## CONTENTS

---

### CHAPTER 1

#### **Cable Commands: a through cable-modem 1**

- ac-start-delay 2
- ac-stop-delay 4
- access-denied 6
- activate-rule at-byte-count 8
- active 11
- add-priv-data 12
- admission-control max-reserved-bandwidth 13
- admission-control application-type 15
- analog 17
- annex 18
- annex modulation 19
- announce-event-profile 21
- application-id 23
- assign 24
- attributes 26
- auto-channel-id 28
- base-channel-power 29
- bind-vcg 30
- block-unref-pids 31

---

### CHAPTER 2

#### **Cable Commands: cable a through cable c 33**

- cable acfe constant-eir-demand 35
- cable acfe enable 36
- cable acfe guar-bw-sync-period 37
- cable acfe max-bonus-bandwidth 38

cable acfe max-eir-ratio	39
cable admission-control	40
cable admission-control ds-bandwidth	42
cable admission-control event	45
cable admission-control max-reserved-bandwidth	47
cable admission-control preempt priority-voice	49
cable admission-control us-bandwidth	50
cable application-type include	53
cable application-type name	57
cable arp	59
cable arp filter	61
cable asf-qos-profile	64
cable attribute-mask	66
cable bgsync	68
cable bgsync active	70
cable bonding-group-id	72
cable bonding-group-secondary	75
cable cache-snmp active	77
cable channel-group	78
cable clock clear-counters	79
cable clock dti	81
cable clock dti clear-counters	82
cable clock force	83
cable clock source-midplane	85
cable clock upgrade	87
cable cm-status	88
cable cm-status enable	90
cable cmc	93
cable cmc image_upgrade	96
cable cmcpe-list valid-time	97
cable cmts-id	99
cable config-file	100
cable controller-profile	104

## ac-start-delay

To configure the time between start of first CP after a change in AC and start of ECM broadcast, use the **ac-start-delay** command in the DVB scrambling ECMG overrule configuration mode. To void the time configuration, use the **no** form of this command.

**ac-start-delay** *delay*

**no ac-start-delay**

<b>ac-start-delay</b> <i>delay</i>	Specifies the time between start of first CP after a change in AC and start of ECM broadcast in millisecond.
------------------------------------	--------------------------------------------------------------------------------------------------------------

### Command Default

None

### Command Modes

DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command specifies the time between start of first CP after a change in AC and start of ECM broadcast in millisecond. The valid range is from -30000 to 30000.

The following is an example of how to specify the time between start of first CP after a change in AC and start of ECM broadcast:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#overrule
Router(config-video-encrypt-dwb-ecmg-overrule)#ac-start-delay 10000
```

### Related Commands

Command	Description
<b>overrule</b>	Enters DVB scrambling configuration mode.
<b>ac-stop-delay</b>	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
<b>max-comp-time</b>	Specifies the maximum time needed by ECMG to compute an ECM.
<b>max-streams</b>	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.

<b>Command</b>	<b>Description</b>
<b>min-cp-duration</b>	Specifies the minimum crypto period.
<b>rep-period</b>	Specifies the time between two ECM packets at the output.
<b>start-delay</b>	Specifies the delay between the start of CP and ECM broadcast.
<b>stop-delay</b>	Specifies the delay between the end of CP and ECM broadcast.
<b>trans-start-delay</b>	Specifies the transition start delay.
<b>trans-stop-delay</b>	Specifies the transition stop delay.

## ac-stop-delay

To configure the time between end of last CP preceding a change in AC and end of ECM broadcast, use the **ac-stop-delay** command in the DVB scrambling ECMG overrule configuration mode. To void the time configuration, use the **no** form of this command.

**ac-stop-delay** *delay*

**no ac-stop-delay**

<b>ac-stop-delay</b> <i>delay</i>	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast in millisecond.
-----------------------------------	-------------------------------------------------------------------------------------------------------------

### Command Default

None

### Command Modes

DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command specifies the time between end of last CP preceding a change in AC and end of ECM broadcast in milliseconds. The valid range is from -30000 to 30000.

The following is an example of how to configure the time between end of last CP preceding a change in AC and end of ECM broadcast:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#overrule
Router(config-video-encrypt-dwb-ecmg-overrule)#ac-stop-delay 10000
```

### Related Commands

Command	Description
<b>overrule</b>	Enters DVB scrambling configuration mode.
<b>ac-start-delay</b>	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
<b>max-comp-time</b>	Specifies the maximum time needed by ECMG to compute an ECM.
<b>max-streams</b>	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.

<b>Command</b>	<b>Description</b>
<b>min-cp-duration</b>	Specifies the minimum crypto period.
<b>rep-period</b>	Specifies the time between two ECM packets at the output.

<b>stop-delay</b>	Specifies the delay between the end of CP and ECM broadcast.
<b>trans-start-delay</b>	Specifies the transition start delay.
<b>trans-stop-delay</b>	Specifies the transition stop delay.

# access-denied

To create a DOCSIS configuration file that disables network access to the customer premise equipment (CPE) devices that are attached to the cable modem (CM) on a Cisco CMTS router, use the **access-denied** command in cable config-file configuration mode. To enable access, use the **no** form of this command.

**access-denied**  
**no access-denied**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Access to the cable network is permitted.

**Command Modes** Cable config-file configuration (config-file)

## Command History

Release	Modification
12.1(2)EC1	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command sets the Network Access Control object in the DOCSIS configuration file. If the object is set to 1 (set by the default of **no access-denied**), the CPE devices behind the CM allow access to the network. If the object is set to 0 (by configuration of the **access-denied** command) to disable network access for the CPE devices, the CM does not forward traffic from its attached CPE devices.

For normal operation, the CM must be set to allow access (the default). However, to deny service for reasons such as nonpayment or unauthorized use of services, the **access-denied** command can be used.

## Examples

The following example shows how to disable network access for the CPE devices that are connected to the CM:

```
cable config-file disable.cm
access-denied
```

## Related Commands

Command	Description
<b>cable config-file</b>	Creates a DOCSIS configuration file and enters configuration file mode.
<b>channel-id</b>	Specifies upstream channel ID.
<b>cpe max</b>	Specifies customer premise equipment information.
<b>download</b>	Specifies download information for the configuration file.

<b>Command</b>	<b>Description</b>
<b>frequency</b>	Specifies the downstream frequency.
<b>option</b>	Specifies vendor-specific information fields in a DOCSIS configuration file.
<b>privacy</b>	Specifies privacy options for baseline privacy images.
<b>service-class</b>	Specifies service class definitions for the configuration file.
<b>snmp manager</b>	Specifies Simple Network Management Protocol (SNMP) options.
<b>timestamp</b>	Enables time-stamp generation.

# activate-rule at-byte-count

**Note** Effective with Cisco IOS Release 12.3(9a)BC, the **activate-rule at-byte-count** command is not available in Cisco IOS software.

To specify the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router, use the **activate-rule at-byte-count** command in enforce-rule configuration mode. To reset the rule to its default values, use the **no** form of this command.

```
activate-rule at-byte-count kbytes {downstream | upstream} [enforce]
no activate-rule at-byte-count kbytes {downstream | upstream} [enforce]
```

## Syntax Description

<i>kbytes</i>	Maximum number of kilobytes that the subscriber can transmit in the specified direction during the monitoring period. The valid range is 1 to 4294967, with a default of 0 (no limit). <b>Note</b> To reset the kilobyte count to 0, use the <b>no</b> form of this command.
<b>downstream</b>	Specifies that the kilobyte count applies to traffic in the downstream direction.
<b>upstream</b>	Specifies that the kilobyte count applies to traffic in the upstream direction. The default value is <b>upstream</b> .
<b>enforce</b>	(Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates the registered QoS profile. <b>Note</b> You must have previously configured a registered QoS profile, using the <b>qos-profile registered</b> command, before being able to use the <b>enforce</b> keyword.

## Command Default

The *kbytes* value defaults to 0 (no limit), upstream direction, and enforce-rule QoS profiles are not automatically applied (**no activate-rule at-byte-count enforce**).

## Command Modes

Enforce-rule configuration (enforce-rule)

## Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.3(9a)BC	This command was removed.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **activate-rule at-byte-count** command specifies the maximum number of bytes that a subscriber can transmit during the monitor window period (see the **monitoring-duration** command). If a subscriber transmits traffic beyond this maximum value, the CMTS router considers the subscriber to be overconsuming.

If the optional **enforce** keyword has been specified for an enforce-rule, the CMTS router automatically switches overconsuming subscribers to the enforced QoS profile (see the **qos-profile enforced** command). The enforced QoS profile remains in force during the penalty time period (see the **qos-profile registered** command).

An enforce-rule can be created for only one direction, either upstream or downstream. To activate subscriber traffic management for both the upstream and downstream directions, create two different enforce-rules, with one rule's **activate-rule-at-byte-count** command specifying the downstream direction and the other rule specifying the upstream direction.

When you change the configuration of a currently active enforce-rule, that rule begins using the new configuration immediately to manage the cable modems tracked by the enforce-rule.

---

**Note** You can create an enforce-rule that is a duplicate of an existing enforce-rule, but the duplicate rule is not activated and applied to service flows until at least one of its parameters is changed so that it has a unique configuration.

---

## Examples

The following example shows a typical **activate-rule-at-byte-count** command for the downstream direction:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# activate-rule at-byte-count 20 downstream
```

The following example shows a typical **activate-rule-at-byte-count** command for the upstream direction. The **enforce** option is also added so that the enforce-rule QoS profile is automatically applied to users who exceed their registered profile:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# activate-rule at-byte-count 5 upstream enforce
```

The following example shows the same command being given for a second enforce-rule. The system rejects the command because it is a duplicate of an existing rule, using the same QoS profile and direction. You must change at least one of the rule parameters to make it unique before it is mapped and applied to service flows.

```
Router# configure terminal
Router(config)# cable qos enforce-rule test2
Router(enforce-rule)# activate-rule at-byte-count 5 upstream enforce
```

Enforce-rule test2 won't be mapped to service flows as it is duplicate of test1 with same registered qos-profile 5 and same direction

## Related Commands

Command	Description
<b>cable qos enforce-rule</b>	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
<b>enabled (enforce-rule)</b>	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
<b>duration</b>	Specifies the time period and sample rate to be used for monitoring subscribers.
<b>penalty-period</b>	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
<b>qos-profile enforced</b>	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
<b>qos-profile registered</b>	Specifies the registered QoS profile that should be used for this enforce-rule.
<b>show cable qos enforce-rule</b>	Displays the QoS enforce-rules that are currently defined.
<b>show cable subscriber-usage</b>	Displays subscribers who are violating their registered QoS profiles.

# active

To activate the logical edge device, use the **active** command in logical edge device protocol configuration mode. To deactivate the logical edge device, use the **no** form of this command.

**active**  
**no active**

## Command Default

None.

## Command Modes

Logical edge device protocol configuration (config-video-led-protocol)

## Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command activates the logical edge device.

## Examples

The following example shows how to activate the logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
Router(config-video-led)# protocol table-based
Router(config-video-led-protocol)# active
```

## Related Commands

Command	Description
<b>logical-edge-device</b>	Define a logical edge device.
<b>protocol</b>	Specifies the protocol used in the logical edge device.
<b>virtual-edge-input-ip</b>	Specifies and configures a cable multicast QoS group.
<b>vcg</b>	Specifies the virtual carrier group assigned to this logical edge device.
<b>show cable video logical-edge-device</b>	Displays the logical edge device information.

## add-priv-data

To add private data to the descriptor, use the **add-priv-data** command in the DVB scrambling ECMG descriptor configuration mode. To void the addition, use the **no** form of this command.

**add-priv-data** {**as-per-eis** | **at-es-level**} **private-data** *data* {**all** | **ecm-ids** *id*}  
**no add-priv-data** {**as-per-eis** | **at-es-level**} **private-data** *data* {**all** | **ecm-ids** *id*}

<b>as-per-eis</b>	Specifies that the insertion level is determined by EIS.
<b>at-es-level</b>	Insert at elementary streams level.
<b>private-data</b> <i>data</i>	Specifies the private data for the descriptor.
<b>all</b>	Apply the rule for all ecm ids.
<b>ecm-ids</b> <i>id</i>	Specifies the ecm ids to apply the rule. Only applies to session-based scrambling.

**Command Default** None

**Command Modes** DVB scrambling ECMG descriptor configuration mode (config-video-encrypt-dvb-ecmg-desc)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to add private data to the descriptor:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#desc-rule desc_8_1 id 1
Router(config-video-encrypt-dwb-ecmg-desc)#add-priv-data at-es-level private-data 12345678
ecm-ids 81,82,83,84,85
```

**Related Commands**

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>do-not-insert</b>	Prohibits inserting standard descriptors.

# admission-control max-reserved-bandwidth

To define the maximum reserved bandwidth per bonding group for all service flows that are allowed by the Cisco CMTS, use the **admission-control max-reserved-bandwidth** command in the interface configuration mode. To reset or disable the maximum reserved bandwidth value, use the **no** form of this command.

**admission-control max-reserved-bandwidth** *bw-in-kbps*  
**no admission-control max-reserved-bandwidth**

<b>Syntax Description</b>	<i>bw-in-kbps</i>	Maximum admission control reserved bandwidth. The value is in kbps and is based on the RF bandwidth percent defined for the bonding group. Valid range is from 0 to the maximum bandwidth of the upstream bonding group.
---------------------------	-------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>Command Default</b>	Without explicitly configured max-reserved-bandwidth, service flows admitted on a US bonding group are not subject to admission control.
------------------------	------------------------------------------------------------------------------------------------------------------------------------------

<b>Command Modes</b>	Upstream bonding configuration (config-upstream-bonding)
----------------------	----------------------------------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

<b>Usage Guidelines</b>	This command allows the user to define the maximum reserved bandwidth per bonding group. The default maximum reserved bandwidth value is 80 percent. However the user can choose to configure a higher (up to 96 percent) or lower reserved bandwidth so that there is bandwidth allocated for zero committed information rate (CIR) best effort traffic.
-------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>Examples</b>	The following example shows a sample definition of the maximum reserved bandwidth value.
-----------------	------------------------------------------------------------------------------------------

```
Router> enable
Router# configure terminal
Router(config)# interface c5/0/1
Router(config-if)# cable upstream bonding-group 1
Router(config-upstream-bonding)# admission-control max-reserved-bandwidth 6344
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable admission-control</b>	Configures the CPU and memory thresholds for the Cisco CMTS router and supporting broadband processing engines (BPEs).
	<b>cable admission-control event</b>	Configures and enables admission control event types on the Cisco CMTS router.
	<b>cable admission-control ds-bandwidth</b>	Configures admission control downstream bandwidth thresholds on the Cisco CMTS router.

Command	Description
<b>cable admission-control us-bandwidth</b>	Configures admission control upstream bandwidth thresholds on the Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on the Cisco CMTS router.
<b>show cable admission-control</b>	Displays the current admission control configuration and status on the Cisco CMTS router or on a specified interface.

# admission-control application-type

To enable Service Group Admission Control (SGAC) checking for the specified application-type, use **admission-control application-type** command in cable fiber node configuration mode. To remove the configuration, use the **no** form of this command.

**admission-control application-type** *app-type* **ds-bandwidth** *percentage*  
**no admission-control application-type** *app-type* **ds-bandwidth**

**admission-control application-type** *grouplist* **ds-bandwidth** *percentage*  
**no admission-control application-type** *grouplist* **ds-bandwidth**

Syntax Description	application-type <i>app-type</i>	Specifies the application type. The valid range is from 1 to 8.
	application-type <i>grouplist</i>	Specifies the application type. The valid range is from 1 to 8. The <i>grouplist</i> variable can be either a range of application types or a list of specific application types separated by a space.
	ds-bandwidth <i>percentage</i>	Specifies the downstream bandwidth percentage. Valid range is from 0 to 100.

**Command Default** The command is not configured by default.

**Command Modes** cable fiber node configuration (config-fiber-node)

Command History	Release	Modification
	IOS-XE 3.17.0S	This command was modified. The <i>app-type</i> variable was replaced by <i>grouplist</i> variable.
	IOS-XE 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **admission-control application-type** command under each fiber node to enable SGAC check for an application type and any service flow of the specified application type, which is admitted to a service group. Starting with Cisco IOS-XE Release 3.17.0S, admission control can be applied for both normal priority and emergency voice flows. The *grouplist* variable can be either a range of application types or a list of specific application types separated by a space.

**Examples** The following example shows how to enable SGAC check for an application type and any service flow of the specified application type:

```
Router# configure terminal
Router(config)# cable fiber-node 1
Router(config-fiber-node)# admission-control application-type 1 ds-bandwidth 1
```

The following example shows how to enable SGAC check for a group of application types:

**admission-control application-type**

```
Router# configure terminal
Router(config)# cable fiber-node 1
Router(config-fiber-node)# admission-control application-type 1 6 ds-bandwidth 1
```

Or

```
Router# configure terminal
Router(config)# cable fiber-node 1
Router(config-fiber-node)# admission-control application-type 3-6 ds-bandwidth 1
```

**Related Commands**

Command	Description
<b>cable application-type</b>	Defines an application type and its categorization rules.

# analog

To configure the analog Tx/Rx modules alarm threshold, use the **analog** command in RPD configuration mode. To void the alarm threshold configuration, use the **no** form of this command.

**analog** {rx-power | tx-power} major-lo-th *value* minor-lo-th *value* normal-th *value* minor-hi-th *value*

**no analog** {rx-power | tx-power}

Syntax Description		
<b>rx-power</b>	Specifies the RPD analog module receiving power.	
<b>tx-power</b>	Specifies the RPD analog module transmitting power.	
<b>major-lo-th</b>	Specifies the major low threshold.	
<b>minor-lo-th</b>	Specifies the minor low threshold.	
<b>normal-th</b>	Specifies the normal threshold.	
<b>minor-hi-th</b>	Specifies the minor high threshold.	

**Command Default** None

**Command Modes** RPD configuration (config-rpd)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1d	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to configure the analog Tx/Rx modules alarm threshold.

**Note** The threshold for each alarm must follow this rule: major low threshold < minor low threshold < normal threshold < minor high threshold. Otherwise the command can not be executed.

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# analog rx-power major-lo-th 0 minor-lo-th 50 normal-th 150 minor-hi-th
200
```

Related Commands	Command	Description
	<b>cable rpd</b>	Enters the RPD configuration mode.

## annex

To set the annex (MPEG framing format) for a specific QAM profile, use the **annex** command in QAM profile configuration mode.

**annex** {**A** | **B** | **C**}

### Syntax Description

<b>A</b>   <b>B</b>   <b>C</b>	<p>Specifies the MPEG framing format:</p> <ul style="list-style-type: none"> <li>• <b>A</b>—Annex A. The downstream is compatible with the European MPEG framing format specified in ITU-TJ.83 Annex A.</li> <li>• <b>B</b>—Annex B. The downstream is compatible with the North American MPEG framing format specified in ITU-TJ.83 Annex B.</li> <li>• <b>C</b>—Annex C. The downstream is compatible with the Japan MPEG framing format specified in ITU-TJ.83 Annex C.</li> </ul>
-----------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

None

### Command Modes

QAM profile configuration (config-qam-prof)

### Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to set the Annex (MPEG framing format) for a specific QAM profile.

### Examples

The following example shows how to set the MPEG framing format for a specific QAM profile:

```
Router# configure terminal
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# annex A
```

### Related Commands

Command	Description
<b>cable downstream qam-profile</b>	Set the QAM profile for the cable interface line card.
<b>interleaver-depth</b>	Set the interleaver-depth.
<b>modulation</b>	Set the QAM modulation format.
<b>spectrum-inversion</b>	Set the spectrum-inversion on or off.
<b>symbol-rate</b>	Set the symbol rate.

# annex modulation

**Note** Effective with Cisco IOS Release 12.3(23)BC, the **annex modulation** command is obsolete and **annex** and **modulation** are included as keyword options in the **rf-channel frequency** command.

To set the annex (MPEG framing format) and modulation for the Wideband SPA, use the **annex modulation** command in controller configuration mode. To set the annex to B and the modulation to 64 QAM, use the **no** form of this command.

**annex** {A | B} **modulation** {64qam | 256qam} [*rf-start-index* *rf-end-index*]  
**no annex** {A | B} **modulation** {64qam | 256qam} [*rf-start-index* *rf-end-index*]

Syntax Description		
	A   B	Specifies the MPEG framing format: <ul style="list-style-type: none"> <li>• <b>A</b>—Annex A. The downstream is compatible with the European MPEG framing format specified in ITU-TJ.83 Annex A.</li> <li>• <b>B</b>—Annex B. The downstream is compatible with the North American MPEG framing format specified in ITU-TJ.83 Annex B.</li> </ul>
	64qam 256qam	Specifies the modulation rate: <ul style="list-style-type: none"> <li>• <b>64qam</b>—64-QAM modulation.</li> <li>• <b>256qam</b>—256-QAM modulation.</li> </ul>
	<i>rf-start-index</i> <i>rf-end-index</i>	(Optional) Specifies the start and end indexes for RF channels. The following values are allowed: <ul style="list-style-type: none"> <li>• If the annex is A and the modulation is 256 QAM, <i>rf-start-index</i> must be 0, and <i>rf-end-index</i> must be 17.</li> <li>• For all other cases, <i>rf-start-index</i> must be 0, and <i>rf-end-index</i> must be 23.</li> </ul>

**Command Default** No annex or modulation is set for the Wideband SPA.

**Command Modes** Controller configuration (config-controller)

Command History	Release	Modification
	12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
	12.3(23)BC	This command was made obsolete and <b>annex</b> and <b>modulation</b> were included as keyword options in the <b>rf-channel frequency</b> command.
	IOS-XE 3.15.0S	This command was replaced by the <b>controller Integrated-Cable</b> and <b>controller Upstream-Cable</b> commands on the Cisco eBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to set the following on a Wideband SPA:

- Annex (MPEG framing format)
- Modulation
- Start and end indexes for RF channels

Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command.

- For annex A and 256 QAM modulator, each Wideband SPA supports 18 RF channels.
- For all other cases, each Wideband SPA supports 24 RF channels.

The *rf-start-index* and *rf-end-index* arguments are intended for future use and are not currently needed. If *rf-start-index* and *rf-end-index* are not specified, the default values are as follows:

- If the annex is A and the modulation is 256 QAM, *rf-start-index* is 0, and *rf-end-index* is 17.
- For all other cases, *rf-start-index* is 0, and *rf-end-index* is 23.

## Examples

The following example shows how to set the MPEG framing format and modulation for the Wideband SPA located at slot 1, subslot 0, bay 0:

```
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# annex B modulation 64qam
```

## Related Commands

Command	Description
<b>cable rf-channel</b>	Associates an RF channel on a Wideband SPA with a wideband channel.
<b>controller modular-cable</b>	Enters controller configuration mode to configure the Wideband SPA controller.
<b>ip-address (controller)</b>	Sets the IP address of the Wideband SPA FPGA.
<b>modular-host subslot</b>	Specifies the modular-host line card.
<b>rf-channel frequency</b>	Sets the frequency for each RF channel.
<b>rf-channel ip-address mac-address udp-port</b>	Sets the IP address, MAC address and UDP port for each RF channel.
<b>rf-channel network delay</b>	Specifies the CIN delay for each RF channel.
<b>rf-channel description</b>	Specifies the description for each RF channel.
<b>rf-channel cable downstream channel-id</b>	Assigns a downstream channel ID to an RF channel.

# announce-event-profile

To configure the GQI announce event profile, use the **announce-event-profile** command in global configuration mode.

**announce-event-profile** {*name* | **id** *id* }

**ack-timeout** *time (in seconds)*

**filter** [**all-events** | *event-code*]

Syntax Description		
	<i>name</i>	Specify a name for the GQI announce event profile.
	<i>id</i>	Specify an ID for the GQI announce event profile.
	<b>ack-timeout</b> <i>time (in seconds)</i>	Specify the time (in seconds) the Cisco cBR-8 router waits for an acknowledgement from the SRM before sending the next announce message. The range is from 0-240 seconds.  If the time is set to 0 seconds, the Cisco cBR-8 router sends the message without waiting for an acknowledgement from SRM.
	<b>filter all-events</b>	Specifies that the Cisco cBR-8 router does not send any announce messages.
	<b>filter</b> <i>event-code</i>	Filter one or more messages by using specific event codes.

**Command Default** None.

**Command Modes** Global configuration (config).

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to configure the GQI announce event profile:

```
enable
configure terminal
cable video
    announce-event-profile gqi-led-1 id 2
        ack-timeout 240
        filter 5502
        filter 5602
logical-edge-device led-1 id 1
    protocol gqi
    event-profile gqi-led-1
    vcg vcg-1
    active
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show cable video announce-event-profile</b>	Displays the configuration of the GQI announce event profile and a list of LEDs that use the profile.
<b>event-profile</b>	Applies the GQI announce event profile to a specific LED.

# application-id

To specify an application type to allow admission control to be applied to a group configuration, use the **application-id** command in multicast QoS configuration mode. To disable admission control, use the **no** form of this command.

**application-id** *number*  
**no application-id** *number*

<b>Syntax Description</b>	<i>number</i> Specifies the application identification number of the multicast QoS group. The valid range is 1–65535.
---------------------------	-----------------------------------------------------------------------------------------------------------------------

**Command Default** Multicast QoS group application type is not identified.

**Command Modes** Multicast QoS configuration (config-mqos)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCA	This command was introduced.
	IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

**Usage Guidelines** To enable intelligent multicast admission control, you must enable and configure an application type using the **application-id** command.

**Examples** The following example identifies a multicast QoS group application ID using the **applicaton-id** command:

```
Router(config)# cable multicast qos group 20 priority 55 global
Router(config-mqos)# application-id 44
```

The following example identifies a multicast QoS group application ID using the **applicaton-id** command in Cisco cBR Series Converged Broadband Routers:

```
Router(config)# cable multicast qos group 30 priority 60 global
Router(config-mqos)# application-id 77
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable multicast qos group</b>	Specifies and configures a cable multicast QoS group.
	<b>show interface bundle multicast-sessions</b>	Displays multicast session information for a specific virtual cable bundle.
	<b>show interface cable multicast-sessions</b>	Displays multicast session information for a specific cable interface.

# assign

To assign modulation to subcarrier, use the **assign** command in OFDM modulation profile configuration mode. To undo a modulation assignment, use **no** form of this command.

```
assign {modulation-default value | modulation value {list-subcarriers {freq-abs | freq-offset}frequency
| range-subcarriers {freq-abs | freq-offset}frequency width value}}
```

```
no assign {modulation-default value | modulation value {list-subcarriers {freq-abs | freq-offset}frequency
| range-subcarriers {freq-abs | freq-offset}frequency width value}}
```

## Syntax Description

<b>modulation-default</b> <i>value</i>	Assign a modulation value as the default value for all subcarriers. Valid values are QPSK, 16-QAM, 64-QAM, 128-QAM, 256-QAM, 512-QAM, 1024-QAM, 2048-QAM, and 4096-QAM.
<b>modulation</b> <i>value</i>	Assign a specific modulation value to a range or list of subcarriers. Valid values are QPSK, 16-QAM, 64-QAM, 128-QAM, 256-QAM, 512-QAM, 1024-QAM, 2048-QAM, 4096-QAM, and zero-bit-load.
<b>list-subcarriers</b>	Assign modulation to a list of up to 10 subcarriers.
<b>range-subcarriers</b>	Assign modulation to a range of consecutive subcarriers specified by the first frequency and width in Hz.
<b>freq-abs</b> <i>frequency</i>	Specify range using absolute frequencies in Hz.
<b>freq-offset</b> <i>frequency</i>	Specify range using frequency offsets in Hz from the first configurable subcarrier determined by the profile's width.
<b>width</b> <i>value</i>	Specify width of range in Hz.

## Command Default

None

## Command Modes

OFDM modulation profile configuration (config-ofdm-mod-prof)

## Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE 16.8.1	This command was modified on the Cisco cBR Series Converged Broadband Routers. <b>zero-bit-load</b> was added as a modulation value.

## Usage Guidelines

Use this command to assign modulation to subcarrier.

Only **freq-abs** or **freq-offset** keyword can be used depending on whether the **start-frequency** is configured. If it is configured, **freq-abs** is used and subsequent frequency values must be absolute values. If it is not configured, **freq-offset** is used and subsequent frequency values are offsets from the first configurable subcarrier determined by the profile's width.

## Examples

The following example shows how to assign modulation to subcarrier with **start-frequency** configured:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)# width 96000000
Router(config-ofdm-mod-prof)# start-frequency 627000000
Router(config-ofdm-mod-prof)# assign modulation 1024-QAM range-subcarriers freq-abs 635000000
width 74050000
```

The following example shows how to assign modulation to subcarrier without **start-frequency** configured:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)# width 96000000
Router(config-ofdm-mod-prof)# assign modulation 1024-QAM range-subcarriers freq-offset
8000000 width 74050000
```

The following example shows how to configure ZBL on a modulation profile:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 159
Router(config-ofdm-mod-prof)# description an example of ZBL starting at 10MHZ for 1MHZ
Router(config-ofdm-mod-prof)# subcarrier-spacing 50KHZ
Router(config-ofdm-mod-prof)# width 96000000
Router(config-ofdm-mod-prof)# assign modulation-default 1024-QAM
Router(config-ofdm-mod-prof)# assign modulation zero-bit-load range-subcarriers freq-offset
10000000 width 1000000
```

## Related Commands

Command	Description
<b>cable downstream ofdm-modulation-profile</b>	Define the OFDM modulation profile on the OFDM channel.
<b>description (OFDM modulation profile)</b>	Specify a user defined description for the profile up to 64 characters.
<b>start-frequency</b>	(Optional) Specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width.
<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.
<b>width</b>	Specify width of profile in Hz.

# attributes

To configure the attribute value for an upstream bonding group, use the **attributes** command in upstream bonding configuration submode. To restore the default attribute value, use the **no** form of this command.

**attributes** *value*  
**no attributes**

## Syntax Description

<i>value</i>	The upstream bonding group attribute value, in hexadecimal format. The range is from 0 to FFFFFFFF. The default is 80000000.
--------------	------------------------------------------------------------------------------------------------------------------------------

## Command Default

The upstream bonding group attribute value is 80000000.

## Command Modes

Upstream bonding configuration (config-upstream-bonding)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The changes made to the configuration, using this command, on the working line card are synchronized with the configuration on the protect line card only after exiting the configuration mode. Use the end command to exit to Privileged EXEC mode, before using the show running configuration command.

**Note** Effective with Cisco IOS Release 12.2(33)SCH, the **no** form of this command disables the attribute on a Cisco uBR10012 router.

## Examples

The following example shows how to configure the attribute value for an upstream bonding group on a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable7/1/0
Router(config-if)# cable upstream bonding-group 20
Router(config-upstream-bonding)# attributes eeeeeeee
```

The following example shows how to configure the attribute value for an upstream bonding to allow all devices:

```
Router# configure terminal
Router(config)# interface cable7/1/0
Router(config-if)# cable upstream 2 attribute-mask 20000000
```

The following example shows how to configure the attribute value for an upstream bonding to specific devices:

```
Router# configure terminal  
Router(config)# interface cable7/1/0  
Router(config-if)# cable upstream 2 attribute-mask 20000004
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable upstream bonding-group</b>	Creates an upstream bonding group on a cable interface.

## auto-channel-id

To enable automatic channel ID selection, use the **auto-channel-id** command in the DVB scrambling ECMG configuration mode. To disable automatic channel ID selection, use the **no** form of this command.

**auto-channel-id**  
**no auto-channel-id**

**Command Default** None

**Command Modes** DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to enable automatic channel ID selection:

```
Router>enable
Router#configure terminal
Router (config)#cable video
Router (config-video)#encryption
Router (config-video-encrypt)#dwb
Router (config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router (config-video-encrypt-dvb-ecmg)#auto-channel-id
```

**Related Commands**

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>connection</b>	Configures the ECMG connection.
<b>ecm-pid-source</b>	Configures the source of ECM PID.
<b>ca-system-id</b>	Configures the CA system ID.
<b>type</b>	Configures the ECMG type.
<b>mode</b>	Configures the application mode of ECMG.
<b>desc-rule</b>	Configures the descriptor rule.
<b>override</b>	Overrules the default settings.

# base-channel-power

To set the base channel power level, use the **base-channel-power** command in the controller sub configuration mode.

**base-channel-power** *value*

## Syntax Description

*value* Value for the base channel power level. Valid range is from 26 to 34.

## Command Default

If not specified, the default value is calculated based on the number of carriers.

## Command Modes

Controller sub configuration mode (config-controller).

## Command History

Release	Modification
Cisco IOS-XE Release 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command is used to specify the base channel power level on an RF port.

The following example shows how to define the base channel power level:

```
router#configure terminal
router(config)#controller Integrated-Cable 3/0/0
router(config-controller)#base-channel-power 26
router(config-controller)#exit
router#show controllers Integrated-Cable 3/0/0 rf-port
  Admin:  UP  MaxCarrier: 128  BasePower: 26 dBmV  Mode: normal
cbr8-router #show controller integrated-Cable 3/0/0 rf-channel 0

Chan State Admin Frequency  Type  Annex Mod  srate Interleaver  dcid  power  output
0      UP    UP    93000000  DOCSIS B    256   5361  I32-J4      1    26   NORMAL
```

## Related Commands

Command	Description
<b>max-carrier</b>	Specifies the maximum number of carriers.
<b>power-adjust</b>	Adjusts the power levels of the RF channel.

# bind-vcg

To bind a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group, use the **bind-vcg** command in video configuration mode. To unbind all virtual groups, use the **no** form of this command.

**bind-vcg**  
**no bind-vcg**

**Command Default** None.

**Command Modes** Video configuration (config-video)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command binds a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group.

**Examples** The following example shows how to bind a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group:

```
Router#config t
Router(config)#cable video
Router(config-video)#bind-vcg
Router(config-video-bd)#vcg movie-channels sdg west-regions
```

Related Commands	Command	Description
	<b>service-distribution-group</b>	Defines a service distribution group.
	<b>rf-port integrated-cable</b>	Specifies the RF ports in a service distribution group.
	<b>virtual-carrier-group</b>	Defines a virtual carrier group.
	<b>rf-channel</b>	Specifies the virtual RF channels in a virtual carrier group.

# block-unref-pids

To block unreferenced PIDs on a QAM channel, use the **block-unref-pids** command in video configuration mode. To remove the configuration, use the **no** form of the command.

**block-unref-pids**  
**no block-unref-pids**

**Command Default** None.

**Command Modes** Video configuration (config-video)

Command History	Release	Modification
	IOS-XE 16.8.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to block unreferenced PIDs on a QAM channel:

```
Router(config)# cable video
Router(config-video)# filter pid vcg vcg1
Router(cable-video-filter)#rf-channel 20-21
Router(cable-video-filter-ch)#block-unref-pids
```

## cable acfe constant-eir-demand

To set the EIR demand(raw/scale) value for a bonding group, use **cable acfe constant-eir-demand** command in interface configuration mode.

**cable acfe constant-eir-demand** *value*

<b>Syntax Description</b>	<i>value</i> Constant EIR demand value for a bonding group. The valid range is from 1 to 100.
---------------------------	-----------------------------------------------------------------------------------------------

<b>Command Default</b>	0
------------------------	---

<b>Command Modes</b>	Interface configuration—cable interface only (config-if) Wideband-interface profile configuration (config-profile-wb)
----------------------	--------------------------------------------------------------------------------------------------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

<b>Usage Guidelines</b>	ACFE uses the EIR demand value as weight to allocate bandwidth between bonding groups. The EIR demand value is calculated dynamically base on service flow priority, unless this command is configured.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>Examples</b>	The following example shows how to configure the EIR demand value for a bonding group:
-----------------	----------------------------------------------------------------------------------------

```
Router(config-if)# cable acfe constant-eir-demand 11
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable acfe enable</b>	Enables Fairness Across DOCSIS Interfaces feature on the CMTS routers.
	<b>debug cable dp acfe</b>	Displays the debug information related to algorithm or interaction with the system.

## cable acfe enable

To enable Fairness Across DOCSIS Interfaces feature on the integrated-cable (IC), modular-cable (MC), or wideband-cable (WB) interfaces, use the **cable acfe enable** command in global configuration mode. To disable Fairness Across DOCSIS Interfaces feature, use the **no** form of this command.

**cable acfe enable**

**no cable acfe enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Fairness Across DOCSIS Interfaces feature is disabled.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Configure the Fairness Across DOCSIS Interfaces feature on the MC, IC, or WB interfaces.

It is recommended that you clear the CIR reservation above the legacy “reservable” bandwidth before disabling Fairness Across DOCSIS Interfaces feature. This is to prevent any CIR over-subscription after disabling Fairness Across DOCSIS Interfaces feature.

**Examples** The following example shows how to enable Fairness Across DOCSIS Interfaces feature in cable interfaces.

```
Router(config)# cable acfe enable
```

Command	Description
<b>cable acfe period</b>	Configures the interval for running the EIR rebalancing process.
<b>show cable acfe summary</b>	Displays Fairness Across DOCSIS Interfaces feature status and statistics.
<b>debug cable acfe</b> (for uBR series router)	Displays the debug information related to algorithm or interaction with the system.
<b>debug cable dp acfe</b> (for cBR series router)	Displays the debug information related to algorithm or interaction with the system.

## cable acfe guar-bw-sync-period

Use the **cable acfe guar-bw-sync-period** configuration command to adjust bandwidth synchronisation period between active SUP and standby SUP. The default value is 40 seconds.

**cable acfe guar-bw-sync-period**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The default value is 40 seconds.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	IOS XE Fuji 16.7.1	This command was introduced.

### Examples

The following example shows how to configure the ACFE to adjust bandwidth synchronisation period between active SUP and standby SUP

```
Router(config)# cable acfe guar-bw-sync-period
```

Related Commands	Command	Description
	<b>cable acfe period</b>	Configures the interval for running the EIR rebalancing process.
	<b>show cable acfe summary</b>	Displays Fairness Across DOCSIS Interfaces feature status and statistics.

## cable acfe max-bonus-bandwidth

To configure the maximum usable bonus bandwidth for a bonding group (BG), use the **cable acfe max-bonus-bandwidth** command in interface configuration mode. To revert to the default values, use the **no** form of this command.

**cable acfe max-bonus-bandwidth** *bonus-bandwidth*  
**no cable acfe max-bonus-bandwidth**

### Syntax Description

<i>bonus-bandwidth</i>	Maximum usable bonus bandwidth for a BG. There is no valid range, and the bonus bandwidth can use the entire bandwidth of an interface.
------------------------	-----------------------------------------------------------------------------------------------------------------------------------------

### Command Default

The bonus bandwidth can use the entire bandwidth of an interface.

### Command Modes

Interface configuration—cable interface only (config-if)  
 Wideband-interface profile configuration (config-profile-wb)

### Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable acfe max-bonus-bandwidth** command configures the maximum usable bonus bandwidth. After disabling Fairness Across DOCSIS Interfaces feature, this configuration is retained. However, it will not be used.

### Examples

The following example shows how to configure the maximum usable bonus bandwidth for a BG:

```
Router(config-if)# cable acfe max-bonus-bandwidth 1000000
```

### Related Commands

Command	Description
<b>cable acfe enable</b>	Enables Fairness Across DOCSIS Interfaces feature on the CMTS routers.
<b>debug cable dp acfe</b>	Displays the debug information related to algorithm or interaction with the system.

## cable acfe max-eir-ratio

To configure the maximum EIR ratio between the BE bandwidth among adjacent bonding groups (BGs), use the **cable acfe max-eir-ratio** command in global configuration mode. To return to the default values, use the **no** form of this command.

**cable acfe max-eir-ratio** *eir-ratio*  
**no cable acfe max-eir-ratio**

<b>Syntax Description</b>	<i>eir-ratio</i>	EIR rebalance ratio between two adjacent BGs. The valid range is from 1 to 100 with a default value of 10.
---------------------------	------------------	------------------------------------------------------------------------------------------------------------

**Command Default** The default value for EIR rebalance ratio is 10.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCF	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable acfe max-eir-ratio** command configures the maximum EIR ratio between the BE bandwidth among adjacent BGs.

The failure to maintain the maximum EIR ratio may reduce the guaranteed bandwidth rate for the BE traffic to zero. This may lead to rejection of unicast CIR flows.

### Examples

The following example shows how to configure the EIR rebalance ratio between two adjacent BGs:

```
Router(config)# cable acfe max-eir-ratio 20
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable acfe enable</b>	Enables Fairness Across DOCSIS Interfaces feature on the CMTS router.
	<b>debug cable acfe</b> (for uBR series router)	Displays the debug information related to algorithm or interaction with the system.
	<b>debug cable dp acfe</b> (for cBR series router)	Displays the debug information related to algorithm or interaction with the system.

## cable admission-control

To configure the CPU and memory thresholds for a Cisco CMTS router supporting broadband processing engines (BPEs), use the **cable admission-control** command in global configuration mode. This command sets the CPU averaging method and memory thresholds. To remove thresholds from a Cisco CMTS router, use the **no** form of this command.

```
cable admission-control {cpu-5sec | cpu-avg} {[io-mem] | [proc-mem] | [total-memory]} minor num1
major num2 critical num3
no cable admission-control {cpu-5sec | cpu-avg} {[io-mem] | [proc-mem] | [total-memory]} minor num1
major num2 critical num3
```

### Syntax Description

<b>cpu-5sec</b>	Sets Admission Control thresholds on the Cisco CMTS based on a five-second average for the CPU. This setting must be combined with the additional <b>minor</b> , <b>major</b> , and <b>critical</b> threshold percentage values.
<b>cpu-avg</b>	Sets Admission Control thresholds on the Cisco CMTS based on a one-minute average for the CPU. This setting must be combined with the additional <b>minor</b> , <b>major</b> , and <b>critical</b> threshold percentage values.
<b>io-mem</b>	Sets Admission Control thresholds for input/output (IO) memory on the Cisco CMTS route processors and BPE processors.
<b>proc-mem</b>	Sets Admission Control thresholds according to CPU processor memory on the Cisco CMTS.
<b>total-memory</b>	Sets Admission Control thresholds on the Cisco CMTS according to total-memory allocation.
<b>minor</b> <i>num1</i>	Sets the minor threshold level for the CPU or memory resource to be configured. Num1 expresses a percentage and must be an integer between 1 and 100.
<b>major</b> <i>num2</i>	Sets the major threshold level for the CPU or memory resource to be configured. Num2 expresses a percentage and must be an integer between 1 and 100.
<b>critical</b> <i>num3</i>	Sets the critical threshold level for the CPU or memory resource to be configured. Num3 expresses a percentage and must be an integer between 1 and 100.

### Command Default

Admission control is disabled with no CPU or memory resource threshold settings on the Cisco CMTS router.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router, with supporting broadband processing engines (BPEs) or cable interface line cards on the respective routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The threshold counters are set to zero when the resource is reconfigured.

An important concept for system resources that are set with this command (CPU and memory) is the concept of *dampening*. Without dampening, and when admission control is configured for the first time, the system resource check is unsuccessful if the current value exceeds the critical threshold. When this happens, the system resource check subsequently succeeds only if the current value drops below the major threshold.

**Note** When the **minor** threshold value set with *Num1* or a **major** threshold value set with *Num2* is crossed, the Cisco CMTS router sends an alarm (SNMP trap, when supported). When the **critical** threshold value set with *Num3* is crossed, the Cisco CMTS router drops the call request.

This dampening approach helps prevent significant fluctuations in the outcome of resource checks. For example, if the critical threshold were 80 percent and the current values fluctuated between 79 and 81 percent, this scenario would lead to an alternate success then failure event without dampening. The first check would succeed, the second check would fail, and so forth.

For additional Admission Control feature information, refer to the *Admission Control for the Cisco Cable Modem Termination System* document on Cisco.com.

**Examples**

The following example configures the Cisco CMTS router with a Quality of Service (QoS) policy that includes admission control dampening. This example illustrates the following conditions:

- When the **cpu-avg** exceeds 60%, a minor alarm (SNMP trap, when supported) is sent.
- When the **cpu-avg** exceeds 70%, a major alarm (SNMP trap, when supported) is sent.
- When the **cpu-avg** exceeds 80%, the incoming call request is rejected, and additional calls are not accepted until after the **cpu-avg** returns to below 60% (the minor alarm level).

```
Router(config)# cable admission-control cpu-avg minor 60 major 70 critical 80
```

**Related Commands**

Command	Description
<b>cable admission-control event</b>	Configures and enables admission control event types on the Cisco CMTS router.
<b>cable admission-control ds-bandwidth</b>	Configures admission control downstream bandwidth thresholds on the Cisco CMTS router.
<b>cable admission-control us-bandwidth</b>	Configures admission control upstream bandwidth thresholds on the Cisco CMTS router.
<b>clear cable admission control counters</b>	Clears all admission control resource counters on the Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on the Cisco CMTS router.
<b>show cable admission-control</b>	Displays the current admission control configuration and status on the Cisco CMTS router, or on a specified interface.

## cable admission-control ds-bandwidth

To set the minor, major, and exclusive thresholds for downstream voice or data bandwidth for all interfaces on a Cisco CMTS router, use the **cable admission-control ds-bandwidth** command in global configuration mode or interface configuration mode. To remove this setting from a Cisco CMTS router or from a specified interface, use the **no** form of this command.

**cable admission-control ds-bandwidth** *traffic-type* **minor** *minor-threshold* **major** *major-threshold* **exclusive** *exclusive-percentage* **non-exclusive** *non-exclusive-percentage*  
**no cable admission-control ds-bandwidth** *traffic-type* **minor** *minor-threshold* **major** *major-threshold* **exclusive** *exclusive-percentage* **non-exclusive** *non-exclusive-percentage*

### Syntax Description

<b>ds-bandwidth</b>	Sets downstream throughput thresholds.
<i>traffic-type</i>	Either of the following keywords sets the traffic type for which Admission Control applies. Both settings can be applied to the Cisco CMTS. <ul style="list-style-type: none"> <li>• <b>voice</b>—Applies thresholds to downstream voice traffic.</li> <li>• <b>data</b>—Applies thresholds to downstream data traffic.</li> </ul>
<b>minor</b> <i>minor-threshold</i>	Sets the minor alarm threshold. The <i>minor-threshold</i> value is a percentage value from 1 to 100.
<b>major</b> <i>major-threshold</i>	Sets the major alarm threshold. The <i>major-threshold</i> value is a percentage value from 1 to 100.
<b>exclusive</b> <i>exclusive-percentage</i>	Specifies the percentage of throughput reserved exclusively for this class (voice or data). The <i>exclusive-percentage</i> value is an integer between 1 and 100. No other class can use this throughput.
<b>non-exclusive</b> <i>non-exclusive-percentage</i>	Specifies the percentage of throughput, over and above the exclusive share, that can be used by this class. The <i>non-exclusive-percentage</i> value is an integer between 1 and 100. Because this throughput is non-exclusive, it can be used by other classes as specified.

### Command Default

Admission control is disabled on the Cisco CMTS router.

### Command Modes

Global configuration (config)

Interface configuration (config-if)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced on the Cisco uBR10012 and the Cisco uBR7246VXR router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Release	Modification
12.2(33)SCC	This command was modified to run on modular cable and integrated cable interfaces.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Downstream bandwidth settings support all interfaces on the Cisco CMTS router through global configuration.

Downstream bandwidth settings can be further refined per-interface or per-upstream, the latter of which provides optimal downstream Admission Control granularity on the Cisco CMTS router.

When interface-level downstream configuration is used in combination with global configuration, then the interface configuration supersedes global configuration.

**Note** The **critical** keyword is not present for the upstream throughput resource management with the Cisco Service Flow Admission Control feature.

**Note** The **minor** threshold level cannot be greater than the **major** threshold level.

### Examples

The following example configures downstream bandwidth in the global configuration mode, with 30% of downstream bandwidth reserved exclusively for voice traffic. Minor and major alarms for voice traffic are also set to be generated at 15% and 25% respectively.

```
Router(config)# cable admission-control ds-bandwidth voice minor 15 major 25 exclusive 30
```

### Related Commands

Command	Description
<b>cable admission-control</b>	Configures the CPU and memory thresholds for the Cisco CMTS router and supporting broadband processing engines (BPEs).
<b>cable admission-control event</b>	Configures and enables admission control event types on the Cisco CMTS router.
<b>cable admission-control max-reserved-bandwidth</b>	Defines the maximum reserved bandwidth per bonding group for all service flows that are allowed by the Cisco CMTS.
<b>cable admission-control us-bandwidth</b>	Configures admission control upstream bandwidth thresholds on the Cisco CMTS router.
<b>clear cable admission control counters</b>	Clears all admission control resource counters on the Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on the Cisco CMTS router.

Command	Description
<b>show cable admission-control</b>	Displays the current admission control configuration and status on the Cisco CMTS router or on a specified interface.

## cable admission-control event

To configure admission control event types on a Cisco CMTS router, and to enable admission control for all previously configured resources on a Cisco CMTS router, use the **cable admission-control event** command in global configuration mode. To disable admission control event types on a Cisco CMTS router, use the **no** form of this command.

```
cable admission-control event {cm-registration | dynamic-service}
no cable admission-control event event_type
```

### Syntax Description

<b>cm-registration</b>	Performs admission control checks when a cable modem registers with the Cisco CMTS router headend. This setting can be combined with the <b>dynamic-service</b> setting, in which cable modems are allowed to register but remain subject to a Quality of Service (QoS) policy on the Cisco CMTS.
<b>dynamic-service</b>	Performs admission control checks each time a voice call is made, and rejects voice calls if they would impede QoS policies on the Cisco CMTS router. This setting can be combined with the <b>cm-registration</b> setting.

### Command Default

Admission control event types are not defined on the Cisco CMTS router.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

At least one event type must be configured to enable admission control on the Cisco CMTS router.

For additional Admission Control feature information, refer to the *Admission Control for the Cisco Cable Modem Termination System* document on Cisco.com.

### Examples

The following example configures each available option for the **cable admission-control event** command on the Cisco CMTS router.

```
Router(config)# cable admission-control event cm-registration
Router(config)# cable admission-control dynamic-service
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable admission-control</b>	Configures the CPU and memory thresholds for a Cisco CMTS router and supporting broadband processing engines (BPEs).
<b>cable admission-control ds-bandwidth</b>	Configures admission control downstream bandwidth thresholds on a Cisco CMTS router.
<b>cable admission-control us-bandwidth</b>	Configures admission control upstream bandwidth thresholds on a Cisco CMTS router.
<b>clear cable admission control counters</b>	Clears all admission control resource counters on a Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on a Cisco CMTS router.
<b>show cable admission-control</b>	Displays the current admission control configuration and status on a Cisco CMTS router, or on a specified interface.

## cable admission-control max-reserved-bandwidth

To define the maximum reserved bandwidth per bonding group for all service flows that are allowed by the Cisco CMTS, use the **cable admission-control max-reserved-bandwidth** command in the interface configuration mode. To reset or disable the maximum reserved bandwidth value, use the **no** form of this command.

**cable admission-control max-reserved-bandwidth** *bw-in-kbps*  
**no cable admission-control max-reserved-bandwidth**

### Syntax Description

<i>bw-in-kbps</i>	Maximum admission control reserved bandwidth. The value is in kbps and is based on the RF bandwidth percent defined for the bonding group. Valid range is from 0 to 14762.
-------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

The max-reserved-bandwidth value is 80 percent of the aggregate bandwidth of the RF channels configured in the US or DS bonding group.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command allows the user to define the maximum reserved bandwidth per bonding group. The default maximum reserved bandwidth value is 80 percent. However the user can choose to configure a higher (up to 96 percent) or lower reserved bandwidth so that there is bandwidth allocated for zero committed information rate (CIR) best effort traffic.

### Examples

The following example shows a sample definition of the maximum reserved bandwidth value.

```
Router> enable
Router# configure terminal
Router(config)# interface c5/0/1
Router(config-if)# cable admission-control max-reserved-bandwidth 6344
```

### Related Commands

Command	Description
<b>cable admission-control</b>	Configures the CPU and memory thresholds for the Cisco CMTS router and supporting broadband processing engines (BPEs).
<b>cable admission-control event</b>	Configures and enables admission control event types on the Cisco CMTS router.
<b>cable admission-control ds-bandwidth</b>	Configures admission control downstream bandwidth thresholds on the Cisco CMTS router.

Command	Description
<b>cable admission-control us-bandwidth</b>	Configures admission control upstream bandwidth thresholds on the Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on the Cisco CMTS router.
<b>show cable admission-control</b>	Displays the current admission control configuration and status on the Cisco CMTS router or on a specified interface.

## cable admission-control preempt priority-voice

To change the default PacketCable emergency 911 call preemption functions on a Cisco CMTS router to support throughput and bandwidth requirements for emergency 911 calls above all other buckets on the Cisco CMTS router, use the **cable admission-control preempt priority-voice** command in global configuration mode. To disable preemption and return the bucket that supports PacketCable emergency 911 calls to its default configuration, use the **no** form of this command.

**cable admission-control preempt priority-voice**  
**no cable admission-control preempt priority-voice**

### Syntax Description

This command has no arguments or keywords.

### Command Default

Emergency 911 call preemption and service flow admission control is enabled on the Cisco CMTS router.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

By default, PacketCable Emergency 911 calls are given priority on the Cisco CMTS. This priority may be preempted or removed from the Cisco CMTS router with non-standard configuration of the Service Flow Admission Control feature.

For additional information for Service Flow Admission Control beginning in Cisco IOS Release 12.3(21)BC, refer to the *Service Flow Admission Control for the Cisco Cable Modem Termination System* document on Cisco.com.

### Examples

The following example disables and then restores emergency 911 call preemption on the Cisco CMTS router.

```
Router(config)# no cable admission-control preempt priority-voice
Router(config)# cable admission-control preempt priority-voice
```

## cable admission-control us-bandwidth

To configure upstream bandwidth thresholds for admission control on a Cisco CMTS router, use the **cable upstream admission-control us-bandwidth** command in global configuration or interface configuration mode. To disable or to remove this configuration from a Cisco CMTS router or the specified port, use the **no** form of this command.

**cable admission-control us-bandwidth** [**sched** *scheduling-type* | **service** *service-class-name*] **minor** *minor-threshold* **major** *major-threshold* **exclusive** *exclusive-percentage* **non-exclusive** *non-exclusive-percentage*

**no cable admission-control us bandwidth** [**sched** *scheduling-type* | **service** *service-class-name*] **minor** *minor-threshold* **major** *major-threshold* **exclusive** *exclusive-percentage* **non-exclusive** *non-exclusive-percentage*

### Syntax Description

<i>n</i>	Upstream on the router interface.
<b>us-bandwidth</b>	Configures the upstream throughput thresholds.
<b>sched</b> <i>scheduling-type</i>	(Optional) Specifies the scheduling type for a traffic class, where <i>scheduling-type</i> is one of the following values: <ul style="list-style-type: none"> <li>• <b>BE</b>—Selects best effort traffic.</li> <li>• <b>NRTPS</b>—Selects non-real-time polling service.</li> <li>• <b>RTPS</b>—Selects real time polling service.</li> <li>• <b>UGS-AD</b>—Selects UGS-AD service.</li> <li>• <b>UGS</b>—Selects UGS service.</li> </ul>
<b>service</b> <i>service-class-name</i>	(Optional) Displays a string representing a previously defined service class. Instead of specifying a class by a scheduling type, this keyword can be used to specify a class using the <i>service-class-name</i> .
<b>minor</b> <i>minor-threshold</i>	Sets the minor alarm threshold in a percentage value between 1 and 100.
<b>major</b> <i>major-threshold</i>	Sets the major alarm threshold in a percentage value between 1 and 100.
<b>exclusive</b> <i>exclusive-percentage</i>	Represents the critical threshold for the upstream throughput resource in a percentage value between 1 and 100. Specifies the percentage of throughput reserved exclusively for this class.
<b>non-exclusive</b> <i>non-exclusive-percentage</i>	Specifies the percentage of throughput, over and above the exclusive share, that can be used by this class. The <i>non-exclusive-percentage</i> value is an integer between 1 and 100. Because this throughput is non-exclusive, it can be used by other classes as specified.

### Command Default

Admission control is disabled by default on a Cisco CMTS router.

### Command Modes

Global configuration (config)

Interface configuration (config-if)

Command History	Release	Modification
	12.3(13a)BC	This command was introduced on the Cisco uBR10012 and the Cisco uBR7246VXR routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCC	This command was modified to run on modular cable and integrated cable interfaces.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Upstream bandwidth settings support all interfaces on a Cisco CMTS router through global configuration.

Upstream bandwidth settings can be further refined on a per-interface or per-upstream basis using interface configuration mode. Per-upstream settings provide the optimal upstream admission control granularity on the Cisco CMTS router.

When interface or per-upstream configuration is used in combination with global configuration, then interface or per-upstream configuration supersedes global configuration. Per-upstream configuration also supersedes per-interface configuration.

**Note** The **critical** keyword is not present for the upstream throughput resource management with Cisco Admission Control.

**Note** The **minor** threshold level cannot be greater than the **major** threshold level.

### Examples

For additional Admission Control feature information and examples, refer to the *Admission Control for the Cisco Cable Modem Termination System* document on Cisco.com.

Related Commands	Command	Description
	<b>cable admission-control</b>	Configures the CPU and memory thresholds for the Cisco CMTS router and supporting broadband processing engines (BPEs).

	<b>cable admission-control ds-bandwidth</b>	Configures admission control downstream bandwidth thresholds on the Cisco CMTS router.
	<b>cable admission-control max-reserved-bandwidth</b>	Defines the maximum reserved bandwidth per bonding group for all service flows that are allowed by the Cisco CMTS.

Command	Description
<b>clear cable admission control counters</b>	Clears all admission control resource counters on the Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on the Cisco CMTS router.
<b>show cable admission-control</b>	Displays the current admission control configuration and status on the Cisco CMTS router or on a specified interface.

## cable application-type include

To associate an application type with a specific and prioritized bucket on a Cisco CMTS router, use the **cable application-type include** command in global configuration mode. To remove the application type settings, use the **no** form of this command.

```
cable application-type bucket-number include {Best-effort | multicast application-id | packetcable
{normal | priority} | pcmm {app-id gate-app-id | priority gate-priority} | sched-type type | service-class
service-class-name}
```

```
no cable application-type bucket-number include {Best-effort | multicast application-id | packetcable
{normal | priority} | pcmm {app-id gate-app-id | priority gate-priority} | sched-type type | service-class
service-class-name}
```

### Cisco cBR Series Converged Broadband Routers

```
cable application-type bucket-number include {Best-effort | multicast application-id | packetcable
{normal | priority} | pcmm {app-id gate-app-id | priority gate-priority} | service-class
service-class-name}
```

```
no cable application-type bucket-number include {Best-effort | multicast application-id | packetcable
{normal | priority} | pcmm {app-id gate-app-id | priority gate-priority} | service-class
service-class-name}
```

### Syntax Description

<i>bucket-number</i>	Bucket number to which an application type is associated. Range is from 1 to 8, with 1 as the first in the sequence.
<b>Best-effort</b>	Applies best effort committed information rate (CIR) to the specified bucket.
<b>multicast</b> <i>application-id</i>	Specifies the application identification for the multicast service flow. The valid range is 1 to 65535.
<b>packetcable</b> { <b>normal</b>   <b>priority</b> }	Specifies PacketCable service flows for the designated bucket, with the following priorities: <ul style="list-style-type: none"> <li>• <b>normal</b>—Selects PacketCable calls with normal priority.</li> <li>• <b>priority</b>—Selects PacketCable calls with high priority.</li> </ul>
<b>pcmm</b> { <b>app-id</b> <i>gate-app-id</i>   <b>priority</b> <i>gate-priority</i> }	Specifies PacketCable Multimedia (PCMM) service flows for the designated bucket, with the following options: <ul style="list-style-type: none"> <li>• <b>app-id</b> <i>gate-app-id</i>—Selects the gate application identifier from 0 to 65535. For each bucket, up to ten application type rules may be defined.</li> <li>• <b>priority</b> <i>gate-priority</i>—Selects the priority level from 0 to 7.</li> </ul>
<b>sched-type</b> <i>type</i>	Specifies upstream scheduling types, with one of the following additional keywords used for the DOCSIS scheduling type: <ul style="list-style-type: none"> <li>• <b>be</b>—Best effort.</li> <li>• <b>nrtps</b>—Non-real-time polling service.</li> <li>• <b>rtps</b>—Real-time polling service.</li> <li>• <b>ugs</b>—Unsolicited Grant Service.</li> <li>• <b>ugs-ad</b>—Unsolicited grant service-activity detection (UGS-AD) service.</li> </ul>

<b>service-class</b> <i>service-class-name</i>	Specifies the name of the service class being assigned to the designated bucket, where <i>service-class-name</i> is an alphanumeric string.
---------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------

**Command Default**

Service flow admission control is enabled without the application types.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.
12.2(33)SCA	This command was introduced in Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. The <b>multicast</b> keyword was added to this command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.16.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>sched-type</b> keyword was removed.

**Usage Guidelines**

The details of this command vary according to the bucket number and application type being mapped to a service flow on the Cisco CMTS router. This command overrides default service flow admission control settings on the Cisco CMTS.

**Best Effort**

The best effort CIR service flow rule may be applicable to both upstream and downstream. However, in the case of upstream service flows, in most cases, the same service flow may map both the rules.

For best effort, there is also the **sched-type** keyword option that applies to upstream service flows. This best effort scheduling type rule is applicable only for upstream service flows.

**Service Classes**

DOCSIS 1.1 introduced the concept of service classes. A service class is identified by a service class name. A service class name is a string the CMTS router associates with a QoS parameter set. One of the objectives of using a service class is to allow the high-level protocols to create the service flows with the desired QoS parameter set. Using a service class is a convenient way to bind the application with the service flows. The rules provide a mechanism to implement such binding.

Note the following factors when using the **service-class** keyword:

- Service classes are separately configured using the **cable match** command to provide the QoS for multicast traffic. This step maps a bucket using a rule to allocate bandwidth for multicast traffic.
- A named service class may be classified into any application type.
- Up to ten service class names may be configured per application type. Attempting to configure more than ten service classes results in an error message.

For additional information, see the *Service Flow Admission Control* feature documentation on Cisco.com.

**Examples**

The following example maps high-priority PacketCable service flows into application bucket 5:

```
Router(config)# cable application-type 5 include packetcable priority
```

The following example maps normal PacketCable service flows into application bucket 1:

```
Router(config)# cable application-type 1 include packetcable normal
```

The following example maps the specified bucket number with PCMM service flow with a priority of 7, then maps an application identifier of 152 for the same bucket number:

```
Router(config)# cable application-type 2 include pcmm priority 7
```

```
Router(config)# cable application-type 2 include pcmm app-id 152
```

The following example maps both UGS and UGS-AD into bucket number 1:

```
Router(config)# cable application-type 1 include sched-type ugs
```

```
Router(config)# cable application-type 1 include sched-type ugs-ad
```

The following example maps the best effort CIR flows to bucket 3:

```
Router(config)# cable application-type 3 include Best-effort
```

The following example maps the service class name with a value of service-name1 into application bucket 3:

```
Router(config)# cable application-type 3 include service-class service-name1
```

The following example maps the multicast application type with a value of 18 into application bucket 3:

```
Router(config)# cable application-type 3 include multicast 18
```

## Related Commands

Command	Description
<b>cable admission-control ds-bandwidth</b>	Sets the minor, major, and exclusive thresholds for downstream voice or data bandwidth for all interfaces on the Cisco CMTS router.
<b>cable admission-control preempt priority-voice</b>	Changes the default PacketCable emergency 911 call preemption functions on the Cisco CMTS router to support throughput and bandwidth requirements for emergency 911 calls above all other buckets on the Cisco CMTS router.
<b>cable admission-control us-bandwidth</b>	Configures upstream bandwidth thresholds for admission control on the Cisco CMTS router.
<b>cable application-type name</b>	Assigns an alphanumeric name for the specified bucket.
<b>cable upstream admission-control</b>	Configures per-upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS router.
<b>debug cable admission-control flow-categorization</b>	Displays service flow categorization results, enabled when a service flow is classified.
<b>show application-buckets</b>	Displays rules for any or all buckets supporting service flow admission control on the Cisco CMTS router.

Command	Description
<b>show interface cable admission-control reservation</b>	Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS router, for the specified interface, and the specified service flow direction.

## cable application-type name

To assign an alphanumeric name for the specified bucket, use the **cable application-type name** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable application-type** *bucket-number* **name** *bucket-name*  
**no cable application-type** *bucket-number* **name** *bucket-name*

### Cisco cBR Series Converged Broadband Routers

**cable application-type** *bucket-number* **name** *bucket-name*  
**no cable application-type** *bucket-number* **name** *bucket-name*

#### Syntax Description

<i>bucket-number</i>	Bucket number to which the name is applied. The priority sequence of the buckets, according to their original numeration of 1 to 8, still applies, whether the default bucket numbers or customized alphanumeric names are used.
<i>bucket-name</i>	Alphanumeric bucket name.

#### Command Default

Service flow admission control and the default configuration of this command is enabled.

#### Command Modes

Global configuration (config)

#### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.
12.2(33)SCA	This command was introduced in Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.16.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

#### Usage Guidelines

This bucket name appears in supporting **show** and **debug** commands along with the default bucket number. For additional information, see the *Service Flow Admission Control* feature documentation on Cisco.com.

#### Examples

The following example illustrates the use of descriptive names for the associated buckets:

```
Router(config)# cable application-type 2 name video
Router(config)# cable application-type 3 name gaming
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable admission-control ds-bandwidth</b>	Sets minor, major and exclusive thresholds for downstream voice or data bandwidth for each or all interfaces on the Cisco CMTS
<b>cable admission-control preempt priority-voice</b>	Changes the default PacketCable Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS.
<b>cable admission-control us-bandwidth</b>	Configures global or interface-level upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.
<b>cable application-type include</b>	Associates an application type with a specific and prioritized bucket on the Cisco CMTS.
<b>cable upstream admission-control</b>	Configures per-upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.
<b>debug cable admission-control flow-categorization</b>	Displays service flow categorization results, enabled when a service flow is classified.
<b>show application-buckets</b>	Displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS.
<b>show interface cable admission-control reservation</b>	Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction.

# cable arp

To activate cable Address Resolution Protocol (ARP), use the **cable arp** command in cable interface or subinterface configuration mode. To block ARP requests for cable modems (CMs), use the **no** form of this command.

**cable arp**  
**no cable arp**

## Syntax Description

This command has no arguments or keywords.

## Command Default

ARP is enabled.

## Command Modes

Interface configuration (config-if)

Subinterface configuration (config-subif)

## Command History

Release	Modification
12.1T	This command was introduced.
12.0(6)SC	This command was supported.
12.1(2) EC1	This command was supported.
12.1(3a)EC	Subinterface support was added.
12.2(8)BC1	Interaction with the <b>clear arp-cache</b> command was changed. Previously, the <b>clear arp-cache</b> command sent an ARP request to a CM before clearing its ARP entry. Now, the <b>clear arp-cache</b> command clears the ARP entry without communicating with the CM. The CM (or its CPE devices) must send one or more IP packets to the CMTS before IP communications can be restored (assuming the CM or CPE devices are authorized to connect to the network).
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. This command is integrated into bundle interface configuration mode.

## Usage Guidelines

ARP is an Internet protocol used to map IP addresses to MAC addresses on computers and other equipment installed in a network. You must activate ARP requests so that the Cisco CMTS router can perform IP address resolution on the downstream path.

Occasionally, you might want to use the **no cable arp** and **clear arp-cache** commands to block out new ARP requests and clear the existing ARP table. In this situation, the Cisco CMTS router will retain the ARP addresses of currently online CMs (CMs with a known IP address) and will continue to send ARP requests for those CMs when those ARP entries time out or are cleared, so that those CMs can continue to remain online. ARP

requests for CMs that are currently offline and for any other unknown IP addresses, however, will remain blocked until ARP requests are reenabled on the downstream using the **cable arp** command.

**Note** Using the **no cable arp** and **no cable proxy-arp** commands shifts all responsibility for the management of the IP addresses used by CMs and CPE devices to the DHCP server and provisioning system.

**Tip** You can expect to see a temporary spike in CPU usage after initially giving the **no cable arp** command, because of the need to verify CPE IP addresses. CPU usage drops after the router has verified and learned all of the CPE IP addresses that are currently online. (This same situation occurs after initially enabling the **cable source-verify dhcp** command, because the router must send a DHCP LEASEQUERY request for every unknown CPE IP address.)

**Note** Starting from IOX-XE 3.15 OS, this command is integrated into bundle interface configuration mode for cBR Series Converged Broadband Routers.

## Examples

The following example shows how to activate cable ARP requests for port 0 on the cable interface line card installed in slot 6 of a Cisco CMTS router:

```
router(config)# interface cable 6/0
router(config-if)# cable arp
```

The following example shows how to activate cable ARP requests for port 0 on the cable interface line card installed in slot 6, subinterface 1, of a Cisco CMTS router:

```
router(config)# interface cable 6/0.1
router(config-subif)# cable arp
```

The following example shows how to activate cable ARP requests on the bundle interface line card on Cisco cBR Series Converged Broadband Routers:

```
router(config)# interface bundle 1
router(config-if)# cable arp
```

## Related Commands

Command	Description
<b>clear arp-cache</b>	Clears the ARP table on the router.
<b>cable proxy-arp</b>	Activates cable proxy ARP on the cable interface.

## cable arp filter

To control the number of Address Resolution Protocol (ARP) packets that are allowable for each Service ID (SID) on a cable interface, use the **cable arp filter** command in cable interface configuration mode. To stop the filtering of ARP broadcasts for CMs, use the **no** form of this command.

**cable arp filter** {**reply-accept** | **request-send**} *number* *window-size*

**no cable arp filter** {**reply-accept** | **request-send**}

**default cable arp filter** {**reply-accept** | **request-send**}

### Syntax Description

<b>reply-accept</b>	Configures the cable interface to accept only the specified <i>number</i> of ARP reply packets every <i>window-size</i> seconds for each active Service ID (SID) on that interface. The cable interface drops ARP reply packets for a SID that would exceed this number.
<b>request-send</b>	Configures the cable interface to send only the specified <i>number</i> of ARP request packets every <i>window-size</i> seconds for each active SID on that interface. The cable interface drops ARP requests for a SID that would exceed this number.
<i>number</i>	Number of ARP reply packets that is allowed for each SID within the window time period. The allowable range is 0 to 20 packets, with a default of 4 packets. If <i>number</i> is 0, the cable interface drops all ARP reply packets.
<i>window-size</i>	Size of the window time period, in seconds, in which to monitor ARP requests. The valid range is 1 to 5 seconds, with a default of 2 seconds.

### Command Default

ARP packets are not filtered, which means the Cisco CMTS router accepts all ARP reply packets and sends all ARP request packets.

### Command Modes

Cable interface configuration (config-if)

### Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.
12.3(9a)BC	The values of <i>number</i> and <i>window-size</i> are optional for the the respective <b>reply-accept</b> and <b>request-send</b> settings. In this release and for earlier supporting releases, when ARP filtering is enabled, the default values for <i>number</i> and <i>window-size</i> are 4 and 2 respectively.
12.3(17a)BC	In this release and for later releases, when ARP filtering is enabled, the default values for <i>number</i> and <i>window-size</i> are 3 and 2 respectively.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco eBR Series Converged Broadband Routers. This command is integrated into bundle interface configuration mode.

**Usage Guidelines**

Viruses, worms, and theft-of-service attacks can generate a large volume of ARP requests on a cable interface. In some situations, the volume of ARP traffic can become so large that it throttles all other traffic.

To control the number of ARP replies and ARP requests that are allowed for each SID on a cable interface, use the **cable arp filter** command. This command configures the interface so that it accepts only a certain number of ARP reply or request packets per a specified time period. If a SID generates more ARP packets than what is allowed, the cable interface drops the excessive traffic.

By default, no ARP filtering is done. ARP filtering is enabled on individual cable interfaces, and you can choose to filter ARP packets only on the specific cable interfaces that require it. You can further choose to filter only ARP request packets, only ARP reply packets, or both. You can configure different threshold values on each interface, allowing you to customize the feature for each interface's traffic patterns.

If using bundled cable interfaces, the Cable ARP Filtering feature is configured separately on the primary and subordinate interfaces. This allows you to configure the feature only on the particular interfaces that require it.

**Note** Cisco IOS Release 12.3(9a)BC introduces enhanced command option syntax for the **cable arp filter** command, where *number* and *window-size* values are optional for **reply-accept** and **request-send** settings.

**Note** Disabling the cable ARP filtering feature, using the **no cable arp filter** command, does not reset the ARP packet counters. The ARP packet counters do not increment when cable ARP filtering is disabled, but the counters retain their current values until the interface counters are specifically cleared, using the **clear counters** command.

The Linksys Wireless-B Broadband Router BEFW11S4 version 4 with 1.44.2 firmware incorrectly sends its own ARP reply packet for every ARP request packet it receives, instead of replying only to the ARP requests that are specifically for itself. Customers with these routers should upgrade the firmware to the latest revision to fix this bug. To upgrade the firmware, go to the download section on the Linksys web site.

**Note** Starting from IOX-XE 3.15 OS, this command is integrated into bundle interface configuration mode for cBR Series Converged Broadband Routers.

**Examples**

The following example shows how to filter cable ARP reply packets, so that the cable interface accepts a maximum of 15 ARP replies every three seconds per SID:

```
Router(config)# interface cable 5/1/0

Router(config-if)# cable arp filter reply-accept 15 3
```

The following example shows how to filter cable ARP request packets, so that the cable interface sends a maximum of 10 requests per second per SID:

```
Router(config)# interface cable 6/0

Router(config-if)# cable arp filter request-send 10 1
```

The following example shows how to enable the filtering of cable ARP request and reply packets on a cable interface, using the default values of 4 packets per CPE per every 2 seconds:

```
Router(config)# interface cable 3/0

Router(config-if)# default cable arp filter reply-accept

Router(config-if)# default cable arp filter request-send

Router(config-if)# end

Router# show running-config | include filter

cable arp filter reply-accept 4 2
cable arp filter request-send 4 2
```

The following example shows how to disable the filtering of cable ARP request and reply packets on a cable interface:

```
Router(config)# interface cable 1/0

Router(config-if)# no cable arp filter reply-accept

Router(config-if)# no cable arp filter request-send
```

The following example shows how to filter cable ARP reply packets, so that the bundle interface accepts a maximum of 15 ARP replies every three seconds per SID on Cisco cBR Series Converged Broadband Routers:

```
Router(config)# interface bundle 1

Router(config-if)# cable arp filter reply-accept 15 3
```

The following example shows how to filter cable ARP request packets, so that the bundle interface sends a maximum of 10 requests per second per SID on Cisco cBR Series Converged Broadband Routers:

```
Router(config)# interface bundle 1

Router(config-if)# cable arp filter request-send 10 1
```

#### Related Commands

Command	Description
<b>cable arp</b>	Activates cable ARP.
<b>cable proxy-arp</b>	Activates cable proxy ARP on the cable interface.
<b>clear arp-cache</b>	Refreshes dynamically created entries from the ARP cache.
<b>clear counters</b>	Clears the packet counters on all interfaces or on a specific interface.
<b>debug cable arp filter</b>	Displays debugging messages about the filtering of ARP broadcasts.
<b>show cable arp-filter</b>	Displays the total number of ARP replies and requests that have been sent and received, including the number of requests that have been filtered.

## cable asf-qos-profile

This feature introduces LLD support for eBR-8 routers. LLD capable D31 modems can establish a bidirectional ASF with two associated static service flows (sent from modem in individual TLVs). You can evaluate different downstream classification approaches to have gaming traffic over one SF and BE traffic over the other SF. Low Latency ASF can be configured via TLVs, Service Classes and/or ASF QoS Profiles (AQPs).

Use the **cable asf-qos-profile** command to configure an ASF QoS Profiles (AQPs) in global configuration mode.

```
cable asf-qos-profile profile-name [ ds | us ] { aqm-coupling value | data-rate-unit data-rate |
classic-sf-scen string | ll-classifiers hex-data | ll-sf-scen string | max-burst | max-rate value | peak-rate
value | priority value | qp-drain-rate-exp value | qp-enable value | qp-latency-threshold value |
qp-score-threshold value | scheduling-weight value }
```

### Syntax Description

<i>profile-name</i>	Name of the ASF QoS profile
<b>ds</b>	Downstream ASF.
<b>us</b>	Upstream ASF.
<b>aqm-coupling</b> <i>value</i>	AQM Coupling Factor. The range is 0-255.
<b>classic-sf-scen</b>	Classic SF SCN string.
<b>data-rate-unit</b> <i>data-rate</i>	Configure Data Rate Unit Setting. The range is 0-3. 0=bps, 1=kbps, 2=Mbps, 3=Gbps.
<b>ll-classifiers</b>	Low Latency SF Classifiers. Enter Hex-data value (Classifier TLV hexbytes).
<b>ll-sf-scen</b>	The Ascii string identifier for this Service Class.
<b>llasf</b>	Low Latency ASF. Enter 1 to enable and 0 to disable.
<b>max-burst</b>	Max Tx Burst. The supported range is 1522-4294967295.
<b>max-rate</b>	Max Rate (bps). The supported range is 0-4294967295.
<b>min-packet-size</b>	Min Packet Size for Reserved Rate. The supported range is 0-65535.
<b>min-rate</b>	Min Resv Rate (bps). The supported range is 0-4294967295.
<b>peak-rate</b>	Peak Rate within maximum traffic burst (bps). The supported range is 0-4294967295.
<b>priority</b>	Priority. The supported range is 0-7.
<b>qp-drain-rate-exp</b>	Queue Protection Drain Rate Exponent. The supported range is 0-255.
<b>qp-enable</b>	Queue Protection. Enter 1 to enable and 0 to disable.
<b>qp-latency-threshold</b>	Queue Protection Latency Threshold. The supported range is 0-65535.

<b>qp-score-threshold</b>	Queue Protection Score Threshold. The supported range is 0-65535.
<b>scheduling-weight</b>	Scheduling Weight (ratio out of 256). The supported range is 0-255.

**Command Default**

None.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
Cisco IOS XE Dublin 17.12.1z	The <b>data-rate-unit</b> <i>data-rate</i> option is added.
Cisco IOS XE Cupertino 17.9.1x	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to configure an `asf-qos-profile`:

```
Router# configure terminal
Router(config)# cable asf-qos-profile profile1 ds
```

Command	Description
<b>show cable asf-qos-profile</b>	Display Cable AQP Table.

## cable attribute-mask

To configure an attribute for a modular cable interface, use the **cable attribute-mask** command in interface configuration mode or MAC domain profile configuration mode. To disable this configuration, use the **no** form of this command.

**cable attribute-mask** *mask*  
**no cable attribute-mask** *mask*

### Syntax Description

<i>mask</i>	Specifies the mask value for the interface.
-------------	---------------------------------------------

### Command Default

If this command is not used, the default attribute will be used for the modular cable interface. The default attribute for a modular cable interface is zero.

### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The attribute mask comprises 32 attributes and each attribute represents a single bit in the mask. You can configure a provisioned attribute mask for each channel and provisioned bonding group to assign values to the operator-defined binary attributes, or to override the default values of the specification-defined attributes. The operator may configure, in the CM configuration file, a required attribute mask and a forbidden attribute mask for a service flow. Additionally, in a CM-initiated dynamic service request, the CM can include a required attribute mask and a forbidden attribute mask for a service flow.

### Examples

The following example shows how to configure an attribute for a modular cable interface:

```
Router# configure terminal
Router(config)# interface modular-cable 1/0/0:0
Router(config-if)# cable attribute-mask 2000ff00
```

The following example shows how to configure an attribute for a Integrated cable interface:

```
Router# configure terminal
Router(config)# interface Integrated-Cable 9/0/3:0
Router(config-if)# cable attribute-mask 2000ff00
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>interface modular-cable</b>	Specifies a modular cable interface.
<b>cable downstream attribute-mask</b>	Specifies an attribute mask value for a wideband cable interface.
<b>interface wideband-cable</b>	Specifies a wideband cable interface.

# cable bgsync

To set the data intervals for the background synchronization of SNMP MIB data on the Cisco CMTS, use the **cable bgsync** command in global configuration mode. To disable background synchronization, use the **no** form of this command.

**cable bgsync** {**itime** *i-interval* | **ptime** *p-interval* | **delay** *seconds*}  
**no cable bgsync**

## Syntax Description

<b>itime</b>	Indicates the data interval time between two interval synchronizations.
<b>ptime</b>	Indicates the incremental data interval time between two synchronizations.
<i>i-interval</i>	Length of the data interval in seconds. The valid range is from 5 to 31536000. The default value is 86400.
<i>p-interval</i>	Length of the incremental data interval in seconds. The valid range is from 5 to 86400. The default value is 5.
<b>delay</b> <i>seconds</i>	Indicates the delay time (in seconds) by which the first i packet (synchronization packet) is sent after SUP switchover. The valid range is from 0 to 31536000. The default value is 0.

## Command Default

This command is enabled by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0S	This command is implemented on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Fuji 16.7.3	This command is update to include <b>delay</b> keyword.

## Usage Guidelines

**Note** To use the **cable bgsync** command, you must configure the **service internal** command in global configuration mode. Use the **cable bgsync** command carefully as it can impact the CPU utilization.

For more information about MIB objects that are synchronized during background synchronization, see the [Cisco CMTS Universal Broadband Router Series MIB Specifications Guide 12.2SC](#).

## Examples

The following example shows how to set the data intervals for background synchronization on the Cisco CMTS:

```
Router# configure terminal
Router(config)# service internal
Router(config)# cable bgsync itime 3600
Router(config)# cable bgsync ptime 6
Router(config)# cable bgsync delay 300
Router(config)#
```

## Related Commands

Command	Description
<b>cable bgsync active</b>	Activates background synchronization process on the Cisco CMTS.
<b>clear cable bgsync counters</b>	Clears the background synchronization counters on the Cisco CMTS.
<b>show cable bgsync</b>	Displays the information on the background synchronization process on the Cisco CMTS.

## cable bgsync active

To activate the background synchronization process on the Cisco CMTS, use the **cable bgsync active** command in global configuration mode. To deactivate the background synchronization process, use the **no** form of this command.

**cable bgsync active**  
**no cable bgsync active**

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is enabled by default.

**Command Modes** Global configuration (config)

### Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0S	This command is implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use the **cable bgsync active** command to activate the background synchronization process.

In Cisco uBR10012 and Cisco 7200 Series routers, SNMP objects use interprocess communication (IPC) to access data between the line card and the route processor (RP). When SNMP queries are sent to a Cisco CMTS with large number of modems configured, IPC takes a long time to retrieve the information from the line card and pass it on to the RP. This resulted in an increase in the SNMP response time. The background synchronization process slowly synchronizes the data between the line card and the RP. Therefore, when SNMP queries are sent to the Cisco CMTS, the Cisco CMTS returns the SNMP data from the RP. IPC requests are not sent to retrieve the data, thereby improving the SNMP performance.

In Cisco cBR Series routers, SNMP background synchronization features provides periodic background synchronization of DOCSIS MIB data from line card to Supervisor in order to improve the performance of the SNMP polling of these MIB tables. It is based on raw socket and uses TCP protocol.

The background synchronization process is enabled by default on the Cisco cBR-8, Cisco uBR10012, and Cisco 7200 Series routers.

For more information about the MIB objects that are synchronized during background synchronization, see the [Cisco CMTS Universal Broadband Router Series MIB Specifications Guide 12.2SC](#). and [Cisco cBR Series Converged Broadband Routers Troubleshooting and Network Management Configuration Guide](#).

### Examples

The following example shows how to deactivate the background synchronization process on the Cisco CMTS:

```
Router# configure terminal
```

```
Router(config)# no cable bgsync active
Router(config)#
```

**Related Commands**

Command	Description
<b>cable bgsync</b>	Sets the data intervals for background synchronization on the Cisco CMTS.
<b>show cable bgsync</b>	Displays the information on the background synchronization process, on the Cisco CMTS.
<b>clear cable bgsync counters</b>	Clears the background synchronization counters on the Cisco CMTS.

# cable bonding-group-id

**Note** Effective with Cisco IOS Release 12.2(33)SCE, the **cable bonding-group-id** command is replaced by the **cable bonding-group-secondary** command. See the **cable bonding-group-secondary** command for more information.

To specify a Bonding Group ID and indicate whether the bonding group is a primary or secondary bonded channel, use the **cable bonding-group-id** command in wideband-cable interface configuration mode. To remove a bonding group configuration and revert to the default bonding group (a primary bonding group), use the **no** form of this command.

```
cable bonding-group-id id_num [secondary]
no cable bonding-group-id id_num [secondary]
```

## Syntax Description

<i>id_num</i>	A unique Bonding Group ID. Valid values are 1 to 255. The bonding group ID must be unique for each wideband channel on the CMTS.
<b>secondary</b>	Specifies that the bonding group is a secondary bonding group. If the <b>secondary</b> keyword is not used, the bonding group is a primary bonding group.

## Command Default

If the **cable bonding-group-id** command is not issued, Cisco IOS software assigns a default ID to the bonding group and configures the wideband-channel cable interface as a primary bonding group.

## Command Modes

Interface configuration mode for a wideband-cable interface (config-if)

## Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCE	This command was replaced with the <b>cable bonding-group-secondary</b> command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable bonding-group-id** command is not needed for the wideband channels that will be received by the Scientific Atlanta DPC2505 or EPC2505 wideband cable modems.

The **cable bonding-group-id** command is used only for wideband channels that will be received by the Linksys WCM300-NA, WCM300-EURO, or WCM300-JP wideband cable modems.

### Linksys WCM300 Cable Modem

For wideband channels that will be received by the Linksys WCM300-NA, WCM300-EURO, and WCM300-JP cable modems, the **cable bonding-group-id** command assigns a Bonding Group ID to a wideband-channel

cable interface and configures the bonding group as a primary bonding group if the **secondary** keyword is not specified, or as a secondary bonding group if the **secondary** keyword is specified.

- A primary bonding group is a primary bonded channel.
- A secondary bonding group is a secondary bonded channel.

The primary bonded channel is the wideband channel on which the Linksys WCM300 modem receives all of its unicast traffic and some of its multicast traffic. The cable modem may identify the primary bonded channel and any secondary bonded channels to the CMTS at cable modem registration time. The DOCSIS configuration file may define the primary bonded channel for the CMTS to assign to the cable modem.

In addition to joining one primary bonded channel, the Linksys WCM300 may join up to two secondary bonded channels simultaneously in order to receive additional data streams. The DOCSIS configuration file may define the secondary bonded channels for the modem to pass to the CMTS. Secondary bonded channels are intended to receive multicast traffic such as broadcast video that is not available on the primary bonded channel.

For information on the TLV encodings that can be used in the DOCSIS configuration file to identify primary and secondary bonded channels, see the *Cisco Cable Wideband Solution Design and Implementation Guide, Release 1.0*.

---

**Note** If a wideband channel is specified as a primary or secondary bonded channel in the DOCSIS configuration file, it *must be identically defined* as a primary or secondary bonded channel in the CMTS active, running configuration file.

---

- If a wideband channel is configured with the **cable bonding-group-id** command or by default to be a primary bonded channel, the Linksys WCM300 modem will not register using it as one of its secondary bonded channels.
- If a wideband channel is configured with the **cable bonding-group-id** command to be a secondary bonded channel, the Linksys WCM300 modem will not register using it as its primary bonded channel.

---

**Note** When a wideband channel is defined on a Wideband SPA, Cisco IOS software configures the wideband channel as a primary bonding group (primary bonded channel) and assigns a default ID to the bonding group. If a wideband channel is to be used as a secondary bonded channel, use the **cable bonding-group-id** command with the **secondary** keyword to specify that the channel is a secondary bonded channel.

---

If you specify a non-unique Bonding Group ID for the *id\_num* argument, **cable bonding-group-id** displays an error message and does not modify the ID.

## Examples

The following examples show how to use the **cable bonding-group-id** command for a variety of purposes. The following **cable bonding-group-id** command specifies that wideband channel 10 on the Wideband SPA in slot/subslot/bay 1/0/1 will be a secondary bonding group (secondary bonded channel) having the bonding group ID 20.

```
Router# configure terminal
Router(config)# interface wideband-cable 1/0/1:10
Router(config-if)# cable bonding-group-id 20 secondary
```

The following example shows how to change a bonding group with an ID of 20 from a secondary to a primary bonding group by omitting the **secondary** keyword:

```
Router(config-if)# cable bonding-group-id 20
```

The **no** form of the **cable bonding-group-id** removes the configured bonding group and reverts the configuration to the default bonding group. For a secondary bonding group with the ID of 20, the following **no** forms of the command are equivalent:

```
Router(config-if)# no cable bonding-group-id 20
```

OR

```
Router(config-if)# no cable bonding-group-id 20 secondary
```

When either of the preceding commands are issued, the wideband-channel cable interface is configured to use a default bonding group, which has a default bonding group ID assigned by Cisco IOS software and is a primary bonding group.

#### Related Commands

Command	Description
<b>interface</b>	Enters interface configuration mode.

# cable bonding-group-secondary

To specify a bonding group as a secondary bonded channel, use the **cable bonding-group-secondary** command in wideband-cable interface configuration mode. To remove the bonding group configuration and revert to the default bonding group (a primary bonding group), use the **no** form of this command.

**cable bonding-group-secondary**

**no cable bonding-group-secondary**

## Command Default

If the **cable bonding-group-secondary** command is not issued, Cisco IOS software configures the wideband-channel cable interface as the primary bonding group.

## Command Modes

Interface configuration—cable interface only (config-if)

Wideband-interface profile configuration (config-profile-wb)

## Command History

Release	Modification
12.2(33)SCE	This command was introduced for the Cisco uBR-MC3GX60V cable interface line card.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Starting with Cisco IOS Release 12.2(33)SCE, the **cable bonding-group-secondary** command replaces the **cable bonding-group-id** command. If you upgrade from an earlier Cisco IOS Release to Cisco IOS Release 12.2(33)SCE and later, the **cable bonding-group-id** command will no longer change the bonding-group ID.

The **cable bonding-group-secondary** command is used only for wideband channels that are received by the Linksys WCM300-NA, WCM300-EURO, or WCM300-JP wideband cable modems.

### Linksys WCM300 Cable Modem

For wideband channels that are received by the Linksys WCM300-NA, WCM300-EURO, and WCM300-JP cable modems, the **show controllers Modular-Cable slot/subslot/controller wideband** command displays the bonding group ID of a wideband-channel cable interface and the **cable bonding-group-secondary** command configures the bonding group as a secondary bonding group.

The primary bonded channel is the wideband channel on which the Linksys WCM300 modem receives all of its unicast traffic and some of its multicast traffic. The cable modem identifies the primary bonded channel and any secondary bonded channels to the CMTS at cable modem registration time. The DOCSIS configuration file defines the primary bonded channel for the CMTS to assign to the cable modem.

In addition to joining one primary bonded channel, the Linksys WCM300 joins up to two secondary bonded channels simultaneously in order to receive additional data streams. The DOCSIS configuration file defines the secondary bonded channels for the modem to pass to the CMTS. Secondary bonded channels are intended to receive multicast traffic such as broadcast video that is not available on the primary bonded channel.

For information on the TLV encodings that can be used in the DOCSIS configuration file to identify primary and secondary bonded channels, see *Cisco Cable Wideband Solution Design and Implementation Guide, Release 1.0*.

---

**Note** If a wideband channel is specified as a primary or secondary bonded channel in the DOCSIS configuration file, it must be identically defined as a primary or secondary bonded channel in the CMTS active, running configuration file.

---

The following points list the restrictions for configuring the wideband channel with the **cable bonding-group-secondary** command:

- If a wideband channel is not configured with the **cable bonding-group-secondary** command, the Linksys WCM300 modem may not use it as a secondary bonding group.
- If a wideband channel is configured with the **cable bonding-group-secondary** command to be a secondary bonded channel, the Linksys WCM300 modem may not use it as a primary bonded group.

---

**Note** When a wideband channel is defined, the Cisco IOS software configures the wideband channel as a primary bonding group (primary bonded channel) and assigns a default ID to the bonding group. If a wideband channel is to be used as a secondary bonded channel, use the **cable bonding-group-secondary** command to specify that the channel is a secondary bonded channel.

---

## Examples

The following example shows how to use the **cable bonding-group-secondary** command:

```
Router# configure terminal

Router(config)# interface wideband-cable 1/0/1:10
Router(config-if)# cable bonding-group-secondary
```

## Related Commands

Command	Description
<b>interface</b>	Enters interface configuration mode.

## cable cache-snmp active

To enable the cache mechanism, use **cable cache-snmp active** command in global configuration mode. To remove the configuration, use the **no** form of this command.

**cable cache-snmp active**  
**no cable cache-snmp active**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The cache mechanism is active by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCI2	This command was introduced.

**Usage Guidelines** By default, the SNMP cache feature is activated. It can be enabled or disabled globally using the **cable cache-snmp active** command. It cannot be enabled or disabled per table currently. You can turn cache off if their polling strategy does not suit the cache principle so that cache will help on a sequential polling.

### Examples

The following example shows how to enable the cache mechanism:

```
Router#configure terminal
Router(config)#cable cache-snmp active
Router(config)#
```

## cable channel-group

To configure the channel group, use the **cable channel-group** command in global configuration mode. To disable the channel group, use the **no** form of the command.

**cable channel-group** *group-id*

**no cable channel-group** *group-id*

### Syntax Description

*group-id* Channel group ID. The range is from 1 to 1000.

### Command Default

Channel group is not configured.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)CX	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to configure a channel group:

```
Router# configure terminal
Router(config)# cable channel-group 1
Router(config-ch-group)# upstream Cable 7/1/0 channel 0-3
Router(config-ch-group)# downstream Modular-Cable 7/1/0 rf-channel 0-15
Router(config-ch-group)# cmc 0010.2024.7035
```

### Related Commands

Command	Description
<b>show cable channel-group</b>	Displays the channel group information.
<b>upstream cable channel</b>	Configures the upstream cable channel for a channel group.
<b>downstream modular-cable rf-channel (channel group)</b>	Configures the downstream modular cable RF channel for a channel group.
<b>cmc</b>	Configures the Cisco Coaxial Media Converter (CMC).

# cable clock clear-counters

To reset the counters that are displayed with the **show controllers clock-reference** command, use the **cable clock clear-counters** command in privileged EXEC mode.

**cable clock clear-counters**

**Syntax Description** This command has no keywords or arguments.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.1(1a)T1	This command was introduced.
	12.1(2)EC1	This command was supported on the EC train for the Cisco uBR7246VXR router.
	12.2(2)XF	This command was supported for the TCC+ card on Cisco uBR10012 routers.
	12.2(4)BC1	Support for this command was added to the Release 12.2 BC train for the Cisco uBR7246VXR and Cisco uBR10012 routers.
	12.3(23)BC	This command is supported only for standalone (freerun) mode.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command resets any counters that were displayed from the last time the **show controllers clock-reference** command was used.

**Note** This command is not supported on the SC train.

This command supports the Cisco CMTS clock feature set, which provides a synchronized clock for improved Voice-over-IP (VoIP) operations. The clock feature set requires one of the following configurations:

- A Cisco uBR10012 router with one or two TCC+ cards that are connected to an external national clock source.

**Note** Beginning in Cisco IOS Release 12.3(23)BC, TCC+ is replaced with the DOCSIS Timing and Control Card (DTCC) and does not require to be connected to an external national clock source.

- A Cisco uBR7246 VXR router using a Cisco uBR-MC16S, Cisco uBR-MC16E, Cisco uBR-MC28C, or Cisco uBR-MC28C-BNC cable interface line card. The router must also be equipped with a Cisco cable clock card and be running Cisco IOS Release 12.1(1a)T1, Cisco IOS Release 12.1(2)EC1, or a later release. The Cisco cable clock card should be connected to an external national clock source.

Only these cable interface cards support the external clock card reference from a clock card to distribute that signal to CMs or set-top boxes (STBs) attached to the specific network segments. You can use other cable interface cards, such as the Cisco uBR-MC16C, with the clock card, but these other cable interfaces will not synchronize their downstream SYNC messages with the external clock source.

Each CM or STB must also support VoIP applications and the clock feature set. For example, the Cisco uBR924, running Cisco IOS Release 12.0(7)T or later releases, supports the clock card feature automatically.

---

**Note** The **show controllers clock-reference** command might display compare errors on the Cisco uBR10012 router because there could be a slight delay at system startup before the clock cards synchronize with each other. These initial compare errors can be ignored and cleared with the **cable clock clear-counters** command.

---

### Examples

The following example shows how to reset all counters that are displayed for the clock card:

```
Router# cable clock clear-counters
```

### Related Commands

Command	Description
<b>show controllers clock-reference</b>	Displays the cable clock card's hardware information.

# cable clock dti

To configure the DOCSIS Timing Interface (DTI) clock reference mode, use the **cable clock dti** command in global configuration mode. To terminate the DTI clock reference mode and restart the standalone mode, use the **no** form of the command.

**cable clock dti**  
**no cable clock dti**

**Syntax Description** This command has no keywords or arguments.

**Command Default** Standalone mode

**Command Modes** Global configuration (config)

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to configure DTI clocking mode.

This command may be stored in NVRAM as part of the DOCSIS Timing and Control Card (DTCC) configuration on the Cisco uBR10012 and Cisco uBR7225VXR routers.

**Note** When the **cable clock dti** command or its **no** form is used to configure the DTI clock reference mode, the DTCC card on the Cisco uBR10012 router restarts and the cable modems may re-initialize or re-register.

## Examples

```
Router# configure terminal
Router(config)# cable clock dti
```

Command	Description
<b>show cable clock dti</b>	Displays DTI information.

## cable clock dti clear-counters

To reset the counters that are displayed with the **show cable clock dti counters** command in DOCSIS Timing Interface (DTI) mode, use the **cable clock dti clear-counters** command in privileged EXEC mode.

**cable clock dti clear-counters** *slot/subslot*

### Syntax Description

<i>slot/subslot</i>	Specifies the slot and subslot location of the DTCC ports. Valid values are 1/1 or 2/1.
---------------------	-----------------------------------------------------------------------------------------

### Command Default

No default behavior or values

### Command Modes

Privileged EXEC

### Command History

Release	Modification
12.3(23)BC	This command was introduced on the Cisco uBR10012 router .
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command resets any counters that were displayed from the last time the **show cable clock dti client** command was used in DTI mode.

This command supports the Cisco CMTS clock feature set, which provides a synchronized clock for improved Voice-over-IP (VoIP) operations.

### Examples

The following example shows how to reset all counters that are displayed for the clock card:

```
Router# cable clock dti clear-counters
```

### Related Commands

Command	Description
<b>show cable clock dti counters</b>	Displays the cable clock card's hardware information.

# cable clock force

To select the external timing source when the clock card is in holdover mode, use the **cable clock force** command in global configuration mode. To disable the selection and return to the default, use the **no** form of this command.

**cable clock force** {primary | secondary}  
**no cable clock force**

## Syntax Description

<b>primary</b>	Forces the primary source to act as the clock reference.
<b>secondary</b>	Forces the secondary source to act as the clock reference.

## Command Default

The clock card automatically uses the primary external source, if available. If the primary source fails, the clock card enters holdover mode and, after a few seconds, switches to the secondary external source. The clock card switches back to the primary source when it becomes available.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.1(1a)T1	This command was introduced.
12.1(2)EC1	This command was integrated into Cisco IOS Release 12.1(2)EC1.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command overrides the default behavior of the clock card when the clock card is in holdover mode. If the clock card is not in holdover mode, this command is ignored. You cannot force the reference to a port if the clock card is in free-running mode.

**Note** This command is not applicable on the SC train.

**Note** The clock card enters holdover mode if the forced reference is lost, even if the other external reference is available.

To support the clock feature set in VoIP configurations, a Cisco uBR7246 VXR chassis, equipped with a clock card; and a Cisco uBR-MC16S, a Cisco uBR-MC16E, or a Cisco uBR-MC28C cable interface line card must be used running Cisco IOS Release 12.1(1a)T1 or later releases. Only these cable interface line cards support the external clock card reference from a clock card to distribute that signal to CMs or set-top boxes (STBs) attached to the specific network segments. You can use other cable interface cards, such as the Cisco uBR-MC16C, with the clock card, but these other cable interfaces will not synchronize their downstream SYNC messages with the external clock source.

Each CM or STB must also support VoIP applications and the clock feature set. For example, the Cisco uBR924, running Cisco IOS Release 12.0(7)T or later releases, supports the clock card feature automatically.

### Examples

The following example shows how to force the timing reference for the cable clock card to come from the secondary external source, when the clock card is in holdover mode:

```
Router(config)# cable clock force secondary
```

### Related Commands

Command	Description
<b>show cable clock</b>	Displays status information for the cable clock card.
<b>show controllers clock-reference</b>	Displays hardware information, register values, and current counters for the cable clock card.

## cable clock source-midplane

To make the midplane time-division multiplexing (TDM) clock the primary timing reference for the clock card, use the **cable clock source-midplane** command in global configuration mode. To disable the selection and return to the default, use the **no** form of this command.

**cable clock source-midplane**  
**no cable clock source-midplane**

### Syntax Description

This command has no keywords or arguments.

### Command Default

The clock card does not get its timing reference from the midplane TDM clock.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.1(1a)T1	This command was introduced.
12.1(2)EC1	This command was integrated into Cisco IOS Release 12.1(2)EC1.
12.3BC	This command was integrated into Cisco OS Release 12.3BC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Because the clock card automatically provides the timing reference to the midplane TDM clock, the midplane cannot in turn act as the reference for the clock card. This means that the **cable clock source-midplane** command does not take effect unless a port adapter is configured as the primary clock reference source for the midplane.

**Note** This command is not applicable on the SC train.

To support the clock feature set in VoIP configurations, a Cisco uBR7246 VXR chassis, equipped with a clock card; and a Cisco uBR-MC16S, a Cisco uBR-MC16E, or a Cisco uBR-MC28C cable interface line card must be used running Cisco IOS Release 12.1(1a)T1 or higher releases. Only these cable interface line cards support the external clock card reference from a clock card to distribute that signal to CMs or set-top boxes (STBs) attached to the specific network segments. You can use other cable interface cards, such as the Cisco uBR-MC16C, with the clock card, but these other cable interfaces will not synchronize their downstream SYNC messages with the external clock source.

Each CM or STB must also support VoIP applications and the clock feature set. The Cisco uBR924, running Cisco IOS Release 12.0(7)T or later releases, supports the clock card feature automatically.

### Examples

The following example shows how to set the primary clock reference to the midplane TDM clock:

**cable clock source-midplane**

```
Router(config)# cable clock source-midplane
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show cable clock</b>	Displays status information for the cable clock card.

# cable clock upgrade

To upgrade the Field-Programmable Gate Array (FPGA) image manually on the DOCSIS Timing & Control Card (DTCC), use the **cable clock upgrade** command in privileged EXEC mode.

```
cable clock upgrade slot/subslot
```

Syntax Description	slot	Chassis slot number of the DTCC card. The valid slot is 1.
	subslot	Secondary slot number of the DTCC card. Valid subslots are 1 or 2.

**Command Default** No default behaviors or values

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** In Cisco IOS Release 12.2(33) SCC and later, you can manually upgrade the FPGA image only if a single DTCC card is installed on the Cisco uBR 10012 router. If the manual upgrade fails or is interrupted, the DTCC card may become unusable. Do not reset or unplug the DTCC card during the manual upgrade. We recommend that you take precaution against extended downtime if the FPGA upgrade fails unexpectedly by having a standby DTCC card installed on the Cisco uBR10012 router.

**Note** You will have to enter **y (yes)** when the system prompts you to continue the manual upgrade.

## Examples

The following example shows how to start the manual FPGA upgrade process on the DTCC card:

```
Router# cable clock upgrade 1/1
```

Related Commands	Command	Description
	<b>cable clock dti</b>	Configures the DOCSIS Timing Interface (DTI) clock reference mode.

## cable cm-status

To configure the values of the “Event Holdoff Timer” and “Number of Reports per Event” parameters for the cable modem (CM) status events, use the **cable cm-status** command in global configuration mode. To revert to the default values, use the **no** form of this command.

```
cable cm-status {allevent} [holdoff {timer | default}] | reports {reportvalue | default}]
no cable cm-status
```

### Syntax Description

<b>all</b>	Specifies all CM status events.
<i>event</i>	Type of CM status event.
<b>holdoff</b>	(Optional) Sets the CM status event holdoff timer. The holdoff units are defined in milliseconds. The timer value increments by 20 milliseconds. <ul style="list-style-type: none"> <li><i>timer</i>—Holdoff timer value. The valid range is from 1 to 65535 milliseconds. The default value is 500 milliseconds.</li> <li><b>default</b>—Specifies the default value of 500 milliseconds.</li> </ul>
<b>reports</b>	(Optional) Sets the value for the number of reports per event. <ul style="list-style-type: none"> <li><i>reportvalue</i>—Report value. The valid range is from 0 to 255. The default value is 5.</li> <li><b>default</b>—Specifies the default value of 5.</li> </ul>

### Command Default

Default values are used for the “Event Holdoff Timer” and “Number of Reports per Event” parameters.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE 17.3.1z	The default value was updated.

### Usage Guidelines

The **cable cm-status** command updates the event table for the MAC Domain Descriptor (MDD) belonging to a primary channel. The help text of the command provides a mapping of an event type to the corresponding integer.

The ten CM status events are:

1. Secondary channel MDD time-out
2. QAM/FEC lock failure
3. Sequence out-of-range

4. MDD recovery
5. QAM/FEC lock recovery
6. T4 time-out
7. T3 re-tries exceeded
8. Successful ranging after T3 re-tries exceeded
9. CM operating on battery backup
10. CM returned to A/C power

**Note** The CM-STATUS message event ‘sequence out of range’ is enabled and supported on the Cisco Wideband SPA from Cisco IOS Release 12.2(33)SCE5 onwards. When the Cisco CMTS receives the ‘sequence out of range’ event, it toggles the sequence-change-count (SCC) bit for each of the indicated downstream service identifiers (DSIDs).

### Examples

The following example shows how to configure an event holdoff timer of 100 milliseconds and four reports per event for all CM-STATUS events:

```
Router# configure terminal
Router(config)# cable cm-status all holdoff 100 reports 4
```

The following example shows how to configure the CM status event “MDD recovery” with an event holdoff timer of 150 milliseconds and three reports for the event:

```
Router# configure terminal
Router(config)# cable cm-status 4 holdoff 150 reports 3
```

### Related Commands

Command	Description
<b>cable cm-status enable</b>	Enables a CM status event or a group of CM status events on a primary cable interface.

## cable cm-status enable

To enable a CM status event or a group of CM status events on a primary cable interface, use the **cable cm-status enable** command in interface configuration mode or MAC domain profile configuration mode. To disable a particular event on a primary cable interface, use the **no** form of this command.

**cable cm-status enable** *range*  
**no cable cm-status**

### Syntax Description

<i>range</i>	<p>Specifies the CM status events you want to enable on a primary cable interface. The valid range is 1 to 10. You can enable a single event by specifying the event number or a group of events by specifying a range (for example, 1-9).</p> <p>The following events are enabled by default on a cable or modular cable interface on the Cisco uBR10012 and Cisco uBR7200 series routers:</p> <ul style="list-style-type: none"> <li>• Secondary channel MDD time-out</li> <li>• QAM/FEC lock failure</li> <li>• Sequence out of range</li> <li>• MDD recovery</li> <li>• QAM/FEC lock recovery</li> </ul> <p><b>Note</b> The default events are not displayed in the output of the <b>show running-config interface cable</b> command.</p>
--------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

The downstream related events such as secondary channel MDD time-out, QAM/FEC lock failure, Sequence out of range, MDD recovery, and QAM/FEC lock recovery are enabled.

### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command applies to all non-primary RF channels on a CMTS.

The ten CM status events per interface on the Cisco uBR10012 and Cisco uBR7200 series routers are:

- 1—Secondary channel MDD time-out

- 2—QAM/FEC lock failure
- 3—Sequence out of range
- 4—MDD recovery
- 5— QAM/FEC lock recovery
- 6—T4 time-out
- 7— T3 re-tries exceeded
- 8— Successful ranging after T3 re-tries exceeded
- 9— CM operating on battery backup
- 10— CM returned to A/C power

The six CM status events per interface on the Cisco cBR series routers are:

- 3—Sequence out of range
- 6—T4 time-out
- 7—T3 re-tries exceeded
- 8— Successful ranging after T3 re-tries exceeded
- 9—CM operating on battery backup
- 10— CM returned to A/C power

---

**Note** If the **no** form of the command is executed on the interface for specific events, then the **show running-config interface** command lists the events only that are enabled. If no events are enabled then, the **show running interface cable** command displays **no cable cm-stauts enable** with the events.

---

## Examples

The following example shows how to enable all CM status events on a primary cable interface:

```
Router# configure terminal
Router(config)# interface cable 8/0/0
Router(config-if)# cable cm-status enable 1-10
```

The following example shows the **no cable cm-status enable** command being configured and the corresponding example shows **show running-config interface** command output:

```
Router(config)# interface cable 8/0/0
Router(config-if)# cable cm-status enable 1-10
Router(config-if)# no cable cm-status enable 1-2 4-5
Router(config-if) exit
Router# show running-config interface cable 8/0/0
Building configuration...
Current configuration : 1557 bytes
!
interface Cable8/0/0
 shutdown
 cable cm-status enable 3 6-10
```

```

no cable packet-cache
cable default-phy-burst 0
cable map-advance dynamic 300 500
cable bundle 1
cable downstream channel-id 145

```

The following example shows the **show running-config interface cable** command output when no events are enabled on the CMTS:

```

Router# show running-config interface cable 8/0/0
Building configuration...
Current configuration : 1558 bytes
!
interface Cable8/0/0
 shutdown
 no cable cm-status enable 1-10
 no cable packet-cache
 cable default-phy-burst 0
 cable map-advance dynamic 300 500
 cable bundle 1
 cable downstream channel-id 145
 cable downstream annex B
 cable downstream modulation 256qam
 cable downstream interleave-depth 32
 cable downstream frequency 555000000
 cable downstream rf-shutdown
 cable upstream max-ports 4
 no cable upstream 0 connector
 cable upstream 0 frequency 40000000
 cable upstream 0 channel-width 3200000 3200000
 cable upstream 0 power-level 26
 cable upstream 0 docsis-mode tdma-atdma
 cable upstream 0 minislots-size 4
--More--

```

#### Related Commands

Command	Description
<b>show cable modem</b>	Displays information for the registered and unregistered CMs.

## cable cmc

To configure the downstream RF power or Forward Optical Receiver Module (FRx) for the Cisco Coaxial Media Converter (CMC), use the **cable cmc** command in global configuration mode. To disable the configuration, use the **no** form of the command.

```
cable cmc mac-address {ds-rf-power power [tilt tilt-value ] | frx {att att-value | eq eq-value}}
```

```
no cable cmc mac-address { ds-rf-power | frx {att | eq}}
```

### Syntax Description

<i>mac-address</i>	MAC address of the Cisco CMC.
<b>ds-rf-power</b>	Specifies the RF power for downstream channels on the Cisco CMC.
<i>power</i>	RF power in dBmV. The valid range is from 35 to 62. RF power is specified in the format <i>xy.z</i> , where <i>z</i> is 0.
<b>tilt</b> <i>tilt-value</i>	(Optional) Sets the tilt equalization value for downstream channel RF power on the Cisco CMC. The default value is 9 dB.  <i>tilt-value</i> —Tilt equalization can be set to one of the following values: <ul style="list-style-type: none"> <li>• <b>-15dB</b>—Sets the tilt equalization value to -15 dB.</li> <li>• <b>-12dB</b>—Sets the tilt equalization value to -12 dB.</li> <li>• <b>-9dB</b>—Sets the tilt equalization value to -9 dB.</li> <li>• <b>-6dB</b>—Sets the tilt equalization value to -6 dB.</li> <li>• <b>-3dB</b>—Sets the tilt equalization value to -3 dB.</li> <li>• <b>0dB</b>—Sets the tilt equalization value to 0 dB.</li> </ul>
<b>frx</b>	Configures FRx on the Cisco CMC.
<b>att</b> <i>att-value</i>	Specifies the attenuation value in dB. <ul style="list-style-type: none"> <li>• <i>att-value</i>—Attenuation value. The valid range is from 0 to 10.</li> </ul>
<b>eq</b> <i>eq-value</i>	Sets the equalization value in dB. <ul style="list-style-type: none"> <li>• <i>eq-value</i>—Equalization value. The valid range is from 3 to 15.</li> </ul>

### Command Default

Downstream RF power and FRx are not configured on the Cisco CMC.

### Command Modes

Global configuration (config)

Command History	Release	Modification
	Cisco IOS Release 12.2(33)CX	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The **cable cmc** command configures the resource sharing between the Cisco CMCs in a channel group based on the MAC address.

The valid downstream RF power value is based on the number of active downstream RF channels on the Cisco CMC. If the configured downstream RF power value for a specific number of downstream RF channels is out of the valid range, the downstream RF power is adjusted according to the number of active downstream RF channels on the Cisco CMC and a warning message is displayed.

We recommend that you use the following downstream RF power values based on the number of active downstream RF channels:

**Table 1: Recommended Downstream RF Power Values**

Number of Downstream RF Channels	Recommended RF Power Values
1	50 dBmV to 6 2dBmV
2	46 dBmV to 58 dBmV
3	44 dBmV to 56 dBmV
4	42 dBmV to 54 dBmV
5	41 dBmV to 53 dBmV
6	40 dBmV to 52 dBmV
7	39 dBmV to 51 dBmV
8	39 dBmV to 51 dBmV
9	38 dBmV to 50 dBmV
10	38 dBmV to 50 dBmV
11	37 dBmV to 49 dBmV
12	37 dBmV to 49 dBmV
13	36 dBmV to 48 dBmV
14	36 dBmV to 48 dBmV
15	35 dBmV to 47 dBmV
16	35 dBmV to 47 dBmV

The following example shows how to configure RF power for downstream channel on the Cisco CMC with a tilt equalization value of 0 dB:

```
Router# configure terminal
Router(config)# cable cmc 0001.0002.0003 ds-rf-power 35 tilt 0dB
```

The following example shows how to configure FRx for the Cisco CMC with an attenuation value of 6 dB:

```
Router# configure terminal
Router(config)# cable cmc 0001.0002.0003 frx att 6
```

The following example shows how to configure FRx for the Cisco CMC with an equalization value of 3 dB:

```
Router# configure terminal
Router(config)# cable cmc 0001.0002.0003 frx eq 3
```

**Related Commands**

Command	Description
<b>clear cable cmc</b>	Clears the information on the Cisco CMC.
<b>show cable cmc</b>	Displays the Cisco CMC information.

## cable cmc image\_upgrade

To upgrade the Cisco CMC image , use the **cable cmc image\_upgrade** command in privileged EXEC mode. To disable the upgrade, use the **no** form of the command.

**cable cmc** *mac-address* **image\_upgrade**

**no cable cmc** *mac-address* **image\_upgrade**

<b>Syntax Description</b>	<i>mac-address</i>	MAC address of the Cisco CMC.
<b>Command Default</b>	None	
<b>Command Modes</b>	Privileged EXEC (#)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS Release 12.2(33)CX	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
<b>Usage Guidelines</b>	<p>Before upgrading the Cisco CMC image through the Cisco CMTS, you must specify the TFTP or FTP server address and the full file path in the DHCP server.</p> <p>The following example shows how to upgrade the Cisco CMC image:</p> <pre>Router&gt; enable Router# cable cmc 0001.0002.0003 image_upgrade</pre>	

## cable cmcpe-list valid-time

To set the length of time that a CMTS router will consider the current list of CM and CPE devices to be valid, use the **cable cmcpe-list valid-time** command in global configuration mode. To reset the time period to its default value of 3 minutes, use the **no** form of this command.

**cable cmcpe-list valid-time** *time*  
**no cable cmcpe-list valid-time**

### Syntax Description

<i>time</i>	Specifies the time period, in seconds, that the Cisco CMTS router should consider the current CM/CPE list to be valid. In Cisco IOS Release 12.2(15)BC1 and earlier releases, the valid range is 0 to 3600 seconds, with a default value of 180 seconds (3 minutes). In Cisco IOS Release 12.2(15)BC2 and later releases, the valid range is 0 to 86400 seconds, with a default value of 900 seconds (15 minutes).
-------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

180 seconds (3 minutes)—Cisco IOS Release 12.2(15)BC1 and earlier releases  
 900 seconds (15 minutes)—Cisco IOS Release 12.2(15)BC2 and later releases

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.0(15)SC1, 12.1(8)EC1,	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series routers.
12.2(4)BC1	This command was supported on the 12.2 BC train for the Cisco uBR10012 router.
12.2(15)BC2	The maximum range for time was expanded from 3600 to 86400 seconds, and the default was changed from 180 to 900 seconds.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The Cisco CMTS router maintains an internal list of cable modems and CPE devices that were connected on its cable interfaces in the last 24 hours. This list does not capture cable modems and CPE devices that were connected before the last 24 hours.

The CMTS router uses this list to provide the data for various **show** commands and to respond to SNMP requests that query the entries in the `cdxCmCpeTable` table in the `CISCO-DOCS-EXT-MIB` MIB.

By default, the Cisco CMTS router uses the current list if it is less than 3 minutes old. If the current list is older than 3 minutes, the Cisco CMTS router considers it invalid and rebuilds a new list. This prevents the CMTS router from having to build a new list for every query, which could impact system performance.

You can use the **cable cmcpe-list valid-time** command to change the length of time that the CMTS router considers the current CM and CPE device list to be valid. This allows you to find the optimum time value that provides the most current information without affecting the number of CPU cycles that are available for network processing.

A smaller time period ensures that the CM and CPE device list is more current but it requires more processing time to maintain the list. A longer time period reduces the load on the processor but the CM/CPE list might not be current.

If CPU usage dramatically increases when performing SNMP queries of the `cdxCmCpeTable` table, use this command to increase the valid list time so that the Cisco CMTS router does not have to rebuild the CM/CPE list more often than needed to respond to the queries.

---

**Note** To find the current valid list time, use the **show running-config** command and look for the **cable cmcpe-list valid-time** command in the output. If the command does not appear, the valid list time is set for its default value.

---

### Examples

The following example shows how to set the valid list time to 60 seconds (1 minute):

```
Router(config)# cable cmcpe-list valid-time 60
```

The following example shows how to find the current valid list time setting:

```
Router# show running-config | include cmcpe-list
cable cmcpe-list valid-time 60
```

### Related Commands

Command	Description
<b>show cable modem</b>	Displays information for the registered and unregistered CMs.

## cable cmts-id

To configure the CMTS ID for the Cisco CMTS, use the **cable cmts-id** command in global configuration mode. To set the CMTS ID to its default value, use the **no** form of this command.

**cable cmts-id** *cmts-id*  
**no cable cmts-id** *cmts-id*

### Syntax Description

*cmts-id* CMTS ID for the Cisco CMTS. The range is from 0 to 16383. The default is 8191.

### Command Default

CMTS ID is 8191.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This configuration allows you to define the value for the CMTS ID portion of Gate IDs. The CMTS ID value is the 13 least significant bits (0-12) of the Gate ID.

### Example

The following example shows how to configure the CMTS ID:

```
Router(config)# cable cmts-id 9000
```

### Related Commands

Command	Description
<b>show cable cmts-id</b>	Displays the configured CMTS ID.

# cable config-file

To create a configuration filename for a Cisco CMTS router internal CM configuration file, use the **cable config-file** command in global configuration mode. To delete the configuration filename, use the **no** form of this command.

**cable config-file** *filename*  
**no cable config-file** *filename*

<b>Syntax Description</b>	<i>filename</i> Specifies the configuration filename to create and edit.
---------------------------	--------------------------------------------------------------------------

**Command Default** None.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1(2)EC1	This command was introduced.
	12.2(4)BC1	This command was integrated into Cisco IOS Release 12.2(4)BC1.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** A DOCSIS CMTS router automatically downloads a DOCSIS configuration file to a CM during its initial registration procedure. The DOCSIS configuration file configures the CM for its network operations and includes information such as the maximum number of CPE devices that are supported, the quality of service (QoS) options provided for the CM, and whether the CM should upgrade to a new software image.

The DOCSIS specification defines the format of the DOCSIS configuration files, which can be created by any number of tools. In addition to the other tools that Cisco provides for this purpose, the **cable config-file** command can be used to create the DOCSIS configuration files needed for your network. These configuration files are stored in the Flash memory on the Cisco CMTS router and can be automatically downloaded to the CM as needed.

The **cable config-file** command creates the DOCSIS configuration file if it does not already exist and then enters config-file configuration mode. You can then give one of the following subcommands to create the configuration file:

- **access-denied**
- **channel-id**
- **cpe max**
- **download**

- **frequency**
- **option**
- **privacy**
- **service-class**
- **snmp manager**
- **timestamp**

**Note** When a DOCSIS shared secret is configured on the downstream interface (see the **cable shared-secret** command), the **cable config-file** command automatically inserts the appropriate MD5 Message Integrity Check (MIC) value at the end of the dynamically generated DOCSIS configuration file. You do not need to specify the DOCSIS shared secret string with the **cable config-file** command.

After using the **cable config-file** subcommands, enter the **exit** command to leave config-file mode and to save the configuration file in the Flash memory. After a configuration file is created, it also appears in the running-configuration file. To delete a configuration file and remove it from Flash memory, use the **no cable config-file** command.

To allow CMs to download the configuration files, you must also enable the router's onboard TFTP server, using the **tftp-server** configuration command. Unless you are running on a small lab network, you should also remove the default limit of 10 TFTP sessions by using the **service udp-small-serves max-servers no limit** command.

In addition, the following commands are also recommended:

- **cable time-server** - Enables the Cisco CMTS router to function as a time-of-day (ToD) server.
- **ip dhcp pool** - Configures the Cisco CMTS router as a DHCP server. Otherwise, you need an external DHCP server.
- **ip dhcp ping packets 0** - Improves the scalability of the Cisco CMTS router DHCP server.

**Note** For complete information on DOCSIS configuration files, see Appendix C in the DOCSIS 1.1 Radio Frequency (RF) Interface Specification, available on the DOCSIS Cable Labs official web site at <http://www.cablemodem.com>

## Examples

The following example shows two DOCSIS configuration files being configured. The first configuration file allows each CM to have up to four CPE devices and configures the QoS parameters for its traffic. The second configuration file denies network access to the CM and its CPE devices.

```
Router# configure terminal
Router(config)# cable config-file test.cm
Router(config-file)# cpe max 4
Router(config-file)# service-class 1 priority 2
Router(config-file)# service-class 1 max-upstream 128
Router(config-file)# service-class 1 max-downstream 1000
```

```

Router(config-file)# timestamp
Router(config-file)# exit
Router(config)# cable config-file denied.cm
Router(config-file)# access-denied
Router(config-file)# exit
Router(config)#

```

The following is a portion of a typical Cisco IOS configuration file that shows the above two DOCSIS configuration files, as well as a typical DHCP server configuration:

```

Router# show running-config
...
service udp-small-servers max-servers no-limit
!
cable time-server
!
cable config-file test.cm
  cpe max 4
  service-class 1 priority 2
  service-class 1 max-upstream 128
  service-class 1 max-downstream 1000
  timestamp
cable config-file disable.cm
  access-denied
!
ip dhcp pool modems-c3
  network 10.30.128.0 255.255.240.0
  bootfile test.cm
  next-server 10.30.128.1
  default-router 10.30.128.1
  option 7 ip 10.30.128.1
  option 4 ip 10.30.128.1
  option 2 hex 0000.0000
!
...

```

## Related Commands

Command	Description
<b>cable config-file</b>	Creates a DOCSIS configuration file and enters configuration file mode.
<b>access-denied</b>	Disables access to the network.
<b>channel-id</b>	Specifies upstream channel ID.
<b>cpe max</b>	Specifies the maximum number of CPE devices allowed access.
<b>debug cable config-file</b>	Displays information about the DOCSIS configuration files that are generated by the internal DOCSIS configuration file editor.
<b>download</b>	Specifies the filename and server IP address for downloading a new software image.
<b>frequency</b>	Specifies the downstream frequency.
<b>option</b>	Specifies options for the configuration file that are not provided for by the other commands.
<b>privacy</b>	Specifies privacy options for baseline privacy images.

<b>Command</b>	<b>Description</b>
<b>service-class</b>	Specifies service class definitions for the configuration file.
<b>snmp manager</b>	Specifies Simple Network Management Protocol (SNMP) options.
<b>timestamp</b>	Enables time-stamp generation.
<b>show running-config</b>	Displays the current run-time configuration, which includes any configuration files that have been defined.
<b>show startup-config</b>	Displays the current saved configuration, which includes any configuration files that have been defined and saved.

# cable controller-profile

To enable I-CMTS controller profile configuration, use the **cable controller-profile I-CMTS enable** command in global configuration mode.

Post configuring the **cable controller-profile I-CMTS enable** command, total chassis only supports Profile based controller configuration. Once enabled, it cannot rollback.

## cable controller-profile I-CMTS enable

**Command Default** None.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.7.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** i-CMTS controllers are configured using legacy controller configuration commands by default. If you want to use i-CMTS controller profile, then you must enable it first.

The following example shows how to enable i-CMTS controller profile configuration:

```
Router# configure terminal
Router(config)# cable controller-profile I-CMTS enable
```

## Related Commands

Command	Description
<b>cable downstream controller-profile</b>	Enters downstream controller profile configuration mode.
<b>cable upstream controller-profile</b>	Enters upstream controller profile configuration mode.

# cable d31-mode

To enable the DOCSIS 3.1 mode on a MAC domain, use the **cable d31-mode** command in the interface configuration mode. To disable the DOCSIS 3.1 mode, use the **no** form of the command.

[no] **cable d31-mode**

This command has no keywords or arguments.

**Command Default** DOCSIS 3.1 mode is enabled.

**Command Modes** Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Enabling the DOCSIS 3.1 mode has the following effects:

- MDDs advertise the MAC domain as DOCSIS 3.1 capable.
- DOCSIS 3.1 protocol support is enabled for the MAC domain, including:
  - v5 Ranging support
  - D3.1 TLV parsing
  - D3.1 MMMs
- OFDM channels are included in MD-SG calculations assuming that they are a member of an associated fiber node.
- OFDM channels are allowed to become active primary-capable downstream channels within the MAC domain.

The following example shows how to enable DOCSIS 3.1 mode:

```
router#configure terminal
router(config)#interface c3/0/0
router(config-if)#cable d31-mode
```

## Related Commands

Command	Description
<b>cable mtc-mode</b>	Enables Multiple Transmit Channel mode for the MAC domain. For d31-mode to be active, mtc-mode must also be configured.
<b>cable mrc-mode</b>	Enables Multiple Receive Channel mode for the MAC domain. For d31-mode to be active, mrc-mode must also be configured.

Command	Description
<b>show interface Cable <i>slot/subslot/port</i> controller</b>	Displays the status of the controller, including the d31-mode enablement state.

## cable d40-mode

To enable the DOCSIS 4.0 mode on a MAC domain, use the **cable d40-mode** command in the interface configuration mode. To disable the DOCSIS 4.0 mode, use the **no** form of the command.

**cable d40-mode**

**no cable d40-mode**

This command has no keywords or arguments.

**Command Default** DOCSIS 4.0 mode is enabled.

**Command Modes** Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1z	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Enabling the DOCSIS 4.0 mode has the following effects:

- MDDs advertise the MAC domain as DOCSIS 4.0 capable.
- DOCSIS 4.0 protocol support is enabled for the MAC domain, including:
  - D4.0 TLV parsing
  - D4.0 MMMs
- OFDM channels are included in MD-SG calculations assuming that they are a member of an associated fiber node.
- OFDM channels are allowed to become active primary-capable downstream channels within the MAC domain.

The following example shows how to enable DOCSIS 4.0 mode:

```
router#configure terminal
router(config)#interface c4/0/0
router(config-if)#cable d40-mode
```

**Related Commands**

Command	Description
<b>cable d31-mode</b>	To enable the DOCSIS 3.1 mode on a MAC domain, use the <b>cable d31-mode</b> command in the interface configuration mode.

## cable dci-response

To configure how a cable interface responds to DCI-REQ messages for CMs on that interface, use the **cable dci-response** command in cable interface configuration mode.

**cable dci-response** [**success** | **ignore** | **reject permanent** | **reject temporary**]

Syntax Description		
<b>success</b>	(Optional) Configures the interface so that the Cisco CMTS responds to DCI-REQ messages from CMs on the interface by sending a DCI-RSP response with the confirmation code of Success (0).	
<b>ignore</b>	(Optional) Configures the interface so that the Cisco CMTS ignores DCI-REQ messages from CMs on the interface. It does not send any DCI-RSP responses.	
<b>reject permanent</b>	(Optional) Configures the interface so that the Cisco CMTS responds to DCI-REQ messages from CMs on the interface by sending a DCI-RSP response with the confirmation code of Reject Permanent (4).	
<b>reject temporary</b>	(Optional) Configures the interface so that the Cisco CMTS ignores the first four DCI-REQ messages from a CM on the interface, but on the fifth DCI-REQ message, the CMTS responds with a DCI-RSP response with the confirmation code of Reject Temporary (3). The CMTS then continues to ignore the next seven DCI-REQ messages and then restarts this process when it receives the twelfth DCI-REQ message.	

**Command Default** The Cisco CMTS router responds to DCI-REQ messages from all CMs by sending a DCI-RSP response with the confirmation code of Success (0).

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Description
	12.1(4)CX	This command was introduced for DOCSIS 1.1 operation.
	12.2(4)BC1	This command was integrated into Cisco IOS Release 12.2(4)BC1.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The Device Class Identification (DCI) messages are part of the Media Access Control Specification section of the DOCSIS 1.1 specification (revision SP-RFiv1.1-I05-000714 and above). A CM can optionally use the DCI-REQ message to inform the CMTS router of certain capabilities, such as whether it is a CPE-controlled cable modem (CCCM).

The CMTS router then responds with one of the following confirmation codes:

- Success—Allows the CM to continue with the registration process.

- **Reject Permanent**—Instructs the CM to cancel its registration process on this downstream channel. The CM must try all other available downstream channels before attempting to register on this downstream channel again.
- **Reject Temporary**—Instructs the CM to reset its DCI-REQ counter, to send another DCI-REQ message, and to wait for the DCI-RSP before proceeding with the registration process.

**Note** The CMTS router also can respond with an Upstream Transmitter Disable (UP-DIS) message. See the description of the **cable dci-upstream-disable** command for details.

## Examples

The following example shows how to configure the CMTS router so that it ignores all DCI-REQ messages from CMs on the cable interface at slot 6:

```
Router# configure terminal
Router(config)# interface c6/0
Router(config-if)# cable dci-response ignore
```

The following example shows how to configure the CMTS router so that it returns to its default behavior for the cable interface on slot 6, which is to respond to all DCI-REQ messages from CMs by sending a DCI-RSP with a Success confirmation code:

```
Router# configure terminal
Router(config)# interface c6/0
Router(config-if)# cable dci-response success
```

**Note** The **cable dci-response success** command does not appear in a startup or running configuration file, because it is the default configuration for a cable interface.

## Related Commands

Command	Description
<b>cable dci-upstream-disable</b>	Configures the cable interface so that it transmits an Upstream Transmitter Disable (UP-DIS) message instead of a DCI-RSP message to a particular CM.
<b>debug cable dci</b>	Enables debugging of DCI-REQ, DCI-RSP, and UP-DIS messages.

## cable dci-upstream-disable

To configure a cable interface so that it transmits a DOCSIS 1.1 Upstream Transmitter Disable (UP-DIS) message to a particular CM, use the **cable dci-upstream-disable** command in cable interface configuration mode. To remove that configuration and return to the default configuration, use the **no** form of this command.

**cable dci-upstream-disable** *mac-address* [**enable** | **disable**]  
**no cable dci-upstream-disable** *mac-address* [**enable** | **disable**]

Syntax Description	
<i>mac-address</i>	Specifies the MAC physical layer address for a particular CM.
<b>enable</b>	(Optional) Enables the UP-DIS message for the particular CM, so that when the CM sends a DCI-REQ message, the CMTS router responds by sending an UP-DIS response.
<b>disable</b>	(Optional) Disables the sending of UP-DIS messages to a particular CM.

**Command Default** The Cisco CMTS router does not transmit UP-DIS messages to any CMs.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Description
	12.1(4)CX	This command was introduced for DOCSIS 1.1 operation.
	12.2(4)BC1	This command was integrated into Cisco IOS Release 12.2(4)BC1.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The DOCSIS 1.1 specification (revision SP-RFIV1.1-I05-000714 and above) allows a CMTS router to transmit an Upstream Transmitter Disable (UP-DIS) message to a CM. If the CM supports the UP-DIS message, it responds by immediately disabling its upstream transmitter circuitry. The CM must be power-cycled before it can begin transmitting on the upstream again.

**Examples** The following example shows the **cable dci-upstream-disable** command being used to enable the UP-DIS message for the CM with the MAC address of 0123.4567.89ab.

```
Router# configure terminal
Router(config)# interface c6/0
Router(config-if)# cable dci-upstream-disable 0123.4567.89ab enable
Router(config-if)# exit
Router(config)# exit
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable dci-response</b>	Configures how the cable interface responds to DCI-REQ messages from CMs on that interface.
<b>debug cable dci</b>	Enables debugging of DCI-REQ, DCI-RSP, and UP-DIS messages.

## cable def-phy-burst

To specify a value for the upstream Maximum Traffic Burst parameter for CMs that do not specify their own value, use the **cable def-phy-burst** command in controller configuration mode. To reset the maximum burst size to its default, use the **no** form of this command.

```
cable def-phy-burst burst-size
no cable def-phy-burst
```

<b>Syntax Description</b>	<i>burst-size</i> Specifies the maximum number of bytes that are allowed in a burst. The valid range is 0 to 4096 bytes, with a default of 2000 bytes. A value of 0 specifies that CMs cannot register unless they specify a valid burst size.				
<b>Command Default</b>	2000 bytes				
<b>Command Modes</b>	Controller configuration—upstream-cable only (config-controller)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.15.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>cable default-phy-burst</b> command.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>cable default-phy-burst</b> command.
Release	Modification				
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>cable default-phy-burst</b> command.				

### Usage Guidelines

**Note** The **cable def-phy-burst** command applies to cable modems that cannot perform fragmentation. The value specified by the **cable def-phy-burst** command is used to determine the maximum total frame burst size supported for a cable modem request. In contrast, the **cable upstream fragment-force** command may be used to determine the largest single physical burst a cable modem can transmit, when the cable modem supports fragmentation.

The DOCSIS 1.0 specification allows CMs to register without specifying a maximum upstream burst size, or to register with a value of 0, which means an unlimited burst size. This behavior can interfere with DOCSIS 1.1 networks because excessively large bursts on an upstream will generate unpredictable jitter and delay in voice calls. DOCSIS 1.1 CMs can also cause this problem if they register without enabling fragmentation of packets at the DOCSIS MAC layer.

This command allows you to specify a default burst size for CMs that register without specifying a burst size or that register with a burst size of 0. It also specifies the maximum size of long data grants if a CM specifies a size of 0 (unlimited) in the Upstream Channel Descriptor (UCD) packet. If a CM specifies a long data grant that would exceed the maximum burst size, and the CM is not using DOCSIS concatenation, the DOCSIS scheduler drops the bandwidth request.

To prevent CMs from registering without defining a burst profile, use this command with a *burst-size* of zero. CMs that do not define a burst profile will not be allowed to register and come online.

**Note** Typically, DOCSIS 1.1 CMs set the maximum upstream transmit burst size to the larger value of 1522 bytes and maximum concatenated burst size (which can be a maximum of 4096 bytes).

The default PHY burst parameter interacts with two other parameters that are configured in the DOCSIS configuration file:

- DOCSIS 1.1 configuration files can also specify a value for the maximum concatenation burst, which has a default of 1522 bytes. If this parameter is greater than the default PHY burst size, the CM can override the default PHY burst when it is using concatenation.
- DOCSIS 1.0 and 1.1 configuration files can also specify a maximum transmit burst size. In DOCSIS 1.1 configurations, this parameter defaults to 3044 bytes, with a minimum of 1522 bytes. DOCSIS 1.0 configuration files could set this parameter to a value lower than 1522 bytes, depending on what version of the DOCSIS 1.0 specification they support. The CMTS router will enforce the lower limit between the default phy burst and the maximum transmit burst, so you should ensure that all configuration files in your network specify a minimum of 1522 bytes for the maximum transmit burst size.

