured value for the interface has higher priority than the system value. The following example shows how to configure session cache on forwarding interface and make Cisco cBR use the system values:

```
enable
configure terminal
interface wideband-Cable {slot /subslot /controller :wideband-channel}
[no|default] cable multicast ses-cache
```

The following example shows how to set the maximum number of cache for the interface:

```
enable
configure terminal
interface integrated-Cable {slot/subslot/port:rf-channel}
cable multicast ses-cache 500
```

The following example shows how to configure a value 0 for an interface:

```
enable
configure terminal
interface integrated-Cable {slot/subslot/port:rf-channel}
no cable multicast ses-cache
```

## Clearing Multicast Replication Cache

Use the following command to clear the multicast replication session for all or for a specific L2 forwarding interface. The system deletes all current cache entries for all L2 forwarding interfaces or for a specific L2 interface.

```
enable
clear cable multicast ses-cache [interface xxx | all | counter]
```

## How to Monitor the DOCSIS 3.0 Multicast Support

To monitor the DOCSIS 3.0 Multicast Support feature, use the following procedures:

## Verifying the Basic Multicast Forwarding

To verify the configuration parameters for basic multicast forwarding, use the **show ip mroute** command as shown in the following example:

```
Router# show ip mroute

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
 T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
 X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
 U - URD, I - Received Source Specific Host Report,
 Z - Multicast Tunnel, z - MDT-data group sender,
 Y - Joined MDT-data group, y - Sending to MDT-data group,
 V - RD & Vector, v - Vector
Outgoing interface flags: H - Hardware switched, A - Assert winner
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

(*, 230.1.1.1), 00:00:03/00:02:55, RP 30.1.1.1, flags: S
 Incoming interface: Null, RPF nbr 0.0.0.0
 Outgoing interface list:
 Bundle1, Forward/Sparse, 00:00:03/00:02:55, H
(*, 224.0.1.40), 00:12:02/00:02:19, RP 30.1.1.1, flags: SJCL
 Incoming interface: Null, RPF nbr 0.0.0.0
 Outgoing interface list:
 Bundle1, Forward/Sparse, 00:12:02/00:02:19
```

To verify the multicast information for the specified virtual interface bundle, based on IGMPv3, use the **show cable bundle multicast** command as shown in the following example:

```
Router# show cable bundle 1 multicast

CableBundle Interface Source IP Multicast IP MAC Address
1 Bundle1.1 * 230.1.1.1 0100.5e00.0001
```

To verify the MAC forwarding table for the specified virtual interface bundle, based on IGMPv3, use the **show cable bundle forwarding** command as shown in the following example:

```
Router# show cable bundle 1 forwarding

MAC address Interface Flags Location link sublink
00c0.5e01.0203 Cable8/0/0 3 64E5BF60 0 64E5BE00
00c0.5e01.0203 Cable7/0/0 3 64E5BE00 0 0
00c0.5e01.0101 Cable8/0/0 3 64E5BEE0 0 64E5BE40
```

## Verifying the Multicast DSID Forwarding

To verify the entire DSID database content, use the **show cable multicast dsid** command as shown in the following example:

```
Router# show cable multicast dsid
Multicast Group : 230.1.2.3
 Source : *
 IDB : Bu2 Interface: Mo1/1/0:0 Dsid: 0x1F078
 StatIndex : 2 SAID: DEFAULT
Multicast Group : 230.1.2.3
```

```

Source : *
IDB : Bu2 Interface: Mo1/1/0:0 Dsid: 0x1F078
StatIndex : 3 SAID: 8196
Multicast Group : 230.1.2.3
Source : *
IDB : Bu2 Interface: Mo1/1/0:0 Dsid: 0x1F078

```

**StatIndex : 4 SAID: 8197**

To verify the entire database content, use the **show cable multicast db** command as shown in the following example:

**Router# show cable multicast db**

```

interface : Bundle1
Session (S,G) : (*,230.1.1.1)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts
Wi1/1/0:0 Bundle1 Ca5/0/0 0018.6852.8056 1

```

To verify the information for the registered and unregistered CMs, use the **show cable modem verbose** command as shown in the following example:

**Router# show cable modem 00C0.7bb3.fcd1 verbose**

```

MAC Address : 00C0.7bb3.fcd1
IP Address : 10.20.113.2
Prim Sid : 1
QoS Profile Index : 6
Interface : C5/0/U5

Spoof attempt : Dynamic secret check failed
Total Time Online : 16:16

```

## Verifying the Explicit Tracking Feature

To verify explicit tracking information, use the **show cable multicast db** command as shown in the following example:

```
Router# show cable multicast db
```

```
Interface : Bundle1
Session (S,G) : (*,230.1.1.1)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts
Mo1/1/0:0 Bundle1 Ca5/0/0 0018.6852.8056 1
```

## Verifying the Multicast QoS Feature

To verify the cable MQoS details, use the **show cable multicast qos** commands as shown in the following example:

```
Router# show cable multicast qos ?
group-config Display Multicast Group Config information
group-encryption Display Multicast Group Encryption information
group-qos Display Multicast Group QOS information
Router# show cable multicast qos group-config
Multicast Group Config 1 : Priority 1
Group QOS - 1
Group Encryption - 1
Session Range - Group Prefix 230.0.0.0 Mask 255.0.0.0 Source Prefix 0.0.0.0 Mask 0.0.0.0
Router# show cable multicast qos group-encryption
Multicast Group Encryption 1 : Algorithm 56bit-des
Router# show cable multicast qos group-qos
Group QOS Index Service Class Control Icmp Limit Override
DEFAULT MQOS_DEFAULT Aggregate NO-LIMIT 1 MQOS Aggregate NO-LIMIT
```

To verify the DOCSIS service flows on a given cable interface, use the **show interface service-flow** command as shown in the following example:

```
Router# show interface cable 6/0 service-flow
```

| Sfid  | Sid  | Mac Address    | QoS Param | Index | Type | Dir       | Curr  | Active |
|-------|------|----------------|-----------|-------|------|-----------|-------|--------|
| BG/CH |      |                |           |       |      |           |       |        |
|       |      |                | Prov      | Adm   | Act  |           | State | Time   |
| 4     | 8193 | ffff.ffff.ffff | 3         | 3     | 3    | sec(S) DS | act   | 21h57m |
| 5     | 8196 | ffff.ffff.ffff | 4         | 4     | 4    | sec(S) DS | act   | 00:17  |

## Verifying the Service Flow Attributes

To verify the configuration of service flow attributes on the service class configuration, use the **show cable service-class verbose** command as shown in the following example:

```
Router# show cable service-class 10 verbose
Index: 10
Name: mcast10
Direction: Downstream
Traffic Priority: 0
Maximum Sustained Rate: 1000000 bits/sec
Max Burst: 3044 bytes
Minimum Reserved Rate: 1000000 bits/sec
Minimum Packet Size 0 bytes
```

```

Admitted QoS Timeout 200 seconds
Active QoS Timeout 0 seconds
Required Attribute Mask 8000000F
Forbidden Attribute Mask 7FFFFFF0
Scheduling Type: Undefined
Max Latency: 0 usecs
Parameter Presence Bitfield: {0x3148, 0x0}

```

To verify the configuration of SF attributes on the Wideband interface configuration, use the **show running-config interface** command as shown in the following example:

```

Router# show running-config interface Wideband-Cable 1/0/0:2
interface Wideband-Cable1/0/0:2
 cable bundle 1
 cable bonding-group-id 3
 cable rf-channel 3
 cable downstream attribute-mask 8000000F
end

```

## Verifying the Multicast Group Classifiers

To verify the details of the Group Classifier Rule, use the **show interface wideband-cable multicast-gcr** command as shown in the following example:

```

Router# show interface wideband-cable 1/1/0:0 multicast-gcr
Group Classifier Rules on Wideband-Cable1/1/0:0:
Classifier_id Group_id Group_Qos_id Sid SFID ref_count
7 1 1 8196 10 1
8 2 1 8197 11 1

```

## Troubleshooting Tips

Make sure that CM can listen to the RF-frequencies specified for the Wideband interfaced chosen for forwarding multicast traffic.

## Viewing Current Cache

Use this command to show the current multicast replication session per L2 forwarding interface.

- If you do not specify an interface, this command shows a summary of the current L2 forwarding interface. The summary includes the cache number.
- If you specify an interface, this command shows a summary of the interface. Add the verbose option for more detailed information of the cache.

```

Router#show cable multicast ses-cache global summary

Global Cache Config: 20

Fwd Cache Cache Cache Cache
Intfc Config Used Missed Hitted
Wi7/0/0:1 10 4 4 12

Total 4 4 12

Router# show cable multicast ses-cache global

```

```

Fwd Intfc Sub Intfc Session (S,G)
Wi7/0/0:0 Bundle1 (30.30.30.30,227.0.0.20)
 Bundle1 (30.30.30.30,227.0.0.22)

Wi7/0/0:1 Bundle1 (30.30.30.30,226.0.0.20)
 Bundle1 (30.30.30.30,226.0.0.22)
 Bundle1 (30.30.30.30,226.0.0.23)

 10 8859 25 0 1 0

```

```
Total session cache num: 2
```

For the **Cache Missed** value, the value is increased for a new join request when cached entry is not available for reusing.

# Configuration Examples for DOCSIS 3.0 Multicast Support

This section provides the following configuration examples:

## Example: Configuring Basic Multicast Forwarding

**Note** The commands given below are required to enable the Cisco CMTS to forward multicast packets. However, Multicast QoS, and Authorization features are all optional for multicast packets to be forwarded correctly.

In the following example, a basic multicast forwarding profile is configured.

```
ip multicast-routing
interface TenGigabitEthernet4/1/0
 ip pim sparse-dense-mode
interface Bundle 1
 ip pim sparse-mode
 ip igmp version 3
```

## Example: Configuring Multicast QoS

**Note** A default service class and GQC must be defined before proceeding with configuring Multicast QoS.

In the following example, Multicast QoS is configured. You should define three objects and templates and then associate these to a particular bundle or forwarding interface. The objects are Service-Class, Group-QoS-Config (GQC), and Group-Config.

```
cable service class 1 name MQOS_DEFAULT
cable service class 1 downstream
cable service class 1 max-rate 10000000
cable service class 1 min-rate 1000000
cable multicast group-qos default scn MQOS_DEFAULT aggregate
cable multicast group-qos 10 scn MQOS single
cable multicast qos group 20 priority 1
application-id 10
session-range 230.0.0.0 255.0.0.0
tos 1 6 15
vrf name1
cable multicast qos group 20 priority 63 global
```

## Example: Configuring Forwarding Interface Selection Based on Service Flow Attribute

In the following example, the service flow attribute-based Forwarding Interface Selection is configured. To send multicast traffic for group 230.1.1.1, interface W6/0/0:0 is selected. The multicast QoS parameters are taken from group qos 1 (effectively from service class “mcast10”).

**Example: Configuring Multicast Replication Session**

```

cable service class 10 name mcast10
cable service class 10 downstream
cable service class 10 max-rate 1000000
cable service class 10 min-rate 1000000
cable service class 10 req-attr-mask 8000000F
cable service class 10 forb-attr-mask 7FFFFFF0
cable multicast group-qos 1 scn mcast10 aggregate
cable multicast qos group 1 priority 1
session-range 230.1.1.1 255.255.255.255
 group-qos 1
interface Bundle1
 ip address 40.1.1.1 255.255.255.0
 ip pim sparse-mode
 ip helper-address 2.39.16.1
 cable multicast-qos group 1
end
interface Wideband-Cable6/0/0:0
cable bundle 10
cable rf-channels channel-list 0-7 bandwidth-percent 20
cable downstream attribute-mask 8000000F
end

```

## Example: Configuring Multicast Replication Session

The following example shows how to enable the multicast replication session on each L2 forwarding interface.

```

enable
conf t
interface xxx

[no|default] cable multicast ses-cache
cable multicast ses-cache 3

```

## Feature Information for DOCSIS 3.0 Multicast Support

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfmg.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 154: Feature Information for DOCSIS 3.0 Multicast Support**

| Feature Name                           | Releases                 | Feature Information                                                                |
|----------------------------------------|--------------------------|------------------------------------------------------------------------------------|
| DOCSIS 3.0 Multicast Support           | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into the Cisco cBR Series Converged Broadband Routers. |
| Dynamic Multicast Replication Sessions | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 59

# IPv6 Segment Routing on Cisco cBR

---

In Cisco Converged Broadband Router, IPv6 Segment Routing is available as a sub mode of IPv6 address configuration.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

- [Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 897](#)
- [Information about IPv6 Segment Routing, on page 898](#)
- [How to Configure IPv6 Segment Routing, on page 899](#)
- [Configuration Examples, on page 901](#)
- [Feature Information for IPv6 Segment Routing, on page 902](#)

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 155: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Information about IPv6 Segment Routing

IPv6 Segment Routing (SR) is an SDN technology supporting IPv6 forwarding. In SR, a source or edge router performs source routing of traffic and encodes it as a segment list in an IPv6 routing extension header. The network is not required to maintain a per-application or per-flow state.

Any IPv6 capable node in a network may forward IPv6 traffic with an SR extension header to the first segment in the segment list without supporting IPv6 Segment Routing (SRv6).

At the node that hosts the current segment in the segment list, SRv6 is configured to modify the destination address of the traffic containing the SR extension header and destined to that segment ID. As part of SRv6 final processing, the next segment ID in the SR extension header is written to the destination address of the packet and a lookup is performed to forward the traffic to the new destination address.

The forwarding and SRv6 end processing continues at nodes hosting the segment IDs in the SR extension header until the last segment in the list is removed and the traffic is delivered to its ultimate destination.

## Restriction for Configuring IPv6 Segment Routing

Configuring duplicate IPv6 addresses on the same interface is not allowed.

# How to Configure IPv6 Segment Routing

## Configuring IPv6 Segment Routing on cBR

To configure IPv6 segment routing, use the following procedure.

1. Enter segment-routing sub mode when configuring an IPv6 address on an interface.

```
enable
configure terminal
interface type [slot_#/]port_#
ipv6 address ipv6_address_prefix/prefix_length
ipv6 address ipv6_address_prefix/prefix_length segment-routing
```

2. Define a local prefix as an SID

```
ipv6-sr prefix-sid
exit
```

## Verifying IPv6 Segment Routing Configuration

The following example shows how to verify SRv6 configuration:c

```
Router#sh run
*Oct 17 13:13:23.975: %SYS-5-CONFIG_I: Configured from console by console
Router#sh run | sec Ether
interface Ethernet0/0
no ip address
shutdown
ipv6 address 2001::2001/64 segment-routing >>>>>>
ipv6-sr prefix-sid >>>>>>
```

## Configure Multiple IPv6 Addresses for Segment Routing

To configure multiple IPv6 addresses for SRv6 under the same interface, use the following commands.

1. Enter segment-routing sub mode when configuring an IPv6 address on an interface.

```
enable
configure terminal
interface type [slot_#/]port_#
ipv6 address ipv6_address_prefix/prefix_length segment-routing
```

2. Define a local prefix as an SID.

```
ipv6-sr prefix-sid
exit
```

## Verifying IPv6 Segment Routing Configuration on Multiple IPv6 Addresses

The following example shows how to verify SRv6 configuration for multiple IPv6 addresses:

```
Router#sh run | sec Ether
interface Ethernet0/0
```

```

no ip address
shutdown
ipv6 address 2001:db8:110::/64 segment-routing >>> submode 1
 ipv6-sr prefix-sid
ipv6 address 2001:db9:111::/64 segment-routing >>> submode 2
 ipv6-sr prefix-sid
interface Ethernet0/1
no ip address
shutdown
interface Ethernet0/2
no ip address
shutdown
interface Ethernet0/3
no ip address
shutdown
interface Ethernet1/0
no ip address
shutdown
interface Ethernet1/1
no ip address
shutdown
interface Ethernet1/2

```

## Disabling Prefix SID

To disable the local prefix SID associated to the segment ID, use the following commands.

```

enable
configure terminal
interface type [slot_#/]port_#
ipv6 address ipv6_address_prefix/prefix_length segment-routing
no ipv6-sr prefix-sid
end

```

## Verifying whether Prefix SID is Disabled

The following example shows how to verify whether the prefix SID is disabled:

```

Router#sh run | sec Ether
interface Ethernet0/0
no ip address
shutdown
 ipv6 address 110::110/64 segment-routing >>> "ipv6-sr prefix sid" is no longer present
 ipv6 address 111::111/64 segment-routing
 ipv6-sr prefix-sid

```

## Disabling SRv6 for a Prefix-SID

To disable SRv6 configuration for an IPv6 address and remove the IPv6 address, use the following command:

```

enable
configure terminal
interface type [slot_#/]port_#
no ipv6 address ipv6_address_prefix/prefix_length segment-routing
end

```

## Verifying whether SRv6 is Disabled and Prefix SID Removed

The following example shows how to verify whether SRv6 is disabled and the prefix SID is removed for the prefix SID.

```
Router#sh run |
*Oct 17 13:17:51.523: %SYS-5-CONFIG_I: Configured from console by console
Router#sh run | sec Ether
interface Ethernet0/0
 no ip address
 shutdown
 ipv6 address 110::110/64 segment-routing
 ipv6 address 111::111/64 segment-routing is entirely removed from ethernet0/0
```

## Configuration Examples

This section provides examples for IPv6 Segment Routing.

### Example: Configuring IPv6 Segment Routing on Cisco cBR

```
Router#conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether0/0
Router(config-if)#ipv6 address 110::110/64 ?
 anycast
 eui-64
 segment-routing
 <cr>
Router(config-if)#ipv6 address 110::110/64 segment-routing
Router(config-if-sr-ipv6)#?
ipv6 address segment-routing mode configuration commands:
 default Set a command to its defaults
 exit Exit from SR submode
 ipv6-sr Request options specific to IPV6 segment-routing
 no Negate a command or set its defaults
Router(config-if-sr-ipv6)#ipv6-sr ?
 prefix-sid Set host prefix as IPv6 SR identifier prefix-sid
Router(config-if-sr-ipv6)#ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#exit
Router(config-if)#exit
Router(config)#exit
Router#
```

### Example: Configure Multiple IPv6 Addresses for SRv6

```
Router#conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether 0/0
Router(config-if)# ipv6 address 110::110/64 segment-routing
Router(config-if)# ipv6 address 111::111/64 segment-routing
Router(config-if-sr-ipv6)#ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#end
```

### Example: Disabling Prefix SID

```
Router#conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether0/0
```

**Example: Disabling SR with an Active Prefix SID**

```
Router(config-if)#inter Ether0/0
Router(config-if)#ipv6 address 110::110/64 segment-routing
Router(config-if-sr-ipv6)#no ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#end
```

**Example: Disabling SR with an Active Prefix SID**

```
Router#conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether0/0
Router(config-if)#no ipv6 address 111::111/64 segment-routing
Router(config-if)#end
```

## Feature Information for IPv6 Segment Routing

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 156: Feature Information for IPv6 Segment Routing**

| Feature Name         | Releases                 | Feature Information                                                                                            |

## CHAPTER 60

# IP Access Control Lists

---

Access control lists (ACLs) perform packet filtering to control which packets move through a network and to where. The packet filtering provides security by helping to limit the network traffic, restrict the access of users and devices to a network, and prevent the traffic from leaving a network. IP access lists reduce the chance of spoofing and denial-of-service attacks and allow dynamic, temporary user-access through a firewall.

IP access lists can also be used for purposes other than security, such as bandwidth control, restrict the content of routing updates, redistribute routes, trigger dial-on-demand (DDR) calls, limit debug output, and identify or classify traffic for quality of service (QoS) features. This module provides an overview of IP access lists.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About IP Access Lists

### Benefits of IP Access Lists

Access control lists (ACLs) perform packet filtering to control the flow of packets through a network. Packet filtering can restrict the access of users and devices to a network, providing a measure of security. Access lists can save network resources by reducing traffic. The benefits of using access lists are as follows:

- Authenticate incoming rsh and rcp requests—Access lists can simplify the identification of local users, remote hosts, and remote users in an authentication database that is configured to control access to a device. The authentication database enables Cisco software to receive incoming remote shell (rsh) and remote copy (rcp) protocol requests.
- Block unwanted traffic or users—Access lists can filter incoming or outgoing packets on an interface, thereby controlling access to a network based on source addresses, destination addresses, or user authentication. You can also use access lists to determine the types of traffic that are forwarded or blocked at device interfaces. For example, you can use access lists to permit e-mail traffic to be routed through a network and to block all Telnet traffic from entering the network.

- Control access to vty—Access lists on an inbound vty (Telnet) can control who can access the lines to a device. Access lists on an outbound vty can control the destinations that the lines from a device can reach.
- Identify or classify traffic for QoS features—Access lists provide congestion avoidance by setting the IP precedence for Weighted Random Early Detection (WRED) and committed access rate (CAR). Access lists also provide congestion management for class-based weighted fair queueing (CBWFQ), priority queueing, and custom queueing.
- Limit debug command output—Access lists can limit debug output based on an IP address or a protocol.
- Provide bandwidth control—Access lists on a slow link can prevent excess traffic on a network.
- Provide NAT control—Access lists can control which addresses are translated by Network Address Translation (NAT).
- Reduce the chance of DoS attacks—Access lists reduce the chance of denial-of-service (DoS) attacks. Specify IP source addresses to control traffic from hosts, networks, or users from accessing your network. Configure the TCP Intercept feature to can prevent servers from being flooded with requests for connection.
- Restrict the content of routing updates—Access lists can control routing updates that are sent, received, or redistributed in networks.
- Trigger dial-on-demand calls—Access lists can enforce dial and disconnect criteria.

## Border Routers and Firewall Routers Should Use Access Lists

There are many reasons to configure access lists; for example, you can use access lists to restrict contents of routing updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide a basic level of security for your network by controlling access to it. If you do not configure access lists on your router, all packets passing through the router could be allowed onto all parts of your network.

An access list can allow one host to access a part of your network and prevent another host from accessing the same area. In the figure below, by applying an appropriate access list to the interfaces of the router, Host A is allowed to access the Human Resources network and Host B is prevented from accessing the Human Resources network.

Access lists should be used in firewall routers, which are often positioned between your internal network and an external network such as the Internet. You can also use access lists on a router positioned between two parts of your network, to control traffic entering or exiting a specific part of your internal network.

To provide some security benefits of access lists, you should at least configure access lists on border routers--routers located at the edges of your networks. Such an access list provides a basic buffer from the outside network or from a less controlled area of your own network into a more sensitive area of your network. On these border routers, you should configure access lists for each network protocol configured on the router interfaces. You can configure access lists so that inbound traffic or outbound traffic or both are filtered on an interface.

Access lists are defined on a per-protocol basis. In other words, you should define access lists for every protocol enabled on an interface if you want to control traffic flow for that protocol.

## Definition of an Access List

Access control lists (ACLs) perform packet filtering to control the movement of packets through a network. Packet filtering provides security by limiting the access of traffic into a network, restricting user and device access to a network, and preventing traffic from leaving a network. IP access lists reduce the chance of spoofing and denial-of-service attacks, and allow dynamic, temporary user-access through a firewall.

IP access lists can also be used for purposes other than security, such as to control bandwidth, restrict the content of routing updates, redistribute routes, trigger dial-on-demand (DDR) calls, limit debug output, and identify or classify traffic for quality of service (QoS) features.

An access list is a sequential list that consists of at least one **permit** statement and possibly one or more **deny** statements. In the case of IP access lists, these statements can apply to IP addresses, upper-layer IP protocols, or other fields in IP packets.

Access lists are identified and referenced by a name or a number. Access lists act as packet filters, filtering packets based on the criteria defined in each access list.

After you configure an access list, for the access list to take effect, you must either apply the access list to an interface (by using the **ip access-group** command), a vty (by using the **access-class** command), or reference the access list by any command that accepts an access list. Multiple commands can reference the same access list.

In the following configuration, an IP access list named `branchoffices` is configured on Ten Gigabit Ethernet interface 4/1/0 and applied to incoming packets. Networks other than the ones specified by the source address and mask pair cannot access Ten Gigabit Ethernet interface 4/1/0. The destinations for packets coming from sources on network 172.16.7.0 are unrestricted. The destination for packets coming from sources on network 172.16.2.0 must be 172.31.5.4.

```
ip access-list extended branchoffices
 10 permit 172.16.7.0 0.0.0.3 any
 20 permit 172.16.2.0 0.0.0.255 host 172.31.5.4
!
interface tengigabitethernet 4/1/0
 ip access-group branchoffices in
```

## Access List Rules

The following rules apply to access lists:

- Only one access list per interface, per protocol, and per direction is allowed.
- An access list must contain at least one **permit** statement or all packets are denied entry into the network.
- The order in which access list conditions or match criteria are configured is important. While deciding whether to forward or block a packet, Cisco software tests the packet against each criteria statement in the order in which these statements are created. After a match is found, no more criteria statements are checked. The same **permit** or **deny** statements specified in a different order can result in a packet being passed under one circumstance and denied in another circumstance.
- If an access list is referenced by a name, but the access list does not exist, all packets pass. An interface or command with an empty access list applied to it permits all traffic into the network.
- Standard access lists and extended access lists cannot have the same name.

- Inbound access lists process packets before the packets are routed to an outbound interface. Inbound access lists that have filtering criteria that deny packet access to a network saves the overhead of routing lookup. Packets that are permitted access to a network based on the configured filtering criteria are processed for routing. For inbound access lists, when you configure a **permit** statement, packets are processed after they are received, and when you configure a **deny** statement, packets are discarded.
- Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed by the outbound access list. For outbound access lists, when you configure a **permit** statement, packets are sent to the output buffer, and when you configure a **deny** statement, packets are discarded.
- An access list can control traffic arriving at a device or leaving a device, but not traffic originating at a device.

## Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient, useful access lists.

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit **deny** statement that follows could cause you immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one **permit** statement; otherwise, all packets are denied and no traffic passes.
- Use the statement **permit any any** if you want to allow all other packets not already denied. Using the statement **permit any any** in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry **permit any any** because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify **permit any any**, all traffic not already denied will get through.
- Although all access lists end with an implicit **deny** statement, we recommend use of an explicit **deny** statement (for example, **deny ip any any**). On most platforms, you can display the count of packets denied by issuing the **show access-list** command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit **deny** statements are counted, which is why the explicit **deny** statement will yield more complete data for you.
- While you are creating an access list or after it is created, you might want to delete an entry.
  - You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
  - You can delete an entry from a named access list. Use the **no permit** or **no deny** command to delete the appropriate entry.
- In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the **remark** command.
- If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the **log** keyword with the corresponding **deny** statement so that the packets denied from that source are logged for you.

- This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

## Named or Numbered Access Lists

All access lists must be identified by a name or a number. Named access lists are more convenient than numbered access lists because you can specify a meaningful name that is easier to remember and associate with a task. You can reorder statements in or add statements to a named access list.

Named access lists support the following features that are not supported by numbered access lists:

- IP options filtering
- Noncontiguous ports
- TCP flag filtering
- Deleting of entries with the **no permit** or **no deny** command

---

**Note** Not all commands that accept a numbered access list will accept a named access list. For example, vty uses only numbered access lists.

---

## Standard or Extended Access Lists

All access lists are either standard or extended access lists. If you only intend to filter on a source address, the simpler standard access list is sufficient. For filtering on anything other than a source address, an extended access list is necessary.

- Named access lists are specified as standard or extended based on the keyword **standard** or **extended** in the **ip access-list** command syntax.
- Numbered access lists are specified as standard or extended based on their number in the **access-list** command syntax. Standard IP access lists are numbered 1 to 99 or 1300 to 1999; extended IP access lists are numbered 100 to 199 or 2000 to 2699. The range of standard IP access lists was initially only 1 to 99, and was subsequently expanded with the range 1300 to 1999 (the intervening numbers were assigned to other protocols). The extended access list range was similarly expanded.

### Standard Access Lists

Standard IP access lists test only source addresses of packets (except for two exceptions). Because standard access lists test source addresses, they are very efficient at blocking traffic close to a destination. There are two exceptions when the address in a standard access list is not a source address:

- On outbound VTY access lists, when someone is trying to telnet, the address in the access list entry is used as a destination address rather than a source address.
- When filtering routes, you are filtering the network being advertised to you rather than a source address.

### Extended Access Lists

Extended access lists are good for blocking traffic anywhere. Extended access lists test source and destination addresses and other IP packet data, such as protocols, TCP or UDP port numbers, type of service (ToS), precedence, TCP flags, and IP options. Extended access lists can also provide capabilities that standard access lists cannot, such as the following:

- Filtering IP Options
- Filtering TCP flags
- Filtering noninitial fragments of packets (see the module “[Refining an IP Access List](#)”)

---

**Note** Packets that are subject to an extended access list will not be autonomous switched.

---

## IP Packet Fields You Can Filter to Control Access

You can use an extended access list to filter on any of the following fields in an IP packet. Source address and destination address are the two most frequently specified fields on which to base an access list:

- Source address--Specifies a source address to control packets coming from certain networking devices or hosts.
- Destination address--Specifies a destination address to control packets being sent to certain networking devices or hosts.
- Protocol--Specifies an IP protocol indicated by the keyword **eigrp**, **gre**, **icmp**, **igmp**, **ip**, **ipinip**, **nos**, **ospf**, **tcp**, or **udp**, or indicated by an integer in the range from 0 to 255 (representing an Internet protocol). If you specify a transport layer protocol (**icmp**, **igmp**, **tcp**, or **udp**), the command has a specific syntax.
  - Ports and non-contiguous ports--Specifies TCP or UDP ports by a port name or port number. The port numbers can be noncontiguous port numbers. Port numbers can be useful to filter Telnet traffic or HTTP traffic, for example.
  - TCP flags--Specifies that packets match any flag or all flags set in TCP packets. Filtering on specific TCP flags can help prevent false synchronization packets.
- IP options--Specifies IP options; one reason to filter on IP options is to prevent routers from being saturated with spurious packets containing them.

## Wildcard Mask for Addresses in an Access List

Address filtering uses wildcard masking to indicate to the software whether to check or ignore corresponding IP address bits when comparing the address bits in an access list entry to a packet being submitted to the access list. By carefully setting wildcard masks, you can specify one or more IP addresses for permit or deny tests.

Wildcard masking for IP address bits uses the number 1 and the number 0 to specify how the software treats the corresponding IP address bits. A wildcard mask is sometimes referred to as an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet (network) mask.

- A wildcard mask bit 0 means check the corresponding bit value; they must match.
- A wildcard mask bit 1 means ignore that corresponding bit value; they need not match.

If you do not supply a wildcard mask with a source or destination address in an access list statement, the software assumes an implicit wildcard mask of 0.0.0.0, meaning all values must match.

Unlike subnet masks, which require contiguous bits indicating network and subnet to be ones, wildcard masks allow noncontiguous bits in the mask.

The table below shows examples of IP addresses and masks from an access list, along with the corresponding addresses that are considered a match.

**Table 158: Sample IP Addresses, Wildcard Masks, and Match Results**

| Address       | Wildcard Mask                            | Match Results                                                            |
|---------------|------------------------------------------|--------------------------------------------------------------------------|
| 0.0.0.0       | 255.255.255.255                          | All addresses will match the access list conditions.                     |
| 172.18.0.0/16 | 0.0.255.255                              | Network 172.18.0.0                                                       |
| 172.18.5.2/16 | 0.0.0.0                                  | Only host 172.18.5.2 matches                                             |
| 172.18.8.0    | 0.0.0.7                                  | Only subnet 172.18.8.0/29 matches                                        |
| 172.18.8.8    | 0.0.0.7                                  | Only subnet 172.18.8.8/29 matches                                        |
| 172.18.8.15   | 0.0.0.3                                  | Only subnet 172.18.8.15/30 matches                                       |
| 10.1.2.0      | 0.0.252.255 (noncontiguous bits in mask) | Matches any even-numbered network in the range of 10.1.2.0 to 10.1.254.0 |

## Access List Sequence Numbers

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If you wanted to insert an entry in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When you add a new entry, you specify the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

## Access List Logging

The Cisco IOS software can provide logging messages about packets permitted or denied by a single standard or extended IP access list entry. That is, any packet that matches the entry will cause an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the **logging console** global configuration command.

The first packet that triggers the access list entry causes an immediate logging message, and subsequent packets are collected over 5-minute intervals before they are displayed or logged. The logging message includes the

access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

However, you can use the **ip access-list log-update** command to set the number of packets that, when match an access list (and are permitted or denied), cause the system to generate a log message. You might want to do this to receive log messages more frequently than at 5-minute intervals.

---

**Caution** If you set the *number-of-matches* argument to 1, a log message is sent right away, rather than caching it; every packet that matches an access list causes a log message. A setting of 1 is not recommended because the volume of log messages could overwhelm the system.

---

Even if you use the **ip access-list log-update** command, the 5-minute timer remains in effect, so each cache is emptied at the end of 5 minutes, regardless of the count of messages in each cache. Regardless of when the log message is sent, the cache is flushed and the count reset to 0 for that message the same way it is when a threshold is not specified.

---

**Note** The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

---

## Alternative to Access List Logging

Packets matching an entry in an ACL with a log option are process switched. It is not recommended to use the log option on ACLs, but rather use NetFlow export and match on a destination interface of Null0. This is done in the CEF path. The destination interface of Null0 is set for any packet that is dropped by the ACL.

## Additional IP Access List Features

Beyond the basic steps to create a standard or extended access list, you can enhance your access lists as mentioned below. Each of these methods is described completely in the module entitled “Refining an Access List.”

- You can impose dates and times when **permit** or **deny** statements in an extended access list are in effect, making your access list more granular and specific to an absolute or periodic time period.
- After you create a named access list, you might want to add entries or change the order of the entries, known as resequencing an access list.
- You can achieve finer granularity when filtering packets by filtering on noninitial fragments of packets.

## Where to Apply an Access List

You can apply access lists to the inbound or outbound interfaces of a device. Applying an access list to an inbound interface controls the traffic that enters the interface and applying an access list to an outbound interface controls the traffic that exits the interface.

When software receives a packet at the inbound interface, the software checks the packet against the statements that are configured for the access list. If the access list permits packets, the software processes the packet. Applying access lists to filter incoming packets can save device resources because filtered packets are discarded before entering the device.

Access lists on outbound interfaces filter packets that are transmitted (sent) out of the interface. You can use the TCP Access Control List (ACL) Splitting feature of the Rate-Based Satellite Control Protocol (RBSCP) on the outbound interface to control the type of packets that are subject to TCP acknowledgment (ACK) splitting on an outbound interface.

You can reference an access list by using a **debug** command to limit the amount of debug logs. For example, based on the filtering or matching criteria of the access list, debug logs can be limited to source or destination addresses or protocols.

You can use access lists to control routing updates, dial-on-demand (DDR), and quality of service (QoS) features.

## Feature Information for IP Access Lists

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 159: Feature Information for IP Access Lists*

| Feature Name    | Releases                 | Feature Information                                                                                            |

## CHAPTER 61

# Creating an IP Access List and Applying It to an Interface

---

IP access lists provide many benefits for securing a network and achieving nonsecurity goals, such as determining quality of service (QoS) factors or limiting **debug** command output. This module describes how to create standard, extended, named, and numbered IP access lists. An access list can be referenced by a name or a number. Standard access lists filter on only the source address in IP packets. Extended access lists can filter on source address, destination address, and other fields in an IP packet.

After you create an access list, you must apply it to something in order for it to have any effect. This module describes how to apply an access list to an interface. However, there are many other uses for access lists, which are mentioned in this module and described in other modules and in other configuration guides for various technologies.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About Creating an IP Access List and Applying It to an Interface

### Helpful Hints for Creating IP Access Lists

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit **deny** statement that follows could cause immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one **permit** statement; otherwise, all packets are denied and no traffic passes.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.

- A packet will match the first ACE in the ACL. Thus, a **permit ip any any** will match all packets, ignoring all subsequent ACES.
- Although all access lists end with an implicit **deny** statement, we recommend use of an explicit **deny** statement (for example, **deny ip any any**). On most platforms, you can display the count of packets denied by issuing the **show access-list** command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit **deny** statements are counted, which is why the explicit **deny** statement will yield more complete data for you.
- While you are creating an access list or after it is created, you might want to delete an entry. You can delete an entry from a named access list. Use the **no permit** or **no deny** command to delete the appropriate entry.
- In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the **remark** command.
- If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the **log** keyword with the corresponding **deny** statement so that the packets denied from that source are logged for you.
- This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

## Access List Remarks

You can include comments or remarks about entries in any IP access list. An access list remark is an optional remark before or after an access list entry that describes the entry so that you do not have to interpret the purpose of the entry. Each remark is limited to 100 characters in length.

The remark can go before or after a **permit** or **deny** statement. Be consistent about where you add remarks. Users may be confused if some remarks precede the associated **permit** or **deny** statements and some remarks follow the associated statements.

The following is an example of a remark that describes function of the subsequent **deny** statement:

```
ip access-list extended telnetting
 remark Do not allow host1 subnet to telnet out
 deny tcp host 172.16.2.88 any eq telnet
```

## Additional IP Access List Features

Beyond the basic steps to create a standard or extended access list, you can enhance your access lists as mentioned below. Each of these methods is described completely in the *Refining an IP Access List module*.

- You can impose dates and times when **permit** or **deny** statements in an extended access list are in effect, making your access list more granular and specific to an absolute or periodic time period.
- After you create a named or numbered access list, you might want to add entries or change the order of the entries, known as resequencing an access list.
- You can achieve finer granularity when filtering packets by filtering on noninitial fragments of packets.

# How to Create an IP Access List and Apply It to an Interface

This section describes the general ways to create a standard or extended access list using either a name or a number. Access lists are very flexible; the tasks simply illustrate one **permit** command and one **deny** command to provide you the command syntax of each. Only you can determine how many **permit** and **deny** commands you need and their order.

**Note** The first two tasks in this module create an access list; you must apply the access list in order for it to function. If you want to apply the access list to an interface, perform the task “Applying the Access List to an Interface”.

## Creating a Standard Access List to Filter on Source Address

If you want to filter on source address only, a standard access list is simple and sufficient. There are two alternative types of standard access list: named and numbered. Named access lists allow you to identify your access lists with a more intuitive name rather than a number, and they also support more features than numbered access lists.

## Creating a Named Access List to Filter on Source Address

Use a standard, named access list if you need to filter on source address only. This task illustrates one **permit** statement and one **deny** statement, but the actual statements you use and their order depend on what you want to filter or allow. Define your **permit** and **deny** statements in the order that achieves your filtering goals.

### Step 1 enable

#### Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

### Step 2 configure terminal

#### Example:

```
Device# configure terminal
```

Enters global configuration mode.

### Step 3 ip access-list standard *name*

#### Example:

```
Device(config)# ip access-list standard R&D
```

Defines a standard IP access list using a name and enters standard named access list configuration mode.

**Step 4**      **remark** *remark*

**Example:**

```
Device(config-std-nacl)# remark deny Sales network
```

(Optional) Adds a user-friendly comment about an access list entry.

- A remark can precede or follow an access list entry.
- In this example, the remark reminds the network administrator that the subsequent entry denies the Sales network access to the interface (assuming this access list is later applied to an interface).

**Step 5**      **deny** { *source* [*source-wildcard*] | **any** } [ **log** ]

**Example:**

```
Device(config-std-nacl)# deny 172.16.0.0 0.0.255.255 log
```

(Optional) Denies the specified source based on a source address and wildcard mask.

- If the *source-wildcard* is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source address.
- Optionally use the keyword **any** as a substitute for the *source source-wildcard* to specify the source and source wildcard of 0.0.0.0 255.255.255.255.
- In this example, all hosts on network 172.16.0.0 are denied passing the access list.
- Because this example explicitly denies a source address and the **log** keyword is specified, any packets from that source are logged when they are denied. This is a way to be notified that someone on a network or host is trying to gain access.

**Step 6**      **remark** *remark*

**Example:**

```
Device(config-std-nacl)# remark Give access to Tester's host
```

(Optional) Adds a user-friendly comment about an access list entry.

- A remark can precede or follow an access list entry.
- This remark reminds the network administrator that the subsequent entry allows the Tester's host access to the interface.

**Step 7**      **permit** { *source* [*source-wildcard*] | **any** } [ **log** ]

**Example:**

```
Device(config-std-nacl)# permit 172.18.5.22 0.0.0.0
```

Permits the specified source based on a source address and wildcard mask.

- Every access list needs at least one **permit** statement; it need not be the first entry.
- If the *source-wildcard* is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source address.

## Creating a Numbered Access List to Filter on Source Address

- Optionally use the keyword **any** as a substitute for the *source source-wildcard* to specify the source and source wildcard of 0.0.0.0 255.255.255.255.
- In this example, host 172.18.5.22 is allowed to pass the access list.

**Step 8** Repeat some combination of Steps 4 through 7 until you have specified the sources on which you want to base your access list.

Remember that all sources not specifically permitted are denied by an implicit **deny** statement at the end of the access list.

**Step 9** **end**

**Example:**

```
Device(config-std-nacl)# end
```

Exits standard named access list configuration mode and enters privileged EXEC mode.

**Step 10** **show ip access-list**

**Example:**

```
Device# show ip access-list
```

(Optional) Displays the contents of all current IP access lists.

## Creating a Numbered Access List to Filter on Source Address

Configure a standard, numbered access list if you need to filter on source address only and you prefer not to use a named access list.

IP standard access lists are numbered 1 to 99 or 1300 to 1999. This task illustrates one **permit** statement and one **deny** statement, but the actual statements you use and their order depend on what you want to filter or allow. Define your **permit** and **deny** statements in the order that achieves your filtering goals.

**Step 1** **enable**

**Example:**

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2** **configure terminal**

**Example:**

```
Device# configure terminal
```

Enters global configuration mode.

**Step 3** **access-list** *access-list-number permit { source [ source-wildcard ] | any } [ log ]*

**Example:**

```
Device(config)# access-list 1 permit 172.16.5.22 0.0.0.0
```

Permits the specified source based on a source address and wildcard mask.

- Every access list needs at least one permit statement; it need not be the first entry.
- Standard IP access lists are numbered 1 to 99 or 1300 to 1999.
- If the source-wildcard is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source address.
- Optionally use the keyword **any** as a substitute for the source source-wildcard to specify the source and source wildcard of 0.0.0.0 255.255.255.255.
- In this example, host 172.16.5.22 is allowed to pass the access list.

**Step 4**    **access-list**    *access-list-number*    **deny** { *source* [ *source-wildcard* ] | **any** } [ **log** ]

**Example:**

```
Device(config)# access-list 1 deny 172.16.7.34 0.0.0.0
```

Denies the specified source based on a source address and wildcard mask.

- If the *source-wildcard* is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source address.
- Optionally use the abbreviation **any** as a substitute for the *source source-wildcard* to specify the source and source wildcard of 0.0.0.0 255.255.255.255.
- In this example, host 172.16.7.34 is denied passing the access list.

**Step 5**    Repeat some combination of Steps 3 through 6 until you have specified the sources on which you want to base your access list.

Remember that all sources not specifically permitted are denied by an implicit **deny** statement at the end of the access list.

**Step 6**    **end**

**Example:**

```
Device(config)# end
```

Exits global configuration mode and enters privileged EXEC mode.

**Step 7**    **show ip access-list**

**Example:**

```
Device# show ip access-list
```

(Optional) Displays the contents of all current IP access lists.

## Creating an Extended Access List

If you want to filter on anything other than source address, you need to create an extended access list. There are two alternative types of extended access list: named and numbered. Named access lists allow you to identify your access lists with a more intuitive name rather than a number, and they also support more features.

For details on how to filter something other than source or destination address, see the syntax descriptions in the command reference documentation.

## Creating a Named Extended Access List

Create a named extended access list if you want to filter the source and destination address or filter a combination of addresses and other IP fields.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended name**
4. **deny protocol source [ source-wildcard ] destination [ destination-wildcard ] [ option option-name ] [ precedence precedence ] [ tos tos ] [ established ] [ log | log-input ] [ time-range time-range-name ] [ fragments ]**
5. **permit protocol source [ source-wildcard ] destination [ destination-wildcard ] [ option option-name ] [ precedence precedence ] [ tos tos ] [ established ] [ log | log-input ] [ time-range time-range-name ] [ fragments ]**
6. Repeat some combination of Steps 4 through 7 until you have specified the fields and values on which you want to base your access list.
7. **end**
8. **show ip access-list**

### DETAILED STEPS

|               | Command or Action                                                                                              | Purpose                                                                                                   |
|---------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><br>Device> enable                                                     | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><br>Device# configure terminal                             | Enters global configuration mode.                                                                         |
| <b>Step 3</b> | <b>ip access-list extended name</b><br><br><b>Example:</b><br><br>Device(config)# ip access-list extended acl1 | Defines an extended IP access list using a name and enters extended named access list configuration mode. |
| <b>Step 4</b> | <b>deny protocol source [ source-wildcard ] destination [ destination-wildcard ] [ option option-name ] [</b>  | (Optional) Denies any packet that matches all of the conditions specified in the statement.               |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>precedence</b> <i>precedence</i> [<b>tos</b> <i>tos</i>] [<b>established</b>] [<b>log</b>   <b>log-input</b>] [<b>time-range</b> <i>time-range-name</i>] [<b>fragments</b>]</p> <p><b>Example:</b></p> <pre>Device(config-ext-nacl)# deny ip 172.18.0.0 0.0.255.255 host 172.16.40.10 log</pre>                                                                                                                   | <ul style="list-style-type: none"> <li>• If the <i>source-wildcard</i> or <i>destination-wildcard</i> is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source or destination address, respectively.</li> <li>• Optionally use the keyword <b>any</b> as a substitute for the <i>source source-wildcard</i> or <i>destination destination-wildcard</i> to specify the address and wildcard of 0.0.0.0 255.255.255.255.</li> <li>• Optionally use the keyword <b>host source</b> to indicate a source and source wildcard of <i>source</i> 0.0.0.0 or the abbreviation <b>host destination</b> to indicate a destination and destination wildcard of <i>destination</i> 0.0.0.0.</li> <li>• In this example, packets from all sources are denied access to the destination network 172.18.0.0. Logging messages about packets permitted or denied by the access list are sent to the facility configured by the <b>logging facility</b> command (for example, console, terminal, or syslog). That is, any packet that matches the access list will cause an informational logging message about the packet to be sent to the configured facility. The level of messages logged to the console is controlled by the <b>logging console</b> command.</li> </ul> |
| <b>Step 5</b> | <p><b>permit</b> <i>protocol source</i> [<i>source-wildcard</i>] <i>destination</i> [<i>destination-wildcard</i>] [<b>option</b> <i>option-name</i>] [<b>precedence</b> <i>precedence</i>] [<b>tos</b> <i>tos</i>] [<b>established</b>] [<b>log</b>   <b>log-input</b>] [<b>time-range</b> <i>time-range-name</i>] [<b>fragments</b>]</p> <p><b>Example:</b></p> <pre>Device(config-ext-nacl)# permit tcp any any</pre> | <p>Permits any packet that matches all of the conditions specified in the statement.</p> <ul style="list-style-type: none"> <li>• Every access list needs at least one permit statement.</li> <li>• If the <i>source-wildcard</i> or <i>destination-wildcard</i> is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source or destination address, respectively.</li> <li>• Optionally use the keyword <b>any</b> as a substitute for the <i>source source-wildcard</i> or <i>destination destination-wildcard</i> to specify the address and wildcard of 0.0.0.0 255.255.255.255.</li> <li>• In this example, TCP packets are allowed from any source to any destination.</li> <li>• Use the <b>log-input</b> keyword to include input interface, source MAC address, or virtual circuit in the logging output.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 6</b> | Repeat some combination of Steps 4 through 7 until you have specified the fields and values on which you want to base your access list.                                                                                                                                                                                                                                                                                 | Remember that all sources not specifically permitted are denied by an implicit <b>deny</b> statement at the end of the access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|               | Command or Action                                                            | Purpose                                                                              |
|---------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config-ext-nacl)# end                | Exits standard named access list configuration mode and enters privileged EXEC mode. |
| <b>Step 8</b> | <b>show ip access-list</b><br><b>Example:</b><br>Device# show ip access-list | (Optional) Displays the contents of all current IP access lists.                     |

## Creating a Numbered Extended Access List

Create a numbered extended access list if you want to filter on source and destination address, or a combination of addresses and other IP fields, and you prefer not to use a name. Extended IP access lists are numbered 100 to 199 or 2000 to 2699.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* **remark** *remark*
4. **access-list** *access-list-number* **permit** *protocol* { *source* [*source-wildcard*] | **any** } { *destination* [*destination-wildcard*] | **any** } [ **precedence** *precedence* ] [ **tos** *tos* ] [ **established** ] [ **log** | **log-input** ] [ **time-range** *time-range-name* ] [ **fragments** ]
5. **access-list** *access-list-number* **remark** *remark*
6. **access-list** *access-list-number* **deny** *protocol* { *source* [*source-wildcard*] | **any** } { *destination* [*destination-wildcard*] | **any** } [ **precedence** *precedence* ] [ **tos** *tos* ] [ **established** ] [ **log** | **log-input** ] [ **time-range** *time-range-name* ] [ **fragments** ]
7. Repeat some combination of Steps 3 through 6 until you have specified the fields and values on which you want to base your access list.
8. **end**
9. **show ip access-list**

### DETAILED STEPS

|               | Command or Action                                                          | Purpose                                                                                                            |
|---------------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal | Enters global configuration mode.                                                                                  |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p><b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>remark</i></p> <p><b>Example:</b></p> <pre>Device(config)# access-list 107 remark allow Telnet   packets from any source to network 172.69.0.0   (headquarters)</pre>                                                                                                                                                                                                                                                                                       | <p>(Optional) Adds a user-friendly comment about an access list entry.</p> <ul style="list-style-type: none"> <li>• A remark of up to 100 characters can precede or follow an access list entry.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <p><b>access-list</b> <i>access-list-number</i> <b>permit</b> <i>protocol</i> { <i>source</i> [<i>source-wildcard</i>]   <b>any</b> } { <i>destination</i> [<i>destination-wildcard</i>]   <b>any</b> } [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>established</b> ] [ <b>log</b>   <b>log-input</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>fragments</b> ]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 107 permit tcp any   172.69.0.0 0.0.255.255 eq telnet</pre> | <p>Permits any packet that matches all of the conditions specified in the statement.</p> <ul style="list-style-type: none"> <li>• Every access list needs at least one <b>permit</b> statement; it need not be the first entry.</li> <li>• Extended IP access lists are numbered 100 to 199 or 2000 to 2699.</li> <li>• If the <i>source-wildcard</i> or <i>destination-wildcard</i> is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source or destination address, respectively.</li> <li>• Optionally use the keyword <b>any</b> as a substitute for the <i>source source-wildcard</i> or <i>destination destination-wildcard</i> to specify the address and wildcard of 0.0.0.0 255.255.255.255.</li> <li>• TCP and other protocols have additional syntax available. See the <b>access-list</b> command in the command reference for complete syntax.</li> </ul> |
| <b>Step 5</b> | <p><b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>remark</i></p> <p><b>Example:</b></p> <pre>Device(config)# access-list 107 remark deny all   other TCP packets</pre>                                                                                                                                                                                                                                                                                                                                        | <p>(Optional) Adds a user-friendly comment about an access list entry.</p> <ul style="list-style-type: none"> <li>• A remark of up to 100 characters can precede or follow an access list entry.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <p><b>access-list</b> <i>access-list-number</i> <b>deny</b> <i>protocol</i> { <i>source</i> [<i>source-wildcard</i>]   <b>any</b> } { <i>destination</i> [<i>destination-wildcard</i>]   <b>any</b> } [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>established</b> ] [ <b>log</b>   <b>log-input</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>fragments</b> ]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 107 deny tcp any any</pre>                                    | <p>Denies any packet that matches all of the conditions specified in the statement.</p> <ul style="list-style-type: none"> <li>• If the <i>source-wildcard</i> or <i>destination-wildcard</i> is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source or destination address, respectively.</li> <li>• Optionally use the keyword <b>any</b> as a substitute for the <i>source source-wildcard</i> or <i>destination destination-wildcard</i> to specify the address and wildcard of 0.0.0.0 255.255.255.255.</li> </ul>                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 7</b> | Repeat some combination of Steps 3 through 6 until you have specified the fields and values on which you want to base your access list.                                                                                                                                                                                                                                                                                                                                                                                      | Remember that all sources not specifically permitted are denied by an implicit <b>deny</b> statement at the end of the access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|               | Command or Action                                                                | Purpose                                                          |
|---------------|----------------------------------------------------------------------------------|------------------------------------------------------------------|
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# end                         | Exits global configuration mode and enters privileged EXEC mode. |
| <b>Step 9</b> | <b>show ip access-list</b><br><b>Example:</b><br><br>Device# show ip access-list | (Optional) Displays the contents of all current IP access lists. |

## Applying an Access List to an Interface

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip access-group** {*access-list-number* | *access-list-name*} {**in** | **out**}
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                          | Purpose                                                                                                                                                                                     |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                 | Enters global configuration mode.                                                                                                                                                           |
| <b>Step 3</b> | <b>interface</b> <i>type number</i><br><b>Example:</b><br>Device(config)# interface TenGigabitEthernet4/1/0                                                                | Specifies an interface and enters interface configuration mode.                                                                                                                             |
| <b>Step 4</b> | <b>ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }<br><b>Example:</b><br>Device(config-if)# ip access-group acl1 in | Applies the specified access list to the inbound interface. <ul style="list-style-type: none"> <li>• To filter source addresses, apply the access list to the inbound interface.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                                                                                    | Exits interface configuration mode and returns to privileged EXEC mode.                                                                                                                     |

# Configuration Examples for Creating an IP Access List and Applying It to an Interface

## Example: Filtering on Host Source Address

In the following example, the workstation belonging to user1 is allowed access to Ten Gigabit Ethernet interface 4/1/0, and the workstation belonging to user2 is not allowed access:

```
interface TenGigabitEthernet4/1/0
 ip access-group workstations in
 !
 ip access-list standard workstations
 remark Permit only user1 workstation through
 permit 172.16.2.88
 remark Do not allow user2 workstation through
 deny 172.16.3.13
```

## Example: Filtering on Subnet Source Address

In the following example, the user1 subnet is not allowed access to Ten Gigabit Ethernet interface 4/1/0, but the Main subnet is allowed access:

```
interface TenGigabitEthernet4/1/0
 ip access-group prevention in
 !
 ip access-list standard prevention
 remark Do not allow user1 subnet through
 deny 172.22.0.0 0.0.255.255
 remark Allow Main subnet
 permit 172.25.0.0 0.0.255.255
```

## Example: Filtering on Source and Destination Addresses and IP Protocols

The following configuration example shows an interface with two access lists, one applied to outgoing packets and one applied to incoming packets. The standard access list named Internet-filter filters outgoing packets on source address. The only packets allowed out the interface must be from source 172.16.3.4.

The extended access list named marketing-group filters incoming packets. The access list permits Telnet packets from any source to network 172.26.0.0 and denies all other TCP packets. It permits any ICMP packets. It denies UDP packets from any source to network 172.26.0.0 on port numbers less than 1024. Finally, the access list denies all other IP packets and performs logging of packets passed or denied by that entry.

```
interface TenGigabitEthernet4/1/0
 ip address 172.20.5.1 255.255.255.0
 ip access-group Internet-filter out
 ip access-group marketing-group in
 !
 ip access-list standard Internet-filter
 permit 172.16.3.4
 ip access-list extended marketing-group
 permit tcp any 172.26.0.0 0.0.255.255 eq telnet
```

**Example: Filtering on Source Addresses Using a Numbered Access List**

```
deny tcp any any
permit icmp any any
deny udp any 172.26.0.0 0.0.255.255 lt 1024
deny ip any any
```

**Example: Filtering on Source Addresses Using a Numbered Access List**

In the following example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host. Using access list 2, the Cisco IOS-XE software would accept one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the software would accept addresses on all other network 10.0.0.0 subnets.

```
interface TenGigabitEthernet4/1/0
 ip access-group 2 in
!
access-list 2 permit 10.48.0.3
access-list 2 deny 10.48.0.0 0.0.255.255
access-list 2 permit 10.0.0.0 0.255.255.255
```

**Example: Preventing Telnet Access to a Subnet**

In the following example, the user1 subnet is not allowed to telnet out of Ten Gigabit Ethernet interface 4/1/0:

```
interface TenGigabitEthernet4/1/0
 ip access-group telnetting out
!
ip access-list extended telnetting
 remark Do not allow user1 subnet to telnet out
 deny tcp 172.20.0.0 0.0.255.255 any eq telnet
 remark Allow Top subnet to telnet out
 permit tcp 172.33.0.0 0.0.255.255 any eq telnet
```

**Example: Filtering on TCP and ICMP Using Port Numbers**

In the following example, the first line of the extended access list named acl1 permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 172.28.1.2. The last line permits incoming ICMP messages for error feedback.

```
interface TenGigabitEthernet4/1/0
 ip access-group acl1 in
!
ip access-list extended acl1
 permit tcp any 172.28.0.0 0.0.255.255 gt 1023
 permit tcp any host 172.28.1.2 eq 25
 permit icmp any 172.28.0.0 255.255.255.255
```

**Example: Allowing SMTP E-mail and Established TCP Connections**

Suppose you have a network connected to the Internet, and you want any host on an Ethernet to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on the Ten Gigabit Ethernet except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same two port numbers are used throughout the life of the connection. Mail packets coming in from the Internet will have a destination port of 25. Outbound packets will have the port numbers reversed. The fact that the secure system behind the router always will accept mail connections on port 25 is what makes possible separate control of incoming and outgoing services. The access list can be configured on either the outbound or inbound interface.

In the following example, the Ten Gigabit Ethernet network is a Class B network with the address 172.18.0.0, and the address of the mail host is 172.18.1.2. The **established** keyword is used only for the TCP protocol to indicate an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which indicate that the packet belongs to an existing connection.

```
interface TenGigabitEthernet4/1/0
 ip access-group 102 in
 !
access-list 102 permit tcp any 172.18.0.0 0.0.255.255 established
access-list 102 permit tcp any host 172.18.1.2 eq 25
```

## Example: Preventing Access to the Web by Filtering on Port Name

In the following example, the w1 and w2 workstations are not allowed web access; other hosts on network 172.20.0.0 are allowed web access:

```
interface TenGigabitEthernet4/1/0
 ip access-group no-web out
 !
ip access-list extended no-web
 remark Do not allow w1 to browse the web
 deny host 172.20.3.85 any eq http
 remark Do not allow w2 to browse the web
 deny host 172.20.3.13 any eq http
 remark Allow others on our network to browse the web
 permit 172.20.0.0 0.0.255.255 any eq http
```

## Example: Filtering on Source Address and Logging the Packets

The following example defines access lists 1 and 2, both of which have logging enabled:

```
interface TenGigabitEthernet4/1/0
 ip address 172.16.1.1 255.0.0.0
 ip access-group 1 in
 ip access-group 2 out
 !
access-list 1 permit 172.25.0.0 0.0.255.255 log
access-list 1 deny 172.30.0.0 0.0.255.255 log
 !
access-list 2 permit 172.27.3.4 log
access-list 2 deny 172.17.0.0 0.0.255.255 log
```

If the interface receives 10 packets from 172.25.7.7 and 14 packets from 172.17.23.21, the first log will look like the following:

```
list 1 permit 172.25.7.7 1 packet
list 2 deny 172.17.23.21 1 packet
```

Five minutes later, the console will receive the following log:

## Example: Limiting Debug Output

```
list 1 permit 172.25.7.7 9 packets
list 2 deny 172.17.23.21 13 packets
```

## Example: Limiting Debug Output

The following sample configuration uses an access list to limit the **debug** command output. Limiting the **debug** output restricts the volume of data to what you are interested in, saving you time and resources.

```
Device(config)# ip access-list acl1
Device(config-std-nacl)# remark Displays only advertisements for LDP peer in acl1
Device(config-std-nacl)# permit host 10.0.0.44

Device# debug mpls ldp advertisements peer-acl acl1

tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 172.17.0.33
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 172.16.0.31
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 172.22.0.33
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 192.168.0.1
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 192.168.0.3
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 192.168.1.33
```

## Feature Information Creating an IP Access List and Applying It to an Interface

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 161: Feature Information for Creating an IP Access List and Applying It to an Interface**

| Feature Name    | Releases                 | Feature Information                                                                                            |

## CHAPTER 62

# Creating an IP Access List to Filter IP Options, TCP Flags, Noncontiguous Ports

---

This module describes how to use an IP access list to filter IP packets that contain certain IP Options, TCP flags, noncontiguous ports.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Creating an IP Access List to Filter IP Options TCP Flags Noncontiguous Ports

Before you perform any of the tasks in this module, you should be familiar with the information in the following modules:

- “IP Access List Overview”
- “Creating an IP Access List and Applying It to an Interface”

# Information About Creating an IP Access List to Filter IP Options, TCP Flags, Noncontiguous Ports

## IP Options

IP uses four key mechanisms in providing its service: Type of Service, Time to Live, Options, and Header Checksum.

The Options, commonly referred to as IP Options, provide for control functions that are required in some situations but unnecessary for the most common communications. IP Options include provisions for time stamps, security, and special routing.

IP Options may or may not appear in datagrams. They must be implemented by all IP modules (host and gateways). What is optional is their transmission in any particular datagram, not their implementation. In some environments the security option may be required in all datagrams.

The option field is variable in length. There may be zero or more options. IP Options can have one of two formats:

- Format 1: A single octet of option-type.
- Format 2: An option-type octet, an option-length octet, and the actual option-data octets.

The option-length octet counts the option-type octet, the option-length octet, and the option-data octets.

The option-type octet is viewed as having three fields: a 1-bit copied flag, a 2-bit option class, and a 5-bit option number. These fields form an 8-bit value for the option type field. IP Options are commonly referred to by their 8-bit value.

For a complete list and description of IP Options, refer to RFC 791, *Internet Protocol* at the following URL: <http://www.faqs.org/rfcs/rfc791.html>

## Benefits of Filtering IP Options

- Filtering of packets that contain IP Options from the network relieves downstream devices and hosts of the load from options packets.
- This feature also minimizes load to the Route Processor (RP) for packets with IP Options that require RP processing on distributed systems. Previously, the packets were always routed to or processed by the RP CPU. Filtering the packets prevents them from impacting the RP.

## Benefits of Filtering on TCP Flags

The ACL TCP Flags Filtering feature provides a flexible mechanism for filtering on TCP flags. Previously, an incoming packet was matched as long as any TCP flag in the packet matched a flag specified in the access control entry (ACE). This behavior allows for a security loophole, because packets with all flags set could get past the access control list (ACL). The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

Because TCP packets can be sent as false synchronization packets that can be accepted by a listening port, it is recommended that administrators of firewall devices set up some filtering rules to drop false TCP packets.

The ACEs that make up an access list can be configured to detect and drop unauthorized TCP packets by allowing only the packets that have a very specific group of TCP flags set or not set. The ACL TCP Flags Filtering feature provides a greater degree of packet-filtering control in the following ways:

- You can select any desired combination of TCP flags on which to filter TCP packets.
- You can configure ACEs to allow matching on a flag that is set, as well as on a flag that is not set.

## TCP Flags

The table below lists the TCP flags, which are further described in RFC 793, *Transmission Control Protocol*.

**Table 163: TCP Flags**

| TCP Flag | Purpose                                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACK      | Acknowledge flag—Indicates that the acknowledgment field of a segment specifies the next sequence number the sender of this segment is expecting to receive. |
| FIN      | Finish flag—Used to clear connections.                                                                                                                       |
| PSH      | Push flag—Indicates the data in the call should be immediately pushed through to the receiving user.                                                         |
| RST      | Reset flag—Indicates that the receiver should delete the connection without further interaction.                                                             |
| SYN      | Synchronize flag—Used to establish connections.                                                                                                              |
| URG      | Urgent flag—Indicates that the urgent field is meaningful and must be added to the segment sequence number.                                                  |

## Benefits of Using the Named ACL Support for Noncontiguous Ports on an Access Control Entry Feature

This feature greatly reduces the number of access control entries (ACEs) required in an access control list to handle multiple entries for the same source address, destination address, and protocol. If you maintain large numbers of ACEs, use this feature to consolidate existing groups of access list entries wherever it is possible and when you create new access list entries. When you configure access list entries with noncontiguous ports, you will have fewer access list entries to maintain.

## How Filtering on TTL Value Works

IP extended named and numbered access lists may filter on the TTL value of packets arriving at or leaving an interface. Packets with any possible TTL values 0 through 255 may be permitted or denied (filtered). Like filtering on other fields, such as source or destination address, the **ip access-group** command specifies **in** or **out**, which makes the access list ingress or egress and applies it to incoming or outgoing packets,

respectively. The TTL value is checked in conjunction with the specified protocol, application, and any other settings in the access list entry, and all conditions must be met.

### Special Handling for Packets with TTL Value of 0 or 1 Arriving at an Ingress Interface

The software switching paths—distributed Cisco Express Forwarding (dCEF), CEF, fast switching, and process switching—will usually permit or discard the packets based on the access list statements. However, when the TTL value of packets arriving at an ingress interface have a TTL of 0 or 1, special handling is required. The packets with a TTL value of 0 or 1 get sent to the process level before the ingress access list is checked in CEF, dCEF, or the fast switching paths. The ingress access list is applied to packets with TTL values 2 through 255 and a permit or deny decision is made.

Packets with a TTL value of 0 or 1 are sent to the process level because they will never be forwarded out of the device; the process level must check whether each packet is destined for the device and whether an Internet Control Message Protocol (ICMP) TTL Expire message needs to be sent back. This means that even if an ACL with TTL value 0 or 1 filtering is configured on the ingress interface with the intention to drop packets with a TTL of 0 or 1, the dropping of the packets will not happen in the faster paths. It will instead happen in the process level when the process applies the ACL. This is also true for hardware switching platforms. Packets with TTL value of 0 or 1 are sent to the process level of the route processor (RP) or Multilayer Switch Feature Card (MSFC).

On egress interfaces, access list filtering on TTL value works just like other access list features. The check will happen in the fastest switching path enabled in the device. This is because the faster switching paths handle all the TTL values (0 through 255) equally on the egress interface.

### Control Plane Policing for Filtering TTL Values 0 and 1

The special behavior for packets with a TTL value of 0 or 1 results in higher CPU usage for the device. If you are filtering on TTL value of 0 or 1, you should use control plane policing (CPP) to protect the CPU from being overwhelmed. In order to leverage CPP, you must configure an access list especially for filtering TTL values 0 and 1 and apply the access list through CPP. This access list will be a separate access list from any other interface access lists. Because CPP works for the entire system, not just on individual interfaces, you would need to configure only one such special access list for the entire device. This task is described in the section "Enabling Control Plane Policing to Filter on TTL Values 0 and 1".

## Benefits of Filtering on TTL Value

- Filtering on time-to-live (TTL) value provides a way to control which packets are allowed to reach the device or are prevented from reaching the device. By looking at your network layout, you can choose whether to accept or deny packets from a certain device based on how many hops away it is. For example, in a small network, you can deny packets from a location more than three hops away. Filtering on TTL value allows you to validate if the traffic originated from a neighboring device. You can accept only packets that reach you in one hop, for example, by accepting only packets with a TTL value of one less than the initial TTL value of a particular protocol.
- Many control plane protocols communicate only with their neighbors, but receive packets from everyone. By applying an access list that filters on TTL to receiving routers, you can block unwanted packets.
- The Cisco software sends all packets with a TTL value of 0 or 1 to the process level. The device must then send an Internet Control Message Protocol (ICMP) TTL value expire message to the source. By filtering packets that have a TTL value of 0 through 2, you can reduce the load on the process level.

# How to Create an IP Access List to Filter IP Options TCP Flags Noncontiguous Ports

## Filtering Packets That Contain IP Options

Complete these steps to configure an access list to filter packets that contain IP options and to verify that the access list has been configured correctly.

### Note

- The ACL Support for Filtering IP Options feature can be used only with named, extended ACLs.
- Resource Reservation Protocol (RSVP) Multiprotocol Label Switching Traffic Engineering (MPLS TE), Internet Group Management Protocol Version 2 (IGMPV2), and other protocols that use IP options packets may not function in drop or ignore mode if this feature is configured.
- On most Cisco devices, a packet with IP options is not switched in hardware, but requires control plane software processing (primarily because there is a need to process the options and rewrite the IP header), so all IP packets with IP options will be filtered and switched in software.

### Step 1 enable

#### Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

### Step 2 configure terminal

#### Example:

```
Device# configure terminal
```

Enters global configuration mode.

### Step 3 ip access-list extended *access-list-name*

#### Example:

```
Device(config)# ip access-list extended mylist1
```

Specifies the IP access list by name and enters named access list configuration mode.

### Step 4 [ *sequence-number* ] deny *protocol source source-wildcard destination destination-wildcard* [ option *option-value* ] [ precedence *precedence* ] [ tos *tos* ] [ log ] [ time-range *time-range-name* ] [ fragments ]

#### Example:

```
Device(config-ext-nacl)# deny ip any any option traceroute
```

(Optional) Specifies a **deny** statement in named IP access list mode.

- This access list happens to use a **deny** statement first, but a **permit** statement could appear first, depending on the order of statements you need.

- Use the **option** keyword and *option-value* argument to filter packets that contain a particular IP Option.
- In this example, any packet that contains the traceroute IP option will be filtered out.
- Use the **no** *sequence-number* form of this command to delete an entry.

**Step 5** `[ sequence-number ] permit protocol source source-wildcard destination destination-wildcard [ option option-value ] [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]`

**Example:**

```
Device(config-ext-nacl)# permit ip any any option security
```

Specifies a **permit** statement in named IP access list mode.

- In this example, any packet (not already filtered) that contains the security IP option will be permitted.
- Use the **no** *sequence-number* form of this command to delete an entry.

**Step 6** Repeat Step 4 or Step 5 as necessary.

Allows you to revise the access list.

**Step 7** **end**

**Example:**

```
Device(config-ext-nacl)# end
```

(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.

**Step 8** **show ip access-lists** *access-list-name*

**Example:**

```
Device# show ip access-lists mylist1
```

(Optional) Displays the contents of the IP access list.

## What to Do Next

Apply the access list to an interface or reference it from a command that accepts an access list.

**Note** To effectively eliminate all packets that contain IP Options, we recommend that you configure the global **ip options drop** command.

## Filtering Packets That Contain TCP Flags

This task configures an access list to filter packets that contain TCP flags and verifies that the access list has been configured correctly.

**Note**

- TCP flag filtering can be used only with named, extended ACLs.
- The ACL TCP Flags Filtering feature is supported only for Cisco ACLs.
- Previously, the following command-line interface (CLI) format could be used to configure a TCP flag-checking mechanism:

**permit tcp any any rst** The following format that represents the same ACE can now be used: **permit tcp any any match-any +rst** Both the CLI formats are accepted; however, if the new keywords **match-all** or **match-any** are chosen, they must be followed by the new flags that are prefixed with “+” or “-”. It is advisable to use only the old format or the new format in a single ACL. You cannot mix and match the old and new CLI formats.

**Caution**

If a device having ACEs with the new syntax format is reloaded with a previous version of the Cisco software that does not support the ACL TCP Flags Filtering feature, the ACEs will not be applied, leading to possible security loopholes.

**Step 1** **enable****Example:**

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2** **configure terminal****Example:**

```
Device# configure terminal
```

Enters global configuration mode.

**Step 3** **ip access-list extended *access-list-name*****Example:**

```
Device(config)# ip access-list extended kmdl
```

Specifies the IP access list by name and enters named access list configuration mode.

**Step 4** `[ sequence-number ] permit tcp source source-wildcard [ operator [ port ] ] destination destination-wildcard [ operator [ port ] ] [ established | { match-any | match-all } { + | - } flag-name ] [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]`

**Example:**

```
Device(config-ext-nacl)# permit tcp any any match-any +rst
```

Specifies a **permit** statement in named IP access list mode.

- This access list happens to use a **permit** statement first, but a **deny** statement could appear first, depending on the order of statements you need.
- Use the TCP command syntax of the **permit** command.
- Any packet with the RST TCP header flag set will be matched and allowed to pass the named access list `kmd1` in Step 3.

**Step 5** `[ sequence-number ] deny tcp source source-wildcard [ operator [ port ]] destination destination-wildcard [ operator [ port ]] [ established | { match-any | match-all } { + | - } flag-name ] [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]`

**Example:**

```
Device(config-ext-nacl)# deny tcp any any match-all -ack -fin
```

(Optional) Specifies a **deny** statement in named IP access list mode.

- This access list happens to use a **permit** statement first, but a **deny** statement could appear first, depending on the order of statements you need.
- Use the TCP command syntax of the **deny** command.
- Any packet that does not have the ACK flag set, and also does not have the FIN flag set, will not be allowed to pass the named access list `kmd1` in Step 3.
- See the **deny** (IP) command for additional command syntax to permit upper-layer protocols (ICMP, IGMP, TCP, and UDP).

**Step 6** Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the **no sequence-number** command to delete an entry.

Allows you to revise the access list.

**Step 7** **end**

**Example:**

```
Device(config-ext-nacl)# end
```

(Optional) Exits the configuration mode and returns to privileged EXEC mode.

**Step 8** **show ip access-lists** *access-list-name*

**Example:**

```
Device# show ip access-lists kmd1
```

(Optional) Displays the contents of the IP access list.

- Review the output to confirm that the access list includes the new entry.

## Configuring an Access Control Entry with Noncontiguous Ports

Perform this task to create access list entries that use noncontiguous TCP or UDP port numbers. Although this task uses TCP ports, you could use the UDP syntax of the **permit** and **deny** commands to filter noncontiguous UDP ports.

Although this task uses a **permit** command first, use the **permit** and **deny** commands in the order that achieves your filtering goals.

**Note** The ACL—Named ACL Support for Noncontiguous Ports on an Access Control Entry feature can be used only with named, extended ACLs.

### Step 1 enable

#### Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

### Step 2 configure terminal

#### Example:

```
Device# configure terminal
```

Enters global configuration mode.

### Step 3 ip access-list extended *access-list-name*

#### Example:

```
Device(config)# ip access-list extended acl-extd-1
```

Specifies the IP access list by name and enters named access list configuration mode.

### Step 4 *[ sequence-number ] permit tcp source source-wildcard [ operator port [ port ] destination destination-wildcard [ operator [ port ] [ established { match-any | match-all } { + | - } flag-name ] [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*

#### Example:

```
Device(config-ext-nacl)# permit tcp any eq telnet ftp any eq 450 679
```

Specifies a **permit** statement in named IP access list configuration mode.

- Operators include **lt** (less than), **gt** (greater than), **eq** (equal), **neq** (not equal), and **range** (inclusive range).
- If the operator is positioned after the source and source-wildcard arguments, it must match the source port. If the operator is positioned after the destination and destination-wildcard arguments, it must match the destination port.
- The **range** operator requires two port numbers. You can configure up to 10 ports after the **eq** and **neq** operators. All other operators require one port number.
- To filter UDP ports, use the UDP syntax of this command.

**Step 5** `[ sequence-number ] deny tcp source source-wildcard [ operator port [ port ] destination destination-wildcard [ operator [ port ] ] [ established { match-any | match-all } { + | - } flag-name ] [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]`

**Example:**

```
Device(config-ext-nacl)# deny tcp any neq 45 565 632 any
```

(Optional) Specifies a **deny** statement in named access list configuration mode.

- Operators include **lt** (less than), **gt** (greater than), **eq** (equal), **neq** (not equal), and **range** (inclusive range).
- If the *operator* is positioned after the *source* and *source-wildcard* arguments, it must match the source port. If the *operator* is positioned after the *destination* and *destination-wildcard* arguments, it must match the destination port.
- The **range** operator requires two port numbers. You can configure up to 10 ports after the **eq** and **neq** operators. All other operators require one port number.
- To filter UDP ports, use the UDP syntax of this command.

**Step 6** Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the **no sequence-number** command to delete an entry.

Allows you to revise the access list.

**Step 7** **end**

**Example:**

```
Device(config-ext-nacl)# end
```

(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.

**Step 8** **show ip access-lists** *access-list-name*

**Example:**

```
Device# show ip access-lists kmdl
```

(Optional) Displays the contents of the access list.

## Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry

Perform this task to consolidate a group of access list entries with noncontiguous ports into one access list entry.

Although this task uses TCP ports, you could use the UDP syntax of the **permit** and **deny** commands to filter noncontiguous UDP ports.

Although this task uses a **permit** command first, use the **permit** and **deny** commands in the order that achieves your filtering goals.

**Step 1** **enable**

**Example:**

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2** `show ip access-lists` *access-list-name***Example:**

```
Device# show ip access-lists mylist1
```

(Optional) Displays the contents of the IP access list.

- Review the output to see if you can consolidate any access list entries.

**Step 3** `configure terminal`**Example:**

```
Device# configure terminal
```

Enters global configuration mode.

**Step 4** `ip access-list extended` *access-list-name***Example:**

```
Device(config)# ip access-list extended mylist1
```

Specifies the IP access list by name and enters named access list configuration mode.

**Step 5** `no` [*sequence-number*] `permit` *protocol source source-wildcard destination destination-wildcard* [`option` *option-name*] [`precedence` *precedence*] [`tos` *tos*] [`log`] [`time-range` *time-range-name*] [`fragments`]**Example:**

```
Device(config-ext-nacl)# no 10
```

Removes the redundant access list entry that can be consolidated.

- Repeat this step to remove entries to be consolidated because only the port numbers differ.
- After this step is repeated to remove the access list entries 20, 30, and 40, for example, those entries are removed because they will be consolidated into one **permit** statement.
- If a *sequence-number* is specified, the rest of the command syntax is optional.

**Step 6** [*sequence-number*] `permit` *protocol source source-wildcard* [`operator port` [*port*]] *destination destination-wildcard* [`operator port` [*port*]] [`option` *option-name*] [`precedence` *precedence*] [`tos` *tos*] [`log`] [`time-range` *time-range-name*] [`fragments`]**Example:**

```
Device(config-ext-nacl)# permit tcp any neq 45 565 632 any eq 23 45 34 43
```

Specifies a **permit** statement in named access list configuration mode.

- In this instance, a group of access list entries with noncontiguous ports was consolidated into one **permit** statement.
- You can configure up to 10 ports after the **eq** and **neq** operators.

**Step 7** Repeat Steps 5 and 6 as necessary, adding **permit** or **deny** statements to consolidate access list entries where possible. Use the **no sequence-number** command to delete an entry.

Allows you to revise the access list.

**Step 8** **end**

**Example:**

```
Device(config-std-nacl)# end
```

(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.

**Step 9** **show ip access-lists** *access-list-name*

**Example:**

```
Device# show ip access-lists mylist1
```

(Optional) Displays the contents of the access list.

## What To Do Next

Apply the access list to an interface or reference it from a command that accepts an access list.

## Filtering Packets Based on TTL Value

Because access lists are very flexible, it is not possible to define only one combination of **permit** and **deny** commands to filter packets based on the TTL value. This task illustrates just one example that achieves TTL filtering. Configure the appropriate **permit** and **deny** statements that will accomplish your filtering plan.

**Note** When the access list specifies the operation EQ or NEQ, depending on the Cisco software release in use on the device, the access lists can specify up to ten TTL values. The number of TTL values can vary by the Cisco software release.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *access-list-name*
4. [*sequence-number*] **permit** *protocol source source-wildcard destination destination-wildcard* [**option** *option-name*] [**precedence** *precedence*] [**tos** *tos*] [**ttl operator value**] [**log**] [**time-range** *time-range-name*] [**fragments**]
5. Continue to add **permit** or **deny** statements to achieve the filtering you want.
6. **exit**
7. **interface** *type number*
8. **ip access-group** *access-list-name* {**in** | **out**}

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> enable                                                                                                                                                                                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                                                                                                                                                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ip access-list extended</b> <i>access-list-name</i><br><b>Example:</b><br><br>Device(config)# ip access-list extended ttlfilter                                                                                                                                                                                                                                                         | Defines an IP access list by name. <ul style="list-style-type: none"> <li>• An access list that filters on TTL value must be an extended access list.</li> </ul>                                                                                                                                        |
| <b>Step 4</b> | <i>[sequence-number]</i> <b>permit</b> <i>protocol source source-wildcard destination destination-wildcard</i> <b>[option option-name]</b><br><b>[precedence precedence]</b> <b>[tos tos]</b> <b>[ttl operator value]</b> <b>[log]</b><br><b>[time-range time-range-name]</b> <b>[fragments]</b><br><b>Example:</b><br><br>Device(config-ext-nacl)# permit ip host 172.16.1.1 any ttl lt 2 | Sets conditions to allow a packet to pass a named IP access list. <ul style="list-style-type: none"> <li>• Every access list must have at least one <b>permit</b> statement.</li> <li>• This example permits packets from source 172.16.1.1 to any destination with a TTL value less than 2.</li> </ul> |
| <b>Step 5</b> | Continue to add <b>permit</b> or <b>deny</b> statements to achieve the filtering you want.                                                                                                                                                                                                                                                                                                 | --                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config-ext-nacl)# exit                                                                                                                                                                                                                                                                                                                        | Exits any configuration mode to the next highest mode in the command-line interface (CLI) mode hierarchy.                                                                                                                                                                                               |
| <b>Step 7</b> | <b>interface</b> <i>type number</i><br><b>Example:</b><br><br>Device(config)# interface TenGigabitEthernet4/1/0                                                                                                                                                                                                                                                                            | Configures an interface type and enters interface configuration mode.                                                                                                                                                                                                                                   |
| <b>Step 8</b> | <b>ip access-group</b> <i>access-list-name</i> <b>{in   out}</b><br><b>Example:</b><br><br>Device(config-if)# ip access-group ttlfilter in                                                                                                                                                                                                                                                 | Applies the access list to an interface.                                                                                                                                                                                                                                                                |

## Enabling Control Plane Policing to Filter on TTL Values 0 and 1

Perform this task to filter IP packets based on a TTL value of 0 or 1 and to protect the CPU from being overwhelmed. This task configures an access list for classification on TTL value 0 and 1, configures the

Modular QoS Command-Line Interface (CLI) (MQC), and applies a policy map to the control plane. Any packets that pass the access list are dropped. This special access list is separate from any other interface access lists.

Because access lists are very flexible, it is not possible to define only one combination of **permit** and **deny** commands to filter packets based on the TTL value. This task illustrates just one example that achieves TTL filtering. Configure the appropriate **permit** and **deny** statements that will accomplish your filtering plan.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *access-list-name*
4. [*sequence-number*] **permit** *protocol source source-wildcard destination destination-wildcard ttl operator value*
5. Continue to add **permit** or **deny** statements to achieve the filtering you want.
6. **exit**
7. **class-map** *class-map-name* [**match-all** | **match-any**]
8. **match access-group** { *access-group* | **name** *access-group-name* }
9. **exit**
10. **policy-map** *policy-map-name*
11. **class** { *class-name* | **class-default** }
12. **drop**
13. **exit**
14. **exit**
15. **control-plane**
16. **service-policy** { **input** | **output** } *policy-map-name*

## DETAILED STEPS

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                 |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                     | Enters global configuration mode.                                                                                                                                  |
| Step 3 | <b>ip access-list extended</b> <i>access-list-name</i><br><b>Example:</b><br>Device(config)# ip access-list extended ttlfilter | Defines an IP access list by name. <ul style="list-style-type: none"> <li>• An access list that filters on a TTL value must be an extended access list.</li> </ul> |

|                | Command or Action                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b>  | <p>[ <i>sequence-number</i> ] <b>permit</b> <i>protocol source source-wildcard destination destination-wildcard ttl operator value</i></p> <p><b>Example:</b></p> <pre>Device(config-ext-nacl)# permit ip host 172.16.1.1 any ttl lt 2</pre> | <p>Sets conditions to allow a packet to pass a named IP access list.</p> <ul style="list-style-type: none"> <li>• Every access list must have at least one <b>permit</b> statement.</li> <li>• This example permits packets from source 172.16.1.1 to any destination with a TTL value less than 2.</li> </ul> |
| <b>Step 5</b>  | Continue to add <b>permit</b> or <b>deny</b> statements to achieve the filtering you want.                                                                                                                                                   | The packets that pass the access list will be dropped.                                                                                                                                                                                                                                                         |
| <b>Step 6</b>  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-ext-nacl)# exit</pre>                                                                                                                                                           | Exits any configuration mode to the next highest mode in the CLI mode hierarchy.                                                                                                                                                                                                                               |
| <b>Step 7</b>  | <p><b>class-map</b> <i>class-map-name</i> [ <b>match-all</b>   <b>match-any</b> ]</p> <p><b>Example:</b></p> <pre>Device(config)# class-map acl-filtering</pre>                                                                              | Creates a class map to be used for matching packets to a specified class.                                                                                                                                                                                                                                      |
| <b>Step 8</b>  | <p><b>match access-group</b> { <i>access-group</i>   <b>name</b> <i>access-group-name</i> }</p> <p><b>Example:</b></p> <pre>Device(config-cmap)# match access-group name ttlfilter</pre>                                                     | Configures the match criteria for a class map on the basis of the specified access control list.                                                                                                                                                                                                               |
| <b>Step 9</b>  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-cmap)# exit</pre>                                                                                                                                                               | Exits any configuration mode to the next highest mode in the CLI mode hierarchy.                                                                                                                                                                                                                               |
| <b>Step 10</b> | <p><b>policy-map</b> <i>policy-map-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# policy-map acl-filter</pre>                                                                                                                      | Creates or modifies a policy map that can be attached to one or more interface to specify a service policy.                                                                                                                                                                                                    |
| <b>Step 11</b> | <p><b>class</b> { <i>class-name</i>   <b>class-default</b> }</p> <p><b>Example:</b></p> <pre>Device(config-pmap)# class acl-filter-class</pre>                                                                                               | Specifies the name of the class whose policy you want to create or change or to specify the default class (commonly known as the class-default class) before you configure its policy.                                                                                                                         |
| <b>Step 12</b> | <p><b>drop</b></p> <p><b>Example:</b></p> <pre>Device(config-pmap-c)# drop</pre>                                                                                                                                                             | Configures a traffic class to discard packets belonging to a specific class.                                                                                                                                                                                                                                   |

|         | Command or Action                                                                                                                 | Purpose                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Step 13 | <b>exit</b><br><b>Example:</b><br>Device(config-pmap-c)# exit                                                                     | Exits any configuration mode to the next highest mode in the CLI mode hierarchy.                          |
| Step 14 | <b>exit</b><br><b>Example:</b><br>Device(config-pmap)# exit                                                                       | Exits any configuration mode to the next highest mode in the CLI mode hierarchy.                          |
| Step 15 | <b>control-plane</b><br><b>Example:</b><br>Device(config)# control-plane                                                          | Associates or modifies attributes or parameters that are associated with the control plane of the device. |
| Step 16 | <b>service-policy { input   output } policy-map-name</b><br><b>Example:</b><br>Device(config-cp)# service-policy input acl-filter | Attaches a policy map to a control plane for aggregate control plane services.                            |

## Configuration Examples for Filtering IP Options, TCP Flags, Noncontiguous Ports

### Example: Filtering Packets That Contain IP Options

The following example shows an extended access list named mylist2 that contains access list entries (ACEs) that are configured to permit TCP packets only if they contain the IP Options that are specified in the ACEs:

```
ip access-list extended mylist2
 10 permit ip any any option eool
 20 permit ip any any option record-route
 30 permit ip any any option zsu
 40 permit ip any any option mtup
```

The **show access-list** command has been entered to show how many packets were matched and therefore permitted:

```
Device# show ip access-list mylist2
Extended IP access list test
10 permit ip any any option eool (1 match)
20 permit ip any any option record-route (1 match)
30 permit ip any any option zsu (1 match)
40 permit ip any any option mtup (1 match)
```

## Example: Filtering Packets That Contain TCP Flags

The following access list allows TCP packets only if the TCP flags ACK and SYN are set and the FIN flag is not set:

```
ip access-list extended aaa
 permit tcp any any match-all +ack +syn -fin
 end
```

The **show access-list** command has been entered to display the ACL:

```
Device# show access-list aaa

Extended IP access list aaa
 10 permit tcp any any match-all +ack +syn -fin
```

## Example: Creating an Access List Entry with Noncontiguous Ports

The following access list entry can be created because up to ten ports can be entered after the **eq** and **neq** operators:

```
ip access-list extended aaa
 permit tcp any eq telnet ftp any eq 23 45 34
 end
```

Enter the **show access-lists** command to display the newly created access list entry.

```
Device# show access-lists aaa

Extended IP access list aaa
 10 permit tcp any eq telnet ftp any eq 23 45 34
```

## Example: Consolidating Some Existing Access List Entries into One Access List Entry with Noncontiguous Ports

The **show access-lists** command is used to display a group of access list entries for the access list named abc:

```
Device# show access-lists abc

Extended IP access list abc
 10 permit tcp any eq telnet any eq 450
 20 permit tcp any eq telnet any eq 679
 30 permit tcp any eq ftp any eq 450
 40 permit tcp any eq ftp any eq 679
```

Because the entries are all for the same **permit** statement and simply show different ports, they can be consolidated into one new access list entry. The following example shows the removal of the redundant access list entries and the creation of a new access list entry that consolidates the previously displayed group of access list entries:

```
ip access-list extended abc
 no 10
 no 20
 no 30
```

```
no 40
permit tcp any eq telnet ftp any eq 450 679
end
```

When the **show access-lists** command is reentered, the consolidated access list entry is displayed:

```
Device# show access-lists abc
Extended IP access list abc
 10 permit tcp any eq telnet ftp any eq 450 679
```

## Example: Filtering on TTL Value

The following access list filters IP packets containing type of service (ToS) level 3 with time-to-live (TTL) values 10 and 20. It also filters IP packets with a TTL greater than 154 and applies that rule to noninitial fragments. It permits IP packets with a precedence level of flash and a TTL value not equal to 1, and it sends log messages about such packets to the console. All other packets are denied.

```
ip access-list extended incomingfilter
deny ip any any tos 3 ttl eq 10 20
deny ip any any ttl gt 154 fragments
permit ip any any precedence flash ttl neq 1 log
!
interface TenGigabitEthernet4/1/0

ip access-group incomingfilter in
```

## Example: Control Plane Policing to Filter on TTL Values 0 and 1

The following example configures a traffic class called `acl-filter-class` for use in a policy map called `acl-filter`. An access list permits IP packets from any source having a time-to-live (TTL) value of 0 or 1. Any packets matching the access list are dropped. The policy map is attached to the control plane.

```
ip access-list extended ttlfilter

permit ip any any ttl eq 0 1

class-map acl-filter-class

match access-group name ttlfilter

policy-map acl-filter

class acl-filter-class

drop

control-plane

service-policy input acl-filter
```

# Feature Information for Creating an IP Access List to Filter IP Options, TCP Flags, Noncontiguous Ports, or TTL Values

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 164: Feature Information for Creating an IP Access List to Filter IP Options, TCP Flags, Noncontiguous Ports, or TTL Values**

| Feature Name    | Releases                 | Feature Information                                                                                            |

## CHAPTER 63

# Refining an IP Access List

---

There are several ways to refine an access list while or after you create it. You can change the order of the entries in an access list or add entries to an access list. You can restrict access list entries to a certain time of day or week, or achieve finer granularity when filtering packets by filtering noninitial fragments of packets.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About Refining an IP Access List

### Access List Sequence Numbers

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If you wanted to insert an entry in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

Sequence numbers allow users to add access list entries and resequence them. When you add a new entry, you specify the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

## Benefits of Access List Sequence Numbers

An access list sequence number is a number at the beginning of a **permit** or **deny** command in an access list. The sequence number determines the order that the entry appears in the access list. The ability to apply sequence numbers to IP access list entries simplifies access list changes.

Prior to having sequence numbers, users could only add access list entries to the end of an access list; therefore, needing to add statements anywhere except the end of the list required reconfiguring the entire access list. There was no way to specify the position of an entry within an access list. If a user wanted to insert an entry (statement) in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When a user adds a new entry, the user chooses the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry. Sequence numbers make revising an access list much easier.

## Sequence Numbering Behavior

- For backward compatibility with previous releases, if entries with no sequence numbers are applied, the first entry is assigned a sequence number of 10, and successive entries are incremented by 10. The maximum sequence number is 2147483647. If the generated sequence number exceeds this maximum number, the following message is displayed:

```
Exceeded maximum sequence number.
```

- If the user enters an entry without a sequence number, it is assigned a sequence number that is 10 greater than the last sequence number in that access list and is placed at the end of the list.
- If the user enters an entry that matches an already existing entry (except for the sequence number), then no changes are made.
- If the user enters a sequence number that is already present, the following error message is generated:

```
Duplicate sequence number.
```

- If a new access list is entered from global configuration mode, then sequence numbers for that access list are generated automatically.
- Sequence numbers are not nvgened. That is, the sequence numbers themselves are not saved. In the event that the system is reloaded, the configured sequence numbers revert to the default sequence starting number and increment. The function is provided for backward compatibility with software releases that do not support sequence numbering.
- This feature works with named and numbered, standard and extended IP access lists.

## Benefits of Time Ranges

Benefits and possible uses of time ranges include the following:

- The network administrator has more control over permitting or denying a user access to resources. These resources could be an application (identified by an IP address/mask pair and a port number), policy routing, or an on-demand link (identified as interesting traffic to the dialer).
- Network administrators can set time-based security policy, including the following:
  - Perimeter security using access lists
  - Data confidentiality with IP Security Protocol (IPsec)
- When provider access rates vary by time of day, it is possible to automatically reroute traffic cost effectively.
- Network administrators can control logging messages. Access list entries can log traffic at certain times of the day, but not constantly. Therefore, administrators can simply deny access without needing to analyze many logs generated during peak hours.

## Benefits Filtering Noninitial Fragments of Packets

Filter noninitial fragments of packets with an extended access list if you want to block more of the traffic you intended to block, not just the initial fragment of such packets. You should first understand the following concepts.

If the **fragments** keyword is used in additional IP access list entries that deny fragments, the fragment control feature provides the following benefits:

### Additional Security

You are able to block more of the traffic you intended to block, not just the initial fragment of such packets. The unwanted fragments no longer linger at the receiver until the reassembly timeout is reached because they are blocked before being sent to the receiver. Blocking a greater portion of unwanted traffic improves security and reduces the risk from potential hackers.

### Reduced Cost

By blocking unwanted noninitial fragments of packets, you are not paying for traffic you intended to block.

### Reduced Storage

By blocking unwanted noninitial fragments of packets from ever reaching the receiver, that destination does not have to store the fragments until the reassembly timeout period is reached.

### Expected Behavior Is Achieved

The noninitial fragments will be handled in the same way as the initial fragment, which is what you would expect. There are fewer unexpected policy routing results and fewer fragments of packets being routed when they should not be.

## Access List Processing of Fragments

The behavior of access list entries regarding the use or lack of use of the **fragments** keyword can be summarized as follows:

| If the Access-List Entry Has...                                                                                     | Then...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>...no <b>fragments</b> keyword (the default), and assuming all of the access-list entry information matches,</p> | <p>For an access list entry that contains only Layer 3 information:</p> <ul style="list-style-type: none"> <li>• The entry is applied to nonfragmented packets, initial fragments, and noninitial fragments.</li> </ul> <p>For an access list entry that contains Layer 3 and Layer 4 information:</p> <ul style="list-style-type: none"> <li>• The entry is applied to nonfragmented packets and initial fragments. <ul style="list-style-type: none"> <li>• If the entry is a <b>permit</b> statement, then the packet or fragment is permitted.</li> <li>• If the entry is a <b>deny</b> statement, then the packet or fragment is denied.</li> </ul> </li> <li>• The entry is also applied to noninitial fragments in the following manner. Because noninitial fragments contain only Layer 3 information, only the Layer 3 portion of an access list entry can be applied. If the Layer 3 portion of the access list entry matches, and <ul style="list-style-type: none"> <li>• If the entry is a <b>permit</b> statement, then the noninitial fragment is permitted.</li> <li>• If the entry is a <b>deny</b> statement, then the next access list entry is processed.</li> </ul> </li> </ul> <p><b>Note</b> The <b>deny</b> statements are handled differently for noninitial fragments versus nonfragmented or initial fragments.</p> |
| <p>...the <b>fragments</b> keyword, and assuming all of the access-list entry information matches,</p>              | <p>The access list entry is applied only to noninitial fragments.</p> <p>The <b>fragments</b> keyword cannot be configured for an access list entry that contains any Layer 4 information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Be aware that you should not add the **fragments** keyword to every access list entry because the first fragment of the IP packet is considered a nonfragment and is treated independently of the subsequent fragments. An initial fragment will not match an access list **permit** or **deny** entry that contains the **fragments** keyword. The packet is compared to the next access list entry, and so on, until it is either permitted or denied by an access list entry that does not contain the **fragments** keyword. Therefore, you may need two access list entries for every **deny** entry. The first **deny** entry of the pair will not include the **fragments** keyword and applies to the initial fragment. The second **deny** entry of the pair will include the **fragments** keyword and applies to the subsequent fragments. In the cases in which there are multiple **deny** entries for the same host but with different Layer 4 ports, a single **deny** access list entry with the **fragments** keyword for that host is all that needs to be added. Thus all the fragments of a packet are handled in the same manner by the access list.

Packet fragments of IP datagrams are considered individual packets, and each counts individually as a packet in access list accounting and access list violation counts.

## How to Refine an IP Access List

The tasks in this module provide you with various ways to refine an access list if you did not already do so while you were creating it. You can change the order of the entries in an access list, add entries to an access

list, restrict access list entries to a certain time of day or week, or achieve finer granularity when filtering packets by filtering on noninitial fragments of packets.

## Revising an Access List Using Sequence Numbers

Perform this task if you want to add entries to an existing access list, change the order of entries, or simply number the entries in an access list to accommodate future changes.

**Note** Remember that if you want to delete an entry from an access list, you can simply use the **no deny** or **no permit** form of the command, or the **no sequence-number** command if the statement already has a sequence number.

**Note** • Access list sequence numbers do not support dynamic, reflexive, or firewall access lists.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list resequence** *access-list-name starting-sequence-number increment*
4. **ip access-list** { **standard** | **extended** } *access-list-name*
5. Do one of the following:
  - *sequence-number permit source source-wildcard*
  - *sequence-number permit protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*
6. Do one of the following:
  - *sequence-number deny source source-wildcard*
  - *sequence-number deny protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*
7. Repeat Step 5 and Step 6 as necessary, adding statements by sequence number where you planned. Use the **no sequence-number** command to delete an entry.
8. **end**
9. **show ip access-lists** *access-list-name*

### DETAILED STEPS

|        | Command or Action                                  | Purpose                                                                                                            |
|--------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                                                                                                                                                                                                                                                                                                                                                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <p><b>ip access-list resequence</b> <i>access-list-name</i><br/><i>starting-sequence-number increment</i></p> <p><b>Example:</b></p> <pre>Router(config)# ip access-list resequence kmdl 100 15</pre>                                                                                                                                                                                                                                                                                                                  | <p>Resequences the specified IP access list using the starting sequence number and the increment of sequence numbers.</p> <ul style="list-style-type: none"> <li>This example resequences an access list named kmdl. The starting sequence number is 100 and the increment is 15.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 4 | <p><b>ip access-list</b> { <b>standard</b>   <b>extended</b> } <i>access-list-name</i></p> <p><b>Example:</b></p> <pre>Router(config)# ip access-list standard xyz123</pre>                                                                                                                                                                                                                                                                                                                                            | <p>Specifies the IP access list by name and enters named access list configuration mode.</p> <ul style="list-style-type: none"> <li>If you specify <b>standard</b>, make sure you specify subsequent <b>permit</b> and <b>deny</b> statements using the standard access list syntax.</li> <li>If you specify <b>extended</b>, make sure you specify subsequent <b>permit</b> and <b>deny</b> statements using the extended access list syntax.</li> </ul>                                                                                                                                                                                                                                                                                                      |
| Step 5 | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li><i>sequence-number</i> <b>permit</b> <i>source source-wildcard</i></li> <li><i>sequence-number</i> <b>permit</b> <i>protocol source source-wildcard destination destination-wildcard</i> [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>log</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>fragments</b> ]</li> </ul> <p><b>Example:</b></p> <pre>Router(config-std-nacl)# 105 permit 10.5.5.5 0.0.0.255</pre> | <p>Specifies a permit statement in named IP access list mode.</p> <ul style="list-style-type: none"> <li>This access list happens to use a <b>permit</b> statement first, but a <b>deny</b> statement could appear first, depending on the order of statements you need.</li> <li>See the <b>permit</b> (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP).</li> <li>Use the <b>no</b> <i>sequence-number</i> command to delete an entry.</li> <li>As the prompt indicates, this access list was a standard access list. If you had specified <b>extended</b> in Step 4, the prompt for this step would be Router(config-ext-nacl)# and you would use the extended <b>permit</b> command syntax.</li> </ul> |
| Step 6 | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li><i>sequence-number</i> <b>deny</b> <i>source source-wildcard</i></li> <li><i>sequence-number</i> <b>deny</b> <i>protocol source source-wildcard destination destination-wildcard</i> [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>log</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>fragments</b> ]</li> </ul> <p><b>Example:</b></p>                                                                       | <p>(Optional) Specifies a deny statement in named IP access list mode.</p> <ul style="list-style-type: none"> <li>This access list happens to use a <b>permit</b> statement first, but a <b>deny</b> statement could appear first, depending on the order of statements you need.</li> <li>See the <b>deny</b> (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP).</li> </ul>                                                                                                                                                                                                                                                                                                                               |

|               | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Router(config-std-nacl)# 110 deny 10.6.6.7 0.0.0.255</pre>                                                                                                     | <ul style="list-style-type: none"> <li>Use the <b>no</b> <i>sequence-number</i> command to delete an entry.</li> <li>As the prompt indicates, this access list was a standard access list. If you had specified <b>extended</b> in Step 4, the prompt for this step would be Router(config-ext-nacl)# and you would use the extended <b>deny</b> command syntax.</li> </ul> |
| <b>Step 7</b> | Repeat Step 5 and Step 6 as necessary, adding statements by sequence number where you planned. Use the <b>no</b> <i>sequence-number</i> command to delete an entry. | Allows you to revise the access list.                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-std-nacl)# end</pre>                                                                                            | (Optional) Exits the configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                |
| <b>Step 9</b> | <b>show ip access-lists</b> <i>access-list-name</i><br><b>Example:</b><br><pre>Router# show ip access-lists xyz123</pre>                                            | (Optional) Displays the contents of the IP access list. <ul style="list-style-type: none"> <li>Review the output to see that the access list includes the new entry.</li> </ul>                                                                                                                                                                                             |

### Examples

The following is sample output from the **show ip access-lists** command when the **xyz123** access list is specified.

```
Router# show ip access-lists xyz123
Standard IP access list xyz123
100 permit 10.4.4.0, wildcard bits 0.0.0.255
105 permit 10.5.5.5, wildcard bits 0.0.0.255
115 permit 10.0.0.0, wildcard bits 0.0.0.255
130 permit 10.5.5.0, wildcard bits 0.0.0.255
145 permit 10.0.0.0, wildcard bits 0.0.0.255
```

## Restricting an Access List Entry to a Time of Day or Week

By default, access list statements are always in effect once they are applied. However, you can define the times of the day or week that **permit** or **deny** statements are in effect by defining a time range, and then referencing the time range by name in an individual access list statement. IP and Internetwork Packet Exchange (IPX) named or numbered extended access lists can use time ranges.

### SUMMARY STEPS

- enable
- configure terminal
- ip access-list extended *name*

4. [ *sequence-number* ] **deny** *protocol* *source* [ *source-wildcard* ] [ *operator port* [ *port* ] ] *destination* [ *destination-wildcard* ] [ *operator port* [ *port* ] ]
5. [ *sequence-number* ] **deny** *protocol* *source* [ *source-wildcard* ] [ *operator port* [ *port* ] ] *destination* [ *destination-wildcard* ] [ *operator port* [ *port* ] ] **fragments**
6. [ *sequence-number* ] **permit** *protocol* *source* [ *source-wildcard* ] [ *operator port* [ *port* ] ] *destination* [ *destination-wildcard* ] [ *operator port* [ *port* ] ]
7. Repeat some combination of Steps 4 through 6 until you have specified the values on which you want to base your access list.
8. **end**
9. **show ip access-list**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                   |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                        |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                                                                                            | Enters global configuration mode.                                                                                                                                                                                         |
| Step 3 | <b>ip access-list extended</b> <i>name</i><br><b>Example:</b><br><pre>Router(config)# ip access-list extended rstrct4</pre>                                                                                                                                                                                                                      | Defines an extended IP access list using a name and enters extended named access list configuration mode.                                                                                                                 |
| Step 4 | [ <i>sequence-number</i> ] <b>deny</b> <i>protocol</i> <i>source</i> [ <i>source-wildcard</i> ] [ <i>operator port</i> [ <i>port</i> ] ] <i>destination</i> [ <i>destination-wildcard</i> ] [ <i>operator port</i> [ <i>port</i> ] ]<br><b>Example:</b><br><pre>Router(config-ext-nacl)# deny ip any 172.20.1.1</pre>                            | (Optional) Denies any packet that matches all of the conditions specified in the statement. <ul style="list-style-type: none"> <li>• This statement will apply to nonfragmented packets and initial fragments.</li> </ul> |
| Step 5 | [ <i>sequence-number</i> ] <b>deny</b> <i>protocol</i> <i>source</i> [ <i>source-wildcard</i> ] [ <i>operator port</i> [ <i>port</i> ] ] <i>destination</i> [ <i>destination-wildcard</i> ] [ <i>operator port</i> [ <i>port</i> ] ] <b>fragments</b><br><b>Example:</b><br><pre>Router(config-ext-nacl)# deny ip any 172.20.1.1 fragments</pre> | (Optional) Denies any packet that matches all of the conditions specified in the statement <ul style="list-style-type: none"> <li>• This statement will apply to noninitial fragments.</li> </ul>                         |
| Step 6 | [ <i>sequence-number</i> ] <b>permit</b> <i>protocol</i> <i>source</i> [ <i>source-wildcard</i> ] [ <i>operator port</i> [ <i>port</i> ] ] <i>destination</i> [ <i>destination-wildcard</i> ] [ <i>operator port</i> [ <i>port</i> ] ]<br><b>Example:</b>                                                                                        | Permits any packet that matches all of the conditions specified in the statement. <ul style="list-style-type: none"> <li>• Every access list needs at least one <b>permit</b> statement.</li> </ul>                       |

|               | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Router(config-ext-nacl)# permit tcp any any</pre>                                                                       | <ul style="list-style-type: none"> <li>If the <i>source-wildcard</i> or <i>destination-wildcard</i> is omitted, a wildcard mask of 0.0.0.0 is assumed, meaning match on all bits of the source or destination address, respectively.</li> <li>Optionally use the keyword <b>any</b> as a substitute for the <i>source source-wildcard</i> or <i>destination destination-wildcard</i> to specify the address and wildcard of 0.0.0.0 255.255.255.255.</li> </ul> |
| <b>Step 7</b> | Repeat some combination of Steps 4 through 6 until you have specified the values on which you want to base your access list. | Remember that all sources not specifically permitted are denied by an implicit <b>deny</b> statement at the end of the access list.                                                                                                                                                                                                                                                                                                                             |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-ext-nacl)# end</pre>                                                     | Ends configuration mode and returns the system to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 9</b> | <b>show ip access-list</b><br><b>Example:</b><br><pre>Router# show ip access-list</pre>                                      | (Optional) Displays the contents of all current IP access lists.                                                                                                                                                                                                                                                                                                                                                                                                |

## What to Do Next

Apply the access list to an interface or reference it from a command that accepts an access list.

**Note** To effectively eliminate all packets that contain IP Options, we recommend that you configure the global **ip options drop** command.

## Configuration Examples for Refining an IP Access List

### Example Resequencing Entries in an Access List

The following example shows an access list before and after resequencing. The starting value is 1, and increment value is 2. The subsequent entries are ordered based on the increment values that users provide, and the range is from 1 to 2147483647.

When an entry with no sequence number is entered, by default it has a sequence number of 10 more than the last entry in the access list.

```
Router# show access-list carls
Extended IP access list carls
 10 permit ip host 10.3.3.3 host 172.16.5.34
```

```

20 permit icmp any any
30 permit tcp any host 10.3.3.3
40 permit ip host 10.4.4.4 any
50 Dynamic test permit ip any any
60 permit ip host 172.16.2.2 host 10.3.3.12
70 permit ip host 10.3.3.3 any log
80 permit tcp host 10.3.3.3 host 10.1.2.2
90 permit ip host 10.3.3.3 any
100 permit ip any any
Router(config)# ip access-list extended carls
Router(config)# ip access-list resequence carls 1 2
Router(config)# end
Router# show access-list carls
Extended IP access list carls
 1 permit ip host 10.3.3.3 host 172.16.5.34
 3 permit icmp any any
 5 permit tcp any host 10.3.3.3
 7 permit ip host 10.4.4.4 any
 9 Dynamic test permit ip any any
11 permit ip host 172.16.2.2 host 10.3.3.12
13 permit ip host 10.3.3.3 any log
15 permit tcp host 10.3.3.3 host 10.1.2.2
17 permit ip host 10.3.3.3 any
19 permit ip any any

```

## Example Adding an Entry with a Sequence Number

In the following example, a new entry (sequence number 15) is added to an access list:

```

Router# show ip access-list
Standard IP access list tryon
 2 permit 10.4.4.2, wildcard bits 0.0.255.255
 5 permit 10.0.0.44, wildcard bits 0.0.0.255
10 permit 10.0.0.1, wildcard bits 0.0.0.255
20 permit 10.0.0.2, wildcard bits 0.0.0.255
Router(config)# ip access-list standard tryon
Router(config-std-nacl)# 15 permit 10.5.5.5 0.0.0.255
Router# show ip access-list
Standard IP access list tryon
 2 permit 10.4.0.0, wildcard bits 0.0.255.255
 5 permit 10.0.0.0, wildcard bits 0.0.0.255
10 permit 10.0.0.0, wildcard bits 0.0.0.255
15 permit 10.5.5.0, wildcard bits 0.0.0.255
20 permit 10.0.0.0, wildcard bits 0.0.0.255

```

## Example Adding an Entry with No Sequence Number

The following example shows how an entry with no specified sequence number is added to the end of an access list. When an entry is added without a sequence number, it is automatically given a sequence number that puts it at the end of the access list. Because the default increment is 10, the entry will have a sequence number 10 higher than the last entry in the existing access list.

```

Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.1.1.1 0.0.0.255
Router(config-std-nacl)# permit 10.2.2.2 0.0.0.255
Router(config-std-nacl)# permit 10.3.3.3 0.0.0.255
Router# show access-list
Standard IP access list resources

```

```

10 permit 10.1.1.1, wildcard bits 0.0.0.255
20 permit 10.2.2.2, wildcard bits 0.0.0.255
30 permit 10.3.3.3, wildcard bits 0.0.0.255
Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.4.4.4 0.0.0.255
Router(config-std-nacl)# end
Router# show access-list
Standard IP access list resources
10 permit 10.1.1.1, wildcard bits 0.0.0.255
20 permit 10.2.2.2, wildcard bits 0.0.0.255
30 permit 10.3.3.3, wildcard bits 0.0.0.255
40 permit 10.4.4.4, wildcard bits 0.0.0.255

```

## Example Time Ranges Applied to IP Access List Entries

The following example creates a time range called no-http, which extends from Monday to Friday from 8:00 a.m. to 6:00 p.m. That time range is applied to the **deny** statement, thereby denying HTTP traffic on Monday through Friday from 8:00 a.m. to 6:00 p.m.

The time range called udp-yes defines weekends from noon to 8:00 p.m. That time range is applied to the **permit** statement, thereby allowing UDP traffic on Saturday and Sunday from noon to 8:00 p.m. only. The access list containing both statements is applied to inbound packets on Ten Gigabit Ethernet interface 4/1/0.

```

time-range no-http
 periodic weekdays 8:00 to 18:00
!
time-range udp-yes
 periodic weekend 12:00 to 20:00
!
ip access-list extended strict
 deny tcp any any eq http time-range no-http
 permit udp any any time-range udp-yes
!
interface TenGigabitEthernet4/1/0
 ip access-group strict in

```

## Example Filtering IP Packet Fragments

In the following access list, the first statement will deny only noninitial fragments destined for host 172.16.1.1. The second statement will permit only the remaining nonfragmented and initial fragments that are destined for host 172.16.1.1 TCP port 80. The third statement will deny all other traffic. In order to block noninitial fragments for any TCP port, we must block noninitial fragments for all TCP ports, including port 80 for host 172.16.1.1. That is, non-initial fragments will not contain Layer 4 port information, so, in order to block such traffic for a given port, we have to block fragments for all ports.

```

access-list 101 deny ip any host 172.16.1.1 fragments
access-list 101 permit tcp any host 172.16.1.1 eq 80
access-list 101 deny ip any any

```

## Feature Information for Refining an IP Access List

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfnng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 166: Feature Information for Refining an IP Access List**

| Feature Name    | Releases                 | Feature Information                                                                                            |

## CHAPTER 64

# IP Named Access Control Lists

---

Access control lists (ACLs) perform packet filtering to control the movement of packets through a network. Packet filtering provides security by limiting the access of traffic into a network, restricting user and device access to a network, and preventing traffic from leaving a network. IP access lists reduce the chance of spoofing and denial-of-service attacks, and allow dynamic, temporary user-access through a firewall.

The IP Named Access Control Lists feature gives network administrators the option of using names to identify their access lists.

This module describes IP named access lists and how to configure them.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About IP Named Access Control Lists

### Definition of an Access List

Access control lists (ACLs) perform packet filtering to control the movement of packets through a network. Packet filtering provides security by limiting the access of traffic into a network, restricting user and device access to a network, and preventing traffic from leaving a network. IP access lists reduce the chance of spoofing and denial-of-service attacks, and allow dynamic, temporary user-access through a firewall.

IP access lists can also be used for purposes other than security, such as to control bandwidth, restrict the content of routing updates, redistribute routes, trigger dial-on-demand (DDR) calls, limit debug output, and identify or classify traffic for quality of service (QoS) features.

An access list is a sequential list that consists of at least one **permit** statement and possibly one or more **deny** statements. In the case of IP access lists, these statements can apply to IP addresses, upper-layer IP protocols, or other fields in IP packets.

Access lists are identified and referenced by a name or a number. Access lists act as packet filters, filtering packets based on the criteria defined in each access list.

After you configure an access list, for the access list to take effect, you must either apply the access list to an interface (by using the **ip access-group** command), a vty (by using the **access-class** command), or reference the access list by any command that accepts an access list. Multiple commands can reference the same access list.

In the following configuration, an IP access list named `branchoffices` is configured on Ten Gigabit Ethernet interface 4/1/0 and applied to incoming packets. Networks other than the ones specified by the source address and mask pair cannot access Ten Gigabit Ethernet interface 4/1/0. The destinations for packets coming from sources on network 172.16.7.0 are unrestricted. The destination for packets coming from sources on network 172.16.2.0 must be 172.31.5.4.

```
ip access-list extended branchoffices
 10 permit 172.16.7.0 0.0.0.3 any
 20 permit 172.16.2.0 0.0.0.255 host 172.31.5.4
!
interface TenGigabitEthernet4/1/0
 ip access-group branchoffices in
```

## Named or Numbered Access Lists

All access lists must be identified by a name or a number. Named access lists are more convenient than numbered access lists because you can specify a meaningful name that is easier to remember and associate with a task. You can reorder statements in or add statements to a named access list.

Named access lists support the following features that are not supported by numbered access lists:

- IP options filtering
- Noncontiguous ports
- TCP flag filtering
- Deleting of entries with the **no permit** or **no deny** command

---

**Note** Not all commands that accept a numbered access list will accept a named access list. For example, vty uses only numbered access lists.

---

## Benefits of IP Access Lists

Access control lists (ACLs) perform packet filtering to control the flow of packets through a network. Packet filtering can restrict the access of users and devices to a network, providing a measure of security. Access lists can save network resources by reducing traffic. The benefits of using access lists are as follows:

- Authenticate incoming rsh and rcp requests—Access lists can simplify the identification of local users, remote hosts, and remote users in an authentication database that is configured to control access to a device. The authentication database enables Cisco software to receive incoming remote shell (rsh) and remote copy (rcp) protocol requests.
- Block unwanted traffic or users—Access lists can filter incoming or outgoing packets on an interface, thereby controlling access to a network based on source addresses, destination addresses, or user authentication. You can also use access lists to determine the types of traffic that are forwarded or blocked.

at device interfaces. For example, you can use access lists to permit e-mail traffic to be routed through a network and to block all Telnet traffic from entering the network.

- Control access to vty—Access lists on an inbound vty (Telnet) can control who can access the lines to a device. Access lists on an outbound vty can control the destinations that the lines from a device can reach.
- Identify or classify traffic for QoS features—Access lists provide congestion avoidance by setting the IP precedence for Weighted Random Early Detection (WRED) and committed access rate (CAR). Access lists also provide congestion management for class-based weighted fair queueing (CBWFQ), priority queueing, and custom queueing.
- Limit debug command output—Access lists can limit debug output based on an IP address or a protocol.
- Provide bandwidth control—Access lists on a slow link can prevent excess traffic on a network.
- Provide NAT control—Access lists can control which addresses are translated by Network Address Translation (NAT).
- Reduce the chance of DoS attacks—Access lists reduce the chance of denial-of-service (DoS) attacks. Specify IP source addresses to control traffic from hosts, networks, or users from accessing your network. Configure the TCP Intercept feature to can prevent servers from being flooded with requests for connection.
- Restrict the content of routing updates—Access lists can control routing updates that are sent, received, or redistributed in networks.
- Trigger dial-on-demand calls—Access lists can enforce dial and disconnect criteria.

## Access List Rules

The following rules apply to access lists:

- Only one access list per interface, per protocol, and per direction is allowed.
- An access list must contain at least one **permit** statement or all packets are denied entry into the network.
- The order in which access list conditions or match criteria are configured is important. While deciding whether to forward or block a packet, Cisco software tests the packet against each criteria statement in the order in which these statements are created. After a match is found, no more criteria statements are checked. The same **permit** or **deny** statements specified in a different order can result in a packet being passed under one circumstance and denied in another circumstance.
- If an access list is referenced by a name, but the access list does not exist, all packets pass. An interface or command with an empty access list applied to it permits all traffic into the network.
- Standard access lists and extended access lists cannot have the same name.
- Inbound access lists process packets before the packets are routed to an outbound interface. Inbound access lists that have filtering criteria that deny packet access to a network saves the overhead of routing lookup. Packets that are permitted access to a network based on the configured filtering criteria are processed for routing. For inbound access lists, when you configure a **permit** statement, packets are processed after they are received, and when you configure a **deny** statement, packets are discarded.
- Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed by the outbound access list. For outbound access lists, when you

configure a **permit** statement, packets are sent to the output buffer, and when you configure a **deny** statement, packets are discarded.

- An access list can control traffic arriving at a device or leaving a device, but not traffic originating at a device.

## Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient, useful access lists.

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit **deny** statement that follows could cause you immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one **permit** statement; otherwise, all packets are denied and no traffic passes.
- Because the software stops testing conditions after it encounters the first match (to either a **permit** or **deny** statement), you will reduce processing time and resources if you put the statements that packets are most likely to match at the beginning of the access list. Place more frequently occurring conditions before less frequent conditions.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.
- Use the statement **permit any any** if you want to allow all other packets not already denied. Using the statement **permit any any** in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry **permit any any** because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify **permit any any**, all traffic not already denied will get through.
- Although all access lists end with an implicit **deny** statement, we recommend use of an explicit **deny** statement (for example, **deny ip any any**). On most platforms, you can display the count of packets denied by issuing the **show access-list** command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit **deny** statements are counted, which is why the explicit **deny** statement will yield more complete data for you.
- While you are creating an access list or after it is created, you might want to delete an entry.
  - You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
  - You can delete an entry from a named access list. Use the **no permit** or **no deny** command to delete the appropriate entry.
- In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the **remark** command.
- If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the **log** keyword with the corresponding **deny** statement so that the packets denied from that source are logged for you.

- This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

## Where to Apply an Access List

You can apply access lists to the inbound or outbound interfaces of a device. Applying an access list to an inbound interface controls the traffic that enters the interface and applying an access list to an outbound interface controls the traffic that exits the interface.

When software receives a packet at the inbound interface, the software checks the packet against the statements that are configured for the access list. If the access list permits packets, the software processes the packet. Applying access lists to filter incoming packets can save device resources because filtered packets are discarded before entering the device.

Access lists on outbound interfaces filter packets that are transmitted (sent) out of the interface. You can use the TCP Access Control List (ACL) Splitting feature of the Rate-Based Satellite Control Protocol (RBSCP) on the outbound interface to control the type of packets that are subject to TCP acknowledgment (ACK) splitting on an outbound interface.

You can reference an access list by using a **debug** command to limit the amount of debug logs. For example, based on the filtering or matching criteria of the access list, debug logs can be limited to source or destination addresses or protocols.

You can use access lists to control routing updates, dial-on-demand (DDR), and quality of service (QoS) features.

## How to Configure IP Named Access Control Lists

### Creating an IP Named Access List

You can create an IP named access list to filter source addresses and destination addresses or a combination of addresses and other IP fields. Named access lists allow you to identify your access lists with an intuitive name.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *name*
4. **remark** *remark*
5. **deny** *protocol* [*source source-wildcard*] {**any** | **host** {*address* | *name*} } {*destination* [*destination-wildcard*] } {**any** | **host** {*address* | *name*} } [**log**]
6. **remark** *remark*
7. **permit** *protocol* [*source source-wildcard*] {**any** | **host** {*address* | *name*} } {*destination* [*destination-wildcard*] } {**any** | **host** {*address* | *name*} | **object-group** *object-group-name*} } [**log**]
8. **permit** *protocol* [*source source-wildcard*] {**any** | **host** {*address* | *name*} } {*destination* [*destination-wildcard*] } {**any** | **host** {*address* | *name*} } [**log**]
9. Repeat Steps 4 through 7 to specify more statements for your access list.