### Example

The following example shows how to set the default maximum burst size to 1 on a Cisco cBR-8 router:

```
Router(config)# controller upstream-Cable 3/0/1
Router(config-controller)# cable def-phy-burst 1
```

### Related Commands

Command	Description
<b>cable upstream fragmentation</b>	Enables fragmentation of DOCSIS frames on a particular upstream.
<b>cable upstream fragment-force</b>	Specifies that a cable interface line card should fragment DOCSIS frames on an upstream when the frame exceeds a particular size.
<b>show cable modem</b>	Displays information for the registered and unregistered CMs, including the QoS configuration for individual CMs.
<b>show controllers cable</b>	Displays the downstream MPEG framing format (Annex A or Annex B) setting.

## cable default-phy-burst

To specify a value for the upstream Maximum Traffic Burst parameter for CMs that do not specify their own value, use the **cable default-phy-burst** command in cable interface configuration mode. To reset the maximum burst size to its default, use the **no** form of this command.

**cable default-phy-burst** *burst-size*  
**no cable default-phy-burst**

<b>Syntax Description</b>	<i>burst-size</i> Specifies the maximum number of bytes that are allowed in a burst. The valid range is 0 to 4096 bytes, with a default of 2000 bytes. A value of 0 specifies that CMs cannot register unless they specify a valid burst size.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** 2000 bytes

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(8)BC1	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
	12.2(15)BC2	The <b>cable upstream fragment-force</b> command is introduced, with considerations to the <b>cable default-phy-burst</b> command.  The maximum upstream traffic burst may also be influenced by the new <b>cable upstream fragment-force</b> command for cable modems that are able to perform fragmentation.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was replaced by the <b>cable def-phy-burst</b> command on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

**Note** The **cable default-phy-burst** command applies to cable modems that cannot perform fragmentation. The value specified by the **cable default-phy-burst** command is used to determine the maximum total frame burst size supported for a cable modem request. In contrast, the **cable upstream fragment-force** command may be used to determine the largest single physical burst a cable modem can transmit, when the cable modem supports fragmentation.

The DOCSIS 1.0 specification allows CMs to register without specifying a maximum upstream burst size, or to register with a value of 0, which means an unlimited burst size. This behavior can interfere with DOCSIS 1.1 networks because excessively large bursts on an upstream will generate unpredictable jitter and delay in

voice calls. DOCSIS 1.1 CMs can also cause this problem if they register without enabling fragmentation of packets at the DOCSIS MAC layer.

This command allows you to specify a default burst size for CMs that register without specifying a burst size or that register with a burst size of 0. It also specifies the maximum size of long data grants if a CM specifies a size of 0 (unlimited) in the Upstream Channel Descriptor (UCD) packet. If a CM specifies a long data grant that would exceed the maximum burst size, and the CM is not using DOCSIS concatenation, the DOCSIS scheduler drops the bandwidth request.

To prevent CMs from registering without defining a burst profile, use this command with a *burst-size* of zero. CMs that do not define a burst profile will not be allowed to register and come online.

**Note** Typically, DOCSIS 1.1 CMs set the maximum upstream transmit burst size to the larger value of 1522 bytes and maximum concatenated burst size (which can be a maximum of 4096 bytes).

The default PHY burst parameter interacts with two other parameters that are configured in the DOCSIS configuration file:

- DOCSIS 1.1 configuration files can also specify a value for the maximum concatenation burst, which has a default of 1522 bytes. If this parameter is greater than the default PHY burst size, the CM can override the default PHY burst when it is using concatenation.
- DOCSIS 1.0 and 1.1 configuration files can also specify a maximum transmit burst size. In DOCSIS 1.1 configurations, this parameter defaults to 3044 bytes, with a minimum of 1522 bytes. DOCSIS 1.0 configuration files could set this parameter to a value lower than 1522 bytes, depending on what version of the DOCSIS 1.0 specification they support. The CMTS router will enforce the lower limit between the default phy burst and the maximum transmit burst, so you should ensure that all configuration files in your network specify a minimum of 1522 bytes for the maximum transmit burst size.

## Examples

The following example shows the default maximum burst size to 1522 bytes, which is the minimum size required by the DOCSIS 1.1 specification:

```
Router(config)# interface cable 5/1
Router(config-if)# cable default-phy-burst 1522
```

The following example shows the default maximum burst size to 0, which means that a CM must specify a valid burst profile before the Cisco CMTS allows it to register and come online:

```
Router(config)# interface cable 5/1
Router(config-if)# cable default-phy-burst 0
```

The following example shows the default maximum burst size being reset to its default of 2000 bytes:

```
Router(config)# interface cable 5/1
Router(config-if)# no cable default-phy-burst
```

Related Commands	Command	Description
	<b>cable upstream fragmentation</b>	Enables fragmentation of DOCSIS frames on a particular upstream.
	<b>cable upstream fragment-force</b>	Specifies that a cable interface line card should fragment DOCSIS frames on an upstream when the frame exceeds a particular size.

# cable depi multicast pool

To configure the DEPI multicast pool for downstream virtual splitting, use the **cable depi multicast pool** command in global configuration mode. To void the DEPI multicast pool configuration, use the **no** form of this command.

**cable depi multicast pool** *id*

**no cable depi multicast pool** *id*

<b>Syntax Description</b>	<i>id</i> Specifies the ID of the DEPI multicast pool.
---------------------------	--------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Global configuration (config)
----------------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

<b>Usage Guidelines</b>	Use this command to configure the DEPI multicast pool.
-------------------------	--------------------------------------------------------

The following example shows how to configure the DEPI multicast pool:

```
Router# configure terminal
Router(config)# cable depi multicast pool 1
Router(config-multicast-pool)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>ip address</b>	Specifies IP address range for multicast pool.

# cable depi multicast pool redundant include-video-controller

To configure the DEPI multicast pool for downstream virtual splitting, use the **cable depi multicast pool *id* [redundant include-video-controller]** command in global configuration mode. To void the DEPI multicast pool configuration, use the **no** form of this command.

**cable depi multicast pool *id* [ redundant [ include-video-controller ] ]**

**no cable depi multicast pool *id* [ redundant [ include-video-controller ] ]**

Syntax Description		
	<i>id</i>	Specifies the ID of the DEPI multicast pool.
	<b>redundant</b>	Redundant multicast pool for secondary Linecard Downstream Controller.
	<b>redundant include-video-controller</b>	IP assignment for redundant(stand-by) controllers including video controllers if supported by CBR-CCAP-LC-G2-R Linecard.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

- Usage Guidelines**
- If you configure `cable depi multicast pool 10 redundant`, then multicast IPs is assigned only to downstream-cable controllers.
  - If you configure `cable depi multicast pool 10 redundant include-video-controller`, then multicast IPs are assigned for both downstream-cable and downstream-video controllers CBR-CCAP-LC-G2-R Linecards.

If video controllers are not supported by CBR-CCAP-LC-40G Linecards, then IPs are assigned only to downstream-cable controllers. The total redundant pool is set up by the system and allocates IP addresses for all possible controllers multiplied by the number of interfaces available.

The following example shows how to configure `redundant include-video-controller`:

```
Router# configure terminal
Router(config)# cable depi multicast pool 10
Router(config-multicast-pool)# redundant include-video-controller
Router(config-multicast-pool)#
```

The following example shows the difference between `redundant` and `redundant include-video-controller` configurations:

- If you use the `redundant` config, then the total controllers = 16 DOCSIS(x interfaces) + 20 OOB.

- If you use the `redundant include-video-controller` config, then the total controllers = 16 DOCSIS(x interfaces) + 16 VIDEO(x interfaces) + 20 OOB

For Example, If Linecard '0' is secondary, then IP is allocated to downstream-cable and downstream-video controllers as shown below:

- The following allocations are only applicable to CBR-CCAP-LC-40G and CBR-CCAP-LC-G2-R Linecards prior to Cisco IOS XE Bengaluru 17.6.1z:
  - If Linkha is enabled and `redundant` is configured as  $16(x4) + 20 = 84$  IPs, then the IPs are assigned to the following controllers:

Controllers	Interfaces
DS0/0/0 to DS0/0/15	Te0/1/0 and Te0/1/2
DS0/0/16 to DS0/0/31	Te0/1/4 and Te0/1/6

- If Linkha is disabled and `redundant` is configured as  $16(x8) + 20 = 148$  IPs, then the IPs are assigned to the following controllers:

Controllers	Interfaces
DS0/0/0 to DS0/0/15	Te0/1/0, Te0/1/1, Te0/1/2, Te0/1/3
DS0/0/16 to DS0/0/31	Te0/1/4, Te0/1/5, Te0/1/6, Te0/1/7

- If Linkha is enabled and `redundant include-video-controller` is configured as  $16(x4) + 16(x4) + 20 = 148$  IPs, then the IPs are assigned to the following controllers:

Controllers	Interfaces
DS0/0/0 to DS0/0/15	Te0/1/0 and Te0/1/2
DS0/0/16 to DS0/0/31	Te0/1/4 and Te0/1/6
VID0/0/0 to VID0/0/15	Te0/1/0 and Te0/1/2
VID0/0/16 to VID0/0/31	Te0/1/4 and Te0/1/6

- If Linkha is disabled and `redundant include-video-controller` is configured as  $16(x8) + 16(x8) + 20 = 276$  IPs, then the IPs are assigned to the following controllers:

Controllers	Interfaces
DS0/0/0 to DS0/0/15	Te0/1/0, Te0/1/1, Te0/1/2, Te0/1/3
DS0/0/16 to DS0/0/31	Te0/1/4, Te0/1/5, Te0/1/6, Te0/1/7
VID0/0/0 to VID0/0/15	Te0/1/0, Te0/1/1, Te0/1/2, Te0/1/3
VID0/0/16 to VID0/0/31	Te0/1/4, Te0/1/5, Te0/1/6, Te0/1/7

- The following allocations are only applicable to CBR-CCAP-LC-G2-R cards for Cisco IOS XE Bengaluru 17.6.1z and later.

If Linkha is disabled and `redundant include-video-controller` is configured as  $16(x8) + 16(x8) + 20 = 276$  IPs, then the IPs are assigned to the following controllers:

Controllers	Interfaces
DS0/0/0 to DS0/0/7	Te0/1/0, Te0/1/1
DS0/0/8 to DS0/0/15	Te0/1/2, Te0/1/3
DS0/0/16 to DS0/0/23	Te0/1/4, Te0/1/5
DS0/0/24 to DS0/0/31	Te0/1/6, Te0/1/7
VID0/0/0 to VID0/0/7	Te0/1/0, Te0/1/1
VID0/0/8 to VID0/0/15	Te0/1/2, Te0/1/3
VID0/0/16 to VID0/0/23	Te0/1/4, Te0/1/5
VID0/0/24 to VID0/0/31	Te0/1/6, Te0/1/7

#### Related Commands

Command	Description

# cable depi multicast statistic monitor

This feature enables you to view statistics for the multicast group assigned by DEPI multicast pool. You can enable this feature using the **cable depi multicast statistic monitor** command. Use this command for docsis, bcast and ncst video configurations. OOB configuration is not supported. To void the configuration, use the **no** form of this command.

**cable depi multicast statistic monitor**

**no cable depi multicast statistic monitor**

<b>Syntax Description</b>	<b>monitor</b> Enable monitor multicast DEPI throughput.
---------------------------	----------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Global configuration (config)
----------------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced for the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to view statistics for the multicast group assigned by DEPI multicast pool.

The following example shows how to configure the **cable depi multicast statistic monitor** command:

```
Router# configure terminal
Router(config)# cable depi multicast statistic monitor
Router(config)#
```

After configuring the command, you can verify your configuration using the following command:

```
Router# show cable depi multicast counter
IP                               POOL ID pps          bps          IF
Controller
225.225.225.0                    1           4686         39335848     Te3/1/0
DS3/0/1
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<a href="#">cable rphy statistics session update-freq</a>	Specifies the DEPI statistics synchronization interval in units of 5 seconds

## cable device

To configure an access list for a cable modem (CM) device or host on the Cisco CMTS router, use the **cable device** command in privileged EXEC mode. To remove an access group, use the **no access-group** option of this command.

```
cable device { {ip-addressmac-address} [no] access-group {access-listaccess-name} | [vrf vrf-name]}
ip-address [no] access-group [access-listaccess-name]}

```

### Syntax Description

<i>ip-address</i>	IP address of the CM device or host.
<i>mac-address</i>	MAC address of the CM device or host.
<b>access-group</b>	Enables <b>access-group</b> options. The <b>no</b> form removes access-group specifications.
{ <i>access-list</i>   <i>access-name</i> }	Specifies the IP access list (standard or extended), either by access-list number (1 to 199) or by access-list name.
<b>vrf</b> <i>vrf-name</i>	Specifies a virtual routing and forwarding (VRF) instance that is populated with VPN routes. <ul style="list-style-type: none"> <li><i>vrf-name</i>—Name of the VRF instance</li> </ul>

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Description
12.1	This command was moved from earlier releases.
12.1(1a)T1	The <b>vrf</b> keyword was added for Multiprotocol Label Switching (MPLS) VPN support.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

For the **vrf** keyword of this command, only the *ip-address* option is supported.

An access list can be configured to deny access to any IP address other than the ones previously configured, using the **access-list** *access-list* **deny any any** command. Starting with Cisco IOS Release 12.2(33)SCD, when a CM is added to such an access list on the Cisco uBR7200 series universal broadband routers, the ping fails. If the CM is reset, removed, or powered off, the ping succeeds after the CM comes online. However, the **show cable modem access-group** command displays that the CM does not belong to the access-group.

---

**Note** The **cable device** command is not supported on the Cisco uBR10012 universal broadband router.

---

---

**Note** The **vrf** keyword is not supported in Cisco IOS Releases 12.0 SC, 12.1 EC, and 12.2 BC.

---

### Examples

The following example shows how to assign an access list to the MAC address of a cable device:

```
Router# configure terminal

Router(config)# cable device 0010.7b6b.77ed acc 1
Router(config)# exit
```

### Related Commands

Command	Description
<b>clear cable host</b>	Clears the host from the internal address tables of the Cisco CMTS router.
<b>cable host access-group</b>	Configures the access list for the specified hosts on the Cisco CMTS router.
<b>show cable device access-group</b>	Displays CMs and hosts behind the CMs on the network on the Cisco CMTS router.
<b>show cable host access-group</b>	Displays hosts behind the CMs on the network on the Cisco CMTS router.

## cable dfo-retry-count

To configure the Downstream Frequency Override (DFO) retry count, use the **cable dfo-retry-count** command in global configuration mode. To reset the DFO retry count to its default value, use the **no** form of this command.

```
cable dfo-retry-count n
no cable dfo-retry-count n
```

### Syntax Description

<i>n</i>	Downstream frequency override retry count. The valid range is from 1 to 100.
----------	------------------------------------------------------------------------------

### Command Default

The DFO retry count is 20 on the Cisco uBR10012 and Cisco uBR7200 series routers.  
The DFO retry count is 5 on the Cisco cBR series routers.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCD7	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The Downstream Frequency Override (DFO) feature enables cable modems to register on a specific primary RF channel. Because of RF failure conditions and some cable modem types, the cable modem takes more time to register on a specific primary RF channel. You can configure the DFO retry count to reduce the cable modem registration time using the **cable dfo-retry-count** command.

### Examples

The following example shows how to configure the DFO retry count as 10:

```
Router# configure terminal
Router(config)# cable dfo-retry-count 10
```

### Related Commands

Command	Description
<b>cable service attribute ds-bonded downstream-type bonding-enabled</b>	Forces a downstream bonding-capable modem to initialize on a bonded primary-capable downstream channel.
<b>cable service attribute non-ds-bonded downstream-type bonding-disabled</b>	Forces the non-bonding-capable modems to register only on non-bonded RF channels on the CMTS.
<b>cable service type ds-frequency</b>	Redirects matching service types to the downstream frequency.

## cable dhcp ipv4 profile

To enter the IPv4 DHCP profile configuration mode, use the **cable dhcp ipv4 profile** command in global configuration mode. To remove the configured profile, use the **no** form of this command.

**cable dhcp ipv4 profile** *name*  
**no cable dhcp ipv4 profile** *name*

<b>Syntax Description</b>	<i>name</i> Specifies the name of the IPv4 DHCP profile.
---------------------------	----------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Global configuration (config)
----------------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS XE Fuji 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to enter the IPv4 DHCP profile configuration mode:

```
Router# configure terminal
Router(config)# cable dhcp ipv4 profile DEVICE1
Router(config-dhcpv4-profile)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>match</b>	Specifies the matching option for the IPv4 DHCP profile.

## cable dhcp-giaddr

To modify the GIADDR field for the DHCPDISCOVER and DHCPREQUEST packets with a relay IP address before they are forwarded to the DHCP server, use the **cable dhcp-giaddr** command in cable interface or subinterface configuration mode. To set the GIADDR field to its default, use the **no** form of this command.

```
cable dhcp-giaddr {policy [strict | host | mta | ps | stb | profile name ] giaddr | primary}
no cable dhcp-giaddr
```

Syntax Description		
<b>policy</b>	Selects the control policy, so that the primary address is used for cable modems and the secondary addresses are used for hosts and other customer premises equipment (CPE) devices. This setting is typically used when the CMs on the interface are configured for routing, so that the CMs and hosts can use IP addresses on different subnets.	
<b>strict</b>	(Optional, only when the <b>policy</b> keyword is specified) Selects the GIADDR IP address as the source IP address in the forwarded DHCPOFFER packet.  By default when using the <b>policy</b> option, the Cisco CMTS changes the source IP address in the DHCPOFFER packet to match that of the primary address on the cable interface. Enable the <b>strict</b> option to prevent this behavior, which could interfere with any access lists applied to the CM when the CM is using a different subnet from the primary address space of the cable interface.	
<b>host</b>	Specifies the GIADDR for hosts.	
<b>mta</b>	Specifies the GIADDR for media terminal adapters (MTA).	
<b>ps</b>	Specifies the GIADDR for portal servers (PS).	
<b>stb</b>	Specifies the GIADDR for set-top boxes (STB).	
<b>profile name</b>	Specifies DHCP profile as control policy.	
<i>giaddr</i>	IP addresses of the secondary interface of the bundle interface.	
<b>primary</b>	Selects the primary address always to be used for the GIADDR field for both CMs and CPE devices. This option is typically used for the Cisco uBR-MC16E card and Cisco uBR7100E series routers to support EuroDOCSIS operations.	

**Command Default** None

### Command Modes

Interface configuration (config-if)

Subinterface configuration (config-subif)

Command History	Release	Modification
	12.0(4)T	This command was introduced.

Release	Modification
12.0(6)SC	This command was integrated into Cisco IOS Release 12.0(6)SC.
12.1(2)EC1	This command was integrated into Cisco IOS Release 12.1(2)EC1.
12.1(3a)EC	This command was modified to support subinterfaces.
12.2(15)BC2	This command was modified to include the <b>strict</b> option.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. This command was modified to support the Cisco uBR7225VXR router.
12.2(33)SCD5	This command was modified to support the <b>host</b> , <b>mta</b> , <b>ps</b> , and <b>stb</b> keywords.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.8.1	This command was modified to add the <b>profile</b> keyword.

### Usage Guidelines

You can use this command to modify the GIADDR field of DHCPDISCOVER and DHCPREQUEST packets to provide a relay IP address before packets are forwarded to the DHCP servers. Use this command to set a policy option such that primary addresses are used for CMs and secondary addresses are used for hosts (such as PCs) behind the CMs.

When using multiple secondary subnets, the Cisco CMTS router uses the first secondary IP address as the GIADDR field when forwarding a DHCPDISCOVER request to the DHCP server. If no DHCP server responds with a DHCPOFFER message after three attempts, the Cisco CMTS router uses the next secondary IP address, up to a maximum of 16 secondary addresses.

**Note** If you have configured a Cisco CM for routing mode and are also using the **cable-modem dhcp-prox nat** command on the CM, you must configure the corresponding cable interface on the Cisco CMTS using the **cable dhcp-giaddr policy strict]** command.

**Caution** You cannot use the **strict** option with the internal DHCP server that is onboard the Cisco CMTS router, because the **strict** option requires the use of DHCP relay operation, which is not performed by DHCP termination points such as the internal DHCP server.

**Note** For cBR Series Converged Broadband Routers, internal DHCP server is not supported.

### Examples

The following example shows how to set the primary address to be used always for GIADDR:

```
Router# configure terminal
```

```
Router(config)# interface cable 3/0

Router(config-if)# cable dhcp-giaddr primary
```

The following example shows how to set the primary address to be used always for GIADDR in the cable subinterface mode:

```
Router# configure terminal

Router(config)# interface cable 6/0.1

Router(config-subif)# cable dhcp-giaddr primary
```

The following example shows how to configure the router so that the primary address is used for CMs and the secondary addresses are used for hosts. In addition, the GIADDR is used as the source IP address in forwarded DHCP OFFER packets.

```
Router# configure terminal

Router(config)# interface cable 5/1/0

Router(config-if)# cable dhcp-giaddr policy strict
```

The following example shows how to configure the router so that the CPE device (in this case, the MTA) uses a specific secondary interface:

```
Router# configure terminal
Router(config)# interface bundle 25
Router(config-if)# cable dhcp-giaddr mta 172.10.10.1
```

The following example shows how to specify DHCP profile as control policy:

```
Router# configure terminal
Router(config)# interface bundle 2
Router(config-if)# cable dhcp-giaddr policy profile DEVICE1 2.2.1.1
```

## Related Commands

Command	Description
<b>cable helper-address</b>	Specifies a destination IP address for the User Datagram Protocol (UDP) broadcast (DHCP) packets.
<b>cable relay-agent-option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host, and forward the packet to a DHCP server.
<b>cable source-verify</b>	Enables CM upstream verification.
<b>cable telco-return spd dhcp-authenticate</b>	Enforces the telco-return CM to use a specific DHCP server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the Dynamic Host Configuration Protocol (DHCP) server that the telco-return CM must access.
<b>debug cable dhcp</b>	Enables debugging of the DHCP when it is used on the cable interface.

Command	Description
<b>debug cable mac-address</b>	Enables debugging of the MAC address on the cable interface.
<b>ip dhcp relay information option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host and forward the packet to a DHCP server.
<b>ip dhcp smart-relay</b>	Monitors client retransmissions when address pool depletion occurs.

## cable dhcp-insert

To configure the Cisco CMTS router to insert descriptors into DHCP packets using option 82, use the **cable dhcp-insert** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable dhcp-insert** {**downstream-description** | **hostname** | **service-class** | **upstream-description**}

Syntax Description	Parameter	Description
	<b>downstream-description</b>	Appends received DHCP packets with downstream port descriptors.
	<b>hostname</b>	Appends received DHCP packets with router host names.
	<b>service-class</b>	Appends received DHCP packets with router service class.
	<b>upstream-description</b>	Appends received DHCP packets with upstream port descriptors.

**Command Default** This configuration is disabled by default.

**Command Modes** Interface configuration (config-if) and bundle interface configuration.

Command History	Release	Modification
	12.3(21)BC	This command was introduced.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCF2	This command was modified. The <b>service-class</b> keyword was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable dhcp-insert** command is used to configure the following feature:

[DHCP, ToD, and TFTP Services for the CMTS Routers](#)

This feature enhances the DHCP security potential and the Cable Duplicate MAC Address Feature on the Cisco CMTS router.

The **cable dhcp-insert** command specifies which descriptors to append to DHCP packets. The DHCP servers can then detect cable modem clones and extract geographical information.

**Note** Multiple types of descriptor strings can be configured as long as the maximum relay information option size is not exceeded.

The Cisco CMTS router can use the DHCP Relay Agent Information option (DHCP option 82) to send particular information about a cable modem, such as its MAC address and the cable interface to which it is connected. If the DHCP server cannot match the information with that belonging to a cable modem in its

database, the Cisco CMTS router identifies that the device is a CPE device. This allows the Cisco CMTS router and DHCP server to retain accurate information about which CPE devices are using which cable modems and whether the devices should be allowed network access.

The DHCP Relay Agent can also be used to identify cloned modems or gather geographical information for E911 and other applications. Using the **cable dhcp-insert** command, configure the Cisco CMTS router to insert downstream, upstream, hostname, or service class descriptors into DHCP packets. A DHCP server can utilize such information to determine service levels available to the host specific to the provisioned subscriber.

**Note** To use the **service-class** option, the service class name specified in the CM configuration file must be configured on the Cisco CMTS. The **ip dhcp relay information option-insert** command should be configured on the bundle interface to insert the **service-class** option into the DHCP DISCOVER messages.

### Examples

The following example shows how to insert descriptors into DHCP packets. The DHCP server can then use these descriptors to identify cable modem clones and extract geographical information.

```
Router (dhcp-config) # cable dhcp-insert service-class
```

### Related Commands

Command	Description
<b>ip dhcp relay information option-insert</b>	Enables the system to insert a DHCP Relay Agent option in forwarded BOOTREQUEST messages to a DHCP server.
<b>cable ipv6 dhcp-insert</b>	Enables the system to insert descriptors into DHCPv6 packets.

## cable dhcp-parse option

To enable parsing of Dynamic Host Configuration Protocol (DHCP) options, use the **cable dhcp-parse option** command in cable interface configuration mode. To disable parsing, use the **no** form of this command.

**cable dhcp-parse option** *-optnum*  
**no cable dhcp-parse option** *-optnum*

### Syntax Description

<i>-optnum</i>	Specifies the DHCP option. Valid values are 43 and 60.
----------------	--------------------------------------------------------

### Command Default

The CMTS does not parse the specified DHCP options.

### Command Modes

Cable interface configuration (config-if)

### Command History

Release	Modification
12.3(21)BC	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

To determine specific device and system information, configure cable **dhcp-parse option-43** command on the CMTS. The CMTS parses option-43 of the CPE DHCP message to determine the device and system information of the CPE.

To determine the CPE device type, configure **cable dhcp-parse option-60** command on the CMTS. The CMTS parses option-60 of the CPE DHCP message to determine the device type of the CPE.

### Examples

The following example shows DHCP option 43 enabled on the CMTS:

```
Router(config-if)# cable dhcp-parse option-43

Router(config-if)#
```

### Related Commands

Command	Description
<b>cable helper address</b>	Specifies a destination IP address for User Datagram Protocol (UDP) broadcast Dynamic Host Configuration Protocol (DHCP) packets.

# cable diaglog

To enable the DOCSIS 3.1 mode on a MAC domain, use the **cable d31-mode** command in the interface configuration mode. To disable the DOCSIS 3.1 mode, use the **no** form of the command.

[no] **cable d31-mode**

This command has no keywords or arguments.

**Command Default** DOCSIS 3.1 mode is enabled.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Enabling the DOCSIS 3.1 mode has the following effects:

- MDDs advertise the MAC domain as DOCSIS 3.1 capable.
- DOCSIS 3.1 protocol support is enabled for the MAC domain, including:
  - v5 Ranging support
  - D3.1 TLV parsing
  - D3.1 MMMs
- OFDM channels are included in MD-SG calculations assuming that they are a member of an associated fiber node.
- OFDM channels are allowed to become active primary-capable downstream channels within the MAC domain.

The following example shows how to enable DOCSIS 3.1 mode:

```
router#configure terminal
router(config)#interface c3/0/0
router(config-if)#cable d31-mode
```

## Related Commands

Command	Description
<b>cable mtc-mode</b>	Enables Multiple Transmit Channel mode for the MAC domain. For d31-mode to be active, mtc-mode must also be configured.
<b>cable mrc-mode</b>	Enables Multiple Receive Channel mode for the MAC domain. For d31-mode to be active, mrc-mode must also be configured.
<b>show interface Cable slot/subslot/port controller</b>	Displays the status of the controller, including the d31-mode enablement state.

# cable diplexer-band-edge

To enable transmitting diplexer band edges in MAC Domain Descriptor (MDD) messages use the **cable diplexer-band-edge** command. To disable transmitting diplexer band edges in MAC Domain Descriptor (MDD) messages use the **no cable diplexer-band-edge** command.

**cable diplexer-band-edge**  
**no cable diplexer-band-edge**

This command has no keywords or arguments.

---

## Command Default

Transmitting diplexer band edges in MAC Domain Descriptor (MDD) messages is enabled by default.

---

## Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

---

## Command History

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Example

The following sample shows an example of the **cable diplexer-band-edge** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) #cable diplexer-band-edge
Router(config-profile-md) #end
```

The following sample shows an example of the **no cable diplexer-band-edge** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) #no cable diplexer-band-edge
Router(config-profile-md) #end
```

# cable diplexer-mdd-override-band-edge

To override diplexer band edge settings in MAC Domain Descriptor (MDD) messages, use the **cable diplexer-band-edge** comand. You can manually set the values used in MDD TLV 21.

To disable override diplexer band edge settings in MAC Domain Descriptor (MDD) messages, use the **no cable diplexer-band-edge** comand.

**cable diplexer-mdd-override-band-edge** { **ds\_lower** *frequency-value* | **ds\_upper** *frequency-value* | **us\_upper** *frequency-value* }

**no cable diplexer-mdd-override-band-edge**

Syntax Description		
	<b>ds_lower</b> <i>frequency-value</i>	Configure DS Lower Band Edge. You can configure 108MHz or 258MHz.
	<b>ds_upper</b> <i>frequency-value</i>	Configure DS Upper Band Edge. You can configure 1002MHz or 1218MHz.
	<b>us_upper</b> <i>frequency-value</i>	Configure DS Upper Band Edge. You can configure 42MHz, 65MHz, 85MHz, 117MHz, 204MHz.

**Command Default** override diplexer band edge settings in MAC Domain Descriptor (MDD) messages is disabled by default.

**Command Modes** Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1w	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

The following sample shows an example of the **cable diplexer-mdd-override-band-edge** command.

```
Router#configure terminal
Router#(config)#interface Cable1/0/0
Router(config-if)#cable diplexer-mdd-override-band-edge us_upper 204MHz
Router(config-if)#cable diplexer-mdd-override-band-edge ds_lower 258MHz
Router(config-if)#cable diplexer-mdd-override-band-edge ds_upper 1218MHz
Router(config-if)#end
```

Use the following command to verify the configuration.

```
Router#show cable mac-domain Cable1/0/0 mdd Integrated-Cable 1/0/0 0 | be Diplexer
Diplexer Band Edge
    US Upper Band Edge: 4
    DS Lower Band Edge: 1
    DS Upper Band Edge: 0
```

## cable divert-rate-limit

To set Cable-side DRL rate and limit, use the **cable divert-rate-limit** command in interface configuration mode. To reset the rate and limit to the default values, use the **no** form of this command.

**cable divert-rate-limit** *rate* **limit** *limit*  
**no cable divert-rate-limit**

Syntax Description	
<i>rate</i>	Specifies the divert rate in packets per second. Minimum rate is 1 packet per second. Maximum rate is 65535 packets per second. The default rate is 2000 packets per second.
<i>limit</i>	Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets. The default limit is 2000 packets.

**Command Default** The default DRL configuration for every physical cable interface is 2000 packets per second and the default limit is 2000 packets.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was replaced by the <b>platform punt-sbri subscriber rate</b> command on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Cable-side DRL is configured on the physical cable interface. It cannot be configured on a cable bundle interface.

**Examples** The following example shows how to configure the rate and limit values for a cable interface.:

```
Router(config-if)# cable divert-rate-limit rate 1 limit 4
```

Related Commands	Command	Description
	<b>service divert-rate-limit ip</b>	This command configures DRL rate and limit for WAN-side IP packet streams.
	<b>service divert-rate-limit non-ip</b>	This command configures DRL for WAN-side non-IP packet streams.

## cable docsis30-voice downstream req-attr-mask

To configure downstream DOCSIS 3.0 QoS parameters of the required attribute-mask and forbidden attribute-mask number for all DS voice flows, use the **cable docsis30-voice downstream req-attr-mask** command in global configuration mode. To disable the required attribute-mask and forbidden attribute-mask number, use the **no** form of this command.

**cable docsis30-voice downstream req-attr-mask** *req-attr-mask* **forb-attr-mask** *forb-attr-mask*  
**no cable docsis30-voice**

### Syntax Description

<i>req-attr-mask</i>	Specifies the required attribute-mask value.  Example: 0  It can also include HEX format.  Example: cable docsis30-voice downstream req-attr-mask FF forb-attr-mask 8000AAbb
<i>forb-attr-mask</i>	Specifies the forbidden attribute-mask value.  Example: 80000000

### Command Default

The value of required attribute-mask and forbidden attribute-mask number is 0. Use the **no** form of this command to return to default. It will set the values for required attribute-mask and forbidden attribute-mask number to 0.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command is used to configure DOCSIS 3.0 voice-related downstream service-flow attribute-mask number.

### Examples

The following example shows how to configure the downstream attribute mask for the interface cable:

```
Router# configure terminal

Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable docsis30-voice downstream req-attr-mask ?

<0-FFFFFFFF> The attribute bitmap in hex
Router(config)# cable docsis30-voice downstream req-attr-mask aa00 ?
forb-attr-mask SF Forbidden Attribute Mask
Router(config)# cable docsis30-voice downstream req-attr-mask aa00 forb-attr-mask ?
```

```

<0-FFFFFFF> The attribute bitmap in hex
Router(config)# cable docsis30-voice downstream req-attr-mask aa00 forb-attr-mask bbcc

Router(config)# do show run | include docsis30
cable docsis30-voice downstream req-attr-mask AA00 forb-attr-mask Bbcc

Router(config)# no cable docsis30-voice down

Router(config)# no cable docsis30-voice

Router(config)# do show run | include docsis30

```

**Related Commands**

Command	Description
<b>cable downstream attribute-mask</b>	This command enables attribute-based forwarding which allows CMTS to choose bonding group or individual channel for unicast and multicast forwarding.

## cable docsis-ver

To report the CMTS-supported DOCSIS version to the DHCP server, use the **cable docsis-ver** command in global configuration mode. To report the default DOCSIS version to the DHCP server, use the **no** form of the command.

**cable docsis-ver** [*major version* | *minor version*]

**no cable docsis-ver** [*major version* | *minor version*]

### Syntax Description

<i>major version</i>	Specifies the major DOCSIS version.
<i>minor version</i>	Specifies the minor DOCSIS version.

### Command Default

The default value of the command is **cable docsis-ver 3 1**

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS-XE 16.7.1	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## cable dot1q-vc-map

To map a cable modem to a particular Virtual Local Area Network (VLAN) on a local outbound Ethernet interface, use the **cable dot1q-vc-map** command in global configuration mode. To remove this mapping, or to remove a particular customer's name from the internal tables, use the **no** form of this command.

**cable dot1q-vc-map** *mac-address ethernet-interface vlan-id* {*cust-name*}

**cable dot1q-vc-map** *mac-address ethernet-interface backup-interface ethernet-interface vlan-id* {*cust-name*}

**no cable dot1q-vc-map** *mac-address ethernet-interface backup-interface ethernet-interface vlan-id* {*cust-name*}

**no cable dot1q-vc-map** *mac-address*

**no cable dot1q-vc-map customer** *cust-name*

Syntax Description		
<i>mac-address</i>		Hardware (MAC) address for the cable modem whose traffic is to be mapped.
<i>ethernet-interface</i>		Outbound interface to which this cable modem should be mapped.  On the Cisco uBR7100 series and Cisco uBR7246VXR routers, you can specify an Ethernet, Fast Ethernet, or Gigabit Ethernet interface, depending on what interfaces are actually installed in the chassis.  On the Cisco cBR series routers, you can specify the Gigabit Ethernet 0 interface or a Ten Gigabit Ethernet interface.
<i>vlan-id</i>		ID for the IEEE 802.1Q Virtual Local Area Network (VLAN) that should be used to tag the frames for this cable modem. The range is 1 to 4095, with no default on the Cisco uBR7100 series and Cisco uBR7246VXR routers. The range is 2 to 4095 on the Cisco cBR series routers.  <b>Note</b> The switches acting as the bridge aggregators might support a lower number of VLAN IDs. If so, the Cisco CMTS router should be configured within the limits of the switches' maximum number of VLANs.
<i>cust-name</i>		(Optional) Identifies the customer using this VLAN. The <i>cust-name</i> can be any arbitrary alphanumeric string, up to 127 characters long.
<b>customer</b> <i>cust-name</i>		(Optional) Deletes all VCs belong to this customer. The <i>cust-name</i> can be any arbitrary alphanumeric string, up to 127 characters long.
<b>backup-interface</b> <i>ethernet-interface</i>		Specifies the backup WAN interface.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(15)BC2	This command was introduced for Cisco uBR7246VXR universal broadband routers.

Release	Modification
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
12.2(33)SCJ	This command was modified. The <b>backup-interface</b> keyword was added.
IOS-XE 3.18.0S	This command was modified. The <b>backup-interface</b> keyword was added.

**Usage Guidelines**

This command maps a cable modem, on the basis of its hardware (MAC) address, to a particular IEEE 802.1Q VLAN on a particular outbound Ethernet interface. This enables the cable modem's traffic to be part of a virtual LAN at the Layer-2 level.

**Note** To use this command, you must first enable the use of IEEE 802.1Q Layer 2 tunnels, using the **cable l2-vpn-service dot1q** command. Then use this command to map individual cable modems to specific VLANs.

**Examples**

The following example shows how to enable the use of Layer 2 tunnels and then map specific CMs to VLANs on a specific interface on a Cisco uBR7246VXR router:

```
Router# configure terminal
Router(config)# cable l2-vpn-service dot1q
Router(config)# cable dot1q-vc-map 000C.0e03.69f9 GigabitEthernet 1/0 4
Router(config)# cable dot1q-vc-map 0010.7bed.9c95 GigabitEthernet 1/0 5
Router(config)# exit
```

The following example shows the same command as above on a Cisco uBR7246VXR router, but this time each VLAN is identified by the customer that is using it:

```
Router# configure terminal
Router(config)# cable l2-vpn-service dot1q
Router(config)# cable dot1q-vc-map 000C.0e03.69f9 GigabitEthernet 1/0 4 ENTERPRISE-CO1
Router(config)# cable dot1q-vc-map 0010.7bed.9c95 GigabitEthernet 1/0 5 ENTERPRISE-CO2
Router(config)# exit
```

The following example shows how to remove the Layer 2 mapping for a specific cable modem on a Cisco uBR7246VXR router. This particular cable modem's traffic is then routed using the normal Layer 3 routing processes.

```
Router# config terminal
Router(config)# no cable dot1q-vc-map 000C.0e03.69f9 GigabitEthernet 1/0 4
Router(config)# exit
```

The following example shows how to enable the use of Layer 2 tunnels and then map specific CMs to VLANs on a specific interface on a Cisco cBR-8 router:

```
Router# configure terminal
```

```

Router(config)# cable l2-vpn-service dot1q
Router(config)# cable dot1q-vc-map 000C.0e03.69f9 GigabitEthernet 0 2
Router(config)# cable dot1q-vc-map 0010.7bed.9c95 TenGigabitEthernet 4/1/0 5
Router(config)# exit

```

The following example shows how to configure a backup WAN interface on DOT1Q L2VPN on a Cisco cBR-8 router:

```

Router# configure terminal
Router(config)# cable l2-vpn-service dot1q
Router(config)# cable dot1q-vc-map 0025.2eab.8482 Te4/0/1 backup-interface Te4/0/7 207
Topgun

```

### Related Commands

Command	Description
<b>cable l2-vpn-service dot1q</b>	Enables the use of Layer 2 tunnels so that traffic for individual cable modems can be routed over a particular Virtual Local Area Network (VLAN) on an Ethernet interface.
<b>debug cable l2-vpn</b>	Displays debugging messages for the Layer 2 mapping of cable modems to particular PVCs or VLANs.
<b>show cable l2-vpn dot1q-vc-map</b>	Displays the mapping of one or all cable modems to VLANs on the router's Ethernet interfaces.

# cable dot1q-vc-map port-channel

To configure the port-channel uplink port for TLS L2VPN, use the **cable dot1q-vc-map port-channel** command in global configuration mode.

**cable dot1q-vc-map** *mac address* **port-channel** *number* *vlan id* *custom name*

## Syntax Description

<i>mac address</i>	MAC address of the cable modem.
<i>number</i>	Port-channel interface number.
<i>vlan id</i>	IEEE 802.1Q VLAN ID.
<i>custom name</i>	Name of the customer.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable dot1q-vc-map port-channel** command configures the port-channel uplink port for TLS L2VPN.

The following example shows how to configure the port-channel uplink port for TLS L2VPN:

```
router# configure terminal
router(config)#cable l2-vpn-service xconnect nsi dot1q
router(config)#cable dot1q-vc-map c8fb.26a5.551c port-channel 64 1200 topgun
```

## cable downstream annex

To set the Moving Picture Experts Group (MPEG) framing format for a downstream port on a cable interface line card to either Annex A (Europe) or Annex B (North America), use the **cable downstream annex** command in cable interface configuration mode.

**cable downstream annex** {A | B}

### Syntax Description

<b>A</b>	Annex A. The downstream uses the EuroDOCSIS J.112 standard.
<b>B</b>	Annex B. The DOCSIS-compliant cable plants that support North American channel plans use ITU J.83 Annex B downstream radio frequency.

### Command Default

Annex B for all Cisco cable interface cards other than the Cisco uBR-MC16E. Annex A, if using the Cisco uBR-MC16E cable interface line card and the Cisco uBR7111E and Cisco uBR7114E universal broadband routers.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
12.1(1a)T1	This command was introduced.
12.0(7)T, 12.1(1a)T1, 12.1 mainline, 12.0(8)SC, 12.1(2)EC1	Support for Annex A was introduced for the Cisco uBR-MC16E cable interface line card.
12.1(7)EC	Support for Annex A was added for the Cisco uBR7111E and Cisco uBR7114E universal broadband routers.
12.2(15)CX	Support was added for both Annex A and Annex B on the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line cards.
12.2(15)BC2	Support was added for both Annex A and Annex B on the Cisco uBR-MC5X20U/S cable interface line cards.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

The MPEG framing format must be compatible with the downstream symbol rate you set. Annex B is the North America (DOCSIS) standard and Annex A is the European (EuroDOCSIS) standard. You should review your local standards and specifications for downstream MPEG framing to determine which format you should use.

The Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR-MC5X20U cable interface line cards support both Annex A and Annex B operation. However, on the Cisco uBR-MC28U/X, both downstreams must be configured for the same mode (either both Annex A or both Annex B).

On the Cisco uBR-MC16U and Cisco uBR-MC28U (with integrated upconverter), the IF frequency is fixed at 44 MHz for both Annex A and Annex B modes of operation. On the Cisco uBR-MC16X and Cisco uBR-MC28X (without integrated upconverter), the IF frequency is set to 36.125 MHz in Annex A mode and 44 MHz in Annex B mode.

**Note** This command can be used to change the symbol rate, alpha, and other parameters for compliance with EuroDOCSIS (annex A), or DOCSIS (annex B). Annex A is not supported on the Cisco uBR-MC1xC, Cisco uBR-MC16B, Cisco uBR-MC16S, and Cisco uBR-MC28C cable interface line cards. Annex B is not supported on the Cisco uBR-MC16E card and on the Cisco uBR7111E and Cisco uBR7114E universal broadband routers.

**Note** The cable interface line card downstream ports and the CMs on the HFC network connected through these ports must be set to the same MPEG framing format.

**Caution** In Cisco IOS Release 12.1, only Annex B MPEG framing format is supported.

**Tip** Changing the MPEG framing format affects the PHY layer on the downstream and disconnects all online CMs. For this reason, if you are using N+1 HCCP redundancy, you should configure this command on both the Protect and Working interfaces, so that the PHY layer is properly configured before a switchover occurs. Otherwise, online CMs could be disconnected when a switchover occurs. (This also applies to the **cable downstream modulation** and **cable downstream interleave-depth** commands.)

## Examples

The following example shows how to set the MPEG framing format to Annex A:

```
Router# configure terminal
Router(config)# interface cable 1/0
Router(config-if)# cable downstream annex A
```

The following example shows how to set the MPEG framing format to Annex B:

```
Router# configure terminal
Router(config)# interface cable 4/0
Router(config-if)# cable downstream annex B
```

## Related Commands

Command	Description
<b>show controllers cable</b>	Displays the downstream MPEG framing format (Annex A or Annex B) setting.

# cable downstream attribute-mask

To configure an attribute for a cable interface or a wideband cable interface, use the **cable downstream attribute-mask** command in interface configuration mode or MAC domain profile configuration mode. To disable this configuration, use the **no** form of this command.

**cable downstream attribute-mask** *mask*  
**no cable downstream attribute-mask** *mask*

## Syntax Description

<i>mask</i>	Specifies the mask value for the interface.
-------------	---------------------------------------------

## Command Default

If this command is not used, the default attribute is used for the cable interface and the wideband cable interface. The default attribute is 0x80000000 (31-bit) for the wideband cable interface and zero for the cable interface. For a wideband cable interface, 31-bit mask is always set to 1.

## Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The attribute-mask comprises 32 attributes and each attribute represents a single bit in the mask. You can configure a provisioned attribute mask for each channel and provisioned bonding group to assign values to the operator-defined binary attributes, or to override the default values of the specification-defined attributes. The operator may configure, in the CM configuration file, a required attribute mask and a forbidden attribute mask for a service flow. Additionally, in a CM-initiated dynamic service request, the CM can include a required attribute mask and a forbidden attribute mask for a service flow.

## Examples

The following example shows how to configure an attribute for a wideband cable interface:

```
Router# configure terminal
Router(config)# interface wideband-cable 1/0/0:0
Router(config-if)# cable downstream attribute-mask 800000ff
```

## Related Commands

Command	Description
<b>interface wideband-cable</b>	Specifies a wideband cable interface.
<b>interface cable</b>	Specifies a cable interface.

# cable downstream channel-id

To configure the downstream channel ID, use the **cable downstream channel-id** command in cable interface configuration mode. To set the downstream channel ID to its default value, use the **no** form of this command.

**cable downstream channel-id** *id*  
**no cable downstream channel-id**

## Syntax Description

<i>id</i>	Specifies a downstream channel ID. Valid values for releases prior to Cisco IOS Release 12.2(33)SCB are from 0 to 255 and the valid values for Cisco IOS Release 12.2(33)SCB and later are from 1 to 255 as 0 is reserved for network management.
-----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

The unit number of the downstream device, starting with a value of 1.

## Command Modes

Interface configuration—cable interface only (config-if)

## Command History

Release	Modification
12.0(5)T	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCB1	The downstream channel ID scheme was changed.
IOS-XE 3.15.0S	This command was replaced by the <b>docsis-channel-id</b> command on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

Use this command to ensure that each downstream channel has a unique ID when there are multiple Cisco CMTS routers at a headend facility.

Cisco IOS assigns the default ID number of each downstream channel in the order in which devices connected to the downstream channels appear to the CMTS router. The downstream channel connected to the first device that appears to the CMTS router is configured with a default ID of 1, the downstream channel connected to the second device that appears is configured with an ID of 2, and so on.

The local downstream channel channel ID is unique across all SPA channels. When you add a channel to the MAC domain using the **downstream modular-cable rf-channel** command, the channel IDs in the MAC domain are unique. This also facilitates channel ID uniqueness when the channels are added to a fiber node.

The following applies to **rf-channel rf-port cable downstream channel-id channel-id** command also.

**Table 2: Downstream Channel ID Scheme for 12.2(33)SCB1**

	8/1	8/0	7/1	7/0	6/1	6/0	5/1	5/0	slot 3	slot 1
SPA Bay 0									217-240	193-216

	8/1	8/0	7/1	7/0	6/1	6/0	5/1	5/0	slot 3	slot 1
SPA Bay 1									217-240	193-216
SPA Bay 2									217-240	193-216
SPA Bay 3									217-240	193-216
5x20 DS /0	169	145	121	97	73	49	25	1		
5x20 DS /1	173	149	125	101	77	53	29	5		
5x20 DS /2	177	153	129	105	81	57	33	9		
5x20 DS /3	181	157	133	109	85	61	37	13		
5x20 DS /4	185	161	137	113	89	65	41	17		

**Table 3: Downstream Channel ID Scheme for 12.3(23)BCx**

	8/1	8/0	7/1	7/0	6/1	6/0	5/1	5/0	slot 3	slot 1
SPA Bay 0									24-47	24-47
SPA Bay 1									48-71	48-71
5x20	188-192	180-184	168-172	160-164	148-152	140-144	128-132	120-124		

**Caution** Changing the downstream channel ID of an active channel automatically disconnects all connected CMs and forces them to go offline and reregister with the CMTS router, as required by the DOCSIS specifications.

## Examples

The following example shows how to configure the downstream channel on the cable interface line card in slot 6 of a Cisco CMTS router with a channel ID of 44:

```
Router(config-if)# cable downstream channel-id 44
```

The following example shows how to restore the downstream channel ID configuration to the default configuration:

```
Router(config-if)# cable downstream channel-id
```

# cable downstream-channel-id automatic

To automatically configure the downstream channel IDs, use the **cable downstream-channel-id automatic** command in global configuration mode. To set the downstream channel ID (DCID) to its default value, use the **no** form of this command.

**cable downstream-channel-id automatic**  
**no cable downstream-channel-id automatic**

<b>Syntax Description</b>	<b>automatic</b> Specifies an automatic assignment of the DCIDs by the Cisco CMTS.
---------------------------	------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** Use this command to automatically assign unique channel IDs for all downstream channels in a fiber node. Automatic DCIDs are not assigned to downstreams that are not in any fiber node.

**Examples** This example shows how to automatically configure the downstream channel IDs:

```
Router(config)# cable downstream-channel-id automatic
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show cable fibernode</b>	Displays channel ID information for downstreams in a fiber node.

# cable downstream controller-profile

To configure the downstream controller profile, use the **cable downstream controller-profile** command in global configuration mode. To void the downstream controller profile configuration, use the **no** form of this command.

**cable downstream controller-profile** *id* [**RPHY** | **I-CMTS**]

**no cable downstream controller-profile** *id*

## Syntax Description

**Syntax Description** *id* Specifies the downstream controller profile ID.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Fuji 16.7.1	This command was modified on the Cisco cBR Series Converged Broadband Routers. Keywords <b>RPHY</b> and <b>I-CMTS</b> were added.

## Usage Guidelines

Use this command to configure the downstream controller profile.

When configuring a new i-CMTS controller profile, keyword **I-CMTS** is needed. If user input **RPHY** or do not input any keyword, the system will consider it as a RPHY controller profile.

## Examples

The following example shows how to enter the downstream controller profile configuration mode:

```
Router# configure terminal
Router(config)# cable downstream controller-profile 1 I-CMTS
Router(config-controller-profile)#
```

## Related Commands

Command	Description
<b>multicast-pool</b>	Specifies the multicast pool for the downstream controller profile.

## cable downstream description

To specify a description for a downstream port, use the **cable downstream description** *description* command.

**cable downstream description** *description*

---

<b>Syntax Description</b>	<i>description</i> Specifies a description that is up to 80 characters describing the downstream port.
---------------------------	--------------------------------------------------------------------------------------------------------

---

<b>Command Default</b>	By default, no description is configured.
------------------------	-------------------------------------------

<b>Command Modes</b>	cable interface (config-if) MAC domain profile configuration (config-profile-md)
----------------------	-------------------------------------------------------------------------------------

---

<b>Command History</b>	<b>Release</b> <b>Modification</b>
	IOS-XE 3.15.0S This command was implemented on the Cisco cBR Series Converged Broadband Router.

---

### Example

The following sample shows an example of the **cable downstream description** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # cable downstream description DS
Router(config-profile-md) # no cable downstream description
Router(config-profile-md)#end
```

## cable downstream dsg

Supports Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) configuration under MAC domain interface on a Cisco CMTS router with an OPS MD-profile. The method of configuring A-DSG by OPS MD-profile now is in addition to the existing method of using legacy CLI to configure DSG TG.

**cable downstream dsg** [**channel list** *DSG Channel List Setting* | **dcd-enable** *Enable DSG DCD messages when no enabled rules/tunnels* | **tg** *DSG Tunnel group* | **timer** *DSG Timer Setting* | **vendor-param** *DSG vendor specific parameters*]

<b>chan-list</b>	(Optional) Specifies the downstream Channel List Setting. The valid range is from 1 to 65535.
<b>dcd-enable</b>	(Optional) Enables the DSG DCD messages when no enabled rules/tunnels are enabled.
<b>tg</b>	(Optional) Specifies the DSG Tunnel group.
<b>timer</b>	(Optional) Specifies the DSG Timer Setting.
<b>vendor-param</b>	(Optional) Specifies the DSG vendor-specific parameters group ID.

The following example shows how the **show cable downstream dsg** command is used:

```
router# show cable downstream dsg tg
TG      Chan  TG      Rule  Vendor  UCID  Service-group  Profile
id      id    state  I/F   pri  Param  list           Profile  chan state
-----
2000    1     en     C1/0/0  0           SG1           en
4500    1     en     C1/0/0  2     2       1 2           SG1           dis
4500    2     en           0           --           --
```

# cable downstream dsg chan-list

To associate an Advanced-mode DOCSIS Set-Top Gateway (A-DSG) channel list entry to a downstream channel and include it in the Downstream Channel Descriptor (DCD) message on a Cisco CMTS router, use the **cable downstream dsg chan-list** command in interface configuration mode. To remove the configuration, use the **no** form of this command.

**cable downstream dsg chan-list** *list-index*  
**no cable downstream dsg chan-list** *list-index*

## Syntax Description

<i>list-index</i>	Alphanumeric list index identifier.
-------------------	-------------------------------------

## Command Default

Channel lists are not defined by default.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 and Cisco uBR7200 series routers.
12.2SB	This command was integrated into Cisco IOS Release 12.2SB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

Global configuration for A-DSG must be complete before configuring interface definitions.

## Examples

The following example shows configuration of inclusion of DSG channel list entries in DCD messages on a downstream cable interface on a Cisco CMTS router:

```
interface Cable6/0
 cable downstream dsg chan-list 2
```

### Examples for Cisco cBR Series Converged Broadband Router

```
Router# configure terminal
Router(config)#interface cable 1/0/0
Router(config-if)#cable downstream dsg chan-list 1
```

## Related Commands

Command	Description
<b>cable downstream dsg dcd-enable</b>	Enables DCD messages to be sent on a downstream channel on a Cisco CMTS router.

Command	Description
<b>cable downstream dsg rule</b>	Defines and associates an A-DSG rule to a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg timer</b>	Associates an A-DSG timer entry to a downstream channel and includes the DCD message on a Cisco CMTS router.
<b>cable downstream dsg vendor-param</b>	Associates A-DSG vendor parameters to a downstream and includes them in the DCD message on a Cisco CMTS router.
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a CMTS router.

# cable downstream dsg dcd-enable

To enable Downstream Channel Descriptor (DCD) messages to be sent on a downstream channel on a Cisco CMTS router, use the **cable downstream dsg dcd-enable** command in interface configuration mode. To disable DCD messages, use the **no** form of this command.

**cable downstream dsg dcd-enable**  
**no cable downstream dsg dcd-enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** DCD messages are disabled.

**Command Modes** Interface configuration (config-if)

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Global configuration for Advanced-mode DOCSIS Set-top Gateway (A-DSG) must be complete before configuring interface definitions. This command is used when there are no enabled rules or tunnels for A-DSG on a Cisco CMTS router.

**Examples** The following example shows how to enable DCD messages on a downstream interface on a Cisco CMTS router along with several other A-DSG interface configuration commands:

```
interface Cable6/0
 cable downstream dsg dcd-enable
 cable downstream dsg chan-list 2
 cable downstream dsg timer 3
 cable downstream dsg vendor-param 2
 cable downstream dsg rule 1 priority 1 clients 1 tunnel 1
 cable downstream dsg rule 1 vendor-param 1
 cable downstream dsg rule 1 classifiers 1 5
 cable downstream dsg rule 2 priority 1 clients 2 tunnel 2
```

Command	Description
<b>cable downstream dsg chan-list</b>	Associates the A-DSG channel list entry to a downstream channel, to be included in the DCD message on a Cisco CMTS router.

<b>Command</b>	<b>Description</b>
<b>cable downstream dsg rule</b>	Defines and associates an A-DSG rule to a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg timer</b>	Associates an A-DSG timer entry to a downstream channel and includes the DCD message on a Cisco CMTS router.
<b>cable downstream dsg vendor-param</b>	Associates A-DSG vendor parameters to a downstream and includes them in the DCD message on a Cisco CMTS router.

# cable downstream dsg disable

To exclude the primary capable interface from DOCSIS Set-Top Gateway DSG forwarding, use the **cable downstream dsg disable** command in cable interface configuration mode. To remove the configuration, use the **no** form of this command.

**cable downstream dsg disable**  
**no cable downstream dsg disable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Interface configuration (config-if)

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable downstream dsg disable** command is associated with the [Advanced Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers](#) feature.

When DSG is enabled on the MAC domain interface and DSG forwarding is disabled on the primary capable interface, the Cisco CMTS router does not create multicast service flows on the primary capable interface.

If DSG forwarding is already enabled on the primary capable interface, the Cisco CMTS router removes multicast service flows from the interface.

## Examples

The following example shows how to disable A-DSG forwarding on a primary capable modular interface on the Cisco CMTS router:

```
Router# configure terminal
Router(config)# interface modular-cable 1/0/0:0
Router(config-if)# cable downstream dsg disable
Router(config-if)# end
```

## Related Commands

Command	Description
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on the Cisco CMTS router.
<b>show cable dsg cfr</b>	Displays DSG classifier details.

# cable downstream dsg rule

**Note** Effective with Cisco IOS Release 12.3(17a)BC2, the **cable downstream dsg rule** command is removed from Cisco IOS software.

To define and associate an Advanced-mode DOCSIS Set-top Gateway (A-DSG) rule to the downstream channel on a Cisco CMTS router, use the **cable downstream dsg rule** command in interface configuration mode. To remove the DSG rule configuration, use the **no** form of this command.

```
cable downstream dsg rule rule-id [clients clnt-list-id tunnel tun-id | priority priority | vendor-param
vsif-grp-id | ucid ucid1 | [ucid1 ucid2 . . . ucidn] | cfr cfr-index [cfr-index . . .] | disable]
no cable downstream dsg rule rule-id [clients clnt-list-id tunnel tun-id | priority priority |
vendor-param vsif-grp-id | ucid ucid1 | [ucid1 ucid2 . . . ucidn] | cfr cfr-index [cfr-index . . .] |
disable]
```

## Syntax Description

<i>rule-id</i>	Defines the DSG rule identifier.
<b>clients</b> <i>clnt-list-id</i>	Sets the DSG clients and associates the clients with the channel list identifier for this DSG rule.
<b>tunnel</b> <i>tun-id</i>	Sets the DSG tunnel to be associated with this rule, and defines the DSG tunnel identifier.
<b>priority</b> <i>priority</i>	Sets the priority of the DSG rule.
<b>vendor-param</b> <i>vsif-grp-id</i>	Associates DSG vendor-specific parameters with the specified DSG rule.
<b>ucid</b> <i>ucid1</i>   [ <i>ucid1</i> <i>ucid2</i> ... <i>ucidn</i> ]	Sets the upstream channel identifier for the DSG rule.
<b>cfr</b> <i>cfr-index</i> [ <i>cfr-index</i> ...]	Sets the index for the classifier value associated with the DSG rule.
<b>disable</b>	Disables a DSG rule.

## Command Default

DSG rules are disabled by default when they are created.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.3(17a)BC2	This command was removed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Global configuration for A-DSG must be complete before configuring interface definitions.

Because rules are disabled when they are created, you must enable the configuration using the **no cable downstream dsg rule disable** command. To disable a DSG rule configuration, use the **cable downstream dsg rule disable** command.

You can associate DSG clients, vendor specific parameters, classifiers, DSG tunnel address, upstream channel identifier range, and rule priority to a downstream channel. You can apply more than one rule to a downstream channel. All configured rules that are enabled are included in the Downstream Channel Descriptor (DCD) message.

**Examples**

The following example shows configuration and association of DSG rules on a downstream cable interface on a Cisco CMTS router, followed by an example of enabling the configured DSG rules:

```
interface Cable6/0
 cable downstream dsg rule 1 clients 1 tunnel 1
 cable downstream dsg rule 1 priority 1
 cable downstream dsg rule 1 vendor-param 1
 cable downstream dsg rule 1 classifiers 1 5
 cable downstream dsg rule 2 clients 2 tunnel 2
 cable downstream dsg rule 2 priority 1
!
! Enable the DSG rule configuration
!
no cable downstream dsg rule 1 disable
no cable downstream dsg rule 2 disable
```

The following example shows how to disable DSG rules that were previously enabled:

```
interface cable6/0
 cable downstream dsg rule 1 disable
 cable downstream dsg rule 2 disable
```

**Related Commands**

Command	Description
<b>cable downstream dsg chan-list</b>	Associates an A-DSG channel list to a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg dcd-enable</b>	Enables DCD messages to be sent on a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg timer</b>	Associates an A-DSG timer entry to a downstream channel and includes the DCD message on a Cisco CMTS router.
<b>cable downstream dsg vendor-param</b>	Associates A-DSG vendor parameters to a downstream and includes them in the DCD message on a Cisco CMTS router.

## cable downstream dsg tg

To associate an Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) tunnel group to a MAC domain interface on a Cisco CMTS router, use the **cable downstream dsg tg** command in cable interface configuration mode. To remove this association, use the **no** form of this command.

```
cable downstream dsg tg tgid [channel channel_ID | priority DSG-rule-priority [enable | disable]
| ucid ID1 [ID2 ID3 ID4] | vendor-param vendor-group-ID]
no cable downstream dsg tg tgid
```

### Syntax Description

<b>dsg tg</b> <i>tgid</i>	Specifies the DSG tunnel group ID. The valid range is from 1 to 65535.
<b>channel</b> <i>channel_ID</i>	(Optional) Specifies the downstream channel ID. The valid range is from 1 to 65535.
<b>priority</b> <i>DSG-rule-priority</i>	(Optional) Specifies the DSG rule priority for the cable interface. The valid range is from 0 to 255.
<b>enable</b>	(Optional) Enables the DSG rule priority on a DSG tunnel group.
<b>disable</b>	(Optional) Disables the DSG rule priority on a DSG tunnel group.
<b>ucid</b> <i>upstream-channel-ID</i>	(Optional) Specifies the upstream channel ID (UCID). You can specify a maximum of four upstream channel IDs.  Cisco cBR-8 router—The valid range is 0 to 8.
<b>vendor-param</b> <i>vendor-group-ID</i>	(Optional) Specifies the vendor specific parameters group ID. The valid range is from 1 to 65535.

### Command Default

The DSG traffic is not forwarded to the MAC domain.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

The **cable downstream dsg tg** command is used to configure the [Advanced Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers](#) feature.

If you do not specify a downstream channel ID using the **channel** keyword, the Cisco CMTS router automatically assigns a free channel to associate the MAC domain interface with the DSG tunnel group. This channel is created with default parameters.

If you specify the **channel** keyword in the **no** form of the command, only the MAC domain to DSG tunnel group association is removed from the configuration. If the **no** form of the command is used without the **channel** keyword, both the tunnel group association and the channel are removed.

## Examples

The following example shows how to associate an A-DSG tunnel group to a MAC domain interface:

```
Router(config)# interface cable 5/1/0
Router(config-if)# cable downstream dsg tg 1
Router(config-if)# cable downstream dsg tg 1 channel 22
Router(config-if)# cable downstream dsg tg 1 priority 2 enable
Router(config-if)# cable downstream dsg tg 1 ucid 1 2 3 4
Router(config-if)# cable downstream dsg tg 1 vendor-param 20
```

### Examples for Cisco cBR Series Converged Broadband Router

This example shows how to associate an A-DSG tunnel group to a MAC domain interface on a Cisco cBR-8 router:

```
Router(config)# interface cable 1/0/0
Router(config-if)# cable downstream dsg tg 1
Router(config-if)# cable downstream dsg tg 1 channel 2
Router(config-if)# cable downstream dsg tg 1 priority 0 enable
Router(config-if)# cable downstream dsg tg 1 ucid 1 2 3 4
Router(config-if)# cable downstream dsg tg 1 vendor-param 20
```

## Related Commands

Command	Description
<b>cable downstream dsg disable</b>	Excludes the primary capable interface from A-DSG forwarding.

# cable downstream dsg tg channel

To associate an Advanced-mode DOCSIS Set-Top Gateway (A-DSG) tunnel group to a downstream interface on a Cisco CMTS router, use the **cable downstream dsg tg channel** command in interface configuration mode. To remove this configuration, use the **no** form of this command.

**cable downstream dsg tg** *group-id* **channel** *channel-id*  
**no cable downstream dsg tg** *group-id* **channel** *channel-id*

## Syntax Description

<i>group-id</i>	Specifies the A-DSG tunnel group identifier as a number from 1 to 65535.
<i>channel-id</i>	Specifies the downstream channel identifier as a number from 1 to 65535.

## Command Default

The A-DSG tunnel group is not associated to a downstream interface.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.3(17a)BC2	This command was introduced to support A-DSG 1.2 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

The **cable dsg tg channel** global configuration command establishes the configuration of tunnels in a tunnel group. Tunnel groups are enabled by default.

Then, you can associate the tunnel group to a downstream cable interface using the **cable downstream dsg tg channel** interface configuration command.

## Examples

The following example shows the configuration and activation of a tunnel group with ID of 1 and channel ID of 2 in global configuration, followed by association of the tunnel group to a downstream interface on a Cisco CMTS router:

```
cable dsg tg 1 channel 2
interface cable 8/1/2
  cable downstream dsg tg 1 channel 2
```

## Examples

This example shows the configuration and activation of a tunnel group with ID of 1 and channel ID of 1 in global configuration, followed by association of the tunnel group to a downstream interface on a Cisco cBR-8 router:

```
cable dsg tg 1 channel 1
```

## cable downstream dsg tg channel

```
interface cable 1/0/0
 cable downstream dsg tg 1 channel 1
```

## Related Commands

Command	Description
<b>cable downstream dsg chan-list</b>	Associates an A-DSG channel list entry to a downstream channel and includes it in the DCD message on a Cisco CMTS router.
<b>cable downstream dsg dcd-enable</b>	Enables DCD messages to be sent on a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg timer</b>	Associates an A-DSG timer entry to a downstream channel and includes the DCD message on a Cisco CMTS router.
<b>cable downstream dsg vendor-param</b>	Associates A-DSG vendor parameters to a downstream and includes them in the DCD message on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.

## cable downstream dsg timer

To associate an Advanced-mode DOCSIS Set-Top Gateway (A-DSG) timer entry to a downstream channel and include it in the Downstream Channel Descriptor (DCD) message on a Cisco CMTS router, use the **cable downstream dsg timer** command in interface configuration mode. To remove this setting, use the **no** form of this command.

**cable downstream dsg timer** *timer-index*  
**no cable downstream dsg timer** *timer-index*

### Syntax Description

<i>timer-index</i>	Identifier for the DSG timer setting in the index.
--------------------	----------------------------------------------------

### Command Default

The downstream DSG timer is not configured by default.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

Global configuration for A-DSG must be complete before configuring interface definitions.

### Examples

The following example shows the configuration DSG timers for inclusion in DCD messages on a downstream cable interface on a Cisco CMTS router:

```
interface Cable6/0
 cable downstream dsg timer 3
```

### Examples for Cisco cBR Series Converged Broadband Router

This example shows how to associate an A-DSG tunnel group to a MAC domain interface on a Cisco cBR-8 router:

```
Router(config)# interface cable 1/0/0
Router(config-if)# cable downstream dsg timer 1
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable downstream dsg chan-list</b>	Associates an A-DSG channel list entry to a downstream channel and include it in the DCD message on a Cisco CMTS router.
<b>cable downstream dsg dcd-enable</b>	Enables DCD messages to be sent on a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg rule</b>	Defines and associates an A-DSG rule to a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg vendor-param</b>	Associates A-DSG vendor parameters to a downstream and includes them in the DCD message on a Cisco CMTS router.

## cable downstream dsg vendor-param

To associate Advanced-mode DOCSIS Set-Top Gateway (A-DSG) vendor parameters to a downstream, to be included in the Downstream Channel Descriptor (DCD) message on a Cisco CMTS router, use the **cable downstream dsg vendor-param** command in interface configuration mode. To remove this configuration from a Cisco CMTS router, use the **no** form of this command.

```
cable downstream dsg vendor-param vsif-grp-id
no cable downstream dsg vendor-param vsif-grp-id
```

### Syntax Description

<i>vsif-grp-id</i>	Associates a vendor parameter with a group identifier.
--------------------	--------------------------------------------------------

### Command Default

This command is not configured by default.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Global configuration for A-DSG must be complete before configuring interface definitions.

### Examples

The following example shows configuration of A-DSG vendor parameters on a downstream interface, along with several other downstream interface commands on a Cisco CMTS router:

```
interface Cable6/0
 cable downstream dsg dcd-enable
 cable downstream dsg chan-list 2
 cable downstream dsg timer 3
 cable downstream dsg vendor-param 2
 cable downstream dsg rule 1 priority 1 clients 1 tunnel 1
 cable downstream dsg rule 1 vendor-param 1
 cable downstream dsg rule 1 classifiers 1 5
 cable downstream dsg rule 2 priority 1 clients 2 tunnel 2
```

<b>cable downstream dsg rule</b>	Defines and associates an A-DSG rule to a downstream channel on a Cisco CMTS router.
<b>cable downstream dsg timer</b>	Associates an A-DSG timer entry to a downstream channel and includes the DCD message on a Cisco CMTS router.

# cable downstream freq-profile

To set the frequency profile for the cable interface line card, use the **cable downstream freq-profile** command in global configuration mode.

```
cable downstream freq-profile id
```

---

## Syntax Description

**Syntax Description** *id* Downstream frequency profile ID. 0 to 3 are system defined, 4 to 15 are user defined.

---

**Command Default** None

**Command Modes** Global configuration (config)

---

## Command History

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco eBR Series Converged Broadband Routers.

---

**Usage Guidelines** Use this command to set the frequency profile for the cable interface line card.

---

## Examples

The following example shows how to enable the downstream frequency profile configuration:

```
Router# configure terminal
Router(config)# cable downstream freq-profile 4
Router(config-freq-prof)#
```

---

## Related Commands

Command	Description
<b>lane start-freq</b>	Set the start frequency for a specific lane.

## cable downstream frequency

To note the downstream center frequency for the cable interface line card to reflect the digital carrier frequency of the downstream radio frequency carrier (the channel) for that downstream port, use the **cable downstream frequency** command in cable interface configuration mode. On cable interfaces with an integrated upconverter, to unset the downstream frequency and to disable the RF output from the integrated upconverter, use the **no** form of this command.

**cable downstream frequency** *down-freq-hz*  
**no cable downstream frequency**

### Syntax Description

<i>down-freq-hz</i>	<p>The known center frequency of the downstream carrier in Hz (the valid range is 55,000,000 to 858,000,000). The usable range depends on whether the downstream is configured for DOCSIS or EuroDOCSIS operations:</p> <ul style="list-style-type: none"> <li>• DOCSIS = 88,000,000 to 855,000,000 MHz</li> <li>• Extended frequency range = 70,000,000 to 855,000,000 MHz</li> <li>• EuroDOCIS = 112,000,000 to 858,000,000 MHz</li> </ul> <p>The Cisco IOS supports a superset of these standards, and setting a center frequency to a value outside these limits violates the DOCSIS or EuroDOCSIS standards. Cisco does not guarantee the conformance of the downstream and upconverter outputs when using frequencies outside the DOCSIS or EuroDOCSIS standards.</p>
---------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

Disabled. On the Cisco uBR7100 series routers, the default downstream center frequency for the integrated upconverter is 500 MHz.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
11.3 XA	This command was introduced to support NTSC/DOCSIS Annex B RF operation.
12.0(7)XR2, 12.0(8)SC	Modified to support PAL/SECAM EuroDOCSIS RF operation.
12.1(2)EC1	Supports both Annex A and Annex B.
12.1(5)EC1	Modified to support the integrated upconverter on the Cisco uBR7100 series universal broadband router.
12.2(11)CY, 12.2(11)BC3	Support was added for the Cisco uBR-MC5X20S cable interface line card.
12.2(15)CX	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line cards.
12.2(15)BC2	Support was added for the extended frequency range and for the Cisco uBR-MC5X20U cable interface line card. In addition, the command was changed to accept only center frequencies in 250 KHz increments (previously, the command allowed 125 KHz increments).

Release	Modification
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command is either optional or required, depending on the cable interface line card being used.

- On the Cisco uBR7100 series routers using the integrated upconverter (the DS0 RF output), and on cable interfaces that support integrated upconverters (such as the Cisco uBR-MC16U, Cisco uBR-MC28U, and Cisco uBR-MC5X20U), this command configures the frequency for the integrated upconverter. The **no** form of this command unsets the frequency and disables the output from the integrated upconverter.
- For cable interfaces that use an external upconverter (such as the Cisco uBR-MC16S and the DS0 (IF) output on Cisco uBR7100 series routers), this command is informational-only, because it does not affect the external upconverter. The external upconverter must be programmed separately with the appropriate center frequency.

**Note** The **no** form of this command is supported only on the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR-MC5X20S/U cable interface line cards, and on the Cisco uBR7100 series universal broadband router.

**Note** We recommend configuring this command on all cable interfaces, even those that are using external upconverters. This is because this command is required to enable the downstream frequency override feature and for N+1 line card redundant operation when using SNMP-capable external upconverters.

The downstream frequency of your RF output must be set to match the expected input frequency of your upconverter. To do this, you enter the fixed center frequency of the downstream channel for the downstream port. (You can also select a default that does not set a specific fixed value.) The valid range for a fixed center frequency is 54,000,000 to 858,000,000 Hz. The center frequency is also used to configure an IF-to-RF upconverter that must be installed in your downstream path.

The digital carrier frequency is specified to be the center of a 6.0 MHz channel. For example, EIA channel 95 spans 90.000 to 96.000 MHz. The center frequency is 93.000 MHz, which is the digital carrier frequency that should be configured as the downstream frequency. The typical range for current CATV headends is 88,000,000 to 860,000,000 Hz.

In Cisco IOS software releases before Cisco IOS Release 12.2(15)BC2, the **cable downstream frequency** command allowed the center frequency to be specified in 125 KHz increments. In Cisco IOS Release 12.2(15)BC2 and later releases, this was changed to allow only 250 KHz increments, because of the requirements of the Broadband Processing Engine cable interface line cards that use an internal upconverter (Cisco uBR-MC16U, Cisco uBR-MC28U, and Cisco uBR-MC5X20S/U).

**Note** DOCSIS allows downstreams to use any center frequency within 88,000,000 to 855,000,000 MHz. However, when most cable modems first come online, they initially start scanning the downstream for the frequencies that are in the NTSC channel plan. If a valid downstream is not found among those frequencies, the cable modems then begin scanning the remaining frequencies. For the fastest and most efficient registration times, we recommend configuring downstreams for the frequencies that are specified in the NTSC channel plan.

**Note** For cBR Series Converged Broadband Routers, the frequency configuration will be available as a part of the RF channel configuration.

### Examples

The following example shows how to set the downstream center frequency display value:

```
Router(config)# interface c6/0
Router(config-if)# cable downstream frequency 96000000
```

### Related Commands

Command	Description
<b>cable downstream annex</b>	Sets the MPEG framing format for a downstream port on a cable interface line card to either Annex A (Europe) or Annex B (North America).
<b>cable downstream rf-power</b>	Configures the desired RF output power on the integrated upconverter.
<b>cable downstream rf-shutdown</b>	Enables or disables the RF output from the integrated upconverter.
<b>show controllers cable</b>	Displays status and configuration information for the cable interface. On supported cable interfaces, this includes information about the integrated upconverter.

## cable downstream if-output

To activate a downstream port on a cable interface and to generate either a standard modulated signal or a test signal, use the **cable downstream if-output** command in cable interface configuration mode. To disable all signal output on the intermediate frequency (IF) carrier and to shut down the interface, use the **no** form of this command.

**cable downstream if-output** [**continuous-wave** | **prbs**]  
**no cable downstream if-output**

### Syntax Description

<b>continuous-wave</b>	Outputs an unmodulated carrier signal on the downstream, shutting down normal data network operations.
<b>prbs</b>	Outputs a Pseudo Random Bit Stream (PRBS) test signal on the downstream, shutting down normal data network operations.

### Command Default

The downstream interface is enabled for normal data use.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
11.3 XA	This command was introduced.
12.0(7)XR2, 12.0(7)T, 12.0(0)SC, 12.1(2)EC1	This command was modified to support Annex A (EuroDOCSIS) downstreams, and the <b>continuous-wave</b> and <b>prbs</b> options were added.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

Typically, a downstream is configured to output a modulated signal, using the **cable downstream if-output** command, allowing data transmissions to be sent over the HFC cable network. However, this command can also be used to test the cable plant or to shut down the interface completely:

- **cable downstream if-output continuous-wave**—Generates an unmodulated, continuous sine wave on the downstream interface. You can use a spectrum analyzer to verify the frequency, amplitude, and power of the wave. The test signal continues on the downstream until you resume normal modulated operations using the **cable downstream if-output** command.
- **cable downstream if-output prbs**—Generates a PRBS test signal on the downstream interface. You can use a spectrum analyzer to verify the frequency, amplitude, and power of the wave. The test signal continues on the downstream until you resume normal modulated operations using the **cable downstream if-output** command.

- **no cable downstream if-output**—Terminates all signal output and shuts down the downstream interface. The interface remains shut down until you reactive the downstream using the **cable downstream if-output** command.

---

**Note** Generating a PRBS or continuous-wave test signal or shutting down the interface automatically stops the modulated carrier data signal and disconnects all CMs on that downstream. These commands should not be used on a live network except as part of troubleshooting major network problems.

---

## Examples

The following example shows how to enable downstream port 0 on a cable interface:

```
Router# configure terminal
Router# interface c6/0
Router(config-if)# cable downstream if-output
```

The following example shows a PRBS test signal being generated on a downstream for a period of time. The downstream is then shut down so that the test engineer can verify that no signal is being sent on the downstream. After the tests have been run, the downstream is reactivated for normal modulated data use:

```
Router# configure terminal
Router# interface c6/0
Router(config-if)# cable downstream if-output prbs
(the signals are verified by a spectrum analyzer...)
Router#(config-if)# no cable downstream if-output
(the downstream is checked to verify no signals are being sent on it...)
Router#(config-if)# cable downstream if-output
Router#(config-if)# exit
```

## cable downstream interleave-depth

To set the downstream interleave depth, use the **cable downstream interleave-depth** command in cable interface configuration mode. To restore the default setting, use the **no** form of this command.

```
cable downstream interleave-depth {8 | 16 | 32 | 64 | 128}
no cable downstream interleave-depth
```

### Syntax Description

<b>8   16   32   64   128</b>	Indicates the downstream interleave depth in number of rows of codewords.
-------------------------------	---------------------------------------------------------------------------

### Command Default

The downstream interleave depth value is 32.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

#### Command History

Release	Modification
11.3 XA	This command was introduced.
12.0(7)XR2, 12.(0)SC, 12.1(2)EC1	This command was modified to support Annex A operation (which uses a fixed interleave).
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

**Note** This command is not supported on the Cisco uBR-MC16E cable interface line card or on the Cisco uBR7111E and Cisco uBR7114E universal broadband routers, because the interleave on the EuroDOCSIS downstream is fixed.

This command sets the minimum latency of the system. A higher interleave depth provides more protection from bursts of noise on the HFC network by spreading out the bits for each codeword over a greater transmission time.

Interleave transmissions do not transmit each codeword by itself, but instead send bits from multiple codewords at the same time, so that a noise burst affects the minimum number of bits per codeword, which allows the Forward Error Correction (FEC) algorithm a greater chance of detecting and correcting any transmission errors.

A higher interleave depth transmits bits from a greater number of codewords, increasing the efficacy of the FEC algorithm. However, a higher depth also increases downstream latency, which might slow TCP/IP

throughput for some configurations, so you need to choose an interleave depth that is appropriate both for your plant's noise levels and application needs.

If your cable plant is experiencing high noise levels, consider increasing the interleave from the default of 32 to 64. For plants with exceptionally high noise levels, increase the interleave to 128 to provide the maximum protection from noise bursts.

Low interleave depth values typically cause some packet loss on typical HFC networks, because burst noise lasts beyond the error correction block correctable length. However, on cable plants with exceptionally low noise levels, Cisco recommends initially using the default value of 32, and then trying an interleave of either 16 or 8 to see if this increases performance without increasing the number of errors that result from noise.

The table below shows interleave characteristics and their relation to each other.

**Note** The table below does not apply to EuroDOCSIS cable plants because the interleave depth for EuroDOCSIS cable interfaces is fixed.

**Table 4: DOCSIS Downstream Cable Interleave Descriptions**

I (Number of Taps)	J (Increment)	Burst Protection 64-QAM/256 QAM	Latency 64-QAM/256 QAM
8	16	5.9 microseconds/4.1 milliseconds	0.22 ms/0.15 ms
16	8	12 microseconds/8.2 milliseconds	0.48 ms/0.33 ms
32	4	24 microseconds/16 milliseconds	0.98 ms/0.68 ms
64	2	47 microseconds/33 milliseconds	2.0 ms/1.4 ms
128	1	95 microseconds/66 milliseconds	4.0 ms/2.8 ms

**Tip** Changing the interleave depth affects the PHY layer on the downstream and disconnects all online CMs. For this reason, if you are using N+1 HCCP redundancy, you should configure this command on both the Protect and Working interfaces, so that the PHY layer is properly configured before a switchover occurs. Otherwise, online CMs could be disconnected when a switchover occurs. (This also applies to the **cable downstream annex** and **cable downstream modulation** commands.)

## Examples

The following example shows how to configure the downstream interleave depth to 128 microseconds:

```
Router# configure terminal
Router(config)# interface cable 3/0
Router(config-if)# cable downstream interleave-depth 128
```

# cable downstream modulation

To set the modulation format for a downstream port on a cable interface line card, use the **cable downstream modulation** command in cable interface configuration mode.

```
cable downstream modulation {64qam | 256qam}
```

---

## Syntax Description

### Syntax Description

**64qam** Modulation rate is 6 bits per downstream symbol.

**256qam** Modulation rate is 8 bits per downstream symbol.

---

## Command Default

The default modulation for Cisco RF Gateway 10 is 64 QAM.

---

## Command Modes

Interface configuration—cable interface only (config-if)

---

## Command History

### Command History

Release	Modification
11.3 XA	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

---

## Usage Guidelines

Downstream modulation defines the speed in bits per second at which data travels downstream to the subscriber's CM. A symbol is the basic unit of modulation. QPSK encodes 2 bits per symbol, 16-QAM encodes 4 bits per symbol, 64-QAM encodes 6 bits per symbol, and 256-QAM encodes 8 bits per symbol.

**Note** Setting a downstream modulation format of 256-QAM requires approximately a 6-dB higher signal-to-noise ratio (SNR) than 64-QAM at the subscriber's cable modem. If your network is marginal or unreliable at 256-QAM, use the 64-QAM format instead.

**Tip** Changing the modulation format affects the PHY layer on the downstream and disconnects all online CMs. For this reason, if you are using N+1 HCCP redundancy, you should configure this command on both the Protect and Working interfaces, so that the PHY layer is properly configured before a switchover occurs. Otherwise, online CMs could be disconnected when a switchover occurs. (This also applies to the **cable downstream annex** and **cable downstream interleave-depth** commands.)

---

## Examples

The following example shows how to set the downstream modulation to 256-QAM:

```
Router# configure terminal  
Router(config)# interface cable 3/0  
Router(config-if)# cable downstream modulation 256qam
```

# cable downstream ofdm-chan-profile

To define the OFDM channel profile on the OFDM channel, use the **cable downstream ofdm-chan-profile** command in global configuration mode. To remove the profile, use **no** form of this command.

**cable downstream ofdm-chan-profile** *id*

**no cable downstream ofdm-chan-profile** *id*

## Syntax Description

**Syntax Description** *id* Downstream OFDM modulation profile ID. Valid range is from 20 to 255.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use this command to define the OFDM channel profile for the OFDM channel.

## Examples

The following example shows how to enable the OFDM channel profile configuration:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)#
```

## Related Commands

Command	Description
<b>cyclic-prefix</b>	Specify the channel cyclic-prefix.
<b>description (OFDM channel profile)</b>	Specify a user defined description for the profile.
<b>interleaver-depth</b>	Specify the channel interleaver-depth.
<b>pilot-scaling</b>	Specify the value used to calculate the number of continuous pilots.
<b>profile-control</b>	Specify default modulation or profile as the channel control profile.
<b>profile-data</b>	Specify default modulation or profile as the channel data profile.
<b>profile-ncp</b>	Specify default modulation or profile as the channel ncp profile.
<b>roll-off</b>	Specify the channel roll-off value.

Command	Description
<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.
<b>show cable ofdm-chan-profiles</b>	Verify the OFDM channel profile configuration.

# cable downstream ofdm-flow-to-profile

To override the profile selection logic, use the **cable downstream ofdm-flow-to-profile** command in global configuration mode.

## Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-flow-to-profile** [**interface Integrated-Cable** *slot/subslot/port:chan*]**profile-data** *profile ID* **mac-address** *cable-modem-mac*

Syntax Description	<i>profile ID</i>	Data profile identifier.
	<i>cable-modem-mac</i>	MAC address of the cable modem.
	<b>slot/subslot/port:chan</b>	Specifies the OFDM channel.
Command Default	None	
Command Modes	Global configuration (config)	
Command History		
Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Everest 16.6.1	This command was modified on the Cisco cBR Series Converged Broadband Routers. The <b>interface integrated-Cable</b> keyword was added.

**Usage Guidelines**

When this command is configured, all the service flows on the cable modem, identified by its MAC address, are mapped to the specified data profile. With the Interface option, profile override can be specified for a particular downstream OFDM channel. Thus with two OFDM downstream channels on a single CM, each channel can have a unique profile override. When the ofdm-flow-to-profile override is configured and no OFDM channel is specified, the profile Id will apply to all OFDM channels in use on the cable modem.

## Examples

The following example shows how to override the selection logic:

```
Router(config)# cable downstream ofdm-flow-to-profile profile-data 2 mac-address
fc52.8d5e.9e55
```

Once this command is configured, all the service flows on the cable modem whose MAC address is fc52.8d5e.9e55, are mapped to the profile ID 2.

The following example shows how to override the selection logic on a specific channel.

```
Router(config)# cable downstream ofdm-flow-to-profile interface integrated-Cable 1/0/0:158
profile-data 3 mac-address 4800.33ea.7012
```

```
Router(config)# cable downstream ofdm-flow-to-profile interface integrated-Cable 1/0/0:159
profile-data 2 mac-address 4800.33ea.7012
```

## Related Commands

Command	Description
<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.
<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.
<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.
<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.
<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.

# cable downstream ofdm-modulation-profile

To define the OFDM modulation profile on the OFDM channel, use the **cable downstream ofdm-modulation-profile** command in global configuration mode. To remove the profile, use **no** form of this command.

**cable downstream ofdm-modulation-profile** *id*

**no cable downstream ofdm-modulation-profile** *id*

## Syntax Description

### Syntax Description

*id* Downstream OFDM modulation profile ID. Valid range is from 8 to 255.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use this command to define the OFDM modulation profile for the OFDM channel.

## Examples

The following example shows how to enable the OFDM modulation profile configuration:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)#
```

## Related Commands

Command	Description
<b>assign</b>	Assign modulations to subcarriers.
<b>description (OFDM modulation profile)</b>	Specify a user defined description for the profile up to 64 characters.
<b>start-frequency</b>	(Optional) Specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width.
<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.
<b>width</b>	Specify width of profile in Hz.
<b>show cable ofdm-modulation-profiles</b>	Verify the OFDM modulation profile configuration.

# cable downstream ofdm-power-profile

To configure an OFDM Power Profile on a DOCSIS 3.1 system, use the **cable downstream ofdm-power-profile** command in the global configuration mode.

**cable downstream ofdm-power-profile** *{profile\_id}*

<b>Syntax Description</b>	<p><i>profile_id</i> Specify a global power profile ID. You can define up to 64 OFDM power profiles with IDs from 1 to 64.</p> <p>This profile ID is used to apply the power profile to an OFDM channel in a controller-integrated cable OFDM channel configuration. You can apply a single OFDM power profile to multiple OFDM channels.</p>				
<b>Command Default</b>	None				
<b>Command Modes</b>	Global configuration (config)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 16.5.1</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
<b>Usage Guidelines</b>	Use this command to apply a power profile to an OFDM channel on the Cisco cBR Series Converged Broadband Router.				

The following example shows how to configure an OFDM power profile:

```
Router# configure terminal
Router(config)# cable downstream ofdm-power-profile 3
power-adjust-default 0.0
power-tilt-linear 3.5
band-index 0
power-adjust 4.0

controller Integrated-Cable 3/0/0
...
  rf-chan 158
    power-profile 3
```

Related Commands	Command	Description
	<b>power-adjust-default</b>	<p>Specifies the default power level value applied to bands that are not configured using other means. This value is also the starting power level for band 0 when a linear power-tilt is configured.</p> <p>The value is specified in dB. The valid range is limited by integrated-controllers in which the ofdm-power-profile is configured. The range remains between -9 and +8 dB.</p>

Command	Description
<b>power-tilt-linear</b>	<p>Specifies the amount of linear tilt that is corrected across the OFDM channel. The power tilt is applied from the band value 0, specified by the <code>power-adjust-default</code> value, to the last band value, specified by the <code>power-tilt-linear</code> value.</p> <p>Each band in-between is set to a power level based on the linear interpolation between these two values (to the nearest 1/10th dB).</p> <p>The integrated-cable controllers in which the OFDM power profile is configured limits the valid range for <code>power-tilt-linear</code>. The range remains between -9 dB and +8 dB.</p>
<b>band-index</b>	Specifies a particular band or sequence of bands.
<b>power-adjust</b>	Specifies a power-level override for the current <code>band-index</code> range. Each band is set to the specified value. This command takes precedence over the <code>power-tilt-linear</code> values.
<b>ofdm-channel-width</b>	<p>Specifies the channel width of the OFDM power profile in hertz (Hz).</p> <p>This width should match the OFDM channel width as configured in the integrated-cable (IC) controller OFDM channels.</p> <p>If the channel width of the OFDM power profile is larger than the IC controller OFDM channel width, the system allows configurations. However, it does not use all band settings of the 6 MHz bands of the power-profile.</p> <p>If the channel width of the OFDM power profile is smaller than the IC controller OFDM channel width, configuring the OFDM power profile in the IC controller OFDM channel is not allowed.</p>
<b>controller Integrated-Cable</b> <i>{slot}/{subslot}/{port}</i> <b>rf-channel</b> <i>{158 - 162 }</i> <b>power-profile</b> <i>{ofdm-power-profile-id}</i>	The <i>{ofdm-power-profile-id}</i> specifies the global OFDM power profile that is applied to the OFDM channel of this controller.

# cable downstream ofdm-prof-mgmt exempt-sc-pct

To configure a percentage of subcarriers that can be exempted from bit loading comparison, use the **cable downstream ofdm-prof-mgmt exempt-sc-pct** *percent* command in global configuration mode.

## Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-prof-mgmt exempt-sc-pct** *percent*

<b>Syntax Description</b>	<i>percent</i>	Percentage of subcarriers that can be exempted from bit loading comparison. The valid range is from 0 to 100 percent.
<b>Command Default</b>	2 percent	
<b>Command Modes</b>	Global configuration (config)	
<b>Command History</b>		
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
<b>Usage Guidelines</b>	The configured percentage value is used while comparing a modem's desired bit loading values (derived from its RxMER) to the profiles. It is also used while comparing profiles to determine their ordering.	
<b>Examples</b>	<p>The following example shows how to configure the percentage of subcarriers that can be exempted from bit loading comparison:</p> <pre>Router(config)# cable downstream ofdm-prof-mgmt exempt-sc-pct 20</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.
	<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.
	<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.
	<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.
	<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.
	<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.

# cable downstream ofdm-prof-mgmt mer-margin-qdb

To configure the offset in quarter-decibel (DB), when RxMER is mapped to the ideal bit loading, use the **cable downstream ofdm-prof-mgmt mer-margin-qdb** command in global configuration mode.

## Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-prof-mgmt mer-margin-qdb** *quarter-decibel*

<b>Syntax Description</b>	<i>quarter-decibel</i> Quarter-decibel to configure the offset. The valid value is from 0 to 40 quarter-DB.														
<b>Command Default</b>	0 quarter-DB														
<b>Command Modes</b>	Global configuration (config)														
<b>Command History</b>															
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.18.0SP</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.										
Release	Modification														
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.														
<b>Usage Guidelines</b>	This value is used to control the aggressiveness in mapping RxMER values to the desired bit loading values by a CM. The configured offset value is added to the RxMER before using the default RxMER to bit loading mapping table published in DOCSIS 3.1 OSSI.														
<b>Examples</b>	<p>The following example shows how to configure the offset:</p> <pre>Router(config)# cable downstream ofdm-prof-mgmt mer-margin-qdb 20</pre>														
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i></td> <td>Configure the unfit profile age.</td> </tr> <tr> <td><b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i></td> <td>Configure the recommended profile age.</td> </tr> <tr> <td><b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i></td> <td>Configure the RxMER poll interval.</td> </tr> <tr> <td><b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i></td> <td>Configure the percentage of subcarriers that can be exempted from bit loading comparison.</td> </tr> <tr> <td><b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b></td> <td>Disable the automatic profile downgrade upon CM status event 16.</td> </tr> <tr> <td><b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i></td> <td>Override the selection logic.</td> </tr> </tbody> </table>	Command	Description	<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.	<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.	<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.	<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.	<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.	<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.
Command	Description														
<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.														
<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.														
<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.														
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.														
<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.														
<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.														

# cable downstream ofdm-prof-mgmt prof-dwngrd-auto

To disable the automatic profile downgrade upon CM-status event 16, use the **no cable downstream ofdm-prof-mgmt prof-dwngrd-auto** command in global configuration mode.

**Cisco cBR-8 Converged Broadband Router**  
**no cable downstream ofdm-prof-mgmt prof-dwngrd-auto**

## Command Default

The automatic profile downgrade upon CM-status event 16 is enabled by default.

## Command Modes

Global configuration (config)

## Command History

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to disable the automatic profile downgrade upon CM-status event 16:

```
Router(config)# no cable downstream ofdm-prof-mgmt prof-dwngrd-auto
```

## Related Commands

Command	Description
<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.
<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.
<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.
<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.
<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.

# cable downstream ofdm-prof-mgmt prof-order-method

To configure the type of OFDM Profile Downgrade method **cable downstream ofdm-prof-mgmt prof-order-method** command in global configuration mode. Using the **no cable downstream ofdm-prof-mgmt prof-order-method** command, configures the default option (**bit-loading**).

Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-prof-mgmt prof-order-method** { **bit-loading** | **capacity** }

**no cable downstream ofdm-prof-mgmt prof-order-method**

Syntax Description	bit-loading	Legacy method of profile downgrade.
	capacity	Configure this option if you wish to downgrade the profile based on the capacity. This option does not skip any good profiles.

**Command Default** The **bit-loading** option is configured by default.

**Command Modes** Global configuration (config)

## Command History

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The following example shows how to configure the **capacity** method of downgrading OFDM profiles.

```
Router(config)# cable downstream ofdm-prof-mgmt prof-order-method capacity
```

Related Commands	Command	Description
	<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.

# cable downstream ofdm-prof-mgmt prof-upgrade-pma

To enable the external profile management application (PMA), use the **cable downstream ofdm-prof-mgmt prof-upgrade-pma** command in global configuration mode. This will disable internal PMA. To disable external PMA, use **no** form of this command. This will enable internal PMA.

**Cisco cBR-8 Converged Broadband Router**  
**cable downstream ofdm-prof-mgmt prof-upgrade-pma**

## Command Modes

Global configuration (config)

## Command History

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to disable the PMA:

```
Router(config)# cable downstream ofdm-prof-mgmt prof-upgrade-pma
```

## Related Commands

Command	Description
<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.
<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.
<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.
<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.
<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.
<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.

# cable downstream ofdm-prof-mgmt recommend-profile-age

To configure the recommended profile age, use the **cable downstream ofdm-prof-mgmt recommend-profile-age** command in global configuration mode.

## Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-prof-mgmt recommend-profile-age** *age*

### Syntax Description

<i>age</i>	Recommended profile age in minutes. The valid range is from 5 to 1440 minutes.
------------	--------------------------------------------------------------------------------

### Command Default

120 minutes

### Command Modes

Global configuration (config)

### Command History

#### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If the recommended profile for a cable modem exceeds this age, that profile is no longer valid.

### Examples

The following example shows how to configure the recommended profile age:

```
Router(config)# cable downstream ofdm-prof-mgmt recommend-profile-age 20
```

### Related Commands

Command	Description
<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.
<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER polling interval.
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.
<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.
<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.
<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.

# cable downstream ofdm-prof-mgmt rxmer-poll-interval

To configure the Receive Modulation Error Ratio (RxMER) poll interval, use the **cable downstream ofdm-prof-mgmt rxmer-poll-interval** command in global configuration mode.

## Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-prof-mgmt rxmer-poll-interval** *interval*

### Syntax Description

<i>interval</i>	RxMER poll interval in minutes. The valid range is from 5 to 1440 minutes.
-----------------	----------------------------------------------------------------------------

### Command Default

60 minutes

### Command Modes

Global configuration (config)

### Command History

#### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The CMTS uses OPT message with bit-0 option to collect RxMER data from CMs, after the initial CM registration and periodically thereafter. The RxMER collection period or the poll interval is configurable. The collected RxMER data is used to compute the recommended profile for each CM.

### Examples

The following example shows how to configure the RxMER poll interval:

```
Router(config)# cable downstream ofdm-prof-mgmt rxmer-poll-interval 20
```

### Related Commands

Command	Description
<b>cable downstream ofdm-prof-mgmt unfit-profile-age</b> <i>age</i>	Configure the unfit profile age.
<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.
<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.
<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.
<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.

# cable downstream ofdm-prof-mgmt unfit-profile-age

To configure the unfit profile age, use the **cable downstream ofdm-prof-mgmt unfit-profile-age** command in global configuration mode. Using the **no cable downstream ofdm-prof-mgmt unfit-profile-age** command reverts to the default **unfit-profile-age** configuration of 60 minutes.

## Cisco cBR-8 Converged Broadband Router

**cable downstream ofdm-prof-mgmt unfit-profile-age** { *age* | **disable** }

**no cable downstream ofdm-prof-mgmt unfit-profile-age**

### Syntax Description

<i>age</i>	Unfit profile age in minutes. The valid range is 5–1440 minutes.
<b>disable</b>	Disable OFDM Unfit Profile aging. This is equivalent to an infinite timer.

### Command Default

60 minutes

### Command Modes

Global configuration (config)

### Command History

#### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Dublin 17.12.1z	The <b>disable</b> option is introduced.

### Usage Guidelines

If the unfit profile for a cable modem exceeds this age, the profile is no longer considered unfit for that CM.

### Examples

The following example shows how to configure the unfit profile age:

```
Router(config)# cable downstream ofdm-prof-mgmt unfit-profile-age 20
```

### Examples

The following example shows you how to disable OFDM Unfit Profile aging (Cisco IOS XE Dublin 17.12.1z and later):

```
Router(config)# cable downstream ofdm-prof-mgmt unfit-profile-age disable
```

### Related Commands

Command	Description
<b>cable downstream ofdm-prof-mgmt recommend-profile-age</b> <i>age</i>	Configure the recommended profile age.
<b>cable downstream ofdm-prof-mgmt rxmer-poll-interval</b> <i>interval</i>	Configure the RxMER poll interval.

Command	Description
<b>cable downstream ofdm-prof-mgmt exempt-sc-pct</b> <i>percent</i>	Configure the percentage of subcarriers that can be exempted from bit loading comparison.
<b>cable downstream ofdm-prof-mgmt mer-margin-qdb</b> <i>quarter-decibel</i>	Configure the offset.
<b>no cable downstream ofdm-prof-mgmt prof-dwngrd-auto</b>	Disable the automatic profile downgrade upon CM status event 16.
<b>cable downstream ofdm-flow-to-profile profile-data</b> <i>profile ID mac-address cable-modem-mac</i>	Override the selection logic.

# cable downstream override

To enable cable downstream frequency override, use the **cable downstream override** command in cable interface configuration mode. To disable the override feature, use the **no** form of this command.

**cable downstream override**  
**no cable downstream override**

## Syntax Description

This command has no keywords or arguments.

## Command Default

Cable downstream frequency override is enabled by default.

## Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.0(13)SC	This command was introduced.
12.1(5)EC1	This command was integrated into Cisco IOS Release 12.1(5)EC1.
12.1(6) and 12.1(6)T	This command was integrated into Cisco IOS Release 12.1(6) and Cisco IOS Release 12.1(6)T.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

This command is never needed for normal operations, because downstream frequency override is enabled by default for DOCSIS operations. However, this command can be used to disable the frequency override feature for test and lab use, so as to force the CMTS on that interface to use a particular downstream frequency, regardless of the signal quality.

**Note** Because frequency override is enabled by default, this command does not appear as part of a cable interface's configuration section in the Cisco CMTS router configuration file unless the **no cable downstream override** command has been given.

## Examples

The following example shows how to disable the downstream frequency override feature on a particular cable interface:

```
Router# configure terminal
Router(config)# interface cable 6/0
Router(config-if)# no cable downstream override
```

```
Router(config-if)# exit
```

### Examples for Cisco cBR Series Converged Broadband Router

This example shows how to disable the downstream frequency override feature on a particular cable interface:

```
Router# configure terminal
Router(config)# interface cable 1/0/0
Router(config-if)# no cable downstream override
Router(config-if)# exit
```

Use the **show running-config | include override** to see the disabled status of the command:

```
Router#show running-config | include override
no cable downstream override
Router#
```

## cable downstream power-down-2nd-module

To reduce power consumption on Cisco cBR-8 by powering down the second PHY module on the CCAP line card, use the **cabledownstreampower-down-2nd-module slot** command in global configuration mode.

**cable downstream power-down-2nd-module slot**

**Command Default** None.

**Command Modes** Global configuration (config).

### Command History

Release	Modification
Cisco IOS XE Fuji 16.9.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

### Examples

The following example shows how to set up the power saving configuration.

```
Router# configure terminal  
Router(config)# cable downstream power-down-2nd-module slot 1
```

# cable downstream qam-profile

To set the QAM profile for the cable interface line card, use the **cable downstream qam-profile** command in global configuration mode.

**cable downstream qam-profile** *id*

---

## Syntax Description

**Syntax Description** *id* Downstream QAM profile ID. 0 to 3 are system defined, 4 to 31 are user defined.

---

**Command Default** None

**Command Modes** Global configuration (config)

---

## Command History

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

---

---

## Usage Guidelines

Use this command to set the QAM profile for the cable interface line card.

---

## Examples

The following example shows how to enable the downstream QAM profile configuration:

```
Router# configure terminal
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)#
```

---

## Related Commands

Command	Description
<b>annex</b>	Set the MPEG framing format.
<b>interleaver-depth</b>	Set the interleaver-depth.
<b>modulation</b>	Set the QAM modulation format.
<b>spectrum-inversion</b>	Set the spectrum-inversion on or off.
<b>symbol-rate</b>	Set the symbol rate.

# cable downstream qos wfq weight

To specify custom DOCSIS priority to excess ratio mappings for downstream service flows, use the **cable downstream qos wfq weight** command in cable interface configuration mode. Use the **no** form of this command to revert to the default mappings.

**cable downstream qos wfq weights** *weight1...weight8*  
**no cable downstream qos wfq weights**

<b>Syntax Description</b>	<p><b>weights</b> <i>weight</i></p> <p>Specifies the custom excess ratios for 8 priorities.</p> <ul style="list-style-type: none"> <li><i>weight1...weight8</i> —Custom weight. Valid values range from 1 to 100.</li> </ul>
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** DOCSIS priority to excess ratio mapping is used.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** This command configures custom DOCSIS priority to excess ratio mappings for downstream service flows.

**Examples** This example shows how to configure custom DOCSIS priority to excess ratio mappings for downstream service flows on a cable interface of Cisco uBR series router:

```
Router# configure terminal
Router(config)# interface cable 8/0/0
Router(config-if)# cable downstream qos wfq weights 10 20 30 40 50 60 70 80
```

## Examples for Cisco cBR Series Converged Broadband Router

This example shows the configuration of QoS WFG weights on the wideband cable interface of a Cisco cBR-8 router:

```
Router(config)#interface wideband-Cable 1/0/0:0
Router(config-if)#cable downstream qos wfq weights 10 20 30 40 50 60 70 80
```

This example shows the configuration on integrated cable interface of a Cisco cBR-8 router:

```
Router(config)#interface integrated-Cable 1/0/0:1
```

```
Router(config-if)#cable downstream qos wfq weights 10 20 30 40 50 60 70 80
```

### Related Commands

Command	Description
<b>show cr10k-rp queue</b>	Displays the queue parameters associated with downstream service flow queues (including the excess ratio). (This command is not supported in Cisco cBR-8 routers.)
<b>show running-config interface cable</b>	Displays the configuration for the specified cable interface on a Cisco uBR series router.
<b>show running-config interface [wideband-Cable   integrated-Cable</b>	Displays the configuration for the specified cable interface on a Cisco cBR-8 router.

# cable downstream rate-limit

**Note** Effective with Cisco IOS Release 12.2(33)SCF, the **cable downstream rate-limit** command is not supported for Cisco uBR-MC88U line card in Cisco IOS software.

To enable DOCSIS rate limiting on downstream traffic, use the **cable downstream rate-limit** command in cable interface configuration mode. To disable DOCSIS rate limiting on downstream traffic, use the **no** form of this command.

**cable downstream rate-limit** [**token-bucket** [[**shaping** [**granularity** *msec* | **max-delay** *msec*]] | **weighted-discard**]] [*exp-weight*]  
**no cable downstream rate-limit**

## Syntax Description

<b>token-bucket</b>	(Optional) Specifies the token-bucket filter algorithm, which enforces an average long-term transmission rate while permitting occasional bursts.
<b>shaping</b>	(Optional in Release 12.1 EC, Required in Release 12.2 BC) Enables rate limiting on the downstream port using the token-bucket policing algorithm with default traffic shaping parameters.
<b>granularity</b> <i>msec</i>	(Optional) Specifies traffic shaping granularity in milliseconds. Valid values are 1, 2, 4, 8, or 16 milliseconds.
<b>max-delay</b> <i>msec</i>	(Optional) Specifies the maximum traffic-shaping buffering delay in milliseconds. Valid values are 128, 256, 512, or 1028 milliseconds. As a general guideline, the lower the downstream rates, the higher the delay should be to ensure full use of the bandwidth.
<b>weighted-discard</b>	(Optional) Specifies the weighted discard algorithm.
<i>exp-weight</i>	(Optional) Specifies the weight for the exponential moving average of loss rate. Valid values are from 1 to 4.

## Command Default

In Cisco IOS Release 12.1 EC and earlier releases, the system defaults to monitoring the traffic to and from each CM over each 1-second period, and if the CM exceeds its bandwidth quota for that second, the CMTS router drops packets for the rest of the second (**no cable downstream rate-limit**).

In Cisco IOS Release 12.2 BC and later releases, the **token-bucket** and **shaping** keywords are on by default, and the **max-delay** option is set to 128 milliseconds (**cable downstream rate-limit token-bucket shaping max-delay 128**).

**Note** In Cisco IOS Release 12.2 BC, do not use the **cable downstream rate-limit token** command without specifying the **shaping** option, because this results in packet drops.

## Command Modes

Interface configuration—cable interface only (config-if)

**Command History**

Release	Modification
11.3(6) NA	This command was introduced.
12.0(4)XI, 12.0(5)T1, 12.1(1)EC1	The <b>shaping</b> keyword was added.
12.2(4)BC1	Support was added to the 12.2 BC train, and the defaults were changed so that the <b>shaping</b> keyword is on by default, to accommodate DOCSIS 1.1 requirements.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCF	This command does not support Cisco uBR-MC88U line card in Cisco IOS software.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The **cable downstream rate-limit** command specifies the type of DOCSIS rate limiting that the CMTS router imposes on downstream traffic that is sent to the CMs. When rate-limiting is enabled, traffic to the CM is examined to ensure it will not exceed the limit set for the CM.

For DOCSIS networks, the best rate limiting algorithm combines the **token-bucket** and **shaping** to use keywords, which is optimized for relatively steady data rates, such as are used for web browser, without allowing the user to exceed the maximum allowable download rate that is specified in the DOCSIS configuration file.

**Note** The **token-bucket** and **shaping** options are the default in Cisco IOS Release 12.2 BC and should not be changed. If using a 64 kbps downstream rate, you can avoid a performance impact by turning off the **shaping** option, but this is not recommended for DOCSIS 1.1 operation because it can result in erratic traffic patterns and packet drops on the downstream.

If a packet would exceed the traffic limits for a CM, the CMTS router will buffer the packet, up to the maximum delay time given by the **max-delay** option, so that the traffic can be sent at a later time when it would not violate the maximum downstream traffic limits. If the packet is still too large, or if the volume of traffic consistently exceeds the traffic limits, even after the delay, the CMTS router begins dropping packets.

The default behavior of the **cable downstream rate-limit** command was changed in Cisco IOS Release 12.2 BC to accommodate the different requirements of DOCSIS 1.1 operation (which requires the use of the token-bucket rate-limiting algorithm). This default is optimized for downstream traffic rates that are higher than 84 kbps.

If you are using a 64 kbps downstream traffic rate on a Cisco CMTS router that is running Cisco IOS Release 12.2 BC, you should set the **max-delay** option to 256 milliseconds to avoid a performance impact on TCP/IP traffic that uses packets larger than 1024 bytes (such as FTP or HTTP web traffic). Alternatively, you can set the **max-burst** option on the **cable service class** command to 3044, which is two packets of the minimum size for DOCSIS 1.1 networks.

**Understanding the max-delay and granularity Options**

The Cisco CMTS router uses a calendar-queuing system to process the packets being shaped. The calendar queue is a time wheel that is as big as the value specified by the **max-delay** option (128, 256, 512, or 1028 milliseconds), and is divided into “buckets” of the size specified by the **granularity** option (1, 2, 4, 8, or 16 milliseconds).

The number of buckets depends on both the **max-delay** and **granularity** options. For example, if the **max-delay** option is set to 256 milliseconds, and the **granularity** option is set to 4 milliseconds, the calendar queue contains 256/4, or 64, buckets, where a new bucket is processed every 4 milliseconds.

When the Cisco CMTS router adds a shaped packet to the queue, it adds the packet into the bucket that corresponds to the deadline by which the packet must be processed. At the end of every granularity time period, the Cisco CMTS router processes the packets that are in the corresponding bucket.

Decreasing the **max-delay** value increases how often the packets in the entire queue are processed, while decreasing the **granularity** value increases the accuracy of the shaping mechanism. Decreasing these values, however, could result in a possible increase in CPU processor usage. In most circumstances, this increase in processor usage is negligible, but it should be monitored whenever fine-tuning the **max-delay** or **granularity** values.

**Tip** For more information about the DOCSIS 1.1 rate-limiting specifications, see section C.2.2.5.2, *Maximum Sustained Traffic Rate*, in the DOCSIS 1.1 specification.

## Examples

The following example shows how to apply the token-bucket filter algorithm on a Cisco uBR7200 series router running Cisco IOS Release 12.1 EC:

```
Router(config)# interface cable 6/0
Router(config-if)# cable downstream rate-limit token-bucket
```

The following example shows how to apply the token-bucket filter algorithm on a Cisco uBR10012 router running Cisco IOS Release 12.2 BC:

```
Router(config)# interface cable 5/1/0
Router(config-if)# cable downstream rate-limit token-bucket shaping
```

The following example shows how to use token-bucket shaping with a **max-delay** of 256 milliseconds on a Cisco uBR7100 series router:

```
Router(config)# interface cable 1/0
Router(config-if)# cable downstream rate-limit token-bucket shaping max-delay 256
```

## Related Commands

Command	Description
<b>cable service class</b>	Sets the parameters for a DOCSIS 1.1 cable service class.
<b>cable upstream rate-limit</b>	Sets DOCSIS rate limiting for an upstream port on a cable interface line card.

## cable downstream rf-power

To set the RF power output level on an integrated upconverter on the Cisco uBR7100 series router, Cisco uBR-MC16U, Cisco uBR-MC28U, or Cisco uBR10-MC5X20S/U cable interface line card, use the **cable downstream rf-power** command in cable interface configuration mode. To reset the RF output power level to its default value, use the **no** form of this command.

```
cable downstream rf-power {power-level | hccp-delta diff-pwr | hccp-override override-pwr}
no cable downstream rf-power {power-level | hccp-delta diff-pwr | hccp-override override-pwr}
```

### Syntax Description

<i>power-level</i>	RF output power level in dBmV. The valid range is from 45 to 63 dBmV.  <b>Note</b> The official range for acceptable power levels in the DOCSIS specification is 50 to 61 dBmV. Cisco cable interfaces exceed the DOCSIS standard, but power levels outside the DOCSIS standards should be used only in lab and test environments.
<b>hccp-delta</b> <i>diff-pwr</i>	(Protect interfaces only) When using N+1 Hotstandby Connection-to-Connection Protocol (HCCP) redundancy, the protect interface adds the <i>diff-pwr</i> value to the current power value of the working interface when a switchover occurs. This allows the router to accommodate relative differences between the RF power levels in working and protect interfaces. The valid value for <i>diff-pwr</i> ranges from -12 to +12 dBmV.
<b>hccp-override</b> <i>override-pwr</i>	(Protect interfaces only) When using N+1 HCCP redundancy, the protect interface uses the override power value instead of the power value of the working interface when a switchover occurs. This allows the router to accommodate absolute differences between the RF power levels in working and protect interfaces. The valid value for <i>override-pwr</i> ranges from 45 to 63 dBmV.  <b>Note</b> The official range for acceptable power levels in the DOCSIS specification is 50 to 61 dBmV. Cisco cable interfaces exceed the DOCSIS standard, but power levels outside the DOCSIS standards should be used only in lab and test environments.

### Command Default

50 dBmV for the Cisco uBR7100 series router  
 55 dBmV for the Cisco uBR-MC5X20S cable interface line card on the Cisco uBR10012 router  
 55 dBmV for the Cisco uBR-MC16U and Cisco uBR-MC28U cable interface line cards  
 55 dBmV for the Cisco uBR10-MC5X20U-D cable interface line card on the Cisco uBR10012 router

### Command Modes

Interface configuration (config-if).

### Command History

Release	Modification
12.1(5)EC1	This command was introduced to provide support on the integrated upconverter on the Cisco uBR7100 series router.
12.2(11)CY, 12.2(11)BC3	Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.

Release	Modification
12.2(15)CX	Support was added for the Cisco uBR-MC16U and Cisco uBR-MC28U cable interface line cards.
12.2(15)BC2	Support was added for the Cisco uBR-MC5X20U cable interface line card. Support was also added for the <b>hccp-delta</b> and <b>hccp-override</b> options.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCC4	Support for the following keywords was moved to the global redundancy configuration mode: <ul style="list-style-type: none"> <li>• <b>hccp-delta</b></li> <li>• <b>hccp-override</b></li> </ul>
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

**Note** In Cisco IOS Release 12.2(33)SCC4, the support for the **hccp-delta** and **hccp-override** keywords is moved from the interface configuration mode to the global redundancy configuration mode. You can now configure these keyword options using the **member subslot** command.

The **hccp-delta** and **hccp-override** options can be configured only on a protect interface (an interface that has been configured with the **hccp protect** command). However, it is possible to manually edit a configuration file on a TFTP server to include these options on a working interface configuration, and then download that configuration to the router from the TFTP server.

If you manually edit the Cisco IOS configuration files, ensure that you specify these options only on protect interfaces. If you specify the **hccp-delta** or **hccp-override** option on a working interface, the router will modify the configured downstream power with the given power delta or override value.

The official range for acceptable power levels in the DOCSIS standard depends on the stacking level. The DOCSIS levels are as follows:

- 1:1 stacking—52 dBmV ~ 60 dBmV
- 2:1 stacking—48 dBmV ~ 56 dBmV
- 4:1 stacking—44 dBmV ~ 52 dBmV

**Note** Cisco cable interfaces exceed the DOCSIS standard, but power levels outside the DOCSIS standards should be used only in lab and test environments.

## Examples

The following example shows how to configure the integrated upconverter on a Cisco uBR7100 series router for an RF output power level of 45 dBmV:

```
Router(config)# cable interface 1/0
Router(config-if)# cable downstream rf-power 45
```

The following example shows how to configure the first integrated upconverter on a Cisco uBR10012 router for an RF output power level of 53 dBmV:

```
Router(config)# cable interface 5/1/0
Router(config-if)# cable downstream rf-power 53
```

The following commands shows how to configure the first integrated upconverter to the default power level of 55 dBmV on the Cisco uBR10012 router:

```
Router(config)# cable interface 5/1/0
Router(config-if)# no cable downstream rf-power
Router(config-if)# exit
```

The following example shows how to configure a protect interface to add 3 dBmV to the current working RF power level when a switchover occurs:

```
Router(config)# cable interface 6/0/0
Router(config-if)# cable downstream rf-power hccp-delta 3
Router(config-if)# exit
```

The following example shows how to configure a protect interface to use an RF power level of 48 dBmV instead of the current working RF power level when a switchover occurs:

```
Router(config)# cable interface 6/0/0
Router(config-if)# cable downstream rf-power hccp-override 48
Router(config-if)# exit
```

**Note** The **hccp-delta** and **hccp-override** commands configure the power of the protect interface at the time of the switchover. To display the RF power currently being used on a cable interface, use the **show controller cable** command.

## Related Commands

Command	Description
<b>cable downstream frequency</b>	Configures the cable downstream center frequency on the integrated upconverter.
<b>cable downstream rf-shutdown</b>	Enables or disables the RF output from the integrated upconverter.
<b>debug cable upconverter</b>	Enables debugging of the internal upconverter operation.
<b>show controllers cable</b>	Displays status and configuration information for the cable interface, including the integrated upconverter, if present.

## cable downstream rf-shutdown

To disable the RF output from an integrated upconverter on the Cisco uBR7100 series router, Cisco uBR-MC16U, Cisco uBR-MC28U or the Cisco uBR10-MC5X20S/U cable interface line card and Cisco RF Gateway 10, use the **cable downstream rf-shutdown** command in cable interface configuration mode and QAM interface and subinterface configuration mode. To enable the RF output on the integrated upconverter, use the **no** form of this command.

**cable downstream rf-shutdown**  
**no cable downstream rf-shutdown**

**Syntax Description** This command has no arguments or keywords.

**Command Default** RF output is disabled.

**Command Modes** Interface configuration—cable interface only (config-if)

QAM interface and subinterface configuration (config-if and config-subif)

### Command History

Release	Modification
12.1(5)EC1	This command was introduced to provide support on the integrated upconverter on the Cisco uBR7100 series router.
12.2(11)CY, 12.2(11)BC3	Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.
12.2(15)CX	Support was added for the Cisco uBR-MC16U and Cisco uBR-MC28U cable interface line cards.
12.2(15)BC2	Support was added for the Cisco uBR-MC5X20U cable interface line card.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(44)SQ	This command was integrated into Cisco IOS Release 12.2(44)SQ. Support for the Cisco RF Gateway 10 was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

By default, the integrated upconverter on the Cisco uBR7100 series router, Cisco uBR-MC16U, Cisco uBR-MC28U, and the Cisco uBR10-MC5X20S/U cable interface line cards is disabled, and the downstream port does not output any signal. The **no** form of this command enables the integrated upconverter, allowing it to output an RF signal through the downstream port.

However, before a valid DOCSIS downstream signal can be output, the following must also be done:

- A valid downstream RF frequency must be configured using the **cable downstream frequency** cable interface command.
- The cable interface must be enabled using the **no shutdown** command on the cable interface.

**Note** This command does not affect the IF output from the DS0 downstream port on the Cisco uBR7100 series router. The Cisco uBR10-MC5X20S/U, Cisco uBR-MC16U, and Cisco uBR-MC28U cable interface line cards do not provide IF output for their downstream ports.

Executing this command at the port level command modifies all the QAM channels on that port. However no channel is affected if the command is executed at the channel level.

## Examples

The following example enables the integrated upconverter on the Cisco uBR7100 series router:

```
Router(config)# cable interface 1/0
Router(config-if)# no cable downstream rf-shutdown
```

The following example enables the second integrated upconverter on a Cisco uBR-MC5X20S cable interface line card in the Cisco uBR10012 router:

```
Router(config)# cable interface 7/0/1
Router(config-if)# no cable downstream rf-shutdown
```

The following commands must also be given before the DS0 RF port can transmit a valid RF signal:

```
Router(config-if)# cable downstream frequency
center-frequency
Router(config-if)# no shutdown
Router(config-if)# exit
router(config)#
```

### Cisco RF Gateway 10

The following example enables the integrated upconverter on the Cisco RFGW-10:

```
Router(config)#configure terminal
Router(config-if)#interface qam 3/1.1
Router(config-subif)#cable downstream rf-shutdown
```

## Related Commands

Command	Description
<b>cable downstream frequency</b>	Configures the downstream center frequency on the integrated upconverter.
<b>cable downstream rf-power</b>	Configures the desired RF output power on the integrated upconverter.
<b>debug cable upconverter</b>	Enables debugging of the internal upconverter operation.
<b>show controllers cable</b>	Displays status and configuration information for the cable interface, including information about the integrated upconverter, if present.

Command	Description
<b>show controllers qam</b>	Displays cable downstream information configured on the QAM channel and port.

## cable ds-high-low-rate-ratio

If the ratio between the highest and the lowest rates on an interface is too high, the output traffic can become bursty and may experience long delays. To specify the maximum allowed ratio to achieve expected latency requirement, use the **cable ds-high-low-rate-ratio** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable ds-high-low-rate-ratio** *ratio*  
**no cable ds-high-low-rate-ratio**

### Syntax Description

<i>ratio</i>	Specifies the ratio of highest to lowest max-rate. Suggested value is 1000.
--------------	-----------------------------------------------------------------------------

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command only affects the service flows created after the ratio is configured. We suggest reset all modems after configuring this ratio.

### Examples

The following example shows how to specify the maximum allowed ratio to achieve expected latency requirement:

```
Router> enable
Router# configure terminal
Router(config)# cable ds-high-low-rate-ratio 2000
```

## cable ds-max-burst

To enable a specialized Enhanced-Rate Bandwidth Allocation (ERBA) feature on the Cisco uBR10012 router with Performance Routing Engine 2 (PRE2) or Performance Routing Engine 4 (PRE4) modules, use the **cable ds-max-burst** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cable ds-max-burst [burst-threshold threshold peak-rate peak-rate]  
no cable ds-max-burst
```

### Cisco cBR Series Converged Broadband Routers

```
cable ds-max-burst [burst-threshold threshold ]  
no cable ds-max-burst
```

#### Syntax Description

<b>burst-threshold</b> <i>threshold</i>	(Optional) Defines the burst threshold in Kbytes. The range is from 64 Kbyte to 2 GB. The default is 1MB. For Cisco cBR Series Converged Broadband Routers, the valid rang is from 64Kbyte to 1 GB.  This value is used to compare with the per-service flow maximum traffic burst value as defined in DOCSIS 2.0.
<b>peak-rate</b> <i>peak-rate</i>	Peak rate in Kbps. The default is 0, which represents the line rate.  (For Cisco uBR10012 Router and CiscouBR7200 Series Routers)The peak-rate value is a global value and is applied to all the service flows created after the configuration of <b>cable ds-max-burst</b> command.

#### Command Default

This configuration is disabled on the Cisco uBR10012 router. This command is neither required nor supported on the Cisco uBR7100 Series, Cisco uBR7225VXR and Cisco uBR7246VXR router.

#### Command Modes

Global configuration (config)

#### Command History

Release	Modification
12.3(21)BC	This command was introduced in support of ERBA on the Cisco uBR10012 router with PRE2 modules.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	The peak-rate option was introduced and support for Performance Routing Engine 4 (PRE4) was added in Cisco IOS Release 12.2(33)SCB.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

#### Usage Guidelines

Cisco IOS Release 12.3(21)BC introduces the ERBA feature on the Cisco uBR10012 CMTS with Performance Routing Engine 2 (PRE2) modules. The ERBA feature in Cisco IOS release 12.3(21)BC is characterized by the following enhancements:

- Enables support for the DOCSIS1.1 *Downstream Maximum Transmit Burst* parameter on the Cisco CMTS by using **cable ds-max-burst** configuration command. This command is not supported on the Cisco uBR7225VXR, Cisco uBR7246VXR and the Cisco uBR7100 Series routers, as this parameter is supported by default.
- Allows DOCSIS1.0 modems to support the *DOCSIS1.1 Downstream Maximum Transmit Burst* parameter by using DOCSIS QoS profile. This feature uses the **cable qos pro max-ds-burst** configuration command.

**Note** The **cable ds-max-burst** and related commands are supported only on the Cisco uBR10012 router with PRE2 or PRE4 modules on Cisco IOS Release 12.3(21)BC or later releases.

To display service flows on the Cisco uBR10012 router with PRE2 or PRE4, and identify which service flows have maximum burst enabled, use the following command in privileged EXEC mode:

**show cr10k-rp cable slot/subslot/port sid service-flow ds**

- *slot* = 5 to 8
- *subslot* = 0 or 1
- *port* = 0 to 4 (depending on the cable interface)

For additional information about the **cable qos profile** command and configuring QoS profiles, see the *DOCSIS 1.1 for the Cisco CMTS* document on Cisco.com:

[http://www.cisco.com/en/US/docs/cable/cmts/feature/guide/ufg\\_docs.html](http://www.cisco.com/en/US/docs/cable/cmts/feature/guide/ufg_docs.html)

## Examples

The following example shows how to configure ERBA on the Cisco uBR10012 router, with a sample burst threshold setting:

```
Router> enable
Router# configure terminal
Router(config)# cable ds-max-burst burst-threshold 2048
peak-rate 1000
Router(config)# Ctrl^Z
Router# show cr10k-rp cable 7/0/0 sid service-flow ds
```

When this feature is enabled, new service flows with burst size larger than the burst threshold are supported. However, the existing service flows are not affected.

When this feature is disabled, no new service flows are configured with the *Downstream Maximum Transmit Burst* parameter—the **cable ds-max-burst** command settings. However, the existing service flows are not affected.

The following example illustrates configuration of the ERBA maximum burst for the specified service flow:

```
Router# sh cr10k-rp c7/0/0 1 service-flow ds
RP SFID  LC SFID  Conform      Exceed      Conform      Exceed      Total      QID
          Xmit Pkts  Xmit Pkts   Drop Pkts   Drop Pkts   Pkts
32930    10        41          0           0           0           41         131349
Forwarding interface: Modular-Cable1/0/0:0
32931    13        0           0           0           0           0          131350
Forwarding interface: Modular-Cable1/0/0:0
```

Related Commands	Command	Description
	<b>cable qos profile</b>	Configures a QoS profile.
	<b>show cable qos permission</b>	Displays the status of permissions for changing QoS tables for a cable router.
	<b>show cable qos profile</b>	Displays the QoS profiles that have been defined.
	<b>show cr10k-rp cable sid service-flow ds</b>	Displays service flows on the Cisco uBR10012 router with PRE2, and identifies which service flows have maximum burst enabled.

# cable ds-resiliency

To reserve a resiliency bonding group or wideband (WB) interface for a line card on the Cisco CMTS, use the **cable ds-resiliency** command in interface configuration mode. To remove this setting, use the **no** form of this command.

**cable ds-resiliency**  
**no cable ds-resiliency**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Interface configuration (config-if)

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable ds-resiliency** command is used to configure the Downstream Resiliency Bonding Group feature. Remove all existing configuration commands from the WB interface when setting aside that interface as a WB resiliency bonding group.

The **cable ds-resiliency** command is used in conjunction with the **cable resiliency ds-bonding** command to configure the Downstream Resiliency Bonding Group feature.

## Examples

The following example shows how to reserve a wideband cable interface in slot 5, subslot 1, and port 2 for a resiliency bonding group:

```
Router(config) interface wideband-cable 5/1/2:0
Router(config-if) # cable ds-resiliency
```

Command	Description
<b>cable resiliency ds-bonding</b>	Enables the Downstream Resiliency Bonding Group feature on the Cisco CMTS router.
<b>show cable modem resiliency</b>	Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.
<b>show cable resiliency</b>	Displays all information about the resiliency bonding groups on the Cisco CMTS router.

# cable dsg

**Note** Effective with Cisco IOS Release 12.3(13a)BC, the **cable dsg** command is not available in Cisco IOS software.

To enable the DOCSIS Set-Top Gateway (DSG) on a cable interface on a Cisco CMTS router, and to configure its tunnel-mapping parameters, use the **cable dsg** command in interface or subinterface configuration mode. To remove the DSG tunnel from the interface, use the **no** form of this command.

**cable dsg** *tunnel-MAC-address group-ip-address CA-vendor-name*  
**no cable dsg** *tunnel-MAC-address group-ip-address CA-vendor-name*

## Syntax Description

<i>tunnel-MAC-address</i>	Well-known MAC address for the DSG tunnel.
<i>group-ip-address</i>	Multicast group IP address for the DSG stream.
<i>CA-vendor-name</i>	Name for the Conditional Access (CA) vendor that owns the DSG tunnel. This parameter is a string up to 7 characters in length and should match the vendor of the CA server. A maximum of four vendors per router are supported.

## Command Default

No DSG tunnels are defined.

## Command Modes

Interface configuration—cable interface only (config-if)

Subinterface configuration—cable interface only (config-subif)

## Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7100 series and Cisco uBR7246VXR routers.
12.3(9a)BC	This command was introduced for the Cisco uBR10012 router.
12.3(13a)BC	This command was removed.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

This command enables DSG operations on the cable interface, creating a DSG tunnel that uses the specified IGMP multicast address and well-known MAC address.

The *tunnel-MAC-address* could optionally be an Internet Group Management Protocol (IGMP) multicast address, using the algorithm for converting host group IP address to an Ethernet MAC address that is given in RFC 1112. If the MAC address is 0000.0000.0000, the DSG tunnel uses the algorithm given in RFC 1112 to derive the multicast address for the tunnel as follows:

An IP host group address is mapped to an Ethernet multicast address by placing the low-order 23-bits of the IP address into the low-order 23 bits of the Ethernet multicast address 01-00-5E-xx-xx-xx (hex). Because

there are 28 significant bits in an IP host group address, more than one host group address may map to the same Ethernet multicast address.

For example, if you specify the command **cable dsg 0.0.0 228.9.9.9 AAA**, the command uses the IGMP IP address of 228.9.9.9 to generate the MAC address of 0100.5E09.0909 for the DSG tunnel. If the IGMP address were 228.129.9.9, the resulting MAC address would be 0100.5E01.0909.

You can specify only Global Scope (224.0.1.0 through 238.255.255.255) and Administratively Scoped (239.0.0.0 through 239.255.255.255) addresses. You cannot use Local Scope addresses (224.0.0.0 through 224.0.0.255).

Entering the **cable dsg** command also automatically configures the interface for the appropriate IGMP static group, using the **ip igmp static-group** command. Do not manually enter another **ip igmp static-group** command for this interface, because the system assumes that this IGMP configuration is for a separate configuration that cannot be used by the DSG subsystem.

**Note** If any previously configured static groups exist on this interface, you should remove those other **ip igmp static-group** commands on a cable interface before you can enter the **cable dsg** command. If you do not remove those other groups, the **cable dsg** command displays a warning notifying you that you should remove them.

The **no cable dsg** command automatically removes the IGMP static group from the interface by issuing the **no ip igmp static-group** command. Do not manually remove this static group yourself.

In addition, you must have enabled Protocol Independent Multicast (PIM) on the cable interface, using the **ip pim** interface configuration command, before enabling and configuring DSG operations. The DOCSIS Set-Top Gateway feature supports the following PIM modes:

- **ip pim sparse-mode** command—Configures sparse mode of operation.
- **ip pim sparse-dense-mode** command—Configures the interface for either sparse mode or dense mode of operation, depending on the mode in which the multicast group is operating.
- **ip pim dense-mode** command—Configures dense mode of operation.

### Limitations and Restrictions

The DOCSIS Set-Top Gateway feature also has the following limitations:

- If using bundled interfaces, configure the DSG configurations only on the primary interface, not on the subordinate interfaces. However, when DSG has been properly configured on the primary interface, DSG traffic can flow across both the primary and subordinate interfaces.
- If using subinterfaces, you must configure the DSG tunnels only on subinterfaces. When DSG tunnels are configured on a subinterface, you cannot also configure the tunnels on the main interface. If you configure DSG tunnels on both the main interface and subinterfaces, the main interface can drop packets.

We also recommend putting all DSG configurations on the same, single subinterface. Although you can configure DSG tunnels on multiple subinterfaces, this is not guaranteed to be supported in future software releases.

- You can configure up to four separate Conditional Access (CA) vendors per router.
- You can configure a maximum of eight DSG tunnels (as identified by the well-known MAC address) per CA vendor, for a maximum possible total of 32 DSG tunnels per router.

- Each CA vendor can have one or more DSG tunnels on each cable interface, but each DSG tunnel must be using a separate IP multicast address.
- IP multicast routing should be enabled on the router, using the **ip multicast-routing** command.
- Multicast rate-limiting can be enabled optionally on a cable interface that is configured for DSG operations, using the **ip multicast rate-limit out group-list** command.
- For best performance, fast switching of IP multicast should be enabled on incoming and outgoing interfaces, using the **ip mroute-cache** command.
- You cannot use the same IP multicast groups for both DSG traffic and for other IP multicast traffic. If an IP multicast group is being used for DSG traffic, do not use the **ip igmp static-group** command to manually configure that same IP multicast group for other, non-DSG traffic.
- Different CA vendors cannot share IP multicast addresses. Each vendor must use a unique set of IP multicast addresses, and after an IP multicast address is assigned to a DSG tunnel, that same address cannot be used for any other purpose. However, all other multicast addresses and groups can still be used on the interface for other multicast applications.
- DSG-related IP unicast traffic is not supported. The CMTS receives the unicast traffic from the DSG network controllers, but it does not forward that traffic to the set-top boxes.
- DSG traffic should be less than 2.048 Mbps per vendor, so as to conform to the DSG specifications.
- DSG does not support Baseline Privacy Interface (BPI)-encrypted IP multicast streams.

---

**Note** In Cisco IOS Release 12.2(15)BC2, N+1 HCCP high availability redundancy does not preserve the DSG traffic and configuration after a switchover. If you configure a cable interface for both N+1 HCCP redundancy and for DSG operations, DSG traffic does not continue after a switchover.

---

## Examples

The following example shows how to configure a cable interface on a Cisco uBR7246VXR router to enable the DSG feature on cable interface 3/0, using a well-known MAC address of 0001.0002.0003 and a destination IP address of 225.2.3.4:

```
interface cable 3/0
 ip pim dense-mode
 ip multicast rate-limit out group-list 123 1024
 cable dsg 1.2.3 225.2.3.4 CCC
```

---

**Note** The above configuration also automatically configures the interface with the appropriate **ip igmp static-group** command (**ip igmp static-group 225.3.4.5**). This command will appear in the interface configuration and should not be removed manually.

---

The following example shows the error message that appears if you specify a broadcast IP address that has already been added to the router's IGMP database. This entry typically would have been created manually on the router or dynamically by a customer premise equipment (CPE) device that is attached to a cable modem on the cable network.

```
interface cable 3/0
 cable dsg 1.1.1 224.3.3.10 cisco
Multicast group 224.3.3.10 is already in use on the interface Cable3/0, please retry.
```

The following example shows how to delete a DSG tunnel on a cable interface:

```
interface cable 4/0
 no cable dsg 0020.0020.0020 230.8.8.8 abc
4d17h: DSG: interface Cable5/0 left the igmp static group 230.8.8.8.
4d17h: DSG: tunnel 0020.0020.0020 is removed
4d17h: DSG: the specified DSG entry has been removed.
```

The following example shows the error message that appears when a unicast IP address is specified instead of a multicast IP address:

```
interface cable 4/0
 cable dsg 1.1.1 192.168.13.10 cisco
Only multicast is supported for current version.
```

#### Related Commands

Command	Description
<b>cable dsg keepalive</b>	Enables keepalive messages over DSG tunnels on all cable interfaces.
<b>debug cable dsg</b>	Enables general, DCD, or packet-related debugging for DSG on a Cisco CMTS router.
<b>show cable dsg</b>	Displays the current DSG tunneling parameters.

## cable dsg cfr

To define and enable Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) classifiers on a Cisco CMTS router, use the **cable dsg cfr** command in global configuration mode. To remove one or more specified A-DSG classifiers from a Cisco CMTS router, use the **no** form of this command. To disable one or more specified A-DSG classifiers but retain their configuration, use the **disable** form of this command.

**cable dsg cfr** *index* [**dest-ip** {*ipaddrhostname*}] [**tunnel** *index*] [**dest-ports** *start end*] [**priority** *priority*] [**src-ip** {*ipaddrhostname*} [**src-prefix-len** *length*]] [**disable** | **enable**] [**in-dcd** {**yes** | **no** | **ignore**}]

**no cable dsg cfr** *index*

### Syntax Description

<i>index</i>	DSG index. The valid range is from 1 to 65535.
<i>ipaddr</i>	(Optional) Destination multicast group IP address. This argument is required for a new classifier, but optional for an existing classifier.
<i>hostname</i>	(Optional) Fully-qualified domain name (FQDN). This argument is required for a new classifier, but optional for an existing classifier.
<b>tunnel</b> <i>index</i>	(Optional) Defines a tunnel index identified by a number from 1 to 65535.
<b>dest-ports</b> <i>start end</i>	(Optional) Defines the destination TCP/UDP with the starting and ending port ranging from 0 to 65535.
<b>priority</b> <i>priority</i>	(Optional) Defines the classifier priority.
<b>src-ip</b> <i>ipaddr</i>	(Optional) Defines the source IP address and prefix length, if desired.
<b>src-prefix-len</b> <i>length</i>	(Optional) Defines the source prefix length.
<b>disable</b>	(Optional) Disables the classifier. This is the default.
<b>enable</b>	(Optional) Enables the classifier.
<b>in-dcd</b> { <b>yes</b>   <b>no</b>   <b>ignore</b> }	(Optional) Defines whether to include, exclude, or ignore the DSG rules of the Downstream Channel Descriptor (DCD) message. <ul style="list-style-type: none"> <li>• <b>yes</b>—Includes the classifier.</li> <li>• <b>no</b>—Excludes the classifier.</li> <li>• <b>ignore</b>—Excludes the classifier from the DCD message and enables the DSG rule regardless of the tunnel MAC address.</li> </ul>

### Command Default

The A-DSG classifiers are undefined by default on a Cisco CMTS router. When configured, A-DSG classifiers are enabled by default.

### Command Modes

Global configuration (config)

**Command History**

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.3(17a)BC	The <b>in-dcd</b> keyword option was added.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCD5	This command was modified. The <b>ignore</b> option was added to the <b>in-dcd</b> keyword.
12.2(33)SCG	This command was modified. The <i>hostname</i> argument was added to specify the FQDN for the destination or source IP address.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines**

The **cable dsg cfr** command is used to configure the [Advanced Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers](#) feature.

The **cable dsg cfr** command creates an index to which one or several A-DSG classifiers apply. The A-DSG classifiers can only be mapped to one DSG tunnel. The Cisco CMTS router applies the classifier parameters to the packets received from the DSG server in order to assign the packet to the appropriate DSG tunnel.

When you use the **in-dcd yes** option, the classifiers are also included in the DSG rules as part of the DCD message.

When you use the **in-dcd ignore** option, the DSG rule is enabled after bypassing the RFC-1112 MAC address check, and the DSG classifier is not included in the DCD message.

The **no** form of the **cable dsg cfr** command disables the DSG rule if the tunnel MAC address is derived from the RFC-1112.

During the software downgrade process, if the software does not support the **in-dcd ignore** option then the **in-dcd yes** option is used.

**Examples**

The following example shows how to configure an A-DSG classifier on a Cisco CMTS router:

```
Router(config)# cable dsg cfr 1

Router(config)# cable dsg cfr 2 dest-ip 209.165.200.225 tunnel 1 dest-port 0 65535 priority
1
Router(config)# cable dsg cfr 2 dest-ip 209.165.200.226 dest-ports 22 777 enable in-dcd yes
Router(config)# cable dsg cfr 3 dest-ip 209.165.200.227 dest-ports 22 777 src-ip
ciscovideo.com
```

**Examples**

This example shows how to configure an A-DSG classifier on a Cisco cBR-8 router:

```
Router(config)# cable dsg cfr 1

Router(config)# cable dsg cfr 2 dest-ip 209.165.200.225 tunnel 1 dest-port 0 65535 priority
1
Router(config)# cable dsg cfr 2 dest-ip 209.165.200.226 dest-ports 22 777 enable in-dcd yes
```

```
Router(config)# cable dsg cfr 3 dest-ip 209.165.200.227 dest-ports 22 777 src-ip
ciscovideo.com
```

**Related Commands**

Command	Description
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.
<b>cable dsg vendor param</b>	Configures vendor-specific parameters for an A-DSG on a Cisco CMTS router.

# cable dsg chan-list

To configure the Advanced-mode DOCSIS Set-Top Gateway (A-DSG) downstream channel list on a CMTS router, use the **cable dsg chan-list** command in global configuration mode. To remove the A-DSG channel list, use the **no** form of this command.

```
cable dsg chan-list list-index index entry-index freq freq
no cable dsg chan-list list-index index entry-index freq freq
```

## Syntax Description

<i>list-index</i>	Defines the DSG channel list and index identifier as a number in the range 1 to 65535.
<b>index</b> <i>entry-index</i>	Defines the DSG channel frequency entry index as a number in the range 1 to 65535.
<b>freq</b> <i>freq</i>	Defines the center frequency of the downstream channel in the range 47000000 to 862000000 Hz.

## Command Default

A-DSG channel lists are disabled and undefined by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.3(13a)BC	This command was introduced on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

The channel list entry created with this command can be associated to a downstream interface and be included in the Downstream Channel Descriptor (DCD) message by using the **cable downstream dsg chan-list** command.

## Examples

The following example shows A-DSG channel list global configurations on a Cisco CMTS router:

```
cable dsg chan-list 1 index 1 freq 47000000
cable dsg chan-list 1 index 2 freq 125000000
cable dsg chan-list 1 index 3 freq 555000000
cable dsg chan-list 2 index 1 freq 47000000
cable dsg chan-list 2 index 2 freq 125000000
cable dsg chan-list 2 index 3 freq 555000000
```

## Related Commands

Command	Description
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.

Command	Description
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.
<b>cable dsg vendor param</b>	Configures vendor-specific parameters for A-DSG on a Cisco CMTS router.

## cable dsg client-list

To configure client parameters for Advanced-mode DOCSIS Set-Top Gateway (A-DSG) on a Cisco CMTS router, use the **cable dsg client-list** command in global configuration mode. This command configures the client parameters and the associated DSG rule. To remove this configuration, use the **no** form of the command.

```
cable dsg client-list client-list-id id-index id {application-id app-id | broadcast [broadcast-id] |
ca-system-id sys-id | mac-addr mac-addr}
no cable dsg client-list client-list-id id-index id {application-id app-id | broadcast [broadcast-id] |
ca-system-id sys-id | mac-addr mac-addr}
```

### Syntax Description

<i>client-list-id</i>	Defines an identifier for the <i>DSG client list</i> as a number from 1 to 65535.
<b>id-index</b> <i>id</i>	Defines the DSG client index identifier as a number from 1 to 65535.
<b>application-id</b> <i>app-id</i>	Defines the DSG client type application identifier as a hexadecimal value from 1 to FFFF.
<b>broadcast</b> [ <i>broadcast-id</i> ]	Defines an optional DSG client type broadcast value: <ul style="list-style-type: none"> <li>• 1—Contains Society of Cable Telecommunications Engineers (SCTE) 65.</li> <li>• 2—Contains SCTE 18.</li> <li>• 3—Contains OpenCable Application Platform (OCAP) Object Carousel (OCAP 1.0)</li> <li>• 4—Contains OpenCable Common Download Carousel (OC-CD).</li> <li>• 5 to 55534—Reserved for future use.</li> <li>• 55535 to 65535—Reserved for Multiplier Service Operator (MSO)-specific use.</li> </ul>
<b>ca-system-id</b> <i>sys-id</i>	Defines the DSG client type CA system identifier as a hexadecimal value from 1 to FFFF.
<b>mac-addr</b> <i>mac-addr</i>	Defines the DSG client type hexadecimal MAC address.

### Command Default

Client lists for A-DSG are not configured by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.3(17a)BC2	The <i>broadcast-id</i> argument was added. Support for the same DSG client identifier to be associated with multiple DSG tunnels was added.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines**

Beginning in Cisco IOS Release 12.3(17a)BC2, the same DSG client identifier can be associated with multiple DSG tunnels.

**Examples**

The following example shows global configuration for four A-DSG client lists:

```
cable dsg client-list 1 id-index 1 broadcast
cable dsg client-list 2 id-index 2 application-id FFFF
cable dsg client-list 3 id-index 3 ca-system-id EEEE
cable dsg client-list 4 id-index 4 mac-addr 0100.5e0a.0a04
```

**Related Commands**

Command	Description
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.

# cable dsg keepalive

**Note** Effective with Cisco IOS Release 12.3(13a)BC, the **cable dsg keepalive** command is not available in Cisco IOS software.

To enable keepalive messages over DOCSIS Set-Top Gateway (DSG) tunnels on all cable interfaces, use the **cable dsg keepalive** command in global configuration mode. To disable DSG keepalives, use the **no** form of this command.

**cable dsg keepalive**  
**no cable dsg keepalive**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Keepalive messages are disabled.

**Command Modes** Global configuration (config)

## Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7100 series and Cisco uBR7246VXR routers.
12.3(9a)BC	This command was introduced for the Cisco uBR10012 router.
12.3(13a)BC	This command was removed.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** By default, a Cisco CMTS router does not send keepalive messages on any DSG tunnels. When keepalives are enabled using the **cable dsg keepalive** command, the Cisco CMTS router sends one keepalive message each second on each DSG tunnel on each downstream. In Cisco IOS Release 12.2(15)BC2, the keepalive packet is a null packet.

**Note** Do not enable DSG keepalive messages unless your application and DSG set-top boxes require them.

**Tip** Use the **show cable dsg** command to display whether keepalive messages are enabled.

## Examples

The following example shows how to enable DSG keepalives on all cable interfaces on the router:

```
cable dsg keepalive
```

The following example shows how to disable DSG keepalives on all cable interfaces, which is the default configuration:

```
no cable dsg keepalive
```

**Related Commands**

Command	Description
<b>cable dsg</b>	Enables DSG on a cable interface, and configures its tunnel-mapping parameters.
<b>debug cable dsg</b>	Enables the display of debugging messages for the operation of the DSG feature.
<b>show cable dsg</b>	Displays the current DSG tunneling parameters.

# cable dsg name-update-interval

To update fully-qualified domain name (FQDN) classifiers on a Cisco CMTS router based on the DNS server record, use the **cable dsg name-update-interval** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable dsg name-update-interval** *minutes*  
**no cable dsg name-update-interval** *minutes*

<b>Syntax Description</b>	<i>minutes</i> Interval in minutes to check the DNS server for any FQDN classifier changes. The valid range is from 1 to 60. The default value is 5.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The default value of 5 minutes is configured.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCG	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The **cable dsg-name-update-interval** command is used to configure the [Advanced Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers](#) feature.

Use the **cable dsg name-update-interval** command to configure the DSG name process feature. This feature supersedes the Time to Live (TTL) value associated with the DNS server while obtaining the latest DNS server record.

**Examples** The following example shows how to specify the DSG name interval on the Cisco CMTS router:

```
Router(config)# cable dsg name-update-interval 3
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
	<b>show cable dsg cfr</b>	Displays DSG classifier details.

## cable dsg tg

To associate a group of Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) tunnels to one or more downstream interfaces on a Cisco CMTS router, use the **cable dsg tg** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cable dsg tg group-id [channel channel_ID | priority DSG-rule-priority [enable | disable] | ucid ID1
[ID2 ID3 ID4] | vendor-param vendor-group-ID]
no cable dsg tg group-id
```

### Syntax Description

<i>group-id</i>	A-DSG tunnel group identifier. The valid range is from 1 to 65535.
<i>channel-id</i>	(Optional) The downstream channel identifier. The valid range is from 1 to 65535.
<b>priority</b> <i>DSG-rule-priority</i>	(Optional) Specifies the A-DSG rule priority. The valid range is from 0 to 255.
<b>enable</b>	(Optional) Enables the specified A-DSG tunnel group.
<b>disable</b>	(Optional) Disables the specified A-DSG tunnel group. This is the default.
<b>ucid</b> <i>upstream-channel-ID</i>	(Optional) Specifies the upstream channel ID. You can specify a maximum of four upstream channel IDs.
<b>vendor-param</b> <i>vendor-group-ID</i>	(Optional) Specifies the vendor specific parameters group ID. The valid range is from 1 to 65535.

### Command Default

The A-DSG tunnel group configuration is enabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(17a)BC2	This command was introduced to support A-DSG version 1.2 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCG	The <b>channel</b> keyword was made optional, and the following new keywords were added: <ul style="list-style-type: none"> <li>• <b>ucid</b></li> <li>• <b>vendor-param</b></li> </ul>
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

The **cable dsg tg** command establishes the configuration of the tunnel group. You can use the **disable** and **enable** keyword forms of the command to deactivate and activate the tunnel group configuration.

## Examples

The following example shows configuration and activation of a DSG tunnel group with channel ID, A-DSG rule priority, upstream channel ID, and vendor parameter group ID:

```
Router(config)# cable dsg tg 1
Router(config)# cable dsg tg 1 channel 2
Router(config)# cable dsg tg 1 channel 2 enable
Router(config)# cable dsg tg 1 channel 2 priority 3
Router(config)# cable dsg tg 1 channel 2 priority 3 enable
Router(config)# cable dsg tg 1 channel 2 ucid 1
Router(config)# cable dsg tg 1 channel 2 vendor-param 30
```

## Related Commands

Command	Description
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.

## cable dsg tg channel

To associate a group of Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnels to one or more downstream interfaces on a Cisco CMTS router, use the **cable dsg tg channel** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable dsg tg** *group-id* **channel** *channel-id* [**priority** *rule-priority*] [**enable** | **disable**]  
**no cable dsg tg** *group-id* **channel** *channel-id* [**priority** *rule-priority*]

Syntax Description		
	<i>group-id</i>	Specifies the A-DSG tunnel group identifier as a number from 1–65535.
	<i>channel-id</i>	Specifies the downstream channel identifier as a number from 1–65535.
	<b>priority</b> <i>rule-priority</i>	Specifies the A-DSG rule priority as a number from 0–255.
	<b>enable</b>	Enables the specified A-DSG tunnel group.
	<b>disable</b>	Disables the specified A-DSG tunnel group. This is the default.

**Command Default** The A-DSG tunnel group configuration is enabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(17a)BC2	This command was introduced to support A-DSG version 1.2 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The **cable dsg tg channel** command establishes the configuration of the tunnel group. You can use the **disable** and **enable** keyword forms of the command to deactivate and activate the tunnel group configuration. To remove the configuration, use the **no** form of the command.

**Examples** The following example shows configuration and activation of a tunnel group with group ID 1 and channel ID 2:

```
Router(config)# cable dsg tg 1 channel 2
```

Related Commands	Command	Description
	<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.

Command	Description
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.

# cable dsg tg channel ucid

To configure the upstream channel IDs for an Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnel group on a Cisco CMTS router, use the **cable dsg tg channel ucid** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cable dsg tg group-id channel channel-id ucid upstream-id [upstream-id . . .]
no cable dsg tg group-id channel channel-id ucid upstream-id [upstream-id . . .]
```

Syntax Description	
<i>group-id</i>	Specifies the A-DSG tunnel group identifier as a number from 1–65535.
<i>channel-id</i>	Specifies the downstream channel identifier as a number from 1–65535.
<i>upstream-id</i>	Specifies one or more upstream channel IDs as a number from 1–8.

**Command Default** Upstream channel IDs are not defined.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(17a)BC2	This command was introduced to support A-DSG version 1.2 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The **cable dsg tg channel** command must be configured before this command is made available.

**Examples** The following example shows configuration of a tunnel group with group ID 1 and channel ID 2, followed by configuration of the upstream channel IDs associated with the tunnel group:

```
Router(config)# cable dsg tg 1 channel 2
Router(config)# cable dsg tg 1 channel 2 ucid 1 2 3 4 5 6 7 8
```

Related Commands	Command	Description
	<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
	<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
	<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.

Command	Description
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.

## cable dsg tg channel vendor-param

To associate a vendor-specific group with an Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnel group on a Cisco CMTS router, use the **cable dsg tg channel vendor-param** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cable dsg tg group-id channel channel-id vendor-param vendor-group
no cable dsg tg group-id channel channel-id vendor-param vendor-group
```

Syntax Description	Parameter	Description
	<i>group-id</i>	Specifies the A-DSG tunnel group identifier as a number from 1–65535.
	<i>channel-id</i>	Specifies the downstream channel identifier as a number from 1–65535.
	<i>vendor-group</i>	Specifies the A-DSG vendor-specific group ID as a number from 1–65535.

**Command Default** The A-DSG vendor-specific group is not associated.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(17a)BC2	This command was introduced to support A-DSG version 1.2 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The **cable dsg tg channel** command must be configured before this command is made available. You also need to configure the vendor-specific parameter list using the **cable dsg vendor-param** command before you can associate it with the tunnel group.

**Examples** The following example shows configuration of the vendor-specific parameter list, followed by configuration of a tunnel group and association with the defined vendor group 3:

```
! Configure the vendor-specific parameter list
cable dsg vendor-param 3 vendor 1 oui ABCDEC value 0101AB
!
! Configure the tunnel group and associate the vendor group to the tunnel
!
cable dsg tg 1 channel 2
cable dsg tg 1 channel 2 vendor-param 3
```

Related Commands	Command	Description
	<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.

Command	Description
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.
<b>cable dsg vendor-param</b>	Configures A-DSG vendor-specific parameters on a Cisco CMTS router.

## cable dsg tg default-priority

To change the default channel priority for a tunnel group on the Cisco CMTS router, use the **cable dsg tg default-priority** command in global configuration mode. To set the channel priority back to the default value of zero, use the **no** form this command.

**cable dsg tg** *group-id* **default-priority** *DSG-rule-priority*  
**no cable dsg tg** *group-id* **priority** *DSG-rule-priority*

Syntax Description		
	<i>group-id</i>	Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) tunnel group identifier. The valid range is from 1 to 65535.
	<b>default-priority</b> <i>DSG-rule-priority</i>	Specifies the DSG rule priority of the downstream channels. The range is from 0 to 255. The default is 0.

**Command Default** The default channel priority for a tunnel group is 0.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCG	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The **cable dsg tg default-priority** command is associated with the [Advanced Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers](#) feature.

All channels that are configured after setting the default priority use the same priority value.

**Examples** The following example shows how to specify the default channel priority for a tunnel group on the Cisco CMTS router:

```
Router(config)# cable dsg tg 1 default-priority 20
```

Related Commands	Command	Description
	<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.

# cable dsg tg priority

To change the priority of existing Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) channels in a tunnel group on a Cisco CMTS router, use the **cable dsg tg priority** command in global configuration mode. To set the DSG rule priority of all existing channels in a tunnel group to the default value of zero, use the **no** form of this command.

**cable dsg tg** *group-id* **priority** *DSG-rule-priority*  
**no cable dsg tg** *group-id* **priority** *DSG-rule-priority*

## Syntax Description

<i>group-id</i>	A-DSG tunnel group identifier. The range is from 1 to 65535.
<b>priority</b> <i>DSG-rule-priority</i>	Specifies the DSG rule priority of the downstream channels. The range is from 0 to 255. The default is 0.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

The **cable dsg tg priority** command is used to configure the [Advanced Mode DOCSIS Set-Top Gateway 1.2 for the Cisco CMTS Routers](#) feature.

This command does not impact the downstream channels configured after setting the priority. The **no** form of the **cable dsg tg priority** command sets the DSG rule priority of all existing channels in a tunnel group to the default value of 0.

## Examples

The following example shows how to specify the DSG rule priority for all existing A-DSG channels in a tunnel group on a Cisco CMTS router:

```
Router(config)# cable dsg tg 1 priority 20
```

## Related Commands

Command	Description
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
<b>show cable dsg cfr</b>	Displays DSG classifier details.

## cable dsg timer

To configure the Advanced-mode DOCSIS Set-Top Gateway (A-DSG) timer entry to be associated to the downstream channel, and encoded into the downstream channel descriptor (DCD) message on a Cisco CMTS router, use the **cable dsg timer** command in global configuration mode. To remove the cable A-DSG timer, use the **no** form of this command.

```
cable dsg timer index [Tdsg1 Tdsg1] [Tdsg2 Tdsg2] [Tdsg3 Tdsg3] [Tdsg4 Tdsg4]
no cable dsg timer index [Tdsg1 Tdsg1] [Tdsg2 Tdsg2] [Tdsg3 Tdsg3] [Tdsg4 Tdsg4]
```

### Syntax Description

<i>index</i>	Defines the DSG timer and associates to an index for the downstream channel as a number from 1 to 65535.
<b>Tdsg1</b> <i>Tdsg1</i>	(Optional) Sets the DSG Initialization Timeout (Tdsg1). The range is from 1 to 65535.
<b>Tdsg2</b> <i>Tdsg2</i>	(Optional) Sets the DSG Operational Timeout (Tdsg2). The range is from 1 to 65535.
<b>Tdsg3</b> <i>Tdsg3</i>	(Optional) Sets the DSG Two-Way Retry Timer (Tdsg3). The range is from 0 to 65535.
<b>Tdsg4</b> <i>Tdsg4</i>	(Optional) Sets the DSG One-Way Retry Timer (Tdsg4). The range is from 0 to 65535.

### Command Default

The A-DSG timer is not defined.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

### Usage Guidelines

The A-DSG timer entry can be associated to the downstream to encode into the DCD message.

### Examples

The following example shows global configuration of three A-DSG timers:

```
cable dsg timer 1 Tdsg1 1 Tdsg2 2 Tdsg3 3 Tdsg4 4
cable dsg timer 2 Tdsg1 2 Tdsg2 22 Tdsg3 33 Tdsg4 44
cable dsg timer 3 Tdsg1 2 Tdsg2 600 Tdsg3 300 Tdsg4 1800
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.
<b>cable dsg vendor param</b>	Configures vendor-specific parameters for A-DSG on a Cisco CMTS router.

# cable dsg tunnel

To create Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnels on a Cisco CMTS router, use the **cable dsg tunnel** command in global configuration mode. To remove this configuration, use the **no** form of this command. To disable A-DSG tunnels, use the **disable** form of this command.

**cable dsg tunnel** *tunnel-id* **mac-addr** *mac-addr* **tg** *tunnel-group-id* **clients** *number* [**disable** | **enable**]  
**no cable dsg tunnel** *tunnel-id* **mac-addr** *mac-addr* **tg** *tunnel-group-id* **clients** *number*

Syntax Description		
	<i>tunnel-id</i>	Defines the DSG tunnel with an identifier as a number from 1–65535.
	<b>mac-addr</b> <i>mac-addr</i>	Specifies the multicast group MAC address in hexadecimal format.
	<b>tg</b> <i>tunnel-group-id</i>	Associates a tunnel group ID as a number from 1–65535.
	<b>clients</b> <i>number</i>	Specifies the client to which the configuration applies as a number from 1–65535.
	<b>disable</b>	(Optional) Disables the specified A-DSG tunnel.
	<b>enable</b>	(Optional) Enables the specified A-DSG tunnel.

**Command Default** A-DSG tunnels are not configured by default, but are enabled by default once configured.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(13a)BC	This command was introduced to support A-DSG version 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.3(17a)BC	The <b>tg</b> and <b>clients</b> keywords were added in support of A-DSG version 1.2.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The **cable dsg tunnel** command establishes the configuration of the tunnel. You can use the **disable** and **enable** keywords of the command to deactivate and activate the tunnel configuration. To remove the configuration, use the **no** form of the command.

Each tunnel is mapped to the destination MAC address and once defined, can be associated with a configured QoS service class name using the **cable dsg tunnel srv-class** command.

## Examples

The following example shows configuration of four A-DSG tunnels on a Cisco CMTS router:

```
cable dsg tunnel 1 mac-addr 0100.5e0a.0a01
cable dsg tunnel 2 mac-addr 0100.5e0a.0a02
```

```

cable dsg tunnel 3 mac-addr 0100.5e0a.0a03
cable dsg tunnel 4 mac-addr 0100.5e0a.0a04

```

**Related Commands**

Command	Description
<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.
<b>cable dsg vendor param</b>	Configures vendor-specific parameters for A-DSG on a Cisco CMTS router.

## cable dsg tunnel srv-class

To associate a cable service class with an Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnel on a Cisco CMTS router, use the **cable dsg tunnel srv-class** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cable dsg tunnel tunnel-id srv-class class-name
no cable dsg tunnel tunnel-id srv-class class-name
```

Syntax Description	
<i>tunnel-id</i>	Identifies the DSG tunnel with an identifier as a number from 1–65535.
<i>class-name</i>	Specifies the name of a configured cable service class.

**Command Default** Cable service classes are not configured or associated with a DSG tunnel.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(13a)BC	This command was introduced on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCC1	This command was modified to reflect the change in behavior of the command when the default MQoS is configured.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The A-DSG tunnel and tunnel group must be created before the **cable dsg tunnel srv-class** command becomes available to associate the tunnel with a configured QoS service class.

**Examples** The following example shows how to configure a cable service class named “test” on a Cisco CMTS router, followed by the association of that test cable service class with a DSG tunnel:

```
Router(config)# cable service class 1 name test
Router(config)# cable service class 1 downstream
Router(config)# cable service class 1 max-rate 20000
Router(config)# cable service class 1 min-rate 3000
Router(config)# cable dsg client-list 1 id-index 1 mac-addr 0050.4d00.0007
Router(config)# cable dsg tg 1 channel 1
Router(config)# cable dsg tunnel 1 mac-addr 0050.4d00.0007 tg 1 clients 1
Router(config)# cable dsg tunnel 1 srv-class test
```

When the service class name is configured without the default MQoS configuration, the following error message is displayed and the configuration is rejected prompting the user to configure the default MQoS.

```
Router(config)# cable dsg tunnel 1 srv-class test
The default mqs doesn't exist, please, create one and then reconfigure service class name
to tunnel 1
Router(config)#
```

When the last service class name is not configured, the following error message is displayed prompting the user to remove the default MQoS (if not needed.)

```
Router(config)# no cable dsg tunnel 1 srv-class test
There is no DSG tunnel associated with a service class name, so, remove the default mqs
if not needed
Router(config)#
```

### Related Commands

Command	Description
<b>cable service class</b>	Configures parameters for a DOCSIS service class on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel</b>	Associates a group of A-DSG tunnels to one or more downstream interfaces on a Cisco CMTS router.
<b>cable dsg tg channel ucid</b>	Configures the upstream channel IDs for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Specifies a vendor-specific group for an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.
<b>cable dsg vendor param</b>	Configures vendor-specific parameters for A-DSG on a Cisco CMTS router.

## cable dsg vendor-param

To configure Advanced-mode DOCSIS Set-top Gateway (A-DSG) vendor-specific parameters on a Cisco CMTS router, use the **cable dsg vendor-param** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable dsg vendor-param** *group-id* **vendor** *vendor-index* **oui** *oui* **value** *value-in-TLV*  
**no cable dsg vendor-param** *group-id* **vendor** *vendor-index* **oui** *oui* **value** *value-in-TLV*

Syntax Description		
	<i>group-id</i>	Defines the DSG vendor parameter and associates with a DSG group.
	<b>vendor</b> <i>vendor-index</i>	Selects the DSG vendor and associated DSG index.
	<b>oui</b> <i>oui</i>	Selects the DSG Organizationally Unique Identifier (OUI) setting.
	<b>value</b> <i>value-in-TLV</i>	Sets the type/length value for the defined DSG vendor.

**Command Default** The A-DSG vendor-specific parameters are not defined.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(13a)BC	This command was introduced to support A-DSG on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The vendor-specific parameters can be associated to the downstream to encode into the Downstream Channel Descriptor (DCD) message.

To associate a vendor parameter list with a tunnel group, use the **cable dsg tg channel vendor-param** command. The same vendor parameter list can be associated with multiple tunnel groups.

**Examples** The following sample configuration illustrates global vendor parameters for A-DSG:

```
cable dsg vendor-param 1 vendor 1 oui ABCDEA value 0101AB
cable dsg vendor-param 2 vendor 1 oui ABCDEB value 0101AB
cable dsg vendor-param 3 vendor 1 oui ABCDEC value 0101AB
```

Related Commands	Command	Description
	<b>cable dsg cfr</b>	Defines and enables A-DSG classifiers on a Cisco CMTS router.

Command	Description
<b>cable dsg chan-list</b>	Configures the A-DSG downstream channel list on a Cisco CMTS router.
<b>cable dsg client-list</b>	Configures the A-DSG client parameters and the associated DSG rule on a Cisco CMTS router.
<b>cable dsg tg channel vendor-param</b>	Associates a vendor-specific group with an A-DSG tunnel group on a Cisco CMTS router.
<b>cable dsg timer</b>	Configures the A-DSG timer on a Cisco CMTS router.
<b>cable dsg tunnel</b>	Creates A-DSG tunnels on a Cisco CMTS router.
<b>cable dsg tunnel srv-class</b>	Associates a cable service class with an A-DSG tunnel on a Cisco CMTS router.

## cable dynamic-bonding-group

To enable dynamic bonding group, use the **cable dynamic-bonding-group** command. To disable dynamic bonding group, use the no form of the command.

**cable dynamic-bonding-group** [ **eight-contiguous-channel** | **load-balance** | **reclaim-hold-interval** { **percent** *percentage* | **modems** *count* } | **reclaim-threshold** | **registration** | **snmp** ]

Syntax Description		
<b>eight-contiguous-channel</b>		Forces the cBR-8 router to create 8-channel DBG with contiguous frequency channels.
<b>load-balance</b>		Specifies that the dynamic bonding group creation can be triggered by the load balancing.
<b>reclaim-hold-interval</b>		Specifies the time interval in seconds between DBG unused and reclaim. The default value is 600 seconds. The range is 30-3600 seconds.
<b>reclaim-threshold percent</b> <i>value</i> <b>modems</b> <i>count</i>		Specifies the bonding group reclaim thresholds. The default values are 5 for <i>value</i> and 6 for <i>count</i> .
<b>registration</b>		Specifies that the dynamic bonding group creation can be triggered by the cable modem registration.
<b>snmp</b>		Enable the snmp trap on dynamic bonding group.

**Command Default** The Dynamic Bonding Group is disabled by default.

**Command Modes** Global configuration (config).

Command History	Release	Modification
	Cisco IOS XE 16.7.1	This command is introduced on the Cisco cBR Series Converged Broadband Router.
	Cisco 1x2 / Compact Shelf RPD Software 4.1	This command is modified to add <b>reclaim-threshold</b> , <b>registration</b> , and <b>load-balance</b> options.
	Cisco IOS XE Bengaluru 17.6.1x	This command is modified to add <b>eight-contiguous-channel</b> option.
	Cisco IOS XE Dublin 17.12.1w	This <b>reclaim-hold-interval</b> option is added.

The following example shows how to configure the time interval between DBG unused and reclaim:

```
router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
router(config)# cable dynamic-bonding-group reclaim-hold-interval 1000
router(config)# end
```

Use the following command to verify the above configuration:

```
router# show run | s reclaim-hold-interval
cable dynamic-bonding-group reclaim-hold-interval 1000
```

The following example enables dynamic bonding group on a modular cable interface using the **cable dynamic-bonding-group** command:

```
router # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
router(config)# cable dynamic-bonding-group
router(config)# end
```

The following example shows how to configure the bonding group reclaim thresholds:

```
router # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
router(config)# cable dynamic-bonding-group reclaim-threshold percent 5% modems 6
router(config)# end
```

# cable dynamic-bw-sharing

To enable dynamic bandwidth sharing (DBS) on a specific modular cable or wideband cable interface, use the **cable dynamic-bw-sharing** command in interface configuration mode. To disable DBS on the interface and revert to static bandwidth sharing, use the **no** form of this command.

**cable dynamic-bw-sharing**  
**no cable dynamic-bw-sharing**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Dynamic bandwidth sharing is disabled and static bandwidth sharing is enabled.

**Command Modes** Interface configuration (config-if)

Release	Modification
12.3(23)BC1	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS release 12.2(33)SCB.
12.2(33)SCE	The command default was changed. The DBS mode is now enabled by default.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** DBS may be configured on a modular cable or wideband cable interface only when the interface is administratively down. Additionally, the interface must be administrative down when using the no form of this command to disable dynamic bandwidth sharing.

**Note** Starting with Cisco IOS Release 12.2(33)SCE, the DBS mode is enabled by default, on the WB/MC/IC interfaces. To disable the DBS mode, configure the **no cable dynamic-bw-sharing** command.

**Note** Starting with Cisco IOS-XE 3.15.0S, DBS is enabled by default on cBR series Converged Broadband Routers and cannot be disabled on.

## Examples

The following example enables dynamic bandwidth sharing on a modular cable interface using the **cable dynamic-bw-sharing** command:

```
Router(config)# interface modular-cable 1/0/0:1
Router(config-if)# shutdown
Router(config-if)# cable dynamic-bw-sharing
Router(config-if)# no shutdown
```

The following example enables dynamic bandwidth sharing on a wideband cable interface using the **cable dynamic-bw-sharing** command:

```
Router(config)# interface wideband-cable 1/0/0:0
Router(config-if)# shutdown
Router(config-if)# cable dynamic-bw-sharing
Router(config-if)# no shutdown
```

#### Related Commands

Command	Description
<b>cable rf-bandwidth-percent</b>	Enables either static or dynamic bandwidth sharing for a modular cable (MC) interface.
<b>cable rf-channel</b>	Associates an RF channel on a Wideband SPA with a wideband channel and allocates bandwidth.
<b>debug cr10k-rp dbs-queue</b>	Displays debug information for dynamic bandwidth sharing (DBS) on the Cisco uBr10012 universal broadband router.
<b>show pxf cable controller</b>	Displays information about the RF channel Versatile Traffic Management System (VTMS) links and link queues.
<b>show pxf cpu queue</b>	Displays parallel express forwarding (PXF) queueing and link queue statistics.

## cable dynamic-flow vrf

To configure a VPN routing or forwarding instance for dynamic flow settings, use the **cable dynamic-flow vrf** command. To disable this feature, use the no form of this command.

```
{ no } cable dynamic-flow vrf vrf
```

<b>Syntax Description</b>	<i>vrf</i> Specifies the VPN Routing/Forwarding instance name				
<b>Command Default</b>	By default, no VPN routing or forwarding instance is configured.				
<b>Command Modes</b>	cable interface (config-if) MAC domain profile configuration (config-profile-md)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.15.0S</td> <td>This command was implemented on the Cisco cBR Series Converged Broadband Router.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.
Release	Modification				
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.				

### Example

The following sample shows an example of the **cable dynamic-flow vrf** command.

```
Router# conf t
Router(config)#vrf definition vrpd
Router(config-vrf)#vrf definition vrpd
Router(config-vrf)# rd 27:1
Router(config-vrf)# route-target export 27:1
Router(config-vrf)# route-target import 27:1
Router(config-vrf)#
Router(config-vrf)# address-family ipv4
Router(config-vrf-af)# route-target export 27:1
Router(config-vrf-af)# route-target import 27:1
Router(config-vrf-af)#end

Router# conf t

Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # cable dynamic-flow vrf vrpd
Router(config-profile-md) # no cable dynamic-flow vrf vrpd
Router(config-profile-md)#end
```

## cable dynamic-qos trace

To enable the call trace functionality on the Cisco CMTS router for the PacketCable or PacketCable Multimedia (PCMM) service subscribers, use the **cable dynamic-qos trace** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**cable dynamic-qos trace** *subscriber-number*  
**no cable dynamic-qos trace**

### Syntax Description

<i>subscriber-number</i>	Number of subscribers for a PacketCable or PCMM service. The range is from 1 to 20.
--------------------------	-------------------------------------------------------------------------------------

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

### Examples

The following example shows how to configure the call trace functionality on the Cisco uBR10012 router for the PacketCable or PCMM service subscribers:

```
Router# configure terminal
Router(config)# cable dynamic-qos trace 12
```

### Related Commands

Command	Description
<b>debug cable dynamic-qos subscriber</b>	Enables debugging of the call trace functionality on the Cisco CMTS router for a particular subscriber.
<b>debug cable dynamic-qos trace</b>	Enables call trace debugging on the Cisco CMTS router for all the subscribers for whom call trace is configured.
<b>show cable dynamic-qos trace</b>	Displays the number of subscribers for whom call trace is enabled on the Cisco CMTS router.

## cable dynamic-secret

To enable the Dynamic Shared Secret feature, so that Data-over-Cable Service Interface Specifications (DOCSIS) configuration files are verified with a Message Integrity Check (MIC) that has been created with a dynamically generated shared secret, use the **cable dynamic-secret** command in cable interface configuration mode or MAC domain profile configuration mode. To disable this feature, use the **no** form of this command.

```
cable dynamic-secret {lock [lock-qos] | mark | reject} [nocrypt]
no cable dynamic-secret
```

### Syntax Description

<b>lock</b>	Allows CMs that do not pass MIC verification to come online, but with a restrictive quality of service (QoS) configuration that limits access to the network. The CMTS also locks those CMs so that they must be offline for 24 hours before being allowed to reregister with a valid DOCSIS configuration file. (You can also manually unlock a cable modem using the <b>clear cable modem lock</b> command.)
<i>lock-qos</i>	(Optional) Specifies the QoS profile to be assigned to the CM while it is locked. The valid range is 1 to 256. If not specified, the CM is locked into a CMTS-created profile that limits both the upstream and downstream to 10 Kbps.  <b>Note</b> The QoS profile must have already been created before it can assigned using the <b>lock lock-qos</b> option.
<b>mark</b>	Allows CMs to come online even if they do not present a DOCSIS configuration file with a valid CMTS MIC, but the CMTS prints a warning message and marks those CMs with an exclamation point (!) in the <b>show cable modem</b> command.
<b>reject</b>	Rejects registration for CMs with DOCSIS configuration files that contain an invalid CMTS MIC.
<b>nocrypt</b>	(Optional) Specifies that the filename for DOCSIS configuration files should not be encrypted when the Cisco CMTS sends the files to CMs. The CMTS instead transmits the files using their original filenames.  The <b>nocrypt</b> option slightly decreases the security provided by the dynamic shared secret feature, but it allows the operator to poll the DOCSIS config file name listed by the cable modem for more convenient network management.  <b>Note</b> A cable modem that is running unauthorized or hacked software can return whatever SNMP values the user desires. This information should therefore not be trusted by the billing and provisioning systems.

### Command Default

The Dynamic Shared Secret feature is disabled. When enabled, the filenames for DOCSIS configuration files are encrypted.

### Command Modes

Interface configuration—cable interface only (config-if)

Wideband-interface profile configuration (config-profile-wb)

MAC domain profile configuration (config-profile-md)

**Note** Configuring the Dynamic Shared Secret feature on the primary interface in a bundle also automatically configures it for all interfaces in the bundle.

### Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.2(15)BC1b	Support for the <b>nocrypt</b> option was added.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable dynamic-secret** configuration command automatically creates a unique DOCSIS shared secret on a per-modem basis, creating a one-time-use DOCSIS configuration file that is valid only for the current session. This ensures that a DOCSIS configuration file that has been downloaded for one cable modem can never be used by any other modem, nor can the same modem reuse this configuration file at a later time. This patent-pending feature is designed to guarantee that all registered modems are using only the QOS parameters that have been specified by the DOCSIS provisioning system for that particular modem at the time of its registration.

The **cable dynamic-secret** configuration command enhances the existing shared secret support on the Cisco CMTS by using a one-time, dynamically generated shared secret each time a cable modem registers. This prevents theft-of-service attacks in which users are able to substitute a DOCSIS configuration file that provides a higher-level of service during the registration phase.

The DOCSIS specification allows cable service providers to use a shared secret to create the CMTS MIC value that is stored in a DOCSIS configuration file. If a user attempts to register with the CMTS using a different or modified DOCSIS configuration file, the CMTS can compare the CMTS MIC value sent by the cable modem with the CMTS MIC it has calculated. If the two MIC values are different, the file has been modified.

The **cable dynamic-secret** command allows the CMTS to dynamically create the shared secret at the time that the cable modem is registering, and that shared secret is valid only for that particular session with that particular cable modem. A new dynamically generated shared secret is used each time each cable modem registers, which prevents users from guessing the shared secret and using it again to register with a modified DOCSIS configuration file.

If the cable modem's DOCSIS configuration file fails the CMTS MIC verification check, one of the following messages is displayed on the console:

```
%UBR7200-4-BADCFGFILE: Modem config file platinum.cm at C3/0: CMTS MIC Invalid
%UBR7200-4-BADCFGFILE: Modem config file platinum.cm at C3/0: No CMTS MIC
```

If the error message specifies that the reason for the failure is “CMTS MIC Invalid,” the CMTS MIC was not encoded with the proper dynamically generated shared secret. If the reason is “No CMTS MIC,” the DOCSIS configuration file did not contain any value for the CMTS MIC, which could indicate that the customer has attempted to bypass the DOCSIS security checks by creating the user’s own DOCSIS configuration file without any MIC values.

---

**Note** The Dynamic Shared Secret feature does not affect the use of the original shared secret or secondary shared secrets that are configured using the **cable shared-secondary-secret** and **cable shared-secret** commands. (Cisco cBR-8 router does not allow the simultaneous configuration of the two commands.) If these shared secrets are configured, the Cisco CMTS continues to use them to validate the original DOCSIS configuration file that is downloaded from the TFTP server. If the DOCSIS configuration file fails to pass the original or secondary shared secret verification checks, the cable modem is not allowed to register, and the Dynamic Shared Secret feature is not invoked for that particular cable modem.

---

---

**Note** The Cisco uBR7100 series router does not support the Dynamic Shared Secret feature when running in MxU bridging mode.

---

The original filename for the DOCSIS configuration file is automatically encrypted by default to prevent unauthorized parties from obtaining any useful information from the filename, or from attempting to replace the original file with their own. This encryption can be disabled, using the **nocrypt** option, so that DOCSIS configuration files are sent using their original filenames.

---

**Note** Do not use the **cable dynamic-secret** command along with the **ip tftp-source** command in Cisco IOS Release 12.2(15)BC1, because this could result in certain models of CMs not being able to come online but instead be stuck in the init(o) state. This restriction is removed in Cisco IOS Release 12.2(15)BC2 and later releases.

---

### Modes of Operation

The **cable dynamic-secret** command offers three different possible responses to cable modems that fail the CMTS MIC verification check:

- When the **mark** option is used, the CMTS allows CMs to come online even if they fail the CMTS MIC validity check. However, the CMTS also prints a warning message on the console and marks the cable modem in the **show cable modem** command with an exclamation point (!), so that this situation can be investigated. The following message is displayed on the console when such a CM registers with the Cisco CMTS:

```
06:53:57: %UBR7200-4-CMMARKED: Cable Modem 00ff.ffee.ddcc in C3/0 attempted theft of service
```

- When the **lock** option is used, the CMTS assigns a restrictive QoS configuration to CMs that fail the CMTS MIC validity check. If an optional *lock-qos* profile is specified, the CMTS assigns this profile to the CM while it is locked.

If the *lock-qos* profile is not specified, the CMTS uses a special QoS configuration that limits the network access for these CMs by restricting their downstream and upstream service flows to a maximum rate of 10

kbps. (If you do not specify the *lock-qos* profile, you must also allow cable modems to create QoS profiles, using the **cable qos permission** command. If you do not do this and use the **lock** option without specifying a particular QoS profile, locked cable modems will not be allowed to register until the lock clears or expires.)

If a customer resets their CM, the CM will reregister but still uses the restricted QoS profile. A locked CM continues with the restricted QoS profile until it goes offline and remains offline for at least 24 hours, at which point it is allowed to reregister with a valid DOCSIS configuration file. This option frustrates users who are repeatedly registering with the CMTS in an attempt to guess the shared secret, or to determine the details of the Dynamic Shared Secret security system.

In addition, the following message is displayed on the console when a CM is locked.

```
06:53:57: %UBR7200-4-CMLOCKED: Cable Modem 00ff.ffee.ddcc in C3/0 attempted theft of service
```

Locked cable modems are shown with an exclamation point (!) in the **show cable modem** displays:

```
Router# show cable modem

MAC Address      IP Address      I/F      MAC      Prim RxPwr  Timing  Num BPI
                  State          Sid  (db)    Offset  CPE  Enb
0010.9507.01db  144.205.151.130 C5/1/0/U5 online(pt)  1    0.25    938    1    N
0080.37b8.e99b  144.205.151.131 C5/1/0/U5 online      2    -0.25   1268   0    N
0002.fdfa.12ef  144.205.151.232 C6/1/0/U0 online(pt)  13   -0.25   1920   1    N
0002.fdfa.137d  144.205.151.160 C6/1/0/U0 !online    16   -0.50   1920   1    N
0003.e38f.e9ab  144.205.151.237 C6/1/0/U0 !online     3   -0.50   1926   1    N
Router#
```

**Tip** You can also manually clear the lock on a CM by using the **clear cable modem lock** command.

- When the **reject** option is used, the CMTS refuses to allow CMs to come online if they fail the CMTS MIC validity check. These cable modems appear with a MAC state of “reject(m)” in the displays generated by the **show cable modem** command. After a short timeout period, the CM attempts to reregister with the CMTS. The CM must register with a valid DOCSIS configuration file before being allowed to come online. When the CM does come online, the CMTS prints a warning message on the console and marks the cable modem in the **show cable modem** command with an exclamation point (!), so that this situation can be investigated.

**Tip** Cisco recommends that you initially use the **mark** option, so that potential problems are identified without immediately interfering with users’ ability to come online. After you identify and resolve these initial problems, reconfigure the cable interfaces with the **reject** or **lock** option to block problem cable modems that attempt to come online without a valid shared secret.

**Note** To account for possible network problems, such as loss of packets and congestion, the Cisco CMTS will allow a cable modem to attempt to register twice before marking it as having failed the Dynamic Shared Secret authentication checks.

### Filename Encryption

By default, the **cable dynamic-secret** command encrypts the original filename for a DOCSIS configuration file when the Cisco CMTS transmits the file to the CM. This filename changes in a semi-random manner, making it difficult for users to predict the filename for the file that should be downloaded to the CM.

This does mean, however, that the filenames specified in the DHCP HELLO and ACK messages are different, and that the filenames on the CM and on the TFTP server are different. This could interfere with custom network management applications and scripts. If this is the case, you can disable the automatic filename encryption by adding the **nocrypt** option to the command.

The **nocrypt** option does slightly decrease the security provided by this feature, so this possibility should be weighed against the ability to more conveniently manage the network.

### Interaction with the TFTP Enforce Feature

**Note** Cisco cBR-8 router does not support **cable tftp-enforce** command.

The **cable tftp-enforce** command provides another layer of protection against theft-of-service attacks by requiring cable modems to download a DOCSIS configuration file through the CMTS cable interface before being allowed to register. When the **cable tftp-enforce** command is used with the **cable dynamic-secret** command, the TFTP enforce checks are done before the dynamic shared-secret checks. If a cable modem fails to download a DOCSIS configuration file through the CMTS, it is not allowed to register, regardless of the dynamic shared-secret checks.

### Displaying Rogue Cable Modems

Use the **show cable modem rogue** command to display the cable modems that have failed the dynamic shared-secret authentication checks:

```
Router# show cable modem rogue

```

MAC Address	Vendor	Interface	Spoof Count	TFTP Dnld	Dynamic Secret
AAAA.7b43.aa7f	Vendor1	C4/0/U5	2	Yes	45494DC933F8F47A398F69EE6361B017
AAAA.7b43.aa7f	Vendor1	C4/0/U5	2	Yes	D47BCBB5494E9936D51CB0EB66EF0B0A
BBBB.7b43.aa7f	Vendor2	C4/0/U5	2	No	8EB196423170B26684BF6730C099D271
AAAA.7b43.aa7f	Vendor1	C4/0/U5	2	No	DF8FE30203010001A326302430120603
BBBB.7b43.aa7f	Vendor2	C4/0/U5	2	No	300E0603551D0F0101FF040403020106
AAAA.7b43.aa7f	Vendor1	C4/0/U5	2	Yes	820101002D1A264CE212A1BB6C1728B3
DDDD.7b43.aa7f	Vendor4	C4/0/U5	2	Yes	7935B694DCA90BC624AC92A519C214B9
AAAA.7b43.aa7f	Vendor1	C4/0/U5	2	No	3AB096D00D56ECD07D9B7AB662451CFF

```
Router#
```

If the CMTS cannot obtain the DOCSIS configuration file from the TFTP server, a message similar to the following is displayed on the console:

```
%UBR7200-4-NOCFGFILE: Cannot read modem config file platinum.cm from C3/0: <reason>
```

where the reason can be one of the following, depending on the error that the TFTP server reported:

- Compression Failed
- File too big
- Invalid Checksum
- Invalid IP address or hostname
- Uncompression Failed

- User Abort

## Examples

The following example shows how to configure a cable interface on a Cisco uBR7200 series router with the **mark** option, so that CMs that fail the MIC verification are allowed to register but are marked in the **show cable modem** displays so that their situation can be further investigated:

```
Router# configure terminal
Router(config)# interface cable 4/0
Router(config-if)# cable dynamic-secret mark
Router(config-if)# exit
Router(config)# exit
Router#
```

The following example shows how to configure the cable interface on a Cisco uBR7100 series router, so that CMs that fail the MIC verification are locked with a QoS profile that limits upstream and downstream service flows to 10 kbps:

```
Router# configure terminal
Router(config)# cable qos permission create
Router(config)# cable qos permission update
Router(config)# interface cable 1/0
Router(config-if)# cable dynamic-secret lock
Router(config-if)# exit
Router(config)# exit
Router#
```

---

**Note** If you do not use the **cable qos permission** global configuration command to allow cable modems to create their own QoS profiles, the CMTS rejects this command and displays the following error message: %Need permission for modems to create QoS profile

---

The following example shows how to configure a cable interface so that CMs that fail the MIC verification are locked with a specific QoS profile:

```
Router# configure terminal
Router(config)# interface cable 1/0
Router(config-if)# cable dynamic-secret lock 31
Router(config-if)# exit
Router(config)# exit
Router#
```

**Note** If the specified QoS profile does not exist, the CMTS rejects this command and displays the following error message: %Profile *qos-id* to lock modem does not exist

The following example shows how to configure a cable interface on a Cisco uBR7200 series router, so that CMs that fail the MIC verification are not allowed to register and must reregister with a valid DOCSIS configuration file before being allowed to come online:

```
Router# configure terminal
Router(config)# interface cable 3/0
Router(config-if)# cable dynamic-secret reject
Router(config-if)# exit
Router(config)# exit
Router#
```

The following example shows how to disable the Dynamic Shared Secret feature on a cable interface on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 6/1/0
Router(config-if)# no cable dynamic-secret
Router(config-if)# exit
Router(config)# exit
Router#
```

**Related Commands**

Command	Description
<b>cable dynamic-secret exclude</b>	Excludes one or more specific cable modems from being processed by the Dynamic Shared Secret feature.
<b>cable shared-secondary-secret</b>	Configures one or more secondary shared secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable shared-secret</b>	Configures an authentication shared secret key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable tftp-enforce</b> (for uBR series router)	Requires that all CMs on a cable interface attempt to download a DOCSIS configuration file using Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs, and reinitializes them, so that they can reregister with a valid DOCSIS configuration file.

Command	Description
<b>show cable modem rogue</b>	Displays a list of cable modems that have been marked, locked, or rejected because they failed the dynamic shared-secret authentication checks.

## cable dynamic-secret exclude

To exclude one or more specific cable modems from being processed by the Dynamic Shared Secret feature, use the **cable dynamic-secret exclude** command in global configuration mode. To disable this feature, use the **no** form of this command.

```
cable dynamic-secret exclude {modem mac-address | oui oui-id}
no cable dynamic-secret {modem mac-address | oui oui-id}
```

### Syntax Description

<b>modem</b> <i>mac-address</i>	Specifies the hardware (MAC) address of a specific individual cable modem to be excluded from the Dynamic Shared Secret feature. (You cannot specify a multicast MAC address.)
<b>oui</b> <i>oui-id</i>	Specifies the organization unique identifier (OUI) of a vendor, so that cable modems from this vendor are excluded from the Dynamic Shared Secret feature. The OUI should be specified as three hexadecimal bytes separated by either periods or colons.

### Command Default

All modems are processed by the Dynamic Shared Secret feature when the feature is enabled.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(9a)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

When the **cable dynamic-secret** configuration command is configured on a cable interface, it automatically includes all cable modems that register on that interface. To exclude one or more cable modems from being processed by the Dynamic Shared Secret security checks, use the **cable dynamic-secret exclude** command in global configuration mode.

You may exclude cable modems from the Dynamic Shared Secret security checks if they need to download additional files from the TFTP server at registration time. For example, Cisco cable CPE devices, such as the Cisco uBR925 cable access router, can be instructed to download a Cisco IOS configuration file after downloading the DOCSIS configuration file.

However, when Dynamic Shared Secret checks are being used, the Cisco CMTS does not allow the cable modem to download any other files after the first successful download of the DOCSIS configuration file. To allow these cable modems to download their Cisco IOS configuration files, use the **cable dynamic-secret-exclude** command to exclude them from the Dynamic Shared Secret checks.

You can exclude either a specific cable modem by its MAC address, or all of a vendor's cable modems by their OUI value. Excluded cable modems must still register according to the normal DOCSIS provisioning

procedures, but their DOCSIS configuration files are no longer verified by the Dynamic Shared Secret security checks.

**Tip** When a cable modem is excluded from the Dynamic Shared Secret feature, the Dynamic Secret field in its **show cable modem verbose** display shows “Excluded”.

## Examples

The following example shows how to exclude a specific cable modem, with the MAC address of 00d0.45ba.b34b, from being processed by the Dynamic Shared Secret feature:

```
Router# configure terminal
Router(config)# cable dynamic-secret exclude modem 00d0.45ba.b34b
Router(config)# exit
Router#
```

The following example shows how to exclude all cable modems with a vendor OUI value 00.01.B4 from being processed by the Dynamic Shared Secret feature:

```
Router# configure terminal
Router(config)# cable dynamic-secret exclude oui 00.01.B4
Router(config)# exit
```

## Related Commands

Command	Description
<b>cable dynamic-secret</b>	Enables the Dynamic Shared Secret feature, so that DOCSIS configuration files are verified with a MIC that has been created with a dynamically generated shared secret.
<b>cable shared-secondary-secret</b>	Configures one or more secondary shared secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable shared-secret</b>	Configures an authentication shared secret key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable tftp-enforce</b> (for uBR series router)	Requires that all CMs on a cable interface attempt to download a DOCSIS configuration file using Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs, and reinitializes them, so that they can reregister with a valid DOCSIS configuration file.
<b>show cable modem rogue</b>	Displays a list of cable modems that have been marked, locked, or rejected because they failed the dynamic shared-secret authentication checks.

# cable dynamic-secret tftp insert-upgrade-server

To dynamically insert the IPv4 or IPv6 TLV values in the Data-over-Cable Service Interface Specifications (DOCSIS) configuration file to complete firmware upgrade on cable modems, use the **cable dynamic-secret tftp insert-upgrade-server** command in the global configuration mode.

```
cable dynamic-secret tftp insert-upgrade-server
no cable dynamic-secret tftp insert-upgrade-server
```

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCD2	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The Dynamic Shared Secret feature must be configured before you can upgrade the firmware on cable modems. To enable this feature, execute the **cable dynamic-secret** command in the cable interface configuration mode.

**Examples** The following example dynamically inserts the correct IPv4 or IPv6 TLV values from the DOCSIS configuration file to upgrade firmware on the cable modems.

```
Router(config)# cable dynamic-secret tftp insert-upgrade-server
Router(config)# end
```

Related Commands	Command	Description
	<b>cable dynamic-secret</b>	Enables the Dynamic Shared Secret feature so that DOCSIS configuration files are verified with a Message Integrity Check (MIC) that has been created with a dynamically generated shared secret.
	<b>cable dynamic-secret exclude</b>	Excludes one or more specific cable modems from being processed by the Dynamic Shared Secret feature.
	<b>clear cable modem lock</b>	Resets the lock on one or more CMs, and re-initializes them, so that they can reregister with a valid DOCSIS configuration file.

## cable enable-trap

To permanently set four CISCO-DOCS-EXT-MIB MIB attributes that enable the sending of a trap when a CM changes between the online and offline states, use the **cable enable-trap** command in cable interface configuration mode. To return to the default settings found in the MIB, which disable the sending of these traps, use the **no** form of this command.

**cable enable-trap** [**cmonoff-notification** | **cmonoff-interval** *time-in-secs*]

**no cable enable-trap** [**cmonoff-notification** | **cmonoff-interval**]

### Syntax Description

<b>cmonoff-notification</b>	Enables or disables the sending of the notification traps.
<b>cmonoff-interval</b>	Specifies the minimum interval that must pass before sending out a new trap for the same CM.
<i>time-in-secs</i>	Specifies the number of seconds. The range is from 0 to 86400. The default is zero.

### Command Default

The default is to use the MIB defaults, which specify that traps must not be sent. The default value is zero seconds.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
12.0(13)SC	This command was introduced.
12.1(5)EC1	This command was added to the 12.1 EC train and support was added for the Cisco uBR7100 series routers.
12.2(4)BC1	This command was added to the 12.2 BC train and support was added for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command sets four attributes in the CISCO-DOCS-EXT-MIB MIB, so that the new values can be automatically loaded whenever the CMTS router powers on or reloads. To do so, put the appropriate commands in the configuration file and save it to the CMTS router's Flash memory. The CMTS router automatically sets the appropriate MIB values when it processes the configuration file at startup.

These commands affect whether the CM online/offline notification trap (cdxCmtsCmOnOffNotification) is sent, and if so, the minimum interval that must exist between traps that are sent for the same CM undergoing the same state changes. The following describes the relationship between these commands and the attributes in the CISCO-DOCS-EXT-MIB MIB:

- The **cable enable-trap cmonoff-notification** command sets the `cdxCmtsCmOnOffTrapEnable` attribute to 1 (true), which enables the sending of the CM online and offline traps.
- The **no cable enable-trap cmonoff-notification** command sets the `cdxCmtsCmOnOffTrapEnable` attribute to 2 (false), which disables the sending of the CM online and offline traps.
- The **cable enable-trap cmonoff-interval** command sets the `cdxCmtsCmOnOffTrapInterval` attribute to the specified time period (0 to 86400 seconds), which sets the minimum interval that must exist before the CMTS sends out the same trap for the same CM.

For example, if the interval is set to 600 seconds, and the same CM goes offline three times and online twice in that time period, only one online trap and one offline trap is sent to the SNMP manager.

- The **no cable enable-trap cmonoff-interval** command sets the `cdxCmtsCmOnOffTrapInterval` attribute to 0, which means a trap will be sent for every CM online/offline transition.

---

**Note** cBR-8 does not support sending modem on/off event notifications to the syslog-server.

---

---

**Note** Setting the **cmonoff-interval** option and the `cdxCmtsCmOnOffTrapInterval` attribute has meaning only if `cdxCmtsCmOnOffNotification` traps have been previously enabled.

---

## Examples

The following commands enable the sending of CM on or off traps, with a minimum interval of 1200 seconds between traps being sent for the same CM:

```
router(config)# interface c6/0

router(config-if)# cable enable-trap cmonoff-notification
router(config-if)# cable enable-trap cmonoff-interval 1200
router(config-if)# exit
```

```
router(config)#
```

The following commands disable the sending of CM on or off traps.

```
router(config)# interface c6/0

router(config-if)# no cable enable-trap cmonoff-notification
router(config-if)# exit
```

```
router(config)#
```

## Related Commands

Command	Description
<b>snmp-server enable traps cable</b>	Enables traps for cable-related events.
<b>snmp-server enable traps docsis-cmts</b>	Enables traps for DOCSIS-related MAC-layer events.

## cable event priority

To configure the event reporting flags for DOCSIS event messages, which determines how the Cisco CMTS reports these events, use the **cable event priority** command in global configuration mode. To return to the default settings found in the MIB, use the **no** form of this command.

**cable event priority** {**alert** | **critical** | **debug** | **emergency** | **error** | **informational** | **notice** | **warning**}  
*flags*

### Syntax Description

<b>alert</b>	Sets the event reporting flag for alert system error messages. (Alert messages indicate that some type of system or connection failure has occurred and requires immediate attention.)
<b>critical</b>	Sets the event reporting flag for critical system error messages. (Critical messages indicate that an error occurred which requires immediate attention to avoid system or connection failure.)
<b>debug</b>	Sets the event reporting flag for debug system error messages. (Debug messages appear only when debugging has been enabled.)
<b>emergency</b>	Sets the event reporting flag for emergency system error messages. (Emergency messages indicate that the system has become unusable and requires immediate attention. This problem might also be affecting other parts of the network.)
<b>error</b>	Sets the event reporting flag for error system error messages. (Error messages indicate that an error condition occurred that requires attention to resolve. Failure to address this problem will result in some type of system or connection failure in the near future.)
<b>informational</b>	Sets the event reporting flag for informational system error messages. (Informational messages might or might not be significant to the system administrators.)
<b>notice</b>	Sets the event reporting flag for notice system error messages. (Notice messages indicate that a situation occurred that is normal but is significant enough that system administrators might want to notice.)
<b>warning</b>	Sets the event reporting flag for warning system error messages. (Warning messages indicate that a condition occurred that indicates attention is needed in near future to avoid potential problems. Failure to address this problem could result in some type of system or connection failure later on.)
<i>flags</i>	Sets the event reporting flags value, in hex, which specifies how this particular type of event message should be reported. The valid range is 0x0 through 0xF0, which is a bitmask specifying the types of reporting that should be done. See the Usage Guidelines for details.

### Command Default

The defaults are configured as per the [DOCSIS 1.1 Operations Support System Interface \(OSSI\) Specification](#):

- Emergency and alert messages = (0x10) (reported to the local volatile log)
- Critical, error, warning, and notice = (0x70) (reported to the local volatile log, and forwarded as traps and to the SYSLOG server)
- Information and debug = 0x0 (not reported)

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.2(8)BC1	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The DOCSIS 1.1 specifications require the CMTS to generate a set of messages for DOCSIS-specific events. These messages can be assigned one of eight priority levels, ranging from emergency (the highest level) to debug (the lowest level), and the CMTS can be configured to log each level of messages differently.

The Cisco CMTS supports the following types of logging, as defined by the [DOCS-CABLE-DEVICE-MIB](#) MIB ([RFC 2669](#)):

- none (0x0) = DOCSIS messages are not reported. (The corresponding Cisco IOS event messages, however, continue to be logged.)
- local-volatile (0x10) = DOCSIS messages are saved in a local log on the CMTS. This log can be limited in size and can automatically discard previous messages to make room for incoming messages.
- syslog (0x20) = DOCSIS messages are sent to a SYSLOG server (if one has been configured, using the **cable event syslog-server** command).
- traps (0x40) = DOCSIS messages are sent as SNMP traps to one or more SNMP managers.

These values can be added together to specify that the CMTS should report an event in more than one way. For example, a value of 0x70 specifies that the CMTS should record the event in its local volatile log, and also send it both as a trap and as a SYSLOG message.

**Note** If event messages are configured for traps or syslog reporting, they must also be configured for either local volatile or local non-volatile reporting. This means that values 0x20 (syslog-only), 0x40 (trap-only), and 0x60 (syslog and trap only) are not supported.

Use the **cable event priority** command to set the reporting flags for each type of event. This also configures the appropriate instance of the docsDevEvReporting attribute [DOCS-CABLE-DEVICE-MIB](#) MIB ([RFC 2669](#)) with the same value.

**Note** This command affects only the DOCSIS event messages, and does not affect how the Cisco IOS software handles event messages. If SYSLOG traps are enabled on the Cisco CMTS (using the **snmp-server enable traps syslog** command), they continue to be sent, regardless of the **cable event priority** configuration.

## Examples

The following commands configure the Cisco CMTS so that it reports all emergency, alert, and critical messages as SNMP traps and SYSLOG messages, as well as logging it in the local volatile log:

```
Router# configure terminal
Router(config)# cable event priority alert 0x70
Router(config)# cable event priority critical 0x70
Router(config)# cable event priority emergency 0x70
```

The following commands configure the Cisco CMTS so that it reports the lowest priority messages only to the local volatile log and SYSLOG server:

```
Router# configure terminal
Router(config)# cable event priority debug 0x30
Router(config)# cable event priority informational 0x30
Router(config)# cable event priority notice 0x30
```

## Related Commands

Command	Description
<b>cable event syslog-server</b>	Enables logging of DOCSIS event messages to a SYSLOG server.
<b>cable event throttle-adminStatus</b>	Configures how the Cisco CMTS throttles the SNMP traps and SYSLOG messages it generates for DOCSIS event messages.
<b>cable event throttle-interval</b>	Specifies the throttle interval, which helps control how often the Cisco CMTS generates SNMP traps and SYSLOG messages for DOCSIS event messages.
<b>cable event throttle-threshold</b>	Sets the maximum number of SNMP traps and SYSLOG messages that the Cisco CMTS can generate for DOCSIS event messages during the throttle interval.
<b>snmp-server enable traps cable</b>	Enables traps for cable-related events.
<b>snmp-server enable traps docsis-cmts</b>	Enables traps for DOCSIS-related MAC-layer events.

## cable event syslog-server

To enabling logging of DOCSIS event messages to a SYSLOG server, use the **cable event syslog-server** command in global configuration mode. To disable the logging of a DOCSIS syslog server, use the **no** form of this command.

**cable event syslog-server** *ip-address*  
**no cable event syslog-server**

<b>Syntax Description</b>	<i>ip-address</i> Specifies the IPv4 or IPv6 address for the DOCSIS SYSLOG server, which is the docsDevEvSyslog attribute in the DOCS-CABLE-DEVICE-MIB (RFC 2669). If the IP address is 0.0.0.0 or 0:0:0:0::0, SYSLOG service is disabled for DOCSIS events.
---------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** 0.0.0.0 or 0:0:0:0::0 (No DOCSIS SYSLOG server is defined.)

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(8)BC1	This command was introduced.
	12.2(33)SCA	This command was modified in Cisco IOS Release 12.2(33)SCA to support IPv6 addresses. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The DOCSIS 1.1 specifications require the CMTS router to generate a set of messages for DOCSIS-specific events. Use the **cable event syslog-server** command to enable DOCSIS SYSLOG services and to set the IP address for the DOCSIS SYSLOG server (which is the docsDevEvSyslog attribute in the DOCS-CABLE-DEVICE-MIB).

**Note** cBR-8 does not support sending modem on/off event notifications to the syslog-server.

You can also configure the server's IP address using SNMP commands to set the docsDevEvSyslog attribute directly. Setting the docsDevEvSyslog attribute also creates a matching **cable event syslog-server** command in the router's configuration.

When you specify the IP address for a DOCSIS SYSLOG server, either by using the **cable event syslog-server** command or by setting the docsDevEvSyslog attribute, the Cisco CMTS router begins generating event messages that conform to the DOCSIS 1.1 specifications. This format is similar to but not identical to the format that is used by the Cisco IOS software. For example, the following message is in the typical Cisco IOS software format:

```
%UBR7200-4-DCC_ACK_REJ_MSG_SYNTAX_ERROR: DCC-ACK rejected message syntax error
```

The same error message appears as follows when using the DOCSIS 1.1 format:

```
<133>CMTS[DOCSIS]:<67040500> DCC-ACK rejected message syntax error
```

To disable the sending of events to the DOCSIS SYSLOG server, use the **no cable event syslog-server** command, or specify an IP address of 0.0.0.0 (**cable event syslog-server 0.0.0.0**). Both commands set the docsDevEvSyslog attribute to 0.0.0.0 and disable DOCSIS SYSLOG service. However, this does not disable the Cisco IOS SYSLOG server (if it has been configured using the **logging ip-address** command).

**Note** You can use the same SYSLOG server for both Cisco IOS event messages and for DOCSIS-style event messages, but it might be more convenient to use separate servers for the two different message formats. Use the **logging ip-address** command in global configuration mode to set the IP address for the Cisco IOS SYSLOG server. The DOCSIS SYSLOG server collects only event messages for DOCSIS events using the DOCSIS format, while the Cisco IOS server collects all event messages (including DOCSIS events) using the standard Cisco IOS message format.

**Tip** For more information about DOCSIS SYSLOG services and event messages, see Section 4.4.2.2.2, SYSLOG Message Format, in the *DOCSIS 1.1 Operations Support System Interface (OSSI) Specification* (SP-OSSIV1.1-I06-020830). For more information about all cable-related event messages that can be generated on a Cisco CMTS router, see the *Cisco CMTS System Messages* guide.

## Examples

The following command sets the docsDevEvSyslog attribute with an IPv4 address of 192.168.100.137:

```
cable event syslog-server 192.168.100.137
```

The following commands specifies different SYSLOG servers. The server at IPv4 address 192.168.100.137 receives the DOCSIS-style event messages, and the server at IPv4 address 192.168.100.138 receives the Cisco IOS style messages.

```
cable event syslog-server 192.168.100.137
logging 192.168.100.138
```

The following command sets the docsDevEvSyslog attribute to IPv4 address 0.0.0.0, which disables DOCSIS SYSLOG services:

```
no cable event syslog-server
```

**Note** You can also disable DOCSIS SYSLOG services with the **cable event syslog-server 0.0.0.0** command.

The following command specifies a DOCSIS SYSLOG server with an IPv6 address:

```
cable event syslog-server 2001:0DB8:0:ABCD::1
```

Related Commands	Command	Description
	<b>cable event priority</b>	Configures the event reporting flags for DOCSIS event messages, which determines how the Cisco CMTS router reports these events.
	<b>cable event throttle-adminStatus</b>	Configures how the Cisco CMTS router throttles the SNMP traps and SYSLOG messages it generates for DOCSIS event messages.
	<b>cable event throttle-interval</b>	Specifies the throttle interval, which helps control how often the Cisco CMTS router generates SNMP traps and SYSLOG messages for DOCSIS event messages.
	<b>cable event throttle-threshold</b>	Sets the maximum number of SNMP traps and SYSLOG messages that the Cisco CMTS router can generate for DOCSIS event messages during the throttle interval.
	<b>snmp-server enable traps cable</b>	Enables traps for cable-related events.
	<b>snmp-server enable traps docsis-cmts</b>	Enables traps for DOCSIS-related MAC-layer events.

## cable event throttle-adminStatus

To configure how the Cisco CMTS router throttles the SNMP traps and syslog messages it generates for DOCSIS event messages, use the **cable event throttle-adminStatus** command in global configuration mode. To restore the default behavior, use the **no** form of this command.

```
cable event throttle-adminStatus {inhibited | maintainBelowThreshold | stopAtThreshold |
unconstrained}
no cable event throttle-adminStatus
```

### Syntax Description

<b>inhibited</b>	Suppresses all SNMP traps and syslog messages for DOCSIS event messages.
<b>maintainBelowThreshold</b>	Performs throttling, so that SNMP traps and syslog messages are suppressed if they would otherwise exceed the throttle threshold. The Cisco CMTS resumes generating traps and messages at the start of the next throttle interval.
<b>stopAtThreshold</b>	Performs throttling, so that the Cisco CMTS stops generating all SNMP traps and syslog messages if they would exceed the throttle threshold. The Cisco CMTS does not resume generating traps and messages until directed to do so by repeating this command.
<b>unconstrained</b>	Specifies that the SNMP traps and syslog messages for DOCSIS event messages are not throttled.

### Command Default

SNMP traps and syslog messages for DOCSIS event messages are not throttled (**unconstrained**).

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(8)BC1	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command sets the value of the docsDevEvThrottleAdminStatus attribute in the [DOCS-CABLE-DEVICE-MIB](#) MIB ( [RFC 2669](#) ), which controls whether the Cisco CMTS should throttle SNMP traps and syslog messages that are generated for DOCSIS event messages.

The [DOCS-CABLE-DEVICE-MIB](#) MIB supports the following threshold configurations:

- **inhibited**—The Cisco CMTS does not generate any SNMP traps or syslog messages for DOCSIS events.
- **maintainBelowThreshold**—Throttling is performed, and SNMP traps and syslog messages are suppressed if they would exceed the throttle threshold (as set by the **cable event throttle-interval** and **cable event**

**throttle-threshold** commands). The Cisco CMTS resumes generating traps and messages at the start of the next throttle interval.

- **stopAtThreshold**—Throttling is performed, and the Cisco CMTS stops generating all SNMP traps and syslog messages when they exceed the throttle threshold. The Cisco CMTS does not resume generating traps and messages until the threshold state is reset. This can be done by repeating the **cable event throttle-adminStatus** command, or by setting the docsDevEvThrottleAdminStatus attribute in the [DOCS-CABLE-DEVICE-MIB](#) MIB.
- **unconstrained**—All SNMP traps and syslog messages are transmitted without any throttling.

**Tip** For more information about DOCSIS syslog services and event messages, see Section 4.4.2.2.2, syslog Message Format, in the [DOCSIS 1.1 Operations Support System Interface \(OSSI\) Specification](#) (SP-OSSIV1.1-I06-020830). For more information about all cable-related event messages that can be generated on the Cisco CMTS router, see the Cisco CMTS Error Message manual.

## Examples

The following commands configure the Cisco CMTS router to throttle SNMP traps and syslog messages according to the specified throttle interval and threshold:

```
Router# configure terminal
Router(config)# cable event throttle-interval 90
Router(config)# cable event throttle-threshold 30
Router(config)# cable event throttle adminStatus maintainBelowThreshold
```

The following commands configure the Cisco CMTS router for the default behavior, so that it does not throttle SNMP traps and syslog messages. The configured throttle interval and threshold are ignored.

```
Router# configure terminal
Router(config)# cable event throttle adminStatus unconstrained
```

## Related Commands

Command	Description
<b>cable event priority</b>	Configures the event reporting flags for DOCSIS event messages, which determines how the Cisco CMTS reports these events.
<b>cable event syslog-server</b>	Enables logging of DOCSIS event messages to a syslog server.
<b>cable event throttle-interval</b>	Specifies the throttle interval, which helps control how often the Cisco CMTS generates SNMP traps and syslog messages for DOCSIS event messages.
<b>cable event throttle-threshold</b>	Sets the maximum number of SNMP traps and syslog messages that the Cisco CMTS can generate for DOCSIS event messages during the throttle interval.
<b>snmp-server enable traps cable</b>	Enables traps for cable-related events.

Command	Description
snmp-server enable traps docsis-cmts	Enables traps for DOCSIS-related MAC-layer events.

## cable event throttle-interval

To specify the throttle interval, which controls how often the Cisco CMTS router generates SNMP traps and syslog messages for DOCSIS event messages, use the **cable event throttle-interval** command in global configuration mode. To restore the default behavior, use the **no** form of this command.

**cable event throttle-interval** *seconds*  
**no cable event throttle-interval**

<b>Syntax Description</b>	<i>seconds</i> Length of the throttle interval, in seconds. The range is from 0 to 2147483647. The default is 60.
---------------------------	-------------------------------------------------------------------------------------------------------------------

**Command Default** The throttle interval is 60 seconds (1 minute).

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(8)BC1	This command was introduced.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The DOCSIS 1.1 specifications require the CMTS to generate a set of messages for DOCSIS-specific events. In certain situations, such as a power outage that causes a mass reregistration of cable modems, this can generate such a large volume of event messages that it can impact system performance.

To avoid this possibility, use the **cable event throttle-interval** command, together with the **cable event throttle-threshold** command, to specify the maximum number of SNMP traps or syslog events that the Cisco CMTS can generate for DOCSIS events over a specific interval:

- **cable event throttle-interval**—Specifies the length of the throttle interval.
- **cable event throttle-threshold**—Specifies the maximum number of SNMP traps and syslog events that the Cisco CMTS can generate during that period.

The threshold value counts DOCSIS events, not SNMP traps or syslog messages. If a DOCSIS event generates both an SNMP trap and a syslog message, the Cisco CMTS counts it as only one event.

**Note** The **cable event throttle-interval** and **cable event throttle-threshold** commands do not have any effect unless the **cable event throttle-adminStatus** has been configured to allow the throttling of DOCSIS event messages.

**Tip** For more information about DOCSIS syslog services and event messages, see Section 4.4.2.2.2, syslog Message Format, in the [DOCSIS 1.1 Operations Support System Interface \(OSSI\) Specification](#) (SP-OSSIV1.1-I06-020830). For more information about all cable-related event messages that can be generated on the Cisco CMTS router, see the Cisco CMTS Error Message manual.

## Examples

The following commands configure the Cisco CMTS router so that it can generate a maximum number of 30 SNMP traps and syslog messages for DOCSIS events over a 90-second period:

```
Router# configure terminal
Router(config)# cable event throttle-interval 90
Router(config)# cable event throttle-threshold 30
```

## Related Commands

Command	Description
<b>cable event priority</b>	Configures the event reporting flags for DOCSIS event messages, which determines how the Cisco CMTS reports these events.
<b>cable event syslog-server</b>	Enables logging of DOCSIS event messages to a syslog server.
<b>cable event throttle-adminStatus</b>	Configures how the Cisco CMTS throttles the SNMP traps and syslog messages it generates for DOCSIS event messages.
<b>cable event throttle-threshold</b>	Sets the maximum number of SNMP traps and syslog messages that the Cisco CMTS can generate for DOCSIS event messages during the throttle interval.
<b>snmp-server enable traps cable</b>	Enables traps for cable-related events.
<b>snmp-server enable traps docsis-cmts</b>	Enables traps for DOCSIS-related MAC-layer events.

## cable event throttle-threshold

To set the maximum number of SNMP traps and syslog messages that the Cisco CMTS router can generate for DOCSIS event messages during the throttle interval, use the **cable event throttle-threshold** command in global configuration mode. To restore the default number, use the **no** form of this command.

**cable event throttle-threshold** *number*  
**no cable event throttle-threshold**

<b>Syntax Description</b>	<i>number</i>	Maximum allowable number of DOCSIS events for which the Cisco CMTS can generate SNMP traps and syslog messages during the throttle period. The range is from 0 to 2147483647. The default of 10.
---------------------------	---------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The default maximum is 10.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(8)BC1	This command was introduced.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The DOCSIS 1.1 specifications require the CMTS to generate a set of messages for DOCSIS-specific events. In certain situations, such as a power outage that causes a mass reregistration of cable modems, this can generate such a large volume of event messages that it can impact system performance.

To avoid this possibility, use the **cable event throttle-threshold** command, together with the **cable event throttle-interval** command, to specify the maximum number of SNMP traps or syslog events that the Cisco CMTS can generate for DOCSIS events over a specific interval:

- **cable event throttle-interval**—Specifies the length of the throttle interval.
- **cable event throttle-threshold**—Specifies the maximum number of SNMP traps and syslog events that the Cisco CMTS can generate during that period.

The threshold value counts DOCSIS events, not SNMP traps or syslog messages. If a DOCSIS event generates both an SNMP trap and a syslog message, the Cisco CMTS counts it as only one event.

**Note** The **cable event throttle-interval** and **cable event throttle-threshold** commands do not have any effect unless the **cable event throttle-adminStatus** has been configured to allow the throttling of DOCSIS event messages.

**Tip** For more information about DOCSIS syslog services and event messages, see Section 4.4.2.2.2, syslog Message Format, in the [DOCSIS 1.1 Operations Support System Interface \(OSSI\) Specification](#) (SP-OSSIV1.1-I06-020830). For more information about all cable-related event messages that can be generated on the Cisco CMTS router, see the Cisco CMTS Error Message manual.

## Examples

The following commands configure the Cisco CMTS router so that it can generate a maximum number of 25 SNMP traps and syslog messages for DOCSIS events over a two-minute period:

```
Router# configure terminal
Router(config)# cable event throttle-interval 120
Router(config)# cable event throttle-threshold 25
```

## Related Commands

Command	Description
<b>cable event priority</b>	Configures the event reporting flags for DOCSIS event messages, which determines how the Cisco CMTS reports these events.
<b>cable event syslog-server</b>	Enables logging of DOCSIS event messages to a syslog server.
<b>cable event throttle-adminStatus</b>	Configures how the Cisco CMTS throttles the SNMP traps and syslog messages it generates for DOCSIS event messages.
<b>cable event throttle-interval</b>	Specifies the throttle interval, which helps control how often the Cisco CMTS generates SNMP traps and syslog messages for DOCSIS event messages.
<b>snmp-server enable traps cable</b>	Enables traps for cable-related events.
<b>snmp-server enable traps docsis-cmts</b>	Enables traps for DOCSIS-related MAC-layer events.

## cable falcon-100g

To configure the falcon registers for the two falcon 100g modes, use the **cable falcon-100g** command in the cable falcon-100g configuration mode.

**cable falcon-100g** { **10-km-link** | **10-m-link** }

**no cable falcon-100g**

<b>Syntax Description</b>	<b>10-km-link</b>	Configures sup250 falcon 100g 10-km-link mode
	<b>10-m-link</b>	Configures sup250 falcon 100g 10-m-link mode
<b>Command Default</b>	The default configuration is sup250 falcon 100g 10-km-link mode.	
<b>Command Modes</b>	cable falcon-100g configuration mode (config-falcon)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Amsterdam 17.3.1 This command was introduced.	

The following example shows how to configure sup250 falcon 100g 10-km-link mode.

```
Router# configure terminal
Router(config)# cable falcon-100g 10-km-link
Router(config)# end
```

The following example shows how to configure sup250 falcon 100g 10-m-link mode.

```
Router# configure terminal
Router(config)# cable falcon-100g 10-m-link
Router(config)# end
```

The following example shows how to use the command **no cable falcon-100g**.

```
Router# configure terminal
Router(config)# no cable falcon-100g
Router(config)# end
```

## cable fiber-node

To enter cable fiber-node configuration mode to configure a fiber node, use the **cable fiber-node** command in global configuration mode. To remove a fiber node configuration, use the **no** form of this command.

**cable fiber-node** *fiber-node-id*  
**no cable fiber-node** *fiber-node-id*

### Syntax Description

<i>fiber-node-id</i>	Specifies a unique numerical ID for the fiber node. The range is from 1 to 256.
----------------------	---------------------------------------------------------------------------------

### Command Default

The command mode is unchanged.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.3(23)BC	This command was updated to allow an RF channel from the SPA or a Cisco uBR10-MC5X20 downstream channel can serve as a primary channel in a fiber node.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

In Cisco uBR series router, the **cable fiber-node** command allows the multiple service operator (MSO) or service provider to configure the CMTS to be more intelligent by making Cisco IOS aware of how the cable plant is wired. The downstream channels of the cable plant must be accurately configured in the CMTS fiber nodes. This allows the CMTS to accurately signal the wideband modems on which wideband channels are available to the modem.

In a cable network, a cable modem is physically connected to only one fiber node. Fiber node software configuration mirrors the physical topology of the cable network. When configuring fiber nodes with Cisco IOS CLI commands, a fiber node is a software mechanism to define the following:

- The set of downstream RF channels that will flow into the fiber node
- At least one primary downstream channel

**Note** In Cisco IOS Releases 12.3(21)BC and 12.3(21a)BC3, this is a traditional DOCSIS downstream channel for the fiber node. Beginning in Cisco IOS Release 12.3(23)BC, either an RF channel from the SPA or a Cisco uBR10-MC5X20 downstream channel can serve as a primary channel in a fiber node.

- The set of upstream channel ports on the cable interface line card that are connected to the fiber node and available as upstream channels

Use the **cable fiber-node** command to enter cable fiber-node configuration mode so that you can configure a fiber node.

For a wideband channel to work correctly, each fiber node must be configured as follows:

1. Use the **cable fiber-node** command to create the fiber node and to enter cable fiber-node configuration mode.
2. Use the **downstream** command to associate the fiber node with one or more primary downstream channels (traditional DOCSIS downstream channels).

---

**Note** Beginning in Cisco IOS Release 12.3(23)BC, if the primary downstream channel for this fiber node is assigned from a SPA RF downstream channel, then this command is not required.

---

3. Use the **upstream** command to specify the upstream channel ports for a fiber node.
4. Use the **downstream modular-cable rf-channel** command to make one or more SPA RF channels available for the fiber node.
5. Optionally, use the **description (cable fiber-node)** command to specify a description for the fiber node.

For each fiber node, a traditional DOCSIS downstream channel on the Cisco uBR10-MC5X20 cable interface line card is used to carry MAC management and signaling messages, and the associated traditional DOCSIS upstream channel is used for return data traffic and signaling. The traditional DOCSIS downstream channel used in this way is called the *primary downstream channel*. Beginning in Cisco IOS Release 12.3(23)BC, either an RF channel from the SPA or a Cisco uBR10-MC5X20 downstream channel can serve as a primary channel in a fiber node. If the fiber node does not have a Cisco uBR10-MC5X20 downstream channel, then make sure that at least one of the SPA RF channels specified in the **downstream modular-cable rf-channel** command is a primary-capable downstream channel.

Each wideband channel must be associated with at least one primary downstream channel and can be associated with multiple primary downstream channels. A wideband channel and its associated primary downstream channels must belong to the same virtual bundle interface.

The maximum number of cable fiber nodes that can be configured is limited to 256 for each CMTS.

In Cisco cBR series router, for a wideband channel to work correctly, each fiber node must be configured as follows:

1. Use the **cable fiber-node** command to create the fiber node and to enter cable fiber-node configuration mode.
2. Use the **downstream integrated-cable** command to associate the fiber node with a downstream port, all the downstream channels on this port are included in the fiber node.
3. Use the **upstream upstream-cable** command to specify the a upstream port for the fiber node.

To map SG channel to the physical RF channel, use the following commands:

- **downstream sg-channel** *low high* **integrated-cable** *slot/subslot/port* **rf-channel** *low high*
- **upstream sg-channel** *low high* **upstream-controller** *slot/subslot/port* **us-channel** *low high*

Use the **service-group profile** *profile name* command to associate SG profile to a fiber-node, which will generate all the MAC domains, integrated-cable interfaces and wideband interfaces.

## Examples

The following example shows how to enter configuration mode for fiber node 5.

### Cisco IOS Release 12.3(21)BC

```
Router# configure terminal
```

```
Router(config)# cable fiber-node 5
Router(config-fiber-node)#
downstream Cable 6/0/0
downstream Modular-Cable 1/0/0 rf-channel 0-1
upstream cable 5/0 connector 0
```

### Cisco IOS Release 12.3(23)BC

```
Router# configure terminal
Router# cable fiber-node 5
Router(config-fiber-node)#
downstream Modular-Cable 1/0/0 rf-channel 0-3
upstream cable 5/0 connector 0
```

### Cisco IOS-XE Release 3.15.0S

```
Router# configure terminal
Router(config)# cable fiber-node 5
Router(config-fiber-node)# downstream Integrated-Cable 3/0/0
```

#### Related Commands

Command	Description
<b>description (cable fiber-node)</b>	Specifies a description for a fiber node.
<b>downstream cable</b>	Assigns a primary downstream channel for a fiber node.
<b>downstream modular-cable rf-channel</b>	Specifies the RF channels that are available for wideband channels on a fiber node.
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.

## cable filter group

To create, configure, and activate a DOCSIS 1.1 filter group that filters packets on the basis of the TCP/IP and UDP/IP headers, use the **cable filter group** command in global configuration mode. To delete a filter group or to reset a particular option to its default value, use the **no** form of this command.

**cable filter group** *group-id* **index** *index-num* [*option option-value*]  
**no cable filter group** *group-id* **index** *index-num* [*option option-value*]

Syntax Description	
<i>group-id</i>	Specifies a unique group ID for this filter group.  (For Cisco uBR Series Router) The range is from 1 to 254. 255 is reserved for use by the CMTS router.  (For Cisco cBR Series Router) The range is from 1 to 254.
<i>index-num</i>	Specifies a unique index for this particular filter. The range is from 1 to 128 on a uBR7200 series router, and 1 to 255 on a uBR10012 router and cBR-8 router.
<b>Specify one of the following options and option-values</b>	
<b>dest-ip</b> <i>ip-address</i>	(Optional) Specifies the destination IP address that should be matched. The default IP address is 0.0.0.0. (IPv4 filters only)
<b>dest-mac-addr</b> <i>mac-address</i>	(Optional) Specifies the destination MAC address that should be matched. Cisco cBR-8 router does not have this option.
<b>dest-mac-mask</b> <i>mask</i>	(Optional) Specifies the mask for the destination MAC address that should be matched. Cisco cBR-8 router does not have this option.
<b>dest-mask</b> <i>mask</i>	(Optional) Specifies the mask for the destination address that should be matched. The <i>mask</i> is ANDed with the IP address specified by the <b>dest-ip</b> option and compared to the result of ANDing the <i>mask</i> with the packet's destination IP address. The filter considers it a match if the two values are the same. (IPv4 filters only)  <b>Note</b> The default mask of 0.0.0.0 matches all IP addresses.
<b>dest-port</b> <i>port-number</i>	(Optional) Specifies the TCP/UDP destination port number that should be matched. The range is from 0 to 65535. The default value matches all TCP/UDP port numbers (IPv4 and IPv6 filters).
<b>eth-proto-type</b> <i>ethernet protocol type</i>	(Optional) Specifies the Ethernet protocol type number that should be matched. The range is from 0 to 65536. Cisco cBR-8 router does not have this option.

<b>eth-protocol</b> <i>ethernet protocol number</i>	(Optional) Specifies the Ethernet protocol that should be matched. The range is from 0 to 65536. Cisco cBR-8 router does not have this option.
<b>ip-proto</b> <i>proto-type</i>	(Optional) Specifies the IP protocol type number that should be matched. The range is from 0 to 256. The default is 256, which matches all protocols (IPv4 and IPv6 filters).  Some commonly-used values are: <ul style="list-style-type: none"> <li>• 1—ICMP, Internet Control Message Protocol.</li> <li>• 2—IGMP, Internet Group Management Protocol.</li> <li>• 4—IP in IP encapsulation.</li> <li>• 6—TCP, Transmission Control Protocol.</li> <li>• 17—UDP, User Datagram Protocol.</li> </ul>
<b>ip-tos</b> <i>tos-mask tos-value</i>	(Optional) Specifies a type of service (TOS) mask and value to be matched (IPv4 and IPv6 filters): <ul style="list-style-type: none"> <li>• <i>tos-mask</i>—8-bit value expressed in hexadecimal notation. The valid range is 0x00 through 0xFF.</li> <li>• <i>tos-value</i>—8-bit value expressed in hexadecimal notation. The valid range is 0x00 through 0xFF.</li> </ul> <p>The <i>tos-mask</i> is logically ANDed with the <i>tos-value</i> and compared to the result of ANDing the <i>tos-mask</i> with the packet's actual TOS value. The filter considers it a match if the two values are the same.</p> <p><b>Note</b> The default values for both parameters matches all ToS values.</p>
<b>ip-version</b>	(Optional) Specifies the IP version of the filter: <ul style="list-style-type: none"> <li>• <b>ipv4</b>—Filter is an IP version 4 filter group (default).</li> <li>• <b>ipv6</b>—Filter is an IP version 6 filter group.</li> </ul>
<b>match-action</b> { <b>accept</b>   <b>drop</b> }	(Optional) Specifies the action that should be taken for packets that match this filter (IPv4 and IPv6 filters): <ul style="list-style-type: none"> <li>• <b>accept</b>—Packets that match the filter are accepted (default).</li> <li>• <b>drop</b>—Packets that match the filter are dropped.</li> </ul>
<b>range-dest-port</b> <i>start-port number end-port number</i>	(Optional) Specifies the TCP/UDP destination port start range. The range is from 0 to 65535.
<b>range-ip-tos</b> <i>mask against TOS start value and end value</i>	(Optional) Specifies IP TOS byte range settings expressed in hexadecimal notation. The range is from 0x00 through 0xFF.
<b>range-src-port</b> <i>start-port number end-port number</i>	(Optional) Specifies TCP/UDP source port start range. The range is from 0 to 65535.

<b>range-user-pri</b> <i>low-priority value high-priority value</i>	(Optional) Specifies the user priority. The range for priority is from 0 to 8. The Priority field indicates the frame priority level from 0 (lowest) to 8 (highest), which prioritizes different classes of traffic (such as voice, video and data). Cisco cBR-8 router does not have this option.
<b>src-ip</b> <i>ip-address</i>	(Optional) Specifies the source IP address that should be matched. The default IP address is 0.0.0.0. (IPv4 filters only)
<b>src-mac-addr</b> <i>mac address</i>	(Optional) Specifies the source MAC address to be matched. Cisco cBR-8 router does not have this option.
<b>src-mask</b> <i>mask</i>	(Optional) Specifies the mask for the source address that should be matched. The <i>mask</i> is ANDed with the IP address specified by the <b>src-ip</b> option and compared to the result of ANDing the <i>mask</i> with the packet's source IP address. The filter considers it a match if the two values are the same. (IPv4 filters only)  <b>Note</b> The default mask of 0.0.0.0 matches all IP addresses.
<b>src-port</b> <i>port-number</i>	(Optional) Specifies the TCP/UDP source port number that should be matched. The range is from 0 to 65535. The default value matches all TCP/UDP port numbers (IPv4 and IPv6 filters).
<b>status</b> { <b>active</b>   <b>inactive</b> }	(Optional) Enables or disables the filter (IPv4 and IPv6 filters):  <ul style="list-style-type: none"> <li>• <b>active</b>—Enables the filter immediately (default).</li> <li>• <b>inactive</b>—Disables the filter immediately.</li> </ul> <b>Note</b> You must create a filter group using at least one of the other options before you can use this command to enable or disable the filter.
<b>tcp-flags</b> <i>flags-mask flags-value</i>	(Optional) Specifies the TCP flag mask and value to be matched (IPv4 and IPv6 filters):  <ul style="list-style-type: none"> <li>• <i>flags-mask</i>—8-bit value expressed in hexadecimal notation. The valid range is 0x0 through 0x3F.</li> <li>• <i>flags-value</i>—8-bit value expressed in hexadecimal notation. The valid range is 0x0 through 0x3F.</li> </ul>
<b>v6-dest-address</b> <i>ipv6-address</i>	(Optional) Specifies the IPv6 destination address that should be matched using the format X:X:X:X::X (IPv6 filters only).
<b>v6-dest-pfxlen</b> <i>prefix-length</i>	(Optional) Specifies the length of the network portion of the IPv6 destination address. The range is from 0 to 128 (IPv6 filters only).

<b>v6-flow-label</b> <i>flow-label value</i>	(Optional) Specifies the IPv6 flow label to be used by the source to label packets of a flow. The range is from 0 to 1048575. A flow label of zero is used to indicate packets not part of any flow.
<b>v6-src-address</b> <i>ipv6-address</i>	(Optional) Specifies the IPv6 source address that should be matched using the format X:X:X:X::X (IPv6 filters only).
<b>v6-src-pfxlen</b> <i>prefix-length</i>	(Optional) Specifies the length of the network portion of the IPv6 source address. The range is form 0 to 128 (IPv6 filters only).
<b>vlan-id</b> <i>vlan-id</i>	(Optional) Specifies the VLAN Identifier to be matched, which is a 12-bit field specifying the VLAN to which the packet belongs. The range is from 0 to 4094. Cisco cBR-8 router does not have this option.

**Command Default**

No filter groups are defined. When a filter group is created, it defaults to accepting all source and destination IP addresses and TCP/UDP ports, all protocol types, and all ToS and TCP flag values.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.1(6)EC1	This command was introduced on the Cisco uBR7100 series and Cisco uBR7200 series routers.
12.2(2)XF, 12.2(4)BC1	This command was supported on the Cisco uBR10012 routers.
12.2(8)BC2	The <b>status</b> option was added to allow filter groups to be activated and deactivated without removing the filter group's configuration.
12.2(33)SCA	The <b>v6-src-address</b> , <b>v6-dest-address</b> , <b>v6-src-pfxlen</b> , <b>v6-dest-pfxlen</b> , and <b>ip-version</b> keywords were added for support of IPv6 filter groups. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>dest-mac-addr</b> , <b>dest-mac-mask</b> , <b>eth-proto-type</b> , <b>eth-protocol</b> , <b>range-user-pri</b> , <b>src-mac-addr</b> and <b>vlan-id</b> keywords were removed.

**Usage Guidelines**

This command implements DOCSIS 1.1 packet filtering, as defined in the [DOCS-SUBMGT-MIB](#). Each filter group can contain multiple filters, as defined by the different index numbers.

**Note** The [DOCS-SUBMGT-MIB](#) MIB is supported only on Cisco IOS Release 12.2(8)BC2 and later 12.2 BC releases. See the description of the docsSubMgtPktFilterTable table in this MIB for further information.

---

**Note** Before configuring layer 4 **src-port** and **dest-port** options, configure the IP protocol number using the **ip-PROTO** option. If a layer 4 IP protocol is not configured, the default value (256) is used and the filter groups configured with multiple filters will fail.

---

When matching the source or destination addresses, the filter ANDs the mask value with the filter's corresponding IP address. The filter then ANDs the mask with the packet's actual IP address and compares the two values. If they are the same, the filter matches the packet.

For example, if you specify a **src-ip** of 192.168.100.0 and a **src-mask** of 255.255.255.0, the filter matches all packets that have a source IP address in the range of 192.168.100.0 through 192.168.100.255. Use a mask value of 0.0.0.0 (default) to match all IP addresses. Use a mask value of 255.255.255.255 to match one specific IP address.

Similarly, when comparing TOS values, the filter ANDs the *tos-mask* parameter with the *tos-value* parameter and compares it to the result of ANDing the *tos-mask* parameter with the packet's actual TOS value. If the two values are the same, the filter matches the packet.

---

**Note** For the filter group to work for CMs, a CM must re-register after the CMTS router is configured.

---

#### Cable Subscriber Management Guidelines

Cable subscriber management is a DOCSIS 1.1 specification, whose functionality can be established using the following configuration methods:

- CMTS router configuration (via CLI)
- SNMP configuration
- DOCSIS 1.1 configuration file (TLVs 35, 36, and 37)

There are certain CMTS configuration requirements if the CM DOCSIS 1.1 configuration file is not used to activate cable subscriber management for the CPE. Specifically, if the `docsSubMgtCpeActive` object is not provisioned using TLVs 35, 36, and 37 in the DOCSIS 1.1 CM configuration file, then the object uses the `docsSubMgtCpeActiveDefault` object setting, which is false. This means that cable subscriber management functionality is disabled.

Therefore, if you do not provision TLVs 35, 36, and 37, then you must activate the functionality by specifying the **cable submgmt default active** global configuration command on the CMTS router.

---

**Note** Since TLVs 35, 36, and 37 do not apply to DOCSIS 1.0 CM configuration files, the only way to enable cable subscriber management for a DOCSIS 1.0 CM is to configure it explicitly on the CMTS router and activate it by using the **cable submgmt default active** global configuration command.

---

#### IPv6 Cable Filter Group Guidelines

---

**Note** When parallel eXpress forwarding (PXF) is configured on the Cisco ubR10012 router, either the interface ACL (**ip access-list** command) or the **cable filter group** commands can be used to filter the packets.

---

Consider the following restrictions and guidelines when configuring IPv6 cable filter groups:

- Chained IPv6 headers are not supported.
- If you need to support IPv4 and IPv6 filters for the same filter group, then you must use a separate index number with the same filter group ID, and configure one index as **ip-version ipv4**, and the other index as **ip-version ipv6**.

## Examples

The following example shows configuration of an IPv4 filter group that drops packets with a source IP address of 10.7.7.7 and a destination IP address of 10.8.8.8, and a source port number of 2000 and a destination port number of 3000. All protocol types and ToS and TCP flag values are matched:

```
configure terminal
cable filter group 10 index 10 src-ip 10.7.7.7
cable filter group 10 index 10 src-mask 255.255.0.0
cable filter group 10 index 10 dest-ip 10.8.8.8
cable filter group 10 index 10 dest-mask 255.255.0.0
cable filter group 10 index 10 ip-proto 256
cable filter group 10 index 10 src-port 2000
cable filter group 10 index 10 dest-port 3000
cable filter group 10 index 10 tcp-flags 0 0
cable filter group 10 index 10 match-action drop
```

## IPv6 Example

The following example shows the configuration of an IPv6 filter group that drops traffic from a specific IPv6 host (with source address 2001:33::20B:BFFF:FEA9:741F/128) behind a cable router to an IPv6 host on the network (with destination address 2001:1::224/128):

```
configure terminal
!
! Specify the filter group criteria using ID 254
!
cable filter group 254 index 128 v6-src-address 2001:33::20B:BFFF:FEA9:741F
cable filter group 254 index 128 v6-src-pfxlen 128
cable filter group 254 index 128 v6-dest-address 2001:1::224
cable filter group 254 index 128 v6-dest-pfxlen 128
!
! Specify that the filter group is IPv6
!
cable filter group 254 index 128 ip-version IPv6
!
! Specify the drop action for matching packets
!
cable filter group 254 index 128 match-action drop
!
! Apply the filter group with ID 254 to all CM upstream traffic
!
cable submgmt default filter-group cm upstream 254
```

## Related Commands

Command	Description
<b>show cable filter</b>	Displays the DOCSIS 1.1 filter groups that are currently defined.

Command	Description
<b>cable submgt default</b>	Sets the default values for attributes in the Subscriber Management MIB (DOCS-SUBMGT-MIB), and enables the Cisco Static CPE Override feature on the Cisco CMTS.

# cable flap-list aging

To specify the number of days to keep a CM in the flap-list table before aging it out of the table, use the **cable flap-list aging** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable flap-list aging** *minutes*  
**no cable flap-list aging**

## Syntax Description

<i>minutes</i>	Specifies how long, in minutes, that a CM remains in the flap list. The range is from 1 to 86400. The default is 10080.
----------------	-------------------------------------------------------------------------------------------------------------------------

## Command Default

A CM is kept in the flap-list table for 10080 minutes (1 week).

## Command Modes

Global configuration (config)

## Command History

Release	Modification
11.3 NA	This command was introduced.
12.0(4)XA, 12.1 T, 12.1 EC	The <i>days</i> parameter was removed.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Flapping refers to the rapid disconnecting and reconnecting of a CM that is having problems holding its connection to the CMTS. A flap list is a table maintained by the Cisco CMTS for every modem (active or not) that is having communication difficulties. The flap list contains modem MAC addresses and logs the time of the most recent activity. You can configure the size and entry thresholds for the flap list.

## Examples

The following example shows how to specify that the flap-list table retain 2400 minutes (40 hours) of performance for this CM:

```
Router(config)# cable flap-list aging 2400
```

## Related Commands

Command	Description
<b>cable flap-list insertion-time</b>	Sets the insertion time interval that determines whether a CM is placed in the flap list.
<b>cable flap-list miss-threshold</b>	Specifies miss threshold for recording a flap-list event.

Command	Description
<b>cable flap-list power-adjust threshold</b>	Specifies the power-adjust threshold for recording a CM flap-list event.
<b>cable flap-list size</b>	Specifies the maximum number of CMs that can be listed in the flap-list table.
<b>clear cable flap-list</b>	Clears all the entries in the flap-list table.
<b>debug cable flap</b>	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
<b>ping docsis</b>	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
<b>show cable flap-list</b>	Displays the current contents of the flap list.

## cable flap-list insertion-time

To set the cable flap-list insertion time interval, use the **cable flap-list insertion-time** command in global configuration mode. To disable insertion time, use the **no** form of this command.

**cable flap-list insertion-time** *seconds*  
**no cable flap-list insertion-time**

### Syntax Description

<i>seconds</i>	Insertion time interval in seconds. The range is from 60 to 86,400. The default is 180.
----------------	-----------------------------------------------------------------------------------------

### Command Default

The default insertion time interval is 180 seconds (3 minutes).

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.1 T	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command controls the operation of a flapping modem detector. When a CM makes two or more initial Ranging Requests (also known as insertion or reinsertion requests) within the period of time defined by this command, the CM is placed in the flap list. A CM is not put into the flap list if the time between its two consecutive initial Ranging Requests is greater than the insertion time interval.

For example, if the CMTS is configured for the default insertion time of three minutes, and if the CM reinserts itself four minutes after its last insertion, the CM is not placed in the flap list. However, if the CM reinserts itself two minutes after its last insertion, the CM is placed in the flap list.

Also, a CM is put into the flap list only once for each insertion time interval, even if the CM reinserts itself multiple times. For example, if the CMTS is set for the default insertion time interval of 3 minutes, and the CM reinserts itself three times within that period, the flap list shows that the CM has flapped once. If the CM reinserts itself three times within the first 3 minute period and three more times within the next 3 minute period, the flap list shows that the CM has flapped twice.

### Examples

The following example shows how to set the insertion time interval to 62 seconds:

```
Router(config)# cable flap-list insertion-time 62
```

Related Commands	Command	Description
	<b>cable flap-list aging</b>	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
	<b>cable flap-list miss-threshold</b>	Specifies miss threshold for recording a flap-list event.
	<b>cable flap-list power-adjust threshold</b>	Specifies the power-adjust threshold for recording a CM flap-list event.
	<b>cable flap-list size</b>	Specifies the maximum number of CMs that can be listed in the flap-list table.
	<b>clear cable flap-list</b>	Clears all the entries in the flap-list table.
	<b>debug cable flap</b>	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
	<b>ping docsis</b>	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
	<b>show cable flap-list</b>	Displays the current contents of the flap list.

# cable flap-list miss-threshold

To set the miss threshold for recording a flap-list event, use the **cable flap-list miss-threshold** command in global configuration mode. To disable this function, use the **no** form of this command.

**cable flap-list miss-threshold** *misses*  
**no cable flap-list miss-threshold**

## Syntax Description

<i>misses</i>	Specifies the number of consecutive MAC-layer keepalive (Station Maintenance) that can be missed before a CM is placed in the flap list. The range is from 1 to 12. The default is 6.
---------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

The default number of station maintenance messages that can be missed is 6.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.1 T	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

In a DOCSIS network, the CMTS regularly sends out MAC-layer keepalive messages, known as station maintenance messages, to each CM that is online. If a CM does not respond to a station maintenance message, the CMTS repeats sending these messages either until the CM responds or the CMTS reaches the maximum allowable number of messages that can be sent.

The **cable flap-list miss-threshold** command specifies how many consecutive station maintenance messages can be missed before the cable modem is placed in the flap list. A miss occurs when a CM does not reply to a station maintenance message.

**Note** Station maintenance messages are occasionally lost due to noise or congestion in a typical DOCSIS network, with a loss rate of approximately 8 percent considered nominal. A higher miss rate can indicate RF plant problems, such as intermittent upstream problems, fiber laser clipping, or common-path distortion.

## Examples

The following example shows how to set the miss threshold to 5:

```
Router(config)# cable flap-list miss-threshold 5
```

Related Commands	Command	Description
	<b>cable flap-list aging</b>	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
	<b>cable flap-list insertion-time</b>	Sets the insertion time interval that determines whether a CM is placed in the flap list.
	<b>cable flap-list power-adjust threshold</b>	Specifies the power-adjust threshold for recording a CM flap-list event.
	<b>cable flap-list size</b>	Specifies the maximum number of CMs that can be listed in the flap-list table.
	<b>clear cable flap-list</b>	Clears all the entries in the flap-list table.
	<b>debug cable flap</b>	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
	<b>ping docsis</b>	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
	<b>show cable flap-list</b>	Displays the current contents of the flap list.

# cable flap-list power-adjust threshold

To specify the power-adjust threshold for recording a flap-list event, use the **cable flap-list power-adjust threshold** command in global configuration mode. To disable power-adjust thresholds, use the **no** form of this command.

**cable flap-list power-adjust threshold *dB***  
**no cable flap-list power-adjust threshold**

<b>Syntax Description</b>	<i>dB</i> Specifies the minimum power adjustment, in decibels, that results in a flap-list event. The range is from 1 to 10.
---------------------------	------------------------------------------------------------------------------------------------------------------------------

**Command Default** The default minimum power adjustment threshold is 2 dB.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1 T	This command was introduced.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command controls the operation of a flapping modem detector. When the power adjustment of a CM exceeds the configured threshold value, the modem is placed in the flap list.

**Note** A power adjustment threshold of less than 2 dB might cause excessive flap-list event recording. Cisco recommends setting this threshold value to 3 dB or higher.

**Note** For underground HFC networks with 4 amplifier cascade length, a typical threshold value should be 3 dB. For overhead HFC networks with 4 amplifier cascade length, a typical threshold value should be 4 dB. Longer coaxial cascades without return path thermal gain control and sites with extreme daily temperatures will have larger threshold ranges.

## Examples

The following example shows the power-adjust threshold being set to 5 dB:

```
Router(config)# cable flap-list power-adjust threshold 5
```

Related Commands	Command	Description
	<b>cable flap-list aging</b>	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
	<b>cable flap-list insertion-time</b>	Sets the insertion time interval that determines whether a CM is placed in the flap list.
	<b>cable flap-list miss-threshold</b>	Specifies miss threshold for recording a flap-list event.
	<b>cable flap-list size</b>	Specifies the maximum number of CMs that can be listed in the flap-list table.
	<b>clear cable flap-list</b>	Clears all the entries in the flap-list table.
	<b>debug cable flap</b>	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
	<b>ping docsis</b>	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
	<b>show cable flap-list</b>	Displays the current contents of the flap list.

## cable flap-list size

To specify the maximum number of CMs that can be displayed from the flap-list table, use the **cable flap-list size** command in global configuration mode. To reset it to the default flap-list table size, use the **no** form of this command.

**cable flap-list size** *number*  
**no cable flap-list size**

<b>Syntax Description</b>	<i>number</i> Maximum number of CMs to be displayed. The range is from 1 to 8191 depending on the type of line cards. The default is 100.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1 T	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

- The flap-list size is determined by the architecture of the CMTS and the cable line cards. Previously, the cable flap-list tables were stored on the Route Processors and Performance Routing Engine (PRE) modules.
- The legacy non-distributed cable line cards, Cisco uBR-MC16C/MC16E/MC16S line card and Cisco uBR-MC28C/MC28E line card did not store the flap-list tables in the line cards.
- The distributed line cards are designed such that they store the flap-list tables on the line cards. For a CMTS using distributed line cards, the flap-list size is the maximum size per line card.
- The distributed line cards supported on a Cisco uBR7200 router are Cisco uBR-MC28U/X and Cisco uBR-16U/16X.
- The distributed line cards supported on a Cisco uBR10012 router are Cisco uBR10-MC5X20S/U/H.
- You can calculate the flap list sizes using the following formulas:
  - For a Cisco uBR10012 router without line card high availability (LC-HA)— $8191 * (\text{Number of cable line cards})$
  - For a Cisco uBR10012 router with line card high availability (LC-HA)— $8191 * (\text{Number of cable line cards} - 1)$
  - For a Cisco uBR72VXR router using legacy and distributed line cards— $8191 * (1 + \text{Number of distributed cable line cards})$
- The flap-list tables sizes are as follows:
  - A fully loaded Cisco uBR10012 router
    - With distributed line cards and no LC-HA configured— $8191 * 8 = 65528$  CMs.
    - With distributed line cards and LC-HA configured— $8191 * (8-1) = 57337$  CMs.

**Note:** Legacy line cards behave as the distributed line cards on a Cisco uBR10012 router. Thus, the flap-list sizes are same as for distributed line cards.

- A fully loaded Cisco uBR7246VXR router

With distributed line cards—  $8191 * 6 = 49146$  CMs.

With legacy line cards—  $8191 * (1+0) = 8191$  CMs.

With legacy and distributed line cards—  $8191 * (1 + \text{no of the distributed line cards})$  CMs.

## Examples

The following example shows how to display a maximum of 200 flap-list entries per downstream:

```
Router# configure terminal
Router(config)# cable flap-list size 200
Router(config)#
```

## Related Commands

Command	Description
<b>cable flap-list aging</b>	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
<b>cable flap-list insertion-time</b>	Sets the insertion time interval that determines whether a CM is placed in the flap list.
<b>cable flap-list miss-threshold</b>	Specifies miss threshold for recording a flap-list event.
<b>cable flap-list power-adjust threshold</b>	Specifies the power-adjust threshold for recording a CM flap-list event.
<b>clear cable flap-list</b>	Clears all the entries in the flap-list table.
<b>debug cable flap</b>	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
<b>ping docsis</b>	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
<b>show cable flap-list</b>	Displays the current contents of the flap list.

## cable freq-range

To configure the Cisco CMTS router for the range of frequencies that are acceptable on upstreams, use the **cable freq-range** command in global configuration mode. To restore the default value (which is based on the cable interface and on the Annex A/B configuration), use the **no** form of this command.

**cable freq-range** [**european** | **japanese** | **north-american**]  
**no cable freq-range**

### Syntax Description

<b>european</b>	Configures the Cisco CMTS router to accept upstream frequency ranges that conform with the EuroDOCSIS specifications (5 MHz to 65 MHz).
<b>japanese</b>	Configures the Cisco CMTS router to accept upstream frequency ranges that conform to the extended range used in Japan (5 MHz to 55 MHz).
<b>north-american</b>	Configures the Cisco CMTS router to accept upstream frequency ranges that conform to the DOCSIS specifications (5 MHz to 42 MHz).

### Command Default

**no cable freq-range**, which defaults to a frequency range based on the Annex configuration:

- Annex A = **european** (EuroDOCSIS, 5 MHz to 65 MHz)—Supported only on cable interfaces that support EuroDOCSIS
- Annex B = **north-american** (DOCSIS, 5 MHz to 55 MHz)—All cable interfaces support the 5 MHz to 42 MHz range. The 42 MHz to 55 MHz range is supported only on certain cable interfaces.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

In Cisco IOS Release 12.2(15)BC2 and later, the Cisco CMTS router supports three different modes of operation, depending on the cable interface line cards being used. The range of frequencies that are allowed in each mode are as follows:

- North American DOCSIS (Annex B)—Upstreams use frequencies between 5 MHz and 42 MHz. This range is supported by all cable interface line cards.
- European EuroDOCSIS (Annex A)—Upstreams use frequencies between 5 MHz and 65 MHz.
- Japanese Extended Range (Annex B)—Upstreams use frequencies between 5 MHz and 55 MHz.

---

**Note** The frequency range specified in this command does not apply to upstreams of the Cisco uBR-MC3GX60V cable interface line cards. To specify the upstream frequency for the Cisco uBR-MC3GX60V cable interface line card, use the **cable upstream frequency** command.

---

To configure the router so that it supports the proper range of upstream frequencies, use the **upstream freq-range** command. After you have configured the router with the **cable freq-range** command, the **cable upstream frequency** and **cable spectrum-group (interface configuration)** commands then accept only frequencies that are in the configured range.

Typically, the **upstream freq-range** command is not needed because the default behavior covers the most common configurations. However, this command can be used in the following situations:

- This command is required to enable EuroDOCSIS operations on the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cards.
- This command is never needed for the Cisco uBR-MC5X20U card nor for EuroDOCSIS cable interfaces (Cisco uBR-MC16E card, and the Cisco uBR7111E and Cisco uBR7114E routers), because these interfaces default to the EuroDOCSIS range of frequencies. However, if you have previously used this command to restrict the allowable range of frequencies, you must use the **european** option to re-enable the EuroDOCSIS range of frequencies.
- The **north-american** option is usually not needed, because this is the default mode of operations for all DOCSIS cable interfaces. However, this option can be useful on the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cards when noise exists on the frequencies above 42 MHz. In this situation, using the **north-american** option filters out the higher frequencies and reduces the impact of that noise.
- Similarly, the **japanese** option is not needed on those cable interface cards that support it, because this is the default configuration on those cards. However, if you have previously used the **north-american** option on an interface, you need to use the **japanese** option to re-enable the extended frequency range.
- Even when the **upstream freq-range** command is not needed to enable a frequency range, using it ensures that the **cable upstream frequency** and **cable spectrum-group** commands allow only frequencies that are within the desired range. This can help operators from assigning invalid frequencies to upstreams.

---

**Tip** If one or more cable interface line cards that are installed in the chassis do not support the frequency range that you select with this command, the command displays an informational warning message for each of those cable interface cards. Also, you cannot configure the router for a particular frequency range if an upstream or spectrum group on the router is currently configured for a frequency that is invalid for the new range. If you try to do so, the command is ignored and a warning message is printed prompting you to reconfigure the upstream or spectrum group before retrying the command.

---

---

**Note** This command configures only the range of frequencies that can be configured on an upstream. It does not configure the upstreams for the DOCSIS (Annex B) or EuroDOCSIS (Annex A) modes of operation, which is done using the **cable downstream annex** interface command. (Annex C mode is not supported.) You must configure the downstream for Annex A for EuroDOCSIS operations and Annex B for DOCSIS operations. You can configure certain cable interface cards (such as the Cisco uBR-MC28U) for both the DOCSIS Annex B mode and the EuroDOCSIS frequency range, but this violates the DOCSIS specifications and should not be used on standard DOCSIS networks.

---

The allowable range for the upstream channel frequency depends on the cable interface line card and Cisco IOS software release being used. See Table below for the currently supported values.

**Table 5: Allowable Frequency Range for Cable Interface Line Cards**

Frequency Range	Supported Cable Interfaces	Minimum Cisco IOS Releases
5 to 42 MHz	All cable interfaces	All releases supported for the Cisco CMTS
5 to 55 MHz	Cisco uBR-MC16E, Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, Cisco uBR-MC5X20U	Cisco IOS Release 12.2(15)BC2
5 to 65 MHz	Cisco uBR-MC16E, Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, Cisco uBR-MC5X20U, Cisco uBR7111E and Cisco uBR7114E routers	Cisco IOS Release 12.0(13)SC and 12.1(4)EC for Cisco uBR-MC16E Cisco IOS Release 12.1(5)EC1 for Cisco uBR7111E and Cisco uBR7114E Cisco IOS Release 12.2(15)BC2 for Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR-MC5X20U

**Note** The **cable freq-range** command fails if any upstreams or spectrum groups on the router are currently configured for a frequency that is outside the new range being selected. You must reconfigure those upstreams or spectrum groups, using the **cable upstream frequency** or **cable spectrum-group** commands, for lower frequencies, and then repeat the **cable freq-range** command.

## Examples

The following example shows how to configure the Cisco CMTS router to support the EuroDOCSIS upstream frequency range of 5 MHz to 65 MHz. The router then displays a list of the cable interface line cards, if any, that do not support this range. After giving this command, the **cable upstream frequency** command shows the valid range of upstream frequencies as being the EuroDOCSIS range:

```
Router# configure terminal
Router(config)# cable freq-range european

Interface Cable3/0 does not support European frequency range
Interface Cable3/1 does not support European frequency range
Interface Cable5/0 does not support European frequency range
Interface Cable5/1 does not support European frequency range
Router(config)# interface cable 6/0
! This cable interface supports EuroDOCSIS
Router(config-if)# cable upstream 0 frequency ?

<5000000-65000000> Return Frequency in HZ
Router(config-if)#
```

The following example shows how to configure the Cisco CMTS router to support the extended Japanese upstream frequency range of 5 MHz to 55 MHz. The router then displays a list of the cable interface line cards, if any, that do not support this range. After giving this command, the **cable upstream frequency** command shows the valid range of upstream frequencies as being the extended frequency range for Japanese networks:

```

Router# configure terminal

Router(config)# cable freq-range japanese

Interface Cable3/0 does not support Japanese frequency range
Interface Cable4/0 does not support Japanese frequency range
Interface Cable5/0 does not support Japanese frequency range
Router(config)# interface cable 6/0
! This cable interface supports the Japanese range
Router(config-if)# cable upstream 0 frequency ?

<5000000-55000000> Return Frequency in HZ

```

The following example shows how to configure the Cisco CMTS router for its default configuration (DOCSIS upstream frequency range of 5 MHz to 42 MHz). (No warning messages are displayed with this configuration because all cable interface line cards support the basic DOCSIS frequency range.) After giving this command, the **cable upstream frequency** command shows the valid range of upstream frequencies as being the DOCSIS range:

```

Router# configure terminal

Router(config)# cable freq-range north-american

Router(config)# interface cable 3/0

Router(config-if)# cable upstream 0 frequency ?

<5000000-42000000> Return Frequency in HZ

```

The following example shows all of the commands that are needed to configure the cable interface and upstream on a Cisco uBR-MC28U/X cable interface line card to support a frequency in the EuroDOCSIS upstream frequency range of 5 MHz to 65 MHz:

```

Router# configure terminal

Router(config)# cable freq-range european

Router(config)# interface 3/0

Router(config-if)# cable downstream annex a

Router(config-if)# cable upstream 0 frequency 62500000

```

The following example shows the **cable freq-range** command failing because an upstream is configured for a frequency that is invalid for the new range. The upstream must be reconfigured before the **cable freq-range** command can be given successfully.

```

Router# configure terminal

Router(config)# cable freq-range japanese

%%Interface Cable 3/0/U0 has invalid frequency (62500000 Hz) for specified range
%%Set upstream frequencies within range prior to changing freq-range
Router(config)# interface 3/0

Router(config-if)# cable upstream 0 frequency 38600000

Router(config-if)# exit

```

```
Router(config)# cable freq-range japanese
```

**Related Commands**

Command	Description
<b>cable downstream annex</b>	Sets the Motion Picture Experts Group (MPEG) framing format for a downstream port on a cable interface line card.
<b>cable upstream frequency</b>	Configures a fixed frequency of the upstream radio frequency (RF) carrier for an upstream port.

# cable frequency-exclusion-band

To exclude a frequency band from TaFDM, use the **cable frequency-exclusion-band** command in the configuration mode.

## **cable frequency-exclusion-band**

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If you want the SC-QAM to exclusively use a specific frequency range, configure Cisco cBR to exclude the band using the **cable frequency-exclusion-band** command.

The following example shows how to excule a frequency range:

```
controller Upstream-Cable slot/subslot/port
 cable frequency-exclusion-band 18700000 22100000
```

## cable helper-address

To specify a destination IP address for User Datagram Protocol (UDP) broadcast Dynamic Host Configuration Protocol (DHCP) packets, use the **cable helper-address** command in cable interface or subinterface configuration mode. To disable this feature, use the **no** form of this command.

```
cable helper-address IP-address [cable-modem | host | mta | stb | profile name ]
no cable helper-address IP-address [cable-modem | host | mta | stb | profile name ]
```

### Syntax Description

<i>IP-address</i>	The IP address of a DHCP server to which UDP broadcast packets will be sent.
<b>cable-modem</b>	(Optional) Specifies that only CM UDP broadcasts are forwarded.
<b>host</b>	(Optional) Specifies that only host UDP broadcasts are forwarded.
<b>mta</b>	(Optional) Specifies that only media terminal adapter (MTA) UDP broadcasts are forwarded.
<b>stb</b>	(Optional) Specifies that only set-top box (STB) UDP broadcasts are forwarded.
<b>profile name</b>	(Optional) Specifies that only UDP broadcasts with specific DHCP profile are forwarded.

### Command Default

If no options are specified, both CM and host UDP broadcasts are forwarded.

### Command Modes

Interface configuration—cable interface only (config-if)

Subinterface configuration—cable interface only (config-subif)

### Command History

Release	Modification
12.1 T	This command was introduced.
12.1(3a)EC	This command was modified to add the subinterface support.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.3(33)SCB and the <b>mta</b> and <b>stb</b> keywords were added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.8.1	This command was modified to add the <b>profile</b> keyword.

### Usage Guidelines

This command enables CMs and their attached CPE devices (hosts) to use separate DHCP servers, so that CMs and hosts receive their IP addresses from separate address pools. The **cable-modem** keyword specifies that only UDP DHCP broadcasts from CMs are forwarded to that particular destination IP address. The **host** keyword specifies that only UDP broadcasts from hosts (CPE devices) are forwarded to that particular destination IP address.

---

**Note** You must specify both the **cable-modem** or **host** options in separate commands, using separate IP addresses, if you decide to use them. If you specify only one option, then the other type of device (cable modem or host) will not be able to connect with a DHCP server. In addition, if you use the **cable-modem** or **host** option with the same IP address that was previously configured with this command, the new configuration overwrites the old configuration.

---

---

**Note** Starting with Cisco IOS Release 12.2(33)SCG, if you use the **cable-modem** or **host** option with the same IP address that was previously configured with this command on the Cisco uBR10012 and Cisco uBR7200 series routers, the new configuration does not overwrite the old configuration. It is configured under a bundle interface.

---

---

**Tip** If you configure different helper addresses on different sub-bundles within a bundle, the cable modem may not come online. We recommend that you use the same helper address on all sub-bundles within a bundle.

---

The **cable helper-address** command is similar to the **ip helper-address** command, but the **cable helper-address** command has been enhanced for cable interfaces and DOCSIS networks to allow separate helper addresses for CMs and hosts. Use only the **cable helper-address** command on cable interfaces, and use the **ip helper-address** command on all non-cable interfaces.

The **cable helper-address** command, as is the case with the **ip helper-address** command, cannot be used on subordinate interfaces, so these commands are automatically removed from an interface configuration when the interface is configured as a subordinate interface. Subordinate interfaces use the IP configuration of the primary interface, which includes not only the IP address for the interface itself, but also the helper addresses that have been configured on the primary interface.

---

**Tip** You can repeat this command to specify any number of helper addresses, but the Cisco IOS software uses only the first 16 valid addresses that are configured on each interface (using either the **cable helper-address** command or the **ip helper-address** command) when forwarding DHCP requests.

---

## Examples

The following example shows how to forward UDP broadcasts from both CMs and CPE devices to the DHCP server at 172.23.66.44:

```
Router(config)# interface cable 1/0
Router(config-if)# cable helper-address 172.23.66.44
Router(config-if)# exit
Router(config)#
```

The following example shows how to forward UDP broadcasts from CMs and CPE devices to separate DHCP servers:

```
Router(config)# interface cable 6/0
Router(config-if)# cable helper-address 172.23.66.143 host
Router(config-if)# cable helper-address 172.23.66.144 cable-modem
```

```
Router(config-if)# exit
Router(config)#
```

The following example shows that when you specify the **cable-modem** and **host** options with the same IP address, the second command overwrites the first one:

```
Router(config)# interface cable 3/0
Router(config-if)# cable helper-address 10.10.10.13 host
Router(config-if)# cable helper-address 10.10.10.13 cable-modem
Router(config-if)# exit
Router(config)# exit
```

```
Router# show running-config | include helper-address
  cable helper-address 10.10.10.13 cable-modem
Router#
```

The following example shows that when you specify the **cable-modem** and **host** options with the same IP address on a Cisco uBR10012 router running Cisco IOS Release 12.2(33)SCG and later, it is configured under a bundle interface:

```
Router(config)# interface cable 3/0
Router(config-if)# cable helper-address 10.10.10.13 host
Router(config-if)# cable helper-address 10.10.10.13 cable-modem
Router(config-if)# end
Router# show running-config | include helper-address
cable helper-address 10.10.10.13 cable-modem
cable helper-address 10.10.10.13 host
Router#
```

The following example shows how to specify that only UDP broadcasts with specific DHCP profile are forwarded on Cisco cBR-8 router.

```
Router(config)# interface bundle 2
Router(config-if)# cable helper-address 2.2.2.2 profile DEVICE1
```

## Related Commands

Command	Description
<b>cable dhcp-giaddr</b>	Modifies the GIADDR field of DHCPDISCOVER and DHCPREQUEST packets with a Relay IP address before they are forwarded to the DHCP server.
<b>cable relay-agent-option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host and forward the packet to a DHCP server.
<b>cable source-verify</b>	Turns on CM upstream verification.
<b>cable telco-return spd dhcp-authenticate</b>	Enforces the telco-return CM to use a specific Dynamic Host Configuration Protocol (DHCP) server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the Dynamic Host Configuration Protocol (DHCP) server that the telco-return CM must access.
<b>ip dhcp relay information option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host and forward the packet to a DHCP server.

Command	Description
ip dhcp smart-relay	Monitors client retransmissions when address pool depletion occurs.

## cable host access-group

To configure the access list for a customer premises equipment (CPE) device or host on the Cisco CMTS router, use the **cable host** command in privileged EXEC mode. To remove an access list, use this command with the **no access-group** option.

```
cable host {ip-addressmac-address} access-group {access-listaccess-name}
cable host {ip-addressmac-address} no access-group
```

### Syntax Description

<i>ip-address</i>	IP address of the CPE device or host.
<i>mac-address</i>	MAC address of the CPE device or host.
<b>access-group</b>	Enables <b>access-group</b> options. The <b>no</b> form removes access-group specifications.
{ <i>access-list</i>   <i>access-name</i> }	Specifies the IP access list (standard or extended), either by access-list number (1 to 199) or by access-list name.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
11.3 NA	This command was introduced.
12.2(4)BC1	The functionality of this command was made identical to that of the <b>cable modem access-group</b> command, but both commands were retained for backwards compatibility.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

For the **vrf** keyword of this command, only the *ip-address* option is supported.

An access list can be configured to deny access to any IP address other than the ones previously configured, using the **access-list** *access-list* **deny any any** command. Starting with Cisco IOS Release 12.2(33)SCD, when a CM is added to such an access list on the Cisco uBR10012 and Cisco uBR7200 series universal broadband routers, the ping fails. If the CM is reset, removed, or powered off, the ping succeeds after the CM comes online. However, the **show cable modem access-group** command displays that the CM does not belong to the access-group.

**Note** The **cable host** command, and its SNMP equivalent, `cdxCmCpeAccessGroup`, are not supported on the Cisco uBR10012 universal broadband router. On this router, use the standard DOCSIS MIB, DOCS-SUBMGT-MIB, instead.

**Tip** This command is equivalent to configuring `cdxCmCpeAccessGroup` in CISCO-DOCS-EXT-MIB.

### Examples

The following example shows how to assign access list number 2 to the cable host with an IP address of 10.1.1.1:

```
Router# cable host 10.1.1.1 access-group 2
```

### Related Commands

Command	Description
<b>clear cable host</b>	Clears the host from the internal address tables of the Cisco CMTS router.
<b>cable device</b>	Configures an access list for a CM device or host on the Cisco CMTS router.
<b>cable modem access-group</b>	Configures the access-group for a CM on the Cisco CMTS router.
<b>show cable device access-group</b>	Display the CMs and the hosts behind the CMs on the network on the Cisco CMTS router.
<b>show cable host access-group</b>	Displays the hosts behind the CMs on the network on the Cisco CMTS router.

## cable high-priority-call-window

To set the call window (in minutes) during which the Cisco CMTS router maintains records of Emergency 911 calls, use the **cable high-priority-call-window** command in global configuration mode. To remove the call window configuration from the Cisco CMTS router, use the **no** form of this command:

```
cable high-priority-call-window minutes
no cable high-priority-call-window
```

### Syntax Description

<i>window</i>	This value defines the length of time, in minutes, for which E911 Call History is to be maintained.
---------------	-----------------------------------------------------------------------------------------------------

### Command Default

This command and the PacketCable Emergency 911 Services Listing and History feature is disabled by default on the Cisco CMTS.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced supporting PacketCable Emergency 911 Services Listing and History on the Cisco CMTS: <ul style="list-style-type: none"> <li>• Cisco uBR7246VXR router</li> <li>• Cisco uBR10012 router</li> </ul>
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The following command example configures the call window on the Cisco uBR10012 router to be 1 minute in length:

```
Router(config)# cable high-priority-call-window 1
```

To observe Emergency 911 calls made within the configured window, use the **show cable calls** command in privileged EXEC mode:

The following command example illustrates that one Emergency 911 call was made on the Cable8/1/1 interface on the Cisco uBR10012 router during the window set for high priority calls:

```
Router# show cable calls
Interface  ActiveHiPriCalls  ActiveAllCalls  PostHiPriCallCms  RecentHiPriCms
Cable5/0/0  0                  0                0                  0
Cable5/0/1  0                  0                0                  0
Cable5/1/0  0                  0                0                  0
Cable5/1/1  0                  0                0                  0
Cable5/1/2  0                  0                0                  0
Cable5/1/3  0                  0                0                  0
Cable5/1/4  0                  0                0                  0
Cable6/0/0  0                  0                0                  0
```

```

Cable6/0/1 0          0          0          0
Cable7/0/0 0          0          0          0
Cable7/0/1 0          0          0          0
Cable8/1/0 0          0          0          0
Cable8/1/1 1          1          0          0
Cable8/1/2 0          0          0          0
Cable8/1/3 0          0          0          0
Cable8/1/4 0          0          0          0
Total      1          1          0          0

```

The following command example configures the call window on the Cisco cBR Series Converged Broadband Routers to be 2 minutes in length:

```
Router(config)# cable high-priority-call-window 2
```

#### Related Commands

Command	Description
<b>show cable calls</b>	Displays voice call history information and status for the PacketCable Emergency 911 Services Listing and History feature.
<b>show cable modem calls</b>	Displays voice call information for a particular cable modem.

## cable igmp static-group

To configure cable per-physical-downstream static multicast support on the Cisco CMTS router, use the **cable igmp static-group** command in interface configuration mode.

**cable igmp static-group** *multicast-group-ip* [**source** *source-ip*] [*subinterface*]

### Syntax Description

<i>multicast-group-ip</i>	IP address of the multicast group.
<b>source</b> <i>source-ip</i>	(Optional) Source IP address for SSM.
<i>subinterface</i>	(Optional) Subinterface number: <ul style="list-style-type: none"> <li>• default: 0 for the main interface</li> </ul> <p><b>Note</b> If the subinterface is configured at the virtual bundle interface, the subinterface number option for this CLI must be configured to match up with the desired subinterface devices.</p>

### Command Default

Cable per-physical-downstream static multicast support is not defined by default.

### Command Modes

Interface configuration—cable interface only (config-if)

Wideband-interface profile configuration (config-profile-wb)

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.

### Usage Guidelines

The Cable per-physical-downstream Static Multicast Support feature introduces the concept of a physical IGMP static group, which is an extension of the existing logical IGMP static group. The differences between the two IGMP static groups are:

- A cable bundle logical IGMP static group creates the IGMP static group for the logical IP domain and forwards multicast traffics for the configured multicast group to every subordinate interface in the same bundle.
- A cable bundle physical IGMP static group creates the IGMP static group on per-physical subordinate interface basis and will only forwards multicast traffics to only configured subordinate interfaces.

When an IGMP static group is configured on a primary interface, the IGMP static group will perform a check for each subordinate interface in the multicast group. If the multicast group is configured as a physical static group, then only the corresponding subordinate interfaces will be added to the cable bundle forwarding table. If the multicast group is configured as a logical static group, then all subordinate interfaces will be added to the cable bundle forwarding table.

**Note** When all remaining physical static groups are un-configured from the subordinate interface for a particular multicast group on a particular bundle, the Cisco CMTS router will revert back to the logical static group for that multicast group on that bundle.

The **cable igmp static-group** command will only appear in the output of the **show running-configuration** command if it is configured via the CLI. If it is configured by DSG, the **cable igmp static-group** command CLI will remain hidden for a particular multicast group. This is done in order to eliminate any confusion with the current DSG configurations.

**Note** Any multicast group being used by DSG (or CLI) within the same CMTS, should not be used for CLI (or DSG) configuration.

### Examples

The following example shows the **cable igmp static-group** command on the Cisco CMTS router:

```
Router(config-if)# cable igmp static-group 230.1.1.1
```

The following example shows the **cable igmp static-group** command with the **source** option on the Cisco CMTS router:

```
Router(config-if)# cable igmp static-group 232.1.1.1 source 10.1.1.1
```

### Related Commands

Command	Description
<b>ip igmp static-group</b>	Configure static group membership entries on an interface.