10. **end**
11. **show ip access-lists**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                   |
| Step 3 | <b>ip access-list extended name</b><br><b>Example:</b><br>Device(config)# ip access-list extended acl1                                                                                                                                                  | Defines an extended IP access list using a name and enters extended named access list configuration mode.                                                                                                                                                                                                                                                           |
| Step 4 | <b>remark remark</b><br><b>Example:</b><br>Device(config-ext-nacl)# remark protect server by denying sales access to the acl1 network                                                                                                                   | (Optional) Adds a description for an access list statement. <ul style="list-style-type: none"> <li>• A remark can precede or follow an IP access list entry.</li> <li>• In this example, the <b>remark</b> command reminds the network administrator that the <b>deny</b> command configured in Step 5 denies the Sales network access to the interface.</li> </ul> |
| Step 5 | <b>deny protocol [source source-wildcard] {any   host {address   name} {destination [destination-wildcard] {any   host {address   name} [log]</b><br><b>Example:</b><br>Device(config-ext-nacl)# deny ip 192.0.2.0 0.0.255.255 host 192.0.2.10 log      | (Optional) Denies all packets that match all conditions specified by the remark.                                                                                                                                                                                                                                                                                    |
| Step 6 | <b>remark remark</b><br><b>Example:</b><br>Device(config-ext-nacl)# remark allow TCP from any source to any destination                                                                                                                                 | (Optional) Adds a description for an access list statement. <ul style="list-style-type: none"> <li>• A remark can precede or follow an IP access list entry.</li> </ul>                                                                                                                                                                                             |
| Step 7 | <b>permit protocol [source source-wildcard] {any   host {address   name} {destination [destination-wildcard] {any   host {address   name}   object-group object-group-name} [log]</b><br><b>Example:</b><br>Device(config-ext-nacl)# permit tcp any any | Permits all packets that match all conditions specified by the statement.                                                                                                                                                                                                                                                                                           |
| Step 8 | <b>permit protocol [source source-wildcard] {any   host {address   name} {destination [destination-wildcard] {any   host {address   name} [log]</b>                                                                                                     | Permits all packets that match all conditions specified by the statement.                                                                                                                                                                                                                                                                                           |

## Applying an Access List to an Interface

|                | Command or Action                                                              | Purpose                                                                                                                                                     |
|----------------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Example:</b><br>Device(config-ext-nacl)# permit tcp any any                 |                                                                                                                                                             |
| <b>Step 9</b>  | Repeat Steps 4 through 7 to specify more statements for your access list.      | <b>Note</b> All source addresses that are not specifically permitted by a statement are denied by an implicit deny statement at the end of the access list. |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br>Device(config-ext-nacl)# end                  | Exits extended named access list configuration mode and returns to privileged EXEC mode.                                                                    |
| <b>Step 11</b> | <b>show ip access-lists</b><br><b>Example:</b><br>Device# show ip access-lists | Displays the contents of all current IP access lists.                                                                                                       |

**Example:**

The following is sample output from the **show ip access-lists** command:

```
Device# show ip access-lists acl1

Extended IP access list acl1
 permit tcp any 192.0.2.0 255.255.255.255 eq telnet
 deny tcp any any
 deny udp any 192.0.2.0 255.255.255.255 lt 1024
 deny ip any any log
```

## Applying an Access List to an Interface

### Procedure

|               | Command or Action                                                                                    | Purpose                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                           | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>interface type number</b><br><b>Example:</b><br>Device(config)# interface TenGigabitEthernet4/1/0 | Specifies an interface and enters interface configuration mode.                                                    |

|        | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Feature Information for IP Named Access Control Lists

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 168: Feature Information for IP Named Access Control Lists**

| Feature Name    | Releases                 | Feature Information                                                                                            |
|-----------------|--------------------------|----------------------------------------------------------------------------------------------------------------|
| IP access lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 65

# IPv4 ACL Chaining Support

ACL Chaining, also known as Multi-Access Control List, allows you to split access control lists (ACLs). This module describes how with the IPv4 ACL Chaining Support feature, you can explicitly split ACLs into common and user-specific ACLs and bind both ACLs to a target for traffic filtering on a device. In this way, the common ACLs in Ternary Content Addressable Memory (TCAM) are shared by multiple targets, thereby reducing the resource usage.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for IPv4 ACL Chaining Support

- A single access control List (ACL) cannot be used for both common and regular ACLs for the same target in the same direction.
- ACL chaining applies to only security ACLs. It is not supported for feature policies, such as Quality of Service (QoS), Firewall Services Module (FW) and Policy Based Routing (PBR).
- Per-target statistics are not supported for common ACLs.

## Information About IPv4 ACL Chaining Support

### ACL Chaining Overview

The packet filter process supports only a single Access control list (ACL) to be applied per direction and per protocol on an interface. This leads to manageability and scalability issues if there are common ACL entries

needed on many interfaces. Duplicate Access control entries (ACEs) are configured for all those interfaces, and any modification to the common ACEs needs to be performed for all ACLs.

A typical ACL on the edge box for an Internet Service Provider (ISP) has two sets of ACEs:

- Common ISP specific ACEs
- Customer/interface specific ACEs

The purpose of these address blocks is to deny access to ISP's protected infrastructure networks and anti-spoofing protection by allowing only customer source address blocks. This results in configuring unique ACL per interface and most of the ACEs being common across all ACLs on a device. ACL provisioning and modification is very cumbersome, hence, any changes to the ACE impacts every target.

## IPv4 ACL Chaining Support

IPv4 ACL Chaining Support allows you to split the Access control list (ACL) into common and customer-specific ACLs and attach both ACLs to a common session. In this way, only one copy of the common ACL is attached to Ternary Content Addressable Memory (TCAM) and shared by all users, thereby making it easier to maintain the common ACEs.

The IPv4 ACL Chaining feature allows two IPV4 ACLs to be active on an interface per direction:

- Common
- Regular
- Common and Regular

---

**Note** If you configure both common and regular ACLs on an interface, the common ACL is considered over a regular ACL.

---

## How to Configure IPv4 ACL Chaining Support

ACL chaining is supported by extending the **ip traffic filter** command.

The **ip traffic filter** command is not additive. When you use this command, it replaces earlier instances of the command.

For more information, refer to the *IPv6 ACL Chaining with a Common ACL* section in the Security Configuration Guide: Access Control Lists Configuration Guide.

## Configuring an Interface to Accept Common ACL

Perform this task to configure the interface to accept a common Access control list (ACL) along with an interface-specific ACL:

## Procedure

|               | Command or Action                                                                                                                                                                                                                   | Purpose                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                          | Enters global configuration mode.                                                      |
| <b>Step 3</b> | <b>interface</b> <i>type number</i><br><b>Example:</b><br>Device(config)# interface TenGigabitEthernet4/1/0                                                                                                                         | Configures an interface and enters the interface configuration mode.                   |
| <b>Step 4</b> | <b>ip access-group</b> { <b>common</b> { <i>common-access-list-name</i> { <i>regular-access-list</i>   <b>acl</b> }} { <b>in</b>   <b>out</b> }}<br><b>Example:</b><br>Device(config-if)# ipv4 access-group common acl-p<br>acl1 in | Configures the interface to accept a common ACL along with the interface-specific ACL. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                                                                                                                                             | (Optional) Exits the configuration mode and returns to privileged EXEC mode.           |

## Configuration Examples for IPv4 ACL Chaining Support

This section provides configuration examples of Common Access Control List (ACL).

### Example: Configuring an Interface to Accept a Common ACL

This example shows how to replace an Access Control List (ACL) configured on the interface without explicitly deleting the ACL:

```
interface TenGigabitEthernet4/1/0
ipv4 access-group common C_acl ACL1 in
end
replace interface acl ACL1 by ACL2
interface TenGigabitEthernet4/1/0
ipv4 access-group common C_acl ACL2 in
end
```

This example shows how common ACL cannot be replaced on interfaces without deleting it explicitly from the interface:

```
interface TenGigabitEthernet4/1/0
ipv4 access-group common C_acl1 ACL1 in
```

```

end
change the common acl to C_acl2
interface TenGigabitEthernet4/1/0
no ipv4 access-group common C_acl1 ACL1 in
end
interface TenGigabitEthernet4/1/0
ipv4 access-group common C_acl2 ACL1 in
end

```

---

**Note** When reconfiguring a common ACL, you must ensure that no other interface on the line card is attached to the common ACL.

---

---

**Note** If both common ACL and interface ACL are attached to an interface and only one of the above is reconfigured on the interface, then the other is removed automatically.

---

This example shows how the interface ACL is removed:

```

interface TenGigabitEthernet4/1/0
ipv4 access-group common C_acl1 ACL1 in
end

```

## Feature Information for IPv4 ACL Chaining Support

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 170: Feature Information for IPv4 ACL Chaining Support**

| Feature Name    | Releases                 | Feature Information                                                                                            |
|-----------------|--------------------------|----------------------------------------------------------------------------------------------------------------|
| IP access lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 66

# IPv6 ACL Chaining with a Common ACL

ACL Chaining, also known as Multi-Access Control List (ACL), allows you to split ACLs. This document describes how with the IPv6 ACL Chaining Support feature, you can explicitly split ACLs into common and user-specific ACLs and bind both ACLs to a target for traffic filtering on a device. In this way, the common ACLs in Ternary Content Addressable Memory (TCAM) are shared by multiple targets, thereby reducing the resource usage.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About IPv6 ACL Chaining with a Common ACL

### ACL Chaining Overview

The packet filter process supports only a single Access control list (ACL) to be applied per direction and per protocol on an interface. This leads to manageability and scalability issues if there are common ACL entries needed on many interfaces. Duplicate Access control entries (ACEs) are configured for all those interfaces, and any modification to the common ACEs needs to be performed for all ACLs.

A typical ACL on the edge box for an Internet Service Provider (ISP) has two sets of ACEs:

- Common ISP specific ACEs
- Customer/interface specific ACEs

The purpose of these address blocks is to deny access to ISP's protected infrastructure networks and anti-spoofing protection by allowing only customer source address blocks. This results in configuring unique ACL per interface and most of the ACEs being common across all ACLs on a device. ACL provisioning and modification is very cumbersome, hence, any changes to the ACE impacts every target.

## IPv6 ACL Chaining with a Common ACL

With IPv6 ACL Chaining, you can configure a traffic filter with the following:

- Common ACL
- Specific ACL
- Common and Specific ACL

Each Access control list (ACL) is matched in a sequence. For example, if you have specified both the ACLs - a common and a specific ACL, the packet is first matched against the common ACL; if a match is not found, it is then matched against the specific ACL.

---

**Note** Any IPv6 ACL may be configured on a traffic filter as a common or specific ACL. However, the same ACL cannot be specified on the same traffic filter as both common and specific.

---

## How to Configure IPv6 ACL Chaining with a Common ACL

### Before you begin

IPv6 ACL chaining is configured on an interface using an extension of the existing IPv6 traffic-filter command:  
**ipv6 traffic-filter** [**common** *common-acl*] [*specific-acl*] [ **in** | **out** ]

---

**Note** You may choose to configure either of the following:

---

- Only a common ACL. For example: **ipv6 traffic-filter common** *common-acl*
- Only a specific ACL. For example: **ipv6 traffic-filter** *common-acl*
- Both ACLs. For example: **ipv6 traffic-filter common** *common-acl specific-acl*

The `ipv6 traffic-filter` command is not additive. When you use the command, it replaces earlier instances of the command. For example, the command sequence: **ipv6 traffic-filter** [**common** *common-acl*] [*specific-acl*] **in** **ipv6 traffic-filter** [*specific-acl*] **in** binds a common ACL to the traffic filter, removes the common ACL and then binds a specific ACL.

## Configuring IPv6 ACL to an Interface

Perform this task to configure the interface to accept a common access control list (ACL) along with an interface-specific ACL:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ipv6 traffic filter** {*common-access-list-name* {**in** | **out**}}

5. end

## DETAILED STEPS

|               | Command or Action                                                                                                                             | Purpose                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                            | Enables privileged EXEC mode. Enter your password if prompted.                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                    | Enters global configuration mode.                                                       |
| <b>Step 3</b> | <b>interface <i>type number</i></b><br><b>Example:</b><br>Device(config)# interface TenGigabitEthernet4/1/0                                   | Specifies the interface type and number, and enters interface configuration mode.       |
| <b>Step 4</b> | <b>ipv6 traffic filter {<i>common-access-list-name</i> {in   out}}</b><br><b>Example:</b><br>Device(config)# ipv6 traffic-filter outbound out | Applies the specified IPv6 access list to the interface specified in the previous step. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                                                       | (Optional) Exits the configuration mode and returns to privileged EXEC mode.            |

# Configuration Examples for IPv6 ACL Chaining with a Common ACL

You may configure the following combinations in no particular order:

- A common ACL, for example: **ipv6 traffic-filter common *common-acl* in**
- A specific ACL, for example: **ipv6 traffic-filter *specific-acl* in**
- Both ACLs, for example: **ipv6 traffic-filter common *common-acl* *specific-acl* in**

## Example: Configuring an Interface to Accept a Common ACL

This example shows how to replace an access control list (ACL) configured on the interface without explicitly deleting the ACL:

```
interface TenGigabitEthernet4/1/0
ipv6 access-group common C_acl ACL1 in
end
replace interface acl ACL1 by ACL2
interface TenGigabitEthernet4/1/0
```

```
ipv6 access-group common C_acl ACL2 in
end
```

This example shows how to delete a common ACL from an interface. A common ACL cannot be replaced on interfaces without deleting it explicitly from the interface.

```
interface TenGigabitEthernet4/1/0
ipv6 access-group common C_acl1 ACL1 in
end
change the common acl to C_acl2
interface TenGigabitEthernet4/1/0
no ipv6 access-group common C_acl1 ACL1 in
end
interface TenGigabitEthernet4/1/0
ipv6 access-group common C_acl2 ACL1 in
end
```

**Note** When reconfiguring a common ACL, you must ensure that no other interface on the line card is attached to the common ACL.

**Note** If both common ACL and interface ACL are attached to an interface and only one of the above is reconfigured on the interface, then the other is removed automatically.

This example shows how to remove the interface ACL:

```
interface TenGigabitEthernet4/1/0
ipv6 access-group common C_acl1 ACL1 in
end
```

## Feature Information for IPv6 ACL Chaining with a Common ACL

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 172: Feature Information for IPv6 ACL Chaining with a Common ACL**

| Feature Name      | Releases                 | Feature Information                                                                                            |
|-------------------|--------------------------|----------------------------------------------------------------------------------------------------------------|
| IPv6 access lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 67

# Commented IP Access List Entries

---

The Commented IP Access List Entries feature allows you to include comments or remarks about **deny** or **permit** conditions in any IP access list. These remarks make access lists easier for network administrators to understand. Each remark is limited to 100 characters in length.

This module provides information about the Commented IP Access List Entries feature.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About Commented IP Access List Entries

### Benefits of IP Access Lists

Access control lists (ACLs) perform packet filtering to control the flow of packets through a network. Packet filtering can restrict the access of users and devices to a network, providing a measure of security. Access lists can save network resources by reducing traffic. The benefits of using access lists are as follows:

- Authenticate incoming rsh and rcp requests—Access lists can simplify the identification of local users, remote hosts, and remote users in an authentication database that is configured to control access to a device. The authentication database enables Cisco software to receive incoming remote shell (rsh) and remote copy (rcp) protocol requests.
- Block unwanted traffic or users—Access lists can filter incoming or outgoing packets on an interface, thereby controlling access to a network based on source addresses, destination addresses, or user authentication. You can also use access lists to determine the types of traffic that are forwarded or blocked at device interfaces. For example, you can use access lists to permit e-mail traffic to be routed through a network and to block all Telnet traffic from entering the network.

- Control access to vty—Access lists on an inbound vty (Telnet) can control who can access the lines to a device. Access lists on an outbound vty can control the destinations that the lines from a device can reach.
- Identify or classify traffic for QoS features—Access lists provide congestion avoidance by setting the IP precedence for Weighted Random Early Detection (WRED) and committed access rate (CAR). Access lists also provide congestion management for class-based weighted fair queueing (CBWFQ), priority queueing, and custom queueing.
- Limit debug command output—Access lists can limit debug output based on an IP address or a protocol.
- Provide bandwidth control—Access lists on a slow link can prevent excess traffic on a network.
- Provide NAT control—Access lists can control which addresses are translated by Network Address Translation (NAT).
- Reduce the chance of DoS attacks—Access lists reduce the chance of denial-of-service (DoS) attacks. Specify IP source addresses to control traffic from hosts, networks, or users from accessing your network. Configure the TCP Intercept feature to can prevent servers from being flooded with requests for connection.
- Restrict the content of routing updates—Access lists can control routing updates that are sent, received, or redistributed in networks.
- Trigger dial-on-demand calls—Access lists can enforce dial and disconnect criteria.

## Access List Remarks

You can include comments or remarks about entries in any IP access list. An access list remark is an optional remark before or after an access list entry that describes the entry so that you do not have to interpret the purpose of the entry. Each remark is limited to 100 characters in length.

The remark can go before or after a **permit** or **deny** statement. Be consistent about where you add remarks. Users may be confused if some remarks precede the associated **permit** or **deny** statements and some remarks follow the associated statements.

The following is an example of a remark that describes function of the subsequent **deny** statement:

```
ip access-list extended telnetting
 remark Do not allow host1 subnet to telnet out
 deny tcp host 172.16.2.88 any eq telnet
```

## How to Configure Commented IP Access List Entries

### Writing Remarks in a Named or Numbered Access List

You can use a named or numbered access list configuration. You must apply the access list to an interface or terminal line after the access list is created for the configuration to work.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **ip access-list** {**standard** | **extended**} {*name* | *number*}
4. **remark** *remark*
5. **deny** *protocol* **host** *host-address* **any** **eq** *port*
6. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                   |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                             | Enters global configuration mode.                                                                                                                                                         |
| <b>Step 3</b> | <b>ip access-list</b> { <b>standard</b>   <b>extended</b> } { <i>name</i>   <i>number</i> }<br><b>Example:</b><br>Device(config)# ip access-list extended telnetting                   | Identifies the access list by a name or number and enters extended named access list configuration mode.                                                                                  |
| <b>Step 4</b> | <b>remark</b> <i>remark</i><br><b>Example:</b><br>Device(config-ext-nacl)# remark Do not allow host1<br>subnet to telnet out                                                           | Adds a remark for an entry in a named IP access list. <ul style="list-style-type: none"> <li>• The remark indicates the purpose of the <b>permit</b> or <b>deny</b> statement.</li> </ul> |
| <b>Step 5</b> | <b>deny</b> <i>protocol</i> <b>host</b> <i>host-address</i> <b>any</b> <b>eq</b> <i>port</i><br><b>Example:</b><br>Device(config-ext-nacl)# deny tcp host 172.16.2.88<br>any eq telnet | Sets conditions in a named IP access list that denies packets.                                                                                                                            |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-ext-nacl)# end                                                                                                                          | Exits extended named access list configuration mode and enters privileged EXEC mode.                                                                                                      |

## CHAPTER 68

# Standard IP Access List Logging

---

The Standard IP Access List Logging feature provides the ability to log messages about packets that are permitted or denied by a standard IP access list. Any packet that matches the access list logs an information message about the packet at the device console.

This module provides information about standard IP access list logging.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 175: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Restrictions for Standard IP Access List Logging

IP access list logging is supported only for routed interfaces or router access control lists (ACLs).

## Information About Standard IP Access List Logging

### Standard IP Access List Logging

The Standard IP Access List Logging feature provides the ability to log messages about packets that are permitted or denied by a standard IP access list. Any packet that matches the access list causes an information log message about the packet to be sent to the device console. The log level of messages that are printed to the device console is controlled by the **logging console** command.

The first packet that the access list inspects triggers the access list to log a message at the device console. Subsequent packets are collected over 5-minute intervals before they are displayed or logged. Log messages include information about the access list number, the source IP address of packets, the number of packets from the same source that were permitted or denied in the previous 5-minute interval, and whether a packet

was permitted or denied. You can also monitor the number of packets that are permitted or denied by a particular access list, including the source address of each packet.

# How to Configure Standard IP Access List Logging

## Creating a Standard IP Access List Using Numbers

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {deny | permit} *host address* [log]
4. **access-list** *access-list-number* {deny | permit} **any** [log]
5. **interface** *type number*
6. **ip access-group** *access-list-number* {in | out}
7. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                  | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                          | Enters global configuration mode.                                                                                                                                                                          |
| <b>Step 3</b> | <b>access-list</b> <i>access-list-number</i> {deny   permit} <i>host address</i> [log]<br><b>Example:</b><br>Device(config)# access-list 1 permit host 10.1.1.1 log | Defines a standard numbered IP access list using a source address and wildcard, and configures the logging of informational messages about packets that match the access list entry at the device console. |
| <b>Step 4</b> | <b>access-list</b> <i>access-list-number</i> {deny   permit} <b>any</b> [log]<br><b>Example:</b><br>Device(config)# access-list 1 permit any log                    | Defines a standard numbered IP access list by using an abbreviation for the source and source mask 0.0.0.0 255.255.255.255.                                                                                |
| <b>Step 5</b> | <b>interface</b> <i>type number</i><br><b>Example:</b><br>Device(config)# interface TenGigabitEthernet4/1/0                                                         | Configures an interface and enters interface configuration mode.                                                                                                                                           |

|               | Command or Action                                                                                                         | Purpose                                                                                                                                                                                                                                      |
|---------------|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b> | <b>ip access-group</b> <i>access-list-number</i> {in   out}<br><b>Example:</b><br>Device(config-if)# ip access-group 1 in | Applies the specified numbered access list to the incoming or outgoing interface. <ul style="list-style-type: none"> <li>When you filter based on source addresses, you typically apply the access list to an incoming interface.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                                   | Exits interface configuration mode and enters privileged EXEC mode.                                                                                                                                                                          |

## Creating a Standard IP Access List Using Names

### SUMMARY STEPS

- enable
- configure terminal
- ip access-list standard *name*
- {deny | permit} {host *address* | any} log
- exit
- interface *type number*
- ip access-group *access-list-name* {in | out}
- end

### DETAILED STEPS

|               | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                   |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                     | Enters global configuration mode.                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ip access-list standard</b> <i>name</i><br><b>Example:</b><br>Device(config)# ip access-list standard acl1                  | Defines a standard IP access list and enters standard named access list configuration mode.                                                                                                                                                               |
| <b>Step 4</b> | <b>{deny   permit} {host <i>address</i>   any} log</b><br><b>Example:</b><br>Device(config-std-nacl)# permit host 10.1.1.1 log | Sets conditions in a named IP access list that will deny packets from entering a network or permit packets to enter a network, and configures the logging of informational messages about packets that match the access list entry at the device console. |

|        | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>exit</b><br><b>Example:</b><br>Device(config-std-nacl)# exit                                                     | Exits standard named access list configuration mode and enters global configuration mode.                                                                                                                                             |
| Step 6 | <b>interface type number</b><br><b>Example:</b><br>Device(config)# interface TenGigabitEthernet4/1/0                | Configures an interface and enters interface configuration mode.                                                                                                                                                                      |
| Step 7 | <b>ip access-group access-list-name {in   out}</b><br><b>Example:</b><br>Device(config-if)# ip access-group acl1 in | Applies the specified access list to the incoming or outgoing interface. <ul style="list-style-type: none"> <li>• When you filter based on source addresses, you typically apply the access list to an incoming interface.</li> </ul> |
| Step 8 | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                             | Exits interface configuration mode and enters privileged EXEC mode.                                                                                                                                                                   |

## Configuration Examples for Standard IP Access List Logging

### Example: Limiting Debug Output

The following sample configuration uses an access list to limit the **debug** command output. Limiting the **debug** output restricts the volume of data to what you are interested in, saving you time and resources.

```

Device(config)# ip access-list acl1
Device(config-std-nacl)# remark Displays only advertisements for LDP peer in acl1
Device(config-std-nacl)# permit host 10.0.0.44

Device# debug mpls ldp advertisements peer-acl acl1

tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 172.17.0.33
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 172.16.0.31
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 172.22.0.33
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 192.168.0.1
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 192.168.0.3
tagcon: peer 10.0.0.44:0 (pp 0x60E105BC): advertise 192.168.1.33

```

## Feature Information for Standard IP Access List Logging

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 176: Feature Information for Standard IP Access List Logging*

| Feature Name    | Releases                 | Feature Information                                                                                            |

## CHAPTER 69

# IP Access List Entry Sequence Numbering

The IP Access List Entry Sequence Numbering feature allows you to apply sequence numbers to **permit** or **deny** statements as well as reorder, add, or remove such statements from a named IP access list. The IP Access List Entry Sequence Numbering feature makes revising IP access lists much easier. Prior to this feature, you could add access list entries to the end of an access list only; therefore, needing to add statements anywhere except at the end of a named IP access list required reconfiguring the entire access list.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for IP Access List Entry Sequence Numbering

- This feature does not support dynamic, reflexive, or firewall access lists.
- This feature does not support old-style numbered access lists, which existed before named access lists. Keep in mind that you can name an access list with a number, so numbers are allowed when they are entered in the standard or extended named access list (NACL) configuration mode.

## Information About IP Access List Entry Sequence Numbering

### Purpose of IP Access Lists

Access lists perform packet filtering to control which packets move through the network and where. Such control can help limit network traffic and restrict the access of users and devices to the network. Access lists have many uses, and therefore many commands accept a reference to an access list in their command syntax. Access lists can be used to do the following:

- Filter incoming packets on an interface.
- Filter outgoing packets on an interface.
- Restrict the contents of routing updates.
- Limit debug output based on an address or protocol.
- Control virtual terminal line access.
- Identify or classify traffic for advanced features, such as congestion avoidance, congestion management, and priority and custom queuing.
- Trigger dial-on-demand routing (DDR) calls.

## How an IP Access List Works

An access list is a sequential list consisting of a permit statement and a deny statement that apply to IP addresses and possibly upper-layer IP protocols. The access list has a name by which it is referenced. Many software commands accept an access list as part of their syntax.

An access list can be configured and named, but it is not in effect until the access list is referenced by a command that accepts an access list. Multiple commands can reference the same access list. An access list can control traffic arriving at the device or leaving the device, but not traffic originating at the device.

## IP Access List Process and Rules

- The software tests the source or destination address or the protocol of each packet being filtered against the conditions in the access list, one condition ( **permit** or **deny** statement) at a time.
- If a packet does not match an access list statement, the packet is then tested against the next statement in the list.
- If a packet and an access list statement match, the rest of the statements in the list are skipped and the packet is permitted or denied as specified in the matched statement. The first entry that the packet matches determines whether the software permits or denies the packet. That is, after the first match, no subsequent entries are considered.
- If the access list denies the address or protocol, the software discards the packet and returns an Internet Control Message Protocol (ICMP) Host Unreachable message.
- If no conditions match, the packet is dropped. This is because each access list ends with an unwritten or implicit **deny** statement. That is, if the packet has not been permitted by the time it was tested against each statement, it is denied.
- Because the software stops testing conditions after the first match, the order of the conditions is critical. The same **permit** or **deny** statements specified in a different order could result in a packet being passed under one circumstance and denied in another circumstance.
- If an access list is referenced by name in a command, but the access list does not exist, all packets pass.
- Only one access list per interface, per protocol, per direction is allowed.
- Inbound access lists process packets arriving at the device. Incoming packets are processed before being routed to an outbound interface. An inbound access list is efficient because it saves the overhead of

routing lookups if the packet is to be discarded because it is denied by the filtering tests. If the packet is permitted by the tests, it is then processed for routing. For inbound lists, **permit** means continue to process the packet after receiving it on an inbound interface; **deny** means discard the packet.

- Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed through the outbound access list. For outbound lists, **permit** means send it to the output buffer; **deny** means discard the packet.

## Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient, useful access lists.

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit **deny** statement that follows could cause you immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one **permit** statement; otherwise, all packets are denied and no traffic passes.
- Because the software stops testing conditions after it encounters the first match (to either a **permit** or **deny** statement), you will reduce processing time and resources if you put the statements that packets are most likely to match at the beginning of the access list. Place more frequently occurring conditions before less frequent conditions.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.
- Use the statement **permit any any** if you want to allow all other packets not already denied. Using the statement **permit any any** in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry **permit any any** because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify **permit any any**, all traffic not already denied will get through.
- Although all access lists end with an implicit **deny** statement, we recommend use of an explicit **deny** statement (for example, **deny ip any any**). On most platforms, you can display the count of packets denied by issuing the **show access-list** command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit **deny** statements are counted, which is why the explicit **deny** statement will yield more complete data for you.
- While you are creating an access list or after it is created, you might want to delete an entry.
  - You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
  - You can delete an entry from a named access list. Use the **no permit** or **no deny** command to delete the appropriate entry.
- In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the **remark** command.

- If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the **log** keyword with the corresponding **deny** statement so that the packets denied from that source are logged for you.
- This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

## Source and Destination Addresses

Source and destination address fields in an IP packet are two typical fields on which to base an access list. Specify source addresses to control the packets being sent from certain networking devices or hosts. Specify destination addresses to control the packets being sent to certain networking devices or hosts.

## Wildcard Mask and Implicit Wildcard Mask

When comparing the address bits in an access list entry to a packet being submitted to the access list, address filtering uses wildcard masking to determine whether to check or ignore the corresponding IP address bits. By carefully setting wildcard masks, an administrator can select one or more IP addresses for permit or deny tests.

Wildcard masking for IP address bits uses the number 1 and the number 0 to specify how the software treats the corresponding IP address bits. A wildcard mask is sometimes referred to as an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet (network) mask.

- A wildcard mask bit 0 means check the corresponding bit value.
- A wildcard mask bit 1 means ignore that corresponding bit value.

If you do not supply a wildcard mask with a source or destination address in an access list statement, the software assumes a default wildcard mask of 0.0.0.0.

Unlike subnet masks, which require contiguous bits indicating network and subnet to be ones, wildcard masks allow noncontiguous bits in the mask.

## Transport Layer Information

You can filter packets based on transport layer information, such as whether the packet is a TCP, UDP, Internet Control Message Protocol (ICMP) or Internet Group Management Protocol (IGMP) packet.

## Benefits IP Access List Entry Sequence Numbering

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If you wanted to insert an entry (statement) in the middle of an existing list, all of the entries *after* the desired position had to be removed. Then, once you added the new entry, you needed to reenter all of the entries you removed earlier. This method was cumbersome and error prone.

The IP Access List Entry Sequence Numbering feature allows you to add sequence numbers to access list entries and resequence them. When you add a new entry, you can choose the sequence number so that the

entry is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced (reordered) to create room to insert the new entry.

## Sequence Numbering Behavior

- For backward compatibility with previous releases, if entries with no sequence numbers are applied, the first entry is assigned a sequence number of 10, and successive entries are incremented by 10. The maximum sequence number is 2147483647. If the generated sequence number exceeds this maximum number, the following message is displayed:

```
Exceeded maximum sequence number.
```

- If you enter an entry without a sequence number, it is assigned a sequence number that is 10 greater than the last sequence number in that access list and is placed at the end of the list.
- If you enter an entry that matches an already existing entry (except for the sequence number), then no changes are made.
- If you enter a sequence number that is already present, the following error message is generated:

```
Duplicate sequence number.
```

- If a new access list is entered from global configuration mode, then sequence numbers for that access list are generated automatically.
- Distributed support is provided so that the sequence numbers of entries in the Route Processor (RP) and line card (LC) are always synchronized.
- Sequence numbers are not nvgened. That is, the sequence numbers themselves are not saved. In the event that the system is reloaded, the configured sequence numbers revert to the default sequence starting number and increment from that number. The function is provided for backward compatibility with software releases that do not support sequence numbering.
- The IP Access List Entry Sequence Numbering feature works with named standard and extended IP access lists. Because the name of an access list can be designated as a number, numbers are acceptable.

## How to Use Sequence Numbers in an IP Access List

### Sequencing Access-List Entries and Revising the Access List

This task shows how to assign sequence numbers to entries in a named IP access list and how to add or delete an entry to or from an access list. When completing this task, keep the following points in mind:

- Resequencing the access list entries is optional. The resequencing step in this task is shown as required because that is one purpose of this feature and this task demonstrates that functionality.
- In the following procedure, the **permit** command is shown in Step 5 and the **deny** command is shown in Step 6. However, that order can be reversed. Use the order that suits the need of your configuration.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list resequence** *access-list-name starting-sequence-number increment*
4. **ip access-list** { **standard** | **extended** } *access-list-name*
5. Do one of the following:
  - *sequence-number* **permit** *source source-wildcard*
  - *sequence-number* **permit** *protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*
6. Do one of the following:
  - *sequence-number* **deny** *source source-wildcard*
  - *sequence-number* **deny** *protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*
7. Do one of the following:
  - *sequence-number* **permit** *source source-wildcard*
  - *sequence-number* **permit** *protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*
8. Do one of the following:
  - *sequence-number* **deny** *source source-wildcard*
  - *sequence-number* **deny** *protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]*
9. Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.
10. **end**
11. **show ip access-lists** *access-list-name*

## DETAILED STEPS

|        | Command or Action                                                                                              | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                             | Enables privileged EXEC mode. Enter your password if prompted.                                                     |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                     | Enters global configuration mode.                                                                                  |
| Step 3 | <b>ip access-list resequence</b> <i>access-list-name starting-sequence-number increment</i><br><b>Example:</b> | Resequences the specified IP access list using the starting sequence number and the increment of sequence numbers. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Step 7</b> | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <i>sequence-number</i> <b>permit</b> <i>source</i> <i>source-wildcard</i></li> <li>• <i>sequence-number</i> <b>permit</b> <i>protocol</i> <i>source</i> <i>source-wildcard</i> <i>destination</i> <i>destination-wildcard</i> [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>log</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>fragments</b> ]</li> </ul> <p><b>Example:</b></p> <pre>Device(config-ext-nacl)# 150 permit tcp any any<br/>log</pre>    | <p>Specifies a permit statement in named IP access list mode.</p> <ul style="list-style-type: none"> <li>• This access list happens to use a <b>permit</b> statement first, but a <b>deny</b> statement could appear first, depending on the order of statements you need.</li> <li>• See the permit (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP).</li> <li>• Use the <b>no</b> <i>sequence-number</i> command to delete an entry.</li> </ul>                                        |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li><code>sequence-number deny source source-wildcard</code></li> <li><code>sequence-number deny protocol source source-wildcard destination destination-wildcard [ precedence precedence ] [ tos tos ] [ log ] [ time-range time-range-name ] [ fragments ]</code></li> </ul> <p><b>Example:</b></p> <pre>Device(config-ext-nacl)# 150 deny tcp any any log</pre> | <p>(Optional) Specifies a deny statement in named IP access list mode.</p> <ul style="list-style-type: none"> <li>This access list happens to use a <b>permit</b> statement first, but a <b>deny</b> statement could appear first, depending on the order of statements you need.</li> <li>See the deny (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP).</li> <li>Use the <b>no sequence-number</b> command to delete an entry.</li> </ul> |
| <b>Step 9</b>  | Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.                                                                                                                                                                                                                                                                                                                                                         | Allows you to revise the access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-std-nacl)# end</pre>                                                                                                                                                                                                                                                                                                                                                      | (Optional) Exits the configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 11</b> | <p><b>show ip access-lists access-list-name</b></p> <p><b>Example:</b></p> <pre>Device# show ip access-lists kmdl</pre>                                                                                                                                                                                                                                                                                                               | (Optional) Displays the contents of the IP access list.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Examples

Review the output of the **show ip access-lists** command to see that the access list includes the new entries:

```
Device# show ip access-lists kmdl

Standard IP access list kmdl
100 permit 10.4.4.0, wildcard bits 0.0.0.255
105 permit 10.5.5.0, wildcard bits 0.0.0.255
115 permit 10.0.0.0, wildcard bits 0.0.0.255
130 permit 10.5.5.0, wildcard bits 0.0.0.255
145 permit 10.0.0.0, wildcard bits 0.0.0.255
```

# Configuration Examples for IP Access List Entry Sequence Numbering

## Example: Resequencing Entries in an Access List

The following example shows access list resequencing. The starting value is 1, and increment value is 2. The subsequent entries are ordered based on the increment values specified, and the range is from 1 to 2147483647.

When an entry with no sequence number is entered, by default the entry has a sequence number of 10 more than the last entry in the access list.

```
Device# show access-list 150

Extended IP access list 150
 10 permit ip host 10.3.3.3 host 172.16.5.34
 20 permit icmp any any
 30 permit tcp any host 10.3.3.3
 40 permit ip host 10.4.4.4 any
 50 Dynamic test permit ip any any
 60 permit ip host 172.16.2.2 host 10.3.3.12
 70 permit ip host 10.3.3.3 any log
 80 permit tcp host 10.3.3.3 host 10.1.2.2
 90 permit ip host 10.3.3.3 any
100 permit ip any any

Device(config)# ip access-list extended 150
Device(config)# ip access-list resequence 150 1 2
Device(config)# exit

Device# show access-list 150

Extended IP access list 150
 1 permit ip host 10.3.3.3 host 172.16.5.34
 3 permit icmp any any
10 permit tcp any any eq 22 log
 5 permit tcp any host 10.3.3.3
 7 permit ip host 10.4.4.4 any
 9 Dynamic test permit ip any any
11 permit ip host 172.16.2.2 host 10.3.3.12
13 permit ip host 10.3.3.3 any log
15 permit tcp host 10.3.3.3 host 10.1.2.2
17 permit ip host 10.3.3.3 any
19 permit ip any any
```

## Example: Adding Entries with Sequence Numbers

In the following example, a new entry is added to a specified access list:

```
Device# show ip access-list

Standard IP access list tryon
 2 permit 10.4.4.2, wildcard bits 0.0.255.255
 5 permit 10.0.0.44, wildcard bits 0.0.0.255
10 permit 10.0.0.1, wildcard bits 0.0.0.255
```

```

20 permit 10.0.0.2, wildcard bits 0.0.0.255

Device(config)# ip access-list standard tryon
Device(config-std-nacl)# 15 permit 10.5.5.5 0.0.0.255
Device(config-std-nacl)# exit
Device(config)# exit
Device# show ip access-list

Standard IP access list tryon
2 permit 10.4.0.0, wildcard bits 0.0.255.255
5 permit 10.0.0.0, wildcard bits 0.0.0.255
10 permit 10.0.0.0, wildcard bits 0.0.0.255
15 permit 10.5.5.0, wildcard bits 0.0.0.255
20 permit 10.0.0.0, wildcard bits 0.0.0.255

```

## Example: Entry Without Sequence Number

The following example shows how an entry with no specified sequence number is added to the end of an access list. When an entry is added without a sequence number, it is automatically given a sequence number that puts it at the end of the access list. Because the default increment is 10, the entry will have a sequence number 10 higher than the last entry in the existing access list.

```

Device(config)# ip access-list standard 1
Device(config-std-nacl)# permit 10.1.1.1 0.0.0.255
Device(config-std-nacl)# permit 10.2.2.2 0.0.0.255
Device(config-std-nacl)# permit 10.3.3.3 0.0.0.255
Device(config-std-nacl)## exit
Device# show access-list

Standard IP access list 1
10 permit 0.0.0.0, wildcard bits 0.0.0.255
20 permit 0.0.0.0, wildcard bits 0.0.0.255
30 permit 0.0.0.0, wildcard bits 0.0.0.255

Device(config)# ip access-list standard 1
Device(config-std-nacl)# permit 10.4.4.4 0.0.0.255
Device(config-std-nacl)# end
Device(config-std-nacl)## exit
Device# show access-list

Standard IP access list 1
10 permit 0.0.0.0, wildcard bits 0.0.0.255
20 permit 0.0.0.0, wildcard bits 0.0.0.255
30 permit 0.0.0.0, wildcard bits 0.0.0.255
40 permit 0.0.0.0, wildcard bits 0.0.0.255

```

## Feature Information for IP Access List Entry Sequence Numbering

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 178: Feature Information for IP Access List Entry Sequence Numbering**

| Feature Name    | Releases                 | Feature Information                                                                |

| IP Access Lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 70

# ACL IP Options Selective Drop

---

The ACL IP Options Selective Drop feature allows Cisco routers to filter packets containing IP options or to mitigate the effects of IP options on a router or downstream routers by dropping these packets or ignoring the processing of the IP options.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for ACL IP Options Selective Drop

Resource Reservation Protocol (RSVP) (Multiprotocol Label Switching traffic engineering [MPLS TE]), Internet Group Management Protocol Version 2 (IGMPv2), and other protocols that use IP options packets may not function in drop or ignore modes.

## Information About ACL IP Options Selective Drop

### Using ACL IP Options Selective Drop

The ACL IP Options Selective Drop feature allows a router to filter IP options packets, thereby mitigating the effects of these packets on a router and downstream routers, and perform the following actions:

- Drop all IP options packets that it receives and prevent options from going deeper into the network.
- Ignore IP options packets destined for the router and treat them as if they had no IP options.

For many users, dropping the packets is the best solution. However, in environments in which some IP options may be legitimate, reducing the load that the packets present on the routers is sufficient. Therefore, users may prefer to skip options processing on the router and forward the packet as though it were pure IP.

## Benefits of Using ACL IP Options Selective Drop

- Drop mode filters packets from the network and relieves downstream routers and hosts of the load from options packets.
- Drop mode minimizes loads to the Route Processor (RP) for options that require RP processing on distributed systems. Previously, the packets were always routed to or processed by the RP CPU. Now, the ignore and drop forms prevent the packets from impacting the RP performance.

## How to Configure ACL IP Options Selective Drop

### Configuring ACL IP Options Selective Drop

This section describes how to configure the ACL IP Options Selective Drop feature.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip options { drop | ignore }**
4. **exit**
5. **show ip traffic**

#### DETAILED STEPS

|        | Command or Action                                                                         | Purpose                                                                                                            |
|--------|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                | Enters global configuration mode.                                                                                  |
| Step 3 | <b>ip options { drop   ignore }</b><br><b>Example:</b><br>Router(config)# ip options drop | Drops or ignores IP options packets that are sent to the router.                                                   |

|               | Command or Action                                                    | Purpose                                          |
|---------------|----------------------------------------------------------------------|--------------------------------------------------|
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# exit               | Returns to privileged EXEC mode.                 |
| <b>Step 5</b> | <b>show ip traffic</b><br><b>Example:</b><br>Router# show ip traffic | (Optional) Displays statistics about IP traffic. |

## Configuration Examples for ACL IP Options Selective Drop

### Example Configuring ACL IP Options Selective Drop

The following example shows how to configure the router (and downstream routers) to drop all options packets that enter the network:

```
Router(config)# ip options drop
% Warning:RSVP and other protocols that use IP Options packets may not function in drop or ignore modes.
end
```

### Example Verifying ACL IP Options Selective Drop

The following sample output is displayed after using the **ip options drop** command:

```
Router# show ip traffic
IP statistics:
 Rcvd: 428 total, 323 local destination
 0 format errors, 0 checksum errors, 0 bad hop count
 0 unknown protocol, 0 not a gateway
 0 security failures, 0 bad options, 0 with options
 Opts: 0 end, 0 nop, 0 basic security, 0 loose source route
 0 timestamp, 0 extended security, 0 record route
 0 stream ID, 0 strict source route, 0 alert, 0 cipso, 0 ump
 0 other, 30 ignored
 Frags: 0 reassembled, 0 timeouts, 0 couldn't reassemble
 0 fragmented, 0 fragments, 0 couldn't fragment
 Bcast: 0 received, 0 sent
 Mcast: 323 received, 809 sent
 Sent: 809 generated, 591 forwarded
 Drop: 0 encapsulation failed, 0 unresolved, 0 no adjacency
 0 no route, 0 unicast RPF, 0 forced drop, 0 unsupported-addr
 0 options denied, 0 source IP address zero
```

# Additional References for IP Access List Entry Sequence Numbering

## CHAPTER 71

# ACL Syslog Correlation

---

The Access Control List (ACL) Syslog Correlation feature appends a tag (either a user-defined cookie or a device-generated MD5 hash value) to access control entry (ACE) syslog entries. This tag uniquely identifies the ACE, within the ACL, that generated the syslog entry.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for ACL Syslog Correlation

Before you configure the ACL Syslog Correlation feature, you must understand the concepts in the "IP Access List Overview" module.

The ACL Syslog Correlation feature appends a user-defined cookie or a device-generated hash value to ACE messages in the syslog. These values are only appended to ACE messages when the log option is enabled for the ACE.

## Information About ACL Syslog Correlation

### ACL Syslog Correlation Tags

The ACL Syslog Correlation feature appends a tag (either a user-defined cookie or a device-generated MD5 hash value) to access control entry (ACE) syslog entries. This tag uniquely identifies an ACE that generated the syslog entry.

Network management software can use the tag to identify which ACE generated a specific syslog event. For example, network administrators can select an ACE rule in the network management application and can then view the corresponding syslog events for that ACE rule.

To append a tag to the syslog message, the ACE that generates the syslog event must have the log option enabled. The system appends only one type of tag (either a user-defined cookie or a device-generated MD5 hash value) to each message.

To specify a user-defined cookie tag, the user must enter the cookie value when configuring the ACE log option. The cookie must be in alpha-numeric form, it cannot be greater than 64 characters, and it cannot start with hex-decimal notation (such as 0x).

To specify a device-generated MD5 hash value tag, the hash-generation mechanism must be enabled on the device and the user must not enter a cookie value while configuring the ACE log option.

## ACE Syslog Messages

When a packet is matched against an access control entry (ACE) in an ACL, the system checks whether the log option is enabled for that event. If the log option is enabled and the ACL Syslog Correlation feature is configured on the device, the system attaches the tag to the syslog message. The tag is displayed at the end of the syslog message, in addition to the standard information.

The following is a sample syslog message showing a user-defined cookie tag:

```
Jun 5 12:55:44.359: %SEC-6-IPACCESSLOGP: list logacl permitted tcp 192.168.16.1(38402) -> 192.168.16.2(23), 1 packet [User_permitted_ACE]
```

The following is a sample syslog message showing a hash value tag:

```
Jun 5 12:55:44.359: %SEC-6-IPACCESSLOGP: list logacl permitted tcp 192.168.16.1(38402) -> 192.168.16.2(23), 1 packet [0x723E6E12]
```

# How to Configure ACL Syslog Correlation

## Enabling Hash Value Generation on a Device

Perform this task to configure the device to generate an MD5 hash value for each log-enabled access control entry (ACE) in the system that is not configured with a user-defined cookie.

When the hash value generation setting is enabled, the system checks all existing ACEs and generates a hash value for each ACE that requires one. When the hash value generation setting is disabled, all previously generated hash values are removed from the system.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list logging hash-generation**
4. **end**
5. Do one of the following:

- **show ip access-list** *access-list-number*
- **show ip access-list** *access-list-name*

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ip access-list logging hash-generation</b><br><b>Example:</b><br>Device(config)# ip access-list logging hash-generation                                                                                                                                                                               | Enables hash value generation on the device. <ul style="list-style-type: none"> <li>• If an ACE exists that is log enabled, and requires a hash value, the device automatically generates the value and displays the value on the console.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                                                                                                                                                                                     | (Optional) Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                       |
| <b>Step 5</b> | Do one of the following: <ul style="list-style-type: none"> <li>• <b>show ip access-list</b> <i>access-list-number</i></li> <li>• <b>show ip access-list</b> <i>access-list-name</i></li> </ul> <b>Example:</b><br>Device# show ip access-list 101<br><b>Example:</b><br>Device# show ip access-list acl | (Optional) Displays the contents of the numbered or named IP access list. <ul style="list-style-type: none"> <li>• Review the output to confirm that the access list for a log-enabled ACE includes the generated hash value.</li> </ul>              |

## Disabling Hash Value Generation on a Device

Perform this task to disable hash value generation on the device. When the hash value generation setting is disabled, all previously generated hash values are removed from the system.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no ip access-list logging hash-generation**

4. **end**
5. Do one of the following:
  - **show ip access-list** *access-list-number*
  - **show ip access-list** *access-list-name*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                        |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                               | Enters global configuration mode.                                                                                                                                                                                         |
| Step 3 | <b>no ip access-list logging hash-generation</b><br><b>Example:</b><br>Device(config)# no ip access-list logging hash-generation                                                                                                                                                                         | Disables hash value generation on the device. <ul style="list-style-type: none"> <li>• The system removes any previously created hash values from the system.</li> </ul>                                                  |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                                                                                                                                                                                     | (Optional) Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                           |
| Step 5 | Do one of the following: <ul style="list-style-type: none"> <li>• <b>show ip access-list</b> <i>access-list-number</i></li> <li>• <b>show ip access-list</b> <i>access-list-name</i></li> </ul> <b>Example:</b><br>Device# show ip access-list 101<br><b>Example:</b><br>Device# show ip access-list acl | (Optional) Displays the contents of the IP access list. <ul style="list-style-type: none"> <li>• Review the output to confirm that the access list for a log-enabled ACE does not have a generated hash value.</li> </ul> |

## Configuring ACL Syslog Correlation Using a User-Defined Cookie

Perform this task to configure the ACL Syslog Correlation feature on a device for a specific access list, using a user-defined cookie as the syslog message tag.

The example in this section shows how to configure the ACL Syslog Correlation feature using a user-defined cookie for a numbered access list. However, you can configure the ACL Syslog Correlation feature using a

user-defined cookie for both numbered and named access lists, and for both standard and extended access lists.

**Note** The following restrictions apply when choosing the user-defined cookie value:

- The maximum number of characters is 64.
- The cookie cannot start with hexadecimal notation (such as 0x).
- The cookie cannot be the same as, or a subset of, the following keywords: **reflect** , **fragment** , **time-range** . For example, reflect and ref are not valid values. However, the cookie can start with the keywords. For example, reflectedACE and fragment\_33 are valid values
- The cookie must contains only alphanumeric characters.

>

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* **permit** *protocol source destination* **log** *word*
4. **end**
5. **show ip access-list** *access-list-number*

|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> enable                                                                                                                                                                                     | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                                                                                                                             | Enters global configuration mode.                                                                                                |
| <b>Step 3</b> | <b>access-list</b> <i>access-list-number</i> <b>permit</b> <i>protocol source destination</i> <b>log</b> <i>word</i><br><b>Example:</b><br><br>Device(config)# access-list 101 permit tcp host 10.1.1.1 host 10.1.1.2 log UserDefinedValue | Defines an extended IP access list and a user-defined cookie value.<br><br>• Enter the cookie value as the <i>word</i> argument. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# end                                                                                                                                                                                   | (Optional) Exits global configuration mode and returns to privileged EXEC mode.                                                  |

|        | Command or Action                                                                                          | Purpose                                                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>show ip access-list</b> <i>access-list-number</i><br><b>Example:</b><br>Device# show ip access-list 101 | (Optional) Displays the contents of the IP access list. <ul style="list-style-type: none"> <li>Review the output to confirm that the access list includes the user-defined cookie value.</li> </ul> |

### Examples

The following is sample output from the **show ip access-list** command for an access list with a user-defined cookie value.

```
Device# show ip access-list
101
Extended IP access list 101
30 permit tcp host 10.1.1.1 host 10.1.1.2 log (tag = UserDefinedValue)
```

## Configuring ACL Syslog Correlation Using a Hash Value

Perform this task to configure the ACL Syslog Correlation feature on a device for a specific access list, using a device-generated hash value as the syslog message tag.

The steps in this section shows how to configure the ACL Syslog Correlation feature using a device-generated hash value for a numbered access list. However, you can configure the ACL Syslog Correlation feature using a device-generated hash value for both numbered and named access lists, and for both standard and extended access lists.

### SUMMARY STEPS

- enable
- configure terminal
- ip access-list logging hash-generation
- access-list *access-list-number* permit *protocol source destination* log
- end
- show ip access-list *access-list-number*

### DETAILED STEPS

|        | Command or Action                                                          | Purpose                                                                                                          |
|--------|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal | Enters global configuration mode.                                                                                |

|               | Command or Action                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>ip access-list logging hash-generation</b><br><b>Example:</b><br><pre>Device(config)# ip access-list logging hash-generation</pre>                                                           | Enables hash value generation on the device. <ul style="list-style-type: none"> <li>• If an ACE exists that is log enabled, and requires a hash value, the device automatically generates the value and displays the value on the console.</li> </ul>               |
| <b>Step 4</b> | <b>access-list <i>access-list-number</i> permit protocol source destination log</b><br><b>Example:</b><br><pre>Device(config)# access-list 102 permit tcp host 10.1.1.1 host 10.1.1.2 log</pre> | Defines an extended IP access list. <ul style="list-style-type: none"> <li>• Enable the log option for the access list, but do not specify a cookie value.</li> <li>• The device automatically generates a hash value for the newly defined access list.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                                                                                 | (Optional) Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                     |
| <b>Step 6</b> | <b>show ip access-list <i>access-list-number</i></b><br><b>Example:</b><br><pre>Device# show ip access-list 102</pre>                                                                           | (Optional) Displays the contents of the IP access list. <ul style="list-style-type: none"> <li>• Review the output to confirm that the access list includes the router-generated hash value.</li> </ul>                                                             |

### Examples

The following is sample output from the **show ip access-list** command for an access list with a device-generated hash value.

```
Device# show ip access-list
102
Extended IP access list 102
10 permit tcp host 10.1.1.1 host 10.1.1.2 log (hash = 0x7F9CF6B9)
```

## Changing the ACL Syslog Correlation Tag Value

Perform this task to change the value of the user-defined cookie or replace a device-generated hash value with a user-defined cookie.

The steps in this section shows how to change the ACL Syslog Correlation tag value on a numbered access list. However, you can change the ACL Syslog Correlation tag value for both numbered and named access lists, and for both standard and extended access lists.

### SUMMARY STEPS

1. **enable**
2. **show access-list**
3. **configure terminal**

4. `access-list access-list-number permit protocol source destination log word`
5. `end`
6. `show ip access-list access-list-number`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                                                                                                                                                                                        | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                   |
| Step 2 | <p><code>show access-list</code></p> <p><b>Example:</b></p> <pre>Device(config)# show access-list</pre>                                                                                                                                                                                                                                                         | (Optional) Displays the contents of the access list.                                                                                                                                                                                        |
| Step 3 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                                                                                                                                                                   | Enters global configuration mode.                                                                                                                                                                                                           |
| Step 4 | <p><code>access-list <i>access-list-number</i> permit protocol source destination log word</code></p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit tcp host 10.1.1.1 host 10.1.1.2 log NewUDV</pre> <p><b>Example:</b></p> <p>OR</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit tcp any any log replacehash</pre> | <p>Modifies the cookie or changes the hash value to a cookie.</p> <ul style="list-style-type: none"> <li>• You must enter the entire access list configuration command, replacing the previous tag value with the new tag value.</li> </ul> |
| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                                                                                                                                                                         | (Optional) Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                             |
| Step 6 | <p><code>show ip access-list <i>access-list-number</i></code></p> <p><b>Example:</b></p> <pre>Device# show ip access-list 101</pre>                                                                                                                                                                                                                             | <p>(Optional) Displays the contents of the IP access list.</p> <ul style="list-style-type: none"> <li>• Review the output to confirm the changes.</li> </ul>                                                                                |

## Troubleshooting Tips

Use the **debug ip access-list hash-generation** command to display access list debug information. The following is an example of the **debug** command output:

```
Device# debug ip access-list hash-generation
Syslog hash code generation debugging is on
Device# show debug
IP ACL:
Syslog hash code generation debugging is on
Device# no debug ip access-list hash-generation

Syslog hash code generation debugging is off
Device# show debug
Device#
```

## Configuration Examples for ACL Syslog Correlation

### Example: Configuring ACL Syslog Correlation Using a User-Defined Cookie

The following example shows how to configure the ACL Syslog Correlation feature on a device using a user-defined cookie.

```
Device#
Device# debug ip access-list hash-generation
Syslog MD5 hash code generation debugging is on
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# access-list 33 permit 10.10.10.6 log cook_33_std
Device(config)# do show ip access 33
Standard IP access list 33
10 permit 10.10.10.6 log (tag = cook_33_std)
Device(config)# end
```

### Example: Configuring ACL Syslog Correlation using a Hash Value

The following examples shows how to configure the ACL Syslog Correlation feature on a device using a device-generated hash value.

```
Device# debug ip access-list hash-generation
Syslog MD5 hash code generation debugging is on
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# access-list 33 permit 10.10.10.7 log
Device(config)#
*Nov 7 13:51:23.615: %IPACL-HASHGEN: Hash Input: 33 standard permit 10.10.10.7
Hash Output: 0xCE87F535
Device(config)#
do show ip access 33

Standard IP access list 33
 10 permit 10.10.10.6 log (tag = cook_33_std)
 20 permit 10.10.10.7 log (hash = 0xCE87F535)
```

## Example: Changing the ACL Syslog Correlation Tag Value

The following example shows how to replace an existing access list user-defined cookie with a new cookie value, and how to replace a device-generated hash value with a user-defined cookie value.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# do show ip access-list 101
Extended IP access list 101
 10 permit tcp host 10.1.1.1 host 10.1.1.2 log (tag = MyCookie)
 20 permit tcp any any log (hash = 0x75F078B9)
Device(config)# access-list 101 permit tcp host 10.1.1.1 host 10.1.1.2 log NewUDV
Device(config)# do show access-list
Extended IP access list 101
 10 permit tcp host 10.1.1.1 host 10.1.1.2 log (tag = NewUDV)
 20 permit tcp any any log (hash = 0x75F078B9)
Device(config)# access-list 101 permit tcp any any log replacehash
Device(config)# do show access-list
Extended IP access list 101
 10 permit tcp host 10.1.1.1 host 10.1.1.2 log (tag = NewUDV)
 20 permit tcp any any log (tag = replacehash)
```

## Feature Information for ACL Syslog Correlation

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 182: Feature Information for ACL Syslog Correlation**

| Feature Name    | Releases                 | Feature Information                                                                                            |
|-----------------|--------------------------|----------------------------------------------------------------------------------------------------------------|

## CHAPTER 72

# IPv6 Access Control Lists

---

Access lists determine what traffic is blocked and what traffic is forwarded at device interfaces and allow filtering of traffic based on source and destination addresses, and inbound and outbound traffic to a specific interface. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About IPv6 Access Control Lists

### Access Control Lists for IPv6 Traffic Filtering

The standard ACL functionality in IPv6 is similar to standard ACLs in IPv4. Access lists determine what traffic is blocked and what traffic is forwarded at device interfaces and allow filtering based on source and destination addresses, inbound and outbound to a specific interface. Each access list has an implicit deny statement at the end. IPv6 ACLs are defined and their deny and permit conditions are set using the **ipv6 access-list** command with the **deny** and **permit** keywords in global configuration mode.

IPv6 extended ACLs augments standard IPv6 ACL functionality to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control (functionality similar to extended ACLs in IPv4).

## IPv6 Packet Inspection

The following header fields are used for IPv6 inspection: traffic class, flow label, payload length, next header, hop limit, and source or destination IP address. For further information on and descriptions of the IPv6 header fields, see RFC 2474.

## Access Class Filtering in IPv6

Filtering incoming and outgoing connections to and from the device based on an IPv6 ACL is performed using the **ipv6 access-class** command in line configuration mode. The **ipv6 access-class** command is similar to the **access-class** command, except the IPv6 ACLs are defined by a name. If the IPv6 ACL is applied to inbound traffic, the source address in the ACL is matched against the incoming connection source address and the destination address in the ACL is matched against the local device address on the interface. If the IPv6 ACL is applied to outbound traffic, the source address in the ACL is matched against the local device address on the interface and the destination address in the ACL is matched against the outgoing connection source address. We recommend that identical restrictions are set on all the virtual terminal lines because a user can attempt to connect to any of them.

# How to Configure IPv6 Access Control Lists

## Configuring IPv6 Traffic Filtering

### Creating and Configuring an IPv6 ACL for Traffic Filtering

**Note** IPv6 ACLs on the Cisco cBR router do not contain implicit permit rules. The IPv6 neighbor discovery process uses the IPv6 network-layer service; therefore, to enable IPv6 neighbor discovery, you must add IPv6 ACLs to allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link-layer protocol; therefore, by default IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 access-list** *access-list-name*
4. Do one of the following:
  - **permit protocol** { *source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address* } [ *operator* [ *port-number* ] ] { *destination-ipv6-prefix / prefix-length* | **any** | **host** *destination-ipv6-address* } [ **operator** [ *port-number* ] ] [ **dest-option-type** [ *doh-number* | *doh-type* ] ] [ **dscp** *value* ] [ **flow-label** *value* ] [ **fragments** ] [ **log** ] [ **log-input** ] [ **mobility** ] [ **mobility-type** [ *mh-number* | *mh-type* ] ] [ **routing** ] [ **routing-type** *routing-number* ] [ **sequence** *value* ] [ **time-range** *name* ]
  - **deny protocol** { *source-ipv6-prefix / prefix-length* | **any** | **host** *source-ipv6-address* } [ *operator* *port-number* ] ] { *destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address* } [ *operator* [ *port-number* ] ] [ **dest-option-type** [ *doh-number* | *doh-type* ] ] [ **dscp** *value* ] [ **flow-label**

```
value] [fragments] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [
routing] [routing-type routing-number] [sequence value] [time-range name] [
undetermined-transport
```

## DETAILED STEPS

IPv6 ACL names cannot contain a space or quotation mark, or begin with a numeral.</li> </ul> |
| <b>Step 4</b> | Do one of the following: <ul style="list-style-type: none"> <li>• <b>permit protocol</b> { <i>source-ipv6-prefix/prefix-length</i>   <b>any</b>   <b>host</b> <i>source-ipv6-address</i> } [ <i>operator</i> [ <i>port-number</i> ] ] { <i>destination-ipv6-prefix / prefix-length</i>   <b>any</b>   <b>host</b> <i>destination-ipv6-address</i> } [ <b>operator</b> [ <i>port-number</i> ] ] [ <b>dest-option-type</b> [ <i>doh-number</i>   <i>doh-type</i> ] ] [ <b>dscp</b> <i>value</i> ] [ <b>flow-label</b> <i>value</i> ] [ <b>fragments</b> ] [ <b>log</b> ] [ <b>log-input</b> ] [ <b>mobility</b> ] [ <b>mobility-type</b> [ <i>mh-number</i>   <i>mh-type</i> ] ] [ <b>routing</b> ] [ <b>routing-type</b> <i>routing-number</i> ] [ <b>sequence</b> <i>value</i> ] [ <b>time-range</b> <i>name</i> ]</li> <li>• <b>deny protocol</b> { <i>source-ipv6-prefix / prefix-length</i>   <b>any</b>   <b>host</b> <i>source-ipv6-address</i> } [ <i>operator</i> [ <i>port-number</i> ] ] { <i>destination-ipv6-prefix/prefix-length</i>   <b>any</b>   <b>host</b> <i>destination-ipv6-address</i> } [ <i>operator</i> [ <i>port-number</i> ] ] [ <b>dest-option-type</b> [ <i>doh-number</i>   <i>doh-type</i> ] ] [ <b>dscp</b> <i>value</i> ] [ <b>flow-label</b> <i>value</i> ] [ <b>fragments</b> ] [ <b>log</b> ] [ <b>log-input</b> ] [ <b>mobility</b> ] [ <b>mobility-type</b> [ <i>mh-number</i>   <i>mh-type</i> ] ] [ <b>routing</b> ] [ <b>routing-type</b> <i>routing-number</i> ] [ <b>sequence</b> <i>value</i> ] [ <b>time-range</b> <i>name</i> ] [ <b>undetermined-transport</b> ]</li> </ul> <b>Example:</b><br><pre>Device(config-ipv6-acl)# permit tcp 2001:DB8:0300:0201::/32 eq telnet any</pre> | Specifies permit or deny conditions for an IPv6 ACL.                                                                                                                                                                                                                                |

|  | Command or Action                                                                            | Purpose |
|--|----------------------------------------------------------------------------------------------|---------|
|  | <b>Example:</b><br><br>Device(config-ipv6-acl)# deny tcp host<br>2001:DB8:1::1 any log-input |         |

## Applying the IPv6 ACL to an Interface

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ipv6 traffic-filter** *access-list-name* {in|out}

### DETAILED STEPS

|               | Command or Action                                                                                                                                | Purpose                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><br>Device> enable                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><br>Device# configure terminal                                                               | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br><br>Device(config)# interface TenGigabitEthernet4/1/0                              | Specifies the interface type and number, and enters interface configuration mode.                                  |
| <b>Step 4</b> | <b>ipv6 traffic-filter</b> <i>access-list-name</i> {in out}<br><br><b>Example:</b><br><br>Device(config-if)# ipv6 traffic-filter outbound<br>out | Applies the specified IPv6 access list to the interface specified in the previous step.                            |

## Controlling Access to a vty

### Creating an IPv6 ACL to Provide Access Class Filtering

#### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **ipv6 access-list** *access-list-name*
4. Do one of the following:

- **permit protocol** { *source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address* } [ *operator* [ *port-number* ] ] { *destination-ipv6-prefix / prefix-length* | **any** | **host** *destination-ipv6-address* } [ *operator* [ *port-number* ] ] [ **dest-option-type** [ *doh-number* | *doh-type* ] ] [ **dscp** *value* ] [ **flow-label** *value* ] [ **fragments** ] [ **log** ] [ **log-input** ] [ **mobility** ] [ **mobility-type** [ *mh-number* | *mh-type* ] ] [ **routing** ] [ **routing-type** *routing-number* ] [ **sequence** *value* ] [ **time-range** *name* ]
- **deny protocol** { *source-ipv6-prefix / prefix-length* | **any** | **host** *source-ipv6-address* } [ *operator* *port-number* ] ] { *destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address* } [ *operator* [ *port-number* ] ] [ **dest-option-type** [ *doh-number* | *doh-type* ] ] [ **dscp** *value* ] [ **flow-label** *value* ] [ **fragments** ] [ **log** ] [ **log-input** ] [ **mobility** ] [ **mobility-type** [ *mh-number* | *mh-type* ] ] [ **routing** ] [ **routing-type** *routing-number* ] [ **sequence** *value* ] [ **time-range** *name* ] [ **undetermined-transport** ]

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                            |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>ipv6 access-list</b> <i>access-list-name</i><br><b>Example:</b><br>Device(config)# ipv6 access-list cisco                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Defines an IPv6 ACL, and enters IPv6 access list configuration mode.                                               |
| <b>Step 4</b> | Do one of the following: <ul style="list-style-type: none"> <li>• <b>permit protocol</b> { <i>source-ipv6-prefix/prefix-length</i>   <b>any</b>   <b>host</b> <i>source-ipv6-address</i> } [ <i>operator</i> [ <i>port-number</i> ] ] { <i>destination-ipv6-prefix / prefix-length</i>   <b>any</b>   <b>host</b> <i>destination-ipv6-address</i> } [ <i>operator</i> [ <i>port-number</i> ] ] [ <b>dest-option-type</b> [ <i>doh-number</i>   <i>doh-type</i> ] ] [ <b>dscp</b> <i>value</i> ] [ <b>flow-label</b> <i>value</i> ] [ <b>fragments</b> ] [ <b>log</b> ] [ <b>log-input</b> ] [ <b>mobility</b> ] [ <b>mobility-type</b> [ <i>mh-number</i>   <i>mh-type</i> ] ] [ <b>routing</b> ] [ <b>routing-type</b> <i>routing-number</i> ] [ <b>sequence</b> <i>value</i> ] [ <b>time-range</b> <i>name</i> ]</li> <li>• <b>deny protocol</b> { <i>source-ipv6-prefix / prefix-length</i>   <b>any</b>   <b>host</b> <i>source-ipv6-address</i> } [ <i>operator</i> <i>port-number</i> ] ] { <i>destination-ipv6-prefix/prefix-length</i>   <b>any</b>   <b>host</b> <i>destination-ipv6-address</i> } [ <i>operator</i></li> </ul> | Specifies permit or deny conditions for an IPv6 ACL.                                                               |

|  | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Purpose |
|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
|  | <pre>[ port-number ] [ dest-option-type [ doh-number   doh-type ] ] [ dscp value ] [ flow-label value ] [ fragments ] [ log ] [ log-input ] [ mobility ] [ mobility-type [ mh-number   mh-type ] ] [ routing ] [ routing-type routing-number ] [ sequence value ] [ time-range name ] [ undetermined-transport ]</pre> <p><b>Example:</b></p> <pre>Device(config-ipv6-acl)# permit ipv6 host 2001:DB8:0:4::32 any</pre> <p><b>Example:</b></p> <pre>Device(config-ipv6-acl)# deny ipv6 host 2001:DB8:0:6::6 any</pre> |         |

## Applying an IPv6 ACL to the Virtual Terminal Line

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line [ aux | console | tty | vty ] line-number [ ending-line-number ]**
4. **ipv6 access-class ipv6-access-list-name { in | out }**

### DETAILED STEPS

|               | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <pre>enable</pre> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                    |
| <b>Step 2</b> | <pre>configure terminal</pre> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                      | Enters global configuration mode.                                                                                                                                                                                                                     |
| <b>Step 3</b> | <pre>line [ aux   console   tty   vty ] line-number [ ending-line-number ]</pre> <p><b>Example:</b></p> <pre>Device(config)# line vty 0 4</pre> | Identifies a specific line for configuration and enters line configuration mode. <ul style="list-style-type: none"> <li>• In this example, the <b>vty</b> keyword is used to specify the virtual terminal lines for remote console access.</li> </ul> |
| <b>Step 4</b> | <pre>ipv6 access-class ipv6-access-list-name { in   out }</pre> <p><b>Example:</b></p>                                                          | Filters incoming and outgoing connections to and from the device based on an IPv6 ACL.                                                                                                                                                                |

|  | Command or Action                               | Purpose |
|--|-------------------------------------------------|---------|
|  | Device(config-line)# ipv6 access-class cisco in |         |

## Configuration Examples for IPv6 Access Control Lists

### Example: Verifying IPv6 ACL Configuration

In this example, the **show ipv6 access-list** command is used to verify that IPv6 ACLs are configured correctly:

```
Device> show ipv6 access-list

IPv6 access list inbound
 permit tcp any any eq bgp (8 matches) sequence 10
 permit tcp any any eq telnet (15 matches) sequence 20
 permit udp any any sequence 30

IPv6 access list Virtual-Access2.1#427819008151 (per-user)
 permit tcp host 2001:DB8:1::32 eq bgp host 2001:DB8:2::32 eq 11000 sequence 1
 permit tcp host 2001:DB8:1::32 eq telnet host 2001:DB8:2::32 eq 11001 sequence 2
```

### Example: Creating and Applying an IPv6 ACL

The following example shows how to restrict HTTP access to certain hours during the day and log any activity outside of the permitted hours:

```
Device# configure terminal
Device(config)# time-range lunchtime
Device(config-time-range)# periodic weekdays 12:00 to 13:00
Device(config-time-range)# exit
Device(config)# ipv6 access-list INBOUND
Device(config-ipv6-acl)# permit tcp any any eq www time-range lunchtime
Device(config-ipv6-acl)# deny tcp any any eq www log-input
Device(config-ipv6-acl)# permit tcp 2001:DB8::/32 any
Device(config-ipv6-acl)# permit udp 2001:DB8::/32 any
Device(config-ipv6-acl)# end
```

### Example: Controlling Access to a vty

In the following example, incoming connections to the virtual terminal lines 0 to 4 are filtered based on the IPv6 access list named **acl1**:

```
ipv6 access-list acl1
 permit ipv6 host 2001:DB8:0:4::2/32 any
!
line vty 0 4
 ipv6 access-class acl1 in
```

## Feature Information for IPv6 Access Control Lists

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 184: Feature Information for IPv6 Access Control Lists**

| Feature Name      | Releases                 | Feature Information                                                                                            |
|-------------------|--------------------------|----------------------------------------------------------------------------------------------------------------|
| IPv6 Access Lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 73

# IPv6 Template ACL

When user profiles are configured using vendor-specific attribute (VSA) Cisco AV-pairs, similar per-user IPv6 ACLs may be replaced by a single template ACL. That is, one ACL represents many similar ACLs. By using IPv6 template ACLs, you can increase the total number of per-user ACLs while minimizing the memory and Ternary Content Addressable Memory (TCAM) resources needed to support the ACLs.

The IPv6 Template ACL feature can create templates using the following ACL fields:

- IPv6 source and destination addresses
- TCP and UDP, including all associated ports (0 through 65535)
- ICMP neighbor discovery advertisements and solicitations
- IPv6 DSCP with specified DSCP values

ACL names are dynamically generated by this feature; for example:

- 6Temp\_#152875854573--Example of a dynamically generated template name for a template ACL parent
- Virtual-Access2.32135#152875854573--Example of a child ACL or an ACL that has not yet been made part of a template.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About IPv6 ACL—Template ACL

### IPv6 Template ACL

When user profiles are configured using vendor-specific attribute (VSA) Cisco AV-pairs, similar per-user IPv6 ACLs may be replaced by a single template ACL. That is, one ACL represents many similar ACLs. By using IPv6 template ACLs, you can increase the total number of per-user ACLs while minimizing the memory and Ternary Content Addressable Memory (TCAM) resources needed to support the ACLs.

The IPv6 Template ACL feature can create templates using the following ACL fields:

- IPv6 source and destination addresses
- TCP and UDP, including all associated ports (0 through 65535)
- ICMP neighbor discovery advertisements and solicitations
- IPv6 DSCP with specified DSCP values

ACL names are dynamically generated by this feature; for example:

- 6Temp\_#152875854573--Example of a dynamically generated template name for a template ACL parent
- Virtual-Access2.32135#152875854573--Example of a child ACL or an ACL that has not yet been made part of a template.

## How to Enable IPv6 ACL—Template ACL

### Enabling IPv6 Template Processing

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list template** [ *number-of-rules* ]
4. **exit**
5. **show access-list template** { **summary** | *aclname* | **exceed** *number* | **tree** }

#### DETAILED STEPS

|        | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                           | Enters global configuration mode.                                                                                                                                                                                                                                   |
| Step 3 | <b>access-list template</b> [ <i>number-of-rules</i> ]<br><b>Example:</b><br><pre>Router(config)# access-list template 50</pre> | Enables template ACL processing. <ul style="list-style-type: none"> <li>• The example in this task specifies that ACLs with 50 or fewer rules will be considered for template ACL status.</li> <li>• The <i>number-of-rules</i> argument default is 100.</li> </ul> |

|               | Command or Action                                                                                                                             | Purpose                                                                        |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# exit                                                                                        | Exits global configuration mode and places the router in privileged EXEC mode. |
| <b>Step 5</b> | <b>show access-list template { summary   aclname   exceed number   tree }</b><br><b>Example:</b><br>Router# show access-list template summary | Displays information about ACL templates.                                      |

## Configuration Examples for IPv6 ACL—Template ACL

### Example: IPv6 Template ACL Processing

In this example, the contents of ACL1 and ACL2 are the same, but the names are different:

```

ipv6 access-list extended ACL1 (PeerIP: 2001:1::1/64)
permit igmp any 2003:1::1/64
permit icmp 2002:5::B/64 any
permit udp any host 2004:1::5
permit udp any host 2002:2BC::a
permit icmp host 2001:BC::7 host 2003:3::7
ipv6 access-list extended ACL2 (PeerIP: 2007:2::7/64)
permit igmp any 2003:1::1/64
permit icmp 2002:5::B/64 any
permit udp any host 2004:1::5
permit udp any host 2002:2BC::a
permit icmp host 2001:BC::7 host 2003:3::7

```

The template for these ACLs is as follows:

```

ipv6 access-list extended Template_1
permit igmp any 2003:1::1/64
permit icmp 2002:5::B/64 any
permit udp any host 2004:1::5
permit udp any host 2002:2BC::a
permit icmp host 2001:BC::7 host 2003:3::7

```

## Feature Information for IPv6 Template ACL

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfmg.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 186: Feature Information for IPv6 Template ACL**

| Feature Name      | Releases                 | Feature Information                                                                                           |
|-------------------|--------------------------|---------------------------------------------------------------------------------------------------------------|
| IPv6 Access Lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on theCisco cBR Series Converged Broadband Routers. |

## CHAPTER 74

# IPv6 ACL Extensions for Hop by Hop Filtering

The IPv6 ACL Extensions for Hop by Hop Filtering feature allows you to control IPv6 traffic that might contain hop-by-hop extension headers. You can configure an access control list (ACL) to deny all hop-by-hop traffic or to selectively permit traffic based on protocol.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About IPv6 ACL Extensions for Hop by Hop Filtering

### ACLs and Traffic Forwarding

IPv6 access control lists (ACLs) determine what traffic is blocked and what traffic is forwarded at device interfaces. ACLs allow filtering based on source and destination addresses, inbound and outbound to a specific interface. Use the **ipv6 access-list** command to define an IPv6 ACL, and the **deny** and **permit** commands to configure its conditions.

The IPv6 ACL Extensions for Hop by Hop Filtering feature implements RFC 2460 to support traffic filtering in any upper-layer protocol type.

# How to Configure IPv6 ACL Extensions for Hop by Hop Filtering

## Configuring IPv6 ACL Extensions for Hop by Hop Filtering

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 access-list** *access-list-name*
4. **permit** *protocol* { *source-ipv6-prefix / prefix-length* | **any** | **host** *source-ipv6-address* | **auth** } [ *operator* [ *port-number* ] ] { *destination-ipv6-prefix / prefix-length* | **any** | **host** *destination-ipv6-address* | **auth** } [ *operator* [ *port-number* ] ] [ **dest-option-type** [ *header-number* | *header-type* ] ] [ **dscp** *value* ] [ **flow-label** *value* ] [ **fragments** ] [ **hbh** ] [ **log** ] [ **log-input** ] [ **mobility** ] [ **mobility-type** [ *mh-number* | *mh-type* ] ] [ **reflect** *name* [ **timeout** *value* ] ] [ **routing** ] [ **routing-type** *routing-number* ] [ **sequence** *value* ] [ **time-range** *name* ]
5. **deny** *protocol* { *source-ipv6-prefix / prefix-length* | **any** | **host** *source-ipv6-address* / **auth** } [ *operator* [ *port-number* ] ] { *destination-ipv6-prefix / prefix-length* | **any** | **host** *destination-ipv6-address* | **auth** } [ *operator* [ *port-number* ] ] [ **dest-option-type** [ *header-number* | *header-type* ] ] [ **dscp** *value* ] [ **flow-label** *value* ] [ **fragments** ] [ **hbh** ] [ **log** ] [ **log-input** ] [ **mobility** ] [ **mobility-type** [ *mh-number* | *mh-type* ] ] [ **routing** ] [ **routing-type** *routing-number* ] [ **sequence** *value* ] [ **time-range** *name* ] [ **undetermined-transport** ]
6. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Enters global configuration mode.                                       |
| Step 3 | <b>ipv6 access-list</b> <i>access-list-name</i><br><b>Example:</b><br>Device(config)# ipv6 access-list hbh-acl                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Defines an IPv6 ACL and enters IPv6 access list configuration mode.     |
| Step 4 | <b>permit</b> <i>protocol</i> { <i>source-ipv6-prefix / prefix-length</i>   <b>any</b>   <b>host</b> <i>source-ipv6-address</i>   <b>auth</b> } [ <i>operator</i> [ <i>port-number</i> ] ] { <i>destination-ipv6-prefix / prefix-length</i>   <b>any</b>   <b>host</b> <i>destination-ipv6-address</i>   <b>auth</b> } [ <i>operator</i> [ <i>port-number</i> ] ] [ <b>dest-option-type</b> [ <i>header-number</i>   <i>header-type</i> ] ] [ <b>dscp</b> <i>value</i> ] [ <b>flow-label</b> <i>value</i> ] [ <b>fragments</b> ] [ <b>hbh</b> ] [ <b>log</b> ] [ <b>log-input</b> ] [ <b>mobility</b> ] [ <b>mobility-type</b> [ <i>mh-number</i>   <i>mh-type</i> ] ] [ <b>reflect</b> <i>name</i> | Sets permit conditions for the IPv6 ACL.                                |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
|               | <p>[ <b>timeout</b> <i>value</i> ] [ <b>routing</b> ] [ <b>routing-type</b> <i>routing-number</i> ] [ <b>sequence</b> <i>value</i> ] [ <b>time-range</b> <i>name</i> ]</p> <p><b>Example:</b></p> <pre>Device(config-ipv6-acl)# permit icmp any any dest-option-type</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                |
| <b>Step 5</b> | <p><b>deny</b> <i>protocol</i> { <i>source-ipv6-prefix</i> / <i>prefix-length</i>   <b>any</b>   <b>host</b> <i>source-ipv6-address</i>   <b>auth</b> } [ <i>operator</i> [ <i>port-number</i> ] ] { <i>destination-ipv6-prefix</i> / <i>prefix-length</i>   <b>any</b>   <b>host</b> <i>destination-ipv6-address</i>   <b>auth</b> } [ <i>operator</i> [ <i>port-number</i> ] ] [ <b>dest-option-type</b> [ <i>header-number</i>   <i>header-type</i> ] ] [ <b>dscp</b> <i>value</i> ] [ <b>flow-label</b> <i>value</i> ] [ <b>fragments</b> ] [ <b>hbh</b> ] [ <b>log</b> ] [ <b>log-input</b> ] [ <b>mobility</b> ] [ <b>mobility-type</b> [ <i>mh-number</i>   <i>mh-type</i> ] ] [ <b>routing</b> ] [ <b>routing-type</b> <i>routing-number</i> ] [ <b>sequence</b> <i>value</i> ] [ <b>time-range</b> <i>name</i> ] [ <b>undetermined-transport</b> ]</p> <p><b>Example:</b></p> <pre>Device(config-ipv6-acl)# deny icmp any any dest-option-type</pre> | Sets deny conditions for the IPv6 ACL.         |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device (config-ipv6-acl)# end</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Returns to privileged EXEC configuration mode. |

## Configuration Example for IPv6 ACL Extensions for Hop by Hop Filtering

### Example: IPv6 ACL Extensions for Hop by Hop Filtering

```
Device(config)# ipv6 access-list hbh_acl
Device(config-ipv6-acl)# permit tcp any any hbh
Device(config-ipv6-acl)# permit tcp any any
Device(config-ipv6-acl)# permit udp any any
Device(config-ipv6-acl)# permit udp any any hbh
Device(config-ipv6-acl)# permit hbh any any
Device(config-ipv6-acl)# permit any any
Device(config-ipv6-acl)# hardware statistics
Device(config-ipv6-acl)# exit

! Assign an IP address and add the ACL on the interface.

Device(config)# interface TenGigabitEthernet4/1/0
Device(config-if)# ipv6 address 1001::1/64
Device(config-if)# ipv6 traffic-filter hbh_acl in
Device(config-if)# exit
Device(config)# exit
```

```

Device# clear counters
Clear "show interface" counters on all interfaces [confirm]
Device#

! Verify the configurations.

Device# show running-config interface TenGigabitEthernet4/1/0

Building configuration...

Current configuration : 114 bytes
!
interface TenGigabitEthernet4/1/0
no switchport
ipv6 address 1001::1/64
ipv6 traffic-filter hbh_acl
end

```

## Feature Information for IPv6 ACL Extensions for Hop by Hop Filtering

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 188: Feature Information for IPv6 ACL Extensions for Hop by Hop Filtering**

| Feature Name      | Releases                 | Feature Information                                                                                            |
|-------------------|--------------------------|----------------------------------------------------------------------------------------------------------------|
| IPv6 access lists | Cisco IOS XE Fuji 16.7.1 | This feature was integrated into Cisco IOS XE Fuji 16.7.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 75

# Unique Device Identifier Retrieval

---

The Unique Device Identifier (UDI) Retrieval feature provides the ability to retrieve and display the UDI information from any Cisco product that has electronically stored such identity information.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Unique Device Identifier Overview

Each identifiable product is an entity, as defined by the Entity MIB (RFC-2737) and its supporting documents. Some entities, such as a chassis, will have sub-entities like slots. An Ethernet switch might be a member of a super-entity like a stack. Most Cisco entities that can be ordered leave the factory with an assigned UDI. The UDI information is printed on a label that is affixed to the physical hardware device, and it is also stored electronically on the device in order to facilitate remote retrieval.

A UDI consists of the following elements:

- Product identifier (PID)
- Version identifier (VID)
- Serial number (SN)

The PID is the name by which the product can be ordered; it has been historically called the “Product Name” or “Part Number.” This is the identifier that one would use to order an exact replacement part.

The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. The VID is incremented according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.

The SN is the vendor-unique serialization of the product. Each manufactured product will carry a unique serial number assigned at the factory, which cannot be changed in the field. This is the means by which to identify an individual, specific instance of a product.

## Benefits of the Unique Device Identifier Retrieval Feature

- Identifies individual Cisco products in your networks.
- Reduces operating expenses for asset management through simple, cross-platform, consistent identification of Cisco products.
- Identifies PIDs for replaceable products.
- Facilitates discovery of products subject to recall or revision.
- Automates Cisco product inventory (capital and asset management).
- Provides a mechanism to determine the entitlement level of a Cisco product for repair and replacement service.

### Product Item Descriptor for Cable Products

For information on the Product Item Descriptor (PID), see the product hardware installation guide available on Cisco.com.

## Retrieving the Unique Device Identifier

To use UDI retrieval, the Cisco product in use must be UDI-enabled. A UDI-enabled Cisco product supports five required Entity MIB objects. The five Entity MIB v2 (RFC-2737) objects are:

- entPhysicalName
- entPhysicalDescr
- entPhysicalModelName
- entPhysicalHardwareRev
- entPhysicalSerialNum

Although the **show inventory** command may be available, using that command on devices that are not UDI-enabled will likely produce no output.

Enter the **show inventory** command to retrieve and display information about all of the Cisco products installed in the networking device that are assigned a PID, VID, and SN. If a Cisco entity is not assigned a PID, that entity is not retrieved or displayed.

```
Router# show inventory

PID: , VID: , SN:

NAME: "Temp: UPX 3/19", DESCR: "Temp: UPX"
PID: , VID: , SN:

```

## Troubleshooting Tips

If any of the Cisco products do not have an assigned PID, the output may display incorrect PIDs and the VID and SN elements may be missing, as in the following example.

```

NAME: "POS3/0/0", DESCR: "Skystone 4302 Sonet Framer"

PID: FastEthernet, VID: , SN:

NAME: "Serial1/0", DESCR: "M4T"

PID: M4T , VID: , SN:

```

In the sample output, the PID is exactly the same as the product description. The UDI is designed for use with new Cisco products that have a PID assigned. UDI information on older Cisco products is not always reliable.

## Feature Information for Unique Device Identifier Retrieval

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 190: Feature Information for Unique Device Identifier Retrieval*

| Feature Name                       | Releases                    | Feature Information                                                                                               |
|------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|

## CHAPTER 76

# Advanced-Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers

---

The Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) Issue 1.2 introduces support for the latest DOCSIS Set-Top specification from CableLabs™, to include the following enhancements:

- *DOCSIS Set-top Gateway (DSG) Interface Specification*
- A-DSG 1.2 introduces support for the DOCS-DSG-IF MIB.

Cisco A-DSG 1.2 is certified by CableLabs™, and is a powerful tool in support of latest industry innovations. A-DSG 1.2 offers substantial support for enhanced DOCSIS implementation in the broadband cable environment. The set-top box (STB) dynamically learns the overall environment from the Cisco CMTS router, to include MAC address, traffic management rules, and classifiers.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Advanced-Mode DSG Issue 1.2

No special equipment or software is needed to use the Advanced-Mode DSG Issue 1.2 feature.

## Restrictions for Advanced-Mode DSG Issue 1.2

This section contains restrictions that are specific to A-DSG 1.2 on a Cisco CMTS router.

## DSG Configuration File Transfer Operations

DSG 1.2 does not support the copying of a DSG configuration file from a TFTP server, file system, or bootflash to the running configuration.

## Multicast Configuration Restrictions

IP multicasting must be configured for correct operation of A-DSG 1.2. Specifically, IP multicast routing must be set in global configuration. Also, IP PIM must be configured on all bundle interfaces of cable interfaces that are to carry multicast traffic.

See the [Configuring the Default Multicast Quality of Service, on page 1072](#) and the [Configuring IP Multicast Operations, on page 1078](#) for additional Multicast information and global configurations supporting DSG.

## NAT for DSG Unicast-only Mapping

A-DSG 1.2 supports multicast IP addressing. However, it also supports unicast IP destination addresses. On the Cisco cBR-8 router, DSG 1.2 support is provided with the configuration of Network Address Translation (NAT) on the router, to include these settings:

- WAN interface(s) are configured with the **ip nat outside** command.
- Cable interface(s) are configured with the **ip nat inside** command.
- For each mapping, additional configuration includes the source static multicast IP address and the unicast IP address.

The unicast IP address is the unicast destination IP address of the DSG packets arriving at the Cisco CMTS router. The multicast IP address is the new destination IP address that is configured to map to one or a set of DSG tunnels.

## PIM and SSM for Multicast

When using Source Specific Multicast (SSM) operation in conjunction with A-DSG 1.2, the following system-wide configuration command must be specified:

- **ip pim ssm**

Refer to the [Configuring IP Multicast Operations, on page 1078](#).

## Subinterfaces

A-DSG 1.2 supports subinterfaces on the Cisco CMTS router.

## Information About Advanced-Mode DSG Issue 1.2

A-DSG 1.2 offers these new or enhanced capabilities:

- A-DSG client and agent modes
- Advanced-mode MIBs supporting DSG 1.2, including the DOCS-DSG-IF-MIB
- Advanced-mode tunnels with increased security
- Cable interface bundling through virtual interface bundling

- Downstream Channel Descriptor
- IP multicast support
- Quality of Service (QoS)

## DSG 1.2 Clients and Agents

A-DSG 1.2 supports the DSG client and agent functions outlined by the CableLabs™ *DOCSIS Set-top Gateway (DSG) Interface Specification*, CM-SP-DSG-I05-050812.

## FQDN Support

You can specify either a fully-qualified domain name (FQDN) or IP address for A-DSG classifier multicast group and source addresses using the **cable dsg cfr** command in global configuration mode. We recommend that you use an FQDN to avoid modification of multicast group and source addresses when network changes are implemented.

This feature allows you to use a hostname (FQDN) in place of the source IP address using the **cable dsg cfr** command. For example, you have two A-DSG tunnel servers, in two locations, sending multicast traffic to the same multicast address. In this scenario, you can specify a hostname for the source IP address and let the DNS server determine which source is sending the multicast traffic.

If you configure an A-DSG classifier with a hostname, the Cisco CMTS router immediately verifies if the hostname can be resolved against an IP address using the local host cache. If not, the router does not enable the classifier until the hostname is resolved. If the hostname cannot be resolved locally, the router performs a DNS query to verify the DSG classifiers.

The FQDN format does not support static Internet Group Management Protocol (IGMP) join requests initiated on the Cisco CMTS router. The IGMP static group IP address created automatically under a bundle interface at the time of A-DSG configuration is not displayed in the **show running-config interface** command output. To display the A-DSG static groups configured under a bundle interface, use the **show cable dsg static-group bundle** command in privileged EXEC mode.

## DSG Name Process and DNS Query

Every DNS record contains a time to live (TTL) value set by the server administrator, and this may vary from seconds to weeks. The DSG name process supersedes the TTL value criterion to update A-DSG classifiers on the Cisco CMTS router.

The DSG name process enables the Cisco CMTS router to query the DNS server for faster classifier updates. To enable the Cisco CMTS router to perform a DNS query for an A-DSG classifier verification, you must configure one or more DNS servers using the **ip name-server** command in global configuration mode. You can also specify the DNS query interval using the **cable dsg name-update-interval** command in global configuration mode.

During a Cisco IOS software reload or a route processor switchover, the router may fail to query the DNS server if the interfaces are down, and the router may not wait for the interval specified using the **cable dsg name-update-interval** command to perform a DNS query. In this case, for an unresolved hostname, the router automatically performs a DNS query based on a system-defined (15 seconds) interval to facilitate faster DSG classifier updates. You cannot change the system-defined interval.

## A-DSG Forwarding on the Primary Channel

You can disable A-DSG forwarding per primary capable interface using the **cable downstream dsg disable** command in interface configuration mode. Primary capable interfaces include modular, integrated cable interfaces, and Cisco cBR-8 CCAP cable interfaces.

For example, assume the cable interface 7/1/1 has A-DSG enabled and has four modular channels attached to it. However, you want A-DSG forwarding enabled only on two of these four modular channels. You can exclude the channels of your choice using the **cable downstream dsg disable** command. For details on how to disable modular channels, see the [Disabling A-DSG Forwarding on the Primary Channel, on page 1085](#).

---

**Note** If A-DSG downstream forwarding is disabled on a primary capable interface, the router does not create multicast service flows on the primary capable interface and stops sending Downstream Channel Descriptor (DCD) messages.

---

## DOCSIS 3.0 DSG MDF Support

Support for DOCSIS 3.0 DSG Multicast DSID Forwarding (MDF) is introduced using DSG DA-to-DSID Association Entry type, length, value (TLV 13) in the MAC domain descriptor (MDD) message to communicate the association between a downstream service identifier (DSID) and a group MAC address used for DSG tunnel traffic. This is automatically supported on the Cisco CMTS router.

DOCSIS 2.0 hybrid CMs and DOCSIS 3.0 CMs use Dynamic Bonding Change (DBC) to get DSID information from the Cisco CMTS router, whereas DOCSIS 2.0 DSG hybrid embedded CMs and DOCSIS 3.0 DSG embedded CMs get DSID information from the Cisco CMTS router through MDD messages.

To disable MDF capability on all DSG embedded cable modems, including DOCSIS 3.0 DSG and DOCSIS 2.0 DSG hybrid modems, use the **cable multicast mdf-disable** command with the **dsg** keyword in global configuration mode.

## Source Specific Multicast Mapping

Source Specific Multicast (SSM) is a datagram delivery model that best supports one-to-many applications, also known as broadcast applications. SSM is a core networking technology for the Cisco implementation of IP multicast solutions targeted for audio and video broadcast application environments.

The following two Cisco IOS components together support the implementation of SSM:

- Protocol Independent Multicast source-specific mode (PIM-SSM)
- Internet Group Management Protocol Version 3 (IGMPv3)

SSM mapping can be configured on Cisco CMTS routers.

For details on how to configure SSM mapping on a Cisco CMTS router, see the [Source Specific Multicast \(SSM\) Mapping](#) feature guide.

# How to Configure Advanced-Mode DSG Issue 1.2

Advanced-mode DSG Issue 1.2 entails support for DSG tunnel configuration, to include global, WAN-side, and interface-level settings in support of Multicast.

## Configuring the Default Multicast Quality of Service

According to DOCSIS 3.0, you must configure the default multicast quality of service (MQoS) when using the MQoS. This also applies to the DSG, which uses the MQoS by associating a service class name with the tunnel.

If the default MQoS is not configured, the DSG tunnel service class configuration is rejected. Similarly, if no DSG tunnel uses the MQoS, you are prompted to remove the default MQoS.

The CMTS selects the primary downstream channel to forward the multicast traffic when the default MQoS is configured and there is no matching MQoS group configuration. Otherwise, the wideband interface is used to forward the multicast traffic.

### Procedure

|               | Command or Action                                                                                                                                                                       | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre> <b>Example:</b><br><pre>Router(config)#</pre>                                                     | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>cable multicast group-qos default scn <i>service-class-name</i> aggregate</b><br><b>Example:</b><br><pre>Router(config)# cable multicast group-qos default scn name1 aggregate</pre> | Configures a service class name for the QoS profile.                                                               |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config)# end</pre>                                                                                                                         | Returns to privileged EXEC mode.                                                                                   |

**What to do next**

**Note** If you configure or remove the default MQoS while the CMTS is sending multicast traffic, duplicate traffic is generated for approximately 3 minutes (or 3 times the query interval).

## Configuring Global Tunnel Group Settings for Advanced-Mode DSG 1.2

This procedure configures global and interface-level commands on the Cisco CMTS router to enable DSG tunnel groups. A DSG tunnel group is used to bundle some DSG channels together and associate them to a MAC domain interface.

### Global A-DSG 1.2 Tunnel Settings

This procedure sets and enables global configurations to support both A-DSG 1.2 clients and agents. Additional procedures provide additional settings for these clients and agents.

**Before you begin**

When DOCSIS Set-top Gateway (DSG) is configured to have quality of service (QoS) for tunnel, ensure that the default multicast QoS (MQoS) is also configured. For more information, see [Configuring the Default Multicast Quality of Service, on page 1072](#).

**Note** The DSG tunnel service class configuration is rejected, if default MQoS is not configured.

**Procedure**

|               | <b>Command or Action</b>                                                                                                                                                            | <b>Purpose</b>                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b><br>Router(config)#                                                                                | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>cable dsg tgroup-id [channelchannel-id  priorityDSG-rule-priority ] [enable disable]</b><br><b>Example:</b><br>Router(config)# <b>cable dsg tg 1 channel 1 priority 1 enable</b> | Command allows the association of a group of tunnels to one or more downstream interfaces on the Cisco CMTS.       |

|               | Command or Action                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>cabledsg tg</b> <i>group-id</i> [ <b>channel</b> <i>channel-id</i> [ <b>ucid</b> <i>IDI</i> ]]<br><b>Example:</b><br><pre>Router(config)# cable dsg tg 1 channel 1 ucid 1</pre>                                                                     | Sets the upstream channel or channels to which the DSG 1.2 tunnel applies.                                                                                                                                                                                                                             |
| <b>Step 5</b> | <b>cable dsg tg</b> <i>group-id</i> [ <b>channel</b> <i>channel-id</i> [ <b>vendor-param</b> <i>vendor-group-id</i> ]]<br><b>Example:</b><br><pre>Router(config)# cable dsg tg 1 channel 1 vendor-param 1</pre>                                        | Sets the vendor-specific parameters for upstream DSG 1.2 channels.                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>cable dsg vendor-param</b> <i>group-id</i> <b>vendor</b> <i>vendor-index</i><br><b>oui</b> <i>oui</i> <b>value</b> <i>value-in-TLV</i><br><b>Example:</b><br><pre>Router(config)# cable dsg vendor-param 1 vendor 1 oui ABCDEA value 0101AB</pre>   | Configures vendor-specific parameters for A-DSG 1.2. To remove this configuration from the Cisco CMTS, use the no form of this command.                                                                                                                                                                |
| <b>Step 7</b> | <b>cable dsg chan-list</b> <i>list-index</i> <b>index</b> <i>entry-index</i> <b>freq</b> <i>freq</i><br><b>Example:</b><br><pre>Router(config)# cable dsg chan-list 1 index 1 freq 47000000</pre>                                                      | Configures the A-DSG 1.2 downstream channel list. The channel list is a list of DSG channels (downstream frequencies) that set-top boxes can search to find the DSG tunnel appropriate for their operation. To remove the A-DSG 1.2 channel list from the Cisco CMTS, use the no form of this command. |
| <b>Step 8</b> | <b>cable dsg timer inde</b> [ <b>Tdsg1</b> <i>Tdsg1</i> ] [ <b>Tdsg2</b> <i>Tdsg2</i> ] [ <b>Tdsg3</b> <i>Tdsg3</i> ] [ <b>Tdsg4</b> <i>Tdsg4</i> ]<br><b>Example:</b><br><pre>Router(config)# cable dsg timer 1 Tdsg1 1 Tdsg2 2 Tdsg3 3 Tdsg4 4</pre> | Configures the A-DSG 1.2 timer entry to be associated to the downstream channel, and encoded into the Downstream Channel Descriptor (DCD) message. To remove the cable DSG timer from the Cisco CMTS, use the no form of this command.                                                                 |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config)# end</pre>                                                                                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                       |

### What to do next

#### Troubleshooting Tips

Refer to **debug** and **show** commands in the [How to Monitor and Debug the Advanced-mode DOCSIS Set-Top Gateway Feature](#), on page 1085.

## Adding DSG Tunnel Group to a Subinterface

This procedure adds a DSG tunnel group to a subinterface using the `cable dsg tg group-id` command. After adding the DSG tunnel-group to a subinterface, appropriate IP Internet Group Management Protocol (IGMP) static joins are created and forwarding of DSG traffic begins, if the downstream DSG is configured.

### Before you begin

The downstream DSG should exist to create IGMP static joins.

**Restriction** You can associate a DSG tunnel group to only one subinterface within the same bundle interface.

### Procedure

|        | Command or Action                                                                                                                                    | Purpose                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <code>enable</code>                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configureterminal</b><br><b>Example:</b><br>Router# <code>configure terminal</code><br>Router(config)#                                            | Enters global configuration mode.                                                                                  |
| Step 3 | <b>interface bundle</b> <i>bundle-subif-number</i><br><b>Example:</b><br>Router(config)# <code>interface bundle 11.2</code><br>Router(config-subif)# | Specifies the interface bundle and enters the subinterface configuration mode.                                     |
| Step 4 | <b>cable dsg tg</b> <i>group-id</i><br><b>Example:</b><br>Router(config-subif)# <code>cable dsg tg 1</code>                                          | Adds a DSG tunnel group to a subinterface.                                                                         |
| Step 5 | <b>end</b><br><b>Example:</b><br>Router(config-subif)# <code>end</code>                                                                              | Returns to privileged EXEC mode.                                                                                   |

## Configuring the DSG Client Settings for Advanced-Mode DSG 1.2

After the global configurations and DSG client configurations are set for DSG 1.2 on the Cisco CMTS, use the following procedure to continue DSG 1.2 client configurations.

**Restriction** The **in-dcd ignore** option is not supported by DSG-IF-MIBS specification.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                                                                                                                                                                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>cable dsg client-list</b> <i>client-list-id</i> <b>id-index</b> <i>id</i><br><b>{application-id</b> <i>app-id</i>   <b>ca-system-id</b> <i>sys-id</i>   <b>mac-addr</b> <i>mac-addr</i>   <b>broadcast</b> [ <i>broadcast-id</i> ]<br><b>Example:</b><br><pre>Router(config)# cable dsg client-list 1 id-index 1 mac-addr abcd.abcd.abcd</pre>                                                                                                                                     | Sets the DSG client parameters. This command is changed from earlier Cisco IOS Releases, and for DSG 1.2, this command specifies the optional broadcast ID to client ID broadcast type and vendor specific parameter index.                                                                                                                                |
| <b>Step 4</b> | <b>cable dsg client-list</b> <i>client-list-id</i> <b>id-index</b> <i>id</i><br><b>[vendor-param</b> <i>vendor-group-id</i> ]<br><b>Example:</b><br><pre>Router(config-if)# cable dsg client-list 1 id-index 1 vendor-param 1</pre>                                                                                                                                                                                                                                                   | Sets vendor-specific parameters for the DSG client.                                                                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>cable dsg tunnel</b> <i>tunnel id</i> <b>mac_addr</b> <i>mac addr</i> <b>tg</b> <i>tunnel-group</i> <b>clients</b> <i>client-list-id</i> [ <b>enable</b>   <b>disable</b> ]<br><b>Example:</b><br><pre>Router(config)# cable dsg tunnel mac-addr abcd.abcd.abcd tg 1 clients 1 enable</pre>                                                                                                                                                                                        | This command is changed to associate a tunnel group and client-list ID to a DSG tunnel. Also, an optional QoS service class name can be associated to the tunnel.<br><br><b>Note</b> To associate a cable service class with an A-DSG tunnel on a Cisco CMTS router, use the <code>cable dsg tunnel srv-class</code> command in global configuration mode. |
| <b>Step 6</b> | <b>cable dsg cfr</b> <i>cfr index</i> [ <b>dest-ip</b> { <i>ipaddr</i>   <i>hostname</i> }] [ <b>tunnel</b> <i>tunnel-index</i> ] [ <b>dest-port</b> <i>start end</i> ]   [ <b>priority</b> <i>priority</i> ] [ <b>src-ip</b> { <i>ipaddr</i>   <i>hostname</i> } ] [ <b>src-prefix-len</b> <i>length</i> ]   [ <b>enable</b>   <b>disable</b> ] [ <b>in-dcd</b> { <b>yes</b>   <b>no</b>   <b>ignore</b> }]<br><b>Example:</b><br><pre>Router(config)# cable dsg cfr 1 dest-ip</pre> | Specifies the DSG classifier index, with optional support for the DCD parameter, indicating whether or not to include the classifier in the DCD message.<br><br><b>Note</b> When you use the <b>ignore</b> option, the DSG classifier is not included in the DCD message.                                                                                  |

|               | Command or Action                                                                                               | Purpose                          |
|---------------|-----------------------------------------------------------------------------------------------------------------|----------------------------------|
|               | <code>224.225.225.225 tunnel 1 dest-port 40 50 priority 2 src-ip ciscovideo.com src-prefix-len 24 enable</code> |                                  |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config)# end Router#</pre>                                         | Returns to privileged EXEC mode. |

**What to do next****Troubleshooting Tips**

Refer to **debug** and **show** commands in the [How to Monitor and Debug the Advanced-mode DOCSIS Set-Top Gateway Feature](#), on page 1085.

## Configuring Downstream DSG 1.2 Settings for Advanced-Mode DSG 1.2

When the global and client configurations are set for DSG 1.2 on the Cisco CMTS, use the following procedure to continue with DSG 1.2 downstream configurations.

**Procedure**

|               | Command or Action                                                                                                                                                           | Purpose                                                                                                                      |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>           |
| <b>Step 2</b> | <b>configureterminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                        | Enters global configuration mode.                                                                                            |
| <b>Step 3</b> | <b>interface cable</b> <i>{slot /port  slot /subslot/port }</i><br><b>Example:</b><br><pre>Router(config)# interface cable 8/1/1</pre>                                      | Enters interface configuration mode.                                                                                         |
| <b>Step 4</b> | <b>cable downstream dsg tg</b> <i>group-id</i> [ <b>channel</b> <i>channel-id</i> ]<br><b>Example:</b><br><pre>Router(config-if)# cable downstream dsg tg 1 channel 1</pre> | Associates the DSG tunnel group to the downstream interface. To remove this setting, use the <b>no</b> form of this command. |

|               | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                               |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>cable downstream dsg chan-list</b> <i>list-index</i><br><b>Example:</b><br><pre>Router(config-if)# cable downstream dsg chan-list 2</pre>               | Associates the A-DSG channel list entry to a downstream channel, to be included in the DCD message. To remove this setting, use the <b>no</b> form of this command.                                                                   |
| <b>Step 6</b> | <b>cable downstream dsg timer</b> <i>timer-index</i><br><b>Example:</b><br><pre>Router(config-if)# cable downstream dsg timer 3</pre>                      | Associates the DSG timer entry to a downstream channel, to be included in the DCD message. To remove this setting, use the no form of this command.                                                                                   |
| <b>Step 7</b> | <b>cable downstream dsg vendor-param</b> <i>vsif-grp-id</i><br><b>Example:</b><br><pre>Router(config-if)# cable downstream dsg vendor-param 2</pre>        | Associates A-DSG vendor parameters to a downstream to be included in the DCD message. To remove this configuration from the Cisco CMTS, use the no form of this command.                                                              |
| <b>Step 8</b> | <b>cable downstream dsg</b> [ <b>dcd-enable</b>   <b>dcd-disable</b> ]<br><b>Example:</b><br><pre>Router(config-if)# cable downstream dsg dcd-enable</pre> | Enables DCD messages to be sent on a downstream channel. This command is used when there are no enabled rules or tunnels for A-DSG currently on the Cisco CMTS. To disable DCD messages, use the <b>disable</b> form of this command. |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-if)# end</pre>                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                      |

## Configuring IP Multicast Operations

This section describes how to configure the operation of IP multicast transmissions on the cable and WAN interfaces on the Cisco CMTS. You should perform this configuration on each cable interface being used for DSG traffic and for each WAN interface that is connected to a network controller or Conditional Access (CA) server that is forwarding IP multicast traffic.

### Procedure

|               | Command or Action                                                                                 | Purpose                                  |
|---------------|---------------------------------------------------------------------------------------------------|------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>             | Enters global configuration mode.        |
| <b>Step 2</b> | <b>ip multicast-routing</b><br><b>Example:</b><br><pre>Router(config)# ip multicast-routing</pre> | Enables multicast routing on the router. |

|               | Command or Action                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Step 6</b> | <b>ip pim</b> {dense-mode   sparse-mode   sparse-dense-mode}<br><b>Example:</b><br><pre>Router(config-if)# ip pim dense-mode</pre>                                                                                                                                                                            | Enables Protocol Independent Multicast (PIM) on the cable interface, which is required to use the DSG feature:<br><br><b>Note</b> You must configure this command on each interface that forwards multicast traffic.                                                                                                                                                                                                                                                                                                                         |
| <b>Step 7</b> | Repeat <a href="#">Step 5, on page 1079</a> and <a href="#">Step 6, on page 1079</a> for each cable interface that is being used for DSG traffic. Also repeat these steps on each WAN interface that is forwarding IP multicast traffic from the DSG network controllers and Conditional Access (CA) servers. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-if)# end</pre>                                                                                                                                                                                                                                            | Exits interface configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Enabling DNS Query and DSG Name Process

The DSG name process enables the Cisco CMTS router to query the DNS server for faster classifier updates.

**Before you begin**

Ensure that the IP DNS-based hostname-to-address translation is configured on the Cisco CMTS router using the **ip domain-lookup** command in global configuration mode. This is configured by default, and the status is not displayed in the running configuration.

**Procedure**

|               | Command or Action                                                                                                                                                  | Purpose                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <code>configure terminal</code>                                                                        | Enters global configuration mode.                                                           |
| <b>Step 2</b> | <b>ip domain-name <i>name</i></b><br><b>Example:</b><br><br>Router(config)# <code>ip domain-name cisco.com</code>                                                  | Sets the IP domain name that the Cisco IOS software uses to complete unqualified host names |
| <b>Step 3</b> | <b>ip name-server <i>server-address</i> [<i>multiple-server-addresses</i>]</b><br><b>Example:</b><br><br>Router(config)# <code>ip name-server 131.108.1.111</code> | Sets the server IP address.                                                                 |
| <b>Step 4</b> | <b>cable dsg name-update-interval <i>minutes</i></b><br><b>Example:</b><br><br>Router(config)# <code>cable dsg name-update-interval 10</code>                      | Sets the interval to check the DNS server for any FQDN classifier changes.                  |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Router(config)# <code>end</code>                                                                                              | Returns to privileged EXEC mode.                                                            |

## Configuring NAT to Support Unicast Messaging

This section describes how to configure a Cisco CMTS router for Network Address Translation (NAT) to enable the use of IP unicast addresses for DSG messaging. This allows the Cisco CMTS router to translate incoming IP unicast addresses into the appropriate IP multicast address for the DSG traffic.

For the Cisco cBR-8 router, A-DSG 1.2 can use an external router that is close to the Cisco CMTS to support unicast messaging. In this case, the nearby router must support NAT, and then send the address-translated multicast IP packets to the Cisco CMTS.

**Tip** This procedure should be performed after the cable interface has already been configured for DSG operations, as described in the [Configuration Examples for Advanced-Mode DSG, on page 1088](#).

**Note** The Cisco CMTS router supports NAT only when it is running an “IP Plus” (-i-) Cisco IOS software image. Refer to the release notes for your Cisco IOS release for complete image availability and requirements.

### Procedure

|               | Command or Action                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>interface</b> <i>wan-interface</i><br><b>Example:</b><br>Router(config)# <b>interface</b> FastEthernet0/0                                                 | Enters interface configuration mode for the specified WAN interface.                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ip nat outside</b><br><b>Example:</b><br>Router(config-if)# <b>ip nat outside</b>                                                                         | Configures the WAN interface as the “outside” (public) NAT interface.                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>interface bundle</b> <i>bundle-number</i><br><b>Example:</b><br>Router(config-if)# <b>interface bundle</b> 10                                             | Enters interface configuration mode for the specified interface bundle.<br><br><b>Note</b> This interface bundle should have previously been configured for DSG operations.                                                                                                     |
| <b>Step 5</b> | <b>ip address</b> <i>ip-address mask secondary</i><br><b>Example:</b><br>Router(config-if)# <b>ip address</b> 192.168.18.1<br>255.255.255.0 <b>secondary</b> | Configures the cable interface with an IP address and subnet that should match the unicast address being used for DSG traffic. This IP address and its subnet must not be used by any other cable interfaces, cable modems, or any other types of traffic in the cable network. |
| <b>Step 6</b> | <b>ip nat inside</b><br><b>Example:</b><br>Router(config-if)# <b>ip nat inside</b>                                                                           | Configures the cable interface as the “inside” (private) NAT interface.                                                                                                                                                                                                         |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Router(config-if)# <b>exit</b>                                                                                             | Exits interface configuration mode and returns to global configuration mode.                                                                                                                                                                                                    |
| <b>Step 8</b> | <b>ip nat inside source static</b> <i>ip-multicast-address cable-ip-address</i><br><b>Example:</b>                                                           | Maps the unicast IP address assigned to the cable interface to the multicast address that should be used for the DSG traffic.                                                                                                                                                   |

|                | Command or Action                                                                                                                                       | Purpose                                                              |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
|                | Router (config)# <b>ip nat inside source static 224.3.2.1 192.168.18.2</b>                                                                              |                                                                      |
| <b>Step 9</b>  | Repeat <a href="#">Step 2, on page 1081</a> and <a href="#">Step 8, on page 1081</a> for each cable interface to be configured for DSG unicast traffic. |                                                                      |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br>Router (config)# <b>end</b>                                                                                            | Exits global configuration mode and returns to privileged EXEC mode. |

## Configuring WAN Interfaces for Multicast Operations

In addition to basic WAN interface configuration on the Cisco CMTS, described in other documents, the following WAN interface commands should be configured on the Cisco CMTS to support IP multicast operations with A-DSG 1.2, as required.

- **ip pim**
- **ip pim ssm**
- **ip cef**

These commands are described in the [Configuring IP Multicast Operations, on page 1078](#), and in the following documents on Cisco.com.

For additional information about the **ip pim** command, refer to the following document on Cisco.com:

- *Cisco IOS IP Command Reference, Volume 3 of 4 : Multicast*, Release 12.3

[http://www.cisco.com/en/US/docs/ios/12\\_3/ipmulti/command/reference/iprnc\\_r.html](http://www.cisco.com/en/US/docs/ios/12_3/ipmulti/command/reference/iprnc_r.html)

For additional information about the **ip pim ssm** command, refer to the following document on Cisco.com:

- *Cisco IOS IP Command Reference, Volume 3 of 4: Multicast*, Release 12.3 T

[http://www.cisco.com/en/US/docs/ios/12\\_3t/ip\\_mcast/command/reference/ip3\\_i2gt.html](http://www.cisco.com/en/US/docs/ios/12_3t/ip_mcast/command/reference/ip3_i2gt.html)

For additional information about the **ip cef** command, refer to the following document on Cisco.com:

- *Cisco IOS Switching Services Command Reference*, Release 12.3

[http://www.cisco.com/en/US/docs/ios/12\\_3/switch/command/reference/swtch\\_r.html](http://www.cisco.com/en/US/docs/ios/12_3/switch/command/reference/swtch_r.html)

## Configuring a Standard IP Access List for Packet Filtering

This section describes how to configure a standard IP access list so that only authorized traffic is allowed on the cable interface.

**Tip** This procedure assumes a basic knowledge of how access lists use an IP address and bitmask to determine the range of IP addresses that are allowed access. For full details on configuring access lists, see the documents listed in the [Additional References, on page 1091](#).

## Procedure

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>access-list access-list permit group-ip-address [mask ]</b><br><b>Example:</b><br>Router(config)# <b>access-list 90 permit 228.1.1.1</b>            | Creates an access list specifying that permits access to the specific multicast address that matches the specified <i>group-ip-address</i> and <i>mask</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>access-list access-list deny group-ip-address [mask ]</b><br><b>Example:</b><br>Router(config)# <b>access-list 90 deny 224.0.0.0 15.255.255.255</b> | Configures the access list that denies access to any multicast address that matches the specified <i>group-ip-address</i> and <i>mask</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>access-list access-list deny any</b><br><b>Example:</b><br>Router(config)# <b>access-list 90 deny any</b>                                           | Configures the access list so that it denies access to any IP addresses other than the ones previously configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>interface bundle bundle-number</b><br><b>Example:</b><br>Router(config)# <b>interface bundle 10</b>                                                 | Enters interface configuration mode for the specified interface bundle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <b>ip access-group access-list</b><br><b>Example:</b><br>Router(config-if)# <b>ip access-group 90</b>                                                  | (Optional, but recommended) Configures the interface with the access list, so that packets are filtered by the list before being accepted on the interface.<br><br><b>Note</b> Standard Access lists only allow one address to be specified in the earlier step. If you apply an outbound access-list with only the multicast address of the tunnel denied, then the DSG traffic is not allowed to pass.<br><br><b>Note</b> On the Cisco cBR-8 router, inbound access lists on the cable interface do not apply to multicast traffic, so they do not apply here. As a result, the Cisco cBR-8 requires that you use extended access lists that are blocked in the outbound direction for packets originating from the cable modem or CPE device on the network, and destined to the multicast group. The multicast group contains the classifiers associated with A-DSG 1.1 rules enabled on the interface. |

|               | Command or Action                                              | Purpose                                                                 |
|---------------|----------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config-if)# <b>end</b> | Exits interface configuration mode and returns to Privileged EXEC mode. |

## Configuring a Standard IP Access List for Multicast Group Filtering

This section describes how to configure a standard IP access list so that non-DOCSIS devices, such as DSG set-top boxes, can access only the authorized multicast group addresses and DSG tunnels.

**Tip** This procedure assumes a basic knowledge of how access lists use an IP address and bitmask to determine the range of IP addresses that are allowed access. For full details on configuring access lists, see the documents listed in the [Additional References, on page 1091](#).

### Procedure

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                      | Enters global configuration mode.                                                                                                                            |
| <b>Step 2</b> | <b>access-list access-list permit group-ip-address [mask ]</b><br><b>Example:</b><br>Router(config)# <b>access-list 90 permit 228.1.1.1</b>            | Creates an access list specifying that permits access to the specific multicast address that matches the specified <i>group-ip-address</i> and <i>mask</i> . |
| <b>Step 3</b> | <b>access-list access-list deny group-ip-address [mask ]</b><br><b>Example:</b><br>Router(config)# <b>access-list 90 deny 224.0.0.0 15.255.255.255</b> | Configures the access list that denies access to any multicast address that matches the specified <i>group-ip-address</i> and <i>mask</i> .                  |
| <b>Step 4</b> | <b>access-list access-list deny any</b><br><b>Example:</b><br>Router(config)# <b>access-list 90 deny any</b>                                           | Configures the access list so that it denies access to any IP addresses other than the ones previously configured.                                           |
| <b>Step 5</b> | <b>interface cable interface</b><br><b>Example:</b><br>Router(config)# <b>interface cable 3/0</b>                                                      | Enters interface configuration mode for the specified cable interface.                                                                                       |

|        | Command or Action                                                                                                                         | Purpose                                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>ip igmp access-group</b> <i>access-list</i> [ <i>version</i> ]<br><b>Example:</b><br>Router(config-if)# <b>ip igmp access-group</b> 90 | (Optional, but recommended) Configures the interface to accept traffic only from the associated access list, so that only authorized devices are allowed to access the DSG tunnels. |
| Step 7 | <b>end</b><br><b>Example:</b><br>Router(config-if)# <b>end</b>                                                                            | Exits interface configuration mode and returns to privileged EXEC mode.                                                                                                             |

## Disabling A-DSG Forwarding on the Primary Channel

You can disable A-DSG forwarding per primary capable interface.

### Procedure

|        | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                            |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                 | Enters global configuration mode.                                                                                                                                                                  |
| Step 2 | <b>interface modular-cable</b> <i>slot /subslot/port</i><br><i>:interface-number</i><br><b>Example:</b><br>Router(config)# <b>interface modular-cable</b> 1/0/0:0 | Specifies the modular cable interface and enters cable interface configuration mode. Variables for this command may vary depending on the Cisco CMTS router and the Cisco IOS-XE software release. |
| Step 3 | <b>cable downstream dsg disable</b><br><b>Example:</b><br>Router(config-if)# <b>cable downstream dsg disable</b>                                                  | Disables A-DSG forwarding and DCD messages on the primary capable interface.                                                                                                                       |
| Step 4 | <b>end</b><br><b>Example:</b><br>Router(config-if)# <b>end</b>                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                   |

## How to Monitor and Debug the Advanced-mode DOCSIS Set-Top Gateway Feature

This section describes the following commands that you can use to monitor and display information about the Advanced-mode DOCSIS Set-Top Gateway feature:

## Displaying Global Configurations for Advanced-Mode DSG 1.2

The following commands display globally-configured or interface-level DSG settings, status, statistics, and multiple types of DSG 1.2 tunnel information.

### show cable dsg cfr

To verify all DSG classifier details, such as the classifier state, source, and destination IP addresses, use the **show cable dsg cfr** command.

To verify details of a particular DSG classifier, use the **show cable dsg cfr *cfr-id*** command.

To verify the detailed output for all DSG classifiers, use the **show cable dsg cfr verbose** command.

To verify the detailed output for a single DSG classifier, use the **show cable dsg cfr *cfr-id* verbose** command.

### show cable dsg host

To verify the mapping of the DSG hostnames and IP addresses on a Cisco CMTS router, use the **show cable dsg host** command.

To verify the verbose output of the mapping of the DSG hostnames and IP addresses on a Cisco CMTS router, use the **show cable dsg host verbose** command.

### show cable dsg tunnel

To display tunnel MAC address, state, tunnel group id, classifiers associated to tunnel and its state, use the **show cable dsg tunnel** command in privileged EXEC mode. This command also displays the number of interfaces to which a tunnel is associated, the clients associated, and the QoS service class name for all the configured tunnels.

To display information for a given DSG tunnel, use the **show cable dsg tunnel *tunnel-id*** command, specifying the tunnel for which to display information.

**show cable dsg tunnel *tunnel-id* [cfr | clients | interfaces | statistics | verbose]**

- **cfr**—Shows DSG tunnel classifiers.
- **clients**—Shows DSG tunnel clients.
- **interfaces**—Shows DSG tunnel interfaces.
- **statistics**—Shows DSG tunnel statistics.
- **verbose**—Shows DSG tunnel detail information.

### show cable dsg tg

To display the configured parameters for all DSG tunnel groups, use **show cable dsg tg** command.

---

**Note** The **Chan state** column in the **show cable dsg tg** command output indicates that a channel belonging to a tunnel group is either enabled or disabled. It is possible that a tunnel group is enabled but a particular channel in that tunnel group is disabled.

---

To display the configured parameters for the specified tunnel group, use **show cable dsg tg *tg-id* channel *channel-id*** command.

To display detailed information for the specified tunnel group, use **show cable dsg tg *tg-id* channel *channel-id* verbose** command.

### show running-config interface

To display a tunnel group attached to a subinterface, use the **show running-config interface** command in privileged EXEC mode, as shown in the example below:

```
Router# show running-config interface bundle 11.2
!
interface Bundle11.2
 ip address 4.4.2.1 255.255.255.0
 no ip unreachable
 ip pim sparse-mode
 ip igmp static-group 230.1.1.30
 no cable ip-multicast-echo
 cable dsg tg 61
end
```

---

**Note** The IGMP static group IP address created automatically at the time of DSG configuration is not displayed in the **show running-config interface** command output.

---

### show cable dsg static-group bundle

To verify all DSG static groups configured under a bundle interface, use the **show cable dsg static-group bundle** command in privileged EXEC mode.

## Displaying Interface-level Configurations for Advanced-Mode DSG 1.2

The following **show** commands display interface-level configurations for A-DSG 1.2.

### show cable dsg tunnel interfaces

To display all interfaces and DSG rules for the associated tunnel, use the **show cable dsg tunnel interfaces** command in privileged EXEC mode.

**show cable dsg tunnel (*tunnel-id*) interfaces**

### show interfaces cable dsg downstream

To display DSG downstream interface configuration information, to include the number of DSG tunnels, classifiers, clients, and vendor-specific parameters, use the **show interfaces cable dsg downstream** command in privileged EXEC mode.

### show interfaces cable dsg downstream dcd

To display DCD statistics for the given downstream, use the **show interfaces cable dsg downstream dcd** command in privileged EXEC mode. This command only displays DCD Type/Length/Value information if the **debug cable dsg** command is previously enabled.

## show interfaces cable dsg downstream tg

To display DSG tunnel group parameters, and rule information applying to the tunnel group, to include tunnels and tunnel states, classifiers, and client information, use the **show interfaces cable dsg downstream tg** command in privileged EXEC mode. You can display information for a specific tunnel, if specified.

## show interfaces cable dsg downstream tunnel

To display DSG tunnel information associated with the downstream, use the **show interfaces cable dsg downstream tunnel** command in privileged EXEC mode.

## Debugging Advanced-Mode DSG

To enable debugging for A-DSG on a Cisco CMTS router, use the **debug cable dsg** command in privileged EXEC mode.

## Configuration Examples for Advanced-Mode DSG

This configuration example illustrates a sample DSG network featuring these components:

- Two Cisco universal broadband routers
- IP Multicast for each DSG implementation
- Two DSG Clients for each Cisco CMTS
- Two DSG Servers (one for each Cisco CMTS)

Each Cisco CMTS is configured as follows, and the remainder of this topic describes example configurations that apply to this architecture.

### CMTS Headend 1

- DSG Server #1—Connected to Cisco CMTS via IP Multicast, with DSG Server having IP Address 12.8.8.1
- Destination IP Address for the Cisco CMTS—228.9.9.1
- DSG Tunnel Address—0105.0005.0005
- Downstream #1 Supporting two DSG Clients:
  - DSG Client #1—ID 101.1.1
  - DSG Client #2—ID 102.2.2

### CMTS Headend 2

- DSG Server #2—Connected to Cisco CMTS via IP Multicast, with DSG Server having IP Address 12.8.8.2
- Destination IP Address for the Cisco CMTS—228.9.9.2
- DSG Tunnel Address—0106.0006.0006
- Downstream #2 Supporting two DSG Clients:
  - DSG Client #1—ID 101.1.1
  - DSG Client #2—ID 102.2.2

### Example of Two DSG Tunnels with MAC DA Substitution

In this configuration, and given the two Cisco CMTS Headends cited above, below are the two sets of DSG rules, with each set applying to each Cisco CMTS, in respective fashion.

These settings apply to DSG #1 and two downstreams:

- DSG Rule ID 1
- DSG Client ID 101.1.1
- DSG Tunnel Address 105.5.5

These settings apply to DSG Rule #2 and two downstreams:

- DSG Rule ID 1
- DSG Client ID 102.2.2
- DSG Tunnel Address 106.6.6

### DSG Example with Regionalization Per Downstream

In this configuration, and given the two Cisco CMTS Headends cited earlier in this topic, below are two downstream rules that can be configured in this architecture, for example:

- Downstream Rule #1
  - DSG Rule ID #1
  - DSG Client ID—101.1.1
  - DSG Tunnel Address—105.5.5
- Downstream Rule #2
  - DSG Rule ID #2
  - DSG Client ID—102.2.2
  - DSG Tunnel Address—106.6.6

### DSG Example with Regionalization Per Upstream

In this configuration, and given the two Cisco CMTS Headends cited earlier in this topic, below are two upstream rules that can be configured in this architecture, for example:

- Upstream Rule #1
  - DSG Rule ID #1
  - DSG Client ID—101.1.1
  - DSG UCID Range—0 to 2
  - DSG Tunnel Address—105.5.5
- Upstream Rule #2
  - DSG Rule ID #2
  - DSG Client ID—102.2.2
  - DSG UCID Range—3 to 5
  - DSG Tunnel Address—106.6.6

### Example of Two DSG Tunnels with Full Classifiers and MAC DA Substitution

In this configuration, and given the two Cisco CMTS Headends cited above, below are the two sets of DSG rules, with each set applying to each Cisco CMTS, in respective fashion.

These settings apply to DSG #1:

- DSG Rule ID 1
- Downstreams 1 and 2
- DSG Client ID 101.1.1
- DSG Tunnel Address 105.5.5
- DSG Classifier ID—10
- IP SA—12.8.8.1
- IP DA—228.9.9.1
- UDP DP—8000

These settings apply to DSG Rule #2:

- DSG Rule ID 2
- Downstreams 1 and 2
- DSG Client ID 102.2.2
- DSG Tunnel Address 106.6.6
- DSG Classifier ID—20
- IP SA—12.8.8.2
- IP DA—228.9.9.2
- UDP DP—8000

### Example of One DSG Tunnel Supporting IP Multicast from Multiple DSG Servers

In this configuration, and given the two Cisco CMTS Headends cited earlier in this topic, below is an example of one DSG Tunnel with multiple DSG servers supporting IP Multicast:

- DSG Rule ID 1
- Downstreams 1 and 2
- DSG Client ID 101.1.1 and 102.2.2
- DSG Tunnel Address 105.5.5
- DSG Classifier ID—10
  - IP SA—12.8.8.1
  - IP DA—228.9.9.1
  - UDP DP—8000
- DSG Classifier ID—20
  - IP SA—12.8.8.2
  - IP DA—228.9.9.2
  - UDP DP—8000

## Example: Enabling DNS Query

The following example shows how to enable a DNS query on the Cisco CMTS router:

```

Router# configure terminal
Router(config)# ip domain-lookup
Router(config)# ip domain-name cisco.com
Router(config)# ip name-server 131.108.1.111
Router(config)# cable dsg name-update-interval 10
Router(config)# end

```

## Example: Disabling A-DSG Forwarding on the Primary Channel

The following example shows how to disable A-DSG forwarding on a primary capable modular interface on the Cisco CMTS router:

```

Router# configure terminal
Router(config)# interface modular-cable 1/0/0:0
Router(config-if)# cable downstream dsg disable
Router(config-if)# end

```

## Additional References

The following sections provide references related to A-DSG 1.2.

## Feature Information for Advanced-Mode DSG 1.2 for the Cisco CMTS Routers

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfmng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 192: Feature Information for DOCSIS Set-Top Gateway and A-DSG for the Cisco CMTS Routers*

| <b>Feature Name</b>                               | <b>Releases</b>             | <b>Feature Information</b>                                                                                        |
|---------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| DOCSIS Set-Top Gateway for the Cisco CMTS Routers | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 77

# Cisco Network Registrar for the Cisco CMTS Routers

This chapter supplements the Cisco Network Registrar (CNR) documentation by providing additional cable-specific instructions to provision a hybrid fiber-coaxial (HFC) network using Cisco universal broadband routers as CMTSs at the headend of the network.

---

**Note** For information about the IPv6 provisioning on CNR server, please refer to [IPv6 on Cable](#).

---

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

# Hardware Compatibility Matrix for the Cisco cBR Series Routers

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

**Table 193: Hardware Compatibility Matrix for the Cisco cBR Series Routers**

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Servers Required on the HFC Network

A TFTP server, DHCP server, and time-of-day (TOD) server are required to support two-way data cable modems on an HFC network. A cable modem will not boot if these servers are not available. The log server and security servers are not required to configure and operate a cable modem. If the log server or security servers are not present, a cable modem will generate warning messages, but it will continue to boot and function properly.

Figure 30: Servers Required on a Two-Way HFC Network

The servers shown here can exist on the same platform. For example, the time-of-day server and the TFTP server can run on the same platform.

3064545

In this provisioning model, TOD and TFTP servers are standard Internet implementations of the RFC 868 and RFC 1350 specifications. Most computers running a UNIX-based operating system supply TOD and TFTP servers as a standard software feature. Typically, the TOD server is embedded in the UNIX *inetd* and it requires no additional configuration. The TFTP server is usually disabled in the standard software but can be enabled by the user. Microsoft NT server software includes a TFTP server that can be enabled with the services control panel. Microsoft NT does not include a TOD server. A public domain version of the TOD server for Microsoft NT can be downloaded from several sites.

The DHCP and Domain Name System (DNS) server shown in Figure above must be the DHCP/DNS server available in Cisco Network Registrar version 2.0 or later. CNR is the only DHCP server that implements policy-based assignment of IP addresses. The headend must be a Cisco cBR-8 converged broadband router. The remote access server is only required on HFC networks that are limited to one-way (downstream only) communication. In a one-way HFC network, upstream data from a PC through the headend to the Internet is carried over a dialup connection. This dialup connection for upstream data is referred to as telco return. For simplification, the model will not include a log or security server. Cable modems can be set up to use the logging and security servers by including the appropriate DHCP options in the cable modem policy as described in the *Cisco Network Registrar User Manual*.

## Cisco Network Registrar Description

CNR is a dynamic IP address management system, running on Windows or Solaris, that uses the Dynamic Host Configuration Protocol (DHCP) to assign IP addresses to cable interfaces, PCs, and other devices on the broadband network. The CNR tool includes script extensions that allow a cable system administrator to define and view individual DHCP options, define the identity or type of device on the network, and assign the device to a predefined class or group.

Using the CNR tool, a cable system administrator can specify policies to provide:

- Integrated DHCP and Domain Name Server (DNS) services
- Time of Day (ToD) and Trivial File Transfer Protocol (TFTP) server based on the size of the network
- DHCP safe failover and dynamic DNS updates

---

**Note** This is available only in CNR 3.0 or higher.

---

Using the CNR tool and the extension scripts identified in the [Overview of Scripts, on page 1102](#) section, a cable system administrator can specify scopes, policies, and options for the network and each cable interface based on the services and configuration to support at each subscriber site.

---

**Note** Scopes refer to the administrative grouping of TCP/IP addresses; all IP addresses within a scope should be on the same subnet.

---

The cable system administrator defines system default policies for all standard options and uses scope-specific policies for options related to particular subnets, such as cable interfaces. This allows DHCP to send the information with the IP address.

Seven entry points exist for scripts:

- post-packet-decode
- pre-client-lookup
- post-client-lookup—Examines and takes action on results of the client-class process, places data items in the environment dictionary to use at the pre-packet-encode extension point, includes DHCP relay option
- check-lease-acceptable
- pre-packet-encode
- post-sent-packet
- pre-dns-add-forward

## Overview of DHCP Using CNR

Cisco Network Registrar (CNR) is a dynamic IP address management system that uses the Dynamic Host Configuration Protocol (DHCP) and assigns IP addresses to PCs and other devices on a network based on a predefined set of policies, such as class of service. CNR assigns available IP addresses from address pools based on the identity or type of the requesting device and the policies in effect. For example, CNR can distinguish between registered devices, unregistered devices, and registered devices that have been assigned to a particular class of service.

CNR also provides extensions that can be customized (via programming or a script) so that you can view individual DHCP options, determine the identity or type of a device based on the content of the options, and assign a device to a predefined class or group. Using these extensions, you can determine the difference between PCs and cable modems and assign them IP addresses from different address pools.

In typical data-over-cable environments, service providers are interested in simplifying provisioning to limit the amount of information that must be collected about subscribers' customer premise equipment (CPEs). To support current provisioning models, a field technician must be sent to a subscriber's home or business to install and setup a cable modem. During this site visit, the technician might register the serial number and MAC address of the cable modem in the customer account database. Because a field technician must go to a subscriber's site to replace a cable modem, you can easily track modem information.

Manually registering and tracking information about a cable subscriber's PC is more difficult. A subscriber might purchase a new PC or exchange the network interface card (NIC) without notifying you of the change. Automatic provisioning with CNR reduces the amount of customer service involvement needed to track customer equipment. To use the provisioning model described in this document, you must still track serial numbers and MAC addresses for cable modems, but you do not need to track information about the PC or NIC cards installed at a subscriber site.

The remainder of this document describes how to configure CNR to support this model. The following sections describe the equipment and servers required for the cable headend, provide an overview of the interaction between DOCSIS-compatible cable modems and the Cisco universal broadband routers, and provide a guide on how to configure CNR to support this provisioning model.

## How Cisco Converged Broadband Routers and Cable Modems Work

Cisco converged broadband routers and cable modems are based on the Data Over Cable Service Interface Specification (DOCSIS) standards. These standards were created by a consortium of cable service providers called Multimedia Cable Network Systems, Ltd. (MCNS) so that cable headend and cable modem equipment produced by different vendors will interoperate. The key DOCSIS standards provide the basis for a cable modem to communicate with any headend equipment and headend equipment to communicate with any cable modem.

Cable modems are assigned to operate on specific cable channels so activity can be balanced across several channels. Each Cisco cBR-8 router installed at the headend serves a specific channel. Part of network planning is to decide which channel each cable modem can use.

A cable modem cannot connect to the network until the following events occur:

- The cable modem initializes and ranges through available frequencies until it finds the first frequency that it can use to communicate to the headend. The cable modem might be another vendor's DOCSIS-compatible device and the headend might have a Cisco cBR-8 router installed. At this point on the initial connection, the cable modem cannot determine if it is communicating on the correct channel.
- The cable modem goes through the DHCP server process and receives a configuration file from the server.
- One of the parameters in the configuration file tells the cable modem which channel it can use.
- If the assigned channel is not available on the Cisco cBR-8 router to which the cable modem is currently connected, it resets itself and comes up on the assigned channel.
- During this second DHCP process, the modem will be connected to the correct CMTS. This time, the configuration file will be loaded. For a DOCSIS-compatible cable modem to access the network, it might go through the DHCP server two times on two different networks; therefore, one-lease-per-client IP addressing is critical.

## DHCP Fields and Options for Cable Modems

DHCP options and packet fields are required to enable cable modems to boot and operate properly. Table below lists the required DHCP options and fields.

Table 194: Required DHCP Fields and Options

| Required Field/Option | Field/Option In Cisco Network Registrar | Value/Description                                                                                                                                                                                                                              |
|-----------------------|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fields</b>         |                                         |                                                                                                                                                                                                                                                |
| giaddr                | -                                       | IP address. As a DHCP packet passes through the relay agent to the DHCP server, the relay agent supplies a unique IP address to the packet and stores it in this field. The relay agent is a cBR-8 router with the iphelper attribute defined. |
| subnet-mask           | -                                       | Subnet mask for the IP address stored in the giaddr field. This value is also stored in the DHCP packet by the relay agent.                                                                                                                    |
| file                  | Packet-file-name                        | Name of the cable modem configuration file that will be read from a TFTP server.                                                                                                                                                               |
| siaddr                | Packet-siaddr                           | IP address of the TFTP server where configuration files are stored.                                                                                                                                                                            |
| <b>Options</b>        |                                         |                                                                                                                                                                                                                                                |
| Time-servers          | -                                       | List of hosts running the time server specified in the RFC 868 standard.                                                                                                                                                                       |
| Time-offset           | -                                       | Time offset of a cable modem internal clock from Universal Time Coordinated (UTC). This value is used by cable modems to calculate the local time that is stored in time-stamping error logs.                                                  |
| MCNS-security-server  | -                                       | IP address of the security server. This should be set if security is required. See RFC 1533 for details.                                                                                                                                       |

## Cisco Network Registrar Sample Configuration

You can use the following information to set up Cisco Network Registrar in a trial configuration. The configuration describes DHCP-related setup only; it does not cover setting up DNS or configuring dynamic DNS (DDNS). You should be familiar with important CNR concepts including scopes, primary and secondary scopes, scope selection tags, client classes, and CNR policies. See the Using Network Registrar publication for detailed information on these concepts.

In the trial configuration, you can configure CNR to perform the following operations:

- Receive DHCP requests from a cable modem and a PC on an HFC network via a port supporting multiple network numbers. The Cisco cBR-8 router at the headend must be configured as a forwarder (iphelper is configured).
- Serve IP addresses on two networks; a net-10 network (non-Internet routable) and a net-24 network (Internet routable).
- Tell the difference between a cable modem and a PC based on the MAC address of the device and provide net-24 addresses to the PC and net-10 addresses to the cable modem.
- Refuse to serve IP addresses to MAC addresses that it does not recognize.

To perform these options, you must implement the following CNR configuration items:

- Create two scope selection tags; one for PCs, one for cable modems.
- Create two client-classes; one for PCs, one for cable modems.
- Create a lease policy appropriate for the cable modem devices.
- Create a lease policy appropriate for the PC devices.
- Create a scope containing Class A net-24 (routable) addresses.
- Create a scope containing Class A net-10 (nonroutable) addresses.
- Identify the scope containing the net-24 addresses as the primary scope and configure the other scope containing the net-10 addresses as secondary to the net-24 scope.

---

**Note** The Cisco cBR-8 router upstream ports must be configured with the primary network address on the net-24 network; such as 24.1.1.1.

---

- Assign the policies to the appropriate scope.
- Add the MAC address of the cable modem and the PC to the client-entry list.
- Associate the PC tag with the scope containing routable addresses.
- Associate the cable modem tag with the scope containing nonroutable addresses.
- Associate the cable modem tag with the cable modem client-class.
- Associate the PC tag with the PC client-class.
- Assign the PC MAC to the PC class.
- Assign the cable modem MAC to the cable modem class.
- Enable client-class processing.

Figure below shows the trial CNR configuration in an HFC network.

Figure 31: Trial Configuration in an HFC Network

These configuration items and their associations can be created using either the CNR management graphical user interface (GUI) or command-line interface (CLI). The following sample script configures DHCP for a sample server:

```
File: cabledemo.rc
Command line: nrcmd -C <cluster> -N <user name> -P <password> -b < cabledemo.rc>

scope-selection-tag tag-CM create
scope-selection-tag tag-PC create
client-class create class-CM
client-class class-CM set selection-criteria=tag-CM
client-class create class-PC
client-class class-PC set selection-criteria=tag-PC
policy cmts-cisco create
policy cmts-cisco setleasetime 1800
policy cmts-cisco setoption domain-name-servers 192.168.10.2
policy cmts-cisco setoption routers 10.1.1.1
policy cmts-cisco setoption time-offset 604800
policy cmts-cisco setoption time-servers 192.168.10.20
policy cmts-cisco set packet-siaddr=192.168.10.2
policy cmts-cisco setoption log-servers 192.168.10.2
policy cmts-cisco setoption mcns-security-server 192.168.10.2
policy cmts-cisco set dhcp-reply-options=packet-file-name,packet-siaddr,mcns-security-server
policy pPC create
policy pPC set server-lease-time 1800
policy pPC setleasetime 1800
policy pPC setoption domain-name-servers 192.168.10.2
policy pPC setoption routers 24.1.1.1
scope S24.1.1.0 create 24.1.1.0 255.255.255.0
scope S24.1.1.0 addrange 24.1.1.5 24.1.1.254
scope S24.1.1.0 set policy=pPC
scope S24.1.1.0 set selection-tags=tag-PC
scope S10.1.1.0 create 10.1.1.0 255.255.255.0
scope S10.1.1.0 addrange 10.1.1.5 10.1.1.254
scope S10.1.1.0 set policy=cmts-cisco
scope S10.1.1.0 set selection-tags=tag-CM
scope S10.1.1.0 set primary-scope=S24.1.1.0
client 01:02:03:04:05:06 create client-class-name=class-PC
```

```

client ab:cd:ef:01:02:03 create client-class-name=class-CM
client default create action=exclude
dhcp enable client-class
dhcp enable one-lease-per-client
save
dhcp reload

```

In addition to the DHCP server setup, you might want to enable packet-tracing. When packet-tracing is enabled, the server parses both requests and replies, and then adds them to the logs. If you do enable tracing, performance will be adversely affected, and the logs will roll over quickly.

Use the following nrcmd command to set packet tracing.

```
DHCP set log-settings=incoming-packet-detail,outgoing-packet-detail
```

## Cable Modem DHCP Response Fields

Each cable interface on the broadband network requires the following fields in the DHCP response:

- CM's IP address
- CM's subnet mask

---

**Note** For cable operators with less experience in networking, you can fill in a guess based on the network number and indicate how your IP network is divided.

---

- Name of the DOCSIS configuration file on the TFTP server intended for the cable interface
- Time offset of the cable interface from the Universal Coordinated Time (UTC), which the cable interface uses to calculate the local time when time-stamping error logs
- Time server address from which the cable interface obtains the current time

## DOCSIS DHCP Fields

DOCSIS DHCP option requirements include:

- IP address of the next server to use in the TFTP bootstrap process; this is returned in the siaddr field
- DOCSIS configuration file that the cable interface downloads from the TFTP server

---

**Note** If the DHCP server is on a different network that uses a relay agent, then the relay agent must set the gateway address field of the DHCP response.

---

- IP address of the security server should be set if security is required

## DHCP Relay Option (DOCSIS Option 82)

DOCSIS Option82 modifies DHCPDISCOVER packets to distinguish cable interfaces from the CPE devices or “clients” behind them. The DOCSIS Option82 is comprised of the following two suboptions:

- Suboption 1, Circuit ID:

```
Type 1 (1 byte)
Len 4 (1 byte)
Value (8 bytes)
<bit 31,30,.....0)
<xYYYYYYYYYYYYYYYYYYYY>
```

where the MSB indicates if the attached device is a cable interface.

x=1 Cable Modem REQ

x=0 CPE device (Behind the cable interface with the cable interface MAC address shown in suboption 2.)

The rest of the bits make up the SNMP index to the CMTS interface.

Y=0xYYYYYYY is the SNMP index to the CMTS interface.

- Suboption 2, MAC address of the cable interface:

```
Type 2 (1 byte)
Len 6 (1 byte)
Value xxxx.xxxx.xxxx (6 bytes)
```

## Overview of Scripts

This section lists the scripts applicable to cable interface configuration.

### Two-way Cable Modem Scripts

To support two-way configurations at a subscriber site, use these scripts:

- **Relay.tcl**
- **SetRouter.tcl**

### Telco Return Cable Modem Scripts

To support telco return and two-way cable interface configurations on the same cable interface card or chassis, use these scripts:

- **PostClientLookup.tcl**
- **PrePacketEncode.tcl**

## Placement of Scripts

### Windows NT

For CNR running on Windows NT, place the appropriate scripts in the following directory:

```
\program files\network registrar\extensions\dhcp\scripts\tcl
```

## Solaris

For CNR running on Solaris, place the appropriate scripts in the following directory:

```
/opt/nwreg2/extensions/dhcp/scripts/tcl
```

## Activating Scripts in Cisco Network Registrar

To activate the scripts after you have placed them in the appropriate directory:

---

**Step 1** Open up a text editor.

**Step 2** Open one of the scripts at the `nrcmd>` command prompt.

**Step 3** Create the extension points and attach them to the system.

**Note** The easiest way to do this is to simply cut and paste the command lines from the scripts to the `nrcmd>` command line.

**Step 4** After you have created and attached the extension points, do a `dhcp reload`.

The scripts are active.

---

## Configuring the Cisco CMTS Routers to Use Scripts

Each cable interface must be set up as a BOOTP forwarder and have the relay option enabled. The primary and secondary IP addresses for each cable interface must be in sync with the CNR tool.

To properly communicate with scripts in the system, use the following commands on the Cisco CMTS router:

- To enable option 82, use the **`ip dhcp relay info option`** command.
- To disable the validation of DHCP relay agent information in forwarded BOOTREPLY messages, use the **`no ip dhcp relay information option check`** command.

---

**Note** You can also use the `cable dhcp-giaddr` command in cable interface configuration mode to modify the GIADDR field of DHCPDISCOVER and DHCPREQUEST packets to provide a relay IP address before packets are forwarded to the DHCP server. Use this command to set a “policy” option such that primary addresses are used for CMs and secondary addresses are used for hosts behind the CMs.

---

## Configuring the System Default Policy

Add these options to the system default policy for:

- Cable modems to support on your network
- PCs to support behind each cable interface on your network

## Cable Modems

Define these settings following the CNR tool documentation:

- TFTP server (IP address) for those cable interfaces using BOOTP
- Time-server (IP address)
- Time-offset (Hex value, 1440 for Eastern Standard Time)
- Packet-siaddr (IP address of CNR)
- Router (set to 0.0.0.0)
- Boot-file (name of .cm file for those cable interfaces using BOOTP)
- Packet-file-name (.cm file name)

## PCs

Define these settings following the CNR tool documentation:

- Domain name
- Name servers (IP address of DNS servers)

# Creating Selection Tag Scopes

## General

When you create your scope selection tags:

---

**Step 1** Cut and paste the scope selection tag create commands from the scripts into the nrcmd> command line.

**Note** These names have to be exactly as they appear in the scripts.

**Step 2** Then attach the selection tags to the appropriate scripts:

Example:

CM\_Scope tagCablemodem

PC\_Scope tagComputer

---

## Telco Return for the Cisco cBR-8 Router

### Before you begin

---

**Note** If you are using the prepacketencode and postclientlookup .tcl scripts for telco return, the telco return scope does not have a selection tag associated to the scope.

---

**SUMMARY STEPS**

1. Put the tag `Telcocablemodem` on the primary cable interface scope to pull addresses from that pool instead.
2. Follow the same procedure as above, but use a telco return policy which has a different `.cm` file with telco-specific commands in it.

**DETAILED STEPS**

- 
- Step 1** Put the tag `Telcocablemodem` on the primary cable interface scope to pull addresses from that pool instead.
- Step 2** Follow the same procedure as above, but use a telco return policy which has a different `.cm` file with telco-specific commands in it.
- 

## Creating Network Scopes

Following is an example for creating scopes for your network. This example assumes two Cisco cBR-8 converged broadband routers in two locations, with one cable interface card on one Cisco cBR-8 configured for telco return.

```
cm-toledo1_2-0 10.2.0.0 255.255.0.0 assignable 10.2.0.10-10.2.254.254 tagCablemodem
tagTelcomodem Default GW=10.2.0.1 (assigned by scripts)
cm-toledo1_3-0 10.3.0.0 255.255.0.0 assignable 10.3.0.10-10.3.254.254 tagCablemodem
tagTelcomodem Default GW=10.3.0.1 (assigned by scripts)
pc-toledo1_2-0 208.16.182.0 255.255.255.248 assignable 208.16.182.2-208.16.182.6 tagComputer
Default GW=208.16.182.1 (assigned by scripts)
pc-toledo1_3-0 208.16.182.8 255.255.255.248 assignable 208.16.182.10-208.16.182.14 tagComputer
Default GW=208.16.182.9 (assigned by scripts)
telco_return_2-0 192.168.1.0 255.255.255.0 (No assignable addresses, tag was put on cable
modem primary scope to force telco-return cable modem to pull address from primary scope)
cm-arlington1_2-0 10.4.0.0 255.255.0.0 assignable 10.4.0.10-10.4.254.254 tagCablemodem
Default GW=10.4.0.1 (assigned by scripts)
cm-arlington1_3-0 10.5.0.0 255.255.0.0 assignable 10.5.0.10-10.5.254.254 tagCablemodem
Default GW=10.5.0.1 (assigned by scripts)
pc-arlington1_2-0 208.16.182.16 255.255.255.248 assignable 208.16.182.17-208.16.182.22
tagComputer Default GW=208.16.182.17 (assigned by scripts)
pc-toledo1_3-0 208.16.182.24 255.255.255.248 assignable 208.16.182.2-208.16.182.30 tagComputer
Default GW=208.16.182.25 (assigned by scripts)
```

---

**Note** Remember the last valid address in the `.248` subnet range is the broadcast address; do not use this.

---

## Creating Policies for Class of Service or for Upgrading Cable Modem Cisco IOS Images

To support Class of Service (CoS), define:

- Scope selection tags—Identifiers that describe types of scope configurations

---

**Note** This is needed for Option82.

---

- Client classes—Class with which a group of clients is associated

---

**Note** Scope selection tags are excluded from or included in client-classes.

---

- Client—Specific DHCP clients and the defined class to which they belong

To assign the CoS or use Option82, make a client entry with a MAC address and point to the appropriate policy. To use client-based MAC provisioning, add a client entry “default - exclude,” then put in MAC addresses for all devices (for example, cable interfaces and PCs) in the client tab and select the policy to use, including the appropriate tag.

## CNR Steps to Support Subinterfaces

The CNR configuration is done differently if subinterfaces are configured. Here is an example. If you have configured two ISP subinterfaces and one management subinterface on a Cisco cBR-8 router, make sure that the management subinterface is the first subinterface that is configured. If cable interface three—c3/0/0—is being used, create c3/0/0.1, c3/0/0.2 and c3/0/0.3 as three subinterfaces and c3/0/0.1 as the first subinterface configured as the management subinterface.

---

**Note** The Cisco cBR-8 router requires management subinterfaces to route DHCP packets from CMs when they first initialize because the Cisco cBR-8 router does not know the subinterfaces they belong to until it has seen the IP addresses assigned to them by gleaning DHCP reply message from CNR.

---

In CNR, complete the following steps for such a configuration:

### SUMMARY STEPS

1. Create two scope selection tags such as: isp1-cm-tag and isp2-cm-tag
2. Configure three scopes; for example, mgmt-scope, isp1-cm-scope, and isp2-cm-scope such that isp1-cm-scope and isp2-cm-scope each define mgmt-scope to be the primary scope
3. Also configure two scopes for PCs for each of the ISPs; isp1-pc-scope and isp2-pc-scope. For scope isp1-cm-scope, configure isp1-cm-tag to be the scope selection tag. For scope isp2-cm-scope, configure isp2-cm-tag to be the scope selection tag
4. Configure two client classes; for example, isp1-client-class and isp2-client-class
5. Create client entries with their MAC addresses for CMs that belong to ISP1 and assign them to isp1-client-class. Also assign the scope selection tag isp1-cm-tag
6. Create client entries for CMs that belong to ISP2 and assign them to isp2-client-class. Also assign the scope selection tag isp2-cm-tag
7. Enable client class processing from the scope-selection-tag window

## DETAILED STEPS

- 
- Step 1** Create two scope selection tags such as: isp1-cm-tag and isp2-cm-tag
- Step 2** Configure three scopes; for example, mgmt-scope, isp1-cm-scope, and isp2-cm-scope such that isp1-cm-scope and isp2-cm-scope each define mgmt-scope to be the primary scope
- Step 3** Also configure two scopes for PCs for each of the ISPs; isp1-pc-scope and isp2-pc-scope. For scope isp1-cm-scope, configure isp1-cm-tag to be the scope selection tag. For scope isp2-cm-scope, configure isp2-cm-tag to be the scope selection tag
- Step 4** Configure two client classes; for example, isp1-client-class and isp2-client-class
- Step 5** Create client entries with their MAC addresses for CMs that belong to ISP1 and assign them to isp1-client-class. Also assign the scope selection tag isp1-cm-tag
- Step 6** Create client entries for CMs that belong to ISP2 and assign them to isp2-client-class. Also assign the scope selection tag isp2-cm-tag
- Step 7** Enable client class processing from the scope-selection-tag window
- Overlapping address ranges cannot be configured on these subinterfaces because software gleans the DHCP reply to figure out the subinterface it really belongs to. Although CNR can be configured with overlapping address range scopes, it cannot be used to allocate addresses from these scopes.
-

## Finding Feature Information

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

# Hardware Compatibility Matrix for the Cisco cBR Series Routers

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

**Table 195: Hardware Compatibility Matrix for the Cisco cBR Series Routers**

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Restrictions for PacketCable Operations

- Supports only embedded multimedia terminal adapter (E-MTA) clients. Standalone MTA (S-MTA) clients are not supported.
- PacketCable operations can be configured together with HCCP N+1 redundancy, but the PacketCable states are not synchronized between the Working and Protect interfaces. If a switchover occurs, existing voice calls continue, but when the user hangs up, PacketCable event messages are not generated because the Protect interface is not aware of the previous call states. However, new voice calls can be made and proceed in the normal fashion.

- The 200,000 Hz channel width cannot be used on upstreams that support PacketCable voice calls, or on any upstreams that use Unsolicited Grant Service (UGS) or UGS with Activity Detection (UGS-AD) service flows. Using this small a channel width with voice and other UGS/UGS-AD service flows results in calls being rejected because of “DSA MULTIPLE ERRORS”.

## Information About PacketCable Operations

This section provides an overview and other information about PacketCable operations, the components of a PacketCable network, and how they interact with the other components of a DOCSIS cable networks.

### Feature Overview

PacketCable is a program initiative from Cablelabs and its associated vendors to establish a standard way of providing packet-based, real-time video and other multimedia traffic over hybrid fiber-coaxial (HFC) cable networks. The PacketCable specification is built upon the Data-over-Cable System Interface Specifications (DOCSIS) 1.1, but it extends the DOCSIS protocol with several other protocols for use over noncable networks, such as the Internet and the public switched telephone network (PSTN).

This allows PacketCable to be an end-to-end solution for traffic that originates or terminates on a cable network, simplifying the task of providing multimedia services over an infrastructure composed of disparate networks and media types. It also provides an integrated approach to end-to-end call signaling, provisioning, quality of service (QoS), security, billing, and network management.

## Emergency 911 Features

### PacketCable Emergency 911 Cable Interface Line Card Prioritization

The PacketCable Emergency 911 cable interface line card prioritization feature enables cable interface line cards that are supporting an Emergency 911 call to be given automatic priority over cable interface line cards supporting non-emergency voice calls, even in the case of HCCP switchover events. In such cases, Protect HCCP line card interfaces automatically prioritize service to Emergency 911 voice calls, should Working HCCP cable interface line cards be disrupted. This feature is enabled by default, and may not be disabled with manual configuration.

---

**Note** Emergency 911 cable interface line card prioritization applies only to PacketCable voice calls.

---

During HCCP switchover events, cable modems recover in the following sequence:

1. Cable modems supporting Emergency 911 voice traffic
2. Cable modems supporting non-emergency voice traffic
3. Cable modems that are nearing a T4 timeout event, in which service would be disrupted
4. Remaining cable modems

To view information about Emergency 911 voice events and cable interface line card prioritization on the Cisco CMTS router, use the `show hccp`, `show cable calls`, and `show hccp event-history` commands in privileged EXEC mode.

## PacketCable Emergency 911 Services Listing and History

The enhanced informational support for PacketCable Emergency 911 calls on the Cisco CMTS router provides the following information and related history:

- active Emergency 911 calls
- recent Emergency 911 calls
- regular voice calls
- voice calls made after recent Emergency 911 calls

This feature is enabled and supported with the following configuration and show commands:

- cable high-priority-call-window
- **show cable calls**
- **show cable modem calls**

To set the call window (in minutes) during which the Cisco CMTS router maintains records of Emergency 911 calls, use the cable high-priority-call-window command in global configuration mode. To remove the call window configuration from the Cisco CMTS router, use the **no** form of this command:

## PacketCable Network Components

A PacketCable network contains a number of components. Some components are the same as those that exist in a DOCSIS 1.1 network, while other components are new entities that create the end-to-end infrastructure that the PacketCable network needs to establish calls. Wherever possible, the PacketCable components and protocols build on existing protocols and infrastructures to simplify implementation and interoperability.

- Cable modem—A customer premises equipment (CPE) device that connects to a DOCSIS 1.0 or DOCSIS 1.1 cable network. All DOCSIS cable modems provide high-speed data connectivity to the Internet, while other cable modems can provide additional features, such as telephone connectivity.
- Cable Modem Termination System (CMTS)—A headend-based router that connects a DOCSIS cable network to the IP backbone network. The CMTS controls the DOCSIS 1.1 MAC layer and enforces the quality of service (QoS) limits that the cable operator guarantees to its subscribers. A typical CMTS services between several hundred and several thousand cable modems.

---

**Note** See the DOCSIS 1.1 specifications for information about cable modem and CMTS operations.

---

- Multimedia terminal adapter (MTA)—A CPE device that connects telephones and other end-user devices to the PacketCable network. The PacketCable specification defines two MTA types, an embedded MTA (E-MTA) and a standalone MTA (S-MTA). The E-MTA is an MTA integrated into a DOCSIS 1.1 cable modem, while the S-MTA is a separate MTA that requires a DOCSIS 1.1 cable modem to connect to the cable network.
- Call management server (CMS)—A centrally located server that provides the signaling functions that allow MTAs to establish calls over the network. The CMS uses the Network-based call signaling (NCS) protocol to provide authentication and authorization, call routing, and support for special features such as three-way calling. A PacketCable network could have multiple CMS servers, depending on its size and complexity.

---

**Note** The CMS implements several protocols on top of the Common Open Policy Service (COPS) protocol to communicate with the rest of the PacketCable network.

---

- Gate controller (GC)—A server that controls the establishment of gates in the PacketCable network. A gate is a logical entity in the CMTS that ensures that a service flow is authorized for the QoS features it is requesting. A separate gate controls the upstream and downstream directions of a service flow. When a call is established, the GC instructs the CMTS to create each gate and supplies the set of authorized parameters for each gate, which the CMTS uses to authorize the QoS requests that the MTA is making for the call. The GC is also responsible for coordinating the creation of the two sets of gates at each end of the call so that the call can be authorized and established.

---

**Note** A PacketCable network can contain multiple GCs, although only one server at a time is in control of any particular call. Typically, the same workstation provides both the CMS and GC servers.

---

- Record keeping server (RKS)—Billing server that collects the information about each call as it is made. The RKS uses the Remote Authentication Dial-In User Service (RADIUS) protocol to collect the billing data from the CMTS and other PacketCable servers. The RKS generates a call data record (CDR) for every call and forwards that information to the appropriate application server at the service provider's data processing center for further processing.

## Dynamic Quality of Service

A key feature of a PacketCable network is a dynamic quality of service (DQoS) capability that is similar to the dynamic services provided by DOCSIS 1.1. However, DOCSIS 1.1 DQoS authorizes and provisions services only in the cable network and does not reserve the resources needed to propagate a call from one endpoint to another across the network.

The PacketCable DQoS extends the DOCSIS 1.1 services across the entire network, so that resources can be dynamically authorized and provisioned from one endpoint to another. This prevents possible theft-of-service attacks and guarantees customers the services they are authorized to use.

---

**Note** PacketCable 1.0 requires that DOCSIS 1.1 be used for resource reservation within the cable network for E-MTA clients.

---

## Two-Stage Resource Reservation Process

The PacketCable DQoS model uses a two-stage resource reservation process, in which resources are first reserved and then committed. This allows a bidirectional reservation process that ensures that resources are available at both endpoints of the connection before actually placing the call.

When an MTA makes a call request, the local CMTS communicates with the gate controller to authorize the call's resources. After the resources are authorized, the CMTS reserves the local resources while it negotiates with the remote end for the resources that are required at that end.

**Note** The CMTS uses DOCSIS 1.1 Dynamic Service Addition (DSA) messages to reserve the resources, and then uses Dynamic Service Change (DSC) messages to commit the resources.

When all required resources are available, the local CMTS and remote CMTS both commit the resources, allowing traffic to flow. Usage accounting and billing do not begin until the remote MTA picks up and the call is actually in progress.

The DQoS model ensures that both endpoints of a call, as well as the backbone network, have reserved the same bandwidth, and that the bandwidth is reserved only while the call is in progress. When a call terminates, all portions of the network can release the call's resources and make them available for other users.

## Making a Call Using DQoS

DOCSIS 1.1 networks use service flows to implement different QoS policies, but service flows exist only within the cable network. To control the service flows and to extend them across the entire network, a PacketCable network creates and maintains "gates."

A gate is a logical entity created on the CMTS at each side of a connection that authorizes and establishes a particular DQoS traffic flow. The CMTS communicates with the gate controller to coordinate the creation of matching gates at each side of the connection.

Gates are unidirectional, so separate gates are required for the downstream and upstream traffic flows. The same gate ID, however, is usually used for the downstream and upstream gates for a call. Each CMTS maintains its own set of gates, so a bidirectional traffic flow requires four gates to be created, two gates on the local CMTS and two gates on the remote CMTS.

For a typical call, gates progress through the following stages to create a DQoS traffic flow:

1. The local MTA makes a call request, and the gate controller sends a Gate-Allocation command to the CMTS, which creates a gate in response and puts it into the Allocated state.
2. The call management server, which might be the same server as the gate controller, parses the call request to translate the destination phone number into the appropriate destination gateway.
3. The gate controller verifies that the MTA making the call request is authorized for the required resources and sends a Gate-Set command to the CMTS, which puts the gate into the Authorized state.
4. The CMTS on each side of the connection reserves the local resources needed for the call, putting the gate into the Reserved state.
5. As the remote CMTS and local CMTS perform gate coordination, their respective gates get put into the Local\_Committed and Remote\_Committed states.
6. When both sides have reserved all required resources, each CMTS puts its gates into the Committed state, allowing traffic to flow.

## DQoSLite Based IPv6 Voice Support

DQoSLite is a modem centric solution without notion of gates, to validate and deliver residential voice services over IPv6 to reclaim IPv4 address space. CMTS does not participate in resource reservation and authorization.

DQoSLite leverages elements from PacketCable 2.0. It is SIP based, its provision mechanism is similar to PacketCable 2.0 and it can be part of an IP Multimedia Subsystem (IMS) infrastructure for the ISP.

The key factors for deploying IPv6 voice solution on this new DQoSLite infrastructure are as follows:

- It is SIP or IMS based.

- Support for a wide range of multimedia services.
- To reclaim some IPv4 address space.

This feature is enabled and supported with the following configuration and show commands:

- **packetcafe authorize vanilla-docsis-mta**
- **show cable modem** {*ip-address* | *mac-address*} **qos**
- **show cable modem** {*ip-address* | *mac-address*} **service-flow**
- **show interface cable** *slot/subslot/cable-interface-index* **sid** *sid*
- **show interface cable** *slot/subslot/cable-interface-index* **service-flow** *sfid*

## Dynamic Service Transaction ID Support

DOCSIS 2.0 mandates unique Transaction IDs (TAIDs) across transactions. The TAIDs must be unique and not incremented. The TAIDs are assigned by the senders and sometimes the TAID timeout is mismatched between senders and receivers. This affects the uniqueness of the TAID.

A TAID can be reused when the sender finishes a transaction. Similarly, DOCSIS allows the receiver to identify a transaction by TAID without the SFID. Problems arise in DSD transaction and DSA/DSC interrupted transactions, when these two requirements are combined.

The uniqueness of TAID must be ensured to resolve the interoperability issue. This is done by making the CMTS wait until T10 to reuse the same TAID. A new TAID allocation algorithm is used to fulfill this requirement.

It creates a TAID pool to replace the existing 16-bit counter. This TAID pool is monitored by timers to track the TAID expiration. A flag is assigned to each TAID in the pool to indicate its availability. When new TAID is requested, the dynamic service process checks the availability of the TAID. If the TAID is available, it is allocated to the new service flow, else the request is rejected.

Once the TAID is allocated, the timer starts with T10 expiration time and the TAID flag is set to FALSE to indicate the unavailability of TAID. The dynamic service process keeps track of the timer. When the time expires, the timer stops and the flag is set to TRUE to indicate the availability of TAID.

The TAID pool is allocated and initialized at the process initialization. All timers associated with the TAIDs are added as leaf timers to the process' parent timer.

## PacketCable Subscriber ID Support

The PacketCable Subscriber ID feature adds a subscriber ID to all Gate Control messages and enhances error codes returned from the Cisco CMTS router.

Previously, the Gate ID was unique only to individual CMTS systems, with the CMTS proxying all CMS Gate Control messaging through a central device, which manages the CMTS connections on behalf of the CMS. The CMS had a single Common Open Policy Service (COPS) association to the proxy device. Therefore, the Gate IDs could be duplicated when using multiple CMTS systems.

A subscriber ID is added to each Gate Control message to disambiguate the Gate IDs between the CMS and proxy device. The subscriber ID parameter is added to the following COPS messages:

- GATE-INFO

- GATE-DELETE
- GATE-OPEN
- GATE-CLOSE

The subscriber ID is available at the CMS and is used in the Gate-Set messages. Additionally, the error codes returned from CMTS or its proxy are enhanced to include more specific information about gate operation failures.

To enable this feature, use the **packetcable gate send-subscriberID** command in global configuration mode.

## Benefits

The PacketCable feature offers the following benefits to service providers and their customers:

### Integrated Services on a Cable Network

PacketCable allows cable operators the ability to offer multimedia, real-time services, in addition to data connectivity, across their entire network. These services could include basic telephony with lifeline support, as well as telephony that offers competitive extended calling services. Operators can deploy new services while heavily leveraging their existing network infrastructures.

The widespread use of IP as the standard transport mechanism for data networks today is enabling many advanced Internet applications such as multimedia e-mail, real-time chat, streaming media (including music and video), and videoconferencing. The PacketCable initiative provides the network architecture for a cable operator to deliver these services quickly and economically.

### Standardized Provisioning

PacketCable provides a standardized, efficient method to provision IP services for individual subscribers, because PacketCable specifications define a uniform, open, and interoperable network. Cable operators are assured of standardized provisioning and the associated lower costs of deployment.

### Interoperability

Customer premises equipment (CPE) devices account for a major portion of the capital expense in deploying a VoIP solution at a cable plant. The PacketCable specifications ensure that vendors will build MTA clients that support the voice and other services that cable operators plan to deploy. Because these CPE devices are based on existing DOCSIS-compliant cable modems, time and cost of development is minimized.

Interoperability with the other components of the PacketCable network is also guaranteed because of the standards-based approach to the specifications. Any PacketCable-certified component will be able to interoperate within a network that conforms to the PacketCable standards.

### Secure Architecture

Because PacketCable is built upon the security features available in DOCSIS 1.1, cable operators will be assured of networks that are secure from end to end, with a high standard of security that prevents the most common theft-of-service attacks. The comprehensive, standards-based PacketCable specifications are designed to create a network that is as secure as the public switched telephone network (PSTN).

### CALEA Support

The PacketCable architecture was designed to accommodate the 1994 Communications Assistance for Law Enforcement Act (CALEA), which requires telecommunications carriers to assist law-enforcement agencies

in conducting court-ordered electronic surveillance. PacketCable networks will be able to provide the two types of information that a carrier must provide, depending on the type of court order:

- Call-identifying information—The carrier must provide the call-identifying information for calls to or from an intercept target. For telephone calls, this information includes the phone numbers called by the target or calling the target.
- Call content—The carrier must provide the content of calls to or from an intercept target. For telephone calls, this real-time content is the voice conversation.

## How to Configure PacketCable Operations

This section contains the following tasks to configure the PacketCable feature. Each task is required unless otherwise identified as optional.

### Enabling PacketCable Operation

To enable PacketCable operation, use the following commands beginning in user EXEC mode. This is a required procedure.

#### Procedure

|        | Command or Action                                                                 | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                              |
| Step 3 | <b>packetcable</b><br><b>Example:</b><br>Router(config)# <b>packetcable</b>       | Enables PacketCable operation on all cable interfaces.         |
| Step 4 | <b>exit</b><br><b>Example:</b><br>Router(config)# <b>exit</b>                     | Exits global configuration mode.                               |

### Disabling PacketCable Operation

To disable PacketCable operation, use the following commands beginning in user EXEC mode. This procedure is required only when you no longer want the Cisco CMTS to support PacketCable signaling.

## Procedure

|               | Command or Action                                                                     | Purpose                                                        |
|---------------|---------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b> | Enters global configuration mode.                              |
| <b>Step 3</b> | <b>no packetcable</b><br><b>Example:</b><br><br>Router(config)# <b>no packetcable</b> | Disables PacketCable operation on all cable interfaces.        |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><br>Router(config)# <b>exit</b>                     | Exits global configuration mode.                               |

## Configuring PacketCable Operation

To configure the different parameters that affect PacketCable operations, use the following commands beginning in user EXEC mode. All of these procedures are optional, because each parameter is set to a default that is appropriate for typical PacketCable operations.

## Procedure

|               | Command or Action                                                                                                 | Purpose                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <b>enable</b>                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b>                             | Enters global configuration mode.                                                                                                                                                                              |
| <b>Step 3</b> | <b>packetcable element-id <i>n</i></b><br><b>Example:</b><br><br>Router(config)# <b>packetcable element-id 23</b> | Configures the Event Message Element ID for the Cisco CMTS. If you do not manually configure the Element ID, the CMTS defaults to a random value between 0 and 99,999 when PacketCable operations are enabled. |

|        | Command or Action                                                                                                       | Purpose                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Step 4 | <b>packetcable gate maxcount</b> <i>n</i><br><b>Example:</b><br>Router(config)# <b>packetcable gate maxcount 524288</b> | Sets the maximum number of gate IDs to be allocated in the gate database on the Cisco CMTS. |
| Step 5 | <b>packetcable timer T0</b> <i>timer-value</i><br><b>Example:</b><br>Router(config)# <b>packetcable timer T0 40000</b>  | Sets the T0 timer in milliseconds.                                                          |
| Step 6 | <b>packetcable timer T1</b> <i>timer-value</i><br><b>Example:</b><br>Router(config)# <b>packetcable timer T1 300000</b> | Sets the T1 timer in milliseconds.                                                          |
| Step 7 | <b>exit</b><br><b>Example:</b><br>Router(config)# <b>exit</b>                                                           | Exits global configuration mode.                                                            |

## Enabling Both PacketCable and Non-PacketCable UGS Service Flows

By default, when PacketCable operations are enabled using the **packetcable** command, cable modems must follow the PacketCable protocol when requesting Unsolicited Grant Service (UGS) service flows. This prevents DOCSIS cable modems that do not support PacketCable operations from using DOCSIS-style UGS service flows.

If you have a mixed network that contains both PacketCable and non-PacketCable DOCSIS CMs, you can use the **packetcable authorize vanilla-docsis-mta** command to enable both types of UGS service flows. This is an optional procedure.

### Procedure

|        | Command or Action                                                                 | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                              |
| Step 3 | <b>packetcable</b><br><b>Example:</b>                                             | Enables PacketCable operations.                                |

|               | Command or Action                                                                                                                         | Purpose                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
|               | Router(config)# <b>packetcable</b>                                                                                                        |                                                            |
| <b>Step 4</b> | <b>packetcable authorize vanilla-docsis-mta</b><br><b>Example:</b><br><br>Router(config)# <b>packetcable authorize vanilla-docsis-mta</b> | Enables the use of DOCSIS-style UGS service flow requests. |
| <b>Step 5</b> | <b>cable dsx authorization</b><br><b>Example:</b><br><br>Router(config)# <b>cable dsx authorization</b>                                   | Enables the dsx authorization.                             |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br><br>Router(config)# <b>exit</b>                                                                         | Exits global configuration mode.                           |

**What to do next**

**Tip** Use the **show packetcable global** command to display whether non-PacketCable UGS service flows have been enabled.

## Enabling PacketCable Subscriber ID Support

To include subscriber identification in GATE-OPEN and GATE-CLOSE Gate Control messages, use the **packetcable gate send-subscriberID** command in global configuration mode.

**Procedure**

|               | Command or Action                                                                     | Purpose                                                        |
|---------------|---------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b> | Enters global configuration mode.                              |
| <b>Step 3</b> | <b>packetcable</b><br><b>Example:</b>                                                 | Enables PacketCable operations.                                |

|               | Command or Action                                                                                                         | Purpose                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
|               | Router (config) # <b>packetcable</b>                                                                                      |                                                                        |
| <b>Step 4</b> | <b>packetcable gate send-subscribeID</b><br><b>Example:</b><br>Router (config) # <b>packetcable gate send-subscribeID</b> | Enables the use of gate control subscriber identification information. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Router (config) # <b>exit</b>                                                           | Exits global configuration mode.                                       |

## Configuring RADIUS Accounting for RKS Servers

To enable the Cisco CMTS router to communicate with the Record Keeping Servers (RKS servers) using the RADIUS protocol, use the following commands. This is a required procedure.

### Procedure

|               | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                              | Enters global configuration mode.                                                                                                                                                         |
| <b>Step 3</b> | <b>aaa new-model</b><br><b>Example:</b><br>Router (config) # <b>aaa new-model</b>                                                              | Enables the authentication, authorization, and accounting (AAA) access control model.                                                                                                     |
| <b>Step 4</b> | <b>aaa group server radius <i>group-name</i></b><br><b>Example:</b><br>Router (config) # <b>aaa group server radius packetcable</b>            | Creates a group of RADIUS servers for authentication and enters RADIUS group configuration mode. The value of <i>group-name</i> is a unique, arbitrary string that identifies this group. |
| <b>Step 5</b> | <b>server {<i>hostname</i>   <i>ip-address</i>} [<b>auth-port</b> <i>udp-port</i> ] [<b>acct-port</b> <i>udp-port</i> ]</b><br><b>Example:</b> | Specifies the host name or IP address for the RADIUS server that is providing the RKS services.                                                                                           |

|                | Command or Action                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Router (config-sg-radius) # <b>server radius-server1</b>                                                                                                                                                                                                            | <b>Note</b> Repeat this command as needed to enter multiple RADIUS servers. The Cisco CMTS uses the servers in the order given with this command.                                                                                                                                                                                                                                                                       |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br>Router (config-sg-radius) # <b>exit</b>                                                                                                                                                                                           | Exits RADIUS group configuration mode.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 7</b>  | <b>aaa accounting network default start-stop group radius group group-name</b><br><b>Example:</b><br>Router (config) # <b>aaa accounting network default start-stop group radius group packetcable</b>                                                              | Enables AAA services using the group of RADIUS servers that are defined in the previously created group. The <i>group-name</i> parameter should be the same name specified in Step 4 .                                                                                                                                                                                                                                  |
| <b>Step 8</b>  | <b>radius-server host {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] key 0000000000000000</b><br><b>Example:</b><br>Router (config) # <b>radius-server host radius-server1 key 0000000000000000</b> | Specifies a RADIUS host. Use the same values for <i>hostname</i> or <i>ip-address</i> as for one of the servers specified in Step 5 . If you also specified the <b>auth-port</b> or <b>acct-port</b> values in Step 5 , you must also specify those here, as well. The <b>key</b> value is required and must be 16 ASCII zeros, as shown.<br><b>Note</b> Repeat this command for each RADIUS server entered in Step 5 . |
| <b>Step 9</b>  | <b>radius-server vsa send accounting</b><br><b>Example:</b><br>Router (config) # <b>radius-server vsa send accounting</b>                                                                                                                                           | Configures the Cisco CMTS to recognize and use accounting-related vendor-specific attributes (VSA).                                                                                                                                                                                                                                                                                                                     |
| <b>Step 10</b> | <b>exit</b><br><b>Example:</b><br>Router (config) # <b>exit</b>                                                                                                                                                                                                     | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                        |

### What to do next

#### Troubleshooting Tips

If the connection between a PacketCable CMS and the Cisco CMTS router is not completely established, and the PacketCable CMS does not correctly terminate the session by sending a TCP FIN message, the connection shows a COPS server in the output of the **show cops server** command.

## PacketCable Client Accept Timeout

The PacketCable Client Accept Timeout feature supports COPS for PacketCable on the Cisco CMTS router. This feature also allows you to set timeout values for COPS Telnet connections on the Cisco CMTS router, and for clearing COPS Telnet sessions.

Telnet errors on the network or Cisco CMTS router might cause incomplete COPS sessions to be created. In order to address this issue, the timeout timer enables clearing and cleaning of allocated resources for the stale COPS Telnet sessions on the Cisco CMTS router.

The timeout timer applies to each COPS Telnet connection on the Cisco CMTS router. When this timeout setting expires, it terminates the Telnet session and clears supporting resources on the Cisco CMTS router.

### Procedure

|        | Command or Action                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                                                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                                                                                                                                                            | Enters global configuration mode.                                                                                  |
| Step 3 | <b>packetcable timer</b> {T0 timer-value   T1 timer-value   multimedia T1 timer-value}<br><b>Example:</b><br>Router(config)# <b>packetcable timer T0 300000</b><br><b>Example:</b><br>Router(config)# <b>packetcable timer T1 400000</b><br><b>Example:</b><br>Router(config)# <b>packetcable timer multimedia T1 400000</b> | Sets the PacketCable timer value.                                                                                  |
| Step 4 | <b>end</b><br><b>Example:</b><br>Router(config)# <b>end</b>                                                                                                                                                                                                                                                                  | Returns to privileged EXEC mode.                                                                                   |

## Configuration Examples for PacketCable

This section provides a PacketCable configuration example.

### Example: Typical PacketCable Configuration

This section provides a typical configuration for a Cisco CMTS router that has been configured for PacketCable operations, using default parameters. To use this configuration, you must change the IP addresses for the RADIUS and RKS servers to match the addresses for the servers in your network.

## Verifying PacketCable Operations

To verify and maintain information about PacketCable operations, use one or more of the following commands:

- **show packetcable global**

- **show packetcable gate**
- **show packetcable gate ipv6**
- **show packetcable gate dqos**
- **show packetcable gate counter commit**

To verify the PacketCable configuration, values for the Element ID, maximum number of gates, and the different CMTS-based DQoS timers, use the **show packetcable global** command in privileged EXEC mode.

```
Router# show packetcable global
Packet Cable Global configuration:
Enabled : Yes
Element-ID: 12456

 T1 : 300000 msec
```

To verify information about one or more gates in the gate database, use the **show packetcable gate** command as shown in the following example:

```
Router# show packetcable gate summary
GateID i/f SubscriberID GC-Addr State Type SFID(us) SFID(ds)
13582 Ca8/1/0 3.18.1.4 20.5.0.254 RECOVERY Dqos 74
29962 Ca8/1/0 3.18.1.5 20.5.0.254 RECOVERY Dqos 73
46354 Ca8/1/0 ----- 20.5.0.254 RECOVERY Dqos 72
62738 Ca8/1/0 ----- 20.5.0.254 RECOVERY Dqos
Total number of gates = 4
Total Gates committed(since bootup or clear counter) = 8
```

To verify information about one or more PacketCable gates associated with IPv6 subscriber IDs in the gate database, use the **show packetcable gate ipv6** command as shown in the following example:

```
Router# show packetcable gate ipv6 summary
GateID i/f SubscriberID State SFID(us) SFID(ds)
13582 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 74
29962 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 73
46354 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 72
62738 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT
Total number of gates = 4
Total Gates committed(since bootup or clear counter) = 8
```

To verify information about one or more PacketCable gates associated with IPv4 subscriber IDs in the gate database, use the **show packetcable gate dqos** command as shown in the following example:

```
Router# show packetcable gate dqos summary
GateID i/f SubscriberID GC-Addr State Type SFID(us) SFID(ds)
13576 Ca8/1/0 40.1.43.60 10.74.58.5 COMMIT DQoS 527 528
29956 Ca8/1/0 40.1.43.56 10.74.58.5 COMMIT DQoS 525 526
Total number of DQoS gates = 2
Total Gates committed(since bootup or clear counter) = 346
```

To verify the total number of gates that the Cisco CMTS router has moved to the Committed state since the router was last reset, or since the counter was last cleared, use the **show packetcable gate counter commit** command as shown in the following example:

```
Router# show packetcable gate counter commit
```

Total Gates committed (since bootup or clear counter) = 132

## Verifying Emergency 911 Calls

This section provides a few examples to illustrate how you can use the show cable calls and show cable modem calls commands to verify different scenarios associated with Emergency 911 calls.

The following example displays Emergency 911 calls made on the Cable8/1/1 interface on the Cisco CMTS router during the window set for high priority calls:

```
Router# show cable calls
Interface ActiveHiPriCalls ActiveAllCalls PostHiPriCallCms RecentHiPriCms
C5/0/0 0 0 0 0
C5/0/1 0 0 0 0
C5/1/0 0 0 0 0
C5/1/1 0 0 0 0
C5/1/2 0 0 0 0
C5/1/3 0 0 0 0
C5/1/4 0 0 0 0
C6/0/0 0 0 0 0
C6/0/1 0 0 0 0
C7/0/0 0 0 0 0
C7/0/1 0 0 0 0
C8/1/0 0 0 0 0
C8/1/1 1 1 0 0
C8/1/2 0 0 0 0
C8/1/3 0 0 0 0
C8/1/4 0 0 0 0
Total 1 1 0 0
```

The following example displays the change on the Cisco CMTS router when this Emergency 911 calls ends:

```
Router# show cable calls
Interface ActiveHiPriCalls ActiveAllCalls PostHiPriCallCms RecentHiPriCms
C5/0/0 0 0 0 0
C5/0/1 0 0 0 0
C5/1/0 0 0 0 0
C5/1/1 0 0 0 0
C5/1/2 0 0 0 0
C5/1/3 0 0 0 0
C5/1/4 0 0 0 0
C6/0/0 0 0 0 0
C6/0/1 0 0 0 0
C7/0/0 0 0 0 0
C7/0/1 0 0 0 0
C8/1/0 0 0 0 0
C8/1/1 0 0 0 1
C8/1/2 0 0 0 0
C8/1/3 0 0 0 0
C8/1/4 0 0 0 0
Total 0 0 0 1
```

The following example displays information that is available when making a voice call from the same MTA to another MTA on the same interface:

```
Router# show cable calls
Interface ActiveHiPriCalls ActiveAllCalls PostHiPriCallCms RecentHiPriCms
C5/0/0 0 0 0 0
C5/0/1 0 0 0 0
C5/1/0 0 0 0 0
```

|        |   |   |   |   |
|--------|---|---|---|---|
| C5/1/1 | 0 | 0 | 0 | 0 |
| C5/1/2 | 0 | 0 | 0 | 0 |
| C5/1/3 | 0 | 0 | 0 | 0 |
| C5/1/4 | 0 | 0 | 0 | 0 |
| C6/0/0 | 0 | 0 | 0 | 0 |
| C6/0/1 | 0 | 0 | 0 | 0 |
| C7/0/0 | 0 | 0 | 0 | 0 |
| C7/0/1 | 0 | 0 | 0 | 0 |
| C8/1/0 | 0 | 0 | 0 | 0 |
| C8/1/1 | 0 | 2 | 1 | 1 |
| C8/1/2 | 0 | 0 | 0 | 0 |
| C8/1/3 | 0 | 0 | 0 | 0 |
| C8/1/4 | 0 | 0 | 0 | 0 |
| Total  | 0 | 2 | 1 | 1 |

The following example displays information that is available when a voice call from the same MTA to another MTA on the same interface ends:

```
Router# show cable calls
Interface ActiveHiPriCalls ActiveAllCalls PostHiPriCallCMs RecentHiPriCMs
C5/0/0 0 0 0 0
C5/0/1 0 0 0 0
C5/1/0 0 0 0 0
C5/1/1 0 0 0 0
C5/1/2 0 0 0 0
C5/1/3 0 0 0 0
C5/1/4 0 0 0 0
C6/0/0 0 0 0 0
C6/0/1 0 0 0 0
C7/0/0 0 0 0 0
C7/0/1 0 0 0 0
C8/1/0 0 0 0 0
C8/1/1 0 0 0 1
C8/1/2 0 0 0 0
C8/1/3 0 0 0 0
C8/1/4 0 0 0 0
Total 0 0 0 1
```

The following examples display the show cable modem calls command output on the Cisco CMTS router over a period of time, with changing call status information. The call information disappears when a call ends.

```
Router# show cable modem calls
Cable Modem Call Status Flags:
H: Active high priority calls
R: Recent high priority calls
V: Active voice calls (including high priority)
MAC Address IP Address I/F Prim CMCallStatus LatestHiPriCall
 IP Address I/F Sid CMCallStatus (min:sec)

 Sid (min:sec)
0000.cab7.7b04 10.10.155.38 C8/1/1/U0 18 HV 1:30

```

The following example displays the end of the Emergency 911 call on the Cisco CMTS router:

```

Router# show cable modem calls
Cable Modem Call Status Flags:
H: Active high priority calls
R: Recent high priority calls
V: Active voice calls (including high priority)
MAC Address IP Address I/F Prim CMCallStatus LatestHiPriCall
 Sid (min:sec)
0000.cab7.7b04 10.10.155.38 C8/1/1/U0 18 R 0:3

```

The following example displays a non-emergency voice call on the Cisco CMTS router from the same MTA:

```

Router# show cable modem calls
Cable Modem Call Status Flags:
H: Active high priority calls
R: Recent high priority calls
V: Active voice calls (including high priority)
MAC Address IP Address I/F Prim CMCallStatus LatestHiPriCall
 Sid (min:sec)
0000.ca36.f97d 10.10.155.25 C8/1/1/U0 5 V -
0000.cab7.7b04 10.10.155.38 C8/1/1/U0 18 RV 0:30

```

The following example displays the end of the non-emergency voice call on the Cisco CMTS router:

```

Router# show cable modem calls
Cable Modem Call Status Flags:
H: Active high priority calls
R: Recent high priority calls
V: Active voice calls (including high priority)
MAC Address IP Address I/F Prim CMCallStatus LatestHiPriCall
 Sid (min:sec)
0000.cab7.7b04 10.10.155.38 C8/1/1/U0 18 R 0:36

```

## Information About PacketCable Multimedia Operations

The PacketCable Multimedia (PCMM) feature is a powerful implementation of the CableLabs® standards for PacketCable Multimedia. PCMM provides enhanced QoS for multimedia applications, voice, and bandwidth-intensive services over a DOCSIS (DOCSIS 1.1 and later versions) network.

The Cisco CMTS router supports DOCSIS QoS for SIP-based telephones and SIP video phones, Bandwidth-on-Demand applications, and network-based gaming applications, all of which place extensive bandwidth demands on the network.

This section provides information about the following aspects of PacketCable Multimedia for the Cisco CMTS router, emphasizing PCMM components that are configured with the Cisco IOS command-line interface later in this document:

## PCMM Overview

The following network components are required to support the PCMM feature:

- Application Server—Responsible for relaying client requests to the Application Manager.
- Application Manager—Responsible for application or session-level state and for applying session control domain (SCD) policy.
- Policy Server—Responsible for applying the RCD policy and for managing relationships between the Application Manager and a Cisco CMTS router.
- Cisco CMTS router—Responsible for performing admission control and managing network resources through DOCSIS service flows.

Figure below provides an architectural overview of the PCMM functionality:

**Figure 32: PCMM Architectural Overview**

## PCMM Enhancements over PacketCable 1.x

PacketCable Multimedia is a service delivery framework that leverages and uses as much of existing PacketCable 1.x deployments and functionality as possible. Furthermore, PCMM offers powerful enhancements to the VoIP service delivery framework with straightforward CLI implementation. The key enhancements that the PCMM provides are:

- Time and volume based network resource authorizations are based on DOCSIS 1.1 Quality of Service (QoS) mechanisms.
- Event-based network resource auditing and management functions.
- Secure infrastructure that protects all interfaces at appropriate levels.

- Preauthorized model from PacketCable 1.x, where the PCMM gate installation and management is supplemented with service flow creation, modification and deletion functions. Together, these provide a secure, network-based QoS.

## PCMM and High Availability Features on the Cisco CMTS Router

High Availability on the Cisco CMTS router accommodates synchronization of service flows created for the PCMM applications and the PCCM gate.

## PCMM Gates

### PCMM Gate Overview and PCMM Dynamic Quality of Service

A PacketCable 1.x gate defines QoS parameters and policy-based authorization for subscribers, and a specific envelope of network resources. A PacketCable 1.x gate also maintains classifiers for originating and terminating IP addresses and ports.

The subscriber ID can identify both IPv4 and IPv6 addresses of either the cable modem or the client CPE.

PacketCable 1.x defines a preauthorization model. The PacketCable gates are created and installed at the Cisco CMTS router prior to network resource reservation or activation requests. This process, termed gate control, is managed through a COPS-based policy interface on the Cisco CMTS router.

In PCMM, this COPS-based interface is enhanced for QoS life-cycle management. PCMM gates maintain service flow creation, modification and deletion functions to provide for network-based QoS. Multiple PCMM gates and service flow policies can be maintained on the Cisco CMTS router at a given time, and these PCMM gates are fully interoperable with PacketCable 1.x gates.

When a cable modem subscriber requests bandwidth for a network-intensive application, the network Policy Server sends a Gate-Set message to the Cisco CMTS router. This message contains QoS, service flow, and billing information for this subscriber. This gate profile information is maintained on the Cisco CMTS router, to include PCMM gate states and PCMM state transitions.

The Cisco CMTS router initiates service flows with cable modems, and optimizes DOCSIS resource availability on the Cisco CMTS router for bandwidth-intensive service flows characteristic to PCMM.

#### Restrictions

On some upstream paths, best effort service flows are configured on some modems with Committed Information Rate (CIR). When a number of bandwidth requests are queued in the modems, only a few requests are sent to the CMTS. This occurs due to congestion of sending requests caused by higher number of service flows, greater traffic and small size of packets. Therefore, only a few best effort service flow requests are satisfied by the CMTS.

### PCMM Persistent Gate

Persistent Gate is a feature by which PCMM gate information is maintained for cable modems that go offline. This gate information is quickly enabled after a cable modem returns online. When a cable modem returns online, the Cisco CMTS router scans PCMM gates previously stored, and initiates service to the cable modem according to the respective PCMM gate. This re-enabled service maintains traffic support profiles for that gate, and allocates DOCSIS resources based on the new online subscriber.

## PCMM Interfaces

PCMM optimizes the IPC handshake between the cable interface line card and the Route Processor (RP) for the Cisco CMTS router. Additional PCMM interface changes from PacketCable 1.x include the handling for COPS interface and distributed cable interface line cards.

### PCMM to COPS Interface

PCMM differs from PacketCable 1.x in handling COPS sessions. The COPS sessions on PCMM use TCP port number 3918 by default. Whereas, PacketCable uses the DQoS specification for TCP port requirements and COPS sessions.

When the PCMM module initializes for the first time, a PCMM registry is added to the cable interface line card and the route processor. The PCMM module also registers the PCMM COPS client with the COPS layer on the Cisco CMTS router.

### PCMM and Distributed Cable Interface Line Cards

As with PacketCable 1.x, PCMM uses IPC messages for voice support. When PCMM gates are created on the Network Processing Engine (NPE) or route processor (RP), the PCMM gate parameters are sent to cable interface line cards. IPC maintains all communication between the NPE or RP, and the cable interface line cards.

Event messaging is used with PCMM to support billing information based on Gate-Set messages. Event messaging for distributed cable interface line cards originates from the line cards, based on the success of DSX operation.

The PCMM module also registers the PCMM COPS client with the COPS layer.

## PCMM Unicast and Multicast

In unicast transmission, content is sent to a unique user. In multicast transmission, content is sent to multiple users simultaneously.

### PCMM Multicast Session Range

You can configure a PCMM multicast session range by specifying IPv4 IP addresses and a mask for a PCMM multicast group. The PCMM multicast session range enables the Cisco CMTS router to accept Gate-Set messages from the PCMM Policy Server. If a PCMM multicast session range is configured, the Cisco CMTS router does not allow you to create multicast sessions using other sources such as Internet Group Management Protocol (IGMP) and DOCSIS Set-Top Gateway (DSG).

## How to Configure PCMM Operations

The following tasks describe how to enable PCMM operations and configure its related features on the Cisco CMTS router:

### Enabling PCMM Operations on the Cisco CMTS Router

To enable PCMM operations on the Cisco CMTS router:

## Procedure

|               | Command or Action                                                                                                                                                                 | Purpose                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                             | Enters global configuration mode.                                                                                                                                                                 |
| <b>Step 3</b> | <b>packetcable multimedia</b><br><b>Example:</b><br><pre>Router(config)# packetcable multimedia</pre>                                                                             | Enables and displays PCMM processing on the Cisco CMTS router. This command enables the Cisco CMTS router to start or stop responding to PCMM COPS messages received from the PCMM Policy Server. |
| <b>Step 4</b> | <b>packetcable authorize vanilla-docsis-mta</b><br><b>Example:</b><br><pre>Router(config)# packetcable authorize<br/>vanilla-docsis-mta</pre>                                     | Allows non-DQoS MTAs to send DOCSIS DSX messages.                                                                                                                                                 |
| <b>Step 5</b> | <b>packetcable gate maxcount <i>n</i></b><br><b>Example:</b><br><pre>Router(config)# packetcable gate maxcount 890</pre>                                                          | Sets the maximum number of PCMM gates in the gate database.                                                                                                                                       |
| <b>Step 6</b> | <b>packetcable timer multimedia T1 <i>timer-value</i></b><br><b>Example:</b><br><pre>Router(config)# packetcable timer multimedia T1<br/>300000</pre>                             | Sets the timeout value for T1 timer used in PCMM gate processing.                                                                                                                                 |
| <b>Step 7</b> | <b>clear packetcable gate counter commit [<i>dqos</i>  <br/>multimedia]</b><br><b>Example:</b><br><pre>Router(config)# clear packetcable gate counter<br/>commit multimedia</pre> | (Optional) Clears the specified PCMM gate counter.                                                                                                                                                |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config)# end</pre>                                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                  |

## Configuring a PCMM Multicast Session Range

A PCMM multicast session range enables the Cisco CMTS router to use a range of IP addresses for a PCMM multicast group.

### Before you begin

Ensure that PCMM is configured using the **packetcable multimedia** command.

#### Note

- You can configure only one PCMM multicast group on the Cisco CMTS router. You can configure a maximum of ten multicast sessions for a single multicast group.
- The PCMM multicast feature is supported only with the cable modems that are capable of Multicast DSID-based Forwarding (MDF).

### Procedure

|        | Command or Action                                                                                                     | Purpose                                                                                                              |
|--------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>   |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                     | Enters global configuration mode.                                                                                    |
| Step 3 | <b>cable multicast source pcmm</b><br><b>Example:</b><br>Router(config)# <b>cable multicast source pcmm</b>           | Enables PCMM-based multicast service on the Cisco CMTS router and enters multicast session range configuration mode. |
| Step 4 | <b>session-range ip-addressip-mask</b><br><b>Example:</b><br>Router(config)# <b>session-range 229.0.0.0 255.0.0.0</b> | Configures a session range for the PCMM multicast group.                                                             |
| Step 5 | <b>end</b><br><b>Example:</b><br>Router(config)# <b>end</b>                                                           | Returns to privileged EXEC mode.                                                                                     |

## Configuration Examples for PacketCable Multimedia

The following sections provide configuration examples for PCMM operations on the Cisco CMTS router:

## Example: Enabling PCMM Operations on the Cisco CMTS Router

```
Router# configure terminal
Router(config)# packetcable multimedia
Router(config)# packetcable authorize vanilla-docsis-mta
Router(config)# packetcable gate maxcount 890
Router(config)# packetcable timer multimedia 30000
```

## Example: Enabling a Multicast Session Range on the Cisco CMTS Router

```
Router# configure terminal
Router(config)# cable multicast source pcmm
Router(config)# session-range 229.0.0.0 255.0.0.0
```

## Verifying PCMM Operations

Use the following **show** commands to verify PCMM operations:

- **show packetcable gate multimedia**
- **show cable multicast db**
- **show interface wideband-cable**
- **show cable multicast qos**

To verify the PCMM multicast gates, use the **show packetcable gate multimedia** command as shown in the following example:

```
Router# show packetcable gate multimedia multicast summary
GateID i/f SubscriberID GC-Addr State Type SFID(us) SFID(ds)
134 Ca5/0/0 60.1.1.202 2.39.26.19 COMMIT MM 4 4
Total number of Multimedia-MCAST gates = 1
Total Gates committed(since bootup or clear counter) = 1
```

To verify the PCMM IPv6 gates, use the **show packetcable gate multimedia ipv6** command as shown in the following example:

```
Router# show packetcable gate multimedia ipv6 summary
Load for five secs: 10%/1%; one minute: 9%; five minutes: 9%
Time source is NTP, 03:29:42.153 EST Mon Nov 9 2015

GateID i/f SubscriberID State SFID(us) SFID(ds)
409 Ca5/0/2 2001:420:2C7F:FC38:58AF:E36A:80:213A COMMIT 1326
16789 Ca5/0/2 2001:420:2C7F:FC38:AC40:A49A:F80A:8D0B COMMIT 1321
33177 Ca5/0/2 2001:420:2C7F:FC38:DD49:72A3:2ECC:8770 COMMIT 1322
49577 Ca5/0/2 2001:420:2C7F:FC38:485:31DF:C88B:E315 COMMIT 1308
65953 Ca5/0/2 2001:420:2C7F:FC38:5AB:AA0B:34AD:ACCF COMMIT 1336
82337 Ca5/0/2 2001:420:2C7F:FC38:5AB:AA0B:34AD:ACCF COMMIT 1337
98721 Ca5/0/2 2001:420:2C7F:FC38:5570:EF2E:7565:D36A COMMIT 1316
115097 Ca5/0/2 2001:420:2C7F:FC38:6009:EF26:F573:7356 COMMIT 1318
```

```

131489 Ca5/0/2 2001:420:2C7F:FC38:7D4A:BC50:3FD:CA7 COMMIT 1312
147873 Ca5/0/2 2001:420:2C7F:FC38:E83E:8259:AEF6:5624 COMMIT 1332

```

```

Total number of Multimedia gates = 10
Total Gates committed(since bootup or clear counter) = 1024

```

To verify all the PCMM client entries available with the multicast database, use the **show cable multicast db** command as shown in the following example:

```

Router# show cable multicast db client pcmm
Interface : Bundle1
Session (S,G) : (*,229.2.2.12)
Fwd Intf Bundle Intf Host Intf CM MAC CPE IP Gate-ID SFID
Wi1/1/0:0 Bundle1 Ca5/0/0 0018.6852.8056 60.1.1.202 134 4

```

To verify multicast sessions on a specific wideband cable interface, use the **show interface wideband-cable** command as shown in the following example:

```

Router# show interface wideband-cable 1/1/0:0 multicast-sessions
Default Multicast Service Flow 3 on Wideband-Cable1/1/0:0
Multicast Group : 229.2.2.12
Source : N/A
Act GCRs : 1
Interface : Bul
State: A GI: Bul RC: 0
GCR : GC SAID SFID Key GQC GEn 0
 512 8196 4 0 512

```

To verify the attribute-based assignment of service flows on a specific wideband cable interface, use the **show interface wideband-cable** command as shown in the following example:

```

Router# show interface wideband-cable 1/1/0:0
service-flow 4 verbose
Sfid : 4
Mac Address : ffff.ffff.ffff
Type : Secondary(Static)
Direction : Downstream
Current State : Active
Current QoS Indexes [Prov, Adm, Act] : [4, 4, 4]
Active Time : 05:26
Required Attributes : 0x00000000
Forbidden Attributes : 0x00000000
Aggregate Attributes : 0x00000000
Multicast Sid : 8196
Traffic Priority : 0
Maximum Sustained rate : 0 bits/sec
Maximum Burst : 3044 bytes
Minimum Reserved Rate : 250000 bits/sec
Minimum Packet Size : 0 bytes
Maximum Latency : 0 usecs
Peak Rate : 0 bits/sec
Admitted QoS Timeout : 200 seconds
Active QoS Timeout : 0 seconds
Packets : 0
Bytes : 0
Rate Limit Delayed Packets : 0
Rate Limit Dropped Packets : 0

```

```

Current Throughput : 0 bits/sec, 0 packets/sec
Application Priority : 0
Low Latency App : No
Blaze/JIB3 DS Statistic Index : 0
Forwarding Interface : Wi1/1/0:0
Classifiers: NONE

```

To verify that the PCMM-based MQoS gate controllers are created using the correct session ranges, use the **show cable multicast qos** command as shown in the following example:

```

Router# show cable multicast qos group-qos
Group QoS Index Service Class Control Icmp Limit Override App

DEFAULT mcast_default Aggregate NO-LIMIT
1 SDV_SD Single --- No CLI
512 SDV_HD Single --- No PCMM

```

## High Availability Stateful Switchover (SSO) for PacketCable and PacketCable MultiMedia

Enhanced high availability support enables the synchronization of PacketCable and PacketCable MultiMedia (PCMM) gates during switchover events on the Cisco CMTS router. This enhancement is enabled by default.

This functionality uses the existing per-interface HCCP commands that are used to associate the working and protect interfaces in the case of N+1 redundancy.

## PacketCable and PCMM with Admission Control

A PacketCable or PacketCable Multimedia network contains a number of components that benefit from Admission Control QoS. Admission Control manages and optimizes QoS for PacketCable and PCMM in these ways:

- QoS (based on DOCSIS 1.1 or later versions) for voice and data
- Cable modem registration
- CMS
- Gateway controllers (GC)
- Record keeping servers (RKS)
- Video telephony

When configuring Admission Control with either PacketCable or PCMM, PacketCable or PCMM must be fully operational on the Cisco CMTS headend prior to gaining the benefits from Admission Control.

## Voice MGPI Support

The multiple grants per interval (MGPI) feature enables the Cisco CMTS router to map multiple PacketCable Multimedia gates (application flows) to a single DOCSIS service flow using UGS traffic profiles of the same cable modem. In other words, the Cisco CMTS router increases the number of grants per interval for each application flow based on a single service flow, resulting in multiple grants per interval.

The MGPI feature supports the flow-aggregated voice MGPI functionality based on CableLabs PacketCable Specification (PKT-SP-MM-I05-091029). The flow-aggregated MGPI functionality allows the application manager to use the UGS traffic profile to explicitly set the number of grants per interval and place several application flows on a single gate. This results in an aggregated view for event messages, volume, and time usage limits.

## Voice Support Over DOCSIS 3.0 E-MTAs

PacketCable and PCMM services are supported on embedded multimedia terminal adapters (E-MTAs). An E-MTA is a network element that contains the interface to a physical voice device, a network interface, and all signaling and encapsulation functions required for the VoIP transport, class features signaling, and QoS signaling.

## PacketCable and PCMM Call Trace

To effectively capture signaling information, this functionality buffers signaling for a configured number of PacketCable or PCMM gates. By default, only ten user-configured gate traces are saved in a buffer. After the specified number is reached, any subsequent gate signaling information does not get buffered. When one of the gates being traced is deleted, gate signaling of a new gate is buffered.

Use the **cable dynamic-qos trace** command in global configuration mode to enable the call trace functionality for PacketCable and PacketCable Multimedia gates on the Cisco CMTS router. You will have to specify the number of subscribers for whom call trace needs to be enabled.

## Verifying PacketCable and PCMM Statistics

Use the following commands to verify PacketCable and PCMM statistics on the Cisco CMTS router:

- **show interface cable dynamic-service statistics**
- **show interface cable packetcable statistics**
- **show packetcable cms**

To verify dynamic service statistics based on the cable interface, use the **show interface cable dynamic-service statistics** command as shown in the following example:

```
Router# show interface cable 7/1/0 dynamic-service statistics
 Upstream Downstream
DSA REQ 0 5
DSA RSP 5 0
DSA ACK 0 5
DSC REQ 0 5
DSC RSP 5 0
DSC ACK 0 5
DSD REQ 0 0
DSD RSP 0 0
Retransmission counts
 Upstream Downstream
DSA REQ 0 0
DSA RSP 0 0
DSA ACK 0 0
DSC REQ 0 5
DSC RSP 5 0
DSC ACK 0 0
```

```
DSD REQ 0 0
DSD RSP 0 0
```

To verify PacketCable IPC statistics based on the cable interface, use the show interface cable packetcable statistics command as shown in the following example:

```
Router# show interface cable 7/1/0 packetcable statistics
Packetcable IPC Statistics on RP
Msg create gate gate gate set dsd
 gie set del notify notify
Sent 0 10 0 0 0
Rcvd 0 0 0 10 0
Packetcable IPC Statistics on LC
Msg create gate gate gate set dsd
 gie set del notify notify
Sent 0 0 0 10 0
Rcvd 0 10 0 0 0
```

To verify all gate controllers that are currently connected to the PacketCable client, use the show packetcable cms command as shown in the following example:

```
Router# show packetcable cms
GC-Addr GC-Port Client-Addr COPS-handle Version PSID Key PDD-Cfg
1.100.30.2 47236 2.39.34.1 0x2FF9E268/1 4.0 0 0 0
2.39.26.19 55390 2.39.34.1 0x2FF9D890/1 1.0 0 0 2
```

To verify all gate controllers including the COPS servers for which the PacketCable connection is gone down, use the show packetcable cms command with the all keyword as shown in the following example:

```
Router# show packetcable cms all
GC-Addr GC-Port Client-Addr COPS-handle Version PSID Key PDD-Cfg
1.100.30.2 47236 2.39.34.1 0x2FF9E268/1 4.0 0 0 0
2.39.26.19 55390 2.39.34.1 0x2FF9D890/1 1.0 0 0 2
1.10.30.22 42307 2.39.34.1 0x0 /0 4.0 0 0 0
```

To verify gate controller statistics, use the show packetcable cms command with the keyword, verbose, as shown in the following example:

```
Router# show packetcable cms verbose
Gate Controller
 Addr : 1.100.30.2
 Port : 47236
 Client Addr : 2.39.34.1
 COPS Handle : 0x2FF9E268
 Version : 4.0
 Statistics :
 gate del = 0 gate del ack = 0 gate del err = 0
 gate info = 0 gate info ack = 0 gate info err = 0
 gate open = 0 gate report state = 0
 gate set = 0 gate set ack = 0 gate set err = 0
 gate alloc = 0 gate alloc ack = 0 gate alloc err = 0
 gate close = 0
Gate Controller
 Addr : 2.39.26.19
 Port : 55390
 Client Addr : 2.39.34.1
 COPS Handle : 0x2FF9D890
 Version : 1.0
 Statistics :
 gate del = 0 gate del ack = 0 gate del err = 0
 gate info = 0 gate info ack = 0 gate info err = 0
```

```

gate open = 0 gate report state = 0
gate set = 2 gate set ack = 2 gate set err = 0
PCMM Timers Expired
Timer T1 = 0 Timer T2 = 0 Timer T3 = 0 Timer T4 = 0
GC-Addr GC-Port Client-Addr COPS-handle Version PSID Key PDD-Cfg
1.100.30.2 47236 2.39.34.1 0x2FF9E268/1 4.0 0 0 0
2.39.26.19 55390 2.39.34.1 0x2FF9D890/1 1.0 0 0 2

```

## Feature Information for PacketCable and PacketCable Multimedia

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfnng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

| <b>Feature Name</b>                              | <b>Releases</b>             | <b>Feature Information</b>                                                                                        |
|--------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| PacketCable and PacketCable Multimedia Unicast   | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |
| PacketCable and PacketCable Multimedia Multicast | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |
| DQoS Lite Based IPv6 Voice Support               | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 79

# COPS Engine Operation

---

This document describes the Common Open Policy Service (COPS) engine feature on the Cisco CMTS routers. The Cisco CMTS routers also support Access control lists (ACLs) with the COPS engine.

- [Finding Feature Information, on page 1147](#)
- [Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 1147](#)

## Finding Feature Information

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 196: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Prerequisites for the COPS Engine on the Cisco CMTS Routers

- A compatible policy server must be connected to the network, such as the Cisco COPS QoS Policy Manager.
- Compliance with administrative policy, such as the Computer Assisted Law Enforcement Act (CALEA) or other lawful intercept (LI), is required for use of this feature on the Cisco CMTS routers.

## Restrictions for the COPS Engine on the Cisco CMTS

- Resource Reservation Protocol (RSVP) is not configured on the Cisco CMTS. COPS engine configuration on the Cisco CMTS is limited to networks in which separate RSVP and COPS Servers are configured and operational.

# Information About the COPS Engine on the Cisco CMTS

Common Open Policy Service (COPS) is a protocol for communicating network traffic policy information to network devices.

COPS works in correspondence with the Resource Reservation Protocol (RSVP), which is a means for reserving network resources—primarily bandwidth—to guarantee that applications sending end-to-end across the Internet will perform at the desired speed and quality. RSVP is not configured on the Cisco CMTS, but the Cisco CMTS presumes RSVP on the network for these configurations.

Refer to the [Additional References, on page 1155](#) for further information about COPS for RSVP.

## How to Configure the COPS Engine on the Cisco CMTS

This section describes the tasks for configuring the COPS for RSVP feature on the Cisco CMTS.

To configure the COPS engine on the Cisco CMTS, perform the following tasks:

### Configuring COPS TCP and DSCP Marking

This feature allows you to change the Differentiated Services Code Point (DSCP) marking for COPS messages that are transmitted or received by the Cisco router. The **cops ip dscp** command changes the default IP parameters for connections between the Cisco router and COPS servers in the cable network.

DSCP values are used in Quality of Service (QoS) configurations on a Cisco router to summarize the relationship between DSCP and IP precedence. This command allows COPS to remark the packets for either incoming or outbound connections.

The default setting is 0 for outbound connections. On default incoming connections, the COPS engine takes the DSCP value from the COPS server initiating the TCP connection.

---

**Note** This feature affects all TCP connections with all COPS servers.

---

- For messages transmitted by the Cisco router, the default DSCP value is 0.
- For incoming connections to the Cisco router, the COPS engine takes the DSCP value used by the COPS server that initiates the TCP connection, by default.
- The **cops ip dscp** command allows the Cisco router to re-mark the COPS packets for either incoming or outbound connections.
- This command affects all TCP connections with all COPS servers.
- This command does not affect existing connections to COPS servers. Once you issue this command, this function is supported only for new connections after that point in time.

Perform the following steps to enable optional DSCP marking for COPS messages on the Cisco CMTS.

#### Procedure

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|               | <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                                                                              | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <p><b>cops ip dscp [&lt;0-63&gt;   default   af11-af43   cs1-cs7]</b></p> <p><b>Example:</b></p> <pre>Router(config)# cops ip dscp default</pre> | <p>Specifies the marking for COPS messages that are transmitted by the Cisco router.</p> <p>The values for this command specify the markings with which COPS messages are transmitted. The following values are supported for the Cisco CMTS router:</p> <ul style="list-style-type: none"> <li>• <b>0-63</b>—DSCP value ranging from 0-63.</li> <li>• <b>af11</b>—Use AF11 dscp (001010)</li> <li>• <b>af12</b>—Use AF12 dscp (001100)</li> <li>• <b>af13</b>—Use AF13 dscp (001110)</li> <li>• <b>af21</b>—Use AF21 dscp (010010)</li> <li>• <b>af22</b>—Use AF22 dscp (010100)</li> <li>• <b>af23</b>—Use AF23 dscp (010110)</li> <li>• <b>af31</b>—Use AF31 dscp (011010)</li> <li>• <b>af32</b>—Use AF32 dscp (011100)</li> <li>• <b>af33</b>—Use AF33 dscp (011110)</li> <li>• <b>af41</b>—Use AF41 dscp (100010)</li> <li>• <b>af42</b>—Use AF42 dscp (100100)</li> <li>• <b>af43</b>—Use AF43 dscp (100110)</li> <li>• <b>cs1</b>—Use CS1 dscp (001000) [precedence 1]</li> <li>• <b>cs2</b>—Use CS2 dscp (010000) [precedence 2]</li> <li>• <b>cs3</b>—Use CS3 dscp (011000) [precedence 3]</li> <li>• <b>cs4</b>—Use CS4 dscp (100000) [precedence 4]</li> <li>• <b>cs5</b>—Use CS5 dscp (101000) [precedence 5]</li> <li>• <b>cs6</b>—Use CS6 dscp (110000) [precedence 6]</li> <li>• <b>cs7</b>—Use CS7 dscp (111000) [precedence 7]</li> <li>• <b>default</b>—Use default dscp (000000)</li> <li>• <b>ef</b>—Use EF dscp (101110)</li> </ul> |
| <b>Step 4</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config)# exit Router#</pre>                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring COPS TCP Window Size

This feature allows you to override the default TCP receive window size that is used by COPS processes. This setting can be used to prevent the COPS server from sending too much data at one time.

Perform the following steps to change the TCP Window size on the Cisco CMTS.

### Procedure

|        | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 3 | <b>cops tcp window-size</b> <i>bytes</i><br><b>Example:</b><br><pre>Router(config)# cops tcp window-size 64000</pre> | Overrides the default TCP receive window size on the Cisco CMTS. To return the TCP window size to a default setting of 4K, use the <b>no</b> form of this command. <p><b>Note</b> The default COPS TCP window size is 4000 bytes.</p> <p><b>Note</b> This command does not affect existing connections to COPS servers. Once you issue this command, this function is supported only for new connections after that point in time.</p> <p><b>Note</b> This command affects all TCP connections with all COPS servers.</p> |
| Step 4 | <b>exit</b><br><b>Example:</b><br><pre>Router(config)# exit Router#</pre>                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring Access Control List Support for COPS Engine

Perform the following steps to configure COPS ACLs on the Cisco CMTS.

### Procedure

|        | Command or Action                | Purpose                                                                                                            |
|--------|----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router> <b>enable</b>                                                                                                                     |                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                         | Enters global configuration mode.                                                                                                                                                                       |
| <b>Step 3</b> | <b>cops listeners access-list</b> { <i>acl-num</i>   <i>acl-name</i> }<br><b>Example:</b><br>Router# <b>cops listeners access-list 40</b> | Configures access control lists (ACLs) for inbound connections to all COPS listener applications on the Cisco CMTS. To remove this setting from the Cisco CMTS, use the <b>no</b> form of this command. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# <b>exit</b><br>Router#                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                        |

**What to do next**

Access lists can be displayed by using the **show access-list** command in privileged EXEC mode.

**Restricting RSVP Policy to Specific Access Control Lists**

Perform the following steps to restrict the RSVP policy to specific ACLs, as already configured on the Cisco CMTS.

For ACL configuration, refer to the [Configuring Access Control List Support for COPS Engine, on page 1151](#).

**Procedure**

|               | Command or Action                                                                                                                              | Purpose                                                           |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                      | Enables privileged EXEC mode.<br>Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                              | Enters global configuration mode.                                 |
| <b>Step 3</b> | <b>interface cable</b> ( <i>slot /subslot /port</i> )<br><b>Example:</b><br>Router(config)# <b>interface cable 8/0/1</b><br>Router(config-if)# | Enters interface configuration mode.                              |

|        | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>ip rsvp policy cops</b> <i>ACL-1 ACL-2 servers iP-addr1 IP-addr2</i><br><b>Example:</b><br><pre>Router(config-if)# ip rsvp policy cops 40 160 servers 161.44.130.164 161.44.129.2</pre> | Tells the router to apply RSVP policy to messages that match the specified ACLs, and specifies the COPS server or servers for those sessions. |
| Step 5 | <b>exit</b><br><b>Example:</b><br><pre>Router(config)# exit Router#</pre>                                                                                                                  | Returns to privileged EXEC mode.                                                                                                              |

## Displaying and Verifying COPS Engine Configuration on the Cisco CMTS

Once COPS is enabled and configured on the Cisco CMTS, you can verify and track configuration by using one or all of the **show** commands in the following steps.

### Procedure

|        | Command or Action                                                                                 | Purpose                                                                            |
|--------|---------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                  | Enables privileged EXEC mode.<br>Enter your password if prompted.                  |
| Step 2 | <b>show cops servers</b><br><b>Example:</b><br><pre>Router# show cops servers</pre>               | Displays server addresses, port, state, keepalives, and policy client information. |
| Step 3 | <b>show ip rsvp policy cops</b><br><b>Example:</b><br><pre>Router# show ip rsvp policy cops</pre> | Displays policy server addresses, ACL IDs, and client/server connection status.    |
| Step 4 | <b>show ip rsvp policy</b><br><b>Example:</b><br><pre>Router# show ip rsvp policy</pre>           | Displays ACL IDs and their connection status.                                      |

## Show Commands for COPS Engine Information

The following examples display three views of the COPS engine configuration on the Cisco router. These respective show commands verify the COPS engine configuration.

## Displaying COPS Servers on the Network

This example displays the policy server address, state, keepalives, and policy client information:

```
Router# show cops servers
COPS SERVER: Address: 161.44.135.172. Port: 3288. State: 0. Keepalive: 120 sec
Number of clients: 1. Number of sessions: 1.
COPS CLIENT: Client type: 1. State: 0.
```

## Displaying COPS Policy Information on the Network

This example displays the policy server address, the ACL ID, and the client/server connection status:

```
Router# show ip rsvp policy cops
COPS/RSVP entry. ACLs: 40 60
PDPs: 161.44.135.172
Current state: Connected
Currently connected to PDP 161.44.135.172, port 0
```

## Displaying Access Lists for COPS

This example displays the ACL ID numbers and the status for each ACL ID:

```
Router# show ip rsvp policy
Local policy: Currently unsupported
COPS:
ACLs: 40 60 . State: CONNECTED.
ACLs: 40 160 . State: CONNECTING.
```

# COPS Engine Configuration Examples for Cable

The following sections provide COPS for RSVP configuration examples on the Cisco CMTS:

## Example: COPS Server Specified

The following example specifies the COPS server and enables COPS for RSVP on the server. Both of these functions are accomplished by using the **ip rsvp policy cops** command. By implication, the default settings for all remaining COPS for RSVP commands are accepted.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip rsvp policy cops servers 161.44.130.168 161.44.129.6
Router(config)# exit
```

## Example: COPS Server Display

The following examples display three views of the COPS for RSVP configuration on the router, which can be used to verify the COPS for RSVP configuration.

This example displays the policy server address, state, keepalives, and policy client information:

```
Router# show cops servers
```

```
COPS SERVER: Address: 161.44.135.172. Port: 3288. State: 0. Keepalive: 120 sec
Number of clients: 1. Number of sessions: 1.
 COPS CLIENT: Client type: 1. State: 0.
```

This example displays the policy server address, the ACL ID, and the client/server connection status:

```
Router# show ip rsvp policy cops
COPS/RSVP entry. ACLs: 40 60
PDPs: 161.44.135.172
Current state: Connected
Currently connected to PDP 161.44.135.172, port 0
```

This example displays the ACL ID numbers and the status for each ACL ID:

```
Router# show ip rsvp policy
Local policy: Currently unsupported
COPS:
ACLs: 40 60 . State: CONNECTED.
ACLs: 40 160 . State: CONNECTING.
```

## Feature Information for COPS Engine Operation

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 197: Feature Information for COPS Engine Operation**

| Feature Name          | Releases                    | Feature Information                                                                                               |
|-----------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| COPS Engine Operation | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 80

# Dynamic Bandwidth Sharing

---

The Cisco cBR series router enables dynamic bandwidth sharing (DBS) on integrated cable (IC) and wideband (WB) cable interfaces.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About Dynamic Bandwidth Sharing

### DBS for Integrated and Wideband Cable Interfaces

Prior to DOCSIS 3.0 standards, cable service flows were associated with a single cable interface, which in turn corresponded to a physical downstream on a line card. Under DOCSIS 3.0 standards, cable service flows can be associated with more than one downstream channel.

DBS is the dynamic allocation of bandwidth for IC and WB cable interfaces sharing the same downstream channel. The bandwidth available to each IC, WB cable, or narrowband channel is not a fixed value—it depends on the configuration and the traffic load on the IC or WB cable.

DBS enables high burst rates with DOCSIS 2.0 cable modems as well as DOCSIS 3.0 cable modems. The DBS feature continues working across line card and Supervisor switchovers with no loss of functionality.

# How to Configure Dynamic Bandwidth Sharing

Dynamic bandwidth sharing is enabled by default on the integrated and wideband cable interfaces on the Cisco cBR router. You can configure the bandwidth allocation for the WB and IC interfaces.

**Important** Dynamic bandwidth sharing cannot be disabled on the Cisco cBR router.

This section contains the following procedures:

## Configuring DBS for a Wideband Cable Interface

Perform the following to configure the bandwidth allocation for a wideband cable interface.

### Procedure

|        | Command or Action                                                                                                                                                                                                            | Purpose                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                        | Enters global configuration mode.                                                                                  |
| Step 3 | <b>interface wideband-cable</b><br><i>slot/subslot/portwideband-channel</i><br><b>Example:</b><br><pre>Router(config)# interface wideband-cable 1/0/0:0</pre>                                                                | Configures a wideband cable interface.                                                                             |
| Step 4 | <b>cable rf-channel channel-list</b> <i>group-list</i><br><b>[bandwidth-percent</b> <i>bw-percent</i> <b>]</b><br><b>Example:</b><br><pre>Router(config-if)# cable rf-channel channel-list<br/>10 bandwidth-percent 50</pre> | Configures the bandwidth allocation for the wideband channel interface.                                            |

## Configuring DBS for an Integrated Cable Interface

Perform this procedure to configure the bandwidth allocation for an integrated cable interface.

## Procedure

|               | Command or Action                                                                                                                             | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                    | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>interface integrated-cable</b> <i>slot/subslot/portrf-channel</i><br><b>Example:</b><br>Router(config)# interface integrated-cable 1/0/0:0 | Enters the cable interface mode.                                                                                   |
| <b>Step 4</b> | <b>cable rf-bandwidth-percent</b> <i>bw-percent</i><br><b>Example:</b><br>Router(config-if)# cable rf-bandwidth-percent 50                    | Configures the bandwidth allocation for the integrated cable interface.                                            |

## Verifying the Dynamic Bandwidth Sharing Configuration

Use the following commands to verify the dynamic bandwidth sharing information:

- **show controllers Integrated-Cable** *slot/subslot/port* **bandwidth rf-channel**—Displays the bandwidth information for RF channels.

Following is a sample output of the command:

```
Router# show controllers integrated-Cable 2/0/0 bandwidth rf-channel
```

```

## Feature Information for Dynamic Bandwidth Sharing

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 199: Feature Information for Dynamic Bandwidth Sharing**

| Feature Name              | Releases                    | Feature Information                                                                                               |
|---------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| Dynamic bandwidth sharing | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 81

# Modular Quality of Service Command-Line Interface QoS

This module contains the concepts about applying QoS features using the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC) and the tasks for configuring the MQC. The MQC allows you to define a traffic class, create a traffic policy (policy map), and attach the traffic policy to an interface. The traffic policy contains the QoS feature that will be applied to the traffic class.

- [Finding Feature Information, on page 1167](#)
- [Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 1167](#)
- [Restrictions for Applying QoS Features Using the MQC, on page 1168](#)
- [About, on page 1170](#)
- [How to Apply QoS Features Using the MQC, on page 1175](#)
- [Configuration Examples for Applying QoS Features Using the MQC, on page 1180](#)
- [How to Configure Input MQC on the Port-Channel Interfaces, on page 1184](#)
- [Example: Configuring Input MQC on the Port-Channel Interfaces, on page 1185](#)
- [Additional References, on page 1186](#)
- [Feature Information for Modular Quality of Service Command-Line Interface QoS, on page 1187](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

Table 200: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Restrictions for Applying QoS Features Using the MQC

The MQC-based QoS does not support classification of legacy Layer 2 protocol packets such as Internetwork Packet Exchange (IPX), DECnet, or AppleTalk. When these types of packets are being forwarded through a generic Layer 2 tunneling mechanism, the packets can be handled by MQC but without protocol classification. As a result, legacy protocol traffic in a Layer 2 tunnel is matched only by a "match any" class or class-default.

The number of QoS policy maps and class maps supported varies by platform and release.

**Note** The policy map limitations do not refer to the number of applied policy map instances, only to the definition of the policy maps.

The following restrictions apply to Cisco IOS XE Release 3.5S for the Cisco ASR 903 router:

- QoS policy maps are not supported in sessions.
- Nested traffic maps are not supported.

For more information on restrictions for Cisco ASR 903 router, refer the [Quality of Service Configuration Guidelines for Cisco ASR 903 Router](#).

**Table 201: Cisco ASR 903 Policy and Class Map Support**

|                                  | <b>Cisco IOS XE 3.5S, 3.6S, 3.7S, 3.8S</b> | <b>Cisco IOS XE 3.9S and higher</b> |
|----------------------------------|--------------------------------------------|-------------------------------------|

## About

### The MQC Structure

The MQC (Modular Quality of Service (QoS) Command-Line Interface (CLI)) enables you to set packet classification and marking based on a QoS group value. MQC CLI allows you to create traffic classes and policies, enable a QoS feature (such as packet classification), and attach these policies to interfaces.

The MQC structure necessitates developing the following entities: traffic class, policy map, and service policy.

### Elements of a Traffic Class

A traffic class contains three major elements: a traffic class name, a series of **match** commands, and, if more than one **match** command is used in the traffic class, instructions on how to evaluate these **match** commands.

The **match** commands are used for classifying packets. Packets are checked to determine whether they meet the criteria specified in the **match** commands; if a packet meets the specified criteria, that packet is considered a member of the class. Packets that fail to meet the matching criteria are classified as members of the default traffic class.

#### Available match Commands

The table below lists *some* of the available **match** commands that can be used with the MQC. The available **match** commands vary by Cisco IOS XE release. For more information about the commands and command syntax, see the *Cisco IOS Quality of Service Solutions Command Reference*.

**Table 205: match Commands That Can Be Used with the MQC**

| <b>Command</b>            | <b>Purpose</b>                                                                                         |
|---------------------------|--------------------------------------------------------------------------------------------------------|
| <b>match access-group</b> | Configures the match criteria for a class map on the basis of the specified access control list (ACL). |
| <b>match any</b>          | Configures the match criteria for a class map to be successful match criteria for all packets.         |
| <b>match cos</b>          | Matches a packet based on a Layer 2 class of service (CoS) marking.                                    |

| Command                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>match destination-address mac</b>   | Uses the destination MAC address as a match criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>match discard-class</b>             | Matches packets of a certain discard class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>match [ip] dscp</b>                 | Identifies a specific IP differentiated service code point (DSCP) value as a match criterion. Up to eight DSCP values can be included in one match statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>match input-interface</b>           | Configures a class map to use the specified input interface as a match criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>match ip rtp</b>                    | Configures a class map to use the Real-Time Transport Protocol (RTP) port as the match criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>match mpls experimental</b>         | Configures a class map to use the specified value of the Multiprotocol Label Switching (MPLS) experimental (EXP) field as a match criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>match mpls experimental topmost</b> | Matches the MPLS EXP value in the topmost label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>match not</b>                       | <p>Specifies the single match criterion value to use as an unsuccessful match criterion.</p> <p><b>Note</b> The <b>match not</b> command, rather than identifying the specific match parameter to use as a match criterion, is used to specify a match criterion that prevents a packet from being classified as a member of the class. For instance, if the <b>match not qos-group 6</b> command is issued while you configure the traffic class, QoS group 6 becomes the only QoS group value that is not considered a successful match criterion. All other QoS group values would be successful match criteria.</p> |
| <b>match packet length</b>             | Specifies the Layer 3 packet length in the IP header as a match criterion in a class map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>match port-type</b>                 | Matches traffic on the basis of the port type for a class map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>match [ip] precedence</b>           | Identifies IP precedence values as match criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>match protocol</b>                  | <p>Configures the match criteria for a class map on the basis of the specified protocol.</p> <p><b>Note</b> A separate <b>match protocol</b> (NBAR) command is used to configure network-based application recognition (NBAR) to match traffic by a protocol type known to NBAR.</p>                                                                                                                                                                                                                                                                                                                                    |
| <b>match protocol fasttrack</b>        | Configures NBAR to match FastTrack peer-to-peer traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>match protocol gnutella</b>         | Configures NBAR to match Gnutella peer-to-peer traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Command                         | Purpose                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>match protocol http</b>      | Configures NBAR to match Hypertext Transfer Protocol (HTTP) traffic by URL, host, Multipurpose Internet Mail Extension (MIME) type, or fields in HTTP packet headers. |
| <b>match protocol rtp</b>       | Configures NBAR to match RTP traffic.                                                                                                                                 |
| <b>match qos-group</b>          | Identifies a specific QoS group value as a match criterion.                                                                                                           |
| <b>match source-address mac</b> | Uses the source MAC address as a match criterion.                                                                                                                     |

### Multiple match Commands in One Traffic Class

If the traffic class contains more than one **match** command, you need to specify how to evaluate the **match** commands. You specify this by using either the **match-any** or **match-all** keyword of the **class-map** command. Note the following points about the **match-any** and **match-all** keywords:

- If you specify the **match-any** keyword, the traffic being evaluated by the traffic class must match *one* of the specified criteria.
- If you specify the **match-all** keyword, the traffic being evaluated by the traffic class must match *all* of the specified criteria.
- If you do not specify either keyword, the traffic being evaluated by the traffic class must match *all* of the specified criteria (that is, the behavior of the **match-all** keyword is used).

## Elements of a Traffic Policy

A traffic policy contains three elements: a traffic policy name, a traffic class (specified with the **class** command), and the command used to enable the QoS feature.

The traffic policy (policy map) applies the enabled QoS feature to the traffic class once you attach the policy map to the interface (by using the **service-policy** command).

---

**Note** A packet can match only *one* traffic class within a traffic policy. If a packet matches more than one traffic class in the traffic policy, the *first* traffic class defined in the policy will be used.

---

### Commands Used to Enable QoS Features

The commands used to enable QoS features vary by Cisco IOS XE release. The table below lists *some* of the available commands and the QoS features that they enable. For complete command syntax, see the *Cisco IOS QoS Command Reference*.

For more information about a specific QoS feature that you want to enable, see the appropriate module of the Cisco IOS XE Quality of Service Solutions Configuration Guide.

Table 206: Commands Used to Enable QoS Features

| Command                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bandwidth</b>                                    | Configures a minimum bandwidth guarantee for a class.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>bandwidth remaining</b>                          | Configures an excess weight for a class.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>fair-queue</b>                                   | Enables the flow-based queueing feature within a traffic class.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>fair-queue pre-classify</b>                      | Configures and checks whether the <b>qos pre-classify</b> command can be used for fair queue. When the <b>qos pre-classify</b> command is enabled on the tunnel interface, and then the <b>fair-queue pre-classify</b> command is enabled for the policy-map, the policy-map is attached to either the tunnel interface or the physical interface.<br><br>The inner IP header of the tunnel will be used for the hash algorithm of the fair queue. |
| <b>drop</b>                                         | Discards the packets in the specified traffic class.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>police</b>                                       | Configures traffic policing.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>police (percent)</b>                             | Configures traffic policing on the basis of a percentage of bandwidth available on an interface.                                                                                                                                                                                                                                                                                                                                                   |
| <b>police (two rates)</b>                           | Configures traffic policing using two rates, the committed information rate (CIR) and the peak information rate (PIR).                                                                                                                                                                                                                                                                                                                             |
| <b>priority</b>                                     | Gives priority to a class of traffic belonging to a policy map.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>queue-limit</b>                                  | Specifies or modifies the maximum number of packets the queue can hold for a class configured in a policy map.                                                                                                                                                                                                                                                                                                                                     |
| <b>random-detect</b>                                | Enables Weighted Random Early Detection (WRED).                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>random-detect discard-class</b>                  | Configures the WRED parameters for a discard-class value for a class in a policy map.                                                                                                                                                                                                                                                                                                                                                              |
| <b>random-detect discard-class-based</b>            | Configures WRED on the basis of the discard class value of a packet.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>random-detect exponential-weighting-constant</b> | Configures the exponential weight factor for the average queue size calculation for the queue reserved for a class.                                                                                                                                                                                                                                                                                                                                |
| <b>random-detect precedence</b>                     | Configure the WRED parameters for a particular IP Precedence for a class policy in a policy map.                                                                                                                                                                                                                                                                                                                                                   |
| <b>service-policy</b>                               | Specifies the name of a traffic policy used as a matching criterion (for nesting traffic policies [hierarchical traffic policies] within one another).                                                                                                                                                                                                                                                                                             |
| <b>set atm-clp</b>                                  | Sets the cell loss priority (CLP) bit when a policy map is configured.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>set cos</b>                                      | Sets the Layer 2 class of service (CoS) value of an outgoing packet.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>set discard-class</b>                            | Marks a packet with a discard-class value.                                                                                                                                                                                                                                                                                                                                                                                                         |

| Command                      | Purpose                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>set [ ip ] dscp</b>       | Marks a packet by setting the differentiated services code point (DSCP) value in the type of service (ToS) byte.                     |
| <b>set fr-de</b>             | Changes the discard eligible (DE) bit setting in the address field of a Frame Relay frame to 1 for all traffic leaving an interface. |
| <b>set mpls experimental</b> | Designates the value to which the MPLS bits are set if the packets match the specified policy map.                                   |
| <b>set precedence</b>        | Sets the precedence value in the packet header.                                                                                      |
| <b>set qos-group</b>         | Sets a QoS group identifier (ID) that can be used later to classify packets.                                                         |
| <b>shape</b>                 | Shapes traffic to the indicated bit rate according to the algorithm specified.                                                       |

## Nested Traffic Classes

The MQC does not necessarily require that you associate only one traffic class to one traffic policy.

In a scenario where packets satisfy more than one match criterion, the MQC enables you to associate multiple traffic classes with a single traffic policy (also termed *nested traffic classes*) using the **match class-map** command. (We term these *nested class maps* or *MQC Hierarchical class maps*.) This command provides the only method of combining match-any and match-all characteristics within a single traffic class. By doing so, you can create a traffic class using one match criterion evaluation instruction (either match-any or match-all) and then use that traffic class as a match criterion in a traffic class that uses a different match criterion type. For example, a traffic class created with the match-any instruction must use a class configured with the match-all instruction as a match criterion, or vice versa.

Consider this likely scenario: Suppose A, B, C, and D were all separate match criterion, and you wanted traffic matching A, B, or C and D (i.e., A or B or [C and D]) to be classified as belonging to a traffic class. Without the nested traffic class, traffic would either have to match all four of the match criterion (A and B and C and D) or match any of the match criterion (A or B or C or D) to be considered part of the traffic class. You would not be able to combine “and” (match-all) and “or” (match-any) statements within the traffic class; you would be unable to configure the desired configuration.

The solution: Create one traffic class using match-all for C and D (which we will call criterion E), and then create a new match-any traffic class using A, B, and E. The new traffic class would have the correct evaluation sequence (A or B or E, which is equivalent to A or B or [C and D]).

## match-all and match-any Keywords of the class-map Command

One of the commands used when you create a traffic class is the **class-map** command. The command syntax for the **class-map** command includes two keywords: **match-all** and **match-any**. The **match-all** and **match-any** keywords need to be specified only if more than one match criterion is configured in the traffic class. Note the following points about these keywords:

- The **match-all** keyword is used when *all* of the match criteria in the traffic class must be met in order for a packet to be placed in the specified traffic class.
- The **match-any** keyword is used when only *one* of the match criterion in the traffic class must be met in order for a packet to be placed in the specified traffic class.

- If neither the **match-all** keyword nor **match-any** keyword is specified, the traffic class will behave in a manner consistent with the **match-all** keyword.

## input and output Keywords of the service-policy Command

As a general rule, the QoS features configured in the traffic policy can be applied to packets entering the interface or to packets leaving the interface. Therefore, when you use the **service-policy** command, you need to specify the direction of the traffic policy by using the **input** or **output** keyword.

For instance, the **service-policy output policy-map1** command would apply the QoS features in the traffic policy to the interface in the output direction. All packets leaving the interface (output) are evaluated according to the criteria specified in the traffic policy named policy-map1.

---

**Note** For Cisco releases, queueing mechanisms are not supported in the input direction. Nonqueueing mechanisms (such as traffic policing and traffic marking) are supported in the input direction. Also, classifying traffic on the basis of the source MAC address (using the **match source-address mac** command) is supported in the input direction only.

---

## Benefits of Applying QoS Features Using the MQC

The MQC structure allows you to create the traffic policy (policy map) once and then apply it to as many traffic classes as needed. You can also attach the traffic policies to as many interfaces as needed.

## How to Apply QoS Features Using the MQC

### Creating a Traffic Class

To create a traffic class, use the **class-map** command to specify the traffic class name. Then use one or more **match** commands to specify the appropriate match criteria. Packets matching the criteria that you specify are placed in the traffic class. For more information about the **match-all** and **match-any** keywords of the class-map command, see the “match-all and match-any Keywords of the class-map Command” section.

---

**Note** The **match cos** command is shown in Step 4. The **match cos** command is simply an example of one of the **match** commands that you can use. For information about the other available **match** commands, see the “match-all and match-any Keywords of the class-map Command” section.

---

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map** [ **match-all** | **match-any** ] *class-map-name*
4. **match cos** *cos-number*

5. Enter additional match commands, if applicable; otherwise, continue with step 6.
6. end

## DETAILED STEPS

|               | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>class-map [ match-all   match-any ] class-map-name</b><br><b>Example:</b><br><pre>Router(config)# class-map match-any class1</pre> | Creates a class to be used with a class map and enters class-map configuration mode. <ul style="list-style-type: none"> <li>• The class map is used for matching packets to the specified class.</li> <li>• Enter the class name.</li> </ul> <p><b>Note</b> The <b>match-all</b> keyword specifies that all match criteria must be met. The <b>match-any</b> keyword specifies that one of the match criterion must be met. Use these keywords only if you will be specifying more than one <b>match</b> command.</p> |
| <b>Step 4</b> | <b>match cos cos-number</b><br><b>Example:</b><br><pre>Router(config-cmap)# match cos 2</pre>                                         | Matches a packet on the basis of a Layer 2 class of service (CoS) number. <ul style="list-style-type: none"> <li>• Enter the CoS number.</li> </ul> <p><b>Note</b> The <b>match cos</b> command is an example of the <b>match</b> commands you can use. For information about the other <b>match</b> commands that are available, see the “match-all and match-any Keywords of the class-map Command” section.</p>                                                                                                    |
| <b>Step 5</b> | Enter additional match commands, if applicable; otherwise, continue with step 6.                                                      | --                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-cmap)# end</pre>                                                                  | (Optional) Exits QoS class-map configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Creating a Traffic Policy

**Note** The **bandwidth** command is shown in Step 5. The **bandwidth** command is an example of the commands that you can use in a policy map to enable a QoS feature (in this case, Class-based Weighted Fair Queuing (CBWFQ)). For information about other available commands, see the “Elements of a Traffic Policy” section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-map-name*
4. **class** { *class-name* | **class-default** }
5. **bandwidth** {*bandwidth-kbps* | **percent percent** }
6. Enter the commands for any additional QoS feature that you want to enable, if applicable; otherwise, continue with Step 7.
7. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                          | Purpose                                                                                                                                                                                                                                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                      | Enters global configuration mode.                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>policy-map</b> <i>policy-map-name</i><br><b>Example:</b><br><pre>Router(config)# policy-map policy1</pre>                               | Creates or specifies the name of the traffic policy and enters QoS policy-map configuration mode. <ul style="list-style-type: none"> <li>• Enter the policy map name.</li> </ul>                                                                                  |
| <b>Step 4</b> | <b>class</b> { <i>class-name</i>   <b>class-default</b> }<br><b>Example:</b><br><pre>Router(config-pmap)# class class1</pre>               | Specifies the name of a traffic class and enters QoS policy-map class configuration mode.<br><b>Note</b> This step associates the traffic class with the traffic policy.                                                                                          |
| <b>Step 5</b> | <b>bandwidth</b> { <i>bandwidth-kbps</i>   <b>percent percent</b> }<br><b>Example:</b><br><pre>Router(config-pmap-c)# bandwidth 3000</pre> | (Optional) Specifies a minimum bandwidth guarantee to a traffic class in periods of congestion. <ul style="list-style-type: none"> <li>• A minimum bandwidth guarantee can be specified in kb/s or by a percentage of the overall available bandwidth.</li> </ul> |

|               | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                          |

## Verifying the Traffic Class and Traffic Policy Information

The show commands described in this section are optional and can be entered in any order.

### Procedure

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                     |
| <b>Step 2</b> | <b>show class-map</b><br><b>Example:</b><br><pre>Router# show class-map</pre>                                                                       | (Optional) Displays all class maps and their matching criteria.                                                                                                                                                        |
| <b>Step 3</b> | <b>show policy-map <i>policy-map-name</i> class <i>class-name</i></b><br><b>Example:</b><br><pre>Router# show policy-map policy1 class class1</pre> | (Optional) Displays the configuration for the specified class of the specified policy map. <ul style="list-style-type: none"> <li>• Enter the policy map name and the class name.</li> </ul>                           |
| <b>Step 4</b> | <b>show policy-map</b><br><b>Example:</b><br><pre>Router# show policy-map</pre>                                                                     | (Optional) Displays the configuration of all classes for all existing policy maps.                                                                                                                                     |
| <b>Step 5</b> | <b>show policy-map interface <i>type number</i></b><br><b>Example:</b><br><pre>Router# show policy-map interface TengigabitEthernet 4/1/0</pre>     | (Optional) Displays the statistics and the configurations of the input and output policies that are attached to an interface. <ul style="list-style-type: none"> <li>• Enter the interface type and number.</li> </ul> |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br><pre>Router# exit</pre>                                                                                           | (Optional) Exits privileged EXEC mode.                                                                                                                                                                                 |

# Configuration Examples for Applying QoS Features Using the MQC

## Creating a Traffic Class

In the following example, we create traffic classes and define their match criteria. For the first traffic class (`class1`), we use access control list (ACL) 101 as match criteria; for the second traffic class (`class2`), ACL 102. We check the packets against the contents of these ACLs to determine if they belong to the class.

```
class-map class1
 match access-group 101
 exit
class-map class2
 match access-group 102
 end
```

## Creating a Policy Map

In the following example, we define a traffic policy (`policy1`) containing the QoS features that we will apply to two classes: `class1` and `class2`. The match criteria for these classes were previously defined in [Creating a Traffic Class, on page 1180](#).

For `class1`, the policy includes a bandwidth allocation request and a maximum packet count limit for the queue reserved for that class. For `class2`, the policy specifies only a bandwidth allocation request.

```
policy-map policy1
 class class1
 bandwidth 3000
 queue-limit 30
 exit
 class class2
 bandwidth 2000
 end
```

## Example: Attaching a Traffic Policy to an Interface

The following example shows how to attach an existing traffic policy to an interface. After you define a traffic policy with the **policy-map** command, you can attach it to one or more interfaces by using the **service-policy** command in interface configuration mode. Although you can assign the same traffic policy to multiple interfaces, each interface can have only one traffic policy attached in the input direction and only one traffic policy attached in the output direction.

```
Router(config)# interface TengigabitEthernet 4/1/0
Router(config-if)# service-policy output policy1
Router(config-if)# exit
Router(config)# interface TengigabitEthernet 4/1/0
Router(config-if)# service-policy output policy1
Router(config-if)# end
```

## Using the match not Command

Use the **match not** command to specify a QoS policy value that is not used as a match criterion. All other values of that QoS policy become successful match criteria. For instance, if you issue the **match not qos-group 4** command in QoS class-map configuration mode, the specified class will accept all QoS group values except 4 as successful match criteria.

In the following traffic class, all protocols except IP are considered successful match criteria:

```
class-map noip
 match not protocol ip
end
```

## Configuring a Default Traffic Class

Traffic that does not meet the match criteria specified in the traffic classes (that is, *unclassified traffic*) is treated as belonging to the default traffic class.

If you do not configure a default class, packets are still treated as members of that class. The default class has no QoS features enabled so packets belonging to this class have no QoS functionality. Such packets are placed into a first-in, first-out (FIFO) queue managed by tail drop, which is a means of avoiding congestion that treats all traffic equally and does not differentiate between classes of service. Queues fill during periods of congestion. When the output queue is full and tail drop is active, packets are dropped until the congestion is eliminated and the queue is no longer full.

The following example configures a policy map (policy1) for the default class (always called class-default) with these characteristics: 10 queues for traffic that does not meet the match criteria of other classes whose policy is defined by class policy1, and a maximum of 20 packets per queue before tail drop is enacted to handle additional queued packets.

In the following example, we configure a policy map (policy1) for the default class (always termed class-default) with these characteristics: 10 queues for traffic that does not meet the match criterion of other classes whose policy is defined by the traffic policy policy1.

```
policy-map policy1
 class class-default
 shape average 100m
```

## How Commands "class-map match-any" and "class-map match-all" Differ

This example shows how packets are evaluated when multiple match criteria exist. It illustrates the difference between the **class-map match-any** and **class-map match-all** commands. Packets must meet either all of the match criteria ( **match-all** ) or one of the match criteria ( **match-any** ) to be considered a member of the traffic class.

The following examples show a traffic class configured with the **class-map match-all** command:

```
class-map match-all cisco1
 match qos-group 4
 match access-group 101
```

If a packet arrives on a router with traffic class cisco1 configured on the interface, we assess whether it matches the IP protocol, QoS group 4, and access group 101. If all of these match criteria are met, the packet is classified

as a member of the traffic class `cisco1` (a logical AND operator; Protocol IP AND QoS group 4 AND access group 101).