## cable init-channel-timeout

To specify the maximum time that a CM can spend performing initial ranging on the upstream channels described in the Registration Response (REG-RSP) and Multipart Registration Response (REG-RSP-MP) messages, use the **cable init-channel-timeout** command in cable interface configuration mode. To disable this configuration, use the **no** form of this command.

**cable init-channel-timeout** *value*

**no cable init-channel-timeout** *value*

### Syntax Description

<i>value</i>	Channel timeout value in seconds. The range is from 10 to 180. The default is 60.
--------------	-----------------------------------------------------------------------------------

### Command Default

None

### Command Modes

Interface configuration—cable interface only (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to specify the channel timeout value on a cable interface at slot/subslot/port 5/1/0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 5/1/0
Router(config-if)# cable init-channel-timeout 90
```

The following example shows how to specify the channel timeout value on a cable interface at slot/subslot/port 3/0/0 on a Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface cable 3/0/0
Router(config-if)# cable init-channel-timeout 90
```

## cable insertion-interval

To configure the interval between consecutive initial ranging slots on an upstream, use the **cable insertion-interval** interface configuration command. To configure the automatic setting and ignore any minimum or maximum time settings, use the **no** form of this command.

**cable insertion-interval** {**fixed-intrvl** | **automatic** [*min-intrvl*] [*max-intrvl*]}  
**no cable insertion-interval**

Syntax Description	
<b>fixed-intrvl</b>	Fixed interval between initial ranging slots in milliseconds. The range is from 100 to 2000.
<b>automatic</b>	Causes the Cisco CMTS MAC scheduler for each upstream CM to vary the initial ranging times available to new CMs joining the network.
<i>min-intrvl</i>	(Optional) Minimum value in milliseconds between the initial ranging slots on the upstream. The range is from 20 to 120. The default is 60.
<i>max-intrvl</i>	(Optional) Maximum value in milliseconds between the initial ranging slots on the upstream. The range is from 240 to 1800. The default is 480.

**Command Default** Automatic (dynamically varying the frequency of initial ranging upstream slots between 60 milliseconds and 480 milliseconds).

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	11.NA	This command was introduced.
	12.1 T	This command was modified.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to specify the minimum and maximum duration between initial ranging opportunities that appear in MAP messages sent by the Cisco CMTS router. MAP messages define the precise time intervals during which CMs can send.

The default insertion interval setting (**automatic**) configures the Cisco CMTS router to optimize the initial ranging times available to new CMs that attempt to join the network. The optimization algorithm automatically varies the initial ranging times between 60 and 480 milliseconds, depending on the number of CMs attempting to come online.

Use the **cable insertion-interval automatic** command to bring a large number of CMs online quickly (for example, after a major power failure). After the CMs have come online, you can override the **automatic** keyword by giving this command again and specifying a specific insertion interval.

### Examples

The following example shows the default configuration, which is to specify automatic insertion intervals, using the default initial ranging intervals:

```
Router# configure terminal
Router(config)# interface cable 3/0
Router(config-if)# cable insertion-interval automatic
```

The following example shows how to set the minimum insertion interval to 100 ms:

```
Router# configure terminal
Router(config)# interface cable 5/1/0
Router(config-if)# cable insertion-interval 100
```

### Related Commands

Command	Description
<b>cable upstream data-backoff</b>	Specifies automatic or fixed start and stop values for data backoff.
<b>cable upstream range-backoff</b>	Specifies automatic or configured initial ranging backoff calculation.

# cable intercept

To allow the Cisco CMTS router to forward all traffic to and from a particular CPE to a data collector located at particular User Datagram Protocol (UDP) port, use the **cable intercept** command in cable interface configuration mode. To deactivate this function, use the **no** form of this command.

**cable intercept** *mac-address ip-address udp-port*  
**no cable intercept** *mac-address*

## Syntax Description

<i>mac-address</i>	Specifies the MAC address to be intercepted.  For Cisco uBR10012 router, a maximum of 4095 MAC addresses can be configured. For Cisco uBR7200 series router, a maximum of 10 MAC addresses per interface can be configured.
<i>ip-address</i>	Specifies the IP address for the destination data collector.
<i>udp-port</i>	Specifies the destination UDP port number for the intercept stream at the data collector. The range is from 0 to 65535.

## Command Default

Disabled

## Command Modes

Interface configuration—cable interface only (config-if)

Starting from Cisco IOS Release 12.2(33)SCC,  
 Interface configuration—bundle interface only (config-if)

## Command History

Release	Modification
12.0(5)T1	This command was introduced.
12.0(6)SC	This command was introduced on the 12.0 SC train.
12.1(2)EC	This command was introduced on 12.1 EC train.
12.1(11b)EC	Support was added to allow the data collector to be more than two hops from the Cisco CMTS router.
12.2(4)BC1	This command was integrated into Cisco IOS Release 12.2(4)BC1.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCC	This command was modified. The command is now configured under bundle interface.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

## Usage Guidelines

When this command is activated, the Cisco CMTS router examines each packet for the desired MAC address; when a matching MAC address is found (for either the origination or destination endpoint), a copy of the

packet is encapsulated into a UDP packet, which is then sent to the specified server at the given IP address and port.

---

**Note** The data collecting system at the *ip-address* on the *udp-port* must be configured to listen for and capture the necessary data stream. An IP route to the specified IP address must exist, and IP connectivity to that device must be present for the traffic to be captured. Before Cisco IOS Release 12.1(11b)EC, the data collecting system must be within two routing hops of the Cisco CMTS.

---

For Cisco uBR10012 router, a maximum of 4095 MAC intercepts can be configured. This includes the MAC intercepts configured using the **cable intercept** command, and other lawful intercept features (such as Service Independent Intercept [SII]). The bandwidth used by each MAC intercept is also a deciding factor for the number of MAC intercepts that can be configured. High bandwidth usage by a MAC intercept might reduce the number of MAC intercepts that can be configured.

This command is originally designed to comply with the United States Federal Communications Assistance for Law Enforcement Act (CALEA) and other law enforcement wiretap requirements for voice communications. For additional information, see the *PacketCable Electronic Surveillance Specification*, which is available at the following URL at the PacketCable web site: <http://www.packetcable.com>.

---

**Note** For lawful intercept, it is recommended to use SII (through SNMPv3) instead of the **cable intercept** command.

---

---

**Note** Starting from Cisco IOS Release 12.2(33)SCC, the **cable intercept** command is configured under bundle interface.

Starting from Cisco IOS Release 12.2(33)SCH, the cable intercept command is not allowed to configure in Cable Interface, both in Cisco uBR7200 series and Cisco uBR10012 routers.

---

## Examples

The following commands specify that a copy of all traffic for the CPE with the MAC address of 0080.fcaa.aabb should be forwarded to the data collector that is listening at UDP port 512 at the IP address of 10.12.13.8. The **show interface cable intercept** command displays which intercepts are currently active.

```
Router# configure terminal

Router#(config) interface cable 6/0

Router(config-if)# cable intercept 0080.fcaa.aabb 10.12.13.8 512
Router(config-if)# exit

Router(config)# exit

Router# show interface cable 6/0 intercept

MAC Address      Destination      Destination
-----
0080.fcaa.aabb   3.12.13.8       512
```

The following example shows the behavior of the **cable intercept** command that is configured under bundle interface. The **show running interface** command displays which intercepts are currently active.

```
Router# configure terminal

Router#(config) interface bundle 10

Router(config-if)# cable intercept 0080.fcaa.aabb 10.12.13.8 512
Router(config-if)# exit

Router(config)# exit

Router# show running interface bundle 10 | i intercept

cable intercept 0080.fcaa.aabb 10.12.13.8 512
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable monitor</b>	Enables the forwarding of selected packets on the cable interface to an external LAN analyzer.
<b>show interface cable intercept</b>	Displays the CMs for which cable intercept is currently active.

## cable ip-init

To configure the IP provisioning mode supported by the cable interface on a Cisco CMTS router, use the **cable ip-init** command in interface or subinterface configuration mode or MAC domain profile configuration mode. To remove the IP provisioning configuration, use the **no** form of this command.

```
cable ip-init {apm | dual-stack | ipv4 | ipv6}
no cable ip-init {apm | dual-stack | ipv4 | ipv6}
```

### Syntax Description

<b>apm</b>	Configures the interface to support Alternative Provisioning Mode (APM).
<b>dual-stack</b>	Configures the interface to support both IPv4 and IPv6 addressing.
<b>ipv4</b>	Configures the interface to support IPv4 address only.
<b>ipv6</b>	Configures the interface to support IPv6 address only.

### Command Default

None

### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCC	This command was modified. The <b>apm</b> keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable ip-init** command configures the cable interface for the IP addressing mode that it supports. This information is included in the IP initialization parameters of the MAC Domain Descriptor (MDD) message.

### Examples

The following example shows how to configure a cable interface on a Cisco CMTS router to support both IPv4 and IPv6 addressing:

```
interface cable 5/0/1
 cable ip-init dual-stack
```

## cable ip-broadcast-echo

To activate upstream IP broadcast echo so that the Cisco CMTS router can echo broadcast packets, use the **cable ip-broadcast-echo** command in cable interface or subinterface configuration mode. To disable the upstream IP broadcast echo, use the **no** form of this command.

**cable ip-broadcast-echo**  
**no cable ip-broadcast-echo**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Upstream IP broadcast echo is disabled.

**Command Modes**

Cable interface configuration (config-if)

Cable subinterface configuration (config-subif)

Command History	Release	Modification
	11.3 XA	This command was introduced.
	12.1(3a) EC	The subinterface support was added.
	12.1(5)EC	Support was added for the Cisco uBR7100 series routers.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** By default, broadcast IP packets that arrive on the upstream at the Cisco CMTS router are not forwarded on the downstream ports so that they would be delivered to the other CMs and CPE devices. This behavior prevents broadcast storms in which such packets are repeatedly looped through the network.

The **cable ip-broadcast-echo** command changes this behavior by forwarding such packets on the appropriate downstream ports, so that the packet is received by all CMs and CPE devices on that segment of the network. This allows the cable network to behave more like a standard Ethernet network, and support direct peer-to-peer communications using IP broadcasts.

**Note** This command should not be used in a typical service provider network.

### Examples

The following example shows how to activate IP broadcast echo in the cable interface configuration mode:

```
Router(config-if)# cable ip-broadcast-echo
```

The following example shows how to activate IP broadcast echo in the cable subinterface configuration mode:

```
Router(config)# interface cable 6/0.1  
Router(config-subif)# cable ip-broadcast-echo
```

---

**Related Commands**

Command	Description
<b>cable ip-multicast-echo</b>	Enables IP multicast echo so that the Cisco CMTS can echo multicast packets.

# cable ip-multicast-echo

To enable IP multicast echo so that the Cisco CMTS can echo multicast packets, use the **cable ip-multicast-echo** command in cable interface configuration mode. To disable IP multicast echo, use the **no** form of this command.

**cable ip-multicast-echo**  
**no cable ip-multicast-echo**

**Syntax Description** This command has no arguments or keywords.

**Command Default** IP multicast echo is disabled.

**Command Modes** Cable interface configuration (config-if)

Command History	Release	Modification
	11.3 XA	This command was introduced for Cisco uBR7200 series routers.
	12.1(3a) EC	The subinterface support was added.
	12.1(5)EC	Support was added for Cisco uBR7100 series routers.
	12.2(4)BC1	Support was added for the Cisco uBR10012 router.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCB	The command default is changed to disabled in Cisco IOS Release 12.2(33)SCB and later.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** By default, multicast IP packets that arrive on the upstream at the Cisco CMTS are forwarded on the appropriate downstream ports so that they are delivered to the other CMs and CPE devices on that segment of the network. This allows the cable network to behave like a standard Ethernet network in terms of its handling of multicast IP traffic.

This behavior might not be appropriate for certain applications or networks, so the **no cable ip-multicast-echo** command changes this behavior by preventing the forwarding of multicast packets. Disabling multicast traffic can prevent some types of broadcast storms in which such packets are repeatedly looped through the network.

To verify if IP multicast echo has been activated or deactivated, enter the **show running-config** command and look for the cable interface configuration information.

If IP multicast echo is enabled, it appears in this output of the **show running-config** command.

If IP multicast echo is disabled, it is not displayed in the output **show running-config** command.

If you are having trouble, make sure that you have entered the correct slot and port numbers when you entered cable bundle interface configuration mode.

---

**Note** On the Cisco uBR10012 router, input access lists are not applied to the multicast traffic that is echoed on each downstream. To control the echoed multicast traffic, you therefore need to configure an output access list and apply it to each downstream interface.

---

---

### Examples

The following example shows how to disable IP multicast echo in the bundle interface configuration mode:

```
Router(config-if)# no cable ip-multicast-echo
```

---

### Related Commands

Command	Description
<b>cable ip-broadcast-echo</b>	Enables upstream IP broadcast echo so that the Cisco CMTS can echo broadcast packets.

# cable ipc-stats

To enable the Cable IPC Statistics Collection tool on a Cisco CMTS router, use the **cable ipc-stats** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**cable ipc-stats**  
**no cable ipc-stats**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The Cable IPC Statistics Collection tool is disabled.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The Cable IPC Statistics Collection tool provides debugging information about all IPC messages. We recommend that you enable this tool only when it is necessary as the tool consumes considerable amount of CPU memory while running on a Cisco CMTS router.

The **cable ipc-stats** command is synchronized on all cable interface line cards from the active RP. You do not have to use this command on cable interface line cards separately.

**Examples** The following example shows how to enable the Cable IPC Statistics Collection tool on a Cisco CMTS router:

```
Router# configure terminal
Router(config)# cable ipc-stats
```

Command	Description
<b>clear cable ipc-stats</b>	Clears the active database and resets IPC statistics in the active database to zero.
<b>show cable ipc-stats</b>	Displays statistics of all the IPC messages on a Cisco CMTS router.

# cable ipc-watermark

To set the IPC watermark level for the line cards on a Cisco CMTS router, use the **cable ipc-watermark** command in global configuration mode. To disable this configuration, use the **no** form of this command.

```
cable ipc-watermark {clcslot/subslot service-type low medium high | rp service-type low medium high }
no cable ipc-watermark {clcslot/subslot service-type low medium high | rp service-type low medium high }
}
```

## Syntax Description

<i>slot/subslot</i>	<ul style="list-style-type: none"> <li>Specifies the slot number. The range is from 5 to 8.</li> <li>Specifies the sub-slot number. The values are 0 and 1.</li> </ul>
<i>service-type</i>	<p>Specifies the IPC service type for the Cisco CMTS router.</p> <p>The values are:</p> <ul style="list-style-type: none"> <li>0—Default</li> <li>1—Inband</li> <li>2—Expedite</li> <li>3—Non-critical</li> </ul>
<i>low medium high</i>	Specifies the low, medium, and high IPC watermark level. The range is from 1 to 8000.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCJ1	This command was introduced in Cisco uBR10012 router.

## Examples

The following example shows how to set the IPC watermark level for the line cards on a Cisco CMTS router:

```
Router# configure terminal
Router(config)# cable ipc-watermark rp 0 1000 2000 4000
Router(config)# cable ipc-watermark clc 5/0 0 1000 2000 2000
```

## Related Commands

Command	Description
<b>show ipc node</b>	Displays statistics of all the IPC nodes on a Cisco CMTS router.

# cable ipv6 dhcp-insert

To configure the Cisco cBR-8 series routers to insert descriptors into DHCPv6 packets, use the **cable ipv6 dhcp-insert hostname** command in global configuration mode.

To configure the Cisco cBR-8 series routers to insert downstream description into the DHCPv6 packets, use the **cable ipv6 dhcp-insert downstream-description** command in global configuration mode.

To remove this configuration, use the **no** form of this command.

**cable ipv6 dhcp-insert { hostname | downstream-description }**

<b>hostname</b>	Appends received DHCPv6 packets with router hostnames.
<b>downstream-description</b>	Appends received DHCPv6 packets with downstream description.

## Command Default

This configuration is disabled by default.

## Command Modes

Interface configuration (config-if) and bundle interface configuration.

## Command History

Release	Modification
Cisco IOS XE Gibraltar 17.3.1x	This command is introduced.
Cisco IOS XE Cupertino 17.9.1x	The <b>downstream-description</b> option is introduced.

## Usage Guidelines

The **cable ipv6 dhcp-insert** command is used to configure the following feature: [DHCP, ToD, and TFTP Services for the CMTS Routers](#).

This feature enhances the DHCPv6 security potential and the Cable duplicate MAC address feature on the Cisco cBR-8 router.

The **cable ipv6 dhcp-insert** command specifies which descriptors to append to DHCPv6 packets. The DHCPv6 servers can then detect cable modem clones and extract geographical information.

The Cisco cBR-8 series router can use the DHCPv6 Relay Agent Information option to send particular information about a cable modem, such as its MAC address and the cable interface to which it is connected. If the DHCPv6 server cannot match the information with that belonging to a cable modem in its database, the Cisco cBR-8 series router identifies that the device is a CPE device. This allows the Cisco cBR-8 series router and DHCPv6 server to retain accurate information about which CPE devices are using which cable modems and whether the devices should be allowed network access.

## Example: Configuration

The following example shows how to configure `downstream-description` and `hostname`:

```
router(config)#interface bundle 1
router(config-if)#cable ipv6 dhcp-insert downstream-description
router(config-if)#cable ipv6 dhcp-insert hostname

router(config)#interface cable 9/0/1
router(config-if)#cable downstream description node1-ca9/0/1
```

Use the following command to verify the configuration:

```
router#show running-config interface bundle 1 | inc insert
ip dhcp relay information option-insert
cable ipv6 dhcp-insert hostname
cable ipv6 dhcp-insert downstream-description
cable dhcp-insert hostname
cable dhcp-insert downstream-description
```

## cable ipv6 dhcp-relay override

To configure the Cisco cBR-8 series routers to override Enterprise ID to 4491 in Vendor Specific Information when relaying DHCPv6 packets, use the **cable ipv6 dhcp-relay override** command in global configuration mode. This is the default behavior. To disable overriding of Enterprise ID in Vendor Specific Information during DHCPv6 relay, use the **no** form of this command.

**cable ipv6 dhcp-relay override**

**no cable ipv6 dhcp-relay override**

---

**Command Default** This configuration is enabled by default.

---

**Command Modes** Global configuration (config)

---

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1z2	This command was introduced.

---

---

**Usage Guidelines** The command, **cable ipv6 dhcp-relay override** is enabled by default. When it relays DHCPv6 packets, cBR-8 overrides Enterprise ID to 4491 in Vendor Specific Information.

If you explicitly disable this command by using the **no cable ipv6 dhcp-relay override** command, cBR-8 does not change Enterprise ID in Vendor Specific Information during DHCPv6 relay.

## cable ipv6 source-verify

To enable source verification of IPv6 packets received by a cable interface upstream on a Cisco CMTS router, use the **cable ipv6 source-verify** command in bundle interface or subinterface configuration mode. To disable IPv6 source verification, use the **no** form of this command.

```
cable ipv6 source-verify [dhcp [server ip-address] | leasequery-filter upstream threshold interval | leasetimer value]
```

```
no cable ipv6 source-verify
```

### Syntax Description

<b>dhcp</b>	(Optional) Verifies IP address with the DHCPv6 server. <ul style="list-style-type: none"> <li>• <b>server</b>—Enables the Leasequery server to send the DHCPv6 Leasequeries.</li> <li>• <i>ip-address</i>—IPv6 address of the Leasequery server.</li> </ul>
<b>leasequery-filter</b>	(Optional) Filters the IPv6 Leasequery requests. <ul style="list-style-type: none"> <li>• <b>upstream</b>—Indicates that the Leasequery requests are sent on cable upstream interfaces.</li> <li>• <i>threshold</i>—Maximum number of DHCP Leasequeries allowed per SID for each interval period. The range is from 0 to 55.</li> <li>• <i>interval</i>—Time period, in seconds, when Leasequeries should be monitored. The range is from 1 to 5.</li> </ul>
<b>leasetimer</b>	(Optional) Specifies the time, in minutes, when the router should check its internal CPE database for IP addresses whose lease times has expired. <ul style="list-style-type: none"> <li>• <i>value</i>—Lease time value. The range is from 1 to 240. The default is 60.</li> </ul>

### Command Default

IPv6 source verification is disabled.

### Command Modes

Bundle interface configuration (config-if),

Bundle subinterface configuration (config-subif)

### Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCF1	This command was modified. The <b>dhcp</b> keyword was added to verify IPv6 address with the DHCPv6 server. The <b>leasequery-filter</b> and <b>leasetimer</b> keywords were added to further filter the IPv6 Leasequery requests.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The IPv6 source verification feature is enabled on a cable bundle interface or subinterface.

When you enable IPv6 source verification on the Cisco CMTS bundle interface, the source verification routine is run to verify the MAC-SID-IP binding of the packet. If the source verification succeeds, the packet is forwarded. If the verification fails, then the packet is dropped.

When a cable modem (CM) is operating as a bridged modem device, then the Cisco CMTS router verifies the entire IPv6 address for that CM and the CPEs behind that CM.

When a CM is operating as a router modem device, then the Cisco CMTS router only verifies the network prefix for that CM and the CPEs behind that CM. To be successful, this means that all cable modem routers must have different prefixes assigned to them.

The **cable ipv6 source-verify** command only controls the source verification of IPv6 packets. For IPv4-based source verification, you must use the **cable source-verify** command, which also supports different options.

---

**Note** On the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCA, source verification of IPv6 packets occurs only on packets in the process-switched path of the route processor (RP).

---

### Using the dhcp Option

If the **dhcp** option is used, the Cisco CMTS sends a DHCPv6 Leasequery message to the DHCP server to verify the IP address. If a valid response is received from the DHCP server, the Cisco CMTS updates its database with the new CPE device and allows future traffic through. If the DHCP server does not return a successful response, all traffic from the CPE is dropped.

If you are using the **dhcp** option, you have the option to specify an alternate DHCP server using its IP address. The **dhcp** option supports source verification from multiple dhcp servers.

For single DHCP server, use the **cable ipv6 source-verify dhcp [server ipv6-address]** command. For multiple DHCP servers use the **cable ipv6 source-verify dhcp** command.

### Using the leasetimer Option

The **leasetimer** option adds another level of verification by activating a timer that periodically examines the lease times for the IP addresses for known CPE devices. If the Cisco CMTS discovers that the DHCP lease for a CPE device has expired, it removes that IP address from its database, preventing the CPE device from communicating until it makes another DHCP request. This prevents users from treating DHCP-assigned addresses as static addresses, as well as from using IP addresses that were previously assigned to other devices.

The **leasetimer** option takes effect only when the **dhcp** option is also used on an interface. Also, this option is supported only on the primary bundle interface and cannot be configured on subinterfaces. Configuring it for a primary bundle interface automatically applies it to all subinterfaces.

### Using the leasequery-filter Option

To prevent a large volume of Leasequery requests on a cable interface, use the **cable ipv6 source-verify leasequery-filter** command. After configuring this command, the Cisco CMTS allows only the configured number of DHCPv6 Leasequery requests within the specified interval time period.

For example, the **cable ipv6 source-verify leasequery-filter 5 10** command configures the Cisco CMTS so that the Cisco CMTS allows a maximum of five DHCPv6 Leasequery requests every 10 seconds for each SID.

---

## Examples

The following example shows how to enable IPv6 source verification on a Cisco CMTS router bundle interface by first configuring **cable ipv6 source-verify** at the bundle interface:

```
interface bundle 1
 cable ipv6 source-verify
```

After you configure the bundle interface, associate the bundle at the cable interface:

```
interface cable 6/0/2
 cable bundle 1
```

The following example shows how to configure the Cisco CMTS router to send DHCPv6 Leasequeries to verify unknown source IP addresses in upstream data packets. Both **cable ipv6 source-verify dhcp** and **no cable nd** commands must be configured on the Cisco CMTS bundle before the Cisco CMTS will issue any DHCPv6 Leasequery to recover an unknown IPv6 CPE to the Cisco CMTS.

```
configure terminal
 interface bundle 1
  cable ipv6 source-verify dhcp
  no cable nd
```

The following example shows how to configure the leasetimer option so that the Cisco CMTS checks the IP addresses in the CPE database for that particular interface for expired lease time:

```
configure terminal
 interface bundle 1
  cable ipv6 source-verify dhcp
  cable ipv6 source-verify leasetimer 120
```

The following example shows how to configure the Cisco CMTS router so that it allows a maximum of five DHCP Leasequery requests per SID over each 2-second interval on a particular cable interface.

```
configure terminal
 interface bundle 1
  cable ipv6 source-verify dhcp
  cable ipv6 source-verify leasequery-filter 5 2
```

### Associated Features

The **cable ipv6 source-verify** command is used to configure the following feature:

- [Cable DHCP Leasequery](#)

### Related Commands

Command	Description
<b>cable source-verify</b>	Enables verification of IPv4 addresses for CMs and CPE devices on an upstream.
<b>cable ipv6 source-verify leasequery-filter downstream</b>	Enables the Leasequery filter in the CMTS downstream for IPv6 packets.

# cable ipv6 source-verify dhcp ns-probe

To send NS to CPE after source verify is successful, use the **cable ipv6 source-verify dhcp ns-probe** command in global configuration mode. To disable the configuration, use the **no** form of this command.

```
cable ipv6 source-verify dhcp ns-probe [ cpe | pd | interval seconds { retries number-of-probes } ]
no cable ipv6 source-verify dhcp ns-probe [ cpe | pd | interval seconds { retries number-of-probes }
]
```

Syntax Description		
<b>source-verify</b>		IPv6 Source verification.
<b>dhcp</b>		DHCPv6 LQ.
<b>ns-probe</b>		NS Probe If a switch is present between CM and CPE router, for some CM firmware, the CPE router can't receive traffic until it sends traffic. Configure <b>ns-probe</b> to overcome this issue.
<b>cpe</b>		Send probe to any CPE
<b>pd</b>		Only send probe to CPE router
<b>interval</b> <i>seconds</i>		Interval between NS probes (seconds). Range is 10–60 seconds.
<b>retries</b> <i>number-of-probes</i>		Number of probes.

**Command Default** This command is disabled by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** **Using the ns-probe option**  
If the **ns-probe** option is used, the Cisco CMTS sends NS probes to CPE or PD, after LQ succeeds.

**Examples** The following example shows how to enable DHCPv6 LQ NS Probe IPv6 source verification on a Cisco CMTS router:

```
router#configure terminal
router(config)#cable ipv6 source-verify dhcp ns-probe pd interval 30 retries 3
```

Use the following command to verify the configuration:

```
router(config)#do sh run | i ns-probe
cable ipv6 source-verify dhcp ns-probe pd interval 20 retries 8
```

The following example shows how to configure the `no cable ipv6 source-verify dhcp ns` command:

```
router(config)#no cable ipv6 source-verify dhcp ns
router(config)#do sh run | i ns-probe
router(config)#end
```

#### Related Commands

Command	Description
<b>cable source-verify</b>	Enables verification of IPv4 addresses for CMs and CPE devices on an upstream.

# cable ipv6 source-verify leasequery-filter downstream

To enable the Leasequery filter on the Cisco CMTS downstream for IPv6 packets, use the **cable ipv6 source-verify leasequery-filter downstream** command in global configuration mode. To disable the Leasequery filter on the Cisco CMTS downstream, use the **no** form of this command.

**cable ipv6 source-verify leasequery-filter downstream** *threshold interval*  
**no cable ipv6 source-verify leasequery-filter downstream**

<b>Syntax Description</b>	<p><b>downstream</b> Filters the IPv6 Leasequery requests on the Cisco CMTS downstream.</p> <ul style="list-style-type: none"> <li>• <i>threshold</i> —Maximum number of DHCP Leasequeries allowed for unknown SIDs for each interval period. The range is from 0 to 255.</li> <li>• <i>interval</i> —Time period, in seconds, when Leasequeries should be monitored. The range is from 1 to 10.</li> </ul>
---------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** IPv6 source verification for downstream is disabled.

**Command Modes** Global configuration (config)

<b>Command History</b>	Release	Modification
	12.2(33)SCF1	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **cable ipv6 source-verify leasequery-filter downstream** command to enable the Leasequery filter on the Cisco CMTS downstream for IPv6 packets.

**Examples** The following example shows how to enable the Leasequery filter on the CMTS downstream for IPv6 packets on all downstream cable interfaces.

```
Router# configure terminal
Router(config)# cable ipv6 source-verify leasequery-filter downstream 10 5
```

### Associated Features

The **cable ipv6 source-verify leasequery-filter downstream** command is used to configure the following feature:

- [Cable DHCP Leasequery](#)

<b>Related Commands</b>	Command	Description
	<b>cable ipv6 source-verify</b>	Enables source verification of IPv6 packets received by a cable interface upstream on a Cisco CMTS router.

# cable l2vpn

To enable the Ethernet Layer 2 Virtual Private Network (L2VPN) service and enter L2VPN configuration mode, use the **cable l2vpn** command in global configuration mode. To disable this configuration, use the **no** form of this command.

```
cable l2vpn mac-address [customer-name]  
no cable l2vpn mac-address [customer-name]
```

Syntax Description	
<i>mac-address</i>	MAC address of a CM.
<i>customer-name</i>	(Optional) Customer name. Only 0-9, a-z, A-Z, ., -, _, can be used as the customer name.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to enable the Ethernet L2VPN service and enter L2VPN configuration mode:

```
Router# configure terminal  
Router(config)# cable l2vpn 0000.396e.6a68 customer1  
Router(config-l2vpn)#
```

Related Commands	Command	Description
	<b>service instance</b>	Specifies an Ethernet service instance for a particular customer.

## cable l2-vpn-service atm-vc

To enable the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems so that individual CPE traffic can be routed to a particular permanent virtual connection (PVC) on an Asynchronous Transfer Mode (ATM) interface, use the **cable l2-vpn-service atm-vc** command in global configuration mode. To disable the use of Layer 2 tunneling, use the **no** form of this command.

**cable l2-vpn-service atm-vc**  
**no cable l2-vpn-service atm-vc**

### Syntax Description

This command has no arguments or keywords.

### Command Default

The use of Layer 2 tunneling for ATM PVC mapping is disabled.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(11)BC3	This command was introduced for Cisco uBR7100 series and Cisco uBR7200 series routers.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command enables the use of Layer 2 tunnels on all cable and ATM interfaces in the router—which in turn allows you to map cable modems, on the basis of their hardware (MAC) addresses, to particular PVCs on an ATM interface—using the **cable vc-map** command.

### Examples

The following example shows how to enable the use of Layer 2 tunnels on a router so that cable modems can be mapped to particular PVCs on an ATM interface:

```
Router# config terminal
Router(config)# cable l2-vpn-service atm-vc
```

### Related Commands

Command	Description
<b>cable vc-map</b>	Maps a cable modem to a particular PVC on an ATM interface.
<b>debug cable l2-vpn</b>	Displays debugging messages for the Layer 2 mapping of cable modems to a particular PVC on an ATM interface.
<b>show cable l2-vpn vc-map</b>	Displays the mapping of one or all cable modems to PVCs on the ATM interfaces.

# cable l2-vpn-service default-nsi

**Note** Effective with Cisco IOS Release 12.2(33)SCC, the **cable l2-vpn-service default-nsi** command is replaced by the **cable l2-vpn-service xconnect** command. See the **cable l2-vpn-service xconnect** command for more information.

To configure an Ethernet Network System Interface (NSI) for Layer 2 VPN support over cable, use the **cable l2-vpn-service default-nsi** command in global configuration mode. To remove the interface, use the **no** form of this command.

**cable l2-vpn-service default-nsi** *type number*  
**no cable l2-vpn-service default-nsi** *type number*

## Syntax Description

<i>type</i>	Interface type. See the <i>Usage Guidelines</i> section for supported types.
<i>number</i>	Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.

## Command Default

No NSI interface is configured.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCC	This command was replaced by the <b>cable l2-vpn-service xconnect</b> command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The Cisco CMTS routers support only the configuration of a single L2VPN NSI per CMTS.

This command supports the following interface types:

- Cisco uBR100012 Universal Broadband Router—Gigabit Ethernet.
- Cisco uBR7246VXR Universal Broadband Router—Fast Ethernet or Gigabit Ethernet

## Examples

The following example configures the Gigabit Ethernet line card located in slot 4/0/0 as an NSI for L2VPN using global configuration mode:

```
cable l2-vpn-service default-nsi GigabitEthernet4/0/0
```

**Related Commands**

Command	Description
<b>show cable l2-vpn dot1q-vc-map</b>	Displays the mapping of one or all cable modems to IEEE 802.1Q VLANs on the router's Ethernet interfaces.

## cable l2-vpn-service dot1q

To enable the use of Layer 2 tunnels so that traffic for individual cable modems can be routed over a particular Virtual Local Area Network (VLAN), use the **cable l2-vpn-service dot1q** command in global configuration mode. To disable the use of Layer 2 tunneling, use the **no** form of this command.

**cable l2-vpn-service dot1q**  
**no cable l2-vpn-service dot1q**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Layer 2 tunneling is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(15)BC2	This command was introduced for Cisco uBR7246VXR universal broadband routers.
	IOS-XE 3.15.0S	This command was replaced by the <b>cable l2-vpn-service xconnect nsi dot1q</b> command on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command enables the use of Layer 2 tunnels, using IEEE 802.1Q VLAN tagging, on all cable interfaces in the router. This in turn allows you to map traffic to and from cable modems, on the basis of the modems's™ hardware (MAC) addresses, to a particular VLAN on a particular WAN interface, using the **cable dot1q-vc-map** command.

**Examples** The following example shows how to enable the use of IEEE 802.1Q Layer 2 tunnels on a router so that cable modems can be mapped to particular VLAN:

```
Router# config terminal
Router(config)# cable l2-vpn-service dot1q
Router(config)#
```

The following example shows how to disable the use of IEEE 802.1Q Layer 2 tunnels on a router. All mapping of cable modems to IEEE 802.1Q VLANs is halted (but any other Layer 2 mapping, such as the mapping of cable modems to ATM PVCs, is unaffected).

```
Router# config terminal
Router(config)# no cable l2-vpn-service dot1q
Router(config)#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable dot1q-vc-map</b>	Maps a cable modem to a particular Virtual Local Area Network (VLAN) on a local outbound Ethernet interface.
<b>debug cable l2-vpn</b>	Displays debugging messages for the Layer 2 mapping of cable modems to particular PVCs or VLANs.
<b>show cable l2-vpn dot1q-vc-map</b>	Displays the mapping of one or all cable modems to IEEE 802.1Q Virtual Local Area Networks (VLANs) on the router's Ethernet interfaces.

## cable l2-vpn-service xconnect

To enable Multiprotocol Label Switching (MPLS) tunnel traffic on the network side interface to support configuration of MPLS pseudowires for L2VPN service, use the **cable l2-vpn-service xconnect** command in global configuration mode. To disable this configuration, use the **no** form of this command.

```

cable l2-vpn-service xconnect nsi { dot1q | mpls }
no cable l2-vpn-service xconnect nsi { dot1q | mpls }
cable l2-vpn-service xconnect nsi dot1q interface ethernet-interface
no cable l2-vpn-service xconnect nsi dot1q interface ethernet-interface
cable l2-vpn-service xconnect nsi dot1q interface ethernet-interface backup-interface ethernet-interface
no cable l2-vpn-service xconnect nsi dot1q interface ethernet-interface backup-interface
ethernet-interface
cable l2-vpn-service xconnect { extended-mtu | mtu-auto-negotiation }

```

### Syntax Description

<b>nsi</b>	Specifies the network side interface (NSI).
<b>dot1q</b>	Specifies the usage of DOT1Q tunneling on the NSI for Ethernet L2VPN traffic.
<b>mpls</b>	Specifies the usage of MPLS tunneling on the NSI for Ethernet L2VPN traffic.
<b>backup-interface</b>	Specifies the backup WAN interface.
<b>extended-mtu</b>	Specifies a global MTU used by all D31 CMs to negotiate VC.
<b>mtu-auto-negotiation</b>	Enables the capability to match the remote MTU in VC negotiation, as long as the remote VC is not higher than the CM's capability. It overrides extended-mtu.

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
12.2(33)SCJ	This command was modified. The <b>backup-interface</b> keyword was added.
IOS-XE 3.18.0S	This command was modified. The <b>backup-interface</b> keyword was added.
IOS-XE 17.3.1x	This command was modified. The <b>mtu-auto-negotiation</b> keyword was added.

### Usage Guidelines

You must enable MPLS tunnel traffic on the network side interface using the **cable l2-vpn-service xconnect** command before provisioning MPLS pseudowires.

## Examples

The following example shows how to enable the use of Layer 2 tunnels based on an AToM pseudowire on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# cable l2-vpn-service xconnect nsi mpls
```

The following example shows how to configure an ethernet interface on DOT1Q L2VPN on the Cisco CMTS router:

```
Router# configure terminal
Router(config)# cable l2-vpn-service xconnect nsi dot1q interface Te4/0/1
```

The following example shows how to configure a backup WAN interface on DOT1Q L2VPN on the Cisco CMTS router:

```
Router# configure terminal
Router(config)# cable l2-vpn-service xconnect nsi dot1q interface Te4/0/2 backup-interface
Te4/0/3
```

The following example shows how to configure a global MTU used by all D31 CMs:

```
Router# configure terminal
Router(config)# cable l2-vpn-service xconnect extended-mtu ?
<1500-2000> Customized MTU
<cr> <cr>
```

The following example shows how to configure arbitrary Maximum Transmission Unit (MTU) for each D3.1 modem differently. This auto-negotiates the set up of L2VPN pseudowire automatically:

```
Router# configure terminal
Router(config)# cable l2-vpn-service xconnect mtu-auto-negotiation
<cr> <cr>
Router# show mpls l2transport vc 235 detail | in MTU
      MTU: local 1700, remote 1700 ..... CM default MTU 2000, remote MTU 1700, CBR
will set CM MTU to 1700
```

## Related Commands

Command	Description
<b>cable l2vpn</b>	Enables the Ethernet Layer 2 Virtual Private Network (L2VPN).

# cable l2-vpn-service xconnect nsi dot1q interface port-channel

To configure the port-channel uplink port for DOCSIS L2VPN, use the **cable l2-vpn-service xconnect nsi dot1q interface port-channel** command in global configuration mode.

**cable l2-vpn-service xconnect nsi dot1q interface port-channel** *number*

<b>Syntax Description</b>	<i>number</i> Port-channel interface number.				
<b>Command Default</b>	None.				
<b>Command Modes</b>	Global configuration (config)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.18.0S</td> <td>This command was introduced on Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.
Release	Modification				
IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.				
<b>Usage Guidelines</b>	<p>The <b>cable l2-vpn-service xconnect nsi dot1q interface port-channel</b> command configures the port-channel uplink port for DOCSIS L2VPN.</p> <p>The following example shows how to configure the port-channel uplink port for DOCSIS L2VPN:</p> <pre>router# <b>configure terminal</b> router (config) #<b>cable l2-vpn-service xconnect nsi dot1q interface port-channel</b> 64</pre>				

## cable l2-vpn dot1q-nsi-redundancy force-switchover

This command is designed for uplink redundancy feature, which allows you to configure a backup Network System Interface(NSI) interface and a default primary interface for dot1q L2VPN. When the primary NSI interface goes down, the backup NSI interface takes over and the traffic flows through the second interface.

When two uplink DOT1Q Ethernet NSI ports are UP, to manually switch over traffic flows from current active NSI port to another, use the **cable l2-vpn dot1q-nsi-redundancy force-switchover** command in privileged EXEC mode.

**cable l2-vpn dot1q-nsi-redundancy force-switchover from** *active-nsi*

<b>Syntax Description</b>	<i>active-nsi</i> Specifies the active NSI.
---------------------------	---------------------------------------------

<b>Command Default</b>	The current active uplink NSI port is not changed.
------------------------	----------------------------------------------------

<b>Command Modes</b>	Privileged EXEC(#)
----------------------	--------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33) SCJ	This command was introduced on the Cisco uBR Series Universal Broadband Routers
	IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

- This feature is applicable only for DOT1Q L2VPN and not Multiprotocol Label Switching (MPLS) L2VPN.
- This feature is configurable when both the DOT1Q NSI ports are UP.

The following example shows how to manually switch over active uplink NSI port from current active uplink port to the specified port:

```
Router# cable l2-vpn dot1q-nsi-redundancy force-switchover from Te4/0/1
```

### Related Commands

<b>Command</b>	<b>Description</b>
<b>show cable l2-vpn dot1q-nsi-redundancy</b>	Displays the backup pair details and the current active uplink DOT1Q NSI port.

# xconnect backup force-switchover

To manually force a switchover to a pseudowire peer, use the **xconnect backup force-switchover** command in privileged EXEC mode.

**xconnect backup force-switchover peer ip-address vcid**

<b>Syntax Description</b>	<p><b>peer ip-address vcid</b> Specifies the IP address and virtual circuit (VC) ID of the pseudowire to be used for the switchover.</p> <ul style="list-style-type: none"> <li><i>ip-address</i>—IP address of the peer pseudowire.</li> <li><i>vcid</i>—Virtual circuit address of the peer pseudowire.</li> </ul>
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The pseudowire is not changed.

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCF	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** You can perform a switchover only to an available member in the redundancy group. That is, if the member being specified in the **xconnect backup force-switchover** command is not available, the command will be rejected.

**Examples** The following example shows how to manually switchover to a peer router.

```
Router# xconnect backup force-switchover peer 10.10.1.1 123
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>backup delay</b>	Specifies how long a backup pseudowire VC should wait before taking over after the primary pseudowire VC goes down.
	<b>backup peer</b>	Configures a redundant peer for a pseudowire VC.
	<b>show cable l2vpn xconnect</b>	Displays information about the mapping between a Multiprotocol Label Switching (MPLS) pseudowire and its VCs.
	<b>show mpls l2transport vc</b>	Displays information about Any Transport over MPLS (AToM) VCs and static pseudowires that have been enabled to route Layer 2 packets on a router
	<b>show xconnect all</b>	Displays information about xconnect attachment circuits and pseudowires.

# cable I3-mobility

To enable mobility for a particular IPv4 or IPv6 subnet, use the **cable I3-mobility** command in bundle or sub-bundle interface mode. To disable mobility, use the no form of this command.

**cable I3-mobility** {*IPv4-address mask IPv6 prefix*}

**nocable I3-mobility** {*IPv4-address mask IPv6 prefix*}

## Syntax Description

<i>IPv4-address</i>	Specifies the IPv4 address of a CPE for which the mobility has to be enabled.
<i>IPv6 prefix</i>	Specifies the IPv6 prefix associated with a particular SAV group, specified in the X:X:X:X::/X format.
<i>mask</i>	Specifies the subnet mask for which the mobility has to be enabled.

## Command Default

The mobility of the IP address is disabled.

## Command Modes

Bundle interface configuration (config-if)

Bundle sub-interface configuration (config-subif)

## Command History

Release	Modification
12.2(33)SCH2	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Mobility subnets should match with the IPv4 or IPv6 address configured on the bundle or sub-bundle interface.

If the IPv4 or IPv6 address does not match, the following warning message is displayed:

```
Mobility IP should match the IDB subnet!
```

If you remove the IPv4 or IPv6 address from the interface, the mobility scope is removed for the IP address and the following warning message is displayed.

```
IPv6 2001:40:3:111::1 removed from Mobility subnets on Bundle1
```

## Examples

The following example shows how to enable the mobility for a particular IPv4 or IPv6 subnet in a bundle interface:

```
Router# configure terminal
Router(config)# interface Bundle 1
Router(config-if)#cable I3-mobility 192.173.82.1 255.255.255.0
```

The following example shows how to enable the mobility for a particular IPv4 or IPv6 subnet in a sub-bundle interface:

```
Router# configure terminal
```

```
Router(config)# interface Bundle 1
Router(config-if)#cable cable l3-mobility 192.173.82.1 255.255.255.0
```

**Related Commands**

Command	Description
<b>show cablebundle</b>	Displays the details of the cable bundle.
<b>service divert-limitl3-mobility-counter</b>	Sets the layer 3 mobility threshold limit.

## cable lcha partial-service-reset-timer

Some Docsis 3.1 cable modems enter partial service mode (downstream or upstream) after LCHA. To configure a timer that starts running after LCHA is complete to reset any Docsis 3.1 cable modems that are in partial service mode after the line card switchover, use the **cable lcha partial-service-reset-timer** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable lcha partial-service-reset-timer** *time*  
**no cable lcha partial-service-reset-timer** *time*

**Command Default** N/A

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command enables or disables the timer to reset the cable modem in partial service mode. It is recommended that a value of 120 or greater to be used for the timer.

**Examples** The following example shows how to set the timer to reset the cable modem in partial service mode:

```
Router# config terminal
Router(config)# cable lcha partial-service-reset-timer 120
```

Related Commands	Command	Description
	<b>show cable flap-list reset-cm-list</b>	Displays the Docsis 3.1 cable modem list that was reset by the partial service reset timer.

## cable lcha sw-reset

To enable the software reset option in the normal LCHA scenario and reduce the time for linecard ISSU to complete, use the **cable lcha sw-reset enable** command in global configuration mode. To disable the software reset option, use the **cable lcha sw-reset disable** command in global configuration mode. To restore the pre-configured behavior, use the **no** form of this command.

```
cable lcha sw-reset {disable | enable}
no cable lcha sw-reset {disable | enable}
```

### Command Default

N/A

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command enables or disables the software reset option in the normal LCHA scenario. It is only applicable to Docsis 3.1 Downstream Module with Micro firmware version 3.16 and higher.

### Examples

The following example shows how to enable the software reset option:

```
Router# config terminal
Router(config)# cable lcha sw-reset enable
```

## cable license 100G-conversion

The **cable license 100G-conversion** command configures the Cisco cBR to consume 100G WAN licenses for Supervisor 250G

**cable license 100G-conversion**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled

**Command Modes** Privileged EXEC (#)

Release	Modification
IOS-XE 16.8.1	This command was introduced.

Command	Description
<b>cable license 100G-conversion</b>	Configures the 10G WAN license on the 100G WAN ports.
<b>no cable license 100G-conversion</b>	Disables the 10G WAN license for the 100G WAN ports.

# cable linecard auto-rommon-downgrade

To enable the automatic ROM-Monitor (ROMMON) image downgrade on cable interface line cards, use the **cable linecard auto-rommon-downgrade** command in global configuration mode. To disable automatic ROMMON image downgrade on cable interface line cards, use the **no** form of this command.

**cable linecard auto-rommon-downgrade**  
**no cable linecard auto-rommon-downgrade**

## Syntax Description

This command has no arguments or keywords.

## Command Default

The automatic ROMMON image downgrade is disabled.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The automatic ROMMON downgrade is disabled by default on all line cards, and we recommend that you do not change this default behavior.

## Examples

The following example shows how to enable automatic ROMMON downgrade on all cable interface line cards:

```
Router(config)
# cable linecard auto-rommon-downgrade
```

The following example shows how to disable automatic ROMMON downgrade on all cable interface line cards:

```
Router(config)
# no cable linecard auto-rommon-downgrade
```

## Related Commands

Command	Description
<b>cable linecard auto-rommon-upgrade</b>	Enables or disables automatic ROMMON image upgrade on cable interface line cards.

# cable linecard auto-rommon-upgrade

To enable the automatic ROM-Monitor (ROMMON) image upgrade on cable interface line cards, use the **cable linecard auto-rommon-upgrade** command in global configuration mode. To disable automatic ROMMON upgrade on cable interface line cards, use the **no** form of this command.

**cable linecard auto-rommon-upgrade**  
**no cable linecard auto-rommon-upgrade**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The automatic ROMMON image upgrade is disabled.

**Note** Effective with Cisco IOS Release 12.2(33)SCF1, the automatic ROMMON image upgrade is enabled by default.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** To perform automatic ROMMON upgrade on the cable interface line card, use the **cable linecard auto-rommon-upgrade** command to enable automatic ROMMON image upgrade on the line card and then reload the line card.

**Examples** The following example shows how to enable automatic ROMMON image upgrade on all cable interface line cards:

```
Router(config)
)# cable linecard auto-rommon-upgrade
```

The following example shows how to disable automatic ROMMON image upgrade on all cable interface line cards:

```
Router(config)
)# no cable linecard auto-rommon-upgrade
```

Command	Description
<b>cable linecard auto-rommon-downgrade</b>	Enables or disables automatic ROMMON image downgrade on cable interface line cards.

# cable linecard critical-event-poweroff

To power off the Cisco uBR-MC3GX60V cable interface line card when a device temperature reaches critical threshold values on the CMTS chassis, use the **cable linecard critical-event-poweroff** command in the global configuration mode. To disable this feature, use the **no** form of the command.

**cable linecard critical-event-poweroff**  
**no cable linecard critical-event-poweroff**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Enabled

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

**Usage Guidelines** The PRE powers off the Cisco uBR-MC3GX60V line card if any of the device temperatures on the line card exceeds the critical threshold value. To disable this power off feature, user should configure the **no cable linecard critical-event-poweroff** command and save the configuration.

The temperature thresholds for the devices on the Cisco uBR-MC3GX60V line card are:

```
Router#show environment subslot 6/0
-----
TEMPERATURE/POWER INFORMATION
-----
Number of Temperature Sensors : 9
Sampling frequency           : 2 minutes
-----
Sensor      | ID | Current  | Minor | Major | Critical | Alarm  |
            |    | Temperature |      |      | Threshold | Condition |
            |    | degC    |      |      | degC    |          |
-----
Nickel 10G  | 1  | 69      | 84   | 89   | 94      | Normal |
Inlet #1    | 2  | 47      | 64   | 69   | 74      | Normal |
CPU         | 3  | 68      | 86   | 91   | 96      | Normal |
Raven      | 4  | 46      | 64   | 69   | 74      | Normal |
Santana    | 5  | 36      | 57   | 62   | 67      | Normal |
Coldplay  | 6  | 63      | 73   | 78   | 83      | Normal |
Waxbill    | 7  | 76      | 85   | 90   | 95      | Normal |
Fauna      | 8  | 70      | 77   | 82   | 87      | Normal |
Fluorine   | 9  | 62      | 70   | 75   | 80      | Normal |
-----
Power: 146.216 watts
```

## Examples

The following example allows the PRE to power off the Cisco uBR-MC3GX60V line card when the device temperature reaches critical threshold values.

```
Router# cable linecard critical-event-poweroff
```

**Related Commands**

Command	Description
<b>show environment</b>	Displays temperature, voltage, fan, and power supply information.

## cable load-balance d20-ggrp-default

To configure a DOCSIS 2.0 general load balancing group (GLBG) that is created automatically for each fiber node (FN) configuration, use the **cable load-balance d20-ggrp-default** command in the global configuration mode. To disable the default values of the DOCSIS 2.0 GLBG, use the **no** form of this command.

```
cable load-balance d20-ggrp-default {disable | init-tech-list tech-list | docsis-policy 0-0xffffffff | interval
n | method {modemservice-flowsutilization} | threshold {load [minimum]pcmmpure-ds-loadugsus-across-ds}
| us-method {modemservice-flowsutilization}}
no cable load-balance d20-ggrp-default disable
```

### Cisco cBR Series Converged Broadband Routers

```
cable load-balance d20-ggrp-default {disable | init-tech-list tech-list | docsis-policy 0-4294967295 |
interval n | method {modemutilization} | threshold {load [minimum]pcmmpure-ds-loadugsus-across-ds} |
us-method {modemutilization}}
```

**Note** The default values that are set using the command apply to DOCSIS 2.0 GLBGs created thereafter. Parameters for existing DOCSIS 2.0 GLBGs do not change.

### Syntax Description

<b>disable</b>	Disables the default values of the DOCSIS 2.0 GLBG that are enabled by default.
<b>init-tech-list</b> <i>tech-list</i>	Sets the default DOCSIS 2.0 GLBG DCC and DBC initialization techniques.
<b>docsis-policy</b> <i>0-0xffffffff</i>	Sets the default DOCSIS 2.0 GLBG load balancing policy.
<b>interval</b> <i>n</i>	Sets the default interface polling interval in seconds. The range is 1 to 1000.
<b>method</b>	Sets the default load balancing method. It can have one of the following values: <ul style="list-style-type: none"> <li>• modems—Number of modems.</li> <li>• (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) service-flows—Number of service flows.</li> <li>• utilization—Interface utilization.</li> </ul>
<b>policy</b>	Sets the default policy on modems selection based on the type of service flow to be balanced. <ul style="list-style-type: none"> <li>• pcm—Enable balancing of modems with active PCMM service flows</li> <li>• pure-ds-load—Considers only DS utilization for load balancing</li> <li>• ugs—Enable balancing of modems with active UGS service flows</li> <li>• us-across-ds—Load balancing on US groups across DS, DS method will be ignored</li> </ul>

<b>threshold</b>	<p>Specifies the default threshold percentage of usage. Load balancing occurs after the threshold is exceeded.</p> <ul style="list-style-type: none"> <li>• load—Sets the default interface load threshold setting. <ul style="list-style-type: none"> <li>• minimum—(Optional) Sets the minimum default interface load threshold setting.</li> </ul> </li> <li>• pcmm—Sets the default PCMM service flow threshold.</li> <li>• stability—Sets the default threshold for stability detection.</li> <li>• ugs—Sets the default UGS service flow threshold.</li> <li>• n—Percentage of usage. The range is 1 to 100.</li> </ul>
<b>us-method</b>	<p>(Optional) Sets the default load balancing method to upstream. It can have one of the following values:</p> <ul style="list-style-type: none"> <li>• modems—Number of modems.</li> <li>• (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) service-flows—Number of service flows.</li> <li>• utilization—Interface utilization.</li> </ul>

**Command Default**

**no cable load-balance d20-ggrp-default disable**

**cable load-balance d20-ggrp-default init-tech-list 0-4**

**cable load-balance d20-ggrp-default docsis-policy 0**

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCH	This command was modified. The interval, method, policy, and threshold keywords were introduced.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

**Usage Guidelines**

The group parameters in the **cable load-balance d20-ggrp-default** command can be set as default values.

**Examples**

The following is a sample output of the **cable load-balance d20-ggrp-default** command.

```

Router(config)# cable load-balance d20-ggrp-default
Router(config)# cable load-balance d20-ggrp-default disable
Router(config)# cable load-balance d20-ggrp-default docsis-policy 2
Router(config)# cable load-balance d20-ggrp-default init-tech-list 1
Router(config)# cable load-balance d20-ggrp-default interval 1
Router(config)# cable load-balance d20-ggrp-default method modems
Router(config)# cable load-balance d20-ggrp-default policy ugs
Router(config)# cable load-balance d20-ggrp-default threshold load 10
Router(config)# cable load-balance d20-ggrp-default us-method
modems

```

**Related Commands**

Command	Description
<b>cable load-balance d20-ggrp-default</b>	Configures a DOCSIS 2.0 general load balancing group (GLBG) that is created automatically for each fiber node (FN) configuration.

## cable load-balance d20 GLBG auto-generate

To automatically generate DOCSIS 2.0 general load balancing group (GLBG), use the **cable load-balance d20 GLBG auto-generate** command in privileged EXEC mode.

**cable load-balance d20 GLBG auto-generate** [FN *fnid*] [renew | update]

### Syntax Description

<b>FN</b> <i>fnid</i>	(Optional) Specifies the fiber node ID number for which GLBG is automatically generated. The range is 1 - 256. If <i>fnid</i> is not specified, GLBG is created for all the fiber nodes.
<b>renew</b>	(Optional) Creates DOCSIS 2.0 GLBG for the current FN configuration after removing all DOCSIS load balancing groups with group IDs in the reserved range (0xff00 to 0xffff).
<b>update</b>	(Optional) Updates DOCSIS 2.0 GLBG with reserved group ID for the current FN configuration. See "Usage Guidelines" section for more information.

### Command Default

Creates GLBG for all fiber nodes.

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.2(33)SCH	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

For **renew** keyword, the command executes as follows:

- If the reserved group range (0xff00 to 0xffff) has not been used for any GLBG, a new GLBG is created for the current fiber node.
- If the reserved group range has been used for any GLBG, the existing GLBG is removed and a new GLBG is created for the current fiber node configuration.
- If the reserved group ID has been used for a restricted load balancing group (RLBG), the command fails with a warning message.

For **update** keyword, the command executes as follows:

- If the reserved group range (0xff00 to 0xffff) has not been used for any GLBG, a new GLBG is created for that fiber node.
- If the reserved group range has been used for any GLBG, the GLBG is updated for the current fiber node configuration.
- If the reserved group ID has been used for a restricted load balancing group (RLBG), the command fails with a warning message.

This command is associated with Auto-generate DOCSIS 2.0 GLBG feature.

### Examples

The following example shows how to configure the **cable load-balance d20 GLBG auto-generate** command:

```
Router#  
Router# cable load-balance d20 GLBG auto-generate  
FN  
3  
Router#
```

**Related Commands**

Command	Description
<b>show cable load-balance docsis-group</b>	Displays real time configurational, statistical, and operational information of the load balancing operations on the router.

## cable load-balance d30-ggrp-default

To configure a DOCSIS 3.0 general load balancing group (GLBG) that is created automatically for each MD-CM-SG based on the fiber node (FN) configuration, use the **cable load-balance d30-ggrp-default** command in the global configuration mode. To disable the default values of the DOCSIS 3.0 GLBG, use the **no** form of this command.

```
cable load-balance d30-ggrp-default {disable | init-tech-list tech-list | docsis-policy 0-0xffffffff | interval
n | method {modemservice-flowsutilization} | threshold {load [minimum]pcmmpure-ds-loadugsus-across-ds}
| us-method {modemservice-flowsutilization}}
no cable load-balance d30-ggrp-default disable
```

### Cisco cBR Series Converged Broadband Routers

```
cable load-balance d30-ggrp-default {disable | init-tech-list tech-list | docsis-policy 0-4294967295 |
interval n | method {modemutilization} | threshold {load [minimum]pcmmpure-ds-loadugsus-across-ds} |
us-method {modemutilization}}
```

**Note** The default values that are set using the command apply to DOCSIS 3.0 GLBGs created thereafter. Parameters for existing DOCSIS 3.0 GLBGs do not change.

### Syntax Description

<b>disable</b>	Disables the default values of the DOCSIS 3.0 GLBG that are enabled by default.
<b>init-tech-list</b> <i>tech-list</i>	Sets the default DOCSIS 3.0 GLBG DCC and DBC initialization techniques.
<b>docsis-policy</b> <i>0-0xffffffff</i>	Sets the default DOCSIS 3.0 GLBG load balancing policy.
<b>interval</b>	Sets the default interface polling interval in seconds. The range is 1-1000.
<b>method</b>	Sets default load balancing method. It can have one of the following values: <ul style="list-style-type: none"> <li>• modems—Number of modems.</li> <li>• (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) service-flows—Number of service flows.</li> <li>• utilization—Interface utilization.</li> </ul>
<b>policy</b>	Sets the default policy for modems selection based on the type of service flow to be balanced. <ul style="list-style-type: none"> <li>• pcm—Enable balancing of modems with active PCMM service flows</li> <li>• pure-ds-load—Considers only DS utilization for load balancing</li> <li>• ugs—Enable balancing of modems with active UGS service flows</li> <li>• us-across-ds—Load balancing on US groups across DS groups</li> </ul>

<b>threshold</b>	<p>Specifies the default threshold percentage of usage. Load balancing occurs after the threshold is exceeded.</p> <ul style="list-style-type: none"> <li>• <b>load</b>—Sets the default interface load threshold setting.</li> <li>• <b>minimum</b>—(Optional) Sets the minimum default interface load threshold setting.</li> <li>• <b>pcmm</b>—Sets the default PCMM service flow threshold.</li> <li>• <b>stability</b>—Sets the default threshold for stability detection.</li> <li>• <b>ugs</b>—Sets the default UGS service flow threshold.</li> <li>• <b>n</b>—Percentage of usage. The range is 1 to 100.</li> </ul>
<b>us-method</b>	<p>(Optional) Sets the default load balancing method to upstream. It can have one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>modems</b>—Number of modems.</li> <li>• (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) <b>service-flows</b>—Number of service flows.</li> <li>• <b>utilization</b>—Interface utilization.</li> </ul>

**Command Default**

**no cable load-balance d30-ggrp-default disable**

**cable load-balance d30-ggrp-default init-tech-list 0-4**

**cable load-balance d30-ggrp-default docsis-policy 0**

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCH	This command was modified. The interval, method, policy, and threshold keywords were introduced.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

**Usage Guidelines**

The group parameters in the **cable load-balance d30-ggrp-default** command can be set as default values.

**Examples**

The following is a sample output of the **cable load-balance d30-ggrp-default** command.

```
Router(config)# cable load-balance d30-ggrp-default
Router(config)# cable load-balance d30-ggrp-default disable
Router(config)# cable load-balance d30-ggrp-default docsis-policy 2
Router(config)# cable load-balance d30-ggrp-default init-tech-list 1
Router(config)# cable load-balance d20-ggrp-default interval 1
Router(config)# cable load-balance d20-ggrp-default method modems
Router(config)# cable load-balance d20-ggrp-default policy ugs
Router(config)# cable load-balance d20-ggrp-default threshold load 10
Router(config)# cable load-balance d20-ggrp-default us-method
modems
```

**Related Commands**

Command	Description
cable load-balance d20-ggrp-default	Configure a DOCSIS 2.0 general load balancing group (GLBG) that is created automatically for each fiber node (FN) configuration

# cable load-balance docsis-enable

To enable or disable DOCSIS load balancing on the CMTS, use the **cable load-balance docsis-enable** command in the global configuration mode. To disable DOCSIS load balancing, use the **no** form of this command.

**cable load-balance docsis-enable**  
**no cable load-balance docsis-enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The command is disabled on all the routers.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** When the **no cable load-balance docsis-enable** command is configured, cable modems do not participate in the load balancing operation after they are assigned to the correct Load Balancing Group (LBG).

However, the **no cable load-balance docsis-enable** command does not prevent the cable modems from moving to the correct LBG, therefore, the **show cable load-balance docsis-group pending** and **show cable load-balance** commands may display the movement of the cable modems while they are being assigned to the correct LBG. This is an expected behavior.

## Examples

The following example shows how to enable DOCSIS load balancing on the CMTS using the **cable load-balance docsis-enable** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-enable
Config: Last Batch 0, 38 bytes
cable load-balance docsis-enable
end
Router(config)#
```

Related Commands	Command	Description
	<b>cable load-balance docsis-group</b>	Configures a DOCSIS load balancing group on the CMTS.
	<b>show cable load-balance docsis-group</b>	Displays real-time configuration, statistical and operational information for load balancing operations on the router.

## cable load-balance docsis20-enable

To enable dynamic downstream Load Balancing for DOCSIS 2.0 Cable Modems, use the **cable load-balance docsis20-enable** command in global configuration mode. Use the **no** form of this command to disable this feature.

**cable load-balance docsis20-enable**  
**no cable load-balance docsis20-enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is enabled by default.

**Command Modes** Global configuration mode (config)

Release	Modification
IOS-XE 3.17.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Please provide some usage guidelines.

When the **no cable load-balance docsis20-enable** command is configured, cable modems which are narrow-band online does not participate in the load balancing operation after the correct Load Balancing Group (LBG) is assigned.

The following example show how to configure the enable dynamic downstream Load Balancing for DOCSIS 2.0 Cable Modems using the **no cable load-balance docsis20-enable** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# no cable load-balance docsis20-enable
Router(config)# end
```

**Related Commands**

Command	Description
<b>show cable load-balance</b>	Displays real-time configurational, statistical and operational information for load balancing operations on the router.
<b>show cable load-balance docsis-group</b>	Displays real-time configurational, statistical, and operational information of the DOCSIS group operations on the router.

## cable load-balance docsis30-enable

To enable DOCSIS 3.0 static modem count-based load balancing, use the **cable load-balance docsis30-enable** command in global configuration mode. To disable DOCSIS 3.0 static modem count-based load balancing, use the **no** form of this command.

**cable load-balance docsis30-enable [downstream-only]**  
**no cable load-balance docsis30-enable [downstream-only]**

### Cisco cBR Series Converged Broadband Routers

**cable load-balance docsis30-enable**  
**no cable load-balance docsis30-enable**

<b>Syntax Description</b>	<b>downstream-only</b> (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) Enables only downstream load balancing without enabling upstream load balancing.
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** By default, DOCSIS 3.0 static modem count-based load balancing is enabled.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCF1	This command was introduced.
	12.2(33)SCH1	This command was modified. The <b>downstream-only</b> keyword was added.
	12.2(33)SCG6	This command was integrated into Cisco IOS Release 12.2(33)SCG6.
	IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.
	IOS-XE 3.17.0S	This command is implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **downstream-only** keyword to enable only the downstream load balancing. When the **downstream-only** keyword is used, upstream load balancing is disabled.

**Examples** The following example shows how to disable DOCSIS 3.0 static modem count-based load balancing:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# no cable load-balance docsis30-enable
Router(config)#
```

The following example shows how enable only downstream load balancing, without enabling upstream load balancing:

```
Router# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.  
 Router(config)# **cable load-balance docsis30-enable downstream-only**

Router(config)#

The following example shows how to verify if the DOCSIS 3.0 static modem count-based load balancing is disabled:

```
Router# show cable load-balance | include DOCSIS 3
DOCSIS 2.0 LB Enabled: Yes DOCSIS 3.0 LB Enabled: No
DOCSIS 3.0 General LB
```

The following example shows how to enable DOCSIS 3.0 static modem count-based load balancing:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis30-enable
Router(config)#
```

The following example shows how to verify if DOCSIS 3.0 static modem count-based load balancing is enabled:

```
Router# show cable load-balance | include DOCSIS 3
DOCSIS 2.0 LB Enabled: Yes DOCSIS 3.0 LB Enabled: Yes
DOCSIS 3.0 General LB
```

Effective with Cisco IOS Release 12.2(33)SCH1, the output of the **show cable load-balance** command shows the status of the **downstream-only** keyword configuration. The following example shows how to verify if only downstream load balancing is enabled:

```
Router#show cable load-balance
Load for five secs: 0%/0%; one minute: 0%; five minutes: 0%
Time source is NTP, 20:22:33.307 UTC Wed Jul 17 2013

Router#
```

The **cable load-balance docsis30-enable** command is used to configure the following features:

- [Load Balancing, Dynamic Channel Change, and Dynamic Bonding Change on the Cisco CMTS Routers](#)
- [Restricted/General Load Balancing and Narrowband Dynamic Bandwidth Sharing with Downstream Dynamic Load Balancing](#)

Related Commands	Command	Description
	<b>show cable load-balance</b>	Displays real-time configurational, statistical and operational information for load balancing operations on the router.
	<b>show cable load-balance docsis-group</b>	Displays real-time configurational, statistical, and operational information of the DOCSIS group operations on the router.

## cable load-balance docsis30-enable dynamic downstream

To enable utilization based dynamic downstream Load Balancing for DOCSIS 3.0 Cable Modems, use the **cable load-balance docsis30-enable dynamic downstream** command in global configuration mode. Use the **no** form of this command to disable this feature.

**cable load-balance docsis30-enable dynamic downstream**  
**no cable load-balance docsis30-enable dynamic downstream**

This command has no arguments or keywords.

**Command Default** The command is disabled by default.

**Command Modes** Global configuration mode (config)

Release	Modification
IOS-XE 3.17.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** When the **cable load-balance docsis30-enable dynamic downstream** command is configured, cable modems which are wide-band online participates in the dynamic downstream utilization based on load balancing operation after the correct Load Balancing Group (LBG) is assigned.

The following example shows how to enable utilization based dynamic downstream Load Balancing for DOCSIS 3.0 Cable Modems using the **cable load-balance docsis30-enable dynamic downstream** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis30-enable dynamic downstream
endRouter(config)#
```

**Related Commands**

Command	Description
<b>show cable load-balance</b>	Displays real-time configurational, statistical and operational information for load balancing operations on the router.
<b>show cable load-balance docsis-group</b>	Displays real-time configurational, statistical, and operational information of the DOCSIS group operations on the router.

## cable load-balance docsis30-enable static

To enable static downstream Load Balancing for DOCSIS 3.0 Cable Modems, use the **cable load-balance docsis30-enable static** command in global configuration mode. Use the **no** form of this command to disable this feature.

**cable load-balance docsis30-enable static**  
**no cable load-balance docsis30-enable static**

**Syntax Description** **static** Please provide a description.

**Command Default** The command is enabled by default.

**Command Modes** Global configuration mode (config)

Release	Modification
IOS-XE 3.17.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** When the **cable load-balance docsis30-enable static** command is configured, cable modems which are wide-band online does not participate in the static modem count based load balancing operation after the correct Load Balancing Group (LBG) is assigned.

The following example shows how to enable static downstream Load Balancing for DOCSIS 3.0 Cable Modems using the **cable load-balance docsis30-enable static** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# no cable load-balance docsis30-enable static
Router(config)# end
```

Related Commands	Command	Description
	<b>show cable load-balance</b>	Displays real-time configurational, statistical and operational information for load balancing operations on the router.
	<b>show cable load-balance docsis-group</b>	Displays real-time configurational, statistical, and operational information of the DOCSIS group operations on the router.

# cable load-balance docsis30-dynamic-enable

To enable DOCSIS 3.0 dynamic load balancing on the downstream channels, use the **cable load-balance docsis30-dynamic-enable** command in the global configuration mode. To disable the DOCSIS 3.0 dynamic load balancing, use the **no** form of this command.

**cable load-balance docsis30-dynamic-enable**

**no cable load-balance docsis30-dynamic-enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The DOCSIS 3.0 dynamic load balancing is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCI	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Before configuring the DOCSIS 3.0 dynamic load balancing on Cisco CMTS, you need to enable DOCSIS 2.0 and DOCSIS 3.0 load balancing on CMTS.

## Example

The following example shows how to enable the DOCSIS 3.0 dynamic load balancing on the CMTS using the **cable load-balance docsis30-dynamic-enable** command.

```
Router>enable
Router# configure terminal
Router(config)# cable load-balance docsis30-dynamic-enable
Router(config)# exit
```

## Related Commands

Command	Description
<b>show cable load-balance</b>	Displays real-time configuration, statistical and operational information for load balancing operations on the router.
<b>clear cable load-balance error-statistics</b>	Clears all the failure counters in error statistics.
<b>show cable load-balance</b>	Displays information of the DOCSIS 3.0 and DOCSIS 2.0 load balance failure.
<b>show cable load-balance docsis-group</b>	Displays real-time configurational, statistical, and operational information of the DOCSIS group operations on the router.

## cable load-balance docsis-group

To configure a DOCSIS load balancing group (LBG) on the CMTS, use the **cable load-balance docsis-group** command in the global configuration mode. To delete a DOCSIS load balancing group and to remove it from the CMTS configuration, use the **no** form of this command.

```
cable load-balance docsis-group docsis-group-id
no cable load-balance docsis-group docsis-group-id
```

### Cisco uBR10012 Router

```
cable load-balance docsis-groupFN fn-id MD cable slot/subslot/port
```

### Cisco uBR7225VXR and Cisco uBR7246VXR Routers

```
cable load-balance docsis-groupFN fn-id MD cable slot/port
```

### Cisco cBR Series Converged Broadband Routers

```
cable load-balance docsis-groupFN fn-id MD cable slot/subslot/port
```

Syntax Description	
<i>docsis-group-id</i>	DOCSIS load balance group ID. A valid DOCSIS load balance group ID ranges from 1 to 2147483647 and does not overlap with the legacy LBG ID. Therefore, both <b>cable load-balance group 1</b> and <b>cable load-balance docsis-group 1</b> commands can be configured. The DOCSIS load balance group ID ranging from 2147483648 to $2^{32}-1$ is reserved for DOCSIS 3.0 general load balancing group (GLBG).
FN <i>fn-id</i>	Specifies the fiber node (FN) where certain DOCSIS 3.0 GLBG parameters, such as <b>disable</b> , <b>docsis-policy</b> , <b>init-tech-list</b> , <b>interval</b> , <b>method</b> , <b>policy</b> , and <b>threshold</b> , can be configured.
MD <i>cable slot/subslot/port</i>	Specifies the MAC domain interface of the fiber node. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides. The permitted range is from 5 to 8. The permitted range is 0 to 9 in cBR.</li> <li><i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1. For cBR, only slot 0 is available.</li> <li><i>port</i>—The downstream controller number on the line card. The permitted <i>port</i> range is from 0 to 4. For cBR, the permitted range is 0 to 15.</li> </ul>
MD <i>cable slot/port</i>	Specifies the MAC domain interface of the fiber node on the Cisco uBR7246VXR or Cisco uBR7225VXR router. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid range is from 1 to 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> </ul> </li> <li><i>port</i>—Downstream controller number on the line card. The permitted <i>port</i> values are 0 or 1.</li> </ul>

**Command Default** None

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

**Usage Guidelines**

The **cable load-balance docsis-group** command creates a DOCSIS LBG with the specified number and then enters the config-lb-group configuration mode. Use the config-lb-group configuration mode to configure the DOCSIS LBG.

- **disable**
- **docsis-policy**
- **downstream**
- **init-tech-list**
- **init-tech-ovr**
- **interval**
- **method**
- **policy**
- **restricted**
- **service-type-id**
- **tag**
- **threshold**
- **upstream**

**Examples**

The following example shows how to create a DOCSIS group numbered "1":

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# init-tech-list 1 ucc
Router(config-lb-group)# downstream Cable 1/1
Router(config-lb-group)# upstream Cable 1/0 2
Router(config-lb-group)# docsis-policy 0
Router(config-lb-group)# init-tech-ovr Cable 1/1 1 Cable 1/0 2 init-tech-list 1 ucc
Router(config-lb-group)# service-type-id ccc
Router(config-lb-group)# tag t1
Router(config-lb-group)# interval 10
Router(config-lb-group)# method modems us-method modems
Router(config-lb-group)# no policy us-across-ds pure-ds-load ugs

Router(config-lb-group)# restricted
Router(config-lb-group)# threshold pcmm 70 load 10 stability 50 ugs 70
Router(config-lb-group)#
```

The following example shows how to configure DOCSIS 3.0 GLBG parameters:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group FN 2 MD cable 1/0
```

Related Commands	Command	Description
	<b>docsis-policy</b>	Assigns a policy to a group, which is the default policy assigned to the CM when the CM is not assigned a different policy.
	<b>downstream</b>	Sets downstream RF channels.
	<b>upstream</b>	Sets upstream channels.
	<b>init-tech-list</b>	Sets the DCC/DBC initialization techniques that the CMTS uses to load balance cable modems. The <b>init-tech-list</b> command can also be used to determine whether UCC can be used for modems during dynamic upstream load balancing.
	<b>init-tech-ovr</b>	(For Cisco uBR10012, uBR7225VXR and uBR7246VXR Series Routers) Sets DCC initialization techniques that overrides the physical upstream channel pair. The <b>init-tech-ovr</b> command can also be used to determine whether UCC can be used for modems during dynamic upstream load balancing.  <b>Note</b> The <b>init-tech-list</b> command accepts an upstream that is not added into the load balancing group. The upstream channel pair is invalid until the upstream is added. When the load balancing group is removed, all upstream channel pairs are also removed.
	<b>interval</b>	Sets the duration of time the CMTS waits before checking the load on an interface.
	<b>method</b>	Selects the method the CMTS uses to determine the load. US methods can be different from DS methods.
	<b>policy</b>	Selects modems, based on the type of service flow that will be balanced.
	<b>restricted</b>	Selects the restricted group type. By default, the general group type is selected.
	<b>service-type-id</b>	Adds a service type ID that is compared with the cable modem provisioned service type ID, to determine an appropriate restricted load balancing group (RLBG).
	<b>tag</b>	Adds a tag to the load balancing group. The tag is used to assign the RLBG to the CMs that have the same tag name.
	<b>threshold</b>	Specifies the threshold percentage of use exceeding which load balancing occurs.
	<b>cable tag</b>	Configures the tag that gets added to the load balancing group.

# cable load-balance docsis-policy

To create a DOCSIS policy and associate an existing rule and tag with the policy, use the **cable load-balance docsis-policy** command in global configuration mode. To remove a DOCSIS policy, rule, or tag from the policy, use the **no** form of this command.

**cable load-balance docsis-policy** *policy-id* [**rule** *rule-id* | **tag** *tag name* [**override**]]  
**no cable load-balance docsis-policy** *policy-id* [**rule** *rule-id* | **tag** *tag name* [**override**]]

## Syntax Description

<i>policy-id</i>	Specifies the DOCSIS policy to be created.
<b>rule</b> <i>rule-id</i>	Specifies the rule to be used with the DOCSIS policy.
<b>tag</b> <i>tag name</i>	Specifies the tag to be used with the DOCSIS policy.
<b>override</b>	Overrides all the policies in the CM that has the specified tag name.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCC	The <b>tag</b> parameter was added to the command.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command associates a rule with a policy. A policy is created only when a rule is associated with it. Similarly, the policy is removed if you remove the last rule associated with the policy.

## Examples

The following example defines a DOCSIS policy, and associates a predefined rule and tag with this policy:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-policy 1 rule 1
Router(config)# cable load-balance docsis-policy 1 tag SPG override
Router(config)#
```

## Related Commands

Command	Description
<b>cable load-balance rule</b>	Creates a rule to prevent CM from disabling or enabling load balancing.
<b>cable tag</b>	Creates a tag to associate it with DOCSIS policies and groups.

## cable load-balance exclude

To exclude a particular cable modem, or all cable modems from a particular vendor, from one or more forms of load-balancing operations, use the **cable load-balance exclude** command in global configuration mode. To end the exclusion, so that these particular cable modems are subject to the load-balancing policies of the load-balance group to which they belong, use the **no** form of this command.

**cable load-balance exclude** {*device-class id* | **modem** *mac-address* | **oui** *word*} [*mask* | **assignment** | **enforce** | **static** | **strict**]

**cable load-balance exclude** {*device-class id* | **modem** *mac-address* | **oui** *word*}

### Cisco cBR Series Converged Broadband Routers

**cable load-balance exclude** { **modem** *mac-address* | **oui** *word* }

Syntax Description	
<b>device-class</b> <i>id</i>	(For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) Specifies the device class ID of the cable modems to be excluded in a bitmap format (0-ffff).
<b>modem</b> <i>mac-address</i>	Specifies the hardware (MAC) address of an individual cable modem to be excluded from load balancing. (You cannot specify a multicast MAC address.)
<i>mask</i>	(Optional) Specifies the mask for the range (group) of hardware (MAC) addresses, so that the cable modems with hardware (MAC) addresses in that range are excluded from load balancing.
<b>oui</b> <i>word</i>	Specifies the organization unique identifier (OUI) of a vendor, so that cable modems from this vendor are excluded from load balancing. The OUI must be specified as three hexadecimal bytes separated by either periods or colons.
<b>assignment</b>	(Optional) Excludes the cable modems that were moved into a load balancing group in assignment phase.
<b>enforce</b>	(Optional) Excludes the cable modems from dynamic load balancing, but they continue to participate in static load balancing.
<b>static</b>	(Optional) Excludes the cable modems from static load balancing, but they continue to participate in passive load balancing and dynamic load balancing.
<b>strict</b>	(Optional) Excludes the cable modems from all forms of load balancing.

**Note** Passive load balancing is not supported on cBR Series Converged Broadband Routers.

### Command Default

By default, all cable modems on an interface are automatically included in all configured load-balancing operations when that cable interface is assigned to a load-balance group (**no cable load-balance exclude**). When a cable modem is excluded without any options specified, the cable modem is excluded from dynamic and static load balancing, but it continues to participate in passive load balancing.

### Command Modes

Global configuration

Command History	Release	Modification
	12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
	12.2(33)SCH	This command was modified with the following argument and keywords: <ul style="list-style-type: none"> <li>• <i>mask</i></li> <li>• <b>assignment</b></li> <li>• <b>device-class</b></li> </ul>
	IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

### Usage Guidelines

The **cable load-balance exclude** command allows you to specify that particular cable modems should not participate in one or more types of load-balancing operations. This might be done for cable modems that are currently provisioned for premium services, for cable modems that do not respond appropriately to upstream channel change (UCC) or channel override messages, or for other reasons.

In particular, you must use the **cable load-balance exclude** command to exclude cable modems that require specific upstream channels or downstream frequencies. Load balancing cannot be done when cable modems are assigned specific channels or frequencies in their DOCSIS configuration files.

The load balancing process has two phases.

- Assignment phase:

When a modem is coming online in the assignment phase, the modem is moved to the load balance group by assigning it a load balancing group (LBG) ID. The assignment phase occurs only when a modem is coming online. Use the **assignment** option to exclude a modem during the assignment phase.

- Balancing phase:

In the balancing phase, a modem is re-assigned to an LBG to balance the load. Use the **static** option to exclude a modem from static load balancing, the **enforce**, or **strict** options from dynamic load balancing, in the balancing phase.

You can use the **cable load-balance exclude** command to specify that these cable modems should not participate in the following types of load-balancing operations:

- Static load balancing—Load balancing is done at the time a cable modem registers by specifying the proper target channel in the Downstream Frequency Override or an Upstream Channel ID Override field in the registration response (REG-RSP) message that the Cisco CMTS sends to the cable modem. This is the default form of registration-based load balancing.
- Passive load balancing—Load balancing is done at the time a cable modem registers by ignoring a cable modem's registration request (REG-REQ) message until it uses the correct target channels. Use the **cable load-balance exclude** command to specify this form of load balancing for older cable modems that do not respond well to the active form of load balancing.

**Note** Passive load balancing is not supported on cBR Series Converged Broadband Routers.

- Dynamic load balancing—A form of traffic-based load balancing, in which cable modems are balanced among upstreams and downstreams after they come online, while they are passing traffic. (Dynamic load balancing is enabled using the **enforce** option with the **cable load-balance group threshold** command.)

Use the **cable load-balance exclude** command to exclude a cable modem from any combination of load-balancing operations. The table below shows which forms of load-balancing operations are excluded and which are enabled for each form of the **cable load-balance exclude** command:

**Table 6: cable load-balance exclude Command**

	Static	Passive <sup>1</sup>	Dynamic <sup>2</sup>
Default (no <b>cable load-balance exclude</b> )	Yes	Excluded	Yes
<b>cable load-balance exclude</b>	Excluded	Yes	Excluded
<b>cable load-balance exclude enforce</b>	Yes	Excluded	Excluded
<b>cable load-balance exclude static</b>	Excluded	Yes	Yes
<b>cable load-balance exclude strict</b>	Excluded	Excluded	Excluded
<b>cable load-balance exclude static strict</b>	Excluded	Excluded	Yes

<sup>1</sup> Passive load balancing is not supported on cBR Series Converged Broadband Routers.

<sup>2</sup> Dynamic load balancing must also be separately enabled for a load-balance group by using the **enforce** option with the **cable load-balance group threshold** command.

**Note** Excluding cable modems might be required for some cable modems that are not DOCSIS-compliant. Such cable modems can go offline for long periods of time when load balancing is attempted using DOCSIS MAC messages. If this is the case, use the **cable load-balance exclude** command to exclude such cable modems from load-balancing operations until the modem can be upgraded to DOCSIS-compliant software.

Effective with Cisco IOS Release 12.2(33)SCH, you can configure the **cable load-balance exclude** command once to exclude all the STBs, that do not support load balancing, using the mask argument. You can also move cable modems that were moved to a load balancing group in assignment phase, using the assignment option.

## Examples

The following example shows how to exclude a particular cable modem with the MAC address of 0001.0203.0405 from active and dynamic load-balancing operations:

```
Router# config terminal
Router(config)# cable load-balance exclude mac 0001.0203.0405
```

The following example shows how to exclude all cable modems with the OUI of 00.00.0C from active and dynamic load-balancing operations:

```
Router# config terminal
Router(config)# cable load-balance exclude oui 00.00.0C
```

The following example shows how to exclude all cable modems with the OUI of 00.00.0C from dynamic load-balancing operations. These cable modems are still subject to static load-balancing operations.

```
Router# config terminal
Router(config)# cable load-balance exclude oui 00.00.0C enforce
```

The following example shows how to exclude a particular cable modem from all forms of load-balancing operations:

```
Router# config terminal
Router(config)# cable load-balance exclude mac 0001.0203.0405
strict
```

The following example shows how to exclude all the cable modems with MAC address 0016.924f.82b4 and mask f000.0000.0000 which have been moved to the load balancing group in the assignment phase.

```
Router# configure terminal
Router(config)# cable load-balance exclude modem 0016.924f.82b4 f000.0000.0000 assignment
```

The following example shows how to exclude cable modems from DOCSIS load balance based on the cable modem device class:

```
Router# config terminal
Router(config)# cable load-balance exclude device-class 1
```

The **cable load-balance exclude** command is associated with the [Excluding Cable Modems from a Load Balancing Group](#) feature.

## Related Commands

Command	Description
<b>cable load-balance group (global configuration)</b>	Creates and configures a load-balance group.
<b>cable load-balance group (interface configuration)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load-balancing policy updates.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations.
<b>cable upstream load-balance group</b>	Assigns an upstream to a load-balance group.
<b>clear cable load-balance</b>	Clears the counters or state machine used to track load-balancing operations.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.

# cable load-balance fixed-primary-channel

To reduce service outage while enabling dynamic load balancing, enable fixed primary channel movement, use the **cable load-balance fixed-primary-channel** command in global configuration mode.

DOCSIS 3.0 load balance does not change the modem's primary channel during dynamic movement when you enable fixed primary channel movement.

## **cable load-balance fixed-primary-channel**

### Command Default

Fixed primary channel for load balancing is not enabled by default on the Cisco CMTS.

### Command Modes

Global configuration

### Command History

Release	Modification
IOS-XE 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to enable fixed primary channel movement:

```
Router# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance fixed-primary-channel
Router(config)# end
```

The following example shows how to check the enabled status of the fixed primary channel movement:

```
Router# show run
Router# show running-config | in fixed
cable load-balance fixed-primary-channel
```

### Related Commands

Command	Description
<b>cable load-balance docsis30-enable dynamic downstream</b>	Enables utilization based dynamic downstream Load Balancing for DOCSIS Cable Modems

## cable load-balance group

To create a load-balance group and configure the type of load-balancing to be used, use the **cable load-balance group** command in global configuration mode. To delete a load-balance group, use the **no** form of this command. To reset a load-balance group to its default configuration, use the **default** form of this command.

**cable load-balance group** *n* [**method utilization** | **method modem** | **method service-flows**]  
**no cable load-balance group** *n*

### Syntax Description

<i>n</i>	Specifies the number of the load balance group. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256.
<b>method modem</b>	(Optional) Specifies that the load-balance group should use the number of active cable modems on an interface to determine the current load (default). This method does not take into account the amount of traffic flowing through those particular cable modems.
<b>method service-flows</b>	(Optional) Specifies that the load-balance group should use the number of active service flow IDs (SFIDs) on an interface to determine the current load.
<b>method utilization</b>	(Optional) Specifies that the load-balance group should use an interface's current percentage of utilization to determine the current load.  <b>Tip</b> The <b>utilization</b> method does not begin moving cable modems for load balancing until the utilization of the interface is at 25 percent or more. This is done to avoid the unnecessary moving of cable modems due to temporary spikes in an interface's utilization rates.

### Command Default

No load-balance groups are created. By default, a load-balance group uses the actual number of cable modems online each interface to determine load balancing needs (**modem** option).

**Note** If you do not create any load-balance groups, the Cisco CMTS defaults to using a form of registration-based load balancing that attempts to equally distribute cable modems among upstreams at the time the cable modems register and come online. No load balancing is done for downstreams or for cable modems that are already online.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable load-balance group** command is used to configure the following features:

- [IGMP-Triggered Dynamic Channel Change Load Balancing for DOCSIS 2.0 Cable Modems](#)
- [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)
- [Restricted/General Load Balancing and Narrowband Dynamic Bandwidth Sharing with Downstream Dynamic Load Balancing](#)

The **cable load-balance** command creates a load-balance group, which can then be assigned to a number of upstream and downstream cable interfaces to allow the Cisco CMTS to load balance cable modems as needed. The Cisco CMTS can use the load-balance groups for static, passive, and dynamic load balancing of both upstream and downstream channels. You can configure downstreams and upstreams to use the same load balancing parameters, or you can configure upstreams and downstreams separately.

**Note** You can create a maximum of 20 load-balance groups on each chassis. However, you can reuse those load-balance groups on different sets of cable interfaces, as long as they are in different domains. If downstreams are not included in a load-balance group, then each downstream can be considered a separate domain.

Use the **cable load-balance group (global configuration)** command to initially create and configure a load-balance group. Then use the **cable load-balance group (interface configuration)** command to assign this load-balance group to an upstream or downstream, so that the cable interface will begin participating in load-balancing operations.

You can configure a load-balance group to use one of the following types of load-balancing methods:

- **Modem Method**—Uses the number of active cable modems on an interface.
- **Service Flow Method**—Uses the number of active Service Flow IDs (SFIDs) on an interface.
- **Utilization Method**—Uses an interface's current percentage of utilization.

See the following sections for more information about each method.

### Modem Method

The **modem** method of load-balancing uses the number of active cable modems on an interface to determine the current load. This is a form of distribution-based load balancing, in which the absolute numbers of modems are used to determine whether interfaces are load balanced.

This method does not take into account the amount of traffic flowing through the cable modems, but the system does take into account the relative bandwidth of the channels being used, so that channels with higher bandwidths are allocated higher numbers of cable modems. This means that when interfaces are using different channel widths or modulation profiles, the system can assign different numbers of cable modems to the interfaces to achieve a balanced load. For example:

- **Channel widths**— If two upstreams are being load balanced, and one upstream is configured with a channel width of 1.6 MHz and the other upstream is configured for a channel width of 3.2 MHz, the Cisco CMTS allocates twice as many cable modems to the second upstream, because its channel width is twice as large as the first upstream's channel width.
- **Modulation profiles**— If one downstream is configured for 64-QAM and the other downstream is configured for 256-QAM, the Cisco CMTS allocates a proportionately larger number of cable modems to the second downstream so as to achieve a balanced load.

When both the channel width and different modulation profile are set differently on two interfaces, the system calculates a “weight” value to use as a guide to determine the relative bandwidths of the interfaces.

---

**Tip** In a system with balanced loads, the interfaces will contain the same number of cable modems only when the interfaces are configured with the same modulation parameters.

---

### Service Flow Method

The **service-flows** method of load balancing uses the number of active service flow IDs (SFIDs) on an interface to determine the current load. This is a form of distribution-based load balancing, in which the absolute numbers of service flows are used to determine whether interfaces are load balanced.

This method does not take into account the amount of traffic flowing on each SFID, but the system does take into account the relative bandwidth of the channels being used, so that channels with higher bandwidths are allocated higher numbers of SFIDs. This means that when interfaces are using different channel widths or modulation profiles, the system can assign different numbers of SFIDs to the interfaces to achieve a balanced load. For example:

- Channel widths— For example, if two upstreams are being load balanced, and one upstream is configured with a channel width of 1.6 MHz and the other upstream is configured for a channel width of 3.2 MHz, the Cisco CMTS allocates twice as many SFIDs to the second upstream, because its channel width is twice as large as the first upstream's channel width.
- Modulation profiles— For example, if one downstream is configured for 64-QAM and the other downstream is configured for 256-QAM, the Cisco CMTS allocates a proportionately larger number of SFIDs to the second downstream so as to achieve a balanced load.

When both the channel width and different modulation profile are set differently on two interfaces, the system calculates a “weight” value to use as a guide to determine the relative bandwidths of the interfaces.

---

**Tip** In a system with balanced loads, the interfaces will contain the same number of SFIDs only when the interfaces are configured with the same modulation parameters.

---

### Utilization Method

The **utilization** method uses an interface's current percentage of utilization to determine the current load. This method uses the amount of traffic being sent over an interface, in the form of the percentage of total bandwidth being used. (To avoid unnecessary movement of cable modems, the **utilization** method does not perform load balancing until an interface is at least 25 percent of utilization.)

---

**Note** Do not use the **utilization** method of load balancing on cable interfaces that have a small number of cable modems and where a single modem is responsible for the majority of the interface load. In this condition, the Cisco CMTS could end up continually moving cable modems from one interface to another in an endless attempt to load balance the interfaces. To avoid this, configure the utilization threshold to a value that is higher than what can be caused by any single cable modem.

---

When using the **utilization** method, the system takes into account the relative throughput and bandwidth (as determined by the modulation profiles and channel widths) of each interface when evaluating the load on those interfaces. For example, if two upstreams are being load-balanced using the utilization method, and the first upstream has twice the bandwidth of the second upstream, the two upstreams are considered balanced when they reach the same percentage of utilization. The first upstream is carrying more traffic than the second upstream because it has a larger capacity for traffic, but the percentage of utilization will be the same.

**Note** Certain conditions can cause a system instability that could result in the Cisco CMTS endlessly attempting to load balance the interfaces. For example, this situation could occur in noisy environments, where cable modems drop offline on a regular basis, or when cable modems are repeatedly trying to register because the provisioning system has sent them the wrong DOCSIS configuration files. If the Cisco CMTS detects such unstable situations, it does not load balance cable modems from those interfaces until the system stabilizes. However, if the system instability persists, you should increase the threshold values using the **cable load-balance group threshold** command until you can solve the stability problems.

Use the **no** form of this command to delete a load-balance group. Deleting a load-balance group also automatically removes all upstream and downstream channel associations that were made with that group using the **cable load-balance** and **cable upstream load-balance** commands.

**Tip** To exclude individual cable modems from one or more types of load balancing, use the **cable load-balance exclude** command.

## Examples

The following example shows how to create a load-balance group numbered 10, using the default method of **modem**, which specifies that the Cisco CMTS uses the actual number of cable modems that are online to determine load-balancing operations.

```
Router# config terminal
Router(config)# cable load-balance group 10

Router(config)#
```

The following example shows how to create a load-balance group numbered 1, which uses the number of active SFIDs on an interface to determine the current load on the interface:

```
Router# config terminal
Router(config)# cable load-balance group 1 method service-flows

Router(config)#
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group (interface configuration)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load-balancing policy updates.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.

<b>Command</b>	<b>Description</b>
<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations.
<b>cable upstream load-balance group</b>	Assigns an upstream to a load-balance group.
<b>clear cable load-balance</b>	Clears the counters or state machine used to track load-balancing operations.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.

## cable load-balance group (interface)

To assign a downstream cable interface to a load balance group, use the **cable load-balance group** command in interface configuration mode. To remove a downstream from a load balance group, use the **no** form of this command.

**cable load-balance group** *n*  
**no cable load-balance group** *n*

### Syntax Description

<i>n</i>	Specifies the number of the load balance group to which the downstream should be assigned. In Cisco IOS Release 12.2(33)SCE3 and earlier, the range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the range is from 1 to 256.
----------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

A downstream is not assigned to a load balance group. When you use this command to add a downstream to a group, it also automatically adds all the associated upstreams to the same group, unless you have also used the **cable upstream load-balance group** command to assign the upstreams to different groups.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable load-balance group** command is used to configure the following features:

- [IGMP-Triggered Dynamic Channel Change Load Balancing for DOCSIS 2.0 Cable Modems](#)
- [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)
- [Restricted/General Load Balancing and Narrowband Dynamic Bandwidth Sharing with Downstream Dynamic Load Balancing](#)

After you have used the **cable load-balance group (global configuration)** command to initially create and configure a load balance group, use the **cable load-balance group (interface configuration)** command to assign this load balance group to a downstream. This enables the cable interface to begin participating in load-balancing operations.

**Tip** Use the **cable upstream load-balance group** command to assign this load balance group to an upstream.

The following rules apply when creating and assigning load balance groups:

- A downstream or upstream can belong to only one load balance group.
- All downstreams and upstreams in a load balance group must share physical radio frequency (RF) connectivity to the same group of cable modems. Downstreams can be in a separate load balance group

than upstreams, but all downstreams or all upstreams that have the same RF physical connectivity must be members of the same load balance group. You cannot distribute downstreams or upstreams that share physical connectivity across multiple load balance groups.

**Note** If both downstreams and upstreams are assigned to the same load balance group, the Cisco CMTS attempts to balance both the downstream and upstream values when it moves cable modems.

- If the load balance group includes downstream interfaces, you must also configure the downstream center frequency on those interfaces, using the **cable downstream frequency** cable interface command. This command is informational-only on cable interfaces that use an external upconverter, but it is required for load balancing, so that the Cisco CMTS knows where to move cable modems when it is load balancing downstreams.
- Load balancing is done only on a per-chassis basis—all interfaces in a load balance group must be in the same chassis.

**Note** In Cisco IOS Release 12.2(15)BC1, you can configure an interface for both load balancing and Hot-Standby Connection-to-Connection (HCCP) N+1 redundancy, but load balancing does not continue after a switchover from a Working to a Protect interface. Load balancing resumes when the Cisco CMTS switches back to the Working interface.

## Examples

The following example shows how to assign the first downstream on the cable interface line in slot five to load balance group 5:

```
Router# configure terminal
Router(config)# interface cable 5/0
Router(config-if)# cable load-balance group 5

Router(config-if)#
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group (global configuration)</b>	Creates and configures a load balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load balancing policy updates.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
<b>cable load-balance group threshold</b>	Configures the threshold values that a load balance group should use for load-balancing operations.

<b>show cable load-balance</b>	Displays real-time statistical and operational information for load balancing operations.

## cable load-balance group (Supporting Dynamic Channel Change)

To set multiple parameters for Load Balancing with Dynamic Channel Change (DCC), use the following command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cable load-balance group group-num {dcc-init-technique | interval | method | policy | threshold}
no cable load-balance group group-num {dcc-init-technique | interval | method | policy | threshold}
```

### Syntax Description

<b>dcc-init-technique</b>	Sets DCC initialization technique
<b>interval</b>	Sets interface polling interval
<b>method</b>	Sets upstream load balancing type/method
<b>policy</b>	Sets load balancing policy
<b>threshold</b>	Load balancing threshold in percentage

### Command Default

Load balancing is not configured by default on the Cisco CMTS.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(17a)BC	This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router, with supporting broadband processing engines (BPEs) or cable interface line cards on the respective routers.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example illustrates configuration of the initialization techniques specified for DCC:

```
Router(config)# cable load-balance group 1 dcc-init-technique 4
```

For further examples of this command, and related keywords, refer to related commands, and refer also to *Configuring Load Balancing and Dynamic Channel Change (DCC) on the Cisco CMTS*.

### Usage Guidelines

This command is subject to the restrictions and prerequisites described in *Configuring Load Balancing and Dynamic Channel Change (DCC) on the Cisco CMTS*.

### Related Commands

Command	Description
<b>cable load-balance group dcc-init-technique (Supporting Dynamic Channel Change)</b>	Sets the initialization technique for Dynamic Channel Change (DCC) for Load Balancing.

Command	Description
<b>cable load-balance group policy (Supporting Dynamic Channel Change)</b>	Sets the type of service flow for use with Load Balancing and DCC, whether PacketCable MultiMedia (PCMM) or Unsolicited Grant Service (UGS).

# cable load-balance group interval

To configure the frequency of the load-balancing policy updates, use the **cable load-balance group interval** command in global configuration mode. To reset the frequency of the policy updates to its default values, use the **no** form of this command.

**cable load-balance group *n* interval *interval***  
**no cable load-balance group *n* interval**

## Syntax Description

<i>n</i>	Specifies the number of the load balance group. In Cisco IOS Release 12.2(33)SCE3 and earlier, the range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the range is from 1 to 256.
<i>interval</i>	Specifies the frequency, in seconds, for how often the Cisco CMTS router should determine the current load on each cable interface. This also determines the minimum time between when cable modems can be moved to load balance the interfaces. One cable modem at most is moved during each interval time period. The range is from 1 to 1000. The default is 10 in Cisco IOS Release 12.2(33)SCE and earlier. The default is 30 in Cisco IOS Release 12.2(33)SCE1 and later.

## Command Default

Each load balance group uses the default interval value, if the interval time period is not specified.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCE1	The default value for the <b>interval</b> keyword was changed from 10 seconds to 30 seconds.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable load-balance group interval** command is used to configure the following feature:

- [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)

To perform load balancing, the Cisco CMTS must determine the actual load on an interface on a periodic basis. This frequency of the updates also determines how frequently cable modems can be moved to achieve balanced loads. One cable modem, at most, is moved during each update period.

The more often these updates are performed, the more accurate the Cisco CMTS can be in performing its load balancing operations. As a general rule, begin with the default frequency value, and then adjust the value accordingly, in small increments, as load balancing conditions or performance levels might require. The default interval value was changed in Cisco IOS Release 12.2(33)SCF to reduce thrashing of cable modems when utilization-based method is used with DOCSIS load balancing.

**Note** Having too small an interval could result in cable modems being constantly moved to achieve balanced loads during peak usage times when load balance could spike to transient heavy traffic. Also, more frequent updates can have a performance impact, especially on routers with a large number of active interfaces and cable modems.

## Examples

The following example shows how to configure load-balance group 3 so that it performs a policy update every 30 seconds:

```
Router# configure terminal
Router(config)# cable load-balance group 3 interval 30

Router(config)#
```

The following example shows how to reset load-balance group 10 to its default update frequency of 10 seconds:

```
Router# configure terminal
Router(config)# no cable load-balance group 10 interval
Router(config)#
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group (global configuration)</b>	Creates and configures a load-balance group.
<b>cable load-balance group (interface configuration)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations.
<b>cable upstream load-balance group</b>	Assigns an upstream to a load-balance group.
<b>clear cable load-balance</b>	Clears the counters or state machine used to track load-balancing operations.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.

## cable load-balance group policy

The following command is introduced to the Cisco CMTS starting in Cisco IOS Release 12.2(17b)BC4.

To set the type of service flow policy for use with Load Balancing, use the following command in global configuration mode. This enhancement synchronizes the pending statistic between different cable interface line cards in the load balancing group. The result is an alternative downstream load balancing scheme that makes use of per-upstream loads rather than total downstream loads.

To remove this configuration, use the **no** form of this command.

**cable load-balance group** *ds-lb-group-id* **policy** *us-groups-across-ds*  
**no cable load-balance group** *ds-lb-group-id* **policy** *us-groups-across-ds*

### Syntax Description

<i>ds-lb-group-id</i>	Specifies the load balancing group being configured. This downstream group includes the upstream segment in load balancing decisions.
<i>us-groups-across-ds</i>	Specifies the upstream group to be distributed in load balancing decisions for the downstream group specified.

### Command Default

By default, this load balancing configuration is not enabled on the Cisco CMTS.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(17b)BC4	This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router, with supporting broadband processing engines (BPEs) or cable interface line cards on the respective routers.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example illustrates this command and one supported implementation:

```
Router(config)# cable load-balance group 1 policy 2
Router(config)#
```

In this example, a cable modem that comes online on the interface cable 5/0 Upstream 2 could potentially come online on the following interfaces:

- cable 3/0 upstream 2
- cable 4/0 upstream 2
- cable 6/0 upstream 2
- nowhere else, however

With downstream load balancing prior to Cisco IOS Release 12.2(17b)BC4, having 100 cable modems per segment would be possible in an extreme case that distributes cable modems as follows:

	U0	U1	U2	U3	Downstream
3/0	97	1	1	1	100
4/0	1	97	1	1	100
5/0	1	1	97	1	100
6/0	1	1	1	97	100

### Usage Guidelines

This command is subject to the restrictions and prerequisites described in *Configuring Load Balancing and Dynamic Channel Change (DCC) on the Cisco CMTS*.

Cisco IOS Release 12.2(17b)BC4 enables the optional operation of making downstream load balancing decisions as follows:

- The target downstream segment is in the same downstream load balancing group as the source downstream segment.
- The upstream load balancing group can be set for the corresponding channel on which a cable modem is balanced.
- The Cisco CMTS automatically locates the upstream segment for a load balancing group and processes the upstream group status on the source interface that has the lowest load.
- The target downstream segment must have an upstream channel set in the upstream load balancing group.
- The highest target upstream segment must carry less load than any other potential target—the highest upstream segment on other interfaces.

This command enables an alternative downstream load balancing scheme that makes use of per-upstream loads rather than total downstream loads.

This enhancement performs downstream load balancing that accounts upstream channel loads in the same upstream load balancing group, rather than on the basis of the entire downstream channel load. Prior Cisco IOS releases may not have distributed cable modems evenly over individual upstream channels, nor in a way that accounted for downstream and upstream together.

This enhancement applies when downstream load balancing occurs on a headend system with separate upstream load balancing segments; the upstream segments are spread over multiple downstreams segments.

This optional configuration supports output of the **show cable load-balance** command so that the command displays more information about loads on channels that are configured on external or remote cable interface line cards.

### Related Commands

Command	Description
<b>show cable load-balance</b>	Displays information about loads on channels that are configured on external or remote cable interface line cards, to include integrated per-upstream load balancing information.

## cable load-balance group policy ugs

To configure whether the Cisco CMTS should load balance cable modems with Unsolicited Grant Service (UGS) service flows (which are typically used for active voice calls), use the **cable load-balance group policy ugs** command in global configuration mode. To reset the load-balance group to its default policy setting, use the **no** form of this command.

**cable load-balance group *n* policy ugs**

**no cable load-balance group *n* policy ugs**

### Syntax Description

<i>n</i>	Specifies the number of the load-balance group. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256.
----------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

Cable modems with active UGS service flows can be moved for load-balancing (**cable load-balance group *n* policy ugs**)

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable load-balance group policy ugs** command determines whether a load-balance group can move cable modems with UGS service flows, so as to enforce dynamic load balancing policies. Because most voice calls use UGS service flows to allow real-time traffic, this option is primarily used to determine whether the Cisco CMTS will move cable modems with active voice calls.

If you disable this option (**no cable load-balance group policy ugs**), the Cisco CMTS does not move cable modems with active UGS service flows to a new upstream or downstream. This prevents some possible interruptions of service to these customers, but it could result in denial of service conditions for other customers if the interface starts becoming overloaded.

To avoid this, the default configuration (**cable load-balance group policy ugs**) of this command allows the Cisco CMTS to move cable modems to a new upstream or downstream, even if they have active UGS service flows. This enables the Cisco CMTS to perform optimum load balancing, but it could cause a momentary interruption in the voice call—users on the voice call might hear a momentary drop during the call, but the call should not be terminated.

**Note** The **cable load-balance group policy ugs** command affects only dynamic load-balancing operations and does not affect static and passive load-balancing operations. Dynamic load balancing is enabled using the **enforce** option with the **cable load-balance group threshold** command.

## Examples

The following example shows how to enable the UGS policy on a load-balance group (the default configuration), so that the Cisco CMTS can move cable modems with active UGS service flows as needed to enforce the current dynamic load balancing policy:

```
Router# config terminal
Router(config)# cable load-balance group 13 policy ugs

Router(config)#
```

The following example shows how to configure a load-balance group so that the Cisco CMTS does not move cable modems with active UGS service flows (default configuration):

```
Router# config terminal
Router(config)# no cable load-balance group 100 policy ugs

Router(config)#
```

The **cable load-balance group policy ugs** command is used to configure the following feature:

- [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group</b>	Creates and configures a load-balance group.
<b>cable load-balance group (interface)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load-balancing policy updates.
<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations.
<b>cable upstream load-balance group</b>	Assigns an upstream to a load-balance group.
<b>clear cable load-balance</b>	Clears the counters or state machine used to track load-balancing operations.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.

## cable load-balance group threshold

To configure the threshold values that a load-balance group should use for load-balancing operations, use the **cable load-balance group threshold** command in global configuration mode. To reset the load-balance group to its default threshold values, use the **no** form of this command.

**cable load-balance group *n* threshold** {**load** *load-value* [**enforce** *threshold*] | **load minimum** *number* | **stability** *percent* | **ugs** *band-value*}

Syntax Description	
<i>n</i>	Specifies the number of the load-balance group. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256.
<b>load</b> <i>load-value</i>	Specifies the maximum load difference, as expressed in a percentage of total load, that can exist between interfaces in a load-balance group before the Cisco CMTS performs load balancing. If the load between interfaces is greater than the value specified by <i>load-value</i> , cable modems that are registering are assigned to the lesser-utilized interface until the load difference is once again below this value. The valid range for <i>load-value</i> is 1 to 100 percent, with a default of 10 percent.  <b>Note</b> The default of 10 percent is the minimum recommended threshold. Do not set this threshold below 10 percent unless you have been instructed to do so by Cisco TAC.
<b>enforce</b> <i>threshold</i>	(Optional) Enables dynamic load balancing, which moves online cable modems after their initial registration to achieve load balancing of the cable interfaces in a load-balance group. Cable modems that are currently online are moved when the load difference between two interfaces in the load-balance group exceeds this percentage. Modems continue to be moved until the load difference falls below this value.  The possible valid range for <i>threshold</i> is 1 to 100 percent, but the <i>threshold</i> must be equal to or greater than the percentage specified with the <i>load-value</i> option. For this reason, the actual minimum for <i>threshold</i> is the current setting of the <i>load-value</i> option. The default is also the same value as the <i>load-value</i> parameter.
<b>load minimum</b> <i>number</i>	(Optional) Specifies that cable modems should be moved only if the load between the two interfaces is greater than the specified number of cable modems or service flows (valid only when the method is the number of modems or service flows). The valid range is 1 to 100, with a default of 5.
<b>stability</b> <i>percent</i>	Specifies the threshold to be used to determine whether a channel or interface is unstable, in terms of the percentage of successful ranging requests. The <i>percent</i> value specifies the minimum percentage of successful ranging requests that is acceptable; otherwise, the CMTS begins moving CMs. The valid range is 1 to 100 percent, with a default of 50 percent.

<b>ugs</b> <i>band-value</i>	<p>Specifies that the Cisco CMTS should move cable modems with active UGS service flows when the current UGS usage reaches the percentage of total bandwidth available that is specified by the <i>band-value</i> parameter. The valid range for <i>band-value</i> is 0 to 100 percent, with a default of 70 percent.</p> <p><b>Note</b> This option is effective only when the <b>enforce</b> option has also been used to enable dynamic load balancing, and the Cisco CMTS has been authorized to move cable modems with active UGS service flows (using the <b>cable load-balance group policy ugs</b> command).</p>
------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default**

The **load** parameter defaults to 10 percent, the **load minimum** parameter defaults to 5, the **stability** parameter defaults to 50 percent, and the **ugs** parameter defaults to 70 percent. By default, only static load balancing is done (**no enforce** option). If the **enforce** option is given without a threshold value, it defaults to the same value as the **load** parameter.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The **cable load-balance group threshold** command is used to configure the following feature:

- [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)

The **cable load-balance group threshold** command configures a load-balance group for the threshold values that it should use to determine when a cable modem should be moved to a new downstream or upstream. You can specify the following different thresholds:

- **load**—Specifies the maximum load usage that can exist between interfaces in a load-balance group before the Cisco CMTS begins static load-balancing operations. The default value of *load-value* is 10 percent, which means that two upstreams or two downstreams can have usage rates that vary up to 10 percent before the Cisco CMTS begins rebalancing the load usage. This rebalancing, however, is done only when cable modems first register with the Cisco CMTS—the Cisco CMTS does not switch cable modems that are already online.

For example, if the **load** value is 10 percent, and upstream 1 is at 23 percent and upstream 2 is at 30 percent, no cable modems are moved. However, if load usage for upstream 2 reaches 35 percent, the Cisco CMTS begins assigning new cable modems, as they register, to upstream 1 until the difference in load usage between the two upstreams falls below 10 percent.

**Note** The default of 10 percent is the minimum recommended threshold. Do not set this threshold below 10 percent unless you have been instructed to do so by Cisco TAC.

- **enforce**—Enables dynamic load balancing, so that the Cisco CMTS can move cable modems that are already online. This option has its own threshold value, which specifies the difference in load usage that must exist between two interfaces in a group before the Cisco CMTS begins moving online cable modems. The Cisco CMTS continues to move cable modems until the difference in load usage rates falls below the threshold value.

When using dynamic load balancing and an upstream channel is overloaded, the Cisco CMTS sends an Upstream Channel Change (UCC) request to a cable modem to instruct it to move to another upstream. The cable modem should move to the new upstream channel, without going offline or having to reregister with the CMTS.

When using dynamic load balancing and a downstream channel is overloaded, the Cisco CMTS sends a stop response to a cable modem's ranging request (RNG-REQ) message. When the cable modem sends a new REG-REQ message, the Cisco CMTS specifies the new downstream channel in the Downstream Frequency Override field in its REG-RSP message. The cable modem must go offline and reregister on the new downstream channel, so as to conform to the DOCSIS 1.0 specifications.

---

**Note** In Cisco IOS Release 12.2(15)BC1, the dynamic load balancing method results in cable modems going offline and having to reregister whenever the modems are moved between downstreams. This is because the DOCSIS 1.0 specification requires cable modems to reregister whenever the downstream is changed using the Downstream Frequency Override message. Cable modems should not go offline when moved between upstreams.

---

The Cisco CMTS also continues to enforce the load threshold value to perform static load balancing as well. Therefore, the *threshold* percentage should be equal to or greater than the percentage specified with the **load load-value** option.

For example, if you specify **load 10 enforce 15**, the Cisco CMTS monitors the load usage between cable interfaces in the load-balance group. If upstream 1 reaches 33 percent and upstream 2 reaches 45 percent, the Cisco CMTS begins static load-balancing operations by assigning new cable modems to upstream 1 when they register. If the difference still continues to grow, and upstream 2 reaches 50 percent, the Cisco CMTS also begins dynamic load-balancing operations by moving online cable modems, until the difference in load usage falls below 15 percent. The Cisco CMTS then continues static load-balancing operations until the difference falls below 10 percent.

---

**Tip** The **enforce** threshold is not displayed in the configuration file if it is the same as the **load** threshold. For example, if you enter the **cable load-balance group 1 threshold load 50 enforce 50** command, it appears as **cable load-balance group 1 threshold load 50 enforce** in the configuration file.

---

- **load minimum**—Specifies that cable modems should be moved only if the load between the two interfaces is greater than the specified number of cable modems or service flows. This option is valid only when you have configured the load-balance group using either the **method modem** or **method service-flows** options with the **cable load-balance group** command. It is not used with the **utilization** method.
- **stability**—Specifies the minimum percentage of ranging requests that are successful before the Cisco CMTS determines that the interface or channel is unstable. When the channel has fewer than this percentage of cable modems responding to periodic ranging requests over a one-minute period, the Cisco CMTS begins moving modems to other channels in the load-balance group. For example, when set to 75 percent, the Cisco CMTS begins moving modems when fewer than 75 percent of modems are replying to ranging requests.

- **ugs**—Specifies a threshold for when the Cisco CMTS should move cable modems that have active UGS service flows, which are typically used for active voice calls. This option goes into force only when dynamic load balancing has been enabled (using the **enforce** option), and the Cisco CMTS has been allowed to move cable modems with active UGS service flows (using the **cable load-balance group policy ugs** command). The *band-value* threshold specifies the maximum usage of UGS service flows that should exist before the Cisco CMTS begins moving calls.

For example, if the band-value threshold is at its default of 70 percent, the Cisco CMTS does not begin moving cable modems with active UGS service flows until UGS usage on an upstream or downstream reaches 70 percent of the total available bandwidth. The Cisco CMTS continues moving cable modems that are online with active UGS service flows until the UGS usage on the interface falls below 70 percent.

**Note** Certain conditions can cause a system instability that could result in the Cisco CMTS endlessly attempting to load balance the interfaces. For example, this situation could occur in noisy environments, where cable modems drop offline on a regular basis, or when cable modems are repeatedly trying to register because the provisioning system has sent them the wrong DOCSIS configuration files. If the Cisco CMTS detects such unstable situations, it does not load balance cable modems from those interfaces until the system stabilizes. However, if the system instability persists, you should increase the threshold values using the **cable load-balance group threshold** command until the system stabilizes.

## Examples

The following example shows how to configure load-balance group 2 so that it performs static load balancing when the difference between two cable interfaces in the group is 20 percent or more.

```
Router# config terminal
Router(config)# cable load-balance group 2 threshold load 20
Router(config)#
```

The following example shows how to configure load-balance group 5 so that it performs static load balancing when the difference in usage between two cable interfaces in the group is 20 percent or more, and so that it performs dynamic load balancing when the difference in usage is 30 percent or more. The Cisco CMTS will also begin moving cable modems with active UGS service flows when UGS service flows reach 60 percent of the total bandwidth available on the upstream channel.

```
Router(config)# cable load-balance group 5 threshold load 20 enforce 30
Router(config)# cable load-balance group 5 threshold ugs 60
Router(config)# cable load-balance group 5 policy ugs
Router(config)#
```

**Note** You must configure the load-balance group with the **cable load-balance group policy ugs** command before the Cisco CMTS begins enforcing the threshold that was set with the **cable load-balance group threshold ugs** command.

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group</b>	Creates and configures a load-balance group.
<b>cable load-balance group (interface)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load-balancing policy updates.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
<b>cable upstream load-balance group</b>	Assigns an upstream to a load-balance group.
<b>clear cable load-balance</b>	Clears the counters or state machine used to track load-balancing operations.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.

## cable load-balance group threshold (Supporting Dynamic Channel Change)

To set the threshold levels and corresponding service flow types for the specified Load Balancing group, supporting Dynamic Channel Change (DCC) on the Cisco router, use the following command in global configuration mode. To remove threshold settings, use the **no** form of this command.

**cable load-balance group** *n* **threshold** {**load** | **pcmm** | **stability** | **ugs**} {*0-100*}

**cable load-balance group** *n* **threshold** **ugs** <*1-100*>

**cable load-balance group** *n* **threshold** **load** <*1-100*> {**minimum**}

**cable load-balance group** *n* **threshold** **load** **75** {**enforce**}

### Syntax Description

<i>n</i>	Specifies the number of the load balance group. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256.
<b>load</b>	Interface load threshold settings
<b>pcmm</b>	PCMM service flow threshold
<b>stability</b>	Threshold for stability detection
<b>ugs</b>	UGS service flow threshold
<i>1-100</i>	Interface utilization threshold in percentage of interface capacity.
<b>load</b>	Interface load threshold settings
<i>1-100</i>	Threshold value in percentage
<b>minimum</b>	Set minimum number of modems/flows difference before loadbalancing starts
<b>enforce</b>	Enters the enforce threshold

### Command Default

Load balancing is not configured by default on the Cisco CMTS.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(17a)BC	This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router, with supporting broadband processing engines (BPEs) or cable interface line cards on the respective routers.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Examples**

The following command specifies the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing, and the default threshold is 70%. Note that if UGS is used for PCMM, the UGS threshold needs to be crossed as well. The default UGS threshold is 70%.

```
Router(config)# cable load-balance group 4 threshold pcmm <pcmm-value>
```

**Usage Guidelines**

In Cisco IOS releases prior to Cisco IOS Release 12.3(17a)BC, the load balancing default setting is UGS. This is not the case with Cisco IOS Release 12.3(17a)BC. In this latter release, and subsequent releases, configuration is required if the cable modems with active UGS flows are desired to participate in load balancing.

This command is subject to the restrictions and prerequisites described in *Configuring Load Balancing and Dynamic Channel Change (DCC) on the Cisco CMTS*.

The **cable load-balance group threshold** command is used to configure the following feature:

- [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)

**Related Commands**

Command	Description
<b>cable load-balance group (Supporting Dynamic Channel Change)</b>	Sets multiple parameters for Load Balancing with DCC.
<b>cable load-balance group dcc-init-technique (Supporting Dynamic Channel Change)</b>	Sets the initialization technique for Dynamic Channel Change (DCC) for Load Balancing.
<b>cable load-balance group policy (Supporting Dynamic Channel Change)</b>	Sets the type of service flow for use with Load Balancing and DCC, whether PacketCable MultiMedia (PCMM) or Unsolicited Grant Service (UGS).
<b>show controllers cable</b>	Displays statistics for Dynamic Channel Change (DCC) for load balancing.

## cable load-balance method-utilization min-threshold

To configure the minimum threshold for initiating load balancing under the utilization method , use the **cable load-balance method-utilization min-threshold** command in global configuration mode.

**cable load-balance method-utilization min-threshold** *min\_threshold*

<b>Syntax Description</b>	<i>min_threshold</i> (Optional) Specifies the minimum threshold value in percentage, of utilization to initiate load balancing. The valid range is from 10 to 90. The default value is 25.
---------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The minimum utilization threshold is 25 percent.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCH	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure the **cable load-balance method-utilization min-threshold** *min\_threshold* command:

```
Router# enable
Router(config)# cable load-balance method-utilization min-threshold
40
Router(config)# exit
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations

## cable load-balance modem max-failures

To configure the number of times a CM can fail before the CM is removed from the dynamic load balancing group, use the **cable load-balance modem max-failures** command in the global configuration mode. To remove the configured number for a CM to fail, use the **no** form of this command.

**cable load-balance modem max-failures***0-100*

**no cable load-balance modem max-failures**

### Syntax Description

<i>0-100</i>	Specifies the maximum number of failures before a CM is removed from the dynamic LB. However, if you give the value 0, the <b>cable load-balance modem max-failures</b> command gets disabled.
<b>Note</b>	The CM is excluded from the dynamic load balance operations after it has failed the specified number of times, however it still belongs to a LBG.

### Command Default

The default value is 10.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure CM using the **cable load-balance modem max-failures** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#
cable load-balance modem max-failures 10
Router(config)#
```

## cable load-balance restrict modem

To configure a list of cable modems statically provisioned at the CMTS to a restricted load balancing group (RLBG) or a service type ID, use the **cable load-balance restrict modem** command in the global configuration mode. To remove the configured list of cable modems, use the **no** form of this command.

```
cable load-balance restrict modem index mac-addr [mac-mask] {docsis-group docsis-group-id | service-type-id string}
no cable load-balance restrict modem index mac-addr [mac-mask] {docsis-group docsis-group-id | service-type-id string}
```

Syntax Description		
	<i>index</i>	Assigns an index number ranging from 1 to 4294967295.
	<i>mac-addr</i>	Specifies the MAC address of the modem that is restricted.
	<i>mac-mask</i>	Specifies the MAC mask of the modem that is restricted.
	<b>docsis-group</b> <i>docsis-group-id</i>	Restricts modems to a DOCSIS load balancing group.
	<b>service-type-id</b> <i>string</i>	Restricts modems to a service type ID.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to assign a group of modems with a common MAC mask to a group or a service type ID using the **cable load-balance restrict modem** command. To assign the modem to a LBG, you can either specify the LBG ID or the service type ID.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance restrict modem 1 001a.c30c.7eee FFFF.FFFF.0000 docsis-group
100
Router(config)#
```

## cable load-balance rule

To create a rule that prevents cable modem (CM) from disabling or enabling load balancing, use the **cable load-balance rule** command in cable global configuration mode. To remove a defined rule, a rule from all policies, or the policy itself if it is the last rule of that policy, use the **no** form of this command.

```
cable load-balance rule rule-id {disable-period dis-start start-time dis-period disable-period |
disable-throughput-lowerbound {ds n | us n} | disabled | enabled | vdoc-enabled}
no cable load-balance rule rule-id
```

### Cisco cBR Series Converged Broadband Routers

```
cable load-balance rule rule-id {disable-period dis-start start-time dis-period disable-period |
disable-throughput-lowerbound {ds n | us n} | disabled | enabled}
```

#### Syntax Description

<i>rule-id</i>	Specifies the rule to load balance CM.
<b>disable-period</b>	Specifies the number of seconds to prevent CM from load balancing at a given start time.
<b>dis-start</b> <i>start-time</i>	Specifies the start time to disable CM from load balancing. The dis-start is the start time ranging from 0 to 86400 seconds from midnight.
<b>dis-period</b> <i>disable period</i>	Specifies the period to disable CM from load balancing. The dis-period is the duration time ranging from 0 to 86400 seconds from midnight.
<b>disable-throughput-lowerbound</b>	Disables load balancing if CM throughput is lower than a threshold.
<b>ds</b> <i>n</i>   <b>us</b> <i>n</i>	Specifies downstream or upstream channels throughput lowerbound in kbps, ranging from 0 to 1000000.
<b>disabled</b>	Disables the CM from load balancing.
<b>enabled</b>	Enables load balancing on CM.
<b>vdoc-enabled</b>	(For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) Enables the video over DOCSIS (VDOC) load balancing for static multicast groups.

#### Command Default

None

#### Command Modes

Global configuration (config)

#### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCC	The <b>disable-throughput-lowerbound</b> parameter was added in the command.
12.2(33)SCD5	The <b>vdoc-enabled</b> parameter was added in the command.

Release	Modification
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

### Usage Guidelines

The **cable load-balance rule** *rule-id* **disable-period** **dis-start** *start-time* **dis-period** *disable-period* command can be used for a 24 hours period.

**Important** You cannot disable load balancing and enable it for the next day using a single rule. You must configure two separate rules using the **cable load-balance rule** *rule-id* **disable-period** **dis-start** *start-time* **dis-period** **0** command to disable it and the **cable load-balance rule** *rule-id* **disable-period** **dis-start** **0** **dis-period** *disable-period* command to enable it for the next day.

The **no** form of this command supports the following actions:

- Remove a defined rule.
- Remove the rule from all policies.
- Remove the policy itself if it is the last rule of that policy.

**Note** Static multicast groups must be configured on the specific bundle interface as well as on the correct forwarding interfaces to enable the **vdoc-enabled** rule.

### Examples

The following example shows how to create a rule:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance rule 1 disable-period dis-start 40 dis-period 50
Router(config)# cable load-balance rule 1 disable-throughput-lowerbound ds 2500
Router(config)# cable load-balance rule 1 disabled
Router(config)# cable load-balance rule 2 enabled
Router(config)# cable load-balance rule 1 vdoc-enabled
Router(config)#
```

### Related Commands

Command	Description
<b>cable load-balance docsis-policy</b>	Creates a DOCSIS policy and associates a new or existing rule with the policy.

## cable load-balance static cm-delay

To configure the delay time to trigger static load balancing on the cable modem after registration hold-off time ends, use the **cable load-balance static cm-delay** command.

**cable load-balance static cm-delay** *delay*

---

**Syntax Description**     *delay* Cable modem delay time in seconds for static load balancing to trigger after registration hold. Valid delay range is 0–65535.

---

---

**Command Default**     By default, the cable modem delay time is 600 seconds.

---

**Command Modes**     Global configuration (config)

---

Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.3.1w	This command was introduced.

---

---

**Usage Guidelines**     When you set cable modem delay time to 0, successful registration triggers static load balancing instantly after registration hold off time ends.

---

**Examples**     The following example shows how to set load balancing cm-delay to 60 seconds.

```
Router#configure terminal
Router(config)#cable load-balance static cm-delay 60
Router(config)#end
```

## cable logging badipsource

To log error messages about bad IP source addresses on the cable interfaces to a separate log buffer, use the **cable logging badipsource** command in global configuration mode. To turn off the logging function and clear out the buffer, so that any error messages are logged to the console or current system log, use the **no** form of this command.

**cable logging badipsource** [*buffer-size*]  
**no cable logging badipsource**

### Syntax Description

<i>buffer-size</i>	Specifies the total size of the buffer that contains the logged error messages, in bytes. The range is from 4096 to 1048576 (4 KB to 1 MB). The default is 4096.
<b>Note</b>	The maximum buffer size is limited by the amount of actual unused memory that is available on the Cisco CMTS.

### Command Default

Error messages for bad IP source addresses are logged to the console or current system log. The default logging buffer size is 4096 entries.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.1(13)EC	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.
12.2(11)CY	Support was added for the Cisco uBR10012 universal broadband router.
12.2(11)BC2	Support was added to the Release 12.2 BC train for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
12.2(15)BC1, 12.2(15)CX	The maximum buffer size was adjusted to 1 MB, which can contain approximately 2000 error messages. Also, if the requested amount of memory is not available in a contiguous block, the CMTS displays an error message and does not change the buffer size.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable source-verify** command enables service providers to verify that the IP addresses being used on the cable interface have been properly assigned by the provider's DHCP servers. When a bad IP address is detected, the Cisco CMTS generates a BADIPSOURCE error message in the console logs.

In previous Cisco IOS releases, the Cisco CMTS generated these particular error messages for every IP packet that contained a bad IP source address. This can create a large volume of error messages that can make it difficult to see other error messages in the console logs.

To create a separate log for these error messages, use the **cable logging badipsource** command. You can also specify the size of the buffer that contains these error messages. When the buffer becomes full, the oldest

messages are deleted to make room for newer messages, so choose a buffer size that allows you to retain all messages until you can examine them.

On the Cisco uBR10012 router, this command includes only the BADIPSOURCE error messages generated by the PRE module. The cable interface line cards also generate their own error messages, but because these error messages are typically duplicates of the ones generated by the PRE module, they are not included in the separate log.

**Tip** If you find that the current buffer is too small to contain the current volume of error log messages, you can issue this command again with a larger buffer size. However, doing so automatically clears out all messages currently in the buffer, so ensure that you have viewed all the current messages before giving a second **cable logging badipsource** command.

**Note** Be cautious when specifying the buffer size, because the Cisco CMTS could run out of memory for other tasks. Use the **show memory EXEC** command to display the maximum available processor memory, and set the buffer size for this command to a value well within that maximum value.

To display the contents of this error log, use the **show cable logging** command. To clear the buffer after you have viewed the error messages, use the **clear cable logging** command. You can also use the **service timestamps log** command to add a timestamp to the messages in the log.

To print the BADIPSOURCE messages to the console or syslog server, use the **no cable logging badipsource** command (which is the default configuration). Note that this configuration does not turn off the generation of BADIPSOURCE messages, but only configures the system for the default log message behavior.

**Tip** If you do not want to see any BADIPSOURCE messages at all, use the **cable logging badipsource 4096** command so that these messages go to a separate buffer with the smallest possible size. You will then not see these error messages unless you explicitly use the **show cable logging** command to display them.

## Examples

The following example shows how to enable the logging of bad IP source address error messages, using a buffer size of 524,288 bytes (512 KB):

```
Router# configure terminal
Router(config)# cable logging badipsource 524288
Router(config)#
```

**Tip** You must also use the **cable source-verify** command to enable verification of source IP addresses before the buffer contains any error messages about bad IP source addresses. If you do not use the **cable source-verify** command, you can still use the **cable logging badipsource** command to create a buffer, but the buffer always remains empty.

The following example shows how to enlarge the current buffer for bad IP source address error messages by giving the **cable logging badipsource** command a second time. Because this will empty

out the buffer of all current messages, be sure to display the current buffer contents before giving the command a second time.

```
Router# configure terminal

Router(config)# cable logging badipsource 8192
Router(config)# exit

Router# show cable logging badipsource

<<buffer contents omitted>>
Router# configure terminal

Router(config)# cable logging badipsource 256000
```

The following example shows how to stop the logging of bad IP source address error messages to a separate buffer. This clears out all error messages from the buffer and removes the buffer from memory, and future error messages for bad IP source addresses are logged to the console or to the current system log, if any.

```
Router# configure terminal

Router(config)# no cable logging badipsource

Router(config)#
```

#### Related Commands

Command	Description
<b>cable source-verify</b>	Enables verification of IP addresses for CMs and CPE devices on the upstream.
<b>clear cable logging</b>	Removes all error messages about bad IP source addresses on the cable interfaces from the error log buffer.
<b>show cable logging</b>	Displays the log of error messages about bad IP source addresses on the cable interfaces.

# cable logging downstream-index

To enable logging for downstream indexes, use the **cable logging downstream-index** command in global configuration mode. To turn off logging and clear the buffer, use the **no** form of this command.

**cable logging downstream-index** [*buffer-size*]  
**no cable logging downstream-index** [*buffer-size*]

## Syntax Description

<i>buffer-size</i>	Total size of the buffer that contains the logged downstream indexes, in bytes. The range is from 4096 to 4121440. The default is 4096.
<b>Note</b>	The maximum buffer size is limited by the amount of actual unused memory that is available on the Cisco CMTS.

## Command Default

The downstream indexes are logged on the line card on which this configuration is enabled.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable logging downstream-index** command is configured on the Cisco uBR-MC3GX60V or Cisco UBR-MC20X20V cable line cards or on the line card that is configured to be the modular-host for a SPA. The downstream index logging may be enabled on the cable line card that has the MAC domain.

**Note** This command is used to collect data only when requested by Cisco TAC.

**Caution** Be cautious when specifying the buffer size because the Cisco CMTS could run out of memory for other tasks. Use the **show memory EXEC** command to display the maximum available processor memory, and set the buffer size for this command to a value well within the maximum value.

To display the contents of the downstream index log, use the **show cable logging downstream-index** command. To clear the buffer after you have viewed the log, use the **clear cable logging downstream-index** command. You can also use the **service timestamps log** command to add a timestamp to the messages in the log.

## Examples

The following example shows how to enable downstream index logging:

```
Router> enable
Router# configure terminal
Router(config)# cable logging downstream-index 4096
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>clear cable logging</b>	Removes all downstream index log messages.
<b>show cable logging</b>	Displays all downstream index log messages

# cable logging layer2events

To save selected (low priority) DOCSIS events that are specified in CMTS MIB Registry to the cable logging buffer (instead of to the general logging buffer), use the **cable logging layer2events** command in global configuration mode. To disable the logging of DOCSIS events to the cable logging buffer, use the **no** form of this command.

**cable logging layer2events**  
**no cable logging layer2events**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The DOCSIS events are saved to the general logging buffer on the Cisco CMTS. The default logging buffer size is 4096 entries.

**Command Modes** Global configuration (config)

## Command History

Release	Modification
12.3(9a)BC	This command was introduced on the Cisco uBR10012 and Cisco uBR7246VXR universal broadband routers.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **show cable logging** command to check whether the logging feature is enabled and the status of the logging buffer.

## Examples

The following example shows how to clear the log buffer that contains a bad IP source address error messages:

```
Router# show cable logging summary
Cable logging: BADIPSOURCE Enabled
Total buffer size (bytes): 1000000
Used buffer size (bytes) : 36968
Logged messages : 231
Router# clear cable logging badipsource
Router# show cable logging summary
Cable logging: BADIPSOURCE Enabled
Total buffer size (bytes): 1000000
Used buffer size (bytes) : 0
Logged messages : 0
```

## Related Commands

Command	Description
<b>cable logging badipsource</b>	Logs error messages about bad IP source addresses on the cable interfaces to a separate log buffer,

Command	Description
<b>show cable logging</b>	Indicates whether the logging feature is enabled and the status of the logging buffer.

# cable map-advance

To configure the dynamic map advance algorithm, use the **cable map-advance** command in cable interface configuration mode or MAC domain profile configuration mode. To disable this function, use the **no** form of this command.

**cable map-advance** [**dynamic** [*safety*]|**static**] [*max-delay*]  
**no cable map-advance**

## Syntax Description

<b>dynamic</b> <i>safety</i>	<p>Enables the dynamic MAP advance algorithm that automatically tunes lookahead time in MAPs based on the current farthest CM on a particular upstream port.</p> <ul style="list-style-type: none"> <li><i>safety</i>—Specifies a safety factor for the dynamic map advance algorithm in microseconds. This value controls the amount of extra lookahead time in MAPs to account for inaccuracies of the measurement system and internal software latencies. The range is from 300 to 1500. The default is 1000.</li> </ul> <p><b>Note</b> Using larger safety factors increases the run time lookahead in MAPs, but reduces the upstream performance.</p>
<b>static</b>	<p>Enables the static map advance algorithm that uses a fixed lookahead time value in MAPs based on the worst-case propagation delay of 100 mile HFC cable network.</p>
<i>max-delay</i>	<p>Specifies the maximum round trip delay between the cable plant and furthest CM in microseconds. The range is from 100 to 2000. The default is 1800. The typical delay for a mile of coaxial cable is approximately 7 microseconds. The typical delay for a mile of fiber cable is approximately 8 microseconds.</p>

## Command Default

Dynamic map advance with a safety factor of 1000 microseconds and a maximum round trip delay of 1800 microseconds.

## Command Modes

Interface configuration—cable interface only (config-if)

MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.1T	This command was introduced.
12.0 (9)SC, 12.1(2)EC1	The <b>dynamic</b> option was added.
12.1(10)EC	The <i>max-delay</i> option was added. The dynamic MAP algorithm was also enhanced so that it can quickly determine whether the furthest CM is now offline, so that the MAP advance algorithm can be updated accordingly.
12.2(8)BC1	The range for the <i>max-delay</i> option was changed to the current values of between 100 and 2000 microseconds.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The *max-delay* option, which was introduced in Cisco IOS Release 12.1(10)EC, specifies the maximum possible round-trip delay between the cable plant and furthest CM in the cable network. A CM is not allowed to exceed the maximum timing offset given by the *max-delay* value (in **static** mode) or given by the combination of the *max-delay* and *safety* values (in **dynamic** mode). If a CM reports a timing offset beyond the maximum value, the CMTS resets its offset to the maximum value and puts an exclamation point (!) next to its offset value in the **show cable modem** display.

In dynamic MAP operation, Cisco IOS 12.1(10)EC also implements a regular polling of the furthest CM, to determine if that CM is now offline. If the furthest CM has gone offline, the CMTS scans the currently online CMs to determine which CM is now the furthest offline and updates the dynamic MAP advance algorithm with the new value.

### Examples

The following example shows how to configure the dynamic map advance to 1500 microseconds:

```
router(config-if)# cable map-advance dynamic 1500
```

### Related Commands

Command	Description
<b>show cable modem</b>	Displays statistics for the connected CMs.

## cable match address

To specify that IP multicast streams be encrypted, use the **cable match address** command in cable interface configuration mode. To specify that multicast streams should not be encrypted, use the **no** form of this command.

**cable match address** *access-list*  
**no cable match address**

<b>Syntax Description</b>	<i>access-list</i>	Specifies that the IP multicast streams defined by the access list be encrypted. Access lists can be IP access list numbers or an IP access list name. Valid access list numbers are from 100 to 199.
---------------------------	--------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1 T	This command was introduced.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable match address** command binds an access-list to a cable interface, allowing multicast encryption to be performed on traffic through that interface. To configure the access list, use the **ip access-list** command.

**Note** This command is not available for cable subinterfaces.

**Note** This command is available only on images that support Baseline Privacy Interface (BPI) and Baseline Privacy Interface Plus (BPI+) encryption.

### Examples

The following example shows how to specify that the multicast stream defined by the access list named **reno** be encrypted on cable interface 3/0:

```
Router(config)# interface c3/0
Router(config-if)# cable match address reno
```

The following example shows how to specify that the multicast stream defined by the access list number 102 be encrypted:

```
Router(config)# interface c3/0
Router(config-if)# cable match address 102
```

---

**Related Commands**

Command	Description
<b>ip access-list</b>	Defines an IP access list by name.

## cable max-hosts

To specify the maximum number of hosts that can be attached to a subscriber's CM, use the **cable max-hosts** command in cable interface configuration mode. To reset the allowable number of hosts attached to a CM to the default value of 0 hosts, use the **no** form of this command.

**cable max-hosts** *n*  
**no cable max-hosts**

### Syntax Description

<i>n</i>	Specifies the maximum number of hosts that can be attached to a CM on this interface. The range is from 0 to 255. The default is 0.
----------	-------------------------------------------------------------------------------------------------------------------------------------

### Command Default

The maximum number of hosts that can be attached to a CM is 0.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
12.0(4)XI	This command was introduced.
12.0(6)SC, 12.1(2)EC1	Support was added on the Cisco IOS 12.0 SC and 12.1 EC release trains.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The Cisco CMTS uses three commands set the maximum number of hosts for a particular CM, for all CMs on a particular cable interface, or for all CMs using the Cisco CMTS router:

- **cable modem max-hosts**—Sets the maximum number of hosts for a particular CM.
- **cable max-hosts**—Sets the maximum number of hosts for all CMs on a particular cable interface.
- **cable modem max-cpe**—Sets the maximum number of hosts for all CMs using the Cisco CMTS router.

The more specific commands override the settings of the less specific commands. For example, if you use the **cable modem max-cpe** command to set the maximum number of hosts to 2 for all CMs, you can still use the **cable modem max-hosts** command to give a particular CM a larger maximum host value.

**Note** The CMTS assigns the MAX Host value to a cable modem at the time that the cable modem registers with the CMTS. Changing any of the MAX Host commands affects only cable modems that register after the change.

### Examples

The following example shows how to set the maximum hosts for CMs on this particular cable interface to 15:

```
Router(config)# interface c6/0
Router(config-if)# cable max-hosts 15
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable modem access-group</b>	Specifies an access group for a CM.
<b>cable modem change-frequency</b>	Changes the downstream frequency or upstream channel ID.
<b>cable modem max-cpe</b>	Sets the maximum number of hosts for all CMs using the Cisco CMTS router.
<b>cable modem max-hosts</b>	Sets the maximum number of hosts for a particular CM.
<b>show cable modem</b>	Displays CM configuration settings.

## cable mc-link-stat ignore

To ensure that whenever the Downstream External PHY Interface (DEPI) Ethernet port goes down, the module interface or the mc-link does not go down, use the **cable mc-link-stat ignore** command in global configuration mode.

**cable mc-link-stat ignore**

---

**Syntax Description**

This command has no arguments or keywords.

---

**Command Default**

Whenever DEPI Ethernet port goes down, the module interface or the mc-link also goes down. That is, the **no cable mc-link-stat ignore** command is enabled by default.

---

**Command Modes**

Global configuration (config)

---

**Command History**

Release	Modification
12.2(33)SCH	This command was introduced.

---

**Examples**

The following example shows how to ensure that the module interface does not go down whenever DEPI ethernet port goes down:

```
Router(config)# cable mc-link-stat ignore
```

## cable metering data-per-session

To view the number of cable metering data flows per session for a cable modem termination system, use the **cable metering data-per-session** command in the global configuration mode. To disable this feature, use the **no** form of this command.

**cable metering data-per-session** *data-per-session* **timer** *timer value*  
**no cable metering data-per-session** *data-per-session* **timer** *timer value*

Syntax Description		
	<i>data-per-session</i>	Specifies the number of data flows per session in KB. The range is from 3 to 30. The default is 5.
	<b>timer</b>	Displays the cable line card timer to wake up.
	<i>timer value</i>	Specifies the timer wake up interval value in milliseconds. The range is from 8 to 500. The default is 100.

**Command Default** The cable metering data flow values are not visible.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCB1	This command was introduced.
	12.3(23)BC7	This command was integrated into Cisco IOS Release 12.3(23)BC7.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable metering data-per-session** command allows users to view the number of cable metering data flows per session. The command limits or throttles the data collection between the cable line card and the route processor.

**Examples** The following example displays the number of cable metering data flows per session:

```
Router# configure terminal
Router(config)# cable metering data-per-session 8 timer 100
Router# show run | include metering
cable metering destination 2.7.36.88 6789 0 15 non-secure
cable metering data-per-session 8 timer 100
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show cable metering-status</b>	Displays information about the most recent successful usage-based billing operation.
<b>cable metering destination</b>	Enables usage-based billing and to stream the billing records to an external collection server,

## cable metering destination

To enable usage-based billing and to stream the billing records to an external collection server, use the **cable metering destination** command in global configuration mode. To disable usage-based billing, use the **no** form of this command.

**cable metering destination** *ip-address port* [*ip-address2 port2*] *retries minutes* {**non-secure** | **secure**} [**cpe-list-suppress**] [**flow-aggregate**] [**full-records**]  
**no cable metering**

### Syntax Description

<i>ip-address port</i>	Address and TCP port number for the billing application on the external server: <ul style="list-style-type: none"> <li><i>ip-address</i>— IP address for the external collection server.</li> <li><i>port</i>— TCP port number for the billing collection application on the server. The range is from 0 to 65535, but the port should not be one of the widely-used TCP port numbers (0 to 1024).</li> </ul>
<i>ip-address2 port2</i>	(Optional) IP address and TCP port number for a billing application on a secondary external server that is used if the primary server fails to respond: <ul style="list-style-type: none"> <li><i>ip-address2</i>— IP address for the secondary external server.</li> <li><i>port2</i>— TCP port number for the billing collection application on the secondary server. The range is from 0 to 65535, but the port should not be one of the widely-used TCP port numbers (0 to 1024).</li> </ul>
<i>retries</i>	Number of retry attempts that the Cisco CMTS makes to establish a secure connection with the external server before using the secondary server (if configured) and sending an SNMP trap about the failure. The range for <i>n</i> is from 0 to 5. The default is 1 retry attempt.
<i>minutes</i>	Frequency of the billing records streamed to the external server in minutes. The range is 2 to 1440 (24 hours), with no default. <b>Note</b> We recommend a minimum interval of 30 minutes.
<b>non-secure</b>	Specifies that the Cisco CMTS should use an unencrypted TCP connection when connecting with the billing application on the external server.
<b>secure</b>	Specifies that the Cisco CMTS should use a secure socket layer (SSL) TCP connection when connecting with the billing application on the external server. <b>Note</b> This option is available only on the Cisco CMTS software images that support Baseline Privacy Interface (BPI) encryption.
<b>cpe-list-suppress</b>	(Optional) Eliminates the customer premises equipment (CPE) IP addresses from the billing records to improve performance. <b>Note</b> The default is for CPE addresses to be included in the billing record, up to a maximum of five CPE IP addresses for each cable modem.
<b>flow-aggregate</b>	(Optional) Combines all information for an individual cable modem into one record. Separate counters are maintained for upstream and downstream traffic, but those counters include all service flows in that direction.

<b>full-records</b>	(Optional) Provides information about full service flow (active and idle) records.
---------------------	------------------------------------------------------------------------------------

**Command Default**

Usage-based billing is disabled. When enabled, CPE IP addresses (a maximum of five per cable modem) are included in the billing records by default.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.3(9a)BC	This command was introduced.  <b>Note</b> In Cisco IOS Release 12.3(9a)BC, this command supports the monitoring of all service flows for DOCSIS 1.0, DOCSIS 1.1, and DOCSIS 2.0 cable modems: <ul style="list-style-type: none"> <li>• upstream and downstream</li> <li>• primary</li> <li>• secondary</li> <li>• dynamic</li> </ul>
12.2(33)SCD2	This command was modified to add the <b>full-records</b> keyword.  <b>Note</b> In Cisco IOS Release 12.2(33)SCD2 and later releases, this command is also supported on DOCSIS 3.0 cable modems.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The **cable metering destination** command enables usage-based billing and configures it for streaming mode, where the Cisco CMTS creates the billing records and regularly sends them to an external server for use by the billing application.

The Cisco CMTS attempts to establish a connection with the first (primary) external server, and if this fails, the CMTS sends an SNMP trap about the failure. The Cisco CMTS retries the connection for the number of times specified in the **cable metering destination** command, and if all of those attempts fail, the Cisco CMTS switches to the secondary external server, if configured. The Cisco CMTS repeats this sequence at every interval, and always tries to connect to the primary server first before attempting to use the secondary server.

**Note** You can enable usage-based billing using either the **cable metering filesystem** or **cable metering destination** command, but not both. If you give these commands twice, the second command overwrites the first.

If the CMTS cannot transmit the billing record to the external server, and if metering traps have been enabled using the **snmp-server enable traps cable metering** command, the CMTS sends an SNMP trap to the SNMP manager describing the reason for the failure. Typically, the reason is either that a timeout occurred with the external server, or that the billing record no longer exists on the local filesystem. An SNMP trap is sent for each connection failure.

To disable usage-based billing, use the **no cable metering** command. This immediately stops the collection of billing information, except when the billing records are currently being streamed to the external server. If a billing operation is in progress when you give the **no cable metering** command, the system displays the

message “CMTS Metering in progress. Ignoring current config.” Wait until the billing operation is finished and then reenter the **no cable metering** command.

**Note** If the **show cable metering-status** command displays the status of a streaming operation as “success” but the records were not received on the billing application server, verify that the Cisco CMTS and server are configured for the same type of communications (non-secure TCP or secure SSL). If the Cisco CMTS is configured for non-secure TCP and the server is configured for secure SSL, the Cisco CMTS transmits the billing record successfully, but the server discards all of the data, because it did not arrive in a secure SSL stream.

## Examples

The following example shows how to enable usage-based billing for streaming mode, with the CMTS transmitting the billing records every 60 minutes to the server at the IP address of 10.10.10.37 and TCP port of 5215, using a secure socket layer (SSL) TCP connection. A secondary external service is also defined. The CMTS will retry the connection three times before giving up and switching to the secondary server, as well as sending an SNMPv3 trap to notify the SNMP management system of the failure:

```
U7246VXR# configure terminal
U7246VXR(config)# cable metering destination 10.10.10.37 5215 10.10.10.41 5215 3 60 secure
U7246VXR(config)#
```

The following example shows how to enable usage-based billing for streaming mode, with the CMTS transmitting the billing records every 30 minutes to the server at the IP address of 10.10.10.37 and TCP port of 8181, using an unencrypted TCP connection. No secondary server is defined. The CMTS will retry the connection only once before giving up and sending an SNMPv3 trap to notify the SNMP management system of the failure:

```
Router# configure terminal
Router(config)# cable metering destination 10.10.10.37 8181 1 30 non-secure
Router(config)#
```

The following example shows how to enable usage-based billing, using the same configuration as above, except that the billing records do not include the IP addresses for the CPE devices:

```
Router# configure terminal
Router(config)# cable metering destination 10.10.10.37 8181 1 30 non-secure cpe-list-suppress
Router(config)#
```

The following example shows how to enable usage-based billing, using an unencrypted TCP connection, including the IP addresses for the CPE devices, and enabling the **full-records** option:

```
Router# configure terminal
Router(config)# cable metering destination 10.10.10.37 11 1 222 non-secure full-records
cpe-list-suppress
Router#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable metering filesystem</b>	Enables usage-based billing and writes the billing records to a file on a local file system.
<b>cable metering ipdr</b>	Enables usage-based billing using the IPDR and SP2.1 protocol.
<b>cable metering ipdr-d3</b>	Enables usage-based billing on DOCSIS 3.0 cable modems.
<b>cable metering source-interface</b>	Enables debugging of usage-based billing operations.
<b>show cable metering-status</b>	Displays information about the most recent usage-based billing operation.
<b>snmp-server enable traps cable</b>	Ensures that the Simple Network Management Protocol (SNMP) traps are sent for cable-related events.

## cable metering filesystem

To enable usage-based billing and to write the records to a file on a local file system, use the **cable metering filesystem** command in global configuration mode. To disable usage-based billing, use the **no** form of this command.

**cable metering filesystem** *filesystem* [**cpe-list-suppress**] [**flow-aggregate**] [**full-records**]  
**no cable metering**

### Syntax Description

<i>filesystem</i>	File system where the billing record file is written. The <i>filesys</i> parameter has a maximum length of 25 characters and must specify a valid file system on the router (such as slot0, disk1, or flash).  <b>Note</b> The system writes the billing records to this file system using a file name that contains the hostname of the router followed by a timestamp when the record was written.
<b>cpe-list-suppress</b>	(Optional) Eliminates the customer premises equipment (CPE) IP addresses from the billing records to improve performance.  <b>Note</b> If this option is not selected, a maximum of five CPE IP addresses are included in the billing record for each cable modem.
<b>flow-aggregate</b>	(Optional) Combines all information for an individual cable modem into one record. Separate counters are maintained for upstream and downstream traffic, but those counters include all service flows in that direction.
<b>full-records</b>	(Optional) Provides information about full service flow (active and idle) records.

### Command Default

Usage-based billing is disabled. When usage-based billing is enabled, CPE IP addresses (a maximum of five) are included in the billing records by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(9a)BC	This command was introduced.  <b>Note</b> In Cisco IOS Release 12.3(9a)BC, this command supports the monitoring of all service flows for DOCSIS 1.0, 1.1, and 2.0 cable modems: <ul style="list-style-type: none"> <li>• upstream and downstream</li> <li>• primary</li> <li>• secondary</li> <li>• dynamic</li> </ul>
12.2(33)SCD2	This command was modified to add the <b>full-records</b> keyword.  <b>Note</b> In Cisco IOS Release 12.2(33)SCD2 and later releases, this command is also supported on the DOCSIS 3.0 cable modems.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable metering filesystem** command enables usage-based billing and configures it for file mode, where the CMTS writes the billing records to the local file system. The system writes the billing record to the filesystem specified by this command, using a file name that consists of the router's hostname followed by a timestamp for when the file was created.

When the CMTS writes a billing record, it can also optionally send an SNMPv3 trap to notify the billing application that a billing record is available for pickup. The billing application can then log into the Cisco CMTS and use the File Transfer Protocol (FTP) or Secure Copy (SCP) to pick up the file.

**Note** You can enable usage-based billing using either the **cable metering filesystem** or **cable meteringdestination** command, but not both. If you give these commands twice, the second command overwrites the first.

If the CMTS cannot write the billing record to the local filesystem, and if metering traps have been enabled using the **snmp-server enable traps cable metering** command, the CMTS sends an SNMP trap to the SNMP manager describing the reason for the failure. Typically, the reason is either that the disk is full or that an disk error occurred (such as no PCMCIA card in the slot).

To disable usage-based billing, use the **no cable metering** command. This immediately stops the collection of billing information, except when the billing records are currently being written to the local file system. If a billing operation is in progress when you give the **no cable metering** command, the system displays the message "CMTS Metering in progress. Ignoring current config." Wait until the billing operation is finished and then reenter the **no cable metering** command.

### Examples

The following example shows how to enable usage-based billing, writing the records to a file on the disk0: device.

```
U7246VXR# configure terminal
U7246VXR(config)# cable metering filesystem disk0:
U7246VXR(config)#
```

**Note** Do not use **nvr** as the file system. For example, do not use: Router(config)# **cable metering filesystem nvr**:

The following example shows how to enable usage-based billing, writing the records to files on the disk2 device on an NPE-G1 processor:

```
Router# configure terminal
Router(config)# cable metering filesystem disk2:
Router(config)#
```

The following example shows how to enable usage-based billing, writing the records to files in Flash Memory. The IP addresses for the CPE devices are not included in the billing records.

```
Router# configure terminal
```

```
Router(config)# cable metering filesystem flash: cpe-list-suppress
Router(config)#
```

The following example shows how to enable usage-based billing, writing the records to files in Flash Memory, and enabling the full-records option:

```
Router# configure terminal
Router(config)# cable metering filesystem disk2:xyz full-records
Router#
```

#### Related Commands

Command	Description
<b>cable metering destination</b>	Enables usage-based billing and streams the billing records to an external server.
<b>cable metering ipdr</b>	Enables usage-based billing using the IPDR and SP2.1 protocol.
<b>cable metering ipdr-d3</b>	Enables usage-based billing on DOCSIS 3.0 cable modems.
<b>cable metering source-interface</b>	Enables debugging of usage-based billing operations.
<b>show cable metering-status</b>	Displays information about the most recent usage-based billing operation.
<b>snmp-server enable traps cable</b>	Enables the sending of Simple Network Management Protocol (SNMP) traps for cable-related events.

## cable metering ipdr

To configure the Subscriber Account Management Interface Specification (SAMIS) and enable usage-based billing on DOCSIS 2.0 cable modems, use the **cable metering ipdr** command in global configuration mode. To disable usage-based billing, use the **no** form of this command.

```
cable metering ipdr interval session session-id [flow-aggregate] [full-records]
no cable metering
```

### Cisco cBR Series Converged Broadband Routers

```
cable metering ipdr interval session session-id {full-records}
```

Syntax Description		
<i>interval</i>	Specifies the Metering data streaming interval in minutes. The interval is the time between the completion of one export and the beginning of another. The range is from 2 to 1440 (24 hours).	
<b>session</b> <i>session id</i>	IP Detail Records (IPDR) session ID. The session ID range is from 1 to 255.	
<b>flow-aggregate</b>	(Optional) Combines all information for an individual cable modem into one record. Separate counters are maintained for upstream and downstream traffic, but those counters include all service flows in that direction. (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers)	
<b>full-records</b>	(Optional) Provides information about full service flow (active and idle) records. (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers)	

**Command Default** Usage-based billing is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCA	This command was introduced. <b>Note</b> In Cisco IOS Release 12.2(33)SCA, this command is supported on DOCSIS 1.0, DOCSIS 1.1, and DOCSIS 2.0 cable modems.
	12.2(33)SCD2	The command was modified to include the <b>full-records</b> keyword. <b>Note</b> In Cisco IOS Release 12.2(33)SCD2 and later releases, this command is also supported on DOCSIS 3.0 cable modems.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>flow-aggregate</b> keyword was removed.

**Usage Guidelines** The **cable metering ipdr** command configures how SAMIS data is exported. This command is used for DOCSIS 2.0 SAMIS schema.

When **flow-aggregate** is enabled, the service flows are combined into one record per cable modem:

- ServiceClassName element always returns a null value in IPDR records, even when service flows on the cable modem have a valid service class name.
- ServiceIdentifier element always returns a zero value.

## Examples

The following example shows how to enable usage-based billing for IPDR, with the billing record interval set to every 60 minutes with full-records and flow-aggregate options enabled:

```
Router# configure terminal
Router(config)# cable metering ipdr 60 session 111 full-records flow-aggregate
Router(config)#
```

## Related Commands

Command	Description
<b>cable metering destination</b>	Enables usage-based billing, and streams the billing records to an external server.
<b>cable metering filesystem</b>	Enables usage-based billing and writes the billing records to a file on a local file system.
<b>cable metering source-interface</b>	Enables debugging of usage-based billing operations.
<b>show cable metering-status</b>	Displays information about the most recent usage-based billing operation.
<b>snmp-server enable traps cable</b>	Ensure that the Simple Network Management Protocol (SNMP) traps are sent for cable-related events.

## cable metering ipdr-d3

To configure the Subscriber Account Management Interface Specification (SAMIS) and enable usage-based billing on DOCSIS 3.0 cable modems, use the **cable metering ipdr-d3** command in global configuration mode. To disable usage-based billing, use the **no** form of this command.

```
cable metering ipdr-d3 session session-id type type [flow-aggregate] [full-records]
no cable metering
```

Syntax Description	
<b>session</b> <i>session id</i>	Specifies the IPDR session ID. The range is from 1 to 255.
<b>type</b> <i>type</i>	Specifies the IPDR DOCSIS 3.0 service definition type of metering. The range is from 1 to 2.
<b>flow-aggregate</b>	(Optional) Combines all information for an individual cable modem into one record. Separate counters are maintained for upstream and downstream traffic, but those counters include all service flows in that direction. (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers)
<b>full-records</b>	(Optional) Provides information about full service flow (active and idle) records. (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers)

**Command Default** Usage-based billing is disabled, by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCD2	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable metering ipdr-d3** command configures how the SAMIS data is exported. This command is used for DOCSIS 3.0 SAMIS schema (including type 1 and type 2).

When **flow-aggregate** is enabled, the service flows are combined into one record per cable modem:

- ServiceClassName element always returns a null value in IPDR records, even when service flows on the cable modem have a valid service class name.
- ServiceIdentifier element always returns a zero value.

### Examples

The following example shows how to enable usage-based billing for IPDR DOCSIS 3.0, with full-records and flow-aggregate options enabled:

```
Router# configure terminal
Router(config)# cable metering ipdr-d3 session 111 type 2 full-records flow-aggregate
Router(config)#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable metering destination</b>	Enables usage-based billing, and streams the billing records to an external server.
<b>cable metering filesystem</b>	Enables usage-based billing and writes the billing records to a file on a local file system.
<b>cable metering source-interface</b>	Enables debugging of usage-based billing operations.
<b>cable sflog max-entry</b>	Enables service flow logging and configuring the number and duration of entries in the log.
<b>show cable metering-status</b>	Displays information about the most recent usage-based billing operation.
<b>snmp-server enable traps cable metering</b>	Ensures that Simple Network Management Protocol (SNMP) traps are sent for cable-related events.

# cable metering localtime

To provide usage records with local time timestamping, use **cable metering localtime** command in global configuration mode.

## **cable metering localtime**

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is not configured by default.

**Command Modes** Global configuration(config)

Command History	Release	Modification
	12.2(33)SCI2	This command was introduced.

**Usage Guidelines** When the **cable metering localtime** command is configured, the timestamp in metering output is local time, e.g. "2015-03-03T16:26:07", otherwise it's the UTC time, e.g. "2015-03-03T16:26:07Z" (with a "Z" indicating that the time is UTC/GMT).

**Examples** The following example configures usage records with local time timestamping:

```
Router(config)#cable metering localtime
Router(config)#
```

Related Commands	Command	Description
	<b>cable metering destination</b>	Enables usage-based billing and streams the billing external server.
	<b>cable metering ipdr</b>	Enables usage-based billing using the IPDR and SP2.1 protocol.
	<b>cable metering ipdr-d3</b>	Enables usage-based billing on DOCSIS 3.0 cable modems.
	<b>cable metering source-interface</b>	Enables debugging of usage-based billing operations.
	<b>show cable metering-status</b>	Displays information about the most recent usage-based billing operation.
	<b>cable metering file-system</b>	Enables usage-based billing and writes the billing records to a file on a local file system.

# cable metering source-interface

To enable specification of the source-interface for the billing packets, use the **cable metering source-interface** command in privileged EXEC mode. To turn off the specified source-interface, use the **no** form of this command.

**cable metering source-interface** *interface*  
**no cable metering source-interface** *interface*

## Syntax Description

<i>interface</i>	Specifies the source of the usage-based billing packets originated by the router using the <b>cable metering source-interface</b> command. This is often used to set the source-interface as the IP address of the loopback interface.
------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

Usage billing is disabled. When enabled, CPE IP addresses (a maximum of five per cable modem) are included in the billing records by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.3(21)BC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable metering source-interface** command enables the user to specify the source-interface of the usage-based billing packets. All billing packets are usually automatically assigned a source-interface, but users using the **cable metering source-interface** command can set the source-interface to be the IP address of the loopback interface.

If the user does not specify the source-interface configuration, SAMIS picks the highest IP address of the loopback interface as the source interface. If the loopback interface is not available, then SAMIS selects the highest IP of the physical interface for source interface.

**Note** If a loopback interface is specified, the MAC address is that of the management interface in the docID in the billing packet.

**Note** The option of specifying the source-interface for metering is available only after the metering mode is configured.

If the **cable metering source-interface** command is used when the Usage-Based Billing feature is operating in the File Mode, the CMTS IP address in the billing packets are changed to the IP address of the source-interface specified using the **cable metering source-interface** command or through setting the

```

count="2" endTime="2006-03-06T18:45:37Z"/></IPDRDoc>
Closing socket 2.90.100.100:42380
Router(config)#

```

---

**Related Commands**

Command	Description
<b>cable metering source-interface</b>	Enables usage-based billing and streams the billing records to an external server.
<b>cable metering filesystem</b>	Enables usage-based billing and writes the billing records to a file on a local file system.
<b>debug cable remote-query</b>	Turns on debugging to gather information from remote CMs.
<b>show cable metering-status</b>	Displays information about the most recent usage-based billing operation.
<b>snmp-server enable traps cable</b>	Enables the sending of Simple Network Management Protocol (SNMP) traps for cable-related events.

## cable modem access-group

To configure the access-group for a CM, use the **cable modem access-group** command in privileged EXEC mode. To disable the specification, use the **no access-group** form of this command.

```
cable modem {mac-addr|ip-addr} access-group [access-list|access-name]
cable modem {mac-addr|ip-addr} no access-group
```

**Note** The **cable modem access-group** command is not supported on the Cisco uBR10012 universal broadband router.

### Syntax Description

<i>ip-addr</i>	Specifies the IP address for the CM.
<i>mac-address</i>	Specifies the MAC address for the CM.
<i>access-list</i>	Specifies the IP access list (standard or extended). The range is from 1 to 199.
<i>access-name</i>	Specifies the access-list name.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
11.3(8) NA	This command was introduced.
12.2(4)BC1	The functionality of this command was made identical to that of the <b>cable host access-group</b> command, but both commands were retained for backwards compatibility.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows the **cable modem access-group** command assigning access-list 1 to the CM with the MAC address of **abcd.ef01.2345**:

```
Router# cable modem abcd.ef01.2345 access-group 1
Router#
```

### Related Commands

Command	Description
<b>cable host access-group</b>	Configures the access list for a host.
<b>cable modem change-frequency</b>	Changes the downstream frequency or upstream channel ID.

<b>Command</b>	<b>Description</b>
<b>cable modem max-hosts</b>	Specifies the maximum hosts for a CM.
<b>cable modem qos profile</b>	Specifies the QoS profile for a CM.
<b>show cable modem</b>	Displays CM configuration settings.

# cable modem change-frequency

To override the frequency used by a CM, use the **cable modem change-frequency** command in privileged EXEC mode.

```
cable modem {mac-addr|ip-addr} change-frequency {ds-frequency-hz [us-channel-id]us-channel-id}
```

Syntax Description		
	<i>ip-addr</i>	Specifies the IP address for the CM.
	<i>mac-address</i>	Specifies the MAC address for the CM.
	<i>ds-frequency-hz</i>	Specifies the downstream frequency for the CM (in Hertz).
	<i>us-channel-id</i>	Specifies the upstream channel ID.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command allows the CMTS administrator to change the downstream frequency for a CM, overriding the DOCSIS configuration file setting. This command is not applicable on Cisco IOS Release 12.1(3a)EC.

**Examples** The following example shows how to change the downstream frequency of the CM having IP address 172.172.172.12 to 570 MHz:

```
Router# cable modem 172.172.172.12 change-freq 57000000
Router#
```

Related Commands	Command	Description
	<b>cable modem access-group</b>	Specifies an access group for a CM.
	<b>cable modem max-hosts</b>	Specifies the maximum hosts for a CM.
	<b>cable modem qos profile</b>	Specifies the QoS profile for a CM.
	<b>show cable modem</b>	Displays CM configuration settings.

# cable modem max-cpe

To specify a maximum number of permitted hosts per modem (overriding the max-cpe value in the CM configuration file), use the **cable modem max-cpe** command in global configuration mode.

**cable modem max-cpe** [*n* | **unlimited**]

Syntax Description		
	<i>n</i>	Specifies the configuration file value. The range is from 1 to 255.
	<b>unlimited</b>	Specifies the maximum CPE value to be unlimited.

**Command Default** The **max-cpe** value provided in the configuration file is used by the CMTS to limit the number of hosts connected to a single CM (**no cable modem max-cpe**).

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.0(10)SC, 12.1(2)EC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The CMTS enables up to *n* number of hosts for a modem. When set to **unlimited**, or *n* is greater than the **max-cpe** value in the configuration file of a CM, the **max-cpe** value in the configuration file of the CM is used.

**Note** When the the maximum number of CPEs, set by the **cable modem max-cpe** command in the Cisco CMTS, is smaller than the maximum number of CPEs set in the configuration file of the CMs, the number set by the **cable modem max-cpe** command overrides the number set in the configuration file of the CMs.

**Note** When setting to **unlimited** or *n* is greater than the **max-cpe** value in the configuration file of a CM, the CM must control the maximum number of hosts, and the DHCP server must control the number of IP addresses assigned to hosts behind a single CM.

**Caution** Use of this command might open a security hole in the system by enabling denial of service attacks. Specifically, it might enable a user to obtain a large number of IP addresses, thereby taking down the entire network, after all the available IP addresses have been reserved by this single user. Cisco recommends that, if this command is enabled, the number of IP addresses assigned to hosts behind a single modem be strictly controlled by the DHCP server.

The Cisco CMTS uses three commands to set the maximum number of hosts for a particular CM, for all CMs on a particular cable interface, or for all CMs using the Cisco CMTS router:

- **cable modem max-hosts**—Sets the maximum number of hosts for a particular CM.
- **cable max-hosts**—Sets the maximum number of hosts for all CMs on a particular cable interface.
- **cable modem max-cpe**—Sets the maximum number of hosts for all CMs using the Cisco CMTS router.

The more specific commands override the settings of the less specific commands. For example, if you use the **cable modem max-cpe** command to set the maximum number of hosts to 2 for all CMs, you can still use the **cable modem max-hosts** command to give a particular CM a larger maximum host value.

**Note** The CMTS assigns the MAX Host value to a cable modem at the time that the cable modem registers with the CMTS. Changing any of the MAX Host commands affects only cable modems that register after the change.

**Note** The “Number of CPEs” field in the **show cable modem** command shows the maximum CPE value for the CM, not the value for the CMTS that is set by the **cable modem max-cpe** command.

## Examples

The following example shows how to override the **max-cpe** setting in a CM configuration file:

```
Router(config)# cable modem max-cpe unlimited
```

## Related Commands

Command	Description
<b>cable max-hosts</b>	Sets the maximum number of hosts for all CMs on a particular cable interface.
<b>cable modem access-group</b>	Specifies an access group for a CM.
<b>cable modem change-frequency</b>	Changes the downstream frequency or upstream channel ID.
<b>cable modem max-hosts</b>	Sets the maximum number of hosts for a particular CM.
<b>cable modem qos profile</b>	Specifies the QoS profile for a CM.
<b>show cable modem</b>	Displays CM configuration settings.

## cable modem max-hosts

To specify the maximum number of customer premises equipment (CPE) devices (hosts) that can be supported by a specific CM, use the **cable modem max-hosts** command in privileged EXEC mode.

**cable modem** {*mac-addr*|*ip-addr*} **max-hosts** {*n* | **default**}

Syntax Description		
	<i>ip-addr</i>	Specifies the IP address for the CM.
	<i>mac-address</i>	Specifies the MAC address for the CM.
	<b>max-hosts</b> { <i>n</i>   <b>default</b> }	Specifies either the maximum number of hosts supported by the CM (from 0 to 255), or specifies the default value of 0.

**Command Default** 0

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The Cisco CMTS uses three commands to set the maximum number of hosts for a particular CM, for all CMs on a particular cable interface, or for all CMs using the Cisco CMTS router:

- **cable modem max-hosts**—Sets the maximum number of hosts for a particular CM.
- **cable max-hosts**—Sets the maximum number of hosts for all CMs on a particular cable interface.
- **cable modem max-cpe**—Sets the maximum number of hosts for all CMs using the Cisco CMTS router.

The more specific commands override the settings of the less specific commands. For example, if you use the **cable modem max-cpe** command to set the maximum number of hosts to 2 for all CMs, you can still use the **cable modem max-hosts** command to give a particular CM a larger maximum host value.

**Note** The CMTS assigns the MAX Host value to a cable modem at the time that the cable modem registers with the CMTS. Changing any of the MAX Host commands affects only cable modems that register after the change.

### Examples

The following example shows sets the CM with the IP address of 172.172.172.12 to a maximum of 40 attached CPE devices:

```
Router# cable modem 172.172.172.12 max-hosts 40
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable modem access-group</b>	Specifies an access group for a CM.
<b>cable modem change-frequency</b>	Changes the downstream frequency or upstream channel ID.
<b>cable max-hosts</b>	Sets the maximum number of hosts for all CMs on a particular cable interface.
<b>cable modem max-cpe</b>	Sets the maximum number of hosts for all CMs using the Cisco CMTS router.
<b>cable modem qos profile</b>	Specifies the QoS profile for a CM.
<b>show cable modem</b>	Displays CM configuration settings.

# cable modem opt0

To collect Receive Modulation Error Ratio (RxMER) data from the cable modem on-demand, use the **cable modem opt0** command in privileged EXEC mode.

**cable modem** {*mac-addr*|*ip-addr*} **opt0**

## Syntax Description

<i>ip-addr</i>	IP address for the CM.
<i>mac-address</i>	address for the CM.

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
IOS-XE 3.18.1SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use the **cable modem opt0** command to collect RxMER data from the CM. Based on the RxMER values collected from a modem, the CMTS finds among the existing profiles the one that may provide the highest speed, and yet at the same time may have sufficient Signal to Noise Ratio (SNR) margin for the modem to receive code words with acceptable error.

## Examples

The following example shows how to collect RxMER data from the CM:

```
Router# cable modem fc52.8d5e.84e1 opt0
```

```
Router#
```

## cable modem qos profile

To force a DOCSIS 1.0 CM to use a specific quality-of-service (QoS) profile, use the **cable modem qos profile** command in privileged EXEC mode.

**cable modem** {*mac-addr*|*ip-addr*} **qos profile** *qos-profile-index* [**no-persistence**]

Syntax Description		
	<i>ip-addr</i>	IP address for the CM.
	<i>mac-address</i>	address for the CM.
	<i>qos-profile-index</i>	QoS profile index values.  The range is from 1 to 255, with no default. In Cisco IOS Release 12.2(15)BC1 and later releases, this profile must be created on the Cisco CMTS using the <b>cable qos profile</b> command. In addition, this profile should specify a maximum upstream bandwidth equal to or less than the current bandwidth. If the new profile specifies a higher bandwidth, it is ignored, and the cable modem continues to use the bandwidth that was specified at registration time.  The range is from 1 to 1023 on the Cisco cBR series routers.
	<b>no-persistence</b>	(Optional) Specifies that the QoS profile should not remain in force when a cable modem reboots. Instead, when a cable modem reboots, it uses the QoS profile specified in its DOCSIS configuration file.  The default is without this option, so that the QoS profile remains in force for cable modems across reboots.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	12.1(11)EC	This command was supported on Cisco IOS Release 12.1 EC.
	12.2(8)BC1	This command was enhanced to allow a DOCSIS 1.1 CMTS to temporarily change the QoS profile for DOCSIS 1.0 and 1.0+ CMs.
	12.2(15)BC1	This command was changed so that it does not have any effect unless both the QoS profile specified by this command and the QoS profile specified for the CM in its DOCSIS configuration file are already created on the Cisco CMTS. This restriction did not exist in previous releases.
	12.2(15)BC2	The <b>no-persistence</b> option was added. Also, the restriction on changing CM-created profiles that was implemented in Cisco IOS Release 12.2(15)BC1 was removed, so that this command can again be used to change the profile of a CM that is using a CM-created profile, as was the case in earlier releases.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

On a Cisco CMTS running DOCSIS 1.0 software, the **cable modem qos profile** command forces a CM to use a specific QoS profile.

On a Cisco CMTS running DOCSIS 1.1 software, the **cable modem qos profile** command temporarily forces a DOCSIS 1.0 or DOCSIS 1.0+ CM to use a specific QoS profile, without forcing the CM to first go off-line and re-register. For DOCSIS 1.0+ CMs, this command affects only the primary SID on the CM.

**Note** In Cisco IOS Release 12.2(15)BC1, this command has an effect only when the profile that it specifies and the original QoS profile on the CM have been created already on the Cisco CMTS, using the **cable qos profile** command. In Cisco IOS Release 12.2(15)BC2 and later releases, this restriction is removed and this command can also be used to change the profile for a CM even when it is using a CM-created QoS profile.

This command does not affect DOCSIS 1.1 CMs, which support dynamic service change messages that allow the QoS profile to be changed dynamically.

**Note** This command acts as a toggle. Give the **cable modem qos profile** command once to enforce a QoS profile. Give the same command again with the same parameters to cancel the enforcement of that profile (the CM will return to using its registered profile.)

When the **no-persistence** option is specified, the QoS profile is not applied when a cable modem reboots. Instead, the Cisco CMTS allows the cable modem to use the QoS profile that is specified in its DOCSIS configuration file.

The **no-persistence** option can be used when initially when identifying potential problem applications and users. When repeat offenders are identified, the service provider can remove the **no-persistence** option, so that these users continue to use the specified QoS profile even if they reboot their cable modems.

### Examples

The following example shows how to specify a QoS profile index to a CM:

```
Router# cable modem qos profile 255
```

```
Router#
```

### Related Commands

Command	Description
<b>cable modem access-group</b>	Specifies an access group for a CM.
<b>cable modem change-frequency</b>	Changes the downstream frequency or upstream channel ID.
<b>cable modem max-hosts</b>	Specifies the maximum hosts for a CM.
<b>show cable modem</b>	Displays CM configuration settings.

## cable modem remote-query

To enable and configure the remote query feature to gather cable modem performance statistics on the Cisco CMTS router, use the **cable modem remote-query** command in global configuration mode. To disable the gathering of cable modem statistics, use the **no** form of this command.

**cable modem remote-query** [*polling-interval community-string*] [**src-ip** *ip-address*]  
**no cable modem remote-query** [**src-ip** *ip-address*]

Syntax Description	
<i>polling-interval</i>	(Optional) The delay between each poll that the Cisco CMTS router makes to collect cable modem statistics, in seconds. When the Cisco CMTS router completes one remote query poll, the router waits this time period before beginning another poll. The range is from 1 to 86,400. The recommended default value is 30.
<i>community-string</i>	(Optional) The Simple Network Management Protocol (SNMP) community string. <b>Note</b> If resetting a configured SNMP community string value, first disable the remote query feature with the <b>no</b> form of this command, then set the new community string using the <b>cable modem remote-query</b> command when the polling delays is timed out.
<b>src-ip</b> <i>ip-address</i>	(Optional) Specifies the source IP address for SNMP requests. <b>Note</b> You should enable the remote query feature before configuring <b>src-ip</b> option.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.0(7)XR, 12.1(2)T	This command was introduced.
	12.1(2)EC1	Support for this command was added to the 12.1 EC train. <b>Note</b> This command is not supported on Cisco IOS Release 12.1(3a)EC1 but is supported on Cisco IOS Release 12.1(4)EC and later 12.1 EC releases.
	12.2(4)BC1b	Support for this command was added to the 12.2 BC train.
	12.2(15)BC1, 12.2(15)CX	The sysDescr field is now obtained for each cable modem when the remote query feature is enabled. (This value can be displayed using the <b>verbose</b> option of the <b>show cable modem</b> command.)
	12.3(23)BC	Support for the <b>scr-ip</b> option was added to this release.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** To use the remote query feature, you must configure the cable modem and Cisco CMTS as follows:

- Configure a read-only SNMP community string on the cable modem for use with the remote query feature. This should be a separate community string from the read-write string used to remotely monitor and configure the cable modem.
- Configure a matching community string on the Cisco CMTS using the **snmp-server community** *community-string* and **snmp-server manager** commands.
- Enable the remote query feature on the Cisco CMTS with the **cable modem remote-query** command. The *polling-interval* should be chosen so that the statistics can be obtained in a timely manner without seriously impacting system performance. Cisco recommends initially setting the *polling-interval* to 30 seconds and adjusting that time period as needed.

---

**Note** If the remote query feature is enabled, the Cisco CMTS router consumes extra memory per cable modem and takes additional CPU time. We recommend that you do not configure this feature on routers that have lower free memory or a large number of cable modems.

---

The *polling-interval* time period determines only how long the Cisco CMTS router waits after completing one polling cycle before beginning a new polling cycle. It does not indicate how long the router spends in each polling cycle, which depends on the number of cable modems being polled. To calculate the approximate time for a polling cycle, assume 4 to 5 CMs per second (100 to 200 milliseconds per CM). Also take into account the possibility that one or more cable modems might not respond, with an approximate timeout period of 90 seconds.

You must specify matching community strings for the cable modem, the **snmp-server community** *community-string* command, and the **cable modem remote-query** command.

You can reissue the **cable modem remote-query** command to change the polling interval at any time, and the change becomes effective immediately. However, to change the SNMP community string, you must first disable remote polling with the **no snmp manager** and **no cable modem remote-query** commands. Then reconfigure the new community string with the **snmp-server community** *community-string*, **snmp-server manager**, and **cable modem remote-query** commands.

You must configure the remote query feature before configuring the **scr-ip** option.

---

**Tip** After enabling the remote query feature, you can display the collected statistics with the **show cable modem remote-query** command. You can also display these statistics by querying the attributes in the [CISCO-DOCS-REMOTE-QUERY-MIB](#).

---

### Resetting the Community String for Cable Modem Remote Query

In Cisco IOS Release 12.3BC and later releases, if you wish to reconfigure the SNMP *community string* for the cable modem remote query feature, perform these brief steps.

1. Disable the remote query feature with the **no** form of this command.
2. Reset the timers on the Cisco CMTS router with short timeout values for the polling interval, so that timeout commences quickly. Use the **cable modem remote-query** command in privileged EXEC mode, using a very low value for the *polling interval* value.
3. Once time-outs are applied, reset the *community string* value with the **cable modem remote-query** command.
4. Change the *polling interval* timers on the Cisco CMTS router back to preferred levels using the **cable modem remote-query** command in privileged EXEC mode.

## Examples

The following example illustrates how to set the polling interval to 5 seconds and the SNMP community string to **private**:

```
Router# configure terminal
Router(config)# cable modem remote-query 5 private
Router(config)# snmp-server community private
Router(config)# snmp-server manager
```

The following example demonstrates how to change the remote query configuration, by first deleting the existing configuration and then giving the new configuration:

```
Router# configure terminal
Router(config)# no cable modem remote-query
Router(config)# no snmp-server manager
Router(config)# cable modem remote-query 10 public
Router(config)# snmp-server community public
Router(config)# snmp-server manager
```

## Related Commands

Command	Description
<b>debug cable remote-query</b>	Turns on debugging to gather information from remote CMs.
<b>show cable modem</b>	Displays information for the registered and unregistered CMs.
<b>show cable modem phy</b>	Displays DOCSIS PHY layer information for one or more CMs.
<b>show cable modem remote-query</b>	Displays the statistics accumulated by the remote query feature.
<b>snmp-server enable traps cable</b>	Enables traps that are sent when the remote polling of CMs has been completed.

## cable modem service-class-name

To change a QoS service class for a particular cable modem (CM), use the **cable modem service-class-name** command in privileged EXEC mode.

**cable modem** {*ip-address**mac-address*} **service-class-name** *name*

### Syntax Description

<i>ip-address</i>	Specifies the IP address of the CM to be assigned the named service class.
<i>mac-address</i>	Specifies the MAC address of the CM to be assigned the named service class.
<i>name</i>	Specifies the name of the QoS service class.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command has the following restrictions:

- The **no** form of the command is not supported, as the CMTS does not cache the service class parameters of the modem.
- The command is supported only on DOCSIS 1.1 CMs primary service flows.
- You can specify this command only after the CM has been online for at least 200 seconds.
- The parameters defined by the named service class should be a subset of the admitted qos parameters. Normally, the admitted and the active parameters have the same QoS parameters. However, it is better to ensure that the following parameters are a subset of the original or registered set of parameters: **priority**, **max-rate**, **max-burst**, **min-rate**, **max-latency**, **min-packet-size**, **act\_timeout**, or **adm\_timeout**. Also, ensure that the values of **required\_mask**, **forbidden\_mask**, and **aggregate\_mask** are the same.

### Examples

The following example changes the QoS parameter set for the CM with MAC address aaaa.bbbb.cccc to the service class named “test”:

```
Router# cable modem aaaa.bbbb.cccc service-class-name test
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable service class</b>	Sets parameters for a DOCSIS 1.1 cable service class.
<b>service-class (enforce-rule)</b>	Identifies a particular service class for cable modem monitoring in an enforce-rule.

## cable modem v6-max-cpe-prefix

To specify the maximum number of IPv6 addresses per modem, use the **cable modem v6-max-cpe-prefix** command in global configuration mode. To set the default value of the command, use the **no** form of this command.

**cable modem v6-max-cpe-prefix** [*n*]  
**no cable modem v6-max-cpe-prefix** [*n*]

### Syntax Description

<i>n</i>	Specifies the maximum number of IPv6 addresses per modem. The range is from 0 to 1023. The default is 16.
----------	-----------------------------------------------------------------------------------------------------------

### Command Default

The default number of IPv6 addresses per modem is 16.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCH1	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the <b>cable submgmt default max-ipv6-cpe</b> command on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command is used to check the IPv6 Global Unicast Address (GUA), link-local address (LLA) and IPv6 Prefix Delegation (PD) of the CPE.

### Examples

The following example shows how to specify the maximum number of the IPv6 addresses per modem:

```
Router> enable
Router# configure terminal
Router(config)# cable modem v6-max-cpe-prefix 10
Router(config)# cable submgmt default active
Router(config)# exit
```

### Related Commands

Command	Description
<b>show cable modem</b>	Displays information for the registered and unregistered cable modems.

## cable modem vendor

To associate the name of a vendor with its Organizational Unique Identifier (OUI), use the **cable modem vendor** command in global configuration mode. To remove the association of the vendor name with its OUI, use the **no** form of this command.

```
cable modem vendor OUI [vendor-name]
no cable modem vendor OUI [vendor-name]
```

Syntax Description	
<i>OUI</i>	Specifies the Organizational Unique Identifier (OUI). An OUI is the first 3 octets (3 bytes, 6 hexadecimal digits) of the CM MAC address and typically indicates the vendor for the CM. The octets can be specified as one string (for example, 000102), or each octet can be separated by a hyphen, period, or colon (for example, 00-01-02 or 00:01:02 or 00.01.02).  <b>Note</b> You can use either a period or colon as the separator between octets when manually entering this command, but the command that is written to the running and startup configuration files always uses a period.
<i>vendor-name</i>	(Optional) Specifies an arbitrary string identifying the vendor for this OUI.

**Command Default** A default database contains approximately 300 OUIs associated with approximately 60 vendor names.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(8)BC2	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable modem vendor** command allows you to associate an arbitrary string with an OUI to identify the vendor of the associated CM. The vendor name is then displayed as part of the **show cable modem vendor** command.

The **show cable modem vendor** command uses a default database of approximately 300 OUIs. If the OUI and vendor are not in that database, the **show cable modem vendor** command displays the OUI as the vendor name, but you can use the **cable modem vendor** command to associate a vendor name with the new OUI.

If you specify an OUI with the **cable modem vendor** command that already exists in the OUI database, the previous value is overwritten with the new value. You can use the **default** prefix to restore the original value for an OUI in the default database.

You can also use the **no cable modem vendor** command to remove the association between an OUI and a vendor name. The **show cable modem vendor** command then displays only the OUI as the vendor name.

**Tip** The Institute of Electrical and Electronics Engineers (IEEE) is the official issuer of OUI values. The IEEE OUI web site is at <http://standards.ieee.org/regauth/oui/index.shtml>.

## Examples

The following shows several examples of the **cable modem vendor** command using Cisco OUIs:

```
Router(config)# cable modem vendor 00:01:42 Cisco
Router(config)# cable modem vendor 00:01:43 Cisco
Router(config)# cable modem vendor 00:01:63 Cisco
Router(config)# cable modem vendor 00:01:64 Cisco
Router(config)# cable modem vendor 00:0A:41 Cisco
Router(config)# cable modem vendor 00:0A:42 Cisco

Router(config)#
```

The following shows an example of the **default cable modem vendor** command being used to restore the original association between Cisco and its company OUI of 00:00:0C. Any previous user-defined vendor name is deleted from the OUI database.

```
Router(config)# default cable modem vendor 00000C
```

The following shows an example of the **no cable modem vendor** command being used to remove the association between Cisco and an OUI of 00:0A:42. If any CMs exist with that OUI, the **show cable modem vendor** command displays the OUI (“00:0A:42”) as the vendor name.

```
Router(config)# no
cable modem vendor 00:0A:42 Router(config)#
```

## Related Commands

Command	Description
<b>show cable modem vendor</b>	Displays the vendor name or Organizational Unique Identifier (OUI) for the CMs on each cable interface.

# cable modulation-profile

To define a modulation profile for use on the router, use the **cable modulation-profile** command in global configuration mode. To remove the entire modulation profile or to reset a default profile to its default values, use the **no** form of this command.

## DOCSIS 1.0 and 1.1 Mixed Mode:

```
cable modulation-profile profile {mix | qam-16 | qpsk | robust-mix}
no cable modulation-profile profile {iuc | mix | qam-16 | qpsk | robust-mix}
cable modulation-profile profile iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed diff
pre-len last-cw uw-len
```

## DOCSIS 1.x/2.0 Mixed Mode:

```
cable modulation-profile profile {mix-high | mix-low | mix-mid | mix-qam | qam-16 | qpsk |
robust-mix-high | robust-mix-mid | robust-mix-qam}
no cable modulation-profile profile {iuc | mix-high | mix-low | mix-mid | mix-qam | qam-16 | qpsk |
robust-mix-high | robust-mix-mid | robust-mix-qam}
cable modulation-profile profile iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed diff
pre-len last-cw uw-len
```

## DOCSIS 2.0 A-TDMA Mode:

```
cable modulation-profile profile {mix-high | mix-low | mix-mid | mix-qam | qam-8 | qam-16 | qam-32 |
qam-64 | qpsk | robust-mix-high | robust-mix-low | robust-mix-mid}
no cable modulation-profile profile {iuc | mix-high | mix-low | mix-mid | mix-qam | qam-8 | qam-16 |
qam-32 | qam-64 | qpsk | robust-mix-high | robust-mix-low | robust-mix-mid}
cable modulation-profile profile iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed diff
pre-len last-cw uw-len
```

## Cisco IOS Release 12.2(33)SCC and Later

### DOCSIS 2.0 A-TDMA Mode and DOCSIS 2.0 S-CDMA Mode:

```
cable modulation-profile profile {mix-high | mix-low | mix-mid | mix-qam | qam-16 | qpsk |
robust-mix-high | robust-mix-low | robust-mix-mid}
no cable modulation-profile profile {iuc | mix-high | mix-low | mix-mid | mix-qam | qam-16 | qpsk |
robust-mix-high | robust-mix-low | robust-mix-mid}
cable modulation-profile profile iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed diff
pre-len last-cw uw-len
```

## Cisco cBR Series Converged Broadband Routers

### DOCSIS 1.x TDMA Mode:

```
cable modulation-profile profile tdma {mix | qam-16 | qpsk | robust-mix}
no cable modulation-profile profile tdma {iuc | mix | qam-16 | qpsk | robust-mix}
cable modulation-profile profile tdma iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed
diff pre-len last-cw uw-len
```

### DOCSIS 1.x/2.0 TDMA-ATDMA Mixed Mode:

```
cable modulation-profile profile mixed {mix-high | mix-low | mix-mid | mix-qam | qam-16 | qpsk |
robust-mix-high | robust-mix-mid | robust-mix-qam}
```

**no cable modulation-profile** *profile* **mixed** {*iuc* | **mix-high** | **mix-low** | **mix-mid** | **mix-qam** | **qam-16** | **qpsk** | **robust-mix-high** | **robust-mix-mid** | **robust-mix-qam**}

**cable modulation-profile** *profile* **mixed** *iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed diff pre-len last-cw uw-len*

#### DOCSIS 2.0 A-TDMA Mode:

**cable modulation-profile** *profile* **atdma** {**mix-high** | **mix-low** | **mix-mid** | **mix-qam** | **qam-8** | **qam-16** | **qam-32** | **qam-64** | **qpsk** | **robust-mix-high** | **robust-mix-low** | **robust-mix-mid**}

**no cable modulation-profile** *profile* **atdma** {*iuc* | **mix-high** | **mix-low** | **mix-mid** | **mix-qam** | **qam-8** | **qam-16** | **qam-32** | **qam-64** | **qpsk** | **robust-mix-high** | **robust-mix-low** | **robust-mix-mid**}

**cable modulation-profile** *profile* **atdma** *iuc fec-tbytes fec-len burst-len guard-t mod scrambler seed diff pre-len last-cw uw-len*

#### Syntax Description

<i>profile</i>	Specifies the modulation profile number. The valid values for the profile number depend on the cable interface being used and the upstream's mode of operation.  The range is 1 to 400 on the Cisco cBR series routers.  In Cisco IOS Release 12.2(15)CX and later releases, you can create a maximum of 10 profiles for each mode of operation, for a total of 30 profiles on the Cisco uBR10012 and Cisco uBR7200 series routers. In earlier software releases, you can create a maximum of 8 profiles only for DOCSIS 1.0 and DOCSIS 1.1 mode.
<b>mix</b>	(DOCSIS 1.0 and DOCSIS 1.1 mode only) Creates a default QPSK/16-QAM mix modulation profile where short and long grant bursts are sent using 16-QAM, while request, initial ranging, and station maintenance bursts are sent using QPSK). The burst parameters are set to their default values for each burst type.
<b>mix-high</b>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 modes only) Creates a default QPSK/64-QAM modulation profile.
<b>mix-low</b>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 modes only) Creates a default QPSK/16-QAM modulation profile.
<b>mix-mid</b>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only) Creates a default QPSK/32-QAM modulation profile.
<b>mix-qam</b>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only) Creates a default 16-QAM/64-QAM modulation profile.
<b>qam-8</b>	(DOCSIS 2.0 A-TDMA mode only) Creates a default 8-QAM modulation profile.  This modulation profile is available in hidden and internal mode only from Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S onwards.
<b>qam-16</b>	Creates a default 16-QAM modulation profile.
<b>qam-32</b>	(DOCSIS 2.0 A-TDMA mode only) Creates a default 32-QAM modulation profile.  This modulation profile is available in hidden and internal mode only from Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S onwards.

<b>qam-64</b>	(DOCSIS 2.0 A-TDMA mode only) Creates a default 64-QAM modulation profile. This modulation profile is available in hidden and internal mode only from Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S onwards.
<b>qpsk</b>	Creates a default QPSK modulation profile.
<b>robust-mix</b>	(DOCSIS 1.0 and DOCSIS 1.1 mode only) Creates a default QPSK/16-QAM modulation profile with a longer preamble that is more robust and more able to deal with noise on the upstream better than the <b>mix</b> profile.
<b>robust-mix-high</b>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only) Creates a default QPSK/64-QAM mixed modulation profile with a longer preamble that is more robust and more able to deal with noise on the upstream better than the <b>mix-high</b> profile.
<b>robust-mix-low</b>	(DOCSIS 2.0 A-TDMA mode only) Creates a default QPSK/16-QAM modulation profile with a longer preamble that is more robust and better able to deal with noise on the upstream than the <b>mix-low</b> profile.
<b>robust-mix-mid</b>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only) Creates a default QPSK/32-QAM modulation profile with a longer preamble that is more robust and better able to deal with noise on the upstream than the <b>mix-mid</b> profile.
<b>robust-mix-qam</b>	(DOCSIS 1.x/2.0 mixed mode only) Creates a default 16-QAM/64-QAM mixed modulation profile with a longer preamble that is more robust and better able to deal with noise on the upstream than the <b>mix-qam</b> profile.
<i>iuc</i>	Interval usage code. Valid entries depend on the mode of operation: <ul style="list-style-type: none"> <li>• If the upstream is configured for DOCSIS 1.0 and DOCSIS 1.1 modulation profiles, the valid values are <b>initial</b>, <b>long</b>, <b>request</b>, <b>reqdata</b>, <b>short</b>, or <b>station</b>.</li> <li>• If the upstream is configured for DOCSIS 1.x and DOCSIS 2.0 mixed modulation profiles, the valid values are <b>a-long</b>, <b>a-short</b>, <b>a-ugs</b>, <b>initial</b>, <b>long</b>, <b>request</b>, <b>reqdata</b>, <b>short</b>, or <b>station</b>.</li> <li>• If the upstream is configured for DOCSIS 2.0 A-TDMA modulation profiles, the valid values are <b>a-long</b>, <b>a-short</b>, <b>a-ugs</b>, <b>initial</b>, <b>long</b>, <b>request</b>, <b>reqdata</b>, <b>short</b>, or <b>station</b>.</li> </ul> <p>The <b>reqdata</b> burst type is included as a placeholder for scripts that might reference it, but the DOCSIS MAC scheduler on the Cisco CMTS does not use this type of burst.</p> <p>When you are using the <b>initial</b> and <b>station</b> bursts for DOCSIS 2.0 A-TDMA mode, <b>qam-8</b>, <b>qam-32</b>, and <b>qam-64</b> modulation profiles are available in hidden mode only.</p>
<i>preamble</i>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only, for <b>a-long</b> and <b>a-short</b> options) Specifies the preamble format. Valid values are <b>qpsk0</b> and <b>qpsk1</b> .
<i>rs-interleave-depth</i>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only, for <b>a-long</b> and <b>a-short</b> options) Specifies the RS interleave depth. The valid range is from 0 to 114.
<i>rs-interleave-block</i>	(DOCSIS 1.x/2.0 mixed and DOCSIS 2.0 A-TDMA modes only, for <b>a-long</b> and <b>a-short</b> options) Specifies the RS interleave block size. The valid range is from 18 to 2048.

<i>fec-bytes</i>	The number of bytes that can be corrected per FEC code word. For DOCSIS 1.0 and DOCSIS 1.1 mode, valid values are from 0 to 10 (decimal), where 0 means no FEC. For DOCSIS 2.0 A-TDMA mode, the valid values are from 0 to 16 (decimal), where 0 means no FEC.
<i>fec-len</i>	FEC code-word length. Valid values are from 16 to 253.
<i>burst-len</i>	Maximum burst length in minislots. Valid values are from 0 to 255, where 0 means no limit.
<i>guard-t</i>	Guard time in symbols. The time between successive bursts, with a range from 22 to 255. (In Cisco IOS Release 12.2(15)BC2 and earlier releases, the minimum guard time was 0 symbols, but we do not recommend using a guard time smaller than 22 symbols.)
<i>mod</i>	Modulation. Valid entries are <b>16qam</b> and <b>qpsk</b> for DOCSIS 1.0 and DOCSIS 1.1 upstreams. Valid entries are <b>8qam</b> , <b>16qam</b> , <b>32qam</b> , <b>64qam</b> , and <b>qpsk</b> for DOCSIS 2.0 upstreams.  The <b>qam-8</b> , <b>qam-32</b> , and <b>qam-64</b> modulation profiles are available in hidden and internal modes only from Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S onwards.
<i>scrambler</i>	Enable or disable scrambler. Valid entries are <b>scrambler</b> and <b>no-scrambler</b> .
<i>seed</i>	(Required if <b>scrambler</b> option used) Scrambler seed in hexadecimal format. Valid values are from 0x0 to 0x7FFF.
<i>diff</i>	Enable or disable differential encoding. Valid entries are <b>diff</b> and <b>no-diff</b> .  In DOCSIS 2.0 mode, differential encoding cannot be enabled for the 8-QAM, 32-QAM, and 64-QAM modulations.  The <b>qam-8</b> , <b>qam-32</b> , and <b>qam-64</b> modulation profiles are available in hidden and internal modes only from Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S onwards.
<i>pre-len</i>	Preamble length in bits. Valid values are from 2 to 256.
<i>last-cw</i>	Handling of FEC for last code word. Valid entries are <b>fixed</b> for fixed code-word length and <b>shortened</b> for shortened last code word.
<i>uw-len</i>	Upstream unique word length. Enter <b>uw8</b> for 8-bit unique code words or <b>uw16</b> for 16-bit unique code words.

**Command Default**

Modulation profile 1 is defined as a **qpsk** Time Division Multiple Access (TDMA) profile.

In Cisco IOS Release 12.2(15)CX, Release 12.2(15)BC2 and later releases, additional modulation profiles are defined as the default mixed TDMA/A-TDMA profile and the default Advanced TDMA (A-TDMA) profile.

**Command Modes**

Global configuration (config)

Command History	Release	Modification
	11.3 NA	This command was introduced.
	12.0(7)XR2	This command was supported.
	12.0(6)SC and 12.1(3a)EC1	The <b>mix</b> , <b>qpsk</b> , and <b>qam-16</b> options were added.
	12.2(8)BC2	Support was added for the Cisco uBR10012 router.
	12.2(11)CY	Support was added for the Cisco uBR-MC5X20S cable interface line card. This includes creating default modulation profile 21 for the card.
	12.2(15)CX	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line card, including support for DOCSIS 2.0 A-TDMA and mixed modulation profiles on this card.  The <b>robust</b> predefined modulation profiles were also added for all modes of operation. The robust profiles use a longer preamble to provide better handling of noise on the upstream, but they also consume more bandwidth at the PHY layer than the other profiles.
	12.2(15)BC2	Support was added for the Cisco uBR10-MC5X20S/U cable interface line cards, including support for DOCSIS 2.0 A-TDMA and mixed modulation profiles. Support for the IUC-11 burst profile (Advanced UGS, <b>a-ugs</b> ) was also added for mixed TDMA/A-TDMA modulation profiles.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC. Support was added for the Cisco uBR10-MC5X20H cable interface line card.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCC	This command was modified. Moved <b>qam-8</b> , <b>qam-32</b> , and <b>qam-64</b> options to hidden and internal mode only. Support was added for Synchronous Code Division Multiple Access (S-CDMA) modulation profiles.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

A modulation profile is a collection of at least six burst profiles that are sent out in an upstream channel descriptor (UCD) message to configure a modem's transmit parameters.

You can use the **no cable modulation-profile** command to remove all modulation profiles except the default modulation profiles (1, 21, 41, 101, 121, 201, 221, 241, and 321, depending on the cable interface line cards being used). In the case of the default modulation profiles, the **no cable modulation-profile** command resets the default profile to its default values.

We recommend that you use the predefined profiles instead of manually specifying the individual bursts for a modulation profile. The predefined profiles are optimized for the default of 32 symbols per minislot for each particular modulation scheme. The **robust** predefined profiles use a longer preamble for better handling of noise on the upstream, but at the cost of consuming more PHY layer bandwidth than the other non-robust profiles.

If you want to manually specify the individual bursts, enter a line with all parameters for each upstream burst type. Then repeat this command for each burst type, which also must be fully specified. A profile with incomplete or missing bursts can cause unreliable operation or loss of modem connectivity.

**Caution** Changes to modulation profiles causes changes to the physical layer. Because changing physical layer characteristics affects router performance and function, this task should be reserved for expert users who have a thorough understanding of DOCSIS systems and how each parameter affects the network.

**Note** The **reqdata** burst type is included as a placeholder for SNMP scripts that might reference it, but it has no effect. You can use this command (and SNMP commands) to specify the **reqdata** types, but the DOCSIS MAC scheduler on the Cisco CMTS does not use this type of burst.

From Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S onwards, the **qam-8**, **qam-32**, and **qam-64** modulation profiles are available in hidden and internal modes only. When you are using the **initial** and **station** bursts for DOCSIS 2.0 A-TDMA mode, **qam-8**, **qam-32**, and **qam-64** modulation profiles are available in hidden mode only. However, these modulation profiles are available for **a-long**, **a-short**, **a-ugs**, **long**, **request**, **reqdata**, and **short**.

### Modulation Profile Ranges

The valid range for modulation profiles depends on the cable interface being used and the type of modulation profile being created. The table below lists the valid ranges according to cable interface and modulation type.

**Table 7: Allowable Ranges for Modulation Profiles**

Cable Interface	DOCSIS 1.X (TDMA)	Mixed DOCSIS 1.X/2.0	DOCSIS 2.0 (A-TDMA)	DOCSIS 2.0 (S-CDMA)
Cisco uBR7100 series	1 to 10 <sup>3</sup> , default=1	N/A	N/A	N/A
Cisco uBR-MC16C	1 to 10, default=1	N/A	N/A	N/A
Cisco uBR-MC16S	1 to 10, default=1	N/A	N/A	N/A
Cisco uBR-MC28C	1 to 10, default=1	N/A	N/A	N/A
Cisco uBR-MC5X20S, Cisco uBR-MC5X20U, Cisco uBR-MC5X20H	21 to 30, default=21	121 to 130, default=121	221 to 230, default=221	321 to 330 (default is 321)
Cisco uBR-MC16U/X, Cisco uBR-MC28U/X	41 to 50, default=41	141 to 150, default=141	241 to 250, default=241	N/A
Cisco cBR-8 CCAP	1 to 400, default=21	1 to 400, default=121	1 to 400, default=221	N/A

<sup>3</sup> Only 8 modulation profiles are supported in Cisco IOS software releases before 12.2(15)BC1, so in these releases the valid range is from 1 to 8.

### DOCSIS 1.0 and DOCSIS 1.1 Support

For DOCSIS 1.0 and 1.1 cable modems, the following burst types are required: request, request data, initial maintenance, station maintenance, short grant, and long grant. You must issue the **cable modulation-profile** command six times for each individual burst type to correctly create a new modulation profile.

The three default profiles can be used to quickly create modulation profiles, without having to specify the parameters for each individual burst: **mix**, **qpsk**, and **qam-16**. The burst parameters for the request, initial, station maintenance, short, and long bursts are set to their default values for each burst type. (The **reqdata** burst type is not created when using the default modulation profiles because it is not used by the MAC scheduler.)

The default profiles allow basic profiles to be implemented for initial network connectivity. As the characteristics of a cable plant become better known, the profiles can then be adjusted accordingly.

**Note** Do not use the **qam-16** mode unless you have verified that your cable plant can support that modulation profile. Most cable plants should instead use the **qpsk** or **mix** modulation profile for the primary profile.

**Caution** Turning the scrambler off can cause packet loss and is used only in lab testing environments.

Errors or incompatible configurations in the burst profiles cause cable modems to drop connectivity, to drop short or long data packets, or to fail to connect to the network. It is possible to build a burst profile set for which no implementation of a DOCSIS receiver is capable of receiving the modem's transmission.

Data rates of 160 Ksymbol/sec and 2560 Ksymbol/sec are highly sensitive to unique word length, preamble length, and FEC sizing. Incorrect choices for these values can cause poor, or no, connectivity at these symbol rates.

### DOCSIS 2.0 Support

Cisco IOS Release 12.2(11)CY, 12.2(15)BC1, 12.3BC, 12.2(33)SCA, 12.2(33)SCC, and later releases support 10 modulation profiles for each of the three DOCSIS modes (DOCSIS 1.X, DOCSIS 2.0, and mixed mode) on the Cisco uBR10012 and Cisco uBR7200 series routers, for a total maximum of 30 modulation profiles. In addition, the router also creates several default modulation profiles (1, 21, 41, 101, 121, 141, 201, 221, 241, and 321, depending on the cable interface line cards that are installed).

### Examples

The following example shows how to create a mixed modulation profile, using 16-QAM for the short and long grant bursts and QPSK for the request, initial ranging, and station maintenance bursts on a Cisco uBR10012 router. The burst parameters are set to their default values for each burst type.

```
Router(config)# cable modulation-profile 8 mix
Router(config)# exit
```

```
Router# show cable modulation-profile 8
```

Mod	IUC	Type	Preamb length	Diff enco	FEC T	FEC CW	Scrambl seed	Max B	Guard time	Last CW	Scrambl	Preamb offset
					BYTES	size	size	size	size	short		
8	request	qpsk	64	no	0x0	0x10	0x152	0	8	no	yes	0
8	initial	qpsk	128	no	0x5	0x22	0x152	0	48	no	yes	0
8	station	qpsk	128	no	0x5	0x22	0x152	0	48	no	yes	0
8	short	qam	144	no	0x6	0x4B	0x152	6	8	yes	yes	0
8	long	qam	160	no	0x8	0xDC	0x152	0	8	yes	yes	0

```
Router#
```

**Note** The above example shows the default values for the burst parameters. The main differences in the default values between 16-QAM and QPSK bursts are in the Type and Preamble Length fields.

The following example shows how to define the burst parameters for profile 2 with the following parameters: 0 fec-tbytes, 16 kbytes fec-len, a burst-len of 1, a guard time of 8, a mod value of **qpsk**, scrambler enabled with a seed value of 152, differential encoding disabled, a preamble length of 64 bits, a fixed code-word length, and 8-bit unique words for upstream unique word length a Cisco uBR10012 router.

```
Router(config)# cable modulation-profile 2 request 0 16 1 8 qpsk scrambler 152 no-diff 64
fixed uw8
Router(config)# cable modulation-profile 2 reqdata 0 16 1 8 qpsk scrambler 152 no-diff 64
fixed uw8
Router(config)# cable modulation-profile 2 initial 5 34 0 48 qpsk scrambler 152 no-diff 128
fixed uw16
Router(config)# cable modulation-profile 2 station 5 34 0 48 qpsk scrambler 152 no-diff 128
fixed uw16
Router(config)# cable modulation-profile 2 short 6 75 6 8 16qam scrambler 152 no-diff 144
fixed uw8
Router(config)# cable modulation-profile 2 long 8 220 0 8 16qam scrambler 152 no-diff 160
fixed uw8
```

**Note** You must create all of the bursts (request, initial, station, short and long) for this modulation profile, using the **cable modulation-profile** command. The **reqdata** burst is optional.

The following example shows an example of a DOCSIS 1.X/DOCSIS 2.0 mixed modulation profile a Cisco uBR10012 router:

```
Router# configure terminal

Router(config)# cable modulation-profile 142 request 0 16 0 8 qpsk scrambler 152 no-diff
64 fixed uw8

Router(config)# cable modulation-profile 142 initial 5 34 0 48 qpsk scrambler 152 no-diff
32 fixed uw16

Router(config)# cable modulation-profile 142 station 5 34 0 48 qpsk scrambler 152 no-diff
32 fixed uw16

Router(config)# cable modulation-profile 142 short 5 75 6 8 qpsk scrambler 152 no-diff 72
shortened uw8

Router(config)# cable modulation-profile 142 long 8 220 0 8 qpsk scrambler 152 no-diff 80
shortened uw8

Router(config)# cable modulation-profile 142 a-short qpsk0 0 18 5 99 10 8 64qam scrambler
152 no-diff 128 shortened uw8

Router(config)# cable modulation-profile 142 a-long qpsk0 0 18 15 200 0 8 64qam scrambler
152 no-diff 128 shortened uw8

Router(config)#
```

The following example shows an example of a DOCSIS 2.0 A-TDMA modulation profile a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# cable modulation-profile 242 request qpsk0 0 0 0 16 0 8 qpsk scrambler 152
no-diff 64 fixed uw8
Router(config)# cable modulation-profile 242 initial qpsk0 0 0 5 34 0 48 qpsk scrambler 152
no-diff 32 fixed uw16
Router(config)# cable modulation-profile 242 station qpsk0 0 0 5 34 0 48 qpsk scrambler 152
no-diff 32 fixed uw16
Router(config)# cable modulation-profile 242 short qpsk0 0 0 5 75 6 8 qpsk scrambler 152
no-diff 72 shortened uw8
Router(config)# cable modulation-profile 242 long qpsk0 0 0 8 220 0 8 qpsk scrambler 152
no-diff 80 shortened uw8
Router(config)# cable modulation-profile 242 a-short qpsk0 0 18 5 99 10 8 64qam scrambler
152 no-diff 128 shortened uw8
Router(config)# cable modulation-profile 242 a-long qpsk0 0 18 15 200 0 8 64qam scrambler
152 no-diff 128 shortened uw8
Router(config)#
```

The following example shows an example of a DOCSIS 2.0 S-CDMA modulation profile:

```
Router# configure terminal
Router(config)# cable modulation-profile 324 request 0 16 10 16qam scrambler 152 no-diff
64 fixed qpsk0 spreader 12 12 no-tcm
Router(config)# cable modulation-profile 324 initial 0 16 10 16qam scrambler 152 no-diff
64 fixed qpsk0 off-spreader 12 12 no-tcm
Router(config)# cable modulation-profile 324 station 0 16 10 16qam scrambler 152 no-diff
64 fixed qpsk0 off-spreader 12 12 no-tcm
Router(config)# cable modulation-profile 324 a-short 0 16 10 16qam scrambler 152 no-diff
64 fixed qpsk0 off-spreader 12 12 no-tcm
Router(config)# cable modulation-profile 324 a-long 16 10 16qam scrambler 152 no-diff 64
fixed qpsk0 off-spreader 12 12 no-tcm
Router(config)# cable modulation-profile 324 a-ugs 16 10 16qam scrambler 152 no-diff 64
fixed qpsk0 off-spreader 12 12 no-tcm
Router(config)#
```

The following example shows how to create TDMA modulation profiles on a Cisco cBR series router:

```
Router# configure terminal
Router(config)# cable modulation-profile 24 tdma qam-16
Router(config)# cable modulation-profile 25 tdma qpsk
Router(config)# cable modulation-profile 26 tdma request 0 16 0 8 qpsk scrambler 152 no-diff
68 fixed
```

The following example shows how to create TDMA/A-TDMA mixed modulation profiles on a Cisco cBR series router:

```
Router# configure terminal
Router(config)# cable modulation-profile 125 mixed qam-16
```

```

Router(config)# cable modulation-profile 127 mixed request 0 16 0 8 qpsk scrambler 152
no-diff 68 fixed
Router(config)# cable modulation-profile 127 mixed initial 5 34 0 48 qpsk scrambler 152
no-diff 128 fixed

```

The following example shows how to create A-TDMA mixed modulation profiles on a Cisco cBR series router:

```

Router# configure terminal
Router(config)# cable modulation-profile 225 atdma qam-64
Router(config)# cable modulation-profile 227 atdma request 0 16 0 8 qpsk scrambler 152
no-diff 68 fixed qpsk0 1 2048
Router(config)# cable modulation-profile 227 atdma initial 0 16 0 0 qpsk no-scrambler no-diff
2 fixed qpsk1 0 18

```

See the **show cable modulation-profile** command for a description of the output display fields.

#### Related Commands

Command	Description
<b>cable upstream modulation-profile</b>	Assigns a modulation profile to an interface.
<b>show cable modulation-profile</b>	Displays a modulation profile group's information.

# cable modulation-profile global-scheme

To define a global modulation profile for use on the router, use the **cable modulation-profile global-scheme** command in global configuration mode. To remove the newly created modulation profile or to reset to the legacy profile mode, use the **no** form of this command.

**cable modulation-profile global-scheme** *profile*  
**no cable modulation-profile global-scheme**

## Syntax Description

<i>profile</i>	Modulation profile number. The profile number range is from 1 to 400.
----------------	-----------------------------------------------------------------------

## Command Default

The global modulation profile scheme is disabled by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Using the global modulation profile scheme, you can assign any number between 1 to 400 to any modulation profiles. It eliminates the number space restriction and increases the number of modulation profiles that can be created per DOCSIS mode. The global modulation profile mode allows you to create and configure DOCSIS 3.0 channel type 4SR (scdma-d3). When an upstream DOCSIS mode is changed to scdma-d3, it is initially assigned to the system created default modulation profile.

**Note** Though you can assign any number between 1 to 400 to any modulation profile, the default modulation profile number assigned to an upstream channel for a given channel type will remain the same. That is, modulation profile numbers 21, 121, 221, 321, and 381 will be applicable for TDMA, mixed, A-TDMA, S-CDMA, and DOCSIS 3.0 S-CDMA channel types.

All the existing and previously defined modulation profiles are converted to the new format. However, all the newly created modulation profiles, which are outside of the legacy number space range, are lost when you revert to the legacy modulation profile.

**Note** The default profiles cannot be deleted. Using the **no cable modulation global** command on the default profiles resets them to their original, default values.

## Modulation Profile Ranges

The valid range for modulation profiles depends on the cable interface being used and the type of modulation profile being created.

The table below lists the valid ranges according to cable interface and modulation type:

**Table 8: Allowable Ranges for Modulation Profiles**

Cable Interface	DOCSIS 2.0 (S-CDMA)	DOCSIS 3.0 (S-CDMA)
Cisco UBR-MC20X20V	321 to 330 (default is 321)	1 to 400 (default is 381)

**Examples**

The following example shows how to create a global modulation profile scheme:

```
Router(config)# cable modulation-profile global-scheme
```

**Related Commands**

Command	Description
<b>cable upstream modulation-profile</b>	Assigns a modulation profile to an interface.
<b>show cable modulation-profile</b>	Displays modulation profile information of a group.

# cable mod-profile-ofdma

To define the OFDMA modulation profile for OFDMA channels, **cable mod-profile-ofdma** command in the global configuration mode.

**cable mod-profile-ofdma** *id*

Syntax Description		
<b>data-iuc</b>		Configures the data IUC (Interval Usage Codes) profile.
<b>fine-rng-subcarrier</b>		Configures the number of subcarriers for fine ranging.
<b>initial-rng-preamble</b>		Configures the number of symbols per subcarrier for initial ranging preamble.
<b>initial-rng-subcarrier</b>		Configures the number of subcarriers for initial ranging.
<b>subcarrier-spacing</b>		Defines the subcarrier spacing.
<b>ofdma-prof-mgmt downgrade rxmer min-iuc</b> <i>value</i>		Defines the data IUC below which the OFDMA channel will be downgraded to partial mode.

**Command Default** The default OFDMA modulation profile for subcarrier spacing 25KHz is 421. The default OFDMA modulation profile for subcarrier spacing 50KHz is 461. In these two modulation profiles, the default IUC is IUC 13.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Amsterdam 17.3.1w	This command was updated. <b>ofdma-prof-mgmt downgrade rxmer min-iuc</b> option was added.

**Usage Guidelines** Use this command to define the OFDMA modulation profile that can be applied to OFDMA channels. The OFDMA modulation profile is used to configure initial ranging, fine ranging, and data IUC parameters.

## Configuring OFDMA Modulation Profile

The following example shows how to configure OFDMA modulation profile.

```
Router# enable
Router# configure terminal
Router(config)# cable mod-profile-ofdma 466
Router(config-ofdma-mod-profile)# subcarrier-spacing 50KHz
Router(config-ofdma-mod-profile)# initial-rng-subcarrier 64
Router(config-ofdma-mod-profile)# fine-rng-subcarrier 128
Router(config-ofdma-mod-profile)# data-iuc 13 modulation 1024-QAM pilot-pattern 2
Router(config-ofdma-mod-profile)# exit
Router(config)# cable mod-profile-ofdma 423
Router(config-ofdma-mod-profile)# subcarrier-spacing 25KHz
Router(config-ofdma-mod-profile)# initial-rng-subcarrier 64
```

```
Router(config-ofdma-mod-profile)# fine-rng-subcarrier 128
Router(config-ofdma-mod-profile)# data-iuc 6 modulation 1024-QAM pilot-pattern 8
Router(config-ofdma-mod-profile)# data-iuc 9 modulation 1024-QAM pilot-pattern 8
Router(config-ofdma-mod-profile)# data-iuc 10 modulation 512-QAM pilot-pattern 8
Router(config-ofdma-mod-profile)# data-iuc 11 modulation 256-QAM pilot-pattern 8
Router(config-ofdma-mod-profile)# data-iuc 12 modulation 128-QAM pilot-pattern 9
Router(config-ofdma-mod-profile)# data-iuc 13 modulation 64-QAM pilot-pattern 9
```

# cable mod-profile-ofdma data-iuc modulation pilot-pattern cwerr-downgrade-iuc

To downgrade to a particular IUC directly, use the **cable mod-profile-ofdma data-iuc-type data-iuc data-iuc-type modulation modulation pilot-pattern pilot-pattern-id cwerr-downgrade-iuc cwerr-downgrade-iuc** command in the global configuration mode, to downgrade to this a particular IUC directly.

**cable mod-profile-ofdma data-iuc-type data-iuc data-iuc-type modulation modulation pilot-pattern pilot-pattern-id cwerr-downgrade-iuc cwerr-downgrade-iuc**

Syntax Description		
<b>data-iuc</b>		Configure the data IUC (Interval Usage Codes) profile. The valid options are 10, 11, 12, 13, 5, 6, or 9.
<b>modulation modulation</b>		Configure the data IUC modulation. The valid options are 1024-QAM, 128-QAM, 16-QAM, 2048-QAM, 256-QAM, 32-QAM, 4096-QAM, 512-QAM, 64-QAM, 8-QAM, BPSK, NONE, or QPSK.
<b>pilot-pattern pilot-pattern-id</b>		Configure the data IUC pilot pattern. The valid range is: <ul style="list-style-type: none"> <li>• <b>Regular:</b> 1-4 and 8-11</li> <li>• <b>Boosted:</b> 5-7 and 12-14</li> </ul>
<b>cwerr-downgrade-iuc cwerr-downgrade-iuc</b>		Configure to downgrade to this IUC directly. The valid options are 10, 11, 12, 13, 5, 6, or 9.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1z	This command is introduced on Cisco cBR-8 Series Converged Broadband Routers.

## Configuring OFDMA Modulation Profile

Here is a sample configuration for manually configuring IUC downgrade:

```
Router# configure terminal
Router(config)# cable mod-profile-ofdma 461
Router(config-ofdma-mod-profile)# subcarrier-spacing 50KHz
Router(config-ofdma-mod-profile)# initial-rng-subcarrier 32
Router(config-ofdma-mod-profile)# fine-rng-subcarrier 100
Router(config-ofdma-mod-profile)#
data-iuc 5 modulation 1024-QAM pilot-pattern 1 cwerr-downgrade-iuc 10
Router(config-ofdma-mod-profile)#
data-iuc 6 modulation 512-QAM pilot-pattern 1 cwerr-downgrade-iuc 10
Router(config-ofdma-mod-profile)#
data-iuc 9 modulation 256-QAM pilot-pattern 2 cwerr-downgrade-iuc 13
Router(config-ofdma-mod-profile)# data-iuc 10 modulation 128-QAM pilot-pattern 2
cwerr-downgrade-iuc 13
```

**cable mod-profile-ofdma data-iuc modulation pilot-pattern cwerr-downgrade-iuc**

```
Router(config-ofdma-mod-profile)#  
data-iuc 11 modulation 64-QAM pilot-pattern 3 cwerr-downgrade-iuc 13  
Router(config-ofdma-mod-profile)# data-iuc 12 modulation 32-QAM pilot-pattern 3  
Router(config-ofdma-mod-profile)# data-iuc 13 modulation 16-QAM pilot-pattern 4  
Router(config-ofdma-mod-profile)# end
```

## cable monitor

To enable the forwarding of selected packets on the cable interface to an external LAN analyzer, use the **cable monitor** command in cable interface configuration mode. To disable this function, use the **no** form of this command.

```
cable monitor [incoming | outbound] [timestamp] interface interface {slot / {subslot | bay} / port}
[access-list {name | number} | mac-address address | sid sid-number | upstream number | packet-type
{data docsis | data ethernet | mac [type type]}]
```

```
cable monitor outbound downstream {modular-cable | Integrated-cable | wideband-cable} slot /
{subslot | bay} / controller : channel
```

```
no cable monitor
```

Syntax Description	
<b>incoming</b>	Forwards only packets being received on the upstream.
<b>outbound</b>	Forwards only packets being transmitted on the downstream.
<b>timestamp</b>	Enables packet time-stamping by appending a four-byte value to the forwarded packets. The timestamp value is in hundredths of a second.
<b>interface</b> <i>interface</i>	Specifies the WAN interface to which an external LAN analyzer is attached, and to which packets should be forwarded.  <i>interface</i> —Specifies the interfaces such as Ethernet, Fast Ethernet, Gigabit Ethernet, or Ten Gigabit Ethernet interface.
<i>slot</i>	Slot where the line card resides.  <ul style="list-style-type: none"> <li>• Cisco uBR7246VXR router—The range is from 3 to 6.</li> <li>• Cisco uBR7225VXR router—The range is from 1 to 2.</li> <li>• Cisco uBR7100 series router—The value is 1.</li> </ul>
subslot   bay	(Cisco uBR10012 only) Secondary subslot of the cable interface line card or bay of the SPA. The subslot values are 0 or 1 for the cable line card. The values for bay are from 0 to 3.
port	<i>Specifies the WAN interface number.</i>
<b>access-list</b> <i>name</i>   <i>number</i>	(Optional) Specifies the IP access list name or number (1 to 2699).
<b>mac-address</b> <i>address</i>	(Optional) Specifies the MAC address of the device being monitored.
<b>sid</b> <i>sid-number</i>	(Optional) Specifies the service ID for the packets that should be forwarded (1 to 16384).  <b>Note</b> This option is supported only in Cisco IOS releases that support DOCSIS 1.1 operations.
<b>upstream</b> <i>number</i>	(Optional) Specifies the upstream interface. Valid values for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards range from 0 to 3

<b>packet-type</b>	(Optional) Specifies whether data or MAC packets are forwarded.
<b>data docsis</b>	Specifies that complete DOCSIS packets (both the DOCSIS header and the complete Ethernet frame) should be forwarded.  <b>Note</b> Enabling this option can result in %LINK-4-TOOBIG messages being generated if the original Ethernet frame is at or near the maximum Ethernet size of 1500 bytes. This is because this option adds additional bytes (the DOCSIS header) to the Ethernet frame, which can result in a total frame size that exceeds the maximum size that is allowed for standard Ethernet frames.
<b>data ethernet</b>	Specifies that the DOCSIS header should be stripped from the packet and that only the Ethernet frame should be forwarded.
<b>mac</b> [ <i>type type</i> ]	Specifies that only DOCSIS MAC-layer packets should be forwarded. If you are using the <b>sid</b> option, you can also optionally specify the <b>type</b> option with one of the following keywords to indicate that only the specific type of MAC-layer traffic should be forwarded: <ul style="list-style-type: none"> <li>• <b>dsa</b>—Dynamic service addition</li> <li>• <b>dsc</b>—Dynamic service change</li> <li>• <b>dsd</b>—Dynamic service deletion</li> <li>• <b>map-grant</b>—Grants</li> <li>• <b>map-req</b>—Requests</li> </ul>
<b>outbound downstream</b>	Enables cable monitor on the specified downstream interface.
<i>controller: channel</i>	Identifies the controller. <ul style="list-style-type: none"> <li>• Valid range for Cisco uBR-MC3GX60V line card is from 0 to 2. <ul style="list-style-type: none"> <li>• RF channel—The range is from 0 to 23.</li> <li>• Bonding group—The range is from 0 to 31.</li> </ul> </li> <li>• Valid range for Cisco UBR-MC20X20 line card is 0 to 4. <ul style="list-style-type: none"> <li>• RF channel—The range is from 0 to 3.</li> <li>• Bonding group—The range is from 0 to 5.</li> </ul> </li> <li>• Valid value for Cisco Wideband SPA is 0. <ul style="list-style-type: none"> <li>• RF channel—The range is from 0 to 23.</li> <li>• Bonding group—The range is from 0 to 31.</li> </ul> </li> </ul>

**Command Default**Both upstream (**incoming**) and downstream (**outbound**) traffic is forwarded.**Command Modes**

Interface configuration—cable interface only (config-if)

**Command History**

Release	Modification
12.1(3a)EC	This command was introduced.

Release	Modification
12.1(4)CX	The <b>sid</b> option was added for DOCSIS 1.1 support.
12.2(4)XF	Support was added for the Cisco uBR10012 universal broadband router.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.3(13a)BC	Supports the Cisco MC5x20U-D broadband processing engine (BPE) and the Cisco MC28U cable interface line card.
12.3(17a)BC	<ul style="list-style-type: none"> <li>• Access Control Lists are now supported on the Cisco uBR-MC5X20U/D and Cisco uBR-MC28U cable interface line cards</li> <li>• Unconditional downstream sniffing now enables downstream packets to be monitored, either for MAC or data packets. This enhancement supports both DOCSIS and Ethernet packet encapsulation.</li> </ul>
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCB	Support was added for the Ten Gigabit Ethernet interface type.
12.2(33)SCE	Support was added for the Cisco UBR-MC3XG60V line cards.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable monitor** command is used to configure the [Cable Monitor and Intercept Features on the Cisco CMTS Routers](#) feature.

The **cable monitor** command allows an external LAN packet analyzer to monitor inbound and outbound data packets for specific types of traffic between the Cisco CMTS and the CMs on a cable interface. This feature enables the CMTS administrator to analyze traffic problems with customer data exchanges.

The interface used for forwarding packets can be used only for the external LAN analyzer; and cannot be used for other purposes.

The **cable monitor outbound downstream** command can be enabled:

- only one mac-domain on a line card at a time
- for one modular-cable or intergrated-cable interface per line card at one time
- for one wideband-cable interface per line card at one time

**Tip** One possible software utility you can use for decoding the DOCSIS MAC frames is Wireshark software, which is available for Windows and Unix systems at <http://www.wireshark.org>.

### Examples

The following example shows how to configure the Cisco CMTS so that it monitors incoming MAC-layer packets for the CM with the MAC address of 0123.4567.89ab and forwards copies of the packets to the LAN analyzer on the Ethernet interface in slot 1, port 2:

```
Router(config-if)# cable monitor incoming interface e1/2 mac-address 0123.4567.89ab
packet-type mac
```

The following example shows how to configure a Cisco CMTS running DOCSIS 1.1 software so that it monitors incoming MAC-layer packets of type DSA for the CM identified by SID 173 and forwards copies of the packets to the LAN analyzer on the Ethernet interface in slot 1, port 2:

```
Router(config-if)# cable monitor incoming interface e1/2 sid 173 packet-type mac type dsa
```

The following example shows how to configure a mac domain to monitor all packets on a modular primary downstream and forward copies of the packets to a Gigabit Ethernet interface:

```
Router# configure terminal
Router(config)# interface cable 5/0/0
Router(config-if)# cable monitor outbound downstream Modular-Cable 5/1/0:21
Router(config-if)# cable monitor outbound interface GigabitEthernet3/0/0
Router(config-if)# exit
```

The following example shows how to configure a mac domain to monitor all packets on a particular downstream bonding group and forward copies of the packets to a Gigabit Ethernet interface:

```
Router# configure terminal
Router(config)# interface cable 5/0/0
Router(config-if)# cable monitor outbound downstream Wideband-Cable 5/1/2:30
Router(config-if)# cable monitor outbound interface GigabitEthernet3/0/0
Router(config-if)# exit
```

The following example shows how to configure a mac domain to monitor all packets on a particular bonding group destined to a specific modem and forward copies of the packets to a Gigabit Ethernet interface:

```
Router# configure terminal
Router(config)# interface cable 5/0/0
Router(config-if)# cable monitor outbound downstream Wideband-Cable 5/1/2:30
Router(config-if)# cable monitor outbound interface GigabitEthernet3/0/0 mac-address
0123.4567.89ab
Router(config-if)# exit
```

#### Related Commands

Command	Description
<b>cable intercept</b>	Allows the CMTS to forward all traffic to and from a particular CM to a data collection server located at particular User Datagram Protocol (UDP) port.
<b>show interface cable monitor</b>	Displays monitor flow information on the upstream port.

## cable mrc-mode

To enable Multiple Receive Channel (MRC) mode for a Media Access Control (MAC) interface during or after the cable modem (CM) registration, use the **cable mrc-mode** command in cable interface configuration mode or MAC domain profile configuration mode. To disable this configuration, use the **no** form of this command.

**cable mrc-mode**  
**no cable mrc-mode**

### Syntax Description

This command has no arguments or keywords.

### Command Default

The MRC mode is enabled by default on a downstream bonding capable cable interface line card.

### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

When you enable or disable the MRC mode, cable modems switch the operation to or from the MRC mode only after the reinitialization of cable modems. You cannot enable the MRC mode on a non-upstream bonding capable cable interface line card.

### Examples

The following example shows how to enable the MRC mode for a MAC interface:

```
Router# configure terminal
Router(config)# interface cable 7/1/0
Router(config-if)# cable mrc-mode
```

The following example shows how to enable the MRC mode for a MAC interface on a Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# interface cable 3/0/1
Router(config-if)# cable mrc-mode
```

---

**Related Commands**

Command	Description
<b>cable mtc-mode</b>	Enables or disables the Multiple Transmit Channel mode (MTC) for a MAC interface.

## cable mtc-mode

To enable Multiple Transmit Channel (MTC) mode for a Media Access Control (MAC) interface during or after the cable modem (CM) registration, use the **cable mtc-mode** command in cable interface configuration mode or MAC domain profile configuration mode. To disable this configuration, use the **no** form of this command.

```
cable mtc-mode [required-attribute]
no cable mtc-mode [required-attribute]
```

### Cisco cBR Series Converged Broadband Routers

```
cable mtc-mode[required-attribute]
no cable mtc-mode[required-attribute]
```

#### Syntax Description

<b>required-attribute</b>	(Optional) Specifies the per-CM basis MTC mode configuration.
---------------------------	---------------------------------------------------------------

#### Command Default

The MTC mode is enabled by default with the required attribute. With this default configuration, the Cisco CMTS router enables the MTC mode on a per-CM basis by looking at the configuration file of each cable modem.

#### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

#### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>required-attribute</b> keyword was removed.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>required-attribute</b> keyword was added.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

#### Usage Guidelines

Multiple Transmit Channel mode is a CM capability that enables CMs to send upstream traffic on multiple upstream channels. You can enable the MTC mode on a cable interface line card in two ways:

- MTC mode on a per-CM basis—By default, the MTC mode is enabled with the required attribute. With this default configuration, the Cisco CMTS router enables MTC mode on a per-CM basis by looking at each CM's configuration file. When the CM configuration file has the bonded-bit (bit-0) on in type-length-value (TLV) 43.9.3 (cable modem upstream required attribute mask), the Cisco CMTS router lets the CM come online in the MTC mode. If the CM configuration file does not have the bonded-bit on, the CM comes online in non-MTC mode.

- MTC mode for all cable modems in a MAC domain—The MTC mode for all cable modems in a MAC domain is disabled by default on an upstream bonding capable cable interface line card. You can enable the MTC mode for all cable modems in a MAC domain using the **cable mtc-mode** command in cable interface configuration mode.

**Note** You do not have to use the **required-attribute** keyword to enable the MTC mode for all cable modems in a MAC domain. You can use the **no** form of this command with the **required-attribute** keyword to disable the default per-CM basis configuration.

You cannot enable the MTC mode on a non-upstream bonding capable cable interface line card.

## Examples

The following example shows how to enable the MTC mode for all cable modems in a MAC domain:

```
Router# configure terminal
Router(config)# interface cable 7/1/0
Router(config-if)# cable mtc-mode
```

The following example shows how to enable the MTC mode for all cable modems in a MAC domain on a Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# interface cable 3/0/1
Router(config-if)# cable mtc-mode
```

The following example shows how to configure the required CM attribute on USCB in a MAC domain on a Cisco cBR Series Converged Broadband Router:

```
Router# configure terminal
Router(config)# interface cable 3/0/1
Router(config-if)# cable mtc-mode required-attribute
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable mrc-mode</b>	Enables the Multiple Receive Channel mode (MRC) for a MAC interface.

## cable multicast auth enable default-action

To enable cable multicast authorization profile and set the maximum sessions limit, use the **cable multicast auth enable default-action** command in global configuration mode. To disable a cable multicast authorization profile, use the **no** form of this command.

**cable multicast auth enable default-action** {*permitdeny*} **max-sessions** [*limit*]  
**no cable multicast auth enable**

Syntax Description	
<i>permit</i>	Specifies packets to forward.
<i>deny</i>	Specifies packets to reject.
<i>limit</i>	Specifies the maximum number of dynamic multicast sessions allowed per CM. No default value. Max value allowed is 65535.

**Command Default** Cable multicast authorization is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.

**Usage Guidelines** This command is used to enable cable multicast authorization profile feature and defines the default value. However, it does not define the actual authorization files.

**Examples** The following example shows how to enable the default multicast authorization profile:

```
Router(config)
)# cable multicast auth enable default-action deny max-sessions 10
```

Related Commands	Command	Description
	<b>cable multicast authorization profile-name</b>	Defines the cable multicast authorization profile.
	<b>show cable multicast authorization</b>	Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles.

## cable multicast auth profile-name

To define a cable multicast authorization profile, and to set it as the default profile, use the **cable multicast auth profile-name** command in global configuration mode. To disable a cable multicast authorization profile, use the **no** form of this command.

**cable multicast auth profile-name** *name* [**default**]  
**no cable multicast auth profile-name** *name* [**default**]

Syntax Description	
<i>name</i>	Specifies the name of the authorization profile to be used.
<b>default</b>	(Optional) Specifies that the profile name should be treated as the default profile.

**Command Default** Cable multicast authorization is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	12.2(33)SCC	The optional <b>default</b> keyword was added.

**Usage Guidelines** This command defines a cable multicast authorization profile, and optionally sets it as the default profile. If the **default** keyword is not used while modifying the profile, the profile is automatically converted to a non-default profile. Similarly, if the **default** keyword is added while modifying a profile, the profile is treated as a default profile.

**Examples** The following example shows how to use the selected multicast authorization profile:

```
Router(config)
)# cable multicast auth profile-name GOLD default
```

Related Commands	Command	Description
	<b>cable multicast authorization enable default-action</b>	This command enables the cable multicast authorization features. If the multicast authorization feature is disabled, all defined authorization profiles are ineffective.
	<b>match rule</b>	This command configures the match rule, rule priority and related action in the selected cable multicast authorization profile

# cable multicast group-encryption

To configure a group encryption profile for a multicast group, use the **cable multicast group-encryption** command in global configuration mode. To disable a group encryption profile, use the **no** form of this command.

**cable multicast group-encryption** *number* **algorithm** **56bit-des**  
**no cable multicast group-encryption** *number* **algorithm** **56bit-des**

<b>Syntax Description</b>	<i>number</i>	Specifies the number of a specific cable multicast QoS group encryption profile. The range is from 1 to 255.
	<b>algorithm</b> <b>56bit-des</b>	Specifies that the data encryption standard (DES) is 56 bits.

**Command Default** Cable multicast group encryption is disabled.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCA	This command was introduced.

**Usage Guidelines** To apply encryption rules to a cable multicast QoS group, you must first enable and identify an encryption group.

**Examples** The following example enables encryption, identifies encryption group 12, and applies the encryption rule to QoS group 2:

```
Router(config)# cable multicast group-encryption 12 algorithm 56bit-des
Router(config)# cable multicast qos group 2 priority 7 global
Router(config-mqos)# group-encryption 12
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable multicast qos group</b>	Specifies and configures a cable multicast QoS group.
	<b>show interface bundle multicast-sessions</b>	Displays multicast session information for a specific virtual cable bundle.
	<b>show interface cable multicast-sessions</b>	Displays multicast session information for a specific cable interface.

# cable multicast group-qos

To configure a QoS profile for a QoS group, use the **cable multicast group-qos** command in global configuration mode. To disable a QoS profile, use the **no** form of this command.

**cable multicast group-qos** *number scn service-class-name control* {**single** | **aggregate** [**limit** *max-sessions*]} [**override**]

**no cable multicast group-qos** *number scn service-class-name control* {**single** | **aggregate** [**limit** *max-sessions*]} [**override**]

## Cisco cBR Series Converged Broadband Routers

**cable multicast group-qos** *number scn service-class-name* {**single** | **aggregate** [**limit** *max-sessions*]} [**override**]

**no cable multicast group-qos** *number scn service-class-name* {**single** | **aggregate** [**limit** *max-sessions*]} [**override**]

### Syntax Description

<i>number</i>	Specifies the QoS profile number for the cable multicast QoS group. The range is from 1 to 255. If a multicast group does not match the group QoS classifiers, a default group-QoS option is applied to the multicast flow.
<b>scn</b> <i>service-class-name</i>	Specifies a service class name for the QoS profile.
<b>control</b>	Specifies the type of control to the service flow.
<b>single</b>	Specifies that a separate service flow is created for each session.
<b>aggregate</b>	Specifies that service flows are grouped for sessions in the same multicast QoS group.
<b>limit</b> <i>max-sessions</i>	(Optional) Specifies the Internet Group Management Protocol (IGMP) session limit for aggregate service flows. The range is from 1 to 255.
<b>override</b>	(Optional) Specifies the additional multicast session admitted and forwarded as best effort traffic, else disallows any additional multicast session once the max-sessions limit is reached.

### Command Default

The QoS profile for a QoS group is not enabled.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCB	This command was modified with the addition of <b>override</b> keyword.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>control</b> keyword was removed.

**Usage Guidelines**

If a QoS profile number is not specified, a default QoS profile is applied. The default group QoS configuration creates a default multicast service flow for each cable interface that is used when a multicast session does not match any classifiers of a GC on the interface.

**Examples**

The following example configures QoS profile 5 with a service name of name1 and a control of single to indicate that a separate service flow is created for each session. QoS profile 5 is then assigned to QoS group 2 on the Cisco uBR 10012 router:

```
Router(config)# cable multicast group-qos 5 scn name1 control single
Router(config)# cable multicast qos group 2 priority 7 global
Router(config-mqos)# cable multicast group-qos 5
Router(config)# cable multicast group-qos 1 scn mcast1 aggre lim 2 ?
override Allow sessions when limit is exceeded with Default qos sessions
Router(config)# cable multicast group-qos 1 scn mcast1 aggre lim 2
```

The following example configures QoS profile 5 with a service name of name1 and specifies that a separate service flow is created for each session. QoS profile 5 is then assigned to QoS group 2 on a Cisco cBR-8 router:

```
Router(config)# cable multicast group-qos 5 scn name1 single
Router(config)# cable multicast qos group 2 priority 7 global
Router(config-mqos)# group-qos 5
```

The following example configures QoS profile 1 with a service name of mcast1 and specifies that service flows are grouped for sessions in the same multicast QoS group on a Cisco cBR-8 router:

```
Router(config)# cable multicast group-qos 1 scn mcast1 aggregate limit 2 ?
override Allow sessions when limit is exceeded with Default qos sessions
Router(config)# cable multicast group-qos 1 scn mcast1 aggregate limit 2 override
```

**Related Commands**

Command	Description
<b>cable multicast qos group</b>	Specifies and configures a cable multicast QoS group.
<b>show interface cable multicast-sessions</b>	Displays multicast session information for a specific cable interface.

# cable multicast group-qos default

To configure the service class name of the default multicast quality of service (MQoS) for the QoS profile, use the **cable multicast group-qos default** command in global configuration mode. To disable the service class name of the default MQoS for the QoS profile, use the **no** form of this command.

**cable multicast group-qos default scn service-class-name aggregate**  
**no cable multicast group-qos default scn service-class-name aggregate**

Syntax Description	
<b>scn service-class-name</b>	Specifies a service class name for the QoS profile.
<b>aggregate</b>	Specifies that service flows are grouped for sessions in the same MQoS group.

**Command Default** The default MQoS profile is not configured.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC1	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** If you configure the service class name with the DOCSIS Setup Gateway (DSG) tunnel when no default MQoS exists, the configuration is rejected and you are prompted to configure the default MQoS.

The CMTS selects the primary downstream channel to forward the multicast traffic when the default MQoS is configured and there is no matching MQoS group configuration. Otherwise, the wideband interface is used to forward the multicast traffic.

**Note** If you configure or unconfigure the default MQoS while the CMTS is sending multicast traffic, duplicate traffic is generated for approximately 3 minutes (or 3 times the query interval).

**Examples** The following example configures the default MQoS profile with the service class name name1.

```
Router(config)# cable multicast group-qos default scn name1 aggregate
```

Related Commands	Command	Description
	<b>cable multicast group-qos</b>	Configures a QoS profile for a QoS group.
	<b>cable multicast qos group</b>	Specifies and configures a cable multicast QoS group.
	<b>show interface cable multicast-sessions</b>	Displays multicast session information for a specific cable interface.

## cable multicast mdf-disable

To disable Multicast DSID-based Forwarding (MDF) capability of all cable modems associated with a Cisco CMTS router, use the **cable multicast mdf-disable** command in global configuration mode. To enable MDF on the cable modem, use the **no** form of this command.

```
cable multicast mdf-disable [wb-incapable-cm | dsg]
no cable multicast mdf-disable [wb-incapable-cm | dsg]
```

Syntax Description	Parameter	Description
	<b>wb-incapable-cm</b>	(Optional) Disables MDF on all DOCSIS 2.0 hybrid cable modems.
	<b>dsg</b>	(Optional) Disables MDF capability of all DSG embedded cable modems, including DOCSIS 3.0 DSG and DOCSIS 2.0 DSG hybrid modems.

**Command Default** By default, MDF is not always enabled on the cable modem because it is dependent on the cable modem hardware.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCD3	This command was introduced.
	12.2(33)SCE4	The <b>wb-incapable-cm</b> keyword was added.
	12.2(33)SCF2	The <b>dsg</b> keyword was added, and behavior of the <b>wb-incapable-cm</b> keyword was changed to include only non-DSG DOCSIS 2.0 hybrid cable modems.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable multicast mdf-disable** command is associated with the [DOCSIS 3.0 Multicast Support on the CMTS Routers](#) feature.

In Cisco IOS Release 12.2(33)SCE4, the **wb-incapable-cm** keyword was added to the **cable multicast mdf-disable** command to disable MDF on all DOCSIS 2.0 hybrid cable modems, including DOCSIS 2.0 DSG embedded cable modems. In Cisco IOS Release 12.2(33)SCF2, the **wb-incapable-cm** keyword was changed to include only non-DSG DOCSIS 2.0 hybrid cable modems.

After disabling MDF capability, you must run **clear cable modem reset** command to bring all DSG embedded cable modems online.

### Examples

The following example shows how to disable MDF capability on all cable modems:

```
Router# configure terminal
Router(config)# cable multicast mdf-disable
```

The following example shows how to disable MDF capability of all non-DSG DOCSIS 2.0 hybrid cable modems:

```
Router# configure terminal
Router(config)# cable multicast mdf-disable wb-incapable-cm
```

The following example shows how to disable MDF capability of all DSG embedded cable modems:

```
Router# configure terminal
Router(config)# cable multicast mdf-disable dsg
```

#### Related Commands

Command	Description
<b>ip multicast-routing</b>	Enables multicast routing globally or on a particular virtual routing and forwarding (VRF) interface.
<b>ip multicast-routing distributed</b>	Enables Multicast Distributed Switching (MDS)

## cable multicast qos group

To specify and configure a cable multicast QoS group and enter multicast QoS configuration mode, use the **cable multicast qos group** command in global configuration mode. To disable a cable multicast QoS group, use the **no** form of this command.

**cable multicast qos group** *id* **priority** *value* [**global**]  
**no cable multicast qos group** *id* **priority** *value* [**global**]

Syntax Description		
	<i>id</i>	Specifies the number of the cable multicast QoS group. The range is from 1 to 255.
	<b>priority</b> <i>value</i>	Specifies the priority of the cable multicast QoS group. The range is from 1 to 255. Starting with Cisco IOS Release 12.2(33)SCC and Cisco IOS-XE Release 3.15.0S, the range is from 1 to 63 and from 192 to 255. The values from 64 to 191 are used internally by the Cisco CMTS.
	<b>global</b>	(Optional) Specifies that the multicast QoS group configuration is applied to all cable interfaces.

**Command Default** A cable multicast QoS group is not identified.

**Command Modes** Global configuration (config)  
 Interface configuration—cable interface only (config-if)  
 Wideband-interface profile configuration (config-profile-wb)

Command History	Release	Modification
	12.2(33)SCA	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** You must configure a group QoS profile using the **cable multicast group-qos** command, and a group encryption profile using the **cable multicast group-encryption** command before you configure a cable multicast QoS group.

**Examples** The following example specifies multicast QoS group 2 with a priority of 6 and global application. Application ID, group encryption, group QoS, session range, ToS, and VRF options are configured for QoS group 2.

```
Router(config)# cable multicast qos group 2 priority 6 global
Router(config-mqos)# application-id 44
Router(config-mqos)# group-encryption 4
Router(config-mqos)# group-qos 3
Router(config-mqos)# session-range 224.10.10.01 255.255.255.254
Router(config-mqos)# tos 1 6 15
Router(config-mqos)# vrf name1
```

## Related Commands

Command	Description
<b>application-id</b>	Specifies an application type to allow admission control to be applied to a group configuration.
<b>cable multicast group-encryption</b>	Configures a group encryption profile for a multicast group.
<b>cable multicast group-qos</b>	Configures a group QoS profile for a multicast QoS group.
<b>session-range</b>	Identifies the multicast QoS group session range.
<b>show interface bundle multicast-sessions</b>	Displays multicast session information for a specific virtual cable bundle.
<b>show interface cable multicast-sessions</b>	Displays multicast session information for a specific cable interface.
<b>tos</b>	Sets the type of service (ToS) low byte, high byte, and mask values within a multicast QoS group.
<b>vrf</b>	Specifies the name for a virtual routing and forwarding (VRF) instance.

## cable multicast ses-cache

To enable multicast replication session on the forwarding interface, use the **cable multicast ses-cache** command in global configuration and interface configuration mode. To disable, use the **no cable multicast ses-cache** command.

**cable multicast ses-cache** *value*  
**no cable multicast ses-cache** *value*

<b>Syntax Description</b>	<i>value</i> Sets the value for the multicast replication session cache. The valid range is from 0 to 500. The default value is 0.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------

**Command Default** This command is disabled by default.

**Command Modes** Global configuration (config)  
 Interface configuration—cable interface only (config-if)  
 Wideband-interface profile configuration (config-profile-wb)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCH	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Multicast replication session cache feature helps reducing CPU utilization by reusing multicast replication sessions stored in the cache. The sessions are cached and reused later when a new IGMP join request is received.

**Note** Only IPv4 IGMP multicast replication sessions can be cached and reused.

The multicast replication session cache can be configured at a global level for all the interfaces on the Cisco uBR10012 router or at an interface level for a forwarding interface. The session cache value configured at the interface shall override the global configuration.

The **cable multicast ses-cache** command is supported on the integrated-cable, modular-cable, and wideband-cable interfaces.

**Note** Ensure that the session cache value being configured is lower than that the current value.

- Changing the multicast replication session cache value from 10 to 0 clears the current cache.

The **cable multicast ses-cache** command is used with the multicast replication session cache feature:

- [DOCSIS 3.0 Multicast Support on the CMTS Routers](#)

## Examples

The following example sets the multicast replication session cache to 100 at the global level on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# cable multicast ses-cache 100
Router(config)# exit
```

The following example sets the multicast replication session cache on the integrated interface to 10:

```
Router# configure terminal
Router(config)# interface Integrated-Cable 8/1/0:0
Router(config-if)# cable multicast ses-cache 10
```

## Related Commands

Command	Description
<b>clear cable multicast ses-cache</b>	Clears the cached multicast replication sessions on the interfaces on the Cisco uBR10012 router.
<b>show cable multicast ses-cache</b>	Displays the multicast replication session cache information both at the global and interface level of the forwarding interface.

## cable multicast source

To configure a multicast session range for a PacketCable Multimedia (PCMM) multicast group on a Cisco CMTS router, use the **cable multicast source pcmm** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**cable multicast source pcmm**  
**no cable multicast source pcmm**

<b>Syntax Description</b>	<b>pcmm</b> Specifies the PCMM client and enters the multicast session range configuration mode.
---------------------------	--------------------------------------------------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Global configuration (config)
----------------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCE	This command was introduced in Cisco IOS Release 12.2(33)SCE.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.18.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure a multicast session range for a PCMM multicast group on a Cisco CMTS router:

```
Router# configure terminal
Router(config)# cable multicast source pcmm
Router(config-msrc)# session-range 229.0.0.0 255.0.0.0
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show packetcable gate multimedia summary</b>	Displays information about the total number of PCMM multicast gates.

# cable nd

To enable the IPv6 Neighbor Discovery (ND) Gleaning feature on the Cisco CMTS router, use the **cable nd** command in bundle interface configuration mode. To disable IPv6 ND gleaning, use the **no** form of this command.

**cable nd**  
**no cable nd**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The IPv6 ND Gleaning feature is enabled by default.

**Command Modes** Bundle interface configuration (config-if)

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable nd** command is associated with the [IPv6 ND Gleaning](#) feature.

The **cable nd** command adds a CPE (host behind a cable modem) to the Cisco CMTS subscriber database. This command does not impact the IPv6 ND protocol operation on the Cisco CMTS router.

The **cable ipv6 source-verify** and **cable nd** commands are not compatible with each other in Cisco IOS Release 12.2(33)SCE and later. You must disable IPv6 ND gleaning using the **no** form of the **cable nd** command before configuring IPv6 source verification using the DHCPv6 Leasequery feature.

## Examples

The following example shows how to configure IPv6 ND gleaning on the Cisco CMTS router:

```
Router# configure terminal
Router(config)# interface bundle 1
Router(config-if)# cable nd
```

Command	Description
<b>cable ipv6 source-verify</b>	Enables source verification of IPv6 packets on the Cisco CMTS router.

# cable nd timeout

To delete corresponding IPv6 address from the subscriber database after IPv6 Neighbor Discovery (ND) timeout, use the **cable nd timeout** command in bundle interface configuration mode. To disable this feature, use the **no** form of this command.

**cable nd timeout**  
**no cable nd timeout**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The IPv6 ND Gleaning feature is enabled by default.

**Command Modes** Bundle interface configuration (config-if)

Command History	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** By default, the **cable nd timeout** command is configured. When configured, if the ND cache of an CPE IPv6 address is timed out, the corresponding IPv6 address will be removed from CMTS subscriber DB. In the **no cable nd timeout** configuration, the ND cache timeout will not cause the removal of CPE IPv6 address from the subscriber DB.

**Examples** The following example shows how to configure IPv6 ND timeout on the Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface bundle 1
Router(config-if)# cable nd timeout
```

Related Commands	Command	Description
	<b>cable nd</b>	Enables the IPv6 Neighbor Discovery (ND) Gleaning feature on the Cisco CMTS routers.

# cable nd validate

To enable validation checks of neighbor discovery messages (both NA and NS) to ensure that the messages will be processed, use the **cable nd validate** command in bundle interface configuration mode. To disable this feature, use the **no** form of this command.

**cable nd validate**

**no cable nd validate**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None.

**Command Modes** Bundle interface configuration (config-if)

## Command History

Release	Modification
IOS XE 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to configure IPv6 ND validate on the Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface bundle 1
Router(config-if)# cable nd validate
```

## Related Commands

Command	Description
<b>cable nd</b>	Enables the IPv6 Neighbor Discovery (ND) Gleaning feature on the Cisco CMTS routers.

## cable ofdm-rf-change-trigger

To configure the trigger thresholds specific to OFDM RF impairment, use the **cable ofdm-rf-change-trigger** command in global configuration mode.

**cable ofdm-rf-change-trigger** { **count** *number* | **percent** *value* | **prof-zero-fail dampen-time** *seconds* **recovery-multiplier** *number* } [ **no-ncp** ] [ **no-plc** ]

### Syntax Description

<b>count</b> <i>number</i>	Specifies the number of cable modems that must report that a particular non-primary OFDM RF downstream channel is down before that channel is suspended from the downstream bonding groups. The default is 0.
<b>no-ncp</b>	If you configure this option, the DOCSIS3.1 Downstream Resiliency feature does not take any action when cable modem reports CM-STATUS-EVENT 20.
<b>no-plc</b>	If you configure this option, the DOCSIS3.1 Downstream Resiliency feature does not take any action when cable modem reports CM-STATUS-EVENT 21.
<b>percent</b> <i>value</i>	Indicates the percentage of cable modems that must report that a particular non-primary OFDM RF channel is down before that channel is suspended from the bonding group. The valid range is 1 to 100. The default is 0.
<b>prof-zero-fail</b>	Configure Profile 0 Failure as an Impairment
<i>dampen-time</i>	Configure the time in seconds for a non-primary RF downstream channel status change to persist. The valid range is 1 to 65535. There is no default value.
<i>recovery-multiplier</i>	Multiplier of <i>dampen-time</i> for recovery. Use this option to set an event-specific recovery delay that is equal to the <i>dampen-time</i> in seconds times the <i>recovery-multiplier</i> value. The valid range is 1 to 100. There is no default value.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1z	The <i>dampen-time</i> and <i>recovery-multiplier</i> options are added.
Cisco IOS XE Everest 16.10.1d	You can exclude NCP and PLC reports separately by configuring <b>no-ncp</b> or <b>no-plc</b> . This replaces the <b>no-ncp-plc</b> option.
Cisco 1x2 / Compact Shelf RPD Software 4.1	This command was modified on the Cisco Remote PHY Device to add a <b>no-ncp-plc</b> option.
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

**Cisco IOS XE Dublin 17.12.1z and later:**

The following example shows how to configure Downstream Resiliency for profile 0:

```
Router# configure terminal
Router(config)# cable ofdm-rf-change-trigger prof-zero-fail dampen-time 20 recovery-multiplier
2
```

The following example shows how to disable Downstream Resiliency for profile 0:

```
Router# configure terminal
Router(config)# no cable ofdm-rf-change-trigger
```

Disabling downstream resiliency for profile 0, resets *dampen-time* and *recovery-multiplier* values to 0.

#### Cisco IOS XE Dublin 17.12.1y and earlier:

This command is optional and the configured trigger thresholds apply to non-primary OFDM channels only. If this command is not configured, the trigger thresholds that are configured by the command **cable rf-change-trigger percent** is used for the non-primary OFDM channels.

With **no-nep-plc** configured in the command, DOCSIS3.1 Downstream Resiliency for RPHY feature does not take any action when cable modem reports CM-STATUS-EVENT 20 or 21.

The following example shows how to configure DOCSIS3.1 Downstream Resiliency for RPHY:

```
Router# configure terminal
Router(config)# cable ofdm-rf-change-trigger percent 75 count 10
```

#### Related Commands

Command	Description
<b>cable rf-change-trigger</b>	Specifies the amount of time an event must persist before it triggers an action for the reporting cable modem.

# cable ofdma-frequency-exclusion-band

To exclude the range of frequencies from all OFDMA channels on a port, use the **cable ofdma-frequency-exclusion-band** command in controller configuration mode.

**cable ofdma-frequency-exclusion-band** *start value end value*

## Syntax Description

<i>start value</i>	Specify the start value of the frequency range.
<i>end value</i>	Specify the end value of the frequency range.

## Command Modes

Controller configuration (config-controller)

## Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Exclusion bands apply to OFDMA channels only. OFDMA channel does not use frequencies in exclusion band set by the **cable ofdma-frequency-exclusion-band** command. So the legacy SC-QAM channel can be placed in this band.

## Related Commands

Command	Description
<b>cable ofdma-frequency-unused-band</b>	Set the frequency range in the unused band.

## cable ofdma-frequency-unused-band

To configure frequencies in unused band, use the **cable ofdma-frequency-unused-band** command in controller configuration mode.

**cable ofdma-frequency-unused-band** *start value end value*

### Syntax Description

<i>start value</i>	Specify the start value of the frequency range.
<i>end value</i>	Specify the end value of the frequency range.

### Command Modes

Controller configuration (config-controller)

### Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Unused bands apply to OFDMA channels only. OFDMA channel does not use frequencies in unused band set by the **cable ofdma-frequency-unused-band** command for data traffic, but can send probes in them.

### Related Commands

Command	Description
<b>cable ofdma-frequency-exclusion-band</b>	Set the frequency range to be excluded from all OFDMA channels on a port.

## cable oudp-leak-detect

See the [OFDMA OUDP Leak Detection Configuration](#) section in the configuration guide for the EXEC, Global configuration, Configuration and Show commands.

To configure OUDP leakage test sessions on one or more upstream OFMDA channels simultaneously, use the **cable oudp-leak-detect session-id OUDP parent test session id session create** command.

**cable oudp-leak-detect OUDP parent test session id session { create | delete | stop | reset }**

### Syntax Description

<b>create</b>	Creates a new OUDP Parent test session assigning a new parent session ID.
<b>delete</b>	Deletes the specified OUDP parent test session and frees the parent session ID and all children sessions and IDs.
<b>stop</b>	Stops the specified OUDP test session in ACTIVE state. Stopping a parent session stops all child sessions.
<b>reset</b>	Resets an OUDP Parent Test Session. Removes all child sessions, deletes all stats, clears the parent start and stop time, and sets the session status back to CONFIGURING. This CLI is intended to allow a COMPLETED parent test session to be reused.

### Command Modes

Privileged EXEC (#)

Release	Modification
17.6.1z	This command was introduced.

### Usage Guidelines

The **show cable oudp-leak-detect session-id OUDP parent test session id session create** command is used to configure OUDP leakage test sessions on one or more upstream OFMDA channels simultaneously.

### Examples

The following example shows how to create a OUDP parent test session for leak detection:

```
Router#cable oudp-leak-detect session-id 99 session create
Create Session : 99 (parent) success
```

## cable oudp-leak-detect session-id

To specify the date and time for the test session to start and stop, use the **cable oudp-leak-detect session-id start datetimestop datetime** command.

**cable oudp-leak-detect session-id OUDP parent test session id { start datetime datetime | stop datetime datetime }**

**cable oudp-leak-detect session-id OUDP parent test session id { start now | stop never }**

**cable oudp-leak-detect session-id OUDP parent test session id frequency start hertz end hertz**

**cable oudp-leak-detect session-id** *OUDP parent test session id* **transmit burst duration** *no. of frames* **gap** *no. of frames* { **cycle-gap** *no. of frames* | **fixed-bursts-per-cycle** *no. of frames* | **cycle-time** *milliseconds* }

**cable oudp-leak-detect session-id** *OUDP parent test session id* **controller upstream-cable** *[slot][subslot][ctrlr]* **us-channel** *us-chan*

**cable oudp-leak-detect session-id** *OUDP parent test session id* **interface cable** *[slot][subslot][md-idx]*

**cable oudp-leak-detect session-id** *OUDP parent test session id* **cm** { **add** | **delete** } *mac-address*

**cable oudp-leak-detect session-id** *OUDP parent test session id* **strict-cm-list**

**cable oudp-leak-detect session-id** *OUDP parent test session id* **reserved-probe-pct** *percentage*

**cable oudp-leak-detect session-id** *OUDP parent test session id* **clear** { **cm-list** | **cm-stats** | **interface** | **strict-cm-list** }

**cable oudp-leak-detect session-id** *OUDP parent test session id* **session preview**

**cable oudp-leak-detect session-id** *OUDP parent test session id* **session supha-recover**

**cable oudp-leak-detect delete all**

**cable oudp-leak-detect clear system-boot-holdoff**

#### Syntax Description

<b>start</b> <i>datetime</i>	Date-and-Time Format [YY]YY-[M]M-[D]D,[h]h:mm:ss.0,[+ -][T]T:ZZ
<b>stop</b> <i>datetime</i>	Date-and-Time Format [YY]YY-[M]M-[D]D,[h]h:mm:ss.0,[+ -][T]T:ZZ
<b>start now stop never</b>	In lieu of specifying the Date-and-Time format, the option start now and stop never are supported.  A test session that is stop never must be manually stopped or deleted by the administrator.
<b>frequency</b> <i>start</i> <i>hertz</i> <i>end</i> <i>hertz</i>	Sets the start and end frequencies of the OUDP parent test session. The OUDP child test session includes all minislots, which include the parent test session frequency range.  The valid range is 4500000-204500000 Hz.

<b>transmit burst duration</b> <i>no. of frames</i> <b>gap</b> <i>no. of frames</i> { <b>cycle-gap</b> <i>no. of frames</i>   <b>fixed-bursts-per-cycle</b> <i>no. of frames</i>   <b>cycle-time</b> <i>milliseconds</i> }	Sets the OUDP parent test session OUDP transmit burst parameters for burst duration, burst gap and either cycle-gap or cycle-time.  Cycle-Gap complies with the OSSI specifications for OUDP testing. The OUDP test cycle repeat interval is measured in frames.  Cycle-Time provides a time-based repeat interval for the OUDP test cycle that is compatible with RF-detectors requiring a minimum repeat burst interval.
<b>controller upstream-cable</b> <i>[slot][subslot][ctrlr]</i> <b>us-channel</b> <i>us-chan</i>	Sets the OUDP parent test session interface to specify an upstream-cable controller, or upstream-cable controller channel.  A controller upstream-cable interface may expand to include up to two OFDMA channels/child test session.  A controller upstream-cable channel specifies a single OFDMA channels/child session.  A controller upstream-cable channel specifies a single OFDMA channels/child session.
<b>interface Cable</b> <i>[slot][subslot][md-idx]</i>	Sets the OUDP parent test session interface to specify a mac-domain.  A Cable MAC domain interface may expand to include up to four OFDMA channels/child sessions.
<b>cm-add</b> <i>mac-address</i>	Adds the MAC address to the parent test session CM-List.
<b>cm-delete</b> <i>mac-address</i>	Removes the MAC address from the parent test session CM-List.
<b>strict-cm-list</b>	Requires the child test sessions to preserve the CM-List position of modems in the parent test session CM-List.
<b>reserved-probe-pct</b> <i>percentage</i>	Reserves a percentage of frames in the OUDP test cycle for OFDMA channel upstream profile management probes.  The default value is 3%.
<b>clear</b>	Clears the specified item.
<pre>{ cm-list   cm-stats   interface   strict-cm-list }</pre>	

<b>session preview</b>	Allows the system admin to preview the child test session create from an OUDP parent test session prior to the pretest setup time.  Child test sessions and modems are created based on the current state of the system, and are not guaranteed to be the same at the actual pretest setup time when child test sessions are rebuilt for the actual test start.
<b>session supha-recover</b>	Provides a mechanism for the child test sessions to be restored to the Active SUP. Existing child test sessions are deleted and all CLC line cards update the SUP with their current child test sessions.
<b>delete all</b>	Deletes all OUDP test sessions regardless of state.
<b>clear system-boot-holdoff</b>	Allows the administrator to manually terminate the OUDP system-boot-holdoff timer. OUDP test sessions are started based on the state of the OFDMA channels and modems.

**Command Default** None.

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

## cable oudp-leak-detect

You can use the Global configuration mode to execute the **cable oudp-leak-detect** commands.

**cable oudp-leak-detect pre-test-setup-time** *seconds*

**cable oudp-leak-detect system-boot-holdoff** *minutes*

**cable oudp-leak-detect reserved-probe-pct** *percentage*

**cable oudp-leak-detect ccap-modem-select allow-late-cm-join**

**cable oudp-leak-detect ccap-modem-select allow-late-cm-join** { **all** | **icmts** | **none** }

<b>Syntax Description</b>		
<b>pre-test-setup-time</b> <i>seconds</i>		The valid range is 10-300 seconds. The default value is 60 seconds.
<b>expire-age</b> <i>days</i>		The valid range is 1-7 days. The default value is 3 days.

<b>system-boot-holdoff</b> <i>minutes</i>	
<b>reserved-probe-pct</b> <i>percentage</i>	The valid range is 0-10 percent. The default value is 3 percent.
<b>modem-selectallow-late-cm-join</b>	Enables modems to join child test sessions after they reach the active state. Normal rules for CM-List and interface modem participation apply.
<b>adjust-test-time</b> { <b>all</b>   <b>icmts</b>   <b>none</b> }	<p>OU DP tests are scheduled based on the PTP/GPS clock time. The CLC line card scheduler uses the DOCSIS frame clock. This command enables a timing adjustment between the GPS clock and the DOCSIS clock. Normally RPHY will not require the time adjustment, whereas iCMTS does.</p> <p>The default value is icmts.</p>

**Command Default** None.

**Command Modes** Global Configuration (config)

## cable oudp-leak-detect

You can use the Configuration mode to execute the **cable oudp-leak-detect** commands.

**cable oudp-leak-detect burst-profile** *number*

**cable oudp-leak-detect burst-profile** *number start datetime datetime*

**cable oudp-leak-detect burst-profile** *number start now stop never*

**cable oudp-leak-detect schedule recurring** *weekday days start timeofday time stop timeofday time*

<b>Syntax Description</b>	<b>burst-profile</b> <i>number</i>	Creates a OUDP burst profile and enters the burst profile configuration sub-mode.  The valid range is 1-9999.
	<b>burst-profile</b> <i>number</i> <b>start</b> <i>datetime</i> <b>datetime</b>	Creates a persistent one-time scheduled test session.
	<b>cable oudp-leak-detect burst-profile</b> <i>number</i> <b>start</b> <b>now</b> <b>stop</b> <b>never</b>	Creates a persistent 24x7 OUDP test session.
	<b>cable oudp-leak-detect schedule recurring</b> <i>weekday</i> <b>days</b> <b>start</b> <i>timeofday</i> <b>time</b> <b>stop</b> <i>timeofday</i> <b>time</b>	Creates a persistent weekly test session that runs at the same time, each day, on configured weekdays ("SuMoTuWeThFrSa").  One or more weekdays, for example, "MoWeFr" must be specified.

**Command Default** None.

**Command Modes** Configuration (config)

# cable oob

To enter the out of band (OOB) configuration mode, use the **cable oob** command in global configuration mode. To void the OOB configuration, use the **no** form of this command.

**cable oob**

**no cable oob**

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use this command to enter the OOB configuration mode.

## Examples

The following example shows how to enter the OOB configuration mode:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)#
```

## Related Commands

Command	Description
<b>virtual-arpd</b>	Defines a virtual advanced return path demodulator configuration.
<b>virtual-om</b>	Defines a virtual OOB modulator configuration.

# cable power

To manually power a cable interface line card on or off on a Cisco uBR10012 router, use the **cable power** command in privileged EXEC mode.

**cable power** [**on** | **off**] *slot/card*

## Syntax Description

<b>on</b>	Turns on power to the specified cable interface line card.
<b>off</b>	Turns off power to the specified cable interface line card. Power to that particular card slot remains off until power is turned back on using the <b>cable power on</b> version of this command.
<i>slot/card</i>	Specifies the slot and card number for the desired cable interface card number. The valid range for <i>slot</i> is 5 to 8 and for <i>card</i> is 0 or 1.

## Command Default

Cable interface line cards are powered on by default when the card is inserted into the chassis slot.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(4)BC1b	This command was introduced for the Cisco uBR10012 router.
12.2(8)BC1	This command is disabled if a working TCC+ card is not present in the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command is typically not used during normal operations, but it can be used for lab, diagnostic, and troubleshooting purposes. For example, using this command to first power off and then power on a card is functionally equivalent to performing an online insertion and removal (OIR) of the card.

Be aware of the following points when using this command:

- Using the **cable power off** command is functionally equivalent to disconnect the cables from the card's upstream and downstream connectors and then removing the card from the chassis. When you use this command to turn off power to a card, the output for the **show interface cable** command for that card will display the message "Hardware is not present."

**Note** You can also use the LC Power off Status Reg and Line Card Presence Status Reg fields in the **show controllers clock-reference** command to determine whether a cable interface line card is actually present in the chassis and whether it has been powered on or off.

- Powering off a cable interface line card automatically drops all sessions with the cable modems that are using that card's upstreams and downstreams. Do not use this command on a live network unless this is what you intend.
- All cards are powered on when you upgrade to a new software image for the Cisco uBR10012 router, even if a card had previously been powered off using the **cable power off** command.
- You can turn power both on and off to a cable interface line card slot, even if a card is not physically present in the slot.
- This is the only CLI command that actually powers off a card. The **hw module reset** command appears to perform a similar function, but it performs only the equivalent of issuing the **shutdown** and **no shutdown** commands on the card.
- When power is turned off for a cable interface line card, the power to that card slot will remain off until the **cable power on** command is used to turn the power back on. If you insert a cable interface card in to a slot that had been previously powered down, you will have to use the **cable power on** command to turn on power before being able to use the card.
- This command requires that a working TCC+ card be present because the TCC+ card controls and monitors the operation of the cable interface line cards. In Cisco IOS Release 12.2(8)BC1 and later, this command is disabled if a working TCC+ card is not present in the router.

---

**Note** The Cisco uBR10012 router requires a working TCC+ card for normal operations. Using the router without a working TCC+ card is not a supported configuration.

---

## Examples

The following example shows how to power off the first cable interface card in a Cisco uBR10012 chassis (card 5, slot 0). It also shows the output from the **show interface cable** command, with a line that indicates that the hardware is not present.

```
router# cable power off 5/0

Line Card 5/0 is POWERED OFF
router# show int c5/0/0

Cable5/0/0 is down, line protocol is down
  Hardware is not present
  Hardware is UBR10012 CLC, address is 0005.00e0.2f14 (bia 0005.00e0.2f14)
  Internet address is 10.20.42.1/24
  MTU 1500 bytes, BW 27000 Kbit, DLY 1000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  ...
router#
```

---

**Note** The **show interface cable** command will not display output for a card that is not physically present, so if you can use the **show interface cable** command but it indicates that the hardware is not present, this usually means that power to the card has been turned off using the **cable power off** command.

---

The following example shows the error message that results when you attempt to power on or off a cable interface card that is not physically present in the chassis:

```
router# cable power off 6/1
```

```
Line Card 6/1 is not present
router#
```

**Note** Power is still turned on or off to a cable interface line card slot, even when the card is not physically present in that slot.

#### Related Commands

Command	Description
<b>hw module reset</b>	Resets a line card, performing the equivalent of the <b>shutdown, no shutdown</b> commands.
<b>show controllers clock-reference</b>	Displays status information from the TCC+ card, including whether a line card is physically present and whether power has been turned off to its slot.
<b>show interface cable</b>	Displays configuration and status information for a cable interface line card.
<b>show version</b>	Displays the basic configuration of the router, including whether an active TCC+ card is present.
<b>shutdown</b>	Disables or enables the interface on a line card.

# cable pre-equalization exclude

To exclude a cable modem (CM) from pre-equalization during registration with the Cisco CMTS router, use the **cable pre-equalization exclude** command in global configuration mode. To remove exclusion for the specified cable modem or interface, use the **no** form of this command.

```
cable pre-equalization exclude {modem mac-addr | oui id}
no cable pre-equalization exclude {modem mac-addr | oui id}
```

Syntax Description	modem <i>mac-addr</i>	Excludes the cable modem with the specified MAC address from pre-equalization during cable modem registration.
	oui <i>id</i>	Excludes the specified Organizational Unique Identifier (OUI) from pre-equalization during cable modem registration.

**Command Default** Pre-equalization is disabled by default on a Cisco CMTS router, and for cable modems that have a valid and operational DOCSIS configuration file.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(17a)BC	This command was introduced to the Cisco uBR10012 router and the Cisco uBR7246VXR router.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **cable pre-equalization exclude** command to disable pre-equalization for DOCSIS 1.1 CMs that claim pre-equalization support but do not properly implement pre-equalization functions.

To enable pre-equalization, use the **cable upstream equalization-coefficient** interface configuration command. Pre-equalization starts when a cable modem that supports DOCSIS 1.1 or above sends the CMTS router a ranging request message indicating that pre-equalization is possible.

The following example of output from the **show cable modem verbose** command shows which modems are indicating pre-equalizer support during the DOCSIS registration process. In this example, the first two modems are capable of pre-equalization support, and the last two modems support DOCSIS 1.0, which does not support pre-equalization. You do not need to use the **cable pre-equalization exclude** command for DOCSIS 1.0 CMs.