```
class-map match-all vlan
 match vlan 1
 match vlan inner 1
```

The following example illustrates use of the `class-map match-any` command. Only one match criterion must be met for us to classify the packet as a member of the traffic class (i.e., a logical OR operator; protocol IP OR QoS group 4 OR access group 101):

```
class-map match-any cisco2
 match protocol ip
 match qos-group 4
 match access-group 101
```

In the traffic class `cisco2`, the match criterion are evaluated consecutively until a successful match is located. The packet is first evaluated to determine whether the IP protocol can be used as a match criterion. If so, the packet is matched to traffic class `cisco2`. If not, then QoS group 4 is evaluated as a match criterion and so on. If the packet matches none of the specified criteria, the packet is classified as a member of the default traffic class (`class default-class`).

## Establishing Traffic Class as a Match Criterion (Nested Traffic Classes)

There are two reasons to use the `match class-map` command. One reason is maintenance; if a large traffic class currently exists, using the traffic class match criterion is easier than retyping the same traffic class configuration. The second and more common reason is to mix match-all and match-any characteristics in one traffic policy. This enables you to create a traffic class using one match criterion evaluation instruction (either match-any or match-all) and then use that traffic class as a match criterion in a traffic class that uses a different match criterion type.

Consider this likely scenario: Suppose A, B, C, and D were all separate match criterion, and you wanted traffic matching A, B, or C and D (i.e., A or B or [C and D]) to be classified as belonging to a traffic class. Without the nested traffic class, traffic would either have to match all four of the match criterion (A and B and C and D) or match any of the match criterion (A or B or C or D) to be considered part of the traffic class. You would not be able to combine “and” (match-all) and “or” (match-any) statements within the traffic class; you would be unable to configure the desired configuration.

The solution: Create one traffic class using match-all for C and D (which we will call criterion E), and then create a new match-any traffic class using A, B, and E. The new traffic class would have the correct evaluation sequence (A or B or E, which is equivalent to A or B or [C and D]).

### Example: Nested Traffic Class for Maintenance

In the following example, the traffic class called `class1` has the same characteristics as the traffic class called `class2`, with the exception that traffic class `class1` has added a destination address as a match criterion. Rather than configuring traffic class `class1` line by line, you can enter the `match class-map class2` command. This command allows all of the characteristics in the traffic class called `class2` to be included in the traffic class called `class1`, and you can add the new destination address match criterion without reconfiguring the entire traffic class.

```
Router(config)# class-map match-any class2
```

```

Router(config-cmap) # match protocol ip
Router(config-cmap) # match qos-group 3
Router(config-cmap) # match access-group 2
Router(config-cmap) # exit
Router(config) # class-map match-all class1
Router(config-cmap) # match class-map class2
Router(config-cmap) # match destination-address mac 0000.0000.0000
Router(config-cmap) # exit

```

## Example: Nested Traffic Class to Combine match-any and match-all Characteristics in One Traffic Class

The only method of including both match-any and match-all characteristics in a single traffic class is to use the **match class-map** command. To combine match-any and match-all characteristics into a single class, use the match-any instruction to create a traffic class that uses a class configured with the match-all instruction as a match criterion (through the **match class-map** command).

The following example shows how to combine the characteristics of two traffic classes, one with match-any and one with match-all characteristics, into one traffic class with the **match class-map** command. The result requires a packet to match one of the following three match criteria to be considered a member of traffic class class4: IP protocol *and* QoS group 4, destination MAC address 00.00.00.00.00.00, or access group 2.

In this example, only the traffic class called class4 is used with the traffic policy called policy1.

```

Router(config) # class-map match-all class3
Router(config-cmap) # match protocol ip
Router(config-cmap) # match qos-group 4
Router(config-cmap) # exit
Router(config) # class-map match-any class4
Router(config-cmap) # match class-map class3
Router(config-cmap) # match destination-address mac 00.00.00.00.00.00
Router(config-cmap) # match access-group 2
Router(config-cmap) # exit
Router(config) # policy-map policy1
Router(config-pmap) # class class4
Router(config-pmap-c) # police 8100 1500 2504 conform-action transmit exceed-action
set-qos-transmit 4
Router(config-pmap-c) # end

```

## Example: Traffic Policy as a QoS Policy (Hierarchical Traffic Policies)

A traffic policy can be included in a QoS policy when the **service-policy** command is used in QoS policy-map class configuration mode. A traffic policy that contains a traffic policy is called a hierarchical traffic policy.

A hierarchical traffic policy contains a child policy and a parent policy. The child policy is the previously defined traffic policy that is being associated with the new traffic policy through the use of the **service-policy** command. The new traffic policy using the preexisting traffic policy is the parent policy. In the example in this section, the traffic policy called child is the child policy and traffic policy called parent is the parent policy.

Hierarchical traffic policies can be attached to subinterfaces. When hierarchical traffic policies are used, a single traffic policy (with a child and parent policy) can be used to shape and priority traffic on subinterfaces.

```

Router(config)# policy-map child
Router(config-pmap)# class voice
Router(config-pmap-c)# priority 50
Router(config)# policy-map parent
Router(config-pmap)# class class-default
Router(config-pmap-c)# shape average 10000000
Router(config-pmap-c)# service-policy child

```

The value used with the **shape** command is provisioned from the committed information rate (CIR) value from the service provider.

## How to Configure Input MQC on the Port-Channel Interfaces

To configure input MQC on a port-channel interface to differentiate traffic flow and set corresponding "qos-group" features, follow the steps given below.

### Restriction

- QoS actions like policing, shaping, WRED, and queuing are not supported.
- Input MQC cannot be configured on cable physical interfaces.

## Creating a Traffic Class

The **class-map** command is used to create a traffic class. A traffic class contains three major elements: a name, a series of **match** commands, and, if more than one **match** command exists in the traffic class, an instruction on how to evaluate these **match** commands.

The **match** commands are used to specify various criteria for classifying packets. Packets are checked to determine whether they match the criteria specified in the **match** commands; if a packet matches the specified criteria, that packet is considered a member of the class and is forwarded according to the QoS specifications set in the traffic policy. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class.

To create traffic classes and define their match criteria, complete the following procedure:

```

configure terminal
class-map class
match type

```

## Creating a Policy Map

After creating traffic classes, you can configure traffic policies to configure marking features to apply certain actions to the selected traffic in those classes.

The **policy-map** command is used to create a traffic policy. The purpose of a traffic policy is to configure the QoS features that should be associated with the traffic that has been classified in a user-specified traffic class.

**Note** A packet can match only one traffic class within a traffic policy. If a packet matches more than one traffic class in the traffic policy, the first traffic class defined in the policy will be used.

To define a traffic policy, complete the following procedure:

```
configure terminal
policy-map policy
class class
```

## Defining QoS Actions in a Policy Map

Action commands can be added from within class mode on a policy map.

### Set Actions

**Set** commands allow traffic to be marked such that other network devices along the forwarding path can quickly determine the proper class of service to apply to a traffic flow.

To define a set action, complete the following procedure:

```
configure terminal
policy-map policy
class class
set option
```

## Configuring Aggregate Port-Channel Interface

To configure port-channel interface, complete the following procedure:

```
configure terminal
platform qos port-channel-aggregate port_channel_number
interface port-channel port_channel_number
ip address ip mask
interface name
channel-group number
```

## Attaching a Traffic Policy to an Interface

After you define a traffic policy with the **policy-map** command, you can attach it to one or more interfaces by using the **service-policy** command in interface configuration mode. Although you can assign the same traffic policy to multiple interfaces, each interface can have only one traffic policy attached in the input direction and only one traffic policy attached in the output direction.

To attach a traffic policy to an interface, complete the following procedure:

```
configure terminal
interface port-channel port_channel_number
service-policy input policy
```

## Example: Configuring Input MQC on the Port-Channel Interfaces

The following example shows how to configure input MQC on the port-channel interfaces.

```

Router# configure terminal
Router(config)# class-map class1
Router(config-cmap)# match any
Router(config-cmap)# exit
Router(config)# policy-map policy1
Router(config-pmap)# class class1
Router(config-pmap-c)# set dscp af11
Router(config-pmap-c)# exit
Router(config-pmap)# exit
Router(config)# platform qos port-channel-aggregate 2 Router(config)# interface port-channel
2
Router(config-if)# ip address 192.168.0.1 255.255.255.0
Router(config-if)# no shut
Router(config-if)# interface tenGigabitEthernet 4/1/1
Router(config-if)# no ip address
Router(config-if)# no shut
Router(config-if)# channel-group 2
Router(config-if)# interface port-channel 2
Router(config-if)# service-policy input policy1
Device(config-if)# end

```

# Feature Information for Modular Quality of Service Command-Line Interface QoS

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 207: Feature Information for Modular Quality of Service Command-Line Interface QoS**

| Feature Name                                          | Releases                    | Feature Information                                                                                           |
|-------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------|

## CHAPTER 82

# DOCSIS 1.1 for the Cisco CMTS Routers

---

This document describes how to configure the Cisco CMTS router for Data-over-Cable Service Interface Specifications (DOCSIS) 1.1 operations.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for DOCSIS 1.1 Operations

To support DOCSIS 1.1 operations, the cable modem must also support the DOCSIS 1.1 feature set. In addition, before you power on and configure the Cisco CMTS, check the following points:

- Ensure that your network supports reliable broadband data transmission. Your plant must be swept, balanced, and certified, based on NTSC or appropriate international cable plant recommendations. Ensure that your plant meets all DOCSIS downstream and upstream RF requirements.
- Ensure that your Cisco CMTS is installed according to the instructions provided in the appropriate Hardware Installation Guide. The chassis must contain at least one port adapter to provide backbone connectivity and one Cisco cable line card to serve as the RF cable TV interface.
- Ensure that all other required headend or distribution hub routing and network interface equipment is installed, configured, and operational, based on the services to support. This includes all routers, servers (DHCP, TFTP, and ToD), network management systems, and other configuration or billing systems. This includes IP telephony equipment including gatekeepers and gateways; backbone and other equipment if supporting virtual private networks (VPNs); and dialup access servers, telephone circuits and connections and other equipment if supporting telco return.
- Ensure that DHCP and DOCSIS configuration files have been created and pushed to appropriate servers such that each cable modem, when initialized, can transmit a DHCP request, receive an IP address, obtain

TFTP and ToD server addresses, and download DOCSIS configuration files. Optionally, ensure that your servers can also download updated software images to DOCSIS 1.0 and DOCSIS 1.1 cable modems.

- Ensure that customer premises equipment (CPE)—cable modems or set-top boxes, PCs, telephones, or facsimile machines—meet the requirements for your network and service offerings.
- Familiarize yourself with your channel plan to ensure assigning of appropriate frequencies. Outline your strategies for setting up bundling or VPN solution sets, if applicable, to your headend or distribution hub. Know your dial plan if using H.323 for VoIP services and setting up VoIP-enabled cable modem configuration files. Obtain passwords, IP addresses, subnet masks, and device names, as appropriate.
- Ensure that the system clocks on the Cisco CMTS and on the time-of-day (ToD) servers are synchronized. If this does not occur, the clocks on the CMs will not match the clocks on the Cisco CMTS, which could interfere with BPI+ operations. In particular, this could prevent the proper verification of the digital certificates on the cable modem (CM).

After these prerequisites are met, you are ready to configure the Cisco CMTS. This includes, at a minimum, configuring a host name and password for the Cisco CMTS and configuring the Cisco CMTS to support IP over the cable plant and network backbone.

**Caution**

If you plan to use service-class-based provisioning, the service classes must be configured at the Cisco CMTS before cable modems attempt to make a connection. Use the **cable service class** command to configure service classes.

## Restrictions for DOCSIS 1.1 Operations

DOCSIS 1.1 operations includes the following restrictions:

### Baseline Privacy Interface Plus Requirements

BPI+ encryption and authentication must be supported and enabled by both the cable modem and CMTS. In addition, the cable modem must contain a digital certificate that conforms to the DOCSIS 1.1 and BPI+ specifications.

Also, ensure that the system clocks on the CMTS and on the time-of-day (ToD) servers are synchronized. If this does not occur, the clocks on the CMs will not match the clocks on the CMTS, which could interfere with BPI+ operations. In particular, this could prevent the proper verification of the digital certificates on the CM.

**Note**

Ensure that the system clocks on the CMTS and on the time-of-day (ToD) servers are synchronized. If this does not occur, the clocks on the CMs will not match the clocks on the CMTS, which could interfere with BPI+ operations. In particular, this could prevent the proper verification of the digital certificates on the CM.

### BPI+-Encrypted Multicast Not Supported with Bundled Subinterfaces on the Cisco cBR-8 Router

The current Cisco IOS-XE releases do not support using BPI+ encrypted multicast on bundled cable subinterfaces on the Cisco cBR-8 router. Encrypted multicast is supported on bundled cable interfaces or on non-bundled cable subinterfaces, but not when a subinterface is bundled on the Cisco cBR-8 router.

### **BPI+ Not Supported with High Availability Configurations**

The current Cisco IOS-XE releases do not support using BPI+ encrypted multicast on a cable interface when the interface has also been configured for N+1 (1:n) High Availability or Remote Processor Redundancy Plus (RPR+) High Availability redundancy.

In addition, BPI+ is not automatically supported after a switchover from the Working cable interface to the Protect cable interface, because the cable interface configurations that are required for BPI+ encryption are not automatically synchronized between the two interfaces. A workaround for this is to manually configure the Protect cable interfaces with the required configurations.

### **DOCSIS Root Certificates**

The Cisco CMTS supports only one DOCSIS Root CA certificate.

### **Maximum Burst Size**

Previously, the maximum concatenated burst size parameter could be set to zero to specify an unlimited value. In a DOCSIS 1.1 environment, this parameter should be set to a nonzero value, with a maximum value of 1522 bytes for DOCSIS 1.0 cable modems.

If a cable modem attempts to register with a maximum concatenation burst size of zero, the DOCSIS 1.1 CMTS refuses to allow the cable modem to come online. This avoids the possibility that a DOCSIS 1.0 cable modem could interfere with voice traffic on the upstream by sending extremely large data packets. Since DOCSIS 1.0 does not support fragmentation, transmitting such data packets could result in unwanted jitter in the voice traffic.

In addition, DOCSIS 1.1 requires that the maximum transmit burst size be set to either 1522 bytes or the maximum concatenated burst size, whichever is larger. Do not set the maximum concatenation burst size to values larger than 1522 bytes for DOCSIS 1.0 cable modems.

---

**Note** This change requires you to change any DOCSIS configuration files that specify a zero value for the maximum concatenation burst size. This limitation does not exist for DOCSIS 1.1 cable modems unless fragmentation has been disabled.

---

### **Performance**

DOCSIS 1.0 cable modems lack the ability to explicitly request and provide scheduling parameters for advanced DOCSIS 1.1 scheduling mechanisms, such as unsolicited grants and real-time polling. DOCSIS 1.1 cable modems on the same upstream channel can benefit from the advanced scheduling mechanisms and a DOCSIS 1.1 CMTS can still adequately support voice traffic from DOCSIS 1.1 cable modems with DOCSIS 1.0 cable modems on the same upstream channel.

### **Provisioning**

The format and content of the TFTP configuration file for a DOCSIS 1.1 cable modem are significantly different from the file for a DOCSIS 1.0 cable modem. A dual-mode configuration file editor is used to generate a DOCSIS 1.0 style configuration file for DOCSIS 1.0 cable modems and a DOCSIS 1.1 configuration file for DOCSIS 1.1 cable modems.

## Registration

A DOCSIS 1.1 CMTS must handle the existing registration Type/Length/Value parameters from DOCSIS 1.0 cable modems as well as the new type TLVs from DOCSIS 1.1 cable modems. A DOCSIS 1.0 and DOCSIS 1.1 cable modem can successfully register with the same DOCSIS 1.1 CMTS.

A DOCSIS 1.1 cable modem can be configured to make an indirect reference to a service class that has been statically defined at the CMTS instead of explicitly asking for the service class parameters. When this registration request is received by a DOCSIS 1.1 CMTS, it encodes the actual parameters of the service class in the registration response and expects a DOCSIS 1.1-specific registration-acknowledge MAC message from the cable modem.

When a DOCSIS 1.0 cable modem registers with a DOCSIS 1.1 CMTS, the registration request explicitly requests all nondefault service-class parameters in the registration. The absence of an indirect service class reference eliminates the need for the DOCSIS 1.1 TLVs and eliminates the need to establish a local registration acknowledge wait state.

When a DOCSIS 1.1 CMTS receives a registration request from a DOCSIS 1.0 cable modem, it responds with the DOCSIS 1.0 style registration response and does not expect the cable modem to send the registration-acknowledge MAC message.

# Information about DOCSIS 1.1

DOCSIS 1.1 is the first major revision of the initial DOCSIS 1.0 standard for cable networks. Although the initial standard provided quality data traffic over the coaxial cable network, the demands of real-time traffic such as voice and video required many changes to the DOCSIS specification.

The DOCSIS 1.1 specification provides the following feature enhancements over DOCSIS 1.0 networks:

## Baseline Privacy Interface Plus

DOCSIS 1.0 introduced a Baseline Privacy Interface (BPI) to protect user data privacy across the shared-medium cable network and to prevent unauthorized access to DOCSIS-based data transport services across the cable network. BPI encrypts traffic across the RF interface between the cable modem and CMTS, and also includes authentication, authorization, and accounting (AAA) features.

BPI supports access control lists (ACLs), tunnels, filtering, protection against spoofing, and commands to configure source IP filtering on RF subnets to prevent subscribers from using source IP addresses that are not valid. DOCSIS 1.1 enhances these security features with BPI Plus (BPI+), which includes the following enhancements:

- X.509 Digital certificates provide secure user identification and authentication. The Cisco CMTS supports both self-signed manufacturer's certificates and certificates that are chained to the DOCSIS Root CA certificate.
- Key encryption uses 168-bit Triple DES (3DES) encryption that is suitable for the most sensitive applications.
- 1024-bit public key with Pkcs#1 Version 2.0 encryption.
- Support for encrypted multicast broadcasts, so that only authorized service flows receive a particular multicast broadcast.
- Secure software download allows a service provider to upgrade a cable modem's software remotely, without the risk of interception, interference, or alteration.

## Concatenation

Concatenation allows a cable modem to make a single time-slice request for multiple upstream packets, sending all of the packets in a single large burst on the upstream. Concatenation can send multiple upstream packets as part of one larger MAC data frame, allowing the cable modem to make only one time-slot request for the entire concatenated MAC frame, reducing the delay in transmitting the packets on the upstream channel. This avoids wasting upstream bandwidth when sending a number of very small packets, such as TCP acknowledgement packets.

## Dynamic MAC Messages

Dynamic Service MAC messages allow the cable modem to dynamically create service flows on demand. These messages are DOCSIS link layer equivalents of the higher layer messages that create, tear down, and modify a service flow.

The DOCSIS 1.1 dynamic services state machine supports the following messages:

- Dynamic Service Add (DSA)—This message is used to create a new service flow.
- Dynamic Service Change (DSC)—This message is used to change the attributes of an existing service flow.
- Dynamic Service Deletion (DSD)—This message is used to delete an existing service flow.

---

**Note** These messages are collectively known as DSX messages.

---

## Enhanced Quality of Service

DOCSIS 1.1 provides enhanced quality of service (QoS) capabilities to give priority for real-time traffic such as voice and video:

- The DOCSIS 1.0 QoS model (a service ID (SID) associated with a QoS profile) has been replaced with a service flow and service class model that allows greater flexibility in assigning QoS parameters to different types of traffic and in responding to changing bandwidth conditions.
- Support for multiple service flows per cable modem allows a single cable modem to support a combination of data, voice, and video traffic.
- Greater granularity in QoS per cable modem in either direction, using unidirectional service flows.
- Upstream service flows can be assigned one of the following QoS scheduling types, depending on the type of traffic and application being used:
  - Best-effort—Data traffic sent on a non-guaranteed best-effort basis. This type of service flow is similar to the method used in DOCSIS 1.0 networks.
  - Real-time polling (rtPS)—Real-time service flows, such as video, that produce unicast, variable size packets at fixed intervals.
  - Non-real-time polling service (nrtPS)—Similar to the rtPS type, in that the cable modem is guaranteed regular opportunities to request data bursts of varying length, except that the CMTS can vary the time between its polling of the cable modem depending on the amount of traffic and congestion on the network.
  - Unsolicited grants (UGS)—Constant bit rate (CBR) or committed information rate (CIR) traffic, such as voice, that is characterized by fixed-size packets at fixed intervals, providing a guaranteed minimum data rate.

- Unsolicited grants with activity detection (USG-AD)—Combination of UGS and rtPS, to accommodate real-time traffic that might have periods of inactivity (such as voice using silence suppression). The service flow uses UGS fixed grants while active, but switches to rtPS polling during periods of inactivity to avoid wasting unused bandwidth.

## Fragmentation

DOCSIS fragmentation allows the upstream MAC scheduler to slice large data requests to fit into the scheduling gaps between UGS (voice slots). This prevents large data packets from affecting real-time traffic, such as voice and video.

Fragmentation reduces the run-time jitter experienced by the UGS slots when large data grants preempt the UGS slots. Disabling fragmentation increases the run-time jitter, but also reduces the fragmentation reassembly overhead for fragmented MAC frames.

---

**Note** DOCSIS fragmentation should not be confused with the fragmentation of IP packets, which is done to fit the packets on network segments with smaller maximum transmission unit (MTU) size. DOCSIS Fragmentation is Layer 2 fragmentation that is primarily concerned with efficiently transmitting lower-priority packets without interfering with high-priority real-time traffic, such as voice calls. IP fragmentation is done at Layer 3 and is primarily intended to accommodate routers that use different maximum packet sizes.

---

## Interoperability

DOCSIS 1.1 cable modems can coexist with DOCSIS 1.0 and 1.0+ cable modems in the same network. The Cisco CMTS provides the levels of service that are appropriate for each cable modem.

## Payload Header Suppression

Payload header suppression (PHS) conserves link-layer bandwidth by suppressing repetitive or redundant packet headers on both upstream and downstream service flows. PHS is enabled or disabled per service flow, and each service flow can support a separate set of PHS rules that determine which parts of the header are suppressed. This ensures that PHS is done in the most efficient manner for each service flow and its particular type of application.

## Downstream ToS Overwrite

Downstream ToS Overwrite is supported in DOCSIS 1.1. It can be used in IPv4 and IPv6 environment. You can use CLI command **cable service class *class-index* tos-overwrite *and-mask or-mask*** or the cable modem configuration file to configure downstream ToS overwrite.

To display the ToS value, use the **show cable modem qos verbose** command as shown in the following example:

```
Router# show cable modem 30.140.0.41 qos verbose
Load for five secs: 5%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 15:22:46.911 CST Wed Apr 25 2018

Sfid: 29
Current State: Active
```

```

Sid: 8
Service Class Name:
Traffic Priority: 0
Maximum Sustained rate: 0 bits/sec
Maximum Burst: 3044 bytes
Minimum Reserved rate: 0 bits/sec
Minimum Packet Size: 0 bytes
Admitted QoS Timeout: 200 seconds
Active QoS Timeout: 0 seconds
Maximum Concatenated Burst: 1522 bytes
Scheduling Type: Best Effort
Request/Transmission policy: 0x0
IP ToS Overwrite[AND-mask, OR-mask]: 0xFF, 0x0
Peak Rate: 0 bits/sec
Current Throughput: 545 bits/sec, 0 packets/sec

Sfid: 30
Current State: Active
Sid: N/A
Low Latency App: No
Service Class Name:
Traffic Priority: 0
Maximum Sustained rate: 0 bits/sec
Maximum Burst: 3044 bytes
Minimum Reserved rate: 0 bits/sec
Minimum Packet Size: 0 bytes
Admitted QoS Timeout: 200 seconds
Active QoS Timeout: 0 seconds
Maximum Latency: 0 usecs
IP ToS Overwrite[AND-mask, OR-mask]: 0xFF, 0x0
Peak Rate: 0 bits/sec
Current Throughput: 446 bits/sec, 0 packets/sec

```

## DOCSIS 1.1 Quality of Service

The DOCSIS 1.1 QoS framework is based on the following objects:

- Service flow—A unidirectional sequence of packets on the DOCSIS link. Separate service flows are used for upstream and downstream traffic, and define the QoS parameters for that traffic.
- Service class—A collection of settings maintained by the CMTS that provide a specific QoS service tier to a cable modem that has been assigned a service flow associated with that service class.
- Packet classifier—A set of packet header fields used to classify packets onto a service flow to which the classifier belongs. The CMTS uses the packet classifiers to match the packet to the appropriate service flow.
- Payload header suppression (PHS) rule—A set of packet header fields that are suppressed by the sending entity before transmitting on the link, and are restored by the receiving entity after receiving a header-suppressed frame transmission. PHS increases the bandwidth efficiency by removing repeated packet headers before transmission.

See the following sections for more information on these components.

### Service Flow

In DOCSIS 1.1, the basic unit of QoS is the service flow, which is a unidirectional sequence of packets transported across the RF interface between the cable modem and CMTS. A service flow defines a set of QoS parameters such as latency, jitter, and throughput assurances, and these parameters can be applied independently to the upstream and downstream traffic flows. This is a major difference from DOCSIS 1.0 networks, where the same QoS parameters were applied to both the downstream and upstream flows.

**Note** DOCSIS 1.0 networks used service IDs (SIDs) to identify the QoS parameter set for a particular flow. DOCSIS 1.1 networks use the service flow ID (SFID) to identify the service flows that have been assigned to a particular upstream or downstream. DOCSIS 1.1 networks still use the term SID, but it applies exclusively to upstream service flows.

Every cable modem establishes primary service flows for the upstream and downstream directions, with a separate SFID for the upstream and the downstream flows. The primary flows maintain connectivity between the cable modem and CMTS, allowing the CMTS to send MAC management messages at all times to the cable modem.

In addition, a DOCSIS 1.1 cable modem can establish multiple secondary service flows. The secondary service flows either can be permanently created (by configuring them in the DOCSIS configuration file that is downloaded to the cable modem), or the service flows can be created dynamically to meet the needs of the on-demand traffic, such as voice calls. Permanent service flows remain in effect, even if they are not being used, while dynamic service flows are deleted when they are no longer needed.

At any given time, a service flow might be in one of three states (provisioned, admitted, or active). Only active flows are allowed to pass traffic on the DOCSIS network. Every service flow is identified by an SFID, while upstream service flows in the admitted and active state have an extra Layer 2 SID associated with them. The SID is the identifier used by the MAC scheduler when specifying time-slot scheduling for different service flows.

## Service Class

Each service flow is associated with a service class, which defines a particular class of service and its QoS characteristics, such as the maximum bandwidth for the service flow and the priority of its traffic. The service class attributes can be inherited from a preconfigured CMTS local service class (class-based flows), or they can be individually specified when a cable modem dynamically requests a service flow and the CMTS creates it.

The DOCSIS 1.1 service class also defines the MAC-layer scheduling type for the service flow. The schedule type defines the type of data burst requests that the cable modem can make, and how often it can make those requests. The following types of schedule types are supported:

- **Best-effort (BE)**—A cable modem competes with the other cable modems in making bandwidth requests and must wait for the CMTS to grant those requests before transmitting data. This type of service flow is similar to the method used in DOCSIS 1.0 networks.
- **Real-time polling service (rtPS)**—A cable modem is given a periodic time slot in which it can make bandwidth requests without competing with other cable modems. This allows real-time transmissions with data bursts of varying length.
- **Non-real-time polling service (nrtPS)**—A cable modem is given regular opportunities to make bandwidth requests for data bursts of varying size. This type of flow is similar to the rtPS type, in that the cable modem is guaranteed regular opportunities to request data bursts of varying length, except that the CMTS can vary the time between its polling of the cable modem, depending on the amount of traffic and congestion on the network.
- **Unsolicited grant service (UGS)**—A cable modem can transmit fixed data bursts at a guaranteed minimum data rate and with a guaranteed maximum level of jitter. This type of service flow is suitable for traffic that requires a Committed Information Rate (CIR), such as Voice-over-IP (VoIP) calls.
- **Unsolicited grant service with activity detection (UGS-AD)**—Similar to the UGS type, except that the CMTS monitors the traffic to detect when the cable modem is not using the service flow (such as voice calls when nobody is speaking). When the CMTS detects silence on the service flow, the CMTS

temporarily switches the service flow to an rtPS type. When the cable modem begins using the flow again, the CMTS switches the flow back to the UGS type. This allows the CMTS to more efficiently support VoIP calls.

Each service flow is assigned a single service class, but the same service class can be assigned to multiple service flows. Also, a cable modem can be assigned multiple service flows, allowing it to have multiple traffic flows that use different service classes.

## Packet Classifiers

In DOCSIS 1.0 networks, a cable modem used only one set of QoS parameters for all of its traffic, so the CMTS simply had to route packets to and from the appropriate cable modems. In DOCSIS 1.1 networks, however, cable modems can be using multiple service flows, and each service flow can be given a different level of service. To quickly assign upstream and downstream packets to their proper service flows, the CMTS uses the concept of packet classifiers.

Each packet classifier specifies one or more packet header attributes, such as source MAC address, destination IP address, or protocol type. The classifier also specifies the service flow to be used when a packet matches this particular combination of headers. Separate classifiers are used for downstream and upstream service flows.

When the CMTS receives downstream and upstream packets, it compares each packet's headers to the contents of each packet classifier. When the CMTS matches the packet to a classifier, the CMTS then assigns the proper SFID to the packet and transmits the packet to or from the cable modem. This ensures that the packet is assigned its proper service flow, and thus its proper QoS parameters.

Figure below illustrates the mapping of packet classifiers.

Figure 33: Classification Within the MAC Layer

## Packet Header Suppression Rules

Because many data and real-time applications may use fixed values in their packet header fields, DOCSIS 1.1 supports PHS to suppress the duplicate portions of the packet headers when a group of packets is transmitted during a session. Each service flow can support a separate set of PHS rules that determine which parts of the header are suppressed.

When PHS is being used, the transmitting CMTS suppresses the specified headers in all the packets for that service flow. The receiving CMTS then restores the missing headers before forwarding the packets on to their ultimate destination.

Proper use of PHS can increase the efficiency of packetized transmissions, especially for real-time data that is encapsulated by other protocols, such as VoIP traffic.

## Quality of Service Comparison

This section summarizes the differences in QoS between DOCSIS 1.0, DOCSIS 1.0+, and DOCSIS 1.1 networks.

---

**Note** Cisco CMTS routers can transparently interoperate with cable modems running DOCSIS 1.0, DOCSIS 1.0+ extensions, or DOCSIS 1.1. If a cable modem indicates at system initialization that it is DOCSIS 1.1-capable, the Cisco CMTS router uses the DOCSIS 1.1 features. If the cable modem is not DOCSIS 1.1-capable, but does support the DOCSIS 1.0+ QoS extensions, the Cisco CMTS automatically supports the cable modem's requests for dynamic services. Otherwise, the cable modem is treated as a DOCSIS 1.0 device.

---

## DOCSIS 1.0

DOCSIS 1.0 uses a static QoS model that is based on a class of service (CoS) that is preprovisioned in the DOCSIS configuration file that is downloaded to the cable modem. The CoS is a bidirectional QoS profile that applies to both the upstream and downstream directions, and that has limited control, such as peak rate limits in either direction, and relative priority on the upstream.

DOCSIS 1.0 defines the concept of a service identifier (SID), which identifies the cable modems that are allowed to transmit on the network. In DOCSIS 1.0 networks, each cable modem is assigned only one SID for both the upstream and downstream directions, creating a one-to-one correspondence between a cable modem and its SID. All traffic originating from, or destined for, a cable modem is mapped to that particular SID.

Typically, a DOCSIS 1.0 cable modem has one CoS and treats all traffic the same, which means that data traffic on a cable modem can interfere with the quality of a voice call in progress. The CMTS, however, has a limited ability to prioritize downstream traffic based on IP precedence type-of-service (ToS) bits.

For example, voice calls using higher IP precedence bits receive a higher queueing priority (but without a guaranteed bandwidth or rate of service). A DOCSIS 1.0 cable modem could increase voice call quality by permanently reserving bandwidth for voice calls, but then that bandwidth would be wasted whenever a voice call is not in progress.

## DOCSIS 1.0+

In response to the limitations of DOCSIS 1.0 networks in handling real-time traffic, such as voice calls, Cisco created the DOCSIS 1.0+ extensions to provide the more important QoS enhancements that were expected in DOCSIS 1.1. In particular, the DOCSIS 1.0+ enhancements provide basic Voice-over-IP (VoIP) service over the DOCSIS link.

Cisco's DOCSIS 1.0+ extensions include the following DOCSIS 1.1 features:

- Multiple SIDs per cable modem, creating separate service flows for voice and data traffic. This allows the CMTS and cable modem to give higher priority for voice traffic, preventing the data traffic from affecting the quality of the voice calls.
- Cable modem-initiated dynamic MAC messages—Dynamic Service Addition (DSA) and Dynamic Service Deletion (DSD). These messages allow dynamic SIDs to be created and deleted on demand, so that the bandwidth required for a voice call can be allocated at the time a call is placed and then freed up for other uses when the call is over.
- Unsolicited grant service (CBR-scheduling) on the upstream—This helps provide a higher-quality channel for upstream VoIP packets from an Integrated Telephony Cable Modem (ITCM) such as the Cisco uBR925 cable access router.
- Ability to provide separate downstream rates for any given cable modem, based on the IP-precedence value in the packet. This helps separate voice signaling and data traffic that goes to the same ITCM to address rate shaping purposes.

- Concatenation allows a cable modem to send several packets in one large burst, instead of having to make a separate grant request for each.

**Caution** All DOCSIS 1.0 extensions are available only when using a cable modem and CMTS that supports these extensions. The cable modem activates the use of the extensions by sending a dynamic MAC message. DOCSIS 1.0 cable modems continue to receive DOCSIS 1.0 treatment from the CMTS.

## Interoperability with Different Versions of DOCSIS Networks

DOCSIS 1.1 cable modems have additional features and better performance than earlier DOCSIS 1.0 and 1.0+ models, but all three models can coexist in the same network. DOCSIS 1.0 and 1.0+ cable modems will not hamper the performance of a DOCSIS 1.1 CMTS, nor will they interfere with operation of DOCSIS 1.1 features.

Table below shows the interoperability of a DOCSIS 1.1 CMTS with different versions of cable modems.

**Table 209: DOCSIS 1.1 Interoperability**

| For this configuration...                     | The result is...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DOCSIS 1.1 CMTS with DOCSIS 1.0 cable modems  | DOCSIS 1.0 cable modems receive DOCSIS 1.0 features and capabilities. BPI is supported if available and enabled on the CMTS.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DOCSIS 1.1 CMTS with DOCSIS 1.0+ cable modems | DOCSIS 1.0+ cable modems receive basic DOCSIS 1.0 support. BPI is supported if available and enabled on the CMTS. In addition, DOCSIS 1.0+ cable modems also receive the following DOCSIS 1.1 features: <ul style="list-style-type: none"> <li>• Multiple SIDs per cable modem</li> <li>• Dynamic service MAC messaging initiated by the cable modem</li> <li>• Unsolicited grant service (UGS, CBR-scheduling) on the upstream</li> <li>• Separate downstream rates for any given cable modem, based on the IP-precedence value</li> <li>• Concatenation</li> </ul> |
| DOCSIS 1.1 CMTS with DOCSIS 1.1 cable modems  | DOCSIS 1.1 cable modems receive all the DOCSIS 1.1 features listed in this document. BPI+ is supported if available and enabled on the CMTS.                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Enhanced Rate Bandwidth Allocation (ERBA) Support for DOCSIS 1.0 Cable Modems

To define ERBA on the downstream for DOCSIS 1.0 cable modems, use the cable qos promax-ds-burst command in global configuration mode.

The ERBA feature is characterized by the following enhancements:

- Enables support for the DOCSIS1.1 Downstream Maximum Transmit Burst parameter on the Cisco CMTS by using the **cable ds-max-burst** configuration command.
- Allows DOCSIS1.0 modems to support the DOCSIS1.1 Downstream Maximum Transmit Burst parameter by mapping DOCSIS1.0 modems to overriding DOCSIS 1.1 QoS profile parameters on the Cisco CMTS.

ERBA allows DOCSIS 1.0 modems to burst their temporary transmission rate up to the full line rate for short durations of time. This capability provides higher bandwidth for instantaneous bandwidth requests, such as those in Internet downloads, without having to make changes to existing service levels in the QoS Profile.

This feature allows you to set the DOCSIS 1.0 cable modems burst transmissions, with mapping to overriding DOCSIS 1.1 QoS profile parameters on the Cisco CMTS. DOCSIS 1.0 cable modems require DOCSIS 1.0 parameters when registering to a matching QoS profile. This feature enables maximum downstream line rates, and the ERBA setting applies to all cable modems that register to the corresponding QoS profile.

---

**Note** QoS definitions must previously exist on the Cisco CMTS headend to support this feature.

---

ERBA for DOCSIS 1.0 cable modems is supported with these new or enhanced commands or keywords:

- cable qos pro max-ds-burst burst-size
- show cable qos profile n [verbose]

## DOCSIS 3.0 Downstream Peak Traffic Rate TLV Support for ERBA

The DOCSIS WFQ Scheduler allows each service flow to have one dedicated queue. When ERBA is enabled for the service flow, the peak rate is implemented as the queue shape rate within the scheduler, while the maximum sustained rate is set as the token bucket refill rate. When ERBA is turned off, the burst size and the peak rate value are not used.

The maximum traffic burst parameter is used to control a service flow burst duration, to burst up to the channel line rate or a configured peak rate, when it is within its maximum burst size allowance. On the Cisco cBR-8 Converged Broadband Router, the **cable ds-max-burst** command is used to control this behavior explicitly.

The *peak-rate* keyword is introduced to specify the peak rate an ERBA-enabled service flow can use. The peak rate value is applied to a specific service flow created after the configuration of the **cable ds-max-burst** command.

If the DOCSIS 3.0 TLV 25.27 is specified for a service flow, the *peak rate* value is set as the TLV value. However, if ERBA is not turned on for a service flow, the *peak rate* value is ignored.

During modem registration or Dynamic Service Addition (DSA) operation, the service class name TLV 25.4 is sent to create the static or dynamic downstream service flow that matches the service class template. These downstream service flows are created with a specific *peak rate*.

Some of the DOCSIS 1.x and DOCSIS 2.0 cable modems, which are not fully DOCSIS 1.x or DOCSIS 2.0 compliant, may fail to come online when the downstream peak rate TLV 25.27 is received from the CMTS during registration. To overcome this failure, you can configure the cable service attribute withhold-TLVs command to restrict sending of the peak traffic rate TLVs to DOCSIS 1.x and DOCSIS 2.0 cable modems. For more information on how to suppress peak rate TLVs, see [Suppressing Upstream and Downstream Peak Rate TLVs for pre DOCSIS 3.0 Cable Modems, on page 1203](#).

---

**Note** The ERBA feature is not applicable for high priority service flows and multicast service flows.

---

Table below summarizes the ERBA support for the Cisco cBR-8 router.

**Table 210: Enhanced Rate Bandwidth Allocation Support for the Cisco cBR-8 Router**

|                           | <b>Policer Rate</b>                     | <b>Policer Exceed Action</b> | <b>Policer Token Bucket Size</b>             | <b>Queue Shape Rate</b>        |
|---------------------------|-----------------------------------------|------------------------------|----------------------------------------------|--------------------------------|
| Traditional Service Flow  | Maximum Sustained Traffic Rate (unused) | Transmit                     | A value computed internally by CMTS (unused) | Maximum Sustained Traffic Rate |
| ERBA-Enabled Service Flow | Maximum Sustained Traffic Rate          | Drop                         | Maximum Traffic Burst TLV                    | Peak Traffic Rate              |

In Cisco cBR-8 routers, the dual token bucket-based shaper is used to support ERBA on the Cisco cBR-8 CCAP line card (the ERBA feature is always enabled on the Cisco cBR-8 CCAP line card). The dual token bucket shaper has two independent token buckets for each service flow. The maximum rate of one bucket is configured to MSR and the maximum tokens are set to maximum traffic burst. The other bucket is configured with the refilling rate of the *peak rate* and the maximum tokens are set to the default level of 4 milliseconds. Packets are shaped if any of the two buckets are exhausted.

Table below summarizes the ERBA dual token bucket configuration for the Cisco cBR-8 routers.

**Table 211: ERBA Dual Token Bucket Configuration**

|                           | <b>Token Bucket Rate (One)</b> | <b>Token Bucket Size (One)</b>     | <b>Token Bucket Rate (Two)</b> | <b>Token Bucket Size (Two)</b> |
|---------------------------|--------------------------------|------------------------------------|--------------------------------|--------------------------------|
| Traditional Service Flow  | Maximum Sustained Traffic Rate | 4ms * MSR                          | N/A                            | N/A                            |
| ERBA-enabled Service Flow | Maximum Sustained Traffic Rate | Maximum Traffic Burst or 4ms * MSR | Peak Rate                      | 4ms * Peak Rate                |

## Suppressing Upstream and Downstream Peak Rate TLVs for pre DOCSIS 3.0 Cable Modems

The DOCSIS 3.0 upstream (US) peak rate TLV 24.27 and downstream (DS) peak rate TLV 25.27 are enabled on the Cisco CMTS through the cable service class command or the CM configuration file. The DOCSIS 1.x and DOCSIS 2.0 CMs do not support these TLVs. Ideally, if a DOCSIS 1.x or DOCSIS 2.0 CM receives peak rate TLVs during registration, it should ignore these TLVs and proceed with the registration. However there are a few old non-compliant pre DOCSIS 3.0 CMs, which may fail to come online when peak-rate TLVs are received in the registration response from the Cisco CMTS. To overcome this, the Cisco CMTS enables suppression of the DOCSIS 3.0 peak rate TLVs for the pre-DOCSIS3.0 CMs.

To suppress the DOCSIS 3.0 US and DS peak rate TLVs, use the **cable service attribute withhold-TLVs command with the peak-rate** keyword in global configuration mode. When configured, this command restricts the Cisco CMTS from sending US and DS peak rate TLVs to the DOCSIS 1.x and DOCSIS 2.0 CMs. The decision to send the TLVs is based on the DOCSIS version of the CM received during registration. If the registration request is from a pre DOCSIS 3.0 CM, the peak rate TLVs are not sent in the registration response. However this command does not restrict sending of DOCSIS 3.0 peak-rate TLVs to DOCSIS 3.0 CMs.

## Downstream Classification Enhancement with MAC Addresses

Downstream classifiers, specified in the cable modem configuration file, are used to map packets to service flows based on DOCSIS specifications. New combinations of downstream classifiers with a destination MAC address are supported. This enhancement enables service providers to better manage high priority service flows associated with a downstream classifier. For example, a single User Datagram Protocol (UDP) port can be shared by high priority and low priority traffic.

Downstream classification is automatically enabled on the Cisco CMTS router. The downstream classifier combinations that are supported on the router are listed below:

Without Combination

- IP (IPv4)
- IPv6
- TCP/UDP
- Destination MAC

With Combination

- IPv4 + TCP/UDP
- IPv6 + TCP/UDP
- Destination MAC + IPv4 (with the exception of a destination IP address)
- Destination MAC + IPv6 (with the exception of a destination IPv6 address)
- Destination MAC + TCP/UDP
- Destination MAC + IPv4 + TCP/UDP (with the exception of a destination IP address)
- Destination MAC + IPv6 + TCP/UDP (with the exception of a destination IPv6 address)

## Benefits

DOCSIS 1.1 includes a rich set of features that provide advanced and flexible QoS capabilities for various types of traffic (voice, data, and video) over the cable network. It also provides enhanced security and authentication features.

### Baseline Privacy Interface Plus Enhancement

The Plus (+) version of the Baseline Privacy Interface (BPI+) in DOCSIS 1.1 provides a set of extended services within the MAC sublayer that increase performance and system security. Digital certificates provide secure authentication for each cable modem, to prevent identity theft on the basis of MAC and IP addresses. Advanced encryption provides a secure channel between the cable modem and CMTS, and secure software download allows a service provider to upgrade the software on cable modems, without the threat of interception, interference, or alteration of the software code.

### Dynamic Service Flows

The dynamic creation, modification, and deletion of service flows allows for on-demand reservation on Layer 2 bandwidth resources. The CMTS can now provide special QoS to the cable modem dynamically for the duration of a voice call or video session, as opposed to the static provisioning and reservation of resources at the time of cable modem registration. This provides a more efficient use of the available bandwidth.

### Concatenation

The cable modem concatenates multiple upstream packets into one larger MAC data frame, allowing the cable modem to make only one time-slot request for the entire concatenated MAC frame, as opposed to requesting a time slot for each packet. This reduces the delay in transferring the packet burst upstream.

### Enhanced QoS

Extensive scheduling parameters allow the CMTS and the cable modem to communicate QoS requirements and achieve more sophisticated QoS on a per service-flow level.

Different new time-slot scheduling disciplines help in providing guaranteed delay and jitter bound on shared upstream. Activity detection helps to conserve link bandwidth by not issuing time slots for an inactive service flow. The conserved bandwidth can then be reused for other best-effort data slots.

Packet classification helps the CMTS and cable modem to isolate different types of traffic into different DOCSIS service flows. Each flow could be receiving a different QoS service from CMTS.

### Fragmentation

Fragmentation splits large data packets so that they fit into the smaller time slots inbetween UGS slots. This reduces the jitter experienced by voice packets when large data packets are transmitted on the shared upstream channel and preempt the UGS slots used for voice.

### Multiple Subflows per SID

This feature allows the cable modem to have multiple calls on a single hardware queue. This approach scales much better than requiring a separate SID hardware queue on the cable modem for each voice call.

### Payload Header Suppression

Payload Header Suppression (PHS) allows the CMTS and cable modem to suppress repetitive or redundant portions in packet headers before transmitting on the DOCSIS link. This conserves link bandwidth, especially with types of traffic such as voice, where the header size tends to be as large as the size of the actual packet.

### Service Classes

The use of the service class provides the following benefits for a DOCSIS 1.1 network:

- It allows operators to move the burden of configuring service flows from the provisioning server to the CMTS. Operators provision the modems with the service class name; the implementation of the name is configured at the CMTS. This allows operators to modify the implementation of a given service to local circumstances without changing modem provisioning. For example, some scheduling parameters might need to be set differently for two different CMTSs to provide the same service. As another example, service profiles could be changed by time of day.
- It allows CMTS vendors to provide class-based-queuing if they choose, where service flows compete within their class and classes compete with each other for bandwidth.
- It allows higher-layer protocols to create a service flow by its service class name. For example, telephony signaling might direct the cable modem to instantiate any available provisioned service flow of class G.711.

---

**Note** The service class is optional. The flow scheduling specification may always be provided in full; a service flow may belong to no service class whatsoever. CMTS implementations *may* treat such unclassified flows differently from classed flows with equivalent parameters.

---

## How to Configure the Cisco CMTS for DOCSIS 1.1 Operations

See the following sections for the configuration tasks for DOCSIS 1.1 operations. Each task in the list is identified as either required or optional.

---

**Note** This section describes only the configuration tasks that are specific for DOCSIS 1.1 operations. For complete configuration information, see the software configuration documents listed in the [Additional References, on page 1227](#).

---

## Configuring Baseline Privacy Interface

BPI+ encryption is by default enabled for 56-bit DES encryption on all cable interfaces. If BPI+ encryption has been previously disabled, or if you want to reconfigure BPI+ encryption on a cable interface on the CMTS, use the following procedure.

---

**Note** If you have disabled BPI+ encryption on a cable interface, and a cable modem attempts to register on that interface using BPI+ encryption, the CMTS will reject its registration request, displaying a %CBR-4-SERVICE\_PERMANENTLY\_UNAVAILABLE error message. The **show cable modem** command will also show that this cable modem has been rejected with a MAC status of reject(c).

---

### Before you begin

BPI+ encryption is supported on all Cisco CMTS images that include “k1”, “k8”, or “k9” in its file name or BPI in the feature set description. All BPI images support 40-bit and 56-bit DES encryption.

By default, BPI+ encryption is enabled for 56-bit DES encryption. Also, when a cable modem is running DOCSIS 1.1 software, BPI+ encryption is enabled by default, unless the service provider has disabled it by setting the Privacy Enable field (TLV 29) in the DOCSIS configuration file to 0. Therefore, both the CMTS and cable modem are set to use BPI+ encryption when using the default configurations.

### Procedure

|        | Command or Action         | Purpose                                                        |

|               | Router> <b>enable</b><br>Router#                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b><br>Router(config)#                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>interface cableslot /subslot /port</b><br><b>Example:</b><br><br>Router(config)# <b>interface cable 6/0/0</b><br>Router(config-if)#                                              | Enters interface configuration mode for the cable interface line card at this particular slot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>cable privacy</b><br><b>Example:</b><br><br>Router(config-if)# <b>cable privacy</b><br>Router(config-if)#                                                                        | (Optional) Enables BPI+ 56-bit DES encryption on the cable interface (default).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 5</b> | <b>cable privacyaccept-self-signed-certificate</b><br><b>Example:</b><br><br>Router(config-if)# <b>cable privacy</b><br><b>accept-self-signed-certificate</b><br>Router(config-if)# | <p>(Optional) Allows cable modems to register using self-signed manufacturer certificates, as opposed to the default of allowing only manufacturer's certificates that are chained to the DOCSIS root certificate.</p> <p><b>Caution</b> Use the above command sparingly, as it bypasses DOCSIS BPI+ certificates. Otherwise, self-signed certificates provide workaround registration for cable modems that are not compliant with DOCSIS BPI+ certificates. This functionality is strictly intended for troubleshooting of a short duration or in the context of additional security measures.</p> <p><b>Note</b> By default, the CMTS does not accept self-signed certificates. In the default configuration, if a cable modem attempts to register with self-signed certificates, the CMTS will refuse to allow the cable modem to register.</p> |
| <b>Step 6</b> | <b>cable privacy authorize-multicast</b><br><b>Example:</b><br><br>Router(config-if)# <b>cable privacy</b>                                                                          | (Optional) Enables BPI+ encryption on the cable interface and uses AAA protocols to authorize all multicast stream (IGMP) join requests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                              |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>authorize-multicast</b><br>Router (config-if) #                                                                                                            | <b>Note</b> If you use this command to authorize multicast streams, you must also use the <b>cable privacy authenticate-modem</b> command to enable AAA services on the cable interface.                                                                                             |
| <b>Step 7</b>  | <b>cable privacy mandatory</b><br><b>Example:</b><br><br>Router (config-if) # <b>cable privacy mandatory</b><br>Router (config-if) #                          | (Optional) Requires baseline privacy be active for all CMs with BPI/BPI+ enabled in the DOCSIS configuration files, else the CMs are forced to go offline.<br><br>If a CM does not have BPI enabled in its DOCSIS configuration file, it will be allowed to come online without BPI. |
| <b>Step 8</b>  | <b>cable privacy oaep-support</b><br><b>Example:</b><br><br>Router (config-if) # <b>cable privacy oaep-support</b><br>Router (config-if) #                    | (Optional) Enables BPI+ encryption on the cable interface and enables Optimal Asymmetric Encryption Padding (OAEP). This option is enabled by default. Disabling this option could have a performance impact.                                                                        |
| <b>Step 9</b>  | <b>cable privacy kek {life-time seconds}</b><br><b>Example:</b><br><br>Router (config-if) # <b>cable privacy kek life-time 302400</b><br>Router (config-if) # | (Optional) Configures the life-time values for the key encryption keys (KEKs) for BPI+ operations on all cable interfaces.                                                                                                                                                           |
| <b>Step 10</b> | <b>cable privacy tek {life-time seconds}</b><br><b>Example:</b><br><br>Router (config-if) # <b>cable privacy tek life-time 86400</b><br>Router (config-if) #  | (Optional) Configures the life-time values for the traffic encryption keys (TEKs) for BPI+ operations on all cable interfaces.                                                                                                                                                       |
| <b>Step 11</b> | <b>exit</b><br><b>Example:</b><br><br>Router (config-if) # <b>exit</b><br>Router (config) #                                                                   | Exits interface configuration mode.<br><br><b>Note</b> Repeat steps <a href="#">Step 3, on page 1207</a> through <a href="#">Step 11, on page 1208</a> for each cable interface.                                                                                                     |
| <b>Step 12</b> | <b>exit</b><br><b>Example:</b><br><br>Router (config) # <b>exit</b><br>Router #                                                                               | Exits global configuration mode.                                                                                                                                                                                                                                                     |

**What to do next**

You can also configure the following additional timers for BPI+ operations in the DOCSIS configuration file for each cable modem. As a general rule, you do not need to specify these timers in the DOCSIS configuration file unless you have a specific reason for changing them from their default values.

**Table 212: Individual Cable Modem BPI+ Timer Values**

| Timer                         | Description                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authorize Wait Timeout        | The amount of time a cable modem will wait for a response from a CMTS when negotiating a KEK for the first time.                                                  |
| Reauthorize Wait Timeout      | The amount of time a cable modem will wait for a response from a CMTS when negotiating a new KEK because the Authorization Key (KEK) lifetime is about to expire. |
| Authorize Reject Wait Timeout | The amount of time a cable modem must wait before attempting to negotiate a new KEK if the CMTS rejects its first attempt to negotiate a KEK.                     |
| Operational Wait Timeout      | The amount of time a cable modem will wait for a response from a CMTS when negotiating a TEK for the first time.                                                  |
| Rekey Wait Timeout            | The amount of time a cable modem will wait for a response from a CMTS when negotiating a new TEK because the TEK lifetime is about to expire.                     |

## Downloading the DOCSIS Root Certificate to the CMTS

DOCSIS 1.1 allows cable modems to identify themselves using a manufacturer's chained X.509 digital certificate that is chained to the DOCSIS root certificate. The DOCSIS root certificate is already installed on the bootflash of the CMTS router. However, if you want to install another root certificate, for example, the Euro-DOCSIS certificate, download the certificate and save it on the bootflash as "euro-root-cert".

**Tip** For more information about the DOCSIS root certificate provided by Verisign, see the information at the following URL: <http://www.verisign.com/products-services/index.html>

**Note** You may load the DOCSIS root certificate and a EuroDOCSIS or PacketCable root certificate. Cisco recommends that the EuroDOCSIS PacketCable root certificates be copied into bootflash.

To download the DOCSIS root certificate to the Cisco CMTS, which is required if any cable modems on the network are using chained certificates, use the following procedure:

- Step 1** Download the DOCSIS root certificate from the DOCSIS certificate signer, Verisign. At the time of this document's printing, the DOCSIS root certificate is available for download at the following URL: <http://www.verisign.com/products-services/index.html>
- Step 2** Verisign distributes the DOCSIS root certificate in a compressed ZIP archive file. Extract the DOCSIS root certificate from the archive and copy the certificate to a TFTP server that the CMTS can access.

**Tip** To avoid possible confusion with other certificates, keep the file's original filename of "CableLabs\_DOCSIS.509" when saving it to the TFTP server.

**Step 3** Log in to the Cisco CMTS using either a serial port connection or a Telnet connection. Enter the **enable** command and password to enter Privileged EXEC mode:

**Example:**

```
Router> enable
Password: <password>
Router#
```

**Step 4** Use the **dir bootflash** command to verify that the bootflash has sufficient space for the DOCSIS root certificate (approximately 1,000 bytes of disk space):

**Example:**

```
Router# dir bootflash:
Directory of bootflash:/
 1 -rw- 3229188 Dec 30 2002 15:53:23 cbrsup-universalk9.2015-03-18_03.30_johuynh.SSA.bin

3407872 bytes total (250824 bytes free)
Router#
```

**Tip** If you delete files from the bootflash to make room for the DOCSIS root certificate, remember to use the **squeeze** command to reclaim the free space from the deleted files.

**Step 5** Use the **copy tftp bootflash** command to copy the DOCSIS root certificate to the router's bootflash memory. (The file must be named "root-cert" on the bootflash for the CMTS to recognize it as the root certificate.)

**Example:**

```
Router# copy tftp bootflash:
Address or name of remote host []? tftp-server-ip-address
Source filename []? CableLabs_DOCSIS.509
Destination filename [CableLabs_DOCSIS.509]? root-cert

Loading CableLabs_DOCSIS.509 from tftp-server-ip-address (via FastEthernet0/0): !
[OK - 996/1024 bytes]
996 bytes copied in 4.104 secs (249 bytes/sec)
Router#
```

**Tip** You can also copy the root certificate to a PCMCIA Flash Disk (disk0 or disk1). However, because Flash Disks are not secure and easily removed from the router, we recommend that you keep the root certificate in the bootflash for both operational and security reasons.

**Step 6** Verify that the DOCSIS root certificate has been successfully copied to the bootflash memory:

**Example:**

```
Router# dir bootflash:
Directory of bootflash:/
```

```

1 -rw- 3229188 Dec 30 2002 15:53:23 cbrsup-universalk9.2015-03-18_03.30_johuynh.SSA.bin
2 -rw- 996 Mar 06 2002 16:03:46 root-cert
3408876 bytes total (248696 zbytes free)
Router#

```

**Step 7** (Optional) After the first cable modem has registered using BPI+, you can use the **show crypto ca trustpoints** command to display the Root certificate that the CMTS has learned:

**Note** The **show crypto ca trustpoints** command does not display the root certificate until after at least one cable modem has registered with the CMTS using BPI+ encryption. Alternatively, you can use the unsupported command **test cable generate** in privileged EXEC mode to force the CMTS to register the root certificate.

**Example:**

```

Router# show crypto ca trustpoints
Root certificate
Status: Available
Certificate Serial Number: D54BB68FE934324F6B8FD0E41A65D867
Key Usage: General Purpose
Issuer:
 CN = DOCSIS Cable Modem Root Certificate Authority
 OU = Cable Modems
 O = Data Over Cable Service Interface Specifications
 C = US
Subject Name:
 CN = "BPI Cable Modem Root Certificate Authority "
 OU = DOCSIS
 O = BPI
 C = US
Validity Date:
 start date: 07:00:00 UTC Mar 27 2001
 end date: 06:59:59 UTC Jan 1 2007

```

### What to do next

**Tip** To display all certificates (Root, Manufacturers, CM) that the CMTS has learned, use the **show crypto ca certificates** command.

## Adding a Manufacturer's Certificate as a Trusted Certificate

The DOCSIS specifications allow operators to control which manufacturer's and CM certificates are allowed on each CMTS by marking them as either trusted or untrusted. You can add a certificate to the list of trusted certificates on the Cisco CMTS using SNMP commands, as described in the following section:

### Adding a Certificate as a Trusted Certificate Using SNMP Commands

You can also use an SNMP manager to create and add certificates to the CMTS list of trusted certificates by manipulating the tables and attributes in the [DOCS-BPI-PLUS-MIB](#). To add a manufacturer's certificate, add an entry to the docsBpi2CmtsCACertTable table. Specify the following attributes for each entry:

- docsBpi2CmtsCACertStatus—Set to 4 to create the row entry.

- docsBpi2CmtsCACert—The hexadecimal data, as an X509Certificate value, for the actual X.509 certificate.
- docsBpi2CmtsCACertTrust—An Integer value from 1 to 4 specifying the certificate's trust status: 1=trusted, 2=untrusted, 3= chained, 4=root. Specify 1 for certificates that should be trusted and 3 for chained certificates that should be verified with the root certificate.

Similarly, to add a CM certificate to the list of trusted certificates, add an entry to the docsBpi2CmtsProvisionedCmCertTable table. Specify the following attributes for each entry:

- docsBpi2CmtsProvisionedCmCertStatus—Set to 4 to create the row entry.
- docsBpi2CmtsProvisionedCmCert—The hexadecimal data, as an X509Certificate value, for the actual X.509 certificate.
- docsBpi2CmtsProvisionedCmCertTrust—An Integer value from 1 to 2 specifying the certificate's trust status: 1=trusted, 2=untrusted. Specify 1 for CM certificates that should be trusted.

**Tip** Always set the CertStatus attributes before loading the actual certificate data, because otherwise the CMTS will assume the certificate is chained and will immediately attempt to verify it with the manufacturers and root certificates.

For example, to use the Unix command-line SNMP utility to add a manufacturer's certificate to the list of trusted certificates on the CMTS at IP address 192.168.100.134, enter the following command (be sure to substitute a valid index pointer for the table entry for the *<index>* value).

```
% setany -v2c 192.168.100.134 private docsBpi2CmtsCACertStatus.
<index>
-i 4
docsBpi2CmtsCACert.
<index>
-o
'<hex_data>' docsBpi2CmtsCACertTrust.
<index>
-i 1
```

To do the same thing for a CM certificate, use the following command:

```
% setany -v2c 192.168.100.134 private docsBpi2CmtsProvisionedCmCertStatus.
<index>
-i 4 docsBpi2CmtsProvisionedCmCert.
<index>
-o
'<hex_data>' docsBpi2CmtsProvisionedCmCertTrust.
<index>
-i 1
```

**Tip** Most operating systems cannot accept input lines that are as long as needed to input the hexadecimal decimal string that specifies a certificate. For this reason, you should use a graphical SNMP manager to set these attributes. For a number of certificates, you can also use a script file, if more convenient.

**Note** If you are adding self-signed certificates, you must also use the **cable privacy accept-self-signed-certificate** command before the CMTS will accept the certificates.

## Adding a Manufacturer's or CM Certificate to the Hotlist

The DOCSIS specifications allow operators to add a digital manufacturer's or CM certificate to a hotlist (also known as the certificate revocation list, or CRL) on the CMTS, to indicate that this particular certificate should no longer be accepted. This might be done when a user reports that their cable modem has been stolen, or when the service provider decides not to support a particular manufacturer's brand of cable modems.

### Adding a Certificate to the Hotlist Using SNMP Commands

You can also use an SNMP manager to create and add certificates to the hotlist by manipulating the tables and attributes in the [DOCS-BPI-PLUS-MIB](#). To add a manufacturer's certificate, add an entry to the docsBpi2CmtsCACertTable table. Specify the following attributes for each entry:

- docsBpi2CmtsCACertStatus—Set to 4 to create the row entry.
- docsBpi2CmtsCACert—The hexadecimal data, as an X509Certificate value, for the actual X.509 certificate.
- docsBpi2CmtsCACertTrust—An Integer value from 1 to 4 specifying the certificate's trust status: 1=trusted, 2=untrusted, 3= chained, 4=root. When adding a certificate to the hotlist, set this attribute to 2 for untrusted.

Similarly, to add a CM certificate to the hotlist, add an entry to the docsBpi2CmtsProvisionedCmCertTable table. Specify the following attributes for each entry:

- docsBpi2CmtsProvisionedCmCertStatus—Set to 4 to create the row entry.
- docsBpi2CmtsProvisionedCmCert—The hexadecimal data, as an X509Certificate value, for the actual X.509 certificate.
- docsBpi2CmtsProvisionedCmCertTrust—An Integer value from 1 to 2 specifying the certificate's trust status: 1=trusted, 2=untrusted. When adding a certificate to the hotlist, set this attribute to 2 for untrusted.

**Tip** Always set the CertStatus attributes before loading the actual certificate data, because otherwise the CMTS will assume the certificate is chained and will immediately attempt to verify it with the manufacturers and root certificates.

**Note** This procedure is identical to the one given for adding a certificate as a trusted certificate in the [Adding a Certificate as a Trusted Certificate Using SNMP Commands, on page 1211](#), except that the docsBpi2CmtsProvisionedCmCertTrust attribute is set to 2 instead of 1.

For example, to use the Unix command-line SNMP utility to add a manufacturer's certificate to the hotlist on the CMTS at IP address 192.168.100.113, enter the following command (be sure to substitute a valid index pointer for the table entry for the *<index>* value).

```
% setany -v2c 192.168.100.113 private docsBpi2CmtsCACertStatus.
```

```

<index>
-i 4
docsBpi2CmtsCACert.
<index>
-o
'<hex_data>' docsBpi2CmtsCACertTrust.
<index>
-i 2

```

To do the same thing for a CM certificate, use the following command:

```

% setany -v2c 192.168.100.113 private docsBpi2CmtsProvisionedCmCertStatus.
<index>
-i 4
docsBpi2CmtsProvisionedCmCert.
<index>
-o
'<hex_data>' docsBpi2CmtsProvisionedCmCertTrust.
<index>
-i 2

```

**Tip** Most operating systems cannot accept input lines that are as long as needed to input the hexadecimal decimal string that specifies a certificate. For this reason, you should use a graphical SNMP manager to set these attributes. For a number of certificates, you can also use a script file, if more convenient.

## Enabling Concatenation

To enable concatenation for one or more upstreams on a cable interface (which is the default configuration), use the following procedure:

### Procedure

|               | Command or Action                                                                                                        | Purpose                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable<br>Router#                                                            | Enables privileged EXEC mode. Enter your password if prompted.                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal<br>Router(config)#                            | Enters global configuration mode.                                                              |
| <b>Step 3</b> | <b>interface cableslot / port</b><br><b>Example:</b><br>Router(config)# <b>interface cable</b> 6/0<br>Router(config-if)# | Enters interface configuration mode for the cable interface line card at this particular slot. |

|        | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>command upstream n concatenation</b></p> <p><b>Example:</b></p> <pre>Router(config-if)# cable upstream 0 concatenation Router(config-if)# cable upstream 1 concatenation  Router(config-if)#</pre> | <p>Enables concatenation for the specified upstream on the cable interface.</p> <p><b>Note</b> Repeat this command for each upstream on the interface.</p> |
| Step 5 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config-if)# exit Router(config)#</pre>                                                                                                             | Exits interface configuration mode.                                                                                                                        |
| Step 6 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config)# exit Router#</pre>                                                                                                                        | Exits global configuration mode.                                                                                                                           |

## Enabling DOCSIS Fragmentation

To enable DOCSIS fragmentation for one or more upstreams on a cable interface (which is the default configuration), use the following procedure:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface cableslot /port**
4. **cable upstreamn fragmentation**
5. **cable upstream n unfrag-slot-jitter [limitjitter | cac-enforce]**
6. **exit**
7. **exit**

### DETAILED STEPS

|        | Command or Action                                                                                                  | Purpose                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre> <p><b>Example:</b></p> <pre>Router#</pre> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal Router(config)#</pre>                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>interface cableslot /port</b><br><b>Example:</b><br><pre>Router(config)# interface cable 6/0 Router(config-if)#</pre>                                                                                  | Enters interface configuration mode for the cable interface line card at this particular slot.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>cable upstream n fragmentation</b><br><b>Example:</b><br><pre>Router(config-if)# cable upstream 2 fragmentation Router(config-if)# cable upstream 3 fragmentation Router(config-if)#</pre>             | Enables fragmentation for the specified upstream on the cable interface.<br><br><b>Note</b> Repeat this command for each upstream on the interface.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 5</b> | <b>cable upstream n unfrag-slot-jitter [limit jitter   cac-enforce]</b><br><b>Example:</b><br><pre>Router(config-if)# cable upstream 0 unfrag-slot-jitter limit 2000 cac-enforce Router(config-if)#</pre> | (Optional) Specifies the amount of jitter that can be tolerated on the upstream due to unfragmentable slots. The <b>limit</b> option specifies the allowable <i>jitter</i> limit in microseconds (0 to 4,294,967,295). The <b>cac-enforce</b> option configures the upstream so that it rejects service flows requesting jitter less than the fragmentable slot jitter.<br><br><b>Note</b> By default, <i>jitter</i> is set to a limit of 0 microseconds, and the <b>cac-enforce</b> option is enabled. |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config-if)# exit Router(config)#</pre>                                                                                                                      | Exits interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br><pre>Router(config)# exit Router#</pre>                                                                                                                                 | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Example

The following example of the **show cable qos profile** command illustrates that the maximum downstream burst has been defined, and is a management-created QoS profile:

```
Router# show cable qos profile
```

| ID | Prio | Max<br>upstream<br>bandwidth | Guarantee<br>upstream<br>bandwidth | Max<br>downstream<br>bandwidth | Max<br>tx<br>burst | TOS<br>mask | TOS<br>value | Create<br>by | B<br>priv<br>enab | IP prec.<br>rate<br>enab |
|----|------|------------------------------|------------------------------------|--------------------------------|--------------------|-------------|--------------|--------------|-------------------|--------------------------|
| 1  | 0    | 0                            | 0                                  | 0                              | 0                  | 0xFF        | 0x0          | cmts(r)      | no                | no                       |
| 2  | 0    | 64000                        | 0                                  | 1000000                        | 0                  | 0xFF        | 0x0          | cmts(r)      | no                | no                       |
| 3  | 7    | 31200                        | 31200                              | 0                              | 0                  | 0xFF        | 0x0          | cmts         | yes               | no                       |
| 4  | 7    | 87200                        | 87200                              | 0                              | 0                  | 0xFF        | 0x0          | cmts         | yes               | no                       |
| 6  | 1    | 90000                        | 0                                  | 90000                          | 1522               | 0xFF        | 0x0          | mgmt         | yes               | no                       |
| 10 | 1    | 90000                        | 0                                  | 90000                          | 1522               | 0x1         | 0xA0         | mgmt         | no                | no                       |
| 50 | 0    | 0                            | 0                                  | 96000                          | 0                  | 0xFF        | 0x0          | mgmt         | no                | no                       |
| 51 | 0    | 0                            | 0                                  | 97000                          | 0                  | 0xFF        | 0x0          | mgmt         | no                | no                       |

The following example illustrates the maximum downstream burst size in sample QoS profile 10 with the **show cable qos profile verbose** command in privileged EXEC mode:

```
Router# show cable qos profile 10 verbose
Profile Index 10
Name
Upstream Traffic Priority 1
Upstream Maximum Rate (bps) 90000
Upstream Guaranteed Rate (bps) 0
Unsolicited Grant Size (bytes) 0
Unsolicited Grant Interval (usecs) 0
Upstream Maximum Transmit Burst (bytes) 1522
Downstream Maximum Transmit Burst (bytes) 100000
IP Type of Service Overwrite Mask 0x1
IP Type of Service Overwrite Value 0xA0
Downstream Maximum Rate (bps) 90000
Created By mgmt
Baseline Privacy Enabled no
```

## Enabling DOCSIS 1.1 Downstream Maximum Transmit Burst on the Cisco cBR-8 Router

Perform the following steps to configure ERBA on the Cisco cBR-8 router. This procedure and the associated commands are subject to the guidelines and restrictions cited in this document.

### Procedure

|        | Command or Action                                                                                    | Purpose                                                                                                               |
|--------|------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b><br>Router(config)# | Enters global configuration mode.                                                                                     |

|        | Command or Action                                                                                                                                                             | Purpose                                                                                                                        |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p>[no] <b>cable ds-max-burst burst-threshold</b> <i>threshold</i></p> <p><b>Example:</b></p> <pre>Router(config)# cable ds-max-burst burst-threshold 2048</pre>              | Enables the support for DOCSIS 1.1 downstream max burst. To remove this configuration, use the <b>no</b> form of this command. |
| Step 4 | <p><b>cable service class</b> <i>class-index</i> <b>peak-rate</b> <i>peak-rate</i></p> <p><b>Example:</b></p> <pre>Router(config)# cable service class 1 peak-rate 1000</pre> | Set the peak-rate value of a specific service class.                                                                           |
| Step 5 | <p><b>Ctrl^Z</b></p> <p><b>Example:</b></p> <pre>Router(config)# Ctrl^Z Router#</pre>                                                                                         | Returns to privileged EXEC mode.                                                                                               |

### Example

When this feature is enabled, new service flows with burst size larger than the burst threshold are supported. However, the existing service flows are not affected.

When this feature is disabled, no new service flows are configured with the *Downstream Maximum Transmit Burst* parameter—the **cable ds-max-burst** command settings. However, the existing service flows are not affected.

## Monitoring DOCSIS Operations

The following sections describe the commands that provide information about the DOCSIS network and its cable modems, the RF network and cable interfaces on the CMTS, and BPI+ operations.

### Monitoring the DOCSIS Network

The **show cable modem** command is the primary command to display the current state of cable modems and the DOCSIS network. This command has many options that provide information on different aspects of DOCSIS operations.

#### Displaying the Status of Cable Modems

To display a list of known cable modems and their current status, use the **show cable modem** command.

You can also display a particular cable modem by specifying its MAC address or IP address with the **show cable modem** command. If you specify the MAC address or IP address for a CPE device, the command will display the information for the cable modem that is associated with that device.

**Note** If the CPE IP address is no longer associated with a cable modem, the **show cable modem** command might not display information about the cable modem. To display the IP address of the CPE device for the cable modem, use the **clear cable host ip-address** command to clear the IP address of the modem from the router database, and then enter the **ping docsis mac-address** command, which resolves the MAC address by sending the DOCSIS ping to the CM.

To display a list of cable modems sorted by their manufacturer, use the **vendor** option.

The MAC state field in each of these displays shows the current state of the cable modem:

**Table 213: Descriptions for the MAC State Field**

| MAC State Value                                        | Description                                                                                                                                                                                                                              |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Registration and Provisioning Status Conditions</b> |                                                                                                                                                                                                                                          |
| init(r1)                                               | The CM sent initial ranging.                                                                                                                                                                                                             |
| init(r2)                                               | The CM is ranging. The CMTS received initial ranging from the Cm and has sent RF power, timing offset, and frequency adjustments to the CM.                                                                                              |
| init(rc)                                               | Ranging has completed.                                                                                                                                                                                                                   |
| init(d)                                                | The DHCP request was received. This also indicates that the first IP broadcast packet has been received from the CM.                                                                                                                     |
| init(i)                                                | The DHCP reply was received and the IP address has been assigned, but the CM has not yet replied with an IP packet.                                                                                                                      |
| init(o)                                                | The CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed. |
| init(t)                                                | Time-of-day (TOD) exchange has started.                                                                                                                                                                                                  |
| resetting                                              | The CM is being reset and will shortly restart the registration process.                                                                                                                                                                 |
| <b>Non-error Status Conditions</b>                     |                                                                                                                                                                                                                                          |
| offline                                                | The CM is considered offline (disconnected or powered down).                                                                                                                                                                             |
| online                                                 | The CM has registered and is enabled to pass data on the network.                                                                                                                                                                        |
| online(d)                                              | The CM registered, but network access for the CM has been disabled through the DOCSIS configuration file.                                                                                                                                |
| online(pk)                                             | The CM registered, BPI is enabled and KEK is assigned.                                                                                                                                                                                   |
| online(pt)                                             | The CM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed.                                                                                                                                            |
| expire(pk)                                             | The Cm registered, BPI is enabled, KEK was assigned but has since expired.                                                                                                                                                               |

| MAC State Value                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| expire(pt)                     | The Cm registered, BPI is enabled, TEK was assigned but has since expired.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Error Status Conditions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| reject(m)                      | <p>The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the <b>cable shared-secret</b> command.</p> <p>It can also indicate that the <b>cable tftp-enforce</b> command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.</p>                                                                                          |
| reject(c)                      | <p>The CM attempted to register, but registration was refused due to a number of possible errors:</p> <ul style="list-style-type: none"> <li>• The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the <b>cable upstream admission-control</b> command.</li> <li>• The CM has been disabled because of a security violation.</li> <li>• A bad class of service (COS) value in the DOCSIS configuration file.</li> <li>• The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes.</li> </ul> |
| reject(pk)                     | KEK key assignment is rejected, BPI encryption has not been established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| reject(pt)                     | TEK key assignment is rejected, BPI encryption has not been established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| reject(ts)                     | The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.                                                                                                                                                                                                                                                                                   |
| reject(ip)                     | The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.                                                                                                                                                                                                                                                                                                                                                            |
| reject(na)                     | The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.                                                                                                                                                                                                                                                                                                                                      |

## Displaying a Summary Report for the Cable Modems

The **show cable modem** command also can provide a summary report of the cable modems by using the **summary** and **total** options.

You can also use the **summary** and **total** options to display information for a single interface or a range of interfaces.

## Displaying the Capabilities of the Cable Modems

To display the capabilities and current DOCSIS provisioning for cable modems, use the **mac** option.

To get a summary report of the cable modems and their capabilities, use the **mac** option with the **summary** and **total** options.

## Displaying Detailed Information About a Particular Cable Modem

Several options for the **show cable modem** command display detailed information about a particular cable modem (as identified by its MAC address). The **verbose** option displays the most comprehensive output.

The **connectivity** and **maintenance** options also provide information that can be useful in troubleshooting problems with a particular cable modem.

## Monitoring the RF Network and Cable Interfaces

You can use the **show interface cable** command to display information about the operation of the RF network and the cable interfaces on the CMTS.

**Tip** For a complete description of the **show cable interface** command and its options, see the “Cisco Cable Modem Termination System Commands” chapter in the *Cisco Broadband Cable Command Reference Guide* (see [http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b\\_cmts\\_quality\\_of\\_services/docsis\\_1\\_1.html#ref\\_1239231](http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b_cmts_quality_of_services/docsis_1_1.html#ref_1239231)).

## Displaying Information About Cloned Cable Modems

To display the list of cable modems detected as cloned, use the **privacy hotlist** option with the **show interface cable** command.

## Denying RF Access For Cable Modems

To deny radio frequency (RF) access for cable modems during ranging, use the **cable privacy hotlist cm mac-address** command.

The following example shows how to block cloned cable modems using their own MAC address:

```
Router(config)# cable privacy hotlist cm 00C0.0102.0304
Router(config)#
```

When an operator identifies a modem’s MAC address that should not be registered on a specific CMTS, the operator can add this MAC address to the CMTS using the above command. This command ensures that the modem will not be allowed to come online on any interface on that CMTS.

## Displaying Information About the Mac Scheduler

To display information about the DOCSIS MAC layer scheduler that is operating on each cable interface, use the **mac-scheduler** option with the **show cable interface** command. You can display information for all of the upstreams on an interface, or you can display information for a single upstream on an interface.

## Displaying Information About QoS Parameter Sets

To display information about the DOCSIS 1.1 QoS parameter sets that have been defined on a cable interface, use the **qos paramset** option with the **show cable interface** command.

You can also display detailed information for a particular parameter set by specifying the index number for its Class of Service along with the **verbose** option.

## Displaying Information About Service Flows

To display the service flows and their QoS parameter sets that are configured on a cable interface, use the **service-flow** option with the **show interface cable** command.

To display the major QoS parameters for each service flow, add the **qos** option to this command.

To display the complete QoS parameters for a particular service flow, use the **qos** and **verbose** options. You can use these options separately or together.

## Displaying Information About Service IDs

To display information about Service IDs (SIDs), which are assigned to only upstreams in DOCSIS 1.1 networks, use the **sid** option with the **show interface cable** command.

Add the **qos** option to display the major QoS parameters associated with each SID.

To display detailed information about a particular SID and its QoS parameters, use both the **qos** and **verbose** options.

## Monitoring BPI+ Operations

See the following sections to monitor the state of BPI operations on the CMTS and its connected cable modems:

### Displaying the Current BPI+ State of Cable Modems

To display the current BPI+ state of cable modems, use the **show cable modem** command. If used without any options, this command displays the status for cable modems on all interfaces. You can also specify a particular cable interface on the CMTS, or the IP address or MAC address for a specific cable modem:

```
Router# show cable modem
 [ip-address
 | interface
 | mac-address
```

The MAC State column in the output of the **show cable modem** command displays the current status of each cable modem. The following are the possible BPI-related values for this field:

**Table 214: Possible show cable modem BPI+ States**

| State  | Description                                                                                                                                                                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| online | A cable modem has come online and, if configured to use BPI+, is negotiating its privacy parameters for the session. If the modem remains in this state for more than a couple of minutes, it is online but not using BPI+. Check that the cable modem is running DOCSIS-certified software and is using a DOCSIS configuration file that enables BPI+. |

| State      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| online(pk) | The cable modem is online and has negotiated a Key Encryption Key(KEK) with the CMTS. If BPI+ negotiation is successful, this state will be shortly followed by online(pt).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| online(pt) | The cable modem is online and has negotiated a Traffic Encryption Key (TEK) with the CMTS. The BPI+ session has been established, and the cable modem is encrypting all user traffic with the CMTS using the specified privacy parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| reject(pk) | <p>The cable modem failed to negotiate a KEK with the CMTS, typically because the cable modem failed authentication. Check that the cable modem is properly configured for BPI+ and is using valid digital certificates. If the CMTS requires BPI+ for registration, the cable modem will go offline and have to reregister. Check that the cable modem is properly registered in the CMTS provisioning system.</p> <p><b>Note</b> If a cable modem fails BPI+ authentication, a message similar to the following appears in the CMTS log:</p> <pre>%CBR-5-UNAUTHSIDTIMEOUT: CMTS deleted BPI unauthorized Cable Modem 00c0.abcd.ef01</pre> <p><b>Note</b> In cBR-8, if the CM status has a * (asterisk) as prefix, the router does not apply ACL to block the Layer 3 traffic of the CM. While in Cisco uBR10000, the router will apply ACL.</p> |
| reject(pt) | The cable modem failed to successfully negotiate a TEK with the CMTS. If the CMTS requires BPI+ for registration, the cable modem will have to reregister.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Displaying the BPI+ Timer Values on the CMTS

To display the values for the KEK and TEK lifetime timers on a particular cable interface, use the **show interface cable x/y privacy [kek | tek]** command.

## Displaying the Certificate List on the CMTS

Use the **show crypt ca certificates** command to display the list of known certificates on the CMTS. For example:

```
Router# show crypto ca certificates

Certificate
 Status: Available
 Certificate Serial Number: 7DBF85DDDD8358546BB1C67A16B3D832
 Key Usage: General Purpose
 Subject Name
 Name: Cisco Systems
 Validity Date:
 start date: 00:00:00 UTC Sep 12 2001
 end date: 23:59:59 UTC Sep 11 2021
Root certificate
 Status: Available
 Certificate Serial Number: 5853648728A44DC0335F0CDB33849C19
 Key Usage: General Purpose
 CN = DOCSIS Cable Modem Root Certificate Authority
 OU = Cable Modems
 O = Data Over Cable Service Interface Specifications
 C = US
```

```

Validity Date:
 start date: 00:00:00 UTC Feb 1 2001
 end date: 23:59:59 UTC Jan 31 2031

```

## Configuration Examples for DOCSIS 1.1 Operations

This section lists the following sample configurations for DOCSIS 1.1 operations on the Cisco CMTS:

### Example: DOCSIS 1.1 Configuration for Cisco cBR-8 Router (with BPI+)

```

version 12.2
service timestamps log datetime msec localtime
service password-encryption
!

## Feature Information for DOCSIS 1.1 for Cisco CMTS Routers

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 215: Feature Information for DOCSIS 1.1 for the Cisco CMTS Routers*

| Feature Name                          | Releases                    | Feature Information                                                                                           |
|---------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------|
| DOCSIS 1.1 for the Cisco CMTS Routers | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 83

# Default DOCSIS 1.0 ToS Overwrite

---

This document describes the Default DOCSIS 1.0 ToS Overwrite feature for the Cisco Cable Modem Termination System (CMTS). This feature eliminates the need to create multiple QoS profiles in order to perform type of service (ToS) overwrite by enabling a default ToS overwrite to be bound to all DOCSIS 1.0 Cable Modem (CM) created profiles.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for Default DOCSIS 1.0 ToS Overwrite

- The Default DOCSIS 1.0 ToS Overwrite feature is only applicable to CMs running DOCSIS version 1.0.
- Once the Default DOCSIS 1.0 ToS Overwrite feature is configured, all CMs will need to be reset in order for the effect to take place.
- Once the Default DOCSIS 1.0 ToS Overwrite feature is configured, all CMs will display the default values that were configured. After which, overwrite values can only be changed by editing the QoS profiles.

## Information About Default DOCSIS 1.0 ToS Overwrite

To configure the Default DOCSIS 1.0 ToS Overwrite feature, you should understand the following topic:

## Default DOCSIS 1.0 ToS Overwrite Overview

Currently, ToS overwrite requires the creation of static cable QoS profiles, which are assigned ToS fields and are then associated with 1.0 CMs. This implementation works well if only a few different service types are offered.

However, scalability issues arises when large numbers of service types are presented; each requiring a static QoS profile in order to perform ToS overwrite.

The Default DOCSIS 1.0 ToS Overwrite feature eliminates the need to create multiple QoS profiles in order to perform type-of-service (ToS) overwrite by automatically bounding all DOCSIS 1.0 Cable Modem (CM) created profiles to a default ToS overwrite.

## DOCSIS

Created by CableLabs, Data Over Cable Service Interface Specification (DOCSIS) defines the interface standards and requirements for all cable modems associated with high-speed data distribution over a cable television system network.

The DOCSIS architecture consists of the following two components:

- Cable Modem (CM)
- Cable Modem Termination System (CMTS)

Each of these components are situated at different locations, often with the CM located on a customer site and the CMTS on the service provider site, and communication between the CM and CMTS is conducted over cable through DOCSIS.

---

**Note** Though there are several versions of DOCSIS available, the Default DOCSIS 1.0 ToS Overwrite feature is only applicable to CMs running DOCSIS 1.0.

---

## Type-of-Service (ToS)

Tools such as type-of-service (ToS) bits identification make it possible to isolate network traffic by the type of application being used. ToS capabilities can be further expanded to isolate network traffic down to the specific brands, by the interface used, by the user type and individual user identification, or by the site address.

## How to Configure Default DOCSIS 1.0 ToS Overwrite

The tasks in this section enables the use of the Default DOCSIS 1.0 ToS Overwrite feature.

## Enabling Default DOCSIS 1.0 ToS Overwrite

All CMs with a DOCSIS 1.0 configuration file currently have their ToS overwrite default values are set to tos-and: 0xff and tos-or: 0x00. Since there were previously no mechanism in the DOCSIS 1.0 configuration file to specify the ToS overwrite, QoS profiles were created and assigned to the default ToS overwrites.

The following procedures enable the Default DOCSIS 1.0 ToS Overwrite feature, which will allow a default ToS overwrite to be bound to all CM created profiles.

### Before you begin

There are no prerequisites for these procedures.

#### Note

- The Default DOCSIS 1.0 ToS Overwrite feature is only applicable to CMs running DOCSIS version 1.0.
- Once the Default DOCSIS 1.0 ToS Overwrite feature is configured, all CMs will need to be reset in order for the effect to take place.
- Once the Default DOCSIS 1.0 ToS Overwrite feature is configured, all CMs will display the default values that were configured. After which, overwrite values can only be changed by editing the QoS profiles.

### Procedure

|               | Command or Action                                                                                                                                                              | Purpose                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>         |
| <b>Step 2</b> | <b>configureterminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                      | Enters global configuration mode.                                                                                          |
| <b>Step 3</b> | <b>cable default-tos-qos10 tos-overwrite <i>tos-and tos-or</i></b><br><b>Example:</b><br>Router(config)# <b>cable default-tos-qos10<br/>           tos-overwrite 0x1F 0xE0</b> | Configures the ToS overwrite default value for the CM. This default value will be bound to all future CM created profiles. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router(config-if)# <b>end</b>                                                                                                                 | Exits interface configuration mode and returns to privileged EXEC mode.                                                    |

### What to do next

After configuring the ToS overwrite default value, reset the CM using the **clear cable modem delete** command to allow the new ToS overwrite default value to take effect.

## Editing QoS Profiles

Once the Default DOCSIS 1.0 ToS Overwrite feature is configured, additional ToS overwrite values can be changed by editing the QoS profiles.

### Procedure

|        | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configureterminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                          | Enters global configuration mode.                                                                                  |
| Step 3 | <b>cable qos profile</b> <i>{groupnum   ip-precedence   guaranteed-upstream   max-burst   max-upstream   max-downstream   priority   tos-overwrite   value}</i><br><b>Example:</b><br>Router(config)# cable qos profile 4<br>guaranteed-upstream 2 | Configures the QoS profile.                                                                                        |
| Step 4 | <b>end</b><br><b>Example:</b><br>Router(config-if)# end                                                                                                                                                                                            | Exits interface configuration mode and returns to privileged EXEC mode.                                            |

## Prerequisites for DOCSIS WFQ Scheduler

No special equipment or software is needed to use the DOCSIS WFQ Scheduler feature.

## Restrictions for DOCSIS WFQ Scheduler

- The DBS feature is only applicable to DOCSIS 3.0 downstream channel bonding.

## Information About DOCSIS WFQ Scheduler

The DOCSIS WFQ scheduling engine is used to provide output packet scheduling services, including absolute priority queueing, weighted fair queueing, minimum rate guarantee, traffic shaping, and DOCSIS bonding group dynamic bandwidth sharing on the Cisco cBR-8 converged broadband router.

The DOCSIS WFQ Scheduler provides services on both WAN uplink interfaces and DOCSIS downstream interfaces. The scheduling parameters on WAN uplink interfaces are configured through the Modular QoS

CLI (MQC). On cable downstream interfaces, queues are created for DOCSIS service flows with parameters configured by DOCSIS downstream QoS type, length, values (TLVs).

The default queue size for the DOCSIS service flows (with bandwidth greater than 150 Mbps) is based on the bandwidth on the cable downstream interfaces (see Table below). Additionally, the queue limit for all service flows can also be adjusted using the **cable queue-limit** command, buffer size in service class or downstream buffer control TLVs.

**Note** The default queue size change, and the **cable queue-limit** command do not affect the DOCSIS high priority queues.

Table below is an example of the queue size based on Annex B 256 QAM channels.

**Table 219: Bandwidth, Queue Sizes, and Queue Limits**

| Channel | Bandwidth (Mbps) | Default Queue Size | Queue Size |       |       |       |        |
|---------|------------------|--------------------|------------|-------|-------|-------|--------|
|         |                  |                    | 1 ms       | 20 ms | 30 ms | 40 ms | 200 ms |
| 1       | 37.5             | 63                 | 63         | 63    | 92    | 123   | 617    |
| 2       | 75               | 255                | 63         | 123   | 185   | 247   | 1235   |
| 3       | 112.5            | 255                | 63         | 185   | 277   | 370   | 1852   |
| 4       | 150              | 255                | 63         | 247   | 370   | 494   | 2470   |
| 5       | 187.5            | 319                | 63         | 308   | 463   | 617   | 3087   |
| 6       | 225              | 383                | 63         | 370   | 555   | 741   | 3705   |
| 7       | 262.5            | 447                | 63         | 432   | 648   | 864   | 4323   |
| 8       | 300              | 511                | 63         | 494   | 741   | 988   | 4940   |
| 12      | 450              | 767                | 63         | 741   | 1111  | 1482  | 7411   |
| 14      | 525              | 895                | 63         | 864   | 1296  | 1729  | 8646   |
| 16      | 600              | 1023               | 63         | 988   | 1482  | 1976  | 9881   |

The DOCSIS WFQ Scheduler also allows significant enhancement to the queue scaling limits.

The following sections explain the DOCSIS WFQ Scheduler features:

## Queue Types

The DOCSIS WFQ Scheduler feature supports the following types of queues:

- Priority queues
- CIR queues
- Best Effort queues

## Priority Queues

Priority queues are serviced with absolute priority over all the other queues. On DOCSIS downstream interfaces, the priority queues are configured by DOCSIS applications that request a priority service flow, for example, a packet cable voice service flow. On WAN uplink interfaces, the priority queues are configured by the MQC policy maps.

The following restrictions apply to priority queues:

- Only one priority queue is allowed per WAN uplink interface.
- Only one priority queue is allowed for low latency service flows created for each DOCSIS downstream interface.
- All low latency flows on a DOCSIS downstream are aggregated to the single priority queue.

## CIR Queues

A CIR queue is guaranteed to be serviced with at least the Committed Information Rate (CIR). CIR queues are used to service DOCSIS service flows with non-zero minimum reserved rates. If the offered load to a CIR queue exceeds its CIR value, the excess traffic is serviced as best effort traffic.

## Best Effort Queues

The Best Effort (BE) queues share the interface bandwidth not used by the priority queue and the CIR queues. The sharing is in proportion to each queue's excess ratio.

The following conditions apply to BE queues:

- On DOCSIS downstream interfaces, BE queues are created by DOCSIS service flows that do not request a minimum reserved rate.
- Each DOCSIS flow without a minimum reserved rate uses its own BE queue.

## DOCSIS QoS Support

DOCSIS defines a set of quality of service (QoS) parameters, including traffic priority, maximum sustained traffic rate, minimum reserved traffic rate, maximum traffic burst, maximum downstream latency, and peak traffic rate.

The downstream service flows use the QoS parameters to specify the desired QoS. The downstream policer and scheduler provides services such as traffic shaping, bandwidth provisioning, traffic prioritization, and bandwidth guarantee.

The DOCSIS service flow parameters are mapped to the packet queue parameters and provided with appropriate QoS support for the packet queues to support the DOCSIS parameters

The following DOCSIS QoS parameters are supported:

- Traffic priority
- Maximum sustained traffic rate
- Minimum reserved traffic rate

---

**Note** The maximum traffic burst size and the peak traffic rate are supported as described in the [http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b\\_cmts\\_quality\\_of\\_services/docsis\\_wfq\\_scheduler.html#con\\_1085732](http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b_cmts_quality_of_services/docsis_wfq_scheduler.html#con_1085732).

---

## Traffic Priority

The downstream channel bandwidth available to the best effort traffic, namely the channel bandwidth minus the amount consumed by the priority traffic and the CIR traffic, is allocated to the best effort service flows in proportion to their DOCSIS traffic priorities. For example, if there are three service flows sending packets at a particular moment over the same downstream channel, and their DOCSIS traffic priorities are 0, 1 and 3, respectively, their share of the channel bandwidth will be 1:2:4. To achieve this bandwidth allocation, each service flow is assigned a value known as its excess ratio which is derived from its DOCSIS priority. Table below shows the default mappings of DOCSIS priority to excess ratio.

---

**Note** When traffic priority for a flow is not explicitly specified, a default priority value of 0 is used as per the DOCSIS specification.

---

*Table 220: DOCSIS Priority to Excess Ratio Mapping*

| DOCSIS Traffic Priority | Excess Ratio |
|-------------------------|--------------|
| 0                       | 4            |
| 1                       | 8            |
| 2                       | 12           |
| 3                       | 16           |
| 4                       | 20           |
| 5                       | 24           |
| 6                       | 28           |
| 7                       | 32           |

### Custom DOCSIS Priority to Excess Ratio Mappings

This option is introduced to configure custom priority to excess ratio mappings for downstream service flows that override the default mappings listed in the above Table.

---

**Note** The configured values are used only for new service flows that are created after the configuration has been applied. All the existing service flows maintain their previous excess ratio values.

---

The option to configure priority to excess ratio mappings is available on a per downstream forwarding interface basis and is applicable to legacy cable, wideband and modular cable, and integrated cable interfaces.

The cable downstream qos wfq weights command is used to configure the mappings.

## Maximum Sustained Traffic Rate

The maximum sustained traffic rate (MSR) specifies the peak information rate of a service flow. The MSR of a service flow is mapped to the shape rate of the packet queue. When the maximum sustained traffic rate is not specified or set to zero, its traffic rate becomes limited only by the physical channel capacity set by DOCSIS specifications.

**Note** The Cisco cBR Cisco Packet Processor (CPP) forwarding processor supports a maximum ratio of 1,000:1 between the highest MaxSusRate or MinRsvRate and the lowest MaxSusRate or MinRsvRate. The scheduler is impacted when the ratio exceeds the value. This limitation is per downstream forwarding interface (Wideband-Cable, Integrated-Cable, and Downstream-Cable).

However, flows implemented by Low Latency Queuing (LLQ) are not be affected by this limitation.

## Minimum Reserved Traffic Rate

The minimum reserved traffic rate (MRR) specifies the minimum rate reserved for a service flow. The MRR of a service flow is mapped to the CIR of the packet queue, which ensures the minimum amount of bandwidth a queue gets under congestion. When the MRR is not specified, the CIR is set to zero as per DOCSIS specifications.

## High Priority Traffic

High priority traffic flows are mapped to a Low Latency Queue (LLQ) on the data forwarding interface. The packets in LLQ are serviced with absolute priority over other queues on the same interface.

The following service flows require high priority service:

- Service flows with DOCSIS downstream latency TLV set to a value above zero. For example, PacketCable Multimedia Specification (PCMM) voice calls.
- PacketCable downstream service flows.
- Service flows with Unsolicited Grant Service (UGS) type—non-PacketCable voice calls—upstream flows.

## Enhanced Rate Bandwidth Allocation

The DOCSIS WFQ Scheduler supports the Enhanced Rate Bandwidth Allocation (ERBA) feature for service flows. The ERBA feature allows cable modems (CMs) to burst their temporary transmission rates up to the full line rate for short durations of time. This capability provides higher bandwidth for instantaneous bandwidth requests without having to make changes to existing service levels in the QoS profile.

The DOCSIS WFQ Scheduler allows each service flow to have one dedicated queue. When ERBA is enabled for the service flow, the peak rate is implemented as the queue shape rate within the scheduler, while the maximum sustained rate is set as the token bucket refill rate. When ERBA is turned off, the burst size and the peak rate value are not used.

The maximum traffic burst parameter is used to control a service flow burst duration, to burst up to the channel line rate or a configured peak rate, when it is within its maximum burst size allowance. On the Cisco cBR-8 Converged Broadband Router, the **cable ds-max-burst** command is used to control this behavior explicitly.

**Note** The ERBA feature is not applicable for high priority service flows and multicast service flows.

Table below summarizes the ERBA support for the Cisco cBR-8 router.

**Table 221: Enhanced Rate Bandwidth Allocation Support for the Cisco cBR-8 Router**

|                           | <b>Policer Rate</b>                     | <b>Policer Exceed Action</b> | <b>Policer Token Bucket Size</b>             | <b>Queue Shape Rate</b>        |
|---------------------------|-----------------------------------------|------------------------------|----------------------------------------------|--------------------------------|
| Traditional Service Flow  | Maximum Sustained Traffic Rate (unused) | Transmit                     | A value computed internally by CMTS (unused) | Maximum Sustained Traffic Rate |
| ERBA-Enabled Service Flow | Maximum Sustained Traffic Rate          | Drop                         | Maximum Traffic Burst TLV                    | Peak Traffic Rate              |

For information about ERBA support on the Cisco CMTS routers, refer to Using Enhanced Bandwidth Rate Allocation (ERBA) Support for DOCSIS 1.0 Cable Modems at the following location: [DOCSIS 1.1 for the Cisco CMTS Routers](#)

## Peak Traffic Rate

The *peak-rate* option of the **cable ds-max-burst** command allows you to specify the peak rate an ERBA-enabled service flow can use. The *peak-rate* value is a global value and is applied to all service flows created after the configuration of the **cable ds-max-burst** command. The default value of the *peak-rate* is zero.

If the DOCSIS 3.0 TLV 25.27 is specified for a service flow, the *peak-rate* value is set as the TLV value. However, if ERBA is not turned on for a service flow, the *peak-rate* value is ignored.

The *peak-rate* value can also be configured through cable service class command which forms part of the service class template. During modem registration or Dynamic Service Addition (DSA) operation, the service class name TLV 25.4 is sent to create the static or dynamic downstream service flow that matches the service class template. These downstream service flows are created with a specific *peak-rate*. If the *peak-rate* is not specified in the cable modem's configuration file, then the peak rate specified by the **cable ds-max-burst burst-threshold threshold peak-rate peak rate** command is used.

**Note** The option to specify peak rate in the **cable ds-max-burst** command is not available on the Cisco cBR Series Converged Broadband routers.

If a service flow has both service class and TLV 25.27 defined *peak-rate*, then the *peak-rate* value specified in the TLV is used.

Some of the DOCSIS 1.x and DOCSIS 2.0 cable modems, which are not fully DOCSIS 1.x or DOCSIS 2.0 compliant, may fail to come online when they receive TLV 25.27 from the Cisco CMTS during registration. In order to overcome this you can configure the **cable service attribute withhold-TLVs command with the peak-rate** keyword to restrict sending of this TLV to non-DOCSIS 3.0 cable modems.

## DOCSIS 3.0 Downstream Bonding Support with Bonding Group Dynamic Bandwidth Sharing

DOCSIS 3.0 introduces the concept of downstream channel bonding. Each Bonding Group (BG) is made up of a collection of downstream channels, which can be used by one or more bonding groups. Each downstream channel can also serve as a primary channel in a MAC domain and carry non-bonded traffic, while being part of a BG.

Prior to DOCSIS 3.0 standards, the downstream service flows were associated with a single downstream interface, which in turn corresponded to a physical downstream on an RF channel. In DOCSIS 3.0, the downstream service flows are associated with the downstream bonding groups. These bonding groups can use multiple downstream RF channels.

DBS is the dynamic allocation of bandwidth for wideband (WB) and integrated cable (IC) interfaces sharing the same downstream channel. Due to the channel sharing nature of the bonding groups, the bandwidth available to bonding groups or non-bonded channels is not fixed. The bandwidth depends on the configuration and the traffic load on the WB or IC.

---

**Note** Bonding groups are implemented as WB interfaces and non-bonded channels as IC interfaces.

---

In the DBS mode, the bandwidth of the shared RF channels is dynamically allocated among the WB and IC interfaces. The DBS enables efficient use of the underlying RF channel bandwidth even in the presence of high burst traffic. The DBS is configured at the WB or IC interface level. By default, bandwidth for a WB or IC channel is statically allocated (non-DBS).

For information about DBS support on the Cisco CMTS routers, refer to the [Dynamic Bandwidth Sharing on the Cisco CMTS Router](#) feature.

## How to Configure DOCSIS WFQ Scheduler

You cannot configure the DOCSIS WFQ Scheduler feature as it is automatically loaded. The parameters that the schedule uses include the interface bandwidth and queue parameters.

This section describes the following required and optional procedures:

### Mapping DOCSIS Priority to Excess Ratio

This section describes how to map DOCSIS priorities to custom excess ratios for downstream service flows. These custom mappings will override the default mappings.

#### Procedure

|        | Command or Action                                  | Purpose                                                        |
|--------|----------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. Enter your password if prompted. |

|        | Command or Action                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                           |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                                                            | Enters global configuration mode.                                                                                                                 |
| Step 3 | <b>interface wideband-cable slot/subslot/port</b><br><b>:wideband-channel</b> or <b>interface integrated-cable</b><br><b>slot/subslot/port :rf-channel</b><br><b>Example:</b><br><pre>Router(config)# interface wideband-cable 2/0/0:0</pre> or<br><pre>Router(config)# interface integrated-cable 1/0/0:0</pre> | Enters interface configuration mode for the indicated cable downstream interface.                                                                 |
| Step 4 | <b>cable downstream qos wfq weights {weight1...weight8}</b><br><b>Example:</b><br><pre>Router(config-if)# cable downstream qos wfq weights</pre> <pre>10 20 30 40 50 60 70 80</pre>                                                                                                                              | Configures the custom excess ratios for 8 priorities:<br><b>Note</b> The custom values are used only for new service flows and not existing ones. |
| Step 5 | <b>end</b><br><b>Example:</b><br><pre>Router(config-if)# end</pre>                                                                                                                                                                                                                                               | Exits interface configuration mode and returns to privileged EXEC mode.                                                                           |

## Verifying the Downstream Queues Information

To verify the downstream queue information for a modem, use the **show cable modem** [*mac-address* |*ip-address*] **service-flow** command.

To check queue stats of all queues on an Integrated-Cable or Wideband-Cable interface, use the **show cable dp queue interface** command.

## Feature Information for DOCSIS WFQ Scheduler

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 222: Feature Information for DOCSIS WFQ Scheduler**

| Feature Name         | Releases                    | Feature Information                                                                                               |
|----------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|

## CHAPTER 85

# Fairness Across DOCSIS Interfaces

---

The Fairness Across DOCSIS Interfaces feature introduces an adaptive mechanism to effectively distribute reservable bandwidth for committed information rate (CIR) flows and fair bandwidth for best-effort (BE) service flows across adjacent bonding groups (BGs).

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Fairness Across DOCSIS Interfaces

**Note** The term ‘Bonding Group (BG)’ is used in this document to refer to all the integrated-cable (IC) and wideband-cable (WC) interfaces in the context of Fairness Across DOCSIS Interfaces feature context. The IC interfaces are considered as a single-channel BG.

## Restrictions for Fairness Across DOCSIS Interfaces

- The CIR flows cannot reserve all the RF bandwidth. The CIR flows can only reserve 90 percent<sup>6</sup> of the RF bandwidth that is not statically reserved by the “bandwidth-percent”, in addition to the legacy CIR bandwidth.

<sup>6</sup> The reservable bandwidth for CIR flows consists of static and dynamic portions. By default, the static portion of bandwidth is assigned from the legacy configuration. The dynamic portion of bandwidth comes from the headroom left on each RF channel for BE traffic.

- It is recommended that the CIR reservation be cleared before disabling Fairness Across DOCSIS Interfaces feature to ensure that the CIR reservation is not more than the static reservable bandwidth specified by the “bandwidth-percent” in legacy configuration. This is to prevent CIR over-subscription after disabling Fairness Across DOCSIS Interfaces feature.
- The effect of Fairness Across DOCSIS Interfaces feature depends on topology and flow distribution. In certain cases, Fairness Across DOCSIS Interfaces feature may not achieve BE fairness or maximum CIR utilization.
- Fairness Across DOCSIS Interfaces feature applies only to dynamic bandwidth sharing (DBS) enabled IC and WB interfaces.

## Information About Fairness Across DOCSIS Interfaces

The Fairness Across DOCSIS Interfaces feature is an enhancement over the DOCSIS WFQ scheduler. It enables downstream CIR service flows to be admitted on the interfaces over the thresholds defined in the legacy configuration (that is, “bandwidth-percent” or “max-reserved-bandwidth”). For example, the feature enables large CIR flows (like multicast service flows) to be admitted when the current parameters cannot guarantee enough bandwidth. However, its success rate depends on the allocation and reservation of the bandwidth for cable interfaces within common RF channels.

This feature also ensures fair bandwidth for downstream BE service flows across cable interfaces with common RF channels. The per-flow bandwidth of all active service flows on the adjacent BGs are balanced periodically. The weights (DOCSIS traffic priority (traffic priority + 1)) of all the BGs are equal for downstream BE service flows. The bandwidth, available for BE traffic, can be used to admit additional CIR flows.

---

**Note** For information about DOCSIS traffic priority, see [DOCSIS WFQ Scheduler on the Cisco CMTS Routers guide](#).

---

## On-demand CIR Acquisition

When multiple bonding groups sharing the RF-channel bandwidth and the current bonding group's guaranteed bandwidth is insufficient, this feature can "borrow" neighbor bonding group's non-reserved guaranteed bandwidth for current bonding group's CIR.

This feature is only used by multicast service flow.

## Fairness Across Bonding Groups

Fairness Across DOCSIS Interfaces feature use the weight value of the aggregated active flow count, that is EIR demand, to periodically re-balance the reservable bandwidth. So that the service flows with the same weight in different bonding groups will have roughly the same throughput.

## OFDM Channels

### OFDM Channel

DOCSIS 3.1 introduces modes for higher throughput and higher spectral efficiency while still allowing backward compatibility to DOCSIS 3.0. OFDM Channel support includes 1 OFDM channel per port with channel bandwidth from 24 MHz to 192 MHz wide. In Cisco IOS-XE 16.5.1, a bonding group can consist of SC-QAMs and OFDM channels. An OFDM channel can have multiple profiles configured, and each profile may have different rate. The OFDM Channel rate can vary constantly depending on the profiles being used. For more information on OFDM channels, see *OFDM Channel Configuration Guide*.

### OFDM Channel Rate

An OFDM channel can have multiple profiles configured, and each profile can have different rates. For example, with a 96MHz OFDM channel that is configured with profile A (Control Profile) with modulation 1024-QAM, profile B with modulation 2048-QAM, and profile C with modulation 4096-QAM, the profile rates of profile A, B, and C are 616Mbps, 680Mbps, and 736Mbps respectively.

In Cisco IOS-XE 16.5.1, if an OFDM channel has both Control Profile (profile A) and Data Profiles (profile B, C, and so on) configured, the lowest Data Profile rate is used for Fairness Across DOCSIS Interface calculation. Otherwise, the Control Profile rate is used.

## Interface Bandwidth

A Wideband-Cable (WB) interface can consist of both SC-QAMs and OFDM channels. If it contains OFDM channels, the highest profile rates are used to calculate the interface bandwidth.

For example, with a 96MHz OFDM channel that is configured with profile A having modulation 1024-QAM, profile B with modulation 2048-QAM, and profile C with modulation 4096-QAM, the profile rates of profile A, B, and C are 616Mbps, 680Mbps, and 736Mbps respectively. Here, 736Mbps is used to calculate the interface bandwidth.

## How to Configure Fairness Across DOCSIS Interfaces

This section describes the following tasks that are required to implement Fairness Across DOCSIS Interfaces feature:

### Configuring Fairness Across DOCSIS Interfaces

This section describes how to enable Fairness Across DOCSIS Interfaces feature on the cable interfaces. The configuration is applied to all WB or IC interfaces on the router.

---

**Restriction**

We recommend that you clear the CIR reservation before disabling the Fairness Across DOCSIS Interfaces feature to ensure that CIR reservation is not more than the static reservable bandwidth specified by the “bandwidth-percent” in the legacy configuration.

---

## Procedure

|        | Command or Action                                                                | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal       | Enters global configuration mode.                                                                                  |
| Step 3 | <b>cable acfe enable</b><br><b>Example:</b><br>Router(config)# cable acfe enable | Enables Fairness Across DOCSIS Interfaces feature on the cable interfaces.                                         |
| Step 4 | <b>exit</b><br><b>Example:</b><br>Router(config)# exit                           | Exits global configuration mode and returns to privileged EXEC mode.                                               |

## Configuring Maximum Excess Information Rate Ratio

This section describes how to configure the maximum Excess Information Rate (EIR) ratio between the BE bandwidth among adjacent BGs.

The EIR ratio is used to maintain the maximum EIR bandwidth difference between BGs. It helps to prevent BGs (which has only a few active BE service flows) from getting very low or zero EIR bandwidth. Otherwise, these BGs will not be able to admit CIR flows as they get only very low EIR bandwidth.

For example, there are two BGs sharing the same RF channel, with BG1 having 1000 active BE service flows and BG2 having none. If “max-eir-ratio” is not used, BG1 gets all the bandwidth leaving no bandwidth for BG2. When a voice CIR tries for bandwidth at BG2, it will get rejected. If “max-eir-ratio” is set at 10, BG2 gets about 10 percent of the QAM that is sufficient to admit the voice CIR. The ‘max-eir-ratio’ is a trade-off between perfect fairness and CIR utilization. It means, compromising ‘flow fairness’ to prevent some BGs from getting all the bandwidth leaving the other BGs with none.

## Procedure

|        | Command or Action                                  | Purpose                                                                                                            |
|--------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                   | Purpose                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <code>configure terminal</code>                                         | Enters global configuration mode.                                             |
| <b>Step 3</b> | <b>cable acfe max-eir-ratio <i>eir-ratio</i></b><br><b>Example:</b><br><br>Router(config)# <code>cable acfe max-eir-ratio 20</code> | Configures the maximum EIR ratio between the BE bandwidth among adjacent BGs. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><br>Router(config)# <code>exit</code>                                                             | Exits global configuration mode and returns to privileged EXEC mode.          |

## Configuring Constant Excess Information Rate Demand

This section describes how to configure the constant excess information rate (EIR) demand for a bonding group (BG). EIR demand is a unitless value that is used to determine relative bandwidth ratio between BGs.

An active EIR flow with DOCSIS priority-0 is given 1000 units of demand in ACFE module. Therefore a BG with constant-eir-demand set to 1 will get no more than 1/1000 of the bandwidth of a single service flow.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `cable acfe constant-eir-demand value`
4. `exit`

### DETAILED STEPS

|               | Command or Action                                                                           | Purpose                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <code>enable</code>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <code>configure terminal</code> | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>cable acfe constant-eir-demand <i>value</i></b><br><b>Example:</b>                       | Configures the constant EIR demand as 20 for a BG.                                                                 |

|               | Command or Action                                             | Purpose                                                              |
|---------------|---------------------------------------------------------------|----------------------------------------------------------------------|
|               | Router(config)# <b>cable acfe constant-eir-demand 20</b>      |                                                                      |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# <b>exit</b> | Exits global configuration mode and returns to privileged EXEC mode. |

## Configuring Maximum Bonus Bandwidth

This section describes how to configure the maximum usable bonus bandwidth for a BG.

Bonus bandwidth is the additional bandwidth provided by the Fairness Across DOCSIS Interfaces feature to each BG for CIR reservation. In the default maximum bonus bandwidth configuration, a single BG can reserve all the underlying RF bandwidth. When the maximum bonus is set, the AC module will not admit CIR flows above that setting even if the scheduler has guaranteed more bandwidth. This will effectively prevent BGs from being starved for CIR flows.

**Note** The **cable acfe max-bonus-bandwidth** command configuration is applicable only for the new incoming CIR flows. It will not terminate the existing CIR flows that exceeds the **max-bonus-bandwidth**.

**Restriction** If the maximum bonus bandwidth is less than the current CIR reservation on an interface, no new CIR flows are admitted until the CIR reservation drops below the maximum bonus bandwidth configuration.

### Procedure

|               | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                   | Enters global configuration mode.                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>interface {wideband-cable   interface-cable }slot/subslot /port :interface-num</b><br><b>Example:</b><br>Router(config)# <b>interface wideband-cable 1/0/0:0</b> | Specifies the interface to be configured. <p><b>Note</b> The valid values for the arguments depend on CMTS router and cable interface line card. See the hardware documentation for your router chassis and cable interface line card for supported values.</p> |

|               | Command or Action                                                                                                                                             | Purpose                                                                 |

| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config)# <b>end</b>                                                                                                   | Exits interface configuration mode and returns to privileged EXEC mode. |

## Verifying the Fairness Across DOCSIS Interfaces

To monitor the Fairness Across DOCSIS Interfaces feature, use the following procedures:

### Verifying Reservable Bandwidth

To display the reserved and reservable bandwidth for a particular interface, use the **show interface {wideband-cable | modular-cable | integrated-cable}** command as shown in the example:

```
Router# show interfaces wideband-cable 1/0/0:1 downstream
Total downstream bandwidth 1875 Kbps
Total downstream reserved/reservable bandwidth 20000/1500 Kbps
Total downstream guaranteed/non-guaranteed bonus bandwidth 20760/9741 Kbps
Router#
```

The “reservable bandwidth” is a part of the guaranteed bandwidth from the legacy configuration. When the Fairness Across DOCSIS Interfaces feature is disabled, values of both the “guaranteed bonus bandwidth” and “non-guaranteed bonus bandwidth” is zero. When the feature is enabled, the “reservable bandwidth” and “guaranteed bonus bandwidth” represents the maximum CIR that can be reserved on the interface. Unicast CIR flows exceeding this limit are rejected. The additional “non-guaranteed bonus bandwidth” allows the multicast CIR flows to pass the AC module. However, the service flow may not be created successful because the bandwidth comes from the shared pool.

To display the reserved and reservable bandwidth for a particular interface, use the **show cable admission-control interface** command as shown in the example:

```
Router#show cable admission-control interface wideband-Cable 1/0/0:0

Interface Wi1/0/0:0
BGID: 28673

Resource - Downstream Bandwidth

App-type Name Reservation/bps Exclusive
1 1 0 Not configured
2 2 0 Not configured
3 3 0 Not configured
4 4 0 Not configured
```

```

5 0 Not configured
6 0 Not configured
7 0 Not configured
8 20000000 Not configured
Max Reserved BW = 1500000 bps
Total Current Reservation = 20000000 bps
Guaranteed Bonus BW = 20760000 bps
Non-guaranteed Bonus BW = 9741000 bps
Subset BGs: In1/0/0:8 In1/0/0:9 In1/0/0:10 In1/0/0:11 In1/0/0:12
Superset BGs: N/A
Overlapping BGs: Wi1/0/0:8 Wi1/0/0:9 Wi1/0/0:10
Router#

```

Effective with Cisco IOS-XE Release 3.18.0SP, Capacity BW is also displayed. It is a summation of the channel capacity of the RF channels in this interface, and the capacity of OFDM channels is calculated considering the lowest profile rate.

```
Router#show cable admission-control interface wideband-Cable 2/0/0:1
```

```
Interface Wi2/0/0:1
BGID: 8194
```

```
Resource - Downstream Bandwidth
```

| App-type | Name | Reservation/bps | Maximum | Rejected |
|----------|------|-----------------|---------|----------|
| 1        |      | 4000            | 90%     | 0        |
| 2        |      | 0               | N/A     | 0        |
| 3        |      | 0               | 90%     | 0        |
| 4        |      | 0               | N/A     | 0        |
| 5        |      | 0               | N/A     | 0        |
| 6        |      | 0               | 90%     | 0        |
| 7        |      | 0               | N/A     | 0        |
| 8        |      | 0               | 87%     | 0        |

```

Max Reserved BW = 11424000 bps
Total Current Reservation = 4000 bps
Guaranteed Bonus BW = 884352000 bps
Non-guaranteed Bonus BW = 225904000 bps
Capacity BW = 1428000000 bps
Subset BGs: In2/0/0:0 In2/0/0:1 In2/0/0:2 In2/0/0:3 In2/0/0:4 In2/0/0:5 In2/0/0:6 In2/0/0:7
 In2/0/0:158 Wi2/0/0:0
Superset BGs: N/A

```

## Verifying Global Fairness Across DOCSIS Interfaces Status and Statistics

To display the global status and statistics of the Fairness Across DOCSIS Interfaces feature, use the **show cable acfe summary** command as shown in the example:

```

Router# show cable acfe summary
ACFE state: Enabled
EIR Rebalance period (secs): 5
EIR Rebalance invocations: 254
CIR Acquire rate/limit: 100/100
CIR Acquire invocations: 0
CIR Acquire throttled: 0
CIR Oversubscriptions: 0
Maximal EIR ratio: 10
Constant EIR demand: 2

```

## Verifying Per-Controller Fairness Across DOCSIS Interfaces Status and Statistics

To display the status and statistics for each controller interface, use the **show cable acfe controller** command as shown in the following example:

```
Router# show cable acfe controller integrated-Cable 1/0/0
EIR Rebalance invoked: 450963
Adaptive CIR granted: 20
Adaptive CIR rejected: 1
Total clusters: 9
RF FlexBW
8 36376
9 36376
10 32625
.....
```

The BG clusters span across multiple channels and are used as a means to share the underlying RF channel bandwidth dynamically.

Use the **show controllers integrated-Cable acfe cluster** command to show Per-controller statistics and clusters and checking the bandwidth information as follows:

```
Router# show controllers integrated-Cable 1/0/0 acfe cluster 0
Integrated-Cable 1/0/0 status:
Topology changed: No

=====Cluster 0=====
Number of RF: 2
RF FlexBW WB ExcessBW Quanta
0 35625 - 35438 35438
 0 187 187
1 35250 0 35250 35250

Number of BG: 2
Intf Demand CIR Max CstrMin Alloc NBonus Ratio
WB0 1000 0 70875 35250 35437 35438 14855190400
IC0 1000 0 35625 0 35438 187 14855609600
```

## Verifying Per-Interface Fairness Across DOCSIS Interfaces Status and Statistics

To display the status and statistics for each interface, use the **show cable acfe interface** command as shown in the following example:

```
Router# show cable acfe interface wideband-cable 1/0/0:1
EIR Demand (raw/scale): 0/1
Per-Flow EIR BW (kbps): 19125
Guar Bonus BW (kbps): 19125
Non-guar Bonus BW (kbps): 38250
Reserved Bonus BW (kbps): 0
!
```

# Configuration Examples for Fairness Across DOCSIS Interfaces

This section lists the following sample configurations for the Fairness Across DOCSIS Interfaces feature on a Cisco CMTS router:

## Example: Fairness Across DOCSIS Interfaces

The following sample configuration shows Fairness Across DOCSIS Interfaces feature enabled on the router:

```
Current configuration : 39682 bytes
!
! Last configuration change at 04:30:02 UTC Wed Jan 19 2
! NVRAM config last updated at 04:23:17 UTC Wed Jan 19 2
!
version 12.2
!
cable clock dti
cable acfe enable
!
.
.
.
```

## Example: Maximum EIR Demand Ratio

The following sample configuration shows maximum EIR demand ratio configured on the router:

```
Building configuration...
Current configuration : 54253 bytes
!
version 12.2
!
cable clock dti
cable acfe enable
cable acfe max-eir-ratio 20
!
```

The effect of the **cable acfe max-eir-ratio** command is demonstrated using a simple BG cluster.

```
!
interface integrated-Cable1/0/0:0
cable bundle 1
 cable rf-bandwidth-percent 10
!
interface Wideband-Cable9/0/0:0
cable bundle 1
 cable rf-channels channel-list 0
 bandwidth-percent 1
end
!
```

On this RF channel, 20 percent of the bandwidth is reserved by the 'bandwidth-percent' allowing Fairness Across DOCSIS Interfaces feature to use 27 Mbps, that is:  $(100 - 20) * 90 * 37.5$ . If the 'max-eir-ratio' is above 100 and the WB interface has 99 active BE flows and the IC interface has only 1 BE flow, then IC interface gets only 270 kbps, that is  $1/(1+99)*27$  of the bonus bandwidth. The BE traffic enjoys perfect fairness

here. However, it is not possible to admit a unicast CIR flow beyond 270 kbps on the IC interface, as it would exceed the bonus bandwidth. If the 'max-eir-ratio' is set to 10, then the IC interface is treated to have 99/10 flows on it, resulting in a higher bonus bandwidth allocation. The 'max-eir-ratio' is a trade-off between perfect fairness and CIR utilization.

## Example: Constant EIR Demand

The following sample configuration shows constant EIR demand on the router:

```
Building configuration...
Current configuration : 54253 bytes
!
version 12.2
!
cable clock dti
cable acfe enable
cable acfe max-eir-ratio 20
cable acfe constant-eir-demand 2
!

!
interface integrated-Cable1/0/0:0
cable bundle 1
 cable rf-bandwidth-percent 10
 cable acfe constant-eir-demand 2
!
interface Wideband-Cable9/0/0:0
cable bundle 1
 cable rf-channels channel-list 0
 bandwidth-percent 1
 cable acfe constant-eir-demand 2
end
!
```

## Example: Maximum Bonus Bandwidth

The following sample configuration shows the maximum bonus bandwidth enabled on the router:

```
Building configuration...
Current configuration : 274 bytes
!
interface Wideband-Cable1/0/0:0
cable bundle 1
 cable rf-channel 0 bandwidth-percent 10
 cable acfe max-bonus-bandwidth 10000
end
!
```

In this per-interface configuration, even if the Fairness Across DOCSIS Interfaces feature guarantees more than 10 Mbps for a WB interface, the AC module will not pass more than 10 Mbps bandwidth above the legacy reservable bandwidth.

```
!
.
.
.
```

## Feature Information for Fairness Across DOCSIS Interfaces

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 224: Feature Information for Downstream Interface Configuration*

| Feature Name                      | Releases                    | Feature Information                                                                                               |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 225: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Restrictions for Service Group Admission Control

- To configure SGAC, the Fairness Across DOCSIS Interfaces feature must be enabled.
- SGAC supports downstream only.