```
Router# show cable modem verbose | include MAC Address|Equalizer
MAC Address                : 0019.474a.c4b0
Transmit Equalizer Support  : {Taps/Symbol= 1, Num of Taps= 24}
MAC Address                : 0019.474a.c498
Transmit Equalizer Support  : {Taps/Symbol= 1, Num of Taps= 24}
MAC Address                : 0020.40dc.4ce4
Transmit Equalizer Support  : {Taps/Symbol= 0, Num of Taps= 0}
```

```
MAC Address                : 0020.4077.21a0
Transmit Equalizer Support : {Taps/Symbol= 0, Num of Taps= 0}
```

Exclusion is supported for a specified DOCSIS 1.1 cable modem, or for a specified OUI value for the entire interface. Removing the **cable pre-equalization exclude** configuration returns the cable modem or interface to normal pre-equalization processes during cable modem registration.

## Examples

The following example configures pre-equalization to be excluded for the specified cable modem. Pre-equalization data is not sent for the corresponding cable modem:

```
Router(config)# cable pre-equalization exclude modem 1111.2222.3333
```

The following example configures pre-equalization to be excluded for the specified OUI value of the entire interface. Pre-equalization data is not sent for the corresponding OUI value of the entire interface:

```
Router(config)# cable pre-equalization exclude oui
00.09.04
```

The following series of commands configures pre-equalization on the Cisco uBR10012 router with MC5X20U BPEs. On the PRE Console, configure the following commands.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable pre-equalization exclude oui 00.09.04
Router(config)# end
Router# show run
Router# show running-config | include oui
cable pre-equalization exclude oui 00.09.04
Router#
```

On the line card console for the same Cisco uBR10012 router, verify the configuration with the following command:

```
Linecard# show running-config | include oui
cable pre-equalization exclude oui 00.09.04
```

The following series of commands configures pre-equalization on the Cisco uBR7246VXR router with MC28U cable interface line cards. On the Network Processing Engine (NPE) console, configure and verify with the following commands.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable pre-equalization exclude oui 00.09.24
Router(config)# end
Router#show run
02:58:10: %SYS-5-CONFIG_I: Configured from console by consolen
Router# show running-config | include oui
cable pre-equalization exclude oui 00.09.24
```

On the line card console for the same Cisco uBR7246VXR router, verify the configuration with the following command:

```
Linecard# show running-config | include oui
cable pre-equalization exclude oui 00.09.24
```

After either of these exclusion methods for pre-equalization are configured, you can verify that all ranging messages do not include pre-equalization data. Use the following **debug** commands in global configuration mode:

- **debug cable range**
- **debug cable interface** *cx/x/x mac-addr*

Verify the ranging message for the non-excluded cable modems include pre-equalization data, and for the excluded cable modems, the ranging messages do not include such data.

The following example removes pre-equalization exclusion for the specified OUI and interface. This results in the cable modem or OUI to return to normal pre-equalization functions. Ranging messages resume sending pre-equalization data.

```
Router(config)# no cable pre-equalization exclude {modem mac-addr | oui id}
```

You can verify removal of this feature using the **debug cable interface** command.

#### Related Commands

Command	Description
<b>debug cable interface</b>	Verifies pre-equalization data and configurations.
<b>debug cable range</b>	Verifies ranging messages for pre-equalization.

## cable primary-sflow-qos11 keep

To preserve the traffic counters for primary service flows after a CM that was provisioned for DOCSIS 1.1 quality of service (QoS) goes offline, use the **cable primary-sflow-qos11 keep** command in global configuration mode. To return to the default configuration and reset the counters to zero when a DOCSIS 1.1-provisioned CM goes offline, use the **no** form of this command.

```
cable primary-sflow-qos11 keep {all | snmp-only}
no cable primary-sflow-qos11 keep
```

### Syntax Description

<b>all</b>	Preserves all primary service flow traffic counters when a DOCSIS 1.1-provisioned CM goes offline. This includes the counters displayed by CLI commands and counters that are obtained through SNMP requests.
<b>snmp-only</b>	Preserves only the primary service flow traffic counters that are obtained through SNMP requests. The counters displayed by CLI commands are reset to zero when a DOCSIS 1.1-provisioned CM goes offline.

### Command Default

Primary service flow traffic counters are not preserved after a DOCSIS 1.1-provisioned CM goes offline (**no cable primary-sflow-qos11 keep**). Service-flow information is always preserved for DOCSIS 1.0-provisioned CMs, regardless of the configuration of this command.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)CX, 12.2(15)BC2	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

By default, when a CM that is provisioned for DOCSIS 1.1 quality of service (QoS) service flows goes offline, the CMTS deletes all service flow information, including traffic counters, that correspond to that CM. The **cable primary-sflow-qos11 keep** command preserves the service flow traffic counters after a DOCSIS 1.1-provisioned CM goes offline and then comes back online. This allows service providers to track the total usage of CMs over a period of time, regardless of the number of times the CMs go offline and reboot.

**Note** This command affects only CMs that are provisioned for DOCSIS 1.1 operations and that are currently online all cable interfaces on the Cisco CMTS. Information is not preserved for DOCSIS 1.1-provisioned CMs that went offline before this command was given. The service-flow information for CMs that are provisioned for DOCSIS 1.0 operations is always preserved, regardless of how this command is configured.

### Examples

The following example shows how to preserve both the CLI and SNMP service flow counters when a DOCSIS 1.1-provisioned CM goes offline:

```
Router(config)# cable primary-sflow-qos11 keep all
Router(config)#
```

The following example shows how to preserve only the SNMP-based service flow counters when a DOCSIS 1.1-provisioned CM goes offline. The CLI-based counters are still reset to zero when this CM goes offline.

```
Router(config)# cable primary-sflow-qos11 keep snmp-only
Router(config)#
```

The following example shows how to disable this command and return to the default behavior, which is to reset all CLI-based and SNMP-based counters when a DOCSIS 1.1-provisioned CM goes offline.

```
Router(config)# no cable primary-sflow-qos11 keep
Router(config)#
```

#### Related Commands

Command	Description
<b>cable sflog</b>	Enables service flow logging and configures the number and duration of entries in the log.
<b>show cable modem counters</b>	Displays downstream and upstream traffic counters for one or more CMs.

## cable privacy

To enable and configure BPI or BPI+ encryption, use the **cable privacy** command in cable interface configuration mode or MAC domain profile configuration mode. To disable privacy or to remove a particular configuration, use the **no** form of this command.

### Cisco uBR Series Router

**cable privacy** [**accept-self-signed-certificate** | **authenticate-modem** | **authorize-multicast** | **mandatory** | **oaep-support** | **dsx-support** | **retain-failed-certificates** | **skip-validity-period**]  
**no cable privacy** [**accept-self-signed-certificate** | **authenticate-modem** | **authorize-multicast** | **mandatory** | **oaep-support** | **dsx-support** | **retain-failed-certificates** | **skip-validity-period**]

### Cisco cBR Series Router

**cable privacy** [**accept-self-signed-certificate** | **mandatory** | **oaep-support** | **dsx-support** | **retain-failed-certificates** | **skip-validity-period**]  
**no cable privacy** [**accept-self-signed-certificate** | **mandatory** | **oaep-support** | **dsx-support** | **retain-failed-certificates** | **skip-validity-period**]

#### Syntax Description

<b>accept-self-signed-certificate</b>	(Optional) Allows cable modems to register using self-signed manufacturer certificates, as opposed to a manufacturer certificate that is chained to the DOCSIS root certificate.
<b>authenticate-modem</b> (for uBR series router)	(Optional) Uses AAA protocols in conjunction with BPI to authenticate all CMs.
<b>authorize-multicast</b> (for uBR series router)	(Optional) Uses AAA protocols with baseline privacy interface (BPI) to authorize all multicast stream (IGMP) join requests.
<b>mandatory</b>	(Optional) Requires baseline privacy be active for all CMs with BPI/BPI+ enabled in their DOCSIS configuration files or the CMs are forced to go offline.  If a CM does not have BPI enabled in its DOCSIS configuration file, it will be allowed online without BPI.
<b>oaep-support</b>	(Optional) Enables Optimal Asymmetric Encryption Padding (OAEP) BPI+ encryption.
<b>dsx-support</b>	(Optional) Enables encryption for dynamic services SIDs.
<b>retain-failed-certificates</b>	(Optional) Allows to retain failed certificates.
<b>skip-validity-period</b>	(Optional) Enables to skip certificate validity period.

#### Command Default

The encryption priority defaults to 128bit AES, 56bit DES, 40bit DES depending on modem capability. The CMTS treats self-signed manufacturer certificates as untrusted. Untrusted certificates are not retained by the CMTS.

#### Command Modes

Interface configuration—cable interface only (config-if)

Wideband-interface profile configuration (config-profile-wb)

## MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	12.1 T	This command was introduced.
	12.1(4)CX, 12.2(1)XF1, 12.2(4)BC1	Added the <b>dsx-support</b> and <b>aoep-support</b> keywords as part of support for BPI+ encryption.
	12.2(11)BC1	Changed the <b>accept-self-signed-certificate</b> option from a global configuration option to a cable interface option.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
	12.2(33)SCC	This command was modified. Added the <b>retain-failed-certificates</b> and <b>skip-validity-period</b> keywords. Removed the <b>40-bit-des</b> keyword.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>authenticate-modem</b> and <b>authorize-multicast</b> keywords were removed.
	IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command is applicable only on images that support BPI or BPI+ encryption.

**Note** The **cable privacy accept-self-signed-certificate** command affects only those CMs that register after you give the command. For example, if you give the **no cable privacy accept-self-signed-certificate** command so that CMs cannot register using self-signed certificates, you must then issue the **clear cable modem all reset** command to force all CMs reregister using certificates that are chained to the DOCSIS root certificate.

### Providing Self-Signed Certificates

Cisco IOS Release 12.2(33)SCC and later releases allow self-signed CA certificates to be programmed on the file system to allow specific modems to authenticate. This is frequently used for test equipment and modems that are not DOCSIS compliant.

To provide self-signed CA certificates, perform the following steps:

1. Acquire the CA certificate in Distinguished Encoding Rules (DER) format. This can be supplied by the manufacturer or retrieved from the cable modem.
2. Store the self-signed CA certificate in the bootflash by naming it “trusted-cert-scrt n”, for example “trusted-cert-scrt1” or “trusted-cert-scrt2”.
3. Ensure that **cable privacy accept-self-signed-certificate** command is not enabled.
4. Save the configuration.
5. Reboot the router.

The router reads the new files and the self-signed cable modem comes online.

## Examples

The following example shows how to force baseline privacy interface (BPI) to be used for all CMs on a particular cable interface:

```
Router(config)# interface cable 6/0/0
Router(config-if)# cable privacy mandatory
```

The following example shows how to turn on the BPI modem authentication for an interface:

```
Router(config)# interface cable 6/0/1
Router(config-if)# cable privacy authenticate-modem
```

The following example shows how to turn on BPI multicast authorization on a particular cable interface on Cisco uBR series router:

```
Router(config)# interface cable 1/0
Router(config-if)# cable privacy authorize-multicast
```

The following example shows how to allow CMs to register with self-signed certificates on a particular cable interface:

```
Router(config)# interface cable 7/0/0
Router(config-if)# cable privacy accept-self-signed-certificate
```

The following example shows how to allow CMs to enable privacy DSX support on a particular cable interface:

```
Router(config)# interface cable 6/0/0
Router(config-if)# cable privacy dsx-support
```

The following example shows how to allow CMs to enable OAEP support on a particular cable interface:

```
Router(config)# interface cable 6/0/0
Router(config-if)# cable privacy oaep-support
```

The following example shows how to allow CMs to retain failed certificates on a particular cable interface:

```
Router(config)# interface cable 6/0/0
Router(config-if)# cable privacy
retain-failed-certificates
```

The following example shows how to allow CMs to skip certificate validity period on a particular cable interface:

```
Router(config)# interface cable 6/0/0
Router(config-if)# cable privacy
skip-vailidity-period
```

## Related Commands

Command	Description
<b>cable privacy eae-policy</b>	Selects Early Authentication and Encryption policy.
<b>cable privacy hotlist</b>	Adds a CM certificate to the DOCSIS hotlist so that it is no longer accepted.

Command	Description
<b>cable privacy kek</b>	Sets key encryption keys and timeout periods.
<b>cable privacy tek</b>	Sets traffic encryption keys and timeout periods.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable privacy bpi-plus-enforce

**Note** Effective with Cisco IOS Release 12.2(33)SCD5, the **cable privacy bpi-plus-enforce** command is replaced with the **cable privacy bpi-plus-policy** command. For more information, see the **cable privacy bpi-plus-policy** command.

To mandate that a cable modem provisioned in DOCSIS 1.1 or higher must register with DOCSIS Baseline Privacy Interface Plus (BPI+), and not use the earlier DOCSIS BPI, use the **cable privacy bpi-plus-enforce** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**cable privacy bpi-plus-enforce**  
**no cable privacy bpi-plus-enforce**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The **cable privacy bpi-plus-enforce** command is not enabled by default, but must be configured for optimal DOCSIS BPI+ security.

**Command Modes** Global configuration (config)

Release	Modification
12.3(21)BC	This command was introduced.
12.2(33)SCD5	This command was replaced with the <b>cable privacy bpi-plus-policy</b> command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable privacy bpi-plus-enforce** command enables the Cisco CMTS router to detect cloned cable modems and eliminate denial-of-service (DOS) attacks that are caused by cloned cable modems.

If the cable modem is not provisioned to use DOCSIS BPI or BPI+ security certificates, then the existing behavior of the Cisco CMTS router remains unchanged. The Cisco CMTS router does not attempt to distinguish between two cable modems if neither is provisioned for BPI+ security.

**Note** The non-DOCSIS compliant cable modems that are commonly available contain an option to force registration in DOCSIS BPI, as opposed to DOCSIS BPI+ mode, even in DOCSIS 1.1-provisioned networks.

## Examples

The following example illustrates logging messages that are created with the detection of cloned cable modems:

```
SLOT 7/0: Nov 14 12:07:26: %UBR10000-6-CMOVED: Cable modem 0007.0e03.3e71 has been moved
from interface Cable7/0/1 to interface Cable7/0/0.
```

```
Nov 14 12:07:57: %UBR10000-5-CLONED_CM_DETECTED: Cloned CM with MAC address 0013.7116.e726  
access detected at Cable7/0/0 interface
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable logging layer2events</b>	Saves selected (low priority) DOCSIS events that are specified in the Cisco CMTS MIB registry to the cable logging buffer (instead of to the general logging buffer).
<b>cable privacy bpi-plus-policy</b>	Configures the BPI+ enforcement policies on a Cisco CMTS router.
<b>show cable logging</b>	Displays the log of messages about bad IP source addresses or DOCSIS layer events on the cable interfaces.
<b>show cable modem</b>	Displays information for registered and non-registered cable modems on the Cisco CMTS.

# cable privacy bpi-plus-exclude

To exclude cable modems from the Baseline Privacy Interface Plus (BPI+) enforcement policies configured on a Cisco CMTS router, use the **cable privacy bpi-plus-exclude** command in global configuration mode. To disable this configuration, use the **no** form of this command.

```
cable privacy bpi-plus-exclude mac-address [address-mask]
no cable privacy bpi-plus-exclude mac-address [address-mask]
```

Syntax Description	
<i>mac-address</i>	Cable modem MAC address.
<i>address-mask</i>	(Optional) Cable modem subnet.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCD5	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** You can exclude individual cable modems, which are compliant with DOCSIS 1.0 and later versions, from the BPI+ enforcement policy based on their MAC addresses on a per-MAC domain basis. If a cable modem is added to the exclusion list, the Cisco CMTS router does not enforce the BPI+ enforcement policy on that cable modem. You can exclude a maximum of 30 cable modems per MAC domain.

**Examples** The following example shows how to exclude a cable modem from the BPI+ enforcement policy based on its MAC address:

```
Router# configure terminal
Router(config)# cable privacy bpi-plus-exclude 0010.9571.03ab
```

Related Commands	Command	Description
	<b>cable privacy bpi-plus-policy</b>	Configures the BPI+ enforcement policy on a Cisco CMTS router.
	<b>show interface cable privacy</b>	Displays baseline privacy information.

## cable privacy bpi-plus-policy

To configure the Baseline Privacy Interface Plus (BPI+) enforcement policies on a Cisco CMTS router, use the **cable privacy bpi-plus-policy** command in cable interface configuration mode. To disable this configuration, use the **no** form of this command.

```
cable privacy bpi-plus-policy {capable-enforcement | d11-enabled-enforcement | d11-enforcement | total-enforcement}
no privacy bpi-plus-policy {capable-enforcement | d11-enabled-enforcement | d11-enforcement | total-enforcement}
```

Syntax Description		
	<b>capable-enforcement</b>	Specifies that BPI+ enforcement is required on all BPI+ capable cable modems that are BPI+ enabled and provisioned with DOCSIS1.1 configuration file (Policy 1).
	<b>d11-enabled-enforcement</b>	Specifies that BPI+ enforcement is required on all cable modems that register with a DOCSIS 1.1 configuration file with parameters indicating BPI+ is enabled with or without TLV 29 (Policy 2).
	<b>d11-enforcement</b>	Specifies that BPI+ enforcement is required on all cable modems that are compliant with DOCSIS 1.1 and later versions (Policy 3).
	<b>total-enforcement</b>	Specifies that BPI+ enforcement is required on all cable modems (Policy 4).

**Command Default** None

**Command Modes** Interface configuration—cable interface only (config-if)  
Wideband-interface profile configuration (config-profile-wb)

Command History	Release	Modification
	12.2(33)SCD5	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable privacy bpi-plus-policy** command replaced the **cable privacy bpi-plus-enforce** command in Cisco IOS Release 12.2(33)SCD5. If you upgrade from an earlier Cisco IOS Release to Cisco IOS Release 12.2(33)SCD5 and later, the existing BPI+ enforcement configuration is disabled by default during the upgrade. You must reconfigure the BPI+ enforcement policy using the **cable privacy bpi-plus-policy** command.

You can configure only one enforcement policy at a time per MAC domain. If you configure one policy after another, the latest policy supersedes the already existing policy. For example, if you want Policy 2 to take over Policy 1, you can directly configure the former without disabling the latter.

### Examples

The following example shows how to configure BPI+ enforcement policies on the cable interface 3/0 on the Cisco uBR7246VXR router:

```
Router# configure terminal
```

```

Router(config)# interface cable 3/0
Router(config-if)# cable privacy bpi-plus-policy capable-enforcement
Router(config-if)# cable privacy bpi-plus-policy dll-enabled-enforcement
Router(config-if)# cable privacy bpi-plus-policy dll-enforcement
Router(config-if)# cable privacy bpi-plus-policy total-enforcement

```

---

**Related Commands**

Command	Description
<b>cable privacy bpi-plus-exclude</b>	Excludes individual cable modems from BPI+ enforcement policies based on their MAC addresses.
<b>show interface cable privacy</b>	Displays baseline privacy information.

# cable privacy clone-detect

To enable the clone modem functionality for a cable modem, use the **cable privacy clone-detect** command in global configuration mode. To disable clone modem functionality, use the **no** form of this command.

**cable privacy clone-detect**  
**no cable privacy clone-detect**

**Syntax Description** This command has no keywords or arguments.

**Command Default** The clone modem functionality is enabled .

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to enable the clone modem functionality, so that the cloned cable modems cannot register with the CMTS:

```
Router# configure terminal
Router(config)# cable privacy clone-detect
```

Related Commands	Command	Description
	<b>cable privacy</b>	Enables and configures BPI+ encryption on a cable interface.
	(Not supported for Cisco uBR10K Series and cBR Series Converged Broadband Routers) <b>cable privacy bpi-plus-enforce</b>	Specifies that a cable modem provisioned in DOCSIS 1.1 or higher must register with DOCSIS BPI+, and not use the earlier DOCSIS BPI.
	<b>cable logging layer2events</b>	Saves selected (low priority) DOCSIS events that are specified in the Cisco CMTS MIB registry to the cable logging buffer (not of the general logging buffer).
	<b>show cable logging</b>	Displays the log of messages, about bad IP source addresses or DOCSIS-layer events, on the cable interfaces.
	<b>show cable modem</b>	Displays information for registered and non-registered cable modems on the Cisco CMTS.

Command	Description
show running-config interface cable	Displays the bundles that are configured on a Cisco CMTS router showing the running configuration for each of the cable interfaces.

## cable privacy eae-exclude

To force a cable modem to register without an Early Authentication and Encryption (EAE) and add it to the EAE exclusion list, use the **cable privacy eae-exclude** command in global configuration mode. To remove a particular CM from the exclusion list, use the **no** form of this command.

```
cable privacy eae-exclude cm-mac-address [mask]  
no cable privacy eae-exclude cm-mac-address [mask]
```

Syntax Description	
<i>cm-mac-address</i>	Hardware (MAC) address of a specific cable modem to be added to the EAE exclusion list.
<i>mask</i>	(Optional) Mask value for the cable modem.

**Command Default** The EAE exclusion list does not contain any MAC address.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The exclusion list is mainly used to debug issues with specific cable modems.

**Examples** The following example shows how to add a CM with the MAC address of 00C0.8345.de51 to the EAE exclusion list, so that this particular CM cannot register with the CMTS:

```
Router# configure terminal  
Router(config)# cable privacy eae-exclude 00C0.8345.de51  
Router(config)#
```

Related Commands	Command	Description
	<b>cable privacy</b>	Enables and configures BPI+ encryption on a cable interface.
	<b>cable privacy kek</b>	Sets key encryption keys and timeout periods.
	<b>cable privacy tek</b>	Sets traffic encryption keys and timeout periods.
	<b>show cable privacy</b>	Displays information about BPI status and operation.

## cable privacy eae-policy

To enable the Early Authentication and Encryption (EAE) policy, use the **cable privacy eae-policy** command in cable interface configuration mode or MAC domain profile configuration mode. To disable the EAE policy, use the **no** form of this command.

**cable privacy eae-policy** {**capability-enforcement** | **disable-enforcement** | **ranging-enforcement** | **total-enforcement**}

**no cable privacy eae-policy** {**capability-enforcement** | **disable-enforcement** | **ranging-enforcement** | **total-enforcement**}

### Syntax Description

<b>capability-enforcement</b>	Enforces EAE on capable modems.
<b>disable-enforcement</b>	Disables EAE thereby preventing the CMTS from enforcing EAE on any cable modem.
<b>ranging-enforcement</b>	Enforces EAE only on DOCSIS 3.0 modems.
<b>total-enforcement</b>	Enforces EAE on all cable modems.

### Command Default

EAE policy is disabled.

### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The EAE policy is applied on a MAC domain and the policies are mutually exclusive. The CMTS enforces EAE only on CMs that initialize on a downstream channel on which the CMTS is transmitting MAC Domain Descriptor (MDD) messages.

The EAE exclusion list is a global list and is created on all line cards as part of the DOCSIS 3.0 specifications. Cable modems in the EAE exclusion list are always exempted from EAE enforcement. If the CMTS receives an authorization request before the CM is registered in the EAE exclusion list, the CMTS rejects that request.

**Note** When Early Authentication and Encryption is enabled in Cisco cBR-8 router, BPI will revert back to DES-56 even if the hardware supports AES-128.

## Examples

The following example shows how to enforce EAE policy on capable modems:

```
Router(config)# interface cable 3/0/0
Router(config-if)# cable privacy eae-policy capability-enforcement
```

The following example shows how to disable EAE policy so that the CMTS does not enforce EAE policy on any cable modem:

```
Router(config)# interface cable 3/0/0
Router(config-if)# cable privacy eae-policy disable-enforcement
```

The following example shows how to enforce EAE policy on DOCSIS 3.0 modems only:

```
Router(config)# interface cable 3/0/0
Router(config-if)# cable privacy eae-policy ranging-enforcement
```

The following example shows how to enforce EAE policy on all cable modems:

```
Router(config)# interface cable 3/0/0
Router(config-if)# cable privacy eae-policy total-enforcement
```

## Related Commands

Command	Description
<b>cable privacy exe-exclude</b>	Adds the CM to be excluded from EAE policy enforcement.
<b>cable privacy hotlist</b>	Adds a CM certificate to the DOCSIS hotlist so that it is no longer accepted.
<b>cable privacy kek</b>	Sets key encryption keys and timeout periods.
<b>cable privacy tek</b>	Sets traffic encryption keys and timeout periods.
<b>show cable privacy</b>	Displays information about BPI status and operation.

## cable privacy encrypt-alg-priority

To specify the order in which to use the Advanced Encryption Standard (AES) and Data Encryption Standard (DES) encryption algorithm, use the **cable privacy encrypt-alg-priority** command in global configuration mode. To remove the encryption algorithm and revert to the default priority, use the **no** form of this command.

**cable privacy encrypt-alg-priority** {aes128-des40-des56 | aes128-des56-des40 | des40-aes128-des56 | des40-des56-aes128 | des56-aes128-des40 | des56-des40-aes128}

**no cable privacy encrypt-alg-priority**

### Syntax Description

<b>aes128-des40-des56</b>	Specifies the order of the encryption algorithm priority. AES with a 128-bit block is given the highest priority, followed by DES with 40-bit block size, and DES with 56-bit block size.
<b>aes128-des56-des40</b>	Specifies the order of the encryption algorithm priority. AES with a 128-bit block size is given the highest priority, followed by DES with 56-bit block size, DES with 40-bit block size.
<b>des40-aes128-des56</b>	Specifies the order of the encryption algorithm priority. DES with 40-bit block size is given the highest priority, followed by AES with a 128-bit block size, and DES with 56-bit block size.
<b>des40-des56-aes128</b>	Specifies the order of the encryption algorithm priority. DES with 40-bit block size is given the highest priority, followed by DES with 56-bit block size and AES with 128-bit block size.
<b>des56-aes128-des40</b>	Specifies the order of the encryption algorithm priority. DES with 56-bit block size is given the highest priority, followed by AES with a 128-bit block size, and DES with 40-bit block size.
<b>des56-des40-aes128</b>	Specifies the order of the encryption algorithm priority. DES with 56-bit block size is given the highest priority, followed by DES with 40-bit block size, and AES with a 128-bit block size.

### Command Default

Default value is aes128-des56-des40.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Use this command to specify the order of the encryption algorithm priority.

When Early Authentication and Encryption is enabled in Cisco cBR-8 router, BPI will revert back to DES-56 even if the hardware supports AES-128.

**Examples**

The following example shows how to assign AES the highest priority, followed by 40-bit DES, and 56-bit DES.

```
Router# configure terminal
Router(config)# cable privacy encrypt-alg-priority aes128-des40-des56
Router(config)#
```

**Related Commands**

Command	Description
<b>cable privacy</b>	Enables and configures BPI+ encryption on a cable interface.
<b>cable privacy kek</b>	Sets key encryption keys and timeout periods.
<b>cable privacy tek</b>	Sets traffic encryption keys and timeout periods.
<b>show cable privacy</b>	Displays information about BPI status and operation.

## cable privacy hotlist

To mark a manufacturer's or CM certificate as untrusted and add them to the CMTS hotlist of invalid certificates, thereby preventing those CMs or host's from registering, use the **cable privacy hotlist** command in global configuration mode. To remove a particular CM or manufacturer's certificate from the hotlist, use the **no** form of this command.

```
cable privacy hotlist {cm mac-address | manufacturer cert-serial-number}
no cable privacy hotlist {cm mac-address | manufacturer cert-serial-number}
```

### Cisco cBR Series Converged Broadband Routers

```
cable privacy hotlist {cm mac-address | host mac-address }
no cable privacy hotlist {cm mac-address | host mac-address }
```

#### Syntax Description

<b>cm</b> <i>mac-address</i>	Specifies the MAC address for the CM to be added to the hotlist. The <i>mac-address</i> should be specified as a hexadecimal string, without periods or other separators. In Cisco IOS Release 12.2(15)BC2 and later releases, you can also specify it as three sets of hexadecimal digits, separated by periods.
<b>manufacturer</b> <i>cert-serial-number</i>	Specifies the serial number for the particular manufacturer CA certificate. The <i>cert-serial-number</i> should be specified as a hexadecimal string up to 32 bytes in length. Enter multiple lines as needed, and use a blank line to terminate the string.
<b>host</b> <i>mac-address</i>	Specifies the MAC address for the host to be added to the hotlist. The <i>mac-address</i> should be specified as a hexadecimal string, without periods or other separators. In Cisco IOS Release 12.2(15)BC2 and later releases, you can also specify it as three sets of hexadecimal digits, separated by periods.

#### Command Default

The CMTS hotlist does not contain any certificates.

#### Command Modes

Global configuration (config)

#### Command History

Release	Modification
12.1(7)CX, 12.2(1)XF1, 12.2(4)BC1	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series routers.
12.2(11)BC1	The <b>accept-self-signed-certificate</b> option was moved to the <b>cable privacy cable</b> interface command.
12.2(15)BC2	The mac-address can be specified in the canonical form of three pairs of hexadecimal digits, separated by periods (for example, 0000.0001.0002).
12.2(33)SCB5	This command was integrated into the 12.2SC release train.

Release	Modification
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>host</b> keyword was added.

### Usage Guidelines

The **cable privacy hotlist** command is used to configure the following features:

- [DOCSIS 1.1 for the Cisco CMTS Routers](#)

This command is applicable only on images that support BPI or BPI+ encryption.

**Note** The **cable privacy hotlist** command is not supported on the Cisco uBR10012 router running Cisco IOS releases prior to Cisco IOS release 12.3(23)BC9, Cisco IOS release 12.2(33)SCB5, and Cisco IOS release 12.2(33)SCC. To add a manufacturer's or CM certificate to the hotlist on the Cisco uBR10012 router, use SNMP commands to set the appropriate attributes in DOCS-BPI-PLUS-MIB.

### Examples

The following command adds the CM certificate with the MAC address of 00C0.8345.de51 to the hotlist, so that this particular CM cannot register with the CMTS:

```
Router# configure terminal
Router(config)# cable privacy hotlist cm 00C08345de51
Router(config)#
```

The following example adds a manufacturer CA certificate into the BPI+ hotlist, so that the CMTS will reject any CM attempting to register with a certificate from that particular manufacturer:

```
Router# configure terminal
Router(config)# cable privacy hotlist manufacturer 3435414631413439383335453731423733333643
```

### Related Commands

Command	Description
<b>cable privacy</b>	Enables and configures BPI+ encryption on a cable interface.
<b>option</b>	Determines whether a specific CM is online.
<b>cable privacy kek</b>	Sets key encryption keys and timeout periods.
<b>cable privacy tek</b>	Sets traffic encryption keys and timeout periods.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable privacy kek

To set key encryption keys (KEKs) life-time values for baseline privacy on an HFC network, use the **cable privacy kek** command in cable interface configuration mode or MAC domain profile configuration mode. To restore the default values, use the **no** form of this command.

**Note** This command is applicable only on images that support BPI or BPI+ encryption.

**cable privacy kek life-time** [*seconds*]  
**no cable privacy kek life-time**

## Syntax Description

<b>life-time</b> <i>seconds</i>	(Optional) Length of the key encryption life-time in seconds. The valid range is 300 to 604,800. The default is 604,800 seconds (7 days).
---------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

The **life-time** option to 604,800 seconds (7 days).

## Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
11.3 XA	This command was introduced.
12.1(4)CX, 12.2(1)XF1, 12.2(4)BC1	The valid range for both options was changed to support DOCSIS 1.1 and BPI+ encryption.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Baseline privacy on an HFC network is configured with key encryption keys (KEKs) and traffic encryption keys (TEKs). The encryption is based on 40-bit or 56-bit data encryption standard (DES) encryption algorithms.

A KEK is assigned to a cable modem based on the cable modem service identifier (SID) and permits the cable modem to connect to the Cisco CMTS when baseline privacy is activated. KEKs can be set to expire based a life-time value.

The **life-time** keyword is used to assign a more permanent key to a cable modem.

A cable modem that has a life-time key assigned by the Cisco CMTS requests a new key before the current one expires.

## Examples

The following example shows how to set the KEK privacy life-time to 750,000 seconds:

**Note** CableLabs recommended operational KEK life time is:

- Minimum 1 day
- Normal 7 days
- Maximum 70 days and
- 300 seconds for integration testing alone

```
Router(config)# interface cable c3/0/0
Router(config-if)# cable privacy kek life-time 750000
Router(config-if)#
```

#### Related Commands

Command	Description
<b>cable privacy</b>	Enables and configures BPI+ encryption on a cable interface.
<b>cable privacy tek</b>	Sets traffic encryption keys and timeout periods.
<b>option</b>	Determines whether a specific CM is online.
<b>privacy</b>	Configures the BPI or BPI+ configuration parameters in a DOCSIS configuration file.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>show interface cable privacy</b>	Displays the current values of the KEK and TEK timers for an interface.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

## cable privacy non-mtc-aes128

To allow DOCSIS3.0 cable modem working on non-MTC mode to use AES-128 as BPI encryption algorithms, use the **cable privacy non-mtc-aes128** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable privacy non-mtc-aes128**  
**no cable privacy non-mtc-aes128**

### Command Default

None.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS-XE 3.18.1SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to add a CM with the MAC address of 00C0.8345.de51 to the EAE exclusion list, so that this particular CM cannot register with the CMTS:

```
Router# configure terminal
Router(config)# cable privacy non-mtc-aes128
Router(config)#
```

# cable privacy revocation crl skip-sig-check

To allow the Cisco CMTS router to skip the certification revocation list (CRL) response signature check, use the **cable privacy revocation crl skip-sig-check** command in global configuration mode. To enable CRL signature check, use the **no** form of this command.

**cable privacy revocation crl skip-sig-check**  
**no cable privacy revocation crl skip-sig-check**

## Syntax Description

This command has no keywords or arguments.

## Command Default

The CRL response signature check is enabled by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable privacy revocation crl skip-sig-check** command allows you to use the CRL response from the CRL server without validating the signature of the response.

## Examples

The following example shows how to skip the CRL response signature check:

```
Router(config)# cable privacy revocation crl skip-sig-check
```

## Related Commands

Command	Description
<b>cable privacy revocation oosp skip-sig-check</b>	Allows to skip the OOSP response signature check.
<b>cable privacy revocation skip-cm-cert</b>	Allows to disable checking of the CM certificates.
<b>cable privacy revocation timeout</b>	Sets the timeout value of CRL or OOSP response time.
<b>cable privacy revocation enable</b>	Allows to quickly enable privacy revocation checking.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable privacy revocation enable

To quickly enable privacy revocation checking, use the **cable privacy revocation enable** command in global configuration mode. To disable privacy revocation checking, use the **no** form of this command.

**cable privacy revocation enable**  
**no cable privacy revocation enable**

**Syntax Description** This command has no keywords or arguments.

**Command Default** The privacy revocation checking is disabled by default.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command allows you to quickly enable or disable revocation checking. When you enable revocation checking, it creates the trustpoints for both the EU and US certificates.

**Examples** The following example shows how to enable revocation checking:

```
Router(config)# cable privacy revocation enable
```

Command	Description
<b>cable privacy revocation ocsip skip-sig-check</b>	Allows to skip the OCSP response signature check.
<b>cable privacy revocation skip-cm-cert</b>	Allows to disable checking of the CM certificates.
<b>cable privacy revocation timeout</b>	Sets the timeout value of CRL or OCSP response time.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable privacy revocation obsp skip-sig-check

To allow the Cisco CMTS router to skip the Online Certificate Status Protocol (OCSP) response signature check, use the **cable privacy revocation obsp skip-sig-check** command in global configuration mode. To enable OCSP signature check, use the **no** form of this command.

**cable privacy revocation obsp skip-sig-check**  
**no cable privacy revocation obsp skip-sig-check**

**Syntax Description** This command has no keywords or arguments.

**Command Default** OCSP response signature check is enabled by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.	

**Usage Guidelines** The **cable privacy revocation obsp skip-sig-check** command allows you to use the OCSP response from the OCSP responder without validating the signature of the response.

**Examples** The following example shows how to skip the OCSP response signature check:

```
Router(config)# cable privacy revocation obsp skip-sig-check
```

Related Commands	Command	Description
	<b>cable privacy revocation enable</b>	Allows to quickly enable privacy revocation checking.
	<b>cable privacy revocation skip-cm-cert</b>	Allows to disable checking of the CM certificates.
	<b>cable privacy revocation timeout</b>	Sets the timeout value of CRL or OCSP response time.
	<b>show cable privacy</b>	Displays information about BPI status and operation.
	<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable privacy revocation skip-cm-cert

To disable checking of the CM certificates, use the **cable privacy revocation skip-cm-cert** command in global configuration mode. To enable checking of CM certificates, use the **no** form of this command.

**cable privacy revocation skip-cm-cert**  
**no cable privacy revocation skip-cm-cert**

**Syntax Description** This command has no keywords or arguments.

**Command Default** CM certificate checking is enabled by default.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

**Note** Checking CM certificates requires a lot of processing power, which impacts the router performance.

## Examples

The following example shows how to disable checking of CM certificates:

```
Router(config)# cable privacy revocation skip-cm-cert
```

Related Commands	Command	Description
	<b>cable privacy revocation enable</b>	Allows to quickly enable privacy revocation checking.
	<b>cable privacy revocation ocsig skip-sig-check</b>	Allows to skip the OCSP response signature check.
	<b>cable privacy revocation timeout</b>	Sets the timeout value of CRL or OCSP response time.
	<b>show cable privacy</b>	Displays information about BPI status and operation.
	<b>debug cable privacy</b>	Displays debug messages for BPI operation.

## cable privacy revocation timeout

To set the timeout value of certification revocation list (CRL) or Online Certificate Status Protocol (OCSP) response time for authorization “reply” or “reject” messages, use the **cable privacy revocation timeout** command in global configuration mode. To return to the default timeout value, use the **no** form of this command.

**cable privacy revocation timeout**  
**no cable privacy revocation timeout**

**Syntax Description** This command has no keywords or arguments.

**Command Default** The default timeout value is 1 second.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command only takes effect if **cable privacy revocation enable** command is configured. The timeout value for authorization “reply” or “reject” messages in the CM configuration file must be greater than the revocation timeout value.

**Examples** The following example shows how to set the timeout value for CRL or OCSP response:

```
Router(config)# cable privacy revocation timeout 15
```

Command	Description
<b>cable privacy revocation enable</b>	Allows to quickly enable privacy revocation checking.
<b>cable privacy revocation oosp skip-sig-check</b>	Allows to skip the OCSP response signature check.
<b>cable privacy revocation skip-cm-cert</b>	Allows to disable checking of the CM certificates.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable privacy tek

To set traffic encryption keys (TEKs) life-time values for baseline privacy on an HFC network, use the **cable privacy tek** command in cable interface configuration mode or MAC domain profile configuration mode. To restore the default value, use the **no** form of this command.

**Note** This command is applicable only on images that support BPI or BPI+ encryption.

**cable privacy tek life-time** [*seconds*]  
**no cable privacy tek life-time**

## Syntax Description

<b>life-time</b> <i>seconds</i>	(Optional) Length of the traffic encryption life-time in seconds. The range is 180 to 604,800. The default is 43,200.
------------------------------------	-----------------------------------------------------------------------------------------------------------------------

## Command Default

The **life-time** option to 43200 seconds (12 hours).

## Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
11.3 XA	This command was introduced.
12.1(4)CX, 12.2(1)XF1, 12.2(4)BC1	The valid range for both options was changed to support DOCSIS 1.1 and BPI+ encryption.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Baseline privacy on an HFC network is configured with key encryption keys (KEKs) and traffic encryption keys (TEKs). The encryption is based on 40-bit or 56-bit data encryption standard (DES) or 128-bit AES encryption algorithms.

The TEK is assigned to a CM when its KEK has been established. The TEK is used to encrypt data traffic between the CM and the Cisco CMTS. TEKs can be set to expire based a life-time value.

The **life-time** keyword is used to assign a more permanent key to a CM.

**Note** CableLabs recommended operational TEK life time is:

- Minimum 30 minutes
- Normal 12 hours
- Maximum 7 days and
- 180 seconds for integration testing alone

A CM that has a life-time key assigned by the Cisco CMTS requests a new key before the current one expires.

### Examples

The following example shows how to set the traffic encryption key life-time to 800000 seconds:

```
Router(config)# interface cable c3/0/0
Router(config-if)# cable privacy tek life-time 800000
Router(config-if)#
```

### Related Commands

Command	Description
<b>cable privacy</b>	Enables and configures BPI+ encryption on a cable interface.
<b>cable privacy kek</b>	Sets key encryption keys and timeout periods.
<b>option</b>	Determines whether a specific CM is online.
<b>privacy</b>	Configures the BPI or BPI+ configuration parameters in a DOCSIS configuration file.
<b>show cable privacy</b>	Displays information about BPI status and operation.
<b>show interface cable privacy</b>	Displays the current values of the KEK and TEK timers for an interface.
<b>debug cable privacy</b>	Displays debug messages for BPI operation.

# cable profile

To create and configure common profile for service group based configuration of layer 2 (L2) interfaces, use the **cable profile** command. To remove a common profile use the **no** form of the command with the appropriate key words and variables.

**cable profile** *profile-type* *profile-name*

## Syntax Description

<i>profile-type</i>	Configures the profile type for configuration. <ul style="list-style-type: none"> <li>• <b>mac-domain</b> — Selects a MAC domain common profile for configuration.</li> <li>• <b>downstream</b> — Selects a downstream interface common profile to configure.</li> <li>• <b>wideband-interface</b> — Selects a wideband interface common profile to configure.</li> <li>• <b>service-group</b> — Creates fiber-node service group profile.</li> </ul>
<i>profile-name</i>	Configures the profile name.

## Command Default

Not configured.

## Command Modes

Privileged Configuration Mode (config)

## Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1z	This following statements are introduced for the <b>cable profile mac-domain</b> command: <ul style="list-style-type: none"> <li>• <b>shutdown</b></li> <li>• <b>cable upstream resiliency [ change-channel-set   channel-down-detect   data-burst   modem-offline-detect   on-failure   sf-move ]</b></li> </ul>
Cisco IOS-XE 3.17.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

**Feature**—Service Group Profile Based Configuration for DOCSIS interfaces and fiber nodes.

Use this command to configure the three common profiles — MAC domain, primary downstream channel profile and wideband-cable interface profile. When you enter the profile configuration mode, configure the parameters for the profile. These parameters will be applied when this profile is added to a specific service group profile. This command is used to create the service group profile.

### MAC Domain Common Profile

When you enter the MAC domain common profile configuration mode, configure the following using the **cable** command:

- **cable ip-init [apm | dual-stack | ipv4 | ipv6]**

- **cable mrc-mode**
- **cable mtc-mode**
- **cable dynamic-secret** [lock | mark | reject]
- **cable shared-secret** [0 | 7 | LINE]
- **cable privacy bpi-plus-policy** [capable-enforcement | d11-enabled-enforcement | d11-enforcement | total-enforcement ]
- **cable privacy mandatory**

### Primary Downstream Channel Common Profile

When you enter the primary downstream channel common profile configuration mode, configure the following using the **cable** command:

- **cable rf-bandwidth-percent** *percent* [ **remaining ratio** *percent* ]
- **cable attribute-mask** *mask*

### Wideband Interface Common Profile

When you enter the wideband interface common profile configuration mode, configure the following using the **cable** command:

- **cable downstream attribute-mask** *mask*

### Global Service Group Profile

When you enter the global service group configuration mode, use the following commands:

- Enter the MAC domain mode using **mac-domain** *mac-domain id profile* *mac-domain profile name*
- In the MAC domain mode:
  - Configure the downstream service group channels using the **downstream sg-channel** *group list profile ds profile name upstream group list*
  - Configure the upstream service group channels using the **upstream** *Id sg-channel sg channel Id*
  - Configure the upstream bonding group by entering the upstream bonding group configuration mode using the **us-bonding-group** *Id* command.
    - In the upstream bonding group configuration mode, use the **upstream** *Id* command to add the upstream channels.
    - In the upstream bonding group configuration mode, use the **attribute** *mask* command to add attribute mask for this upstream bonding group .
- Enter the wideband interface configuration group using the **wideband-interface** *Id profile BG profile name*
  - In the wideband interface configuration mode, use the **downstream sg-channel** *group list rf-bandwidth-percent percent* command to add the upstream channels.

### MAC Domain Common Profile

This example shows how to configure a MAC domain common profile using the **cable profile** command.

```
Router(config)#cable profile mac-domain md1
Router(config-profile-md)#cable dynamic-secret mark
Router(config-profile-md)#cable shared-secret 0
Router(config-profile-md)#cable ip-init ipv4
Router(config-profile-md)#cable mtc-mode
Router(config-profile-md)#cable mrc-mode
Router(config-profile-md)#cable privacy mandatory
Router(config-profile-md)#cable privacy bpi-plus-policy total-enforcement

Router(config-profile-md)#exit
Router(config)#
```

### Primary Downstream Channel Common Profile

This example shows how to configure a primary downstream channel common profile using the **cable profile** command. Set the attribute mask value and the RF bandwidth percentage for the primary downstream channel profile.

```
Router(config)#cable profile downstream ds1
Router(config-profile-ds)# cable attribute-mask mask
Router(config-profile-ds)# cable rf-bandwidth-percent percent

Router(config-profile-ds)#exit
Router(config)#
```

### Wideband Interface Common Profile

This example shows how to configure a wideband interface common profile using the **cable profile** command. Set the attribute mask value for the wideband interface profile using the **downstream** keyword.

```
Router(config)#cable profile wideband-interface BG1
Router(config-profile-wb)# cable downstream attribute-mask mask
Router(config-profile-wb)#exit
Router(config)#
```

### Configuring DSG on Service-Group Profile

This example shows how to configure a DSG on service-group profile using the **cable profile service-group <name>** command:

```
Router(config)# cable profile service-group SG-16x8-1_1
```

```

cable bundle bundle ID
mac-domain mac-domain ID profile mac-domain profile name
downstream sg-channel grouplist profile downstream interface
cable downstream dsg chan-list 111
cable downstream dsg timer 1
cable downstream dsg vendor-param 2
cable downstream dsg tg 4500
cable downstream dsg tg 4500 priority 2
cable downstream dsg tg 4500 vendor-param 2
cable downstream dsg tg 4500 ucid 1 2

```

### Global Service Group Profile

This example shows how to configure a global service group profile using the **cable profile** command. Configure the required MAC domain and wideband interface parameters in the global service group profile configuration mode.

```

Router(config)#cable profile service-group SG-16x8-1_1
Router(config-profile-sg)#cable bundle bundle ID
Router(config-profile-sg)#mac-domain mac-domain ID profile mac-domain profile name
Router(config-profile-sg-md)#downstream sg-channel grouplist profile downstream interface
profile ID
upstream grouplist
Router(config-profile-sg-md)#upstream Id sg-channel sg channel Id
Router(config-profile-sg-md)#us-bonding-group bonding group ID
Router(config-profile-sg-md-usb)#upstream Id
Router(config-profile-sg-md-usb)#attributes mask
Router(config-profile-sg-md-usb)#exit
Router(config-profile-sg-md)#exit
Router(config-profile-sg)#

```

```

Router(config-profile-sg)#wideband-interface downstream bonding group id profile
downstream bonding group id
Router(config-profile-sg-bg)#downstream sg-channel grouplist rf-bandwidth-percent
bandwidth percent
Router(config-profile-sg-bg)#end
Router#

```

### Configuring mac-domain with shutdown

```

Router# show run | sec cable profile mac-domain MD1
cable profile mac-domain MD1
shutdown

Router# show run int c2/0/0
Building configuration...

Current configuration : 112 bytes
!
interface Cable2/0/0
shutdown
cable mac-domain-profile MD1
cable bundle 1
cable managed fiber-node 1
end

Router# show derive int c2/0/0
Building configuration...

```

```

Derived configuration : 487 bytes
!
interface Cable2/0/0
 shutdown
 downstream Integrated-Cable 2/0/0 rf-channel 0 profile DS
 upstream 0 Upstream-Cable 2/0/0 us-channel 0
 upstream 1 Upstream-Cable 2/0/0 us-channel 1
 upstream 2 Upstream-Cable 2/0/0 us-channel 2
 upstream 3 Upstream-Cable 2/0/0 us-channel 3
 cable mac-domain-profile MD1
 cable upstream bonding-group 1
   upstream 0
   upstream 1
   attributes 88000000
 cable bundle 1
 cable ip-init ipv4
 cable managed fiber-node 1
 cable mtc-mode
 cable mrc-mode
end

```

### Configuring mac-domain with cable upstream resiliency

```

Router# show cable profile mac-domain MD1
cable profile mac-domain MD1
 cable upstream resiliency on-failure reset-modem
 cable upstream resiliency channel -down-detect 50
 cable upstream resiliency sf-move RTPS
 cable upstream resiliency sf-move NRTPS
 cable upstream resiliency sf-move UGS
 cable upstream resiliency sf-move UGS-AD
 cable upstream resiliency data-burst snr 10 ufec 15 cfec 20 hysteresis 10

```

```

Router# show derive int c2/0/0
Building configuration...

```

```

Derived configuration : 814 bytes

 upstream 1
 attributes 88000000
 cable bundle 1
 cable ip-init ipv4
 cable managed fiber-node 1
 cable mtc-mode
 cable mrc -mode
end

```

## cable profile rpd-event

To configure an event profile and apply it to RPD, use the **cable profile rpd-event** *profile\_id* command in the global configuration mode.

```
cable profile rpd-event profile_id priority {0x00x10x20x3}
```

Syntax Description	rpd-event	Configures an event profile
	<i>profile-id</i>	Profile ID for the event.
	<i>priority</i>	The type of event. <ul style="list-style-type: none"> <li>• emergency</li> <li>• alert</li> <li>• critical</li> <li>• error</li> <li>• warning</li> <li>• notice</li> <li>• informational</li> <li>• debug</li> </ul>
	<i>{0x0 0x1 0x2 0x3}</i>	Type of notifications. <ul style="list-style-type: none"> <li>• 0x0—No log</li> <li>• 0x1— Save log in RPD local storage</li> <li>• 0x2—Report to Cisco cBR</li> <li>• 0x3—Save log in RPD local storage and report to Cisco cBR</li> </ul>

**Command Default** Not configured.

**Command Modes** Privileged Configuration Mode (config)

Command History	Release	Modification
	Cisco RPD IOS 1.1	The <b>cable profile rpd-event</b> <i>profile_id</i> command was introduced.

### Usage Guidelines

#### RPD Event Profile

The **cable profile rpd-event** *profile\_id* command is used to configure an RPD event profile. After you create an event profile, you can apply it to an RPD.

## RPD Event Profile

```
Router(config)>enable
Router#configure terminal
Router(config)#cable profile rpd-event 6
Router(config rpd-event)#priority emergency 0x3
Router(config rpd-event)#priority alert 0x3
Router(config rpd-event)#priority critical 0x3
Router(config rpd-event)#priority error 0x3
Router(config rpd-event)#priority warning 0x3
Router(config rpd-event)#priority notice 0x3
Router(config rpd-event)#priority informational 0x3
Router(config rpd-event)#enable-notify
Router(config)#cable rpd node6
Router(config-rpd)#identifier badb.ad13.5e08
Router(config-rpd)#core-interface Te3/1/5
Router(config-rpd-core)#principal
Router(config-rpd-core)#rpd-ds 0 downstream-cable 3/0/17 profile 10
Router(config-rpd-core)#rpd-us 0 upstream-cable 3/0/34 profile 13
Router(config-rpd-core)#r-dti 16
Router(config-rpd-core)#rpd-event profile 6
```

## cable proxy-arp

To activate cable proxy Address Resolution Protocol (ARP) on the cable interface or subinterface, use the **cable proxy-arp** command in cable interface or subinterface configuration mode. To disable this feature, use the **no** form of this command.

**cable proxy-arp**  
**no cable proxy-arp**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Proxy APR service is enabled.

**Command Modes**

Cable interface configuration (config-if)

Cable subinterface configuration (config-subif)

Command History	Release	Modification
	11.3 XA	This command was introduced.
	12.1(3a)EC	The subinterface support was added.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command enables or disables direct host-to-host communications over the same cable subnet. Because the downstream and upstream are separate interfaces, CMs cannot directly perform address resolution with other CMs on the cable plant. This means that the CMs must send all traffic through the CMTS, even if the destination CM is on the same subnet.

The **cable proxy-arp** command enables the Cisco CMTS to act as a proxy for ARP requests generated by the CMs, which allows CMs on the same cable subnet to communicate directly with each other, without the traffic having to be routed first through the CMTS. The **no cable proxy-arp** command disables this feature, preventing CMs on the same subnet from communicating with each other without routing the traffic through the CMTS.

**Note** Using the **no cable arp** and **no cable proxy-arp** commands shifts all responsibility for the management of the IP addresses used by CMs and CPE devices to the DHCP server and provisioning system.

### Examples

The following example shows how to activate proxy ARP for host-to-host communications:

```
Router(config-subif)# cable proxy-arp
```

The following example shows how to activate proxy ARP for host-to-host communications, on the cable subinterface:

**cable proxy-arp**

```
Router(config)# interface cable 6/0.1  
Router(config-subif)# cable proxy-arp
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable arp</b>	Activates cable Address Resolution Protocol (ARP).

## cable qos enforce-rule

To create an enforce-rule to enforce a particular quality of service (QoS) profile for subscriber traffic management, and to enter enforce-rule configuration mode, use the **cable qos enforce-rule** command in global configuration mode. To delete an enforce-rule and to remove it from the CMTS configuration, use the **no** form of this command.

**cable qos enforce-rule** *rule-name*  
**no cable qos enforce-rule** *rule-name*

### Syntax Description

<i>rule-name</i>	Name of the enforce-rule to be created and configured. This name can be any arbitrary and unique string from 1 to 15 characters in length.
------------------	--------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

No enforce-rules are created.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.3(9a)BC	This command was integrated into Cisco IOS Release 12.3(9a)BC. This command replaces the <b>cable qos monitoring</b> command.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable qos enforce-rule** command creates an enforce-rule with the specified name and then enters enforce-rule configuration mode. After entering enforce-rule configuration mode, use the following commands to configure the enforce-rule for uBR Series Routers:

- **activate-rule at-byte-count**
- **enabled (enforce-rule)**
- **enforced qos-profile**
- **monitoring-duration**
- **penalty-period**
- **registered qos-profile**

At the very minimum, you must use the **activate-rule at-byte-count** and **registered qos-profile** commands to configure an enforce-rule, and the **enabled** command to activate it, before it takes effect.

**Note** Effective with Cisco IOS Release 12.3(9a)BC, the **activate-rule at-byte-count** command is not available in Cisco IOS software.

### Maximum Number of Rules

The Cisco CMTS routers support a certain maximum number of enforce-rules depending on your Cisco IOS software release. If you have created the maximum number of enforce-rules and want to create another rule, you must first delete one of the existing rules.

- Cisco IOS Release 12.2(15)BC1 and later—Supports a maximum of 20 enforce-rules.
- Beginning in Cisco IOS Release 12.3(23)BC2—Supports a maximum of 40 enforce-rules.
- Cisco IOS Release IOS-XE 3.16.0S and later—Supports a maximum of 40 enforce-rules.

**Note** The maximum number of enforce-rules is counted as the total number of rules created on both the upstreams and downstreams combined.

### Examples

The following example shows the creation of an enforce-rule named “residential.” The system then enters the enforce-rule configuration mode.

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# ?
Configuration commands for QoS enforce rules:
  activate-rule      Activate rule parameters
  enabled           Enable the enforce-rule
  enforced          Enforced qos-profile
  exit             Exit from QoS enforce rule editing mode
  monitoring-duration Monitoring duration parameters
  no              Negate a command or set its defaults
  penalty-period   Penalty-period
  registered       Registered qos-profile
Router(enforce-rule)# activate-rule at-byte-count 50000000 downstream enforced
Router(enforce-rule)# registered qos-profile 5
Router(enforce-rule)# enforced qos-profile 99
Router(enforce-rule)# monitoring-duration 120 sample-rate 20
Router(enforce-rule)# penalty-period 1440
Router(enforce-rule)# enabled
Router(enforce-rule)# exit
Router(config)# exit
```

The following example shows the deletion of an enforce-rule named “test”:

```
Router# configure terminal
Router(config)# no cable qos enforce-rule test
```

The following example shows the error message that is displayed if you try to create more than 20 enforce-rules in Cisco IOS Release 12.3(23)BC1 and earlier:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Can't create more enforce-rules. The maximum number is 20.
```

The following example shows the error message that is displayed when you try to name an enforce-rule with a name that is larger than 15 characters. An error message is displayed, and the name is truncated to the first 15 characters.

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule reallyreallyreallylongname
Only the first 15 characters would be taken
```

The following example shows the creation of an enforce-rule named "test1" on Cisco cBR Series Converged Broadband Routers. The system then enters the enforce-rule configuration mode.

```
Router(config)#cable qos enforce-rule test1
Router(enforce-rule)# ?
Configuration commands for QoS enforce rules:
  Penalty-period      Penalty period in Minutes
  duration            Legacy monitoring parameters
  enabled             Enable the enforce-rule
  exit               Exit from QoS enforce rule editing mode
  monitoring-basics  Set the monitoring basics
  no                 Negate a command or set its defaults
  peak-time1        Peak-OffPeak parameters
  qos-profile        qos-profile for monitoring cable modems
  service-class      service-class for monitoring cable modems
  weekend            Setup different peak-time for weekends
```

### Related Commands

Command	Description
<b>activate-rule at-byte-count</b>	Specifies the number of bytes that a subscriber can transmit during the monitoring period.
<b>debug cable subscriber-monitoring</b>	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
<b>enabled (enforce-rule)</b>	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
<b>duration</b>	Specifies the time period and sample rate to be used for monitoring subscribers.
<b>penalty-period</b>	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
<b>qos-profile enforced</b>	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
<b>qos-profile registered</b>	Specifies the registered QoS profile that should be used for this enforce-rule.
<b>show cable qos enforce-rule</b>	Displays the QoS enforce-rules that are currently defined.
<b>show cable subscriber-usage</b>	Displays subscribers who are violating their registered QoS profiles.

## cable qos permission

To specify permission for updating the quality of service (QoS) table, use the **cable qos permission** command in global configuration mode. To remove a previously enabled permission, use the **no** form of this command.

**cable qos permission** {**create** | **enforce** *index* | **modems** | **update**}  
**no cable qos permission**

### Syntax Description

<b>create</b>	Permits creation of QoS table entries by Simple Network Management Protocol (SNMP).
<b>enforce</b> <i>index</i>	The <b>enforce</b> keyword overrides the provisioned QoS profile of the CM and enforces a specific CMTS-local QoS profile. The <i>index</i> argument specifies the number of the QoS profile to be enforced on all CMs connecting to the CMTS. Valid values are from 1 to 255.  <b>Note</b> Both the originally provisioned QoS profile and the enforced QoS profile must be created on the Cisco CMTS. This option does not support profiles that are created by the CM.
<b>modems</b>	Permits creation of QoS table entries by modem registration requests.
<b>update</b>	Permits dynamic update of QoS table entries by SNMP.

### Command Default

Enable by modem and SNMP.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
11.3 NA	This command was introduced.
11.3(9)NA	The <b>enforce</b> keyword was added.
12.1(4)CX	This command was deprecated for DOCSIS 1.1 use, because DOCSIS 1.1 replaces the QoS profile model with a service flow model.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If the QoS profile to be enforced does not exist at the CMTS during registration, the CMTS uses the QoS profile configured for the registering CM.

If you disable the use of CM-created profiles, using the **no cable qos permission** command, any CMs using such a profile go offline immediately and the CM-created profiles are removed.

This **no cable qos permission** command is similar to the `docsIfCmtsQosProfilePermissions` attribute in the DOCS-IF-MIB, as both prohibit CMs from creating their own QoS profiles in the future. However, the **no cable qos permission** command also immediately deletes QoS profiles that have been created by the cable modems and takes those modems offline. The `docsIfCmtsQosProfilePermissions` method does not affect QoS profiles that are currently in use, but only unused profiles and profiles that are created in the future.

**Examples**

The following example shows how to enable CMs to request arbitrary QoS parameters:

```
Router(config)# cable qos permission modems
```

The following example shows how a CM with a QoS profile 4 created by the CM is reset to use QoS profile 225 enforced by the cable router (management):

```
CMTS01# show cable modem
Interface      SID  Online      Timing Receive QoS IP address      MAC address
              State  Offset Power

**Related Commands**

Command	Description
<b>cable qos profile</b>	Configures a QoS profile.
<b>show cable qos permission</b>	Displays the status of permissions for changing QoS tables for a cable router.
<b>show cable qos profile</b>	Displays the QoS profiles that have been defined.

# cable qos pre-registration

To ensure that cable modems get online when a large number of existing online cable modems are actively transmitting data, use the **cable qos pre-registration us-priority** command.

**cable qos pre-registration us-priority** *priority-value*

<b>Syntax Description</b>	<b>us-priority</b>	Specifies the upstream priority to be assigned to the pre-registration traffic.
	<i>priority-value</i>	Priority value of the QoS profile-2. The valid range is from 0 to 7. <b>Note</b> When a cable modem begins initializing, its default upstream service flow is assigned a QoS profile-2 priority of zero. Zero is the lowest priority scheduled.

**Command Default** The default QoS profile-2 priority of the initializing cable modem is zero.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCD2	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable qos pre-registration** command allows the Cisco CMTS operators to enforce a profile on all cable modems that have not yet begun initialization. However, this command has no affect on cable modems that have already started initialization and may be having difficulties getting [w-]online.

**Examples** The following example shows how to set the priority of the QoS profile-2.

```
Router# configure terminal
Router(config)# cable qos pre-registration us-priority 2
Router(config)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show cable qos profile</b>	Displays the QoS profiles for a Cisco CMTS.

## cable qos pro max-ds-burst

To define ERBA on the downstream for DOCSIS 1.0 cable modems, use the **cable qos pro max-ds-burst** command in global configuration mode. To remove this ERBA setting from the QoS profile, use the **no** form of this command.

**cable qos pro max-ds-burst** *burst-size*  
**no cable qos pro max-ds-burst**

<b>Syntax Description</b>	<i>burst-size</i> The downstream burst size of QoS profile in bytes.
---------------------------	----------------------------------------------------------------------

**Command Default** This DOCSIS 1.0 configuration is disabled by default.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.3(13a)BC	This command was introduced for the Cisco uBR7100 Series and Cisco uB7246VXR router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** To display ERBA settings as applied to DOCSIS 1.0 cable modems and QoS profiles on the Cisco CMTS, use the **show cable qos profile** command in Privileged EXEC mode.

The following example of the **cable qos profile** command in global configuration mode illustrates changes to the **cable qos profile** command. Fields relating to the ERBA feature are shown in bold for illustration:

```
Router(config)# cable qos pro 10 ?
grant-interval      Grant interval
grant-size          Grant size
guaranteed-upstream Guaranteed Upstream
max-burst           Max Upstream Tx Burst
max-ds-burst       Max Downstream Tx burst (cisco specific)
max-downstream    Max Downstream
max-upstream        Max Upstream
name                QoS Profile name string (cisco specific)

priority            Priority
privacy             Cable Baseline Privacy Enable
tos-overwrite       Overwrite TOS byte by setting mask bits to value
```

The following example of the **show cable qos profile** command illustrates that the maximum downstream burst has been defined, and is a management-created QoS profile:

```
Router# show cable qos pro
ID Prio Max      Guarantee Max
      Max  TOS  TOS  Create  B  IP prec.
      upstream upstream downstream
tx  mask value by  priv rate
      bandwidth bandwidth bandwidth
burst  enab enab
```

```

1  0  0  0  0  0
    0  0xFF 0x0  cmts(r) no  no
2  0  64000  0  1000000
    0  0xFF 0x0  cmts(r) no  no
3  7  31200  31200  0
    0  0xFF 0x0  cmts  yes  no
4  7  87200  87200  0
    0  0xFF 0x0  cmts  yes  no
6  1  90000  0  90000
    1522
    0xFF 0x0  mgmt
    yes  no
10 1  90000  0  90000
    1522
    0x1  0xA0  mgmt
    no  no
50 0  0  0  96000
    0  0xFF 0x0  mgmt  no  no
51 0  0  0  97000
    0  0xFF 0x0  mgmt  no  no

```

The following example illustrates the maximum downstream burst size in sample QoS profile 10 with the **show cable qos prof verbose** command in privileged EXEC mode:

```

Router# show cable qos pro 10 ver
Profile Index                10
Name
Upstream Traffic Priority    1
Upstream Maximum Rate (bps) 90000
Upstream Guaranteed Rate (bps) 0
Unsolicited Grant Size (bytes) 0
Unsolicited Grant Interval (usecs) 0
Upstream Maximum Transmit Burst (bytes) 1522
Downstream Maximum Transmit Burst (bytes) 100000
IP Type of Service Overwrite Mask 0x1
IP Type of Service Overwrite Value 0xA0
Downstream Maximum Rate (bps) 90000
Created By mgmt
Baseline Privacy Enabled    no

```

If a cable modem registers with a QoS profile that matches one of the existing QoS profiles on the Cisco CMTS, then the maximum downstream burst size, as defined for that profile, is used instead of the default DOCSIS QoS profile of 1522.

For example, a DOCSIS 1.0 configuration that matches QoS profile 10 in the previous examples would be as follows:

```

03 (Net Access Control)      = 1
04 (Class of Service Encodings Block)
  S01 (Class ID)             = 1
  S02 (Maximum DS rate)      = 90000
  S03 (Maximum US rate)      = 90000
  S06 (US burst)             = 1522
  S04 (US Channel Priority)   = 1
  S07 (Privacy Enable)       = 0

```

The maximum downstream burst size (as well as the ToS overwrite values) are not explicitly defined in the QoS configuration file because they are not defined in DOCSIS. However, because all other parameters are a perfect match to profile 10 in this example, then any cable modem that registers with these QoS parameters has a maximum downstream burst of 100000 bytes applied to it.

For further illustration, consider a scenario in which packets are set in lengths of 1000 bytes at 100 packets per second (pps). Therefore, the total rate is a multiplied total of 1000, 100, and 8, or 800kbps.

To change these settings, two or more traffic profiles are defined, with differing downstream QoS settings as desired. The table below provides two examples of such QoS profiles for illustration:

**Table 9: Sample QoS Profiles with Differing ERBA (Maximum Downstream) Settings**

QoS Profile Setting	QoS Profile 101	QoS Profile 102
Maximum Downstream Transmit Burst (bytes)	max-burst 4000	max-burst 4000
Maximum Downstream Burst (bps)	max-ds-burst 20000	max-ds-burst 5000
Maximum Downstream Bandwidth	max-downstream 100	max-downstream 100

In this scenario, both QoS profiles are identical except for the max-ds-burst size, which is set to 5000 in QoS profile 101 and 5000 in QoS profile 102.

### Optimal Settings for DOCSIS 1.0 Downstream Powerburst

DOCSIS allows the setting different token bucket parameters for each service flow, including the token bucket burst size. When burst sizes are closer to 0, QoS is enforced in a stricter manner, allowing a more predictable sharing of network resources, and as a result easier network planning.

When burst sizes are larger, individual flows can transmit information faster (lower latency), although the latency variance can be larger as well.

For individual flows, a larger burst size is likely to be better. As long as the system is not congested, a large burst size reduces the chances of two flows transmitting at the same time, because each burst is likely to take less time to transmit. However, as channel bandwidth consumption increases, it is probably that large burst traffic would exceed the thresholds of buffer depths, and latency is longer than with well shaped traffic.

For additional information about the **cable qos profile** command and configuring QoS profiles, see the *DOCSIS 1.1 for the Cisco CMTS* document on Cisco.com.

### Related Commands

Command	Description
<b>cable qos profile</b>	Configures a QoS profile.
<b>show cable qos permission</b>	Displays the status of permissions for changing QoS tables for a cable router.
<b>show cable qos profile</b>	Displays the QoS profiles that have been defined.

# cable queue-limit

To set the DOCSIS service flow queue limits to non-default values on the Cisco CMTS, use the **cable queue-limit** command in global configuration mode. To disable this function, use the **no** form of this command.

**cable queue-limit** *queue\_limit\_in\_ms* **bandwidth-threshold** *threshold\_value*  
**no cable queue-limit** *queue\_limit\_in\_ms* **bandwidth-threshold** *threshold\_value*

## Syntax Description

<i>queue_limit_in_ms</i>	Queue limit in milliseconds. The valid range is from 1 to 200 milliseconds.
<i>threshold_value</i>	Queue bandwidth threshold in Kbps. The valid range is from 0 to 1000000.  <b>Note</b> The queue limit specification take effect only if the queue shape rate exceeds the queue-bandwidth threshold.

## Command Default

This command is not enabled by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCG	This command was introduced.
12.2(33)SCG1	Support was added for the Cisco uBR7200 Series router.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable queue-limit bandwidth-threshold** command is used to configure the [DOCSIS WFQ Scheduler on the Cisco CMTS Routers](#) feature.

The queue size on the downstream interfaces can be adjusted to be different than the default settings; for example, when the application can benefit from a larger queue size on a high speed queue.

The queue size in packets is calculated as:

$$\text{queue-size} = \text{bandwidth (Kbps)} * \text{queue-limit (ms)} / 8 / 1518$$

(where 1518 B is the packet size, and bandwidth is the same as queue shape rate).

## Examples

The following example shows how to set the queue limit to 25 ms at max-rate when bandwidth exceeds 100000 Kbps:

```
Router(config)# cable queue-limit 25 bandwidth-threshold 100000
```

## Related Commands

Command	Description
(For uBR10K Series Routers) <b>show cable modem queue</b>	Displays the queue information on the Cisco uBR7200 router.

Command	Description
(For uBR10K Series Routers) <b>show pxf cpu queue</b>	Displays parallel express forwarding (PXF) queuing, link queue statistics, and the service flow queue information including the queue size on the Cisco uBR10012 router.
(For uBR10K Series Routers) <b>show pxf cable interface</b>	Displays information about a particular service ID (SID), including information about the status of queues used by the SID on the Cisco uBR10012 router

## cable ranging cm packet

From cBR 16.12.1w and later, the rates of per-CM and per-US SNR have been improved, and supports the **cable ranging cm packet** command, which configures the number of ranging packets to get the CM-based SNR.

**cable ranging cm packet**

---

### Command Default

None

---

### Command Modes

Global configuration (config)

---

### Command History

Release	Modification
IOS-XE 16.12.1w	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to configure the number of ranging packets to get the CM-based SNR using the **cable ranging cm packet** command:

```
Router(config)# cable ranging cm packet
<1-20> number of ranging packet
```

## cable ranging upstream packet

From cBR 16.12.1w and later, the rates of per-CM and per-US SNR have been improved, and supports the **cable ranging upstream packet** command, which configures the number of ranging packets to get the US channel-base SNR.

**cable ranging upstream packet**

---

### Command History

Release	Modification
IOS-XE 16.12.1w	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following **cable ranging upstream packet** command example shows how to configure the number of ranging packets to get the US channel-base SNR:

```
Router(config)# cable ranging upstream packet
<10-80> packet number for ranging to average
```

## cable rate-limit-algorithm min-plus-excess

To enable a service flow to receive not only its configured minimum reserved traffic rate bandwidth but also its expected excess traffic rate bandwidth, use the **cable rate-limit-algorithm min-plus-excess** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**cable rate-limit-algorithm min-plus-excess**  
**no cable rate-limit-algorithm min-plus-excess**

### Syntax Description

<b>min-plus-excess</b>	Specifies that the service flow requires a bandwidth of the specified minimum reserved traffic rate, plus excess traffic rate.
------------------------	--------------------------------------------------------------------------------------------------------------------------------

### Command Default

When the **cable rate-limit-algorithm min-plus-excess** command is not configured, service flows with the minimum reserved traffic rate configured are guaranteed only their minimum reserved traffic rate. Excess traffic rate bandwidth may not be shared evenly among service flows with or without the minimum rate configured.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCD5	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to specify the **min-plus-excess** keyword:

```
Router> enable
Router# configure terminal
Router(config)# cable rate-limit-algorithm argument min-plus-excess
Router(config)#
```

### Related Commands

Command	Description
<b>show interface cable mac-scheduler</b>	Displays the current time-slot scheduling state, statistics, and weighted fair queuing (WFQ) parameters for the indicated cable interface.
<b>show interface cable service-flow</b>	Displays the attributes of the DOCSIS service flows on a cable interface.

# cable rcc-template

To define a receive channel configuration (RCC) template, use the **cable rcc-template** command in global configuration mode.

**cable rcc-template** *index*

## Syntax Description

<i>index</i>	Specifies an RCC template ID in the range 1 to 255.
--------------	-----------------------------------------------------

## Command Default

If an RCC template is not assigned to a cable interface, the CMTS will use the wideband cable interface generated RCC for a receive channel profile (RCP).

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the <b>cable rcc-templates frequency-based</b> command on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

A valid RCC template consists of a configured RCP ID, a receive module (RM) entry, and a receive channel (RC) entry.

First, you define an RCC template for an RCP, and then assign the template to a cable interface to generate RCCs based on the actual DS channel configuration.

**Note** When assigning an RCC template to a cable interface, use this command in interface configuration mode.

## Examples

The following example shows how to define an RCC template:

```
Router# configure terminal
Router(config)# cable rcc-template 1
```

## Related Commands

Command	Description
<b>rcp-id</b>	Specifies an ID for the Receive Channel Profile.
<b>receive-module</b>	Specifies a receive module entry in the form of a numeric value.
<b>receive-channel</b>	Specifies a receive channel entry in the form of a numeric value.

## cable rcc-templates frequency-based

To allow users to create RCC templates based on frequency-based RCC templates, use the **cable rcc-templates frequency-based** command in interface configuration mode. To remove an RCC template, use the **no** form of the command.

**cable rcc-templates frequency-based *ID***  
**no cable rcc-templates frequency-based *ID***

Syntax Description	frequency-based	Specifies frequency-based RCC templates (1 - 8).
	<i>ID</i>	RCC template ID. The range is from 1 to 64.

**Command Default** Associates an RCC template with a particular MAC domain.

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>cable rcc-template</b> command.

**Usage Guidelines** This command is used to define multiple RCC templates.

The following example shows how to define an RCC template:

```
Router(config)# cable rcc-templates frequency-based 1
Router(config-rcc-freq-based)# rcp-id 00 10 18 80 61
(config-rcc-freq-based)# cm-attribute-mask 00ffffff
(config-rcc-freq-based)# rcc-template 1
(config-rcc-freq-based-tmplt)# module 1 channel 1-4 start-frequency 111000000
(config-rcc-freq-based-tmplt)# module 2 channel 5-8 start-frequency 135000000

(config)# interface cable 7/0/0
(config-if)# cable rcc-templates frequency-based 1
```

Related Commands	Command	Description
	<b>cable rcp-id</b>	Specifies an ID for the Receive Channel Profile.

# cable rcp-control

To enable the receive channel profile (RCP) reporting with verbose description, use the **cable rcp-control** command in interface configuration mode. To revert to the default simple RCP reporting, use the **no** form of this command.

**cable rcp-control verbose**  
**no cable rcp-control**

<b>Syntax Description</b>	<b>verbose</b> Enables RCP reporting with verbose description that contains complete subtype encodings defined in DOCSIS 3.0.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------

**Command Default** If this command is not used, cable modems use the default RCP reporting method that contains only the RCP identifiers.

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to enable a CM to send detailed RCP data in the registration request. This detailed RCP data can be verified using the **debug cable registration** command. This verbose RCP data is useful while configuring a receive channel configuration (RCC) template.

## Examples

The following example shows how to enable RCP reporting with verbose description on a cable interface on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 8/0/0
Router(config-if)# cable rcp-control verbose
```

The following example shows how to enable RCP reporting with verbose description on a cable interface on the Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface cable 3/0/0
Router(config-if)# cable rcp-control verbose
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>debug cable registration</b>	Displays debug messages for the CM registration process.

Command	Description
(For Cisco uBR Series Routers) <b> cable rcc-template</b>	Defines a Receive Channel Configuration (RCC) template.
(For Cisco cBR Series Routers) <b> cable rcc-template frequency-based</b>	Defines a frequency based Receive Channel Configuration (RCC) template.

# cable rcp-id

To configure vendor specific Receive Channel Profile's (RCP), use the **cable rcp-id** command in global configuration mode.

**cable rcp-id** *rcp id*  
**no cable rcp-id** *rcp id*

## Syntax Description

*rcp id* Specifies a unique RCP ID in hexadecimal.

## Command Default

The Standard Receive Channel Profile's (RCP) defined in DOCSIS 3.0 MULPI Specification Annex E are pre-defined in the system by default. These RCP's are un-configurable and can be displayed using the **show cable rcps** command.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The RCP's define the physical layer components that permit CM to receive multiple downstream channels. All standard RCP's defined in DOCSIS 3.0 MULPI specification are already pre-loaded into the system. Users can configure vendor specific RCPs using this command.

The following example shows a typical display for the **cable rcp-id** *rcp id* command for all cable interfaces:

```
Router(config)#cable rcp-id 00 10 18 80 61
Router(config-rcp)#name TI
Router(config-rcp)#center-frequency-spacing 6
Router(config-rcp)#number-of-channels 8
Router(config-rcp)#primary-capable-channels 1
Router(config-rcp)#module 1 minimum-center-frequency 111000000 maximum-center-frequency
999000000 (config-rcp)#module 1 number-of-adjacent-channels 10
Router(config-rcp)#module 1 connected-module 1
Router(config-rcp)#module 2 minimum-center-frequency 111000000 maximum-center-frequency
999000000
Router(config-rcp)#module 2 number-of-adjacent-channels 10
Router(config-rcp)#module 2 connected-module 2 #show cable rcp-id 00 10 18 80 61
RCP-ID : 00 10 18 10 61
  Name      : TI
  Number of association      : 1
  Center Frequency Spacing  : 6
  Number of Channels        : 8
  Primary Capable Channels  : 1
  Number of Modules        : 2
  Module [1]:
    Number-of-adjacent-channels : 10
    Minimum-center-frequency    : 111000000
    Maximum-center-frequency    : 999000000
    Connected Module            : 1
  Module [2]:
    Number-of-adjacent-channels : 10
```

```
Minimum-center-frequency : 111000000  
Maximum-center-frequency : 999000000  
Connected Module         : 2
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>center-frequency-spacing</b>	Specifies center frequency spacing between each channel in RCP.
<b>number-of-channels</b>	Specifies the number of receive channels.

## cable reconciliation enable

If the cable modem does not respond to pings from the Cisco Converged Broadband Router, the modem DSBG, DSID, and the BPI index values on the Cisco Converged Broadband Router may be incorrect. To recover the unresponsive modem, run the **cable reconciliation enable command** to generate the correct DSBG, DSID, and the BPI index values.

**cable reconciliation enable**

**Command Default** None

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to recover unresponsive modems using the **cable reconciliation enable** command for all cable interfaces:

```
Router(config)#configure terminal
Router(config)# cable reconciliation enable
Router(config)# end
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable reconciliation time</b>	Specifies the time when the cable reconciliation enable command should run.

# cable reconciliation time

To set the time when the **cable reconciliation enable** command should run, use the **cable reconciliation time** *hours* command, where *hours* is the time in the 24 hour format.

**cable reconciliation time**

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	IOS-XE 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to set the time when the **cable reconciliation enable** command should run:

```
Router(config)#configure terminal
Router(config)# cable reconciliation time 23
Router(config)# end
```

**Related Commands**

Command	Description
<b>cable reconciliation enable</b>	Recover unresponsive modems.

# cable reduction-mode energy-management dynamic-channel-percent

To set the percentage of dynamic channel bandwidth, use the **cable reduction-mode energy-management dynamic-channel-percent** command in the global configuration mode. Use the **no** form of the command to restore the default value.

**[no] cable reduction-mode energy-management dynamic-channel-percent** *value*

<b>Syntax Description</b>	<i>value</i> Percentage to channel bandwidth when creating dynamic bonding groups for energy management. Valid range is from 1-96.				
<b>Command Default</b>	The default value is set to 5.				
<b>Command Modes</b>	Global configuration (config)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.18.0S</td> <td>This command was introduced on Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.
Release	Modification				
IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.				
<b>Usage Guidelines</b>	<p>The <b>cable reduction-mode energy-management dynamic-channel-percent</b> command sets the percentage of dynamic channel bandwidth.</p> <pre>Router# <b>configure terminal</b> Router (config)# <b>cable reduction-mode energy-management dynamic-channel-percent</b> 10</pre>				

# cable reduction-mode energy-management enable

To enable the energy management feature, use the **cable reduction-mode energy-management enable** command in the global configuration mode. To disable the energy management feature, use the **no** form of the command.

**[no] cable reduction-mode energy-management enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled.

**Command Modes** Global configuration (config)  
Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable reduction-mode energy-management enable** command enables the energy management mode.

The following example shows how to enable or disable the energy management feature:

```
Router# configure terminal
Router(config)# cable reduction-mode energy-management enable
Router(config)#no cable reduction-mode energy-management enable
```

## Related Commands

Command	Description
<b>show cable modem</b>	Shows if a modem is working in the energy management mode.
<b>Show cable modem reduction-mode energy-management-mode</b>	Shows the the original wideband and upstream channel information.

# cable reduction-mode energy-management process-queue-size

To set the queue size of the energy management requests, use the **cable reduction-mode energy-management process-queue-size** command in the global configuration mode. Use the **no** form of the command to restore the default value.

**[no] cable reduction-mode energy-management process-queue-size** *value*

## Syntax Description

*value* Queue size.

## Command Default

The default value is set to 150.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable reduction-mode energy-management process-queue-size** command sets the queue size of the energy management requests.

```
Router# configure terminal
```

```
Router (config) #cable reduction-mode energy-management process-queue-size 500
```

# cable reduction-mode energy-management ranging-init-technique

To configure the technique in init-ranging, use the **cable reduction-mode energy-management ranging-init-technique** command in global configuration mode. Use the **no** form of the command to restore the default value.

**[no] cable reduction-mode energy-management ranging-init-technique** *value*

---

**Syntax Description**     *value* Value of US init-ranging technique:

- 1—Broadcast
  - 2—Unicast
  - 3—Broadcast or unicast
  - 4—Direct use
- 

---

**Command Default**     The default value is set to 1.

---

**Command Modes**     Global configuration (config)

---

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

---

---

**Usage Guidelines**     The **cable reduction-mode energy-management ranging-init-technique** command sets the technique in init-ranging.

```
Router#configure terminal
Router(config)#cable reduction-mode energy-management ranging-init-technique
3
```

## cable reduction-mode mta-battery

To configure channel bonding downgrade for cable modems in battery backup mode, use the **cable reduction-mode mta-battery** command in global configuration and interface configuration mode. To remove the configuration, use the **no** form of this command.

**Note** For DOCSIS 3.1 battery mode, the inter-op testing with real CM is limited due to CM limitation. Most of the testing was run by simulation.

```
cable reduction-mode mta-battery { { dampen-time seconds } | { dynamic-channel-percent
percent } | { enable } | { process-queue-size size } | { ranging-init-technique
us-raning-init-technique } | { scqam-primary } }
```

Syntax Description		
<b>dampen-time</b> <i>seconds</i>		Specifies the dampen time in seconds. Valid range is from 30 to 300.
<b>dynamic-channel-percent</b> <i>percent</i>		Specifies the maximum and first try percentage of dynamic channel bandwidth in battery backup mode. Valid range is from 1 to 96.
<b>enable</b>		Enables the channel bonding downgrade for cable modems in battery backup mode.
<b>process-queue-size</b> <i>size</i>		Specifies the maximum transaction that can be processed at the same time. Valid range is from 50 to 10000.
<b>ranging-init-technique</b> <i>us-raning-init-technique</i>		Specifies the init-ranging technique. The valid values are: <ul style="list-style-type: none"> <li>• 1 - Broadcast.</li> <li>• 2 - Unicast.</li> <li>• 3 - Broadcast or Unicast.</li> <li>• 4 - Direct use.</li> </ul>
<b>scqam-primary</b>		Use SCQAM primary channel in battery backup mode when the modem is with OFDM primary channel. This option is disabled by default.

**Command Default** No default behavior or values.

### Command Modes

Global configuration (config)

Interface configuration—cable interface only (config-if)

MAC domain profile configuration (config-profile-md)

**Command History**

Release	Modification
Cisco IOS XE Dublin 17.12.1	This <b>scqam-primary</b> option is introduced.
12.2(33)SCI2	This command was introduced.
IOS-XE 3.16.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Use the **cable reduction-mode mta-battery** command to enable channel bonding downgrade for cable modems in battery backup mode. In addition, you can configure dampen time, init-range technique, maximum and first try percentage using this command.

**Examples**

The following example shows how to enable the channel bonding downgrade for cable modems in battery backup mode globally:

```
Router(config)# cable reduction-mode mta-battery enable
Router(config)#
```

The following example shows how to configure dampen time:

```
Router(config)# cable reduction-mode mta-battery dampen-time 30
Router(config)#
```

The following example shows how to configure the init-ranging technique:

```
Router(config)# cable reduction-mode mta-battery ranging-init-technique 3
Router(config)#
```

The following example shows how to configure the maximum and first try percentage of dynamic channel bandwidth in battery backup mode:

```
Router(config)# cable reduction-mode mta-battery dynamic-channel-percent 20
Router(config)#
```

The following example shows how to enable the channel bonding downgrade for cable modems in battery backup mode for each MAC domain:

```
Router(config-if)# cable reduction-mode mta-battery enable
Router(config-if)#
```

The following example shows how to enable support for DOCSIS 3.1 CM to single carrier (1 SCQAM DS + 1 SCQAM US) when it runs in Battery Reduction Mode:

:

```
Router(config-if)# cable reduction-mode mta-battery scqam-primary
Router(config-if)#
```

**Related Commands**

Command	Description
<b>show cable modem reduction-mode mta-battery</b>	Displays the channel bonding downgrade information for cable modems in battery backup mode.

# cable redundancy hashfilter

To set the MAC address and DDC node mappings of the DDC redundancy scheme, use the **cable redundancy hashfilter** command in global configuration mode. This hash filter is to be shared by all DDC nodes (routers) in the redundancy scheme. To remove the hash filter from the Cisco CMTS router, use the **no** form of this command.

```
cable redundancy hashfilter hash_id {type namestring | mac-mask mac-mask | mac-map mac-address
node node_id | oui-map oui node node_id}
no cable redundancy hashfilter
```

## Syntax Description

<i>hash_id</i>	Unique ID for the shared hash filter. Multiple (differently named) hash filters are supported in the same Cisco DDC Redundancy scheme at the same time, though only one hash filter can be enabled at any one time. The valid range is from 1 to 3.
<b>type</b> <i>namestring</i>	Alphanumeric hash filter name. Only the namestring of <b>default</b> is supported at this time.
<b>mac-mask</b> <i>mac-mask</i>	Specifies the number of bits in the cable modem's MAC address to be used by the hashing algorithm.
<b>mac-map</b> <i>mac-address</i>	A manually configured MAC address for the DDC node (overrides any default MAC address configured on the router).
<b>node</b> <i>node_id</i>	This value overrides the node that all cable modems with the shared <i>mac-address</i> or <i>oui</i> value will use, and updates the MAC address mapping in the hash filter.
<b>oui-map</b> <i>oui</i>	This value overrides the node that all cable modems with the shared OUI value will use, and updates the OUI address mapping in the hash filter.

## Command Default

- Cable redundancy hash filters are disabled (not configured) by default.
- Only the hash filter name of **default** is supported at this time.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command is used in the early stages of configuring DDC Redundancy on all DDC nodes (routers) in the scheme. For additional information in context, refer to the *Configuring Cisco DDC Redundancy on the Cisco uBR7246VXR Universal Broadband Router* feature documentation on Cisco.com.

**Note** This configuration must be present and identical on each CMTS router participating in the DDC redundancy scheme.

### Examples

The following example implements the **cable redundancy hashfilter** command in four sequential steps, completing the entire mapping information required for one DDC node in a redundancy scheme of two routers:

```
Router# cable redundancy hashfilter 1 type default
Router# cable redundancy hashfilter 1 macmask FFFF.FF00.0000
Router# cable redundancy hashfilter 1 macmap 0007.0e03.68ad node 2
Router# cable redundancy hashfilter 1 ouimap 00070e node 1
```

### Related Commands

Command	Description
<b>cable redundancy myid</b>	Sets the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme, and sets the ID of the current DDC node.
<b>cable redundancy node</b>	Configures the DDC node with active or standby state.
<b>show cable redundancy</b>	Displays the current DDC redundancy configurations and status.

## cable redundancy myid

To set the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme, and to set the ID of the current DDC node, use the **cable redundancy myid** command in global configuration mode. To remove a DDC node ID from the router, use the **no** form of this command.

**cable redundancy myid** *node\_id* **nodes** *nodes*  
**no cable redundancy myid** *node\_id*

### Syntax Description

<i>node_id</i>	A unique identifier for the Cisco DDC node currently being configured. The value must be 1 or greater (not to exceed the value used for nodes). This value must be unique on each CMTS that participates in the scheme.
<i>nodes</i>	Total number of Cisco CMTS routers participating in the DDC redundancy scheme (range 1 to 3). This value must be identical on all DDC nodes (routers).

### Command Default

DDC Redundancy is disabled and DDC nodes (routers) are not configured for DDC redundancy by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This configuration must be present (identical except *node\_id*) on all DDC nodes (routers) participating in the scheme.

This command is used in the early stages of configuring DDC Redundancy on all DDC nodes (routers) in the scheme. For additional information in context, refer to the *Configuring Cisco DDC Redundancy on the Cisco uBR7246VXR Universal Broadband Router* feature documentation on Cisco.com.

### Examples

The following example configures the DDC node (router) ID to be 2 in a scheme in which there are three DDC nodes total.

```
Router# cable redundancy myid 2 nodes 3
```

### Related Commands

Command	Description
<b>cable redundancy node</b>	Configures the DDC node with active or standby state.
<b>show cable redundancy</b>	Displays the current DDC redundancy configurations and status.

# cable redundancy node

To set the DDC node (router) with which a subinterface is associated, and to set the state for that interface, use the **cable redundancy node** command in subinterface configuration mode. To remove this configuration from the router, use the **no** form of this command.

```
cable redundancy node node_id {active | standby} [force]
no cable redundancy node node_id {active | standby}
```

## Syntax Description

<i>node_id</i>	DDC node (router) with which the subinterface is associated. The range is the number of DDC nodes in the scheme.
<b>force</b>	Optional keyword forces the subinterface into the standby state regardless of the number of active voice or E911 calls.

## Command Default

DDC switchover events are disabled by default and must be manually initiated on a case-by-case basis.

## Command Modes

Subinterface configuration (config-subif)

## Command History

Release	Modification
Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command can be used in the context of DDC configuration, testing or forced switchover events. Refer to earlier procedures in this document for additional information.

**Note** Use of this command is subject to additional constraints described in the *Active Voice Call Protection in Cisco DDC Redundancy* section of the *Configuring Cisco DDC Redundancy on the Cisco uBR7246VXR Universal Broadband Router* feature documentation on Cisco.com.

## Examples

The following command sequence sets the DDC node states in a scheme with two DDC nodes (routers), then forces a switchover event on DDC node 1 that puts it into standby state.

```
Router(config-subif)# cable redundancy node 2 active
Router(config-subif)# cable redundancy node 1 standby
Router(config-subif)# cable redundancy node 1 standby force
```

## Related Commands

Command	Description
<b>cable redundancy myid</b>	Sets the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme, and sets the ID of the current DDC node.

Command	Description
<b>show cable redundancy</b>	Displays the current DDC redundancy configurations and status.

# cable redundancy node frequency

To set the downstream frequencies for each node participating in the scheme other than the current DDC node (router), use the **cable redundancy node frequency** command in interface configuration mode. This frequency is used to switch cable modems to the downstream frequency of the backup interface (on another DDC node) via DFO and DCC messages. To remove this setting from the router, use the **no** form of this command.

**cable redundancy node** *node\_id* **frequency** *frequency*  
**no cable redundancy node** *node\_id* **frequency** *frequency*

## Syntax Description

<i>node_id</i>	DDC target node ID for which the frequency is being set.
<i>frequency</i>	Downstream frequency of the target interface.

## Command Default

Cable downstream frequency override is enabled by default.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command must be present on each cable interface participating in the scheme, regardless of its bundle status.

## Examples

The following example configures the downstream frequency of DDC node 1 to be 435000000.

```
Router(config-if)# cable redundancy node 1 frequency 435000000
```

## Related Commands

Command	Description
<b>cable redundancy myid</b>	Sets the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme, and sets the ID of the current DDC node.
<b>cable redundancy node</b>	Configures the DDC node with active or standby state.
<b>cable redundancy target</b>	Configures the DDC node by setting the target DDC node (router) to use in a DDC switchover event.
<b>cable redundancy threshold</b>	Configures the DDC node by setting the active voice call threshold on the current DDC node (router)
<b>show cable redundancy</b>	Displays the current DDC redundancy configurations and status.

# cable redundancy target

To set the target DDC node (router) to use in a DDC switchover event, use the **cable redundancy target** command in interface configuration mode. To remove this configuration from the router, use the **no** form of this command.

```
cable redundancy target node_id
no cable redundancy target node_id
```

## Syntax Description

<i>node_id</i>	Target node ID (in relation to the current DDC node)
----------------	------------------------------------------------------

## Command Default

When this command is not present, the default target node is the next higher node in the scheme.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The downstream frequency that is used in a DDC switchover event is the frequency set on the respective target DDC node, as set with this command.

**Note** This command may be present on each participating cable interface, regardless of its bundle status.

When this command is not present, the default target node is the next higher node in the scheme (the next higher *node\_id* value in the scheme). For example, if there are three participating nodes, the default target nodes are as follows (respectively):

- If the current node is 1, the target node is 2.
- If the current node is 2, the target node is 3.
- If the current node is 3, the target node is 1.

## Examples

The following example configures the target node on the current router to be DDC node 1, often referred to as CMTS A in additional sections of this document.

```
Router(config-if)# cable redundancy target 1
```

## Related Commands

Command	Description
<b>cable redundancy myid</b>	Sets the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme, and sets the ID of the current DDC node.
<b>cable redundancy node</b>	Configures the DDC node with active or standby state.

Command	Description
<b>cable redundancy node frequency</b>	Configures the DDC scheme by setting the DS frequencies for each node in the scheme other than the current DDC node (router).
<b>cable redundancy threshold</b>	Configures the DDC node by setting the active voice call threshold on the current DDC node (router).
<b>show cable redundancy</b>	Displays the current DDC redundancy configurations and status.

# cable redundancy threshold

To set the active voice call threshold on the current DDC node (router), use the **cable redundancy threshold** command in interface configuration mode. To remove this configuration from the router, use the **no** form of this command.

**cable redundancy threshold** *max-calls*  
**no cable redundancy threshold**

<b>Syntax Description</b>	<i>max-calls</i>	The threshold value for the number of active voice calls.
---------------------------	------------------	-----------------------------------------------------------

**Command Default** The threshold for maximum calls is not set by default.

**Command Modes** Interface configuration (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** If the number of active voice calls exceeds this value, a DDC switchover does not take place unless it is forced by using the **cable redundancy node** *node\_id* **standby force** subinterface configuration command.

If the command is configured on a bundle primary, the threshold is used to compare with the total number of voice calls in the bundle. This command is not accepted on interfaces configured as bundle subordinates.

If this threshold is not configured, this check does not occur and the DDC switchover proceeds regardless of how many voice calls are active. This is subject to additional constraints described in the *Call Priority in Cisco DDC Redundancy* section of the *Configuring Cisco DDC Redundancy on the Cisco uBR7246VXR Universal Broadband Router* feature documentation on Cisco.com.

## Examples

The following example configures DDC redundancy not to take place if there are more than 20 active or E911 calls at the time a DDC switchover event is attempted or requested.

```
Router(config-if)# cable redundancy threshold 20
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable redundancy myid</b>	Sets the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme, and sets the ID of the current DDC node.
	<b>cable redundancy node</b>	Configures the DDC node with active or standby state.
	<b>cable redundancy node frequency</b>	Configures the DDC scheme by setting the DS frequencies for each node in the scheme other than the current DDC node (router).

Command	Description
<b>cable redundancy target</b>	Configures the DDC node (node_id) by setting the target DDC node (router) to use in a DDC switchover event.
<b>show cable redundancy</b>	Displays the current DDC redundancy configurations and status.

## cable registration-timeout

To set the value of the DOCSIS registration timeout timer (T9 timer) on a particular interface, use the **cable registration-timeout** command in cable interface configuration mode. To reset the timeout value to the default, use the **no** form of this command.

**cable registration-timeout** *minutes*  
**no cable registration-timeout**

<b>Syntax Description</b>	<i>minutes</i>	Sets the value of the DOCSIS CM registration timeout timer (T9 timer). The range is from 2 to 60. The default is 3.
---------------------------	----------------	---------------------------------------------------------------------------------------------------------------------

**Command Default** 3 minutes

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(7)XR2	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The DOCSIS 1.1 specification states that the CMTS should enforce the T9 timer, which is a registration timeout timer that specifies the maximum time allowed between the CMTS sending a successful Ranging Response (RNG-RSP) message and the CM replying with a Registration Request (REG-REQ) message. If this timer expires, the CMTS must remove the CM from its list of active CMs, and the CM must restart the registration process.

The **cable registration-timeout** command can be used to customize the value of the T9 timer for each cable interface, to accommodate the CMs using that interface.

### Examples

The following example shows the registration timeout value being increased from 3 minutes to 10 minutes:

```
Router# configure terminal
Router (config)# interface c6/0
Router(config-if)# cable registration-timeout 10
Router(config-if)# exit
Router(config)#
```

# cable relay-agent-option

To enable the system to insert the CM MAC address into a Dynamic Host Configuration Protocol (DHCP) packet received from a CM or host and forward the packet to a DHCP server, use the **cable relay-agent-option** command in cable interface configuration mode. To disable MAC address insertion, use the **no** form of this command.

**cable relay-agent-option**  
**no cable relay-agent-option**

**Syntax Description** This command has no keywords or arguments.

**Command Default** MAC address insertion is disabled (**no cable relay-agent-option**).

**Command Modes** Interface configuration—cable interface only (config-if)

Release	Modification
11.3 NA	This command was introduced.
12.0 mainline, 12.1(2)EC1, 12.0(10) SC	This command was made obsolete and was replaced by the <b>ip dhcp relay information option</b> command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This functionality enables the use of DHCP Option 82 to allow a DHCP server to identify the CM sending the request and to initiate the appropriate action based on this information. On Cisco IOS Release 12.0 and later releases, use the **ip dhcp relay information option** command to enable Option 82 processing.

**Examples** The following example shows how to enable the insertion of DHCP relay agent information into DHCP packets:

```
Router(config-if)# cable relay-agent-option
```

Command	Description
<b>cable helper-address</b>	Specifies a destination IP address for User Datagram Protocol (UDP) broadcast (DHCP) packets.
<b>cable dhcp-giaddr</b>	Modifies the GIADDR field of DHCPDISCOVER and DHCPREQUEST packets with a Relay IP address before they are forwarded to the DHCP server.
<b>cable source-verify</b>	Turns on CM upstream verification.
<b>cable telco-return spd dhcp-authenticate</b>	Enforces the telco-return CM to use a specific DHCP server.

Command	Description
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CM must access.
<b>ip dhcp relay information option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host and forward the packet to a DHCP server.
<b>ip dhcp smart-relay</b>	Monitors client retransmissions when address pool depletion occurs.

## cable resiliency cm-max-rbg-moves

You can use the **cable resiliency cm-max-rbg-moves** command to configure the maximum number of times a CM can be moved to any RBG within the configured interval.

If a CM is currently at the configured limit, and it reports a new DS impairment, the CM moves to narrow band (primary DS only). CM-STATUS recovery events are still handled for CMs that are currently at the configured limit.

To disable this feature, use the **no** form of this command.

**cable resiliency cm-max-rbg-moves** *moves* **interval** *interval*

**no cable resiliency cm-max-rbg-moves** *moves* **interval** *interval*

Syntax Description	cm-max-rbg-moves <i>moves</i>	Number of times a CM can be moved to any RBG. The range is 1-10.
	interval <i>interval</i>	Configurable interval in minutes. The range is 1-65535.

**Command Default** This command is disabled by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1w	This command is introduced for the Cisco cBR Series Converged Broadband routers.

**Usage Guidelines** Use this command to enter configuration mode.

**Examples** The following example shows how to enter configuration mode:

```
router# configure terminal
router(config)#
```

The following example shows how to deny any CM from moving to RBG more than 5 times in one day

```
router(config)#cable resiliency cm-max-rbg-moves 5 interval 1440
router(config)#end
```

Use the following command to verify the configuration

```
router#show run | s cm-max-rbg-moves
cable resiliency cm-max-rbg-moves 5 interval 1440
```

Related Commands	Command	Description
	<b>show cable modem rbg-activity</b>	View CM RBG usage statistics.

## cable resiliency exclude

You can use the **cable resiliency exclude** command to exclude cable modems from Downstream Resiliency operations. This ensures that RBG and NB are not used and the resiliency activity reduces. The exclusion list is stored on the SUP.

The benefit of excluding cable modems is that you can manage the downstream resiliency feature better and improve CPU efficiency. The following scenarios are examples of when you can use this feature and exclude cable modems from Downstream Resiliency operations.

- If cable modems report an excessive amount of impairment or recovery events, then you can move cable modems to the exclusion list. You can use the **show cable resiliency counts** command to identify which downstream channels and cable modems have the most impairments.
- During planned maintenance windows, you can move cable modems to the exclusion list.

To disable this feature and remove the modem from the exclusion list, use the **no** form of this command.

**cable resiliency exclude** { **modem** *mac-address* | **oui** *id* }

**no cable resiliency exclude** { **modem** *mac-address* | **oui** *id* }

### Syntax Description

<b>modem</b> <i>mac-address</i>	Excludes the cable modem with the specified MAC address from Downstream Resiliency operations.
<b>oui</b> <i>id</i>	Excludes the specified Organizational Unique Identifier (OUI) from Downstream Resiliency operations.

### Command Default

This command is disabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1x	This command is introduced for the Cisco cBR Series Converged Broadband routers.

### Usage Guidelines

Use this command to enter configuration mode.

### Examples

```
router# configure terminal
router(config)#
```

The following example shows how to exclude a cable modem with a specified MAC address from Downstream Resiliency operations.

```
router(config)#cable resiliency exclude modem 34bd.fa0f.4784
router(config)#end
```

The following example shows how to exclude a cable modem with a specified OUI from Downstream Resiliency operations.

```
router(config)#cable resiliency exclude oui 34.bd.fa
router(config)#end
```

Use the following command to verify the configuration and view the list of excluded modems.

```
router# show cable resiliency exclude

#### Related Commands

Command	Description
<a href="#">show cable resiliency exclude</a>	Use this command to display a list of cable modems excluded from Downstream Resiliency operations.

## cable resiliency ds-bonding

To enable the Downstream Resiliency Bonding Group feature and to create a resiliency bonding group (RBG) on the Cisco CMTS router, use the **cable resiliency ds-bonding** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable resiliency ds-bonding**  
**no cable resiliency ds-bonding**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCG	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.	

**Usage Guidelines** The **cable ds-resiliency** command is used to configure the [Downstream Resiliency Bonding Group](#) feature.

**Examples** The following example shows how to configure the Downstream Resiliency Bonding Group feature:

```
Router(config)# cable resiliency ds-bonding
```

Related Commands	Command	Description
	<b>cable ds-resiliency</b>	Reserves a resiliency bonding group for a line card on the Cisco CMTS router.
	<b>show cable modem resiliency</b>	Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.
	<b>show cable resiliency</b>	Displays all information about resiliency bonding groups on the Cisco CMTS router.

## cable resiliency free-interval

To set the wait time before a created resiliency bonding group is freed/recycled, use the **cable resiliency free-interval** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable resiliency free-interval** *seconds*  
**no cable resiliency free-interval**

<b>Syntax Description</b>	<i>seconds</i> Specifies the wait time in seconds before a created resiliency bonding group is freed/recycled. The recommended value is 360.
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** None.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Gibraltar 16.12.1y	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command applies to all non-primary RF channels on a Cisco CMTS router.

**Examples** The following example shows how to specify the wait time in seconds before a created resiliency bonding group is freed/recycled:

```
Router# configure terminal
Router(config)# cable resiliency free-interval 360
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable rf-change-up-multiplier</b>	Specifies the rf-channel up dampen time as an integer multiplier of the rf-channel down dampen time.

## cable resiliency idle-interval

You can set the time in seconds for the **cable ds-resiliency idle-interval** *seconds* command to move an unused Resiliency Bonding Group's (RBG) state from `Assigned` to `In_Delete` in global configuration mode. To disable this feature, use the **no** form of this command.

**cable resiliency idle-interval** *seconds*  
**no cable resiliency idle-interval**

<b>Syntax Description</b>	<i>seconds</i> Specify the time in seconds for the <b>cable ds-resiliency</b> command to move an unused RBG's state from <code>Assigned</code> to <code>In_Delete</code> . The valid range is 1 to 3600. The default value is 300.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced for the Cisco cBR Series Converged Broadband Routers

**Usage Guidelines** Use the **cable ds-resiliency idle-interval** *seconds* command to move an unused Resiliency Bonding Group's (RBG) state from `Assigned` to `In_Delete`. This command applies to all non-primary RF channels on a Cisco CMTS router.

**Examples** The following example shows how to configure the **cable resiliency idle-interval** command:

```
Router# configure terminal
Router(config)# cable resiliency idle-interval 480
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable ds-resiliency</b>	Reserves a resiliency bonding group for a line card on the Cisco CMTS router.

## cable resiliency rbg-throttle

You can use the **cable resiliency rbg-throttle** command to reduce SUP CPU usage during CM Mass Registration Events. You can configure the SUP CPU threshold and CM online rate threshold.

To disable this feature, use the **no** form of this command.

```
cable resiliency rbg-throttle { auto { cm-threshold cm-threshold | cpu-threshold cpu-threshold | nb-to-rbg-rate nb-to-rbg-rate | settle-time time } | rate rate [ auto ] }
```

**no cable resiliency rbg-throttle**

### Syntax Description

<b>auto</b>	Resiliency bonding group throttle auto mode.
<b>rate</b>	Resiliency bonding group throttle rate.
<i>rate</i>	The number of RBGs that are created per minute. The range is 0-100.
<b>cm-threshold</b>	Auto mode CM online threshold.
<i>cm-threshold</i>	Average CM online rate per minute. The range is 0-500.
<b>cpu-threshold</b>	Auto mode cpu threshold.
<i>cpu-threshold</i>	Average cpu usage per minute. The range is 0-100.
<b>nb-to-rbg-rate</b>	Rate of moving CMs from throttled-cm list to RBGs.
<i>nb-to-rbg-rate</i>	<b>Cisco IOS XE Dublin 17.12.1y Release and earlier:</b> Number of CMs moved every 30 seconds. The range is 1-10. <b>Cisco IOS XE Dublin 17.12.1z Release and later:</b> Number of CMs moved every 60 seconds. The range is 1-20.
<b>settle-time</b>	Auto mode settling state duration.
<i>time</i>	Settle state duration in minutes. The range is 0-65535.

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1z	This rate and range for <i>nb-to-rbg-rate</i> values are updated.
Cisco IOS XE Bengaluru 17.6.1z	This command is introduced for the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to enter configuration mode.

## Examples

The following example shows how to enter configuration mode:

```
Router# configure terminal
Router(config)#
```

The following example shows how to configure RBG Throttle auto mode and set CM threshold, CPU threshold values, and settle time values.

```
Router(config)#cable resiliency rbg-throttle rate 10 auto
Router(config)#cable resiliency rbg-throttle auto cm-threshold 25
Router(config)#cable resiliency rbg-throttle auto cpu-threshold 95
Router(config)#cable resiliency rbg-throttle auto settle-time 2
Router(config)#cable resiliency rbg-throttle auto nb-to-rbg-rate 2
Router(config)#end
```

Use the following commands to verify the configuration.

- This is an example for **Cisco IOS XE Dublin 17.12.1z Release and later:**

```
Router# show cable resiliency throttled-cm stats
RBG Throttle:           Enabled
RBG Throttle Auto Mode: Enabled

RBG Throttle Auto Mode State:  STEADY
RBG Throttle Auto Mode Settling State Duration:  3 (minutes)
RBG Throttle Auto Mode NB to RBG Rate:  10 (per minute)

Metric:                Configured Threshold:  Current Value:
RBG Creation Rate      100                      0
CPU Usage              090%                     19
CM Online Rate        500                      0

Throttled CM Statistics  Rate (per minute)  Total
CMs Added to List:      0000                  0
CMs Removed from List:  0000                  0
Attempts to Remove:     0005                  10
RBG Creation:           0000                  4
```

- This is an example for **Cisco IOS XE Dublin 17.12.1y Release and earlier:**

```
Router# show cable resiliency throttled-cm stats
RBG Throttle:           Enabled
RBG Throttle Auto Mode: Enabled

RBG Throttle Auto Mode State:  STEADY
RBG Throttle Auto Mode Settling State Duration:  2 (minutes)
RBG Throttle Auto Mode NB to RBG Rate:  2 (per 30 seconds)

Metric:                Configured Threshold:  Current Value:
RBG Creation Rate      010                      0
CPU Usage              095%                     3
CM Online Rate        025                      0
```

```
Router# show cable resiliency throttled-cm list
Number of Throttled CMs: 3
```

```
MAC Address Timestamp
-----
c8fb.26a3.cd54 Jul 28 23:25:58
```

```
c8fb.26a3.961a Jul 28 23:26:06
c8fb.26a3.aa82 Jul 28 23:26:11
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable ds-resiliency</b>	Reserves a resiliency bonding group for a line card on the Cisco CMTS router.
<b>show cable resiliency throttled-cm</b>	Displays all information about resiliency bonding groups on the Cisco CMTS router.

# cable resiliency traps-interval

To set the interval at which traps must be sent for Wideband Resiliency related events for each cable modem on the Cisco CMTS, use the **cable resiliency traps-interval** command in global configuration mode. To disable the interval, use the **no** form of this command.

**cable resiliency traps-interval** *count*  
**no cable resiliency traps-interval**

<b>Syntax Description</b>	<i>count</i>	Time interval (in seconds) at which the traps must be sent for each cable modem. The range is from 0 to 86400. The default is 1.
---------------------------	--------------	----------------------------------------------------------------------------------------------------------------------------------

**Command Default** By default, the resiliency trap interval is enabled and set as 1 second.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCG2	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable resiliency traps-interval** command is associated with the [Wideband Modem Resiliency](#) feature. When the network has less number of cable modems with resiliency events occurring at a given time, use the default value of 1 second interval. But if the network has many cable modems with resiliency events occurring at a given time, set the interval to a higher value.

**Examples** The following example shows how to set the time interval to 10 second for sending traps for each cable modem:

```
Router(config)# cable resiliency traps-interval 10
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show cable modem resiliency</b>	Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.

## cable rf-adapt timer

To configure timers for RF adaptation, use the **cable rf-adapt timer** command in global configuration mode. To disable the timers, use the **no** form of this command.

**cable rf-adapt timer** {*general time* | *candidate time* | *relocation time*}  
**no cable rf-adapt timer**

### Syntax Description

<b>general</b>	Period when the RF adaptation process examines the physical layer statistics of all modems on RF adaptation-enabled upstream channels. The valid range is from 1 to 300 seconds. The default value is 10 seconds.
<b>candidate</b>	Period when the RF adaptation process examines the physical layer statistics of modems flagged as downgrade and/or upgrade candidates. The valid range is from 1 to 300 seconds. The default value is 1 second.
<b>relocation</b>	Period when the RF adaptation process performs a single relocation of a candidate modem from its current upstream channel to the appropriate destination. The valid range is from 1 to 300 seconds. The default value is 1 second.
<i>time</i>	Time in seconds. The valid range is from 1 to 300.

### Command Default

Default timer values are used.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to set timers for cable modem upstream RF adaptation:

```
Router(config)# cable rf-adapt timer general 120
Router(config)# cable rf-adapt timer candidate 10
Router(config)# cable rf-adapt timer relocation 5
```

### Related Commands

Command	Description
<b>cable upstream rf-adapt</b>	Enables RF adaptation on the physical upstream channel.
<b>cable upstream rf-adapt (logical channel)</b>	Configures the primary upstream logical channel and secondary upstream logical channel.

Command	Description
<b>cable upstream threshold</b>	Configures the upstream for the signal-to-noise ratio (SNR) and forward error correction (FEC) threshold values to be used in determining the allowable noise levels.
<b>cable upstream threshold hysteresis</b>	Configures the hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.
<b>cable upstream threshold rf-adapt</b>	Configures the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary upstream channel.
<b>show cable modem rf-adapt</b>	Displays the RF adaptation history.
<b>show cable rf-adapt</b>	Displays the downgrade and upgrade candidate lists.

## cable rf-bandwidth-percent

To enable either static or dynamic bandwidth sharing for a modular cable (MC) or integrated cable (IC) interface, use the **cable rf-bandwidth-percent** command in interface configuration mode or MAC domain profile configuration mode. To remove bandwidth sharing for the MC or IC interface, use the **no** form of this command.

**cable rf-bandwidth-percent** *percent-value* [**remaining ratio** *excess-value*]  
**no cable rf-bandwidth-percent**

### Cisco cBR Series Converged Broadband Routers

**cable rf-bandwidth-percent** *percent-value*

#### Syntax Description

<i>percent-value</i>	Specifies static bandwidth allocation of a downstream RF channel. The range is 1–96. The default is 0.
<b>remaining ratio</b>	(Optional) Specifies the ratio of the remaining or excess bandwidth that can be allocated to the modular cable channel. (For Cisco uBR10012 Router and Cisco uBR7200 Series Routers)  <b>Note</b> This option is only available when dynamic bandwidth sharing is enabled.
<i>excess-value</i>	(For Cisco uBR10012 Router and Cisco uBR7200 Series Routers) Specifies the value of excess bandwidth that can be allocated to the modular cable channel. The valid range is from 1 to 100. The default is 1.

#### Command Default

The default static bandwidth percentage for a modular cable or integrated cable interface is 0.

#### Command Modes

Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

#### Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.3(23)BC1	The <b>remaining ratio</b> option was added.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

#### Usage Guidelines

The total percentage of the RF channel bandwidth allocated to both the modular cable (MC) and wideband interfaces must not exceed 96 percent. The remaining 4 percent of the bandwidth is reserved for minislots.

allocation packet (MAP) and other MAC management messages (MMM) DOCSIS traffic using this RF channel as its primary channel.

When dynamic bandwidth sharing (DBS) is enabled on the MC or IC interface, the bandwidth percentage is converted to a committed information rate (CIR) value for the corresponding link queue. By re-interpreting the bandwidth percentage value as a CIR value for the interface, the interface receives, at minimum, the configured percent of bandwidth and more when the RF channel's bandwidth is not consumed by other interfaces sharing the same RF channel. The **remaining ratio** option (applicable only for Cisco uBR7K and uBR10K Series Routers) is only available when DBS is enabled using the **cable dynamic-bw-sharing** command.

**Note** For Cisco cBR Series Converged Broadband Routers, DBS is always enabled but the remaining ratio is not configurable.

(For Cisco uBR7K and uBR10K Series Routers) If the **cable rf-bandwidth-percent** command is not configured and DBS is enabled, no bandwidth is reserved for the MC interface and it is effectively in the protocol down state—the MC link queue is not created. Static bandwidth sharing (the default) or DBS can be configured on an MC interface, but you cannot have both on the same interface.

## Examples

The following is an example of static bandwidth allocation configuration:

```
Router# configure terminal
Router(config)# interface modular-cable 1/0/0:0
Router(config-if)# cable rf-bandwidth-percent 70
```

The following is an example of dynamic bandwidth sharing configuration:

```
Router# configure terminal
Router(config)# interface modular-cable 1/0/0:0
Router(config-if)# shutdown
Router(config-if)# cable dynamic-bw-sharing
Router(config-if)# no shutdown
Router(config-if)# cable rf-bandwidth-percent 70 remaining ratio 25
```

The following is an example of static bandwidth allocation configuration in cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface Integrated-cable 3/0/0:0
Router(config-if)# cable rf-bandwidth-percent 70
```

## Related Commands

Command	Description
<b>cable dynamic-bw-sharing</b>	Enables dynamic bandwidth sharing on a specific modular cable or wideband cable interface.
<b>cable rf-channel</b>	Associates an RF channel on a Wideband SPA with a wideband channel and allocates bandwidth.
<b>show pxf cable controller</b>	Displays information about the RF channel Versatile Traffic Management System (VTMS) links and link queues.

Command	Description
<b>show pxf cpu queue</b>	Displays parallel express forwarding (PXF) queueing and link queue statistics.

## cable rf-change-dampen-time

To configure the amount of time a radio frequency (RF) channel must remain in its new state (either up or down), use the **cable rf-change-dampen-time** command in global configuration mode. To restore the default value, use the **no** form of this command.

**cable rf-change-dampen-time** *seconds*  
**no cable rf-change-dampen-time**

<b>Syntax Description</b>	<i>seconds</i>	Specifies the amount of time in seconds for a non-primary RF channel to remain in its new state. The valid range is 1 to 65535. The default value is 60.
---------------------------	----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** If this command is not used, the default value of 30 seconds is restored.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS XE 17.3.1z	The default value was updated.

**Usage Guidelines** This command applies to all non-primary RF channels on a CMTS.

**Examples** The following example shows how to specify the amount of time for a non-primary RF channel to remain in its new state:

```
Router# configure terminal
Router(config)# cable rf-change-dampen-time 10
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable rf-change-trigger</b>	Specifies the persistence thresholds for an event before the event triggers an action for the cable modem.

## cable rf-change-trigger

To specify the amount of time an event must persist before it triggers an action for the reporting cable modem, use the **cable rf-change-trigger** command in global configuration mode. To restore the default value, use the **no** form of this command.

**cable rf-change-trigger** {*percent value* | *count number*} [*secondary*]

**no cable rf-change-trigger** {*percent value* | *count number*} [*secondary*]

### Syntax Description

<b>percent</b> <i>value</i>	Indicates the percentage of cable modems that must report that a particular non-primary RF channel is down before that channel is suspended from the bonding group. The valid range is 1 to 100. The default is 50.
<b>count</b> <i>number</i>	Specifies the number of cable modems that must report that a particular non-primary downstream channel is down before that channel is suspended from the downstream bonding groups. The default is 0
<b>secondary</b>	(Optional) Configures the Cisco CMTS to move the unicast secondary service flows to the primary channel interface, when the number of cable modems reporting RF channel impairment is less than the configured (percent or count) threshold.  By default, the <b>secondary</b> keyword is not configured.  <b>Note</b> Only those unicast secondary service flows, which share the same wideband interface as the primary interface, are moved to the primary channel interface.

### Command Default

If this command is not used, the default value 0 is used.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCE4	This command was modified. A new keyword <b>secondary</b> was added to move the unicast secondary SFs, which share the same interface as the primary SF, to the primary channel interface when the trigger threshold is not reached.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE 17.3.1z	The default value was updated.

### Usage Guidelines

The **cable rf-change-trigger** command is used to configure the [Wideband Modem Resiliency](#) feature.

This command applies to all non-primary RF channels on a Cisco CMTS router. The default value of 0 prevents any bonding group modifications. In order to dampen the change of a logical state of an RF channel, the trigger for the channel can be set to one half of the number used for the logical state. For example, if you enter **cable rf-change-trigger percent 20**, when 20 percent of the cable modems report an RF channel is down, the logical state of the RF channel is changed to down. And when 10 percent of the cable modems report that the affected RF channel is back, the logical state is changed to up.

In the case of a small number of wideband modems, you can specify an absolute value for triggering an event in addition to the percentage. Both values must be true in order to trigger the suspension of an RF channel. When both values are 0, the cable modem is reset if the cable modem reports an RF failure through a status message. Also, if you set thresholds to 0, then all cable modems with RF failures are reset and any RFs suspended from a bonding group are reactivated.

### Examples

The following example shows how to specify the amount of time an event must persist before it triggers an action for the reporting cable modem:

```
Router# configure terminal
Router(config)# cable rf-change-trigger percent 50 count 1
The following example shows how to configure the Cisco CMTS to move secondary SFs to primary
interface when the trigger threshold is not reached, in Cisco IOS Release 12.2(33)SCE4:
Router# configure terminal
Router(config)# cable rf-change-trigger percent 50 count 1 secondary
```

### Related Commands

Command	Description
<b>cable rf-change-dampen-time</b>	Specifies the amount of time an RF channel must remain in its new state.

## cable rf-change-up-multiplier

To set the rf-channel up dampen time as an integer multiplier of the rf-channel down dampen time, use the **cable rf-change-up-multiplier** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable rf-change-up-multiplier** *value*  
**no cable rf-change-up-multiplier**

<b>Syntax Description</b>	<i>value</i> Specifies the multiplier of the rf-channel down dampen time. The valid range is 1 to 10. The default value is 1.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------

**Command Default** 1

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Gibraltar 16.12.1y	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Gibraltar 16.12.1z2	This command was updated on the Cisco cBR Series Converged Broadband Routers. The default value was updated to 1.

**Usage Guidelines** This command applies to all non-primary RF channels on a Cisco CMTS router.

**Examples** The following example shows how to specify the multiplier of the rf-channel down dampen time:

```
Router# configure terminal
Router(config)# cable rf-change-up-multiplier 2
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable resiliency free-interval</b>	Specifies the wait time before a created resiliency bonding group is freed/recycled.

## cable rf-channel

To associate an RF channel on the Cisco Wideband SPA with a wideband interface and allocate bandwidth, use the **cable rf-channel** command in interface configuration mode. To remove an association of an RF channel to a wideband interface, use the **no** form of this command.

**cable rf-channel** {*rf-port* | **controller** *controller-num* **channel** *channel-num*} [**bandwidth-percent** *bw-percent*] [**remaining ratio** *excess-value*]

**no cable rf-channel** {*rf-port* | **controller** *controller-num* **channel** *channel-num*}

### Syntax Description

<i>rf-port</i>	Specifies the RF channel physical port on the Wideband SPA field-programmable gate array (FPGA).  <b>Note</b> Valid values for the RF <i>port</i> depend on the configuration set with the <b>annex modulation</b> command (see the “Usage Guidelines” section).
<i>controller controller-num</i>	Specifies the controller associated with the RF channel. The valid range is from 0 to 4.  Effective with Cisco IOS Release 12.2(33)SCH for Bonding Across 3G60 Controllers Support feature, valid range is from 0 to 2.
<i>channel channel-num</i>	Specifies the channel from the controller. The valid range is from 0 to 3.  Effective with Cisco IOS Release 12.2(33)SCH for Bonding Across 3G60 Controllers Support feature, valid range is from 0 to 23.
<b>bandwidth-percent</b> <i>bw-percent</i>	(Optional) Specifies the percent of bandwidth from this RF channel that will be used for the wideband interface. The range is 0 to 100. If <b>bandwidth-percent</b> is not used, the default bandwidth value is 100 percent.
<b>remaining ratio</b> <i>excess-value</i>	(Optional) Specifies the ratio of the excess bandwidth that can be allocated to the wideband interface. The default value is 1. The range is 1 to 100.  <b>Note</b> This option is only available when dynamic bandwidth sharing (DBS) is enabled.

### Command Default

No default RF channel association with a wideband interface is configured. If the **cable rf-channel** command is used without specifying **bandwidth-percent**, the default bandwidth value is 100 percent.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.3(23)BC	The <b>annex</b> and <b>modulation</b> keyword options were added.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.3(23)BC1	The <b>remaining ratio</b> option was added.

Release	Modification
12.2(33)SCB	The <b>remaining ratio</b> option was integrated into Cisco IOS Release 12.2(33)SCB.
12.2(33)SCH	The <b>controller</b> option is supported for the Cisco uBR-MC3GX60V cable interface line card on the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable rf-channel** command associates an RF channel (port) on a Wideband SPA with a wideband interface. Optionally, you can specify the percent of bandwidth from this RF channel that will be used for the specified wideband interface.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM modulation, each Wideband SPA supports up to 18 RF channels at full rate and up to 24 RF channels at less than full rate. For all other cases, the SPA supports 24 RF channels.

**Note** The command changes in Cisco IOS releases 12.3(23)BC and 12.3(23)BC1 are not supported in Cisco IOS release 12.2(33)SCA.

**Note** In Cisco IOS Releases 12.3(21)BC and 12.3(21a)BC3, the **cable rf-channel** command is not available on the Cisco IOS command line until annex and modulation have been set with **annex modulation** command. Effective with Cisco IOS Release 12.3(23)BC, the **annex modulation** command is obsolete and **annex** and **modulation** are included as keyword options in the **rf-channel frequency** command.

Each Wideband SPA supports up to 32 wideband channels. A wideband interface cannot consist of RF channels from two different Wideband SPAs. The number of RF channels that can be aggregated into a wideband interface is determined by the capability of the wideband cable modem.

- The Linksys WCM300-NA, WCM300-EURO, and WCM300 JP wideband cable modems can receive a wideband interface consisting of up to eight downstream RF channels at 6 MHz per channel, or up to six downstream RF channels at 8 MHz per channel. The modem requires that the channels be received in a 50-MHz capture window.
- The Scientific Atlanta DPC2505 and EPC2505 wideband cable modems support the receiving of one wideband interface. The wideband channel consists of three downstream RF channels at either 6 MHz per channel or 8 MHz per channel.

An RF channel can be associated with multiple wideband interfaces as long as the wideband interfaces belong to the same virtual bundle interface (cable bundle) and the RF channel's total allocated bandwidth does not exceed 100 percent. As an example, the table below shows that a single RF channel can be associated with multiple wideband interfaces as long as the total allocated bandwidth for the RF channel does not exceed 100 percent.

Table 10: RF Channel Bandwidth Allocation

RF Channel	Wideband Interface	Bandwidth Allocated
10	0	30 percent
10	1	30 percent
10	2	40 percent
<b>Total Bandwidth Percent:</b> 100 percent		

The table below shows that a single RF channel can be associated with a narrowband and multiple wideband interfaces as long as the total allocated bandwidth for the RF channel does not exceed 100 percent.

Table 11: Bandwidth Allocation Using a Primary-Capable RF Channel

	Modular Cable Interface	Wideband Channel 0	Wideband Channel 1	Wideband Channel 2	Total Bandwidth Percent
Bandwidth Allocated from RF Channel 10	54 percent (4 percent used internally for DOCSIS signaling)	10 percent	22 percent	14 percent	100 percent

**Note** Each RF channel on the CMTS can be mapped to a specific QAM port on an edge QAM device. Traffic from different Wideband SPAs cannot be mixed on the same QAM port.

When dynamic bandwidth sharing (DBS) is enabled, the bandwidth percentage is converted to a committed information rate (CIR) value that provides the level of guaranteed bandwidth for the wideband interface. The reserved bandwidth for the wideband interface is the sum of its link queue CIR values and is used for admission control of the service flows with minimal reserved rate. With DBS enabled and the **cable rf-channel** command configured, the corresponding link queue can have 100 percent of the CIR value. The *excess-value* is the percent of excess bandwidth that can be allocated to the wideband channel.

Static bandwidth sharing (the default) or DBS can be configured on a wideband interface, but you cannot have both on the same interface.

## Examples

The following example shows how to associate RF channel 10 and RF channel 11 with wideband interface 0:

```
Router(config)# interface wideband-cable 1/0/0:0
Router(config-if)# cable rf-channel 10 bandwidth-percent 50

Router(config-if)# cable rf-channel 11
```

The following example shows how to associate a controller to the RF channel for a wideband interface:

```
Router(config)# interface wideband-Cable 7/1/0:0
Router(config-if)# cable rf-channel controller 0 channel 1
```

In the preceding example, because no **bandwidth-percent** is specified in the second **cable rf-channel** command, the default value (100 percent of bandwidth) applies; that is, 100 percent of RF channel 11 bandwidth is used for wideband interface 0.

The following example shows bandwidth allocation when DBS is enabled:

```
Router(config)# interface wideband-cable 1/0/0:0
Router(config-if)# shutdown
Router(config-if)# cable dynamic-bw-sharing
Router(config-if)# no shutdown
Router(config-if)# cable rf-channel 10 bandwidth-percent 50
                remaining ratio 5
```

In the preceding example, because DBS is enabled, the wideband interface is guaranteed 50 percent of the bandwidth and 5 as the value for allocating excess bandwidth.

The following example shows how the Bonding Groups Across 3G60 Controllers feature is configured:

```
Router(config-if)#interface wideband-cable 7/0/1:30
Router(config-if)#cable rf-channel controller 1 channel 21 bandwidth-percent 10
Router(config-if)#cable rf-channel controller 1 channel 22 bandwidth-percent 10
Router(config-if)#cable rf-channel controller 1 channel 23 bandwidth-percent 10
Router(config-if)#cable rf-channel controller 0 channel 21 bandwidth-percent 10
Router(config-if)#cable rf-channel controller 0 channel 22 bandwidth-percent 10
Router(config-if)#cable rf-channel controller 0 channel 23 bandwidth-percent 10
Router(config-if)#cable rf-channel 18 bandwidth-percent 10
Router(config-if)#cable rf-channel 19 bandwidth-percent 10
Router(config-if)#end
```

## Related Commands

Command	Description
<b>annex modulation</b>	Sets the annex and modulation for the Wideband SPA.
<b>cable bonding-group-id</b>	Specifies a Bonding Group ID and indicates whether the bonding group is a primary or secondary bonded channel.
<b>cable dynamic-bw-sharing</b>	Enables dynamic bandwidth sharing on a specific modular cable or wideband cable interface.
<b>controller modular-cable</b>	Enters controller configuration mode to configure the Wideband SPA controller.
<b>downstream cable</b>	Assigns a primary downstream channel for a fiber node.
<b>ip-address (controller)</b>	Sets the IP address of the Wideband SPA FPGA.
<b>modular-host subslot</b>	Specifies the modular-host line card for Wideband protocol operations.
<b>rf-channel cable downstream channel-id</b>	Assigns a downstream channel ID to an RF channel.
<b>rf-channel description</b>	Specifies the description for each RF channel.
<b>rf-channel frequency</b>	Sets the frequency for each RF channel.
<b>rf-channel ip-address mac-address udp-port</b>	Sets the IP address, MAC address and UDP port for each RF channel.

Command	Description
<b>rf-channel network delay</b>	Specifies the CIN delay for each RF channel.
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.

## cable rf-channels

To associate RF channels on the router with a wideband interface and allocate bandwidth, use the **cable rf-channels** command in interface configuration mode. To remove the association of an RF channel with a wideband interface, use the **no** form of this command.

**Note** This command can be used in the wideband interface configuration to specify RF channels on different controllers or to specify different bandwidth percentages.

**cable rf-channels** [**controller** *controller number*] **channel-list** *group-list* [**bandwidth-percent** *bw-percent*]  
**no cable rf-channels** [**controller** *controller number*] **channel-list** *group-list*

Syntax Description		
<b>channel-list</b> <i>group-list</i>		Specifies the channels from the controller. The valid range is from 0 to 127.
<b>controller</b> <i>controller number</i>		(Optional) Specifies the controller associated with the RF channel. The range is from 0 to 7. If not specified, the controller is the same as wideband interface's controller.
<b>bandwidth-percent</b> <i>bandwidth-percent</i>		(Optional) Specifies the percent of bandwidth from this RF channel that is used for the wideband interface. The range is from 0 to 100.

**Command Default** RF channel is not associated with a wideband interface.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** An RF channel can be associated with multiple wideband interfaces as long as the wideband interfaces belong to the same virtual bundle interface (cable bundle) and the RF channel's total allocated bandwidth does not exceed 100 percent.

An RF channel may be associated to a wideband interface on a different controller using the "controller" option, however the following restriction applies. Wideband interfaces on controllers 0 - 3 may only include RF channels on the same controllers. Likewise, wideband interfaces on controllers 4 - 7 may only include RF channels on those controllers.

The following example shows how to associate an RF channel with wideband interface and allocate bandwidth:

```
Router(config)# interface Wideband-Cable3/0/0:60
Router(config-if)# cable bundle 1
Router(config-if)# cable rf-channels channel-list 0-1 3-31 bandwidth-percent 1
```

```
Router(config)# interface Wideband-Cable3/0/0:45
Router(config-if)# cable bundle 1
Router(config-if)# cable rf-channels controller 2 channel-list 4-6 bandwidth-percent 2
```

# cable rswitch copy

To copy an image from the Cisco CMTS router to the Cisco NGRFSW-ADV or from Cisco NGRFSW-ADV to the Cisco CMTS, use the **cable rswitch copy** command in privileged EXEC mode.

**cable rswitch copy** *filename\_cmts* {**to-rfsw** | **from-rfsw**} *filename\_rfsw*

## Syntax Description

<i>filename_cmts</i>	Filename of the image on or copied to the Cisco CMTS router.
<b>to-rfsw</b>	Copies an image from the Cisco CMTS router to the Cisco NGRFSW-ADV.
<b>from-rfsw</b>	Copies an image from the Cisco NGRFSW-ADV to the Cisco CMTS router.
<i>filename_rfsw</i>	Filename of the image on or copied to the Cisco NGRFSW-ADV.

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use the **cable rswitch copy** command when an existing image on the Cisco NGRFSW-ADV or Cisco CMTS router is corrupt or out-of-date and needs to be replaced with another image.

## Examples

The following example shows how to download the gcv2.11 image from the Cisco CMTS router to the Cisco NGRFSW-ADV:

```
Router> enable
Router# cable rswitch copy disk0:gcv2.11 to-rfsw gcv2.11
```

The following example shows how to upload the gcv2.11 image from the Cisco NGRFSW-ADV to the Cisco uBR10012 CMTS:

```
Router> enable
Router# cable rswitch copy disk0:gcv2.11 from-rfsw gcv2.11
```

## Related Commands

Command	Description
<b>show hccp channel-switch state</b>	Displays the current state of the Cisco NGRFSW-ADV.

# cable rfs switch delete

To delete an image in the Cisco NGRFSW-ADV, use the **cable rfs switch delete** command in privileged EXEC mode.

**cable rfs switch delete** *filename\_rfs*

<b>Syntax Description</b>	<i>filename_rfs</i>	Filename of the image on the Cisco NGRFSW-ADV that needs to be deleted.
---------------------------	---------------------	-------------------------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Privileged EXEC (#)
----------------------	---------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCG	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable rfs switch delete** command is used to configure the Cisco uBR Advanced RF Switch (NGRFSW-ADV). For more information, see the [Cisco uBR Advanced RF Switch Software Configuration Guide](#).

Use the **cable rfs switch delete** command when an existing image on the Cisco NGRFSW-ADV is corrupt, out-of-date, or needs to be replaced with another image. You cannot delete the active or the golden image on the Cisco NGRFSW-ADV.

## Examples

The following example shows how to delete the gcv2.11 image on the Cisco NGRFSW-ADV:

```
Router> enable
Router# cable rfs switch delete gcv2.11
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show hccp channel-switch image</b>	Displays the image list on the Cisco NGRFSW-ADV.
	<b>show hccp channel-switch state</b>	Displays the current state of the Cisco NGRFSW-ADV.

# cable rfs witch reboot

To reboot the Cisco NGRFSW-ADV, use the **cable rfs witch reboot** command in privileged EXEC mode.

## cable rfs witch reboot

<b>Syntax Description</b>	<b>reboot</b> Reboots the Cisco NGRFSW-ADV.
---------------------------	---------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Privileged EXEC (#)
----------------------	---------------------

<b>Usage Guidelines</b>	The <b>cable rfs witch reboot</b> command is used to configure the Cisco uBR Advanced RF Switch (NGRFSW-ADV). For more information, see the <a href="#">Cisco uBR Advanced RF Switch Software Configuration Guide</a> .
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>Examples</b>	The following example shows how to reboot the Cisco NGRFSW-ADV:
-----------------	-----------------------------------------------------------------

```
Router> enable
Router# cable rfs witch reboot
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show hccp channel-switch image</b>	Displays the image list on the Cisco NGRFSW-ADV.
	<b>show hccp channel-switch state</b>	Displays the current state of the Cisco NGRFSW-ADV.

## cable rfs switch set-active

To set an image as active on the Cisco NGRFSW-ADV, use the **cable rfs switch set-active** command in privileged EXEC mode.

**cable rfs switch set-active** *filename\_rfs*

<b>Syntax Description</b>	<i>filename_rfs</i>	Filename of the image on the Cisco NGRFSW-ADV that needs to be set as active.
---------------------------	---------------------	-------------------------------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	Privileged EXEC (#)
----------------------	---------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCG	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable rfs switch set-active** command is used to configure the Cisco uBR Advanced RF Switch (NGRFSW-ADV). For more information, see the [Cisco uBR Advanced RF Switch Software Configuration Guide](#).

**Examples** The following example shows how to set the gcv2.11 image as active on the Cisco NGRFSW-ADV:

```
Router> enable
Router# cable rfs switch set-active gcv2.11
Router# cable rfs switch reboot
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show hccp channel-switch image</b>	Displays the image list on the Cisco NGRFSW-ADV.
	<b>show hccp channel-switch state</b>	Displays the current state of the Cisco NGRFSW-ADV.

# cable rpd

To enter the RPD configuration mode, use the **cable rpd** command in global configuration mode. To void the RPD configuration, use the **no** form of this command.

**cable rpd** *name*

**no cable rpd** *name*

<b>Syntax Description</b>	<i>name</i> Specifies the name of the RPD.						
<b>Command Default</b>	None.						
<b>Command Modes</b>	Global configuration (config)						
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.5.1</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> <tr> <td>Cisco IOS XE Fuji 16.8.1</td> <td>This command was updated to support Generic Control Protocol Principal (GCPP) on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.	Cisco IOS XE Fuji 16.8.1	This command was updated to support Generic Control Protocol Principal (GCPP) on the Cisco cBR Series Converged Broadband Routers.
Release	Modification						
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.						
Cisco IOS XE Fuji 16.8.1	This command was updated to support Generic Control Protocol Principal (GCPP) on the Cisco cBR Series Converged Broadband Routers.						

**Usage Guidelines** Use this command to enter the RPD configuration mode.

**Examples** The following example shows how to enter the RPD configuration mode:

```
Router# configure terminal
Router(config)# cable rpd
Router(config-rpd) #RphyNode-L01
```

Use this command to apply an Event Profile to RPD.

The following example shows how to apply an event profile to RPD.

```
Router(config)#cable rpd node6
Router(config-rpd)#identifier badb.ad13.5e08
Router(config-rpd)#core-interface Te3/1/5
Router(config-rpd)#principal
Router(config-rpd)#rpd-ds 0 downstream-cable 3/0/17 profile 10
Router(config-rpd)#rpd-us 0 upstream-cable 3/0/34 profile 13
Router(config-rpd)#r-dti 16
Router(config-rpd)#rpd-event profile 6
```

Use the following command to get events from RPD.

```
cable rpd {RPD IPRPD MACall }event {locallogpending }
```

To set the GCPP server as the core server, remove the **principal** keyword under RPD configuration.

## cable rpd period-fft (exec mode)

You can start or stop RPD periodical FFT polling using the **cable rpd** { *ip-address* | *mac-address* | **all** | **slot** } **period-fft** { *start* | *stop* } command in Privileged EXEC mode. To void the configuration, use the **no** form of this command.

**cable rpd** { *ip-address* | *mac-address* | **all** | **slot** } **period-fft** { **start** | **stop** }

**no cable rpd** { *ip-address* | *mac-address* | **all** | **slot** } **period-fft** { **start** | **stop** }

Syntax Description	
<i>ip-address</i>	Specify the RPD IPv4 or IPv6 address.
<i>mac-address</i>	Specify the RPD MAC address.
<b>all</b>	Select all the RPDs.
<b>slot</b>	Specify RPDs by slot.
<b>start</b>	Start RPD periodical FFT polling.
<b>stop</b>	Stop RPD periodical FFT polling.

**Command Default** None.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1x	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to start RPD periodical FFT polling for a specific RPD by mentioning the MAC address.

```
Router# cable rpd 0004.9f32.0019 period-fft start
Confirm to continue? [no]: yes
```

### Examples

The following example shows how to stop RPD periodical FFT polling for all RPDs.

```
Router# cable rpd all period-fft stop
Confirm to continue? [no]: yes
```

Related Commands	Command	Description
	<b>show cable rpd core-ident</b>	Displays active Cisco Remote PHY Devices (RPD).

## cable rpd external-core

You can modify auxiliary cores to which the RPD is connected using the **cable rpd** *name external-core ip-address* command. You can add or remove aux cores that exist outside the cBR-8 router without having to reboot the RPD. To void the RPD configuration, use the **no** form of this command.

**cable rpd** *name external-core ip-address*

**no cable rpd** *name external-core ip-address*

### Syntax Description

*name* Specify the name of the RPD.

*ip-address* Specify the IPv4 or IPv6 address.

### Command Default

None.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to enter the RPD configuration mode.

### Examples

The following example shows how to enter the RPD configuration mode:

```
Router# configure terminal
Router(config)# cable rpd node6
Router(config-rpd)# external-core 10.1.19.19
Router(config-rpd)# end
```

### Related Commands

Command	Description
<b>show cable rpd core-ident</b>	Displays RPD CCAP Core Identification information.

## cable rpd external-core (exec mode)

You can modify auxiliary cores to which the RPD is connected using the **cable rpd** { *ip-address | mac-address* | **all** | **group** | **oui** | **slot** } **name external-core** *core-ip-address* { **add** | **delete** } command. You can add or remove aux cores that exist outside the cBR-8 router without having to reboot the RPD. To void the RPD configuration, use the **no** form of this command.

**cable rpd** { *ip-address mac-address* | **all** | **group** | **oui** | **slot** } **name external-core** *core-ip-address* { **add** | **delete** }

**no cable rpd** { *ip-address mac-address* | **all** | **group** | **oui** | **slot** } *name external-core core-ip-address*  
 { **add** | **delete** }

<b>Syntax Description</b>	<i>ip-address</i>	Specify the RPD IPv4 or IPv6 address.
	<i>mac-address</i>	Specify the RPD Mac address.
	<b>all</b>	Select all the RPDs.
	<b>group</b>	Specify HA-Shelf group .
	<b>oui</b>	Specify RPDs by OUI .
	<b>slot</b>	Specify RPDs by slot.
	<i>core-ip-address</i>	Specify the RPD IPv4 or IPv6 address of the core.
	<b>add</b>	Add the core.
	<b>delete</b>	Delete the core.

**Command Default** None.

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to enter the RPD configuration mode.

**Examples** The following example shows how to enter the RPD configuration mode:

```
Router# cable rpd 0004.9f00.0655 external-core 10.1.10.19 add
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show cable rpd core-ident</b>	Displays RPD CCAP Core Identification information.

## cable rphy static-route

cBR8 transmits RPHY packets from the accurate DPIC interface in L3 ECMP scenario (CIN without VRF configured). You can use the **cable rphy static-route** command to dynamically add or remove the static route through code during the time when an RPD comes online or turns to offline, instead of configuring manually.

**cable rphy static-route**

**no cable rphy static-route**

### Command Default

None.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Fuji 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to enter the RPD configuration mode.

### Examples

After configuring the command, you can check if there are static routes that are dynamically added by code through **show [ipv6]ip] static route [vrf <id>]** command.

```
Router# show ipv6 static

## cable rphy gcp

Use the options under **cable rphy gcp** to configure GCP-related information. To remove this configuration, use the **no** form of this command.

**cable rphy gcp** [ **flowctrl-threshold** | **keepalive** *interval retries* | **max-idle-time** | **reconnect-timeout** | **recovery-act-delay** | **recovery-act-retry** | **recovery-action** *action* ]

**no cable rphy gcp** [ **flowctrl-threshold** | **keepalive** *interval retries* | **max-idle-time** | **reconnect-timeout** | **recovery-act-delay** | **recovery-act-retry** | **recovery-action** *action* ]

Syntax Description	
<b>flowctrl-threshold</b>	Set GCP sending flow control for low priority msg.
<b>keepalive</b> <i>interval retries</i>	GCP KA interval in seconds. The default value is 4 and the range is 0-100s. For more information, see <a href="#">cable rphy gcp keepalive timeout, on page 649</a> .
<b>max-idle-time</b>	Configure the maximum GCP idle time in seconds. The range is 0-300s. The default value is 0.  0 means disable Max GCP Idle Time.
<b>reconnect-timeout</b>	Configure the GCP reconnect timeout in seconds. The range is 5-120s. The default value is 120s.
<b>recovery-act-delay</b>	Configure the GCP recovery action delay in seconds. The range is 0-600s. The default value is 30s.
<b>recovery-act-retry</b>	Configure the number of retries that the RPD attempts for the configured recovery action. The range is 0 - 255. The default value is 12.  <b>Note</b> This attribute is not applicable to all of the defined recovery actions.
<b>recovery-action</b> <i>action</i>	Configure one of the following actions: <ul style="list-style-type: none"> <li>• 1 - GcpWaitForAction</li> <li>• 2 - GcpReconnectToSameCore(default)</li> <li>• 3 - GcpHandoverToBackup</li> <li>• 4 - WaitAndReboot</li> <li>• 5 - GcpHandoverToBackupAfterReconnectFail</li> </ul>

**Command Default** None.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.9.1y	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Use this command to enter the configuration mode.

The following is a sample configuration:

```
Router# configure terminal
Router(config)#cable rphy gcp keepalive timeout 20 30
Router(config)#cable rphy gcp max-idle-time 70
Router(config)#cable rphy gcp reconnect-timeout 100
Router(config)#cable rphy gcp recovery-act-delay 500
Router(config)#cable rphy gcp recovery-act-retry 200
Router(config)#cable rphy gcp recovery-action 2
Router(config)#exit
```

After configuring the command, you can verify your configuration using the following command:

```
Router# show cable rphy gcp config-info
      Keepaliveinterval      : 20
      Keepaliveretries       : 30
      MaxGcpIdleTime         : 70
      GcpRecoveryAction      : 2
      GcpRecoveryActionRetry : 200
      GcpRecoveryActionDelay : 500
      GcpReconnectTimeout    : 100
```

## cable rphy gcp keepalive timeout

By default, the cBR-8 router sends a GCP KeepAlive message every 4 seconds to RPD. If no GCP message is received from RPD, the cBR-8 router continues to send GCP KeepAlive message to RPD. The max retry attempts are 6 by default. That means the GCP timeout value is 24(4x6)s by default. After that cBR-8 router marks the RPD offline due to GCP timeout.

GCP KeepAlive messages are used to verify GCP connectivity between a CCAP Core and an RPD. You can use the **cable rphy gcp keepalive timeout interval retries** command to configure the interval and retry attempts of the GCP keepAlive messages, that the cBR-8 router sends to RPD.

**cable rphy gcp keepalive** *timeout retries*

**no cable rphy gcp keepalive** *timeout retries*

### Syntax Description

*timeout* GCP KA interval in seconds. The default value is 4 and the range is 0 through 100.

**Note** If you configure the GCP KA interval using the values as 1 through 3 or if the total timeout value is less than 24, then this may cause RPD flapping during SUPHA or LCHA in a large-scale environment.

If you configure the GCP KA interval as 0, then the GCP keepalive function is disabled and the cBR-8 router cannot detect the GCP connection status using a keepalive message. Configure CP KA interval as 0 only for debugging.

For standby core GCP connection, the GCP KA interval is 3 times the active core. After LCHA, the interval value is reset to the correct value for the corresponding role.

*retries* Number of GCP keepalive retry attempts. The default value is 6 and the range is 3 through 1000.

### Command Default

None.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Cupertino 17.9.1y	The range for <i>timeout</i> is updated from <b>0-1000</b> to <b>0-100</b> .
Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to enter the configuration mode.

### Examples

```
Router# configure terminal
Router(config)# cable rphy gcp keepalive timeout 20 6
Router# test platform software rphyman R0 gcp-keepalive logging enable
```

After configuring the command, you can verify your configuration using the following command:

```

Router# show cable rpd 0004.9f33.0091 Te9/1/5 gcp-transaction | i GDM

## cable rphy rpd-capability reject-mismatch

Use the **cable rphy rpd-capability reject-mismatch** to control whether RPDs with OFDM capability mismatch are online or not. If the **cable rphy rpd-capability reject-mismatch** command is enabled, then RPDs with OFDM capability mismatch do not become online.

You can use the **no cable rphy rpd-capability reject-mismatch** command to disable this configuration and to accept the capabilities mismatch and let the RPDs come online.

RPDs may behave in a non-deterministic manner if there is a capability mismatch.

**cable rphy rpd-capability reject-mismatch**

**no cable rphy rpd-capability reject-mismatch**

### Syntax Description

**reject-mismatch** You can use this configuration to determine whether RPDs with OFDM capability mismatch are online or not.

### Command Default

This command is enabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The following example shows you how to configure the **no cable rphy rpd-capability reject-mismatch** command, accept the capabilities mismatch and let the RPDs come online.

### Examples

```
Router#show cable rpd 0004.9f31.0979 capability | s Downstream OFDM
Downstream OFDM Channels Per Port      : 2
```

```
Router#show cable rpd
MAC Address      IP Address      I/F      State      Role HA  Auth Name
0004.9f31.0979  ---            Te6/1/0  online     Pri  Act N/A  RPD1
```

```
Router(config)#cable rpd RPD1
Router(config-rpd)# identifier 0004.9f31.0979
Router(config-rpd)# core-interface Te6/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)#rpd-ds 0 downstream-cable 6/0/3 profile 23
```

```
2023/01/16 12:27:14.953736374 {rphyman_R0-0}{255}: [errmsg] [1630]: UUID: 0, ra: 0 (ERR):
%RPHYMAN-3-RPD_CAPA_PARAM_MISMATCH_ERROR:
R0/0: rphyman: rpd_capa check, rpd_id: 0004.9f31.0979, config_value 3 rpdCapa_value 2,
event: NumDsOfdmChannels mismatch, reject RPD online,
please configure OFDM channels equal to its capability..
```

```
Router#show cable rpd
MAC Address      IP Address      I/F      State      Role HA  Auth Name
0004.9f31.0979  ---            Te6/1/0  offline     Pri  Act N/A  RPD1
```

After configuring the **no cable rphy rpd-capability reject-mismatch** command, the RPD status displays as **online** as shown in the **show cable rpd** output below.

```
Router(config)#no cable rphy rpd-capability reject-mismatch
```

```
2023/01/16 12:32:13.480653142 {rphyman_R0-0}{255}: [errmsg] [1630]: UUID: 0, ra: 0 (warn):

## cable rphy statistics session update-freq

To configure the DEPI statistics synchronization interval, use the **cable rphy statistics session update-freq** command in global configuration mode. To void the configuration, use the **no** form of this command. This command is applied on all the CLC cards.

**cable rphy statistics session update-freq** *value*

**no cable rphy statistics session update-freq** *value*

### Syntax Description

*value* Specifies the DEPI statistics synchronization interval in unit of 5 seconds.

### Command Default

None.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Amsterdam 17.3.1z	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to configure the DEPI statistics synchronization interval.

### Examples

The following example shows how to configure the DEPI statistics synchronization interval:

```
Router# configure terminal
Router(config)# cable rphy statistics session update-freq 20
```

## cable rphy supso suppress-rpd

SUP CPU utilization is high when SUPSO occurs, during new SUP rebuilding of RPDs, CMs, and so on. At this time, if RPDs fail to recover, then those rpd's are suppressed and the speed it takes to become online again is based on the SUP IOS's CPU utilization. This can prevent the system from being further burdened by RPDs and CMs which come after them, by coming online and reducing the impact to other RPDs or CMs rebuilding.

You can use the **cable rphy supso suppress-rpd max-cpu max-cpu min-cpu min-cpu time time** command to configure this feature.

**cable rphy supso suppress-rpd max-cpu max-cpu min-cpu min-cpu time time**

**no cable rphy supso suppress-rpd max-cpu max-cpu max-cpu max-cpu time time**

### Syntax Description

<i>max-cpu</i>	The maximum IOS CPU Utilization value that starts RPD suppress mode. The valid range is 1–100. The default is 95.
<i>min-cpu</i>	The minimum IOS CPU Utilization value that stops RPD suppress mode. Only if IOS CPU Utilization decreases under this <i>min-cpu</i> the RPD suppress mode stop. The valid range is 1–100. The default is 90.
<i>time</i>	The total suppress time(seconds) after SUPSO. The valid range is 1–3600. The default is 1800.

**Note** If a time out of the total suppress time occurs, then the RPD suppress mode stops even though the CPU load isn't dropped to *min-cpu* value.

### Command Default

This command is enabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Cupertino 17.9.1x	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shown how to configure this feature:

```
router(config)# cable rphy supso suppress-rpd max-cpu 90 min-cpu 80 time 1800
router(config)# end
```

Use this command to verify the configuration:

```
router# show run | in rphy
cable rphy gcp keepalive timeout 5 8
```

```
cable rphy supso suppress-rpd max-cpu 90 min-cpu 80 time 1800  
cable wideband rphy-auto-reset
```

## cable rsvp default-sc

To specify the default service class that enables the Resource ReSerVation Protocol (RSVP) created service flows to inherit characteristics, use the **cable rsvp default-sc** command in global configuration mode.

**cable rsvp default-sc** *service-class name*

### Syntax Description

<i>service-class name</i>	The name of a downstream DOCSIS service-class.
---------------------------	------------------------------------------------

### Command Default

Service class is not configured.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable rsvp default-sc** command allows users to specify the default service class that enables the RSVP created service flows to inherit characteristics.

### Examples

The following example configures a default RSVP service class.

```
Router# configure terminal
Router(config)# cable service class 220 name RSVPClass
Router(config)# cable service class 220 downstream
Router(config)# cable service class 220 max-latency 100000
Router(config)# cable service class 220 req-attr-mask ffff0000
Router(config)# cable rsvp default-sc RSVPClass
Router(config)# cable rsvp default-sc RSVPClass
```

### Related Commands

Command	Description
<b>show cable rsvp flow-db</b>	Displays the contents of the RSVP to DOCSIS service-flow mapping database.

# cable service attribute ds-bonded downstream-type bonding-enabled

To force a downstream bonding-capable modem to initialize on a bonded primary-capable downstream channel, use the **cable service attribute ds-bonded downstream type bonding-enabled** command in global configuration mode. To restore default configuration, use the **no** form of the command.

**cable service attribute ds-bonded downstream-type bonding-enabled [enforce]**  
**no cable service attribute ds-bonded downstream-type bonding-enabled**

## Syntax Description

<b>enforce</b>	Enforces bonding-capable modems to register only on bonded RF channels.
----------------	-------------------------------------------------------------------------

## Command Default

A bonding-capable modem is allowed to register on the primary channel selected by the modem for initiation even if the channel is not part of a bonding group.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.3(23)BC	This command was introduced for the uBR10012 router.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

For bonding capable cable modems, the primary channel selection that is done by the CMTS depends on whether the modems can resolve its MAC Domain Downstream Service Group ID (MD-DS-SG). The CM must attempt to determine its MAC Domain Downstream Service Group ID (MD-DS-SG-ID) if an MDD is present on the downstream. If a modem has resolved its MD-DS-SG, the CMTS selects a bonded primary channel, the primary channel that is part of an operational wideband channel, from the RF channel set corresponding to the MD-DS-SG determined by the modem. The bonded primary channel selected by the CMTS needs to be hosted by an interface on the same uBR10-MC5X20 cable interface line card as the modem's initial primary channel. If there are multiple primary capable channels that meet the above criteria, the final primary channel will be randomly selected among the eligible channel set.

When the CMTS has an existing record of a CM (listed in the **show cable modem** command output) that should be moved to a bonded channel, a Dynamic Frequency Override (DFO) is triggered to be sent in the RNG-RSP from the CMTS to that CM.

If a CM is ranging for the first time (not listed in the **show cable modem** command output), no DFO is triggered at initial-ranging time. The CM proceeds to register and the CMTS gleans the bonding capabilities of the CM to determine if it should be moved to a bonded channel. If the CM is on a wrong primary DS channel, the DOCSIS specification does not allow a DFO at this time, so the CMTS rejects the registration of the CM forcing it to enter the reject(c) state. The CMTS then waits for the CM to start ranging again. If the CM engages with the same incorrect DS channel, the CMTS triggers a DFO to the CM during initial-ranging because it now has a record of that CM.

If a modem has not resolved its MD-DS-SG and the enforce option is configured, the CMTS selects a bonded primary channel based on MAP group associated with the modem's upstream channel. Typically, an upstream

channel is configured into a single fiber node and the CMTS infers the topology information based on the downstream channels associated with the upstream. If the enforce option is not configured or the CMTS cannot find a target primary channel, the modem will be allowed to register on the primary channel currently selected by the modem for initialization.

**Note** The CMTS will only try to move the modem with MD-DS-SG unresolved if the **enforce** option is configured.

By default, changing the primary channel to select a wideband channel is not enforced and modems are allowed to operate on a primary channel even if they are not included in any load balancing groups. At any time after the system is up, enabling the primary channel selection for bonding capable modems will not affect existing modems in the system. The operator has to manually reset the bonding capable modems using the **clear cable modem** command either globally or at per-MAC Domain level.

**Note** Enabling primary channel selection for wideband modems will not affect existing modems in the system.

### Examples

```
Router# configure terminal
```

```
Router(config)# cable service attribute ds-bonded downstream-type bonding-enabled [enforce]
```

### Related Commands

Command	Description
<b>cable dfo-retry-count</b>	Configures the Downstream Frequency Override (DFO) retry count.
<b>cable service attribute non-ds-bonded downstream-type bonding-disabled</b>	Forces the non-bonding-capable modems to register only on non-bonded RF channels on the CMTS.
<b>cable service attribute voice-enabled</b>	Restricts voice services to only to the uBR10-MC5x20 line cards for high availability.

# cable service attribute non-ds-bonded downstream-type bonding-disabled

To force the non-bonding-capable modems to register only on non-bonded RF channels on the CMTS, use the **cable service attribute non-ds-bonded downstream-type bonding-disabled** command in global configuration mode. To restore default behavior, use the **no** form of the command.

**cable service attribute non-ds-bonded downstream-type bonding-disabled**

## Syntax Description

This command has no keywords or arguments.

## Command Default

The non-bonding-capable modem registers on its current primary channel.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

A modem is identified as a non-bonding-capable modem if the modem reports a Multiple Receive Channel Support value of 1 for TLV 5.29 or an RCP ID unknown to the CMTS during the modem's registration request.

The non-bonding capable modem, identified at registration, will be moved to a non-bonded primary channel through downstream frequency override, if its current primary channel is part of a bonding group. The target non-bonded primary channel will be selected among primary capable channels that are associated to the modem's current upstream channel, however not included in any wideband channels associated to any host interfaces on the local line card. Once this option is enabled, the bonded primary channels will be taken out of load balancing group, to prevent non-bonding capable modems to be moved back to bonded primary channels for load balancing purpose.

**Note** Enabling primary channel selection for wideband modems will not affect existing modems in the system. The operator has to reset the existing non-bonding capable modems using the **clear cable modem** command.

## Examples

```
Router# configure terminal
```

```
Router(config)# cable service attribute non-ds-bonded downstream-type bonding disabled
```

## Related Commands

Command	Description
<b>cable dfo-retry-count</b>	Configures the Downstream Frequency Override (DFO) retry count.

Command	Description
<b>cable service attribute ds-bonded downstream-type bonding-disabled</b>	Forces a downstream bonding-capable modem to initialize on a bonded primary-capable downstream channel.
<b>cable service attribute voice-enabled</b>	Restricts voice services to only to the uBR10-MC5x20 line cards for high availability.
<b>clear cable modem</b>	Removes all modems or modems hosted by a uBR10-MC5x20 downstream interface under a specific category.

# cable service attribute non-ds-bonded legacy-ranging downstream-type

To redirect potential non-bonding-capable modems that access the CMTS with INIT-RNG\_REQ at initialization to a specified downstream channel frequency, use the **cable service attribute non-ds-bonded legacy-ranging downstream-type command** in global configuration mode. To restore default behavior, use the **no** form of the command.

**cable service attribute non-ds-bonded legacy-ranging downstream-type frequency *freq***  
**no cable service attribute legacy-ranging downstream-type**

<b>Syntax Description</b>	<b>frequency</b> <i>freq</i>	Specifies the downstream channel frequency to which modems that access the CMTS with legacy INIT-RNG-REQ are moved.
---------------------------	---------------------------------	---------------------------------------------------------------------------------------------------------------------

**Command Default** The non-bonding-capable modem continues the ranging process on the primary channel currently selected by the modem for initialization.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.3(23)BC	This command was introduced for the uBR10012 router.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable service attribute non-ds-bonded** command provides the ability to prevent potential non-bonding-capable modems that access CMTS with legacy INIT-RNG-REQ at initialization to register on a CMTS that supports bonding-capable modem. These modems that use legacy initial ranging will be redirected to a specified downstream channel frequency.

**Note** If the frequency option is used and if the frequency is modified, then the new frequency setting will only impact new modems trying to initialize after the frequency is modified. To enforce the downstream channel selection policy on existing modems, each modem has to be manually reset either globally or at the individual primary channel level using the **clear cable modem** command.

## Examples

```
Router# configure terminal
```

```
Router(config)# cable service attribute non-ds-bonded legacy-ranging downstream-type frequency  
55000000
```

## Related Commands

Command	Description
<b>cable service attribute voice-enabled</b>	Restricts voice services only to the uBR10-MC5x20 line cards for high availability.
<b>cable service attribute ds-bonded downstream-type bonding-enabled</b>	Forces a downstream-bonding capable modem to initialize on a bonded primary-capable downstream channel.
<b>cable service attribute non-ds-bonded downstream-type bonding-disabled</b>	Forces the non-bonding-capable modems to register only on non-bonded RF channels on the CMTS.
<b>clear cable modem</b>	Removes all modems or modems hosted by a uBR10-MC5x20 line card downstream interface under a specific category.

## cable service attribute voice-enabled

To restrict voice services only to the uBR10-MC5X20 downstream interfaces for high availability, use the **cable service attribute voice-enabled** command in global configuration mode. To remove the restriction of voice services to the uBR10-MC5X20 downstream interfaces, use the **no** form of the command.

**cable service attribute voice-enabled downstream-type HA-capable**  
**no cable service attribute voice-enabled downstream-type HA-capable**

Syntax Description	downstream-type	Restricts voice services to a specific downstream type.
	HA-capable	Restricts voice services to the uBR10-MC 5x20 line card.

**Command Default** All primary-capable downstream channels on the uBR10-MC 5x20 line card and the SPA can support downstream voice service flows.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** A voice-enabled cable modem is identified either at registration by decoding DHCP TLV 122 in the modem's DHCP-ACK, or at its first voice call if DHCP TLV 122 is not exchanged. If a voice-enabled modem is detected at registration on a SPA downstream channel, it will be moved to the uBR10-MC5x20 downstream channel in the CGD via downstream frequency override. If the voice-enabled modem is detected at its first voice call after registration, it will be moved after the call is over to the uBR10-MC5x20 channel in the CGD via DCC. If the voice enabled modem fails to come up on the target uBR10-MC5x20 channel, the CMTS will continue to move the modem until three retries (the maximum number of allowed retries) has been reached, when the modem will be allowed to stay on the SPA downstream channel until another set of retries is attempted by the CMTS every 24 hours. A voice enabled modem on the uBR10-MC5x20 channel will be excluded from being load balanced to a SPA downstream channel. If this option is configured at any time after the system is up, voice enabled modems that have been identified on the SPA downstream channel without active voice calls will be gradually moved to the uBR10-MC5x20 downstream channel in the CGD at the rate of one modem per five seconds.

### Examples

```
Router# configure terminal
```

```
Router(config)# cable service attribute voice-enabled downstream-type HA-capable
```

Related Commands	cable service attribute non-ds-bonded	Forces a non-bonding-capable modem to register only on non-bonded RF channels.

<b>cable service attribute ds-bonded</b>	Forces a downstream-bonding capable modem to initialize on a bonded primary-capable DS channel.
------------------------------------------	-------------------------------------------------------------------------------------------------

## cable service attribute withhold-TLVs

To block sending of DOCSIS 3.0 time, length, value (TLVs) to DOCSIS 1.x and DOCSIS 2.0 cable modems, use the **cable service attribute withhold-TLVs** command in global configuration mode. To unblock sending of the DOCSIS 3.0 TLVs to DOCSIS 1.x and DOCSIS2.0 cable modems, use the **no** form of this command.

**cable service attribute withhold-TLVs peak-rate**  
**no cable service attribute withhold-TLVs peak-rate**

<b>Syntax Description</b>	<b>peak-rate</b> Specifies the DOCSIS 3.0 peak traffic rate TLVs 24.27 and 25.27, which are blocked from being sent to the non-DOCSIS 3.0 cable modems.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The DOCSIS 3.0 TLVs are sent to all cable modems.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCB10	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Some DOCSIS 1.x and DOCSIS 2.0 cable modems may fail to come online when they receive DOCSIS 3.0 TLVs from the CMTS during registration. The **cable service attribute withhold-TLVs** command allows you to restrict sending of the configured DOCSIS 3.0 TLVs to DOCSIS 1.x and DOCSIS 2.0 cable modems. This command does not restrict sending of DOCSIS 3.0 TLVs to DOCSIS 3.0 cable modems.

**Note** In Cisco IOS Release 12.2(33)SCB10 only the **peak-rate** keyword is supported, which represents TLVs 24.27 and 25.27.

### Examples

The following example shows how to configure the CMTS to restrict sending of DOCSIS 3.0 peak traffic rate TLVs 24.27 and 25.27 to non-DOCSIS 3.0 cable modems:

```
Router # configure terminal
Router(config)# cable service attribute withhold-TLVs peak-rate
```

The following warning message is displayed when the above example is configured.

```
Warning: This configuration may violate D3.0 MULPI specification per section 6.4.8.
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable service class</b>	Defines and modifies a service class

## cable service class

To set parameters for DOCSIS 1.1 cable service class, use the **cable service class** command in global configuration mode. To delete a service class or to remove a configuration, use the **no** form of the command.

**cable service class** *class-index* [*keyword-options*]

**no cable service class** *class-index* [*keyword-options*]

### Syntax Description

<i>class-index</i>	Specifies the class ID for the class to be modified. Valid range is 1 to 1023.
<b>activity-timeout</b>	Specifies the activity timeout (0 to 65,535).
<b>admission-timeout</b>	Specifies the admitted timeout (0 to 65,535).
<b>downstream</b>	Specifies that the service class is for the downstream direction (from the CMTS to the CM). (The default direction is <b>upstream</b> .)
<b>data-rate-unit</b> <i>data-rate</i>	Configure Data Rate Unit Setting. The range is 0–3. 0=bps, 1=kbps, 2=Mbps, 3=Gbps.
<b>grant-interval</b>	Specifies the grant interval (0 to 4,294,967,295 microseconds).
<b>grant-jitter</b>	Specifies the grant jitter (0 to 4,294,967,295 microseconds).
<b>grant-size</b>	Specifies the grant size (0 to 65,535 bytes).
<b>grants-per-interval</b>	Specifies the grants per interval (0 to 127 grants).
<b>max-burst</b>	Specifies the maximum transmission burst (1522 to 4,294,967,295 bytes). <b>Note</b> The recommended value range is 1600 to 1800 bytes. Using a value of 0 or greater than 1800 bytes can cause latency issues for Voice-over-IP. A value of less than 1522 bytes can prevent the upstream transmission of large ethernet frames for any CM or CMTS not implementing fragmentation.
<b>max-buff-size</b>	Specifies the maximum buffer size of the upstream service-flow queue (or buffer) on the CM. The valid range is from 0 to 4294967295 bytes. The default value is 0.
<b>max-concat-burst</b>	Specifies the maximum concatenation burst (0 to 65,535 bytes).
<b>max-latency</b>	Specifies the maximum latency allowed (0 to 4,294,967,295 microseconds).
<b>max-rate</b>	Specifies the maximum rate (0 to 4,294,967,295 bps).
<b>min-buff-size</b>	Specifies the minimum buffer size of the upstream service-flow queue (or buffer) on the CM. The valid range is from 0 to 4294967295 bytes. The default value is 0.
<b>min-packet-size</b>	Specifies the minimum packet size for reserved rate (0 to 65,535 bytes).
<b>min-rate</b>	Specifies the minimum rate (0 to 4,294,967,295 bps).

<b>name</b>	Specifies the service class name string.
<b>peak-rate</b>	Specifies the peak rate (0 to 4,294,967,295 bps). Default value is zero, which represents the line rate. <b>Note</b> The <b>peak-rate</b> option is not supported on the DOCSIS 1.0 modems.
<b>poll-interval</b>	Specifies the poll interval (0 to 4,294,967,295 microseconds).
<b>poll-jitter</b>	Specifies the poll jitter (0 to 4,294,967,295 microseconds).
<b>priority</b>	Specifies the priority (0 to 7, where 7 is the highest priority).
<b>req-trans-policy</b>	Specifies the request transmission policy bit field (0 to FFFFFFFF in hexadecimal).
<b>sched-type</b>	Specifies the service class schedule type: 2–Best-Effort Schedule Type 3–Non-Real-Time Polling Service Schedule Type (supported only in Cisco 12.2(4)BC and later releases) 4–Real-Time Polling Service Schedule Type 5–Unsolicited Grant Service with Activity Detection Schedule Type 6–Unsolicited Grant Service Schedule Type
<b>tar-buff-size</b>	Specifies the target or desired size of the upstream service-flow queue (or buffer) on the CM. The valid range is from 0 to 4294967295 bytes. The default value is 0.
<b>tos-overwrite</b> <i>and-mask</i> <i>or-mask</i>	Overwrites the ToS byte by first ANDing the TOS value with the <i>and-mask</i> value and then ORing the result of that operation with the <i>or-mask</i> value. Both parameters must be specified in hexadecimal. The <i>and-mask</i> value can range from 0x0 to 0xFF and the <i>or-mask</i> value can range from 0x0 to 0xFF.
<b>upstream</b>	Specifies that the service class is for the upstream direction (from the CM to the CMTS). This is the default direction.
<b>downstream</b>	Specifies that the service class is for the downstream direction (from the CMTS to the CM).
<i>n</i>	Specifies the bundle identifier.
<b>req-attr-mask</b>	Specifies the required attribute mask bit field (0 to FFFFFFFF in hexadecimal).
<b>forb-attr-mask</b>	Specifies the forbidden attribute mask bit field (0 to FFFFFFFF in hexadecimal).

**Command Default**

Values that are not specified are set to their DOCSIS 1.1 defaults, if applicable to the service-class schedule type. See Section C.2.2, *Service Flow Encodings*, in the DOCSIS 1.1 specification.

**Command Modes**

Global configuration (config)

Command History	Release	Modification
	12.1(4)CX	This command was introduced for DOCSIS 1.1 operation. This command replaced the <b>cable qos profile</b> command that was used in previous versions for DOCSIS 1.0 operation.
	12.2(4)BC1	This command was integrated into Cisco IOS release 12.2(4)BC1. This command was also enhanced to support NRTPS scheduling.
	12.2(11)BC2	The default value for the maximum transmission burst parameter (max-burst) was changed from 1522 bytes to 3044 bytes. The default value for the maximum concatenation burst parameter was also changed from 0 bytes (unlimited) to 1522 bytes. These changes are to accommodate the latest revision of the DOCSIS 1.1 specification (SP-RFI-v1.1-I09-020830).
	12.3BC	This command was integrated into Cisco IOS release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA.
	12.2(33)SCB	This command was modified with the addition of <b>req-attr-mask</b> and <b>forb-attr-mask</b> keywords.
	12.2(33)SCB1	This command was modified with the addition of <b>peak-rate</b> to set value greater than the <b>max-rate</b> .
	12.2(33)SCF2	This command was modified. Three new keywords <b>max-buff-size</b> , <b>min-buff-size</b> , and <b>tar-buff-size</b> were added as part of the Upstream Buffer Control feature.
	12.2(33)SCI1	This command was modified with the addition of <b>downstream</b> keyword.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Dublin 17.12.1z	The <b>data-rate-unit</b> <i>data-rate</i> option is added.

### Usage Guidelines

The **sched-type** option must always be specified for each upstream class. The option cannot be configured for downstream classes. When a certain scheduling type is selected, take care that the mandatory parameters for that scheduling type are explicitly entered, while non-applicable parameters must be explicitly removed.

The default direction is **upstream**. We recommend that you do not change the direction of a service class after you have created it, because some of the existing service class parameters might not be appropriate for the new direction. Instead, delete the current service class and create a new service class with the correct upstream or downstream direction.

If the service class is newly created, a service-class name must be defined before entering the parameters for the service class.

**Note** Section C.2.2.6.10, *IP Type of Service Overwrite*, of the DOCSIS 1.1 specification changed the operation of **tos-overwrite** option. In DOCSIS 1.1 networks, the new TOS value is calculated by the following formula: New IP TOS = ((Original TOS value AND *and-mask*) OR *or-mask*). (For a description of the previous method of calculating the TOS value, see the **cable qos profile** command.) The default is to leave the TOS value unchanged (no overwrite).

## Examples

The following examples show configurations that use the **cable service class** command to create service classes. Based on the scheduling type specified, some command lines are mandatory, while others are optional.

Each example shown here is a complete configuration set for creating a service class.

### Configuring a Service Class for Unsolicited Grant Scheduling Service

```
Router(config)# cable service class 1 name UP_UGS
Router(config)# cable service class 1 sched-type 6
Router(config)# cable service class 1 grant-size 100
Router(config)# cable service class 1 grant-interval 20000
Router(config)# cable service class 1 grant-jitter 4000
Router(config)# cable service class 1 grants-per-interval 1
Router(config)# cable service class 1 min-packet-size 100
Router(config)# cable service class 1 req-trans-policy 0x1FF
Router(config)# cable service class 1 tos-overwrite 0x1F 0xE0
Router(config)# cable service class 1 activity-timeout 30
Router(config)# cable service class 1 admission-timeout 30
```

### Configuring a Service Class for Unsolicited Grant Scheduling with Activity Scheduling

```
Router(config)# cable service class 2 name UP_UGSAD
Router(config)# cable service class 2 sched-type 5
Router(config)# cable service class 2 grant-size 100
Router(config)# cable service class 2 grant-interval 20000
Router(config)# cable service class 2 grant-jitter 4000
Router(config)# cable service class 2 grants-per-interval 1
Router(config)# cable service class 2 poll-interval 10000
```

```
Router(config)# cable service class 2 poll-jitter 4000
Router(config)# cable service class 2 min-packet-size 100
Router(config)# cable service class 2 req-trans-policy 0x1FF
Router(config)# cable service class 2 tos-overwrite 0x1F 0xE0
Router(config)# cable service class 2 activity-timeout 30
Router(config)# cable service class 2 admission-timeout 30
```

### Configuring a Service Class with Real-Time Polling Service

```
Router(config)# cable service class 3 name UP_RTPS
Router(config)# cable service class 3 sched-type 4
Router(config)# cable service class 3 poll-interval 10000
Router(config)# cable service class 3 poll-jitter 4000
Router(config)# cable service class 3 min-rate 64000
Router(config)# cable service class 3 max-rate 128000
Router(config)# cable service class 3 max-burst 2000
Router(config)# cable service class 3 max-concat-burst 1522
Router(config)# cable service class 3 req-trans-policy 0x1FF
Router(config)# cable service class 3 tos-overwrite 0x1F 0xE0
Router(config)# cable service class 3 activity-timeout 30
Router(config)# cable service class 3 admission-timeout 30
```

### Configuring a Service Class for Best-Effort Upstream Service

```
Router(config)# cable service class 4 name UP_BE
Router(config)# cable service class 4 sched-type 2
Router(config)# cable service class 4 priority 5
Router(config)# cable service class 4 min-rate 0
Router(config)# cable service class 4 max-rate 128000
Router(config)# cable service class 4 max-burst 2000
Router(config)# cable service class 4 max-concat-burst 1522
Router(config)# cable service class 4 req-trans-policy 0x0
Router(config)# cable service class 4 tos-overwrite 0x1F 0xE0
```

```
Router(config)# cable service class 4 activity-timeout 30
Router(config)# cable service class 4 admission-timeout 30
```

### Configuring a Service Class for Best-Effort Downstream Service

```
Router(config)# cable service class 5 name DOWN_BE
Router(config)# cable service class 5 priority 5
Router(config)# cable service class 5 min-rate 0
Router(config)# cable service class 5 max-rate 1000000
Router(config)# cable service class 5 max-burst 3000
Router(config)# cable service class 5 activity-timeout 30
Router(config)# cable service class 5 admission-timeout 30
```

### Configuring a Service Class for Peak-Rate

```
Router(config)# cable service class
201 name hsd
Router(config)# cable service class
201 downstream
Router(config)# cable service class
201 max-rate 1024000
Router(config)# cable service class
201 min-rate 1024000
Router(config)# cable service class
201 peak-rate 2000000
```

### Configuring a Service Class with Upstream Buffer Control Parameters

```
Router(config)# cable service class
10 name REG-US
Router(config)# cable service class
10 upstream
Router(config)# cable service class
10 max-buff-size 20000
Router(config)# cable service class
10 min-buff-size 10000
Router(config)# cable service class
10 tar-buff-size 15000
```

### Associated Features

The **cable service class** command is used to configure the following features:

- [Configuring Upstream Cable Interface Features on the Cisco CMTS Routers](#)
- [Upstream Scheduler Mode for the Cisco CMTS Routers](#)

---

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable qos profile</b>	Creates a DOCSIS 1.0 QoS profile.
<b>show cable service-class</b>	Displays the service classes that have been created.

## cable service flow activity-timeout

To configure the activity timeout for dynamic cable service flows in DOCSIS 1.1 environments, where PacketCable is inactive, use the **cable service flow activity-timeout** command in global configuration mode. To remove the activity timer once configured, use the **no** form of this command.

**cable service flow activity-timeout** *n*  
**no cable service flow activity-timeout** [*<n>*]

<b>Syntax Description</b>	<i>n</i> The timeout length in seconds. Valid range is 0 - 65535 seconds. Setting this value to 0 configures the service flow to never timeout.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** 0 seconds

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.3(13a)BC2	This command was introduced to support DOCSIS 1.1 service flow operation in non-Packet-Cable environments.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** When PacketCable is supported, PacketCable sets the inactivity timeout from the PacketCable gate, and the PacketCable activity overrides timeout values set with this command. This is the case even where the inactivity timeout is set to zero, which configures the service flow to never timeout.

Apart from PacketCable, this command enables the cable modem to control the setup of the dynamic service flows, and to remove inactive service flows. During the creation of service flows, all Upstream and Downstream flows in the request are checked to see if the configured activity timeout needs to be applied.

**Note** The **cable service flow activity-timeout** command affects new calls only; it does not clear any existing hung flows. To clear existing flows, use the **test cable dsd mac-add sid** command.

### Examples

The following example in global configuration mode configures the cable modems connected to the Cisco CMTS to use activity timeout of zero, which means that related service flows do not timeout in a non-PacketCable environment:

```
Router(config)# cable service flow activity-timeout 0
```

The following example in global configuration mode configures the cable modems connected to the Cisco CMTS to use activity timeout of 300 seconds, which means that related service flows will timeout if no activities in 5 minutes:

```
Router(config)# cable service flow activity-timeout 300
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable qos profile</b>	Creates a DOCSIS 1.0 QoS profile.
(Not for Cisco cBR Series Routers) <b>cable service flow inactivity-threshold</b>	Sets the amount of time a dynamic service-flow can be present in the system without any activity (DOCSIS 1.1 operation).
<b>show cable service-class</b>	Displays the service classes that have been created.

# cable service-flow inactivity-timeout

To set the amount of time a dynamic service-flow can be present in the system without any activity, use the **cable service-flow inactivity-timeout** command in global configuration mode. To remove the specification, use the **no** form of this command.

**cable service-flow inactivity-timeout** *minutes*  
**no cable service-flow inactivity-timeout**

<b>Syntax Description</b>	<i>minutes</i> Specifies service-flow inactivity-timeout in minutes. Valid range is 1 to 120 minutes. Default value is 30 minutes.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------

**Command Default** 30 minutes

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1(3a)EC	This command was introduced.
	12.1(4)CX	This command was replaced by the <b>cable service flow inactivity-threshold</b> command for DOCSIS 1.1 operation.

**Usage Guidelines** Resources such as service identifiers (SIDs) and bandwidth are dynamically allocated by a CM using Dynamic Service Addition (DSA) transaction. If the CM fails to release these resources by issuing a Dynamic Service Deletion (DSD), then the resources might be locked indefinitely. Use this command to release unused resources.

## Examples

The following example shows how to set the inactivity timeout for dynamic service flows to 2 minutes. Once this setting is specified, any dynamic SID that does not show any activity in 2 minutes will be deleted.

```
Router(config)# cable service-flow inactivity-timeout 2
```

The following example shows how to set the inactivity timeout back to the default value of 30 minutes:

```
Router(config)# cable service-flow inactivity-timeout
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable service flow inactivity-threshold</b>	Sets the amount of time a dynamic service-flow can be present in the system without any activity (DOCSIS 1.1 operation).
	<b>cable qos permission</b>	Specifies permission for updating the cable router QoS table.
	<b>cable qos profile</b>	Configures a QoS profile.

Command	Description
show controllers cable	Displays QoS profiles.

## cable service flow inactivity-threshold

To set the inactivity threshold value for service flows using Unsolicited Grant Service with Activity Detection (UGS-AD), use the **cable service flow inactivity-threshold** command in global configuration mode. To disable the inactivity timer and reset the threshold limit timer to its default of 10 seconds, so that service flows revert to UGS activity only, use the **no** form of this command.

**cable service flow inactivity-threshold** *n*  
**no cable service flow inactivity-threshold** *n*

### Syntax Description

<i>n</i>	Specifies the threshold limit in seconds, with 10 seconds as the default. Configurable limits are 1 to 3600 seconds.
----------	----------------------------------------------------------------------------------------------------------------------

### Command Default

The default is to enable the inactivity timer, with a default value of 10 seconds.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.1(4)CX	This command replaced the <b>cable service-flow inactivity-timeout</b> command for DOCSIS 1.1 operation.
12.2(4)BC1	Support for this command was added to the Release 12.2 BC train.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

DOCSIS 1.1 allows a CM to request Unsolicited Grant Service (UGS) for an upstream, allowing the CM to reserve a certain amount of Constant Bit Rate (CBR) bandwidth for real-time traffic, such as Voice-over-IP (VoIP) calls. The UGS-AD variation allows the CMTS to switch a service flow to Real Time Polling Service (RTPS) after a certain period of inactivity, so that bandwidth is not reserved when it is not needed. The CM can then request UGS service when the flow again becomes active.

**Note** This command replaced the **cable service-flow inactivity-timeout** command, which was used in DOCSIS 1.0 operation to enable or disable watchdog cleanup of dynamic service flows that are not sending any packets on the upstream.

The **cable service flow inactivity-threshold** command sets the inactivity timer for how long a service flow must be inactive before the CMTS can switch it from UGS-AD to RTPS. The **no cable service flow inactivity-threshold** command disables the timer and resets it to its default value of 10 seconds, so that the CMTS always provides UGS service to the service flow, even when the flow is idle.

**Caution** The **no cable service flow inactivity-threshold** command effectively disables the use of RTPS and USG-AD services and configures the CMTS to provide only UGS services. This will prevent a CM that registered for USG-AD services from being able to obtain upstream transmission opportunities, resulting in a significant loss of bandwidth when a large number of CMs are requesting UGS-AD service flows.

### Examples

The following example shows the inactivity timer being set to 20 seconds:

```
Router(config)# cable service flow inactivity-threshold 20
```

```
Router(config)#
```

The following command disables the inactivity timer, so that the service flow remains UGS, even during periods of inactivity:

```
Router(config)# no cable service flow inactivity-threshold
```

```
Router(config)#
```

### Related Commands

Command	Description
<b>cable service class</b>	Sets the DOCSIS 1.1 service class parameters.
<b>cable service-flow inactivity-timeout</b>	Sets the amount of time a dynamic service-flow can be present in the system without any activity (DOCSIS 1.0 operation).
<b>show controllers cable</b>	Displays information for the cable interface.

# cable service flow priority

To enable the service flow priority in downstream extended header, use the **cable service flow priority** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable service flow priority**  
**no cable service flow priority**

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **cable service flow priority** command in global configuration mode to enable service flow priority in downstream extended header.

The following example in global configuration mode enables the service flow priority in downstream extended header:

```
Router(config)# cable service flow priority
```

Use the **show running-config | in service flow** command to check the enabled status of the feature:

```
Router(config)# show running-config | in service flow
cable service flow priority
```

Related Commands	Command	Description
	<b>show running-config   in service flow</b>	Displays the service classes that have been created.

## cable service type

To redirect CMs matching a service-type to downstream frequency, use the **cable service type** command in global configuration mode. To cancel the redirection of CMs, use the **no** form of this command.

**cable service type** *service-type-id* **ds-frequency** *frequency*  
**no cable service type** *service-type-id* **ds-frequency** *frequency*

<b>Syntax Description</b>	<i>service-type-id</i>	Specifies the service type identifier to be redirected. The maximum length of <i>service-type-id</i> is 16.
	<b>ds-frequency</b> <i>frequency</i>	Specifies the downstream frequency the CMs will be redirected to.

**Command Default** Disabled

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command will redirect the CMs matching a particular service-type identifier to downstream frequency. Multiple service types can be redirected to one frequency. However, one service type cannot be redirected to multiple DS frequencies.

### Examples

The following example shows how to redirect the CMs matching the service type to downstream frequency:

```
Router(config)# cable service type commercial ds-frequency 519000000
```

# cable set mpls-experimental

To specify experimental bits for Multiprotocol Label Switching (MPLS) labels, use the **cable set mpls-experimental** command in Ethernet service configuration mode. To disable this configuration, use the **no** form of this command.

**cable set mpls-experimental** *value*  
**no cable set mpls-experimental** *value*

<b>Syntax Description</b>	<i>value</i> Experimental bit for MPLS labels. Valid values are from 0 to 7.
---------------------------	------------------------------------------------------------------------------

**Command Default** If this command is not used, the experimental bits on the MPLS label are set to zero.

**Command Modes** Ethernet service configuration (config-ethsrv)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The experimental bits are set for all inner and outer MPLS labels for the egress Layer 2 VPN traffic on the WAN interface.

**Examples** The following example shows how to set an experimental bit for MPLS labels on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# cable l2vpn 0000.396e.6a68 customer1
Router(config-l2vpn)# service instance 2000 Ethernet
Router(config-ethsrv)# xconnect 101.1.0.2 221 encapsulation mpls pw-type 4
Router(config-ethsrv)# cable set mpls-experimental 7
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable l2vpn</b>	Enables Ethernet L2VPN service and enters L2VPN configuration mode.
	<b>service instance</b>	Configures an Ethernet service instance for a particular customer.
	<b>xconnect</b>	Binds an attachment circuit to a pseudowire.

## cable sflog

To enable service flow logging, to configure the number and duration of entries in the log, and to represent the time when the corresponding service flow is destroyed, use the **cable sflog** command in global configuration mode. To disable service flow logging, use the **no** form of the command.

**cable sflog** {**stop-record-time-overwrite** | **max-entry** *number* **entry-duration** *time* }  
**no cable sflog**

### Syntax Description

<b>stop-record-time-overwrite</b>	Specifies the time when the corresponding service flow is destroyed.
<b>max-entry</b> <i>number</i>	Specifies the maximum number of entries in the service flow log. When the log becomes full, the oldest entries are deleted to make room for new entries. The valid range is 0 to 59999, with a default of 0 (which disables service flow logging).  <b>Note</b> The <b>max-entry</b> value applies to the entire chassis on the Cisco uBR7100 series and Cisco uBR7200 series routers, but applies to individual cable line cards on the Cisco uBR10012 router and Cisco cBR Series Converged Broadband Routers.
<b>entry-duration</b> <i>time</i>	Specifies how long, in seconds, entries can remain in the service flow log. The CMTS deletes entries in the log that are older than this value. The valid range is 1 to 86400 seconds, with a default value of 3600 seconds (1 hour).

### Command Default

**max-entry** = 0 (service flow logging is disabled) and **entry-duration** = 3600 seconds

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
12.2(33)SCJ1	This command was modified with the addition of <b>stop-record-time-overwrite</b> keyword.

### Usage Guidelines

A DOCSIS specification currently being developed requires the DOCSIS CMTS to maintain a log table that contains entries of deleted service flows. The **cable sflog** command enables the logging of deleted service flows in this table and also sets the maximum number of entries in the log. When the log becomes full, the oldest entries are deleted to make room for the newest ones.

This command also configures how long each entry can remain in the log. When an entry has been in the table for the specified time, the CMTS deletes it, even if the log is not currently full.

To display the service flow log, use SNMP commands to display the docsQosServiceFlowLogEntry entries in the docsQosServiceFlowLogTable table. These attributes are defined in the *Data Over Cable System Interface Specification Quality of Service Management Information Base (DOCSIS-QOS MIB)* internet draft.

Cisco IOS Release 12.2(15)BC1 supports version 4 of this DOCSIS-QOS MIB draft, which is available on the IETF Internet-Drafts web site: <http://http://www.ietf.org/ID.html>

**Note** At the time of this document's release, the DOCSIS-QOS MIB is still in draft form and is therefore subject to change in future releases of Cisco IOS software.

The **max-entry** value specified by this command applies to the entire chassis for the Cisco uBR7100 series and Cisco uBR7200 series routers, but to individual line cards on the Cisco uBR10012 and Cisco cBR Series Converged Broadband Routers. However, the Cisco uBR10012 and Cisco cBR Series Converged Broadband Routers still maintain only one log table for all deleted service flows.

For example, if the **max-entry** value is set to 10,000 on a Cisco uBR7200 series router, the service flow log table holds a maximum of 10,000 entries for all cable line cards in the chassis. If the **max-entry** value is set to 10,000 on a Cisco uBR10012 router that has four cable line cards installed, the service flow log table holds a maximum of 40,000 entries, with each cable line card having a maximum of 10,000 entries each.

### Examples

The following example shows how to enable service flow logging with a maximum of 2,000 entries in the log, and with each entry remaining in the log for a maximum of 2 hours (7200 seconds):

```
Router(config)# cable sflog max-entry 2000 entry-duration 7200
```

The following example shows how to set the **max-entry** value to its default of 0 and disable service flow logging:

```
Router# configure terminal
Router(config)# no cable sflog
Router(config)# exit
Router#
```

### Related Commands

Command	Description
<b>cable service-flow inactivity-timeout</b>	Sets the amount of time a dynamic service-flow can be present in the system without any activity (DOCSIS 1.0 operation).
<b>cable service flow inactivity-threshold</b>	Sets the amount of time a dynamic service-flow can be present in the system without any activity (DOCSIS 1.1 operation).

## cable shared-secondary-secret

To configure one or more secondary shared-secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS, use the **cable shared-secondary-secret** command in cable interface configuration mode. To remove the secondary shared secrets, use the **no** form of this command.

**cable shared-secondary secret index** *index-num* [**0** | **7**] *authentication-key*  
**no cable shared-secondary secret index** *index-num*

### Syntax Description

<b>index</b> <i>index-num</i>	Specifies the order in which the CMTS will use the secondary shared-secrets to verify the CM during the registration process. The valid range is 1 to 16.
<b>0</b>	(Optional) Specifies that an unencrypted message will follow.
<b>7</b>	(Optional) Specifies that an encrypted message will follow.  <b>Note</b> As a general rule, the <b>7</b> option is not used by users at the command line because it requires a pre-encrypted password. Typically, the <b>7</b> option is useful only when cutting and pasting commands from another router's configuration file.
<i>authentication-key</i>	Text string specifying the shared secret string. When you also use the <b>service password-encryption</b> command, the key is stored in encrypted form. The text string can be any arbitrary string up to 80 characters in length.

### Command Default

No secondary shared secret is used. If no encryption option is specified, the key is stored in the configuration file as encrypted text if the **service password-encryption** command has also been given.

### Command Modes

Interface configuration—cable interface only (config-if)  
 Wideband-interface profile configuration (config-profile-wb)  
 MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(8)BC2	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable shared-secondary-secret** command can be used to supplement the **cable shared-secret** command so as to prevent unauthorized interception and alteration of the DOCSIS configuration file that is downloaded to the CM during the registration process. The DOCSIS specification allows for a CM and CMTS to use a shared secret (a secret encryption string) to calculate the MD5 Message Integrity Check (MIC) value for the DOCSIS configuration file that is downloaded to the CM.

The CM must use the proper shared secret encryption string to successfully decrypt and process the configuration file, and then register with the CMTS. If the CM does not have the proper encryption string, it will be unable to calculate the proper MIC value, and the **show cable modem** command will show **reject(m)** for the modem to indicate a MIC authentication failure.

The **cable shared-secondary-secret** command allows a cable operator to specify up to 16 alternate DOCSIS shared secrets. If a CM has a MIC authentication failure during registration, the CMTS then checks the MIC values using the alternate shared secrets. If a match is found, the CM is allowed online. If none of the alternate MIC values match the value returned by the CM, the CMTS refuses to allow the CM to come online and instead logs a MIC authentication failure.

The use of secondary shared secrets allow the MSO to gradually phase in changes to the shared secret key. If a shared secret has been compromised, or if the MSO decides to regularly change the shared secret, the MSO can use the **cable shared-secret** command to immediately change the primary shared secret. The previous key can then be made a secondary shared secret, using the **cable shared-secondary-secret** command, so that CMs can continue to register until the MSO can change all of the DOCSIS configuration files to use the new shared secret.

To use the secondary shared-secret feature, you must do the following:

- You must specify a shared secret with the **cable shared-secret** command. The **cable shared-secondary-secret** command has no effect if you have not specified a primary shared secret.

---

**Note** At any particular time, the majority of CMs should use the primary shared secret to avoid excessive registration times.

---

- Create DOCSIS configuration files that use the shared-secret encryption string to create the MD5 MIC value. This can be done using the Cisco DOCSIS Configurator tool by entering the shared-secret string in the **CMTS Authentication** field in the **Miscellaneous** parameters.

---

**Tip** The shared-secret string itself is not saved in the DOCSIS configuration file, so you must re-enter the string in the “CMTS Authentication” field whenever you create or edit a DOCSIS configuration file using the Cisco DOCSIS Configurator tool.

---

- Use the **cable shared-secondary-secret** command to configure the cable interfaces with one or more matching shared-secret strings. The string configured on an interface must match the string used to create the DOCSIS configuration files downloaded to the CMs on that interface, or the CMs will not be able to register. You can use different shared secrets for each interface, if you are also using a different set of configuration files for each interface.
- To encrypt the shared-secret strings in the CMTS configuration, you must include the **service password-encryption** global configuration command in the router’s configuration.

---

**Note** You cannot use the shared secret feature with the files created by the internal DOCSIS configuration file editor (**cable config-file** command).

---

## Examples

The following example shows how to specify multiple secondary shared-secret string using encrypted keys:

```
Router# configure terminal
Router(config)# service password-encryption
```

```

Router(config)# int c6/0

Router(config-if)# cable shared-secret n01jk_1a

Router(config-if)# cable shared-secondary-secret index 1 cabl3-x21b

Router(config-if)# cable shared-secondary-secret index 2 dasc9_ruld55ist5q3z

Router(config-if)# cable shared-secondary-secret index 3 j35u556_x_0

Router(config-if)# exit

Router(config)# exit

Router# show running-config | include shared

cable shared-secret 7 1407513181A0F13253920
cable shared-secondary-secret 7 14031A021F0D39263D3832263104080407
cable shared-secondary-secret 7 071B29455D000A0B18060615142B38373F3C2726111202431259545D6
cable shared-secondary-secret 7 0501555A34191B5F261D28420A555D
Router#

```

**Note** In this example, the shared-secret strings are initially entered as clear text, but because the **service password-encryption** command has been used, the strings are encrypted in the configuration file.

#### Related Commands

Command	Description
<b>cable dynamic-secret</b>	Enables the dynamic shared secret feature, so that DOCSIS configuration files are verified with a dynamically generated shared secret.
<b>cable shared-secret</b>	Configures an authentication shared-secret key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable tftp-enforce</b>	Requires that all CMs on a cable interface attempt to download a DOCSIS configuration file using the Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online.

## cable shared-secret

To configure an authentication shared-secret encryption key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS, use the **cable shared-secret** command in cable interface configuration mode or MAC domain profile configuration mode. To disable the use of a shared-secret key during the CM registration phase, use the **no** form of this command.

**cable shared-secret** [0 | 7] *authentication-key*  
**no cable shared-secret**

### Cisco cBR Series Converged Broadband Routers

**cable shared-secret**{0 | 7} *authentication-key*

Syntax Description	0	(Optional) Specifies that an unencrypted message (clear text) will follow.
	7	(Optional) Specifies that an encrypted message will follow.  <b>Note</b> As a general rule, the 7 option is not used by users at the command line because it requires a pre-encrypted password. Typically, the 7 option is useful only when cutting and pasting commands from another router's configuration file.
	<i>authentication-key</i>	Text string specifying the shared secret string. When you also use the <b>service password-encryption</b> command, the key is stored in encrypted form. The text string can be any arbitrary string up to 80 characters in length.

**Command Default** No shared-secret encryption key is used during registration, only the default DOCSIS MD5-encrypted checksum. When **cable shared-secret** is given without specifying an encryption option, the key is stored in the configuration file as an encrypted password if the **service password-encryption** command has also been given.

**Command Modes** Interface configuration—cable interface only (config-if)  
 Wideband-interface profile configuration (config-profile-wb)  
 MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	11.3 XA	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable shared-secret** command can be used to prevent unauthorized interception and alteration of the DOCSIS configuration file that is downloaded to the CM during the registration process. The **cable shared-secret** command specifies a secret encryption string that the CMTS uses to calculate the MD5 Message Integrity Check (MIC) value that is appended to every DOCSIS configuration file and that the CM and CMTS use to verify the file's integrity.

The CM must use the shared secret encryption string to successfully decrypt and process the configuration file, and then register with the CMTS. If the CM does not have the proper encryption string, it will be unable to calculate the proper MIC value, and the **show cable modem** command will show **reject(m)** for the modem to indicate a MIC authentication failure.

To use the shared-secret feature, you must do the following:

- Create DOCSIS configuration files that use the shared-secret encryption string to create the MD5 MIC value. This can be done using the Cisco DOCSIS Configurator tool by entering the shared-secret string in the “CMTS Authentication” field in the “Miscellaneous” parameters.

---

**Note** The shared-secret string itself is not saved in the DOCSIS configuration file, so you must re-enter the string in the “CMTS Authentication” field whenever you create or edit a DOCSIS configuration file using the Cisco DOCSIS Configurator tool.

---

- Use the **cable shared-secret** command to configure the cable interfaces with a matching shared-secret string. The string configured on an interface must match the string used to create the DOCSIS configuration files downloaded to the CMs on that interface, or the CMs will not be able to register. You can use different shared secrets for each interface, if you are also using a different set of configuration files for each interface.
- To encrypt the shared-secret string in the CMTS configuration, you must include the **service password-encryption** global configuration command in the router’s configuration.

---

**Note** You cannot use the shared secret feature with the files created by the internal DOCSIS configuration file editor (**cable config-file** command).

---

---

**Note** In Cisco IOS Release 12.2(8)BC2 and later releases, you can also use the **cable shared-secondary-secret** command to specify multiple shared-secret strings, so that you can gradually phase in a new shared secret string.

---

### Upgrading When Using Shared Secret Passwords

Cisco IOS Release 12.2 BC changed the encryption algorithm used for the **cable shared-secret** command. If you are upgrading from a Cisco IOS 12.1 EC or 12.0 SC release, you cannot cut and paste the **cable shared-secret** configuration lines that include an encrypted password. Instead, you must re-enter the original shared secret passwords at the CLI prompt, and then resave the configuration.

For example, if the actual shared secret password is “cm-sharedsecret-password”, enter the **cable shared-secret cm-sharedsecret-password** command at the CLI prompt. If you have enabled password encryption, the configuration file will then show only the newly encrypted password.

---

**Note** This change affects only the encryption of the passwords that are stored in the configuration file. It does not affect the actual encryption that is used between the CMTS and CMs, so you do not need to change the shared secret in the DOCSIS configuration files for the CMs.

---

## Examples

The following example shows how to specify a shared-secret string using an encrypted key:

```
Router# configure terminal
Router(config)# service password-encryption
Router(config)# int c6/0
Router(config-if)# cable shared-secret password
Router(config-if)# exit
Router(config)# exit
Router# show running-config | include shared
cable shared-secret 7 1407513181A0F13253920
Router#
```

**Note** In this example, the shared-secret string is initially entered as clear text, but because the **service password-encryption** command has been used, the string is encrypted in the configuration file.

The following example shows how to remove the use of a shared-secret encryption key on a cable interface. That particular interface then ignores any shared-secret that is used when calculating the MD5 checksum:

```
Router# configure terminal
Router(config)# int c6/0
Router(config-if)# no cable shared-secret
Router(config-if)# end
Router#
```

## Related Commands

Command	Description
<b>cable dynamic-secret</b>	Enables the dynamic shared secret feature, so that DOCSIS configuration files are verified with a dynamically generated shared secret.
<b>cable shared-secondary-secret</b>	Configures one or more secondary shared-secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable tftp-enforce</b>	Requires that all CMs on a cable interface attempt to download a DOCSIS configuration file using the Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online.

# cable sid-cluster-group

To configure a SID cluster group on a cable interface line card, use the **cable sid-cluster-group** command in cable interface configuration mode. To disable the configuration, use the **no** form of this command.

**cable sid-cluster-group** [ **dynamic** [*max\_rate\_threshold*] | **req-multiplier** *value* | **num-of-cluster** *number* ]  
**no cable sid-cluster-group** [ **dynamic** [*max\_rate\_threshold*] | **req-multiplier** *value* | **num-of-cluster** *number* ]

## Syntax Description

<b>dynamic</b> <i>max_rate_threshold</i>	If specified, the number of SID clusters is dynamically derived from the service flow maximum rate. Valid values are from 1 to 4,294,967,295 bps. If not specified, the legacy threshold of 28 Mbps is preserved.
<b>req-multiplier</b> <i>value</i>	Specifies the queue-depth request byte multiplier. Valid values are 1, 2, 4, 8, and 16. A cable modem uses queue-depth based requesting for all bandwidth requests, if the Multiple Transmit Channel mode is enabled.
<b>num-of-cluster</b> <i>number</i>	Specifies the number of SID clusters. Valid values are from 1 to 8. The default value is 1.

## Command Default

None

## Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS XE Gibraltar 16.12.1z	This command was updated. <i>max_rate_threshold</i> option was added.

## Usage Guidelines

Configure the **cable sid-cluster-group num-of-cluster 2** command to achieve desired upstream bonded speeds. Alternatively, use a large upstream Max Traffic burst in the cable modem file (such as 30 kB). The Max Concat burst in the cable modem file does not need change because DOCSIS 3.0 uses continuous concatenations and fragmentation (CCF), and can therefore use the default value of 3044 in the Max Concat field.

If the **cable sid-cluster-group** command is not used, the router accepts the default SID cluster configuration. By default, only one SID cluster is configured.

## Examples

The following example shows how to configure a SID cluster on a cable interface in slot 5, subslot 1, and port 0 on a Cisco uBR10012 router:

```

Router# configure terminal
Router(config)# interface cable 5/1/0
Router(config-if)# cable sid-cluster-group
Router(config-if)# cable sid-cluster-group dynamic
Router(config-if)# cable sid-cluster-group req-multiplier 8
Router(config-if)# cable sid-cluster-group num-of-cluster 2

```

The following example shows how to configure 2 SID clusters on Cisco cBR-8 router:

```

Router# configure terminal
Router(config)# interface cable 7/0/0
Router(config-if)# cable sid-cluster-group req-multiplier 12
Router(config-if)# cable sid-cluster-group num-of-cluster 2

```

The following example shows how to configure dynamic SID clusters on Cisco cBR-8 router:

```

Router# configure terminal
Router(config)# interface cable 7/0/0
Router(config-if)# cable sid-cluster-group dynamic 3000000000
Router(config-if)# cable sid-cluster-group req-multiplier 12

```

### Associated Features

The `cable sid-cluster-group` command is used to configure the [Upstream Channel Bonding](#) feature.

### Related Commands

Command	Description
<code>cable sid-cluster-switching</code>	Specifies SID cluster switchover criteria on a cable interface line card.

## cable sid-cluster-switching

To specify Service ID (SID) cluster switchover criteria on a cable interface line card, use the **cable sid-cluster-switching** command in cable interface configuration mode. To disable the configuration, use the **no** form of this command.

**cable sid-cluster-switching** [**max-outstanding-byte** *value* | **max-request** *value* | **max-time** *seconds* | **max-total-byte** *value*]  
**no cable sid-cluster-switching** [**max-outstanding-byte** *value* | **max-request** *value* | **max-time** *seconds* | **max-total-byte** *value*]

### Syntax Description

<b>max-outstanding-byte</b> <i>value</i>	(Optional) Specifies the total size, in bytes, for outstanding requests using the SID cluster. The valid values are from 0 to 4294967295.
<b>max-request</b> <i>value</i>	(Optional) Specifies the maximum number of requests that can be made using the SID cluster. The valid values are from 0 to 255. The default value is 1.  <b>Note</b> Do not use 0 as a value for this configuration. The value 0 is used for Cisco Internal purposes only.
<b>max-time</b> <i>milliseconds</i>	(Optional) Specifies the total time, in milliseconds, that a service flow can continue to use the SID cluster for bandwidth requests. The valid values are from 0 to 65535.
<b>max-total-byte</b> <i>value</i>	(Optional) Specifies the total number of bytes that can be requested using the SID cluster. The valid values are from 0 to 4294967295.

### Command Default

None

### Command Modes

Interface configuration—cable interface only (config-if)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If the service flow has only one SID cluster and the SID cluster switchover criterion limit is met, the cable modem stops sending bandwidth requests until the SID cluster is cleared.

The SID cluster configuration along with switchover criterion may impact overall system performance. So we recommend not to customizing switchover criterion unless justified. The default switchover criterion will meet most of the requirements. If the **cable sid-cluster-switching** command is not used, the router accepts the default SID cluster switchover criterion. That is only one request can be made using the SID cluster.

### Examples

The following example shows how to specify SID cluster switchover criteria on a cable interface in slot 5, subslot 1, and port 0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 5/1/0
Router(config-if)# cable sid-cluster-switching
Router(config-if)# cable sid-cluster-switching max-outstanding-byte 4444
Router(config-if)# cable sid-cluster-switching max-request 222
Router(config-if)# cable sid-cluster-switching max-time 444
Router(config-if)# cable sid-cluster-switching max-total-byte 67890
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable sid-cluster-group</b>	Configures a SID cluster on a cable interface line card.

## cable sip cir-scale

To configure the committed information rate (CIR) scaling ratio for scaling the admission control (AC) bandwidth for all Modular Cable and Wideband interfaces on a SIP, use the **cable sip cir-scale** command in global configuration mode. To disable the configuration, use the **no** form of the command.

**cable sip slot cir-scale percent**  
**no cable sip slot cir-scale**

### Syntax Description

*slot* Slot number of the SIP on the Cisco uBR10012 router. The valid values are 1 and 3.

*percent* Percentage for scaling the AC bandwidth on the SIP. The valid range is from 10 to 100.

### Command Default

The AC bandwidth on the SIP is not scaled (that is, 100%).

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCI	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

When CIR scaling is configured, the maximum reserved bandwidth is scaled based on the specified *percent*.

**Note** Do not change the CIR scaling value frequently as it can increase the system load.

The table below provides the recommended values for the CIR scaling:

**Table 12: Recommended Values for the CIR Scaling**

Shared Port Adapters	Recommended CIR Scaling
4 x Cisco 3 Gbps Wideband Shared Port Adapters	100%
4 x Cisco 6 Gbps Wideband Shared Port Adapters	50%
2 x Cisco 6 Gbps Wideband Shared Port Adapters	100%
1 x Cisco 6 Gbps Wideband Shared Port Adapter and 3 x Cisco 3 Gbps Wideband Shared Port Adapters	80%

The following examples shows how to set the CIR value to 50%:

```
Router# configure terminal
Router(config)# cable sip 1 cir-scale 50
```

## cable sip fpd-auto

To configure the automatic upgrade and downgrade of field-programmable device (FPD) image based on the card configuration, use the **cable sip fpd-auto** command in global configuration mode. To disable the configuration, use the **no** form of the command.

**cable sip slot fpd-auto**

<b>Syntax Description</b>	<i>slot</i>	Slot number of the SIP on the Cisco uBR10012 router. The valid values are 1 and 3.
<b>Command Default</b>	Automatic upgrade and downgrade of FPD image is disabled.	
<b>Command Modes</b>	Global configuration (config)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SC11	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
<b>Usage Guidelines</b>	<p>This command can be used for automatic upgrade of Cisco 3 Gbps Wideband Shared Port Adapter and downgrade of Cisco 6 Gbps Wideband Shared Port Adapter FPD images.</p> <p>The following example shows how to enable automatic upgrade and downgrade of FPD image:</p> <pre>Router# <b>configure terminal</b> Router(config)# <b>cable sip 1 fpd-auto</b></pre>	

# cable sip ib-stats

To configure the Ironbus throughput warning message threshold and print interval on a SIP, use the **cable sip ib-stats** command in global configuration mode. To disable the configuration, use the **no** form of the command.

**cable sip** *slot* **ib-stats** **bandwidth-usage** *percent* **message-throttle** *minutes*  
**no cable sip** *slot* **ib-stats**

<b>Syntax Description</b>	<i>slot</i>	Slot number of the SIP on the Cisco uBR10012 router. The valid values are 1 and 3.
	<b>bandwidth-usage</b> <i>percent</i>	Specifies the bandwidth usage, in percentage. The valid range is from 50 to 100. The default value is 90%.
	<b>message-throttle</b> <i>minutes</i>	Specifies the warning message interval, in minutes. The valid range is from 0 to 60. The default value is 2 minutes.
<b>Command Default</b>	None	
<b>Command Modes</b>	Global configuration (config)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

**Note** If the warning message interval is set to 0, then the warning message is not displayed.

The following example shows how to set the bandwidth usage to 50% and the warning message interval to 10 minutes:

```
Router# configure terminal
Router(config)# cable sip 1 ib-stats bandwidth-usage 50 message-throttle 10
```

## Related Commands

Command	Description
<b>show ib statistics</b>	Displays the Ironbus statistics information.

# cable snmp cache active

To enable the SNMP cache status, use the **cable snmp cache active** command in global configuration mode. To disable the configuration, use the **no** form of this command.

**cable snmp cache active**  
**no cable snmp cache active**

**Syntax Description** This command has no keywords or arguments.

**Command Default** SNMP cache is enabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>cable bgsync active</b> command.

## Usage Guidelines

**Important** You must configure the **service internal** command in global configuration mode to enable or disable SNMP cache status.

The time interval for which the SNMP cache information is stored on the Supervisor is known as *age* and set to 5 seconds.

## Example

The following example shows how to enable the SNMP cache status:

```
Router(config)# service internal
Router(config)# cable snmp cache active
```

Related Commands	Command	Description
	<b>show cable snmp cache-status</b>	Displays the SNMP cache status.

## cable snmp cm-rcs

To receive the service-group ID or the bonding-group ID as Receive Channel Set (RCS) ID that the CM is currently using.

**cable snmp cm-rcs** {**service-group** | **bonding-group**}

Syntax Description		
	<b>service-group</b>	Service-group ID is returned as RCS ID.
	<b>bonding-group</b>	Bonding-group ID is returned as RCS ID.

**Command Default** Service-group ID is returned as RCS ID.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **no** form of this command, that is, **no cable snmp cm-rcs** returns service-group ID as RCS ID.

### Example

The following example shows how to configure the command to receive the service-group ID as RCS ID:

```
Router(config)# service internal
Router(config)# cable snmp cm-rcs service-group
```

## cable snmp iftype ds-phy

Use the **cable snmp iftype ds-phy** command to change toggle the iftype for the downstream physical channels between the default Cisco defined mode and the IANA defined mode.

**cable snmp iftype ds-phy** *value*

### Syntax Description

*value* Denotes the iftype of DS\_PHY. The following values may be used:

- 1—Cisco-defined value for iftype of DS\_PHY.
- 257—IANA-defined value for iftype of DS\_PHY.

### Command Default

The default value is 1—Cisco defined iftype.

### Command Modes

Global Configuration (config)

### Command History

Release	Modification
12.2(33)SCH5	This command was introduced.
12.2(33)SCI1	This command is integrated from Cisco IOS Release 12.2(33)SCH5.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command is used to change the **iftype** of the downstream physical channel from the default Cisco-defined value 1, to the IANA-defined value 257. The command is also used to revert to the default Cisco-defined value.

### Example

This example shows how to change the iftype value of the downstream physical channel for IANA:

```
Router(config)#cable snmp iftype ds-phy 257
```

This example shows how to verify that the iftype value has changed:

```
Router#show running-config | include iftype
cable snmp iftype ds-phy 257
```

# cable snmp trap detailed-alarm

The **cable snmp trap detailed-alarm** CLI is used to add an entity name into the alarm description text in alarm trap.

## **cable snmp trap detailed-alarm**

---

**Command Modes** Global configuration (config)

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Everest 16.10.1g	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

---

**Usage Guidelines** The **cable snmp trap detailed-alarm** CLI feature is disabled by default. When this CLI is enabled, the entity name is added into alarm trap description.

With the **cable snmp trap detailed-alarm** CLI, two new information will be added into the content of the **ceAlarmDescrText** component in alarm trap:

- A prefix character ‘#’ .
- The entity name which has alarm.

There are no changes to the other existing components.

The following example shows an usage of the **cable snmp trap detailed-alarm** command:

```
Router(config)# configure terminal
Router(config)# cable snmp trap detailed-alarm
Router(config)# show running-config | i cable snmp
cable snmp trap detailed-alarm
```

## cable source-route

To configure the virtual routing and forwarding instance (VRF) source route, use the **cable source-route** command in the cable modem's subinterface configuration mode. To disable the route, use the **no** form of this command.

**cable source-route**  
**no cable source-route**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The VRF source route is not configured.

**Command Modes** Subinterface configuration (config-subif)

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure the VRF source route:

**Note** This command is supported on the Cisco uBR10012 broadband routers only.

```
Router(config-subif) # cable source-route
```

Command	Description
<b>cable vrf-steering cable-modem</b>	Steers or directs the cable modems to the specified VRF.
<b>ip vrf</b>	Defines a VRF instance and enters the interface configuration mode.
<b>show ip arp vrf</b>	Displays which VRF contains a specific cable modem in the ARP table.

## cable source-verify

To enable verification of IP addresses for CMs and CPE devices on the upstream, use the **cable source-verify** command in bundle interface configuration mode. To disable verification, use the **no** form of this command.

**cable source-verify** [**dhcp** | **leasetimer** *value*]

**no cable source-verify**

### Syntax Description

<b>dhcp</b>	(Optional) Specifies that queries will be sent to verify unknown source IP addresses in upstream data packets.
<b>leasetimer</b> <i>value</i>	(Optional) Specifies the time, in minutes, for how often the router should check its internal CPE database for IP addresses whose lease times have expired. The valid range for value is 1 to 240 minutes, with a default of 60 minutes.

### Command Default

Disabled. When the **dhcp** option is specified, the **leasetimer** option defaults to 60 minutes.

### Command Modes

Bundle Interface configuration (config-if)

### Command History

Release	Modification
11.3 XA	This command was introduced.
12.0(7)T	The <b>dhcp</b> keyword was added.
12.0(10)SC, 12.1(2)EC	Support was added for these trains.
12.1(3a)EC	Subinterface support was added.
12.1(13)EC, 12.2(11)BC1	The <b>leasetimer</b> keyword was added.
12.2(15)BC1	The verification of CPE devices was changed when using the <b>dhcp</b> keyword.
12.2(15)BC2	Support for verifying CMs and CPE devices that are on a different subnet than the cable interface was enhanced to use Reverse Path Forwarding (RFP).
12.3(9a)BC	Cisco IOS Release 12.3(9a)BC adds the option of using a per SID basis for deriving lease queries from CPE devices. This release also introduces a global rate limit for lease queries initiated by downstream traffic.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Configuring the **cable source-verify** command on the bundle interface of a bundle will configure it for all of the subordinate interfaces in the bundle as well.

The **cable source-verify** command helps to prevent the spoofing of IP addresses by CMs or their CPE devices by verifying that the upstream packets coming from each CM are known to be associated with the IP address in that packet. Packets with IP addresses that do not match those associated with the CM are dropped.

In order to protect the Cisco CMTS from denial of service attacks, Cisco IOS Release 12.3(9a)BC adds the option of using a per SID basis for deriving leasequeries from CPE devices. This release also introduces a global rate limit for leasequeries initiated by downstream traffic. These enhancements reduce the CPU utilization of Dynamic Host Configuration Protocol (DHCP) Receive and ISR processes when the Cisco CMTS is configured with the **cable source-verify dhcp** and **no cable arp** commands.

When **cable source-verify dhcp** and **no cable arp** commands are configured, DHCP leasequery is sent for downstream packets to verify unknown IP addresses within the IP address range configured on the bundle interface.

For DHCP leasequery to work in the downstream direction, the Cisco Network Registrar (CNR) should be made aware of the DHCP Option 82. This is required to make the CMTS map the CPE IP address to the correct CM. To do this, configure the **ip dhcp relay information option** command on the bundle interface to insert service class relay agent option into the DHCP DISCOVER messages. When the configuration is in place, during DHCP DISCOVER, the values of DHCP Option 82 is cached by the CNR and is returned to the CMTS on any subsequent DHCP leasequery for that IP address.

The Cisco CMTS maintains a database that links the MAC and IP addresses of known CPE devices with the CMs that are providing network access for those CPE devices. The CMTS typically populates this database with information obtained by examining the DHCP packets sent between the CPE devices and the DHCP server. Other IP traffic provides information about which CMs service which CPE devices.

After the **cable source-verify** command is issued, every IP upstream packet is examined. If the IP and MAC addresses of the CPE device are already associated with a known, online CM, it is allowed through. If not, the source IP address is examined to determine if it belongs to the cable network. If so, and if the **dhcp** option is not used, the packet is allowed through.

### Using the dhcp Option

---

**Note** Do not enable the local DHCP server on the Cisco CMTS and configure local DHCP address pools using the **ip dhcp pool** command, when using **dhcp** option, because this prevents DHCP address validation.

---

If the **dhcp** option is used, all packets with unknown IP addresses within the cable network are dropped, but the Cisco CMTS sends a DHCP leasequery message to the DHCP server to verify the IP address. If a valid response is received from the DHCP server, the CMTS updates its database with the new CPE device and allows future traffic through. If the DHCP server does not return a successful response, all traffic from the CPE is dropped.

In Cisco IOS Release 12.2(15)BC1 and later releases, the **dhcp** option extends the verification to CPE devices that had been online using a valid IP address but then were reconfigured by the user with an unused static IP address. With Cisco IOS Release 12.2(15)BC1 and later, CPE devices are not allowed online when they are using static IP addresses that have not been allocated by the DHCP server. If you are using the **dhcp** option, the CPE device must use an IP address that has been assigned by the DHCP server.

---

**Note** You must enable the **ip dhcp relay information option** command to properly trigger the leasequery after configuring the **cable source-verify dhcp** command. If the **ip dhcp relay information option** command is not enabled, the leasequery does not recover the IP address of the CPE properly.

---

---

**Note** The **dhcp** option automatically blocks all statically-assigned IP addresses unless the DHCP server has been configured to recognize those addresses and respond with the appropriate leasequery response.

---

The **cable source-verify** command by itself prevents someone from stealing another customer's IP address. The **cable source-verify dhcp** command adds another level of security by refusing access to any CPE device with an IP address that has not been assigned by the DHCP server.

---

**Note** This **dhcp** option requires that the DHCP server support the leasequery message. The CNR supports leasequery in version 7.0 onwards. The leasequery message is defined in an IETF draft, and available at the URL: <http://www.ietf.org/rfc/rfc4388.txt>

---

---

**Caution** Do not enable the local DHCP server on the Cisco CMTS and configure local DHCP address pools, using the **ip dhcp pool** command, when you are also enabling the **cable source-verify dhcp** command, because the DHCP server on the Cisco CMTS can intercept the leasequery messages and prevent them from reaching the external DHCP server. This in turn prevents address validation from succeeding because the DHCP server on the Cisco CMTS does not support leasequery messages.

---

---

**Note** When the **cable source-verify dhcp** feature is enabled, and a statically-defined IP address has been added to the CMTS for a CM using the **cable trust** command to override the **cable source-verify dhcp** checks for this device, packets from this CM will continue to be dropped until an entry for this CM is added to the ARP database of the CMTS. To achieve this, disable the **cable source-verify dhcp** feature, ping the CMTS from the CM to add an entry to the ARP database, and re-enable the **cable source-verify dhcp** feature.

---

#### Using the leasetimer Option

---

**Note** The **leasetimer** option takes effect only when the **dhcp** option is also used on an interface. Also, this option is supported only on the primary interface and cannot be configured on subinterfaces. Configuring it for a primary interface automatically applies it to all subinterfaces.

---

The **leasetimer** option adds another level of verification by activating a timer that periodically examines the lease times for the IP addresses for known CPE devices. If the CMTS discovers that the DHCP lease for a CPE device has expired, it removes that IP address from its database, preventing the CPE device from communicating until it makes another DHCP request. This prevents users from treating DHCP-assigned addresses as static addresses, as well as from using IP addresses that were previously assigned to other devices.

---

**Note** The **leasetimer** option is active only if you have also specified the **cable source-verify dhcp** command for the bundle interface. If the **dhcp** option is not used, the leasetimer option has no effect. In addition, the **leasetimer** option can be configured only on an interface, not a subinterface. Applying it to a primary interface automatically applies it to all subinterfaces.

---

The **leasetimer** option allows you to configure how often the timer checks the lease times, so as to specify the maximum amount of time a CPE device can use an IP address that was previously assigned by the DHCP server but whose lease time has since expired. The time period can range from 1 minute to 240 minutes (4 hours), with a grace period of 2 minutes to allow a PC enough time to make a DHCP request to renew the IP address. To turn off the timer, so that the CMTS no longer checks the lease times, issue the **cable source-verify** command without the **dhcp** option, or turn off the feature entirely with the **no cable source-verify** command.

### Using Multiple Subnets

In Cisco IOS Release 12.2(15)BC2 and later releases, the **cable source-verify** command can verify IP addresses that are on different subnets than what is being used on the bundle interface or subinterfaces only when Reverse Path Forwarding (RPF) is used in conjunction.

---

**Note** You must enable RPF before running the **cable source-verify** command to verify IP addresses on subinterfaces.

---

### Examples

The following example shows how to enable RPF before running the **cable source-verify** command to verify IP addresses on subinterfaces:

```
Router# configure terminal
Router(config)# ip cef
Router(config)# interface bundle 1
Router(config-if)# ip verify unicast source reachable-via rx
```

---

**Note** Beginning with Cisco IOS Release 12.2(33)SCA, **ip verify unicast source reachable-via rx** command must be used with the **allow-default** keyword

---

The following example shows how to turn on CM upstream verification and configures the Cisco CMTS router to send DHCP lease queries to verify unknown source IP addresses in upstream data packets:

```
Router# configure terminal
Router#(config) interface bundle 1
Router(config-if)# cable source-verify dhcp
Router(config-if)#
```

The following example shows how to enable the **leasetimer** feature so that every two hours, the CMTS checks the IP addresses in the CPE database for that particular interface for expired lease times:

```
Router# configure terminal
Router#(config) interface bundle 1
Router(config-if)# cable source-verify dhcp
Router(config-if)# cable source-verify leasetimer 120
```

The following example shows how to configure the bundle interface so that the CMTS can verify IP addresses that are on a different subnet than the one that the bundle interface is using:

```

Router# configure terminal
Router(config)# ip cef
Router#(config) interface bundle 1
Router(config-if)# ip verify unicast source reachable-via rx
Router(config-if)# cable source-verify dhcp

```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable arp</b>	Enables or disables the use of the ARP protocol for CMs and their CPE devices.
<b>cable helper-address</b>	Specifies a destination IP address for User Datagram Protocol (UDP) broadcast (DHCP) packets.
<b>cable dhcp-giaddr</b>	Modifies the GIADDR field of DHCP DISCOVER and DHCPREQUEST packets with a Relay IP address before they are forwarded to the DHCP server.
<b>cable logging badipsource</b>	Logs error messages about bad IP source addresses on the cable interfaces.
<b>cable relay-agent-option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host and forward the packet to a DHCP server.
<b>cable source-verify leasequery-filter downstream</b>	Controls the number of DHCP leasequery request messages that are sent for unknown IP addresses on all cable downstream interfaces on the Cisco CMTS router.
<b>cable source-verify leasequery-filter upstream</b>	Controls the number of DHCP leasequery request messages that are sent for unknown IP addresses per each service ID (SID) on an upstream.
<b>clear cable logging</b>	Removes all error messages about bad IP source addresses on the cable interfaces from the error log buffer.
<b>ip dhcp relay information option</b>	Enables the system to insert the CM MAC address into a DHCP packet received from a CM or host and forward the packet to a DHCP server.
<b>ip dhcp smart-relay</b>	Monitors client retransmissions when address pool depletion occurs.
<b>ip verify unicast reverse-path</b>	Enables Unicast Reverse Path Forwarding (Unicast RPF), which checks each packet received on an interface to verify that the packet's source IP address appears in the routing tables as belonging to that interface, so as to prevent spoofed IP source addresses.

## cable source-verify dhcp arp-probe

To send ARP to CPE after source verify is successful, use the **cable source-verify dhcp arp-probe** command to control the interval and retries. To disable the configuration, use the **no** form of this command.

**cable source-verify dhcp arp-probe** [ **interval** *seconds* { **retries** *number-of-probes* } ]

**cable source-verify dhcp arp-probe** [ **interval** *seconds* [ **retries** *number-of-probes* ] ]

Syntax Description	dhcp	DHCP LQ
	arp-probe	ARP Probe
	interval <i>seconds</i>	Interval between ARP probes
	retries <i>number-of-probes</i>	Number of probes

**Command Default** This command is disabled by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The following is a sample configuration of the command:

```
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)#cable source-verify dhcp arp-probe interval 30 retries 3
```

Related Commands	Command	Description
	cable arp	Enables or disables the use of the ARP protocol for CMs and their CPE devices.

# cable source-verify enable-sav-static

To enable source address verification (SAV) on the Cisco CMTS, use the **cable source-verify enable-sav-static** command in global configuration mode. To disable the SAV, use the **no** form of this command.

**cable source-verify enable-sav-static**  
**no cable source-verify enable-sav-static**

**Syntax Description** This command has no arguments or keywords.

**Command Default** SAV is disabled by default

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable source-verify enable-sav-static** command allows you to enable of SAV prefix processing on the Cisco CMTS. If the SAV feature is enabled, the SAV prefixes are matched during source verification. If the feature is disabled the SAV prefixes are not matched, and the configured SAV prefixes do not have any impact on the outcome of the source verification.

This feature is disabled by default.

**Examples** The following example shows how to enable SAV prefix processing on the Cisco CMTS:

```
Router(config)# cable source-verify enable-sav-static
```

Related Commands	Command	Description
	<b>cable source-verify group</b>	Configures SAV groups.
	<b>prefix</b>	Configures IPv4 or IPv6 prefixes in a SAV group.

## cable source-verify group

To configure the source address verification (SAV) prefix group, use the **cable source-verify group** command in global configuration mode. To disable the use of configured SAV prefix group, use the **no** form of this command.

**cable source-verify group** *groupname*  
**no cable source-verify group** *groupname*

<b>Syntax Description</b>	<i>groupname</i>	Name of the SAV prefix group. The <i>groupname</i> can be any arbitrary string up to 15 characters in length.
---------------------------	------------------	---------------------------------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable source-verify group** command is used to configure SAV groups. A SAV group is a group of IPv4 or IPv6 prefixes. The Cisco CMTS uses these prefixes to authenticate a cable modem (CM). A CM may be configured with an IPv4 or IPv6 prefix belonging to a particular SAV group. The time, length, value (TLV) 43.7.1 specifies the group name to which a given CM belongs. The Cisco CMTS considers a packet from a CM authorized if that packet is sourced with an IP address that belongs to the configured prefix in a SAV group.

A maximum of 255 SAV groups can be configured on a Cisco CMTS, with each SAV group containing up to four IPv4s, IPv6s, or a combination of both the prefixes (totalling up to four).

### Examples

The following example shows how to configure a SAV group with one IPv6 prefixes and one IPv4 prefixes:

```
Router(config)
)# cable source-verify group sav1
Router(config)
)# prefix 10.16.0.0/12
Router(config)
)# prefix 10::/12

Router(config)
)# exit
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable source-verify enable-sav-static</b>	Enables SAV prefix processing.
<b>prefix</b>	Configures IPv4 or IPv6 prefixes in a SAV group.

## cable source-verify leasequery-filter downstream

To control the number of Dynamic Host Configuration Protocol (DHCP) LEASEQUERY request messages that are sent for unknown IP addresses on all cable downstream interfaces on the Cisco Cable Modem Termination System (CMTS) router, use the **cable source-verify leasequery-filter downstream** command in global configuration mode. To stop the filtering of DHCP lease queries, use the **no** form of this command.

**cable source-verify leasequery-filter downstream** *threshold interval*  
**no cable source-verify leasequery-filter downstream**

### Syntax Description

<i>threshold</i>	Maximum number of DHCP lease queries allowed for each interval period. The valid range is 0 to 255 lease queries.
<i>interval</i>	Time period, in seconds, over which lease queries should be monitored. The valid range is 1 to 10 seconds.

### Command Default

Filtering of DHCP lease queries is disabled.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(15)BC1d, 12.2(15)BC2b	This command was introduced for the Cisco uBR7100 series, Cisco uBR7246VXR, and Cisco uBR10012 universal broadband routers.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

When the **cable source-verify dhcp** and **no cable arp** commands are configured on a cable interface, the Cisco CMTS router sends a DHCP LEASEQUERY request to the DHCP server to verify unknown IP addresses that are found in packets to and from customer premises equipment (CPE) devices that are using the cable modems on the cable interface. The DHCP server returns a DHCP ACK message with the MAC address of the CPE device that has been assigned this IP address, if any. The router can then verify that this CPE device is authorized to use this IP address, which prevents users from assigning unauthorized IP addresses to their CPE devices.

Problems can occur, though, when viruses, denial of service (DoS) attacks, and theft-of-service attacks scan ranges of IP addresses, in an attempt to find unused addresses. This type of activity can generate a large volume of DHCP LEASEQUERY requests, which can result in high CPU utilization and a lack of available bandwidth for other customers.

To prevent such a large volume of LEASEQUERY requests on all downstreams in the Cisco CMTS router, use the **cable source-verify leasequery-filter downstream** command. After configuring this command, the Cisco CMTS allows only a certain number of DHCP LEASEQUERY requests in the downstream direction within each interval time period.

For example, the **cable source-verify leasequery-filter downstream 5 10** command configures the router so that it allows a maximum of 5 DHCP LEASEQUERY requests every 10 seconds for each SID on the downstream direction. This command applies to all downstream cable interfaces in the router.

**Note** The **cable source-verify leasequery-filter downstream** command enables DHCP lease query filtering on all downstreams, but the actual filtering does not begin until the **cable source-verify dhcp** command and the **no cable arp** command are configured on a particular downstream. You can configure these commands on either the downstream's main interface, or on a subinterface for the downstream. If these commands are configured on a subinterface, however, the lease query filtering occurs only for cable modems using that subinterface.

**Tip** Use the **cable source-verify leasequery-filter upstream** command to filter DHCP LEASEQUERY requests in the upstream direction.

## Examples

The following example shows how to configure the Cisco CMTS router so that it allows a maximum of 10 DHCP lease query requests per SID over each five-second interval on all downstream cable interfaces. This example also shows the configuration of **cable source-verify dhcp** and **no cable arp** commands on a cable interface, which are required to use this feature.

```
Router# configure terminal
Router(config)# cable source-verify leasequery-filter downstream 10 5
Router(config)# interface cable 5/1/0
Router(config-if)# cable source-verify dhcp
Router(config-if)# no cable arp
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable arp</b>	Activates the cable Address Resolution Protocol (ARP).
<b>cable arp filter</b>	Controls the number of ARP requests and replies that can be forwarded over a cable interface.
<b>cable source-verify</b>	Enables verification of IP addresses for cable modems (CMs) and CPE devices on the upstream.
<b>cable source-verify leasequery-filter upstream</b>	Controls the number of DHCP lease query messages that are sent for unknown IP addresses per each service ID (SID) on an upstream.
<b>show cable leasequery-filter</b>	Displays the number of DHCP lease query messages that have been filtered for all cable modems or for a particular cable interface.

## cable source-verify leasequery-filter upstream

To control the number of Dynamic Host Configuration Protocol (DHCP) LEASEQUERY request messages that are sent for unknown IP addresses per each service ID (SID) on an upstream, use the **cable source-verify leasequery-filter upstream** command in cable interface configuration mode. To disable the filtering of DHCP lease queries, use the **no** form of this command.

**cable source-verify leasequery-filter upstream** *threshold interval*  
**no cable source-verify leasequery-filter upstream**

Syntax Description	
<i>threshold</i>	Maximum number of DHCP lease queries allowed per SID for each <i>interval</i> period. The valid range is 0 to 20 lease queries.
<i>interval</i>	Time period, in seconds, over which lease queries should be monitored. The valid range is 1 to 5 seconds.

**Command Default** Filtering of DHCP lease queries is disabled.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.2(15)BC1d, 12.2(15)BC2b	This command was introduced for the Cisco uBR7100 series, Cisco uBR7246VXR, and Cisco uBR10012 universal broadband routers.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** When the **cable source-verify dhcp** and **no cable arp** commands are configured on a cable interface, the Cisco Cable Modem Termination System (CMTS) router sends a DHCP LEASEQUERY request to the DHCP server to verify unknown IP addresses that are found in packets to and from customer premises equipment (CPE) devices that are using the cable modems on the cable interface. The DHCP server returns a DHCP ACK message with the MAC address of the CPE device that has been assigned this IP address, if any. The router can then verify that this CPE device is authorized to use this IP address, which prevents users from assigning unauthorized IP addresses to their CPE devices.

Problems can occur, though, when viruses, denial of service (DoS) attacks, and theft-of-service attacks scan ranges of IP addresses, in an attempt to find unused addresses. This type of activity can generate a large volume of DHCP LEASEQUERY requests, which can result in high CPU utilization and a lack of available bandwidth for other customers.

To prevent such a large volume of LEASEQUERY requests on the upstreams on a cable interface, use the **cable source-verify leasequery-filter upstream** command. After configuring this command, the Cisco CMTS allows only a certain number of DHCP LEASEQUERY requests in the upstream direction within each interval time period.

For example, the **cable source-verify leasequery-filter upstream 5 5** command configures the router so that it allows a maximum of 5 DHCP LEASEQUERY requests every 5 seconds for each SID on the upstream direction. This command applies to all upstreams on the cable interface.

**Note** The **cable source-verify leasequery-filter upstream** command enables DHCP lease query filtering on all upstreams on a cable interface, but the actual filtering does not begin until the **cable source-verify dhcp** command and the **no cable arp** command are configured on the upstream's associated downstream interface. You can configure these commands on either the downstream's main interface, or on a subinterface for the downstream. If these commands are configured on a subinterface, however, the lease query filtering occurs only for cable modems using that subinterface.

**Note** If using cable interface bundling, configure the **cable source-verify leasequery-filter upstream** command on all primary and subordinate interfaces.

**Tip** Use the **cable source-verify leasequery-filter downstream** command to filter DHCP LEASEQUERY requests in the downstream direction.

## Examples

The following example shows how to configure the Cisco CMTS router so that it allows a maximum of five DHCP lease query requests per SID over each two-second interval on all upstreams on a particular cable interface. This example also shows the configuration of **cable source-verify dhcp** and **no cable arp** commands on the cable interface, which are required to use this feature.

```
Router# configure terminal
Router(config)# interface cable 6/0
Router(config-if)# cable source-verify dhcp

Router(config-if)# cable source-verify leasequery-filter upstream 5 2

Router(config-if)# no cable arp

Router(config-if)#
```

## Related Commands

Command	Description
<b>cable arp</b>	Activates the cable Address Resolution Protocol (ARP).
<b>cable arp filter</b>	Controls the number of ARP requests and replies that can be forwarded over a cable interface.
<b>cable source-verify</b>	Enables verification of IP addresses for cable modems (CMs) and CPE devices on the upstream.
<b>cable source-verify leasequery-filter downstream</b>	Controls the number of DHCP lease query messages that are sent for unknown IP addresses on all cable downstream interfaces on the Cisco CMTS router.
<b>show cable leasequery-filter</b>	Displays the number of DHCP lease query messages that have been filtered for all cable modems or for a particular cable interface.

## cable spectrum-group (global)

To create and configure a spectrum group, use the **cable spectrum-group** command in global configuration mode. To disable this spectrum group, use the **no** form of this command.

**cable spectrum-group** *group-number* [**time** *day hh:mm:ss* ] **frequency***up-freq-hz* [*pwr-lvl-dbmV*]  
**no cable spectrum-group** *group-number*

Syntax Description	
<i>group-number</i>	Specifies the spectrum group for which you are specifying a parameter value or specifies the number of the spectrum group you wish to remove from your router configuration. Valid range is from 1 to 32, or from 1 to 40, depending on the Cisco IOS software release.
<b>time</b> <i>day hh:mm:ss</i>	(Optional) For scheduled spectrum groups, enter the day of the week ( <b>Sun—Sat</b> ) and the time of day that the frequency and input power level should change.
<b>frequency</b> <i>up-freq-hz</i>	Specifies a center frequency for the upstream group. The valid range is 5,000,000 Hz to 42,000,000 Hz (DOCSIS), 55,000,000 Hz (Japan), or 65,000,000 (EuroDOCSIS).  <b>Note</b> You can enter this command multiple times for the same spectrum group to create a group of individual frequencies to be used for frequency hopping.
<b>band</b> <i>up-freq1-hz</i> <i>up-freq2-hz</i>	Specifies a range of center frequencies the Cisco CMTS can scan to find an acceptable channel to which the spectrum group may hop. The valid range for <i>up-freq1-hz</i> is 5,000,000 Hz to 42,000,000 Hz (DOCSIS), 55,000,000 Hz (Japan), or 65,000,000 (EuroDOCSIS), but <i>up-freq2-hz</i> must be greater than <i>up-freq1-hz</i> .  <b>Note</b> When creating spectrum groups for cable line cards that support Advanced Spectrum Management (Cisco uBR10-MC16S, uBR10-MC16U/X, uBR10-MC28U/X, and uBR10-MC5X20S/U), use the <b>band</b> option. The <b>frequency</b> option is not supported for these types of line cards.
<i>pwr-lvl-dbmV</i>	(Optional) Specifies the nominal input power level. The valid range is -10 to +25 dBmV, with a default of 0 dBmV. Some cable plants might want to change only the input power level, and not the frequency, on a daily time schedule.

**Command Default** If not specified, the group is set for a nominal input power level of 0 dBmV and the group is not scheduled for automatic frequency or power changes.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	11.3 NA	This command was introduced.
	12.0(7)XR2	The <b>band</b> parameter for this command was added to enable frequency range scanning capabilities in the Cisco uBR-MC16S cable interface line card.

Release	Modification
12.0(13)SC, 12.1(4)EC, 12.2(4)BC1	The allowable frequency range was increased to 65 MHz to support the EuroDOCSIS frequency range of the Cisco uBR-MC16E cable interface line card.
12.2(15)BC2	The maximum number of spectrum groups was increased from 32 to 40 groups per router.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Frequency agility is configured and activated using spectrum groups that are controlled by the spectrum manager. You can create from 1 to 32, or from 1 to 40, spectrum groups for each cable modem card upstream port, depending on the Cisco IOS software release.

To create spectrum groups, specify a list of upstream frequencies and nominal power levels that each spectrum group can use when an upstream frequency change is necessary. Each spectrum group should have its own list of upstream frequencies. At 1.6 MHz, the valid range is -10 dBmV to 25 dBmV. The power level value should be changed only if you want to change only the power level as part of spectrum management. The standard power level is 0 dBmV.

The **cable spectrum-group** command sets the center frequency for the upstream, but the total frequency bandwidth that is actually used depends on the channel width. Table below shows the possible center frequencies for each channel width, for both DOCSIS and EuroDOCSIS cable interfaces.

**Table 13: Allowable Center Frequencies**

Channel Width (MHz)	Center Frequency (MHz)	Center Frequency (MHz)
	DOCSIS (5 to 42 MHz)	EuroDOCSIS (5 to 65 MHz)
200,000	5.1 to 41.9	5.1 to 64.9
400,000	5.2 to 41.8	5.2 to 64.8
800,000	5.4 to 41.6	5.4 to 64.6
1,600,000	5.8 to 41.2	5.8 to 64.2
3,200,000	6.6 to 40.4	6.6 to 63.4

The allowable range for the upstream channel frequency depends on the cable interface line card and Cisco IOS software release being used. See Table 2-11 for the currently supported values.

**Table 14: Allowable Frequency Range for the cable upstream frequency Command**

Frequency Range	Supported Cable Interfaces	Minimum Cisco IOS Releases
5 to 42 MHz	All supported cable interfaces	All releases supported for the Cisco CMTS
5 to 55 MHz	Cisco uBR-MC16U/X and Cisco uBR-MC28U/X, when operating with extended frequencies for Japanese mode	Cisco IOS Release 12.2(15)BC2

Frequency Range	Supported Cable Interfaces	Minimum Cisco IOS Releases
5 to 65 MHz	Cisco uBR-MC16E, Cisco uBR7111E and Cisco uBR7114E routers	Cisco IOS Release 12.0(13)SC, 12.1(4)EC, and 12.2(4)BC1

**Note** If both an Cisco uBR-MC16E cable interface line card and a Cisco uBR-MC16C or a Cisco uBR-MC16S cable interface line card are present in the chassis, a spectrum group in the 42-MHz to 65-MHz range should not be assigned.

**Tip** Cisco cable interface line cards always program the upstream's center frequency in 16 KHz increments, and this is the frequency displayed by the **show controller cable upstream** command. For example, if you use the **cable upstream frequency** command to specify a center frequency of 27 MHz (**cable upstream x frequency 27000000**), the actual center frequency will be 27.008 MHz, which is the next highest 16 KHz boundary.

You must repeat this command for each frequency or power level that you want to add to a spectrum group's list of valid values.

After you have created one or more spectrum groups for your cable network, you can add characteristics to them, providing you with more definitive control over frequency usage and frequency hopping.

The cable interface does not operate until you either create and configure a spectrum group or set a fixed upstream frequency. See the **cable upstream channel-width** command.

## Examples

The following example shows how to configure spectrum group 1 with an upstream frequency of 6,500,000 Hz and a default power level of 0 dBmV:

```
Router(config)# cable spectrum-group 1 frequency 6500000
```

The following example shows how to add the upstream frequency 7,000,000 Hz to the list of valid frequencies with a default power level of 0 dBmV for spectrum group 1:

```
Router(config)# cable spectrum-group 1 frequency 7000000
```

The following example shows how to configure spectrum group 2 with an upstream frequency 7,500,000 Hz and change the power level to 5 dBmV:

```
Router(config)# cable spectrum-group 2 frequency 7500000 5
```

The following example shows how to configure spectrum group 3 with an upstream band of 12,000,000 to 18,000,000 Hz and default power level of 0 dBmV:

```
Router(config)# cable spectrum-group 3 band 12000000 18000000
```

The following example shows how to add the upstream band 20,000,000 to 24,000,000 Hz to the list of valid bands with a change in the power level of 13 dBmV for spectrum group 3:

```
Router(config)# cable spectrum-group 3 band 20000000 24000000 13
```

The following example shows how to configure a continuous band between 5,000,004 and 40,000,000 Hz for scheduled spectrum group 4 with a default power level of 0 dBmV. The spectrum group will be available to the spectrum group starting at 12:00 p.m. local time each Monday:

```
Router(config)# cable spectrum-group 4 time Monday 12:00:00 band 5000004 40000000
```

The following example shows how to add the upstream frequency 9,500,000 Hz to the list of valid frequencies and change the nominal power level to 5 dBmV. The spectrum manager adjusts frequencies and power levels on this group at 2:00 a.m. local time each day:

```
Router(config)# cable spectrum-group 3 time 02:00:00 frequency 9500000 5
```

The following example shows how to remove a specified spectrum group from your configuration:

```
Router(config)# no cable spectrum-group 3
Router(config)#
```

## Related Commands

Command	Description
<b>cable modulation-profile</b>	Configures preset modulation profiles that you can apply to one or more upstream cable interfaces when you identify and configure spectrum groups.
<b>cable spectrum-group hop period</b>	Sets the minimum frequency-hop interval for a cable spectrum group.
<b>cable spectrum-group hop threshold</b>	Specifies a hop threshold for a cable spectrum group.
<b>cable spectrum-group shared</b>	Specifies the upstream ports in a spectrum group can share the same upstream frequency.
<b>cable upstream frequency</b>	Specifies that the upstream should either be set to a specific center frequency or be set dynamically.
<b>cable upstream power-level</b>	Specifies the upstream cable interface receive power level in dBmV.
<b>cable upstream shutdown</b>	Activates or shuts down a specified upstream cable interface.
<b>cable upstream hopping blind</b>	Disengages the advanced spectrum management features of the Cisco uBR-MC16S and Cisco uBR-MC5X20S cable interface line cards by enabling blind frequency hopping behavior.
<b>show controllers cable</b>	Displays information about the cable interface, including the upstream center frequency.

# cable spectrum-group (interface)

To assign a default spectrum group to all of the upstreams on a cable interface, use the **cable spectrum-group** command in interface configuration mode. To remove the spectrum groups from the upstreams, use the **no** form of this command.

**cable spectrum-group** *group-number*  
**no cable spectrum-group** *group-number*

<b>Syntax Description</b>	<i>group-number</i>	Specifies the spectrum group that should be used as the default group for the upstreams on this cable interface. The valid range is from 1 to 32, or from 1 to 40, depending on the Cisco IOS software release.
---------------------------	---------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Interface configuration (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	11.3 NA	This command was introduced.
	12.2(15)BC2	The maximum number of spectrum groups was increased from 32 to 40 groups per router.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command assigns a default spectrum group to all of the upstreams on the cable interface. All upstreams on the interface use this spectrum group unless you override this configuration, using one of the following commands:

- To assign a different spectrum group to a particular upstream, use the **cable upstream spectrum-group** command.
- To assign a new frequency to a particular upstream, use the **cable upstream frequency** command.

These two commands override the **cable spectrum-group** command for the particular upstreams to which they are applied. The remaining upstreams in the interface, however, continue to use the default configuration that is specified by the **cable spectrum-group** command.

**Tip** You must first create and configure the spectrum groups before you can assign them to an interface. To create and configure spectrum groups, use the set of **cable spectrum-group** commands that are available in global configuration mode.

## Examples

The following example shows how to assign spectrum group 1 to all of the upstreams on the cable interface in slot 3/0:

```
Router(config)# interface cable 3/0
```

**cable spectrum-group (interface)**

```
Router(config-if)# cable spectrum-group 1
```

```
Router(config-if)# exit
```

```
Router(config)#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable modulation-profile</b>	Configures preset modulation profiles that you can apply to one or more upstream cable interfaces when you identify and configure spectrum groups.
<b>cable spectrum-group (global configuration)</b>	Creates and configures a spectrum group.
<b>cable spectrum-group hop period</b>	Sets the minimum frequency-hop interval for a cable spectrum group.
<b>cable spectrum-group hop threshold</b>	Specifies a hop threshold for a cable spectrum group.
<b>cable spectrum-group shared</b>	Specifies the upstream ports in a spectrum group can share the same upstream frequency.
<b>cable upstream hopping blind</b>	Disengages the advanced spectrum management features of the Cisco uBR-MC16S and Cisco uBR-MC5X20S cable interface line cards by enabling blind frequency hopping behavior.
<b>cable upstream spectrum-group</b>	Assigns a spectrum group to an individual upstream on a cable interface line card.

## cable spectrum-group hop period

To change the minimum time between frequency hops, use the **cable spectrum-group hop period** command in global configuration mode. To reset the frequency hop interval for this spectrum group to its default value, use the **no** form of this command.

**cable spectrum-group** *groupnum* **hop period** *seconds*  
**no cable spectrum-group** *groupnum* **hop period**

Syntax Description	
<i>groupnum</i>	Spectrum group number. Valid values are from 1 to 32, or from 1 to 40, depending on the Cisco IOS software release.
<i>seconds</i>	Specifies the frequency-hop time period in seconds. Valid values are from 1 to 3600 seconds (before Cisco IOS Release 12.2(8)BC1), or from 1 to 300 seconds (Cisco IOS Release 12.2(8)BC1 or later).  For Cisco cBR Series Converged Broadband Routers, the valid values are from 5 to 300.

Command Default	
	Before Cisco IOS Release 12.2(15)BC1: 25 seconds  Cisco IOS Release 12.2(15)BC1 and later releases: 20 seconds when N+1 HCCP redundancy is not configured, and 15 seconds when N+1 HCCP redundancy is configured on the cable interface

Command Modes	
	Global configuration (config)

Command History	Release	Modification
	12.1 T	This command was introduced.
	12.1(7)CX1	The default <b>hop period</b> was changed from 300 seconds to 25 seconds to accommodate the new spectrum management features for the Cisco uBR-MC16S spectrum management card.
	12.2(8)BC1	The maximum frequency-hop time period was changed from 3600 to 300 seconds.
	12.2(15)BC1	The default <b>hop period</b> was changed from 25 seconds to 20 seconds when N+1 HCCP redundancy is not configured on the cable interface, and changed to 15 seconds when N+1 HCCP redundancy is configured.
	12.2(15)BC2	The maximum number of spectrum groups was increased from 32 to 40 groups per router.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	
	The <b>cable spectrum-group hop period</b> command defines the minimum amount of time that must pass between upstream frequency hops. If ingress noise becomes excessive on a particular upstream, you can set this time period to a smaller value, so as to allow frequency hopping to continue more rapidly until a clear channel is found. Conversely, if the problem appears to be a transient condition, such as a defective CM generating a

large volume of errored packets, this time period can be increased to a larger value, so as to avoid excessive frequency hopping by allowing more time between frequency hops.

On the Cisco uBR-MC1xC cards, the maximum recommended hop period is 20 seconds. On the Cisco uBR-MC16S and Cisco uBR-MC5X20S/U cards, the minimum recommended hop period is 25 seconds and the maximum recommended hop period is 35 seconds.

In Cisco IOS Release 12.2(15)BC2, the Cisco CMTS adaptively increases the hop period from the user-defined value to the maximum value (300 seconds) whenever an upstream does not currently have any CMs ranging on it, so as to avoid unnecessary frequency hopping. The user-defined value is restored when a CM starts ranging on the upstream.

**Note** The hop period should be set to at least 25 seconds on the Cisco uBR-MC16S and Cisco uBR-MC5X20S/U cards so that transient network problems that are unrelated to ingress noise do not generate unnecessary frequency hops.

## Examples

The following example shows how to change the minimum frequency-hop interval to 60 seconds. This means that frequency hops for this spectrum group cannot occur more quickly than once every 60 seconds, even if other characteristics, such as exceeding the CNR or FEC threshold values, would normally trigger the hop.

```
Router# configure terminal
Router(config)# cable spectrum-group 1 hop period 60
Router(config)#
```

## Related Commands

Command	Description
<b>cable modulation-profile</b>	Creates a cable modulation profile.
<b>cable spectrum-group hop threshold</b>	Specifies a hop threshold for a cable spectrum group.
<b>cable upstream channel-width</b>	Configures an upstream for a range of allowable channel widths.
<b>cable upstream modulation-profile</b>	Configures an upstream for one modulation profile (static profile) or two modulation profiles (Dynamic Upstream Modulation).
<b>show cable hop</b>	Displays the current hop period and threshold for an upstream, along with other statistics.

# cable spectrum-group hop threshold

To specify a frequency hop threshold for a spectrum group, use the **cable spectrum-group hop threshold** command in global configuration mode. To delete the hop threshold for this spectrum group, use the **no** form of this command.

**cable spectrum-group** *groupnum* **hop threshold** [*percent*]  
**no cable spectrum-group** *groupnum* **hop threshold**

Syntax Description	
<i>groupnum</i>	Spectrum group number. Valid values are from 1 to 32, or from 1 to 40, depending on the Cisco IOS software release.
<i>percent</i>	(Optional) Specifies the frequency hop threshold as a percentage of station maintenance messages that are lost. Valid range is from 1 to 100 percent.

**Command Default** 20 percent

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.1 T	This command was introduced.
	12.1(7)CX1	The default <b>hop threshold</b> was changed from 100 percent to 20 percent to accommodate the new spectrum management features for the Cisco uBR-MC16S spectrum management card.
	12.2(4)BC1	Support for this command was added to the Release 12.2 BC train.
	12.2(15)BC2	The maximum number of spectrum groups was increased from 32 to 40 groups per router.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The Cisco CMTS sends a station maintenance message to each CM at least once every 25 to 30 seconds. If a CM does not respond to a station maintenance message within that time period, the CMTS then resends station maintenance messages at a faster rate (typically one second apart) in an attempt to restore connectivity with the CM.

Station maintenance messages can be lost because CMs have lost connectivity with the CMTS, or because ingress noise and other factors are causing dropped and errored packets. Downstream noise can also affect the delivery of station maintenance messages. When a user-configurable percentage of station maintenance messages are lost, the CMTS hops to a new upstream frequency to improve connectivity and sends out an Upstream Channel Descriptor (UCD) update to the CMs to inform them of the change.

The optimal hop threshold value depends on several factors, including the quality of the upstream return path and the number of CMs on the upstream. In addition, the hop threshold works together with the hop period so that transient network problems do not generate an unnecessary number of frequency hops. Ideally, the

hop threshold should be set low enough so that the frequency hop can occur before a significant number of CMs go offline, but not so low that it generates frequency hops that are not needed.

For example, if the hop threshold is at its default of 20 percent and an upstream has 100 active CMs, a power outage that affected 20 CMs would usually cause a frequency hop since this is a 20 percent loss of CMs, which in turn would be responsible for at least 20 percent loss of station maintenance messages. But in this situation, the frequency hop would be unneeded because changing the upstream frequency could not correct the original problem (the power outage). If this were a common situation on this upstream, the network administrator might increase the hop threshold so that the repeated power outages would not generate unneeded frequency hops.

If, on the other hand, the power outage affected only 10 CMs, a frequency hop would not occur unless another factor, such as ingress noise, created a sufficient loss of station maintenance messages to reach the 20 percent threshold. In this situation, the default threshold of 20 percent might be sufficient.

Downstream problems can also generate frequency hops. For example, if 20 CMs were on a particularly noisy downstream, over time they could miss a sufficient number of station maintenance messages to generate a frequency hop. The network administrator could increase the hop threshold to limit the possibility of frequency hops due to downstream impairments.

Also, faulty CMs could generate a frequency hop under certain conditions. For example, if a number of faulty CMs generated a large number of uncorrectable forward error correction (FEC) errors or otherwise missed 50 to 60 percent of their station maintenance messages, without actually going offline, over time they could miss a sufficient number of station maintenance messages to cause a frequency hop or modulation change. The network administrator could increase the hop threshold to prevent the CMTS from generating a frequency hop or modulation change for problems such as these, which are unrelated to actual noise on the upstream.

---

**Note** If a previous frequency hop had already occurred within the user-configurable hop period, the CMTS will not immediately frequency hop. Instead, the CMTS would wait until the hop period expires, and if the percentage of station maintenance messages still exceeds the hop threshold, the CMTS would perform another frequency hop.

---

---

**Tip** When an upstream has 25 or fewer CMs (which is typical with lab and test environments), the CMTS increases the rate at which it sends station maintenance messages to the CMs. This higher polling rate, along with the small number of CMs, means that frequency hopping can occur more quickly than with a normally loaded upstream, especially when a small number of CMs are powered down or generate noisy traffic.

---

---

**Note** The DOCSIS specification states that when a CM misses 16 sequential station maintenance messages, the CMTS should consider the CM offline and should stop sending station maintenance messages to that CM. The CM must then reregister with the CMTS to resume connectivity.

---

## Examples

The following example shows how to set the threshold that triggers frequency hop to 25 percent of station maintenance messages on the upstream that is assigned to spectrum-group 4:

```
Router# configure terminal
```

```
Router(config)# cable spectrum-group 4 hop threshold 25
Router(config)#
```

**Related Commands**

Command	Description
<b>cable modulation-profile</b>	Creates a cable modulation profile.
<b>cable spectrum-group hop period</b>	Sets the minimum frequency-hop interval for a cable spectrum group.
<b>cable upstream channel-width</b>	Configures an upstream for a range of allowable channel widths.
<b>cable upstream modulation-profile</b>	Configures an upstream for one modulation profile (static profile) or two modulation profiles (Dynamic Upstream Modulation).
<b>show cable hop</b>	Displays the current hop period and threshold for an upstream, along with other statistics.

# cable spectrum-group shared

**Note** Effective with Cisco IOS Release 12.2(33)SCG, the **cable spectrum-group shared** command is not available in Cisco IOS software.

To specify that the upstream ports in a spectrum group share the same upstream frequency, use the **cable spectrum-group shared** command in global configuration mode. To delete this specification, use the **no** form of this command.

**cable spectrum-group** *groupnum* **shared**  
**no cable spectrum-group** *groupnum* **shared**

## Syntax Description

<i>groupnum</i>	Spectrum group number. Valid values are from 1 to 32, or from 1 to 40, depending on the Cisco IOS software release.
-----------------	---------------------------------------------------------------------------------------------------------------------

## Command Default

Upstream port frequency is the same for all ports in the spectrum group.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.1 T	This command was introduced.
12.2(11)BC3	Support was added for this command on the Cisco uBR-LCP2-MC16S card on the Cisco uBR10012 router.
12.2(15)BC2	The maximum number of spectrum groups was increased from 32 to 40 groups per router.
12.2(33)SCG	This command was removed.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Because this command forces upstream ports to use the same spectrum, you must ensure that you do not configure spectrum groups that have overlapping frequencies. To use shared spectrum groups, each group must be using a discrete set of frequencies.

**Caution** Depending on the frequencies being used, and how cable modems are distributed across those frequencies and among spectrum groups, switching from a group from shared to non-shared, or from non-shared to shared, could cause CMs in the spectrum group to go offline and begin reranging procedures. You should therefore use this command only during regularly schedule maintenance times, so that a minimum number of online customers are affected.

**Note** This command does not enable any sort of load balancing on the shared upstreams.

### Examples

The following example shows how to specify that all the upstream ports for spectrum group 4 share the same upstream frequency, and that these upstream frequencies are not assigned to other upstream interfaces:

```
Router(config)# cable spectrum-group 4 shared
```

```
Router(config)#
```

### Related Commands

Command	Description
<b>cable modulation-profile</b>	Configures preset modulation profiles that you can apply to one or more upstream cable interfaces when you identify and configure spectrum groups.
<b>cable spectrum-group (global configuration)</b>	Creates a spectrum group of one or more frequencies for an upstream.
<b>cable spectrum-group hop period</b>	Sets the minimum frequency-hop interval for a cable spectrum group.
<b>cable spectrum-group hop threshold</b>	Specifies a hop threshold for a cable spectrum group.
<b>cable upstream hopping blind</b>	Disengages the advanced spectrum management features of the Cisco uBR-MC16S and Cisco uBR-MC5X20S cable interface line cards by enabling blind frequency hopping behavior.
<b>show controllers cable</b>	Displays information about the cable interface, including the upstream center frequency.

## cable submgmt default

To set the default values for attributes in the Subscriber Management MIB (DOCS-SUBMGT-MIB), and to enable Cisco Static CPE Override on the Cisco CMTS, use the **cable submgmt default** global configuration command. To restore the original defaults, use the **no** form of this command.

```
cable submgmt default [active | learnable | max-cpe cpe-num | max-ipv6-cpe cpe-num]
no cable submgmt default [active | learnable | max-cpe cpe-num | max-ipv6-cpe cpe-num]
cable submgmt default filter-group {cm | cpe | mta | stb | ps} {downstream | upstream} group-id
no cable submgmt default filter-group {cm | cpe | mta | stb | ps} {downstream | upstream} group-id
```

### Cisco cBR Series Converged Broadband Routers

```
cable submgmt default [active | filter-group | {cm | cpe | mta | stb | ps} | {downstream | upstream}
group-id | learnable | max-cpe cpe-num | max-ipv6-cpe cpe-num]
no cable submgmt default [active | filter-group | {cm | cpe | mta | stb | ps} | {downstream | upstream}
| learnable | max-cpe | max-ipv6-cpe]
```

#### Syntax Description

<b>no</b>	When used with the <b>active</b> and <b>learnable</b> options, the <b>no</b> form of the command sets the default attributes to false. When used with the <b>max-cpe</b> , <b>max-ipv6-cpe</b> and <b>filter-group</b> options, the <b>no</b> form of the command sets the attribute to 0.
<b>active</b>	(Optional) Sets the docsSubMgtCpeActiveDefault attribute, which controls whether the CMTS manages the CPE devices for a particular CM—when set to TRUE, the CMTS enforces the MAX-CPE value and the implemented filters. The <b>no cable submgmt default active</b> command sets the default value to FALSE (the original default), which turns off CPE management at the CMTS.
<b>learnable</b>	(Optional) Sets the docsSubMgtCpeLearnableDefault attribute, which controls whether the CMTS learns the CPE IP addresses for a particular CM—when set to TRUE (the original default), the CMTS learns IP addresses up to the MAX-CPE value. The <b>no cable submgmt default learnable</b> command sets the default value to FALSE, which means that the IP address for each allowable CPE device must be specified in the DOCSIS configuration file.
<b>max-cpe</b> <i>cpe-num</i>	(Optional) Sets the docsSubMgtCpeMaxIpDefault attribute, which specifies the default number of simultaneous IP addresses (CPE devices) permitted for the CM. The possible range is 0 to 1024, where 0 specifies that all CPE traffic from the CM is dropped. The default is 16.
<b>filter-group</b>	Specifies a filter group, which can be applied to either upstream or downstream traffic for either a CM or its CPE devices.
<b>cm</b>	Specifies that the filter group applies to traffic to or from a CM.
<b>cpe</b>	Specifies that the filter group applies to traffic to or from a CPE device.
<b>mta</b>	Specifies that the filter group applies to traffic to or from a multimedia terminal adaptor (mta.)
<b>stb</b>	Specifies that the filter group applies to traffic to or from a Set-Top Box (stb.)

<b>ps</b>	Specifies that the filter group applies to traffic to or from a portal server (ps.)
<b>downstream</b>	Specifies that the filter group applies to the downstream traffic that is going to the specified CM or CPE device.
<b>upstream</b>	Specifies that the filter group applies to the upstream traffic that is coming from the specified CM or CPE device.
<i>group-id</i>	Specifies the filter group ID (0 to 254) to be applied for the CM or CPE, downstream or upstream filter. This ID references the filter indexes that are used for rows in the docsSubMgtPktFilterTable. A value of 0 indicates that no filtering is used for this particular type of traffic.

**Command Default**

The Subscriber Management MIB defaults to the following default values:

- The **active** parameter defaults to FALSE (the CMTS does not actively manage CPE devices).
- The **learnable** parameter defaults to TRUE (the CMTS learns the IP addresses for CPE devices).
- The **max-cpe** parameter defaults to 16 IP addresses.
- The filter group ID for each type of filter group defaults to 0, which means that no filtering is done on that type of traffic.

**Command Modes**

Global configuration (config)

Release	Modification
12.1(7)CX1	This command was introduced.
12.3(9a)BC	This command was integrated into Cisco IOS Release 12.3(9a)BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCB	This command was updated to support MTA, STB, and portal server.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>max-ipv6-cpe</b> keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

This command enables field technicians to add a temporary CPE device behind the subscriber's cable modem. The temporary CPE device shares the same SID settings as the original CPE device, even though the temporary CPE device has a different MAC address. The original CPE device automatically changes from **dhcp cpe** to **static cpe** in the CMTS host routing tables, and the CPE device continues to receive service with the same SID.

To disable Cisco CMTS Static CPE Override on the Cisco CMTS, use the **no** form of this command. This automatically updates the routing tables and enables the MAC address from the technician's laptop for a future field service connection at a different location. Prior to using this command, the first (existing) DHCP CPE device maintains its DHCP dynamic MAC address behind the cable modem. The SID is assigned to this IP address.

However, by enabling Static CPE override, you gain the following states and options on two CPE devices behind the cable modem.

- The SID definition on the first CPE device is assigned a different static IP address. This enables you to change the existing (dynamic) DHCP IP address to a static IP address without first clearing the DHCP CPE host entries from the Cisco CMTS. The CPE IP state changes from **dhcp** to **static cpe**.
- This static override allows a second CPE device with a second MAC address behind the same cable modem with SID1 to be assigned same IP address as the first CPE device.

---

**Note** The second CPE device changes from **dhcp cpe** to **static cpe** in the CMTS host tables.

---

The DOCSIS 1.1 Subscriber Management MIB (DOCS-SUBMGT-MIB) creates and maintains a number of tables that describe the state of subscriber management for the CMs and CPE devices being serviced by the Cisco CMTS. The CMTS creates rows in these tables for each CM and CPE device when the CM registers with the CMTS, and if the CM does not specify a value for an attribute in this table, the CMTS uses the defaults specified by the **cable submgmt default** command.

---

**Timesaver** The DOCS-SUBMGT-MIB MIB contains its own default values for these attributes, and those defaults can be overridden by giving the appropriate SNMP SET commands. The **cable submgmt default** command, however, allows the new defaults to be included in the Cisco IOS configuration file so that the defaults are automatically reconfigured whenever the CMTS reboots or reloads.

---

---

**Note** The **cable submgmt default** command sets only the default value for these attributes. These default values are used only if the CM does not specify other values when it registers with the CMTS. If the CM does specify different values at registration time, those values are used instead of these default values.

---

The attributes in DOCS-SUBMGT-MIB control how the CMTS manages the CPE devices behind a CM and the filters that are applied to the traffic to and from a particular CM and its CPE devices. The following sections describe the relationship between the different forms of the **cable submgmt default** commands and the attributes in DOCS-SUBMGT-MIB.

### CPE Management

The first form of the **cable submgmt default** command controls the default values for the entries in the docsSubMgtCpeControlTable, which controls how the CMTS manages the CPE devices for each CM:

#### **cable submgmt default active**

Sets the docsSubMgtCpeActiveDefault attribute, which is the default value for the docsSubMgtCpeControlActive attribute in docsSubMgtCpeControlTable. This attribute controls whether the CMTS performs CPE management for a particular CM.

- The **cable submgmt default active** command sets the default to TRUE, which specifies that the CMTS is to manage CPE devices by enforcing the MAX-CPE number and the implemented filters.
- The **no cable submgmt default active** command sets the default to FALSE (the default value), which specifies that the CMTS is not to perform CPE management for the particular CM.

#### **cable submgmt default learnable**

Sets the docsSubMgtCpeLearnableDefault attribute, which is the default value for the docsSubMgtCpeControlLearnable attribute in docsSubMgtCpeControlTable. This attribute controls whether the CMTS learns the IP addresses for CPE devices behind a particular CM.

- The **cable submgmt default learnable** command sets the default to TRUE (the default value), which specifies that the CMTS is to learn the IP addresses for the CPE devices behind the CM, up to the value specified by the MAX-CPE parameter. The CMTS learns the IP addresses by monitoring the traffic sent by the CPE devices, and the first CPE devices to transmit traffic are the first CPE devices to be learned.
- The **no cable submgmt default learnable** command sets the default to FALSE, which specifies that the CMTS does not learn the IP addresses for the CPE devices behind a particular CM. Instead, the IP addresses for each CM that is to be allowed access must be specified in the DOCSIS configuration file.

#### **cable submgmt default max-cpe** *cpe-num*

Sets the docsSubMgtCpeMaxIpDefault attribute, which specifies the default value for the docsSubMgtCpeControlMaxCpeIp attribute in docsSubMgtCpeControlTable. This attribute specifies the maximum number of IP addresses that can transmit traffic through a particular CM. The possible range is 0 to 1024, and the original default is 16.

---

**Note** The MAX-CPE attribute is used only when the CMTS is actively managing CPE devices for the CM.

---

### **Filter Group Management**

The second form of the **cable submgmt default** command controls the default values for the entries in the docsSubMgtCmFilterTable, which assigns the CM to one or more filter groups. A filter group specifies what filters are applied to the traffic going to or coming from each particular CM or CPE device. Filter groups can be numbered 0 to 1024, where 0 specifies that no filtering is done for that particular traffic type.

---

**Note** The actual filters specified in these commands must be created by setting the appropriate attributes in the DOCS-SUBMGT-MIB MIB using SNMP SET commands.

---

#### **cable submgmt default filter-group cpe downstream** *group-id*

Sets the ocsSubMgtSubFilterDownDefault attribute, which is the default value for the docsSubMgtSubFilterDownstream attribute in the docsSubMgtCmFilterTable. This attribute applies to downstream traffic that is sent to the CPE devices behind a particular CM.

#### **cable submgmt default filter-group cpe upstream** *group-id*

Sets the docsSubMgtSubFilterUpDefault attribute, which is the default value for the docsSubMgtSubFilterUpstream attribute in the docsSubMgtCmFilterTable. This attribute applies to upstream traffic that is sent by the CPE devices behind a particular CM.

#### **cable submgmt default filter-group cm downstream** *group-id*

Sets the docsSubMgtCmFilterDownDefault attribute, which is the default value for the docsSubMgtCmFilterDownstream attribute in the docsSubMgtCmFilterTable. This attribute applies to downstream traffic that is addressed to a particular CM.

#### **cable submgmt default filter-group cm upstream** *group-id*

Sets the docsSubMgtCmFilterUpDefault attribute, which is the default value for the docsSubMgtCmFilterUpstream attribute in the docsSubMgtCmFilterTable. This attribute applies to upstream traffic that is sent by a particular CM.

**Note** For more information about using static CPE override, see the Cisco CMTS Static CPE Override feature on Cisco.com.

## Examples

The following commands specify that the CMTS defaults to actively managing the CPE devices for each CM that registers, allowing and learning up to four IP addresses for the CPE devices behind that CM. The **cable submgmt default max-cpe** command specifies the number of IPv6 addresses permitted behind a CM which includes all IPv6 addresses of all the CPE's.

```
Router# configure terminal
Router(config)# cable submgmt default active
Router(config)# cable submgmt default learnable
Router(config)# cable submgmt default max-cpe 4
```

The following commands specify that the CMTS defaults to actively managing the CPE devices for each CM that registers. Each CM, however, must specify its own MAX-CPE value; otherwise, that value defaults to 0 and all traffic to and from the CPE devices for that CM is blocked.

```
Router# configure terminal
Router(config)# cable submgmt default active
Router(config)# cable submgmt default max-cpe 0
```

The following commands specify that the CMTS defaults to not actively managing the CPE devices for each CM that registers. However, if the CM at registration time indicates that the CMTS is to actively manage the CPE devices, the CMTS defaults to allowing only one CPE device. Learning also is disabled, so that one CPE device, therefore, must be specified in the DOCSIS configuration file that the CM uses to register.

```
Router# configure terminal
Router(config)# no cable submgmt default active
Router(config)# no cable submgmt default learnable
Router(config)# cable submgmt default max-cpe 1
```

The following commands specify that the CMTS defaults to assigning three filter groups to each CM that registers. Unless the CM indicates otherwise at registration time, downstream and upstream traffic for the CPE devices behind the CM is filtered according to the rules for filter groups 20 and 21, respectively. Filter group 1 is applied to the downstream traffic addressed to the CM. Upstream traffic sent by the CM, however, is not filtered.