## Information About Service Group Admission Control

### Overview

Service Group Admission Control (SGAC) is a mechanism that gracefully manages service group based admission requests when one or more resources are not available to process and support the incoming service request. Lack of such a mechanism not only causes the new request to fail with unexpected behavior but could potentially cause the flows that are in progress to have quality related problems. SGAC monitors such resources constantly, and accepts or denies requests based on resource availability.

SGAC enables you to provide a reasonable guarantee about the Quality of Service (QoS) to subscribers at the time of call admission, and to enable graceful degradation of services when resource consumption approaches critical levels. SGAC reduces the impact of unpredictable traffic demands in circumstances that would otherwise produce degraded QoS for subscribers.

---

**Note** SGAC begins graceful degradation of service when either a critical threshold is crossed, or when bandwidth is nearly consumed on the Cisco CMTS, depending on the resource being monitored.

---

SGAC enables you to configure thresholds for each resource on the Cisco CMTS. These thresholds are expressed in a percentage of maximum allowable resource utilization. Alarm traps may be sent each time a threshold is crossed for a given resource.

For downstream (DS) channels, you can configure the bandwidth allocation with thresholds for each fiber node.

## SGAC and Downstream Bandwidth Utilization

SGAC allows you to control the bandwidth usage for various DOCSIS traffic types or application types. The application types are defined by the user using a CLI to categorize the service flow.

### Categorization of Service Flows

The SGAC feature allows you to allocate the bandwidth based on the application types. Flow categorization allows you to partition bandwidth in up to eight application types or buckets. The composition of a bucket is defined by the command-line interface (CLI), as is the definition of rules to categorize service flows into one of these eight application buckets. Various attributes of the service flow may be used to define the rules.

For flows created by PacketCable, the following attributes may be used:

- The priority of the PacketCable gate associated with the flow (high or normal)

For flows created by PacketCable MultiMedia (PCMM), the following attributes may be used:

- Priority of the gate (0 to 7)
- Application type (0 to 65535)

All flows use the following attribute type:

- Service class name

Before a service flow is admitted, it is passed through the categorization routine. Various attributes of the service flow are compared with the user-configured rules. Based on the match, the service flow is labeled with application type, from 1 to 8. The bandwidth allocation is then performed per application type.

Before a service flow is admitted, it is categorized based on its attributes. The flow attributes are compared against CLI-configured rules, one bucket at a time. If a match is found for any one of the rules, the service flow is labeled for that bucket, and no further check is performed.

Bucket 1 rules are scanned first and bucket 8 rules are scanned last. If two different rules match two different buckets for the same service flow, the flow gets categorized under the first match. If no match is found, the flow is categorized as Best Effort (BE) and the bucket with best effort rule is labelled to the flow. By default, the BE bucket is bucket 8.

## Thresholds for Downstream Bandwidth

SGAC monitors downstream bandwidth consumption using the configured maximum reserved bandwidth. It rejects service flows with a non-zero minimal rate that would make the total reserved bandwidth exceed the configured threshold.

### Flexible Bandwidth Allocation

To address the issue of restricted bandwidth allocation for different application types, admission control can be applied for both normal priority and emergency voice flows. This is done by extending the threshold and assigning a group of application types in a fiber node. Each downstream service flow continues to be categorized for a single application type. However, the one-to-one mapping between an application type and a threshold no longer exists.

Each configured threshold and its associated group of application types can thus be treated as a constraint. A service flow categorized to a certain application type must pass all the constraints associated with that application type.

## Overview of Bonding Group Admission Control

DOCSIS 3.0 introduced bonded channels or bonding groups that allow a single cable modem to send data over multiple RF channels achieving higher throughput. These bonding groups are defined for both upstream and downstream channels. Bonding groups are created by combining multiple RF channels. A single RF channel may also be shared by multiple bonding groups.

---

**Note** Effective from Cisco IOS-XE 3.18.0SP Release, as per DOCSIS 3.1, if bonding group contains an OFDM channel, the bonding group's total bandwidth that can be reserved (its capacity), is calculated using the least efficient OFDM profile it can use.

---

Bonding group SGAC functionality allows to define the maximum reserved bandwidth for an application-type as a fraction of the available bandwidth. This fraction of the bandwidth is defined as a percentage value of the total bandwidth that can be reserved.

## How to Configure, Monitor, and Troubleshoot Service Group Admission Control

Configuration procedures are optional because the default configurations are enabled by default. This section presents a sequence of procedures for non-default configurations, monitoring and debugging procedures for both the default or non-default operations of SGAC.

## Defining Rules for Service Flow Categorization

This procedure describes how to configure service flow categorization rules on the Cisco CMTS. This flexible procedure changes default global service flow rules with variations of the **cable application type include** command.

Any one or several of these steps or commands may be used, in nearly any combination, to set or re-configure SGAC on the Cisco CMTS.

**Note** Application rules for SGAC are global configurations, and downstream bandwidth resources use the same sets of service flow rules.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>cable application-type <i>n</i> include packetcable { normal   priority }</b><br><b>Example:</b><br>Router(config)# <b>cable application-type 5 include packetcable priority</b>                                                                                         | For PacketCable, this command variation maps PacketCable service flow attributes to the specified bucket. PacketCable service flows are associated with PacketCable gates. The gate can be normal or high-priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>cable application-type <i>n</i> include pcmm {priority gate-priority / app-id gate-app-id }</b><br><b>Example:</b><br>Router(config)# <b>cable application-type 2 include pcmm priority 7</b><br>Router(config)# <b>cable application-type 2 include pcmm app-id 152</b> | For PCMM, this command variation maps PCMM service flow priority or application to the specified bucket. The PCMM gates are characterized by a priority level and by an application identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <b>cable application-type <i>n</i> include service-class <i>service-class-name</i></b><br><b>Example:</b><br>Router(config)# <b>cable application-type 1 include service-class stream1</b>                                                                                  | For service class parameters, this command variation applies a service class name to the service flows, and applies corresponding QoS parameters.<br><br>DOCSIS 1.1 introduced the concept of service classes. A service class is identified by a service class name. A service class name is a string that the Cisco CMTS associates with a QoS parameter set. One of the objectives of using a service class is to allow the high level protocols to create service flows with the desired QoS parameter set. Using a service class is a convenient way to bind the application with the service flows. The rules provide a mechanism to implement such binding. |

|               | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                        | <p>Note the following factors when using the command in this step:</p> <ul style="list-style-type: none"> <li>• Service classes are separately configured using the <b>cable service class</b> command to define the service flow.</li> <li>• A named service class may be classified into any application type.</li> <li>• Up to ten service class names may be configured per application types. Attempting to configure more than ten service classes prints an error message.</li> <li>• Use the <b>no cable traffic-type</b> command to remove the configuration of a service class before adding a new class.</li> </ul> |
| <b>Step 6</b> | <p><b>cable application-type <i>n</i> include BE</b></p> <p><b>Example:</b></p> <pre>Router# cable application-type 3 include BE</pre> | For Best Effort service flows, this command variation elaborates on Step 3, and changes the default bucket of 8 for Best Effort service flows with non-zero Committed Information Rate (CIR). These BE service flows are often created during cable modem registration.                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 7</b> | <p><b>Ctrl-Z</b></p> <p><b>Example:</b></p> <pre>Router(config)# Ctrl^Z</pre>                                                          | Returns to Privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Example

The following example maps high-priority PacketCable service flows into application bucket 5.

```
Router(config)# cable application-type 5 include packetcable priority
```

The following example maps normal PacketCable service flows into application bucket 1.

```
Router(config)# cable application-type 1 include packetcable normal
```

The following example maps the specified bucket number with PCMM service flow with a priority of 7, then maps an application identifier of 152 for the same bucket number:

```
Router(config)# cable application-type 2 include pcmm priority 7
Router(config)# cable application-type 2 include pcmm app-id 152
```

The following example maps the Best Effort CIR flows to bucket 3:

```
Router(config)# cable application-type 3 include BE
```

## Naming Application Buckets

This procedure enables you to assign alpha-numeric names to six of the eight application buckets that SGAC supports. The default bucket identifiers range from 1 to 8.

### Procedure

|        | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                        |
| Step 2 | <b>configureterminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                      | Enters global configuration mode.                                                                                                                                                         |
| Step 3 | <b>cable application-type nname bucket-name</b><br><b>Example:</b><br>Router(config)# <b>cable application-type 7 name besteffort</b> | Assigns an alpha-numeric name for the specified bucket.<br><b>Note</b> This bucket name appears in supporting <b>show</b> and <b>debug</b> commands along with the default bucket number. |
| Step 4 | <b>Ctrl-Z</b><br><b>Example:</b><br>Router(config)# <b>Ctrl^Z</b>                                                                     | Returns to Privileged EXEC mode.                                                                                                                                                          |

## Preempting High-Priority Emergency 911 Calls

You may configure SGAC rules and thresholds so that the high-priority voice (911) traffic receives an exclusive share of bandwidth. Because the average call volume for Emergency 911 traffic may not be very high, the fraction of bandwidth reserved for Emergency 911 calls may be small. In the case of regional emergency, the call volume of Emergency 911 calls may surge. In this case, it may be necessary to preempt some of the normal voice traffic to make room for surging Emergency 911 calls.

The Cisco CMTS software preempts one or more normal-priority voice flows to make room for the high-priority voice flows. SGAC provides the command-line interface (CLI) to enable or disable this preemption ability.

SGAC preemption logic follows the following steps:

1. When the first pass of admission control fails to admit a high priority PacketCable flow, it checks if it is possible to admit the flow in another bucket configured for normal PacketCable calls (applicable only if the PacketCable normal and high-priority rules are configured for different buckets). If the bandwidth is available, the call is admitted in the normal priority bucket.
2. If there is no room in normal priority bucket, it preempts a normal priority PacketCable flow and admits the high priority flow in the bucket where the low priority flow was preempted.

3. If there is no normal priority flow that it can preempt, it rejects the admission for high-priority flow. This usually happens when both normal and high-priority buckets are filled with 911 flows.

This preemption is effective only for PacketCable high-priority flows.

When a downstream low-priority service flow is chosen for preemption, the corresponding service flow for the same voice call in the opposite direction gets preempted as well.

### Procedure

|        | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                               |
| Step 3 | <b>[ no ] cable admission-control preempt priority-voice</b><br><b>Example:</b><br><pre>Router(config)# no cable admission-control preempt priority-voice</pre> | Changes the default Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS.<br><br>The <b>no</b> form of this command disables this preemption, and returns the bucket that supports Emergency 911 calls to default configuration and normal function on the Cisco CMTS. |
| Step 4 | <b>Ctrl-Z</b><br><b>Example:</b><br><pre>Router(config)# Ctrl^Z Router#</pre>                                                                                   | Returns to Privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                |

## Calculating Bandwidth Utilization

The SGAC feature maintains a counter for every US and DS channel, and this counter stores the current bandwidth reservation. Whenever a service request is made to create a new service flow, SGAC estimates the bandwidth needed for the new flow, and adds it to the counter. The estimated bandwidth is computed as follows:

- For DS service flows, the required bandwidth is the minimum reservation rate, as specified in the DOCSIS service flow QoS parameters.

In each of the above calculations, SGAC does not account for the PHY overhead. DOCSIS overhead is counted only in the UGS and UGS-AD flows. To estimate the fraction of bandwidth available, the calculation must account for the PHY and DOCSIS overhead, and also the overhead incurred to schedule DOCSIS maintenance messages. SGAC applies a correction factor of 80% to the raw data rate to calculate the total available bandwidth.

**Note** For the DS and US flow in bonded channels, the maximum reserved bandwidth is the bandwidth defined for the SGAC threshold values. This value is indicated in kbps.

## Enabling SGAC Check

A fiber node configured on the CMTS represents one or more matching physical fiber nodes in the HFC plant. The CMTS uses the fiber node configuration to identify the DOCSIS downstream service group (DS-SG) and DOCSIS upstream Service Group (US-SG) of the physical fiber nodes in the plant. The Service Group information is compared with MAC Domain channel configuration to automatically calculate the MAC Domain downstream and upstream service groups (MD-DS-SGs and MD-US-SGs respectively) within the MAC Domains.

Under each Fiber node, use the following procedure to enable SGAC check for an application type and any service flow of the specified application type, which is admitted to a service group.

### Before you begin

Fairness Across DOCSIS Interfaces feature should always be enabled and the bandwidth percentage configured on each bonding group should be kept minimal to allow flexible adjustment of reservable bandwidth.

### Restrictions

SGAC is supported only on the downstream.

### SUMMARY STEPS

1. **enable**
2. **configureterminal**
3. **cable fiber-node *id***
4. **admission-control application-type *n* ds-bandwidth *pct***
5. Ctrl-Z

### DETAILED STEPS

|        | Command or Action                                                                | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configureterminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                                                                                  |
| Step 3 | <b>cable fiber-node <i>id</i></b><br><b>Example:</b>                             | Enters cable fiber-node configuration mode to configure a fiber node.                                              |

|               | Command or Action                                                                                                                                                                            | Purpose                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|               | <code>Router(config)# cable fiber-node 1</code>                                                                                                                                              |                                                                                                                            |
| <b>Step 4</b> | <b>admission-control application-type <i>n</i> ds-bandwidth <i>pct</i></b><br><b>Example:</b><br><code>Router(config-fiber-node)# admission-control application-type 1 ds-bandwidth 1</code> | Enables SGAC checking for the specified application-type. Use the <b>no</b> form of this command to disable SGAC checking. |
| <b>Step 5</b> | <b>Ctrl-Z</b><br><b>Example:</b><br><code>Router(config-if)# Ctrl1^Z</code>                                                                                                                  | Returns to Privileged EXEC mode.                                                                                           |

**What to do next**

Use the `show cable admission-control fiber-node n` command to verify admission-control configuration.

## Configuration Examples for SGAC

This section describes solutions-level examples of the SGAC feature on the Cisco CMTS. This section illustrates the functioning of SGAC in default or non-default operational configurations.

### Example: SGAC Configuration Commands

In this section of configuration examples, the following SGAC parameters are set on the Cisco CMTS:

- All the packetcable flows are mapped into bucket 1.
- The BE service flows are mapped into bucket 8.

The following configuration commands enable these settings:

- To map the packetcable voice flows, use:

```
cable application-type 1 include packetcable normal
cable application-type 1 include packetcable priority
cable application-type 1 name PktCable
```

- To map the BE flows into bucket 8, use:

```
cable application-type 8 name HSD
cable application-type 8 include best-effort
```

- Given the above configurations, you may also control bandwidth allocation to a PCMM streaming video application. The streaming video application is identified by the PCMM application ID 35. The following commands implement this configuration:

```
cable application-type 2 name PCMM-Vid
cable application-type 2 include pcmm app-id 35
```

- These configurations may be verified on the Cisco CMTS using the following **show** commands:

```

Router# show cable application-type
For bucket 1, Name PktCable
 Packetcable normal priority gates
 Packetcable high priority gates
For bucket 2, Name PCMM-Vid
 PCMM gate app-id = 30
For bucket 3, Name Gaming
 PCMM gate app-id = 40
For bucket 4, Name
For bucket 5, Name
For bucket 6, Name
For bucket 7, Name
For bucket 8, Name HSD
 Best-effort (CIR) flows

```

```

Router# show cable admission-control fiber-node 1
App-type Name Exclusive
1 N/A
2 N/A
3 Normal 10%
4 N/A
5 N/A
6 N/A
7 Emergency N/A
8 N/A

```

```

Router#show cable admission-control interface integrated-Cable 8/0/0:0

```

```

```

These above configuration examples might be omitted or changed, but the remaining examples in this section presume the above configurations.

## Example: SGAC for Downstream Traffic

This example presumes that you have configured the rules according to the commands illustrated at the start of this section.

- All the voice flows in bucket 1.
- All the CIR data flows are categorized in bucket 8.

The below example illustrates a sample configuration for SGAC with downstream traffic. In this example, if voice traffic exceeds 30% bandwidth consumption, additional voice flows are denied.

- 30% downstream throughput is reserved exclusively for voice traffic.

The following command implements this configuration:

```
Router(config-fiber-node)#admission-control application-type 1 ds-bandwidth 30
```

The below example illustrates how flexible bandwidth allocation is configured. In this example, normal voice traffic (application-type 1) is associated with two thresholds. Normal voice traffic alone can use up to 40% of the service group's capacity, while normal and emergency voice traffic combined can use up to 50% of the service group's capacity. This means that emergency voice traffic can have at least 10% of the service group's capacity, even if normal voice traffic has used up its share of 40%:

```
Router(config-fiber-node)#admission-control application-type 1 ds-bandwidth 40
Router(config-fiber-node)#admission-control application-type 1-2 ds-bandwidth 50
```

where,

- 1 is normal voice application type
- 2 is emergency voice application type

## Feature Information for Service Group Admission Control

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release,

feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 226: Feature Information for Service Group Admission Control**

| Feature Name                    | Releases                    | Feature Information                                                                                           |

## CHAPTER 87

# Subscriber Traffic Management

This document describes the Subscriber Traffic Management (STM) feature Version 1.3. STM feature supports all DOCSIS-compliant cable modems.

The STM feature allows a service provider to configure a maximum bandwidth threshold over a fixed period for a specific service class (or quality of service [QoS] profile). The subscribers who exceed this configured threshold can then be identified and allocated reduced QoS. STM works as a low-CPU alternative to Network-Based Application Recognition (NBAR) and access control lists (ACLs). However, using STM does not mean that NBAR and ACLs have to be turned off; STM can be applied along with NBAR and ACLs. STM also works in conjunction with the Cisco Broadband Troubleshooter to support additional network management and troubleshooting functions in the Cisco CMTS.

---

**Important** In this document, the phrase QoS profile is synonymously used to indicate a service class for a DOCSIS 1.1 cable modem. However, QoS profile applies only to DOCSIS 1.0 operations. In instances where QoS profile is mentioned to indicate DOCSIS 1.1 operations, the QoS profile should be treated as a service class.

---

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for Subscriber Traffic Management on the Cisco CMTS Routers

**Note** In this document, the phrase QoS profile is synonymously used to indicate a service class for a DOCSIS 1.1 cable modem. However, QoS profile applies only to DOCSIS 1.0 operations. In instances where QoS profile is mentioned to indicate DOCSIS 1.1 operations, the QoS profile should be treated as a service class.

The STM feature has the following restrictions and limitations:

- In STM version 1.1, the sampling rate range (duration) is calculated using the monitoring duration rather than the constant range (10 to 30 minutes) used in STM 1.0.
  - If the monitoring duration is more than a day (1440 minutes), the duration sample rate is calculated as (duration / 100).
  - If the monitoring duration is less than a day, the sample rate range is from 10 to 30 minutes.
  - If you are using STM 1.0 with a duration of two days and a sample rate of 20 minutes, and you try to restore that configuration in STM 1.1, the command fails because now the valid range is from 28 to 86 minutes.
- For DOCSIS1.0, the registered QoS profile specified by an enforce-rule must match exactly a QoS profile that exists on the Cisco CMTS. To manage a cable modem that is using a modem-created QoS profile, you must first create that same exact QoS profile on the Cisco CMTS. All parameters in the QoS profile must match before the cable modem can be managed by the enforce-rule.
- The Cisco cBR series routers support a certain maximum of 40 enforce-rules. If you have created the maximum number of enforce-rules and want to create another rule, you must first delete one of the existing rules.
- Changing the configuration of an enforce-rule automatically resets all byte counters for the subscribers who are mapped to that enforce-rule.
- When specifying a QoS profile to be enforced when users violate their registered QoS profiles, both the originally provisioned QoS profile and the enforced QoS profile must be created on the Cisco CMTS.
- The Subscriber Traffic Management feature calculates duration based on the time set on the router, not uptime. Therefore, if you use the **clock set** command to change the time on the router, you might affect the STM monitoring behavior.
- The maximum cycle for subscriber traffic management is 31 days. If you choose a cycle of 31 days, the minimum sample rate that you can set is (31 days/100) minutes.

## Information About Subscriber Traffic Management on the Cisco CMTS Routers

This section contains the following:

### Feature Overview

The STM feature allows service providers to configure a maximum bandwidth threshold over a fixed period, for a specific service class (or QoS profile). The subscribers who exceed this configured threshold can then be identified and allocated a reduced QoS. This feature supplements current techniques such as NBAR and ACLs, to ensure that a minority of users do not consume a majority of a cable network's bandwidth.

Current subscriber controls, such as NBAR and ACLs, examine all packets coming into the CMTS. These techniques can curb a large volume of problem traffic, but they are not as effective in dealing with the latest generation of peer-to-peer file-sharing applications that can place heavy demands on a network's available bandwidth.

The STM feature allows service providers to focus on a minority of potential problem users without impacting network performance or other users who are abiding by their service agreements.

The STM feature supports two types of monitoring:

- **Legacy Monitoring**—Legacy monitoring allows you to set up a single monitoring duration without the ability to choose the time of day when that monitoring is performed. The configured monitoring parameters remain constant throughout the day.
- **Peak-Offpeak Monitoring**—Peak-Offpeak monitoring allows you to specify up to two high-traffic periods in a day for monitoring, in addition to the ability to continue monitoring during the remaining (or off-peak) periods. By combining the peak time option with weekend monitoring, you can identify and limit the bandwidth usage of certain subscribers for up to two peak network usage periods during weekdays, and during a different set of peak usage periods on weekends.

When a cable modem goes offline and remains offline for 24 hours, the Cisco CMTS router deletes its service flow IDs from its internal databases, and also deletes the modem's traffic counters. This can allow some users to exceed their bandwidth limits, go offline, and come back online with new counters. The Subscriber Traffic Management feature helps to thwart these types of theft-of-service attacks by implementing a penalty period for cable modems that violate their service level agreements (SLAs). Even if a cable modem goes offline, its counters are still reset, and the CMTS continues to enforce the penalty period.

## Feature List

The Subscriber Traffic Management feature has the following operational features:

- Subscriber Traffic Management 1.1 (STM 1.1) supports cable modems that have registered for DOCSIS 1.1 operations (using the service class/service flow ID [SFID] model).
- Up to 40 enforce-rules can be created on each router.
- Separate enforce-rules can be used for downstream traffic and for upstream traffic. However, the limit on the total number of enforce-rules that can be configured includes the upstream and downstream rules combined.
- Each enforce-rule uses a subscriber's registered QoS profile to identify which users should be monitored for excessive traffic for DOCSIS1.0 cable modems. The registered QoS profile must exist on the Cisco CMTS. If you want to manage cable modems that are using QoS profiles that were created by the cable modem, you must first manually create a QoS profile with the exact same QoS parameters on the Cisco CMTS, and then allow the cable modem to come online using the manually created profile.
- Each enforce-rule specifies the maximum number of kilobytes a user can transmit during a specified window.
- Subscribers who exceed the maximum bandwidth that is specified by their enforce-rule can be automatically switched to a separate enforced QoS profile that limits their network use for a customizable penalty period. The enforced QoS profile can change the guaranteed bandwidth, priority, or any other aspect of the traffic that the service provider considers an acceptable response to subscribers who violate their service agreements.
- Subscribers are automatically switched back to their registered QoS profile at the end of their penalty period. A technician at the service provider's network operations center (NOC) can also switch them back before the penalty period expires.

---

**Note** To manually switch back, delete the cable modem and allow it to register again.

---

- This feature also supports a **no-persistence** option, so that the enforced QoS profile does not remain in effect when a cable modem reboots. This option is particularly useful when the feature is initially implemented, so that the service providers can identify problem subscribers and applications, without creating a major impact on the entire user base. When repeat offenders are found, they can then be switched to an enforce-rule that does keep the enforced QoS profile in effect even when the cable modem reboots.
- Service providers can display a list of all subscribers' current usage statistics. Service providers can also display a list of just those subscribers who are overconsuming bandwidth.
- The penalty period persists across reboots of the cable modem, so subscribers cannot avoid the enforced QoS profile by resetting their modems and reregistering on the cable network. This allows service providers to set an appropriate penalty for those users that consistently exceed the maximum bandwidth they have been allocated. Service providers also can specify a time of day when CMs that are identified for penalty can be released from the penalty period.
- If a user that is using excessive bandwidth decides to upgrade to a higher level of service, the service provider can reconfigure the provisioning system to assign a new QoS profile to the cable modem. The user can then reboot the cable modem and come online using the new level of service.
- Service providers can change subscriber service classes for a particular modem using the **cable modem service-class-name** command.
- Different subscriber monitoring parameters can be configured for weekends, including peak and offpeak monitoring windows. You can also establish the same monitoring windows for every day of the week, or turn off monitoring altogether on the weekends as desired.

## Sliding Window for Monitoring Service Flows

When an enforce-rule is activated, the CMTS periodically checks the bandwidth being used by subscribers to determine whether any subscribers are consuming more bandwidth than that specified by their registered QoS profiles. The CMTS keeps track of the subscribers using a sliding window that begins at each sample-rate interval and continues for the monitoring-duration period.

Each sample-rate interval begins a new sliding window period for which the CMTS keeps track of the total bytes transmitted. At the end of each sliding window period, the CMTS examines the byte counters to determine if any subscriber is currently overconsuming bandwidth on the network.

For example, with the default sample-rate interval of 15 minutes and the default monitoring-duration window of 360 minutes (6 hours), the CMTS samples the bandwidth usage every 15 minutes and determines the total bytes transmitted at the end of each 360-minute window. Therefore, every 15 minutes, the CMTS determines each subscriber's usage statistics for the preceding 6-hour period.

Figure below illustrates how this process works, with a new sliding window beginning at the beginning of each sample-rate interval period.

Figure 34: Monitoring-Duration Windows

## Weekend Monitoring

With standard legacy and peak-offpeak monitoring configuration, monitoring continues to occur on the weekends.

STM version 1.2 supports configuration of different monitoring conditions on weekends. Weekend monitoring options support the same parameters that are available in the existing monitoring options, but use a separate set of commands to configure alternate monitoring on weekend days. This includes configuration of peak and offpeak weekend monitoring windows.

In addition, the CLI supports the ability to turn off any monitoring on the weekend, or to use the same monitoring conditions for every day of the week.

## SNMP Trap Notifications

Simple Network Management Protocol (SNMP) trap notification can be sent whenever a subscriber violates the enforce-rule. This trap is defined in the CISCO-CABLE-QOS-MONITOR-MIB and is enabled using the **snmp-server enable traps cable** command.

Each SNMP trap notification contains the following information:

- MAC address of the subscriber's cable modem
- Name of the enforce-rule being applied to this subscriber
- Total bytes sent by the subscriber during the monitoring-duration window
- Time at which the subscriber's penalty period expires

The CISCO-CABLE-QOS-MONITOR-MIB also contains the following tables that provide information about the Subscriber Traffic Management configuration and about subscribers who violate their enforce-rules:

- **ccqmCmtsEnforceRuleTable**—Contains the attributes of the enforce-rules that are currently configured on the Cisco CMTS.
- **ccqmEnfRuleViolateTable**—Provides a snapshot list of the subscribers who violated their enforce-rules over the sliding monitoring-duration window.

The following objects are used for enforce rules:

- ccqmCmtsEnfRulePenaltyEndTime
- ccqmCmtsEnfRuleWkndOff
- ccqmCmtsEnfRuleWkndMonDuration
- ccqmCmtsEnfRuleWkndAvgRate
- ccqmCmtsEnfRuleWkndSampleRate
- ccqmCmtsEnfRuleWkndFirstPeakTime
- ccqmCmtsEnfRuleWkndFirstDuration
- ccqmCmtsEnfRuleWkndFirstAvgRate
- ccqmCmtsEnfRuleWkndSecondPeakTime
- ccqmCmtsEnfRuleWkndSecondDuration
- ccqmCmtsEnfRuleWkndSecondAvgRate
- ccqmCmtsEnfRuleWkndOffPeakDuration
- ccqmCmtsEnfRuleWkndOffPeakAvgRate
- ccqmCmtsEnfRuleWkndAutoEnforce
- ccqmCmtsEnfRuleFirstPeakTimeMin
- ccqmCmtsEnfRuleSecondPeakTimeMin
- ccqmCmtsEnfRuleWkndFirstPeakTimeMin
- ccqmCmtsEnfRuleWkndSecondPeakTimeMin
- ccqmCmtsEnfRulePenaltyEndTimeMin
- ccqmCmtsEnfRuleWkPenaltyPeriod
- ccqmCmtsEnfRuleWkndPenaltyPeriod
- ccqmCmtsEnfRuleRelTimeMonitorOn

The following objects are used for enforce rule violations:

- ccqmEnfRuleViolateID
- ccqmEnfRuleViolateMacAddr
- ccqmEnfRuleViolateRuleName
- ccqmEnfRuleViolateByteCount
- ccqmEnfRuleViolateLastDetectTime
- ccqmEnfRuleViolatePenaltyExpTime
- ccqmEnfRuleViolateAvgRate

## Cable Modem Interaction with the Subscriber Traffic Management Feature

The Subscriber Traffic Management feature ensures that users cannot bypass the QoS restrictions by rebooting their cable modems or performing other configuration changes. The service provider, however, continues to be able to change the modems' profiles and other configuration parameters as desired.

When the Subscriber Traffic Management feature is enabled, the following behavior is in effect:

- The primary service flow counters for downstream and upstream traffic are preserved when the cable modem reboots. The service provider, however, can reset the counters by changing the QoS profile for the cable modem using the **cable modem qos profile** command and resetting the cable modem.

- Secondary service flow counters are reset whenever the cable modem reboots. This happens regardless of the enforce-rule configuration.
- The cable modem retains its current primary downstream and upstream service flows when it reboots. If the cable modem is in an enforced QoS profile penalty period when it reboots, it continues using the enforced QoS profile after the reboot. Service providers can manually change the profile by assigning a new QoS profile using the **cable modem qos profile** command.

**Note** Changing the QoS profile for a cable modem using the **cable modem qos profile** command, also changes the enforce-rule for the cable modem when it reboots. When the cable modem comes back online, it begins operating under the enforce-rule whose registered QoS profile (see the **qos-profile registered** command) matches the new QoS profile the modem is using.

- Service providers can also change the enforce-rule configuration. The following happens when the provider changes the enforce-rule configuration:
  - If the enforce-rule is disabled (using the **no enabled** command), all cable modems using that rule's registered QoS profile are no longer managed by the Subscriber Traffic Management feature. Configuring no enabled, deactivates the enforce-rule and moves all the modems in penalty to its registered QoS.
  - If the registered QoS profile for the rule is changed (using the **qos-profile registered** command), the cable modems that are using the previous registered QoS profile are no longer managed by the Subscriber Traffic Management feature. Instead, any cable modems that use the new registered QoS profile begin being managed by this rule.
  - If the enforced QoS profile for the rule is changed (using the **qos-profile enforced** command), any cable modems using this rule that are currently in the penalty period continue using the previously configured enforced QoS profile. Any cable modems that enter the penalty period after this configuration change, however, use the new enforced QoS profile.
- Service providers also have the option of making an enforce-rule nonpersistent, so that the enforced QoS profile does not remain in force when a cable modem reboots. Instead, when the cable modem reboots and reregisters with the Cisco CMTS, the CMTS assigns it the QoS profile that is specified in its DOCSIS configuration file.

## How to Configure the Subscriber Traffic Management Feature on the Cisco CMTS Routers

This section contains the following:

### Creating and Configuring an Enforce-Rule

Every service class name that needs to be monitored will be linked with an enforce-rule. An enforce-rule defines the monitoring duration, the sample rate, the penalty period, and the registered service class name that the enforce-rule is linked to and the enforced service class name.

Use the procedure given below to create and configure an enforce-rule. An enforce-rule does not become active until the **enabled** command is given.

### Before you begin

- The registered and enforced service (QoS) profiles must be created on the CMTS before creating an enforce-rule that uses those profiles. If you want to manage a cable modem that currently uses a modem-created QoS profile, you must first manually create a new QoS profile on the CMTS with the same QoS parameters as the modem-created profile. Then allow the modem to come online using the manually created profile before beginning this procedure.
  - To display quality of service (QoS) profiles for a Cisco CMTS, use the `show cable qos profile` command in privileged EXEC mode.
  - To configure a QoS profile, use the `cable qos profile` command in global configuration mode. To set a particular value to its default, or to delete the profile when no specific parameters have been set, use the `no` form of this command.
- For monitoring of DOCSIS 1.1 cable modems:
  - Only DOCSIS 1.1 modems that register with a service class name are monitored.
  - To ensure that the DOCSIS 1.1 service flow counters remain across a reboot of the CM, configure the `cable primary-sflow-qos11 keep all` global configuration command.
- Only primary upstream and downstream service flows are supported.

#### Restriction

- When configuring peak-offpeak monitoring, you can define a maximum of two peak durations within a day, and also monitoring of the remaining hours, if you configure the offpeak duration. The monitoring duration and threshold for first peak, second peak, and offpeak, can be different. However, the monitoring duration for any peak or offpeak configuration cannot be more than a day.
- The parameters defined by the named service class should always be a compatible subset of the registered set of parameters for the CM. Only certain options can be changed using a CMTS router service class, such as the `max-rate`, `priority`, or `tos-overwrite` options. The `max-burst` option in both the enforced and registered CMTS router service classes must strictly match the value for `max-burst` in the registered DOCSIS configuration file. If the service class value does not match, either the cable modem registration will fail with a reject-c state, or the enforced class will fail.

### Procedure

|        | Command or Action                                                                       | Purpose                                                                                                |
|--------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted.                                         |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <code>configure terminal</code> | Enters the global configuration mode.                                                                  |
| Step 3 | <b>cable qos enforce-rule <i>name</i></b><br><b>Example:</b>                            | Creates an enforce-rule with the specified <i>name</i> and enters the enforce-rule configuration mode. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Step 5</b> | <p>Perform one of the following:</p> <ul style="list-style-type: none"> <li>If you specified DOCSIS 1.0 cable modems in <a href="#">Step 4, on page 1282</a>, use the following commands: <ul style="list-style-type: none"> <li><b>a. qos-profile registered</b> <i>profile-id</i></li> <li><b>b. qos-profile enforced</b> <i>profile-id</i> [<b>no-persistence</b>]</li> </ul> </li> <li>If you specified DOCSIS 1.1 cable modems in <a href="#">Step 4, on page 1282</a>, use the <b>service-class</b> {<b>enforced</b>   <b>registered</b>} <i>name</i> command.</li> </ul> <p><b>Example:</b></p> <pre>Router (enforce-rule) # service-class enforced test</pre> | <ul style="list-style-type: none"> <li>For DOCSIS 1.0 cable modems: <ul style="list-style-type: none"> <li><b>a.</b> Specifies the registered quality of service (QoS) profile that should be used for this enforce-rule.</li> </ul> </li> </ul> <p><b>Note</b> If you want to manage a cable modem that currently uses a modem-created QoS profile, you must first manually create a new QoS profile on the CMTS with the same QoS parameters as the modem-created profile. Then allow the modem to come online using the manually created profile before using this command.</p> <ul style="list-style-type: none"> <li><b>b.</b> Specifies the quality of service (QoS) profile that should be enforced when users violate their registered QoS profiles for DOCSIS 1.0 cable modems.</li> </ul> <ul style="list-style-type: none"> <li>For DOCSIS 1.1 (and later) cable modems, identifies a particular service class with the specified <i>name</i> for cable modem monitoring in an enforce-rule.</li> </ul> |
| <b>Step 6</b> | <p><b>duration</b> <i>minutes</i> <b>avg-rate</b> <i>rate</i> <b>sample-interval</b> <i>minutes</i> [<b>penalty</b> <i>minutes</i>] {<b>downstream</b>   <b>upstream</b>} [<b>enforce</b>]</p> <p><b>Example:</b></p> <pre>Router (enforce-rule) # duration 10 avg-rate 500 sample-interval 10 penalty 120 downstream enforce</pre>                                                                                                                                                                                                                                                                                                                                   | Specifies the time period and sample rate used for monitoring subscribers when legacy monitoring is configured ( <a href="#">Step 4, on page 1282</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 7</b> | <p><b>peak-time1</b> {<i>hour</i>   <i>hour:minutes</i>} <b>duration</b> <i>minutes</i> <b>avg-rate</b> <i>rate</i> [<b>peak-time2</b> {<i>hour</i>   <i>hour:minutes</i>} <b>duration</b> <i>minutes</i> <b>avg-rate</b> <i>rate</i>] [<b>duration</b> <i>offpeak-minutes</i> <b>avg-rate</b> <i>offpeak-rate</i> ] <b>sample-interval</b> <i>minutes</i> [<b>penalty</b> <i>minutes</i>] {<b>downstream</b>   <b>upstream</b>} [<b>enforce</b>]</p> <p><b>Example:</b></p>                                                                                                                                                                                          | Specifies peak monitoring periods when peak-offpeak monitoring is configured ( <a href="#">Step 4, on page 1282</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <pre>Router(enforce-rule)# peak-time1 6 duration 180 avg-rate 2 peak-time2 18 duration 180 avg-rate 2 duration 120 avg-rate 3 sample-interval 10 upstream enforce Router(enforce-rule)# peak-time1 6:30 duration 180 avg-rate 2 peak-time2 18:40 duration 180 avg-rate 2 duration 120 avg-rate 3 sample-interval 10 penalty 120 upstream enforce</pre> |                                                                                                                                                  |
| <b>Step 8</b>  | <p><b>penalty-period</b> <i>minutes</i> [<b>time-of-day</b> {<i>hour</i>/<i>hour:minutes</i>}] [<b>monitoring-on</b>]</p> <p><b>Example:</b></p> <pre>Router(enforce-rule)# penalty-period 10</pre>                                                                                                                                                    | (Optional) Specifies the period for which an enforced QoS profile should be in effect for subscribers who violate their registered QoS profiles. |
| <b>Step 9</b>  | <p><b>enabled</b></p> <p><b>Example:</b></p> <pre>Router(enforce-rule)# enabled</pre>                                                                                                                                                                                                                                                                  | (Optional) Activates the enforce-rule and begins subscriber traffic management.                                                                  |
| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(enforce-rule)# end</pre>                                                                                                                                                                                                                                                                          | Exits enforce-rule configuration mode and returns to privileged EXEC mode.                                                                       |

## Examples

This section provides command-line interface (CLI) examples, including the help feature for some of the enforce-rule commands.

### Example: Legacy Monitoring Configuration

The following example shows a sample configuration of an enforce-rule for legacy monitoring:

```
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# monitoring-basics ?
 legacy Enable legacy (same average rate for all day) monitoring
 peak-offpeak Enable peak-offpeak monitoring
Router(enforce-rule)# monitoring-basics legacy ?
 docsis10 Enforce-rule will map to docsis 1.0 modems
 docsis11 Enforce-rule will map to docsis 1.1 modems
Router(enforce-rule)# monitoring-basics legacy docsis11
Router(enforce-rule)# service-class ?
 enforced Enforced service class
 registered Registered service class
Router(enforce-rule)# service-class registered ?
 WORD Registered service class name
Router(enforce-rule)# service-class registered BEUS
Router(enforce-rule)# service-class enforced test
Router(enforce-rule)# duration ?
 <10-10080> Duration in minutes
Router(enforce-rule)# duration 10 ?
 avg-rate Average rate for the duration in kbits/sec
```

### Example: Peak-offpeak Monitoring Configuration

```

Router(enforce-rule)# duration 10 avg-rate ?
<1-4294967> average rate in kbits/sec
Router(enforce-rule)# duration 10 avg-rate 2 ?
sample-interval Rate of sampling in Minutes
Router(enforce-rule)# duration 10 avg-rate 2 sample-interval ?
<1-30> Sampling rate in Minutes
Router(enforce-rule)# duration 10 avg-rate 2 sample-interval 10 ?
downstream downstream
upstream upstream
Router(enforce-rule)# duration 10 avg-rate 2 sample-interval 10 upstream ?
enforce enforce the qos-profile automatically
<cr>
Router(enforce-rule)# duration 10 avg-rate 2 sample-interval 10 upstream enf
Router(enforce-rule)# $ avg-rate 2 sample-interval 10 upstream enforce
Router(enforce-rule)# enabled
Router(enforce-rule)# end

```

### Example: Peak-offpeak Monitoring Configuration

The following example shows a sample configuration of an enforce-rule for peak-offpeak monitoring:

```

Router(config)# cable qos enforce-rule test
Router(enforce-rule)# monitoring-basics peak-offpeak
Router(enforce-rule)# monitoring-basics peak-offpeak docsis10
Router(enforce-rule)# qos-profile ?
enforced Enforced qos profile
registered QoS profile index
Router(enforce-rule)# qos-profile registered ?
<1-255> Registered QoS profile index
Router(enforce-rule)# qos-profile registered 5
Router(enforce-rule)# qos-profile enforced 4
Router(enforce-rule)# peak-time1 6 ?
duration First peak duration
Router(enforce-rule)# peak-time1 6 duration ?
<60-1440> Duration in minutes
Router(enforce-rule)# peak-time1 6 duration 180 ?
avg-rate First peak average rate in kbits/sec
Router(enforce-rule)# peak-time1 6 duration 180 avg-rate ?
<1-4294967> Average rate in kbits/sec
Router(enforce-rule)# peak-time1 6 duration 180 avg-rate 2 ?
duration Off-peak duration
peak-time2 Second peak time
sample-interval Rate of sampling in minutes

Router(enforce-rule)# peak-time1 6 duration 180 avg-rate 2 peak-time2 ?
<10-1440> Start of second peak time
Router(enforce-rule)# peak-time1 6 duration 180 avg-rate 2 peak-time2 18 ?
duration Second peak duration
Router(enforce-rule)# $6 duration 180 avg-rate 2 peak-time2 18 duration ?
<10-1440> Duration in minutes
Router(enforce-rule)# $6 duration 180 avg-rate 2 peak-time2 18 duration 240 ?
avg-rate Second peak average rate in kbits/sec
Router(enforce-rule)# $ 180 avg-rate 2 peak-time2 18 duration 240 avg-rate ?
<1-4294967> Average rate in kbits/sec
Router(enforce-rule)# $ 180 avg-rate 2 peak-time2 18 duration 240 avg-rate 3 ?
duration Off-peak duration
sample-interval Rate of sampling in minutes
Router(enforce-rule)# $ 180 avg-rate 2 peak-time2 18 duration 240 avg-rate 3 d
Router(enforce-rule)# $-time2 18 duration 240 avg-rate 3 duration 120 ?
avg-rate Off-peak average rate in kbits/sec
Router(enforce-rule)# $duration 240 avg-rate 3 duration 120 avg-rate 1 ?

```

```

sample-interval Rate of sampling in minutes
Router(enforce-rule)# $40 avg-rate 3 duration 120 avg-rate 1 sample-interval ?
<1-30> Sampling rate in Minutes
Router(enforce-rule)# $e 3 duration 120 avg-rate 1 sample-interval 10 ?

downstream downstream
upstream upstream
Router(enforce-rule)# $e 3 duration 120 avg-rate 1 sample-interval 10 upstream ?
enforce enforce the qos-profile automatically
<cr>
Router(enforce-rule)# $on 120 avg-rate 1 sample-interval 10 upstream enforce
Router(enforce-rule)# enabled
Router(enforce-rule)# end

```

## Configuring Weekend Monitoring

This section describes the tasks required to configure weekend monitoring for STM on a Cisco CMTS router.

### Prerequisites

You must first configure the weekday monitoring parameters for an enforce-rule before configuring weekend monitoring. See the [Creating and Configuring an Enforce-Rule, on page 1280](#).

### Restrictions

- Up to 40 total enforce-rules across both upstream and downstream configurations are supported.
- When using SNMP for weekend monitoring, only SNMP GET and GETMANY operations are supported.

### Configuring Different Legacy Monitoring Conditions for Weekends

Use the following procedure if you want to establish different legacy monitoring conditions for subscribers for either upstream or downstream traffic on weekend days.

#### Procedure

|        | Command or Action                                                                                                  | Purpose                                                                                              |
|--------|--------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                          | Enables privileged EXEC mode. Enter your password if prompted.                                       |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                  | Enters global configuration mode.                                                                    |
| Step 3 | <b>cable qos enforce-rule <i>name</i></b><br><b>Example:</b><br>Router(config)# <b>cable qos enforce-rule test</b> | Accesses the enforce-rule with the specified <i>name</i> and enters enforce-rule configuration mode. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>weekend duration</b> <i>minutes</i> <b>avg-rate</b> <i>rate</i> <b>sample-interval</b> <i>minutes</i> { <b>downstream</b>   <b>upstream</b> } [ <b>penalty</b> <i>minutes</i> ] [ <b>enforce</b> ]<br><b>Example:</b><br><pre>Router(enforce-rule)# weekend duration 15 avg-rate 500 sample-interval 10 penalty 120 downstream enforce</pre> | Specifies the time period and sample rate used for monitoring subscribers on weekends. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Router(enforce-rule)# end</pre>                                                                                                                                                                                                                                                                           | Exits enforce-rule configuration mode and returns to privileged EXEC mode.             |

## Configuring Different Peak-Offpeak Monitoring Conditions for Weekends

Use the following procedure if you want to establish different peak and offpeak monitoring conditions for subscribers for either upstream or downstream traffic on weekend days.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                              |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                       |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Enters global configuration mode.                                                                    |
| <b>Step 3</b> | <b>cable qos enforce-rule</b> <i>name</i><br><b>Example:</b><br><pre>Router(config)# cable qos enforce-rule test</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Accesses the enforce-rule with the specified <i>name</i> and enters enforce-rule configuration mode. |
| <b>Step 4</b> | <b>weekend peak-time1</b> { <i>hour</i>   <i>hour:minutes</i> } <b>duration</b> <i>minutes</i> <b>avg-rate</b> <i>rate</i> [ <b>peak-time2</b> <i>hour</i> <b>duration</b> <i>minutes</i> <b>avg-rate</b> <i>rate</i> ] [ <b>duration</b> <i>offpeak-minutes</i> <b>avg-rate</b> <i>offpeak-rate</i> ] <b>sample-interval</b> <i>minutes</i> [ <b>penalty</b> <i>minutes</i> ] { <b>downstream</b>   <b>upstream</b> } [ <b>enforce</b> ]<br><b>Example:</b><br><pre>Router(enforce-rule)# weekend peak-time1 9 duration 180 avg-rate 2 peak-time2 16 duration 180 avg-rate</pre> | Specifies peak and offpeak monitoring times on weekends.                                             |

|               | Command or Action                                                                                                                                                                                                                                                                                 | Purpose                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
|               | <pre>2 duration 120 avg-rate 3 sample-interval 10 upstream enforce</pre> <p><b>Example:</b></p> <pre>Router(enforce-rule)# weekend peak-time1 9:30 duration 180 avg-rate 2 peak-time2 16:58 duration 180 avg-rate 2 duration 120 avg-rate 3 sample-interval 10 penalty 120 upstream enforce</pre> |                                                                            |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(enforce-rule)# end</pre>                                                                                                                                                                                                                     | Exits enforce-rule configuration mode and returns to privileged EXEC mode. |

## Disabling Weekend Monitoring

Use the following procedure to turn off the weekend monitoring configuration and monitor on weekdays only.

### Procedure

|               | Command or Action                                                                                                              | Purpose                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                                       | Enables privileged EXEC mode. Enter your password if prompted.                                       |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                                  | Enters global configuration mode.                                                                    |
| <b>Step 3</b> | <p><b>cable qos enforce-rule <i>name</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# cable qos enforce-rule test</pre> | Accesses the enforce-rule with the specified <i>name</i> and enters enforce-rule configuration mode. |
| <b>Step 4</b> | <p><b>weekend off</b></p> <p><b>Example:</b></p> <pre>Router(enforce-rule)# weekend off</pre>                                  | Disables monitoring on weekends.                                                                     |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(enforce-rule)# end</pre>                                                  | Exits enforce-rule configuration mode and returns to privileged EXEC mode.                           |

## Removing Weekend Monitoring Conditions and Use the Same Monitoring Criteria Every Day

Use the following procedure to remove the specified weekend monitoring conditions and use the same monitoring criteria all week (including weekends).

### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <b>enable</b>                                                          | Enables privileged EXEC mode. Enter your password if prompted.                                       |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <b>configure terminal</b>                                  | Enters global configuration mode.                                                                    |
| <b>Step 3</b> | <b>cable qos enforce-rule <i>name</i></b><br><b>Example:</b><br><br>Router(config)# <b>cable qos enforce-rule test</b> | Accesses the enforce-rule with the specified <i>name</i> and enters enforce-rule configuration mode. |
| <b>Step 4</b> | <b>no weekend</b><br><b>Example:</b><br><br>Router(enforce-rule)# <b>no weekend</b>                                    | Performs monitoring on the weekends using the same parameters for weekdays and weekends.             |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Router(enforce-rule)# <b>end</b>                                                  | Exits enforce-rule configuration mode and returns to privileged EXEC mode.                           |

## Disabling an Enforce-Rule

Use the following procedure to disable an enforce-rule. The enforce-rule remains in the CMTS configuration file, but any subscriber traffic management that uses this enforce-rule ends.

### Procedure

|               | Command or Action                                             | Purpose                                                        |
|---------------|---------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Router> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|        | Command or Action                                                                                                    | Purpose                                                                                                                                                                  |
|--------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <code>configure terminal</code>                          | Enters global configuration mode.                                                                                                                                        |
| Step 3 | <b>cable qos enforce-rulename</b><br><b>Example:</b><br><br>Router(config)# <code>cable qos enforce-rule test</code> | Creates an enforce-rule with the specified <i>name</i> and enters enforce-rule configuration mode.                                                                       |
| Step 4 | <b>no enabled</b><br><b>Example:</b><br><br>Router(enforce-rule)# <code>no enabled</code>                            | Disables the enforce-rule and ends subscriber traffic management for users with the rule's registered QoS profile. It moves all modems in penalty to its registered QoS. |
| Step 5 | <b>end</b><br><b>Example:</b><br><br>Router(enforce-rule)# <code>end</code>                                          | Exits enforce-rule configuration mode and returns to privileged EXEC mode.                                                                                               |

## Removing an Enforce-Rule

Use the following procedure to delete an enforce-rule and remove it from the CMTS configuration file. Any subscriber traffic management that uses this rule also ends.

### Procedure

|        | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                    |
|--------|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><br>Router> <code>enable</code>                                                           | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><br>Router# <code>configure terminal</code>                                   | Enters global configuration mode.                                                                                                                                                                          |
| Step 3 | <b>no cable qos enforce-rulename</b><br><b>Example:</b><br><br>Router(config)# <code>no cable qos enforce-rule ef-rule</code> | Deletes the enforce-rule with the specified <i>name</i> . This enforce-rule and its configuration are removed from the CMTS configuration, and any subscriber traffic management that uses this rule ends. |

|               | Command or Action                                           | Purpose                                                              |
|---------------|-------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router(config)# <b>end</b> | Exits global configuration mode and returns to privileged EXEC mode. |

## Changing a Cable Modem Service Class

Use the following procedure to change a QoS service class for a particular DOCSIS 1.1 cable modem.

### Restriction

- The command is supported only on DOCSIS 1.1 CM primary service flows.
- You can specify the **cable modem service-class-name** command only after the CM has been online for at least 200 seconds.
- The parameters defined by the named service class should always be a compatible subset of the registered set of parameters for the CM. Only certain options can be changed using a CMTS router service class, such as the **max-rate**, **priority**, or **tos-overwrite** options. The **max-burst** option in both the enforced and registered CMTS router service classes must strictly match the value for **max-burst** in the registered DOCSIS configuration file. If the service class value does not match, then CM registration will fail with a reject-c state, or the enforced class will fail.

### Procedure

|               | Command or Action                                                                                                                                                                                        | Purpose                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|

# Monitoring the Subscriber Traffic Management Feature on the Cisco CMTS Routers

This section describes the following tasks that can be used to monitor the Subscriber Traffic Management feature:

## Displaying the Currently Defined Enforce-Rules

To display all enforce-rules that are currently defined on the Cisco CMTS router, or the definitions for a particular enforce-rule, use the **show cable qos enforce-rule** command in privileged EXEC mode.

For offpeak monitoring, use the **show cable qos enforce-rule** command to display the monitoring duration and average-rate values applicable for that time of day. If no monitoring is taking place, 0 is displayed.

The following example shows sample output from the **show cable qos enforce-rule** command for all configured enforce-rules:

```
Router# show cable qos enforce-rule
 Name Dur Dir byte-cnt Auto rate penalty Reg Enf Ena Persist
 (min) (kbytes) enf (min) (min) QoS QoS
residential 10 us 5 act 1 10080 5 10 Yes Yes
ef-q11d 30 ds 150 act 1 20 11 99 Yes Yes
ef-q11u 30 us 60 act 1 20 11 99 Yes Yes
ef-q21 720 us 60 act 1 10 21 81 Yes Yes
ef-q21d 300 ds 150 act 1 10 21 81 Yes Yes
ef-q22 720 us 60 act 1 10 22 82 Yes Yes
ef-q22d 300 ds 150 act 1 10 22 82 Yes No
ef-q23 720 us 60 act 1 10 23 83 Yes Yes
ef-q23d 300 ds 150 act 1 10 23 83 Yes Yes
ef-q24 720 us 60 act 1 10 24 84 Yes Yes
ef-q24d 300 ds 150 act 1 10 24 84 Yes Yes
ef-q25 720 us 60 act 1 10 25 85 Yes Yes
ef-q25d 300 ds 150 act 1 10 25 85 Yes Yes
ef-q26 720 us 60 act 1 10 26 86 Yes Yes
ef-q26d 300 ds 150 act 1 10 26 86 Yes Yes
ef-q27 720 us 60 act 1 10 27 87 Yes Yes
ef-q27d 300 ds 150 act 1 10 27 87 Yes Yes
ef-q28 720 us 60 act 1 10 28 88 Yes Yes
ef-q28d 300 ds 150 act 1 10 28 88 Yes No
ef-q5d 300 ds 150 act 1 10 5 99 Yes Yes
ef-q5u 720 us 600 act 1 10 5 99 Yes Yes
```

The following example shows sample output from the **show cable qos enforce-rule** command for a particular enforce-rule named "test":

```
Router# show cable qos enforce-rule test
 Name Type Dur Dir Avg-rate Auto rate Reg Enf En Per
 (min) (min) kbits/s enf (min)
test p-off 120 us 1 act 10 255 4 Y Y
```

The following example shows the sample output from the **show cable qos enforce-rule verbose** command for an enforce-rule named "test":

```
Router# show cable qos enforce-rule test verbose
Name : test
```

```

Version : docsis11
Monitoring Type : peak-offpeak
Registered : REG-DS
Enforced : ENF-DS
Monitoring Duration : 70 (in minutes)
Sample-rate : 10 (in minutes)
Average-rate : 3 kbits/sec
Direction : downstream
Auto Enforce : Yes
Current Penalty Duration : 10 (in minutes)
Default Penalty Duration : 10 (in minutes)
Penalty End-time : 23:0 (time of day)
Rule Enabled : Yes
Persistence : Yes
Weekend : No
Penalty Off : No
Monitor Weekend : Yes
Monitoring after RelTime : Off
First Peak Time : 10:0
Duration : 60 (in minutes)
First Average-rate : 1 kbits/sec
Second Peak Time : 19:0
Duration : 65 (in minutes)
Second Average-rate : 2 kbits/sec
Offpeak Duration : 70 (in minutes)
Offpeak Average-rate : 3 kbits/sec
Auto Enforce : Yes

Penalty-Period for week-days : 0
Weekend First Peak Time : 11:0
Weekend Duration : 75 (in minutes)
Weekend First Average-rate : 4 kbits/sec
Weekend Second Peak Time : 20:0
Weekend Duration : 80 (in minutes)
Weekend Second Average-rate : 5 kbits/sec
Weekend Offpeak Duration : 85 (in minutes)
Weekend Offpeak Average-rate : 6 kbits/sec
Weekend Auto Enforce : Yes
Weekend Sample Rate : 12
Penalty-Period for week-ends : 0
router#sh clock
*17:30:50.259 UTC Mon Apr 19 2010

```

The following example shows sample output from the **show cable qos enforce-rule verbose** command for a particular enforce-rule named “test” that has specified peak-offpeak weekend monitoring options:

```

Router# show cable qos enforce-rule test verbose
Name : test
Version : docsis10
Monitoring Type : peak-offpeak
Registered : 255
Enforced : 4
Monitoring Duration : 120 (in minutes)
Sample-rate : 10 (in minutes)
Average-rate : 1 kbits/sec
Direction : upstream
Penalty Time : 10080 (in minutes)
Penalty End-time : 23 (time of day in hrs)
Rule Enabled : Yes
Persistence : Yes
Week-end : Yes
First Peak Time : 6
Duration : 180 (in minutes)

```

```

First Average-rate : 2 kbits/sec
Second Peak Time : 18
Duration : 240 (in minutes)
Second Averate-rate : 3 kbits/sec
Offpeak Duration : 120 (in minutes)
Offpeak Average-rate : 1 kbits/sec
Auto-enforce : active
Weekend First Peak Time : 8
Weekend First Duration : 120 (in minutes)
Weekend First Average-rate : 2 kbits/sec
Weekend Second Peak Time : 18
Weekend Second Duration : 180 (in minutes)
Weekend Second Average-rate : 5 kbits/sec
Weekend Offpeak Duration : 240 (in minutes)
Weekend Offpeak Average-rate : 4 kbits/sec
Weekend Auto-enforce : active

```

## Displaying the Current Subscriber Usage

To display the usage for all subscribers on a cable interface, use the `show cable subscriber-usage` command in privileged EXEC mode without any options.

To display the usage for just those subscribers who are violating their registered quality of service (QoS) profiles, use the `show cable subscriber-usage over-consume` form of the command.

The following example shows sample output from the `show cable subscriber-usage` command for all users on the specified cable interface:

```

Router# show cable subscriber-usage cable 6/0/1
Sfid Mac Address Enforce-rule Total-Kbyte Last-detect Last-penalty Pen
 Name Count time time Flag
3 0007.0e03.110d efrule-q5 121944817 Jan1 03:44:08 Jan1 03:54:08 Act
4 0007.0e03.110d efrule-q5d 1879076068 Jan1 03:35:05 Jan1 03:45:06 Act
5 0007.0e03.1431 efrule-q5 120052387 Jan1 03:44:18 Jan1 03:54:18 Act
6 0007.0e03.1431 efrule-q5d 1838493626 Jan1 03:34:55 Jan1 03:44:55 Act
7 0007.0e03.1445 efrule-q5 120919427 Jan1 03:44:08 Jan1 03:54:08 Act
8 0007.0e03.1445 efrule-q5d 1865955172 Jan1 03:35:06 Jan1 03:45:06 Act
9 0007.0e03.1225 efrule-q5 120200155 Jan1 03:44:18 Jan1 03:54:18 Act
10 0007.0e03.1225 efrule-q5d 1839681070 Jan1 03:34:55 Jan1 03:44:55 -
11 0007.0e03.0cb1 efrule-q5 122941643 Jan1 03:43:58 Jan1 03:53:58 Act
12 0007.0e03.0cb1 efrule-q5d 1889107176 Jan1 03:35:06 Jan1 03:45:06 Act
13 0007.0e03.1435 efrule-q5 119504795 Jan1 03:44:18 Jan1 03:54:18 Act
14 0007.0e03.1435 efrule-q5d 1835164034 Jan1 03:34:55 Jan1 03:44:55 -

```

By default, the display is sorted by the service flow ID (SFID). To sort the display by the subscriber byte count, with the largest byte counts listed first, use the `sort-byte-count` option. The following example shows sample output for `show cable subscriber-usage sort-byte-count` form of the command:

**Note** The `sort-byte-count` option was replaced by the `sort-avg-rate` option.

```

Router# show cable subscriber-usage
sort-byte-count

Sfid Mac Address Enforce-rule Total-Kbyte Last-detect Last-penalty Pen
 Name Count time time Flag
7 0007.0e03.2cad test1 65157114 Feb24 11:36:34 Mar3 11:36:34 Act

```

```

9 0007.0e03.2c45 test1 16381014 -
5 0007.0e03.2c25 test1 13440960 -

```

## Configuration Examples for Subscriber Traffic Management on the Cisco CMTS Routers

This section lists sample configurations for the Subscriber Traffic Management feature on a CMTS router:

### Example: DOCSIS Configuration File and STM Service Classes

The following example shows a sample DOCSIS configuration file along with sample registered and enforced QoS service classes that you could define on a Cisco CMTS router to perform subscriber traffic management.

#### DOCSIS Configuration File Options

This is an example of a very basic set of options that you can configure for a cable modem in your DOCSIS configuration file that supports a successful configuration of new QoS service class options on the Cisco CMTS router.

**Note** There are certain QoS parameters that cannot be changed from the registered QoS parameter set and a new service class. For example, the **max-burst** value must match the originally registered in the DOCSIS configuration file, and the registered and enforced QoS service classes on the Cisco CMTS router. If the **max-burst** value differs from the registered CMTS service class and the DOCSIS configuration file, the CM might go into reject-c state, or the enforced class could fail.

The following example shows the configuration of two service classes named “BE-STM-US-1” and “BE-STM-DS-1” in a DOCSIS configuration file to define a basic set of upstream and downstream parameters:

```

03 (Net Access Control) = Yes
17 (Baseline Privacy Block)
S01 (Authorize Wait Timeout) = 10
18 (Maximum Number of CPE) = 10
24 (Upstream Service Flow Block)
S01 (Flow Reference) = 1
S04 (Service Class Name) = BE-STM-US-1
S06 (QoS Parameter Set Type) = 7
25 (Downstream Service Flow Block)
S01 (Flow Reference) = 2
S04 (Service Class Name) = BE-STM-DS-1
S06 (QoS Parameter Set Type) = 7
29 (Privacy Enable) = Yes

```

The following example shows sample **cable service class** commands on the Cisco CMTS router for configuration of subscriber traffic management that correspond to the service class names in the DOCSIS configuration file of “BE-STM-US-1” and “BE-STM-DS-1.” These service classes correspond to the registered service classes configured by the **service-class registered** command for the QoS enforce-rules shown later in this example:

```

cable service class 2 name BE-STM-US-1
cable service class 2 upstream
cable service class 2 max-rate 2000000
cable service class 2 max-burst 3044

```

```

cable service class 2 max-concat-burst 8000
cable service class 3 name BE-STM-DS-1
cable service class 3 downstream
cable service class 3 max-rate 30000000
cable service class 3 max-concat-burst 8000

```

For the cable modem to achieve maximum US throughput, provide a large value to the `max-concat-burst` keyword in the `cable service class` command.

The following example shows sample **cable service class** commands on the Cisco CMTS router that configure new QoS parameters for identified subscribers to limit bandwidth using the **max-rate** parameter. These service classes correspond to the enforced service classes configured by the **service-class enforced** command for the QoS enforce rules shown later in this example:

```

cable service class 102 name BEUS-1
cable service class 102 upstream
cable service class 102 max-rate 48888
cable service class 102 max-burst 3044
cable service class 102 max-concat-burst 8000
cable service class 103 name BEDS-1
cable service class 103 downstream
cable service class 103 max-rate 988888
cable service class 103 max-concat-burst 8000

```

The following example shows configuration of the corresponding enforce-rules for upstream and downstream monitoring, which identifies the registered and enforced service classes:

```

cable qos enforce-rule US-1
 monitoring-basics legacy docsis11
 penalty-period 10
 service-class registered BE-STM-US-1
 service-class enforced BEUS-1
 duration 10 avg-rate 1 sample-interval 10 up enf
 enabled
!
cable qos enforce-rule DS-1
 monitoring-basics legacy docsis11
 penalty-period 10
 service-class registered BE-STM-DS-1
 service-class enforced BEDS-1
 duration 10 avg-rate 1 sample-interval 10 do enf
 enabled

```

## Example: Downstream Configuration

The following example shows a typical enforce-rule configuration for traffic in the downstream direction:

```

!
cable qos enforce-rule downstream-rule
 monitoring-basics legacy docsis11
 penalty-period 10
 service-class registered class5
 service-class enforced class99
 duration 30 avg-rate 1 sample-interval 10 downstream enforce
 enabled

```

## Example: Upstream Configuration

The following example shows a typical enforce-rule configuration for traffic in the upstream direction:

```
!
cable qos enforce-rule upstream-rule
 monitoring-basics legacy docsis11
 penalty-period 10
 service-class registered class5
 service-class enforced class99
 duration 30 avg-rate 1 sample-interval 10 upstream enforce
 enabled
```

## Example: Downstream and Upstream Configuration

The following example shows a typical enforce-rule configuration for traffic in both the downstream and upstream directions. Two separate rules are created, using the identical configuration, except for the keywords **upstream** and **downstream** in the **duration** command.

---

**Note** The enforce rules for the upstream and downstream directions can use either an identical configuration, or they can use their own individual configurations.

---

```
!
cable qos enforce-rule upstream-rule
 monitoring-basics legacy docsis11
 penalty-period 10
 service-class registered class5
 service-class enforced class99
 duration 30 avg-rate 5 sample-interval 10 upstream enforce
 enabled
cable qos enforce-rule downstream-rule
 monitoring-basics legacy docsis11
 penalty-period 10
 service-class registered class5
 service-class enforced class99
 duration 30 avg-rate 5 sample-interval 10 downstream enforce
 enabled
```

The following example shows an enforce-rule configuration for traffic in upstream direction. A unique penalty duration is configured for upstream, with monitoring turned on after the penalty release time.

---

**Note** For upstream direction, a unique penalty duration (120 minutes) is configured, which takes precedence over the duration configured using the penalty-period command (60 minutes). A fresh monitoring starts after the penalty release time (23:00), when all the traffic counters are reset to 0.

---

```
!
cable qos enforce-rule upstream_rule
 monitoring-basics peak-offpeak docsis10
 penalty-period 60 time-of-day 23:00 monitoring-on
 qos-profile registered 6
```

```

qos-profile enforced 100
peak-time1 10:30 duration 120 avg-rate 10 peak-time2 22:10 duration 60 avg-rate 10
sample-interval 10 penalty 120 upstream enforce
enabled

```

## Example: Weekend Monitoring Configuration

The following example shows a sample configuration of peak-offpeak weekend monitoring for DOCSIS 1.0 cable modems:

```

cable qos enforce-rule monitoring
monitoring-basics peak-offpeak docsis10
penalty-period 60
qos-profile registered 6
qos-profile enforced 100
peak-time1 10 duration 120 avg-rate 10 peak-time2 23 duration 60 avg-rate 10
sample-interval 10 upstream enforce
weekend peak-time1 8 duration 60 avg-rate 100 peak-time2 20 duration 60 avg-rate 10000
duration 90 avg-rate 20000 sample-interval 20 downstream enforce
enabled

```

## Feature Information for Subscriber Traffic Management

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 228: Feature Information for Subscriber Traffic Management**

| <b>Feature Name</b>           | <b>Releases</b>             | <b>Feature Information</b>                                                                                    |
|-------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------|
| Subscriber traffic management | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 88

# Narrowband Digital Forward And Narrowband Digital Return

---

This document describes the narrowband digital forward and narrowband digital return feature.

- [Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 1301](#)
- [Information About NDF and NDR, on page 1302](#)
- [Restrictions for Configuring NDF and NDR, on page 1302](#)

## Information About NDF and NDR

Narrowband Digital Forward (NDF) refers to the digitizing of an analog portion of the downstream spectrum at the headend, sending the digital samples as payload in [DEPI] packets to the RPD, and then re-creating the original analog stream at the RPD. NDF supports services such as FM Broadcast, DAB+ Broadcast, and OOB signals for Forward Sweep, DS Leakage, and Element management.

Narrowband Digital Return (NDR) refers to the digitizing of an analog portion of the upstream spectrum at the RPD, sending the digital samples as payload in [R-UEPI] packets to the CMTS, and then re-creating the original analog stream at the headend. NDR supports legacy OOB signals for Reverse Sweep, Return Path Monitoring, FSK based HMS, and other FSK based telemetry signals.

## Restrictions for Configuring NDF and NDR

The following restrictions are applicable for configuring NDF and NDR:

## 1x2 RPD

### NDF

- Supports a maximum of three narrow band NDF channels if OOB 55-1 or OOB 55-2 is not configured.
- If OOB 55-1 DS is configured, only one NDF channel is supported. OOB 55-1 DS uses first and the second OOB channel while NDF uses the third OOB channel. If 55-1 DS is configured after configuring NDF, ensure that not more than one NDF channel is configured.
- If OOB 55-2 is configured, two NDF channels are supported. OOB 55-2 uses the first OOB channel.
- Supports NDF Mode 0 to Mode 6. NDF Mode 7 is not supported.

### NDR

- Each upstream port supports three OOB channels. OOB 55-1 and OOB 55-2 channels share the upstream OOB resource with NDR channels.
- If two OOB 55-1 channels are configured on upstream port 0, then only one NDR channel is supported on port 0, and up to three NDR channels are supported on port 1.
- If one OOB 55-2 upstream channel is configured on a port, then either one mode 6 (5.12 MHz) NDR can be configured or 2 NDR with mode 5 or lesser can be configured.
- NDR Mode 0 (80 KHz) is not supported.

## Configure NDF and NDR

To configure NDF and NDR, perform these steps.

1. Configure static-pseudowires for NDF and NDR.
2. Configure NDF and NDR profiles.
3. Bind static-pseudowires and profiles with RPD.

## Configure Static-Pseudowires for NDF and NDR

### Note

- For NDF static pseudowire, session ID must be unique within a rf-port across all rf-channels configured in that port.
- For NDR static pseudowire, the session ID and the server IP must be unique within a RPD.

To configure NDF static-pseudowires, run the following commands:

```
Router# enable
Router# configure terminal
Router(config)# cable oob
```

```
Router(config-oob)# [no] static-pseudowire <name> type ndf [id <id>]
Router(config-oob-spw)# [no] dest-ip <ipv4/ipv6 addr> [source-ip <ipv4 | ipv6 addr>]
Router(config-oob-spw)# [no] session-id <session id>
```

To configure NDR static-pseudowires, run the following commands:

```
Router# enable
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# [no] static-pseudowire <name> type ndr [id <id>]
Router(config-oob-spw)# [no] server-ip <ipv4/ipv6 addr>
Router(config-oob-spw)# [no] mtusize <mtu size value>
Router(config-oob-spw)# [no] per-hop-behavior <IP DSCP per hop behavior value>
Router(config-oob-spw)# [no] session-id <session id>
```

**Table 230: Syntax Description**

| Syntax    | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Specify a unique name for the static-pseudowire. The name can be up to 30 characters long and is case sensitive. The name can be alphanumeric and underscore ( _ ) can be used.                                                                                                                                                                                                                    |
| id        | Specify a unique ID for the static-pseudowire. The valid range is from 1 to 4294967295.<br><br>If the ID is not specified, the system auto-generates an ID.                                                                                                                                                                                                                                        |
| dest-ip   | For multicast NDF, specify the Group (Destination) IP address of the multicast group from which RPD has to receive data on a static pseudowire.<br><br>For unicast NDF, the Group (Destination) IP address is set to 0.0.0.0 or 0::0. The Group (Destination) IP address can IPv4 or IPv6.                                                                                                         |
| source-ip | For source specific multicast (SSM) group, specify the source IP address of the multicast group that RPD has to join to to receive data on a static pseudowire.<br><br>For unicast NDF, specify the source IP address of the remote peer from which RPD has to receive data on a NDF static pseudowire.                                                                                            |
| server-ip | Specify the destination IP address from which RPD has to receive data on a static pseudowire. The server IP can be IPv4 or IPv6 address.                                                                                                                                                                                                                                                           |
| type      | Configure the static-pseudowire type. The static-pseudowire type is NDF or NDR.                                                                                                                                                                                                                                                                                                                    |
| mtusize   | Specify the MTU (Maximum Transmission Unit) size supported by the CCAP Core on a return static pseudowire. MTU is the Layer 3 payload of a Layer 2 frame. The MtuSize attribute carries information equivalent to DEPI Local MTU. CCAP core can receive the configured MTU size from the RPD on the CIN interface.<br><br>The valid range for MTU size is 1500–9216. The default MTU size is 1500. |

| Syntax           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# Configure NDF and NDR Profile

**Note** You can configure only one rf-channel in a NDF and NDR profile.

To configure NDF profile, run the following commands:

```
Router# enable
Router# configure terminal
Router(config)# [no] controller downstream-oob NDF-profile <profile id>
Router(config-profile)# [no] ds-channel <channel id> rf-mute
Router(config-profile)# [no] ds-channel <channel id> shutdown
Router(config-profile)# [no] ds-channel <channel id> frequency <frequency>
Router(config-profile)# [no] ds-channel <channel id> width <width>
Router(config-profile)# [no] ds-channel <channel id> poweradjust <power-adjust>
```

To configure NDR profile, run the following commands:

```
Router# enable
Router# configure terminal
Router(config)# [no] controller upstream-oob NDR-profile <profile id>
Router(config-profile)# [no] us-channel <channel id> shutdown
Router(config-profile)# [no] us-channel <channel id> frequency <frequency>
Router(config-profile)# [no] us-channel <channel id> width <width>
Router(config-profile)# [no] us-channel <channel id> poweradjust <power-adjust>
```

**Table 231: Syntax Description**

| Syntax      | Description                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rf-mute     | Specify True to set the modulator in the muted diagnostic state. In the muted diagnostic state, the modulator does not transmit signal, but the operational status of the channel is not affected. |
| shutdown    | Set the administrative state of the selected NDF/NDR channel. Specifying shutdown removes all configuration from the channel. Specifying unshutdown retrieves all configuration of the channel.    |
| width       | Specify the total width of the spectrum in Hertz, including any required guardband.                                                                                                                |
| frequency   | Specify the frequency of the channel in Hertz.                                                                                                                                                     |
| poweradjust | Specify the power level adjustment for the NDF channel relative to the base power level configured for the DS RF port.                                                                             |

## Bind NDF Static-Pseudowire and NDF Profile with Rf-Port

**Note**

- Destination IP address must be configured before binding NDF static-pseudowire to RPD. Once the destination IP address is bound, it cannot be removed, but can be updated.
- Frequency and channel width must be configured in NDF profile before binding NDF static-pseudowire to RPD. If frequency is configured, channel width cannot be removed or updated. To remove or update the channel width from the NDF profile, you must remove the frequency.
- To update frequency and channel width when the NDF profile is associated with the RPD, you must shut down the rf-channel in the NDF profile.

To bind NDF static-pseudowire and NDF profile with rf-port, execute the bind commands under **core-interface TenGigabitEthernet [interface]** command:

```
Router# configure terminal
Router(config)# cable rpd <rpdc name>
Router(config-rpd)# core-interface TenGigabitEthernet <interface>
Router(cable-rpd-core)# [no] rpd-ds <port id> static-pseudowire <name> profile <id>
```

## Bind NDR Static-Pseudowire and NDR Profile with Rf-Port

**Note**

- Server IP address must be configured before binding NDR static-pseudowire to RPD. Once the server IP address is bound, it cannot be removed, but can be updated.
- Frequency and channel width must be configured in NDR profile before binding NDR static-pseudowire to RPD. If frequency is configured, channel width cannot be removed or updated. To remove or update the channel width from the NDR profile, you must remove the frequency.
- To update frequency and channel width when the NDR profile is associated with the RPD, you must shut down the rf-channel in the NDR profile.

To bind NDR static-pseudowire and NDR profile with rf-port, run the bind commands under **core-interface TenGigabitEthernet [interface]** command.

```
Router# configure terminal
Router(config)# cable rpd <rpdc name>
Router(config-rpd)# core-interface TenGigabitEthernet <interface>
Router(cable-rpd-core)# [no] rpd-us <port id> static-pseudowire <name> profile <id>
```

## Display TLV Status

To display the TLV status sent from cBR-8, run these commands:

```
Router# show cable rpd ndf-channels
```

```
Router# show cable rpd ndr-channels
```

To display per channel static-pseudowire and controller profile configuration, run these commands:

**Router# show cable rpd ndf-channels detailed**

**Router# show cable rpd ndr-channels detailed**

These examples show how to display the TLV status.

```
Router# show cable rpd ndf-channels

**Table 232: TLV Status Description**

| TLV Status      | Description                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Success-In-RPD  | NDF/NDR configuration is sent to the RPD and RPD sends the response TLV with status as SUCCESS.                                              |
| Failed-In-RPD   | NDF/NDR configuration is sent to the RPD and RPD sends the response TLV with status as ERROR.                                                |
| Sent-To-RPD     | NDF/NDR configuration is sent to the RPD but no response is received from the RPD.                                                           |
| Failed-To-Send  | NDF/NDR TLV fails to deliver from CCAP core to RPD.                                                                                          |
| RPD-Not-Capable | RPD is not capable of supporting attributes in TLV. For example, if RPD does not support NDF or NDR, the TLV status sent as RPD-Not-Capable. |

| TLV Status  | Description                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In-Progress | Frequency and channel width are set to 0 in a NDF or NDR profile. Depending on the TLV response from the RPD when frequency and channel width are configured and a no shutdown is performed on the rf-channel, the In-Progress status changes. |
| RPD-Offline | RPD is offline.                                                                                                                                                                                                                                |

## Example: NDF Configuration

This example shows how to configure static-pseudowire for NDF.

### Configure static-pseudowire for unicast NDF

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# static-pseudowire ndf0 type ndf id 1
Router(config-oob-spw)# dest-ip 0.0.0.0 source-ip 192.168.1.10
Router(config-oob-spw)# session-id 0x1
```

### Configure static-pseudowire for multicast NDF

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# static-pseudowire ndf2 type ndf id 12
Router(config-oob-spw)# dest-ip 232.1.1.10 source-ip 10.10.10.5
Router(config-oob-spw)# session-id 0x2
```

This example shows how to configure downstream OOB NDF profile.

```
Router# configure terminal
Router(config)# controller downstream-oob NDF-profile id 100
Router(config-profile)# no ds-channel 0 rf-mute
Router(config-profile)# no ds-channel 0 shutdown
Router(config-profile)# ds-channel 0 frequency 70000000
Router(config-profile)# ds-channel 0 width 1280000
Router(config-profile)# ds-channel 0 poweradjust -10
```

This example shows how to configure bind NDF static-pseudowire and NDF profile with rf-port.

```
Router# configure terminal
Router(config)# cable rpd node6
Router(config-rpd)# core-interface TenGigabitEthernet 7/1/0
Router(config-rpd-core)# rpd-ds 0 static-pseudowire ndf0 profile 100
Router(config-rpd-core)# rpd-ds 0 static-pseudowire ndf1 profile 101
Router(config-rpd-core)# rpd-ds 0 static-pseudowire ndf2 profile 102
```

## Example: NDR Configuration

This example shows how to configure static-pseudowire for NDR.

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# static-pseudowire ndr0 type ndr id 19
Router(config-oob-spw)# server-ip 192.168.69.1
```

```
Router(config-oob-spw)# mtusize 1500
Router(config-oob-spw)# per-hop-behavior default
Router(config-oob-spw)# session-id 0x3
```

This example shows how to configure upstream OOB NDR profile.

```
Router# configure terminal
Router(config)# controller upstream-oob NDR-profile id 100
Router(config-profile)# no us-channel 0 shutdown
Router(config-profile)# us-channel 0 frequency 5216000
Router(config-profile)# us-channel 0 width 1280000
Router(config-profile)# us-channel 0 poweradjust -5
```

This example shows how to configure bind NDR static-pseudowire and NDR profile with rf-port.

```
Router# configure terminal
Router(config)# cable rpd node6
Router(config-rpd)# core-interface TenGigabitEthernet 7/1/0
Router(config-rpd-core)# rpd-us 0 static-pseudowire ndr0 profile 100
Router(config-rpd-core)# rpd-us 0 static-pseudowire ndr1 profile 101
Router(config-rpd-core)# rpd-us 0 static-pseudowire ndr2 profile 102
```

## Feature Information for Narrowband Digital Forward And Narrowband Digital Return

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 233: Feature Information for Narrowband Digital Forward And Narrowband Digital Return**

| Feature Name                                             | Releases                       | Feature Information                                                      |
|----------------------------------------------------------|--------------------------------|--------------------------------------------------------------------------|
| Narrowband Digital Forward And Narrowband Digital Return | Cisco IOS XE Gibraltar 16.10.1 | This feature was introduced on the Cisco cBR Converged Broadband Router. |

## CHAPTER 89

# Dynamic Shared Secret

This document describes the Dynamic Shared Secret feature, which enables service providers to provide higher levels of security for their Data-over-Cable Service Interface Specifications (DOCSIS) cable networks. This feature uses randomized, single-use shared secrets to verify the DOCSIS configuration files that are downloaded to each cable modem.

The Dynamic Shared Secret feature automatically creates a unique DOCSIS shared secret on a per-modem basis, creating a one-time use DOCSIS configuration file that is valid only for the current session. This ensures that a DOCSIS configuration file that has been downloaded for one cable modem can never be used by any other modem, nor can the same modem reuse this configuration file at a later time.

This patented feature is designed to guarantee that all registered modems use only the quality of service (QoS) parameters that have been specified by the DOCSIS provisioning system for a particular modem at the time of its registration. This feature is an accepted DOCSIS standard.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Dynamic Shared Secret

The configuration of Dynamic Shared Secret feature is supported on the Cisco CMTS routers.

Following is a list of other important prerequisites for the Dynamic Shared Secret feature:

- The Cisco CMTS must be running Cisco IOS-XE 3.15.0S or later.
- The Dynamic Shared Secret feature supports an external provisioning server.

- A cable modem must be able to register with the Cisco CMTS before enabling the Dynamic Shared Secret feature.
- For full security, DOCSIS configuration files should have filenames that are at least 5 or more characters in length.
- For best performance during the provisioning of cable modems, we recommend using Cisco Network Registrar Release 3.5 or later.

**Note**

When the Dynamic Shared Secret feature is enabled using its default configuration, a cable modem diagnostic webpage shows a scrambled name for its DOCSIS configuration file. This filename changes randomly each time that the cable modem registers with the CMTS. To change the default behavior, use the **nocrypt** option with the **cable dynamic-secret** command.

## Restrictions for Dynamic Shared Secret

### General Restrictions for Dynamic Shared Secret

- Shared-secret and secondary-shared-secret cannot be configured with Dynamic Shared Secret feature.
- If you configure the Dynamic Shared Secret feature on a primary cable interface, you should also configure the feature on all of the corresponding subordinate cable interfaces.
- The Dynamic Shared Secret feature ensures that each cable modem registering with the CMTS can use only the DOCSIS configuration file that is specified by the service provider's authorized Dynamic Host Configuration Protocol (DHCP) and TFTP servers, using the DOCSIS-specified procedures.
- The Dynamic Shared Secret feature does not affect cable modems that are already online and provisioned. If a cable modem is online, you must reset it, so that it reregisters, before it complies with the Dynamic Shared Secret feature.
- The DMIC lock mode uses the following behavior during a switchover event in HCCP N+1 Redundancy. All cable modems which were previously in lock mode are taken offline during a switchover event, and the prior state of locked modems is lost. If previously locked modems remain non-compliant, they will return to LOCK mode after three failed registration attempts. If the modems have become DOCSIS compliant, they will return online in the normal fashion. Refer to the [SNMP Support, on page 1321](#) for additional information about DMIC lock mode.
- If a Broadband Access Center for Cable (BACC) provisioning server is being used, the Device Provisioning Engine (DPE) TFTP server verifies that the IP address of the TFTP client matches the expected DOCSIS cable modem IP Address. If a match is not found, the request is dropped. This functionality is incompatible with the CMTS DMIC feature. Use the `no tftp verify-ip` command on all BACC DPE servers to disable the verification of the requestor IP address on dynamic configuration TFTP requests. Refer to the Cisco Broadband Access Centre DPE CLI Reference in the [http://www.cisco.com/c/en/us/td/docs/net\\_mgmt/broadband\\_access\\_center\\_for\\_cable/4-0/command/reference/DPECLIRef40.html](http://www.cisco.com/c/en/us/td/docs/net_mgmt/broadband_access_center_for_cable/4-0/command/reference/DPECLIRef40.html) for additional information.

# Cable Modem Restrictions for Dynamic Shared Secret

## DHCP Restriction for Incognito Server and Thomson Cable Modems

The Dynamic Host Configuration Protocol (DHCP) passes configuration information to DHCP hosts on a TCP/IP network. Configuration parameters and other control information are stored in the options field of the DHCP message.

When using DMIC with the Incognito DHCP server, the Incognito server must be re-configured so that the following two options are *not* sent in the DHCP message:

- *option 66*—This option is used to identify a TFTP server when the sname field in the DHCP header has been used for DHCP options. Option 66 is a variable-length field in the Options field of a DHCP message described as "an option used to identify a TFTP server when the 'sname' field in the DHCP header has been used for DHCP options" as per RFC 2132.
- *sname field*—The sname field is a 64-octet field in the header of a DHCP message described as "optional server host name, null terminated string," as per RFC2131. A DHCP server inserts this option if the returned parameters exceed the usual space allotted for options. If this option is present, the client interprets the specified additional fields after it concludes interpretation of the standard option fields.

---

**Note** It is not compliant with DOCSIS to include both of these options in the DHCP message.

---

The problematic packet capture below is a DHCP offer in which both sname and option 66 are set (in this respective sequence):

```

0000 00 30 19 47 8f 00 00 d0 b7 aa 95 50 08 00 45 00
0010 01 4a 8f 50 00 00 80 11 46 30 ac 10 02 01 ac 10
0020 0a 01 00 43 00 43 01 36 0c 75 02 01 06 00 b0 a0
0030 25 01 00 00 00 00 00 00 00 00 ac 10 0a 53 00 00
0040 00 00 ac 10 0a 01 00 10 95 25 a0 b0 00 00 00 00
0050 00 00 00 00 00 00 5b 31 37 32 2e 31 36 2e 32 2e
 (sname option immediately above)
0060 31 5d 00 00 00 00 00 00 00 00 00 00 00 00 00
0070 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0080 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0090 00 00 00 00 00 00 64 65 66 61 75 6c 74 2e 63 66
00a0 67 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00b0 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00c0 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00d0 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00e0 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
00f0 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0100 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0110 00 00 00 00 00 00 63 82 53 63 35 01 02 36 04 ac
0120 10 02 01 33 04 00 06 94 0d 01 04 ff ff ff 00 02
0130 04 ff ff b9 b0 03 08 ac 10 02 fe ac 10 0a 01 04
0140 04 ac 10 02 01 07 04 ac 10 02 01 42 0a 31 37 32
 (option 66 immediately above)
0150 2e 31 36 2e 32 2e 31 ff

```

When using DMIC with Incognito DHCP servers and Thomson cable modems, you must prevent both options from being sent in the DHCP offer. Use one of the following workaround methods to achieve this:

- Change the Incognito DHCP server so that it does not include the sname option as described above.

- Change the cable modem code so that sname is not prioritized above option 66, as in the problematic packet capture shown in the example above.
- Migrate to a compliant DHCP and TFTP server such as CNR. This also offers significantly higher performance.

Refer to these resources for additional DOCSIS DHCP information, or optional DHCP MAC exclusion:

- *DHCP Options and BOOTP Vendor Extensions, RFC 2132*

<http://www.ietf.org/rfc/rfc2132.txt>

- *Filtering Cable DHCP Lease Queries on Cisco CMTS Routers*

<http://www.cisco.com/en/US/docs/cable/cmts/feature/cblsrcvy.html>

## DOCSIS Compliance

- Cable modems are assumed to be DOCSIS-compliant. If a cable modem is not fully DOCSIS-compliant, it could trigger a CMTS Message Integrity Check (MIC) failure during registration in rare circumstances. Under normal operations, however, it can be assumed that cable modems that fail the CMTS MIC check from the Dynamic Shared Secret feature are either not DOCSIS-compliant, or they might have been hacked by the end user to circumvent DOCSIS security features.

Some of the cable modems with the following OUIs have been identified as having problems with the Dynamic Shared Secret feature, depending on the hardware and software revisions:

- 00.01.03
- 00.E0.6F
- 00.02.B2

These particular cable modems can remain stuck in the init(o) MAC state and cannot come online until the Dynamic Shared Secret feature is disabled. If this problem occurs, Cisco recommends upgrading the cable modem's software to a fully compliant software revision.

Alternatively, these cable modems may be excluded from the *dynamic* secret function using the following command in global configuration mode:

### **cable dynamic-secret exclude**

Excluding cable modems means that if a violator chooses to modify their cable modem to use one of the excluded OUIs, then the system is no longer protected. Refer to the [#unique\\_1779](#).

---

**Tip** To help providers to identify non-DOCSIS compliant modems in their network, the Dynamic Shared Secret feature supports a “mark-only” option. When operating in the mark-only mode, cable modems might be able to successfully obtain higher classes of service than are provisioned, but these cable modems will be marked as miscreant in the **show cable modem** displays (with **!online**, for example). Such cable modems also display with the **show cable modem rogue** command. Service providers may decide whether those cable modems must be upgraded to DOCSIS-compliant software, or whether the end users have hacked the cable modems for a theft-of-service attack.

---

The following example illustrates output from a Cisco CMTS that is configured with the **cable dynamic-secret mark** command with miscreant cable modems installed. These cable modems may briefly show up as "reject(m)" for up to three registration cycles before achieving the **!online** status.

```

Router# show cable modem rogue

```

## TFTP Restrictions

- Cable modems can become stuck in the TFTP transfer state (this is indicated as init(o) by the **show cable modem** command) in the following situation:
  - The Dynamic Shared Secret feature is enabled on the cable interface, using the **cable dynamic-secret** command. This feature applies if the cable modem is a miscreant cable modem, or if the cable modem is a DOCSIS 1.0 cable modem running early DOCSIS 1.0 firmware that has not yet been updated. This feature also applies if the TFTP server is unable to provide the cable modem's TFTP configuration file to the Cisco CMTS. This is the case, for example, when using BACC and not configuring the system to permit a TFTP request from a non-matching source IP address. The **debug cable dynamic-secret** command also shows this failure.
  - A large number of cable modems are registering at the same time. Some or all of those cable modems could also be downloading the DOCSIS configuration file using multiple TFTP transfers that use multiple TFTP ports on the Cisco CMTS router, and the TFTP server is unable to keep up with the rate of TFTP requests generated by the system. Some TFTP servers may be limited to the number of concurrent TFTP get requests initiated by the same source IP address per unit time, or simply unable to handle the rate of new modem registrations before cable dynamic-secret is configured. The **debug cable dynamic-secret** command shows failure to receive some files in this situation.

This situation of stuck cable modems can result in the TFTP server running out of available ports, resulting in the cable modems failing the TFTP download stage. To prevent this situation from happening, temporarily disable the Dynamic Shared Secret feature on the cable interface or reduce the size of the DOCSIS configuration file.

## Information About Dynamic Shared Secret

The DOCSIS specifications require that cable modems download, from an authorized TFTP server, a DOCSIS configuration file that specifies the quality of service (QoS) and other parameters for the network session. Theft-of-service attempts frequently attempt to intercept, modify, or substitute the authorized DOCSIS configuration file, or to download the file from a local TFTP server.

To prevent theft-of-service attempts, the DOCSIS specification allows service providers to use a shared secret password to calculate the CMTS Message Integrity Check (MIC) field that is attached to all DOCSIS configuration files. The CMTS MIC is an MD5 digest that is calculated over the DOCSIS Type/Length/Value (TLV) fields that are specified in the configuration file, and if a shared secret is being used, it is used in the MD5 calculation as well.

The cable modem must include its calculation of the CMTS MIC in its registration request, along with the contents of the DOCSIS configuration file. If a user modifies any of the fields in the DOCSIS configuration file, or uses a different shared secret value, the CMTS cannot verify the CMTS MIC when the cable modem

registers. The CMTS does not allow the cable modem to register, and marks it as being in the “reject(m)” state to indicate a CMTS MIC failure.

Users, however, have used various techniques to circumvent these security checks, so that they can obtain configuration files that provide premium services, and then to use those files to provide themselves with higher classes of services. Service providers have responded by changing the shared secret, implementing DOCSIS time stamps, and using modem-specific configuration files, but this has meant creating DOCSIS configuration files for every cable modem on the network. Plus, these responses would have to be repeated whenever a shared secret has been discovered.

The Dynamic Shared Secret feature prevents these types of attacks by implementing a dynamically generated shared secret that is unique for each cable modem on the network. In addition, the dynamic shared secrets are valid only for the current session and cannot be reused, which removes the threat of “replay attacks,” as well as the reuse of modified and substituted DOCSIS configuration files.

## Modes of Operation

The Dynamic Shared Secret feature can operate in three different modes, depending on what action should be taken for cable modems that fail the CMTS MIC verification check:

- **Marking Mode**—When using the **mark** option, the CMTS allows cable modems to come online even if they fail the CMTS MIC validity check. However, the CMTS also prints a warning message on the console and marks the cable modem in the **show cable modem** command with an exclamation point (!), so that this situation can be investigated.
- **Locking Mode**—When the **lock** option is used, the CMTS assigns a restrictive QoS configuration to CMs that fail the MIC validity check twice in a row. You can specify a particular QoS profile to be used for locked cable modems, or the CMTS defaults to special QoS profile that limits the downstream and upstream service flows to a maximum rate of 10 kbps.

If a customer resets their CM, the CM will reregister but still uses the restricted QoS profile. A locked CM continues with the restricted QoS profile until it goes offline and remains offline for at least 24 hours, at which point it is allowed to reregister with a valid DOCSIS configuration file. A system operator can manually clear the lock on a CM by using the **clear cable modem lock** command.

This option frustrates users who are repeatedly registering with the CMTS in an attempt to guess the shared secret, or to determine the details of the Dynamic Shared Secret security system.

- **Reject Mode**—In the reject mode, the CMTS refuses to allow CMs to come online if they fail the CMTS MIC validity check. These cable modems are identified in the **show cable modem** displays with a MAC state of “reject(m)” (bad MIC value). After a short timeout period, the CM attempts to reregister with the CMTS. The CM must register with a valid DOCSIS configuration file before being allowed to come online. When it does come online, the CMTS also prints a warning message on the console and marks the cable modem in the **show cable modem** command with an exclamation point (!), so that this situation can be investigated.

---

**Note** To account for possible network problems, such as loss of packets and congestion, the Cisco CMTS will allow a cable modem to attempt to register twice before marking it as having failed the Dynamic Shared Secret authentication checks.

---

## Operation of the Dynamic Shared Secret

The Dynamic Shared Secret feature automatically creates a unique DOCSIS shared secret on a per-modem basis, creating a one-time use DOCSIS configuration file that is valid only for the current session. This ensures that a DOCSIS configuration file that has been downloaded for one cable modem can never be used by any other modem, nor can the same modem reuse this configuration file at a later time.

This patent pending feature is designed to guarantee that all registered modems are using only the QOS parameters that have been specified by the DOCSIS provisioning system for that particular modem at the time of its registration.

When a DOCSIS-compliant cable modem registers with the CMTS, it sends a DHCP request, and the DHCP server sends a DHCP response that contains the name of the DOCSIS configuration file that the cable modem should download from the specified TFTP server. The cable modem downloads the DOCSIS configuration file and uses its parameters to register with the CMTS.

When the Dynamic Shared Secret feature is enabled, the CMTS performs the following when it receives the DHCP messages:

- The CMTS creates a dynamically generated shared secret.
- In the default configuration, the CMTS takes the name of the DOCSIS configuration file and generates a new, randomized filename. This randomized filename changes every time the cable modem registers, which prevents the caching of DOCSIS configuration files by cable modems that are only semi-compliant with the DOCSIS specifications. You can disable this randomization of the filename by using the **nocrypt** option with the **cable dynamic-secret** command.
- The CMTS changes the IP address of the TFTP server that the cable modem should use to the IP address of the CMTS. This informs the cable modem that it should download its configuration file from the CMTS.
- The CMTS downloads the original DOCSIS configuration file from the originally specified TFTP server so that it can modify the file to use the newly generated dynamic secret.

When the cable modem downloads the DOCSIS configuration file, it receives the modified file from the CMTS. Because this file uses the one-time-use dynamically generated shared secret, the CMTS can verify that the cable modem is using this configuration file when it attempts to register with the CMTS.

---

**Note** The Dynamic Shared Secret feature does not support and is incompatible with, the use of the original shared secret or secondary shared secrets that are configured using the **cable shared-secondary-secret** and **cable shared-secret** commands.

---

---

**Tip** Although a user could attempt to circumvent these checks by downloading a DOCSIS configuration file from a local TFTP server, the cable modem would still fail the CMTS MIC verification.

---

## Interaction with Different Commands

The Dynamic Shared Secret feature works together with a number of other commands to ensure network security and integrity:

- **cable shared-secret**—The DOCSIS specification allows service providers to use a shared-secret to ensure that cable modems are using only authorized DOCSIS configuration files.

The Dynamic Shared Secret feature is incompatible with **cable shared-secret**. Do not configure the **cable shared-secret** command when using the Dynamic Shared Secret feature

- **cable shared-secondary-secret**— The Dynamic Shared Secret feature is incompatible with **cable shared-secret**. Do not configure the **cable secondary-shared-secret** command when using the Dynamic Shared Secret feature

## Performance Information

The Dynamic Shared Secret feature does not add any additional steps to the cable modem registration process, nor does it add any additional requirements to the current provisioning systems. This feature can have either a small negative or a small positive effect on the performance of the network provisioning system, depending on the following factors:

- The provisioning system (DHCP and TFTP servers) being used
- The number of cable modems that are coming online
- The vendor and software versions of the cable modems
- The number and size of the DOCSIS configuration files

Large-scale testing has shown that the Dynamic Shared Secret feature can affect the time it takes for cable modems to come online from 5% slower to 10% faster. The most significant factor in the performance of the provisioning process is the provisioning system itself. For this reason, Cisco recommends using Cisco Network Registrar (CNR) Release 3.5 or greater, which can provide significant performance improvements over generic DHCP and TFTP servers.

The second-most important factor in the performance of cable modem provisioning is the number and size of the DOCSIS configuration files. The size of the configuration file determines how long it takes to transmit the file to the cable modem, while the number of configuration files can impact how efficiently the system keeps the files in its internal cache, allowing it to reuse identical configuration files for multiple modems.

## SNMP Support

Cisco IOS-XE 3.15.0S and later releases add the following SNMP support for the Dynamic Shared Secret feature:

- Adds the following MIB objects to the CISCO-DOCS-EXT-MIB:
  - **cdxCmtsCmDMICMode**—Sets and shows the configuration of the Dynamic Shared Secret feature for a specific cable modem (not configured, mark, lock, or reject).
  - **cdxCmtsCmDMICLockQoS**—Specifies the restrictive QoS profile assigned to a cable modem that has failed the Dynamic Shared Secret security checks, when the interface has been configured for lock mode.
  - **cdxCmtsCmStatusDMICTable**—Lists all cable modems that have failed the Dynamic Shared Secret security checks.
- An SNMP trap (**cdxCmtsCmDMICLockNotification**) can be sent when a cable modem is locked for failing the Dynamic Shared Secret security checks. The trap can be enabled using the **snmp-server enable traps cable dmic-lock** command.

---

**Note** The DMIC lock mode is disabled during a switchover event in HCCP N+1 Redundancy.

---

## System Error Messages

The following system error messages provide information about cable modems that have failed the CMTS Message Integrity Check (MIC) when the Dynamic Shared Secret feature is enabled.

### Message

```
%CBR-4-CMLOCKED
```

The cable modem's DOCSIS configuration file did not contain a Message Integrity Check (MIC) value that corresponds with the proper Dynamic Shared Secret that was used to encode it. The CMTS has, therefore, assigned a restrictive quality of service (QoS) configuration to this cable modem to limit its access to the network. The CMTS has also locked the cable modem so that it will remain locked in the restricted QoS configuration until it goes offline for at least 24 hours, at which point it is permitted to reregister and obtain normal service (assuming it is DOCSIS-compliant and using a valid DOCSIS configuration file).

This error message appears when the **cable dynamic-secret lock** command has been applied to a cable interface to enable the Dynamic Shared Secret feature for the DOCSIS configuration files on that cable interface. The cable modem has been allowed to register and come online, but with a QoS configuration that is limited to a maximum rate of 10 kbps for both the upstream and downstream flows. Check to ensure that this cable modem is not running old software that caches the previously used configuration file. Also check for a possible theft-of-service attempt by a user attempting to download a modified DOCSIS configuration file from a local TFTP server. The CM cannot reregister with a different QoS profile until it has been offline for 24 hours, without attempting to register, or you have manually cleared the lock using the **clear cable modem lock** command.

### Message

```
%CBR-4-CMMARKED
```

The cable modem's DOCSIS configuration file did not contain a Message Integrity Check (MIC) value that corresponds with the proper dynamic shared secret that was used to encode it. The CMTS has allowed this modem to register and come online, but has marked it in the **show cable modem** displays with an exclamation point (!) so that the situation can be investigated.

This error message appears when the **cable dynamic-secret mark** command has been applied to a cable interface to enable the Dynamic Shared Secret feature for the DOCSIS configuration files on that cable interface. Check to ensure that this cable modem is not running old software that caches the previously used configuration file. Also check for a possible theft-of-service attempt by a user attempting to download a modified DOCSIS configuration file from a local TFTP server.

### Message

```
%CBR-4-NOCFGFILE
```

The CMTS could not obtain the DOCSIS configuration file for this cable modem from the TFTP server. This message occurs when the Dynamic Shared Secret feature is enabled on the cable interface with the **cable dynamic-secret** command.

Verify that the CMTS has network connectivity with the TFTP server, and that the specified DOCSIS configuration file is available on the TFTP server. Check that the DHCP server is correctly configured to send the proper configuration filename in its DHCP response to the cable modem. Also verify that the DOCSIS configuration file is correctly formatted.

This problem could also occur if the TFTP server is offline or is overloaded to the point where it cannot respond promptly to new requests. It might also be seen if the interface between the CMTS and TFTP server is not correctly configured and flaps excessively.

---

**Note** This error indicates a problem with the provisioning system outside of the Cisco CMTS. Disabling the Dynamic Shared Secret feature does not clear the fault, nor does it allow cable modems to come online. You must first correct the problem with the provisioning system.

---

## Benefits

The Dynamic Shared Secret feature provides the following benefits to cable service providers and their partners and customers:

### Improves Network Security

Service providers do not need to worry about users discovering the shared secret value and using it to modify DOCSIS configuration files to give themselves higher levels of service. Even if a user were to discover the value of a dynamically generated shared secret, the user would not be able to use that shared secret again to register.

The generic TFTP server performance and error handling on the Cisco CMTS routers has been greatly improved to support the high performance that is required for rapidly provisioning cable modems.

### Flexibility in Dealing with Possible Theft-of-Service Attempts

Service providers have the option of deciding what response to take when a DOCSIS configuration file fails its CMTS MIC check: mark that cable modem and allow the user online, reject the registration request and refuse to allow the user to come online until a valid DOCSIS configuration file is used, or lock the cable modem in a restricted QoS configuration until the modem remains offline for 24 hours. Locking malicious modems is the most effective deterrent against hackers, because it provides the maximum penalty and minimum reward for any user attempting a theft-of-service attack.

### No Changes to Provisioning System Are Needed

Service providers can use the Dynamic Shared Secret feature without changing their provisioning or authentication systems. Existing DOCSIS configuration files can be used unchanged, and you do not need to change any existing shared secrets.

---

**Tip** If not already done, the service provider could also install access controls that allow only the CMTS routers to download DOCSIS configuration files from the TFTP servers.

---

### No Changes to Cable Modems Are Needed

The Dynamic Shared Secret feature does not require any end-user changes or any changes to the cable modem configuration. This feature supports any DOCSIS compliant cable modem.

---

**Note** The Dynamic Shared Secret feature does not affect cable modems that are already online and provisioned. Cable modems that are already online when the feature is enabled or disabled remain online.

---

### Simplifies Network Management

Service providers do not have to continually update the shared secrets on a cable interface whenever the files providing premium services become widely available. Instead, providers can use the same shared secret on a cable interface for significant periods of time, trusting in the Dynamic Shared Secret feature to provide unique, single-use shared secrets for each cable modem.

In addition, service providers do not have to manage unique DOCSIS configuration files for each cable modem. The same configuration file can be used for all users in the same service class, without affecting network security.

## Related Features

The following features can be used with the Dynamic Shared Secret feature to enhance the overall security of the cable network.

- **Baseline Privacy Interface Plus (BPI+) Authorization and Encryption**—Provides a secure link between the cable modem and CMTS, preventing users from intercepting or modifying packets that are transmitted over the cable interface. BPI+ also provides for secure authorization of cable modems, using X.509 digital certificates, as well as a secure software download capability that ensures that software upgrades are not spoofed, intercepted, or altered.

## How to Configure the Dynamic Shared Secret Feature

The following sections describe how to enable and configure the Dynamic Shared Secret feature, to disable the feature, to manually clear a lock on a cable modem, or dynamically upgrade firmware on the cable modems.

---

**Note** All procedures begin and end at the privileged EXEC prompt (“Router#”).

---

## Enabling and Configuring the Dynamic Shared Secret Feature

This section describes how to enable and configure the Dynamic Shared Secret feature on a cable interface.

### Procedure

|               | Command or Action                                                                 | Purpose                           |
|---------------|-----------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode. |

### What to do next

**Note** If you configure the Dynamic Shared Secret feature on any interface in a cable interface bundle, you should configure it on all interfaces in that same bundle.

## Disabling the Dynamic Shared Secret on a Cable Interface

This section describes how to disable the Dynamic Shared Secret feature on a cable interface. The cable modem continues to be validated against any shared secret or secondary shared secrets that have been defined on the cable interface.

### Procedure

|               | Command or Action                                                                                                 | Purpose                           |
|---------------|-------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <pre>configure terminal</pre> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                   |

## Excluding Cable Modems from the Dynamic Shared Secret Feature

This section describes how to exclude one or more cable modems from being processed by the Dynamic Shared Secret feature. The cable modem continues to be validated against any shared secret or secondary shared secrets that have been defined on the cable interface.

### Procedure

|               | Command or Action                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>cable dynamic-secret exclude</b> { <i>oui oui-id</i>   <b>modem</b> <i>mac-address</i> }<br><b>Example:</b><br>Router (config) # <b>cable dynamic-secret exclude</b> oui 00.01.B4 | Excludes one or more cable modems from being processed by the Dynamic Shared Secret security checks, on the basis of their MAC addresses or OUI values: <ul style="list-style-type: none"> <li>• <b>modem</b> <i>mac-address</i>—Specifies the hardware (MAC) address of one specific and individual cable modem</li> </ul> |

|               | Command or Action                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Router(config)# cable dynamic-secret exclude modem 00d0.45ba.b34b</pre> | <p>to be excluded from the Dynamic Shared Secret feature. (You cannot specify a multicast MAC address.)</p> <ul style="list-style-type: none"> <li>• <b>oui</b> <i>oui-id</i>—Specifies the organization unique identifier (OUI) of a vendor, so that a group of cable modems from this vendor are excluded from the Dynamic Shared Secret feature. The OUI should be specified as three hexadecimal bytes separated by either periods or colons.</li> </ul> <p><b>Note</b> Repeat this command for each cable modem MAC address or OUI vendor to be excluded.</p> |
| <b>Step 3</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config)# exit</pre>    | Exits the interface configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Clearing the Lock on One or More Cable Modems

This section describes how to manually clear the lock on one or more cable modems. This forces the cable modems to reinitialize, and the cable modems must reregister with a valid DOCSIS configuration file before being allowed online. If you do not manually clear the lock (using the **clear cable modem lock** command), the cable modem is locked in its current restricted QoS profile and cannot reregister with a different profile until it has been offline for at least 24 hours.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>clear cable modem</b> {<i>mac-addr</i>   <i>ip-addr</i>   <b>all</b>   <b>oui</b><i>string</i>   <b>reject</b>} <b>lock</b></p> <p><b>Example:</b></p> <pre>Router# clear cable modem 0001.0203.0405 lock</pre> <p><b>Example:</b></p> <pre>Router# clear cable modem all lock</pre> <p><b>Example:</b></p> <pre>Router# clear cable modem oui 00.00.0C lock</pre> <p><b>Example:</b></p> | <p>Clears the lock for the cable modems, which can be identified as follows:</p> <ul style="list-style-type: none"> <li>• <i>mac-addr</i>—Specifies the MAC address for one particular cable modem to be cleared.</li> <li>• <i>ip-addr</i>—Specifies the IP address for one particular cable modem to be cleared.</li> <li>• <b>all</b>—Clears the locks on all locked cable modems.</li> <li>• <b>oui</b> <i>string</i>—Clears the locks on all cable modems with a vendor ID that matches the specified Organizational Unique Identifier (OUI) string.</li> <li>• <b>reject</b>—Clears the locks on all cable modems that are currently in the reject state (which would occur if a locked cable modem went offline and attempted to reregister before 24 hours had elapsed).</li> </ul> |

|  | Command or Action | Purpose |
|--|-------------------|---------|
|  | Router#           |         |

### What to do next

**Tip** A cable modem can also be unlocked by manually deleting the cable modem from all CMTS internal databases, using the **clear cable modem delete** command.

## Upgrading Firmware on the Cable Modems

This section describes how to upgrade firmware on cable modems by dynamically inserting the correct TLV values in the DOCSIS configuration file that is downloaded by the cable modem. The DOCSIS configuration file contains the following TLV values:

- Software Upgrade Filename (TLV 9)—Specifies the filename of the firmware.
- Upgrade IPv4 TFTP Server (TLV21)—Specifies the IPv4 address of the TFTP server from where the modem downloads the DOCSIS configuration file.
- Upgrade IPv6 TFTP Server (TLV58)—Specifies the IPv6 address of the TFTP server from where the modem downloads the DOCSIS configuration file.

**Note** The TFTP server addresses are inserted only when the software upgrade filename (TLV9) is specified and when the TFTP server address (TLV21/TLV58) is either not specified or set to 0.

### Before you begin

The Dynamic Shared Secret feature must be enabled first before you can upgrade the firmware on cable modems. See [Enabling and Configuring the Dynamic Shared Secret Feature, on page 1324](#) for more information.

**Note** The command to enable or disable the Dynamic Shared Secret feature is available at the MAC domain level. However, the command to upgrade the firmware on cable modems is available at the global level.

### Procedure

|               | Command or Action                                                                                                    | Purpose                               |
|---------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> | Enters the global configuration mode. |

|               | Command or Action                                                                                                                                | Purpose                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|               | Router (config) #                                                                                                                                |                                                                                                                                         |
| <b>Step 2</b> | cable dynamic-secret tftp insert-upgrade-server<br><b>Example:</b><br><pre>Router(config)# cable dynamic-secret tftp insert-upgrade-server</pre> | Dynamically inserts the specific IPv4 or IPv6 TLV values in the DOCSIS configuration file to complete firmware upgrade on cable modems. |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config)# end</pre><br><b>Example:</b><br><pre>Router#</pre>                                         | Exits the configuration mode and returns to the privileged EXEC mode.                                                                   |

#### What to do next

**Note** If you configure the Dynamic Shared Secret feature on an interface in a cable interface bundle, you should configure it on all the interfaces of that bundle.

## How to Monitor the Dynamic Shared Secret Feature

This section describes the following procedures you can use to monitor and display information about the Dynamic Shared Secret feature:

### Displaying Marked Cable Modems

When you configure a cable interface with the **cable dynamic-secret mark** command, cable modems that fail the dynamically generated CMTS MIC verification are allowed online, but are marked with an exclamation point (!) in the MAC state column in the **show cable modem** display. The exclamation point is also used to identify cable modems that were initially rejected, using the **cable dynamic-secret reject** command, but then reregistered using a valid DOCSIS configuration file.

For example, the following example shows that four cable modems are marked as having failed the CMTS MIC verification, but that they have been allowed online:

```
Router# show cable modems
```

```
MAC Address IP Address I/F MAC Prim RxPwr Timing Num BPI
 State Sid (db) Offset CPE Enb
0010.9507.01db 144.205.151.130 C5/1/0/U5 online(pt) 1 0.25 938 1 N
```

## Displaying the Current Dynamic Secrets

In Cisco IOS XE Everest 16.5.1, the **verbose** option for the **show cable modem** command displays the dynamically generated shared secret (a 16-byte hexadecimal value) that was used in the cable modem's previous registration cycle. The display also shows if the cable modem failed the dynamic shared-secret check or did not download the DOCSIS configuration file from the TFTP server. If a cable modem is offline, its dynamic secret is shown as all zeros.

For example, the following example shows a typical display for a single cable modem that failed the dynamic shared-secret check:

```

Router# show cable modem 00c0.73ee.bbba verbose
MAC Address : 00c0.73ee.bbba
IP Address : 3.18.1.6
Prim Sid : 2
QoS Profile Index : 6
Interface : C3/0/U0

```

## Displaying the Current Dynamic Secrets

```

Upstream Power : 0.00 dBmV (SNR = 26.92 dBmV)
Downstream Power : 0.00 dBmV (SNR = ----- dBmV)
Timing Offset : 2812
Initial Timing Offset : 2812

Dynamic Secret : A3D1028F36EBD54FDCC2F74719664D3F
Router#

```

The following example shows a typical display for a single cable modem that is currently offline (the Dynamic Secret field shows all zeros):

```

Router# show cable modem 00C0.6914.8601 verbose

MAC Address : 00C0.6914.8601
IP Address : 10.212.192.119
Prim Sid : 6231
QoS Profile Index : 2
Interface : C5/1/0/U3
Upstream Power : 0.00 dBmV (SNR = 30.19 dBmV)
Downstream Power : 0.00 dBmV (SNR = ----- dBmV)
Timing Offset : 1831
Initial Timing Offset : 1831
Received Power : !-2.25
MAC Version : DOC1.0
Provisioned Mode : DOC1.0
Capabilities : {Frag=N, Concat=Y, PHS=N, Priv=BPI}
Sid/Said Limit : {Max Us Sids=0, Max Ds Sids=0}
Optional Filtering Support : {802.1P=N, 802.1Q=N}
Transmit Equalizer Support : {Taps/Symbol= 0, Num of Taps= 0}
Number of CPE IPs : 4(Max CPE IPs = 4)
CFG Max-CPE : 4
Flaps : 20638(Feb 10 16:04:10)
Errors : 0 CRCs, 0 HCSes
Stn Mtn Failures : 108 aborts, 161 exhausted
Total US Flows : 1(1 active)
Total DS Flows : 1(1 active)
Total US Data : 236222 packets, 146630868 bytes
Total US Throughput : 0 bits/sec, 0 packets/sec
Total DS Data : 9 packets, 1114 bytes
Total DS Throughput : 0 bits/sec, 0 packets/sec
Active Classifiers : 0 (Max = NO LIMIT)
Dynamic Secret : 00000000000000000000000000000000
Router#

```

**Note** The Dynamic Secret field shown above is all zeros (“00000000000000000000000000000000”), which indicates that this cable modem is offline.

You can also use the following command to display all the dynamically generated shared secrets that are in use:

```
Router# show cable modem verbose | include Dynamic Secret

Dynamic Secret : 43433036434644344643303841313237

## Troubleshooting Cable Modems with Dynamic Shared Secret

If a cable modem is being marked as having violated the dynamic shared secret, you can enable the following debugs to get more information about the sequence of events that is occurring:

- **debug cable mac-address *cm-mac-addr* verbose**—Enables detailed debugging for the cable modem with the specific MAC address.
- **debug cable tlv**—Displays the contents of Type/Length/Value messages that are sent during the registration process.
- **debug cable dynamic-secret**—Displays debugging messages about dynamic shared secret operation.

- **debug tftp server events**—Displays debugging messages for the major events that occur with the Cisco CMTS router's onboard TFTP server.
- **debug tftp server packets**—Displays a packet dump for the DOCSIS configuration files that the TFTP server downloads to a cable modem.

**Tip** For more information about these debug commands, see the *Cisco CMTS Debugging Commands* chapter in the Cisco Broadband Cable Command Reference Guide, at the following URL:  
[http://www.cisco.com/en/US/docs/ios/cable/command/reference/cbl\\_book.html](http://www.cisco.com/en/US/docs/ios/cable/command/reference/cbl_book.html)

In addition, examine the messages in the router's log buffer for any helpful information. Use the **show logging** command to display the contents of the router's logging buffer to display these messages. You can limit the output to a specific hour and minute by using the **begin** output modifier. For example, to display only those messages that were recorded at 12:10, give the following command:

```
Router# show logging | begin 12:10
```

**Note** The exact format for the **begin** output modifier depends on the timestamp you are using for your logging buffer.

## Configuration Examples for Dynamic Shared Secret

This section lists a typical configuration for the Dynamic Shared Secret feature.

**Note** These configurations also show a shared secret and secondary secret being configured on the cable interface. This is optional but highly recommended, because it adds an additional layer of security during the registration of cable modems.

### Mark Configuration: Example

The following excerpt from a configuration for the cable interface on a Cisco CMTS router configures the cable interface so that cable modems that fail the CMTS MIC check are allowed to come online, but are marked with an exclamation point (!) in the **show cable modem** displays, so that the situation can be investigated further.

```
interface cable c5/1/0
 cable dynamic-secret mark
 ...
```

## Lock Configuration: Example

The following excerpt from a configuration for the cable interface on a Cisco CMTS router configures the cable interface so that cable modems that fail the CMTS MIC check are allowed to come online, but are locked into a restrictive QoS configuration that limits the upstream and downstream service flows to a maximum rate of 10 kbps. A locked cable modem remains locked into the restrictive QoS configuration until the modem has remained offline for more than 24 hours, or until you have manually cleared it using the **clear cable modem lock** command.

```
cable qos permission create
cable qos permission update
...
interface cable c3/0
 cable dynamic-secret lock
 ...
```

---

**Note** If you use the **lock** option without specifying a specific QoS profile, you must allow cable modems to create and update QoS profiles, using the **cable qos permission** command. If you do not do this and continue to use the **lock** option without specifying a particular QoS profile, locked cable modems will not be allowed to register until the lock clears or expires.

---

The following example is the same except that it specifies that the locked cable modem should be assigned QoS profile 90. The cable modem remains locked with this QoS profile until the modem has remained offline for more than 24 hours, or until you have manually cleared it using the **clear cable modem lock** command. Because a specific QoS profile is specified, you do not need to use the **cable qos permission** command.

```
interface cable c3/0
 cable dynamic-secret lock 90
 ...
```

---

**Note** When a locked modem is cleared, it is automatically reset so that it reregisters with the CMTS. It is allowed online with the requested QoS parameters if it registers with a valid DOCSIS configuration that passes the Dynamic Shared Secret checks. However, the modem is locked again if it violates the DOCSIS specifications again.

---

## Reject Configuration: Example

The following excerpt from a configuration for the cable interface on a Cisco CMTS configures the cable interface so that cable modems that fail the CMTS MIC check are rejected and not allowed to register. The cable modem must reregister using a DOCSIS configuration file with a CMTS MIC that matches one of the shared secret or secondary secret values. When it does come online, the CMTS also prints a warning message on the console and marks the cable modem in the **show cable modem** command with an exclamation point (!), so that this situation can be investigated.

```
interface cable c3/0
 cable dynamic-secret reject
 ...
```

## Disabled Configuration: Example

The following excerpt from a configuration for the cable interface on a Cisco uBR7100 series router disables the Dynamic Shared Secret feature. In this configuration, the CMTS uses the shared secret and secondary shared secret values unchanged when verifying the CMTS MIC value for each DOCSIS configuration file.

```
interface cable c1/0
 no cable dynamic-secret
 ...
```

## Feature Information for Dynamic Shared Secret

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 235: Feature Information for Downstream Interface Configuration*

| Feature Name          | Releases                    | Feature Information                                                                                              |
|-----------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------|
| Dynamic shared secret | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Router. |

## CHAPTER 90

# Lawful Intercept Architecture

---

The Lawful Intercept (LI) feature supports service providers in meeting the requirements of law enforcement agencies to provide the ability to intercept Voice-over-Internet protocol (VoIP) or data traffic going through the edge routers. This document explains LI architecture, including Cisco Service Independent Intercept architecture and PacketCable Lawful Intercept architecture. It also describes the components of the LI feature and provides instructions on how to configure the LI feature in your system.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Lawful Intercept

Access to the Cisco LI MIB view should be restricted to the mediation device and to system administrators who need to be aware of lawful intercepts on the router. To access the MIB, users must have level-15 access rights on the router.

### Communication with Mediation Device

For the router to communicate with the mediation device to execute a lawful intercept, the following configuration requirements must be met:

- The domain name for both the router and the mediation device must be registered in the Domain Name System (DNS).

In DNS, the router IP address is typically the address of the TenGigabitEthernet5/1/0 or TenGigabitEthernet4/1/0 interface (depending on the slot in which the Supervisor is installed) on the router.

- The mediation device must have an access function (AF) and an access function provisioning interface (AFPI).

- You must add the mediation device to the Simple Network Management Protocol (SNMP) user group that has access to the CISCO-TAP2-MIB view. Specify the username of the mediation device as the user to add to the group.

When you add the mediation device as a CISCO-TAP2-MIB user, you can include the mediation device's authorization password if you want. The password must be at least eight characters in length.

## Restrictions for Lawful Intercept

### General Restrictions

There is no command-line interface (CLI) available to configure LI on the router. All error messages are sent to the mediation device as SNMP notifications. All intercepts are provisioned using SNMPv3 only.

Lawful Intercept does not support SUP HA. LI configuration needs to be reapplied after SUP switchover. An SNMP trap will be generated for this event.

### Lawful Intercept MIBs

Only the mediation device and users who need to know about lawful intercepts are allowed to access the LI MIBs.

Due to its sensitive nature, the Cisco LI MIBs are only available in software images that support the LI feature. These MIBs are not accessible through the Network Management Software MIBs Support page (<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>).

### SNMP Notifications

SNMP notifications for LI must be sent to User Datagram Protocol (UDP) port 161 on the mediation device, not port 162 (which is the SNMP default).

## Information About Lawful Intercept

### Introduction to Lawful Intercept

LI is the process by which law enforcement agencies (LEAs) conduct electronic surveillance as authorized by judicial or administrative order. Increasingly, legislation is being adopted and regulations are being enforced that require service providers (SPs) and Internet service providers (ISPs) to implement their networks to explicitly support authorized electronic surveillance. The types of SPs or ISPs that are subject to LI mandates vary greatly from country to country. LI compliance in the United States is specified by the Commission on Accreditation for Law Enforcement Agencies (CALEA).

Cisco supports two architectures for LI: PacketCable and Service Independent Intercept. The LI components by themselves do not ensure customer compliance with applicable regulations but rather provide tools that can be used by SPs and ISPs to construct an LI-compliant network.

## Cisco Service Independent Intercept Architecture

The [Cisco Service Independent Intercept Architecture Version 3.0](#) document describes implementation of LI for VoIP networks using the Cisco BTS 10200 Softswitch call agent, version 5.0, in a non-PacketCable network. Packet Cable Event Message specification version 1.5-I01 is used to deliver the call identifying information along with version 2.0 of the Cisco Tap MIB for call content.

The [Cisco Service Independent Intercept Architecture Version 2.0](#) document describes implementation of LI for VoIP networks using the Cisco BTS 10200 Softswitch call agent, versions 4.4 and 4.5, in a non-PacketCable network. Although not a PacketCable network, PacketCable Event Messages Specification version I08 is still used to deliver call identifying information, along with version 1.0 or version 2.0 of the Cisco Tap MIB for call content. The *Cisco Service Independent Intercept Architecture Version 2.0* document adds additional functionality for doing data intercepts by both IP address and session ID, which are both supported in version 2.0 of the Cisco Tap MIB (CISCO-TAP2-MIB).

The [Cisco Service Independent Intercept Architecture Version 1.0](#) document describes implementation of LI for VoIP networks that are using the Cisco BTS 10200 Softswitch call agent, versions 3.5 and 4.1, in a non-PacketCable network. Although not a PacketCable network, PacketCable Event Message Specification version I03 is still used to deliver call identifying information, along with version 1.0 of the Cisco Tap MIB (CISCO-TAP-MIB) for call content. Simple data intercepts by IP address are also discussed.

## PacketCable Lawful Intercept Architecture

The *PacketCable Lawful Intercept Architecture for BTS Version 5.0* document describes the implementation of LI for VoIP using Cisco BTS 10200 Softswitch call agent, version 5.0, in a PacketCable network that conforms to PacketCable Event Messages Specification version 1.5-I01.

The *PacketCable Lawful Intercept Architecture for BTS Versions 4.4 and 4.5* document describes the implementation of LI for VoIP using Cisco BTS 10200 Softswitch call agent, versions 4.4 and 4.5, in a PacketCable network that conforms to PacketCable Event Messages Specification version I08.

The [PacketCable Lawful Intercept Architecture for BTS Versions 3.5 and 4.1](#) document describes the implementation of LI for voice over IP (VoIP) using Cisco Broadband Telephony Softswitch (BTS) 10200 Softswitch call agent, versions 3.5 and 4.1, in a PacketCable network that conforms to PacketCable Event Message Specification version I03.

The *PacketCable Control Point Discovery Interface Specification* document defines an IP-based protocol that can be used to discover a control point for a given IP address. The control point is the place where Quality of Service (QoS) operations, LI content tapping operations, or other operations may be performed.

---

**Note** The Cisco cBR router does not support PacketCable Communications Assistance for Law Enforcement Act (CALEA).

---

## Cisco cBR Series Routers

The Cisco cBR series router support two types of LI: regular and broadband (per-subscriber). Regular wiretaps are executed on access subinterfaces and physical interfaces. Wiretaps are not required, and are not executed, on internal interfaces. The router determines which type of wiretap to execute based on the interface that the target's traffic is using.

LI on the Cisco cBR series routers can intercept traffic based on a combination of one or more of the following fields:

- Destination IP address and mask (IPv4 or IPv6 address)
- Destination port or destination port range
- Source IP address and mask (IPv4 or IPv6 address)
- Source port or source port range
- Protocol ID
- Type of Service (TOS)
- Virtual routing and forwarding (VRF) name, which is translated to a *vrf-tableid* value within the router.
- Subscriber (user) connection ID
- Cable modem
- MAC address

The LI implementation on the Cisco cBR series routers is provisioned using SNMP3 and supports the following functionality:

- Interception of communication content. The router duplicates each intercepted packet and then places the copy of the packet within a UDP-header encapsulated packet (with a configured CCCid). The router sends the encapsulated packet to the LI mediation device. Even if multiple lawful intercepts are configured on the same data flow, only one copy of the packet is sent to the mediation device. If necessary, the mediation device can duplicate the packet for each LEA.
- Interception of IPv4, IPv4 multicast, IPv6, and IPv6 multicast flows.
- Maximum interception time—The maximum value of **cTap2MediationTimeout** is 260640 minutes or 181 days from the current time. The minimum value for **cTap2MediationTimeout** is 1 minute from the current time.

LI includes two ways of setting a MAC-based tap:

- On CPE—Only intercepts traffic whose source or destination match the MAC address of the CPE device.
- On CM—Intercepts all of the traffic behind the CM, including the CM traffic itself. This form of intercept might generate a lot of traffic to the mediation device.

## VRF Aware LI

VRF Aware LI is the ability to provision a LI wiretap on IPv4 data in a particular Virtual Private Network (VPN). This feature allows a LEA to lawfully intercept targeted data within that VPN. Only IPv4 data within that VPN is subject to the VRF-based LI tap.

VRF Aware LI is available for the following types of traffic:

- ip2ip
- ip2tag (IP to MPLS)
- tag2ip (MPLS to IP)

To provision a VPN-based IPv4 tap, the LI administrative function (running on the mediation device) uses the CISCO-IP-TAP-MIB to identify the name of the VRF table that the targeted VPN uses. The VRF name is used to select the VPN interfaces on which to enable LI in order to execute the tap.

The router determines which traffic to intercept and which mediation device to send the intercepted packets based on the VRF name (along with the source and destination address, source and destination port, and protocol).

---

**Note** When using the Cisco-IP-TAP-MIB, if the VRF name is not specified in the stream entry, the global IP routing table is used by default.

---

## Lawful Intercept- Redundant Mediation Devices

The Cisco cBR Series Converged Broadband Routers supports replicating Lawful Intercept (LI) packets to multiple Mediation Devices (MDs). To use this feature, multiple identical taps are configured. The Cisco cBR Series Converged Broadband Routers support up to two identical taps to replicate to two MDs. Only MAC- and CM-taps are supported with multiple MDs.

For a sample SNMP configuration command set to configure two identical taps to tap to two MDs, see [Example: Configuring Lawful Intercept- Redundant Mediation Devices, on page 1350](#).

## Lawful Intercept MIBs

Due to its sensitive nature, the Cisco LI MIBs are only available in software images that support the LI feature. These MIBs are not accessible through the Network Management Software MIBs Support page (<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>).

## Restricting Access to the Lawful Intercept MIBs

Only the mediation device and users who need to know about lawful intercepts should be allowed to access the LI MIBs. To restrict access to these MIBs, you must:

1. Create a view that includes the Cisco LI MIBs.
2. Create an SNMP user group that has read-and-write access to the view. Only users assigned to this user group can access information in the MIBs.
3. Add users to the Cisco LI user groups to define who can access the MIBs and any information related to lawful intercepts. Be sure to add the mediation device as a user in this group; otherwise, the router cannot perform lawful intercepts.

For more information, see the Creating a Restricted SNMP View of Lawful Intercept MIBs module.

---

**Note** Access to the Cisco LI MIB view should be restricted to the mediation device and to system administrators who need to be aware of lawful intercepts on the router. To access the MIB, users must have level-15 access rights on the router.

---

## Service Independent Intercept

Cisco developed the Service Independent Intercept (SII) architecture in response to requirements that support lawful intercept for service provider customers. The SII architecture offers well-defined, open interfaces between the Cisco equipment acting as the content Intercept Access Point (IAP) and the mediation device. The modular nature of the SII architecture allows the service provider to choose the most appropriate mediation device to meet specific network requirements and regional, standards-based requirements for the interface to the law enforcement collection function.

The mediation device uses SNMPv3 to instruct the call connect (CC) IAP to replicate the CC and send the content to the mediation device. The CC IAP can be either an edge router or a trunking gateway for voice, and either an edge router or an access server for data.

---

**Note** The Cisco cBR router does not support encryption of lawful intercept traffic.

---

To increase the security and to mitigate any SNMPv3 vulnerability, the following task is required:

### Restricting Access to Trusted Hosts (without Encryption)

SNMPv3 provides support for both security models and security levels. A security model is an authentication strategy that is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level will determine the security mechanism employed when handling an SNMP packet.

Additionally, the SNMP Support for the Named Access Lists feature adds support for standard named access control lists (ACLs) to several SNMP commands.

To configure a new SNMP group or a table that maps SNMP users to SNMP views, use the **snmp-server group** command in global configuration mode.

```
access-list my-list permit ip host 10.10.10.1
snmp-server group my-group v3 auth access my-list
```

In this example, the access list named **my-list** allows SNMP traffic only from 10.10.10.1. This access list is then applied to the SNMP group called **my-group**.

## How to Configure Lawful Intercept

Although there are no direct user commands to provision lawful intercept on the router, you do need to perform some configuration tasks, such as providing access to LI MIBs, and setting up SNMP notifications. This section describes how to perform the required tasks:

### Creating a Restricted SNMP View of Lawful Intercept MIBs

To create and assign users to an SNMP view that includes the Cisco lawful intercept MIBs, perform the steps in this section.

#### Before you begin

- You must issue the commands in global configuration mode with level-15 access rights.

- SNMPv3 must be configured on the device.

### Procedure

|               | Command or Action                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>snmp-server view <i>view-name MIB-name</i> included</b><br><b>Example:</b><br>Device(config)# snmp-server view exampleView<br>ciscoTap2MIB included                                                                 | Creates an SNMP view that includes the CISCO-TAP2-MIB (where <i>exampleView</i> is the name of the view to create for the MIB). <ul style="list-style-type: none"> <li>• This MIB is required for both regular and broadband lawful intercept.</li> </ul> |
| <b>Step 4</b> | <b>snmp-server view <i>view-name MIB-name</i> included</b><br><b>Example:</b><br>Device(config)# snmp-server view exampleView<br>ciscoIpTapMIB included                                                                | Adds the CISCO-IP-TAP-MIB to the SNMP view.                                                                                                                                                                                                               |
| <b>Step 5</b> | <b>snmp-server view <i>view-name MIB-name</i> included</b><br><b>Example:</b><br>Device(config)# snmp-server view exampleView<br>cisco802TapMIB included                                                               | Adds the CISCO-802-TAP-MIB to the SNMP view.                                                                                                                                                                                                              |
| <b>Step 6</b> | <b>snmp-server group <i>group-name</i> v3 noauth read <i>view-name</i> write <i>view-name</i></b><br><b>Example:</b><br>Device(config)# snmp-server group exampleGroup v3<br>noauth read exampleView write exampleView | Creates an SNMP user group that has access to the LI MIB view and defines the group's access rights to the view.                                                                                                                                          |
| <b>Step 7</b> | <b>snmp-server user <i>user-name group-name</i> v3 auth md5 <i>auth-password</i></b><br><b>Example:</b><br>Device(config)# snmp-server user exampleUser<br>exampleGroup v3 auth md5 examplePassword                    | Adds users to the specified user group.                                                                                                                                                                                                                   |

|        | Command or Action                                               | Purpose                                                                   |
|--------|-----------------------------------------------------------------|---------------------------------------------------------------------------|
| Step 8 | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre> | Exits the current configuration mode and returns to privileged EXEC mode. |

## Where to Go Next

The mediation device can now access the lawful intercept MIBs and issue SNMP **set** and **get** requests to configure and run lawful intercepts on the router. To configure the router to send SNMP notification to the mediation device, see the Enabling SNMP Notifications for Lawful Intercept.

## Enabling SNMP Notifications for Lawful Intercept

SNMP automatically generates notifications for lawful intercept events. To configure the router to send lawful intercept notifications to the mediation device, perform the steps in this section.

### Before you begin

- You must issue the commands in global configuration mode with level-15 access rights.
- SNMPv3 must be configured on the router.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server host** *ip-address* **community-string** *udp-port* *port notification-type*
4. **snmp-server enable traps snmp authentication linkup linkdown coldstart warmstart**
5. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                     | Purpose                                                                                                                           |
|--------|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                 | Enters global configuration mode.                                                                                                 |
| Step 3 | <b>snmp-server host</b> <i>ip-address</i> <b>community-string</b><br><b>udp-port</b> <i>port notification-type</i><br><b>Example:</b> | Specifies the IP address of the mediation device and the password-like community-string that is sent with a notification request. |

|               | Command or Action                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device(config)# snmp-server 10.2.2.1<br>community-string udp-port 161 udp                                                                                                                                              | <ul style="list-style-type: none"> <li>For lawful intercept, the <b>udp-port</b> must be 161 and not 162 (the SNMP default).</li> </ul>                                                                                              |
| <b>Step 4</b> | <b>snmp-server enable traps snmp authentication linkup linkdown coldstart warmstart</b><br><br><b>Example:</b><br><br>Device(config)# snmp-server enable traps snmp authentication linkup linkdown coldstart warmstart | Configures the router to send RFC 1157 notifications to the mediation device. <ul style="list-style-type: none"> <li>These notifications indicate authentication failures, link status (up or down), and router restarts.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><br>Device(config)# end                                                                                                                                                           | Exits the current configuration mode and returns to privileged EXEC mode.                                                                                                                                                            |

## Disabling SNMP Notifications

To disable SNMP notifications on the router, perform the steps in this section.

**Note** To disable lawful intercept notifications, use SNMPv3 to set the CISCO-TAP2-MIB object cTap2MediationNotificationEnable to false(2). To reenble lawful intercept notifications through SNMPv3, reset the object to true(1).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no snmp-server enable traps**
4. **end**

### DETAILED STEPS

|               | Command or Action                                                                  | Purpose                                                                                                          |
|---------------|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><br>Device> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                    | Purpose                                                                   |
|--------|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Step 3 | <b>no snmp-server enable traps</b><br><b>Example:</b><br>Device(config)# no snmp-server enable traps | Disables all SNMP notification types that are available on your system.   |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                 | Exits the current configuration mode and returns to privileged EXEC mode. |

## Provisioning a MAC Intercept for Cable Modems Using SNMPv3

1. Configure the c802tapStreamInterface object.
2. Set the following bit flags in the c802tapStreamFields object:
  - dstMacAddress (bit 1)
  - srcMacAddress (bit 2)
  - cmMacAddress (bit 6)—The cmMacAddress bit field is newly introduced for cable modem support and determines whether the intercept is a CPE-based or CM-based intercept.
3. Configure the following objects with the same CM MAC address value:
  - c802tapStreamDestinationAddress
  - c802tapStreamSourceAddress

## Provisioning a MAC Intercept for a CPE Device Using SNMPv3

1. Configure the c802tapStreamInterface object.
2. Set the following bit flags in the c802tapStreamFields object:
  - dstMacAddress (bit 1)
  - srcMacAddress (bit 2)
3. Configure the following objects with the same CPE MAC address value:
  - c802tapStreamDestinationAddress
  - c802tapStreamSourceAddress

## Configuration Examples for Lawful Intercept

### Example: Enabling Mediation Device Access Lawful Intercept MIBs

The following example shows how to enable the mediation device to access the lawful intercept MIBs. It creates an SNMP view (tapV) that includes four LI MIBs (CISCO-TAP2-MIB, CISCO-IP-TAP-MIB,

CISCO-802-TAP-MIB, and CISCO-USER-CONNECTION-TAP-MIB). It also creates a user group that has read, write, and notify access to MIBs in the tapV view.

```
snmp-server view tapV ciscoTap2MIB included
snmp-server view tapV ciscoIpTapMIB included
snmp-server view tapV cisco802TapMIB included
snmp-server view tapV ciscoUserConnectionTapMIB included
snmp-server group tapGrp v3 noauth read tapV write tapV notify tapV
snmp-server user MDuser tapGrp v3 auth md5 MDpasswd
snmp-server engineID local 1234
```

## Example: Configuring Lawful Intercept- Redundant Mediation Devices

Lawful Intercept is configured using SNMPv3. The following example shows SNMP configuration command set to configure two identical taps to tap two MDs:

- Setup MD1:

```
setany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
cTap2MediationStatus.1 -i 4 \
cTap2MediationDestAddressType.1 -i 1 \
cTap2MediationTimeout.1 -o 07:E0:04:01:B:15:1A:0 \
cTap2MediationTransport.1 -i 1 \
cTap2MediationSrcInterface.1 -i 0 \
cTap2MediationDestAddress.1 -o 0a:0a:00:35 \
cTap2MediationDestPort.1 -g 63
```

- Setup CM tap:

```
setany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
c802tapStreamStatus.1.2 -i 4 \
c802tapStreamFields.1.2 -o 62 \
c802tapStreamInterface.1.2 -i -1 \
c802tapStreamDestinationAddress.1.2 -o "c8 fb 26 a5 55 98" \
c802tapStreamSourceAddress.1.2 -o "c8 fb 26 a5 55 98"

setany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
cTap2StreamStatus.1.2 -i 5 \
cTap2StreamType.1.2 -i 2 \
cTap2StreamInterceptEnable.1.2 -i 1 \
cTap2StreamStatus.1.2 -i 4
```

- Setup MD2:

```
setany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
cTap2MediationStatus.2 -i 4 \
cTap2MediationDestAddressType.2 -i 1 \
cTap2MediationTimeout.2 -o 07:E0:03:03:7:15:1A:0 \
cTap2MediationTransport.2 -i 1 \
cTap2MediationSrcInterface.2 -i 0 \
cTap2MediationDestAddress.2 -o 0a:0a:00:06 \
cTap2MediationDestPort.2 -g 63
```

- Setup CM tap:

```
setany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
c802tapStreamStatus.2.2 -i 4 \
c802tapStreamFields.2.2 -o 62 \
c802tapStreamInterface.2.2 -i -1 \
c802tapStreamDestinationAddress.2.2 -o "c8 fb 26 a5 55 98" \
```

```
c802tapStreamSourceAddress.2.2 -o "c8 fb 26 a5 55 98"

setany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
cTap2StreamStatus.2.2 -i 5 \
cTap2StreamType.2.2 -i 2 \
cTap2StreamInterceptEnable.2.2 -i 1 \
cTap2StreamStatus.2.2 -i 4
```

- Get tapped packets count:

```
getmany -v3 -timeout 30 -retries 3 10.12.0.34 user1 \
cTap2StreamInterceptedPackets
```

## Feature Information for Lawful Intercept

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 237: Feature Information for Lawful Intercept*

| Feature Name                                   | Releases                    | Feature Information                                                                                               |

## CHAPTER 91

# Cable Monitoring Feature for Cisco cBR Series Routers

---

After you configure cable monitoring, the router forwards copies of selected packets on the cable interface to an external LAN analyzer attached to another interface on the Cisco CMTS router. This command can help in troubleshooting network and application problems.

---

**Note** This feature does not monitor traffic for the purpose of preventing denial-of-service attacks and other types of network attacks. Even after configuring the cable monitoring feature, the traffic continues to its original destination, and only copies of the selected packets are forwarded to the CALEA server or LAN analyzer.

---

---

**Note** This feature doesn't support line card high availability (LCHA).

---

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Overview of Cable Monitor Command for cBR

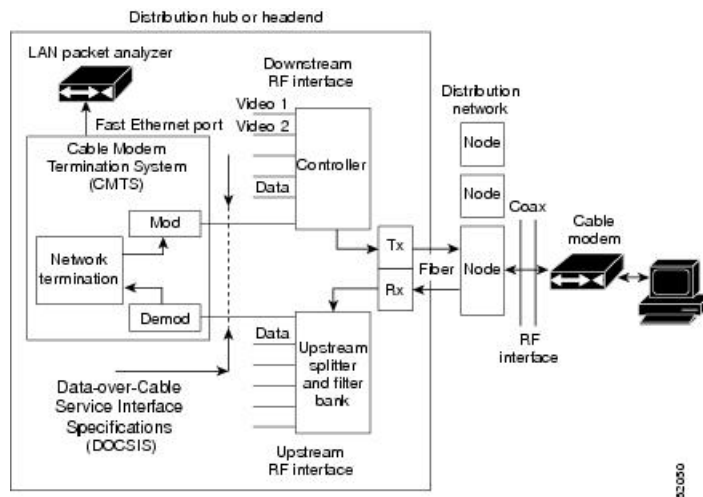

The **cable monitor** command sends copies of packets for specific types of traffic that is sent over a particular cable interface to a LAN analyzer, for use in troubleshooting network problems. This command can select packets to be forwarded using one or more of the following parameters:

- Either incoming or outbound packets
- Packets that match a specific MAC address (source and destination)
- Packets with a specific Service ID (SID)

Packets can also be timestamped to aid in troubleshooting. The packets are then forwarded out of the specified 10 Gigabit Ethernet port to the LAN analyzer for additional analysis.

The figure below illustrates a LAN packet analyzer attached to a Fast Ethernet port in a DOCSIS two-way configuration.

**Figure 35: LAN Packet Analyzer in a DOCSIS Two-Way Configuration**

**Note** The WAN port used for cable monitoring should be exclusively used by the LAN packet analyzer.

## Configuring Cable Monitoring for cBR Routers

To enable the cable traffic monitoring feature on a particular cable interface, use the following procedure, starting in privileged EXEC mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **cable monitor**

4. `sniff card <slot num> <ds/us> <sniff point> <filter> dest cmon-tunnel <cmon-tunnel num>`
5. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### What to do next

You can capture and forward the sniffed packets to an external server or a local hard disk. For more details, see [Capturing Sniffed Packets, on page 1356](#).

## Capturing Sniffed Packets

To forward the captured traffic to an external server, you should configure a tunnel. The external server might not be directly connected and can be away from CMTS.

To capture sniffed packets, you can follow one of these procedures:

- Capture output packets using an external host
- Capture packets by locating the hard disk

## Capturing Sniffed Packets on an External Host

To forward the captured traffic to an external server, you should configure a tunnel. The external server might not be directly connected and can be away from CMTS.

**SUMMARY STEPS**

1. **configure terminal**
2. **interface cmon-tunnel number**
3. **tunnel destination IP address, tunnel source IP address**
4. **end**

## Cable Monitor Packet Struct

The cable monitor packet struct is described as follows:

- For post-docsis and pre-docsis sniffer points: Internal Header (16 Bytes) + Ethernet Header
- For docsis sniffer point: Internal Header (16 Bytes) + Docsis Header + Ethernet Header

If **remove-jib** is configured under CMON-Tunnel interface, the packets will not contain Internal Header.

## Feature Information for Cable Monitoring

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 238: Feature Information for Cable Monitoring**

| Feature Name     | Releases                    | Feature Information                                                                                               |
|------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| Cable Monitoring | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 92

# Source-Based Rate Limit

The Source-Based Rate Limit (SBRL) feature prevents congestion of packets on the forwarding processor (FP) to the Route Processor (RP) interface, which can be caused by denial of service (DoS) attacks directed at the Cisco CMTS or by faulty hardware.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Source-Based Rate Limit

- You must configure Control-Plane Policing (CoPP) for WAN-side SBRL.

## Restrictions for Source-Based Rate Limit

- WAN-IP and Subscriber MAC address entities are identified using a hash, and hash collisions can occur between two (or more) entities.
- On the WAN-side there is no special processing for hash collisions. Sources that hash-collide are rate-limited as if they are the same source.
- The QOS group 99 is reserved for SBRL and cannot be used for other class maps.

## Information About Source-Based Rate Limit

Source-Based Rate Limit (SBRL) feature operates on the punt path in CPP. SBRL identifies and rate-limits the packet streams that can overload the punt path or RP.

Punted packets are sent from the FP to the RP through the FP-to-RP queues. Denial of service (DoS) can occur when:

- The FP-to-RP queues are congested
- The RP cannot process punted packets fast enough

In both cases, the valid punted packets are not processed properly. These situations can be caused deliberately by DoS attacks or by faulty external hardware.

Packet streams identified by SBRL are rate-limited according to configured parameters. Rate-limiting occurs in CPP before the packets reach the FP-to-RP queues. This protects the RP, and also allows other valid punted packets to reach the RP.

SBRL has a separate configuration for the WAN-side and the subscriber-side. WAN-side SBRL is disabled by default. Subscriber-side SBRL has default settings.

### WAN-Side Source-Based Rate Limit

WAN-side SBRL uses Control Plane Policing (CoPP). CoPP specifies the WAN-side packet streams that are directed for SBRL. Both trusted and untrusted sites can be specified using CoPP. Using CoPP, you can specify unlimited trusted sites. Access control list (ACL) is used to specify the trusted sites.

### Subscriber-Side Source-Based Rate Limit

All subscriber-side punts are processed by subscriber-side SBRL. Note that the CoPP processes all punted packets, but there is no dependency between CoPP and subscriber-side SBRL.

## How to Configure Source-Based Rate Limit

This section contains the following:

### Configuring WAN-Side Source-Based Rate Limit

You must enable WAN-side SBRL in two parts:

1. Configure Control Plane Policing (CoPP) to specify which packets are subject to SBRL.
2. Configure WAN-side SBRL to set the rate-limiting parameters for the specified punt-causes.

In the CoPP policy map, the special action **set qos-group 99** denotes that the packets matching a particular class are subject to WAN-side SBRL. This means that the QOS group 99 is globally reserved for SBRL, and must not be used in other policy-maps.

Packets matching a class without **set qos-group 99** bypass WAN-side SBRL. This means that CoPP is also used to specify trusted traffic streams that are not subject to WAN-side SBRL.

All punted packets are subject to CoPP. So, you must ensure that subscriber-side traffic does not match a trusted class.

WAN-side SBRL identifies traffic streams by hashing the punt cause, VRF index, and source IP address. This value is used as the index for rate-limiting. The router does not perform special processing for hash collisions, so hash-colliding streams are treated as if they are from the same stream.

By default, WAN-side SBRL is disabled.

### Restrictions

- All the punted packets are subject to CoPP and punt-policing.

This section contains the following:

## Configuring Control Plane Policing

Punted packets matching the trusted class bypass WAN-side SBRL. The rest of the WAN-side punts are sent to WAN-side SBRL.

**Note** The following example shows a simple trusted class.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                                                                                                                                                                                            | Enables privileged EXEC mode.<br><br>• Enter your password, if prompted.                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                                                                                                                                                                                    | Enters global configuration mode.                                                                                                                                                                                  |
| <b>Step 3</b> | <b>access-list</b> <i>access-list-number</i> <b>permit</b> <i>protocol</i> { <b>any</b>   <b>host</b> { <i>address</i>   <i>name</i> }} { <b>any</b>   <b>host</b> { <i>address</i>   <i>name</i> }}<br><b>tos</b> <i>tos</i><br><b>Example:</b><br>Router(config)# <b>access-list 130 permit ip 192.168.1.10 0.0.0.0 192.168.1.11 0.0.0.0 tos 4</b> | Configures an access list for filtering frames by protocol type.<br><br><b>Note</b> Since all the punted packets are subject to CoPP, you must ensure that subscriber-side traffic does not match a trusted class. |
| <b>Step 4</b> | <b>class-map</b> <i>class-map-name</i><br><b>Example:</b><br>Router(config)# <b>class-map match-all sbrl_v4_trusted</b>                                                                                                                                                                                                                              | Creates a class-map and enters QoS class-map configuration mode.                                                                                                                                                   |
| <b>Step 5</b> | <b>match access-group</b> <i>access-list-index</i><br><b>Example:</b><br>Router(config-cmap)# <b>match access-group 130</b>                                                                                                                                                                                                                          | Specifies access groups to apply to an identity policy. The range of is from 1 to 2799.                                                                                                                            |

|         | Command or Action                                                                                                                                                                                                                                      | Purpose                                                                                                                                                            |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <b>exit</b><br><b>Example:</b><br>Router(config-cmap)# <b>exit</b>                                                                                                                                                                                     | Exits QoS class-map configuration mode and returns to global configuration mode.                                                                                   |
| Step 7  | <b>policy-map</b> <i>policy-map-name</i><br><b>Example:</b><br>Router(config)# <b>policy-map</b> <b>copp_policy</b>                                                                                                                                    | Specifies a service policy and enters QoS policy-map configuration mode.                                                                                           |
| Step 8  | <b>class</b> <i>class-map-name</i><br><b>Example:</b><br>Router(config)# <b>class</b> <b>sbri_v4_trusted</b>                                                                                                                                           | Enters QoS policy-map class configuration mode.                                                                                                                    |
| Step 9  | <b>police rate</b> <i>units pps conform-action action</i><br><b>exceed-action action</b><br><b>Example:</b><br>Router(config-pmap-c)# <b>police rate</b> <b>1000 pps</b><br><b>conform-action</b> <b>transmit</b> <b>exceed-action</b> <b>transmit</b> | Polices traffic destined for the control plane at a specified rate.<br><b>Note</b> The rate is irrelevant if both the configured actions are <b>transmit</b> .     |
| Step 10 | <b>exit</b><br><b>Example:</b><br>Router(config-pmap-c)# <b>exit</b>                                                                                                                                                                                   | Exits policy-map class police configuration mode                                                                                                                   |
| Step 11 | <b>class</b> <b>class-default</b><br><b>Example:</b><br>Router(config-pmap)# <b>class</b> <b>class-default</b>                                                                                                                                         | Specifies the action to take on the packets that do not match any other class in the policy map.                                                                   |
| Step 12 | <b>set qos-group</b> <b>99</b><br><b>Example:</b><br>Router(config-pmap-c)# <b>set qos-group</b> <b>99</b>                                                                                                                                             | Enables WAN-side SBRL for the packets that match this class.                                                                                                       |
| Step 13 | <b>exit</b><br><b>Example:</b><br>Router(config-pmap-c)# <b>exit</b>                                                                                                                                                                                   | Exits policy-map class configuration mode                                                                                                                          |
| Step 14 | <b>exit</b><br><b>Example:</b><br>Router(config-pmap)# <b>exit</b>                                                                                                                                                                                     | Exits policy-map configuration mode                                                                                                                                |
| Step 15 | <b>control-plane</b> [ <b>host</b>   <b>transit</b>   <b>cef-exception</b> ]<br><b>Example:</b><br>Router(config)# <b>control-plane</b>                                                                                                                | Associates or modifies attributes (such as a service policy) that are associated with the control plane of the router and enters control plane configuration mode. |
| Step 16 | <b>service-policy</b> { <b>input</b>   <b>output</b> } <i>policy-map-name</i><br><b>Example:</b>                                                                                                                                                       | Attaches a policy map to a control plane.                                                                                                                          |

|                | Command or Action                                                        | Purpose                                                                     |
|----------------|--------------------------------------------------------------------------|-----------------------------------------------------------------------------|
|                | <code>Router(config-cp)# service-policy input copp_policy</code>         |                                                                             |
| <b>Step 17</b> | <b>end</b><br><br><b>Example:</b><br><code>Router(config-cp)# end</code> | Exits control plane configuration mode and returns to privileged EXEC mode. |

## Enabling WAN-Side Source-Based Rate Limit

### Procedure

|               | Command or Action                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                           |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul>                                                                                                                                                                                                               |

| <b>Step 3</b> | <b>platform punt-sbri wan punt-cause <i>punt-cause</i> rate-per-1-sec <i>rate</i></b><br><br><b>Example:</b><br><code>Router(config)# platform punt-sbri wan punt-cause 10 rate-per-1-sec 4</code> | Configures WAN-side rate limit. <ul style="list-style-type: none"> <li>• <b>punt-cause <i>punt-cause</i></b>—Specifies the punt-cause value in number 1 to 107 or string.</li> <li>• <b>rate-per-1-sec <i>rate</i></b>—Specifies the rate in packets per second. The range is from 1 to 256, specified in powers-of-2.</li> </ul> |

## Configuring WAN-Side Quarantine

The WAN-side quarantine extends the WAN-side SBRL configuration. When a traffic stream enters quarantine, all punted packets in the stream are dropped for the configured period.

### Procedure

|               | Command or Action                                                                           | Purpose                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br><code>Router&gt; enable</code>                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br><code>Router# configure terminal</code> | Enters global configuration mode.                                                                                   |

|        | Command or Action                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>platform punt-sbri wan punt-cause</b> <i>punt-cause</i><br/> <b>rate-per-1-sec</b> <i>rate</i> <b>quarantine-time</b> <i>time</i> <b>burst-factor</b><br/> <i>burst-factor</i></p> <p><b>Example:</b></p> <pre>Router(config)# platform punt-sbri wan punt-cause 10 rate-per-1-sec 4 quarantine-time 10 burst-factor 500</pre> | <p>Configures quarantine for the WAN-side packet stream.</p> <ul style="list-style-type: none"> <li>• <b>punt-cause</b> <i>punt-cause</i>—Specifies the punt-cause value in number 1 to 107 or string.</li> <li>• <b>rate-per-1-sec</b> <i>rate</i>—Specifies the rate limit in packets per second. The range is from 1 to 256, specified in powers-of-2.</li> <li>• <b>quarantine-time</b> <i>time</i>—Specifies the quarantine time, in minutes. The range is from 1 to 60.</li> <li>• <b>burst-factor</b> <i>burst-factor</i>—Specifies the burst-factor, in number of packets. The range is from 50 to 1000.</li> </ul> |

### Example

When (*burst-factor x rate*) packets arrive at a rate faster than *rate*, the packet stream enters quarantine.

For example, during a DoS attack, when the following occurs:

- Punted packets from a WAN-side source arrive at 100 packets per second.
- WAN-side SBRL is configured with a rate of 4 packets per second, quarantine time of 10 minutes, and burst-factor of 500 packets.

The packet rate is significantly higher than the configured rate. Therefore, when 2000 (4 x 500) packets have arrived, the packet stream enters into quarantine. Quarantine is activated at 20 seconds (2000 packets per 100 packets per second), and all punted packets from the stream are dropped for 10 minutes. After 10 minutes, the quarantine is deactivated.

The quarantine calculations restart immediately. So, if the scanning attack is continuous, quarantine is reactivated after the next 20 seconds.

## Configuring Subscriber-Side Source-Based Rate Limit

### Restrictions

- All punted packets are subject to CoPP and punt-policing.
- The ARP-filter handles the subscriber-side ARP packets. ARP packets are not processed by subscriber-side SBRL.
- The maximum rate is 255. Due to this, the configured rate of 256 from 16.8.X will not transfer properly. A new command must be entered to transfer the configuration.

Subscriber-MAC address SBRL identifies traffic streams by hashing the punt cause and the source MAC address. The hash value is used as the index for rate-limiting. Hash-collision detection is performed so that all traffic streams are processed separately.

Default settings for subscriber-side SBRL are listed in this topic. Using the 'no' configuration returns the rate to the default value.

Rate-limiting is performed using a 2-color token-bucket algorithm. The rate is specified in packets-per-4-seconds, in the range [1, 255]. This translates to a packets-per-second rate in the range [0.25, ~64]. The optional bucket-size is specified in packets, in the range [1, 255]. If not specified, then bucket-size is set equal to rate.

The "no-drop" keyword disables rate-limiting for the specified punt-cause.

There is an optional quarantine configuration. When a traffic stream enters quarantine, all punted packets in the stream are dropped for the configured period. A traffic stream enters quarantine when (burst-factor x rate) packets arrive at a rate faster than rate. An example would be that of a faulty cable modem that continuously sends DHCPv6 solicits.

- DHCPv6 solicits from the faulty cable modem arrive at 100 packets/second, and are all punted.
- Subscriber-side SBRL is configured with a rate-per-4-sec of 8 (i.e. 2 packets-per-sec), quarantine time of 10 minutes, and burst-factor of 500 packets.

The traffic stream rate is higher than the configured rate. Therefore, when approximately 1000 (2 x 500) packets have arrived, the traffic stream enters quarantine. The quarantine happens after about 10 seconds (1000 packets at 100 packets per second), and all punted packets from the stream are dropped for 10 minutes. After 10 minutes, the quarantine is deactivated. The quarantine calculations restart immediately, so if the traffic stream remains continuous, quarantine is reactivated after the next 10 seconds.

#### 1. enable

```
Router> enable
```

Enables privileged EXEC mode. Enter your password, if prompted.

#### 2. configure terminal

```
Router# configure terminal
```

Enters global configuration mode.

#### 3. platform punt-sbri subscriber punt-cause *punt-cause* rate-per-4-sec

```
rate [bucket-sizebucket-size] [quarantine-timetimeburst-factorburst-factor]
```

Configures subscriber-MAC address SBRL.

- **punt-cause** *punt-cause* - Specifies the punt cause.
- **rate-per-4-sec** *rate* - Specifies the rate in packets per 4-seconds. The range is from 1 to 255.
- **bucket-size***bucket-size* - Specifies the bucket-size in packets. The range is from 1 to 255. If bucket-size is not entered, the bucket-size is set equal to the rate.
- **quarantine-time** *time* - Specifies the quarantine time, in minutes. The range is from 1 to 60.
- **burst-factor** *burst-factor* - Specifies the burst-factor, in number of packets. The range is from 50 to 1000.

## Configuring Source-Based Rate Limit Ping-Bypass

Follow the steps below to configure source-based rate limit ping-bypass.

## Procedure

|        | Command or Action                                                                                                 | Purpose                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                 | Enters global configuration mode.                                                                                   |
| Step 3 | <b>platform punt-sbri ping-bypass</b><br><b>Example:</b><br>Router(config)# <b>platform punt-sbri ping-bypass</b> | Configures source-based rate limit ping-bypass.                                                                     |

## Configuring Punt Policing

The punt policer aggregates all packets (both subscriber-side and WAN-side) with the specified punt cause, and rate-limits them according to the configured parameters.

## Procedure

|        | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul>                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>platform punt-policer <i>punt-cause punt-rate</i> [high]</b><br><b>Example:</b><br>Router(config)# <b>platform punt-policer 1 10</b> | Configures punt policing. <ul style="list-style-type: none"> <li>• <i>punt-cause</i>—Punt cause. The range is from 1 to 107.</li> <li>• <i>punt-rate</i>—Rate limit in packets per second. The range is from 10 to 146484.</li> <li>• <b>high</b>—(Optional) Specifies that the punt policing is performed only for high priority traffic.</li> </ul> |

## Verifying the Source-Based Rate Limit Configuration

- **show cable dp sbri config**—Displays the SBRL configuration, including default settings. This is equivalent to **show running-config all | include punt-sbri**.

Following is a sample output of the command:

```
Router# show cable dp sbrl config
platform punt-sbri wan punt-cause for-us-data rate-per-1-sec 8
platform punt-sbri wan punt-cause glean-adj rate-per-1-sec 4 quarantine-time 10
burst-factor 1000
platform punt-sbri subscriber punt-cause for-us-data rate-per-4-sec 32 bucket-size 32
platform punt-sbri subscriber punt-cause for-us-ctrl rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cable-l3-mobility rate-per-4-sec 16 bucket-size
 16
platform punt-sbri subscriber punt-cause sv-match-unknown rate-per-4-sec 4 bucket-size
 4
platform punt-sbri subscriber punt-cause cable-pre-reg rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-solicit rate-per-4-sec 8 bucket-size
 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-req rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-sub rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv4-sub rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv4-disc-req rate-per-4-sec 8 bucket-size
 8
```

- **show access-lists**—Displays the access list information for verifying CoPP configuration.

Following is a sample output of the command:

```
Router# show access-lists

Extended IP access list 120
 10 permit ip any any dscp af31
 20 permit ip any any dscp cs2
 30 permit ip any any dscp af21
 40 permit ip 68.86.0.0 0.1.255.255 any
IPv6 access list TRUSTEDV6
 permit ipv6 2001:558::/32 any sequence 10
```

- **show policy-map *policy-map-name***—Displays the information for the policy map.

Following is a sample output of the command:

```
Router# show policy-map copp_policy

Policy Map copp_policy
Class sbri_trusted
 police rate 1000 pps
 conform-action transmit
 exceed-action transmit
Class class-default
 set qos-group 99
```

- **show policy-map control-plane**—Displays the control plane policy map information.

Following is a sample output of the command:

```
Router# show policy-map control-plane

Control Plane

Service-policy input: copp_policy

Class-map: sbri_trusted (match-any)
 0 packets, 0 bytes
 5 minute offered rate 0000 bps, drop rate 0000 bps
 Match: access-group 120
 Match: access-group name TRUSTEDV6
```

```

police:
 rate 1000 pps, burst 244 packets
 conformed 0 packets, 0 bytes; actions:
 transmit
 exceeded 0 packets, 0 bytes; actions:
 transmit
 conformed 0 pps, exceeded 0 pps

Class-map: class-default (match-any)
 28 packets, 4364 bytes
 5 minute offered rate 0000 bps, drop rate 0000 bps
 Match: any
 QoS Set
 qos-group 99
 Marker statistics: Disabled

```

- **show platform hardware qfp active infrastructure punt sbrl**—Displays the SBRL statistics.

Following is a sample output of the command:

```

Router# show platform hardware qfp active infrastructure punt sbrl

SBRL statistics

Subscriber MAC-addr
 drop-cnt evict-cnt quar MAC-Address ID punt-cause

 10000 10000 0 0010.88a3.0456 101 cable-l3-mobility

WAN-IPv4
 drop-cnt evict-cnt quar VRF cause IP-address

 456788 456788 0 0 050 1.2.0.66

WAN-IPv6
 drop-cnt evict-cnt quar VRF cause IP-address

 129334 129334 1 0 011 3046:1829:fefb::ddd1
 965 965 0 0 011 2001:420:2c7f:fc01::3

. . .

```

**Note** The value of *quar* is either 0 or 1. The value 1 indicates that quarantine is activated. The *quar* value is updated only when a packet from the source is dropped. If a source enters quarantine, and then stops sending packets, the *quar* value remains 1. However, the *drop-cnt* does not increment.

**Note** The SBRL statistics algorithm stores the data for the worst offenders. Sources that drop only a few packets are displayed in the table initially, but may be overwritten if the *drop-cnt* does not increase continuously. The *evict-cnt* increases in tandem with *drop-cnt*, but begins to decrease when a source is no longer being actively rate-limited. When the *evict-cnt* drops below 10, the record may be overwritten.

- **show platform hardware qfp active infrastructure punt statistics type global-drop**—Displays the global punt policer statistics.

Following is a sample output of the command:

```
Router# show platform hardware qfp active infrastructure punt statistics type global-drop
```

```
Global Drop Statistics
```

```
Number of global drop counters = 22
```

| Counter ID | Drop Counter Name                       | Packets |
|------------|-----------------------------------------|---------|
| 000        | INVALID_COUNTER_SELECTED                | 0       |

# Configuration Example for Source-Based Rate Limit

## Example: WAN-Side SBRL Configuration

```

access-list 120 permit ip any any dscp af31
access-list 120 permit ip any any dscp cs2
access-list 120 permit ip any any dscp af21
access-list 120 permit ip 192.168.1.10 0.1.255.255 any

ipv6 access-list TRUSTEDV6
 permit ipv6 any any dscp af31
 permit ipv6 any any dscp cs2
 permit ipv6 any any dscp af21
 permit ipv6 2001:558::/32 any

class-map match-all sbrl_trusted_v4
 match access-group 120

class-map match-all sbrl_trusted_v6
 match access-group name TRUSTEDV6

policy-map copp_policy
 ! IPv4 trusted:
 ! Specified rate is irrelevant.
 ! No special action; these packets bypass WAN-side SBRL.
 class sbrl_trusted_v4
 police rate 1000 pps conform transmit exceed transmit
 ! IPv6 trusted:
 ! Specified rate is irrelevant.
 ! No special action; these packets bypass WAN-side SBRL.
 class sbrl_trusted_v6
 police rate 1000 pps conform transmit exceed transmit

 ! add other classes here, if necessary

 ! Special action to activate WAN-side SBRL for this class.
 class class-default
 set qos-group 99

control-plane
 service-policy input copp_policy

platform punt-sbrl wan punt-cause for-us-data rate-per-1-sec 4
platform punt-sbrl wan punt-cause glean-adj rate-per-1-sec 4 quarantine-time 10 burst-factor
1000

```

## Example: Subscriber-Side SBRL Configuration

```

platform punt-sbrl subscriber punt-cause cbl-dhcpv6-solicit rate-per-4-sec 2 bucket-size 8
platform punt-sbrl subscriber punt-cause sv-match-unknown rate-per-4-sec 4 bucket-size 10
quarantine-time 5 burst-factor 500

```

## Default SBRL Configuration

Because of the dependency on CoPP, WAN-side SBRL is disabled by default. There is no default WAN-side SBRL configuration.

Subscriber-side SBRL has the following default settings:

```
platform punt-sbri subscriber punt-cause for-us-data rate-per-4-sec 32 bucket-size 32
platform punt-sbri subscriber punt-cause for-us-ctrl rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cable-l3-mobility rate-per-4-sec 16 bucket-size
16
platform punt-sbri subscriber punt-cause sv-match-unknown rate-per-4-sec 4 bucket-size 4
platform punt-sbri subscriber punt-cause cable-pre-reg rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-solicit rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-req rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-sub rate-per-4-sec 8 bucket-size 8
platform punt-sbri subscriber punt-cause cbl-dhcpv4-disc-req rate-per-4-sec 8 bucket-size
8
platform punt-sbri subscriber punt-cause cbl-dhcpv4-sub rate-per-4-sec 8 bucket-size 8
```

## Conversion of SBRL Subscriber-side Configuration from 16.8.x to 16.9.x

In 16.9.x, several new punt-causes were added for DHCP packets on the subscriber-side. This means that the recommended configuration for 16.8.x does not match up with the default configuration in 16.9.x.

In 16.8.x, the cable-dhcp punt-cause is used by both subscriber-side and WAN-side DHCP punts. In 16.9.x, new punt-causes were added on the subscriber-side for DHCP packets, with the result that the cable-dhcp punt-cause is used ONLY for WAN-side DHCP punts. This means that configuring a rate for cable-dhcp on the subscriber-side is meaningless. The chart below shows the DHCP-related punt-causes for 16.8.x and 16.9.x. In 16.9.x, all the subscriber-side DHCP punt-causes have default SBRL settings.

**Table 240: 16.8.x**

| punt-cause         | Origin  | Description            |
|--------------------|---------|------------------------|
| cbl-dhcpv6-solicit | sub     | DHCPv6 solicit         |
| cbl-dhcpv6-req     | sub     | DHCPv6 request         |
| cable-dhcp         | sub/WAN | all other DHCP packets |

**Table 241: 16.9.x**

| punt-cause         | Origin | Description    |
|--------------------|--------|----------------|
| cbl-dhcpv6-solicit | sub    | DHCPv6 solicit |
| cbl-dhcpv6-req     | sub    | DHCPv6 request |

| punt-cause          | Origin | Description                         |
|---------------------|--------|-------------------------------------|
| cbl-dhcpv6-sub      | sub    | all other (sub-side) DHCPv6 packets |
| cbl-dhcpv4-disc-req | sub    | DHCPv4 discover & request           |
| cbl-dhcpv4-sub      | sub    | all other (sub-side) DHCPv4 packets |
| cable-dhcp          | WAN    | all (WAN-side) DHCP packets         |

## Conversion of Divert Rate Limit Configuration on the Cisco uBR10012 Router to SBRL Configuration on the Cisco cBR Series Routers

### Divert Rate Limit Configuration on the Cisco uBR10012 Router

The following is a sample Divert Rate Limit (DRL) configuration on the Cisco uBR10012 router:

```

service divert-rate-limit ip fib_rp_glean rate 4 limit 4
service divert-rate-limit ip fib_rp_dest rate 4 limit 4
service divert-rate-limit ip fib_rp_punt rate 4 limit 4
service divert-rate-limit ipv6 ipv6_rp_dest rate 4 limit 4
service divert-rate-limit ipv6 ipv6_rp_punt rate 4 limit 4
service divert-rate-limit ipv6 ipv6_rp_glean rate 4 limit 4
service divert-rate-limit ipv6 icmpv6 rate 4 limit 4

service divert-rate-limit trusted-site 0.0.0.0 0.0.0.0 tos 0x68 mask 0xFF
service divert-rate-limit trusted-site 0.0.0.0 0.0.0.0 tos 0x40 mask 0xFF
service divert-rate-limit trusted-site 68.86.0.0 255.254.0.0 tos 0x0 mask 0x0
service divert-rate-limit trusted-site 0.0.0.0 0.0.0.0 tos 0x48 mask 0xFF
service divert-rate-limit trusted-site-ipv6 ::/0 traffic-class 0x40 mask 0xFF
service divert-rate-limit trusted-site-ipv6 ::/0 traffic-class 0x48 mask 0xFF
service divert-rate-limit trusted-site-ipv6 ::/0 traffic-class 0x68 mask 0xFF
service divert-rate-limit trusted-site-ipv6 2001:558::/32 traffic-class 0x0 mask 0x0

interface Cabledx/y/z
 cable divert-rate-limit rate 4 limit 30

```

In Cisco IOS Release 12.2(33)SCH2, the **divert-rate-limit max-rate wan** command was introduced on the Cisco uBR10012 router. This configuration limits the aggregate rate of diverted packets on the WAN-side, on a per-divert-code basis. The following is the recommended best-practice configuration for the **divert-rate-limit max-rate wan** command:

```

service divert-rate-limit max-rate wan fib_rp_glean rate 5000
service divert-rate-limit max-rate wan fib_rp_punt rate 5000
service divert-rate-limit max-rate wan fib_rp_dest rate 40000

service divert-rate-limit max-rate wan ipv6_fib_glean rate 5000
service divert-rate-limit max-rate wan ipv6_fib_punt rate 5000

```

```
service divert-rate-limit max-rate wan ipv6_fib_dest rate 40000
```

### SBRL Configuration on the Cisco cBR Series Routers

The DRL functionality is called as Source-Based Rate Limit (SBRL) on the Cisco cBR Series Routers. The punt-path has three layers of protection:

- [CoPP, on page 1377](#)
- [SBRL, on page 1378](#)
- [Punt Policer, on page 1378](#)

### CoPP

CoPP is used to specify the trusted sites and activate WAN-side SBRL. However, since CoPP applies to all punted packets, you must ensure that cable-side punts do not match the trusted sites.

The following is a sample CoPP configuration, which is equivalent to the configuration on the Cisco uBR10012 router:

```
access-list 120 permit ip any any dscp af31
access-list 120 permit ip any any dscp cs2
access-list 120 permit ip any any dscp af21
access-list 120 permit ip 68.86.0.0 0.1.255.255 any

ipv6 access-list TRUSTEDV6
 permit ipv6 any any dscp af31
 permit ipv6 any any dscp cs2
 permit ipv6 any any dscp af21
 permit ipv6 2001:558::/32 any

class-map match-all sbrl_trusted_v4
 match access-group 120

class-map match-all sbrl_trusted_v6
 match access-group name TRUSTEDV6

policy-map copp_policy
 class sbrl_trusted_v4
 police rate 1000 pps conform transmit exceed transmit
 class sbrl_trusted_v6
 police rate 1000 pps conform transmit exceed transmit
 class class-default
 set qos-group 99

control-plane
 service-policy input copp_policy
```

#### Note

- The **set qos-group 99** command activates SBRL for the specified class.
- The police rate for **sbrl\_trusted\_vx** is irrelevant, as both actions are set to **transmit**.
- You can add other trusted sites, as necessary.

## SBRL

The following subscriber-side SBRL configuration is recommended. This configuration covers the expected subscriber-side punt-causes.

```
platform punt-sbri subscriber punt-cause for-us-data rate-per-4-sec 32
platform punt-sbri subscriber punt-cause for-us-ctrl rate-per-4-sec 8
platform punt-sbri subscriber punt-cause sv-match-unknown rate-per-4-sec 4
platform punt-sbri subscriber punt-cause cable-pre-reg rate-per-4-sec 8
platform punt-sbri subscriber punt-cause cable-dhcp rate-per-4-sec 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-solicit rate-per-4-sec 8
platform punt-sbri subscriber punt-cause cbl-dhcpv6-req rate-per-4-sec 8
```

The recommended subscriber-side SBRL configuration is the default configuration. All expected subscriber-side punt-causes have default settings.

For WAN-side SBRL, the Cisco cBR Series routers do not have separate IPv4 and IPv6 configurations as the punt causes are shared between IPv4 and IPv6. The *limit* cannot be configured as the hardware policer is used. Therefore, we recommend that you configure a higher *rate* initially. In the following sample configuration, *glean-adj* and *for-us-data* correspond to **x\_rp\_glean** and **x\_rp\_dest**, respectively on the Cisco uBR 10012 router.

```
platform punt-sbri wan punt-cause for-us-data rate 8
platform punt-sbri wan punt-cause glean-adj rate 8
```

### Note

- The *fib-punt* punt cause is used in the Cisco uBR10012 router for packets destined to the management Ethernet. This punt cause is not used on the Cisco cBR Series routers.
- The Cisco cBR Series routers do not have an equivalent punt cause for ICMPv6. In the Cisco uBR10012 routers, ICMPv6 packets must be processed by the Route Processor to generate the checksum. In the Cisco cBR Series routers, ICMPv6 is processed in the control-plane. However, ICMPv6 punts can be identified and rate-limited (in aggregate) using CoPP.

## Punt Policer

The punt policer operates on all punt causes and is fully configurable. The punt policer is not divided into WAN-side and subscriber-side. All packets with a given punt cause are aggregated and rate-limited as configured.

Following are the default settings (best-practice configuration) for the punt policer on the Cisco cBR Series routers:

| punt-cause               | LO    | HI   |
|--------------------------|-------|------|
| CPP_PUNT_CAUSE_GLEAN_ADJ | 2000  | 5000 |
| CPP_PUNT_CAUSE_FOR_US    | 40000 | 5000 |

- Note**
- The equivalent punt cause for *fib-glean* (on the Cisco uBR10012 router) is *GLEAN\_ADJ/HI* on the Cisco cBR Series routers.
  - The equivalent punt cause for *fib-dest* (on the Cisco uBR10012 router) is *FOR\_US/LO* on the Cisco cBR Series routers.

## Feature Information for Source-Based Rate Limit

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

- Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 242: Feature Information for Source-Based Rate Limit**

| Feature Name            | Releases                    | Feature Information                                                                                               |
|-------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| Source-based rate limit | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 93

# Cable Duplicate MAC Address Reject

The Cable Duplicate MAC Address Reject feature is a DOCSIS 1.1-compliant security enhancement that helps to eliminate denial-of-service (DOS) attacks that are caused by cloned cable modems. A clone is presumed to be one of two physical cable modems on the same Cisco CMTS router with the same HFC interface MAC address. The cloned cable modem may be DOCSIS 1.0 or later, and may be semi-compliant or non-compliant with portions of the DOCSIS specifications.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Cable Duplicate MAC Address Reject

The Cable Duplicate MAC Address Reject feature entails the following behaviors and prerequisites on the DOCSIS-compliant network:

- The Cisco CMTS router requires that the legitimate cable modem is Baseline Privacy Interface Plus (BPI+) compliant, meaning that it can come to one of the following four online states when provisioned with a DOCSIS configuration file containing at least one BPI+ related type, length, value (TLV). For brevity, this document refers to these states as online(p\_).
- The Cisco CMTS router gives priority to any cable modem that registers to the Cisco CMTS router in any of the following four states:
  - online(pt)
  - online(pk)
  - online(ptd)
  - online(pkd)

The Cisco CMTS router drops registration requests from another device that purports to use the same MAC address as an already operational modem that is in one of these four states.

[Hardware Compatibility Matrix for the Cisco cBR Series Routers](#), on page 37 shows the hardware compatibility prerequisites for this feature.

**Note** The hardware components introduced in a given Cisco IOS Release are supported in all subsequent releases unless otherwise specified.

## Restrictions for Cable Duplicate MAC Address Reject

- If the cable modem is not provisioned to use DOCSIS BPI+, as characterized by not coming online with the above initialization states of online(p\_), then the existing behavior of the Cisco CMTS router remains unchanged. The Cisco CMTS router does not attempt to distinguish between two cable modems if the provisioning system does not provide a DOCSIS configuration file specifying BPI+ be enabled.
- When this feature is enabled, the Cisco CMTS router issues security breach notice in a log message in the cable logging layer2events log, or the generic log if the **cable logging layer2events** command is not configured on the Cisco CMTS router.

## Information About Cable Duplicate MAC Address Reject

The Cable Duplicate MAC Address Reject feature is enabled by default on the Cisco CMTS router, and has no associated configuration commands. This feature creates a new log message, which appears in the system log by default.

This document also describes the following security features that are associated with the Cable Duplicate MAC Address Reject feature:

### Early Authentication and Encryption

The Early Authentication and Encryption (EAE) feature enables the Cisco CMTS router to authenticate DOCSIS 3.0 cable modems immediately after completion of the ranging process, and encrypt all of the registration packets including DHCP and TFTP traffic. This security feature, compatible only with DOCSIS 3.0 cable modems, was introduced to help multiple service operators (MSOs) prevent theft of service.

This feature is enabled only for cable modems that initialize on a downstream channel on which the Cisco CMTS router is transmitting MAC Domain Descriptor (MDD) messages. The Cisco CMTS router uses TLV type 6 in the MDD MAC message to signal EAE to a cable modem. If this feature is enabled, only the authenticated cable modems are allowed to continue their initialization process and subsequently admitted to the network. The early authentication and encryption process involves the following:

- Authentication of the cable modem (that is the BPI+ authorization exchanges) after the ranging process.
- Traffic encryption key (TEK) exchanges for the cable modem primary Security Association Identifier (SAID).
- Encryption of IP provisioning traffic and Multipart Registration Request (REG-REQ-MP) messages during cable modem initialization.

### EAE Enforcement Policies

The Cisco CMTS router supports the following EAE enforcement policies:

- No EAE enforcement (Policy 1)—EAE is disabled and the Cisco CMTS router cannot enforce EAE on any cable modem.
- Ranging-based EAE enforcement (Policy 2)—EAE is enforced on all DOCSIS 3.0 cable modems that range with a B-INIT-RNG-REQ MAC message.
- Capability-based EAE enforcement (Policy 3)—EAE is enforced on all DOCSIS 3.0 cable modems that range with a B-INIT-RNG-REQ MAC message in which the EAE capability flag is set using the .
- Total EAE enforcement (Policy 4)—EAE is enforced on all cable modems irrespective of the EAE capability flag status.

The EAE enforcement policies are mutually exclusive. By default, EAE is disabled on the Cisco CMTS router.

## EAE Exclusion

You can exclude cable modems from EAE enforcement using the **cable privacy eae-exclude** command in the global configuration mode. Cable modems in the EAE exclusion list are always exempted from EAE enforcement. You can remove cable modems from the exclusion list using the no form of the **cable privacy eae-exclude** command.

## BPI+ Security and Cloned Cable Modems

The BPI+ Security and Cloned Cable Modems feature prioritizes cable modems that are online with BPI+ security over new cable modem registration requests that use the same cable modem MAC address. As a result, the legitimate cable modem with BPI+ security certificates that match the HFC MAC address does not experience service disruption, even if a non-compliant cable modem with the same HFC MAC address attempt to register.

The cloned cable modem detection function requires that a cable modem use DOCSIS 1.1 or a later version and should be provisioned with BPI+ enabled. That is, one BPI+ type, length, value (TLV) must be included in the DOCSIS configuration file. All DOCSIS 1.0, DOCSIS 1.1, and later cable modems that are provisioned without DOCSIS BPI+ enabled continue to use the legacy DOCSIS behavior, and experience a DoS attack when a cloned cable modem appears on the Cisco CMTS router.

This cloned cable modem detection function mandates that a cable modem provisioned with BPI+ and DOCSIS 1.1 QoS must register with BPI+ and not use BPI. The commonly available non-DOCSIS-compliant cable modems contain an option to force registration in BPI as opposed to BPI+ mode even when DOCSIS 1.1 QoS and BPI+ are specified in the DOCSIS configuration file.

## Logging of Cloned Cable Modems

Cloned cable modems are detected and tracked with system logging. The Logging of Cloned Cable Modem feature is enabled by default. Due to the large number of DOCSIS Layer 2 messages typically seen in a production network, a separate log is available to segregate these messages. By default, cloned cable modem messages are placed in the cable logger, cable layer2events logging. If you disable this feature using the no form of the **cable logging layer2events** command in global configuration mode, then the cloned cable modem messages are placed in the system log (syslog).

A cloned cable modem might attempt dozens of registration attempts in a short period of time. In order to suppress the number of log messages generated, the Cisco CMTS router suppresses clone detected messages for approximately 3 minutes under certain conditions.

The log message provides the cable interface and MAC address of the cable modem attempting to register when another physical modem with that same MAC address is already in a state of online(p\_) elsewhere on the Cisco CMTS router.

## DOCSIS 3.0 BPI+ Policy Enforcement

The DOCSIS 3.0 BPI+ Policy Enforcement feature was introduced to prevent cable modem MAC address cloning and theft of service. This feature enables a Cisco CMTS router to validate the MAC address of each cable modem. To enforce BPI+ on cable modems, you must configure one of the following enforcement policies per MAC domain on the router:

- 1.1 Style Configuration File Parameters and Capability (Policy 1)—The Cisco CMTS router enforces BPI+ on cable modems that register with a DOCSIS 1.1 configuration file with parameters indicating BPI+ is enabled with or without TLV 29. To configure this policy, the privacy support modem capability TLV (type 5.6) in the DOCSIS configuration file must be set to BPI+ support. This policy forces BPI+ on a cable modem that is BPI+ capable and provisioned with DOCSIS 1.1 configuration file. A cable modem that signals these capabilities during registration is blocked from accessing the network until the modem completes BPI+ negotiation.
- 1.1 Style Configuration File Parameters (Policy 2)—The Cisco CMTS router enforces BPI+ on cable modems that register with a DOCSIS 1.1 configuration file with parameters indicating BPI+ is enabled with or without TLV 29. A cable modem that registers with this type of configuration file is blocked from accessing the network until the modem completes BPI+ negotiation.
- 1.1 Style Configuration File (Policy 3)—The Cisco CMTS router enforces BPI+ on cable modems that register with a DOCSIS 1.1 configuration file. This means that if you provision a DOCSIS 1.1 configuration file with security disabled (privacy flag is not present in the configuration file), all DOCSIS 1.1 and 2.0 cable modems are blocked from accessing the network. Only the DOCSIS 3.0 cable modems that have security enabled implicitly will pass this check if the privacy flag is not present in the configuration file.
- Total enforcement (Policy 4)—The Cisco CMTS router enforces BPI+ on all cable modems. This means that all cable modems that do not run BPI+ are blocked from accessing the network.

---

**Note** You can configure only one enforcement policy at a time per MAC domain. If you configure one policy after another, the latest policy supersedes the already existing policy. For example, if you want Policy 2 to take over Policy 1, you can directly configure the former without disabling the latter.

---

These enforcement policies are implemented based on CableLabs Security Specification, CM-SP-SECv3.0-I13-100611. You can configure these enforcement policies using the **cable privacy bpi-plus-policy** command in cable interface configuration mode. The cable modems that do not comply with the configured policy can still come online but they cannot access the DOCSIS network and some dual stack cable modems may not get both the IPv4 and IPv6 addresses.

Policies 1, 2, and 3 support a mixed network of DOCSIS 1.0 (including DOCSIS Set-top Gateway), DOCSIS 1.1, and later cable modems. Policy 4 is the most effective configuration for preventing cable modem MAC address cloning as this policy enforces BPI+ on all cable modems. Policy 4 blocks all DOCSIS 1.0 cable modems as they do not register in BPI+ mode. Therefore, if Policy 4 is used, you must upgrade all authorized DOCSIS 1.0 cable modems or remove them from the network.

## BPI+ Policy Enforcement Exclusion

You can exclude cable modems (DOCSIS 1.0 and later versions) from BPI+ policy enforcement based on their MAC addresses, using the **cable privacy bpi-plus-exclude** command in global configuration mode. You can exclude a maximum of 30 cable modems per MAC domain.

# How to Configure EAE and BPI+ Enforcement Features

This section provides information on how to configure the following BPI+ enforcement features:

## Configuring EAE Enforcement Policies

By default, EAE is disabled on the Cisco CMTS router. You can configure EAE enforcement policies using the **cable privacy eae-policy** command in cable interface configuration mode.

**Note** EAE enforcement policies are enabled only for the DOCSIS 3.0 cable modems that initialize on a downstream channel.

### Procedure

|               | Command or Action                                                                                                                                                                                                   | Purpose                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                                                   | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>interface cable</b> {slot/cable-interface-index   slot/subslot/cable-interface-index}<br><b>Example:</b><br>Router(config)# <b>interface cable 6/0/1</b>                                                         | Enters interface configuration mode.                                                                               |
| <b>Step 4</b> | <b>cable privacy eae-policy</b> {capability-enforcement   disable-enforcement   ranging-enforcement   total-enforcement}<br><b>Example:</b><br>Router(config-if)# <b>cable privacy eae-policy total-enforcement</b> | Specifies EAE enforcement policies on DOCSIS 3.0 cable modems.                                                     |

|        | Command or Action                                               | Purpose                          |
|--------|-----------------------------------------------------------------|----------------------------------|
| Step 5 | <b>end</b><br><b>Example:</b><br><pre>Router(config)# end</pre> | Returns to privileged EXEC mode. |

## Configuring BPI+ Enforcement Policies

The BPI+ enforcement policies are configured per MAC domain to prevent cable modem MAC address cloning and theft of service.

### Before you begin

The customer premise equipment (CPE) must use DHCP to acquire IP addresses to access the network, or the statically assigned IP addresses must be managed appropriately.

**Note** Only a single enforcement policy can be applied per MAC domain.

### Procedure

|        | Command or Action                                                                                                                                                                                             | Purpose                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                                                                         | Enters global configuration mode.                                                                                  |
| Step 3 | <b>interface cable</b> <i>{slot/subslot/port /slot/port}</i><br><b>Example:</b><br><pre>Router(config)# interface cable 5/1/0</pre>                                                                           | Specifies the cable interface line card on a Cisco CMTS router.                                                    |
| Step 4 | <b>cable privacy bpi-plus-policy</b> {capable-enforcement   d11-enabled-enforcement   d11-enforcement   total-enforcement}<br><b>Example:</b><br><pre>Router (config-if)# cable privacy bpi-plus-policy</pre> | Specifies the BPI+ enforcement policies per MAC domain.                                                            |

|               | Command or Action                                                    | Purpose                          |
|---------------|----------------------------------------------------------------------|----------------------------------|
|               | <code>total-enforcement</code>                                       |                                  |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Router(config-if)# <code>end</code> | Returns to Privileged EXEC mode. |

## Configuring AES-128 for non-MTC DOCSIS3.0 Cable Modem

This feature is enabled by default. To disable this feature, follow the steps below:

```
enable
configure terminal
no cable privacy non-mtc-aes128
end
```

## Verifying AES-128 for non-MTC DOCSIS3.0 Cable Modem

To verify whether AES-128 is supported for non-MTC DOCSIS3.0 Cable Modem, use **show running-config** command as shown in the example below:

```
Router# show running-config | include cable privacy non-mtc-aes128
no cable privacy non-mtc-aes128
```

## Troubleshooting Tips

Use the following debug commands to troubleshoot BPI+ policy enforcement configuration:

- **debug cable mac-address**—Provides debugging information about a specific cable modem.
- **debug cable bpiatp**—Enables debugging of the BPI handler.

## Configuration Example for EAE and BPI+ Enforcement Policies

The following example shows how to configure an EAE enforcement policy on the Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# interface cable 8/1/0
Router (config-if)# cable privacy eae-policy capability-enforcement
Router (config-if)# cable privacy eae-policy ranging-enforcement
Router (config-if)# cable privacy eae-policy total-enforcement
```

The following example shows how to configure a BPI+ enforcement policy at slot/subslot/port 5/1/0 on the Cisco cBR-8 router:

```
Router# configure terminal
```

```
Router(config)# interface cable 5/1/0
Router (config-if)# cable privacy bpi-plus-policy total-enforcement
```

## Verifying EAE and BPI+ Enforcement Policies

Use the following show commands to verify EAE and BPI+ enforcement configurations:

- **show interface cable privacy**
- **show cable privacy**
- **show cable modem access-group**

To verify which EAE policy is configured on the Cisco CMTS router, use the **show interface cable privacy** command.

To verify which cable modems are excluded from EAE enforcement on the Cisco CMTS router, use the **show cable privacy** command.

To verify BPI+ enforcement policies, use the **show interface cable privacy** command.

---

**Note** A character "\*" is placed before the online state to identify modems that have not satisfied the bpi-plus-policy.

---

## What to Do Next

The Cloned Cable Modem Detection feature relates to multiple BPI+ certificate and DOCSIS 1.1 factors.

## System Messages Supporting Cable Duplicate MAC Address Reject

The following example illustrates logged events for the Cloned Cable Modem Detection feature on a Cisco cBR-8 router.

In the below scenario, there are two cable modems with MAC addresses that have been cloned:

- For MAC address 000f.66f9.48b1, the legitimate cable modem is on C5/0/0 upstream 0, and the cloned cable modem is on C7/0/0.
- For MAC address 0013.7116.e726, the legitimate cable modem is on C7/0/0 upstream 0, and the cloned cable modem is also on the same interface.
- In the below example, the CMMOVED message occurred because the cloned cable modem for MAC address 000f.66f9.48b1 came online before the legitimate cable modem.
- There is no CMMOVED message for the cable modem on interface C7/0/0 with MAC address 0013.7116.e726 because the legitimate cable modem came online with state of online(pt) before the cloned cable modem attempted to come online.

```
Dec 5 13:08:18: %CBR-6-CMMOVED: Cable modem 000f.66f9.48b1 has been moved from interface
Cable7/0/0 to interface C able5/0/0.
```

```
Dec 5 13:08:44: %CBR-5-CLONED_CM_DETECTED: Cloned CM with MAC address 0013.7116.e726
connection attempt rejected o n Cable7/0/0 U0
```

```
Dec 5 13:10:48: %CBR-5-CLONED_CM_DETECTED: Cloned CM with MAC address 000f.66f9.48b1
connection attempt rejected on Cable7/0/0 U1
Dec 5 13:12:37: %CBR-5-CLONED_CM_DETECTED: Cloned CM with MAC address 0013.7116.e726
connection attempt rejected on Cable7/0/0 U0
Dec 5 13:18:28: %CBR-5-CLONED_CM_DETECTED: Cloned CM with MAC address 0013.7116.e726
connection attempt rejected on Cable7/0/0 U0
Dec 5 13:18:28: %CBR-5-CLONED_CM_DETECTED: Cloned CM with MAC address 0013.7116.e726
connection attempt rejected on Cable7/0/0 U0
```

The following example of the **show cable modem** command illustrates additional cable modem information for the above scenario involving the specified MAC addresses:

```
Router# show cable modem 000f.66f9.48b1
MAC Address IP Address I/F MAC Prim RxPwr Timing Num BPI
 State Sid (dBmv) Offset CPE Enb

## Feature Information for Cable Duplicate MAC Address Reject

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 244: Feature Information for Cable Duplicate MAC Address Reject**

| Feature Name                       | Releases                    | Feature Information                                                                                               |

## CHAPTER 94

# Cable ARP Filtering

---

This document describes the Cable ARP Filtering feature for the Cisco Cable Modem Termination System (CMTS). This feature enables service providers to filter Address Resolution Protocol (ARP) request and reply packets, to prevent a large volume of such packets from interfering with the other traffic on the cable network.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Cable ARP Filtering

No special equipment or software is needed to use the Cable ARP Filtering feature.

## Restrictions for Cable ARP Filtering

### Cisco cBR-8 Router Restrictions

- The Cisco cBR-8 router maintains ARP filtering statistics on the Supervisor (SUP) module. Statistics are viewed with the **show cable arp-filter** command for a specified interface. When a switchover event occurs, as in SUP Redundancy, these ARP filtering statistics are reset to zero.
- The Cable ARP Filter feature is not configurable per subinterface.

### FP ARP Filter Restrictions

- The FP microcode must be enhanced to provide the rate limiting functionality for ARP filtering in FP.
- The ARP Filter in FP feature is not configurable per subinterface.

# Information About Cable ARP Filtering

## Overview

Theft-of-service and denial-of-service (DNS) attacks have become increasingly common in cable broadband networks. In addition, virus attacks are becoming more common, and users are often unaware that their computers have become infected and are being used to continue the attacks on the network.

One sign that often appears during these attacks is an unusually high volume of Address Resolution Protocol (ARP) packets. The user or virus repeatedly issues ARP requests, trying to find the IP addresses of additional computers that might be vulnerable to attack.

ARP requests are broadcast packets, so they are broadcast to all devices on that particular network segment. In some cases, a router can also forward ARP broadcasts to an ARP proxy for further processing.

This problem is also made worse because some low-end routers commonly used by subscribers for home networks can also incorrectly respond to all ARP requests, which generates even more traffic. Until these customer premises equipment (CPE) devices can be upgraded with firmware that is compliant to the appropriate Request for Comments (RFC) specifications, service providers need to be able to deal with the incorrectly generated or forwarded traffic.

In addition, the Cisco CMTS router automatically monitors ARP traffic and enters the IP addresses found in ARP requests into its own ARP table, in the expectation that a device will eventually be found with that IP address. Unacknowledged IP addresses remain in the router's ARP table for 60 seconds, which means that a large volume of ARP traffic can fill the router's ARP table.

This process can create a large volume of ARP traffic across the network. In some situations, the volume of ARP requests and replies can become so great that it can throttle other traffic and occupy most of the Cisco CMTS router's processing time, hampering efforts by technicians to recover their network.

The router cannot use fast-switching to process ARP packets, but must instead forward them to the route processor (RP). Because of this, processing a large volume of ARP traffic can also prevent the router from handling normal traffic.

## Filtering ARP Traffic

To control the volume of ARP traffic on a cable interface, you can configure the **cable arp filter** command to specify how many ARP packets are allowed per Service ID (SID) during a user-specified time period. You can configure separate thresholds for ARP request packets and for ARP reply packets.

When a cable interface is configured to filter ARP packets, it maintains a table of the number of ARP request or reply packets that have been received for each SID. If a SID exceeds the maximum number of packets during the window time period, the Cisco CMTS drops the packets until a new time period begins.

---

**Note** If using bundled cable interfaces, the Cable ARP Filtering feature is configured on the primary and subordinate interfaces separately. This allows you to configure the feature only on the particular interfaces that require it. In addition, you can configure the feature with different threshold values, allowing you to customize the feature for each interface's traffic patterns.

---

## Monitoring Filtered ARP Traffic

After ARP filtering has been enabled on a cable interface, you can then use the service **divert-rate-limit** command to display the devices that are generating excessive amounts of ARP traffic. These devices could be generating this traffic for any of the following reasons:

- Cable modems that are running software images that are either not DOCSIS-compliant or that have been hacked to allow theft-of-service attacks.
- CPE devices that are either performing a theft-of-service or denial-of-service attack, or that have been infected with a virus that is searching for other computers that can be infected.
- Routers or other devices that mistakenly reply to or forward all ARP requests.

After identifying the specific devices that are generating this traffic, you can use whatever techniques are allowed by your service level agreements (SLAs) to correct the problem.

## Linksys Wireless-Broadband Router (BEFW11S4)

The Linksys Wireless-B Broadband Router, Model number BEFW11S4 version 4 with 1.44.2 firmware, incorrectly sends its own ARP reply packet for every ARP request packet it receives, instead of replying only to the ARP requests that are specifically for itself. Customers with these routers should upgrade the firmware to the latest revision to fix this bug. To upgrade the firmware, go to the download section on the Linksys website.

---

**Note** It is extremely important that non-compliant CPE devices be updated to firmware that correctly handles ARP and other broadcast traffic. Even one or two non-compliant devices on a segment can create a significant problem with dropped packets, impacting all of the other customers on that segment.

---

## ARP Filtering in FP

ARP filter feature is performed on SUP FP complex. When enabled, this FP complex filters ARP packets for identified ARP offenders, decreasing the ARP punt rate and RP CPU usage. It also provides the user with clearer separation in ARP filtering by utilizing source MAC addresses instead of SIDs.

The filter logic now filters by source MAC address instead of by SID. Currently, the modem MAC addresses are excluded from having their ARPs filtered, but Multimedia Terminal Adapters (MTAs) and other non-offending CPEs can still (statistically) have ARPs filtered because all ARPs appear to come from the same SID. Therefore, filtering by source MAC address will isolate the filtering to the offensive devices. By doing so, a customer who has Voice-over-IP (VoIP) service via an MTA and an infected CPE will not have MTA issues while being contacted by the service provider in regards to the infected CPE.

ARP offenders will still be allowed to use ARP to avoid complete loss of Internet connectivity through their configured or provisioned gateway address. Because of this, it is expected that the “ARP Input” process will still show a few percentage points of CPU usage, but the net interrupt CPU usage will decrease.

---

**Note** ARP filtering in FP is enabled by default on Cisco cBR-8 router.

---

## Filtering ARP Traffic in FP

When ARP traffic in FP is enabled, a lightweight algorithm executing on the RP is used to identify ARP offenders by the source MAC address or the SID. All offending source MAC addresses or SIDs are then programmed by the ARP Filter control module into the FP ucode divert rate limiting module (ARP offenders are still allowed to perform ARP transactions, but only at the configured filtering rate).

Offending source MAC addresses or SIDs are filtered in FP for a minimum of 50 minutes (ten 5-minute intervals with no occurring offenses). Utilizing the existing ARP Filter CLI tools, the cable operator can obtain enough information about the modem and CPE to contact the end user to request the necessary anti-virus software installation or firmware upgrade for the CPE.

**Note** If the offending device is not “repaired” or shut off, it will remain in the FP ARP Filter indefinitely.

The FP ARP rate limiter is designed to filter a maximum of 16,000 ARP offenders. If this pool of 16,000 filterable entities is exhausted, then the entity is filtered on the RP. The CLI statistics will distinguish mac addresses filtered on the RP verses FP.

Because of possible mac address hash collisions, ARP offenders that cannot be programmed into the FP ARP rate limiter will still be filtered in FP by SID. Since the hash is done by source mac address and SID, such devices can actually moved back to mac address filtering by deleting the associated modem and forcing it back online with a new SID (this merely a possibility and is not expected to be a common practice).

ARP packets with a source mac address that is not “known” to the CMTS as a modem or CPE will be filtered by their SID in FP. Therefore, there will never be an unusual ARP packet source that will NOT be filtered in FP. False ARP packets with invalid operation codes will be filtered as if they are an ARP Reply.

## How to Configure Cable ARP Filtering

Use the following procedures to determine whether ARP filtering is required and to configure ARP filtering on one or more cable interfaces.

## Monitoring ARP Processing

Use the following steps to monitor how the router is processing ARP traffic and whether the volume of ARP packets is a potential problem.

**Step 1** To discover the CPU processes that are running most often, use the **show process cpu sorted** command and look for the ARP Input process:

**Example:**

```
Router# show process cpu sorted
```

```
CPU utilization for five seconds: 99%/28%; one minute: 93%; five minutes: 90%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
 19 139857888 44879804 3116 31.44% 28.84% 28.47% 0 ARP Input
 154 74300964 49856254 1490 20.29% 19.46% 15.78% 0 SNMP ENGINE
 91 70251936 1070352 65635 8.92% 9.62% 9.59% 0 CEF process
 56 17413012 97415887 178 3.01% 3.67% 3.28% 0 C10K BPE IP Enqu
```

```

78 24985008 44343708 563 3.68% 3.47% 3.24% 0 IP Input
54 6075792 6577800 923 0.90% 0.67% 0.65% 0 CMTS SID mgmt ta
...

```

In this example, the ARP Input process has used 31.44 percent of the CPU for the past five seconds. Total CPU utilization is also at 99 percent, indicating that a major problem exists on the router.

**Note** As a general rule, the ARP Input process should use no more than one percent of CPU processing time during normal operations. The ARP Input process could use more processing time during certain situations, such as when thousands of cable modems are registering at the same time, but if it uses more than one percent of processing time during normal operations, it probably indicates a problem.

**Step 2** To monitor only the ARP processes, use the **show process cpu | include ARP** command:

**Example:**

```

Router# show process cpu | include ARP

 19 139857888 44879804 3116 31.44% 28.84% 28.47% 0 ARP Input
110 0 1 0 0.00% 0.00% 0.00% 0 RARP Input

```

**Step 3** To monitor the number of ARP packets being processed, use the **show ip traffic** command.

**Example:**

```

Router# show ip traffic | begin ARP

ARP statistics:
Rcvd: 11241074 requests, 390880354 replies, 0 reverse, 0 other
Sent: 22075062 requests, 10047583 replies (2127731 proxy), 0 reverse

```

Repeat this command to see how rapidly the ARP traffic increases.

**Step 4** If ARP traffic appears to be excessive, use the **show cable arp-filter** command to display ARP traffic for each cable interface, to identify the interfaces that are generating the majority of the traffic.

**Example:**

```

Router# show cable arp-filter Cable5/0/0

ARP Filter statistics for Cable5/0/0:
Rcvd Replies: 177387 total, 0 unfiltered, 0 filtered
Sent Requests For IP: 68625 total, 0 unfiltered, 0 filtered
Sent Requests Proxied: 7969175 total, 0 unfiltered, 0 filtered

```

In the above example, the unfiltered and filtered counters show zero, which indicates that ARP filtering has not been enabled on the cable interface. After ARP filtering has been enabled with the **cable arp filter** command, you can identify the specific devices that are generating excessive ARP traffic by using the **service divert-rate-limit** command (see the [Identifying the Sources of Major ARP Traffic, on page 1400](#)).

## Enabling ARP Filtering

Use the following procedure to enable ARP filtering on a particular cable interface.

## Procedure

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>interface cable x/y</b><br><b>Example:</b><br><pre>Router(config)# interface cable 5/1</pre>                                                      | Enters interface configuration mode for the specified cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>cable arp filter reply-accept <i>number window-size</i></b><br><b>Example:</b><br><pre>Router(config-if)# cable arp filter reply-accept 2 2</pre> | Configures the cable interface to accept only the specified <i>number</i> of ARP reply packets every <i>window-size</i> seconds for each active Service ID (SID) on that interface. The cable interface drops ARP reply packets for a SID that would exceed this number. (The default behavior is to accept all ARP reply packets.)                                                                                                                                                                             |
| <b>Step 5</b> | <b>cable arp filter request-send <i>number window-size</i></b><br><b>Example:</b><br><pre>Router(config-if)# cable arp filter request-send 3 1</pre> | <p>Configures the cable interface to send only the specified <i>number</i> of ARP request packets every <i>window-size</i> seconds for each active SID on that interface. The cable interface drops ARP requests for a SID that would exceed this number. (The default behavior is to send all ARP request packets.)</p> <p><b>Note</b> Repeat Step 3 through Step 5 to enable ARP filtering on other cable interfaces. Primary and subordinate interfaces in a cable bundle must be configured separately.</p> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><pre>Router(config-if)# end</pre>                                                                                   | Exits interface configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Identifying the Sources of Major ARP Traffic

After you have begun filtering ARP traffic on a cable interface, use the following procedure to identify the cable modems or CPE devices that are generating or forwarding major amounts of ARP traffic.

**Tip** The Linksys Wireless-B Broadband Router, Model number BEFW11S4 version 4 with 1.44.2 firmware, has a known problem in which it incorrectly generates an ARP reply for every ARP request packet it receives. See the [Linksys Wireless-Broadband Router \(BEFW11S4\)](#) guide for information on how to resolve this problem.

**Step 1** To discover the devices that are responsible for generating or forwarding more ARP requests on a specific cable interface than a specified minimum number of packets, use the **show cable arp-filter requests-filtered** command where *number* is the threshold value for the number of packets being generated:

**Example:**

```
show cable arp-filter cable interface requests-filtered number
```

For example, to display the devices that have generated more than 100 ARP request packets, enter the following command:

**Example:**

```
Router# show cable arp-filter cable 5/1/0 requests-filtered 100
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|
| 1   | 0006.2854.72d7 | 10.3.81.4  | 12407        | 0                   | 0            |
| 81  | 00C0.c726.6b14 | 10.3.81.31 | 743          | 0                   | 0            |

**Step 2** Repeat the **show cable arp-filter** command to show how quickly the devices are generating the ARP packets.

**Step 3** To discover the devices that are responsible for generating or forwarding more ARP replies on a specific cable interface than a specified minimum number of packets, use the **show cable arp-filter replies-filtered** command where *number* is the threshold value for the number of packets being generated:

**Example:**

```
show cable arp-filter cable interface requests-filtered number
```

For example, to display the devices that have generated more than 200 ARP reply packets, enter the following command:

**Example:**

```
Router# show cable arp-filter cable 5/0/0 replies-filtered 200
```

| Sid | MAC Address    | IP Address  | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|-------------|--------------|---------------------|--------------|
| 2   | 0006.53b6.562f | 10.11.81.16 | 0            | 0                   | 2358         |
| 191 | 0100.f31c.990a | 10.11.81.6  | 0            | 0                   | 11290        |

**Step 4** (Optional) If a particular cable modem is generating or forwarding excessive ARP replies, contact the customer to see if they are using a Linksys Wireless-B Broadband Router, Model number BEFW11S4. If so, this router could be running

old firmware that is incorrectly generating excessive ARP packets, and the customer should upgrade their firmware. For more information, see the [Linksys Wireless-Broadband Router \(BEFW11S4\)](#) guide

**Step 5** Repeat this command during each filter period (the time period you entered with the **cable arp filter** command) to show how quickly the devices are generating the ARP packets.

**Step 6** (Optional) The ARP reply and request packet counters are 16-bit counters, so if a very large number of packets are being generated on an interface, these counters could wrap around to zero in a few hours or even a few minutes. Clearing the ARP counters eliminates stale information from the display and makes it easier to see the worst offenders when you suspect ARP traffic is currently creating a problem on the network.

To eliminate the modems that are not currently triggering the ARP filters and to isolate the worst current offenders, use the **clear counters cable interface** command to reset all of the interface counters to zero. Then the **show cable arp-filter** commands clearly identify the SIDs of the modems that are currently forwarding the most ARP traffic.

For example, the following example indicates that a number of modems are forwarding a large enough volume of ARP traffic that they have triggered the ARP packet filters:

**Example:**

```
Router# show cable arp-filter cable 5/1/0 requests-filtered 10
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|
| 1   | 0006.2854.72d7 | 10.3.81.4  | 8            | 0                   | 0            |
| 23  | 0007.0e02.b747 | 10.3.81.31 | 32           | 0                   | 0            |
| 57  | 0007.0e03.2c51 | 10.3.81.31 | 12407        | 0                   | 0            |
| ... |                |            |              |                     |              |
| 81  | 00C0.c726.6b14 | 10.3.81.31 | 23           | 0                   | 0            |

SID 57 shows the largest number of packets, but it is not immediately apparent if this modem is causing the current problems. After clearing the counters though, the worst offenders are easily seen:

**Example:**

```
Router# clear counter cable 5/1/0
```

Clear **show interface** counters on this interface [confirm] **y**

```
08:17:53.968: %CLEAR-5-COUNTERS: Clear counter on interface Cable5/1/0 by console
Router# show cable arp cable 5/1/0
```

ARP Filter statistics for Cable3/0:  
 Replies Rcvd: 0 total. 0 unfiltered, 0 filtered  
 Requests Sent For IP: 0 total. 0 unfiltered, 0 filtered  
 Requests Forwarded: 0 total. 0 unfiltered, 0 filtered

```
Router# show cable arp-filter cable 5/1/0 requests-filtered 10
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|
| 57  | 0007.0e03.2c51 | 10.3.81.31 | 20           | 0                   | 0            |
| 81  | 00C0.c726.6b14 | 10.3.81.31 | 12           | 0                   | 0            |

```
Router# show cable arp-filter cable 5/1/0 requests-filtered 10
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|
| 57  | 0007.0e03.2c51 | 10.3.81.31 | 31           | 0                   | 0            |
| 81  | 00C0.c726.6b14 | 10.3.81.31 | 18           | 0                   | 0            |

**Step 7** (Optional) If the Req-For-IP-Filtered column shows the majority of ARP packets, use the **show cable arp-filter ip-requests-filtered** command to display more details about the CPE device that is generating this traffic. Then use the **debug cable mac-address** and **debug cable arp filter** commands to display detailed information about this particular traffic; for example:

**Example:**

```
Router# show cable arp-filter c5/0/0 ip-requests-filtered 100

Sid MAC Address IP Address Req-Filtered Req-For-IP-Filtered Rep-Filtered
1 0007.0e03.1f59 50.3.81.3 0 37282 0
Router# debug cable mac-address 0007.0e03.1f59

Router# debug cable arp filter

Router#
Apr 23 23:03:23.565: ARP for IP Filter=F sid 1 s 0000.0000.0049 d 0005.00e5.3610 sip 50.3.81.13 dip
50.3.82.173 prot 6 len 46 SrcP 445 DstP 445
Apr 23 23:03:23.565: ARP for IP Filter=F sid 1 s 0000.0000.0049 d 0005.00e5.3610 sip 50.3.81.13 dip
50.3.82.174 prot 6 len 46 SrcP 445 DstP 445
Apr 23 23:03:23.565: ARP for IP Filter=F sid 1 s 0000.0000.0049 d 0005.00e5.3610 sip 50.3.81.13 dip
50.3.82.175 prot 6 len 46 SrcP 445 DstP 445
[additional output omitted]...
```

This example shows that the CPE device at IP address 50.3.81.13 is sending packets to TCP port 445 to every IP address on the 50.3.82.0 subnet, in a possible attempt to find a computer that has Microsoft Windows file-sharing enabled.

**Step 8** After determining the specific devices that are generating excessive ARP traffic, you can take whatever action is allowed by your company's service level agreements (SLAs) to correct the problem.

## Examples

In this example, two cable interfaces, C5/0/0 and C7/0/0, are joined in the same bundle, which means the interfaces share the same broadcast traffic. Separate devices on each interface are generating excessive ARP traffic:

- The device at MAC address 000C.2854.72D7 on interface C7/0/0 is generating or forwarding a large volume of ARP requests. Typically, this device is a cable modem that is forwarding the ARP requests that are being generated by a CPE device behind the modem. The CPE device could be attempting a theft-of-service or denial-of-service attack, or it could be a computer that has been infected by a virus and is trying to locate other computers that can be infected.
- The device at MAC address 000C.53B6.562F on Cable 5/0/0 is responding to a large number of ARP requests, which could indicate that the device is a router that is running faulty software.

The following commands identify the device on the C7/0/0 interface that is generating the excessive ARP requests:

```
Router# show cable arp-filter c7/0/0

ARP Filter statistics for Cable7/0/0:
Replies Rcvd: 3 total. 3 unfiltered, 0 filtered
Requests Sent For IP: 0 total. 0 unfiltered, 0 filtered
Requests Forwarded: 27906 total. 562 unfiltered, 27344 filtered
Router# show cable arp-filter c7/0/0 requests-filtered 100
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|
| 1   | 000C.2854.72d7 | 50.3.81.4  | 62974        | 0                   | 0            |

The following commands identify the device on the C5/0/0 interface that is generating the excessive ARP replies:

```
Router# show cable arp-filter c5/0/0
```

```
ARP Filter statistics for Cable5/0/0:
 Replies Rcvd: 2400 total. 456 unfiltered, 1944 filtered
 Requests Sent For IP: 0 total. 0 unfiltered, 0 filtered
 Requests Forwarded: 26 total. 26 unfiltered, 0 filtered
Router# show cable arp-filter c5/0/0 replies-filtered 100
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|
| 2   | 000C.53b6.562f | 50.3.81.6  | 0            | 0                   | 2097         |

## Clearing the Packet Counters

To clear the packet counters on an interface, which includes the ARP packet counters, use the **clear counters cable interface** command. You can also clear the packet counters on all interfaces by using the **clear counters** command without any options. This allows you to use the **show cable arp** commands to display only the CPE devices that are currently generating the most traffic.

---

**Note** The **clear counters** command clears all of the packet counters on an interface, not just the ARP packet counters.

---

## Identifying ARP Offenders in FP

When the FP ARP Filter feature is enabled, use the **show cable arp-filter interface** command to generate a list of ARP offenders.

### cBR-8 Outputs in FP

When the FP ARP Filter feature is enabled, the cBR-8 output formatting displays the modem and the CPE addresses on a single line, in addition to the following columns:

- **M/S**—This column shows if packets are being filtered by MAC address or SID. A majority of these columns will show MAC address.
- **Rate**—This column shows the packet rate for FP-filtered packets in the last 5 minutes monitoring time window. Rate is not calculated for RP-filtered packets.
- **Pro**—This column will identify the processor that performed the filtering with either “RP” or “FP.” On the cBR-8, it is expected that 99.9% of Pro fields will show “FP.”

The following is a sample output for an ARP request on a cBR-8 in FP:

```
Router# show cable arp-filter Bundle1 requests-filtered 40
Interface Cable5/0/0 - none
Interface Cable6/0/2
Sid CPE Mac CPE IP Modem MAC Modem IP M/S Rate Pro REQS
```

```

4 00d0.b75a.822a 50.3.81.56 0007.0e03.9cad 50.3.81.15 MAC - RP 46
4 00d0.b75a.822a 50.3.81.56 0007.0e03.9cad 50.3.81.15 MAC 25 FP 5012
5 00b0.d07c.e51d 50.3.81.57 0007.0e03.1f59 50.3.81.13 MAC - RP 64000
6 - - 0006.2854.7347 50.3.81.4 MAC 101 FP 5122
7 - - 0006.2854.72d7 50.3.81.11 SID - FP 961205
Interface Cable7/0/0 - none

```

This sample output demonstrates the following:

- SID 4 shows a CPE filtered in FP. The threshold specified is low enough to show the packets that were filtered on the RP as the offender was being identified. A high enough threshold would not have shown the RP-filtered packets. The ARP packet rate of 25 is shown for FP-filtered packets.
- SID 5 shows a CPE filtered on the RP. This is extremely unusual and only occurs when the maximum number of FP-filterable entities has been reached.
- SID 6 shows a modem filtered in FP (CPE MAC or CPE IP are not shown).
- SID 7 shows ARP packets from an “unknown” source MAC address filtered by SID in FP.

The counts for requests, replies, and requests for IP will no longer be shown on a single line in order to keep the line concise and less than 90 characters in length.

The “REQs” column is now stated as “REPs” in the case of ARP replies. The column will show “REQ-IP” in cases involving ARP requests for IP.

Requests being sent by the CMTS due to encroaching IP packets, “ip-requests-filtered”, will still be filtered on the RP and not in FP, with Access Control Lists (ACLs) used to defeat IP-based scanning traffic, and the IP punt rate limiting feature for cBR-8 used to decrease the punt rate for such traffic. The ARP Filter can still be used to perform analysis of these IP traffic streams.

## Configuration Examples for Cable ARP Filtering

This section provides the following examples of how to configure the Cable ARP Filtering features:

### ARP Filtering Configuration on an Individual Cable Interface: Example

The following example shows a typical configuration of a cable interface that is configured for the Cable ARP Filtering feature:

```

!
interface Cable5/0/0
ip address 192.168.100.1 255.255.255.0 secondary
ip address 192.168.110.13 255.255.255.0
cable downstream annex B
cable downstream modulation 256qam
cable downstream interleave-depth 32
cable downstream channel-id 0
cable upstream 0 frequency 6000000
cable upstream 0 power-level 0
cable upstream 0 channel-width 3200000 200000
cable upstream 0 minislots-size 16
cable upstream 0 modulation-profile 6 7
no cable upstream 0 shutdown
cable upstream 1 frequency 26000000
cable upstream 1 power-level 0
cable upstream 1 channel-width 3200000 200000
cable upstream 1 minislots-size 4
cable upstream 1 modulation-profile 6 7

```

```

no cable upstream 1 shutdown
cable upstream 2 frequency 15008000
cable upstream 2 power-level 0
cable upstream 2 channel-width 3200000 200000
cable upstream 2 minislots-size 4
cable upstream 2 modulation-profile 6 7
cable upstream 2 shutdown
cable upstream 3 spectrum-group 25
cable upstream 3 channel-width 3200000 200000
cable upstream 3 minislots-size 4
cable upstream 3 modulation-profile 1
cable upstream 3 shutdown
cable upstream 4 frequency 21008000
cable upstream 4 power-level 0
cable upstream 4 channel-width 3200000 200000
cable upstream 4 minislots-size 16
cable upstream 4 modulation-profile 1
no cable upstream 4 shutdown
cable upstream 5 spectrum-group 25
cable upstream 5 channel-width 3200000 200000
cable upstream 5 minislots-size 4
cable upstream 5 modulation-profile 1
cable upstream 5 shutdown
cable arp filter request-send 4 2
cable arp filter reply-accept 4 2
end

```

## ARP Filtering Configuration on Bundled Cable Interfaces: Example

The following example shows a typical configuration of a cable interface bundle that is also using the Cable ARP Filtering feature. Both the primary and subordinate interface are configured separately, allowing you to configure the feature only on the particular interfaces that require it. In addition, you can configure the feature with different threshold values, allowing you to customize the feature for each interface's traffic patterns.

```

!
interface Cable5/0/0
description Master cable interface
ip address 10.3.130.1 255.255.255.0 secondary
ip address 10.3.131.1 255.255.255.0 secondary
ip address 10.3.132.1 255.255.255.0 secondary
ip address 10.3.133.1 255.255.255.0 secondary
ip address 10.3.81.1 255.255.255.0
ip helper-address 10.14.0.4

cable arp filter reply-accept 20 5
end

```

## ARP Filtering in FP Default Configuration: Example

The following example shows the default configuration of a cable interface for the ARP Filtering in FP feature.

```

interface Bundle1
cable arp filter request-send 3 2
cable arp filter reply-accept 3 2
end

```

## Additional References

The following sections provide references related to the Cable ARP Filtering feature.

## Feature Information for Cable ARP Filtering

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 246: Feature Information for the Cable ARP Filtering Feature**

| Feature Name        | Releases                    | Feature Information                                                                                               |
|---------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| Cable ARP Filtering | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 95

# Subscriber Management Packet Filtering Extension for DOCSIS 2.0

---

The Cisco converged broadband router supports management of data packet filtering based on the subscriber's preferences and criteria. Packet filtering enhances security to the cable network by allowing only the specific packets to flow to the Customer Premise Equipment (CPE) while dropping the unwanted data packets from the cable network.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Configuring Subscriber Management Packet Filtering

The software prerequisites for the subscriber management packet filtering feature are:

- The latest software image is loaded and working on the Cable Modem Termination System (CMTS) and the cable modems (CM).
- The configuration information on the main supervisor (SUP) and the standby SUP should be the same before the switchover.

## Restriction for Configuring Subscriber Management Packet Filtering

- This feature can define up to 254 filtering groups. The number of filters in each group is 255.

# Information About Configuring Subscriber Management Packet Filtering

A filter group specifies what filters are applied to the packets going to or coming from each specific CM or CPE device. It defines the rules or criteria to filter or drop a packet. Every packet that has to be filtered can either be accepted to send or filtered to be dropped. The criteria to filter a packet depends on the subscriber's preferences. The filter group can be applied to different subscriber management groups.

Cable subscriber management can be established using the following configuration methods:

- CMTS router configuration (via CLI)
- SNMP configuration

The process of configuring the subscriber management packet filtering is:

1. The packet filter group defines the action for a packet. The packet can be let to go to the CPE or dropped off the cable network based on the subscriber's packet criteria.
2. The CM sends a registration request to the CMTS. The registration request contains provisioning information that defines the association of a Packet Filtering Group (PFG) with the CM and its subscribers.
3. The specific downstream or upstream PFGs are used to bind the CM, CPE, embedded Multimedia Terminal Adaptor (eMTA), embedded Set-Top Box (eSTB) and embedded portal server (ePS) to a specific PFG.
4. The CMTS identifies the CPE device based on the CPE's DHCP information.

---

**Note** For the filter group to work for CMs, a CM must re-register after the CMTS router is configured.

---

## How to Configure Subscriber Management Packet Filtering

This section describes the configuration tasks that are performed to manage subscriber packet filtering on the Cisco CMTS platforms. You can use the command-line interface (CLI) commands to complete the configuration.

### Configuring the Filter Group

This section describes the tasks to configure the packet filter group. Follow the summary steps to complete the configuration.

To create, configure, and activate a DOCSIS filter group that filters packets on the basis of the TCP/IP and UDP/IP headers, use the cable filter group command in global configuration mode.

#### Procedure

|        | Command or Action      | Purpose                                                        |
|--------|------------------------|----------------------------------------------------------------|
| Step 1 | enable<br><br>Example: | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                | Purpose                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
|               | <pre>Router&gt; enable</pre> <p><b>Example:</b></p> <pre>Router#</pre>                                                                                                           |                                                                                |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                  | Enters global configuration mode.                                              |
| <b>Step 3</b> | <p><b>cable filter group group-id index index-num [option option-value]</b></p> <p><b>Example:</b></p> <pre>Router(config)# cable filter group 10 index 10 src-ip 10.7.7.7</pre> | Creates, configures, and activates a DOCSIS filter group that filters packets. |

## Defining the Upstream and Downstream MTA Filter Group

This section describes the configuration tasks to define the upstream and downstream subscriber management filter groups for an embedded Multimedia Terminal Adaptor (eMTA.) Follow the summary steps to complete the configuration.

### Procedure

|               | Command or Action                                                                             | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> | Enters global configuration mode.                                                                                  |

|               | Command or Action                                                                                                                                                                      | Purpose                                                                             |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p>cable submgmt default filter-group mta {downstream   upstream} group-id</p> <p><b>Example:</b></p> <pre>Router(config)# cable submgmt default filter-group mta downstream 130</pre> | Defines the upstream and downstream subscriber management filter groups for an MTA. |

## Defining the Upstream and Downstream STB Filter Group

This section describes the configuration tasks to define the upstream and downstream subscriber management filter groups for a Set-Top Box (STB.) Follow the summary steps to complete the configuration.

### Procedure

|               | Command or Action                                                                                                                                                                     | Purpose                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                                                                                              | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                                                                                         | Enters global configuration mode.                                                                                         |
| <b>Step 3</b> | <p>cable submgmt default filter-group stb {downstream   upstream} group-id</p> <p><b>Example:</b></p> <pre>Router(config)# cable submgmt default filter-group stb downstream 20</pre> | Defines the upstream and downstream subscriber management filter groups for an STB.                                       |

## Defining the Upstream and Downstream PS Filter Group

This section describes the configuration tasks to define the upstream and downstream subscriber management filter groups for a Portal Server (PS.) Follow the summary steps to complete the configuration.

## Procedure

|               | Command or Action                                                                                                                                                                  | Purpose                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre> <b>Example:</b><br><pre>Router#</pre>                                                                             | Enables privileged EXEC mode. Enter your password if prompted.                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre> <b>Example:</b><br><pre>Router(config)#</pre>                                                | Enters global configuration mode.                                                            |
| <b>Step 3</b> | <b>cable submgmt default filter-group ps {downstream   upstream} group-id</b><br><b>Example:</b><br><pre>Router(config)# cable submgmt default filter-group ps downstream 10</pre> | Defines the upstream and downstream subscriber management filter groups for a portal server. |

## Configuration Examples for Subscriber Management Packet Filtering

This section describes a sample configuration example for configuring the subscriber management packet filtering.

### Configuring the Filter Group: Example

The following example shows configuration of a filter group that drops packets with a source IP address of 10.7.7.7 and a destination IP address of 10.8.8.8, and a source port number of 2000 and a destination port number of 3000. All protocol types and ToS and TCP flag values are matched:

```
Router(config)# cable filter group 10 index 10 src-ip 10.7.7.7
Router(config)# cable filter group 10 index 10 src-mask 255.255.0.0
Router(config)# cable filter group 10 index 10 dest-ip 10.8.8.8
Router(config)# cable filter group 10 index 10 dest-mask 255.255.0.0
```

```
Router(config)# cable filter group 10 index 10 ip-proto 256
Router(config)# cable filter group 10 index 10 src-port 2000
Router(config)# cable filter group 10 index 10 dest-port 3000
Router(config)# cable filter group 10 index 10 tcp-flags 0 0
Router(config)# cable filter group 10 index 10 match-action drop
```

## Defining the Upstream and Downstream MTA Filter Group: Example

The following example shows configuration of an upstream and downstream MTA filter group.

```
Router# configure terminal
Router(config)# cable submgmt default filter-group mta downstream 10
```

## Defining the Upstream and Downstream STB Filter Group: Example

The following example shows configuration of an upstream and downstream STB filter group.

```
Router#configure terminal
Router(config)#cable submgmt default filter-group stb downstream 20
```

## Defining the Upstream and Downstream PS Filter Group: Example

The following example shows configuration of an upstream and downstream portal server filter group.

```
Router#configure terminal
Router(config)#cable submgmt default filter-group ps downstream 10
```

## Additional References

The following sections provide references related to configuring the subscriber management packet filtering feature.

### Technical Assistance

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Link                                                                                   |

## Feature Information for Subscriber Management Packet Filtering

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 248: Feature Information for Subscriber Management Packet Filtering*

| Feature Name                           | Releases                    | Feature Information                                                                                             |
|----------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------|
| Subscriber management packet filtering | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Router |

## CHAPTER 96

# MAC Filtering

---

This feature enables/disables MAC address filter on the backhaul interface.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Information About MAC Filtering

With this feature, only the packet whose destination MAC address is the MAC address of the router interface can be forwarded. It supports 32 unicast filter entries per interface. It is disabled by default.

**Note** When port-channel is enabled, MAC filtering must be enabled on backhaul interface to take effect.

**Note** When both dot1q l2vpn and MAC filtering are enabled on backhaul interface, only 1 unicast filter entry is supported per backhaul interface. The MAC filtering is only supported for non-l2vpn unicast packets.

# How to Configure MAC Filtering

This section describes the configuration tasks that are performed to manage MAC filtering. You can use the command-line interface (CLI) commands to complete the configuration.

## Configuring MAC Filtering

To configure MAC filtering, follow the steps below:

```
enable
configure terminal
interface tenGigabitEthernet slot/subslot/port
mac-addr-filter
end
```

## Verifying MAC Filtering

To verify the MAC filtering configuration on the backhaul interface, use **show running-config interface** command as shown below:

```
Router# show running-config interface tenGigabitEthernet 4/1/0
Building configuration...

Current configuration : 73 bytes
!
interface TenGigabitEthernet4/1/0
 no ip address
 mac-addr-filter
end
```

To verify the MAC filtering status on a specific SUP slot and SUP-PIC bay, use **show platform software iomd** command as shown below:

```
Router# show platform software iomd 4/4 mac-filter
IOMD (Input Output Module Driver) Mac Filter Status
```

|         |                   |                 |                   |                   |       |

## Configuration Examples for MAC Filtering

This section describes a sample configuration example for configuring the MAC filtering.

```
router> enable
router# configure terminal
router(config)# interface tenGigabitEthernet 4/1/0
router(config-if)# mac-addr-filter
router(config-if)# end
```

## Feature Information for MAC Filtering

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfngn.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 250: Feature Information for MAC Filtering**

| Feature Name  | Releases                    | Feature Information                                                                                               |
|---------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| MAC Filtering | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

# Call Home

---

Call Home offers diagnostics and real-time alerts on select Cisco devices, which provide higher network availability and increased operational efficiency. Smart Call Home is a secure connected service of Cisco SMARTnet for the Cisco cBR routers.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 251: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Prerequisites for Call Home

- Contact email address (required for full registration with Smart Call Home, optional if Call Home is enabled in anonymous mode), phone number (optional), and street address information (optional) must be configured so that the receiver can determine the origin of messages received.

**Note** Contact email address is not required if you enable Smart Call Home by enabling smart licensing.

- At least one destination profile (predefined or user-defined) must be configured. The destination profiles configured depends on whether the receiving entity is a pager, email, or automated service such as Cisco Smart Call Home.
  - If the destination profile uses email message delivery, you must specify a Simple Mail Transfer Protocol (SMTP) server.
  - Configuring the trustpool certificate authority (CA) is not required for HTTPS server connection as the trustpool feature is enabled by default.

- The router must have IP connectivity to an email server or the destination HTTP(S) server.
- To use Cisco Smart Call Home service, you require an active service contract covering the device, which provides full Smart Call Home service.

---

**Note** An active service contract is only required for full Smart Call Home services like automatically raising a Cisco Technical Assistance Center (TAC) case.

---

## Restrictions for Call Home

- If there is no IP connectivity or if the interface in the VRF to the profile destination is down, Smart Call Home messages cannot be sent.
- Smart Call Home operates with any SMTP server.
- You can configure up to five SMTP servers for Smart Call Home.

## Information About Call Home

The Call Home feature provides email-based and web-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard email, or XML-based automated parsing applications.

Common uses of this feature may include:

- Direct paging of a network support engineer
- Email notification to a network operations center
- XML delivery to a support website
- Use of Cisco Smart Call Home services for direct case generation with the Cisco Technical Assistance Center (TAC).

The Call Home feature can deliver alert messages containing information about configuration, environmental conditions, inventory, syslog, snapshot, and crash events.

The Call Home feature can deliver alerts to multiple recipients, which are seen as *Call Home destination profiles*, each with configurable message formats and content categories. A predefined destination profile (CiscoTAC-1) is provided, and you can also define your own destination profiles. The CiscoTAC-1 profile is used to send alerts to the backend server of the Smart Call Home service. It can be used to create service requests to Cisco TAC. This service depends on the Smart Call Home service support in place for your device and the severity of the alert.

Flexible message delivery and format options make it easy to integrate specific support requirements.

## Benefits of Call Home

- Automatic execution and attachment of the relevant CLI command output.

- Multiple message-format options such as the following:
  - Short Text—Suitable for pagers or printed reports.
  - Full Text—Fully formatted message information suitable for human reading.
  - XML—Matching readable format using Extensible Markup Language (XML). The XML format enables communication with the Cisco TAC.
- Multiple concurrent message destinations.
- Multiple message categories including configuration, crash, diagnostic, environment, inventory, snapshot, and syslog.
- Filtering of messages that are based on the severity and pattern matching.
- Scheduling of periodic message sending.

## Obtaining Smart Call Home Services

If you have a service contract directly with Cisco, you can register for the Smart Call Home service. Smart Call Home analyzes Smart Call Home messages and provides background information and recommendations. For critical issues, Automatic Service Requests are generated with the Cisco TAC.

Smart Call Home offers the following features:

- Continuous device health monitoring and real-time alerts.
- Analysis of Smart Call Home messages. Optional generation of the Automatic Service Request report, including detailed diagnostic information that speeds up the problem resolution, which is routed to the correct TAC team.
- Direct secure message transportation from your device, through an HTTP proxy server, or a downloadable Transport Gateway (TG). You can use a TG aggregation point to support multiple devices. Or, you can use it in scenario where security dictates that your devices may not be connected directly to the Internet.
- Web-based access that provides Smart Call Home messages and recommendations, inventory, and configuration information for all Smart Call Home devices. This access provides associated field notices, security advisories, and end-of-life information.

You need the following items to register for Smart Call Home:

- SMARTnet contract number for your router.
- Your email address
- Your Cisco.com username

For information about how to configure Call Home to work with the Smart Call Home service, see the [Cisco Smart Call Home Support Community](#) forum.

## Anonymous Reporting

Smart Call Home is a service capability that is included with many Cisco service contracts and is designed to assist you help resolve problems quickly. In addition, the information gained from crash messages helps Cisco understand equipment and issues occurring in the field. You can enable Anonymous Reporting without

Smart Call Home. Anonymous Reporting allows Cisco to securely receive minimal error and health information from the device. If you enable Anonymous Reporting, your identity remains anonymous, and no identifying information is sent.

---

**Note** When you enable Anonymous Reporting, you acknowledge your consent to transfer specified data. The data is shared with Cisco or to vendors operating on behalf of Cisco (including countries outside the United States). Cisco maintains the privacy of all customers. For information about how Cisco treats personal information, see the Cisco Privacy Statement at [Cisco Online Privacy Statement](#).

---

When Call Home is configured in an anonymous way, only crash, inventory, and test messages are sent to Cisco. No identifying information is sent.

For more information about what is sent in these messages, see the Alert Group Trigger Events and Commands section.

## Smart Licensing

Smart Licensing uses the Smart Call Home service.

The Smart Licensing service is an alternative licensing architecture to Cisco Software Licensing (CSL). Smart Licensing uses the Cisco Smart Software Manager as a backend tool for managing licenses. Smart Call Home must be configured before using the Smart Licensing. By default, Smart Licensing and Smart Call Home are enabled on the Cisco cBR routers.

For more information about Smart Licensing, see the [Cisco Smart Licensing on the Cisco cBR Router](#) topic.

# How to Configure Call Home

## Configuring Smart Call Home (Single Command)

Smart Call Home is enabled by default on the router. The CiscoTAC-1 profile to send data to Cisco is also enabled by default.

Unless you change to anonymous mode or add HTTP proxy, the single command is not used to enable Smart Call Home on the router.

To enable all Call Home basic configurations using a single command, perform the following steps:

### SUMMARY STEPS

1. **configure terminal**
2. **call-home reporting** { **anonymous** | **contact-email-addr** *email-address* } [ **http-proxy** { *ipv4-address* | *ipv6-address* | **name** } **port** *port number* ]

DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 2</b> | <p><b>call-home reporting</b> { <b>anonymous</b>   <b>contact-email-addr</b> <i>email-address</i> } [ <b>http-proxy</b> { <i>ipv4-address</i>   <i>ipv6-address</i>   <b>name</b> } <b>port</b> <i>port number</i> ]</p> <p><b>Example:</b></p> <pre>Device(config)# call-home reporting contact-email-addr email@company.com</pre> | <p>Enables all Call Home basic configurations using a single command.</p> <ul style="list-style-type: none"> <li>• <b>anonymous</b> —Enables the Call-Home TAC profile to only send crash, inventory, test messages, and send the messages in an anonymous way.</li> <li>• <b>contact-email-addr</b> —Enables Smart Call Home service full reporting capability. The service also sends a full inventory message from the Call-Home TAC profile to the Smart Call Home server to start full registration process.</li> <li>• <b>http-proxy</b> { <i>ipv4-address</i>   <i>ipv6-address</i>   <b>name</b> —An IPv4 or IPv6 address or server name. Maximum length is 64.</li> <li>• <b>port</b> <i>port number</i> —Port number. Range is 1 to 65535.</li> </ul> <p><b>Note</b> HTTP proxy option allows you to set your own proxy server to buffer and secure the internet connections from your devices.</p> <p><b>Note</b> After successfully enabling Call Home either in anonymous or full registration mode using the <b>call-home reporting</b> command, an inventory message is sent out. If Call Home is enabled in anonymous mode, an anonymous inventory message is sent out. If Call Home is enabled in full registration mode, a Full Inventory message for full registration mode is sent. For more information about what is sent in these messages, see the <a href="#">Alert Groups Trigger Events and Commands, on page 1471</a> topic.</p> |

## Configuring Call Home

For security reasons, we recommend that you use the HTTPS transport options, due to the additional payload encryption that HTTPS offers. The Transport Gateway software is downloadable from Cisco.com and is available if you require an aggregation point or a proxy for connection to the Internet.

The implementation on the router supports the trustpool feature (embedded CA certificates in Cisco IOS images). The trustpool feature simplifies configuration to enable Smart Call Home service on configured devices. It eliminates the requirement of manually configuring the trustpool and provides the automatic update of the CA certificate, if it changes in the future.

### Enabling and Disabling Call Home

To enable or disable the Call Home feature, complete the following steps:

#### SUMMARY STEPS

1. **configure terminal**
2. **service call-home**
3. **no service call-home**

#### DETAILED STEPS

|        | Command or Action                                                                                | Purpose                           |
|--------|--------------------------------------------------------------------------------------------------|-----------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Router#<br><b>configure terminal</b>             | Enters global configuration mode. |
| Step 2 | <b>service call-home</b><br><b>Example:</b><br>Router(config)#<br><b>service call-home</b>       | Enables the Call Home feature.    |
| Step 3 | <b>no service call-home</b><br><b>Example:</b><br>Router(config)#<br><b>no service call-home</b> | Disables the Call Home feature.   |

### Configuring Contact Information

Each router must include a contact email address. You can optionally include a phone number, street address, contract ID, customer ID, and site ID.

To assign the contact information, complete the following steps:

**SUMMARY STEPS**

1. **configure terminal**
2. **call-home**
3. **contact-email-addr** *email-address*
4. **phone-number** + *phone-number*
5. **street-address** *street-address*
6. **customer-id** *text*
7. **site-id** *text*
8. **contract-id** *text*

**DETAILED STEPS**

|               | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router&gt; configure terminal</pre>                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>call-home</b><br><b>Example:</b><br><pre>Router (config)# call-home</pre>                                                                                      | Enters call home configuration mode.                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>contact-email-addr</b> <i>email-address</i><br><b>Example:</b><br><pre>Router (cfg-call-home)# contact-email-addr username@example.com</pre>                   | Assigns the customer’s email address. Enter up to 200 characters in email address format with no spaces.                                                                                                                                                                    |
| <b>Step 4</b> | <b>phone-number</b> + <i>phone-number</i><br><b>Example:</b><br><pre>Router (cfg-call-home)# phone-number +1-222-333-4444</pre>                                   | (Optional) Assigns the customer’s phone number.<br><b>Note</b> The number must start with a plus (+) prefix, and may contain only dashes (-) and numbers. Enter up to 16 characters. If you include spaces, you must enclose your entry within double quotation marks (“”). |
| <b>Step 5</b> | <b>street-address</b> <i>street-address</i><br><b>Example:</b><br><pre>Router (cfg-call-home)# street-address "1234 Any Street, Any city, Any state, 12345"</pre> | (Optional) Assigns the customer’s street address where RMA equipment can be shipped. Enter up to 200 characters. If you include spaces, you must enclose your entry within double quotation marks (“”).                                                                     |

|        | Command or Action                                                                                                        | Purpose                                                                                                                                                                             |
|--------|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <p><b>customer-id</b> <i>text</i></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home) # customer-id Customer1234</pre> | (Optional) Identifies the customer ID. Enter up to 64 characters. If you include spaces, you must enclose your entry within double quotation marks (“ ”).                           |
| Step 7 | <p><b>site-id</b> <i>text</i></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home) # site-id Site1ManhattanNY</pre>     | (Optional) Identifies the customer site ID. Enter up to 200 characters. If you include spaces, you must enclose your entry within double quotation marks (“ ”).                     |
| Step 8 | <p><b>contract-id</b> <i>text</i></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home) # contract-id Company1234</pre>  | (Optional) Identifies the customer’s contract ID for the router. Enter up to 64 characters. If you include spaces, you must enclose your entry within double quotation marks (“ ”). |

## Configuring Destination Profiles

A destination profile contains the required delivery information for an alert notification. At least one destination profile is required. You can configure multiple destination profiles of one or more types.

You can create and define a new destination profile or copy and use the predefined destination profile. If you define a new destination profile, you must assign a profile name. You can control which profile to be used for Smart Licensing by enabling or disabling smart-licensing data of that profile. Only one active profile can have a data enabled smart-license.

**Note** If you use the Smart Call Home service, the destination profile must use the XML message format.

A destination profile includes the following information:

- Profile name—String that uniquely identifies each user-defined destination profile. The profile name is limited to 31 characters and is not case-sensitive. You cannot use **all** as a profile name.
- Transport method—Transport mechanism, either email or HTTP (including HTTPS), for delivery of alerts.
  - For user-defined destination profiles, email is the default, and you can enable either or both transport mechanisms. If you disable both methods, email is enabled.
  - For the predefined CiscoTAC-1 profile, you can enable either transport mechanism, but not both.
- Destination address—The actual address that is related to the transport method by which the alert is sent. You can change the destination of the CiscoTAC-1 profile.

- Message formatting—The message format that is used for sending the alert. The format options for a user-defined destination profile are long-text, short-text, or XML. The default is XML. For the predefined CiscoTAC-1 profile, only XML is allowed.
- Message size—The maximum destination message size. The valid range is 50 to 3,145,728 bytes. The default is 3,145,728 bytes.
- Reporting method—You can choose which data to report for a profile. You can enable reporting of Smart Call Home data or Smart Licensing data, or both. Only one active profile is allowed to report Smart Licensing data at a time.
- Anonymous reporting—You can choose for your customer identity to remain anonymous, and no identifying information is sent.
- Subscribing to interesting alert-groups—You can choose to subscribe to alert-groups highlighting your interests.
- Message severity level—The Call Home severity level that the alert must meet before a Call Home message is generated. The Call Home message is then delivered to all email addresses in the destination profile. An alert is not generated if the Call Home severity level of the alert is lower than the message severity level set for the destination profile.

You can also configure a destination profile to allow periodic inventory update messages by using the inventory alert group.

A predefined destination profile CiscoTAC-1 is supported. It supports the XML message format. This profile is preconfigured with the Cisco Smart Call Home server HTTPS URL. This profile contains information such as the email address to reach the server, maximum message size, and message severity level for each alert group.

**Important** We recommend that you do not use the message severity level 0. If you use message severity level 0, all syslogs trigger Call Home messages, which can cause CPU and memory issues.

This section contains the following:

### Creating a New Destination Profile

#### Procedure

|        | Command or Action                                                                 | Purpose                                                                                                             |
|--------|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                                                                                   |
| Step 3 | <b>call-home</b><br><b>Example:</b>                                               | Enters Call Home configuration mode.                                                                                |

|                | Command or Action                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Router(config)# <b>call-home</b>                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b>  | <p><b>profile</b> <i>name</i></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home)# profile profile1</pre>                                                                                                       | Enters the Call Home destination profile configuration mode for the specified destination profile. If the specified destination profile does not exist, it is created.                                                                                                                                                                |
| <b>Step 5</b>  | <p><b>destination transport-method</b> { <b>email</b>   <b>http</b> }</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# destination transport-method email</pre>                                     | <p>(Optional) Enables the message transport method.</p> <ul style="list-style-type: none"> <li>• <b>email</b> —Sets the email message transport method.</li> <li>• <b>http</b> —Sets the HTTP message transport method.</li> </ul> <p><b>Note</b> The <b>no</b> option disables the method.</p>                                       |
| <b>Step 6</b>  | <p><b>destination address</b> { <b>email</b> <i>email-address</i>   <b>http</b> <i>url</i> }</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# destination address email myaddress@example.com</pre> | <p>Configures the destination email address or URL to which Call Home messages are sent.</p> <p><b>Note</b> When entering a destination URL, include either <b>http://</b> or <b>https://</b>, depending on whether the server is a secure server. If the destination is a secure server, you must also configure a trustpool CA.</p> |
| <b>Step 7</b>  | <p><b>destination preferred-msg-format</b> { <b>long-text</b>   <b>short-text</b>   <b>xml</b> }</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# destination preferred-msg-format xml</pre>        | <p>(Optional) Configures a preferred message format. The default is XML.</p> <ul style="list-style-type: none"> <li>• <b>long-text</b> —Configures the long text message format.</li> <li>• <b>short-text</b> —Configures the short text message format.</li> <li>• <b>xml</b> —Configures the XML message format.</li> </ul>         |
| <b>Step 8</b>  | <p><b>destination message-size</b> <i>bytes</i></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# destination message-size 3,145,728</pre>                                                           | (Optional) Configures a maximum destination message size for the destination profile.                                                                                                                                                                                                                                                 |
| <b>Step 9</b>  | <p><b>active</b></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# active</pre>                                                                                                                      | <p>Enables the destination profile. By default, the profile is enabled when it is created.</p> <p>If you activate a profile which enables smart-licensing data while smart-licensing data is already being reported in another active profile, you will receive an error message.</p>                                                 |
| <b>Step 10</b> | <p><b>reporting</b> { <b>all</b>   <b>smart-call-home-data</b>   <b>smart-licensing-data</b> }</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# reporting smart-call-home-data</pre>                | <p>Configures the type of data to report for a profile.</p> <p>You can select either to report Smart Call Home data or Smart Licensing data. Selecting the <b>all</b> option reports data for both types of data.</p>                                                                                                                 |

Copying a Destination Profile

|                | Command or Action                                                                                                               | Purpose                                                                                          |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Router(cfg-call-home-profile)# <b>end</b>                                                      | Returns to privileged EXEC mode.                                                                 |
| <b>Step 12</b> | <b>show call-home profile</b> { <i>name</i>   <b>all</b> }<br><b>Example:</b><br>Router# <b>show call-home profile profile1</b> | Displays destination profile configuration for the specified profile or all configured profiles. |
| <b>Step 13</b> | <b>show call-home smart-licensing</b><br><b>Example:</b><br>Router# <b>show call-home smart-licensing</b>                       | Displays the current Call Home Smart Licensing settings for the configured destination profiles. |
| <b>Step 14</b> | <b>show call-home smart-licensing statistics</b><br><b>Example:</b><br>Router# <b>show call-home smart-licensing statistics</b> | Displays the Call Home Smart Licensing statistics.                                               |

Copying a Destination Profile

You can create a new destination profile by copying an existing profile.

Procedure

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul>                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>call-home</b><br><b>Example:</b><br>Router(config)# <b>call-home</b>                                                                     | Enters Call Home configuration mode.                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>copy profile</b> <i>source-profile target-profile</i><br><b>Example:</b><br>Router(cfg-call-home)# <b>copy profile profile1 profile2</b> | Creates a new destination profile with the same configuration settings as the existing destination profile. <ul style="list-style-type: none"> <li>• <i>source-profile</i> —Name of the source destination profile.</li> <li>• <i>target-profile</i> —Name of the target or new destination profile.</li> </ul> |

## Renaming a Destination Profile

### Procedure

|               | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password, if prompted.</li></ul>                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                               | Enters global configuration mode.                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>call-home</b><br><b>Example:</b><br>Router(config)# <b>call-home</b>                                                                         | Enters Call Home configuration mode.                                                                                                                                                                                                   |
| <b>Step 4</b> | <b>rename profile</b> <i>source-profile target-profile</i><br><b>Example:</b><br>Router(cfg-call-home)# <b>rename profile profile1 profile2</b> | Renames the existing destination profile.<br><ul style="list-style-type: none"><li>• <i>source-profile</i> —Name of the source destination profile.</li><li>• <i>target-profile</i> —Name of the target destination profile.</li></ul> |

## Setting Profiles to Anonymous Mode

### Procedure

|               | Command or Action                                                                               | Purpose                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password, if prompted.</li></ul>                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>               | Enters global configuration mode.                                                                                                                                      |
| <b>Step 3</b> | <b>call-home</b><br><b>Example:</b><br>Router(config)# <b>call-home</b>                         | Enters Call Home configuration mode.                                                                                                                                   |
| <b>Step 4</b> | <b>profile</b> <i>name</i><br><b>Example:</b><br>Router(cfg-call-home)# <b>profile profile1</b> | Enters the Call Home destination profile configuration mode for the specified destination profile. If the specified destination profile does not exist, it is created. |
| <b>Step 5</b> | <b>anonymous-reporting-only</b>                                                                 | Sets the profile to anonymous mode.                                                                                                                                    |

|  | Command or Action                                                                      | Purpose                                                                                                                                                                                                            |
|--|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Example:</b><br>Router (cfg-call-home-profile) #<br><b>anonymous-reporting-only</b> | <b>Note</b> By default, the profile sends a full report of all types of events that are subscribed in the profile. When <b>anonymous-reporting-only</b> is set, only crash, inventory, and test messages are sent. |

## Subscribing to Alert Groups

An alert group is a predefined subset of Call Home alerts that are supported. A destination profile can receive one or more selected alert groups.

- Configuration
- Crash
- Diagnostic
- Environment
- Inventory
- Snapshot
- Syslog

The triggering events for each alert group are listed in the [Alert Groups Trigger Events and Commands](#), and the contents of the alert group messages are listed in the [Message Contents](#).

**Note** Call Home alerts are only sent to destination profiles that have subscribed to the alert group containing that Call Home alert. The alert group must be enabled. The Call Home event severity must be at or above the message severity set in the destination profile.

### Procedure

|               | Command or Action                                                                 | Purpose                                                                                                             |
|---------------|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                                                                                   |
| <b>Step 3</b> | <b>call-home</b><br><b>Example:</b><br>Router (config) # <b>call-home</b>         | Enters Call Home configuration mode.                                                                                |

|         | Command or Action                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4  | <p><b>alert-group</b> { <b>all</b>   <b>configuration</b>   <b>crash</b>   <b>diagnostic</b>   <b>environment</b>   <b>inventory</b>   <b>snapshot</b>   <b>syslog</b> }</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home)# alert-group all</pre>                                                                                                                          | Enables the specified alert group. Use the keyword <b>all</b> to enable all alert groups. By default, all alert groups are enabled.                                    |
| Step 5  | <p><b>profile</b> <i>name</i></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home)# profile profile1</pre>                                                                                                                                                                                                                                                                    | Enters the Call Home destination profile configuration mode for the specified destination profile. If the specified destination profile does not exist, it is created. |
| Step 6  | <p><b>subscribe-to-alert-group configuration</b> [ <b>periodic</b> { <b>daily</b> <i>hh:mm</i>   <b>monthly</b> <i>date hh:mm</i>   <b>weekly</b> <i>day hh:mm</i> } ]</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group configuration periodic daily 12:00</pre>                                                                        | Subscribes this destination profile to the Configuration alert group. The Configuration alert group can be configured for periodic notification.                       |
| Step 7  | <p><b>subscribe-to-alert-group crash</b></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group crash</pre>                                                                                                                                                                                                                                   | Subscribes to the Crash alert group in the user profile. By default, Cisco TAC profile subscribes to the Crash alert group and cannot be unsubscribed.                 |
| Step 8  | <p><b>subscribe-to-alert-group diagnostic</b> [ <b>severity</b> { <b>catastrophic</b>   <b>disaster</b>   <b>fatal</b>   <b>critical</b>   <b>major</b>   <b>minor</b>   <b>warning</b>   <b>notification</b>   <b>normal</b>   <b>debugging</b> } ]</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group syslog severity major</pre>       | Subscribes this destination profile to the Diagnostic alert group. The Diagnostic alert group can be configured to filter messages based on severity.                  |
| Step 9  | <p><b>subscribe-to-alert-group environment</b> [ <b>severity</b> { <b>catastrophic</b>   <b>disaster</b>   <b>fatal</b>   <b>critical</b>   <b>major</b>   <b>minor</b>   <b>warning</b>   <b>notification</b>   <b>normal</b>   <b>debugging</b> } ]</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group environment severity major</pre> | Subscribes this destination profile to the Environment alert group. The Environment alert group can be configured to filter messages based on severity.                |
| Step 10 | <p><b>subscribe-to-alert-group inventory</b> [ <b>periodic</b> { <b>daily</b> <i>hh:mm</i>   <b>monthly</b> <i>date hh:mm</i>   <b>weekly</b> <i>day hh:mm</i> } ]</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group inventory periodic daily 12:00</pre>                                                                                | Subscribes this destination profile to the Inventory alert group. The Inventory alert group can be configured for periodic notification.                               |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 11</b> | <p><b>subscribe-to-alert-group snapshot</b> [ <b>periodic</b> { <b>daily</b> <i>hh:mm</i>   <b>monthly</b> <i>date</i> <i>hh:mm</i>   <b>weekly</b> <i>day</i> <i>hh:mm</i>   <b>hourly</b> <i>mm</i>   <b>interval</b> <i>mm</i> } ]</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group snapshot periodic daily 12:00</pre>                                     | <p>Subscribes this destination profile to the Snapshot alert group. The Snapshot alert group can be configured for periodic notification.</p> <p>By default, the Snapshot alert group has no command to run. You can add commands into the alert group. The output of commands that are added in the Snapshot alert group are included in the snapshot message.</p>                                                                                                                                                                                                                                                                                          |
| <b>Step 12</b> | <p><b>subscribe-to-alert-group syslog</b> [ <b>severity</b> { <b>catastrophic</b>   <b>disaster</b>   <b>fatal</b>   <b>critical</b>   <b>major</b>   <b>minor</b>   <b>warning</b>   <b>notification</b>   <b>normal</b>   <b>debugging</b> } ] [ <b>pattern</b> <i>string</i> ]</p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group syslog severity major</pre> | <p>Subscribes this destination profile to the Syslog alert group. The Syslog alert group can be configured to filter messages based on the severity. You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (").</p> <p>You can specify a text pattern to be matched within each syslog message. If you configure a pattern, a Syslog alert group message is sent only if it contains the specified pattern and meets the severity threshold. If the pattern contains spaces, you must enclose it in quotes ("). You can specify up to five patterns for each destination profile.</p> |
| <b>Step 13</b> | <p><b>subscribe-to-alert-group all</b></p> <p><b>Example:</b></p> <pre>Router(cfg-call-home-profile)# subscribe-to-alert-group all</pre>                                                                                                                                                                                                                                                              | <p>(Optional) Subscribes to all available alert groups.</p> <p><b>Important</b> Entering this command generates many syslog messages. We recommend that you subscribe to alert groups individually, using appropriate severity levels and patterns when possible.</p>                                                                                                                                                                                                                                                                                                                                                                                        |

**Periodic Notification**

For destination profile subscriptions to either the Configuration, Inventory, or Snapshot alert group, you can choose to receive the alert group messages asynchronously or periodically. The following time intervals are available:

- Daily—Specify the time of day to send, using an hour:minute format *hh:mm*, with a 24-hour clock (for example, 14:30).
- Weekly—Specify the day of the week and time of day in the format *day hh:mm*. The day of the week is spelled out (for example, Monday).
- Monthly—Specify the numeric date, from 1 to 31, and the time of day, in the format *date hh:mm*.
- Interval—Specifies the interval at which the periodic message is sent, from 1 to 60 minutes.
- Hourly—Specifies the minute of the hour at which the periodic message is sent, from 0 to 59 minutes.

**Note** Hourly and by interval periodic notifications are available for the Snapshot alert group only.

## Message Severity Threshold

Call Home allows you to filter messages based on the severity. You can associate each predefined or user-defined destination profile with a Call Home threshold from 0 (least urgent) to 9 (most urgent). The default is 0 (all messages are sent).

When subscribing a destination profile to the Environment or Syslog alert group, set a threshold for relay of alert group messages. The threshold can be based on the message severity level. Messages with a value lower than the destination profile threshold is not sent to the destination.

Subscribing to an alert group in a destination profile with a specified severity also includes messages. Events that have same or higher severity in that alert group trigger these messages.

**Note** Subscribing to syslog message with a low severity level is not recommended. This subscription would trigger too many syslog messages that would lower the system performance.

**Note** Call Home severity levels and severity levels of the system message logging are different.

*Table 252: Severity and Syslog Level Mapping*

| Smart Call Home Level | Keyword             | Syslog Level    | Description                                                                          |
|-----------------------|---------------------|-----------------|--------------------------------------------------------------------------------------|
| 9                     | <b>catastrophic</b> | —               | Network-wide catastrophic failure.                                                   |
| 8                     | <b>disaster</b>     | —               | Significant network impact.                                                          |
| 7                     | <b>fatal</b>        | Emergency (0)   | System is unusable.                                                                  |
| 6                     | <b>critical</b>     | Alert (1)       | Critical conditions that indicate that immediate attention is needed.                |
| 5                     | <b>major</b>        | Critical (2)    | Major conditions.                                                                    |
| 4                     | <b>minor</b>        | Error (3)       | Minor conditions.                                                                    |
| 3                     | <b>warning</b>      | Warning (4)     | Warning conditions.                                                                  |
| 2                     | <b>notification</b> | Notice (5)      | Basic notification and informational messages. Possibly independently insignificant. |
| 1                     | <b>normal</b>       | Information (6) | Normal event signifying return to normal state.                                      |
| 0                     | <b>debugging</b>    | Debug (7)       | Debugging messages.                                                                  |

## Syslog Pattern Matching

When you subscribe a destination profile to the Syslog alert group, you can optionally specify a text pattern to be matched within each syslog message. If you configure a pattern, a Syslog alert group message is sent only if it contains the specified pattern and meets the severity threshold. If the pattern contains spaces, you must enclose it in quotes (") when configuring. You can specify up to five patterns for each destination profile.

### Configuring Snapshot Command List

To configure the snapshot command list, perform the following steps:

#### Procedure

|        | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device#<br><b>configure terminal</b>                                                                    | Enters global configuration mode.                                                                                                                                                                                                           |
| Step 2 | <b>call-home</b><br><b>Example:</b><br>Device(config)#<br><b>call-home</b>                                                                              | Enters Call Home configuration mode.                                                                                                                                                                                                        |
| Step 3 | <b>[ no   default ] alert-group-config snapshot</b><br><b>Example:</b><br>Device(cfg-call-home)#<br><b>alert-group-config snapshot</b>                  | Enters snapshot configuration mode.<br>The <b>no</b> or <b>default</b> command removes the snapshot command.                                                                                                                                |
| Step 4 | <b>[ no   default ] add-command <i>command string</i></b><br><b>Example:</b><br>Device(cfg-call-home-snapshot)#<br><b>add-command</b><br>"show version" | Adds the command to the Snapshot alert group. The <b>no</b> or <b>default</b> command removes the corresponding command. <ul style="list-style-type: none"> <li><i>command string</i> —Cisco IOS command. Maximum length is 128.</li> </ul> |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(cfg-call-home-snapshot)#<br><b>exit</b>                                                                         | Exits and saves the configuration.                                                                                                                                                                                                          |

## Configuring General Email Options

### Configuring the Mail Server

To use the email message transport, you must configure at least one Simple Mail Transfer Protocol (SMTP) email server address. You can specify up to four backup email servers, for a maximum of five total mail-server definitions.

Consider the following guidelines when configuring the mail server:

- Backup email servers can be defined by repeating the **mail-server** command using different priority numbers.
- The **mail-server priority number** parameter can be configured from 1 to 100. The server with the highest priority (lowest priority number) is tried first.

To configure general email options, perform the following steps:

### SUMMARY STEPS

1. **configure terminal**
2. **call-home**
3. **mail-server** { *ipv4-address* | *name* } **priority** *number*
4. **sender from** *email-address*
5. **sender reply-to** *email-address*
6. **source-interface** *interface-name*
7. **source-ip-address** *ipv4/ipv6 address*
8. **vrf** *vrf-name*

### DETAILED STEPS

|        | Command or Action                                                                                                                   | Purpose                                                                                                                                                                                                            |
|--------|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device#<br><b>configure terminal</b>                                                | Enters global configuration mode.                                                                                                                                                                                  |
| Step 2 | <b>call-home</b><br><b>Example:</b><br>Device(config)#<br><b>call-home</b>                                                          | Enters call home configuration mode.                                                                                                                                                                               |
| Step 3 | <b>mail-server</b> { <i>ipv4-address</i>   <i>name</i> } <b>priority</b> <i>number</i><br><b>Example:</b><br>Device(cfg-call-home)# | Assigns an email server address and its relative priority among configured email servers.<br>Provide either of the following: <ul style="list-style-type: none"> <li>• The email server’s IP address or</li> </ul> |

|               | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>mail-server stmp.example.com priority 1</code>                                                                                      | <ul style="list-style-type: none"> <li>The email server's fully qualified domain name (FQDN) of 64 characters or less.</li> </ul> Assign a priority number between 1 (highest priority) and 100 (lowest priority).                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>sender from</b> <i>email-address</i><br><b>Example:</b><br>Device (cfg-call-home) #<br><b>sender from username@example.com</b>         | (Optional) Assigns the email address that appears in the from field in Call Home email messages. If no address is specified, the contact email address is used.                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>sender reply-to</b> <i>email-address</i><br><b>Example:</b><br>Device (cfg-call-home) #<br><b>sender reply-to username@example.com</b> | (Optional) Assigns the email address that appears in the reply-to field in Call Home email messages.                                                                                                                                                                                                                                                                                                                   |
| <b>Step 6</b> | <b>source-interface</b> <i>interface-name</i><br><b>Example:</b><br>Device (cfg-call-home) #<br><b>source-interface loopback1</b>         | Assigns the source interface name to send call-home messages.<br><i>interface-name</i> —Source interface name. Maximum length is 64.<br><b>Note</b> For HTTP messages, use the <b>ip http client source-interface interface-name</b> command in global configuration mode to configure the source interface name. This command allows all HTTP clients on the device to use the same source interface.                 |
| <b>Step 7</b> | <b>source-ip-address</b> <i>ipv4/ipv6 address</i><br><b>Example:</b><br>Device (cfg-call-home) #<br><b>ip-address 209.165.200.226</b>     | Assigns source IP address to send call-home messages.<br><ul style="list-style-type: none"> <li><i>ipv4/ipv6 address</i> —Source IP (IPv4 or IPv6) address. Maximum length is 64.</li> </ul>                                                                                                                                                                                                                           |
| <b>Step 8</b> | <b>vrf</b> <i>vrf-name</i><br><b>Example:</b><br>Device (cfg-call-home) #<br><b>vrf</b><br>vpn1                                           | (Optional) Specifies the VRF instance to send call-home email messages. If no vrf is specified, the global routing table is used.<br><b>Note</b> For HTTP messages, if the source interface is associated with a VRF, use the <b>ip http client source-interface interface-name</b> command in global configuration mode. This command would specify the VRF instance that is used for all HTTP clients on the device. |

### Specifying Rate Limit for Sending Call Home Messages

To specify the rate limit for sending Call Home messages, perform the following steps:

#### SUMMARY STEPS

1. **configure terminal**
2. **call-home**
3. **rate-limit** *number*

#### DETAILED STEPS

|        | Command or Action                                                                                    | Purpose                                                                                                                                                                    |
|--------|------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device#<br><b>configure terminal</b>                 | Enters global configuration mode.                                                                                                                                          |
| Step 2 | <b>call-home</b><br><b>Example:</b><br>Device(config)#<br><b>call-home</b>                           | Enters call home configuration mode.                                                                                                                                       |
| Step 3 | <b>rate-limit</b> <i>number</i><br><b>Example:</b><br>Device(cfg-call-home)#<br><b>rate-limit 40</b> | Specifies a limit on the number of messages that are sent per minute. <ul style="list-style-type: none"> <li>• <i>number</i> —Range 1 to 60. The default is 20.</li> </ul> |

### Specifying HTTP Proxy Server

To specify an HTTP proxy server for sending Call Home HTTP(S) messages to a destination, perform the following steps:

#### SUMMARY STEPS

1. **configure terminal**
2. **call-home**
3. **http-proxy** {*ipv4-address* | *ipv6-address name*} *name*

#### DETAILED STEPS

|        | Command or Action                            | Purpose                           |
|--------|----------------------------------------------|-----------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                        | Purpose                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
|               | Device# <b>configure terminal</b>                                                                                                                        |                                                  |
| <b>Step 2</b> | <b>call-home</b><br><b>Example:</b><br>Device(config)# <b>call-home</b>                                                                                  | Enters call home configuration mode.             |
| <b>Step 3</b> | <b>http-proxy</b> { <i>ipv4-address</i>   <i>ipv6-address name</i> } <i>name</i><br><b>Example:</b><br>Device(config)# <b>http-proxy 10.1.1.1 port 1</b> | Specifies the proxy server for the HTTP request. |

### Enabling AAA Authorization to Run Cisco IOS Commands for Call Home Messages

To enable AAA authorization to run Cisco IOS commands that enable the collection of output for a Call Home message, perform the following steps:

#### SUMMARY STEPS

1. **configure terminal**
2. **call-home**
3. **aaa-authorization**
4. **aaa-authorization** [ *username* *username* ]

#### DETAILED STEPS

|               | Command or Action                                                                                 | Purpose                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device#<br><b>configure terminal</b>              | Enters global configuration mode.                                                                  |
| <b>Step 2</b> | <b>call-home</b><br><b>Example:</b><br>Device(config)#<br><b>call-home</b>                        | Enters call home configuration mode.                                                               |
| <b>Step 3</b> | <b>aaa-authorization</b><br><b>Example:</b><br>Device(cfg-call-home)#<br><b>aaa-authorization</b> | Enables AAA authorization.<br><b>Note</b> By default, AAA authorization is disabled for Call Home. |

|        | Command or Action                                                                                                                                                        | Purpose                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>aaa-authorization</b> [ <b>username</b> <i>username</i> ]</p> <p><b>Example:</b></p> <pre>Device(cfg-call-home) # aaa-authorization username <i>username</i></pre> | <p>Specifies the username for authorization.</p> <ul style="list-style-type: none"> <li>• <b>username</b> <i>user</i> —Default username is callhome. Maximum length is 64.</li> </ul> |

### Configuring Syslog Throttling

To enable or disable Call Home syslog message throttling and avoid sending repetitive Call Home syslog messages, perform the following steps:

#### SUMMARY STEPS

1. **configure terminal**
2. **call-home**
3. [ **no** ] **syslog-throttling**

#### DETAILED STEPS

|        | Command or Action                                                                                                         | Purpose                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                             | Enters global configuration mode.                                                                                                                                  |
| Step 2 | <p><b>call-home</b></p> <p><b>Example:</b></p> <pre>Device(config) # call-home</pre>                                      | Enters call home configuration mode.                                                                                                                               |
| Step 3 | <p>[ <b>no</b> ] <b>syslog-throttling</b></p> <p><b>Example:</b></p> <pre>Device(cfg-call-home) # syslog-throttling</pre> | Enables or disables Call Home syslog message throttling and avoids sending repetitive Call Home syslog messages. By default, syslog message throttling is enabled. |

### Configuring Call Home Data Privacy

The **data-privacy** command scrubs data, such as passwords and IP addresses, from running configuration files to protect the privacy of customers. Enabling the **data-privacy** command can affect CPU utilization when scrubbing a large amount of data. Currently, **show** command output is not being scrubbed except for configuration messages in the **show running-config** all and show startup-config data.

**SUMMARY STEPS**

1. **configure terminal**
2. **call-home**
3. **data-privacy { level {normal | high } | hostname }**

**DETAILED STEPS**

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device#<br><b>configure terminal</b>                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>call-home</b><br><b>Example:</b><br>Device(config)#<br><b>call-home</b>                                                               | Enters call home configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>data-privacy { level {normal   high }   hostname }</b><br><b>Example:</b><br>Device(cfg-call-home)#<br><b>data-privacy level high</b> | Scrubs data from running configuration file to protect the privacy of the user. The default data-privacy level is normal.<br><br><b>Note</b> Enabling the data-privacy command can affect CPU utilization when scrubbing a large amount of data.<br><br><ul style="list-style-type: none"> <li>• <b>normal</b> —Scrubs sensitive data such as passwords.</li> <li>• <b>high</b> —Scrubs all normal-level commands plus the IP domain name and IP address commands.</li> <li>• <b>hostname</b> —Scrubs all high-level commands plus the hostname command.</li> </ul> <b>Note</b> Scrubbing the hostname from configuration messages can cause Smart Call Home processing failure on some platforms. |

**Sending Call Home Messages Manually**

**Sending a Call Home Test Message Manually**

You can use the **call-home test** command to send a user-defined Call Home test message.

**SUMMARY STEPS**

1. **call-home test [ “ test-message ” ] profile name**

**DETAILED STEPS**

|               | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>call-home test</b> [ “ <i>test-message</i> ” ] <b>profile</b> <i>name</i></p> <p><b>Example:</b></p> <pre>Router# call-home test profile profile1</pre> | <p>Sends a test message to the specified destination profile. The user-defined test message text is optional, but must be enclosed in quotes (“ ”) if it contains spaces. If no user-defined message is configured, a default message is sent.</p> |

**Sending Call Home Alert Group Messages Manually**

**Before you begin**

- Only the snapshot, crash, configuration, and inventory alert groups can be sent manually. Syslog alert groups cannot be sent manually.
- When you manually trigger a snapshot, configuration, or inventory alert group message and you specify a destination profile name, a message is sent to the destination profile regardless of the profile's active status, subscription status, or severity setting.
- When you manually trigger a snapshot, configuration, or inventory alert group message and do not specify a destination profile name, a message is sent to all active profiles that have either a normal or periodic subscription to the specified alert group.

**Procedure**

|               | Command or Action                                                                                                                                                                         | Purpose                                                                                                                              |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                                                                                                  | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul>           |
| <b>Step 2</b> | <p><b>call-home send alert-group snapshot</b> [ <b>profile</b> <i>name</i> ]</p> <p><b>Example:</b></p> <pre>Router# call-home send alert-group snapshot profile profile1</pre>           | <p>Sends a snapshot alert group message to one destination profile if specified, or to all subscribed destination profiles.</p>      |
| <b>Step 3</b> | <p><b>call-home send alert-group crash</b> [ <b>profile</b> <i>name</i> ]</p> <p><b>Example:</b></p> <pre>Router# call-home send alert-group configuration profile profile1</pre>         | <p>Sends a crash alert group message to one destination profile if specified, or to all subscribed destination profiles.</p>         |
| <b>Step 4</b> | <p><b>call-home send alert-group configuration</b> [ <b>profile</b> <i>name</i> ]</p> <p><b>Example:</b></p> <pre>Router# call-home send alert-group configuration profile profile1</pre> | <p>Sends a configuration alert group message to one destination profile if specified, or to all subscribed destination profiles.</p> |

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>call-home send alert-group inventory</b> [ <b>profile</b> <i>name</i> ]<br><b>Example:</b><br>Router# <b>call-home send alert-group inventory</b> | Sends an inventory alert group message to one destination profile if specified, or to all subscribed destination profiles. |

## Submitting Call Home Analysis and Report Requests

The **call-home request** command allows you to submit the system information to Cisco Systems. The report provides helpful analysis and information specific to your system. You can request various reports, including security alerts, known bugs, recommendations, and the command references.

Note the following guidelines when manually sending Call Home analysis and report requests:

- If a **profile** *name* is specified, the request is sent to the profile. If no profile is specified, the request is sent to the Cisco TAC profile. The Call-home request can have a recipient profile that is not enabled. The recipient profile specifies the email address where the transport gateway is configured. The recipient profile allows the request message to be forwarded to the Cisco TAC and you can receive the reply from the Smart Call Home service.
- The **ccoid** *user-id* is the registered identifier of the Smart Call Home user. If the *user-id* is specified, the response is sent to the email address of the registered user. If no *user-id* is specified, the response is sent to the contact email address of the device.
- Based on the keyword specifying the type of report that is requested, the following information is returned:
  - **config-sanity** —Information on the recommendations for the current running configuration.
  - **bugs-list** —Known bugs in the running version and in the currently applied features.
  - **command-reference** —Reference links to all commands in the running configuration.
  - **product-advisory** —Product Security Incident Response Team (PSIRT) notices. The PSIRT includes End of Life (EOL) or End of Sales (EOS) notices, or field notices (FN) that may affect devices in your network.

To submit a request for analysis and report information from the Cisco Output Interpreter tool, complete the following steps:

## SUMMARY STEPS

1. **call-home request output-analysis** “ *show-command* ”
2. **call-home request** { **config-sanity** | **bugs-list** | **command-reference** | **product-advisory** }

## DETAILED STEPS

|               | Command or Action                                                                        | Purpose                                                                                                                       |
|---------------|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>call-home request output-analysis</b> “ <i>show-command</i> ”<br><b>Example:</b><br>[ | Sends the output of the specified <b>show</b> command for analysis. The <b>show</b> command must be contained in quotes (“”). |

|               | Command or Action                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Step 2</b> | <p><b>call-home request { config-sanity   bugs-list   command-reference   product-advisory }</b></p> <p><b>Example:</b></p> <pre> [ <b>profile</b>  name ] [ <b>ccoid</b>  user-id ]  <b>Example:</b>  Device# <b>call-home request config-sanity profile TG</b>                     </pre> | <p>Sends the output of a predetermined set of commands, such as the <b>show running-config all</b> and <b>show version</b> commands, for analysis. In addition, the <b>call home request product-advisory</b> subcommand includes all inventory alert group commands. The keyword that is specified after the <b>call-home request</b> command specifies the type of report requested.</p> |

**Manually Sending Command Output Message for One Command or a Command List**

The **call-home send** command runs a CLI command and emails the command output to Cisco, or to an email address that is specified.

Note the following guidelines when sending the output of a command:

- The specified Cisco IOS command or list of Cisco IOS commands can be any run command, including commands for all modules. The command must be contained in quotes (").
- If the email option is selected using the "email" keyword and an email address is specified, the command output is sent to that address. If email or HTTP option is not specified, the output is sent in long-text

format to the Cisco TAC (attach@cisco.com). The output has information on the specified service request number.

- Ensure that a service request number is provided if no “email” nor the “http” keyword is specified. The service request number is required for both long-text and XML message formats and is provided in the subject line of the email.
- If the HTTP option is specified without a profile name or destination URL, the CiscoTac-1 profile destination HTTP or HTTPS URL is used as the destination. The destination email address can be specified so that Smart Call Home can forward the message to the email address. You can specify the destination email address and the SR number, or you can specify either of them.
- If a profile is specified and the profile has callhome@cisco.com as one of its email destinations, you must use XML as the message format. If you use long-text format, an error message is displayed.

To execute a command and send the command output, complete the following step:

**Procedure**

|                      | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring Diagnostic Signatures

The Diagnostic Signatures feature downloads digitally signed signatures to devices. Diagnostic Signatures (DS) files are formatted files that collate knowledge of diagnostic events. DS files provide methods to troubleshoot them without a need to upgrade the Cisco software. The aim of DS is to deliver flexible intelligence that can detect and collect troubleshooting information. This information can be used to resolve known problems in customer networks.

### Prerequisites for Diagnostic Signatures

Before you download and configure diagnostic signatures (DSs) on a device, you must ensure that the following conditions are met:

- Ensure that you assign a diagnostic signature to the device. Refer to the “Diagnostic Signature Downloading” section for more information about how to assign DSs to devices.
- HTTP/Secure HTTP (HTTPS) transport is required for downloading DS files. Install the certification authority (CA) certificate to enable the authentication of the destination HTTPS server.

**Note** If you configure the trustpool feature, the CA certificate is not required.

## Information About Diagnostic Signatures

### Diagnostic Signature Overview

Diagnostic signatures (DS) for the Call Home system provides a flexible framework that allows the defining of new events and corresponding CLIs. DSs can analyze these events without upgrading the Cisco software.

DSs enable you to define more types of events and trigger types than the standard Call Home feature supports. The DS subsystem downloads and processes files on a device and also handles callbacks for diagnostic signature events.

The Diagnostic Signature feature downloads digitally signed signatures that are in the form of files to devices. DS files are formatted files that collate the knowledge of diagnostic events and provide methods to troubleshoot these events.

DS files contain XML data to specify the event description, and these files include CLI commands or scripts to perform required actions. Cisco or a third party digitally signs the DSs. The signing ensures their integrity, reliability, and security.

The structure of a DS file can be one of the following formats.

- Metadata-based simple signature. This format specifies the event type. The format also has information to match the event and perform actions such as collecting information by using the CLI. The signature can also change configurations on the device as a workaround for certain bugs.
- Embedded Event Manager (EEM) Tool Command Language (Tcl) script-based signature. This format specifies new events in the event register line and more action in the Tcl script.
- Combination of both the preceding formats.

The following basic information is contained in a DS file:

- ID (unique number)—unique key that represents a DS file that can be used to search a DS.
- Name (ShortDescription)—unique description of the DS file that can be used in lists for selection.
- Description—long description about the signature.
- Revision—version number, which increments when the DS content is updated.
- Event & Action—defines the event to be detected and the action to be performed after the event happens.

## Diagnostic Signature Downloading

To download the diagnostic signature (DS) file, you require the secure HTTP (HTTPS) protocol. If you have configured an email transport method to download files on your device, change your assigned profile transport method to HTTPS.

Cisco software uses a PKI Trustpool Management feature, and this feature is enabled by default. The trustpool feature creates a scheme to provision, store, and manage a pool of certificates from known certification authorities (CAs) on devices. The trustpool feature also installs the CA certificate automatically. The CA certificate is required for the authentication of the destination HTTPS servers.

There are two types of DS update requests to download DS files: regular and forced-download.

Regular download requests DS files that were recently updated. You can trigger a regular download request either by using a periodic configuration or by initiating an on-demand CLI. The regular download update happens only when the version of the requested DS is different from the version of the DS on the device. Periodic download is only started after there is any DS assigned to the device from DS web portal. After the assignment, responses to the periodic inventory message from the same device will include a field. The field notifies the device to start its periodic DS download or an update. In a DS update request message, the status and revision number of the DS is included. However, only a DS with the latest revision number is downloaded.

Forced-download downloads a specific DS or a set of DSs. You can trigger the forced-download update request only by initiating an on-demand CLI. In a force-download update request, the latest version of the DS file is downloaded irrespective of the current DS file version on the device.

The DS file is digitally signed, and signature verification is performed on every downloaded DS file to make sure it is from a trusted source.

## Diagnostic Signature Signing

The diagnostic signature (DS) files are digitally signed before they are made available for downloading. The following methods are used for digitally signing DS files:

- Signing algorithm (Rivest Shamir and Adleman [RSA] 2048 bits).
- Request key pairs to the Abraxas system, which is the digital signing client.
- DS signed through the secure socket layer (SSL) through a code signing client, where the signature is embedded using XML tags.
- Public keys that are embedded in the DS subsystem (Cisco-signed, partner-signed, third-party signed) in the Cisco software. The digitally signed DS file contains the product name such as Diagnostic\_Signatures (Cisco signed), Diagnostic\_Signatures\_Partner, Diagnostic\_Signatures\_3rd\_Party. The product names are only used to sign the DS files.

The digital signing client can be found at the <https://abraxas.cisco.com/SignEngine/submit.jsp> link.

These conditions that must be met to verify the digital signature in a DS file:

- Code sign component support must be available in Cisco software.
- Various public keys that verify the different kinds of diagnostic signatures must be included in platforms where DS is supported.
- After parsing and retrieving the DS, the DS must execute the verification application program interface (API) to verify that the DS is valid.

## Diagnostic Signature Workflow

The diagnostic signature feature is enabled by default in Cisco software. The following is the workflow for creating diagnostic signatures:

1. Find the DSs you want to download and assign them to the device. This step is mandatory for a regular periodic download, but not required for a forced download.
2. The device downloads every assigned DS or a specific DS by regular periodic download or by on-demand forced download.
3. The device verifies the digital signature of every DS. After verification, the device stores the DS file into a nonremovable disk. This nonremovable disk can be a bootflash or hard disk, where that DS files can be read after the device is reloaded. On the routers, the DS file is stored in the bootflash:/call home directory.
4. The device continues sending periodic regular DS download requests to get the latest revision of DS and replace the older one in the device.
5. The device monitors the event and executes the actions that are defined in the DS when the event happens.

## Diagnostic Signature Events and Actions

The events and actions sections are the key areas that are used in diagnostic signatures. The event section defines all event attributes that are used for the event detection. The action section lists all the steps to be completed after the event. The actions include collecting **show** command outputs and sending them to Smart Call Home to parse.

## Diagnostic Signature Event Detection

Event detection in a DS is defined in two ways: single event detection and multiple event detection.

### Single Event Detection

In single event detection, only one event detector is defined within a DS. The event specification format is one of the following two types:

- DS event specification type: syslog, periodic, configuration, Online Insertion Removal (OIR) immediate, and callhome are the supported event types, where “immediate” indicates that this type of DS does not detect any events, its actions are performed once it is downloaded, and the call-home type modifies the current CLI commands defined for existing alert-group.
- The Embedded Event Manager (EEM) specification type: supports any new EEM event detector without having to modify the Cisco software.

Other than using EEM to detect events, a DS is triggered when a Tool Command Language (Tcl) script is used to specify event detection types.

### Multiple Event Detection

Multiple event detection involves defining two or more event detectors, two or more corresponding tracked object states, and a time period for the events to occur. The specification format for multiple event detection can include complex event correlation for tracked event detectors. For example, three event detectors (syslog, OIR, and IPSLA) are defined during the creation of a DS file. The correlation that is specified for these event detectors is that the DS will execute its action if both syslog and OIR events are triggered simultaneously, or if IPSLA is triggered alone.

## Diagnostic Signature Actions

The diagnostic signature (DS) file consists of various actions that must be initiated when an event occurs. The action type indicates the kind of action that will be initiated in response to a certain event.

Variables are elements within a DS file that are used to customize the files.

DS actions are categorized into the following five types:

- call-home
- command
- emailto
- script
- message

DS action types call-home and emailto collect event data and send a message to call-home servers or to the defined email addresses. The message uses "diagnostic-signature" as its message type and DS ID as the message sub-type.

The commands defined for the DS action type initiate CLI commands that can change configuration of the device, collect show command outputs, or run any EXEC command on the device. The DS action type script executes Tcl scripts.

DS action type message defines action to generate message to notify or remind user certain important information. The message could be broadcasted to all TTY lines or generated as a syslog entry.

## Action Types

DS actions are categorized into the following four types:

- Call-home
- Command
- Emailto
- Script

DS action types call-home and emailto collect event data and send a message to call-home servers or to the defined email addresses. The message includes the following elements:

- Message type—diagnostic-signature
- Message subtype—ds-id
- Message description—event-id : ds name

The commands defined for the DS action type initiates CLI commands that can change configuration of the device. The DS action type script executes Tel scripts.

## Diagnostic Signature Variables

Variables are referenced within a DS and are used to customize the DS file. All DS variable names have the prefix ds\_ to separate them from other variables. The following are the supported DS variable types:

- System variable: variables assigned automatically by the device without any configuration changes. The Diagnostic Signatures feature supports two system variables: ds\_hostname and ds\_signature\_id.
- Environment variable: values assigned manually by using the **environment variable-name variable-value** command in call-home diagnostic-signature configuration mode. Use the **show call-home diagnostic-signature** command to display the name and value of all DS environment variables. If the DS file contains unresolved environment variables, this DS will stay in pending status until the variable gets resolved.
- Prompt variable: values assigned manually by using the **call-home diagnostic-signature install ds-id** command in privileged EXEC mode. If you do not set this value, the status of the DS indicates pending.
- Regular expression variable: values assigned from a regular expression pattern match with predefined CLI command outputs. The value is assigned during the DS run.
- Syslog event variable: values assigned during a syslog event detection in the DS file. This variable is valid only for syslog event detection.

# How to Configure Diagnostic Signatures

## Configuring the Service Call Home for Diagnostic Signatures

Configure the Service Call Home feature to set attributes such as the contact email address where notifications related with diagnostic signatures (DS) are sent and destination HTTP/secure HTTP (HTTPS) URL to download the DS files from.

You can also create a new user profile, configure correct attributes, and assign it as the DS profile. For periodic downloads, the request is sent out just following full inventory message. By changing the inventory periodic configuration, the DS periodic download also gets rescheduled.

**Note** The predefined CiscoTAC-1 profile is enabled as a DS profile by default and Cisco recommends using it. Ensure that you change the destination transport-method to the **http** setting, when you use the predefined CiscoTAC-1 profile.

**Before you begin**

Before you download and configure diagnostic signatures (DSs) on a device, you must ensure that the following conditions are met:

- Assign one or more DSs to the device.
- HTTP/Secure HTTP (HTTPS) transport is required for downloading DS files. Install the certification authority (CA) certificate to enable the authentication of the destination HTTPS server.

**Note** If you configure the trustpool feature, the CA certificate is not required.

**Procedure**

|        | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> <b>enable</b>                                                                                         | Enables privileged EXEC mode.<br><br>• Enter your password, if prompted.                                                                                                                           |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                 | Enters global configuration mode.                                                                                                                                                                  |
| Step 3 | <b>service call-home</b><br><b>Example:</b><br>Router(config)# <b>service call-home</b>                                                           | Enables Call Home service on a device.                                                                                                                                                             |
| Step 4 | <b>call-home</b><br><b>Example:</b><br>Router(config)# <b>call-home</b>                                                                           | Enters Call Home configuration mode.                                                                                                                                                               |
| Step 5 | <b>contact-email-addr</b> <i>email-address</i><br><b>Example:</b><br>Router(cfg-call-home)# <b>contact-email-addr</b> <b>username@example.com</b> | Assigns customer's email address. You can enter a maximum of 200 characters in email address format with no spaces.<br><br><b>Note</b> You can use any valid email address. You cannot use spaces. |
| Step 6 | <b>mail-server</b> { <i>ipv4-address</i>   <i>name</i> } <b>priority</b> <i>number</i>                                                            | (Optional) Configures a Simple Mail Transfer Protocol (SMTP) email server address for Call Home. This                                                                                              |

|                | Command or Action                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                          |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Example:</b><br>Router(cfg-call-home)# <b>mail-server 10.1.1.1 priority 4</b>                                                                                                                                                                                                    | command is only used when sending email is part of the actions that are defined in any DS.                                                                                                                                                                                                                       |
| <b>Step 7</b>  | <b>profile</b> <i>name</i><br><b>Example:</b><br>Router(cfg-call-home)# <b>profile profile1</b>                                                                                                                                                                                     | Enters the Call Home destination profile configuration mode for the specified destination profile. If the specified destination profile does not exist, it is created.                                                                                                                                           |
| <b>Step 8</b>  | <b>destination transport-method</b> { <b>email</b>   <b>http</b> }<br><b>Example:</b><br>Router(cfg-call-home-profile)# <b>destination transport-method email</b>                                                                                                                   | (Optional) Enables the message transport method. <ul style="list-style-type: none"> <li>• <b>email</b> —Sets the email message transport method.</li> <li>• <b>http</b> —Sets the HTTP message transport method.</li> </ul> <b>Note</b> To configure diagnostic signatures, you must use the <b>http</b> option. |
| <b>Step 9</b>  | <b>destination address</b> { <b>email</b> <i>email-address</i>   <b>http</b> <i>url</i> }<br><b>Example:</b><br>Router(cfg-call-home-profile)# <b>destination address http https://tools.cisco.com/its/service/oddce/services/DDCEService</b>                                       | Configures the destination email address or URL to which Call Home messages are sent. <b>Note</b> To configure diagnostic signatures, you must use the <b>http</b> option.                                                                                                                                       |
| <b>Step 10</b> | <b>subscribe-to-alert-group inventory</b> [ <b>periodic</b> { <b>daily</b> <i>hh:mm</i>   <b>monthly</b> <i>date hh:mm</i>   <b>weekly</b> <i>day hh:mm</i> } ]<br><b>Example:</b><br>Router(cfg-call-home-profile)# <b>subscribe-to-alert-group inventory periodic daily 12:00</b> | Subscribes this destination profile to the Inventory alert group. The Inventory alert group can be configured for periodic notification. <b>Note</b> This command is used only for the periodic downloading of DS files.                                                                                         |

**What to do next**

Set the configured profile from the previous procedure as the DS profile and configure other DS parameters.

## Configuring Diagnostic Signatures

**Before you begin**

Configure the Service Call Home feature to set attributes for the Call Home profile. You can either use the default CiscoTAC-1 profile or use the newly created user profile.

**Procedure**

|               | Command or Action                | Purpose                                                                                                             |
|---------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password, if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                                                 | Purpose                                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
|               | Router> <b>enable</b>                                                                                                                                                                                                                                                                             |                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                                                                                                                                                 | Enters global configuration mode.                                              |
| <b>Step 3</b> | <b>call-home</b><br><b>Example:</b><br>Router(config)# <b>call-home</b>                                                                                                                                                                                                                           | Enters Call Home configuration mode.                                           |
| <b>Step 4</b> | <b>diagnostic-signature</b><br><b>Example:</b><br>Router(cfg-call-home)# <b>diagnostic-signature</b>                                                                                                                                                                                              | Enters call-home diagnostic signature mode.                                    |
| <b>Step 5</b> | <b>profile</b> <i>ds-profile-name</i><br><b>Example:</b><br>Router(cfg-call-home-diag-sign)# <b>profile user1</b>                                                                                                                                                                                 | Specifies the destination profile on a device that DS uses.                    |
| <b>Step 6</b> | <b>environment</b> <i>ds_env-var-name ds_env-var-value</i><br><b>Example:</b><br>Router(cfg-call-home-diag-sign)# <b>environment ds_env1 envarval</b>                                                                                                                                             | Sets the environment variable value for DS on a device.                        |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(cfg-call-home-diag-sign)# <b>end</b>                                                                                                                                                                                                                      | Exits call-home diagnostic signature mode and returns to privileged EXEC mode. |
| <b>Step 8</b> | <b>call-home diagnostic-signature</b> { <b>deinstall</b>   <b>download</b> } { <i>ds-id</i>   <b>all</b> }   <b>install</b> <i>ds-id</i> }<br><b>Example:</b><br>Router# <b>call-home diagnostic-signature download 6030</b>                                                                      | Downloads, installs, and uninstalls diagnostic signature files on a device.    |
| <b>Step 9</b> | <b>show call-home diagnostic-signature</b> [ <i>ds-id</i> [ <b>actions</b>   <b>events</b>   <b>prerequisite</b>   <b>prompt</b>   <b>variables</b> ]   <b>failure</b>   <b>statistics</b> [ <b>download</b> ] ]<br><b>Example:</b><br>Router# <b>show call-home diagnostic-signature actions</b> | Displays the call-home diagnostic signature information.                       |

## Verifying the Call Home Configuration

- **show call-home** —Displays the Call Home configuration summary.

Following is a sample output of the command:

```

Router# show call-home

Current call home settings:
 call home feature : enable
 call home message's from address: Not yet set up
 call home message's reply-to address: Not yet set up

 vrf for call-home messages: Not yet set up

 contact person's email address: sch-smart-licensing@cisco.com (default)

 contact person's phone number: Not yet set up
 street address: Not yet set up
 customer ID: Not yet set up
 contract ID: Not yet set up
 site ID: Not yet set up

 source ip address: Not yet set up
 source interface: TenGigabitEthernet4/1/1
 Mail-server[1]: Address: 173.36.13.143 Priority: 60
 http proxy: Not yet set up

 Diagnostic signature: enabled
 Profile: CiscoTAC-1 (status: ACTIVE)

 Smart licensing messages: enabled
 Profile: CiscoTAC-1 (status: ACTIVE)

 aaa-authorization: disable
 aaa-authorization username: callhome (default)
 data-privacy: normal
 syslog throttling: enable

 Rate-limit: 20 message(s) per minute

 Snapshot command[0]: show cable modem summary totalb
 Snapshot command[1]: show cable modem summary total

Available alert groups:
 Keyword State Description

 configuration Enable configuration info
 crash Enable crash and traceback info
 diagnostic Enable diagnostic info
 environment Enable environmental info
 inventory Enable inventory info
 snapshot Enable snapshot info
 syslog Enable syslog info

Profiles:
 Profile Name: CiscoTAC-1
 Profile Name: test

```

- **show call-home detail**—Displays the Call Home configuration in detail.

Following is a sample output of the command:

```

Router# show call-home detail

Current call home settings:
 call home feature : enable
 call home message's from address: Not yet set up
 call home message's reply-to address: Not yet set up

```

```

vrf for call-home messages: Not yet set up

contact person's email address: sch-smart-licensing@cisco.com (default)

contact person's phone number: Not yet set up

```

- **show call-home alert-group** —Displays the available alert groups and their status.

Following is a sample output of the command:

```
Router# show call-home alert-group
```

```

Available alert groups:
Keyword State Description

configuration Enable configuration info
crash Enable crash and traceback info
diagnostic Enable diagnostic info
environment Enable environmental info
inventory Enable inventory info
snapshot Enable snapshot info
syslog Enable syslog info

```

- **show call-home mail-server status**—Checks and displays the availability of the configured email servers.

Following is a sample output of the command:

```
Router# show call-home mail-server status
```

```
Mail-server[1]: Address: 173.36.13.143 Priority: 60
```

- **show call-home profile {all | name}** —Displays the configuration of the specified destination profile. Use the keyword **all** to display the configuration of all destination profiles.

Following is a sample output of the command:

```
Router# show call-home profile CiscoTac-1
```

```

Profile Name: CiscoTAC-1
Profile status: ACTIVE

```

SCH 0 0 0
Last call-home message sent time: 2015-03-06 18:21:49 GMT+00:00

```

- **show call-home diagnostic-signature**—Displays the configuration of diagnostic signature information.

Following is a sample output of the command:

```

Router# show call-home diagnostic-signature

Current diagnostic-signature settings:
Diagnostic-signature: enabled
Profile: CiscoTAC-1 (status: ACTIVE)
Environment variable:
 Not yet set up

Downloaded DSes:

DS ID DS Name Revision Status Last Update

```

- **show call-home version**—Displays the Call Home version information.

Following is a sample output of the command:

```

Router# show call-home version

Call-Home Version 3.0
Component Version:
 call-home: (rel4)1.0.15
 eem-call-home: (rel2)1.0.5

```

# Configuration Example for Call Home

## Example: Call Home Configuration

Following is a configuration example for configuring the HTTPS transport:

```

ip host tools.cisco.com 72.163.4.38
vrf definition smart-vrf
!
address-family ipv4
exit-address-family
!
address-family ipv6
exit-address-family
!
interface TenGigabitEthernet4/1/1
vrf forwarding smart-vrf
ip address 172.22.11.25 255.255.255.128
no ip proxy-arp
!
ip route vrf smart-vrf 72.163.4.38 255.255.255.255 172.22.11.1
!
ip http client source-interface TenGigabitEthernet4/1/1

```

!

Following is a configuration example for configuring email options:

```
call-home
mail-server 173.36.13.143 priority 60
source-interface TenGigabitEthernet4/1/1
vrf smart-vrf
alert-group-config snapshot
add-command "show cable modem summary total"
profile "test"
active
destination transport-method email
destination address email call-home@cisco.com
subscribe-to-alert-group configuration
subscribe-to-alert-group crash
subscribe-to-alert-group diagnostic severity debug
subscribe-to-alert-group environment severity debug
subscribe-to-alert-group inventory
subscribe-to-alert-group syslog severity major pattern .*
subscribe-to-alert-group syslog severity notification pattern "^.+UPDOWN.+changed state
to (down|up)$"
subscribe-to-alert-group snapshot periodic daily 12:00
!
ip route vrf smart-vrf 173.36.13.143 255.255.255.255 172.22.11.1
!
```

## Example: Configuring HTTP Transport for Call Home on the Cisco cBR Series Router

**Step 1** Back up the current running configuration file.

**Step 2** Verify the built-in router certificates.

**Example:**

```
Router# show crypto pki trustpool | include Class 3 Public

ou=Class 3 Public Primary Certification Authority
ou=Class 3 Public Primary Certification Authority
```

**Step 3** (Optional) Configure VRF.

**Example:**

```
Router(config)# vrf def smart-vrf
Router(config-vrf)# address-family ipv4
Router(config-vrf-af)# exit-address-family
Router(config-vrf)# address-family ipv6
Router(config-vrf-af)# exit-address-family
```

**Step 4** Set up the network interface.

**Example:**

```
Router(config)# interface TenGigabitEthernet4/1/1
Router(config)# vrf forward smart-vrf
```

```
Router(config-if)# ip address 172.22.11.25 255.255.255.128
Router(config-if)# no ip proxy-arp
Router(config-if)# no shut
```

**Note** If IPv6 is enabled, you must configure the IPv6 address.

**Step 5** Set up the Cisco portal.

**Example:**

```
Router(config)# ip host tools.cisco.com 72.163.4.38
Router(config)# ip route vrf smart-vrf 72.163.4.38 255.255.255.255 172.22.11.1
```

**Step 6** Verify the data path.

**Example:**

```
!Verify the connectivity to TenGigabitEthernet4/1/1 interface
Router# ping vrf smart-vrf 172.22.11.25

!Verify the connectivity to TenGigabitEthernet4//1/1 gateway
Router# ping vrf smart-vrf 172.22.11.1

!Verify the connectivity to tools.cisco.com
Router# ping vrf smart-vrf 72.163.4.38
```

**Step 7** Configure the HTTP client interface.

**Example:**

```
Router(config)# ip http client source-interface TenGigabitEthernet4/1/1
```

**Step 8** Send the Call Home alert group message manually and verify the configuration.

**Example:**

```
Router# call-home send alert inventory profile CiscoTAC-1

Sending inventory info call-home message ...
Please wait. This may take some time ...

Router# show call-home statistics | include Total
Message Types Total Email HTTP
Total Success 0 0 0
Total In-Queue 1 0 1
Total Failed 0 0 0
Total Ratelimit

Router# show call-home statistics | include Total
Message Types Total Email HTTP
Total Success 1 0 1
Total In-Queue 0 0 0
Total Failed 0 0 0
Total Ratelimit
```

**Step 9** Display the Call Home configuration.

**Example:**

```
Router# show call-home profile CiscoTAC-1

Profile Name: CiscoTAC-1
```

```

Profile status: ACTIVE
Profile mode: Full Reporting
Reporting Data: Smart Call Home, Smart Licensing
Preferred Message Format: xml
Message Size Limit: 3145728 Bytes
Transport Method: http
Email address(es): callhome@cisco.com
HTTP address(es): https://tools.cisco.com/its/service/oddce/services/DDCEService

Periodic configuration info message is scheduled every 15 day of the month at 15:37

Periodic inventory info message is scheduled every 15 day of the month at 15:22
Alert-group Severity

crash debug
diagnostic minor
environment minor
inventory normal

Syslog-Pattern Severity

.* major

```

## Example: Configuring Email Transport for Call Home on the Cisco cBR Series Router

**Step 1** Back up the current running configuration file.

**Step 2** (Optional) Configure VRF.

**Example:**

```

Router(config)# vrf def smart-vrf
Router(config-vrf)# address-family ipv4
Router(config-vrf-af)# exit-address-family
Router(config-vrf)# address-family ipv6
Router(config-vrf-af)# exit-address-family

```

**Step 3** Set up the network interface.

**Example:**

```

Router(config)# interface TenGigabitEthernet4/1/1
Router(config)# vrf forward smart-vrf
Router(config-if)# ip address 172.22.11.25 255.255.255.128
Router(config-if)# no ip proxy-arp
Router(config-if)# no shut

```

**Note** If IPv6 is enabled, you must configure the IPv6 address.

**Step 4** Verify the data path.

**Example:**

```
!Verify the connectivity to TenGigabitEthernet4/1/1 interface
Router# ping vrf smart-vrf 172.22.11.25

!Verify the connectivity to TenGigabitEthernet4//1/1 gateway
Router# ping vrf smart-vrf 172.22.11.1

!Verify the connectivity to tools.cisco.com
Router# ping vrf smart-vrf 72.163.4.38
```

**Step 5** (Optional) Configure Call Home.

**Example:**

```
Router(config)# call-home

!Configure the TenGigabitEthernet 4/1/1
Router(cfg-call-home)# source-ip-address 172.22.11.25
```

**Step 6** Configure the mail server and verify the configuration.

**Example:**

```
Router(config)# call-home
Router(cfg-call-home)# mail-server 173.36.13.143 priority 60
Router(cfg-call-home)# vrf smart-vrf
Router(cfg-call-home)# exit
Router(config)# ip route vrf smart-vrf 173.36.13.143 255.255.255.255 172.22.11.1
Router(config)# end

Router# ping vrf smart-vrf 173.36.13.143
...

Router# show call-home mail status

Please wait. Checking for mail server status ...

Mail-server[1]: Address: 173.36.13.143 Priority: 60 [Available]
```

**Note** The VRF configuration is optional.

**Step 7** Create a new destination profile and subscribe to alert the group.

**Example:**

```
Router(config)# call-home
Router(cfg-call-home)# alert-group-config snapshot
Router(cfg-call-home-snapshot)# add-command "show cable modem summary total"
Router(cfg-call-home-snapshot)# exit
Router(cfg-call-home)# profile test
Router(cfg-call-home-profile)# active
Router(cfg-call-home-profile)# destination transport-method email
Router(cfg-call-home-profile)# destination address email xyz@company.com
Router(cfg-call-home-profile)# subscribe syslog severity notification pattern "^.+UPDOWN.+changed state to (down|up)$"
Router(cfg-call-home-profile)# subscribe-to-alert-group snapshot periodic daily 12:00
Router(cfg-call-home-profile)# end
```

**Step 8** Send the Call Home alert group message manually and verify the configuration.

**Example:**

```

Router# call-home send alert-group inventory profile test
Sending inventory info call-home message ...
Please wait. This may take some time ...

Router# show call-home statistics | include Total
Message Types Total Email HTTP
Total Success 1 0 1
Total In-Queue 2 2 0
Total Failed 0 0 0
Total Ratelimit

Router# show call-home statistics | include Total
Message Types Total Email HTTP
Total Success 3 2 1
Total In-Queue 0 0 0
Total Failed 0 0 0
Total Ratelimit

```

**Step 9** Display the Call Home configuration.

**Example:**

```

Router# show call-home profile test

Profile Name: test
Profile status: ACTIVE
Profile mode: Full Reporting
Reporting Data: Smart Call Home
Preferred Message Format: xml
Message Size Limit: 3145728 Bytes
Transport Method: email
Email address(es): abcd@company.com
HTTP address(es): Not yet set up

Periodic snapshot info message is scheduled daily at 12:00

Alert-group Severity

configuration normal
crash debug
diagnostic debug
environment debug

Syslog-Pattern Severity

^.+UPDOWN.+changed state
to (down|up)$ notification

```

# Default Settings

*Table 253: Default Call Home Parameters*

| Parameters               | Default |
|--------------------------|---------|
| Call Home feature status | Enabled |

| Parameters                                 | Default  |
|--------------------------------------------|----------|
| User-defined profile status                | Active   |
| Predefined CiscoTAC-1 profile status       | Active   |
| Transport method                           | HTTP     |
| Message-format type                        | XML      |
| Alert group status                         | Enabled  |
| Call Home message severity threshold       | Debug    |
| Message rate limit for messages per minute | 20       |
| AAA authorization                          | Disabled |
| Call Home syslog message throttling        | Enabled  |
| Data privacy level                         | Normal   |

## Alert Groups Trigger Events and Commands

The following table lists the supported alert groups and the default command output. The command output is included in Call Home messages that are generated for the alert group.

*Table 254: Call Home Alert Groups, Events, and Actions*

| Alert Group   | Call Home Trigger Event | Syslog Event | Severity                   | Description and Executed Commands                                                                                                                                                                                                                                                                              |
|---------------|-------------------------|--------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration | —                       | —            | <b>normal<br/>periodic</b> | Periodic events that are related to configuration sent monthly.<br>Commands executed: <ul style="list-style-type: none"> <li>• <b>show platform</b></li> <li>• <b>show version</b></li> <li>• <b>show inventory</b></li> <li>• <b>show running-config all</b></li> <li>• <b>show startup-config</b></li> </ul> |

## Message Contents

Smart Call Home supports the following message formats:

- Short Text Message Format
- Common Fields for Full Text and XML Messages
- Fields Specific to Alert Group Messages for Full Text and XML Messages
- Inserted Fields for a Reactive and Proactive Event Message
- Inserted Fields for an Inventory Event Message
- Inserted Fields for a User-Generated Test Message

The following table describes the short text formatting option for all the message types.

**Table 255: Short Text Message Format**

| Data Item               | Description                                             |
|-------------------------|---------------------------------------------------------|
| Device identification   | Configured device name.                                 |
| Date and time stamp     | Time stamp of the triggering event.                     |
| Error isolation message | Plain English description of triggering the event.      |
| Alarm urgency level     | Error level such as that applied to the system message. |

The following table describes the first set of common event message fields for full text or XML messages.

Table 256: Common Fields for Full Text and XML Messages

| Data Item (Plain Text and XML) | Description (Plain Text and XML)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Call-Home Message Tag (XML Only)              |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Time stamp                     | Date and time stamp of the event in the ISO time notation:<br><br><i>YYYY-MM-DD HH:MM:SS GMT + HH:MM.</i>                                                                                                                                                                                                                                                                                                                                                                                                                                             | CallHome/EventTime                            |
| Message name                   | Name of message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | For short text message only                   |
| Message type                   | Name of the message type, specifically "Call Home."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | CallHome/Event/Type                           |
| Message subtype                | Specific type of message: full, delta, test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | CallHome/Event/SubType                        |
| Message group                  | Name of the alert group, specifically "reactive." Optional, because the default is "reactive".                                                                                                                                                                                                                                                                                                                                                                                                                                                        | For long-text message only                    |
| Severity level                 | Severity level of message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Body/Block/Severity                           |
| Source ID                      | Product type for routing through the workflow engine. The Source ID is typically the product family name.                                                                                                                                                                                                                                                                                                                                                                                                                                             | For long-text message only                    |
| Device ID                      | Unique device identifier (UDI) for the end device that generated the message. Ensure that the field is empty if the message is nonspecific to a device. The format is <i>type@Sid@serial</i> .<br><br><ul style="list-style-type: none"> <li>The <i>type</i> is the product model number from the backplane IDPROM.</li> <li>@ is a separator character.</li> <li><i>Sid</i> is C, identifying the serial ID as a chassis serial number.</li> <li>The Sid field identifies the <i>serial</i> number.</li> </ul> An example is<br>WS-C6509@C@12345678. | CallHome/CustomerData/ContractData/DeviceId   |
| Customer ID                    | Optional user-configurable field that is used for the contract information or other ID by any support service.                                                                                                                                                                                                                                                                                                                                                                                                                                        | CallHome/CustomerData/ContractData/CustomerId |
| Contract ID                    | Optional user-configurable field that is used for the contract information or other ID by any support service.                                                                                                                                                                                                                                                                                                                                                                                                                                        | CallHome/CustomerData/ContractData/ContractId |

| Data Item<br>(Plain Text and XML) | Description (Plain Text and XML)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Call-Home Message Tag (XML Only)                                          |

| System object ID                  | System Object ID that uniquely identifies the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | CallHome/Device/Cisco_Chassis/AdditionalInformation/AD@name="sysObjectID" |

| Data Item (Plain Text and XML) | Description (Plain Text and XML)            | Call-Home Message Tag (XML Only)                                       |
|--------------------------------|---------------------------------------------|------------------------------------------------------------------------|
| System description             | System description for the managed element. | CallHome/Device/Cisco_Chassis/AdditionalInformation/AD@name="sysDescr" |

The following table describes the fields specific to alert group messages for full text and XML. These fields may be repeated if multiple commands are executed for an alert group.

**Table 257: Fields Specific to Alert Group Messages for Full Text and XML Messages**

| Data Item (Plain Text and XML) | Description (Plain Text and XML)                      | XML Tag (XML Only)                 |
|--------------------------------|-------------------------------------------------------|------------------------------------|
| Command output name            | Exact name of the issued command.                     | /aml/attachments/attachment/name   |
| Attachment type                | The specific command output.                          | /aml/attachments/attachment/type   |
| MIME type                      | Either plain text or encoding type.                   | /aml/attachments/attachment/mime   |
| Command output text            | Output of the command that is automatically executed. | /mml/attachments/attachment/atdata |

The following table describes the event message format for full text or XML messages.

**Table 258: Inserted Fields for a Reactive and Proactive Event Message**

| Data Item (Plain Text and XML)     | Description (Plain Text and XML)                               | XML Tag (XML Only)          |
|------------------------------------|----------------------------------------------------------------|-----------------------------|
| Chassis hardware version           | Hardware version of chassis.                                   | /aml/body/chassis/hwVersion |
| Supervisor module software version | Top-level software version.                                    | /aml/body/chassis/swVersion |
| Affected FRU name                  | Name of the affected FRU that is generating the event message. | /aml/body/fru/name          |
| Affected FRU serial number         | Serial number of the affected FRU.                             | /aml/body/fru/serialNo      |
| Affected FRU part number           | Part number of the affected FRU.                               | /aml/body/fru/partNo        |
| FRU slot                           | Slot number of the FRU that is generating the event message.   | /aml/body/fru/slot          |
| FRU hardware version               | Hardware version of the affected FRU.                          | /aml/body/fru/hwVersion     |
| FRU software version               | Software version that is running on the affected FRU.          | /aml/body/fru/swVersion     |

The following table describes the inventory event message format for full text or XML messages.

**Table 259: Inserted Fields for an Inventory Event Message**

| Data Item (Plain Text and XML)     | Description (Plain Text and XML) | XML Tag (XML Only)          |
|------------------------------------|----------------------------------|-----------------------------|
| Chassis hardware version           | Hardware version of the chassis. | /aml/body/chassis/hwVersion |
| Supervisor module software version | Top-level software version.      | /aml/body/chassis/swVersion |

| Data Item (Plain Text and XML) | Description (Plain Text and XML)                               | XML Tag (XML Only)      |
|--------------------------------|----------------------------------------------------------------|-------------------------|
| FRU name                       | Name of the affected FRU that is generating the event message. | /aml/body/fru/name      |
| FRU s/n                        | Serial number of the FRU.                                      | /aml/body/fru/serialNo  |
| FRU part number                | Part number of the FRU.                                        | /aml/body/fru/partNo    |
| FRU slot                       | Slot number of the FRU.                                        | /aml/body/fru/slot      |
| FRU hardware version           | Hardware version of the FRU.                                   | /aml/body/fru/hwVersion |
| FRU software version           | Software version that is running on the FRU.                   | /aml/body/fru/swVersion |

The following table describes the user-generated test message format for full text or XML.

**Table 260: Inserted Fields for a User-Generated Test Message**

| Data Item (Plain Text and XML) | Description (Plain Text and XML)                   | XML Tag (XML Only)             |
|--------------------------------|----------------------------------------------------|--------------------------------|
| Process ID                     | Unique process ID.                                 | /aml/body/process/id           |
| Process state                  | State of process (for example, running or halted). | /aml/body/process/processState |
| Process exception              | Exception or reason code.                          | /aml/body/process/exception    |

## Feature Information for Call Home

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfmg.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 261: Feature Information for Call Home**

| Feature Name    | Releases                    | Feature Information                                                                                                   |
|-----------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Smart Call Home | Cisco IOS XE Everest 16.6.1 | This feature was integrated into the Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 98

# SNMP Support over VPNs—Context-Based Access Control

---

The SNMP Support over VPNs--Context-Based Access Control feature provides infrastructure for the multiple SNMP context supports in Cisco software and VPN-aware MIB.

## Finding Feature Information

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 262: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Restrictions for SNMP Support over VPNs—Context-Based Access Control

- If you delete an SNMP context using the `no snmp-server context` command, all SNMP instances in that context are deleted.
- Not all MIBs are VPN-aware.

## Information About SNMP Support over VPNs—Context-Based Access Control

### SNMP Versions and Security

Cisco software supports the following versions of SNMP:

- **SNMPv1**—Simple Network Management Protocol: a full Internet standard, which is defined in RFC 1157. (RFC 1157 replaces the earlier versions that were published as RFC 1067 and RFC 1098.) Security is based on the community strings.
- **SNMPv2c**—The community string-based Administrative Framework for SNMPv2. SNMPv2c (the "c" is for "community") is an experimental IP that is defined in RFC 1901, RFC 1905, and RFC 1906. SNMPv2c is an update of the protocol operations and data types of SNMPv2p (SNMPv2 Classic) and uses the community-based security model of SNMPv1.

For more information about SNMP versions, see the “Configuring SNMP Support” module in the *Cisco Network Management Configuration Guide*.

## SNMPv1 or SNMPv2 Security

Cisco IOS software supports the following versions of SNMP:

- **SNMPv1**—Simple Network Management Protocol: a full Internet standard, that is defined in RFC 1157. (RFC 1157 replaces the earlier versions that were published as RFC 1067 and RFC 1098.) Security is based on the community strings.
- **SNMPv2c**—The community string-based Administrative Framework for SNMPv2. SNMPv2c (the "c" is for "community") is an experimental IP that is defined in RFC 1901, RFC 1905, and RFC 1906. SNMPv2c is an update of the protocol operations and data types of SNMPv2p (SNMPv2 Classic) and uses the community-based security model of SNMPv1.

SNMPv1 and SNMPv2 are not as secure as SNMPv3. SNMP version 1 and 2 use plain text communities and do not perform the authentication or security checks that SNMP version 3 performs. When using SNMP version 1 or 2, associate a community name with a VPN to configure the SNMP Support over VPNs—Context-Based Access Control feature. This association causes SNMP to process requests coming in for a particular community string only if it comes in from the configured VRF. Community strings without an associated VRF in the incoming packets are processed only if it came through a non-VRF interface. This process prevents users outside the VPN from snooping a clear text community string to query the VPN's data. These methods of source address validation are not as secure as using SNMPv3.

## SNMPv3 Security

If you are using SNMPv3, the security name must be associated with authentication or privileged passwords. Source address validation is not performed on SNMPv3 users. Configure a minimum security level of AuthNoPriv. This configuration ensures that the VPN accesses only to context associated with it and cannot see the MIB data of other VPNs.

On a provider edge (PE) router, a community can be associated with a VRF to provide the source address validation. Associate source address with the community list by using an access control list, if the source address validation is required on a customer edge (CE) router.

If you are using SNMPv3, the security name or security password of the users of a VPN must be unknown to users of other VPNs. Cisco recommends not to use SNMPv3 nonauthorized users if you need security of management information.

## SNMP Notification Support over VPNs

The SNMP Notification Support over VPNs feature allows the sending and receiving of SNMP notifications (traps and informs) using VPN routing and forwarding (VRF) instance tables. In particular, this feature adds

support to Cisco software for the sending and receiving of SNMP notifications (traps and informs) specific to individual VPNs.

SNMP is an application-layer protocol that provides a message format for communication between SNMP managers and agents.

A VPN is a network that provides high-connectivity transfers on a shared system with the same usage guidelines as a private network. A VPN can be built on the Internet over IP, Frame Relay, or ATM networks.

A VRF stores per-VPN routing data. It defines the VPN membership of a customer site that is attached to the network access server (NAS). The VRF consists of an IP routing table and a derived Cisco Express Forwarding (formerly known as CEF) table. VRF also consists of guidelines and routing protocol parameters that control the information that is included in the routing table.

The SNMP Support for VPNs—Context-Based Access Control feature provides configuration commands that allow you to associate SNMP agents and managers with specific VRFs. The associated VRF is used for the sending of SNMP notifications (traps and informs) and responses between agents and managers. If a VRF is not specified, the default routing table for the VPN is used.

## VPN-Aware SNMP

The SNMP Support for VPNs—Context-Based Access Control feature extends the capabilities of the SNMP Notification Support for VPNs feature and enables SNMP to differentiate between incoming packets from different VPNs.

When the SNMP Support for VPNs—Context-Based Access Control feature is configured, SNMP accepts requests on any configured VRF and returns responses to the same VRF. A trap host can be associated with a specific VRF. The configured VRF is then used for sending out traps; otherwise, the default routing table is used. You can also associate a remote user with a specific VRF. You can also configure the VRFs from which SNMP accepts requests. Any requests coming from VRFs that are not specified are dropped.

IP access lists can be configured and associated with SNMP community strings. This feature enables you to configure an association between VRF instances with SNMP community strings. When a VRF instance is associated with an SNMP community string, SNMP processes the requests coming in for a particular community string only if the requests are received from the configured VRF. If the community string in the incoming packet does not have a VRF associated with it, the community string must come through a non-VRF interface.

You can also enable or disable authentication traps for SNMP packets dropped due to VRF mismatches. By default if SNMP authentication traps are enabled, VRF authentication traps are also enabled.

## VPN Route Distinguishers

A route distinguisher (RD) creates routing and forwarding tables and specifies the default route distinguisher for a VPN. The RD is added to the beginning of your IPv4 prefixes to change them into globally unique VPN-IPv4 prefixes.

The RD is an autonomous system number (ASN)-relative RD, in which case it comprises an autonomous system number and an arbitrary number. Or, the RD is an IP-address-relative RD, in which case it comprises an IP address and an arbitrary number.

You can enter an RD in either of these formats:

- 16-bit ASN: your 16-bit number: For example, 101:3.
- 32-bit IP address: your 32-bit number: For example, 192.168.122.15:1.

## SNMP Contexts

SNMP contexts provide VPN users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN's specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN makes it unique. The context enables a provider to prevent the users of one VPN from accessing information about other VPN users on the same networking device.

VPN-aware SNMP requires an agreement between SNMP manager and agent entities operating in a VPN environment. The agreement ensures mapping between the SNMP security name and the VPN ID. This mapping is created by using multiple contexts for the SNMP data of different VPNs through the configuration of the SNMP-VACM-MIB. The SNMP-VACM-MIB is configured with views. This configuration allows VPN users with a security name access to the restricted object space. The configuration is associated with your access type in the context that is associated with the user of that VPN.

SNMP request messages undergo three phases of security and access control. Once the access is validated, a response message is sent back with the object values in the context of a VPN:

- In the first phase, the username is authenticated. This phase ensures that the user is authenticated and authorized for SNMP access.
- In the second phase, the user is authorized for the SNMP access that is requested to the group objects under consideration of the configured SNMP context. This phase is called the access control phase.
- In the third phase, access is made to an instance of a table entry. With this third phase, complete retrieval can be based on the SNMP context name.

## How to Configure SNMP Support over VPNs—Context-Based Access Control

### Configuring an SNMP Context and Associating the SNMP Context with a VPN

Perform this task to configure an SNMP context and to associate the SNMP context with a VPN.

**Note**

- Only the following MIBs are context-aware. All the tables in these MIBs can be polled:
  - CISCO-IPSEC-FLOW-MONITOR-MIB
  - CISCO-IPSEC-MIB
  - CISCO-PING-MIB
  - IP-FORWARD-MIB
  - MPLS-LDP-MIB
- Only two SNMP variables in the IP-FORWARD-MIB can be polled: 1.3.6.1.2.1.4.24.3 (ipCidrRouteNumber - Scalar) and 1.3.6.1.2.1.4.24.4.1 (ipCidrRouteEntry - Table).

## Procedure

|               | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                               | Enters global configuration mode.                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>snmp-server context</b> <i>context-name</i><br><b>Example:</b><br>Device(config)# snmp-server context context1                                        | Creates and names an SNMP context.                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>vrf definition</b> <i>vrf-name</i><br><b>Example:</b><br>Device(config)# vrf definition vrf1                                                          | Configures a VRF routing table and enters VRF configuration mode.                                                                                                                                                                                              |
| <b>Step 5</b> | <b>rd</b> <i>route-distinguisher</i><br><b>Example:</b><br>Device(config-vrf)# rd 100:120                                                                | Creates a VPN route distinguisher.                                                                                                                                                                                                                             |
| <b>Step 6</b> | <b>context</b> <i>context-name</i><br><b>Example:</b><br>Device(config-vrf)# context context1                                                            | Associates an SNMP context with a particular VRF.<br><b>Note</b> The <b>snmp context</b> command is used instead of the <b>context</b> command, depending on your release. See the <i>Cisco IOS Network Management Command Reference</i> for more information. |
| <b>Step 7</b> | <b>route-target</b> {import   export   both}<br><i>route-target-ext-community</i><br><b>Example:</b><br>Device(config-vrf)# route-target export 100:1000 | (Optional) Creates a route-target extended community for a VRF.                                                                                                                                                                                                |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Device(config-vrf)# end                                                                                                 | Exits interface mode and enters global configuration mode.                                                                                                                                                                                                     |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                                     | Exits global configuration mode.                                                                                                                                                                                                                               |

# Configuring SNMP Support and Associating an SNMP Context

Perform this task to configure SNMP support and associate it with an SNMP context.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server user** *username group-name* [**remote** *host* [**udp-port** *port* ] [**vrf** *vrf-name* ]] { **v1** | **v2c** | **v3** [**encrypted**] [**auth** { **md5** | **sha** } *auth-password* ]} [**access** [**ipv6** *nacl* ] [**priv** { **des** | **3des** | **aes** { **128** | **192** | **256** }} *privpassword* ] { *acl-number* | *acl-name* }]
4. **snmp-server group** *group-name* { **v1** | **v2c** | **v3** { **auth** | **noauth** | **priv** }} [**context** *context-name* ] [**read** *read-view* ] [**write** *write-view* ] [**notify** *notify-view* ] [**access** [**ipv6** *named-access-list* ] [*acl-number* | *acl-name* ]]
5. **snmp-server view** *view-name oid-tree* { **included** | **excluded** }
6. **snmp-server enable traps** [*notification-type* ] [**vrrp** ]
7. **snmp-server community** *string* [**view** *view-name* ] [**ro** | **rw** ] [**ipv6** *nacl* ] [*access-list-number* | *extended-access-list-number* | *access-list-name* ]
8. **snmp-server host** { *hostname* | *ip-address* } [**vrf** *vrf-name* ] [**traps** | **informs** ] [**version** { **1** | **2c** | **3** [**auth** | **noauth** | **priv** ]}] [*community-string* ] [**udp-port** *port* ] [*notification-type* ]
9. **snmp mib community-map** *community-name* [**context** *context-name* ] [**engineid** *engine-id* ] [*security-name* *security-name* ] [**target-list** *upn-list-name* ]
10. **snmp mib target list** *vpn-list-name* { **vrf** *vrf-name* | **host** *ip-address* }
11. **no snmp-server trap authentication vrf**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                               |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Enters global configuration mode.                                                                                     |
| Step 3 | <b>snmp-server user</b> <i>username group-name</i> [ <b>remote</b> <i>host</i> [ <b>udp-port</b> <i>port</i> ] [ <b>vrf</b> <i>vrf-name</i> ]] { <b>v1</b>   <b>v2c</b>   <b>v3</b> [ <b>encrypted</b> ] [ <b>auth</b> { <b>md5</b>   <b>sha</b> } <i>auth-password</i> ]} [ <b>access</b> [ <b>ipv6</b> <i>nacl</i> ] [ <b>priv</b> { <b>des</b>   <b>3des</b>   <b>aes</b> { <b>128</b>   <b>192</b>   <b>256</b> }} <i>privpassword</i> ] { <i>acl-number</i>   <i>acl-name</i> }]<br><b>Example:</b><br>Device(config)# snmp-server user customer1 group1 v1 | Configures a new user to an SNMP group.                                                                               |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                    |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>snmp-server group</b> <i>group-name</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> }} [ <b>context</b> <i>context-name</i> ] [ <b>read</b> <i>read-view</i> ] [ <b>write</b> <i>write-view</i> ] [ <b>notify</b> <i>notify-view</i> ] [ <b>access</b> [ <b>ipv6</b> <i>named-access-list</i> ] [ <i>acl-number</i>   <i>acl-name</i> ] ]</p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server group group1 v1 context context1 read view1 write view1 notify view1</pre> | <p>Configures a new SNMP group or a table that maps SNMP users to SNMP views.</p> <ul style="list-style-type: none"> <li>Use the <b>context</b> <i>context-name</i> keyword argument pair to associate the specified SNMP group with a configured SNMP context.</li> </ul> |

| Step 6 | <p><b>snmp-server enable traps</b> [ <i>notification-type</i> ] [ <b>vrrp</b> ]</p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server enable traps</pre>                                                                                                                                                                                                                                                                                                                                                              | <p>Enables all SNMP notifications (traps or informs) available on your system.</p>                                                                                                                                                                                         |
| Step 7 | <p><b>snmp-server community</b> <i>string</i> [ <b>view</b> <i>view-name</i> ] [ <b>ro</b>   <b>rw</b> ] [ <b>ipv6</b> <i>nacl</i> ] [ <i>access-list-number</i>   <i>extended-access-list-number</i>   <i>access-list-name</i> ]</p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server community public view view1 rw</pre>                                                                                                                                                                                          | <p>Sets up the community access string to permit access to the SNMP.</p>                                                                                                                                                                                                   |
| Step 8 | <p><b>snmp-server host</b> { <i>hostname</i>   <i>ip-address</i> } [ <b>vrf</b> <i>vrf-name</i> ] [ <b>traps</b>   <b>informs</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> [ <b>auth</b>   <b>noauth</b>   <b>priv</b> ] ] <i>community-string</i> [ <b>udp-port</b> <i>port</i> ] [ <i>notification-type</i> ]</p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server host 10.0.0.1 vrf vrf1 public udp-port 7002</pre>                                                                                   | <p>Specifies the recipient of an SNMP notification operation.</p>                                                                                                                                                                                                          |
| Step 9 | <p><b>snmp mib community-map</b> <i>community-name</i> [ <b>context</b> <i>context-name</i> ] [ <b>engineid</b> <i>engine-id</i> ] [ <b>security-name</b> <i>security-name</i> ] [ <b>target-list</b> <i>upn-list-name</i> ]</p> <p><b>Example:</b></p> <pre>Device(config)# snmp mib community-map community1 context context1 target-list commAVpn</pre>                                                                                                                                                                  | <p>Associates an SNMP community with an SNMP context, Engine ID, or security name.</p>                                                                                                                                                                                     |

|         | Command or Action                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                        |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <p><b>snmp mib target list</b> <i>vpn-list-name</i> { <b>vrf</b> <i>vrf-name</i>   <b>host</b> <i>ip-address</i> }</p> <p><b>Example:</b></p> <pre>Device(config)# snmp mib target list commAVpn vrf vrf1</pre> | Creates a list of target VRFs and hosts to associate with an SNMP community.                                                                                                                                                                                                                                                   |
| Step 11 | <p><b>no snmp-server trap authentication vrf</b></p> <p><b>Example:</b></p> <pre>Device(config)# no snmp-server trap authentication vrf</pre>                                                                   | <p>(Optional) Disables all SNMP authentication notifications (traps and informs) generated for packets that received on VRF interfaces.</p> <ul style="list-style-type: none"> <li>Use this command to disable authentication traps only for those packets on VRF interfaces with incorrect community associations.</li> </ul> |

# Configuration Examples for SNMP Support over VPNs—Context-Based Access Control

## Example: Configuring Context-Based Access Control

The following configuration example shows how to configure the SNMP Support over VPNs—Context-Based Access Control feature for SNMPv1 or SNMPv2:

**Note** Use the **snmp context** command instead of the **context** command, depending on your release. See the *Cisco IOS Network Management Command Reference* for more information.

```
snmp-server context A
snmp-server context B
ip vrf Customer_A
 rd 100:110
 context A
 route-target export 100:1000
 route-target import 100:1000
!
ip vrf Customer_B
 rd 100:120
 context B
 route-target export 100:2000
 route-target import 100:2000
!
interface TenGigabitEthernet4/1/0
 description Belongs to VPN A
 ip vrf forwarding CustomerA
 ip address 192.168.2.1 255.255.255.0

interface TenGigabitEthernet4/1/1
 description Belongs to VPN B
```

```

ip vrf forwarding CustomerB
ip address 192.168.2.2 255.255.255.0
snmp-server user commA grp1A v1
snmp-server user commA grp2A v2c
snmp-server user commB grp1B v1
snmp-server user commB grp2B v2c
snmp-server group grp1A v1 context A read viewA write viewA notify viewA
snmp-server group grp1B v1 context B read viewB write viewB notify viewB
snmp-server view viewA ipForward included
snmp-server view viewA ciscoPingMIB included
snmp-server view viewB ipForward included
snmp-server view viewB ciscoPingMIB included
snmp-server enable traps
snmp-server host 192.168.2.3 vrf CustomerA commA udp-port 7002
snmp-server host 192.168.2.4 vrf CustomerB commB udp-port 7002
snmp mib community-map commA context A target-list commAvpn
! Configures source address validation
snmp mib community-map commB context B target-list commBvpn
! Configures source address validation
snmp mib target list commAvpn vrf CustomerA
! Configures a list of VRFs or from which community commA is valid
snmp mib target list commBvpn vrf CustomerB
! Configures a list of VRFs or from which community commB is valid

```

## Feature Information for SNMP Support over VPNs—Context-Based Access Control

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 263: Feature Information for SNMP Support over VPNs—Context-Based Access Control*

| Feature Name                                        | Releases                    | Feature Information                                                                                               |
|-----------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| SNMP Support over VPNs—Context-Based Access Control | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 99

# SNMP Engine Enhancement

---

The SNMP Cache Engine Enhancement feature caches the SNMP information on the Supervisor.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for SNMP Cache Engine Enhancement

The time interval for which the cached information is available on the Supervisor is 5 seconds.

## Information About SNMP Cache Engine Enhancement

The SNMP Cache Engine Enhancement feature caches the information on the Supervisor for the MIB tables, which need to retrieve the data from the interface cards. When a MIB table item is queried from the interface card, the next *N* items are retrieved and cached on the Supervisor.

For example, if SNMP client queries the docsIf3CmtsCmRegStatusMacAddr.1, the interface card bundles docsIf3CmtsCmRegStatusMacAddr.1, docsIf3CmtsCmRegStatusMacAddr.2, docsIf3CmtsCmRegStatusMacAddr.3, to docsIf3CmtsCmRegStatusMacAddr.N together in one IPC response, and sends it to the Supervisor. The Supervisor caches all the items locally. When the SNMP client queries the docsIf3CmtsCmRegStatusMacAddr.2 later, the information is available in the Supervisor cache directly instead of sending another IPC message to interface card. The number *N* depends on the single MIB item size and maximum IPC message buffer size.

The MIB table information for following MIBs are retrieved and cached on the Supervisor:

- DOCS-IF-MIB
- DOCS-IFEXT2-MIB
- DOCS-QOS-MIB
- DOCS-IF3-MIB
- DOCS-IF31-MIB
- DOCS-QOS3-MIB
- DOCS-IETF-QOS-MIB
- DOCS-BPI-PLUS-MIB
- DOCS-LOADBALANCING-MIB
- DOCS-LOADBAL3-MIB
- DOCS-DSG-IF-MIB
- CISCO-DOCS-EXT-MIB
- CISCO-CABLE-WIDEBAND-MIB
- CISCO-CABLE-SPECTRUM-MIB

This feature is enabled by default on the Cisco cBR routers. The time interval for which the SNMP cache information is stored on the Supervisor is known as *age* and set to 5 seconds.

## How to Configure SNMP Cache Engine Enhancement

### Before you begin

You must configure the **service internal** command in global configuration mode to enable or disable SNMP Cache Engine Enhancement.

### Procedure

|        | Command or Action                                                                     | Purpose                                                                  |
|--------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> <b>enable</b>                         | Enables privileged EXEC mode.<br><br>• Enter your password, if prompted. |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                                        |
| Step 3 | <b>cable snmp cache active</b><br><br><b>Example:</b>                                 | Sets the SNMP cache status to active.                                    |

|               | Command or Action                                             | Purpose                                                                             |
|---------------|---------------------------------------------------------------|-------------------------------------------------------------------------------------|
|               | Router(config)# <b>cable snmp cache active</b>                | <b>Note</b> Use the <b>no</b> form of the command to disable the SNMP cache status. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# <b>exit</b> | Exits the global configuration mode and enters the privileged EXEC mode.            |

## Verifying the SNMP Cache Engine Status

Use the **show cable snmp cache-status** command to display the current SNMP cache engine status.

**Important** You must configure the **service internal** command in global configuration mode to verify the SNMP cache engine status.

Following is a sample output of the command.

```
Router# show cable snmp cache-status

Cache engine is ON, age: 5 seconds
```

Use the **test cable snmp counter-show** command to display the cache counters information.

```
Router# test cable snmp counter-show
===== cache counters =====
ubrccce_snmp_cache_hit_counter:0.
ubrccce_snmp_cache_get_from_lc_counter:1.
ubrccce_snmp_cache_miss_counter:0.
ubrccce_snmp_cache_ipc_fail_counter:0.
ubrccce_snmp_cache_buffer_full_counter:0.
```

*hit* and *mis* are the historic information for the SNMP cache after the system bootup. *hit* indicates the number of times the SNMP queries are hit in the cache and *mis* indicates the number of times the SNMP queries are missed in the SNMP cache.

## CHAPTER 100

# Onboard Failure Logging

---

Onboard Failure Logging (OBFL) captures and stores hardware failure and environmental information into nonvolatile memory. OBFL permits improved accuracy in hardware troubleshooting and root cause isolation analysis. Stored OBFL data can be retrieved in the event of a router crash or failure.

## Understanding OBFL

OBFL provides a mechanism to store hardware, software, and environment related critical data in a non-volatile memory, such as flash EPROM or EEPROM on routers. The logging information is used by the TAC team to troubleshoot and fix hardware issues.

OBFL collects data like temperatures and voltages. It stores the data in a dedicated area of the flash memory of the router. This data is retrieved by TAC personnel to troubleshoot routers. It can also be analyzed by back-end software to detect failure patterns, and possibly to recommend specific quality improvements.

### Retrieval of the OBFL message

If the hardware is defective and the system cannot boot up, any data in flash is inaccessible. In that case, use any one of the following methods to recover OBFL data:

- Read the flash through JTAG: this requires provisions in hardware design and back-end hardware and software support tools.
- Repair the system; boot it; use the OBFL CLI commands.

## Configuring OBFL

Use the **hw-module** *{all|slot|module}* *{slotnumber/subslotnumber|modulenum}* **logging onboard** *{disable|enable}* command to enable or disable OBFL on a specified hardware module.

---

**Note** OBFL is enabled by default.

---

```
Router# hw-module slot R0 logging onboard enable
```

## Displaying OBFL Logging Information

Use the **show logging onboard** *{slot|module|bay}* *{slotnumber/subslotnumber|modulenum}* *{dram|message|serdes|status|temperature|uptime|voltage|firmware}* command to view the OBFL log information.

---

**Note** OBFL is enabled by default on the Cisco cBR series router.

---

For the card PICs, use the **show logging onboard bay** *slotnumber/subslotnumber* *{dram|message|serdes|status|temperature|uptime|voltage|firmware}* command to view its OBFL information.

## Clearing OBFL Logging

Use the **clear logging onboard** *{slot|module|bay}* *{slotnumber/subslotnumber|modulenum}* *{dram|message|serdes|temperature|voltage|firmware}* command to clear OBFL logging.

The following example shows how to clear firmware version:

```
Router# clear logging onboard slot R0 firmware
```

```
Router# clear logging onboard bay 4/4 firmware
```

Following example shows how to clear DRAM ECC error log:

```
Router# clear logging onboard slot R0 dram
```

Following example shows how to clear OBFL error message:

```
Router# clear logging onboard slot R0 message
```

Following example shows how to clear onboard serdes log:

```
Router# clear logging onboard slot R0 serdes
```

Following example shows how to clear onboard temperature log:

```
Router# clear logging onboard slot R0 temperature
```

Following example shows how to clear onboard voltage log:

```
Router# clear logging onboard slot R0 voltage
```

# Configuration and Verification Examples

## Example—Verifying OBFL Configuration Status

```
Router#show logging onboard slot R1 status
Status: Enabled
```

```
Router#show logging onboard slot 5 status
Status: Disabled
```

## Example—Displaying OBFL Logs

The following onboard failure logging example shows firmware version for SUP160:  
Router# **show logging onboard slot R0 firmware**

| slot | timestamp         | firmware       | version     |
|------|-------------------|----------------|-------------|
| 0    | 01/16/18 09:36:38 | CPLD           | 16052011    |
| 0    | 01/16/18 09:36:38 | ViperSO CPLD   | 14091201    |

## Feature Information for Onboard Failure Logging

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfngng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 267: Feature Information for Onboard Failure Logging**

| Feature Name            | Releases                    | Feature Information                                                                                               |
|-------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| Onboard Failure Logging | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 101

# Control Point Discovery

---

This document describes the Control Point Discovery (CPD) feature. This feature, along with Network Layer Signaling (NLS), enables automatic discovery of any control point associated with an end point.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

### Contents

- [Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 1519](#)
- [Prerequisites for Control Point Discovery, on page 1520](#)
- [Restrictions for Control Point Discovery, on page 1520](#)
- [Information About Control Point Discovery, on page 1521](#)

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 268: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Prerequisites for Control Point Discovery

No special equipment or software is needed to use the Control Point Discovery feature.

## Restrictions for Control Point Discovery

- The CPD feature does not sync any dynamic CPD/NLS related data between the route processors (RPs). After sending a NLS challenge to the controller, the new active PRE will ignore the NLS response as a result of any RP switchover.
- The CPEs become inaccessible for a small duration during line card switchovers. During this interval, any CPD request received on CMTS will be responded to as if the endpoint is not connected or as if the control relationship is not supported.
- The CPD functionality is restricted to default VPN table id (0).
- Only manual configuration of NLS authentication pass phrase would be supported for CPD/NLS security.
- For NLS authentication, HMAC SHA1 (no configuration option) is used with MAC length truncated to 96 bits.

# Information About Control Point Discovery

To configure the Control Point Discovery feature, you should understand the following concepts:

## Control Points

Control points are points in a network that can be used to apply certain functions and controls for a media stream. In a cable environment, the control points are Cable Modem Termination Systems (CMTS) and devices that utilizes these control points are referred to as CPD Requestors (or controllers).

Cable CPD Requestors include the following:

- Call Management Server (CMS)
- Policy Server (PS)
- Mediation Device for Lawful Intercept (MD)

## Network Layer Signaling (NLS)

Network Layer Signaling (NSL) is an on-path request protocol used to carry topology discovery and other requests in support of various applications. In the CPD feature, NLS is used to transport CPD messages.

### NLS for CPD

NLS is used to transport CPD messages. The CPD data is carried under an application payload of the NLS and contains a NLS header with flow id. The NLS flow id is used during NLS authentication to uniquely identify the CPD requests and responses for an end point of interest.

### NLS Flags

All NLS headers contain bitwise flags. The CMTS expects the following NLS flag settings for CPD applications:

- HOP-BY-HOP = 0
- BUILD-ROUTE = 0
- TEARDOWN = 0
- BIDIRECTOINAL = 0
- AX\_CHALLENGE = 0/1
- AX\_RESPONSE = 0/1

---

**Note** Any requests with flags other than AX flags, set to one will be rejected with an error indicating a poorly formed message.

---

### NLS TLVs

The following NLS TLVs are supported for all CPD applications:

- APPLICATION\_PAYLOAD
- IPV4\_ERROR\_CODE
- IPV6\_ERROR\_CODE

- AGID
- A\_CHALLENGE
- A\_RESPONSE
- B\_CHALLENGE
- B\_RESPONSE
- AUTHENTICATION
- ECHO

The following NLS TLVs are not supported for CPD applications:

- NAT\_ADDRESS
- TIMEOUT
- IPV4\_HOP
- IPV6\_HOP

## Control Point Discovery

The control point discovery feature allows CPD Requestors to determine the control point IP address between the CPD Requestor and the media endpoint.

Using Networking Layer Signaling (NLS), the control point discovery feature sends a CPD message towards the end point (MTA). The edge/aggregation device (CMTS), located between the requestor and the endpoint, will respond to the message with its IP address.

---

**Note** For Lawful Intercept, it is important that the endpoint does not receive the CPD message. In this instance, the CMTS responds to the message without forwarding it to its destination.

---

## CPD Protocol Hierarchy

CPD messages are sent over the NLS.

The CPD Protocol Hierarchy is as follows:

1. CPD
2. NLS
3. UDP
4. IP

---

**Note** Since NLS is implemented on the UDP protocol, there is a potential of message loss. If messages are lost, the controller will re-send the CPD request in any such event.

---

## Control Relationship

A control relationship between a control point and a controller is identified as a function on a media flow that passes through a control point. A control relationship is uniquely defined by a control relationship type (CR TYPE) and control relationship ID (CR ID). The CR ID is provisioned on CMTS as well as the controller.

The table lists the supported CR TYPEs and corresponding pre-defined CR IDs

Table 269: Supported Control Relationship Types and Corresponding Control Relationship IDs

| Control Relationship Type      | Pre-Defined Corresponding Control Relationship ID                  |
|--------------------------------|--------------------------------------------------------------------|
| CR TYPE = 1 (Lawful Intercept) | CR ID = 1: CMTS                                                    |
|                                | CR ID = 2: Aggregation router or switch in front of CMTS           |
|                                | CR ID = 3: Aggregation router or switch in front of Media Services |
|                                | CR ID = 4: Media Gateway                                           |
|                                | CR ID = 5: Conference Server                                       |
|                                | CR ID = 6: Other                                                   |
| CR TYPE = 2 (DQoS)             | CR ID = 1: CMTS                                                    |
| CR TYPE = 3 (PCMM)             | CR ID = 1: CMTS                                                    |

# How to Configure CPD

## Enabling CPD Functionality

To enable the CPD functionality, use the `cpd` command in global configuration mode. The CPD message authentication is determined by NLS configuration.

### Before you begin

The CPD message authentication is determined by NLS configuration.

### Procedure

|        | Command or Action                                                                             | Purpose                                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                      | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                           |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> | <p>Enters global configuration mode.</p>                                                                                                            |
| Step 3 | <p><b>cpd</b></p> <p><b>Example:</b></p>                                                      | <p>Enables CPD functionality</p> <ul style="list-style-type: none"> <li>• Us the “no” form of this command to disable CPD functionality.</li> </ul> |

|               | Command or Action                            | Purpose                                                          |
|---------------|----------------------------------------------|------------------------------------------------------------------|
|               | Router (config)# cpd                         |                                                                  |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router# end | Exits global configuration mode and enters privileged EXEC mode. |

## Examples for CPD Enable

The following example shows the cpd enabled on a router:

```
Router (config)# cpd
```

## Debugging CPD Functionality

To debug the CPD feature, use the **debug cpd** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

## Configuring Control Relationship Identifier

To configure a Control relationship identifier (CR ID) for CMTS, use the cpd cr-id command. When CPD request comes with a wild-card CR ID, the CMTS will respond with this configured value.

### Procedure

|               | Command or Action                                                          | Purpose                                                                                                            |
|---------------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>cpd cr-id</b><br><b>Example:</b><br>Router (config)# cpd cr-id 100      | Configures a control relationship identifier (CR ID) for CMTS.                                                     |

|               | Command or Action                            | Purpose                                                          |
|---------------|----------------------------------------------|------------------------------------------------------------------|
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router# end | Exits global configuration mode and enters privileged EXEC mode. |

## Examples

The following example shows the cpd cr-id command configured with a cr-id number of 100 on a router.

```
Router (config)# cpd cr-id 100
```

## Enabling NLS Functionality

To enable the NLS functionality, use the nls command in global configuration mode. It is recommended that NLS message authentication be enabled at all times.

### Procedure

|               | Command or Action                                                          | Purpose                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                                                                                                    |
| <b>Step 3</b> | <b>nls</b><br><b>Example:</b><br>Router (config)# nls                      | Enables NLS functionality. <ul style="list-style-type: none"> <li>• NLS authentication is optional.</li> <li>• It is recommended that NLS message authentication be enabled at all times.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Router# end                               | Exits global configuration mode and enters privileged EXEC mode.                                                                                                                                     |

## Examples

The following example shows the nls command enabled on a router.

```
Router (config)# nls
```

## Debugging NLS Functionality

To debug the NLS feature, use the **debug nls** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

## Configuring Authorization Group Identifier and Authentication Key

The Authorization Group Identifier (AG ID) and corresponding authorization key are provisioned on CMTS, as well as on controller/CPD requester.

To configure the Authorization Group Identifier and Authentication Key, use the `nls ag-id` command in global configuration mode. It is recommended that NLS message authentication be enabled at all times.

### Procedure

|               | Command or Action                                                                            | Purpose                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>        | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>nls ag-id</b><br><b>Example:</b><br><pre>Router (config)# nls ag-id 100 auth-key 20</pre> | Configures the Authorization Group Identifier and Authentication Key.                                              |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><pre>Router# end</pre>                                      | Exits global configuration mode and enters privileged EXEC mode.                                                   |

## Examples

The following example shows the `nls ag-id` command with an Authorization Group ID of 100 and Authentication Key of 20.

```
Router (config)# nls ag-id 100 auth-key 20
```

## Configuring NLS Response Timeout

The NLS response timeout governs the time CMTS will wait for getting a response for a NLS authentication request.

To configure the NLS response timeout, use the `nls ag-id` command in global configuration mode. It is recommended that NLS message authentication be enabled at all times.

### Procedure

|               | Command or Action                                                                             | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>         | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>nls resp-timeout</b><br><b>Example:</b><br><pre>Router (config)# nls resp-timeout 60</pre> | Configures the NLS response time.                                                                                  |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><pre>Router# end</pre>                                       | Exits global configuration mode and enters privileged EXEC mode.                                                   |

### Examples

The following example shows the `nls resp-timeout` command with a response timeout setting of 60 seconds.

```
Router (config)# nls resp-timeout 60
```

## Feature Information for Control Point Discovery

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 270: Feature Information for Control Point Discovery**

| Feature Name            | Releases                    | Feature Information                                                                                               |

## CHAPTER 102

# IPDR Streaming Protocol

The Cisco cBR Series Converged Broadband Routers supports the Internet Protocol Detail Record (IPDR) streaming protocol feature that provides high volume data exported from the network equipment to mediation systems such as the Operations Support Systems (OSS) or Business Support Systems (BSS). IPDR provides information about IP-based service usage and other activities that are used by OSS and BSS. This protocol provides a mechanism to collect data from various network elements or equipment using a push model as opposed to the conventional Simple Network Management Protocol (SNMP) polling mechanism.

Based on the DOCSIS 3.0 specifications, the IPDR feature optimizes time and resource efficiency in the transfer of large amounts of performance metrics to the management systems. DOCSIS 3.0 introduces five management features or the FCAPS model. FCAPS represents Fault, Configuration, Accounting, Performance and Security.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Restrictions for Configuring IPDR Streaming Protocol

- An IPDR exporter can be connected to many collectors, but it will only send data to the highest priority operating collector at any given time.
- Each IPDR session can be associated to one active (zero) or more standby collector with priority.

## Information About IPDR Streaming Protocol

IPDR Streaming Protocol is designed to address the need for a reliable, fast, efficient, and flexible export process of high volume data records such as billing, performance and diagnostic data.

The IPDR/SP process communicates with IPDR collectors. The IPDR streaming protocol supports multiple IPDR sessions. The architecture supports primary and secondary collectors for failover purposes. At any time, data is sent to only one collector. If the exporter to primary collector connection fails due to any reason, the data is sent to the secondary collector. Depending on the network configuration, you can have only one primary collector for each session, while for different sessions, you can have different primary collectors. For example, there may be a billing collector, a diagnostic collector, and so on.

---

**Note** IPDR exporter refers to the Cable Modem Termination System (CMTS) and the IPDR collector refers to the network equipment.

---

## Data Collection Methodologies

IPDR is the data generated or collected for various performance related metrics such as billing information, diagnostics, network topology, signal quality monitoring, and other management data. These data are based on the FCAPS model (Fault, Configuration, Accounting, Performance and Security.)

The IPDR client application communicates with the IPDR exporter using the IPDR\_GET\_SESSIONS message to identify the streams provided by the exporter, and the exporter sends responses to the client using the IPDR\_GET\_SESSIONS\_RESPONSE message. This data collection method is based on the *Operations Support System Interface Specification* (CM-SP-OSSIv3.0-I13-101008).

The IPDR\_GET\_SESSIONS\_RESPONSE message includes the SessionBlock.reserved attribute to identify the IPDR session ID. This attribute helps the Cisco CMTS router define an IPDR session ID for each data collection mechanism supported for each IPDR service definition. This attribute was not used in Cisco IOS Releases earlier to Cisco IOS Release 12.2(33)SCE.

The IPDR feature defines methods for the collectors or network elements to collect data from the CMTS. Below is the list of collection methodologies:

**Time Interval Session:** In this method, the CMTS follows a schedule-based session to stream data at a periodic time interval. A time interval is the time gap between two adjacent sessions' start messages. This method is managed by the CMTS in controlling the start and stop operation of a session. The time interval session terminates after the CMTS exports the records.

---

**Note** During the course of a one-time interval when the CMTS is streaming records, if another time interval is expected, the CMTS will ignore the new time interval and continue exporting the data until the previous time interval ends.

---

**Event-based Session:** In this method, the CMTS can export records at any time, when the session is open. In other words, this method works on an open-ended session.

**Ad-hoc Session:** In this method, the CMTS creates a session, allows data streaming, and closes the session when the data export is complete or when a closing command is generated.

A new session is created by issuing the **ipdr session** command. After, the CMTS receives the FLOW\_START message from the collector, the CMTS exporter sends a SESSION\_START message to start exporting the IPDR data from the collector. After all data is transported, the exporter receives a ACK message from the collector, and then sends a SESSION\_STOP message to the collector. This method is known as the Ad-hoc session.

## How to Configure IPDR Streaming Protocol

This section describes the configuration tasks that are performed when using the IPDR streaming protocol feature on the Cisco CMTS platforms.

**Note** Use no ipdr command to remove the IPDR configuration.

### Configuring the IPDR Session

To enable the CMTS application to add a session to the IPDR exporter, use the ipdr session command in global configuration mode.

Use the no form of the command to remove the IPDR session.

- Note**
- The session ID must be unique.
  - To remove an active session, you must deactivate it before removing it.

>

#### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                             | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | ipdr session session_id session_name session_descr<br><b>Example:</b><br>Router(config)# ipdr session 1 samis_sxn test | Enables the CMTS application to add a session to the IPDR exporter.                                                |

## Configuring the IPDR Type

To configure the IPDR session type, use the `ipdr type` command in global configuration mode. The IPDR session types that can be defined using this command are event type, time-interval type, and the ad hoc type.

Use the `no` form of the command to reset the session type to the default "event" type.

### Procedure

|               | Command or Action                                                                                                                     | Purpose                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                            | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>ipdr type session_id [ad-hoc   event   time-interval value]</b><br><b>Example:</b><br>Router(config)# ipdr type 1 time-interval 15 | Enables the CMTS application to configure an IPDR session type.                                                    |

### What to do next

**Note** Once the IPDR session type is configured, only the templates supported by this IPDR type are allowed be associated with it. Also, the console provides information about those templates that are not supported by this IPDR session type when the type is changed.

## Configuring the IPDR Collector

To configure the IPDR collector details, use the `ipdr collector` command in global configuration mode. The port number is used when an exporter creates an active connection.

### Procedure

|               | Command or Action                                  | Purpose                                                                                                            |
|---------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                         | Purpose                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                     | Enters global configuration mode.                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ipdr collector</b><br><b>Example:</b><br><pre>Router(config)# ipdr collector federal 192.168.6.5</pre> | Enables the CMTS application to configure an IPDR collector and authenticate the IPDR protocol.<br><br><b>Note</b> Configure the NAT address in case of an IPDR collector that is operating in a NAT enabled network. |

## Configuring the IPDR Associate

To associate the collector with a session, use the ipdr associate command in global configuration mode.

### Before you begin

- You must deactivate the session before configuring the associate.

### Procedure

|               | Command or Action                                                                                                                    | Purpose                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Router&gt; enable</pre>                                                                     | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Router# configure terminal</pre>                                                | Enters global configuration mode.                              |
| <b>Step 3</b> | <b>ipdr associate session_id collector_name priority</b><br><b>Example:</b><br><pre>Router(config)# ipdr associate 1 federal 1</pre> | Associates the collector with a session.                       |

## Configuring the IPDR Template

To add an IPDR template to the IPDR session, use the ipdr template command in global configuration mode. The template list can be viewed by entering a “?” at the command prompt.

**Note** • You can add only the system-supported templates.

**Procedure**

|               | Command or Action                                                                                         | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                | Enters global configuration mode.                                                                                  |
| <b>Step 3</b> | <b>ipdr template session_id template_name</b><br><b>Example:</b><br>Router(config)# ipdr template 1 SAMIS | Adds an IPDR template to the IPDR session.                                                                         |

## Configuring the IPDR Exporter

IPDR exporter parameters such as keepalive timer count, the maximum number of unacknowledged records, and unacknowledged timeout interval value can be configured using the following commands.

- **ipdr exporter keepalive**—Sets the keepalive timer count value on the IPDR Exporter.
- **ipdr exporter max-unacked**—Sets the maximum number of unacknowledged records on the IPDR Exporter.
- **ipdr exporter ack-timeout**—Sets the time interval for acknowledged records on the IPDR Exporter.

**Note** The default value for DataAckTimeInterval is 60 seconds and the default value for DataAckSequenceInterval is 200 seconds.

You can set the values for the IPDR parameters to customize exporter for the collectors used in the facility. However, these commands are optional, so if not configured, the default values of the commands are used when **ipdr exporter start** command is executed.

**Procedure**

|               | Command or Action                | Purpose                                                        |
|---------------|----------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                        | Purpose                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router> enable                                                                                                           |                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                               | Enters global configuration mode.                                                                                                                      |
| <b>Step 3</b> | <b>ipdr exporter keepalive <i>time_interval</i></b><br><b>Example:</b><br>Router(config)# ipdr exporter keepalive 300    | (Optional) Sets the keepalive timer count for the IPDR Exporter. The valid range is from 5 to 300 seconds. The default value is 300.                   |
| <b>Step 4</b> | <b>ipdr exporter max-unacked <i>records</i></b><br><b>Example:</b><br>Router(config)# ipdr exporter max-unacked 200      | (Optional) Sets the number of maximum unacknowledged records on the IPDR Exporter. The valid range is from 5 to 200 records. The default value is 200. |
| <b>Step 5</b> | <b>ipdr exporter ack-timeout <i>time_interval</i></b><br><b>Example:</b><br>Router(config)# ipdr exporter ack-timeout 60 | (Optional) Sets the acknowledged records timeout interval on the IPDR Exporter. The valid range is from 5 to 60 seconds. The default value is 60.      |
| <b>Step 6</b> | <b>ipdr exporter start</b><br><b>Example:</b><br>Router(config)# ipdr exporter start                                     | Enables the CMTS application to start the IPDR exporter process to connect the exporter and the collector.                                             |

## Configuration Examples for IPDR Streaming Protocol

### Example: Configuring the IPDR Session

The following example shows how to configure the IPDR session.

```
Router> enable
Router# configure terminal
Router(config)# ipdr session 1 test no_descr
```

### Example: Configuring the IPDR Type

The following example shows how to configure the IPDR “time-interval” session type for a time interval of 15 minutes.

```
Router> enable
Router# configure terminal
Router(config)# ipdr type 1 time-interval 15
```

## Example: Configuring the IPDR Collector

The following example shows how to configure the IPDR collector.

```
Router> enable
Router# configure terminal
Router(config)# ipdr collector federal 209.165.200.225
```

### Example for Configuring the IPDR Collector with NAT Address

This example shows the **nat-address** keyword used to configure the NAT address for an IPDR collector:

```
Router(config)#ipdr collector federal 192.0.2.225 nat-address 192.0.2.51
```

## Example: Configuring the IPDR Associate

The following example shows how to associate the collector with a session.

```
Router> enable
Router# configure terminal
Router(config)# ipdr associate 1 federal 1
```

## Example: Configuring the IPDR Template

The following example shows how to add an IPDR template to the IPDR session.

```
Router> enable
Router# configure terminal
Router(config)# ipdr template 1 SAMIS-TYPE1
```

## Example: Configuring the IPDR Exporter

The following example shows how to configure the IPDR exporter process to connect the exporter and the collector.

```
Router> enable
Router# configure terminal
Router(config)# ipdr exporter keepalive 300
Router(config)# ipdr exporter max-unacked 200
Router(config)# ipdr exporter ack_timeout 60
Router(config)# ipdr exporter start
```

## Verifying IPDR Streaming Protocol

This section describes the commands used for verification of the IPDR streaming protocol feature on the Cisco CMTS platforms.

## Verifying the IPDR Collector

The **show ipdr collector** command displays the collector information, message statistics, and event for all the sessions that are associated with the collector.

The following example shows the sample output for the **show ipdr collector** command.

```
Router# show ipdr collector federal
Collector Name: federal, IP: 192.0.2.0, Port: 0
2001-07-05T19:28:22 Collector in session 1 Statistics:
 Transmitted 12658 Acknowledged 12658 Enqueued 12658 Lost 0
 Last Event: Event Id 1 IPDR_EVENT_SERVER_CONNECTED - INCOMING
Router(config)#
```

## Verifying IPDR exporter

The **show ipdr exporter** command displays information about the IPDR Exporter state as listed below.

- started
- not started
- not initialized

The following example shows the sample output for the **show ipdr exporter** command:

```
Router# show ipdr exporter
IPDR exporter is started.
Current parameters:
 KeepAliveInterval :300
 AckTimeInterval :60
 AckSequenceInterval :200
Router#
```

## Verifying IPDR session

The **show ipdr session** command displays the session details such as the session ID, description, and the session state for all sessions as well as for a specific session.

The following example shows the sample output for the **all** keyword for the **show ipdr session** command.

```
Router# show ipdr session all
Session ID: 1, Name: utilsta, Descr: test, Started: False
```

The following example shows the sample output for the **session\_id** keyword for the **show ipdr session** command.

```
Router# show ipdr session 1
Session ID: 1, Name: utilsta, Descr: test, Started: False
2001-07-05T19:36:28 Statistics:
 Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
 queuedOutstanding 0 queuedUnacknowledged 0
 1 Collectors in the session:
 Name: federal, IPAddr: 192.0.2.0, Port: 0, Priority: 1
```

## Verifying IPDR Session Collector

The **show ipdr session collector** command displays the details of a collector that is associated with a specific session. Because there can be multiple collectors associated to a session, this command is used to show a specific session-collector pair.

The following example shows the sample output for the **show ipdr session collector** command.

```
Router# show ipdr session 1 collector federal
Session ID: 1, Name: utilsta, Descr: test, Started: False
Collector Name: federal, IP: 192.0.2.0, Port: 0
2001-07-05T19:38:02 Collector in session 1 Statistics:
 Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
 Last Event: Event Id 0 WRONG_EVENT_ID
```

## Verifying IPDR Session Template

The **show ipdr session template** command displays the list of all active templates supported by a specific session.

The following example shows the sample output for the **show ipdr session template** command.

```
Router# show ipdr session 1 template
Template ID: 2, Name:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-CMTS-CMSERVICE-FLOW-TYPE,
Type: DOCSIS-Type, KeyNumber: 22
Session 1 has totally 1 templates.
```

## Feature Information for IPDR Streaming Protocol

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release,

feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfmg.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 271: Feature Information for Downstream Interface Configuration**

| Feature Name            | Releases                    | Feature Information                                                                                              |
|-------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------|
| IPDR Streaming Protocol | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Router. |

## CHAPTER 103

# Usage-Based Billing (SAMIS)

---

This document describes the Usage-based Billing feature for the Cisco Cable Modem Termination System (CMTS) routers, which provides subscriber account and billing information in the Subscriber Account Management Interface Specification (SAMIS) format. The SAMIS format is specified by the Data-over-Cable Service Interface Specifications (DOCSIS) Operations Support System Interface (OSSI) specification.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Prerequisites for Usage-Based Billing (SAMIS)

The Usage-based Billing feature has the following prerequisites:

- Cable modems must be compliant with DOCSIS 1.0 or DOCSIS 2.0, OSSI version 3.0 and DOCSIS 3.0.
- Cable modems that are being monitored should use a DOCSIS configuration file that defines upstream and downstream primary service flows using Service Class Naming (SCN [TLV 24/25, subTLV 4]). If dynamically-created service flows are to be monitored, they should also be created with SCN names.
- When the feature is operating in File mode, an external billing server must log into the Cisco CMTS to copy the billing records to the external server, using either Secure Copy (SCP) or Trivial File Transfer Protocol (TFTP). The Cisco CMTS cannot operate as a FTP or secure FTP (SFTP) server.
- When the feature is operating in Streaming mode in non-secure mode, an external billing server must be configured to receive the billing records at a configurable TCP port.
- When the feature is operating in Streaming mode in secure mode, the following are required:
  - The external billing server must be configured to receive the billing records at a configurable TCP port using a secure socket layer (SSL) connection.

**Tip** Several third-party solutions for SSL support on the billing application server are available <http://www.openssl.org/index.html>.

- A Certificate Authority (CA) must be configured and available to provide the required digital certificates to the billing application and Cisco CMTS router. The CA can be a public CA, such as Verisign, or a server on your private management network that is running software such as the Cisco Provisioning Center (CPC).
- To use the **full-records** keyword, the Cisco CMTS router must be running the Cisco IOS-XE releases.
- To use the **flow-aggregate** keyword for ipdr/ipdr-d3 the Cisco CMTS router must be running the Cisco IOS-XE releases.

When **flow-aggregate** is enabled, the service flows are combined into one record per cable modem:

- ServiceClassName element always returns a null value in IPDR records, even when service flows on the cable modem have a valid service class name.
- ServiceIdentifier element always returns a zero value.

## Restrictions for Usage-based Billing

The Usage-based Billing feature has the following restrictions and limitations:

- SNMP commands can be used to display or modify the Usage-based Billing configuration, and SNMP traps can be used to notify the billing application system when a billing record is available. However, SNMP commands cannot be used to retrieve billing records.
- Enabling IPDR mode through SNMP is not supported.

During a line card switchover, the items in the line card side are lost. Similarly, during a PRE switchover, those items in the RP side of the sflog file are lost.

If the user uses the SAMIS file destination, a PRE switchover also reinitializes that output file

- Billing records do not include information about multicast service flows and traffic counters.
- The packet counters displayed by CLI commands are reset to zero whenever the Cisco CMTS router is rebooted. The packet counters displayed by SNMP commands are not retained across router reloads, and SNMP MIB counters cannot be preserved during reloads. These counters are 64-bit values and could roll over to zero during periods of heavy usage.
- When configuring cable metering in the usage-based billing File Mode, the source-interface cannot be specified immediately after using the cable metering filesystem command. Once the cable metering filesystem command is used, the cable metering file will write to the bootflash. Until this operation is complete, no cable metering configuration will be allowed. After the file write operation is complete, the source-interface command (cable metering source-interface) can then be configured; and the metering file in the bootflash would need to be removed so that billing packets have the source-interface's IP address.

---

**Note** This cable metering restriction will not be a problem during reload.

---

- When configuring cable metering in the usage-based billing Streaming Mode, make sure that the loopback interface is accessible from the collector server. Telnetting to the IP address of the loopback interface from the collector server is a good method of testing whether the loopback interface is accessible from the collector server or not.

## Information About Usage-based Billing

### Feature Overview

The Usage-based Billing feature provides a standards-based, open application approach to recording and retrieving traffic billing information for DOCSIS networks. When enabled, this feature provides the following billing information about the cable modems and customer premises equipment (CPE) devices that are using the cable network:

- IP and MAC addresses of the cable modem.
- Service flows being used (both upstream and downstream service flows are tracked).
- IP addresses for the CPE devices that are using the cable modem.
- Total number of octets and packets received by the cable modem (downstream) or transmitted by the cable modem (upstream) during the collection period.
- Total number of downstream packets for the cable modem that the CMTS dropped or delayed because they would have exceeded the bandwidth levels allowed by the subscriber's service level agreement (SLA).

Billing records are maintained in a standardized text format that the service provider can easily integrate into their existing billing applications. Service providers can use this information to determine which users might be potential customers for service upgrades, as well as those customers that might be trying to exceed their SLA limits on a regular basis.

### Usage-Based Billing and DOCSIS Support on the Cisco CMTS Routers

The usage-based billing feature supports these DOCSIS features on the Cisco CMTS routers:

- DOCSIS 1.0, DOCSIS 2.0, and DOCSIS 3.0 compliant cable modems are supported.
- Best Effort service flows are supported for DOCSIS-compliant cable modems.
- Secondary service flows are supported for DOCSIS-compliant cable modems.
- Dynamic service flows are supported for DOCSIS-compliant cable modems.
- Information about deleted service flows is available only for DOCSIS 1.1 service flows but not for DOCSIS 1.0 service flows.
- Support for terminated service flows must be enabled using the **cable sflog** command in global mode.

## Standards

The Usage-based Billing feature is based on several open standards, allowing it to be supported by a wide range of commercial and custom-written billing applications. The following standards provide the major guidelines for writing and using the billing records that the CMTS produces:

- Extensible Markup Language (XML)—A metalanguage that in turn can easily define other markup languages to contain any kind of structured information, such as billing records. An XML-based approach allows the collected billing information to be used by and distributed among many different billing applications from different vendors. It also allows the format to be easily updated and customized to meet the needs of different providers.
- IP Detail Record (IPDR)—An open, vendor-independent standard, defined in the *Network Data Management—Usage (NDM-U) For IP-Based Services* specification, to simplify billing and usage record-keeping for any type of services that can be delivered over an IP-based network. Service providers can use IPDR to create unified billing applications for all of their services, such as DOCSIS or Voice-over-IP, even though those services use different protocols and application servers.
- DOCSIS Operations Support System Interface (OSSI) specification—A DOCSIS specification that defines the requirements for the network management of a DOCSIS network, including a Subscriber Account Management Interface Specification (SAMIS) for a billing record interface. The DOCSIS 2.0 version of this specification states that a CMTS is not required to provide a billing interface, but if the CMTS does provide a billing interface, it must be based on the IPDR/XML standards.

**Tip** For further information about these standards, see the documents listed in the “Standards” section on page 38.

## IPDR Service Definition Schemas

To standardize the management of objects, service definition schemas are associated with IPDR just as MIBs are associated to SNMP.

For more information, see the OSSI specification document at <http://www.cablelabs.com/wp-content/uploads/specdocs/CM-SP-OSSIV3.0-I02-070223.pdf>.

The schemas are supported on Cisco IOS-XE releases.

**Table 273: IPDR Schema List for DOCSIS 3.0**

| Category | Service Definition | Schema Definition                 | Collection Method     |
|----------|--------------------|-----------------------------------|-----------------------|
| SAMIS    | SAMIS-TYPE-1       | DOCSIS-SAMIS-TYPE-1_3.5.1-A.1.xsd | time interval, ad-hoc |
|          | SAMIS-TYPE-2       | DOCSIS-SAMIS-TYPE-2_3.5.1-A.1.xsd | time interval, ad-hoc |

| Category                                  | Service Definition        | Schema Definition                              | Collection Method            |
|-------------------------------------------|---------------------------|------------------------------------------------|------------------------------|
| Diagnostic Log Service Definition Schemas | DIAG-LOG-TYPE             | DOCSIS-DIAG-LOG-TYPE_3.5.1-A.1.xsd             | ad-hoc                       |
|                                           | DIAG-LOG-EVENT-TYPE       | DOCSIS-DIAG-LOG-EVENT-TYPE_3.5.1-A.1.xsd       | event                        |
|                                           | DIAG-LOG-DETAIL-TYPE      | DOCSIS-DIAG-LOG-DETAIL-TYPE_3.5.1-A.1.xsd      | time interval, ad-hoc, event |
| Spectrum Management                       | SPECTRUM-MEASUREMENT-TYPE | DOCSIS-SPECTRUM-MEASUREMENT-TYPE_3.5.1-A.1.xsd | time interval, ad-hoc        |
| CMTS CM Registration Status Information   | CMTS-CM-REG-STATUS-TYPE   | DOCSIS-CMTS-CM-REG-STATUS-TYPE_3.5.1-A.1.xsd   | time interval, ad-hoc, event |
| CMTS CM Upstream Status Information       | CMTS-CM-US-STATS-TYPE     | DOCSIS-CMTS-CM-US-STATS-TYPE_3.5.1-A.1.xsd     | time interval, ad-hoc        |
| CMTS Topology                             | CMTS-TOPOLOGY-TYPE        | DOCSIS-CMTS-TOPOLOGY-TYPE_3.5.1-A.1.xsd        | ad-hoc, event                |
| CPE Information                           | CPE-TYPE                  | DOCSIS-CPE-TYPE_3.5.1-A.1.xsd                  | ad-hoc, event                |
| CMTS Utilization Statistics               | CMTS-US-UTIL-STATS-TYPE   | DOCSIS-CMTS-US-UTIL-STATS-TYPE_3.5.1-A.1.xsd   | event                        |
|                                           | CMTS-DS-UTIL-STATS-TYPE   | DOCSIS-CMTS-DS-UTIL-STATS-TYPE_3.5.1-A.1.xsd   | event                        |

The schemas listed in the table are supported by implementing the respective Collectors, which work as SNMP agents to generate these IPDR records according to management information of the system.

## IPDR CM-STATUS-2008

Cisco IOS-XE Release 16.5.1 supports the IPDR CM-STATUS 2008 version for forward compatibility to support old IPDR collectors. In the IPDR CM-STATUS 2008 version, the CmtsResId and CmtsTcsId objects are 16 bits in length whereas in the CM-STATUS version both these objects are 32 bits in length.

The CmtsResId object in the CM-STATUS-2008 version returns the lower 16 bits of value from the CM-STATUS version. But, the CmtsTcsId object returns the same value for both the CM-STATUS-2008 and CM-STATUS version since the value does not exceed 16 bits in both the schemas.

## DOCSIS SAMIS Service Definitions

SAMIS for DOCSIS 3.0 service definitions are well structured and has two versions—SAMIS-TYPE-1 and SAMIS-TYPE-2 and provide a different level of information details than SAMIS.

DOCSIS 2.0 SAMIS supports only event session (default type) and DOCSIS 3.0 SAMIS TYPE 1 and DOCSIS 3.0 SAMIS TYPE 2 support only interval and ad-hoc sessions.

SAMIS is collected based on configurable time intervals. Each interval is a different document and the Exporter stops and starts a new session for a new interval. The interval starts from the last metering that has either succeeded or failed, unlike the time-interval session that has a fixed starting point and an interval.

**Note** The SAMIS schema can be configured with the **cable metering ipdr session** command SAMIS-TYPE-1 and SAMIS-TYPE-2 schemas can be configured through the **cable metering ipdr-d3** command. These schemas are mutually exclusive of each other.

### Limitation To DOCSIS SAMIS

- Only schemas that are consistent with the **cable metering ipdr| ipdr-d3** command works. If none of the schemas are consistent, none of them work.
- Changing the SAMIS IPDR type cancels exporting IPDR data.

## DOCSIS Diagnostic Log Service Definitions

This service definition defines the IPDR Streaming using a two-step process:

- SNMP or other configuration management interface, such as the CLI is used to configure the Diagnostic Log.
- IPDR/SP is used to stream the Diagnostic Log instances.

These Diagnostic Log service definition schemas support the following collection methods:

- The Cisco CMTS supports streaming of the DIAG-LOG-TYPE record collections as an ad-hoc session.
- The Cisco CMTS supports streaming of DIAG-LOG-EVENT-TYPE record collections as an event session. For event-based Diagnostic Log records, the Cisco CMTS streams the record when the event is logged in the Diagnostic Log and an IPDR message is transmitted to the Collector.
- The DOCSIS-DIAG-LOG-DETAIL-TYPE supports the following collection methods:
  - Time interval—Follows a schedule based on session configuration to export data on a periodic time interval. When a given time interval end is reached, the Exporter collects the diagnostic log, then streams the record to the Collector associated with this session. For time interval based Diagnostic Log records, the Cisco CMTS streams a snapshot of the Diagnostic Log at the scheduled collection time.
  - Ad-hoc—When the Exporter receives a "FlowStart" message, it triggers the application to collect the diagnostic record and send the data to the Collector.
  - Event—When a diagnostic log record is created, an ipdr message is transmitted to the Collector. For more information, see the Operations Support System Interface (OSSI) Specification.

## DOCSIS Spectrum Measurement Service Definition

This service definition schema defines the IPDR schema for the enhanced signal quality monitoring feature.

The DOCSIS-SPECTRUM-MEASUREMENT-TYPE schema supports the following collection methods:

- Time interval—Follows a schedule based on session configuration to export data on a periodic time interval. When a given time interval end is reached, the Exporter collects the spectrum information, then streams the records to the Collector.
- Ad-hoc—When the Exporter receives a "FlowStart" message, it triggers the application to collect the spectrum information and send the data to the Collector.

## DOCSIS CMTS CM Registration Status Service Definition

This service definition schema defines the IPDR service definition schema for the CMTS CM Registration Status information.

The DOCSIS-CMTS-CM-REG-STATUS-TYPE schema supports the following collection methods:

- Time interval—Follows a schedule based on session configuration to export data on a periodic time interval. When a given time interval end is reached, the Exporter collects the CM status information, then streams the records to the Collector.
- Ad-hoc—When the Exporter receives a "FlowStart" message, it triggers the application to collect all status information of the cable modems and send the data to the Collector.
- Event—When a cable modem goes from "offline" status to "online" or changes to "offline" from "online" (not including intermediate state changes), the Exporter invokes the application to collect the cable modem status information and sends the data to the Collector. For more information, see the Operations Support System Interface (OSSI) Specification.

## DOCSIS CMTS CM Upstream Status Service Definition

This service definition schema define the cable modem registration status objects and upstream status objects from the cable modem and the Cisco CMTS perspective. In the CmtsCmUsEqData IPDR schema field, configure the **cable upstream equalization-coefficient** command under the corresponding MAC domain to enable the feature to have data. For more information on this command, see the [Cisco IOS CMTS Cable Command Reference Guide](#).

The DOCSIS-CMTS-CM-US-STATS-TYPE schema support the following collection methods:

- Time interval—Follows a schedule based on session configuration to export data on a periodic time interval. When a given time interval end is reached, the Exporter collects the cable modem upstream status information, then streams the records to the Collector.
- Ad-hoc—When the Exporter receives a "FlowStart" message, it triggers the application to collect all upstream status information of the cable modem and send the data to the Collector.

## DOCSIS CMTS Topology Service Definition

In the case of an event session, the event means a change of the topology.

This service definition schema defines the IPDR service definition schema for the CMTS Topology information.

The DOCSIS-CMTS-TOPOLOGY-TYPE schema supports the following collection methods:

- Ad-hoc—Sends the entire picture of all fiber-nodes.
- Event—Sends only the updated channels status of the fiber nodes.

## DOCSIS CPE Service Definition

The DOCSIS-CPE-TYPE schema supports the following collection methods:

- Ad-hoc—Follows a schedule based on session configuration to export data on a periodic time interval. When a given time interval end is reached, the Exporter collects the CPE status information, then transfers the records to the Collector.
- Event—When new CPE is added, the status of the CPE changes (including change in IP address), or a new CPE replaces an old one (in this case, two messages are displaced—removal of the old CPE and addition of the new CPE). For more information, see the Operations Support System Interface (OSSI) Specification.

## DOCSIS CMTS Utilization Statistics Service Definition

The CMTS Utilization Statistics mainly focuses on channel utilization. It covers CMTS MAC Domain, channel identifier, and the upstream or downstream utilization attributes and counters.

The DOCSIS-CMTS-US-UTIL-STATS-TYPE schemas defines upstream utilization statistics for a specified upstream logical channel interface for the specified Cisco CMTS. The interval can be configured through Channel Utilization Interval.

The DOCSIS-CMTS-DS-UTIL-STATS-TYPE schema defines downstream utilization statistics for a specified downstream interface for the specified Cisco CMTS. The interval can be configured through Channel Utilization Interval.

For more information, see the IPDR Streaming Protocol on the Cisco CMTS Routers guide at the following URL:

[IPDR Streaming Protocol](#)

These schemas support only interval-driven event session for the entire downstream and upstream. The interval is defined in the docsIfCmtsChannelUtilizationInterval MIB and it creates document for every exporting.

---

**Note** The UsUtilTotalCntnReqDataMslots, UsUtilUsedCntnReqDataMslots, and UsUtilCollCntnReqDataMslots MIBs are not supported on the Cisco CMTS implementation.

---

The DsUtilTotalBytes MIB for RF Gateway RF channels is the maximum counter of bytes this RF channel can pass during an interval.

## Modes of Operation

The Usage-based Billing feature can operate in three modes:

- File Mode—In file mode, the CMTS collects the billing record information and writes the billing records to a file on a local file system, using a file name that consists of the router's hostname followed by a timestamp of when the file was written. A remote application can then log into the CMTS and transfer the billing record file to an external server where the billing application can access it.

The remote application can use the Secure Copy Protocol (SCP) or the Trivial File Transfer Protocol (TFTP) to transfer the file. After a successful transfer, the remote application then deletes the billing record file, which signals the CMTS that it can create a new file. The remote application can either periodically log into the CMTS to transfer the billing record file, or it can wait until the CMTS sends an SNMPv2 trap to notify the application that a billing record file is available.

- Streaming Mode—In streaming mode, the CMTS collects the billing record information and then regularly transmits the billing record file to an application on an external server, using either a non-secure TCP

connection or a secure sockets layer (SSL) connection. The billing record data collected is streamed in real time; and if streaming is unsuccessful, then the SAMIS data is sent only at the next interval.

If the CMTS fails to establish a successful connection with the external server, it retries the connection between one to three times, depending on the configuration. If the CMTS continues to fail to connect with the external server, the Cisco CMTS sends an SNMPv2 trap to notify the SNMP manager that this failure occurred.

In streaming mode, you can configure the CMTS to transmit the billing record file at regular intervals. Typically, the interval chosen would depend on the number of cable modems and the size of the billing record files that the CMTS produces.

- **IPDR Mode**—In the IPDR mode, the IPDR export process communicates with IPDR Collectors. The architecture supports multiple Collectors distinguished by priority value for failover purposes. The smaller the number of Collectors, the higher is the priority value. Associating one session to two or more Collectors with the same priority value is regarded as random priority. At any given time, data is sent to only the available highest priority Collector. If the highest priority Collector connection fails due to any reason, the data is sent to the next available highest priority Collector. After a higher priority Collector comes back online, it will fail over again. Depending on the network configuration, you can have different primary Collectors for different IPDR sessions. For example, there may be a billing Collector or a diagnostic Collector.

## Billing Record Format

Each billing record is an ASCII text file using XML formatting to encode the billing record objects that are required by the DOCSIS specifications. This file can be read by any billing application that can be configured to parse XML data files.

The table lists the objects that are contained in each billing record that the CMTS generates. This table shows the object’s name, as it appears in the billing record, and a description of that object.

**Table 274: Billing Record Objects**

| Object Name      | Description                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPDRcreationTime | (Appears in header of billing record) Date and time that the CMTS created the billing record.                                                                                                                               |
| serviceClassName | Service Class Name (SCN) identifying the service flow (for example, BronzeDS).                                                                                                                                              |
| CMmacAddress     | MAC Address of the cable modem, expressed as six hexadecimal bytes separated by dashes (for example, 00-00-0C-01-02-03).                                                                                                    |
| CMipAddress      | IP address for the cable modem, expressed in dotted decimal notation (for example, 192.168.100.101).                                                                                                                        |
| CMdocsisMode     | Version of DOCSIS QoS provision that the cable modem is currently using (DOCSIS 1.0 or 1.1).                                                                                                                                |
| CPEipAddress     | IP address for each CPE device that is using this cable modem, expressed in dotted decimal notation. This object is optional and can be suppressed to improve performance by reducing the size of the billing record files. |
| CMTsipAddress    | IP address for the CMTS, expressed in dotted decimal notation.                                                                                                                                                              |

| Object Name                                                          | Description                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMTShostName                                                         | Fully qualified hostname for the CMTS (for example, cmts01.cisco.com).                                                                                                                                                                                                                                                         |
| CMTSsysUpTime                                                        | Amount of time, in hundredths of a second, since the last initialization of the CMTS management interface, expressed as a 32-bit decimal number (0 to 4,294,967,296).                                                                                                                                                          |
| RecType (SFTYPE renamed to RecType in Cisco IOS Release 12.3(17a)BC) | Type of service flow being described: <ul style="list-style-type: none"> <li>• <b>Interim</b>—the service flow was active throughout the collection period and should be reported as 1.</li> <li>• <b>Stop</b>—the service flow was deleted at some point during the collection period and should be reported as 2.</li> </ul> |
| serviceIdentifier                                                    | Service flow ID assigned to this service flow by the CMTS, expressed as a decimal number.<br><br><b>Note</b> For DOCSIS 1.0 cable modems, the SFID field always shows the primary service flow for the upstream or downstream.                                                                                                 |
| serviceDirection                                                     | Direction for the service flow ( <b>Downstream</b> or <b>Upstream</b> ).                                                                                                                                                                                                                                                       |
| serviceOctetsPassed                                                  | Total number of octets received by the cable modem (downstream service flows) or transmitted by the cable modem (upstream service flows) during the collection period, expressed as a 64-bit decimal number.                                                                                                                   |
| servicePktsPassed                                                    | Total number of packets received by the cable modem (downstream service flows) or transmitted by the cable modem (upstream service flows) during the collection period, expressed as a 64-bit decimal number.                                                                                                                  |
| SLAdropPkts                                                          | (Downstream service flows only) Total number of downstream packets for the cable modem that the CMTS dropped because otherwise they would have exceeded the bandwidth levels allowed by the subscriber's service level agreement (SLA), expressed as a 64-bit decimal number.                                                  |
| SLAdelayPkts                                                         | (Downstream service flows only) Total number of packets that the CMTS delayed transmitting on the downstream to the cable modem because otherwise they would have exceeded bandwidth levels allowed by the subscriber's service level agreement (SLA), expressed as a 64-bit decimal number.                                   |
| CMTScatvIfIndex                                                      | The ifIndex of the MAC interface.                                                                                                                                                                                                                                                                                              |
| CMTScatvIfName                                                       | The ifName of the CMTS CATV (MAC) interface associated with this cable modem.                                                                                                                                                                                                                                                  |
| CMTSupIfName                                                         | The ifName of the CMTS Upstream interface associated with this cable modem.                                                                                                                                                                                                                                                    |
| CMTSdownIfName                                                       | The ifName of the CMTS Downstream interface associated with this cable modem.                                                                                                                                                                                                                                                  |
| CMcpeFqdn                                                            | FQDNs for cable modem associated CPEs.                                                                                                                                                                                                                                                                                         |

| Object Name        | Description                                                |
|--------------------|------------------------------------------------------------|
| serviceTimeCreated | Timestamp for SF creation (consistent with QoS MIB model). |
| serviceTimeActive  | The active time of the SF in seconds.                      |

**Note** Because the byte and packet counters are 64-bit values, it is possible for them to wrap around to zero during a billing period. The billing application should use the sysUpTime value along with the counters to determine whether the counters have wrapped since the last billing period. If a counter appears to regress, and if the current sysUpTime indicates this billing cycle is the next scheduled cycle for this particular cable modem, you can assume that the counter has wrapped during the billing cycle.

**Note** These billing record objects are defined in Appendix B, *IPDR Standards Submission for Cable Data Systems Subscriber Usage Billing Records*, in the *DOCSIS 2.0 OSSI Specification (SP-OSSIv2.0-IO3-021218)*.

The following example shows a sample IPDR billing record for a downstream service flow:

```

## SNMP Support

Cisco cBR Series Converged Broadband Routers support the following MIBs that provide SNMPv2 support for the Usage-based Billing feature:

### [CISCO-CABLE-METERING-MIB](#)

- Supports configuration of the usage-based billing feature using SNMPv2 commands.
- Displays the current usage-based billing configuration using SNMPv2 commands.
- Sends SNMPv2 traps based on the following usage-based billing events:
  - The Cisco CMTS reports that a new billing record is available.
  - The Cisco CMTS reports that a failure occurred in writing the most recent billing record (for example, the disk is full).
  - The Cisco CMTS reports that it could not successfully open a secure SSL connection to stream a billing record to the billing server.

### CISCO-CABLE-WIDEBAND-MIB

Sets the polling interval for calculating the utilization of an RF channel by using the **ccwbRFChanUtilInterval** object.

### DOCS-QOS-MIB

- Sets the load and utilization of both upstream and downstream physical channels through the **docsIfCmtsChannelUtilizationInterval** object. This information may be used for capacity planning and incident analysis, and may be particularly helpful in provisioning high value QoS.
- Displays information about all service flows (DOCSIS 1.1 service flows only) including multicast service flow is maintained in the **docsQosServiceFlowLogTable** in DOCS-QOS-MIB, **docsIetfQosServiceFlowLogTable** in DOCS-IETF-QOS-MIB, and **docsQos3ServiceFlowLogTable** in DOCS-QOS3-MIB.

To view information about deleted service flows, enable logging of deleted service flows using the **cable sflog** global configuration command.

## Benefits

The usage-based billing feature provides the following benefits to cable service providers and their partners and customers:

- Allows service providers to integrate their billing applications for DOCSIS services with their other XML-capable billing applications.
- Standards-based approach that supports existing networks and services, such as DOCSIS and PacketCable, and is easily extensible to support future services as they are supported on the Cisco CMTS.

## How to Configure the Usage-based Billing Feature

This section describes the following tasks that are required to implement the Usage-based Billing feature:

### Enabling Usage-based Billing Feature File Mode Using CLI Commands

This section describes how to enable and configure the Usage-based Billing feature so that it operates in file mode, where it writes the billing record files to a local file system. The billing application must then log into the Cisco CMTS and retrieve the billing record files on a regular basis.

#### Procedure

|        | Command or Action                                                                                                  | Purpose                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre> <p><b>Example:</b></p> <pre>Router#</pre> | Enables privileged EXEC mode. Enter your password if prompted. |

|        | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                    |
| Step 3 | <p><b>cable metering filesystem <i>filesys</i> [flow-aggregate] [cpe-list-suppress] [full-records]</b></p> <p><b>Example:</b></p> <pre>Router(config)# cable metering filesystem harddisk:</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre> | <p>Enables the Usage-based Billing feature for file mode and configures it.</p> <p>The system will write the billing records on this file system using a file name that contains the hostname of the router followed by a timestamp when the record was written.</p> |
| Step 4 | <p><b>snmp-server enable traps cable metering</b></p> <p><b>Example:</b></p> <pre>Router(config)# snmp-server enable traps cable metering</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                                  | (Optional) Enables SNMP traps for usage-based billing events. Traps are sent when a new billing record is available, or when the system encountered a failure (such as insufficient disk space) in writing the new billing record.                                   |
| Step 5 | <p><b>cable sflog max-entry <i>number</i> entry-duration <i>time</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# cable sflog max-entry 2000 entry-duration 7200</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                    | (Optional) Enables logging for deleted SNMP service flows, which allows the billing feature to include information about deleted service flows.                                                                                                                      |
| Step 6 | <p><b>cable metering source-interface <i>interface</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# cable metering source-interface loopback100</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                     | (Optional) Enables specification of the source-interface for the billing packets, usually a loopback interface.                                                                                                                                                      |

|        | Command or Action                                                                                                 | Purpose                                                              |
|--------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Step 7 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config)# end</pre> <p><b>Example:</b></p> <pre>Router#</pre> | Exits global configuration mode and returns to privileged EXEC mode. |

## Enabling Usage-based Billing Feature File Mode Using SNMP Commands

This section describes how to enable and configure the Usage-based Billing feature so that it operates in file mode and writes the billing record files to a local file system. The billing application must then log into the Cisco CMTS and retrieve the billing record files on a regular basis.

To configure the Cisco CMTS for Usage-based Billing feature in file mode, you must set a number of objects in the CISCO-CABLE-METERING-MIB.

In addition, to include information about deleted service flows in the billing records (supported for DOCSIS 1.1 service flows), you must enable the logging of deleted service flows, using the **cable sflag** global configuration command.

Table 275: SNMP Objects to be Configured for File Mode

| Object                    | Type          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccmtrCollectionType       | Integer       | <p>Enables or disables the Usage-based Billing feature. The valid values are:</p> <ul style="list-style-type: none"> <li>• 1—none. The Usage-based Billing feature is disabled (default).</li> <li>• 2—local. The Usage-based Billing feature is enabled and configured for file mode.</li> <li>• 3—stream. The Usage-based Billing feature is enabled and configured for streaming mode.</li> </ul> <p>Set ccmtrCollectionType to 2 (local) to enable the feature for file mode.</p>       |
| ccmtrCollectionFilesystem | DisplayString | <p>Specifies the file system where the billing record file should be written. This object has a maximum length of 25 characters and must specify a valid file system on the router (such as slot0, disk1, or flash).</p> <p><b>Note</b> The Cisco CMTS writes the billing records to this file system using a file name that consists of the router’s hostname followed by a timestamp when the record was written.</p>                                                                     |
| ccmtrCollectionCpeList    | TruthValue    | <p>(Optional) Indicates whether IP addresses for customer premises equipment (CPE) devices are omitted from the billing records, so as to reduce the size of the billing records and to improve performance. The valid values are the following:</p> <ul style="list-style-type: none"> <li>• true—CPE information is present (default).</li> <li>• false—CPE information is omitted.</li> </ul> <p><b>Note</b> When set to true, a maximum of 5 CPE IP addresses for each cable modem.</p> |

| Object                    | Type       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccmtrCollectionAggregate  | TruthValue | (Optional) Indicates whether all information for an individual cable modem is combined into one record. Separate counters are maintained for upstream and downstream traffic, but those counters include all service flows in that direction. The valid values are as follows: <ul style="list-style-type: none"> <li>• true—All service flow information for each cable modem is aggregated into a single billing record. In this configuration, the service flow ID (SFID) for the billing record is set to 0 and the service class name (SCN) is blank.</li> <li>• false—Information for each cable modem is not aggregated into a single billing record, but instead each service flow is recorded into its own record (default).</li> </ul> |
| ccmtrCollectionSrcIfIndex | TruthValue | (Optional) Specifies the source-interface for the billing packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Note** The following steps use the standard SNMP commands that are available on many Unix and Linux systems. For each step, replace *ip-address* with the IP address of the Cisco CMTS, and replace *rw-community-string* with an SNMP community string that provides read-write access to the router.

**Step 1** Set the ccmtrCollectionType object to 2, to enable the Usage-based Billing feature and to configure it for file mode:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmtrCollectionType.0 -i 2
workstation#
```

**Step 2** Set the ccmtrCollectionFilesystem object to the local file system where the Cisco CMTS should write the billing records:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmtrCollectionFilesystem.0 -D disk0:
workstation#
```

**Step 3** (Optional) To omit the IP addresses of CPE devices from the billing records, set the ccmtrCollectionCpeList object to 2 (false). The default is to include the CPE information.

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmtrCollectionCpeList.0 -i 2
workstation#
```

**Step 4** (Optional) To aggregate all service flow information for each cable modem in a single record, set the `ccmtrCollectionAggregate` object to 1 (true). The default is for each service flow to be written in a separate record:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
 ccmtrCollectionAggregate.0 -i 1
workstation#
```

**Step 5** (Optional) To specify the source-interface for the billing packets, set the `ccmtrCollectionSrcIfIndex` object to 1 (true). The default is for the billing packets to automatically select a source-interface.

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
 ccmtrCollectionSrcIfIndex.0 -i 1
workstation#
```

## Examples for Enabling Usage Billing using SNMP Mode

The following example shows the Usage-based Billing feature being configured using SNMP commands. The following display shows that a Cisco CMTS router at IP address 10.8.8.21 is configured with the default configuration (the Usage-based Billing feature is disabled):

```
workstation# getmany -v2c 10.8.8.21 rw-string ciscoCableMeteringMIB

ccmtrCollectionType.0 = none(1)
ccmtrCollectionFilesystem.0 =
ccmtrCollectionCpeList.0 = true(1)
ccmtrCollectionAggregate.0 = false(2)
ccmtrCollectionStatus.0 = 0
ccmtrCollectionDestination.0 =
ccmtrCollectionTimestamp.0 = 00 00 00 00 00 00 00 00
ccmtrCollectionNotifEnable.0 = true(1)
workstation#
```

The following SNMP commands are then given to enable the Usage-based Billing feature and to configure it for file mode:

```
workstation# setany -v2c 10.8.8.21 rw-string ccmtrCollectionType.0 -i 2
workstation# setany -v2c 10.8.8.21 rw-string
ccmtrCollectionFilesystem
.0 -D disk1:
workstation#
```

These commands add the following line to the router's running configuration file:

```
Router# show running-config | include metering

cable metering filesystem disk1:
```

Router#

The following SNMP display shows the new configuration, after the Cisco CMTS has successfully written a billing record:

```
workstation# getmany -v2c 10.8.8.21 rw-string ciscoCableMeteringMIB

ccmtrCollectionType.0 = local(2)
ccmtrCollectionFilesystem.0 = disk1:
ccmtrCollectionCpeList.0 = true(1)
ccmtrCollectionAggregate.0 = false(2)
ccmtrCollectionStatus.0 = success(1)
ccmtrCollectionDestination.0 = disk1:UBR7246.cisco.com-20030925-185827
ccmtrCollectionTimestamp.0 = 07 d3 09 19 12 3a 1c 00
ccmtrCollectionNotifEnable.0 = true(1)
workstation#
```

## Enabling Usage-based Billing Feature Streaming Mode Using CLI Commands

This section describes how to enable and configure the Usage-based Billing feature so that it operates in streaming mode, where it regularly transmits the billing records to an external server for use by the billing application.

### Procedure

|        | Command or Action                                                                                                                                                                                                                                                                                       | Purpose                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre> <p><b>Example:</b></p> <pre>Router#</pre>                                                                                                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                              |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                                                                                                                                         | Enters global configuration mode.                                                                           |
| Step 3 | <p><b>cable metering destination</b> <i>ip-address port [ip-address2 port2 ] retries minutes {non-secure   secure} [flow-aggregate] [cpe-list-suppress] [full-records]</i></p> <p><b>Example:</b></p> <pre>Router(config)# cable metering destination 10.10.21.3 5300 10.10.21.4 5300 2 30 secure</pre> | Enables the Usage-based Billing feature for streaming mode and configures it with the following parameters: |

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Router(config)#                                                                                                                                                               |                                                                                                                                                                                                                                    |
| <b>Step 4</b> | <b>snmp-server enable traps cable metering</b><br><b>Example:</b><br>Router(config)# snmp-server enable traps cable metering<br><b>Example:</b><br>Router(config)#                               | (Optional) Enables SNMP traps for usage-based billing events. Traps are sent when a new billing record is available, or when the system encountered a failure (such as insufficient disk space) in writing the new billing record. |
| <b>Step 5</b> | <b>cable sflog max-entry <i>number</i> entry-duration <i>time</i></b><br><b>Example:</b><br>Router(config)# cable sflog max-entry 2000 entry-duration 7200<br><b>Example:</b><br>Router(config)# | (Optional) Enables logging for deleted SNMP service flows, which allows the billing feature to include information about deleted service flows.                                                                                    |
| <b>Step 6</b> | <b>cable metering source-interface <i>interface</i></b><br><b>Example:</b><br>Router(config)# cable metering source-interface loopback100<br><b>Example:</b><br>Router(config)#                  | (Optional) Enables specification of the source-interface for the billing packets, usually a loopback interface.                                                                                                                    |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Router(config)# end<br><b>Example:</b><br>Router#                                                                                                               | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                               |

## Enabling Usage-based Billing Feature Streaming Mode Using SNMP Commands

This section describes how to use SNMP commands to enable and configure the Usage-based Billing feature so that it operates in streaming mode, where it regularly transmits the billing records to an external server for use by the billing application.

To configure the Cisco CMTS for Usage-based Billing feature in streaming mode, you must set a number of objects in the CISCO-CABLE-METERING-MIB.

**Note** In addition, to include information about deleted service flows (DOCSIS 1.1 service flows only) in the billing records, you must enable the logging of deleted service flows, using the **cable sflog** global configuration command. See the *Cisco IOS CMTS Cable Command Reference Guide* on Cisco.com:

[Cisco CMTS Cable Command Reference](#)

**Table 276: SNMP Objects to be Configured for Streaming Mode**

| Object                  | Type                                                                                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccmCollectionType       | Integer                                                                                                                                                                                                                                  | Enables or disables the Usage-based Billing feature. The valid values are: <ul style="list-style-type: none"> <li>• 1—none. The Usage-based Billing feature is disabled (default).</li> <li>• 2—local. The Usage-based Billing feature is enabled and configured for file mode.</li> <li>• 3—stream. The Usage-based Billing feature is enabled and configured for streaming mode.</li> </ul> Set ccmCollectionType to 3 (stream) to enable the feature for streaming mode. |
| ccmCollectionIpAddress  | InetAddress                                                                                                                                                                                                                              | IP address for the external collection server. This value must be specified.                                                                                                                                                                                                                                                                                                                                                                                                |
| ccmCollectionPort       | Unsigned32                                                                                                                                                                                                                               | TCP port number at the external collection server to which the billing records should be sent. The valid range is 0 to 65535, but you should not specify a port in the well-known range of 0 to 1024. This value must be specified.                                                                                                                                                                                                                                         |
| <b>Note</b>             | You can configure the ccmCollectionIpAddress and ccmCollectionPort objects twice, to specify a primary collection server and a secondary collection server.                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ccmCollectionIpAddrType | InetAddressType                                                                                                                                                                                                                          | (Optional) Type of IP address being used for the collection server. The only valid value is ipv4, which is the default value.                                                                                                                                                                                                                                                                                                                                               |
| ccmCollectionInterval   | Unsigned32                                                                                                                                                                                                                               | (Optional) Specifies how often, in minutes, the billing records are streamed to the external server. The valid range is 2 to 1440 minutes (24 hours), with a default of 30 minutes. (We recommend a minimum interval of 30 minutes.)                                                                                                                                                                                                                                        |
| ccmCollectionRetries    | Unsigned32                                                                                                                                                                                                                               | (Optional) Specifies the number of retry attempts that the CMTS will make to establish a secure connection with the external server before using the secondary server (if configured) and sending an SNMP trap about the failure. The valid range for <i>n</i> is 0 to 5, with a default of 0.                                                                                                                                                                              |
| <b>Note</b>             | The ccmCollectionInterval and ccmCollectionRetries parameters are optional when configuring usage-based billing for streaming mode with SNMP commands, but these parameters are required when configuring the feature with CLI commands. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Object                    | Type       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccmCollectionSecure       | TruthValue | (Optional) Specifies whether the Cisco CMTS should use a secure socket layer (SSL) connection when connecting with the billing application on the external server. The valid values are: <ul style="list-style-type: none"> <li>• true(1)—The Cisco CMTS uses a SSL connection. This option is available only on CMTS software images that support Baseline Privacy Interface (BPI) encryption.</li> <li>• false(2)—The Cisco CMTS uses an unencrypted TCP connection. This is the default value.</li> </ul>                                                                                                                                                                                                                                     |
| ccmCollectionCpeList      | TruthValue | (Optional) Indicates whether IP addresses for customer premises equipment (CPE) devices are omitted from the billing records, so as to reduce the size of the billing records and to improve performance. The valid values are the following: <ul style="list-style-type: none"> <li>• true—CPE information is present (default).</li> <li>• false—CPE information is omitted.</li> </ul> <p><b>Note</b> When set to true, a maximum of 5 CPE IP addresses for each cable modem.</p>                                                                                                                                                                                                                                                             |
| ccmCollectionAggregate    | TruthValue | (Optional) Indicates whether all information for an individual cable modem is combined into one record. Separate counters are maintained for upstream and downstream traffic, but those counters include all service flows in that direction. The valid values are as follows: <ul style="list-style-type: none"> <li>• true—All service flow information for each cable modem is aggregated into a single billing record. In this configuration, the service flow ID (SFID) for the billing record is set to 0 and the service class name (SCN) is blank.</li> <li>• false—Information for each cable modem is not aggregated into a single billing record, but instead each service flow is recorded into its own record (default).</li> </ul> |
| ccmtrCollectionSrcIfIndex | TruthValue | (Optional) Specifies the source-interface for the billing packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Note** The following steps use the standard SNMP commands that are available on many Unix and Linux systems. For each step, replace *ip-address* with the IP address of the Cisco CMTS, and replace *rw-community-string* with an SNMP community string that provides read-write access to the router.

**Step 1** Set the `ccmCollectionType` object to 3, to enable the Usage-based Billing feature and to configure it for streaming mode:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmCollectionType.0 -i 3
workstation#
```

**Step 2** Set the `ccmCollectionIpAddress` and `ccmCollectionPort` objects to the IP address of the external collection server and the TCP port number to which billing records should be sent:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmCollectionIpAddress.1 -o '0a 08 06 0b'

workstation# setany -v2c
ip-address rw-community-string
ccmCollectionPort.1 -g 6789

workstation#
```

**Step 3** (Optional) Set the `ccmCollectionIpAddress` and `ccmCollectionPort` objects a second time to specify the IP address and TCP port number of a second external collection server to which billing records should be sent, in the case that the Cisco CMTS cannot connect to the primary collection server:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmCollectionIpAddress.1 -o '0a 08 06 0c'

workstation# setany -v2c
ip-address rw-community-string
ccmCollectionPort.1 -g 7000

workstation#
```

**Step 4** (Optional) To change any of the other default parameters, set the appropriate objects to the desired values. For example, the following lines configure the Usage-based Billing feature for a non-secure connection, with a collection interval of 45 minutes, and a maximum number of 3 retries.

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
ccmCollectionSecure.1 -i 2
workstation# setany -v2c
ip-address rw-community-string
ccmCollectionInterval.1 -i 45
workstation# setany -v2c
ip-address rw-community-string
ccmCollectionRetries.1 -i 3
workstation#
```

**Step 5** (Optional) To omit the IP addresses of CPE devices from the billing records, set the `ccmCollectionCpeList` object to 2 (false). The default is to include the CPE information.

**Example:**

```
workstation# setany -v2c

ip-address rw-community-string
ccmCollectionCpeList.0 -i 2
workstation#
```

**Step 6** (Optional) To aggregate all service flow information for each cable modem in a single record, set the `ccmCollectionAggregate` object to 1 (true). The default is for each service flow to be written in a separate record:

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
 ccmCollectionAggregate.0 -i 1
workstation#
```

**Step 7** (Optional) To specify the source-interface for the billing packets, set the `ccmtrCollectionSrcIfIndex` object to 1 (true). The default is for the billing packets to automatically select a source-interface.

**Example:**

```
workstation# setany -v2c
ip-address rw-community-string
 ccmtrCollectionSrcIfIndex.0 -i 1
workstation#
```

---

## Examples for SNMP Commands

The following example shows the Usage-based Billing feature being configured using SNMP commands. The following display shows that a Cisco CMTS router at IP address 10.8.8.21 is configured with the default configuration (the Usage-based Billing feature is disabled):

```
workstation# getmany -v2c 10.8.8.21 rw-string ciscoCableMeteringMIB

ccmCollectionType.0 = none(1)
ccmCollectionFilesystem.0 =
ccmCollectionCpeList.0 = true(1)
ccmCollectionAggregate.0 = false(2)
ccmCollectionStatus.0 = 0
ccmCollectionDestination.0 =
ccmCollectionTimestamp.0 = 00 00 00 00 00 00 00 00
ccmCollectionNotifEnable.0 = true(1)
workstation#
```

The following SNMP commands are then given to enable the Usage-based Billing feature and to configure it for streaming mode:

```
workstation# setany -v2c 10.8.8.21 rw-string ccmCollectionType.0 -i 3
workstation# setany -v2c 10.8.8.21 rw-string ccmCollectionIpAddress.1 -o '0a 08 06 0b'

workstation# setany -v2c 10.8.8.21 rw-string ccmCollectionPort.1 -g 6789

workstation# setany -v2c 10.8.8.21 rw-string ccmCollectionSecure.1 -i 2
workstation# setany -v2c 10.8.8.21 rw-string ccmCollectionRetries.1 -i 3
workstation# setany -v2c 10.8.8.21 rw-string ccmCollectionInterval.1 -i 45
workstation#
```

These commands add the following line to the router's running configuration file:

```
Router# show running-config | include metering

cable metering destination 10.8.6.11 6789 3 45 non-secure
Router#
```

The following SNMP display shows the new configuration:

```
workstation# getmany -v2c 10.8.8.21 rw-string ciscoCableMeteringMIB

ccmCollectionType.0 = stream(3)
ccmCollectionFilesystem.0 =
ccmCollectionIpAddrType.1 = ipv4(1)
ccmCollectionIpAddress.1 = 0a 08 06 0b
ccmCollectionPort.1 = 6789
ccmCollectionInterval.1 = 45
ccmCollectionRetries.1 = 3
ccmCollectionSecure.1 = false(2)
ccmCollectionRowStatus.1 = active(1)
ccmCollectionCpeList.0 = true(1)
ccmCollectionAggregate.0 = false(2)
ccmCollectionStatus.0 = 0
ccmCollectionDestination.0 =
ccmCollectionTimestamp.0 = 00 00 00 00 00 00 00 00
ccmCollectionNotifEnable.0 = true(1)
workstation#
```

## Enabling and Configuring the Secure Copy Protocol (optional)

This section describes how to configure the Cisco CMTS for the Secure Copy Protocol (SCP), which allow an external server to log in to the Cisco CMTS and copy the billing records from the Cisco CMTS to the external server.

### Procedure

|        | Command or Action                                                                                                    | Purpose                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre> <p><b>Example:</b></p> <pre>Router#</pre>   | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> | Enters global configuration mode.                              |

|               | Command or Action                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Router(config)#                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>aaa new-model</b><br><b>Example:</b><br>Router(config)# aaa new-model<br><b>Example:</b><br>Router(config)#                                                                                                  | Enables the Authentication, Authorization, and Accounting (AAA) access control model.                                                                                                                                                                                                                               |
| <b>Step 4</b> | <b>aaa authentication login {default   list-name } method1 [method2 ...]</b><br><b>Example:</b><br>Router(config)# aaa authentication login default enable<br><b>Example:</b><br>Router(config)#                | Enables AAA access control authentication at login, using the following parameters:<br>Valid methods include <b>enable</b> , <b>line</b> , and <b>local</b> .                                                                                                                                                       |
| <b>Step 5</b> | <b>aaa authorization exec {default   list-name } method1 [method2 ...]</b><br><b>Example:</b><br>Router(config)# aaa authorization exec default local<br><b>Example:</b><br>Router(config)#                     | Configures the CMTS to allow users to run an EXEC shell and access the CLI to run the Secure Copy commands.<br>Valid methods include <b>local</b> .                                                                                                                                                                 |
| <b>Step 6</b> | <b>username name privilege level password encryption-type password</b><br><b>Example:</b><br>Router(config)# username billingapp privilege 15 password 7 billing-password<br><b>Example:</b><br>Router(config)# | (Optional) Creates a user account for login access and specifies the privilege level and password for that account:<br><b>Note</b> This step is optional but for the purposes of security and management, Cisco recommends creating a unique account for the billing application to use when logging into the CMTS. |
| <b>Step 7</b> | <b>ip ssh time-out seconds</b><br><b>Example:</b><br>Router(config)# ip ssh time-out 120<br><b>Example:</b>                                                                                                     | Enables Secure Shell (SSH) access on the Cisco CMTS, which is required for SCP use. The <i>seconds</i> parameter specifies the maximum time allowed for SSH authentication, in seconds, with a valid range of 0 to 120 seconds, with a default of 120 seconds.                                                      |

|                | Command or Action                                                                                                                                                                        | Purpose                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Router(config)#                                                                                                                                                                          |                                                                                                                                                                          |
| <b>Step 8</b>  | <p><b>ip ssh authentication-retries <i>n</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# ip ssh authentication-retries 3</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre> | Specifies the maximum number of login attempts a user is allowed before the router disconnects the SSH session. The valid range is 1 to 5, with a default of 3 attempts. |
| <b>Step 9</b>  | <p><b>ip scp server enable</b></p> <p><b>Example:</b></p> <pre>Router(config)# ip scp server enable</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                              | Enables SCP access on the Cisco CMTS.                                                                                                                                    |
| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Router(config)# end Router#</pre>                                                                                                          | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                     |

## Configuring the Cisco CMTS for SSL Operation

This section describes the procedures to configure the Cisco CMTS for secure socket layer (SSL) operation, so that the Usage-based Billing feature can use an SSL connection to transfer the billing record files in streaming mode.

**Note** This procedure is required only when using the **secure** option with the **cable metering destination** command.

### Prerequisites for CA

- The billing application server must be configured for SSL operations.
- A Certificate Authority (CA) must be configured to provide the required digital certificates to the billing application and Cisco CMTS router. The CA can be a public CA, such as Verisign, or a server on your private management network that is running software such as the Cisco Provisioning Center (CPC).

#### SUMMARY STEPS

To prepare the Cisco CMTS router for SSL operation, you must perform the following configuration steps:

- Configuring the router’s host name and IP domain name, if not already done.
- Generating an RSA key pair.
- Declaring a Certification Authority.

- Configuring a Root CA (Trusted Root).
- Authenticating the CA.
- Requesting the Certificates.

For the detailed steps in performing these procedures, see the [Configuring Certification Authority Interoperability](#)

## Retrieving Records from a Cisco CMTS in File Mode

When the Usage-based Billing feature is enabled and configured for File mode, the billing application server must regularly retrieve the billing records from the Cisco CMTS. This is typically done by a script that either logs in to the Cisco CMTS and uses CLI commands to transfer the file, or by a script that uses SNMP commands to transfer the file.

When using CLI commands, the procedure is typically as follows:

1. The billing application server receives an SNMP trap from the Cisco CMTS when a billing record is written. This notification contains the file name of the billing record that should be retrieved.
2. The billing application server starts a custom-written script to retrieve the billing record. This script would do one of the following:
  - a. If using CLI commands, the script logs in to the Cisco CMTS using a telnet connection, and then transfers the billing record to the billing application server, using the **copy** CLI command. The transfer can be done using either the Secure Copy Protocol (SCP) or the Trivial File Transfer Protocol (TFTP).

---

**Note** You could also use the File Transfer Protocol (FTP) to transfer files from the Cisco CMTS to an external FTP server, but this is not recommended, because the FTP protocol transmits the login username and password in cleartext.

---

1. If using SNMP commands, the script sets the ciscoFlashCopyEntry objects in the CISCO-FLASH-MIB to transfer the billing record to the application server, using TFTP.
2. After transferring the billing record, the script deletes it on the Cisco CMTS file system, so that the Cisco CMTS can begin writing a new billing record.

The following sections show examples of how this can be done, using each method.

---

**Tip** The following examples are given for illustration only. Typically, these commands would be incorporated in automated scripts that would retrieve the billing records.

---

## Using SCP

To transfer billing records using SCP, you must first enable and configure the router for SCP operation, using the procedure given in the “Enabling and Configuring Secure Copy (optional)” section on page 21 . Then, the application server must log in to the Cisco CMTS and use the **copy** command at the privileged EXEC prompt. The **copy** command needs to specify the location of the billing record on the local filesystem and the destination server for the SCP transfer.

The following example shows a typical session where a billing record on slot0 is transferred to an FTP server with the hostname of billserver.mso-example.com:

```

CMTS01# copy slot0:CMTS01_20030211-155025 scp://billingapp-server.mso-example.com/

Address or name of remote host [billingapp-server.mso-example.com]?
Destination username [billing-app]?
Destination filename [CMTS01_20030211-155025]?
Writing CMTS01_20030211-155025
Password: billing-password

!!
[OK - 1403352/1024 bytes]
1403352 bytes copied in 17.204 secs (85631 bytes/sec)
CMTS01# delete slot0:CMTS01_20030211-155025

CMTS01# squeeze slot0:

CMTS01#

```

---

**Note** The billing application must delete the billing record after it has been successfully transferred, so that the Cisco CMTS can write the next record. The **squeeze** command frees up the deleted disk space on Flash Memory and old-style PCMCIA cards (bootflash, flash, slot0, slot1). It is not needed on the newer ATA-style PCMCIA cards (disk0, disk1, disk2). However, because the **squeeze** command takes several seconds to complete, it should be given only when insufficient disk space exists for a new billing record. To avoid this problem, Cisco recommends using a 64 MB (or larger) ATA-style PCMCIA memory card, which automatically reclaims disk space for deleted files.

---

## Using TFTP

To transfer billing records using TFTP, you must first configure an external workstation to be a TFTP server. For security, the TFTP server should be isolated from the Internet or any external networks, so that only authorized TFTP clients, such as the Cisco CMTS router, can access the server.

To transfer the billing records, the application server must log in to the Cisco CMTS and use the **copy** command at the privileged EXEC prompt. The **copy** command needs to specify the location of the billing record on the local filesystem and the destination server for the TFTP transfer.

The following example shows a typical session where a billing record on slot0 is transferred to an TFTP server with the hostname of billserver.mso-example.com.

```

Router# copy slot0:CMTS01_20030211-155025 tftp://billingapp-server.mso-example.com/incoming

Address or name of remote host [billingapp-server.mso-example.com]?
Destination username [billing-app]?
Destination filename [CMTS01_20030211-155025]?
Writing CMTS01_20030211-155025
!!
[OK - 1102348/1024 bytes]
1102348 bytes copied in 14.716 secs (63631 bytes/sec)
Router# delete slot0:CMTS01_20030211-155025

Router# squeeze slot0:

Router#

```

**Note** The billing application must delete the billing record after it has been successfully transferred, so that the Cisco CMTS can write the next record. The **squeeze** command frees up the deleted disk space on Flash Memory and old-style PCMCIA cards (bootflash, flash, slot0, slot1). It is not needed on the newer ATA-style PCMCIA cards (disk0, disk1, disk2). However, because the **squeeze** command takes several seconds to complete, it should be given only when insufficient disk space exists for a new billing record. To avoid this problem, Cisco recommends using a 64 MB (or larger) ATA-style PCMCIA memory card, which automatically reclaims disk space for deleted files.

## Using SNMP

To transfer billing record file using SNMP commands, you must set a number of objects in the CISCO-FLASH-MIB to transfer the file to a TFTP server. After the file has been successfully transferred, you can then use SNMP commands to delete the billing record file.

**Note** Before proceeding with these steps, ensure that the TFTP server is properly configured to receive to receive the billing records. At the very least, this means creating a directory that is readable and writable by all users. On some servers, the TFTP server software also requires that you create a file with the same name as the file that is to be received, and this file should also be readable and writable by all users.

To transfer a billing record file to a TFTP server, using SNMP commands, you must set a number of objects in the CISCO-FLASH-MIB.

Table 277: Transferring a File to a TFTP Server Using SNMP Commands

| Object                      | Type          | Description                                                                                                                                                                                                                                                                                                         |
|-----------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ciscoFlashCopyEntryStatus   | RowStatus     | Status of this table entry. Typically, this object is first set to 5 (create-and-wait). Then after all other parameters are specified, it is set to Active (1) to execute the command.                                                                                                                              |
| ciscoFlashCopyCommand       | INTEGER       | Type of copy command to be performed. To copy a billing record file to a TFTP server, set this object to 3 (copyFromFlash).                                                                                                                                                                                         |
| ciscoFlashCopyServerAddress | IpAddress     | IP address of the TFTP server.<br><br><b>Note</b> This parameter defaults to the broadcast address of 255.255.255.255, which means it will transfer the billing record file to the first TFTP server that responds. For security, this object should always be set to the IP address of the authorized TFTP server. |
| ciscoFlashCopySourceName    | DisplayString | Name of the billing record file to be transferred, including the Flash device on which it is stored.                                                                                                                                                                                                                |

| Object                           | Type          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ciscoFlashCopyDestinationName    | DisplayString | (Optional) Name for the billing record, including path, on the TFTP server. If not specified, the copy operation defaults to saving the billing record at the top-most directory on the TFTP server, using the original file name.<br><br><b>Note</b> A file with the destination file name should already exist on the TFTP server. This file should be readable and writable by all users, so that it can be replaced with the billing record file. |
| ciscoFlashCopyProtocol           | INTEGER       | (Optional) Specifies the protocol to be used when copying the file. For a TFTP transfer, set this object to 1 (tftp), which is the default.                                                                                                                                                                                                                                                                                                           |
| ciscoFlashCopyNotifyOnCompletion | TruthValue    | (Optional) Specifies whether the Cisco CMTS should generate a trap upon the completion of the copy operation. The default is false (no trap is generated).                                                                                                                                                                                                                                                                                            |

After transferring the billing records file, you must then set a number of objects in the CISCO-FLASH-MIB to delete the file, so that the Cisco CMTS can begin writing a new file. If the Flash memory is not ATA-compatible, you must also set a number of objects to squeeze the Flash memory to make the deleted space available for new files. [Table 278: Deleting a File Using SNMP Commands](#), on page 1571 describes each of these objects, and whether they are required or optional.

**Table 278: Deleting a File Using SNMP Commands**

| Object                             | Type          | Description                                                                                                                                                                                                                                                  |
|------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ciscoFlashMiscOpCommand            | INTEGER       | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>• 3—Delete the file.</li> <li>• 5—Squeeze the Flash memory, so as to recover the deleted space and make it available for new files.</li> </ul>                               |
| ciscoFlashMiscOpDestinationName    | DisplayString | When deleting a file, the name of the file to be deleted, including the name of the file system, up to a maximum of 255 characters.<br><br>When squeezing a file system, the name of the file system to be squeezed (slot0:, slot1:, flash:, or bootflash:). |
| ciscoFlashMiscOpEntryStatus        | RowStatus     | Status of this table entry. Typically, this object is first set to 5 (create-and-wait). Then after all other parameters are specified, it is set to Active (1) to execute the command.                                                                       |
| ciscoFlashMiscOpNotifyOnCompletion | TruthValue    | (Optional) Specifies whether the Cisco CMTS should generate a trap upon the completion of the operation. The default is false (no trap is generated).                                                                                                        |

DETAILED STEPS

**Note** The following steps use the standard SNMP commands that are available on many Unix and Linux systems. For each step, replace *ip-address* with the IP address of the Cisco CMTS, and replace *rw-community-string* with an SNMP community string that provides read-write access to the router.

## Copying the Billing Record File to the TFTP Server

---

**Step 1** The script performing the copy should generate a 32-bit number to be used as the index entry for this copy command. The script can generate this number in any convenient way, so long as the index number is not currently being used for another operation.

**Step 2** Create the table entry for the copy command, by using the number that was generated in Step 1 and setting the `ciscoFlashCopyEntryStatus` object to the create-and-wait state (5):

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopyEntryStatus.582 -i 5
workstation#
```

**Step 3** Set the `ciscoFlashCopyCommand` to 3 (copyFromFlash) to specify that the billing record file should be copied from the router's Flash file system:

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopyCommand
.582
-i 3
workstation#
```

**Step 4** Set the `ciscoFlashCopyServerAddress` object to the IP address of the TFTP server:

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopyServerAddress
.582
-a "172.20.12.193"
workstation#
```

**Step 5** Set the `ciscoFlashCopySourceName` object to the file name, including the device name, of the billing record file to be transferred:

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopySourceName
.582
-D
"slot0:CMTS01_20030211-155025
"
workstation#
```

**Step 6** (Optional) To specify a specific destination on the TFTP server, set the `ciscoFlashCopyDestinationName` object to the path name and file name for the billing record file on the TFTP server. (Typically, the path name and file name should already exist on the TFTP server.)

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopyDestinationName
.582
-D
```

```
"/cmts01-billing/billing-file
"
workstation#
```

**Step 7** To execute the command, set the `ciscoFlashCopyEntryStatus` object to the active state (1):

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopyEntryStatus.582 -i 1
workstation#
```

**Step 8** Periodically poll the `ciscoFlashCopyStatus` object until the file transfer completes:

**Example:**

```
workstation# getmany -v2c ip-address rw-community-string ciscoFlashCopyStatus
.582
ciscoFlashCopyStatus.582 = copyInProgress(1)
workstation# getmany -v2c ip-address rw-community-string ciscoFlashCopyStatus
.582
ciscoFlashCopyStatus.582 = copyInProgress(1)
workstation# getmany -v2c ip-address rw-community-string ciscoFlashCopyStatus
.582
ciscoFlashCopyStatus.582 = copyOperationSuccess(2)
workstation#
```

If the file transfer fails, the most common status values that are reported by the `ciscoFlashCopyStatus` object are:

- 3—`copyInvalidOperation`. This indicates that the operation failed on the TFTP server, typically because the destination file name and path name do not exist on the TFTP server, or they exist but are not writable by all users.
- 5—`copyInvalidSourceName`. The file name for the billing record, as specified in `ciscoFlashCopySourceName` does not exist. Verify that you specified the correct device name and that no spaces exist in the file name.
- 6—`copyInvalidDestName`. The destination path name and file name specified in `ciscoFlashCopyDestinationName` is not accessible on the TFTP server. This could be because the path name does not exist or is not configured to allow write-access. This error could also occur if a file with the same path name and file name already exists on the TFTP server.
- 7—`copyInvalidServerAddress`. The IP address of the TFTP server specified in `ciscoFlashCopyServerAddress` is invalid, or the TFTP server is not responding.
- 14—`copyFileTransferError`. A network error occurred that prevented the file transfer from completing.

**Step 9** After the file transfer has completed successfully, set the `ciscoFlashCopyEntryStatus` object to 6 (delete) to delete the row entry for this copy command:

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashCopyEntryStatus.582 -i 6
workstation#
```

## What to do next

### Deleting the Billing Record File

## Using SNMP

After the billing record file has been successfully transferred, use the following procedure to delete the billing record on the Cisco CMTS flash file system, so that the Cisco CMTS can write the new billing record.

**Step 1** Generate another random number to be used as an index entry and configure the following objects in the ciscoFlashMiscOpTable:

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpEntryStatus
.31 -i 5

workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpCommand
.31 -i 3
workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpDestinationName
.31 -D
"/cmts01-billing/CMTS01_20030211-155025
"
workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpEntryStatus
.31 -i 1

workstation#
```

**Step 2** Periodically poll the ciscoFlashMiscOpStatus object until the file transfer completes:

**Example:**

```
workstation# getmany -v2c ip-address rw-community-string ciscoFlashMiscOpStatus
.31
 ciscoFlashCopyStatus.31 = miscOpInProgress(1)
workstation# getmany -v2c ip-address rw-community-string ciscoFlashMiscOpStatus
.31
 ciscoFlashCopyStatus.582 = miscOpOperationSuccess(2)
workstation#
```

**Step 3** If the Flash memory system is not ATA-compatible (slot0:, slot1:, flash:, or bootflash:), configure the following objects in the ciscoFlashMiscOpTable to squeeze the Flash file system to recover the deleted file space:

**Example:**

```
workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpEntryStatus
.32
-i 5

workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpCommand
.32 -i 5
workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpDestinationName
.32 -D slot0:
workstation# setany -v2c ip-address rw-community-string ciscoFlashMiscOpEntryStatus
.32
-i 1

workstation#
```

## Examples To Transfer Using SNMP

The following SNMP commands transfer a file named CMTS01\_20030211-155025 to a TFTP server at the IP address 10.10.31.3. After the file is successfully transferred, the row entry for this copy command is deleted.

```
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyEntryStatus.582 -i 5

workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyCommand
.582
 -i 3
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyServerAddress
.582
 -a "10.10.31.3"

workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopySourceName
.582 -D
"slot0:CMTS01_20030211-155025
"
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyDestinationName
.582 -D
"/cmts01-billing/CMTS01_20030211-155025
"
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyEntryStatus.582 -i 1

workstation# getmany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyStatus
.582
 ciscoFlashCopyStatus.582 = copyInProgress(1)
workstation# getmany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyStatus
.582
 ciscoFlashCopyStatus.582 = copyOperationSuccess(2)
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashCopyEntryStatus.582 -i 6

workstation#
```

The following commands show a billing record file being deleted on the Cisco CMTS file system, and the deleted file space being recovered by a squeeze operation:

```
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashMiscOpEntryStatus
.31 -i 5

workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashMiscOpCommand
.31 -i 3
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashMiscOpDestinationName
.31 -D
"/cmts01-billing/CMTS01_20030211-155025
"
workstation# setany -v2c 10.8.8.21 rw-string
 ciscoFlashMiscOpEntryStatus
.31 -i 1
```

```

workstation# getmany -v2c 10.8.8.21 rw-string
ciscoFlashMiscOpStatus
.31
 ciscoFlashCopyStatus.31 = miscOpInProgress(1)
workstation# getmany -v2c 10.8.8.21 rw-string
ciscoFlashMiscOpStatus
.31
 ciscoFlashCopyStatus.582 = miscOpOperationSuccess(2)
workstation# setany -v2c 10.8.8.21 rw-string
ciscoFlashMiscOpEntryStatus
.32 -i 5

workstation# setany -v2c 10.8.8.21 rw-string
ciscoFlashMiscOpCommand
.32 -i 5
workstation# setany -v2c 10.8.8.21 rw-string
ciscoFlashMiscOpDestinationName
.32 -D slot0:
workstation# setany -v2c 10.8.8.21 rw-string
ciscoFlashMiscOpEntryStatus
.32 -i 1

workstation#

```

## Disabling the Usage-based Billing Feature

This section describes how to disable the Usage-based Billing. Giving this command immediately stops the collection of billing information. If a billing record is currently written or being streamed to an external server, the CMTS completes the operation before disabling the usage-based billing feature.

### Procedure

|        | Command or Action                                                                                                | Purpose                                                                                               |
|--------|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Router> enable<br><b>Example:</b><br>Router#                                 | Enables privileged EXEC mode. Enter your password if prompted.                                        |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal<br><b>Example:</b><br>Router(config)# | Enters global configuration mode.                                                                     |
| Step 3 | <b>no cable metering</b><br><b>Example:</b>                                                                      | Immediately disables the Usage-based Billing feature and stops the collection of billing information. |

|               | Command or Action                                                                                                                                                                                       | Purpose                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
|               | <pre>Router(config)# no cable metering</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                                                                                          |                                                                           |
| <b>Step 4</b> | <p><b>no snmp-server enable traps cable metering</b></p> <p><b>Example:</b></p> <pre>Router(config)# no snmp-server enable traps cable metering</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre> | (Optional) Disables SNMP traps for usage-based billing events.            |
| <b>Step 5</b> | <p><b>no cable sflog</b></p> <p><b>Example:</b></p> <pre>Router(config)# no cable sflog</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                                         | (Optional) Disables the logging of deleted service flows.                 |
| <b>Step 6</b> | <p><b>no cable metering source-interface</b></p> <p><b>Example:</b></p> <pre>Router(config)# no cable metering source-interface</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                 | (Optional) Disables a specified source-interface for the billing packets. |
| <b>Step 7</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Router(config)# exit</pre> <p><b>Example:</b></p> <pre>Router#</pre>                                                                                     | Exits global configuration mode.                                          |

## Configuring Certified SSL Servers for Usage-Based Billing

Cisco introduces adds support for the Secure Socket Layer (SSL) Server, used with the usage-based billing feature of the Cisco CMTS. Usage-based billing implements the DOCSIS Subscriber Account Management Interface Specification (SAMIS) format.

This new capability enables the configuration of the SSL server between the Cisco CMTS and a collection server. Certificate creation steps and **debug** commands are added or enhanced to support the SSL Server and certificates. This section describes general steps.

Refer also to the [Configuring the Cisco CMTS for SSL Operation, on page 1567](#) section.

## Generating SSL Server Certification

These general steps describe the creation and implementation of certification for the Secure Socket Layer (SSL) Server.

1. Generate the CA key.
2. Set up the open SSL environment, to include directory and sub-directory.
3. Copy files to the appropriate directories.
4. Generate the SSL Server certification request.
5. Grant the SSL Server certification request.
6. Convert the SSL Server certification to DER format.
7. Copy the SSL certification to Bootflash memory (write mem).
8. Start the SSL server.

## Configuring and Testing the Cisco CMTS for Certified SSL Server Support

Perform the following steps to configure the Cisco router to support the SSL Server and certification.

### Procedure

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                              | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                         | <p>Enters global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <p><b>ip domain name <i>domain</i></b></p> <p><b>Example:</b></p> <pre>Router(config)# ip domain name Cisco.com</pre> | <p>Defines a default domain name that the Cisco IOS software uses to complete unqualified host names (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name.</p> <p><b>Note</b> See the <a href="#">Domain Name System (DNS)</a> document on Cisco.com for additional DNS information.</p> |
| <b>Step 4</b> | <p><b>crypto key generate rsa</b></p> <p><b>Example:</b></p>                                                          | <p>Generates RSA key pairs.</p>                                                                                                                                                                                                                                                                                                                                             |

|                | Command or Action                                                                                                                                                               | Purpose                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
|                | Router(config)# crypto key generate rsa                                                                                                                                         |                                                                                         |
| <b>Step 5</b>  | <p>Ctrl-Z</p> <p><b>Example:</b></p> <pre>Router(config)# Ctrl-Z</pre> <p><b>Example:</b></p> <pre>Router#</pre>                                                                | Returns to privileged EXEC mode.                                                        |
| <b>Step 6</b>  | <p><b>test cable read certificate</b></p> <p><b>Example:</b></p> <pre>Router# test cable read certificate</pre>                                                                 | Verifies the certificate is valid and operational on the Cisco CMTS.                    |
| <b>Step 7</b>  | <p><b>show crypto ca certificate</b></p> <p><b>Example:</b></p> <pre>Router# show crypto ca certificate</pre>                                                                   | Displays the available certificates on the Cisco CMTS.                                  |
| <b>Step 8</b>  | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> <p><b>Example:</b></p> <pre>Router(config)#</pre>                                 | Enters global configuration mode.                                                       |
| <b>Step 9</b>  | <p><b>cable metering destination ip-addr num-1 num-2 num-3 secure</b></p> <p><b>Example:</b></p> <pre>Router(config)# cable metering destination 1.7.7.7 6789 0 15 secure</pre> | Defines the destination IP address for cable metering, to be used with the certificate. |
| <b>Step 10</b> | <p>test cable metering</p> <p><b>Example:</b></p> <pre>Router# test cable metering</pre>                                                                                        | Tests cable metering in light of the supported SSL server and metering configuration.   |

## Monitoring the Usage-based Billing Feature

To display the most current billing record, use the **show cable metering-status** command. The following example shows typical output when usage-based billing is configured to write the billing records to a local file system:

```
CMTS01# show cable metering-status
```

```
destination complete-time flow cpe status
 aggr suppress
disk0:R7519-UBR7246-20000308-004428 Jun 12 09:33:05 No No success
CMTS01#
```

The following example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to stream the billing records to an external server:

```
Router# show cable metering-status
```

```
destination complete-time flow cpe full status
 aggr supp rec
10.11.37.2 :1234 Jun 12 09:33:05 No No No success
Router#
```

The following example shows a typical output for the **show cable metering-status** command using verbose option:

```
Router# show cable metering-status verbose
Last export status
Destination : disk0:sunethra10k-20070129-190423
Complete Time : Jan29 19:04:38
Flow Aggregate : No
Full records : No
Cpe list suppression : No
Source interface : FastEthernet0/0/0
Status of last export : success
Current export status : In progress
```

The following example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to use the IPDR Exporter to stream the billing records to an external server:

```
Router# show cable metering-status
destination complete-time flow cpe full status
 aggr supp rec
IPDR_Session2 Apr12 16:51:15 No No No success
```

The following example shows a typical output for the verbose form of the **show cable metering-status** command when usage-based billing is configured to use the IPDR Exporter to stream the billing records to an external server:

```
Router# show cable metering-status
verbose

Last export status
Destination : IPDR_Session2
Complete Time : Apr12 16:51:15
Flow Aggregate : No
Full records :No
Cpe list suppression : No
Source interface : Not defined
Status of last export : success
```

**Note** If the **show cable metering-status** command displays the status of a streaming operation as “success” but the records were not received on the billing application server, verify that the Cisco CMTS and server are configured for the same type of communications (non-secure TCP or secure SSL). If the Cisco CMTS is configured for non-secure TCP and the server is configured for secure SSL, the Cisco CMTS transmits the billing record successfully, but the server discards all of the data, because it did not arrive in a secure SSL stream.

**Tip** The **show cable metering-status** command continues to show the status of the last billing record operation, until that billing record is deleted. If the record is not deleted, no new records are created.

To display information about the state of the IPDR Exporter, use the **show ipdr Exporter** command. The following example shows typical output:

```
Router#configure terminal
Router#show ipdr exporter
```

IPDR exporter is started.

## Configuration Examples for Usage-based Billing

This section lists the following sample configurations for the Usage-based Billing feature:

### File Mode Configuration (with Secure Copy)

The following excerpt from a configuration file shows a typical configuration for the Usage-based Billing feature when operating in file mode and enabling Secure Copy (SCP) for file transfers.

```
!
cable metering filesystem disk1:
snmp-server enable traps cable metering
...
aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
username billingapp level 15 password 7 billing-password
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

### Non-Secure Streaming Mode Configuration

The following excerpt from a configuration file shows a typical configuration for the Usage-based Billing feature when operating in streaming mode and specifying both a primary and a secondary external server. The data is sent using standard TCP packets, without any security.

```
cable metering destination 10.10.10.171 5321 10.10.10.173 5321 2 30 non-secure
```

```
snmp-server enable traps cable metering
```

The following excerpt from a configuration file shows a typical configuration for the Usage-based Billing feature when operating in streaming mode and specifying only a primary external server:

```
cable metering destination 10.10.11.181 6789 2 30 non-secure
snmp-server enable traps cable metering
```

---

**Note** You must ensure that the billing application server is configured for standard TCP communications. If the billing application server is configured for SSL communications when the Cisco CMTS is configured for standard TCP, the Cisco CMTS is able to send the billing records to the server, but the server discards all of that information because it is not arriving in a secure stream.

---

## Secure Streaming Mode Configuration

The following excerpt from a configuration file shows a typical configuration for the Usage-based Billing feature when operating in streaming mode and specifying only a primary external server. Secure socket layer (SSL) TCP connections are used to transmit the data, which requires the configuration of a digital certificate.

```

# CHAPTER 104

## Frequency Allocation Information for the Cisco CMTS Routers

- [Frequency Allocation for the Cisco CMTS Routers, on page 1583](#)

### Frequency Allocation for the Cisco CMTS Routers

The table below provides information about the NTSC 6-MHz channel bands:

**Table 279: NTSC Cable Television Channels and Relative Frequencies in MHz**

| Channel Number | Bandwidth     | Video Carrier | Color Carrier | Audio Carrier |
|----------------|---------------|---------------|---------------|---------------|
| T 7            | 5.75 - 11.75  | 7             | 10.58         | 11.5          |
| T 8            | 11.75 - 17.75 | 13            | 16.58         | 17.5          |
| T9             | 17.75-23.75   | 19            | 22.58         | 23.5          |
| T10            | 23.75-29.75   | 25            | 28.58         | 29.5          |
| T11            | 29.75-35.75   | 31            | 34.58         | 35.5          |
| T12            | 35.75-41.75   | 37            | 40.58         | 41.5          |
| T13            | 41.75-47.75   | 43            | 46.58         | 47.5          |
| TV-IF          | 40.0-46.0     | 45.75         | 42.17         | 41.25         |
| 2-2            | 54.0-60.0     | 55.25         | 58.83         | 59.75         |
| 3-3            | 60.0-66.0     | 61.25         | 64.83         | 65.75         |
| 4-4            | 66.0-72.0     | 67.25         | 70.83         | 71.75         |
| 5-5            | 76.0-82.0     | 77.25         | 80.83         | 81.75         |
| 6-6            | 82.0-88.0     | 83.25         | 86.83         | 87.75         |

| Channel Number | Bandwidth   | Video Carrier | Color Carrier | Audio Carrier |
|----------------|-------------|---------------|---------------|---------------|

## CHAPTER 105

# Flap List Troubleshooting

---

This document describes how to configure and use the Flap List Troubleshooting feature on the Cisco Cable Modem Termination System (CMTS) routers. The flap list is a patented tool for the Cisco CMTS routers to diagnose potential problems with a particular cable modem or with a particular cable interface. The flap list tracks "flapping" cable modems, which are cable modems that have intermittent connectivity problems. Excessive flapping could indicate a problem with a particular cable modem or with the upstream or downstream portion of the cable plant.

## Finding Feature Information

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 281: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Prerequisites for Flap List Troubleshooting

- To configure and access the flap list using SNMP commands, you must be using an SNMPv3 manager and have configured the Cisco CMTS router for SNMP operations.

## Restrictions for Flap List Troubleshooting

- The Flap List Troubleshooting feature can be used only with two-way cable modems. The flap-list does not support telco-return cable modems or set-top boxes.

**Note**

Since the cable flap list was originally developed, polling mechanisms have been enhanced to have an increased rate of 1/sec when polls are missed. Cable modems can go offline faster than the frequency hop period, which can cause the frequency to stay fixed while cable modems go offline. To compensate for this, reduce the hop period to 10 seconds.

# Information About Flap List Troubleshooting

This section describes the following information about the Flap List Troubleshooting feature:

## Feature Overview

The Flap List Troubleshooting is a patented tool that is incorporated in the Cisco IOS software for the Cisco Cable Modem Termination System (CMTS) routers. The flap list tracks “flapping” cable modems, which are cable modems that have intermittent connectivity problems. A flapping cable modem can indicate either a problem with that particular cable modem, or it could indicate an RF noise problem with the upstream or downstream portion of the cable plant.

The flap-list feature supports any cable modem that conforms to the Data-over-Cable Service Interface Specifications (DOCSIS) because it does not use any special messaging to poll cable modems or to request any special information from them. Instead, this feature monitors the normal registration and station maintenance activity that is already performed over a DOCSIS cable network.

This allows the Cisco CMTS to collect the flap-list data without generating additional packet overhead and without impacting network throughput and performance. It also means that although the Flap List Troubleshooting feature is a proprietary feature for Cisco CMTS routers, it is compatible with all DOCSIS-compliant cable modems. In addition, unlike other monitoring methods that use the Simple Network Management Protocol (SNMP), the flap list uses zero bandwidth.

## Information in the Flap List

The Flap List Troubleshooting feature tracks the following situations:

- **Reinsertions**—A reinsertion occurs when the cable modem re-registers more frequently than the user-specified insertion time. A pattern of reinsertions can indicate either potential problems in the downstream or that the cable modem is being improperly provisioned.
- **Hits and Misses**—A hit occurs when a cable modem successfully responds to the station maintenance messages (MAC-layer “keepalive” messages) that the Cisco CMTS sends out to conform to the DOCSIS standard. A miss occurs when the cable modem does not respond to the request within the user-specified timeout period. A pattern of misses can indicate a potential problem in either the downstream or upstream path, or that a problem can be occurring in the registration process.
- **Power Adjustments**—DOCSIS cable modems can adjust their upstream transmission power levels to adjust to unstable cable plant signal levels, up to a maximum allowable power level. Repeated power adjustments usually indicate a problem with an amplifier in the upstream return path.

The flap-list feature is automatically enabled, but to use the flap list effectively, the cable system administrator should also typically do the following:

- Set up a script to periodically poll the flap list, for example, every 15 minutes.
- Examine the resulting data and perform trend analysis to identify cable modems that are consistently in the flap list.
- Query the billing and administrative database for cable modem MAC address-to-street address translation and generate a report. The reports can be given to the customer service department or the cable plant’s operations and maintenance department. Using these reports, maintenance personnel can quickly discern how characteristic patterns of flapping cable modems, street addresses, and flap statistics indicate which

amplifier or feeder lines are faulty. The reports also help to quickly discern whether problems exist in your downstream or upstream path and whether the problem is ingress noise or equipment related.

The flap list provides a quick way to quickly diagnose a number of possible problems. For example, if a subscriber reports a problem, but the flap list for the cable interface that is providing services to them shows little or no flap-list activity, the cable technician can assume that the Cisco CMTS and cable plant are communicating reliably. The problem, therefore, is probably in the subscriber's computer equipment or in the local connection to the cable modem.

Similarly, a cable technician can use the pattern of reinsertions, hits and misses, and power adjustments to quickly troubleshoot the following types of problems:

- If a subscriber's cable modem shows a lot of flap-list activity, it is having some kind of communication problem. Either the cable modem's hardware is faulty, its installation is faulty, the coaxial cable being used is faulty, or some portion of the cable plant that services this cable modem is faulty.
- Focus on the top 10 percent of cable modems that are most active in the flap list, since these are the most likely to indicate consistent and pervasive plant or equipment problems that will continue to disrupt communication with the headend.
- Cable modems with more than 50 power adjustments per day have a suspect upstream path.
- Cable modems with approximately the same number of hits and misses and with a lot of insertions have a suspect downstream path (for example, low level into the cable modem).
- All cable modems incrementing the insertion at the same time indicates a problem with the provisioning servers.
- Cable modems with high cyclic redundancy check (CRC) errors have bad upstream paths or in-home wiring problems.
- Correlating cable modems on the same physical upstream port with similar flap-list statistics can quickly resolve outside plant problems to a particular node or geography.

In addition, the cable network administrators can use the flap list to collect quality control and upstream performance data. Typically, the network operations center (NOC) saves the flap list to a database on a local computer on a daily basis, providing the ability to generate reports that track upstream performance and installation quality control, as well as to provide trend reports on cable plant problems.

---

**Tip** The system supports automatic power adjustments. The show cable flap-list and show cable modem commands indicate when the headend cable router has detected an unstable return path for a particular modem and has compensated with a power adjustment. An asterisk (\*) appears in the power-adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the modem has reached its maximum power-transmit level and cannot increase its power level any further.

---

## Cisco Cable Manager and Cisco Broadband Troubleshooter

The Flap List Troubleshooting feature is supported by Cisco Cable Manager (CCM), Release 2.0 or later, which is a UNIX-based software suite that manages routers and DOCSIS-compliant cable modems, generates performance reports, troubleshoots connectivity problems, views the network graphically, and edits DOCSIS configuration files. You can access the CCM locally from the CCM server console or remotely from a UNIX workstation or a PC.

The Flap List Troubleshooting feature also works together with the Cisco Broadband Troubleshooter (CBT), which is a graphical-based application to manage and diagnose problems on the hybrid fiber-coaxial (HFC)

network. Radio frequency (RF) technicians can quickly isolate plant and provisioning problems and characterize upstream and downstream trouble patterns, including analyzing flapping modems.

## Benefits

The Flap List Troubleshooting feature is a proactive way to manage and troubleshoot problems on an HFC network. Its use of passive monitoring is more scalable and efficient than techniques that send special messages to cable modems or that regularly poll the cable modems using Simple Network Management Protocol (SNMP) commands. Because it uses mechanisms that already exist in a DOCSIS network, it can be used with any DOCSIS-certified cable modem or set-top box.

The flap list provides a cable technician with both real-time and historical cable health statistics for quick, accurate problem isolation and network diagnosis. Using the flap list, a cable technician is able to do the following:

- Quickly learn how to characterize trouble patterns in the hybrid fiber-coaxial (HFC) network.
- Determine which amplifier or feeder line is faulty.
- Distinguish an upstream path problem from a downstream one.
- Isolate an ingress noise problem from a plant equipment problem.

## How to Configure Flap List Troubleshooting

This section describes how to configure the flap list operation on the Cisco CMTS. You can use either the command-line interface (CLI) commands or Simple Network Management Protocol (SNMP) commands to configure the flap list, to remove a cable modem from the list, or to clear the flap-list counters.

### Configuring Flap List Operation Using the CLI (optional)

To configure the operation of the flap list, use the following procedure, beginning in EXEC mode. This procedure is optional, unless you want to change the default values for the flap list.

**Procedure**

|        | Command or Action                                                                             | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                      | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre> | Enters global configuration mode.                              |

## Clearing the Flap List and Counters Using the CLI (optional)

|               | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>cable flap-list insertion-time</b> <i>seconds</i><br><b>Example:</b><br>Router(config)# cable flap-list insertion-time 3600         | (Optional) Specifies the minimum insertion (registration) time interval in seconds. Any cable modem that makes a registration request more frequently than this period of time is placed in the flap list.                                                                                                                                       |
| <b>Step 4</b> | <b>cable flap-list power-adjust threshold</b> <i>db</i><br><b>Example:</b><br>Router(config)# cable flap-list power-adjust threshold 5 | (Optional) Specifies the minimum power adjustment, in dB, that constitutes a flap-list event.<br><br><b>Note</b> A threshold of less than 2 dB can cause excessive flap-list event recording. If you need to change this parameter from its default, Cisco recommends setting it to 3 dB or higher.                                              |
| <b>Step 5</b> | <b>cable flap-list miss-threshold</b> <i>misses</i><br><b>Example:</b><br>Router(config)# cable flap-list miss-threshold 10            | (Optional) Specifies the number of MAC-layer station maintenance (keepalive) messages that can be missed in succession before the CMTS places the cable modem in the flap list.<br><br><b>Note</b> A high miss rate indicates potential plant problems, such as intermittent upstream problems, fiber laser clipping, or common-path distortion. |
| <b>Step 6</b> | <b>cable flap-list aging</b> <i>minutes</i><br><b>Example:</b><br>Router(config)# cable flap-list aging 20160                          | (Optional) Specifies how long, in minutes, the Cisco CMTS should keep information for cable modems in the flap list.                                                                                                                                                                                                                             |
| <b>Step 7</b> | <b>cable flap-list size</b> <i>number</i><br><b>Example:</b><br>Router(config)# cable flap-list size 4000                              | Specifies the maximum number of cable modems that can be kept in the flap list.<br><br><b>Tip</b> To avoid wasting processor memory, do not set this value beyond the actual number of cable modems being serviced by the Cisco CMTS.                                                                                                            |
| <b>Step 8</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# exit                                                                                 | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                 |

## Clearing the Flap List and Counters Using the CLI (optional)

To clear one or more cable modems from the flap list, or to clear the flap list counters for one or more cable modems (while still keeping the modems in the flap list), use the following procedure, beginning in EXEC mode.

**Procedure**

|               | <b>Command or Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Purpose</b>                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <p><b>clear cable flap-list <i>mac-addr</i>   all} [save-counters]</b></p> <p><b>Example:</b></p> <pre>Router# clear cable flap-list 0102.0304.0506 save-counters</pre> <p><b>Example:</b></p> <pre>Router# clear cable flap-list 000C.0102.0304</pre>                                                                                                                                                                                                                                 | <p>Clears one or all cable modems from the flap list.</p>                                                                 |
| <b>Step 3</b> | <p><b>clear cable modem {<i>mac-addr</i>   <i>ip-addr</i>   [<i>cable interface</i>] all   <i>ouistring</i>   reject} } counters</b></p> <p><b>Example:</b></p> <pre>Router# clear cable modem 172.12.23.45 counters</pre> <p><b>Example:</b></p> <pre>Router# clear cable modem oui Cisco counters</pre> <p><b>Example:</b></p> <pre>Router# clear cable modem reject counters</pre> <p><b>Example:</b></p> <pre>Router# clear cable modem c4/0 counters</pre> <p><b>Example:</b></p> | <p>Sets the flap-list counters to zero for one or more CMs.</p>                                                           |

## Enabling or Disabling Power Adjustment Using the CLI (optional)

The Cisco CMTS can automatically monitor a cable modem’s power adjustments and determine whether a particular cable modem requires a change in the power adjustment method. To enable a cable interface to make automatic power adjustments, and to set the frequency threshold for when those adjustments are made, use the following procedure, beginning in EXEC mode.

## Procedure

|               | Command or Action                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                   | Enters global configuration mode.                                                                                                                                                  |
| <b>Step 3</b> | <b>interface cable <i>x/y</i></b><br><b>Example:</b><br>Router(config)# interface cable 4/0                                                                                                                                                                                                  | Enters cable interface configuration mode for the specified cable interface.                                                                                                       |
| <b>Step 4</b> | <b>cable upstream <i>n</i> power-adjust {continue <i>pwr-level</i>   noise <i>perc-pwr-adj</i>   threshold value}</b><br><b>Example:</b><br>Router(config-if)# cable upstream 0 power-adjust threshold 2<br><br><b>Example:</b><br>Router(config-if)# cable upstream 0 power-adjust noise 50 | Enables automatic power adjustment on an upstream port for this cable interface.<br><br><b>Note</b> Repeat 4 for each upstream port on the cable interface.                        |
| <b>Step 5</b> | <b>cable upstream <i>n</i> freq-adj averaging <i>percent</i></b><br><b>Example:</b><br>Router(config-if)# cable upstream 0 freq-adj averaging 50                                                                                                                                             | Specifies the percentage of frequency adjustment packets needed to change the adjustment method from the regular power-adjustment method to the automatic power adjustment method. |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                                                                                                                                    | Exits interface configuration mode.                                                                                                                                                |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                                                                                       | Exits global configuration mode.                                                                                                                                                   |

**What to do next**

**Caution** The default settings are adequate for system operation. Amplitude averaging is an automatic procedure. In general, Cisco does not recommend that you adjust values. Cisco does recommend, however, that you clean up your cable plant should you encounter flapping cable modems.

**Note** In some instances, you might adjust certain values for the **cable upstream power-adjust** command: If CMs cannot complete ranging because they have reached maximum power levels, increase the **continue pwr-level** parameter beyond the default value of 2 dB. Values larger than 10 dB on “C” versions of cable interface line cards, or 5 dB on FPGA versions, are not recommended. If the flap list shows CMs with a large number of power adjustments, but the CMs are not detected as “noisy,” decrease the **noise perc-pwr-adj** value. If too many CMs are unnecessarily detected as “noisy,” increase the percentage.

## Configuring Flap List Operation Using SNMP (optional)

To configure the Flap List Troubleshooting feature on the Cisco CMTS using SNMP, set the appropriate `cssFlapObjects` attributes in the `CISCO-CABLE-SPECTRUM-MIB`. The table lists each of the configurable attributes:

*Table 282: Flap-List Configuration Attributes*

| Attribute                                | Type       | Range                    | Description                                                                                                                                                                                                 |
|------------------------------------------|------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>cssFlapListMaxSize</code>          | Integer32  | 1 to 65536 <sup>13</sup> | The maximum number of modems that a flap list can support per line card. The default is 100. <sup>14</sup>                                                                                                  |
| <code>cssFlapListCurrentSize</code>      | Integer32  | 1 to 65536               | The current number of modems in the flap list. <sup>15</sup>                                                                                                                                                |
| <code>cssFlapAging</code>                | Integer32  | 1 to 86400               | The flap entry aging threshold in minutes. The default is 10080 minutes (180 hours or 7 days).                                                                                                              |
| <code>cssFlapInsertionTime</code>        | Integer32  | 60 to 86400              | The worst-case insertion time, in seconds. If a cable modem has not completed the registration stage within this interval, the cable modem is inserted into the flap list. The default value is 90 seconds. |
| <code>cssFlapPowerAdjustThreshold</code> | Integer32  | 1 to 10                  | When the power of the modem is adjusted beyond the power adjust threshold, the modem is inserted into the flap list.                                                                                        |
| <code>cssFlapMissThreshold</code>        | Unsigned32 | 1 to 12                  | When a cable modem does not acknowledge this number of consecutive MAC-layer station maintenance (keepalive) messages, the cable modem is placed in the flap list.                                          |

<sup>13</sup> The allowable range when using SNMP for these parameters is 1 to 65536 (a 32-bit value), but the valid operational range is 1 to 8191.

<sup>14</sup> This value is the same as set by the **cable flap-list size** command and is applied only to the command output. The flap list entries displayed via SNMP are not affected by this.

<sup>15</sup> The number of SNMP entries is the same as this value. The number of the CLI entries depends on the value set by **cssFlapListMaxSize**.

**Note** `ccsFlapListMaxSize` controls the display of the flap list per downstream cable interface. As long as the number of flap list entries per line card does not exceed 8191, these entries will be stored in the system, and will not be displayed via CLI.

`ccsFlapListCurrentSize` reflects the number of flap list entries of all the line cards that in the system, regardless of their visibility to the CLI.

## Clearing the Flap List and Counters Using SNMP (optional)

To remove a cable modem from the flap list or to clear one or all of the flap-list counters, set the appropriate `ccsFlapObjects` attributes in the CISCO-CABLE-SPECTRUM-MIB. The table lists the attributes that clear the SNMP counters.

Table 283: Attributes to Clear the Flap List

| Attribute                    | Type    | Description                                                                                                                                                                                                                     |
|------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ccsFlapResetAll</code> | Boolean | Setting this object to True (1) resets all flap-list counters to zero.                                                                                                                                                          |
| <code>ccsFlapClearAll</code> | Boolean | Setting this object to True (1) removes all cable modems from the flap list, and destroys all entries in the <code>ccsFlapTable</code> . If a modem keeps flapping, the modem is added again into the flap list as a new entry. |

**Note** The `ccsFlapLastClearTime` attribute contains the date and time that the entries in the `ccsFlapTable` table were last cleared.

## How to Monitor and Troubleshoot Using Flap Lists

### Displaying the Flap List Using the show cable flap-list Command

To display the current contents of the flap list, use the `show cable flap-list` command in privileged EXEC mode. This command has the following syntax:

- **show cable flap-list**—Displays the complete flap list.
- **show cable flap-list sort-interface**—Displays the complete flap list sorted by cable interface.
- **show cable flap-list cable *interface* upstream *port***—Displays the flap list for a specific cable interface, or for a specific upstream port on that cable interface.

To change the way the output is sorted, add one of the following optional keywords:

- **sort-flap**—Sorts the output by the number of times that the cable modem has flapped.
- **sort-time**—Sorts the output by the most recent time that the cable modem flapped.

The following example shows typical output of the **show cable flap-list** command.

```

Router# show cable flap-list
Mac Addr CableIF Ins Hit Miss CRC P-Adj Flap Time
0010.9500.461f C1/0 U1 56 18857 887 0 1 116 Jun 1 14:09:12

## Displaying the Flap List Using the show cable modem flap Command

To display the contents of the flap list for a specific cable modem, use the **show cable modem flap** command in privileged EXEC mode. This command has the following syntax:

- **show cable modem** [*ip-address* | *mac-address*] **flap**—Displays the flap list for a specific cable modem, as identified by its IP address or MAC address.
- **show cable modem cable***interface* [**upstream port**] **flap**—Displays the flap list for all cable modems on a specific cable interface.

**Note** The **show cable modem flap** command displays information similar to that shown by the **show cable flap-list** command, except it displays this information on a per-modem basis.

The following example shows sample output for the **show cable modem flap** command for a particular cable modem:

```

Router# show cable modem 0010.7bb3.fcd1 flap
MAC Address I/F Ins Hit Miss CRC P-Adj Flap Time
0010.7bb3.fcd1 C5/0/U5 0 36278 92 0 369 372 Jun 1 13:05:23 (18000msec)

```

The following example shows sample output for the **show cable modem flap** command for all cable modems on a specific cable interface:

```

Router# show cable modem cable 6/0/0 flap
MAC Address I/F Ins Hit Miss CRC P-Adj Flap Time
0025.2e34.4386 C6/0/0/U0 0 46778 3980 0 0 0 (14212 msec)

0025.2e2f.d490 C6/0/0/U0 0 48029 1819 0 0 0 (--)

```

## Displaying the Flap List Using SNMP

To display the contents of the flap list using SNMP, query the `ccsFlapTable` table in the CISCO-CABLE-SPECTRUM-MIB. This table contains an entry for each cable modem. The table briefly describes each attribute in this table.

Table 284: `ccsFlapTable` Attributes

| Attribute                              | Type           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ccsFlapMacAddr</code>            | MacAddress     | MAC address of the cable modem's cable interface. Identifies a flap-list entry for a flapping cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>ccsFlapUpstreamIfIndex</code>    | InterfaceIndex | Upstream being used by the flapping cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>ccsFlapDownstreamIfIndex</code>  | InterfaceIndex | Downstream being used by the flapping cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>ccsFlapLastFlapTime</code>       | DateAndTime    | Time stamp for the last time the cable modem flapped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>ccsFlapCreateTime</code>         | DateAndTime    | Time stamp that this entry was added to the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>ccsFlapRowStatus</code>          | RowStatus      | Control attribute for the status of this entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>ccsFlapInsertionFailNum</code>   | Unsigned32     | Number of times the CM comes up and inserts itself into the network. This counter is increased when the time between initial link establishment and a reestablishment was less than the threshold parameter configured using the <b>cable flap-list insertion-time</b> command or <code>ccsFlapInsertionTime</code> attribute.<br><br>When the cable modem cannot finish registration within the insertion time ( <code>ccsFlapInsertionTime</code> ), it resends the Initial Maintenance packet. When the CMTS receives the packet sooner than expected, the CMTS increments this counter. |
| <code>ccsFlapHitNum</code>             | Unsigned32     | Number of times the CM responds to MAC-layer station maintenance (keepalive) messages. (The minimum hit rate is once per 30 seconds.)                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>ccsFlapMissNum</code>            | Unsigned32     | Number of times the CM misses and does not respond to a MAC-layer station maintenance (keepalive) message. An 8 percent miss rate is normal for the Cisco cable interface line cards. If the CMTS misses a ranging request within 25 msec, then the miss number is incremented.                                                                                                                                                                                                                                                                                                             |
| <code>ccsFlapCrcErrorNum</code>        | Unsigned32     | Number of times the CMTS upstream receiver flagged a packet with a CRC error. A high value indicates that the cable upstream may have a high noise level. The modem may not be flapping yet, but this could become a possible problem.                                                                                                                                                                                                                                                                                                                                                      |
| <code>ccsFlapPowerAdjustmentNum</code> | Unsigned32     | Number of times the cable modem upstream transmit power is adjusted during station maintenance. When the adjustment is greater than the power-adjustment threshold, the number is incremented.                                                                                                                                                                                                                                                                                                                                                                                              |

| Attribute            | Type        | Description                                                                                                                                                                                                                                                                             |
|----------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccsFlapTotalNum      | Unsigned32  | Number of times a modem has flapped, which is the sum of the following: <ul style="list-style-type: none"> <li>• When ccsFlapInsertionFailNum is increased</li> <li>• When the CMTS receives a miss followed by a hit</li> <li>• When ccsFlapPowerAdjustmentNum is increased</li> </ul> |
| ccsFlapResetNow      | Boolean     | Setting this object to True (1) resets all flap-list counters to zero.                                                                                                                                                                                                                  |
| ccsFlapLastResetTime | DateAndTime | Time stamp for when all the counters for this particular entry were reset to zero.                                                                                                                                                                                                      |

## Displaying Flap-List Information for Specific Cable Modems

To use SNMP requests to display flap-list information for a specific cable modem, use the cable modem’s MAC address as the index to retrieve entries from the ccsFlapTable. Use the following procedure to retrieve flap-list entries for a particular cable modem.

- 
- Step 1** Convert the cable modem’s MAC address into a dotted decimal string. For example, the MAC address 000C.64ff.eb95 would become 0.12.100.255.235.149.
- Step 2** Use the dotted decimal version of the MAC address as the instance for requesting information from the ccsFlapTable. For example, to retrieve the ccsFlapHits, ccsFlapMisses, and ccsFlapPowerAdjustments values for this cable modem, you would make an SNMP request for the following objects:
- ccsFlapHits.0.12.100.255.235.149
  - ccsFlapMisses.0.12.100.255.235.149
  - ccsFlapPowerAdjustments.0.12.100.255.235.149
- 

### Example

Assume that you want to retrieve the same flap-list information as the **show cable flap-list** command for a cable modem with the MAC address of 000C.64ff.eb95:

```
Router# show cable flap-list
MAC Address Upstream Ins Hit Miss CRC P-Adj Flap Time
000C.64ff.eb95 Cable3/0/U4 3314 55605 50460 0 *42175 47533 Jan 27 02:49:10
Router#
```

Use an SNMP tool to retrieve the ccsFlapTable and filter it by the decimal MAC address. For example, using the standard Unix **getone** command, you would give the following command:

```
csh% getmany -v2c 192.168.100.121 public ccsFlapTable | grep 0.12.100.255.235.149

ccsFlapUpstreamIfIndex.0.12.100.255.235.149 = 15
ccsFlapDownstreamIfIndex.0.12.100.255.235.149 = 17
ccsFlapInsertionFails.0.12.100.255.235.149 = 3315
ccsFlapHits.0.12.100.255.235.149 = 55608
ccsFlapMisses.0.12.100.255.235.149 = 50460
ccsFlapCrcErrors.0.12.100.255.235.149 = 0
```

```

ccsFlapPowerAdjustments.0.12.100.255.235.149 = 42175
ccsFlapTotal.0.12.100.255.235.149 = 47534
ccsFlapLastFlapTime.0.12.100.255.235.149 = 07 d4 01 1b 02 33 1a 00
ccsFlapCreateTime.0.12.100.255.235.149 = 07 d4 01 16 03 23 22 00
ccsFlapRowStatus.0.12.100.255.235.149 = active(1)
ccsFlapInsertionFailNum.0.12.100.255.235.149 = 3315
ccsFlapHitNum.0.12.100.255.235.149 = 55608
ccsFlapMissNum.0.12.100.255.235.149 = 50460
ccsFlapCrcErrorNum.0.12.100.255.235.149 = 0
ccsFlapPowerAdjustmentNum.0.12.100.255.235.149 = 42175
ccsFlapTotalNum.0.12.100.255.235.149 = 47534
ccsFlapResetNow.0.12.100.255.235.149 = false(2)
ccsFlapLastResetTime.0.12.100.255.235.149 = 07 d4 01 16 03 20 18 00
csh%

```

To request just one particular value, use the decimal MAC address as the instance for that object:

```

csh% getone -v2c 172.22.85.7 public ccsFlapMisses.0.12.100.255.235.149

ccsFlapMisses.0.12.100.255.235.149 = 50736
csh %

```

## Troubleshooting Suggestions

This section provides tips on how to interpret the flap-list counters, as well as how to determine the optimum power level for a flapping cable modem.

### Troubleshooting Tips

This section includes suggestions on how to interpret different network conditions based on the flap-list statistics:

- Condition 1: Low miss or hit ratio, low insertion, low P-Adj, low flap counter, and old time stamp. Analysis: This exhibits an optimal network situation.
- Condition 2: High ratio of misses over hits (> 10 percent). Analysis: Hit and miss analysis should be done after the Ins count stops incrementing. In general, if the hit and miss counts are about the same order of magnitude, the upstream can be experiencing noise. If the miss count is greater, then the modem is probably dropping out frequently and not completing registration. The upstream or downstream might not be stable enough for reliable link establishment. Very low hits and miss counters and high insertion counters indicate provisioning problems.
- Condition 3: Relatively high power-adjustment counter. Analysis: Indicates that the power-adjustment threshold is probably set at default value of 2 dB. The modem transmitter step size is 1.5 dB, but the headend can command 0.25 dB step sizes. Tuning your power threshold to 6 dB is recommended to decrease irrelevant entries in the flap list. The power-adjustment threshold can be set using cable flap power threshold <0-10 dB> in the Cisco IOS global configuration mode. A properly operating HFC network with short amplifier cascades can use a 2 to 3 dB threshold.
- Condition 4: High P-Adj and CRC errors. Analysis: This condition can indicate that the fiber node is clipping the upstream return laser. Evaluate the modems with the highest CRC count first. If the modems are not going offline (Ins = 0), this is not noticed by subscribers. However, they could receive slower service due to dropped IP packets in the upstream. This condition also results in input errors on the Cisco CMTS router cable interface.

- Condition 5: High insertion rate. Analysis: If link reestablishment happens too frequently, the modem is usually having a registration problem. This is indicated by a high Ins counter, which tracks the Flap counter.

## Performing Amplitude Averaging

The CMTS uses an averaging algorithm to determine the optimum power level for a cable modem with low carrier-to-noise ratio that is making excessive power adjustments—known as flapping. To avoid dropping flapping cable modems, the CMTS averages a configurable number of RNG-REQ messages before it makes power adjustments. By compensating for a potentially unstable return path, the CMTS maintains connectivity with affected cable modems. You can interpret these power adjustments, however, as indicating unstable return path connections.

The **show cable flap-list** and **show cable modem** commands are expanded to indicate to which paths the CMTS is making power adjustments and which modems have reached maximum transmit power settings. These conditions indicate unstable paths that should be serviced.

The following example shows the output of the **show cable flap-list** command:

```
Router# show cable flap-list
MAC Address Upstream Ins Hit Miss CRC P-Adj Flap Time
0010.7bb3.fd19 Cable1/0/U1 0 2792 281 0 *45 58 Jul 27 16:54:50
0010.7bb3.fcfc Cable1/0/U1 0 19 4 0 !43 43 Jul 27 16:55:01
0010.7bb3.fcdd Cable1/0/U1 0 19 4 0 *3 3 Jul 27 16:55:01
```

The asterisk (\*) indicates that the CMTS is using the power-adjustment method on this modem. An exclamation point (!) indicates that the modem has reached maximum transmit power.

Output of the **show cable modem** command appears below:

```
Router# show cable modem
Interface Prim Online Timing Rec QoS CPE IP address MAC address
 Sid State Offset Power
Cable1/0/U0 1 online 2257 0.00 3 0 10.30.128.142 0090.8330.0217
Cable1/0/U0 2 online 2262 *-0.50 3 0 10.30.128.145 0090.8330.020f
Cable1/0/U0 3 online 2260 0.25 3 0 10.30.128.146 0090.8330.0211
Cable1/0/U0 4 online 2256 *0.75 3 0 10.30.128.143 0090.8330.0216
Cable1/0/U0 5 online 2265 *0.50 3 0 10.30.128.140 0090.8330.0214
Cable1/0/U0 6 online 2256 0.00 3 0 10.30.128.141 0090.8330.0215
Cable1/0/U0 7 online 4138 !-1.00 3 1 10.30.128.182 0050.7366.124d
Cable1/0/U0 8 online 4142 !-3.25 3 1 10.30.128.164 0050.7366.1245
Cable1/0/U0 9 online 4141 !-3.00 3 1 10.30.128.185 0050.7366.17e3
Cable1/0/U0 10 online 4142 !-2.75 3 0 10.30.128.181 0050.7366.17ab
Cable1/0/U0 11 online 4142 !-3.25 3 1 10.30.128.169 0050.7366.17ef
```

Similar to the **show cable flap-list** command display, the \* symbol in the **show cable modem** command output indicates that the CMTS is using the power-adjustment method on this CM. The ! symbol indicates that the CM has reached maximum transmit power.

## Using Other Related Commands

The following related Cisco IOS commands can be used to do maintenance on or display information about a cable modem.

- The following clears the counters for a cable modem (or all cable modems) in the station maintenance list:

```
clear cable modem {mac-addr | ip-addr | all} counters
```

- The following displays the QoS, modem status, In and Out octets, IP and MAC addresses per SID:

```
show int cable slot/port sid
```

- The following drops the modem's RF link by removing a modem from the keepalive polling list. This forces the modem to reset. Note the warning below.

```
clear cable-modem {mac-addr | ip-addr | all} reset
```

---

**Tip** The **clear cable-modem all reset** command causes all modems to go offline and disrupt service for your users. It is best used in a test or nonproduction environment.

---

- The following uses a MAC-layer ping to determine if the cable modem is online. It uses smaller data units on the wire than a standard IP ping, resulting in lower overhead. This command works even if the IP layer in the modem is down or has not completed registration:

```
ping DOCSIS cable-modem mac-addr | IP address
```

- The following displays the timing offset, receive power, and QoS values by cable interface, SID, and MAC address:

```
show cable modem [ip-address | MAC-address]
```

- The following displays the current allocation table and frequency assignments:

```
show cable spectrum-group [spectrum group number]
```

- The following displays maximum, average, and minimum percent of online time and offline time for a given SID on a given cable router interface:

```
show int slot/port sid connectivity
```

- The following command displays input and output rates, input errors, CRC, frames, overruns, underruns, collisions, interface resets. High input errors in the CMTS retrieved from this query suggest noisy upstream. In older versions of the chassis, loose midplane and line card screws caused a similar problem:

```
show interface slot/downstream-port
```

- The following command displays upstream packet discards, errors, error-free packets, correctable and uncorrectable errors, noise, and micro-reflection statistics.

```
show interface slot/downstream-port upstream
```

## Configuration Examples for Flap List Troubleshooting

The following excerpt from a configuration file shows a typical flap-list configuration:

```
!
cable flap-list insertion-time 120
cable flap-list power-adjust threshold 3
cable flap-list miss-threshold 4
cable flap-list aging 8
cable flap-list size 8191
...
```

## Feature Information for Flap List Troubleshooting

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfnng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 285: Feature Information for Flap List Troubleshooting*

| Feature Name              | Releases                    | Feature Information                                                                                               |

## Finding Feature Information

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

---

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

---

Table 286: Hardware Compatibility Matrix for the Cisco cBR Series Routers

| Cisco CMTS Platform                    | Processor Engine                                                                                                                                                                                                                                                   | Interface Cards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Information About the MAX CPE and Host Parameters

The DOCSIS specification includes a number of provisions to allow service providers to control the number of subscribers who can access the network through any particular cable modem.

The following are the parameters that controls the number of CPE that can access the network:

**Note** In addition, the DOCSIS configuration file contains a Network Access parameter that specifies whether the CPE devices behind the cable modem can access the cable network. If the Network Access parameter is set to Disabled, no CPE devices behind a cable modem are able to access the network.

**Tip** Also, the Cisco CMTS lists offline cable modems in its internal database for 24 hours. The CMTS does not reset the CPE counts for these offline cable modems until the 24 hour period expires and the cable modems come back online. If the cable modems come back online before the 24 hour period expires, the CMTS continues to use the existing CPE counts.

All of these methods are similar in purpose, but they are configured differently and have a different impact on cable modems and their CPE devices.

The cable modem enforces the MAX CPE value, the CMTS enforces the MAX Host, MAX CPE IP, and MAX CPE IPv6 values.

---

**Note** The MAX CPE parameter provides Layer 2 control of CPE devices. The MAX CPE IP and MAX CPE IPv6 parameters provide Layer 3 control of CPE devices. The two methods are complimentary but not otherwise related.

---

## MAX CPE

The MAX CPE is a required parameter and used to control the number of CPE devices that can access the network during the current session. In DOCSIS 1.0 cable networks, the MAX CPE parameter is the primary means of controlling the number of CPE devices that can connect to the cable network using any particular cable modem. This parameter is configured in the DOCSIS configuration file (TLV 18). If this parameter is not specified in the DOCSIS configuration file, it defaults to a value of 1.

---

**Note** In DOCSIS 1.1 cable networks, the CMTS ignores the MAX CPE parameter that is specified in the DOCSIS configuration file, and uses the MAX Host parameter instead.

---

Each time a new CPE device attempts to connect to the cable network, the cable modem logs the hardware (MAC) address. If the cable modem has not reached the MAX CPE number of MAC addresses, the new CPE device is allowed to access the network. If the cable modem has reached the MAX CPE limit, it drops the traffic from any additional CPE devices.

By default, the cable modem learns new MAC addresses on a first-come, first-served basis. You can also preconfigure the allowable MAC addresses for CPE devices by entering those MAC addresses in the DOCSIS configuration file (TLV 14). These cable modem gives these preconfigured MAC addresses preference in connecting to the network.

The DOCSIS specification does not allow cable modems to age out MAC addresses, so a MAC address stays in the log table of the cable modem until the cable modem is reset. You should therefore think of this parameter as specifying the maximum number of CPE devices that can connect during any particular session, instead of the maximum number of CPE devices that can simultaneously connect to the cable network.

For example, if you set MAX CPE to 2, a customer could use their cable modem to connect a maximum of two CPE devices (two MAC addresses) to the cable network. A customer could choose to connect two PCs simultaneously to their cable modem and use both to access the network.

However, if the customer then disconnected these PCs and connected two new PCs, the cable modem would not allow the new PCs to come online, because they would be the third and fourth MAC addresses that are connected to the cable modem. The customer would have to reset the cable modem before being able to use the new PCs.

---

**Note** The MAX CPE value, if present, must be a positive integer in DOCSIS 1.0 configuration files. This parameter can be zero in DOCSIS 1.1 configuration files, but if so, the cable modem uses a MAX CPE value of 1. If the MAX CPE parameter is not present in either type of DOCSIS configuration file, it defaults to 1.

---

## MAX Host

The MAX Host parameter is an optional parameter and is configured on the Cisco CMTS and specifies the maximum number of CPE devices (MAC addresses) that the CMTS will allow to have network access. You can control this parameter for individual cable modems, for all cable modems on a particular cable interface, or for all cable modems on the Cisco CMTS, depending on the CLI command being used:

- **cable modem max-cpe**—Configures MAX Host for all cable modems on the Cisco CMTS. You can use the **unlimited** keyword to specify that the Cisco CMTS should not enforce a MAX Host limit for cable modems.

When this is enabled, the Cisco CMTS learns a MAC address the first time that the CPE device accesses the cable network. After the Cisco CMTS has logged the maximum number of MAC addresses specified by a MAX Host parameter, it drops all traffic from CPE devices that have any other MAC address.

---

**Tip** In DOCSIS 1.1 cable networks, when both the MAX CPE IP and MAX Host parameters are configured, the Cisco CMTS uses the lesser value to determine the maximum number of CPE devices that are allowed behind each cable modem. By default, MAX Host is set to 16.

---

---

**Note** The entire MAX Host address table is cleared whenever the Cisco TS is reset. You can also clear an entry for a particular CPE device using the **clear cable host** command.

---

## Specifying an Unlimited Value for Max Host

The **cable modem max-cpe** command, which affects all cable modems on the CMTS, supports the **unlimited** keyword, which specifies that the CMTS should not enforce any limit on CPE devices. When you configure the CMTS with the unlimited **keyword**, this setting, you are allowing cable modems to support any number of CPE devices.

Do not use the **unlimited** option without also specifying the proper value for MAX CPE in the DOCSIS configuration file, so that each cable modem can control the maximum number of CPE devices it supports. In addition, to prevent users from requesting an unlimited number of IP address, be sure to configure the DHCP servers so that they control how many IP addresses are assigned to the CPE devices behind each cable modem.

## MAX CPE IP

The MAX CPE IP parameter is applicable only in DOCSIS 1.1 cable networks and is an optional parameter. This parameter specifies whether the cable modem should perform IP address filtering on the CPE devices.

If so, this attribute also specifies the maximum number of simultaneous IP addresses that are permitted behind the modem at any one time.

The MAX CPE IP parameter is configured in the DOCSIS configuration file (TLV 35), or by using SNMP commands to set the docsDevCpeIpMax attribute (in DOCS-CABLE-DEVICE-MIB) for the cable modem. By default, this parameter is not enabled and the Cisco CMTS does not actively manage CPE devices, unless you enable the use of the MAX CPE IP parameter by using the **cable submgmt default active** command. The **cable submgmt default max-cpe** command can be used to limit the number of IP addresses behind the cable modem.

If this feature is enabled, the cable modem learns the allowable IP addresses the first time that the CPE device sends an IP packet out into the network. The IP addresses are added to the docsDevFilterCpeTable table. This address table is cleared automatically when the cable modem is reset or powered off, or you can manually clear the IP address table by setting the docsSubMgtCpeControlReset attribute in the appropriate table entry for this cable modem.

**Tip** The CMTS uses the MAX CPE IP value as part of its own filtering process, but the two filters operate independently on the cable modem and CMTS.

## MAX CPE IPv6

The MAX CPE IPv6 parameter is an optional parameter and specifies the maximum number of simultaneous IPv6 addresses that are permitted for a cable modem at any time.

The MAX CPE IPv6 parameter is configured in the DOCSIS 3.0 configuration file (TLV 63), or by using the SNMP commands to set the docsSubmgmt3BaseCpeMaxIpv6PrefixDef attribute (in DOCS-SUBMGT3-MIB) for the cable modem. By default, this parameter is not enabled and the Cisco CMTS does not actively manage CPE devices, unless the use of the MAX CPE IPv6 parameter is enabled by using the **cable submgmt default active** command. The **cable submgmt default max-ipv6-cpe** command can be used to limit the number of IPv6 addresses allowed behind a cable modem.

When the MAX CPE IPv6 feature is enabled, the cable modem learns the allowable IPv6 addresses the first time that the CPE device sends an IPv6 packet out into the network. The IPv6 addresses are added to the IPv6 address table. The address table is cleared automatically when the cable modem is reset or powered off.

## Interoperation of the Maximum CPE Parameters

The different methods of CPE control can all be active simultaneously. They can interact with one another but do not conflict with one another. The table lists each method and compares their characteristics.

**Table 287: Comparison of the Different Max CPE and Max Host Control Mechanisms**

| CM Configuration Parameter | Function                                    | CMTS Equivalent                 | CMTS Enforcement Priority     |
|----------------------------|---------------------------------------------|---------------------------------|-------------------------------|
| Network Access Control     | Prevents all network access for CPE devices | Cable submgmt default learnable | CMTS overrides CM Config File |
| MAX CPE                    | Limits MAC addresses per CM                 | Cable modem max-hosts           | Least restrictive is enforced |

| CM Configuration Parameter | Function                     | CMTS Equivalent                    | CMTS Enforcement Priority    |
|----------------------------|------------------------------|------------------------------------|------------------------------|
| MAX CPE IP                 | Limits IP addresses per CM   | Cable submgmt default max-cpe      | Most restrictive is enforced |
| MAX CPE IPv6               | Limits IPv6 addresses per CM | Cable submgmt default max-ipv6-cpe | Most restrictive is enforced |

The table lists the MAX CPE parameters in order of priority. For example, the Network Access Control and MAX CPE parameters interact as follows:

- If the Network Access Control field for a cable modem is set to Disabled, none of that modem's CPE devices will be able to access the network, regardless of how the other parameters are set.
- If Network Access Control is Enabled and MAX CPE is set to 1 for a cable modem, then a maximum of one CPE device will be able to access the network, no matter how the remaining parameters are configured.

## Benefits

- CMTS flexibility allows multiple service operator provisioners, service providers, and other users to synchronize between the CMTS and the cable modem, the maximum number of CPE devices, maximum number of IPv4 addresses, and maximum number of IPv6 addresses that can be connected behind a cable modem.
- Changes can be made by using CLI commands or by using SNMP commands.

## How to Configure the MAX CPE and Host Parameters

To reset the maximum number of permitted CPE devices recognized by the CMTS, use one of the following configuration commands. All procedures are optional, depending on the requirements.

**Note** The CMTS assigns the MAX Host value to a cable modem at the time that the cable modem registers with the CMTS. Changing any of the MAX Host commands affects only cable modems that register after the change.

## Configuring the Maximum Number of CPE Devices on the Cisco CMTS

To configure the maximum number of CPE devices per cable modem, use the following procedure:

### Procedure

|        | Command or Action         | Purpose                                                                                                            |
|--------|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | enable<br><b>Example:</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|               | Router> enable                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 3</b> | <p><b>cable modem max-cpe</b> [<i>number</i>   <b>unlimited</b>]</p> <p><b>Example:</b></p> <pre>Router(config)# cable modem max-cpe 8</pre>          | <p>Sets the value of the MAX CPE parameter on the Cisco CMTS for all cable interfaces.</p> <p>The <b>show cable modem subscriber</b> displays the MAXIMUM value of cable modem max-cpe and the MAX CPE value in the DOCSIS configuration file of the cable modem.</p> <p>The number of the CPE that can be online is determined based on one of the following aspects:</p> <ul style="list-style-type: none"> <li>• If the number of the CPE is lower than the MAX CPE value in the DOCSIS configuration file of the cable modem, then the <b>cable modem max-cpe</b> command overrides the configuration file value.</li> <li>• If number of the CPE is higher than the MAX CPE value in the DOCSIS configuration file of the cable modem or is set as unlimited, then the value set in the configuration file takes precedence.</li> </ul> <p><b>Note</b> If the value in the configuration file is zero and <b>no cable modem max-cpe</b> is configured, then no CPE device is able to obtain an IP address.</p> |
| <b>Step 4</b> | <p><b>cable submgmt default active</b></p> <p><b>Example:</b></p> <pre>Router(config)# cable submgmt default active</pre>                             | Specifies that the CMTS should actively manage CPE devices. The default is the <b>no</b> version of this command, so that the CMTS does not actively manage CPE devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <p><b>cable submgmt default max-cpe</b> <i>cpe-ip</i></p> <p><b>Example:</b></p> <pre>Router(config)# cable submgmt default max-cpe 4</pre>           | (Optional) Specifies the default value for the MAX CPE IP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 6</b> | <p><b>cable submgmt default max-ipv6-cpe</b> <i>ipv6-num</i></p> <p><b>Example:</b></p> <pre>Router(config)# cable submgmt default max-ipv6-cpe</pre> | (Optional) Specifies the default value for the MAX IPv6 CPE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|               | Command or Action                                      | Purpose                          |
|---------------|--------------------------------------------------------|----------------------------------|
|               | 4                                                      |                                  |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Router(config)# exit | Exits global configuration mode. |

**What to do next**

**Note** Use of the **cable modem max-cpe unlimited** command can open a security hole in the system by enabling denial of service attacks. It could allow a single user to obtain a large number of IP addresses, and thereby cause the entire network to go down after this single user has reserved all available IP addresses.

## Configuration Examples

To display the current configuration and status of a cable interface, use the **show running-config** command in privileged EXEC mode. The following is sample output that shows that the CMTS permits up to five CPE devices to use the specified cable interface to pass traffic.

```
interface Cable3/0
 ip address 192.168.1.1 255.255.255.0 secondary
 ip address 10.1.1.1 255.255.255.0
 load-interval 30
 no keepalive
 cable downstream annex B
 cable downstream modulation 256qam
 cable downstream interleave-depth 32
 cable downstream frequency 507000000
 cable upstream 0 frequency 27008000
 cable upstream 0 power-level 0
 cable upstream 0 minislots-size 32
 cable upstream 0 modulation-profile 2
 no cable upstream 0 shutdown
 cable upstream 1 frequency 29008000
 cable upstream 1 power-level 0
 cable upstream 1 channel-width 3200000
 cable upstream 1 minislots-size 4
 no cable upstream 1 shutdown
 cable dhcp-giaddr policy
 cable helper-address 172.17.110.131
end
```

You can also use the **more system:running-config** command to verify the maximum number of permitted CPE devices for a cable interface.

```
CMTS01# more system:running-config
Building configuration...
Current configuration:
!
```

```

interface Cable6/0
 ip address 10.1.1.1 255.255.255.0
 no keepalive
 cable insertion-interval 2000
 cable downstream annex B
 cable downstream modulation 64qam
 cable downstream interleave-depth 32
 cable downstream symbol-rate 5056941
 cable upstream 0 frequency 15008000
 cable upstream 0 fec
 cable upstream 0 scrambler
 no cable upstream 0 shutdown

```

## Feature Information for Maximum CPE and Host Parameters

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 288: Feature Information for Maximum CPE and Host Parameters*

| Feature Name                    | Releases                    | Feature Information                                                                                               |
|---------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| Maximum CPE and Host Parameters | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on the Cisco cBR Series Converged Broadband Routers. |

## CHAPTER 107

# SNMP Background Synchronization

The SNMP Background Synchronization features provides periodic background synchronization of DOCSIS MIB data from line card to Supervisor in order to improve the performance of the SNMP polling of these MIB tables.

### Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

### Contents

- [Information About SNMP Background Synchronization, on page 1623](#)
- [How to Configure SNMP Background Synchronization, on page 1624](#)
- [Configuring Example for SNMP Background Synchronization, on page 1631](#)
- [Feature Information for SNMP Background Synchronization, on page 1631](#)

## Information About SNMP Background Synchronization

To improve SNMP performance, SNMP background synchronization feature is introduced to synchronize the SNMP MIB information between the line card and the Supervisor. It is based on raw socket and uses TCP protocol. The benefits of the SNMP Background Synchronization include:

- Bundles small packets together before sending out, increases IPC channel utilization.
- Use pre-allocated static buffer to send/receive message, avoid buffer allocation at run time.
- In order not to burden CPU when the system is in high load, SNMP background synchronization receive process can sleep based on CPU utilization, so it will not compete with other priority processes.
- Significantly improve SNMP polling performance for supported MIB tables, and reduce the CPU utilization in both Supervisor and line card.

The following MIB tables are supported in SNMP background synchronization:

- docsQosParamSetEntry
- docsIetfQosParamSetEntry

- docsQos3ParamSetEntry
- docsIf3CmtsCmUsStatusEntry
- docsIfCmtsCmStatusEntry
- docsSubMgtCpeControlEntry
- docsSubMgtCmFilterEntry
- cdxCmtsCmStatusExtEntry
- docsLoadBalCmtsCmStatusEntry
- docsIf3CmtsCmRegStatusTable
- docsIfSignalQualityTable
- docsifCmtsServiceTable
- cdxCmtsServiceExtEntry

# How to Configure SNMP Background Synchronization

## Enabling SNMP Background Synchronization

### Before you begin

To use the **cable bgsync** command, you must configure the **service internal** command in global configuration mode.

SNMP background synchronization is enabled by default, use **no cable bgsync active** to disable this feature, and use **cable bgsync active** to enable it again. The following procedure lists detailed steps to enable SNMP background synchronization:

```
enable
configure terminal
cable bgsync active
exit
```

## Setting Data Interval

### Before you begin

To use the **cable bgsync** command, you must configure the **service internal** command in global configuration mode. Use the **cable bgsync** command carefully as it can impact the CPU utilization.

To set the data intervals for the background synchronization of SNMP MIB data on the Cisco cBR routers, use the **cable bgsync {itime *i-interval*|ptime *p-interval*}** command in global configuration mode. To disable background synchronization, use the **no** form of this command. The following procedure lists detailed steps to set data interval:

```
enable
configure terminal
```

```

service internal
cable bgsync itime i-interval
cable bgsync ptime p-interval
exit

```

**itime** is the interval of synchronizing all related MIB tables from line card to Supervisor. The valid range is from 5 to 31536000. The default value is 86400. **ptime** is the interval of synchronizing the changed MIB content from line card to Supervisor.

## Verifying SNMP Background Synchronization

- To display the current status of the SNMP background synchronization, use the **show cable bgsync** command as shown in the example below:

```

Router#show cable bgsync
Background Sync is active, uptime is 5 minutes, 14 seconds.
Background Sync last active time is 5 minutes, 14 seconds. ago.
I-packet interval time is 1 day, P-packet interval time is 5 seconds.

## Configuring Example for SNMP Background Synchronization

The following example shows how to configure SNMP background synchronization:

```

enable
configure terminal
cable bgsync active
service internal
cable bgsync itime 200
cable bgsync ptime 500
exit

```

## Feature Information for SNMP Background Synchronization

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

---

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

---

*Table 289: Feature Information for SNMP Background Synchronization*

| Feature Name                    | Releases                    | Feature Information                                                                                              |
|---------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------|
| SNMP Background Synchronization | Cisco IOS XE Everest 16.6.1 | This feature was integrated into Cisco IOS XE Everest 16.6.1 on theCisco cBR Series Converged Broadband Routers. |

## CHAPTER 108

# Online Offline Diagnostics

Online Offline Diagnostics (OOD) Field Diagnostics feature allows the customer to test and verify hardware-related issues on a line card deployed in the field. The test results can be used to verify whether a line card is fault and troubleshoot network issues.

- [Overview of Online Offline Diagnostics, on page 1633](#)
- [How to Configure Online Offline Diagnostics, on page 1634](#)
- [Configuration Example for Online Offline Diagnostics, on page 1635](#)
- [Feature Information for Online Offline Diagnostics, on page 1635](#)

## Overview of Online Offline Diagnostics

The Online Offline Diagnostics is a field diagnostic mechanism that allows the customers to test and verify the line card hardware problems.

To perform a hardware diagnostic test on a line card in the Cisco cBR universal broadband router, download an OOD Field Diagnostic image for free from Cisco.com and use it to verify if the line card problems are due to hardware failure. The customer can run field diagnostic tests on the standby line card at any time without interrupting service. Testing the standby line card improves high availability of the system by ensuring the standby line card is ready for a switchover.

### Field Diagnostic Image Information

Field Diagnostic image is used to run diagnostic tests on a line card and is available from Cisco.com.

First, download it from Cisco.com to one of the flash file systems on the router. Then move it to the line card, and the line card is automatically taken offline. Once field diagnostic tests are complete and the test results are gathered, the Field Diagnostic image must be unloaded from the line card. Normal line card operation will automatically resume after the Field Diagnostic image is unloaded from the line card.

## Benefits of Online Offline Diagnostics

- **Improved Troubleshooting.** Field diagnostics verifies whether a line card problem is hardware-related or not. If the problem is software-related, the Field Diagnostic image allows customer to quickly rule out hardware related cause and focus on fixing the software issue causing the problem.
- **Pre-installation Line Card Hardware Verification.** Field diagnostics verifies whether a line card has hardware problems before installing the line card in a Cisco cBR Series router.

- **Onsite Fault Detection.** Field diagnostics helps to confirm if the problem is hardware-related and if it is necessary to replace the line card.
- **Additional Uptime.** Field diagnostics ensures that line cards are not mistakenly taken offline if the problem is not hardware-related, thereby increasing network uptime.

## Prerequisites for Online Offline Diagnostics

- Before running the OOD Field Diagnostic tests on the working (active) line card in an N + 1 redundancy setup, it is advisable to switch over to the protect (standby) line card before loading the Field Diagnostic image to the line card to avoid service interruption.
- After an OOD Field Diagnostic image is loaded to the line card, the line card goes offline. Therefore, schedule a downtime for the line card to be tested before performing field diagnostic tests.
- Before performing any field diagnostic test, unplug all cables on the device that connect to other interfaces. If the cables that connect interfaces are not unplugged, some field diagnostic tests may send packets to connected devices, which increments packet counters on the receiving interfaces.

## Restrictions for Online Offline Diagnostics

- When accessing a router through Telnet while running an OOD Field Diagnostic test, testing progress messages do not appear on the screen.
- If supervisor switchover occurs during a field diagnostic test, the test stops immediately and the line card run-time image automatically replaces the Field Diagnostic image on the line card.
- This feature is supported on CBR-CCAP-LC-40G line card in Cisco IOS-XE release 3.18.0S and later releases.
- It is suggested to run OOD on one line card at a time to avoid service impact.
- To run OOD on multiple line cards, leave 5 to 10 minutes gap before loading the OOD image to the next line card.

## How to Configure Online Offline Diagnostics

### Configuring Field Diagnostic Test

To load the field diagnostic image and start field diagnostic test, complete the following procedure:

```
copy tftp:image-file {harddisk: | bootflash: | flash:}
request platform hardware diagnostic load slot slot-id image-file autostart
```

### Verifying the Testing Process

To verify whether the field diagnostic tests are running, use the **show platform hardware diagnostic status slot slot-id** command as shown in the example below:

```
Router# show platform hardware diagnostic status slot 0
Online Offline Diagnostic Status (P=Passed, F=Failed, U=Untested)
State Overall Test Num Test Done Num Test Result

Running Auto Test 75 70 P:69 F:1 U:5
```

**Note** If the test result shows that the failed test number is not 0, please copy the full log and contact Cisco TAC team for support. You can use `dir harddisk:ood/` command to list the log files.

## Removing the Field Diagnostic Image from a Line Card

To unload the Field Diagnostic image, use the `request platform hardware diagnostic unload slot slot-id` command as below:

```
request platform hardware diagnostic unload slot slot-id
```

Then the line card will be reloaded to run-time image.

**Note** To retain the results of a diagnostic test, copy and paste the `show platform hardware diagnostic status slot` command output into a separate file before unloading the Field Diagnostic image. The output of the `show platform hardware diagnostic status slot` command cannot be gathered after unloading the Field Diagnostic image from the line card.

## Configuration Example for Online Offline Diagnostics

The following example shows running output for Online Offline Diagnostics:

```
copy tftp:field_diag harddisk:
request platform hardware diagnostic load slot 0 harddisk:field_diag autostart

Mar 2 16:00:51.933 CST: %IOSXE_OIR-6-REMCARD: Card (cc) removed from slot x
Mar 2 16:00:51.934 CST: %CABLE_CLC-5-LOGGER_LC_REMOVED: Carrier Card x removed
```

## Feature Information for Online Offline Diagnostics

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

*Table 290: Feature Information for Online Offline Diagnostics*

| <b>Feature Name</b>        | <b>Releases</b>             | <b>Feature Information</b>                                                                                       |