```
Router# configure terminal
Router(config)# cable submgmt default filter-group cpe downstream 20
```

```
Router(config)# cable submgmt default filter-group cpe upstream 21
Router(config)# cable submgmt default filter-group cm downstream 1
Router(config)# cable submgmt default filter-group cm upstream 0
```

---

**Note** The above example assumes that filter groups 1, 20, and 21 have already been created on the CMTS using the appropriate SNMP commands.

---

**Related Commands**

Command	Description
<b>cable filter group</b>	Creates a DOCSIS 1.1 filter group that filters packets on the basis of the TCP/IP and UDP/IP headers.

## cable sync-interval

To specify the interval between successive sync message transmissions from the Cisco CMTS, use the **cable sync-interval** command in cable interface configuration mode. To return the sync message interval to its default value, use the **no** form of this command.

**cable sync-interval** *msec*

**no cable sync-interval**

<b>Syntax Description</b>	<i>msec</i> Specifies the interval in milliseconds (ms) between successive sync message transmissions from the Cisco CMTS. Valid values are from 1 to 200 ms. Default value is 10 ms.						
<b>Command Default</b>	10 ms						
<b>Command Modes</b>	Interface configuration—cable interface only (config-if) MAC domain profile configuration (config-profile-md)						
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>11.3 NA</td> <td>This command was introduced.</td> </tr> <tr> <td>IOS-XE 3.15.OS</td> <td>This command was implemented on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	11.3 NA	This command was introduced.	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
Release	Modification						
11.3 NA	This command was introduced.						
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.						

**Usage Guidelines** To verify whether or not a sync message interval has been configured, enter the **show running-config** command and look for the cable interface configuration information. If a sync message interval has been configured, it appears in this output. If the sync message interval has been deactivated or reset to its default value, no sync interval command line appears in the output.

**Examples** The following example shows how to specify the interval for the sync message transmissions to 100 ms:

```
Router (config-if)# cable sync-interval 20
```

# cable tag

To configure a tag for a DOCSIS load balancing group on the CMTS, use the **cable tag** command in the global configuration mode. To delete the tag and remove it from the CMTS configuration, use the **no** form of this command.

**cable tag** *1-1000*  
**no cable tag** *1-1000*

<b>Syntax Description</b>	<i>1-1000</i> Specifies a cable tag number.
---------------------------	---------------------------------------------

**Command Default** None.

**Command Modes** Global configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced.
	12.2(33)SCH	This command was modified. The tag to exclude TLV type was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable tag** command creates a tag with the specified number and then enters the CMTS-tag configuration mode. Use the following commands in the CMTS-tag configuration mode to configure the tag:

- **docsis-version**
- **exclude**
- **exit**
- **name**
- **oui**
- **override**
- **service-class**
- **service-type-id**
- **tlv**

General tagging is used by Cisco CMTS as follows:

- The Cisco CMTS can classify some modems with user-defined modem classifiers using the STID, service class name, DOCSIS version and capability TLVs and MAC Organization Unique Identifier (OUI).
- Each modem classifier has a unique tag. The Cisco CMTS allows each modem to carry one tag. When multiple tags match one cable modem, the tag that has the least index gets applied on the CM.
- The Cisco CMTS classifies a CM and assigns a tag, and if a RLBG with that tag is configured, the CM gets assigned to that RLBG.
- The Cisco CMTS can match multiple tags to a RLBG and a DOCSIS policy.

- Note**
- Try to match tag with upstream service flow prior to downstream service flow.
  - Only match service class name of the first upstream/downstream service flow.

## Examples

The following example shows how to create a tag numbered as “1” following which the system enters the cmts-tag configuration mode:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(config-cmts-tag)# name CSCO
Router(config-cmts-tag)# service-type-id commercial
Router(config-cmts-tag)# service-class work
Router(config-cmts-tag)# docsis-version docsis20
Router(config-cmts-tag)# oui 00.1a.c3
Router(config-cmts-tag)# override
```

The following example shows how to configure the tag to exclude a DOCSIS version, a MAC address, a service class name, or a service type ID.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(config-cmts-tag)# exclude docsis-version docsis10
Router(config-cmts-tag)# exclude oui 00.1a.c3
Router(config-cmts-tag)# exclude service-class work
Router(config-cmts-tag)# exclude service-type-id commercial
```

In Cisco IOS Release 12.2(33)SCH, **TLV type** was introduced. The following example shows how to configure the tag to exclude the **TLV type**:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(config-cmts-tag)# exclude tlv mrcc 4
```

## Related Commands

Command	Description
<b>docsis-version</b>	Configures the specified DOCSIS version of the cable modem (CM) for the tag.
<b>exclude</b>	Configures the tag to exclude a DOCSIS version, a MAC address, a service class name, or a service type ID.
<b>name</b>	Specifies the name of the tag.
<b>oui</b>	Configures the specified Organization Unique Identifier (OUI) of the CM for the tag.
<b>override</b>	Overrides type/length/value (TLV) or Simple Network Management Protocol (SNMP) settings when assigning the restricted load balancing group (RLBG) to CMs.
<b>service-class</b>	Configures the specified service class name for the tag.

Command	Description
<b>service-type-id</b>	Configures the specified service type ID for the tag.
<b>tag</b>	Associates the cable modem tag with a RLBG.
<b>tlv</b>	Configures a TLV type matching rule.

## cable telco-return enable

To enable telco-return support, use the **cable telco-return enable** command in cable interface configuration mode. To disable this feature, use the **no** form of this command.

**telco-return enable**  
**no cable telco-return enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Telco-return support is disabled.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.	

### Examples

The following example shows how to enable telco-return:

```
Router(config-if)# cable telco-return enable
```

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

Related Commands	Command	Description
	<b>cable telco-return interval</b>	Defines the interval for sending Telephony Channel Descriptor (TCD) and Termination System Information (TSI) messages.
	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.
	<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
	<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
	<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
	<b>cable telco-return spd factory-default</b>	Indicates the service provider descriptor (SPD) that the telco-return CM uses during the initialization process.

Command	Description
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD message.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

## cable telco-return interval

To set the interval for sending Telephony Channel Descriptor (TCD) and Termination System Information (TSI) messages, use the **cable telco-return interval** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return interval** *seconds*  
**no cable telco-return interval**

<b>Syntax Description</b>	<i>seconds</i>	Number of seconds between intervals for sending TCD and TSI messages. The valid range is from 2 to 60.
---------------------------	----------------	--------------------------------------------------------------------------------------------------------

**Command Default** 2 seconds

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to set the TCD and TSI message interval to 40 seconds:

```
Router(config-if)# cable telco-return interval 40
```

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.
	<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
	<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
	<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.

Command	Description
<b>cable telco-return spd factory-default</b>	Indicates the service provider descriptor (SPD) that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

## cable telco-return registration-ip

To select a different IP address for the telco-return CM to send its registration requests, use the **cable telco-return registration-ip** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return registration-ip** *ip-address*  
**no cable telco-return registration-ip**

<b>Syntax Description</b>	<i>ip-address</i>	Registration IP address that is sent in Termination System Information (TSI) messages. Value is any of the cable interface's IP addresses.
---------------------------	-------------------	--------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The downstream channel IP address of the Cisco CMTS is used.

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1(2)EC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Registration IP Address parameter in TSI messages. By default, the downstream channel IP address of the Cisco CMTS is also used for the registration IP address. When this **cable telco-return registration-ip** command is configured, telco-return CMs send their registration requests to this IP address instead of to the downstream channel IP address.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

### Examples

The following example shows how to send the CM's registration requests to IP address 172.16.1.1:

```
Router(config-if)# cable telco-return registration-ip 172.16.1.1
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return interval</b>	Defines the interval for sending Telephony Channel Descriptor (TCD) and TSI messages.
	<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.

Command	Description
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the service provider descriptor (SPD) that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

## cable telco-return spd dhcp-authenticate

To require the telco-return CM to use a specific Dynamic Host Configuration Protocol (DHCP) server, use the **cable telco-return spd dhcp-authenticate** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* dhcp-authenticate**  
**no cable telco-return spd *spd-number* dhcp-authenticate**

<b>Syntax Description</b>	<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
---------------------------	-------------------	-------------------------------------------------------------------------------------------------------

**Command Default** The CM can use any available DHCP server.

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(4)XI	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.	

**Usage Guidelines** This command sets the DHCP Authenticate parameter to TRUE (1) for the specified SPD in the Telephony Channel Descriptor (TCD) messages. It indicates that the CM must use the DHCP server that is specified with the **cable telco-return spd dhcp-server** command.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

### Examples

The following example indicates that for SPD 2, CMs must use the DHCP server identified by IP address 192.168.255.255:

```
Router(config-if)# cable telco-return spd 2 dhcp-authenticate
Router(config-if)# cable telco-return spd 2 dhcp-server 192.168.255.255
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.
	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.

Command	Description
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd dhcp-server

To identify the IP address of the Dynamic Host Configuration Protocol (DHCP) server that the telco-return CM must access, use the **cable telco-return spd dhcp-server** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* dhcp-server *ip-address***  
**no cable telco-return spd *spd-number* dhcp-server**

## Syntax Description

<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
<i>ip-address</i>	IP address of the DHCP server that CMs must use.

## Command Default

The IP address is set to 0.

## Command Modes

Interface configuration—cable interface only (config-if)

## Command History

Release	Modification
12.0(4)XI	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command sets the DHCP Server parameter in the specified SPD in Telephony Channel Descriptor (TCD) messages. Telco-return CMs use the DHCP server that is identified by this IP address if the **cable telco-return spd dhcp-authenticate** command is configured. If the **cable telco-return spd dhcp-authenticate** command is not configured, the CMs use any available DHCP server.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example indicates that for SPD 2, CMs must use the DHCP server identified by IP address 192.168.255.255:

```
Router(config-if)# cable telco-return spd 2 dhcp-authenticate
Router(config-if)# cable telco-return spd 2 dhcp-server 192.168.255.255
```

## Related Commands

Command	Description
<b>cable telco-return enable</b>	Enables telco-return functionality.
<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.

Command	Description
<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.
<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd dial-timer

To set the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call, use the **cable telco-return spd dial-timer** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* dial-timer *seconds***  
**no cable telco-return spd *spd-number* dial-timer**

Syntax Description	
<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
<i>seconds</i>	Number of seconds that a connection is idle before the CM disconnects the call. Valid range is 0 through 4,294,967,295. The default of 0 means that the dial-timer is not used.

**Command Default** The dial-timer is set to 0, which means that inactive telephone connections are not disconnected.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Demand Dial Timer parameter for the specified SPD in Telephony Channel Descriptor (TCD) messages. This enables the CM to emulate true dial-on-demand functionality by monitoring inactive networking time and allowing it to disconnect any telephone connection that exceeds the timer.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

**Examples** The following example shows how to set the timer to 2 hours:

```
Router(config-if)# cable telco-return spd 2 dial-timer 7200
```

Related Commands	Command	Description
	<b>cable telco-return enable</b>	Enables telco-return functionality.

<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd factory-default

To indicate the service provider descriptor (SPD) that the telco-return CM uses during the initialization process, use the **cable telco-return spd factory-default** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* factory-default**  
**no cable telco-return spd *spd-number* factory-default**

<b>Syntax Description</b>	<i>spd-number</i>	Service provider descriptor (SPD) that contains the set of telephony attributes used by the CM during initialization. Valid range is 1 through 5.
---------------------------	-------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

<b>Command Default</b>	The Factory Default Flag in the SPD is set to 0, which means that this SPD is not used for the initialization process.
------------------------	------------------------------------------------------------------------------------------------------------------------

<b>Command Modes</b>	Interface configuration—cable interface only (config-if)
----------------------	----------------------------------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

<b>Usage Guidelines</b>	This command sets the Factory Default parameter in the specified SPD in Telephony Channel Descriptor (TCD) messages. This determines the set of telephony attributes, as defined by the SPD, that are used for the initialization process when the CM is powered on or is reset to its factory default.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>Note</b>	This command is available only in images that support telco-return. These images have a “t” as part of the image name.
-------------	------------------------------------------------------------------------------------------------------------------------

<b>Examples</b>	The following example shows how to set the telco-return CM to use SPD 2 during the initialization procedure:
-----------------	--------------------------------------------------------------------------------------------------------------

```
Router(config-if)# cable telco-return spd 2 factory-default
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable telco-return enable</b>	Enables telco-return functionality.

	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.

Command	Description
<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific Dynamic Host Configuration Protocol (DHCP) server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd manual-dial

To enable the telco-return CM to operate in manual-dial mode, use the **cable telco-return spd manual-dial** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* manual-dial**  
**no cable telco-return spd *spd-number* manual-dial**

<b>Syntax Description</b>	<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
---------------------------	-------------------	-------------------------------------------------------------------------------------------------------

**Command Default** Manual-dial mode is disabled.

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(4)XI	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.	

**Usage Guidelines** This command sets the Manual Dial vendor-specific parameter in the specified SPD in Telephony Channel Descriptor (TCD) messages.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example shows how to set manual-dial mode for SPD 1:

```
Router(config-if)# cable telco-return spd 1 manual-dial
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.
	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.
	<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.

<b>Command</b>	<b>Description</b>
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd password

To set the password that the telco-return CM uses for authentication when establishing a PPP connection with the access server, use the **cable telco-return spd password** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd** *spd-number* **password** *password-string*  
**no cable telco-return spd** *spd-number* **password**

Syntax Description		
	<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
	<i>password-string</i>	Login password that the CM uses for authentication during the initialization procedure.

**Command Default** No password is used.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Login Password parameter for the specified SPD in Telephony Channel Descriptor (TCD) messages.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example shows how to set the password to 9JwoKd7 in service provider descriptor 2:

```
Router(config-if)# cable telco-return spd 2 password 9JwoKd7
```

Related Commands	Command	Description
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.
	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.

Command	Description
<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.

<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd phonenum

To set the telephone numbers that the telco-return CM uses when connecting to the headend's network access server, use the **cable telco-return spd phonenum** command in cable interface configuration mode. To delete previously entered telephone numbers, use the **no** form of this command.

**cable telco-return spd** *spd-number* **phonenum** *dial-string*  
**no cable telco-return spd** *spd-number* **phonenum** *dial-string*

Syntax Description	
<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
<i>dial-string</i>	Telephone number that the CM uses to connect to the headend's network access server.

**Command Default** None

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Phone Number parameters in the specified SPD in Telephony Channel Descriptor (TCD) messages. You can repeat this command, entering as many as three telephone numbers for the CM to use when attempting to establish a PPP connection with the network access server. The phone numbers are mapped to the parameters Phone Number1, Phone Number2, Phone Number3 in the order in which you enter them. The CM attempts to connect using Phone Number1 first. If it fails to connect, and its number of retries exceeds the limit set with the **cable telco-return spd threshold** command, the CM dials the next number in the list.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example shows how to set the primary phone number to 9255551212. If the CM fails to connect using that number, it tries the next phone number, 9255551234:

```
Router(config-if)# cable telco-return spd 2 phonenum 9255551212
Router(config-if)# cable telco-return spd 2 phonenum 9255551234
```

Related Commands	Command	Description
	<b>cable telco-return enable</b>	Enables telco-return functionality.

<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd ppp-authenticate

To select the authentication method used when the telco-return CM is establishing a PPP connection, use the **cable telco-return spd ppp-authenticate** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* ppp-authenticate [both | chap | pap]**  
**no cable telco-return spd *spd-number* ppp-authenticate**

## Syntax Description

<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
<b>both</b>	Challenge Handshake Authentication Protocol (CHAP) is used if the network access server supports CHAP. Password Authentication Protocol (PAP) is used only if the network access server does not support CHAP.
<b>chap</b>	CHAP authentication is used.
<b>pap</b>	PAP authentication is used.

## Command Default

The default is **both**; either CHAP or PAP is used depending on the methods supported by the network access server.

## Command Modes

Interface configuration—cable interface only (config-if)

## Command History

Release	Modification
12.0(4)XI	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command sets the PPP Authentication parameter for the specified SPD in Telephony Channel Descriptor (TCD) messages.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example requires the CM to perform CHAP authentication:

```
Router(config-if)# cable telco-return spd 2 ppp-authenticate chap
```

## Related Commands

Command	Description
<b>cable telco-return enable</b>	Enables telco-return functionality.

Command	Description
<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.
<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.
<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.

<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

## cable telco-return spd radius-realm

To select a RADIUS server domain to use for the login response string, use the **cable telco-return spd radius-realm** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd** *spd-number* **radius-realm** *string*  
**no cable telco-return spd** *spd-number* **radius-realm**

Syntax Description	
<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
<i>string</i>	Alphanumeric string identifying a RADIUS server domain.

**Command Default** The default value is the null string.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the RADIUS Realm parameter for the specified SPD in Telephony Channel Descriptor (TCD) messages. When this command is configured, telco-return CMs use this realm string to construct a domain name for the login username when responding to a PPP login query.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

### Examples

The following example shows a login response string of “sandy@sunol”:

```
Router(config-if)# cable telco-return spd 3 radius-realm sunol
Router(config-if)# cable telco-return spd 3 username sandy
```

Related Commands	Command	Description
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.
	<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.

Command	Description
<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

## cable telco-return spd service-provider

To include the service provider name in the SPD, use the **cable telco-return service-provider** command in cable interface configuration mode. To remove the parameter from the SPD, use the **no** form of this command.

**cable telco-return spd *spd-number* service-provider *spd-string***  
**no cable telco-return spd *spd-number* service-provider**

Syntax Description	<i>spd-number</i>	Service provider descriptor number for which this parameter is set. Valid range is 1 through 5.
	<i>spd-string</i>	Alphanumeric string that identifies the service provider.

**Command Default** None

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Service Provider Name parameter for the specified SPD in the Telephony Channel Descriptor (TCD) messages.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

### Examples

The following example shows the service provider name being set to “san\_jose” for SPD 2:

```
Router(config-if)# cable telco-return spd 2 service-provider san_jose
```

Related Commands	Command	Description
	<b>cable telco-return enable</b>	Enables telco-return functionality.

<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd threshold

To set the number of failed dial-up connections that can occur before the CM indicates a connection failure, use the **cable telco-return spd threshold** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd *spd-number* threshold *threshold-number***  
**no cable telco-return spd *spd-number* threshold**

Syntax Description		
	<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
	<i>threshold-number</i>	Number of dial-up attempts that fail before the CM declares a connection failure. Valid range is 1 through 255.

**Command Default** The default value is 1.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Connection Threshold parameter for the specified SPD in the Telephony Channel Descriptor (TCD) messages. A dial-up attempt is considered a connection failure if an answer connection is not made after ten rings. The CM continues to try to connect until the connection threshold is reached. If multiple phone numbers are configured using the **cable telco-return spd phonenum** command, the CM dials each phone number until it makes a connection or exceeds the configured threshold.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example shows the connection threshold being set to 20:

```
Router(config-if)# cable telco-return spd 2 threshold 20
```

Related Commands	Command	Description
	<b>cable telco-return enable</b>	Enables telco-return functionality.
	<b>cable telco-return interval</b>	Defines the interval for sending TCD and Termination System Information (TSI) messages.

Command	Description
<b>cable telco-return registration-ip</b>	Selects a different IP address for the telco-return CM to send its registration requests.
<b>cable telco-return spd dhcp-authenticate</b>	Indicates that telco-return CMs must use a specific DHCP server.
<b>cable telco-return spd dhcp-server</b>	Identifies the IP address of the DHCP server that the telco-return CMs must use.
<b>cable telco-return spd dial-timer</b>	Sets the number of seconds that a telephone connection is idle before the telco-return CM disconnects the call.
<b>cable telco-return spd factory-default</b>	Indicates the SPD that the telco-return CM uses during the initialization process.
<b>cable telco-return spd manual-dial</b>	Enables the telco-return CM to operate in manual-dial mode.
<b>cable telco-return spd password</b>	Sets the password that the telco-return CM uses for authentication when establishing a PPP connection.
<b>cable telco-return spd phonenum</b>	Sets the telephone numbers that the telco-return CM dials when connecting to the headend's network access server.
<b>cable telco-return spd ppp-authenticate</b>	Selects the authentication procedure to use when the telco-return CM is establishing a PPP connection.
<b>cable telco-return spd radius-realm</b>	Selects a RADIUS server domain to use for the login response string.
<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd username</b>	Sets the username that the telco-return CM uses for authentication when establishing a PPP connection.

# cable telco-return spd username

To set the username that the telco-return CM uses for authentication when establishing a PPP connection with the access server, use the **cable telco-return spd username** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable telco-return spd** *spd-number* **username** *login-string*  
**no cable telco-return spd** *spd-number* **username** *login-string*

Syntax Description	
<i>spd-number</i>	Service provider descriptor (SPD) number for which this parameter is set. Valid range is 1 through 5.
<i>login-string</i>	Username that the CM uses for authentication during the initialization procedure.

**Command Default** The default value is *guest*.

**Command Modes** Interface configuration—cable interface only (config-if)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the Login Username parameter for the specified SPD in the Telephony Channel Descriptor (TCD) messages.

**Note** This command is available only in images that support telco-return. These images have a “t” as part of the image name.

## Examples

The following example shows the username being set to “sandy” for SPD 3:

```
Router(config-if)# cable telco-return spd 3 username sandy
```

<b>cable telco-return spd service-provider</b>	Includes the service provider name in the SPD.
<b>cable telco-return spd threshold</b>	Sets the number of failed dial-up connections that can occur before the CM indicates a connection failure.

## cable tftp-enforce

To require that all CMs on a cable interface attempt to download a DOCSIS configuration file using the Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online, use the **cable tftp-enforce** command in cable interface configuration mode. To disable this feature, use the **no** form of this command.

**cable tftp-enforce** [mark-only]

**no cable tftp-enforce** [mark-only]

### Syntax Description

<b>mark-only</b>	(Optional) Allow CMs to come online without attempting to download a DOCSIS configuration file through the Cisco CMTS cable interface, but prints a warning message and marks those CMs with a pound sign (#) in the <b>show cable modem</b> command.
------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

TFTP downloads through the Cisco CMTS are not required (**no cable tftp-enforce**).

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
12.1(11b)EC1	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.
12.1(19)EC	CMs that fail the TFTP checked are now marked with a reject(c) error in the <b>show cable modem</b> command, instead of the original reject(m) error, so as to be consistent with the behavior in the Release 12.2 BC train.
12.2(8)BC2	Support for this command was added to the 12.2 BC release train for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 universal broadband routers.
12.2(15)BC1	The command was enhanced on the Cisco uBR10012 router to prevent the router from rejecting cable modems that did properly download a DOCSIS configuration file.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable tftp-enforce** cable interface configuration command requires all cable modems on a cable interface to attempt a TFTP request for the DOCSIS configuration file through the cable interface with the Cisco CMTS router before being allowed to register and come online. This can help prevent the following situations from occurring:

- Users who attempt theft-of-service by reconfiguring their local networks to allow the downloading of an unauthorized DOCSIS configuration file from a local TFTP server. Typically, some users do this to obtain services that they have not paid for, such as higher guaranteed bandwidths or a higher priority Quality of Service (QoS) profile.
- Some brands or models of cable modems might be running older software releases that cache the DOCSIS configuration file and use the cached version instead of downloading the actual file from a TFTP server during the registration process. Although this can marginally speed up the registration process, it also

violates the DOCSIS requirements and could create a situation in which the cable modem is not using the proper DOCSIS configuration file. A user might then be mistakenly accused of theft-of-service, when in reality the problem is the non-DOCSIS-compliant cable modem.

The **cable tftp-enforce** command identifies these situations and can block these cable modems from registering and coming online. This command also has a **mark-only** option that allows these cable modems to come online, but it also identifies the cable modems so that the network administrators can investigate the situation further before taking any action.

When the command is used without the **mark-only** option, cable modems that do not download a TFTP file through the cable interface are blocked from registering and coming online. The following message is displayed on the console when such a cable modem attempts to register:

```
06:53:57: %UBR7200-4-REGISTRATION_BEFORE_TFTP: Registration request unexpected:
Cable Modem did not attempt TFTP. Registration Rejected. CM Mac Addr <00ff.ff66.12fb>
```

The **mark-only** option allows cable modems that do not download the TFTP file to come online, but it also prints a warning message on the console and marks the cable modem in the **show cable modem** command with a pound sign (#). The following message is displayed on the console when such a cable modem registers with the Cisco CMTS.

```
06:53:57: %UBR7200-4-REGISTRATION_BEFORE_TFTP: Registration request unexpected:
Cable Modem did not attempt TFTP. Modem marked with #. CM Mac Addr <00ff.ff66.12fb>
```

---

**Tip** Cisco recommends that you initially configure cable interfaces with the **mark-only** option, so that potential problems are identified without immediately interfering with users' ability to come online. After you identify and resolve these initial problems, reconfigure the cable interfaces without the **mark-only** option to block problem cable modems that attempt to come online without downloading a valid DOCSIS configuration file.

---

The default behavior is not to require the TFTP download through the cable interface with the Cisco CMTS router. Each cable interface must be configured with this command to require the TFTP download.

---

**Note** The **cable tftp-enforce** command cannot be used on subinterfaces or on non-cable interfaces.

---

### Operation on the Cisco uBR10012 Router

In Cisco IOS Release 12.2(15)BC1 and later releases, the Cisco uBR10012 router can occasionally allow a cable modem to temporarily come online before the system has received confirmation that the cable modem has downloaded the proper DOCSIS configuration file. This situation can occur when the cable interface line card receives a registration request (REG-REQ) message from a cable modem before the PRE1 module has notified the line card whether the modem did download the proper file from the TFTP server.

In previous Cisco IOS releases, these cable modems were not allowed to come online (or marked as TFTP violators) even if they had successfully downloaded the appropriate DOCSIS configuration file. In Cisco IOS Release 12.2(15)BC1 and later releases, however, the Cisco uBR10012 router allows these cable modems to temporarily come online until the PRE1 module has finished determining the modem's TFTP status. If the system determines that the modem did not download the appropriate DOCSIS configuration file, it is then taken offline (or marked as a TFTP violator).

**Note** In the above situation, cable modems that do not download a DOCSIS configuration file are marked as “offline” instead of “reject(c)” by the **show cable modem** command. The console still displays the %UBR10000-4-REGISTRATION\_BEFORE\_TFTP error message, however, to allow you to identify these cable modems as TFTP violators.

## Examples

The following example shows how to enforce TFTP downloads for all of the cable modems on cable interface 3/0. These cable modems must attempt a TFTP download of the DOCSIS configuration file through the cable interface with the Cisco CMTS. If they do not, they are not allowed to register or come online, and they are marked as having either a registration error—reject(c)—in the **show cable modem** command.

**Note** The initial version of this feature marked CMs that failed the TFTP check as having a Message Integrity Check (MIC) failure—reject(m). The command was changed to show reject(c) in Cisco IOS Release 12.2(8)BC2 and Release 12.1(19)EC.

```
Router# configure terminal
Router(config)# interface cable 3/0
Router(config-if)# cable tftp-enforce
Router(config-if)# exit

Router(config)#
Router# show cable modems
```

Interface	Prim Sid	Online State	Timing Offset	Rec Power	QoS	CPE	IP address	MAC address
Cable3/0/U1	1	online (pt)	2734	0.50	5	0	10.1.1.38	00ff.fffa.0a35
Cable3/0/U0	2	online (pt)	2729	0.25	5	0	10.1.1.50	00ff.ff07.382f
Cable3/0/U0	3	init (i)	2732	0.25	2	0	10.1.1.48	00ff.ff03.307d
Cable3/0/U1	4	online (pt)	2737	0.75	5	0	10.1.1.34	00ff.ff59.4477
Cable3/0/U1	5	reject (m)	2215	0.25	2	0	10.1.1.47	00ff.ff66.12fb

```
Router#
```

**Note** DOCSIS-compliant cable modems that are rejected with a MIC failure go into the offline state for a short period of time and then retry the registration process.

The **debug cable registration** command can be used to display additional information:

```
Router# debug cable interface c3/0 verbose

Router# debug cable registration CMTS registration debugging is on
Jun  6 23:27:15.859: Registration request from 00ff.ff66.12fb, SID 7 on Cable3/0/U1

Jun  6 23:27:15.859: Sec sids obtained for all requested classes of service
Jun  6 23:27:15.859: Performing connection admission control (CAC) for each Sid
Jun  6 23:27:15.859: CAC Status for ClassID:1 is CAC_SUCCESS
Jun  6 23:27:15.859: Registration Status: ok (0)
Jun  6 23:27:15.859: Registration Response Transmitted

```

**Tip** You can also use the **show interface cable sid** and **show cable qos profile** commands to examine the SID and service classes in use, to determine whether a CM has registered using unauthorized QoS parameters.

**Related Commands**

Command	Description
<b>cable dynamic-secret</b>	Enables the dynamic shared secret feature, so that DOCSIS configuration files are verified with a dynamically generated shared secret.
<b>cable shared-secondary-secret</b>	Configures one or more secondary shared-secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>cable shared-secret</b>	Configures an authentication shared-secret key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS.
<b>debug cable registration</b>	Displays debug messages for the CM registration process.
<b>show cable modem</b>	Displays information for the registered and unregistered CMs.

# cable throttle-modem

To enable the Cable Modem Registration Throttling feature, which improves the cable modem online speed at initial ranging stage by reducing CPU usage, use the **cable throttle-modem** command in global configuration mode. To disable this feature, use the **no** form of this command.

**cable throttle-modem** *init-rate value holdoff-time value flush-rate value*  
**no cable throttle-modem**

## Syntax Description

<b>init-rate</b> <i>value</i>	Specifies the maximum number of modems allowed to pass the initialization step per second. The valid range is from 1 to 1000. The default value is 32.
<b>holdoff-time</b> <i>value</i>	Specifies the maximum number of seconds a cable modem is allowed to wait in the throttling queue. The valid range is from 5 to 100. The default value is 45.
<b>flush-rate</b> <i>value</i>	Specifies the maximum number of modems flushed per second from the throttling queue after the holdoff time expires. The valid range is from 100 to 1000. The default value is 300.

## Command Default

This command is disabled by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCF3	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable throttle-modem** command enables dynamic adjustment of number of cable modems in the registration queue thus reducing CPU usage.

You must manually disable the **cable throttle-ranging** command (applicable only for Cisco uBR10K Series Routers) configuration to enable the **cable throttle-modem** command configuration.

## Examples

The following example shows how to enable the Cable Modem Registration Throttling feature on a Cisco CMTS:

```
Router# configure terminal
Router(config)# cable throttle-modem init-rate 1 holdoff-time 5 flush-rate 100
```

## Related Commands

Command	Description
(For Cisco uBR10K Series Routers) <b>cable throttle-ranging</b>	Enables faster cable modem registration times.

Command	Description
show cable throttle-modem	Displays cable throttle configuration information.

# cable throttle-ranging

To enable faster cable modem registration times, use the **cable throttle-ranging** command in global configuration mode. To disable faster cable modem registration times, use the **no** form of this command.

**cable throttle-ranging**  
**no cable throttle-ranging**

**Syntax Description** This command has no arguments or keywords

**Command Default** This command is disabled by default.

**Command Modes** Global configuration (config)

Release	Modification
12.3(21)BC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable throttle-ranging** command enables faster cable modem registration times on the CMTS. Reload the Cisco CMTS with a Cisco IOS Release 12.3(21)BC image and configure the **cable throttle-ranging** command on the CMTS. Once the **cable throttle-ranging** has been configured, save the new configuration and reload the Cisco CMTS again. Faster cable modem registration times will now be enabled on the Cisco CMTS.

**Note** The **cable throttle-ranging** command is only available on anubr10k CMTS.

## Examples

The following example shows how to enable Fast CM registration feature on a Cisco CMTS:

```
Router(config)# cable throttle-ranging
```

## cable time-server

To enable the integrated time-of-day (ToD) server on the Cisco CMTS series, enter the **cable time-server** command in global configuration mode. To disable the time-of-day server function, use the **no** form of this command.

```
cable time-server
no cable time-server
```

**Syntax Description** This command has no keywords or arguments.

**Command Default** The integrated time-of-day (ToD) server is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Per the DOCSIS specifications, the ToD server uses the UDP protocol, so UDP minor servers must also be enabled using the **service udp-small-servers max-servers no-limit** command.

**Examples** The following example shows how to enable the time-of-day server:

```
Router# configure terminal

Router(config)# service udp-small-servers max-servers no-limit
Router(config)# cable time-server
Router(config)#
```

# cable toaster-shrink

To enable turbo mode, which uses six or seven pipelines in Parallel eXpress Forwarding, use the **cable toaster-shrink** command in global configuration mode. To reset to default settings, which use eight pipelines in Parallel eXpress Forwarding, use the **no** form of this command.

**cable toaster-shrink** *row-count*  
**no cable toaster-shrink** [*row-count*]

## Syntax Description

<i>row-count</i>	Specifies the shutdown row count in toaster.  The values are: <ul style="list-style-type: none"> <li>• 1—Shutdown one pipeline and uses seven pipelines.</li> <li>• 2—Shutdown two pipelines and uses six pipelines.</li> </ul>
------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

Disabled

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCJ1	This command was introduced in Cisco uBR10012 router.

## Examples

The following example shows how to enable turbo mode which shutdown one pipeline and uses seven pipelines:

```
Router# configure terminal
Router(config)# cable toaster-shrink 1
```

## cable toaster-voltage-adjust

To change PRE5 toaster voltage from 1.2 V to 1.3 V for T0 to T3, and to enable high voltage margin for T4, use the **cable toaster-voltage-adjust** command in global configuration mode. To reset to default settings, use the **no** form of this command.

```
cable toaster-voltage-adjust {groupA | groupB}
no cable toaster-voltage-adjust {groupA | groupB}
```

Syntax Description	groupA	groupB
	Enables the PRE5 toaster voltage from 1.2 V to 1.3 V for T0 to T3.	
		Enables the high voltage margin for T4.

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCJ1	This command was introduced in Cisco uBR10012 router.

### Examples

The following example shows how to change PRE5 toaster voltage from 1.2 V to 1.3 V for T0 to T3:

```
Router# configure terminal
Router(config)# cable toaster-voltage-adjust groupA
```

# cable trust

To enable packets from trusted source MAC addresses in DHCP, use the **cable trust** command in global configuration mode. To remove a trusted MAC address from the MAC exclusion list, use the **no** form of this command. Removing a MAC address from the exclusion list subjects all packets from that source to standard DHCP source verification.

**cable trust** *mac-address*  
**no cable trust** *mac-address*

## Syntax Description

<i>mac-address</i>	The MAC address of a trusted DHCP source, and from which packets will not be subject to standard DHCP source verification.
--------------------	----------------------------------------------------------------------------------------------------------------------------

## Command Default

Disabled

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.3(13a)BC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Per the DOCSIS specifications, the ToD server uses the UDP protocol, so UDP minor servers must also be enabled using the **service udp-small-servers max-servers no-limit** command.

This command and capability are only supported in circumstances in which the Cable Source Verify feature is first enabled on the Cisco CMTS.

When this feature is enabled in addition to cable source verify, a packet's source must belong to the MAC Exclude list on the Cisco CMTS. If the packet succeeds this exclusionary check, then the source IP address is verified against Address Resolution Protocol (ARP) tables as per normal and previously supported source verification checks. The service ID (SID) and the source IP address of the packet must match those in the ARP host database on the Cisco CMTS. If the packet check succeeds, the packet is allowed to pass. Rejected packets are discarded in either of these two checks.

Any trusted source MAC address in the optional exclusion list may be removed at any time. Removal of a MAC address returns previously trusted packets to non-trusted status, and subjects all packets to standard source verification checks on the Cisco CMTS.

**Note** When the **cable source-verify dhcp** feature is enabled, and a statically-defined IP address has been added to the CMTS for a CM using the **cable trust** command to override the **cable source-verify dhcp** checks for this device, packets from this CM will continue to be dropped until an entry for this CM is added to the ARP database of the CMTS. To achieve this, disable the **cable source-verify dhcp** feature, ping the CMTS from the CM to add an entry to the ARP database, and re-enable the **cable source-verify dhcp** feature.

---

**Examples**

The following example shows how to enable the time-of-day server:

```
Router# configure terminal  
Router(config)# cable trust 0007.0e03.69f9  
Router(config)# Ctrl^Z  
Router#
```

# cable tx-power-headroom

To configure cable modems with the extended transmit power capability based on the Organizational Unique Identifier (OUI), use the **cable tx-power-headroom** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**cable tx-power-headroom** *OUI* *dB-value*

**no cable tx-power-headroom** *OUI* *dB-value*

Syntax Description		
<i>OUI</i>	First 24 bits of a MAC address that is unique to the cable modem vendor.	
<i>dB-value</i>	Decibel value for the upstream channel transmit power. The valid range is from 1 to 6.	

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS Release 12.2(33)SCE3	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** You can use the **cable tx-power-headroom** command for each unique OUI. You can specify either the MAC address or the OUI value with this command. If you specify the MAC address, only its OUI value is saved.

**Examples** The following example shows how to configure extended transmit power on the Cisco CMTS router in Cisco IOS Release 12.2(33)SCE3:

```
Router# configure terminal
Router(config)# cable tx-power-headroom 0025.2ed0.8cba 3
```

Related Commands	Command	Description
	<b>cable upstream max-channel-power-off</b>	Specifies the power budget offset value on the Cisco CMTS router for the reduced channel set assignment.
	<b>show cable modem</b>	Displays transmit power values for each assigned upstream channel along with cable modem details.

# cable udc-capability

To enable the Upstream Drop Classifier (UDC) feature on cable modems, use the **cable udc-capability** command in interface configuration mode. To disable the UDC feature, use the **no** form of this command.

**cable udc-capability**  
**no cable udc-capability**

**Syntax Description** This command has no arguments or keywords

**Command Default** Disabled.

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	12.2(33)SCG5	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command is used in the MAC domain. When this command is used on a particular interface, the UDC feature for all the cable modems on that interface is enabled.

## Examples

The following example shows how to configure the **cable udc-capability** command:

```
Router# configure terminal
Router(config)# interface cable 7/0/0
Router(config-if)# cable udc-capability
```

The following example shows how to configure the **cable udc-capability** command on Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface cable 3/0/0
Router(config-if)# cable udc-capability
```

The **cable udc-capability** command is used to configure the Upstream Drop Classifier (UDC) feature on Cisco CMTS. For more information on the UDC feature, refer to the [Configuring Upstream Cable Interface Features on the Cisco CMTS Routers](#) *guide*.

Related Commands	Command	Description
	<b>show cable modem</b>	Displays information for the registered and unregistered cable modems.

## cable upgrade dsphy-fw auto

To enable automatic upgrade of the Downstream PHY firmware on the Cisco cBR-8 router, use the **cable upgrade dsphy-fw auto** command in global configuration mode. To disable the automatic upgrade, use the **no** form of this command.

**cable upgrade dsphy-fw auto**  
**no cable upgrade dsphy-fw auto**

### Syntax Description

This command has no arguments or keywords

### Command Default

Downstream PHY firmware auto upgrade is enabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to automatically upgrade the Downstream PHY firmware on the Cisco cBR-8 router.

### Examples

The following example shows how to enable automatic upgrade of the Downstream PHY firmware on the Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# cable upgrade dsphy-fw auto
```

The following example shows how to disable automatic upgrade of the Downstream PHY firmware on the Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# no cable upgrade dsphy-fw auto
```

### Related Commands

## cable upstream active-codes

To specify the number of active codes that can be configured on an upstream channel, use the **cable upstream active-codes** command in cable interface configuration mode. To set the default value of active codes to 112 when ingress noise cancellation is enabled and to 128 when it is disabled, use the **no** form of this command.

**cable upstream *n* active-codes *active-code***

**no cable upstream *n* active-codes**

Syntax Description		
<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.	
<i>active-code</i>	Specifies the number of active codes. Valid values are from 64 to 128, with a default value of 112, when ingress noise cancellation is enabled; and a default value of 128, when ingress noise cancellation is disabled.	

**Command Default** The active-code setting cannot be applied if the Synchronous Code Division Multiple Access (S-CDMA) is not configured.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command is applicable only for S-CDMA channels. You should configure S-CDMA to apply the active-code setting.

**Examples** The following example sets the active code to 128 on upstream port 0:

```
Router(config)# interface cable 7/0/4
Router(config-if)# cable upstream 0 active-codes 128
Router(config-if)#
```

Related Commands	Command	Description
	<b>cable upstream codes-per-minislot</b>	Specifies the number of codes per minislot allowed on an upstream channel.
	<b>cable upstream spreading-interval</b>	Specifies the spreading interval for S-CDMA channels on an upstream channel.

## cable upstream adjust-frequency

To enable frequency adjustment, use the **cable upstream adjust-frequency** command in cable interface configuration mode. To turn off frequency adjustment, use the **no** form of this command.

**no**  
**cable** *n* **upstream adjust-frequency**

<b>Syntax Description</b>	<b>adjust-frequency</b>	Enables frequency adjustment
	<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For cBR Series Converged Broadband Routers, the valid range is from 0 to 15.
<b>Command Default</b>	Frequency adjustment is enabled by default.	
<b>Command Modes</b>	Interface configuration—cable interface only (config-if) MAC domain profile configuration (config-profile-md)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Example

The following sample shows an example of the **cable upstream adjust-frequency** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # cable upstream 0 adjust-frequency
Router(config-profile-md)#end
```

The following sample shows an example of the **no cable upstream adjust-frequency** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # no cable upstream 0 adjust-frequency
Router(config-profile-md)#end
```

# cable upstream admission-control

To specify the percentage overbooking rate that is allowed on an upstream channel, use the **cable upstream admission-control** command in cable interface configuration mode. To set overbooking rate to its default of 100 percent, use the **no** form of this command.

**cable upstream *n* admission-control *percentage***  
**no cable upstream *n* admission-control**

Syntax Description		
	<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
	<i>percentage</i>	Specifies the percentage overbooking rate to limit overbooking. Valid values are from 10 to 1000 percent, with a default of 100 percent.

**Command Default** 100 percent

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	11.3(6) NA	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command limits the maximum number of CMs for a given upstream port by looking at the minimum guaranteed upstream bandwidth allocated to each CM. Cable modems providing residential services and commercial services can be given different weights according to their traffic needs. This command affects only whether CMs can register with the CMTS—it does not affect CMs that have already come online.

The CMTS uses the minimum guaranteed upstream bandwidth field from the CM's DOCSIS configuration file to calculate whether the CM can come online or not. If the CM's minimum guaranteed upstream bandwidth would exceed the total upstream bandwidth multiplied by the overbooking percentage specified by this command, the CM cannot come online on that upstream. The CM will attempt to find another upstream, and if it cannot register on any upstreams, it will attempt to lock on to a new downstream.

**Note** A CM with a guaranteed upstream bandwidth does not consume that bandwidth unless it has active traffic. By guaranteeing a CM a minimum upstream bandwidth, individual customers are assured of never being totally shut out from network access in a very high-traffic situation.

The following table shows the approximate bandwidth for each upstream channel, depending on channel width, symbol rate, and modulation type, when admission control is used at 100 percent. When setting admission control to other values, scale the bandwidth values in the following table accordingly, so as to plan for the maximum number of CMs effectively allowed per upstream port.

Table 15: Admission Control Bandwidth Table

Channel Width (KHz)	Symbol Rate (Ksym/sec)	QPSK Virtual Channel Bandwidth—100% limit (bits/sec)	16 QAM Virtual Channel Bandwidth—100% limit (bits/sec)
200	160	320,000	640,000
400	320	640,000	1,280,000
800	640	1,280,000	2,560,000
1600	1280	2,560,000	5,120,000
3200	2560	5,120,000	10,240,000

For example, with a 3.2 MHz channel width and QPSK modulation, the total bandwidth is approximately 5 Mbps. This is the maximum allowable bandwidth that can be allocated to CMs at the default admission rate of 100%. If each CM is allocated a minimum upstream bandwidth of 128 kbps, this means a maximum of 40 CMs will be allowed to come online.

To verify whether or not upstream admission control is configured and activated, use the **show interface** command for a cable upstream to display its configuration information. If upstream admission control is configured and enabled, the output contains an entry stating “CIR admission control enforced.” If upstream admission control is disabled, no admission control entry is displayed in the output.

**Note** Setting the admission control limit to below the current total reserved bandwidth for the channel does not immediately force any CMs offline, but may prevent CMs from reconnecting if they drop offline at a later time. Increasing the admission control limit allows more CMs to connect.

When an upstream becomes overbooked, use the **test cable ucc** command to move a cable modem that is currently online from one upstream port to another. For example, the following example shows that the cable modem with the IP address of 10.128.1.128 is being moved from port C3/0/U0 to C3/0/U1:

```
Router# show cable modem 10.128.1.128

Interface  Prim Online   Timing Rec   QoS CPE IP address   MAC address
          Sid  State      Offset Power
Cable3/0/U0 101  online    1919   5.25   7   0   10.128.1.128   0030.1976.7067
Router# test cable ucc c3/0 101 1
Router# show cable modem 10.128.1.128

Interface  Prim Online   Timing Rec   QoS CPE IP address   MAC address
          Sid  State      Offset Power
Cable3/0/U1 101  online    1920   5.25   7   0   10.128.1.128   0030.1976.7067
```

## Examples

The following example shows overbooking on upstream port 4 being limited to 125 percent:

```
Router(config)# interface cable 3/0
Router(config-if)# cable upstream 4 admission-control 125
Router(config-if)#
```

Use the **show interface cable upstream** command to display the current status of admission control on an interface. For example, the following command output shows that this upstream has allocated a total bandwidth of 2.5 Mbit/sec to those online CMs that were assigned a guaranteed upstream bandwidth in their DOCSIS configuration files.

This displays also shows that the admission control is being enforced at a subscription level of 125 percent. The Virtual channel BW field is computed by multiplying channel bandwidth by the admission control limit. The Admissions requests rejected counter shows the number of cable modems that attempted to register but were refused because of the admission control policy.

```
Router# show interface c3/0 u4

Cable3/0: Upstream 4 is up
  Received 11585 broadcasts, 11854 multicasts, 3222651 unicasts

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>debug cable mac-scheduler</b>	Displays information for the MAC layer's scheduler and admission control activities.
<b>debug cable us-adm-ctrl</b>	Displays debug messages for upstream admission control activity.
<b>show cable modem</b>	Displays statistics for a CM, including its upstream port and primary SID.
<b>show interface cable upstream</b>	Displays the interface configuration, which for an upstream includes the current admission control policy, if any.

# cable upstream admission-control max-reserved-bandwidth

To define the maximum reserved bandwidth per bonding group for all service flows that are allowed by the Cisco CMTS, use the **cable upstream admission-control max-reserved-bandwidth** command in the interface configuration mode. To reset or disable the maximum reserved bandwidth value, use the **no** form of this command.

**cable upstream***n***admission-control max-reserved-bandwidth** *bw-in-kbps*  
**no cable upstream***n***admission-control max-reserved-bandwidth**

## Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>bw-in-kbps</i>	Maximum admission control reserved bandwidth. The value is in kbps and is based on the RF bandwidth percent defined for the bonding group. Valid range is from 0 to 30720.

## Command Default

The max-reserved-bandwidth value is 80 percent of the aggregate bandwidth of the RF channels configured in the US or DS bonding group.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command allows the user to define the maximum reserved bandwidth per bonding group. The default maximum reserved bandwidth value is 80 percent. However the user can choose to configure a higher (up to 96 percent) or lower reserved bandwidth so that there is bandwidth allocated for zero committed information rate (CIR) best effort traffic.

## Examples

The following example shows a sample definition of the maximum reserved bandwidth value.

```
Router> enable
Router# configure terminal
Router(config)# interface c5/0/1
Router(config-if)# cable upstream 0 admission-control max-reserved-bandwidth 6344
```

## Related Commands

Command	Description
<b>cable admission-control</b>	Configures the CPU and memory thresholds for the Cisco CMTS router and supporting broadband processing engines (BPEs).
<b>cable admission-control event</b>	Configures and enables admission control event types on the Cisco CMTS router.
<b>cable admission-control ds-bandwidth</b>	Configures admission control downstream bandwidth thresholds on the Cisco CMTS router.

Command	Description
<b>cable admission-control us-bandwidth</b>	Configures admission control upstream bandwidth thresholds on the Cisco CMTS router.
<b>debug cable admission-control</b>	Enables automatic admission control troubleshooting processes on the Cisco CMTS router.
<b>show cable admission-control</b>	Displays the current admission control configuration and status on the Cisco CMTS router or on a specified interface.

# cable upstream attribute-mask

To specify an upstream attribute mask in hexadecimal format, use the **cable upstream attribute-mask** command in cable interface configuration mode or MAC domain profile configuration mode. Use the **no** form of this command to set default value to upstream channel attribute mask.

**cable upstream** *upstreamattribute-mask attribute-mask*  
**no cable upstream** *upstream attribute-mask attribute-mask*

## Syntax Description

<i>upstream</i>	Specifies the upstream port.
<b>attribute-mask</b> <i>attribute-mask</i>	Specifies the attribute mask bitmap in hexadecimal format. Example: 0-FFFFFFFF

## Command Default

If the router is not high availability (HA) supported and the upstream is not bonded, the default value for cable upstream attribute mask is 0x00.

If the router is HA supported, the default value is 0x20000000.

If the upstream channel is part of a bonding group, the default value is 0x80000000.

If the router is HA supported and the upstream channel is part of a bonding group, the default value is 0xA0000000.

## Command Modes

Interface configuration—cable interface only (config-if)

MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command sets the attribute mask of upstream channel.

## Examples

The following example shows how to set upstream attribute mask in hexadecimal format:

```
Router(config-if)# cable upstream 0 attribute-mask ffff
```

## Related Commands

Command	Description
<b>clear cable modem attribute-masks</b>	This command clears the cable modem attribute masks.

## cable upstream balance-scheduling

To enable the USCB balancing scheduler, use the **cable upstream balance-scheduling** command in cable interface configuration mode or MAC domain profile configuration mode. To disable, use the **no** form of this command.

**cable upstream balance-scheduling**  
**no cable upstream balance-scheduling**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled.

**Command Modes** Interface configuration (config-if)

MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	12.2(33)SCH2	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command is used to balance service flows across upstream channels in a MAC domain. This command is used only for UB-online cable modems.

The following example shows the configuration of the **cable upstream balance-scheduling** command:

```
Router# configure terminal
Router(config)# interface cable 8/1/2
Router(config-if)# cable upstream balance-scheduling
```

The following example shows the output of the **show cable interface** command that displays the enabled status of the balancing scheduler:

```
Router# show interface cable 8/1/2 mac-scheduler 0
Load for five secs: 1%/0%; one minute: 2%; five minutes: 2%
Time source is hardware calendar, *07:29:34.137 CST Wed Feb 5 2014

Command	Description
<b>cable upstream scheduling type</b>	Enables various scheduler modes
<b>show interface cable</b>	Displays the current configuration and status of a cable interface

## cable upstream bcast-init-ranging tcc-enc excl-timing

To enable feature of ECN MULPIv3.0-N-14.1145-1 on the CMTS router, use the **cable upstream bcast-init-ranging tcc-enc excl-timing** command in global configuration mode. To disable feature of ECN MULPIv3.0-N-14.1145-1, use the no form of this command - **no cable upstream bcast-init-ranging tcc-enc excl-timing**.

**cable upstream bcast-init-ranging tcc-enc excl-timing**  
**no cable upstream bcast-init-ranging tcc-enc excl-timing**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled.

**Command Modes** Global configuration (config)

Release	Modification
IOS XE Fuji 16.9.1a	This command was introduced.

**Usage Guidelines** To verify whether or not ECN MULPIv3.0-N-14.1145-1 feature is activated, enter the **show running-config command** and look for the **cable upstream bcast-init-ranging tcc-enc excl-timing** information. By default, it is disabled.

The following example shows the configuration of the **cable upstream balance-scheduling** command:

```
Router# configure terminal
Router(config)# cable upstream bcast-init-ranging tcc-enc excl-timing
```

**Related Commands** There are no related commands.

# cable upstream bonding-group

To create a static upstream bonding group on a cable interface, use the **cable upstream bonding-group** command in cable interface configuration mode. To disable this configuration, use the **no** form of this command.

**cable upstream bonding-group** *id*  
**no cable upstream bonding-group** *id*

## Syntax Description

<i>id</i>	Bonding group ID on the cable interface. Valid values are from 1 to 65535.
-----------	----------------------------------------------------------------------------

## Command Default

None

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0S	The valid range of upstream channels for each MAC Domain was increased to 0-15.

## Usage Guidelines

You can configure up to 32 static upstream bonding groups for each Media Access Control (MAC) domain. However, you can configure only 16 upstream channels for each MAC domain. If you delete an upstream bonding group using the **no** form of the command, the Cisco CMTS router enforces the bonded upstream service flows associated with the deleted upstream bonding group to readmit.

Under the upstream bonding configuration submode, you can specify the following for an upstream bonding group:

- Upstream channels
- Bandwidth reservation
- Provisioned attribute masks

**Note** While adding upstream channels under the upstream bonding group, ensure that the upstream channel is pre-configure using the following command:

```
downstream integrated-cable slot/subslot/port rf-channel rf-channels [upstream grouplist]
```

Upstream channels that are not pre-configured are not accepted and an error message is displayed as follows:

```
Router(config-if)#cable upstream bonding-group 106
Router(config-upstream-bonding)#upstream 0
Router(config-upstream-bonding)#upstream 6
Upstream 6 is not yet defined in MD Cable9/0/0.
```

**Note** The changes made to the configuration, using the attributes command in the upstream bonding configuration submode, on the working line card are synchronized with the configuration on the protect line card only after exiting the configuration mode. Use the end command to exit to Privileged EXEC mode, before using the show running configuration command.

Starting from Cisco IOS-XE 3.18.0S release, maximum of 16 upstream channels can be configured for each MAC Domain, which are divided into two groups:

- Group 1: upstream channel 0-7
- Group 2: upstream channel 8-15

An **upstream bonding-group** should include all the upstream channels either from Group 1 or Group 2 only. For example, consider the following configuration:

```
Router(config-if)#cable upstream bonding-group 106
Router(config-upstream-bonding)#upstream 0
Router(config-upstream-bonding)#upstream 6
Router(config-upstream-bonding)#upstream 7
.
.
.
Router(config-if)#cable upstream bonding-group 110
Router(config-upstream-bonding)#upstream 12
Router(config-upstream-bonding)#upstream 13
Router(config-upstream-bonding)#upstream 14
```

If you try to add **upstream 11** into **upstream bonding-group 106** or **upstream 4** into **upstream bonding-group 110**, it will be rejected.

### Examples

The following example shows how to configure an upstream bonding group on a cable interface in slot 7, subslot 1, and port 0 on a Cisco CMTS router:

```
Router# configure terminal
Router(config)# interface cable 7/1/0
Router(config-if)# cable upstream bonding-group 235
```

### Related Commands

Command	Description
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.
<b>cable fiber-node</b>	Creates a fiber node and enters cable fiber-node configuration mode.

# cable upstream chan-class-id

To configure a channel class ID for a logical upstream channel on the CMTS router, use the **cable upstream chan-class-id** command in cable interface configuration mode. To disable the channel class ID configuration, use the **no** form of this command.

**cable upstream** *port-number* **chan-class-id** *id*  
**no cable upstream** *port-number* **chan-class-id** *id*

## Syntax Description

<i>port-number</i>	Cable upstream port number. The valid range depends on the number of upstream channels configured in a MAC domain. For example, if the total number of upstream channels configured is 4, then the valid range for the upstream port number is from 0 to 3.
<i>id</i>	Channel class ID for the logical upstream channel in the hexadecimal format. The valid range is from 0 to ffffffff. The default value is 0.

## Command Default

None

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.2(33)SCH	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable upstream chan-class-id** command is associated with the [CM Steering on the Cisco CMTS Routers](#) feature.

An upstream channel descriptor (UCD) message includes type, length, value (TLV) 18 and 19 for an upstream logical channel based on the channel class ID and ranging hold-off priority configuration. If a channel class ID is not configured, the UCD does not include TLV18 and 19 irrespective of the ranging hold-off priority configuration.

## Examples

The following example shows how to configure a channel class ID for a logical upstream channel on a cable interface line card on the cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 5/0/0
Router(config-if)# cable upstream 0 chan-class-id ff
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a cable modem or a group of cable modems from DOCSIS load balance.

Command	Description
<b>cable upstream rng-holdoff</b>	Configures an upstream ranging hold-off priority value for an upstream logical channel on the CMTS router.
<b>show cable modem verbose</b>	Displays information about the registered and unregistered cable modems connected to the CMTS router.

## cable upstream channel-width

To specify an upstream channel width for an upstream port, use the **cable upstream channel-width** command in cable interface configuration mode. To set the channel width back to the default setting of 1,600,000 Hz, use the **no** form of this command.

**cable upstream *n* channel-width *first-choice-width* [*last-choice-width*]**  
**no cable upstream *n* channel-width**

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>first-choice-width</i>	Specifies the upstream channel width in hertz (Hz).
<i>last-choice-width</i>	The upstream channel width in hertz. The valid values are the same as those for the <i>first-choice-width</i> parameter, but for proper operation, the <i>last-choice-width</i> should be equal to or less than the <i>first-choice-width</i> value. Use this parameter with supported cards to enable symbol rate management algorithms.

### Command Default

The *first-choice-width* value and the *last-choice-width* value default to 1,600,000 Hz. When an upstream channel is configured to operate in DOCSIS 2.0 A-TDMA or DOCSIS 3.0 S-CDMA-mode, only three channel width options (1.6 Mhz, 3.2 Mhz, and 6.4 Mhz) are available.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
11.3(5)NA	This command was introduced.
12.0(4)XI	The <i>last-choice-width</i> argument was added.
12.2(11)CY, 12.2(11)BC3	Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.
12.2(15)CX	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line card, including DOCSIS 2.0 A-TDMA and mixed modulation profiles using 6.4 MHz channel widths.
12.2(15)BC2	Support was added for DOCSIS 2.0 A-TDMA and mixed modulation profiles using 6.4 MHz channel widths on the Cisco uBR-MC5X20S/U cable interface line cards.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCC	Support was added for Cisco UBR10-MC20X20V cable interface line card.
12.2(33)SCG2	Support was added for Copy and Paste Support for TDMA to A-TDMA Upgrade feature.

Release	Modification
IOS-XE 3.15.OS	This command was removed. This command is replaced by <b>us-channel channel-width</b> command.

**Usage Guidelines**

The *last-choice-width* parameter is supported only by the Cisco uBR-MC16S, Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR-MC5X20S/U cable interface line cards. When one of these particular cards is installed, the system attempts to increase the channel width from the smallest channel width value to the largest channel width value.

When you specify both channel width values, the smaller value is taken as the *last-choice-width* parameter and the larger value is taken as the *first-choice-width* parameter. In the event of noise in the channel, the symbol rate automatically steps down to a value that is lower than the *first-choice-width* and greater or equal to the *last-choice-width* to maintain a stable channel.

**Table 16: Supported Channel Widths and DOCSIS Modes for Cable Interfaces**

Cable Interface	Channel Width	DOCSIS 1.X (TDMA)	Mixed DOCSIS 1.X/2.0	DOCSIS 2.0 (A-TDMA)	DOCSIS 2.0 (S-CDMA)	DOCSIS 3.0 (S-CDMA)
Cisco uBR-MC16U/X <sup>4</sup> , Cisco uBR-MC28U/X	6.4 MHz 3.2 MHz 1.6 MHz 800 kHz 400 kHz 200 kHz	41 to 50 (default is 41)	141 to 150 (default is 141)	241 to 250 (default is 241)	N/A	N/A
Cisco uBR-MC5X20S/U/H	6.4 MHz 3.2 MHz 1.6 MHz 800 kHz 400 kHz 200 kHz	21 to 30 (default is 21)	121 to 130 (default is 121)	221 to 230 (default is 221)	N/A	N/A
Cisco uBR-MC20X20 <sup>5</sup>	6.4 MHz 3.2 MHz 1.6 MHz 800 kHz 400 kHz 200 kHz	21 to 30 (default is 21)	121 to 130 (default is 121)	221 to 230 (default is 221)	321 to 330 (default is 321)	1 to 400 (default is 381)
Cisco uBR-MC88U	6.4 MHz 3.2 MHz 1.6 MHz 800 kHz 400 kHz 200 kHz	21 to 30 (default is 21)	121 to 130 (default is 121)	221 to 230 (default is 221)	321 to 330 (default is 321)	1 to 400 (default is 381)
Cisco uBR-MC3GX60V	6.4 MHz 3.2 MHz 1.6 MHz 800 kHz 400 kHz 200 kHz	21 to 30 (default is 21)	121 to 130 (default is 121)	221 to 230 (default is 221)	321 to 330 (default is 321)	1 to 400 (default is 381)

<sup>4</sup> Supports 6,400,000 Hz (5,120,000) symbols/sec) while operating in the DOCSIS 2.0 (A-TDMA-only) mode.

<sup>5</sup> The DOCSIS 3.0 S-CDMA modulation profiles do not support 200 kHz, 400 kHz, and 800 kHz channel widths. This applies to Cisco uBR-MC88U and Cisco uBR-MC3GX60V.

**Note** The UBR-MC20X20V cable interface line card has three variants, UBR-MC20X20V-0D, UBR-MC20X20V-5D, and UBR-MC20X20V-20D. The UBR-MC20X20V-0D line card supports 20 upstreams and zero (no) downstreams. The UBR-MC20X20V-5D line card supports 20 upstreams and five downstreams, and the UBR-MC20X20V-20D line card supports 20 upstreams and 20 downstreams.

**Note** In Cisco IOS Release 12.2(15)BC1 and later releases, changing the channel width could force a frequency hop, if the current frequency does not fit within the new channel width parameters, or if the system needs to reset the fixed frequency or shared frequency group parameters to match the new channel width.

**Caution** In DOCSIS 1.X networks, do not change the channel width more than one step at a time on an interface that has cable modems that are currently online. The DOCSIS 1.X specifications require that cable modems remain online when the channel width is changed in single step increments (such as 800,000 to 1,600,000 Hz), but cable modems can go offline when you change the channel width in larger amounts (such as changing it from 800,000 to 3,200,000 Hz). To check if the DOCSIS 2.0 cable modems support changing the channel width by two steps, test each brand of modem before attempting it on a live network. Also, after changing the channel width, do not change the channel width again until all cable modems have performed their ranging adjustments for the new width (which could take up to a minute, depending on the number of cable modems).

**Note** To specify only one channel width for the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, or Cisco uBR-MC5X20S/U/H card, specify the same value for both the *first-choice-width* and *last-choice-width* parameters. For example: **cable upstream 0 channel-width 800000 800000**

When using this command to change channel-widths for an upstream interface on the Cisco uBR-MC5X20S cable interface line card, some DOCSIS 1.1 CMs can go offline if you do not change the minislots to the corresponding value. See the following examples for the correct channel-width and minislots pairings:

```
Router(config-if)# cable upstream 0 channel-width 3200000
Router(config-if)# cable upstream 0 minislots 4
Router(config-if)# cable upstream 0 channel-width 1600000
Router(config-if)# cable upstream 0 minislots 8
Router(config-if)# cable upstream 0 channel-width 800000
Router(config-if)# cable upstream 0 minislots 16
Router(config-if)# cable upstream 0 channel-width 400000
Router(config-if)# cable upstream 0 minislots 32
Router(config-if)# cable upstream 0 channel-width 200000
Router(config-if)# cable upstream 0 minislots 64
```

**Note** This limitation does not affect DOCSIS 1.1-compliant CMs. Also, in Cisco IOS Release 12.2(15)CX, Cisco IOS Release 12.2(15)BC2, and later releases, there is no need to manually change the minislots on the Cisco uBR-MC16U/X, Cisco uBR-MC28C, and Cisco uBR-MC28U/X cards. These cards automatically change the minislots size when the channel width is changed, to produce 32 symbols per minislots.

**Note** Starting with Cisco IOS 12.2(33)SCG2, when the channel-width value in the **cable upstream channel-width** command is specified as 6.4 MHz in the TDMA or mixed TDMA/A-TDMA mode, the DOCSIS mode automatically changes to A-TDMA-only (DOCSIS 2.0) mode.

### PacketCable Limitations

The 200,000 Hz channel width cannot be used on:

- Upstreams that support PacketCable voice calls
- Upstreams that use Unsolicited Grant Service (UGS) or UGS with Activity Detection (UGS-AD) service flows.

Using this small channel width with voice and other UGS/UGS-AD service flows results in rejected calls because of “DSA MULTIPLE ERRORS”.

### Examples

The following example shows the upstream port 2 on a Cisco uBR-MCXXC card being configured with a channel width of 200,000 Hz (which is equivalent to a symbol rate of 160 kilosymbols/second):

```
Router(config-if) # cable upstream 2 channel-width 200000
Router(config-if) #
```

The following example shows the upstream port 2 on a Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, or Cisco uBR-MC5X20S card being configured with a channel width of 200,000 Hz (which is equivalent to a symbol rate of 160 kilosymbols/second):

```
Router(config-if) # cable upstream 2 channel-width 200000 200000
Router(config-if) #
```

The following example shows the upstream port 3 being configured to step from a channel width of 1,600,000 Hz to a channel width of 3,200,000 Hz in increments of 200,000 Hz:

```
Router(config-if) # cable upstream 3 channel-width 1600000 3200000
Router(config-if) #
```

The following example shows an upstream port on a Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, Cisco uBR-MC5X20S, Cisco uBR-MC20X20V, Cisco uBR-MC88U or Cisco uBR-MC3GX60V card being configured with a channel width of 6.4 MHz, which is supported only in DOCSIS 2.0 A-TDMA-only mode:

```
Router(config-if) # cable upstream 0 channel-width 6400000
Router(config-if) #
```

The following example shows an upstream port on Cisco uBR-MC5X20H, Cisco uBR-MC20X20V, Cisco uBR-MC88U, Cisco uBR-MC3GX60V line cards being configured with a channel width of 6.4 MHz in DOCSIS 3.0 S-CDMA mode:

```
Router(config-if) # cable upstream 0 channel-width 6400000
Router(config-if) #
```

### Related Commands

Command	Description
<b>cable upstream hopping blind</b>	Disables optimum frequency hopping on the Cisco uBR-MC16S and Cisco uBR-MC5X20S cable interface line cards.
<b>cable upstream minislot-size</b>	Specifies the minislot size for a specific upstream interface.
<b>cable upstream modulation-profile</b>	Overrides modulation types specified in the modulation profile for the specified upstream channel.

Command	Description
cable upstream docsis-mode	Configures an upstream to use either DOCSIS 1.x or DOCSIS 2.0 modulation profiles.

## cable upstream codes-per-minislot

To specify the number of codes-per-minislot allowed on an upstream channel, use the **cable upstream codes-per-minislot** command in cable interface configuration mode. To set the default values to the codes-per-minislot, which depend on the setting of the **cable upstream spreading-interval** command, use the **no** form of this command.

**cable upstream** *n* **codes-per-minislot** *code*  
**no cable upstream** *n* **codes-per-minislot**

### Syntax Description

<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>code</i>	Specifies the number of codes-per-minislot. Valid values range from 2 to 32.

### Command Default

The codes-per-minislot setting cannot be applied if the Synchronous Code Division Multiple Access (S-CDMA) is not configured. The default value of codes-per-minislot depends on the setting of the **cable upstream spreading-interval** command.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command limits the maximum number of codes-per-minislot for a given upstream port. You should configure S-CDMA to apply the active-code setting.

### Examples

The following example sets the codes-per-minislot to 8 on the upstream port 0:

```
Router(config)# interface cable 7/1/0
Router(config-if)# cable upstream 0 codes-per-minislot 8
Router(config-if)#
```

### Related Commands

Command	Description
<b>cable upstream active-codes</b>	Specifies the number of active codes that can be configured on an upstream channel.
<b>cable upstream spreading-interval</b>	Specifies the spreading interval for SCDMA on an upstream channel.

# cable upstream concatenation

To enable DOCSIS concatenation at the CMTS, use the **cable upstream concatenation** command in cable interface configuration mode. To turn off concatenation, use the **no** form of this command.

**cable upstream *n* concatenation**  
**no cable upstream *n* concatenation**

## Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For cBR Series Converged Broadband Routers, the valid range is from 0 to 15.
----------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

Concatenation is enabled.

## Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.0(7)XR2	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Concatenation is part of DOCSIS 1.0 extension support. Concatenation provides for improved bandwidth efficiency but must be supported at both the headend CMTS and the CM.

DOCSIS concatenation combines multiple upstream packets into one packet to reduce packet overhead and overall latency and increase transmission efficiency. Using concatenation, a DOCSIS CM needs to make only one bandwidth request for a concatenated packet, compared to making bandwidth requests for each individual packet. This technique is especially effective for bursty real-time traffic such as voice calls.

Concatenation support improves upstream per CM data throughput. The Cisco CMTS radio frequency (RF) line card driver can receive only one MAC frame in a data burst. Thus the CM must make explicit bandwidth requests for every packet it sends upstream. This limits the maximum upstream data throughput received by the CM due to the inherent request-to-grant round-trip latency of the hybrid fiber-coaxial (HFC) cable system incurred by every packet. To increase this per-CM upstream throughput, the Cisco CMTS driver has been enhanced to receive a concatenated burst of multiple MAC frames from the same CM.

**Note** Concatenation is not supported on the Cisco uBR-MC11 FPGA and Cisco uBR-MC16B cable interface line cards.

## Examples

The following example shows how to enable concatenation for CMs on upstream port 2 on the cable interface in slot 3/0:

```
Router(config)# interface c3/0
Router(config-if)# cable upstream 2 concatenation
```

## cable upstream connector

To map a MAC domain upstream port to a physical port on the Cisco cable interface line cards (Cisco uBR-MC5X20U/H, Cisco uBR-MC20X20V, Cisco uBR-MC88V, Cisco uBR-MC28U, or Cisco uBR-MC3GX60V), use the **cable upstream connector** command in cable interface configuration mode. To remove the mapping, use the **no** form of this command.

**cable upstream port connector physical-port shared**  
**no cable upstream port connector physical-port shared**

### Syntax Description

<i>port</i>	Index of the MAC domain upstream. The index range is configured with the <b>cable upstream max-ports n</b> command, and the valid range is 0 to <i>n</i> - 1.
<i>physical-port</i>	Index of the actual physical port to be mapped.  The valid range for Cisco uBR-MC520U/H, Cisco uBR-MC20X20V, and Cisco uBR-MC3GX60V cable line cards is from 0 to 19. The valid range for Cisco uBR-MC28U and Cisco uBR-MC88V cable line cards is from 0 to 7.
<b>shared</b>	Indicates that the connector is shared by multiple upstream ports.  <b>Note</b> This option is not valid for Cisco uBR-MC3GX60V cable interface line card on Cisco IOS Release 12.2(33)SCE and later releases. A connector becomes shared automatically when multiple upstream ports are mapped to it.

### Command Default

By default, each MAC domain has four upstream ports allocated. For all the currently supported cable line cards—Cisco uBR-MC5X20U/H, Cisco uBR-MC20X20V, Cisco uBR-MC88V, Cisco uBR-MC28U, and Cisco uBR-MC3GX60V the default mapping is four upstream for each MAC domain.

For the Cisco uBR-MC5X20U/H and Cisco uBR-MC28U cable line cards, each MAC domain has one downstream and four upstreams. For the other cards, each MAC domain can have multiple downstreams.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced to support the Cisco uBR-MC5X20S cable interface line card.
12.2(15)BC2	Support was added for the Cisco uBR-MC5X20U card. Also, the entAliasMappingTable in the ENTITY-MIB was updated to show the mapping between the physical upstream connectors and the logical upstream connectors.
12.2(33)SCE	Support for the <b>shared</b> keyword was removed.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable upstream connector** command maps a MAC domain upstream port to a particular physical RF port on the cable line card front panel. For all cable line cards except the Cisco uBR-MC3GX60V, the default mapping assigns one upstream port to one physical port. The default mapping of Cisco uBR-MC3GX60V

cable line card assigns four upstream ports to one physical port. The physical ports are mapped sequentially in the order in which they appear on the front panel.

The **no** version of this command removes the upstream port mapping and shuts down the upstream port. The port must be remapped to another physical port before it can come online again.

**Tip** Use the **cable upstream max-ports** command to set the maximum number of upstream ports per MAC domain before using the **cable upstream connector** command.

**Table 17: Default Upstream Port Assignments for the Cisco uBR-MC5X20U/H Cable Interface Line Card**

	Physical Ports (upstream, as labeled on the card)																			
Physical Upstream Ports	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
MAC Domain 0 Upstream	0	1	2	3																
MAC Domain 1 Upstream					0	1	2	3												
MAC Domain 2 Upstream									0	1	2	3								
MAC Domain 3 Upstream													0	1	2	3				
MAC Domain 4 Upstream																	0	1	2	3

**Table 18: Default Upstream Port Assignments for the Cisco uBR-MC3GX60V Cable Interface Line Card**

	Physical Ports (upstream, as labeled on the card)																			
Physical Upstream Ports	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
MAC Domain 0 Upstream	0-3																			

		Physical Ports (upstream, as labeled on the card)																	
MAC Domain 1 Upstream		0-3																	
MAC Domain 2 Upstream			0-3																
MAC Domain 3 Upstream				0-3															
MAC Domain 4 Upstream					0-3														
MAC Domain 5 Upstream						0-3													
MAC Domain 6 Upstream							0-3												
MAC Domain 7 Upstream								0-3											
MAC Domain 8 Upstream									0-3										
MAC Domain 9 Upstream										0-3									
MAC Domain 10 Upstream											0-3								
MAC Domain 11 Upstream												0-3							
MAC Domain 12 Upstream														0-3					
MAC Domain 13 Upstream																0-3			

	Physical Ports (upstream, as labeled on the card)																
MAC Domain 14 Upstream																	0-3

Each MAC domain can have up to 8 upstream ports. Each upstream port can be mapped to a physical port.

## Examples

The following example shows how to configure a MAC domain with 8 upstream ports:

```
Router# configure terminal
Router(config)# interface cable 8/1/0
Router(config-if)# cable upstream max-ports 8
Router(config-if)# cable upstream 0 connector 16
Router(config-if)# cable upstream 1 connector 17
Router(config-if)# cable upstream 2 connector 18
Router(config-if)# cable upstream 3 connector 12
Router(config-if)# cable upstream 4 connector 13
Router(config-if)# cable upstream 5 connector 14
Router(config-if)# cable upstream 6 connector 15
Router(config-if)# cable upstream 7 connector 11
Router(config-if)# exit
Router(config)# exit
Router#
```

**Note** The "WARNING: This upstream will be removed from all the upstream channel bonding groups in the MAC Domain." warning message is displayed when you configure **no cable upstream connector** command.

When an upstream is mapped to a physical upstream port (connector), it is also mapped to an internal upstream PHY receiver. In Cisco uBR-MC5X20U/H, Cisco uBR-MC20X20V, and Cisco uBR-MC88V cable line cards, each upstream PHY chip has two connectors and two receivers, and can support two upstreams. The two upstreams can be mapped in four ways:

- Straight mapping: upstream1 =>connector1 =>receiver1; upstream2 =>connector2 =>receiver2;
- Share A mapping: upstream1 =>connector1 =>receiver1; upstream2 =>connector1 =>receiver2;
- Share B mapping: upstream1 =>connector2 =>receiver1; upstream2 =>connector2 =>receiver2;
- Crossed mapping: upstream1 =>connector2 =>receiver1; upstream2 =>connector1 =>receiver2;

The card hardware only supports the first three mappings, and does not support crossed mapping. During normal configuration, certain configuration sequence can cause crossed mapping. When that happens, the connector command will fail, and the CNNR-NOXC error message is displayed. To fix the cross mapping, remove all existing upstream connector configurations in these two connectors, and re-provision them.

## Related Commands

Command	Description
<b>cable upstream max-ports</b>	Configures the maximum number of upstreams on a downstream (MAC domain) on a Cisco uBR-MC5X20S cable interface line card.

## cable upstream controller-profile

To configure the upstream controller profile, use the **cable upstream controller-profile** command in global configuration mode. To void the upstream controller profile configuration, use the **no** form of this command.

**cable upstream controller-profile** *id* [**RPHY** | **I-CMTS**]

**no cable upstream controller-profile** *id*

---

### Syntax Description

**Syntax Description** *id* Specifies the upstream controller profile ID.

---

**Command Default** None

**Command Modes** Global configuration (config)

---

### Command History

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Fuji 16.7.1	This command was modified on the Cisco cBR Series Converged Broadband Routers. Keywords <b>RPHY</b> and <b>I-CMTS</b> were added.

---

### Usage Guidelines

Use this command to configure the upstream controller profile.

When configuring a new i-CMTS controller profile, keyword **I-CMTS** is needed. If user input **RPHY** or do not input any keyword, the system will consider it as a RPHY controller profile.

---

### Examples

The following example shows how to enter the upstream controller profile configuration mode:

```
Router# configure terminal
Router(config)# cable upstream controller-profile 1 I-CMTS
Router(config-controller-profile)#
```

## cable upstream data-backoff

To specify automatic or fixed start and stop values for data backoff, use the **cable upstream data-backoff** command in cable interface configuration mode. To use the default data backoff values, use the **no** form of this command.

**cable upstream n data-backoff** {automatic | start end}  
**no cable upstream n data-backoff**

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<b>automatic</b>	Specifies automatic data backoff start and stop values. It enables dynamic variation in the <i>start</i> and <i>end</i> values.
<i>start</i>	Binary exponential algorithm. Sets the start value for data backoff. Valid values are from 0 to 15. The default value is 3.
<i>end</i>	Binary exponential algorithm. Sets the end value for data backoff. Valid values are from 0 to 15. The default value is 5.

### Command Default

The default cable upstream data-backoff values are 3 5.

### Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.1 T	This command was introduced.
12.1(5)EC1	Support was added for the Cisco uBR7100 series router.
12.2(4)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The DOCSIS-specified method of contention resolution for CMs used to send data or requests on the upstream channel is a truncated binary exponential backoff with the initial backoff window and the maximum backoff window controlled by the CMTS. The Cisco CMTS router specifies backoff window values for both data and initial ranging, and sends these values downstream as part of the Bandwidth Allocation Map (MAP) MAC message.

The values specified in this command are exponential power-of-two values. For example, a value of 4 indicates a window between 0 and 15; a value of 10 indicates a window between 0 and 1023.

To manually specify the data-backoff values, use the following formula as a guideline for the *start* and *end* binary exponents:

$$0.33 = (2^{**stop} - 2^{**start}) / n$$

where  $n$  is the number of CMs on the upstream. Choose *start* and *stop* values that come closest to the value of 0.33 (which is the optimal probability to transmit on a contention-based system).

Related Commands	Command	Description
	<b>cable insertion-interval</b>	Configures the interval between consecutive initial ranging slots on an upstream.
	<b>cable upstream range-backoff</b>	Specifies automatic or configured initial ranging backoff calculation.
	<b>show controllers cable</b>	Displays the backoff window setting for the configured upstream port.

# cable upstream description

To assign a label to an upstream, use the **cable upstream description** command in cable interface configuration mode. To remove the label from the upstream, use the **no** form of this command.

**cable upstream *n* description *label***  
**no cable upstream *n* description**

## Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>label</i>	An arbitrary string, up to 80 characters long, that describes this upstream for management and tracking purposes. If the string contains any spaces, enclose the string within quotes.

## Command Default

No description is assigned to upstreams.

## Command Modes

Interface configuration—cable interface only (config-if)

## Command History

Release	Modification
11.3 NA	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the <b>us-channel description</b> command on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use the **cable upstream description** command to assign arbitrary labels to the upstreams on the cable interfaces. These labels can contain any information that identifies the upstream and that could aid in network management or troubleshooting.

**Tip** Use the **show interface cable upstream** command to display the labels that are assigned to a particular upstream.

## Examples

The following example shows how to assign descriptions to the first two upstreams on the cable interface in slot 3:

```
Router# configure terminal
Router(config)# interface cable 3/0
Router(config-if)# cable upstream 0 description "SJ-Node1-Upstream 0"
Router(config-if)# cable upstream 1 description "SJ-Node1-Upstream 1 (Unused)"
Router(config-if)#
```

## Related Commands

Command	Description
<b>show interface cable</b>	Displays the current configuration and status of a cable interface.

## cable upstream differential-encoding

To enable differential encoding on upstream traffic to a specified cable interface, use the **cable upstream differential-encoding** command in cable interface configuration mode. To disable this function, use the **no** form of this command.

**cable upstream *n* differential-encoding**  
**no cable upstream *n* differential-encoding**

<b>Syntax Description</b>	<i>n</i> Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
---------------------------	--------------------------------------------------------------------------------------------------------------------------------------

**Command Default** Enabled

**Command Modes** Interface configuration—cable interface only (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.1	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** To verify whether or not upstream differential encoding is activated, enter the **show running-config** command and look for the cable interface configuration information. If upstream differential encoding is enabled, a differential encoding entry is displayed in the output of the **show running-config** command. If upstream differential encoding is disabled, no differential encoding entry is displayed in the output.

If you are having trouble, make sure that the cable connections are not loose or disconnected; the cable interface line card is firmly seated in its chassis slot; the captive installation screws are tight; you have entered the correct slot and port numbers; and you selected a valid frequency for your router.

### Examples

The following example shows how to enable differential encoding for upstream port 2:

```
Router(config-if)# cable upstream 2 differential-encoding
Router(config-if)#
```

## cable upstream docsis-mode

To configure an upstream to use DOCSIS 1.x, DOCSIS 2.0 or DOCSIS 3.0 modulation profiles, use the **cable upstream docsis-mode** command in cable interface configuration mode. To reset the upstream to its default configuration, use the **no** form of this command.

```
cable upstream n docsis-mode {atdma | scdma | scdma-d3 | tdma | tdma-atdma}
no cable upstream n docsis-mode {atdma | scdma | scdma-d3 | tdma | tdma-atdma}
```

### Syntax Description

<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
<b>atdma</b>	Configures the upstream only for DOCSIS 2.0 Advanced Time Division Multiple Access (A-TDMA) modulation profiles.
<b>scdma</b>	Configures the upstream for DOCSIS 2.0 Synchronous Code Division Multiple Access (S-CDMA) modulation profiles only.
<b>scdma-d3</b>	Configures the upstream for DOCSIS 3.0 S-CDMA modulation profiles. The <b>scdma-d3</b> option uses channel type 4SR mode.
<b>tdma</b>	Configures the upstream only for DOCSIS 1.0/DOCSIS 1.1 Time Division Multiple Access (TDMA) modulation profiles (default).
<b>tdma-atdma</b>	Configures the upstream for both A-TDMA and TDMA operations (mixed mode). If you are using abbreviations at the command line, you must specify at least the <b>tdma</b> to select the mixed mode. If you choose a shorter abbreviation, you select TDMA-only mode.

### Command Default

All upstreams are configured ATDMA-only mode.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(15)CX	This command was introduced to support DOCSIS 2.0 A-TDMA and mixed modulation profiles on the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line card on the Cisco uBR7246VXR router.
12.2(15)BC2	Support was added for the Cisco uBR-MC5X20S/U cable interface line cards on the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCC	This command was modified with the addition of <b>scdma</b> and <b>scdma-d3</b> keyword options and support was added for the Cisco UBR-MC20X20V cable interface line card on the Cisco uBR10012 router.
12.2(33)SCG	The command default was changed from TDMA to ATDMA.

Release	Modification
12.2(33)SCG2	Support was added for the Copy and Paste Support for TDMA to A-TDMA upgrade feature.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel docsis-mode</b> command.

### Usage Guidelines

The DOCSIS 2.0 specification builds on the existing TDMA to support advanced modulation profiles that increase potential upstream bandwidth. The A-TDMA profiles support higher QAM rates of up to 64-QAM and wider channel widths of up to 6.4 MHz (5.12 Msymbols).

**Note** The advanced hardware-based spectrum management features for the Cisco uBR-MC16S/U/X, Cisco uBR-MC28U/X, and Cisco uBR-MC5X20S/U cards are supported only in the DOCSIS 1.0/1.1 TDMA-only mode. They cannot be used in the mixed or A-TDMA-only modes.

**Note** Starting with Cisco IOS Release 12.2(33)SCG and later, the default upstream DOCSIS mode is ATDMA only.

The DOCSIS 2.0 specification allows an upstream to be configured in one of the following three modes:

- A-TDMA only mode—Upstreams only support cable modems that register using A-TDMA modulation profiles. The CMTS does not allow DOCSIS 1.0 and DOCSIS 1.1 cable modems to register and come online on these upstreams. The Cisco uBR-MC5X20S /U , Cisco uBR-MC16U/X, and Cisco uBR-MC28U/X cards also support 6,400,000 Hz (5,120,000 symbols/sec) when operating in DOCSIS 2.0 (A-TDMA-only) mode.

Changing the DOCSIS mode to A-TDMA only mode automatically changes the symbol rate to 5.12 megasymbols per second and the channel width to 6.4 MHz. It also automatically disables the dynamic upstream modulation.

**Note** Starting with Cisco IOS 12.2(33)SCG2, when the channel-width value in the **cable upstream channel-width** command is specified as 6.4 MHz in the TDMA or mixed TDMA/A-TDMA mode, the DOCSIS mode automatically changes to A-TDMA-only (DOCSIS 2.0) mode. Changing DOCSIS mode to A-TDMA only mode will not automatically change the symbol rate to 5.12 megasymbols per second and the channel width to 6.4 MHz. The symbol rate and channel width before the DOCSIS mode change are maintained after the change.

In addition, the following are required to support the DOCSIS 2.0 A-TDMA features:

- Cable modems must be DOCSIS 2.0 compliant.
- The DOCSIS configuration file for the cable modem must either omit the DOCSIS 2.0 Enable field (TLV 39), or it must set TLV 39 to 1 (enable). If you set TLV 39 to 0 (disable), a DOCSIS 2.0 CM uses the TDMA mode.
- The upstream must be configured for either A-TDMA-only or mixed TDMA/A-TDMA mode.

- TDMA-only mode—Upstreams only support cable modems that register using TDMA modulation profiles. DOCSIS 2.0 cable modems can register on these upstreams only by using a DOCSIS 1.0/DOCSIS 1.1 modulation profile (which typically would happen only when a DOCSIS 2.0 cable modem cannot find an A-TDMA channel in its DOCSIS domain).

Changing the DOCSIS mode to TDMA-only mode automatically changes the symbol rate to 1.28 megasymbols per second and the channel width to 3.2 MHz. It also automatically disables the dynamic upstream modulation.

- Mixed mode—Upstreams support both DOCSIS 1.0/DOCSIS 1.1 cable modems using TDMA modulation profiles and DOCSIS 2.0 cable modems using A-TDMA modulation profiles. (The maximum channel width in mixed mode is 3.2 MHz.)

Changing the DOCSIS mode to mixed mode also automatically changes the symbol rate to 1.28 megasymbols per second and the channel width to 3.2 MHz. Dynamic upstream modulation is also automatically disabled.

---

**Note** Mixed mode upstreams do not support the 6.4 MHz channel width.

---

The DOCSIS 3.0 specification allows an upstream to be configured in one of the following modes:

- SCDMA-d3 mode—Upstreams only support cable modems that register using DOCSIS 3.0 S-CDMA modulation profiles.
- SCDMA mode—Upstreams only support cable modems that register using DOCSIS 2.0 S-CDMA modulation profiles.

---

**Note** The DOCSIS 3.0 option **scdma-d3** (4SR) is available only when the CMTS is configured to operate in the global modulation profile format and is not available in the default mode. This option is available only for the Cisco UBR-MC20X20V cable interface line card, and not for other legacy line cards.

---

Refer to the **cable upstream channel-width** command for valid values of supported channel widths and DOCSIS modes for cable interfaces.

---

**Note** Changing the DOCSIS Mode for an Upstream Port Forces the Cable Modems on That Upstream to Go Offline and Reregister

---

When you switch the DOCSIS mode of an upstream between the TDMA-only and mixed TDMA/A-TDMA modes, cable modems that are currently online on that upstream are taken offline and are forced to reregister. This helps the CMTS to determine the capabilities of the cable modems on the new channels.

If you change an upstream port to A-TDMA only mode, DOCSIS 1.x cable modems will not be able to come online on that upstream. If you change an upstream to TDMA only mode, DOCSIS 2.0-compliant cable modems are expected to attempt to come online on another upstream that is configured for A-TDMA or mixed mode. If no such upstreams are configured, or if the cable modem is configured to use only that particular upstream, it comes online in the DOCSIS 1.x mode.

**Note** DOCSIS 2.0-compliant cable modems that are already online on a TDMA-only upstream do not automatically reregister on another upstream that has been configured for mixed-mode operations. The cable modem must either be reset or the CMTS must send an Upstream Channel Change (UCC) message to instruct the cable modem to move to the new channel.

If you change an upstream port to the mixed TDMA/A-TDMA mode, and some cable modems remain offline, or appear to come online but cannot pass traffic, upgrade the modem software to a DOCSIS-compliant software version.

**Note** The cable physical plant must support the higher upstream bandwidths and symbol rates to be able to use the A-TDMA or mixed mode modulation profiles.

## Examples

The following example configures the first four upstreams for the first downstream on the Cisco uBR-MC28U/X cable interface line card in slot 5/0. The first two upstreams are configured for A-TDMA mode and the last two upstreams are configured for mixed TDMA/A-TDMA mode.

```
Router# configure terminal
Router(config)# interface cable 5/0/0
Router(config-if)# cable upstream 0 docsis-mode atdma

%%Docsis mode set to ATDMA only, 1.x CMs will go offline.
%%The following defaults will be set:
%%Channel Width 6.4MHz
%%Minislot Size 1 tick
%%Modulation Profile 241
Router(config-if)# cable upstream 1 docsis-mode atdma

%%Docsis mode set to ATDMA only, 1.x CMs will go offline.
%%The following defaults will be set:
%%Channel Width 6.4MHz
%%Minislot Size 1 tick
%%Modulation Profile 241
Router(config-if)# cable upstream 2 docsis-mode tdma-atdma

%%Docsis mode set to DOCSIS2.0 Mixed Mode.
Router(config-if)# cable upstream 3 docsis-mode tdma-atdma

%%Docsis mode set to DOCSIS2.0 Mixed Mode.
Router(config-if)# exit

Router(config)# exit

Router#
```

The following example shows the abbreviations needed to configure TDMA-only and mixed TDMA/A-TDMA modes.

```
Router# configure terminal
Router(config)# interface cable 4/0
Router(config-if)# cable upstream 0 docsis-mode tdm
%%Docsis mode set to DOCSIS1.0 TDMA Mode.
Router(config-if)# cable upstream 1 docsis-mode tdma-
```

```
%%Docsis mode set to DOCSIS2.0 Mixed Mode.
Router(config-if)#
```

The following examples configures the SCDMA and SCDMA-d3 modes.

```
Router# configure terminal
Router(config-if)# cable upstream 0 docsis-mode scdma

%interface Cable7/1/0 U0 Docsis mode set to DOCSIS2.0 SCDMA
%modulation profile set to 321
Router(config-if)#
Router# configure terminal
Router(config-if)# cable upstream 0 docsis-mode scdma
-d3
%interface Cable7/1/0 U0 Docsis mode set to DOCSIS3.0 SCDMA (1.x and 2.0 CMs wi)
%modulation profile set to 381
Router(config-if)#
SLOT 7/1: Jul 10 22:04:24.356: %UBR10000-6-PREAMLENADJUST: initial burst's prea.
SLOT 7/1: Jul 10 22:04:24.356: %UBR10000-6-PREAMLENADJUST: station burst's prea.
Router(config-if)# end
```

#### Related Commands

Command	Description
<b>cable modulation-profile</b>	Defines a modulation profile for use on the router.
<b>cable modulation-profile global-scheme</b>	Defines a global modulation profile for use on the router.
<b>cable upstream channel-width</b>	Specifies an upstream channel width for an upstream port.
<b>cable upstream equalization-coefficient</b>	Enables the use of a DOCSIS 1.1 pre-equalization coefficient on an upstream.
<b>cable upstream maintain-psd</b>	Requires DOCSIS 2.0 CMs on an A-TDMA-only upstream to maintain a constant power spectral density after a modulation rate change.
<b>cable upstream modulation-profile</b>	Assigns one or two modulation profiles to an upstream port.
<b>show cable modulation-profile</b>	Displays the modulation profile information for a Cisco CMTS.
<b>show interface cable mac-scheduler</b>	Displays the current time-slot scheduling state and statistics.

## cable upstream dpon

To enable the DOCSIS Passive Optical Network (DPON) for a MAC domain on the Cisco CMTS router, use the **cable upstream dpon** command in interface configuration mode. To disable one or more DPONs for the MAC domains, use the **no** form of this command.

**cable upstream dpon**  
**no cable upstream dpon**

### Syntax Description

This command has no arguments or keywords.

### Command Default

D-PON is not enabled.

### Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.OS	This command is implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Configuring D-PON for a MAC domain enables D-PON for all MAC domains on that line card. However, only a single MAC domain can be used within a D-PON fiber node. This is to ensure proper scheduling of the upstream and to prevent multiple Optical Network Terminals (ONTs) from transmitting upstream data at the same time.

**Note** On cBR Series Converged Broadband Routers, when the **cable upstream dpon** command is configured for a specific MAC domain or interface, it is localized to that MAC domain or interface alone.

You should configure the **cable upstream ranging-init-technique 2** command to prevent the use of additional broadcast initial ranging opportunities for the non-DPON reference upstream channels.

When you shutdown an upstream channel, the D-PON associated with that MAC domain will stop working. To enable D-PON again, you must manually shut down and enable the MAC domain using the **shutdown** and **no shutdown** command.

### Examples

The following example shows how to enable D-PON on a Cisco CMTS router:

```
Router# configure terminal
Router(config)# interface cable 7/0/1
Router(config-if)# cable upstream dpon
```

```
Router(config-if)# shutdown
Router(config-if)# no shutdown
```

**Related Commands**

Command	Description
<b>cable upstream ranging-init-technique</b>	Configures the initial ranging technique for the modem in the MTC-mode.
<b>interface cable</b>	Specifies a cable interface.
<b>show interface cable mac-scheduler</b>	Displays the current time-slot scheduling state and statistics.

## cable upstream dps

To enable DOCSIS Predictive Scheduler (DPS) on a MAC domain, use the **cable upstream dps** command in cable interface configuration mode.

**cable upstream dps** { **scqam-only** | **ofdma-only** | **all** }

**no cable upstream dps** { **scqam-only** | **ofdma-only** | **all** }

Keyword	Description
<b>scqam-only</b>	Enables DPS for scqam only.
<b>ofdma-only</b>	Enables DPS for ofdma only.
<b>all</b>	Enable sDPS for scqam and ofdma.

### Command Default

DPS is in disabled state by default.

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1z	You can configure the <b>cable upstream dps ofdma-only</b> command without configuring the <b>service internal</b> command in global configuration mode.
IOS XE Amsterdam 17.3.1w	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure DPS on a MAC domain:

```
Router> enable
Router# configure terminal
Router(config)# interface Cable 7/0/1
Router(config-if)# cable upstream dps scqam-only
```

# cable upstream equalization-coefficient

To enable the use of a DOCSIS 1.1 or 2.0 pre-equalization coefficient on an upstream port, use the **cable upstream equalization-coefficient** command in cable interface configuration mode. To disable the use of the pre-equalization coefficient, use the **no** form of this command.

**cable upstream *n* equalization-coefficient**  
**no cable upstream *n* equalization-coefficient**

<b>Syntax Description</b>	<i>n</i> Specifies the upstream port number. Valid range is from 0 to 7 for upstream ports in the cable interface line card.
---------------------------	------------------------------------------------------------------------------------------------------------------------------

**Command Default** Pre-equalization coefficient is disabled.

**Command Modes** Interface configuration (config-if)

Release	Modification														
12.2(4)BC1	This command was introduced.														
12.2(15)CX	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line card, including DOCSIS 2.0 A-TDMA and mixed modulation profiles.														
12.2(15)BC2	Support was added for DOCSIS 2.0 A-TDMA and mixed modulation profiles on the Cisco uBR-MC5X20S/U cable interface line cards.														
12.3(23)BC6	Support was added for updated default modulation profiles for use with pre-equalization on the Cisco uBR-MC5X20S/U/H cable interface line cards.														
12.2(33)SCB	Support was added for updated default modulation profiles for use with pre-equalization on the Cisco uBR-MC5X20S/U/H cable interface line cards.														
IOS-XE 3.15.OS	This command was replaced by the <b>us-channel equalization-coefficient</b> command.														

**Usage Guidelines** The DOCSIS 1.1 and 2.0 specifications allow a CMTS to specify a pre-equalization coefficient in the DOCSIS ranging response (RNG-RSP) MAC management messages it forwards to the cable modems (CM)s. When this is enabled, a CM can engage in transmit-side equalization (pre-equalization) to mitigate the effects of certain impairments in the cable plant, such as in-channel tilt, and group delay.

These impairments are more significant with higher order modulation formats such as 64-QAM or 16-QAM, and near the first octave break-point of the diplex filters (34 MHz to 38 MHz). This break-point exists predominantly as a time-domain group delay issue, and becomes severe for longer amplifier cascades.

Each amplifier causes the DOCSIS upstream signal to traverse two diplex filters. All diplex filter frequency splits (5-42 MHz, 5-65 MHz, or 5-88 MHz) share this characteristic, which is not visible in a frequency response measurement or sweep test.

For more information about the use of pre-equalization, see the DOCSIS 2.0 RFI specification section 6.2.15, Transmit Pre-Equalizer, and section 8.3.6 Ranging Response (RNG-RSP) MAC Management Messages.

DOCSIS 1.1 specifies the Type 4 type length value (TLV), and an 8-tap equalizer. DOCSIS 2.0 adds the Type 9 TLV, and increases the equalizer to support 24 taps to compensate for more complex impairments.

The **cable upstream equalization-coefficient** command configures the CMTS to send Type 4 TLV or Type 9 TLVs in the DOCSIS RNG-RSP MAC management messages to the CMs.

The **no** form of the command disables the CMTS from sending Type 4 TLV or Type 9 TLVs in the DOCSIS RNG-RSP MAC management messages to the CMs.

After the CMTS stops sending pre-equalization TLVs to the CM, the CM must retain these values until the modem's cable interface resets, or a modification is made to the upstream channel descriptor (UCD), which would make the stored equalization coefficients invalid.

You can reset the cable modem's interface by:

- Power cycling the cable modem
- Resetting the cable modem from the CMTS using the **clear cable modem** command

```
Router# clear cable modem aaaa.bbbb.cccc reset
```

You can reset the equalizer coefficient of all CMs on an upstream by:

- Changing the upstream center frequency. A 16-kHz or 32-kHz change is sufficient and unlikely to take many CMs offline.
- Briefly changing the periodic ranging messages in the modulation profile between 16-QAM and Quadrature Phase Shift Keying (QPSK), or 64-QAM and 16-QAM.

A CMTS operating in a pure DOCSIS 2.0 upstream mode sends equalizer data supporting 24 taps to all modems during initial ranging.

The **cable up 0 docsis-mode atdma** command configures a DOCSIS 2.0-only upstream mode on the CMTS.

A CMTS operating in a DOCSIS 1.1 or mixed TDMA-ATDMA upstream mode sends equalizer data supporting 8 taps to all modems during initial ranging. The CMTS cannot send data supporting 24 taps until it is notified by the CM, that it is DOCSIS 2.0 compliant in the Registration Request (REG-REQ) message, immediately preceding the online state.

This can be configured on the CMTS using the **cable up 0 docsis-mode tdma-atdma** command.

When a CM receives a Type 4 TLV in the RNG-RSP MAC management message from the CMTS, it must combine the previously stored values with the new values from the CMTS. Under certain HFC plant conditions, a dynamic impairment occurs that require the CM to adjust its main equalizer tap. The DOCSIS standard specifies a convolution function that is sometimes unable to adjust for dynamic impairments. The result, is a CM whose signal-to-noise ratio (SNR) value as received by the CMTS, is quite low compared to other CMs on the same upstream.

In a mixed modulation profile, where station maintenance is of a lower order modulation format than the data grants, it is possible for the modem to enter a steady state where the SNR estimate is:

- Below the required estimate for data grants to be processed by the CMTS
- Above the requirement for station maintenance

This results in a modem that responds to DOCSIS Layer 2 pings, but not to Layer 3 traffic. The following commands can be used to check status:

- **ping docsis** {*cm-mac address* | *cm ip address*}—succeeds
- **ping ip** {*cm IP address* | *CPE IP address*}—fails

A cable modem whose SNR estimate is in this condition may enter the expired(pt) state when baseline privacy interface plus (BPI+) is enabled. A modulation profile where station maintenance and data grants are of the same order modulation, prevents this condition.

The CMTS may be configured to enable cable upstream pre-equalization on a per upstream port basis, and may be configured to disable the sending of upstream equalization-coefficients on a per modem MAC address or Organizational Unique Identifier (OUI) basis, using the related global exclude commands.

Some DOCSIS 2.0 compliant CMs / embedded media terminal adapters (EMTA)s have been known to report as DOCSIS 1.1 compliant to the CMTS, unless connected to a DOCSIS 2.0 format upstream. These CMs are treated by the CMTS as DOCSIS 1.1, and only send 8-tap equalizer coefficients. A firmware or SNMP set may be used on these cable modems to enable the proper reporting of DOCSIS 2.0 compliance under a DOCSIS 1.1-style upstream (for example, 3.2 MHz, 16-QAM, TDMA format).

Some older DOCSIS cable modem firmware versions will incorrectly process the transition from 8 to 24 taps when in a mixed TDMA-ATDMA mode, and will experience degrading or low SNR MER as displayed with **show cable modem phy command**. Upgrade the CM firmware, and temporarily move these modems to a pure DOCSIS 1.1 or 2.0 channel or disable pre-equalization for these devices with the exclude command.

## Examples

The example shows how to enable the use of the pre-equalization coefficient on upstream port 0 in the cable interface line card in slot 5/1 on the Cisco uBR10012 router, while excluding the equalization coefficient messaging to a modem with MAC address aaaa.bbbb.cccc, and all modems with the OUI of 00aa.bb:

```
Router# configure terminal
Router# cable pre-equalization exclude aaaa.bbbb.cccc
Router# cable pre-equalization exclude 00aa.bb
Router(config)# interface cable 5/1/0
Router(config-if)# cable upstream 0 equalization-coefficient
Router(config-if)#
```

## Related Commands

Command	Description
<b>show cable modem phy</b>	Displays the physical layer RF parameters of the cable modem, including USSNR estimate (MER).
<b>show cable modem docsis version</b>	Displays the DOCSIS version of a cable modem, and the upstream DOCSIS mode— TDMA or ATDMA.
<b>show cable modem [verbose]</b>	Displays detailed information about the cable modem. Lines with the string Equalizer describe modem specific equalizer data.
<b>debug cable range</b>	Debugging commands to display the equalizer coefficients being sent by the CMTS to the cable modem in the DOCSIS RNG-RSP MAC management messages.
<b>debug cable interface</b> {interface} {cm-mac-address}[verbose]	Debugging commands to display the equalizer coefficients being sent by the CMTS to the cable modem in the DOCSIS RNG-RSP MAC management messages.  <b>Caution</b> Certain debug settings can produce a very large amount of data on a production router, and should be used with caution. Specifying the CM mac-address will dramatically reduce the amount of data produced.

# cable upstream equalization-error-recovery

To enable the pre-equalizer direct load mechanism on an upstream port, use the **cable upstream equalization-error-recovery** command in cable interface configuration mode.

**cable upstream** *port number* **equalization-error-recovery**  
**no cable upstream** *port number* **equalization-error-recovery**

<b>Syntax Description</b>	<i>port number</i> Specifies an upstream port number on a cable interface. Valid range is from 0 to 7.
---------------------------	--------------------------------------------------------------------------------------------------------

**Command Default** This command is enabled by default.

**Command Modes** Interface configuration (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.3(23)BC7	This command was introduced.
	12.2(33)SCB4	This command was integrated into Cisco IOS Release 12.2(33)SCB4.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The pre-equalizer direct load mechanism is enabled by default. However, to use this direct load mechanism, you must enable the pre-equalization coefficient on an upstream port using the **cable upstream equalization-coefficient** command.

The **cable upstream equalization-error-recovery** command enables the CMTS to send Type-Length-Value (TLV) Type 9 in the DOCSIS RNG-RSP MAC management messages. This mechanism helps CMs come online when TLV Type 4 convolved method causes CMs to go offline.

**Note** The TLV Type 9, called pre-equalizer direct load, supports only the DOCSIS 2.0 or 3.0-certified modems. When a CM receives TLV Type 9, the CM replaces its data with the new data provided in the DOCSIS RNG-RSP MAC management messages.

## Examples

The example shows how to enable the pre-equalizer direct load mechanism on a cable interface line card in slot 8/0 on the Cisco uBR10012 router.

```
Router# configure terminal
Router(config)# interface cable 8/0/0
Router(config-if)# cable upstream 0 equalization-error-recovery
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show cable modem</b>	Displays information for the registered and unregistered CMs.

Command	Description
<b>cable upstream equalization-coefficient</b>	Enables the use of a DOCSIS 1.1 or 2.0 pre-equalization coefficient on an upstream port.
<b>show cable modem calls</b>	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.

## cable upstream ext-power

To enable the DOCSIS extended transmit power support on the Cisco CMTS, use the **cable upstream ext-power** command in interface configuration mode. To disable DOCSIS extended transmit power support, use the **no** form of this command.

**cable upstream ext-power**  
**no cable upstream ext-power**

### Syntax Description

This command has no arguments or keywords.

### Command Default

DOCSIS extended transmit power support is enabled.

### Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(33)SCF2	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable upstream ext-power** command is used to configure the following feature:

- [Upstream Channel Bonding](#)

### Examples

The following example shows how to enable DOCSIS extended transmit power support on the Cisco CMTS:

```
Router# configure terminal
Router(config)# interface cable 7/0/0
Router(config-if)# cable upstream ext-power
Router(config-if)# end
```

### Related Commands

Command	Description
<b>show cable modem extended-power</b>	Displays the list of cable modems that are transmitting at an extended power level.

# cable upstream fec

To enable upstream forward error correction (FEC), use the **cable upstream fec** command in cable interface configuration mode. To disable FEC, use the **no** form of this command.

**cable upstream *n* fec**  
**no cable upstream *n* fec**

## Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
----------	-----------------------------------------------------------------------------------------------------------------------------

## Command Default

Enabled

## Command Modes

Interface configuration (cable interface only)

## Command History

Release	Modification
11.3 XA	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The Cisco CMTS uses FEC to attempt to correct any upstream data that might have been corrupted. To use this feature, you need to activate FEC on the upstream RF carrier. When FEC is activated, the Cisco CMTS commands all CMs on the network to activate FEC.

## Examples

The following example shows how to activate upstream forward error correction:

```
Router (config-if)# cable upstream 0 fec
```

## Related Commands

Command	Description
<b>cable upstream frequency</b>	Enters a fixed frequency of the upstream RF carrier for an upstream port.
<b>cable upstream power-level</b>	Sets the input power level for the upstream RF carrier in decibels per millivolt (dBmV).
<b>cable upstream scrambler</b>	Enables the cable upstream scrambler.
<b>cable upstream shutdown</b>	Disables the upstream port.

## cable upstream fec-strength

To override the forward error correction (FEC) setting specified in the modulation profile for this upstream channel, use the **cable upstream fec-strength** command in cable interface configuration mode. To restore the default value, use the **no** form of this command.

**cable upstream** *n* **fec-strength** *t-bytes*  
**no cable upstream** *n* **fec-strength**

Syntax Description	
<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>t-bytes</i>	Overrides the FEC strength specified in the modulation profile for this upstream channel. Valid values are from 0 to 10, where: <ul style="list-style-type: none"> <li>• 0 disables FEC.</li> <li>• 1 is the lowest FEC strength.</li> <li>• 10 is the highest FEC strength.</li> </ul>

**Command Default** No default behavior or values

**Command Modes** Interface configuration (cable interface only)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	12.1T	This command was deprecated and removed.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Examples** The following example shows how to configure the **cable upstream fec-strength** command:

```
Router(config-if)# cable upstream 2 fec-strength 3
```

Related Commands	Command	Description
	<b>cable upstream channel-width</b>	Specifies an upstream channel width for a headend cable router.
	<b>cable upstream fec</b>	Enables the upstream FEC.
	<b>cable upstream hopping blind</b>	Disables optimum frequency hopping on the Cisco uBR-MC16S and Cisco uBR-MC5X20S/U cable interface line cards.
	<b>cable upstream modulation-profile</b>	Overrides modulation types specified in the modulation profile for the specified upstream channel.

# cable upstream fragmentation

To enable fragmentation of DOCSIS frames on a particular upstream, use the **cable upstream fragmentation** command in cable interface configuration mode. To disable fragmentation, use the **no** form of this command.

**cable upstream *n* fragmentation**  
**no cable upstream *n* fragmentation**

## Syntax Description

*n* Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 15.

## Command Default

By default, fragmentation is enabled for all upstream ports on ASIC line cards (Cisco uBR-MC11C, Cisco uBR-MC12C, Cisco uBR-MC14C, Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C) and disabled for all upstream ports on old FPGA line cards.

**Note** Cisco IOS Release 12.1 CX supports the Multiple Grant Mode of DOCSIS 1.1 fragmentation.

## Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.1(4)CX	This command was introduced.
12.2(4)BC1	Support for this command was added to the Release 12.2 BC train.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command enables and disables DOCSIS layer 2 fragmentation, which reduces run-time jitter experienced by constant bit rate (CBR) slots on the corresponding upstream. Disabling fragmentation increases the run-time jitter, but also reduces the fragmentation reassembly overhead for fragmented MAC frames. For ports running CBR traffic, fragmentation should be enabled (the default).

**Note** Do not confuse DOCSIS Layer 2 fragmentation with IP Layer 3 fragmentation.

## Examples

The following command shows DOCSIS fragmentation being enabled on upstream 0 on the cable interface in slot 2/0:

```
Router# configure terminal
Router(config)# interface c2/0
Router(config-if)# cable upstream 0 fragmentation
Router(config-if)#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable default-phy-burst</b>	Specifies a value for the upstream Maximum Traffic Burst parameter for CMs that do not specify their own value.
<b>cable upstream fragment-force</b>	Specifies that a cable interface line card should fragment DOCSIS frames on an upstream when the frame exceeds a particular size.

## cable upstream fragment-force

To specify that a cable interface line card should fragment DOCSIS frames on an upstream when the frame exceeds a particular size, use the **cable upstream fragment-force** command in cable interface configuration mode. To set the fragment size to its default value, use the **no** form of this command.

**cable upstream *n* fragment-force** [*fragment-threshold* [*number-of-fragments*]]  
**no cable upstream *n* fragment-force**

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 15.
<i>fragment-threshold</i>	(Optional) Number of bytes for the threshold at which DOCSIS frames are fragmented. The valid value ranges from 1,500 to 3,500 bytes, with the default value of 2,000 bytes.  For Cisco uBR10-MC5X20S cable interface line card running Cisco IOS Release 12.3(23)BC1, the valid value ranges from 0 to 1,987 bytes, with the default value of 1,600 bytes.
<i>number-of-fragments</i>	(Optional) Number of fragments that the cable interface line card should create when fragmenting DOCSIS frames. The card attempts to create this many equal-sized fragments when fragmenting. The valid value ranges from 1 to 10 fragments, with the default value of 3 fragments.  The <i>number-of-fragments</i> option has been deprecated. See Usage Guidelines section for more details.

### Command Default

- Default value for *fragment-threshold* is 2,000 bytes.
- For Cisco uBR10-MC5X20S cable interface line card running Cisco IOS Release 12.3(23)BC1, default value for *fragment-threshold* is 1,600 bytes.

### Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.2(15)BC2	This command was introduced.
12.3(21a)BC	This command was modified and the <i>number-of-fragments</i> option has been deprecated.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

DOCSIS 1.1 allows the CMTS to fragment DOCSIS frames to improve performance, especially in networks that combine real-time traffic, such as voice, with data traffic. The **cable upstream fragment-force** command

allows you to specify the size of frames that should be fragmented, as well as the number of fragments that should be created when fragmenting.

**Tip** This command takes effect only when fragmentation has been enabled on the upstream using the **cable upstream fragmentation** command (which is the default configuration). Whether fragment is enabled or not, is decided by the **cable upstream fragmentation** command.

In the default configuration, the Cisco CMTS fragments DOCSIS frames that are 2,000 bytes or larger in size, and it fragments these frames into equally-sized fragments. Starting from Cisco IOS Release 12.2(21a)BC, 12.2(33)SCB, and later releases, the larger frames are fragmented by the threshold. Instead of dividing frames into equal number of fragments as before, the concatenated frames are cut into many fragments, as defined in the threshold size, with the last one being the shortest. For example, the previous form of the **cable upstream fragment-force** command fragments a concatenated frame of 9000 into 5 frames of 1800. The new form of the **cable upstream fragment-force** command fragments a concatenated frame of 9000 into frames of 2000, 2000, 2000, and 1000.

Do not use a fragment size greater than 1,600 bytes on the Cisco uBR10-MC5X20S cable interface line card running Cisco IOS Release 12.3(23)BC1. Do not use a fragment size greater than 2,000 bytes on the Cisco uBR10-MC5X20U cable interface line card, and do not use a fragment size greater than 3,500 bytes on all other cable interface line cards, unless otherwise instructed by a Cisco TAC engineer.

When using DOCSIS concatenation, you might need to change the **cable default-phy-burst** command from its default size, so that multiple frames can be concatenated into a maximum-sized burst. If you set the **cable default-phy-burst** command to zero, the max burst then becomes the lowest of 255 mini-slots, the maximum concatenated burst setting in the DOCSIS configuration file, or the value of the long data grant burst that is specified in the upstream's profile.

When you set the **cable default-phy-burst** command to zero, the CMTS fragments large requests into big chunks and the cable modems will not be able to register on specific groupings of upstream interfaces due to the large fragment size. We recommend the use of a fragment size of 2,000 bytes, if you want to set the **cable default-phy-burst** command to zero to provide upstream speed of above 5 Mbps.

**Caution** Ensure that the *number-of-fragments* parameter is large enough to keep the size of each fragment of a maximum-sized burst less than the 1,600 bytes or 2,000 bytes or 3,500 bytes specified above. If fragments are too large, the cable modem might not be able to come online or pass traffic.

**Note** The *number-of-fragments* option has been deprecated from Cisco IOS Release 12.2(21a)BC, 12.2(33)SCB, and later releases.

**Note** Do not confuse DOCSIS Layer 2 fragmentation with IP Layer 3 fragmentation.

## Examples

The following example shows how to enable DOCSIS fragmentation on frames that are 1,500 bytes or larger, using four fragments per frame:

```
Router# configure terminal
Router(config)# interface c2/0
Router(config-if)# cable upstream 0 fragment-force 1500 4
Router(config-if)#
```

The following example shows how to disable the forced fragmentation of DOCSIS frames on an upstream. This also resets the *fragment-threshold* parameter to default value.

```
Router# configure terminal
Router(config)# interface c5/1/0
Router(config-if)# no cable upstream 0 fragment-force
Router(config-if)#
```

### Cisco IOS Release 12.2(21a)BC, 12.2(33)SCB and Later

The following example shows how to enable DOCSIS fragmentation on frames that are 2,000 bytes or larger:

```
Router# configure terminal
Router(config)# interface c2/0
Router(config-if)# cable upstream 0 fragment-force 2000
Router(config-if)#
```

#### Related Commands

Command	Description
<b>cable default-phy-burst</b>	Specifies a value for the upstream Maximum Traffic Burst parameter for CMs that do not specify their own value.
<b>cable upstream fragmentation</b>	Enables fragmentation of DOCSIS frames on a particular upstream.

## cable upstream freq-adj averaging

To specify the percentage of frequency adjustment packets that is required to change the adjustment method from the regular power-adjustment method to the noise power-adjustment method, use the **cable upstream freq-adj averaging** command in cable interface configuration mode. To disable power adjustments, use the **no** form of this command.

**cable upstream *n* freq-adj averaging % of frequency adjustment**  
**no cable upstream *n* freq-adj averaging**

Syntax Description		
	<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 15.
	<i>% of frequency adjustment</i>	Specifies the percentage of frequency-adjustment packets required to switch from the regular power-adjustment method to the noise power-adjustment method. Valid range is from 10 to 100 percent.

**Command Default** No default behavior or values

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	12.0(7)T	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to change the power-adjustment method when the frequency-adjustment packet count reaches 50 percent:

```
Router(config-if)# cable upstream 0 freq-adj averaging 50
```

Related Commands	Command	Description
	<b>cable upstream power-adjust</b>	Controls power-adjustment methods on the Cisco CMTS.
	<b>show cable flap-list</b>	Displays a list of CMs that have exceeded the threshold number of power adjustments.
	<b>show cable modem</b>	Displays CM configuration settings.

## cable upstream frequency

To enter a fixed frequency of the upstream radio frequency (RF) carrier for an upstream port, use the **cable upstream frequency** command in cable interface configuration mode. To restore the default value for this command, use the **no** form of this command.

```
cable upstream n frequency up-freq-hz
no cable upstream n frequency up-freq-hz
```

### Syntax Description

<i>n</i>	Specifies the upstream port number on the cable interface line card for which you want to assign an upstream frequency. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>up-freq-hz</i>	The upstream center frequency is configured to a fixed Hertz (Hz) value. The valid upstream frequency range is 5 MHz (5000000 Hz) to 42 MHz (42000000 Hz), 55 MHz (55000000 Hz), or 65 MHz (65000000 Hz), depending on the cable interface line card being used. If you wish to have the Cisco CMTS dynamically specify a center frequency for the given upstream interface, do not enter any frequency value.

For D30 CMs, the upstream path selection will look at CM Capability TLV 5.20 to determine the upstream frequency range supported by the CM. The frequency range can either be Standard (5MHz to 42MHz), or Extended (5MHz to 85MHz). This new configuration is intended to be used by customers who are configuring US spectrum above 42MHz. The configuration ensures that only the D30 CMs supporting Standard US frequency range are excluded from US channels above 42Mhz.

```
cable us-freq-use-cm-cap
no cable us-freq-use-cm-cap
```

The default value of the config is **no cable us-freq-use-cm-cap**. Therefore, by default there is no change in behavior.

### Command Default

Dynamic (not fixed frequency)

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
11.3 XA	This command was introduced.
12.0(13)SC	Support for the higher EuroDOCSIS upstream range (5 to 65 MHz) was introduced for the Cisco uBR-MC16E cable interface line card.
12.1(4)EC, 12.2(4)BC1	Support for the higher EuroDOCSIS upstream range (5 to 65 MHz) was introduced for the Cisco uBR7111E and Cisco uBR7114E routers.
12.2(15)BC2	The allowable range of frequencies that you can select with this command is determined by the configuration of the <b>upstream freq-range</b> command.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel frequency</b> command.

**Usage Guidelines**

The upstream channel frequency of your RF output must be set to comply with the expected input frequency of your cable interface line card. To configure an upstream channel frequency, you may:

- Configure a fixed frequency between the allowable ranges and enable the upstream port, or
- Create a global spectrum group, assign the interface to it, and enable the upstream port.

The allowable range for the upstream channel frequency depends on the cable interface line card and Cisco IOS software release being used. The following table provides the currently supported values.

**Table 19: Allowable Frequency Range for the cable upstream frequency Command**

Frequency Range	Supported Cable Interfaces	Minimum Cisco IOS Releases
5 to 42 MHz	All supported cable interfaces	All releases supported for the Cisco CMTS
5 to 55 MHz	Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, Cisco uBR-MC5X20U	Cisco IOS Release 12.2(15)BC2
5 to 65 MHz	Cisco uBR-MC16E, Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, Cisco uBR-MC5X20U, Cisco uBR7111E and Cisco uBR7114E routers	Cisco IOS Release 12.0(13)SC, 12.1(4)EC, and 12.2(4)BC1

**Note** In Cisco IOS Release 12.2(15)BC2 and later releases, the allowable range of frequencies that you can select with the **cable upstream frequency** command is determined by the configuration of the **upstream freq-range** command.

**Tip** If both a Cisco uBR-MC16E cable interface line card and a Cisco uBR-MC16C and/or a Cisco uBR-MC16S cable interface line card are present in the chassis, a spectrum group in the 42 MHz to 65 MHz range should not be assigned.

To configure the default upstream frequency (which is no fixed frequency), enter the **cable upstream n> frequency** command without specifying a center frequency.

**Examples**

The following example shows how to configure the upstream center frequency for port 0, located in slot 6, to 5,700,000 Hz:

```
Router(config-if)# cable upstream 0 frequency 5700000
Router(config-if)# exit
Router(config)# exit
Router# show running-config | include frequency
cable upstream 0 frequency 5696000

Router#
```

**Note** Cisco cable interface line cards always program the upstream's center frequency in 16 KHz increments, and this is the frequency displayed by the lines added to the router's configuration and by the **show controllers cable upstream** command. For example, if you use the **cable upstream frequency** command to specify a center frequency of 27 MHz (**cable upstream x frequency 27000000**), the actual center frequency will be 27.008 MHz, which is the next highest 16 KHz boundary. The configuration file will therefore show the line **cable upstream 0 frequency 27008000**.

The following example shows how to configure the upstream center frequency to a frequency (54,700,000 Hz) within the extended Japanese frequency range:

```
Router# configure terminal
Router(config)# upstream freq-range japanese
Router(config)# interface cable 3/0
Router(config-if)# cable upstream 0 frequency 54000000
Router(config-if)# exit
Router(config)# exit
Router#
```

The following example shows how to allow the Cisco CMTS to dynamically specify a center frequency for the upstream port 0:

```
Router(config-if)# no cable upstream 0 frequency
```

The following command example from Cisco IOS Release 12.3 BC illustrates the allowable upstream frequency range in Hz:

```
Router(config-if)# cable upstream 3 frequency ?
<5000000-55000000> Upstream Frequency in Hz
```

#### Related Commands

Command	Description
<b>cable spectrum-group (global configuration)</b>	Creates spectrum groups, which contain one or more upstream frequencies.
<b>show controllers cable</b>	Displays information about the cable interface, including the upstream center frequency.
<b>upstream freq-range</b>	Configures the Cisco CMTS router for the range of frequencies that are acceptable on upstreams.

# cable upstream hopping blind

To override hop decisions, use the **cable upstream hopping blind** command in cable interface configuration mode. To stop blind hopping, enter the **no** form of this command.

**cable upstream *n* hopping blind**  
**no cable upstream *n* hopping blind**

## Syntax Description

<i>n</i>	Specifies the upstream port for which blind frequency hopping will be activated. Valid values start with 0 for the first upstream port on the cable interface line card.
----------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

Disabled (hopping is optimized)

## Command Modes

Interface configuration (cable interface only)

## Command History

Release	Modification
12.0(7)XR2	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Enter this command to override the hardware spectrum manager's decision to optimize hopping.

**Note** Do not use this command unless you have a specific reason to disable optimum hopping configurations. For example, if you are experimenting with a Cisco uBR-MC16S or Cisco uBR-MC5X20S/U card, you can use this command to enforce blind hopping on individual upstream channels.

## Examples

The following example shows how to specify hopping blind on the upstream port 0:

```
Router(config-if)# cable upstream 0 hopping blind
```

## Related Commands

Command	Description
<b>cable monitor</b>	Configures preset modulation profiles that you can apply to one or more upstream cable interfaces when you identify and configure spectrum groups.
<b>cable spectrum-group (global configuration)</b>	Configures spectrum management characteristics for the given spectrum group.
<b>cable upstream channel-width</b>	Specifies the channel width of the given upstream cable interface.
<b>cable upstream frequency</b>	Specifies the center frequency for a given upstream cable interface.

Command	Description
<b>cable upstream power-level</b>	Specifies the upstream cable interface receive power level in dBmV.
<b>cable upstream shutdown</b>	Activates or shuts down a specified upstream cable interface.

## cable upstream hop-priority

To configure the priority of the corrective actions to be taken when a frequency hop is necessary due to ingress noise on the upstream, use the appropriate **cable upstream hop-priority** command in cable interface configuration mode.

```
cable upstream n hop-priority frequency modulation channel-width
cable upstream n hop-priority modulation frequency channel-width
cable upstream n hop-priority frequency channel-width modulation
```

### Syntax Description

<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
<b>frequency, modulation, channel-width</b>	Specifies the priority of corrective actions to be taken when ingress noise occurs on a downstream.  <b>Note</b> The <b>channel-width</b> option must come after the <b>frequency</b> option, either immediately or after the <b>modulation</b> option, as shown in the above examples.

### Command Default

The default priority is **frequency, modulation, and channel-width**.

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
12.1(7)CX1	This command was introduced for Cisco uBR7200 series routers using the Cisco uBR-MC16S cable interface line card.
12.2(8)BC2	Support was added for the Cisco uBR10012 router and the Cisco uBR-LCP2-MC16S cable interface line card.
12.2(11)CY, 12.2(11)BC3	Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.
12.2(15)BC2	Support was added for the Cisco uBR10-MC5X20U cable interface line card on the Cisco uBR10012 router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel hop-priority</b> command.

### Usage Guidelines

This command specifies the priority of the corrective actions that should be taken when a frequency hop is necessary to correct excessive ingress noise on an upstream. For example, if the upstream on a Cisco uBR-MC16S card is set for the default settings (**frequency, modulation, and channel-width**), the following occurs when the upstream noise exceeds the CNR threshold value for the current modulation profile:

1. The Cisco uBR-MC16S changes to a new frequency, if a clean frequency is available in its spectrum group.

2. If no clean frequency is available, the Cisco uBR-MC16S uses the Dynamic Upstream Modulation feature to switch the upstream to the secondary modulation profile.
3. If the noise levels still exceed the CNR threshold value for the secondary modulation profile, and if the upstream has been configured for a range of channel widths, the Cisco uBR-MC16S narrows the channel width of the upstream by half. If the noise levels are still excessive, the channel width is again cut in half, and this process continues until a clean upstream is found or the bandwidth is reduced to the minimum channel width that has been configured using the **cable upstream channel-width** command.

Allowable DOCSIS channel widths are 3.2 MHz, 1.6 MHz, 800 KHz, 400 KHz, and 200 KHz. If the channel width drops to 200 KHz, but the noise still exceeds the SNR threshold, the CMs go offline.

**Note** The default specifies only a single channel width of 1.6 MHz. If this is not changed to specify a range of allowable channel widths (using the **cable upstream channel-width** command), the Cisco uBR-MC16S does not attempt to change the channel width.

To use the Dynamic Upstream Modulation feature, you must first create two modulation profiles (using the **cable modulation-profile** command) and assign them to the upstream (using the **cable upstream modulation-profile** command).

## Examples

The following example shows that when ingress noise on the upstream exceeds the threshold allowed for the primary modulation profile, the Cisco uBR-MC16S line card should first switch to the secondary modulation profile, then try frequency hopping, and if that fails to correct problem, to finally try narrowing the channel width:

```
Router(config)#interface cable 3/0
Router(config-if)#cable upstream 0 hop-priority modulation frequency channel-width
Router(config-if)#exit
Router(config)#
```

## Related Commands

Command	Description
<b>cable modulation-profile</b>	Creates a cable modulation profile.
<b>cable upstream channel-width</b>	Configures an upstream for a range of allowable channel widths.
<b>cable upstream modulation-profile</b>	Configures an upstream for one modulation profile (static profile) or two modulation profiles (Dynamic Upstream Modulation).
<b>show cable hop</b>	Displays the current hop period and threshold for an upstream, along with other statistics.
<b>show cable modulation-profile</b>	Displays the cable modulation profiles that have been created.

## cable upstream ingress-noise-cancellation

To configure how often a cable interface line card should train its noise-cancellation circuitry so as to adjust to noise levels on the upstream, use the **cable upstream ingress-noise-cancellation** command in cable interface configuration mode. To disable the ingress noise cancellation feature, use the **no** form of this command.

**cable upstream *n* ingress-noise-cancellation *interval***  
**no cable upstream *n* ingress-noise-cancellation**

Syntax Description		
<i>n</i>	Upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.	
<i>interval</i>	Triggering interval, in milliseconds. The valid range is 10 to 3000 milliseconds, with a default value of 100 milliseconds.	

**Command Default** The default interval is 100 milliseconds.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	12.2(15)CX	This command was introduced for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line cards on the Cisco uBR7246VXR router.
	12.3(17b)BC4	Support was added for the Cisco uBR10-MC5X20H broadband processing engine on the Cisco uBR10012 router.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(23)BC10 and later 12.2(33)SCB11 and later 12.2(33)SCC6 and later 12.2(33)SCD6 and later 12.2(33)SCE and later 12.2(33)SCF and later	The default interval was changed to 100 milliseconds.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel ingress-noise-cancellation</b> command.

## Usage Guidelines

**Note** This command is available only on the Cisco uBR10-MC5X20H BPE, Cisco uBR-MC16U/X, and Cisco uBR-MC28U/X cable interface line cards. It cannot be used on other cable interface line cards.

Cable interface line cards, such as the Cisco uBR-MC28U/X cards, contain advanced hardware-based noise cancellation circuitry that digitally removes in-channel impairments such as ingress, common path distortion, and certain types of impulse noise. To configure how often these line cards should train their noise cancellation circuitry, so as to adapt to changes in the noise types and levels, use the **cable upstream ingress-noise-cancellation** command.

When you enable ingress noise cancellation on an upstream, the Cisco CMTS periodically schedules a 256-symbol idle slot on the upstream channel. The *interval* option specified in the **cable upstream ingress-noise-cancellation** command determines how often this idle slot is generated.

The default for BPE cards is for the card to train its circuitry every 100 milliseconds. The smaller the triggering interval, the faster the card can adjust to changes in ingress noise, which makes the upstream more robust to noise problems, but at the cost of decreasing bandwidth on the upstream channel. To determine the bandwidth cost, in percentage of raw bandwidth, use the following formula:

$$(256/\text{interval})/\text{channel-symbol-rate}$$

where *interval* is the time period in milliseconds specified by the **cable upstream ingress-noise-cancellation** command, and *channel-symbol-rate* is the symbol rate in kilohertz. For example, if the upstream is using a 2.56 MHz channel rate and a noise cancellation interval of 10 milliseconds, the bandwidth cost is 1% of the total raw bandwidth:

$$(256/10)/2560 = 0.01 \text{ (1\% of bandwidth)}$$

### Broadband Processing Engine Support

The **cable upstream ingress-noise-cancellation** command is required on the Cisco uBR10-MC5X20H broadband processing engine (BPE) to enable ingress noise cancellation.

The Cisco uBR10-MCX520S/U BPEs have ingress noise cancellation capability enabled by default, so no configuration of ingress noise cancellation is available in the Cisco IOS software for these cards.

However, for configuration compatibility in support of high availability among Cisco uBR10-MC5X20S/U/H cards, the Cisco IOS software will accept configuration of the **cable upstream ingress-noise-cancellation** command for these BPEs without generating any warning or error when synchronizing the configuration.

## Examples

The following example shows how to configure the first upstream on a Cisco uBR-MC16U/X or Cisco uBR-MC28U/X card to perform ingress noise cancellation every 300 milliseconds:

```
interface cable 5/0
 cable upstream 0 ingress-noise-cancellation 300
```

## Related Commands

Command	Description
<b>cable modulation-profile</b>	Defines a modulation profile for use on the router.
<b>cable upstream channel-width</b>	Specifies an upstream channel width for an upstream port.

Command	Description
<b>cable upstream docsis-mode</b>	Configures an upstream to use either DOCSIS 1.x or DOCSIS 2.0 modulation profiles.
<b>cable upstream frequency</b>	Enters a fixed frequency of the upstream RF carrier for an upstream port.
<b>cable upstream minislot-size</b>	Specifies the minislot size (in ticks) for a specific upstream interface.
<b>cable upstream modulation-profile</b>	Assigns one or two modulation profiles to an upstream port.
<b>cable upstream power-level</b>	Sets the input power level for the upstream RF carrier in decibels per millivolt (dBmV).
<b>show cable hop</b>	Displays CM configuration settings.
<b>show cable modulation-profile</b>	Displays the modulation profile information for a Cisco CMTS.
<b>show interface cable mac-schedule</b>	Displays the current time-slot scheduling state and statistics.
<b>show interface cable sid</b>	Displays cable interface information.

# cable upstream jumbo-grants

To allow jumbo grants, use the **cable upstream jumbo-grants** command. To disable jumbo grants, use the no form of this command.

**no**  
**cable upstream** *n* **jumbo-grants**

<b>Syntax Description</b>	<b>jumbo-grants</b> Allows jumbo grants				
	<i>n</i> Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For cBR Series Converged Broadband Routers, the valid range is from 0 to 15.				
<b>Command Default</b>	Jumbo grants are disabled by default.				
<b>Command Modes</b>	Interface configuration—cable interface only (config-if) MAC domain profile configuration (config-profile-md)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.15.OS</td> <td>This command was implemented on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.				

## Example

The following sample shows an example of the **cable upstream jumbo-grants** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # cable upstream 0 jumbo-grants
Router(config-profile-md)#end
```

The following sample shows an example of the **no cable upstream jumbo-grants** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # no cable upstream 0 jumbo-grants
Router(config-profile-md)#end
```

## cable upstream load-balance group

To assign an upstream to a load-balance group, use the **cable upstream load-balance group** command in interface configuration mode. To remove an upstream from a load-balance group, use the **no** form of this command.

**cable upstream** *uport* **load-balance group** *n*  
**no cable upstream** *uport* **load-balance group** *n*

### Syntax Description

<i>uport</i>	Specifies the upstream port that should be assigned to the load-balance group. Upstream port values start with 0 and end with a value that depends on the number of upstream ports on the cable interface line card.
<i>n</i>	Specifies the number of the load-balance group to which the upstream should be assigned. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 80. In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256.

### Command Default

An upstream is not assigned to any load-balance groups. If you use the **cable load-balance group (interface configuration)** command to assign a downstream interface to a load-balance group, all its upstreams are automatically assigned to the same group until you use the **cable upstream load-balance group** command to reassign an upstream to a different group.

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCE4	The valid range for the load balance group was changed.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable upstream load-balance group** command is used to configure the following feature:

#### [Load Balancing and Dynamic Channel Change on the Cisco CMTS Routers](#)

After you have used the **cable load-balance group (global configuration)** command to initially create and configure a load-balance group, use the **cable upstream load-balance group** command to assign this load-balance group to an upstream. This enables the cable interface to begin participating in load-balancing operations.

**Tip** Use the **cable load-balance group (interface configuration)** command to assign this load-balance group to a downstream.

The following rules apply when creating and assigning load-balance groups:

- A downstream or upstream can belong to only one load-balance group.

- All downstreams and upstreams in a load-balance group must share physical radio frequency (RF) connectivity to the same group of cable modems. Downstreams can be in a separate load-balance group than upstreams, but all downstreams or all upstreams that have the same RF physical connectivity must be members of the same load-balance group. You cannot distribute downstreams or upstreams that share physical connectivity across multiple load-balance groups.
- Load balancing is done only on a per-chassis basis—all interfaces in a load-balance group must be in the same chassis.

## Examples

The following example shows how to assign the first four upstreams for cable interface 5/1 to load balance group 14:

```
Router# config terminal
Router(config)# interface cable 5/1/0
Router(config-if)# cable upstream 0 load-balance group 14
Router(config-if)# cable upstream 1 load-balance group 14
Router(config-if)# cable upstream 2 load-balance group 14
Router(config-if)# cable upstream 3 load-balance group 14
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group (global configuration)</b>	Creates and configures a load-balance group.
<b>cable load-balance group (interface configuration)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load-balancing policy updates.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations.
<b>clear cable load-balance</b>	Clears the counters or state machine used to track load-balancing operations.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.

## cable upstream maintain-psd

To require DOCSIS 2.0 CMs on an A-TDMA-only upstream to maintain a constant power spectral density (PSD) after a modulation rate change, use the **cable upstream maintain-psd** command in cable interface configuration mode. To return to the default behavior, so that CMs do not need to maintain their power spectral density, use the **no** form of this command.

**cable upstream** *uport* **maintain-psd**  
**no cable upstream** *uport* **maintain-psd**

### Syntax Description

<i>uport</i>	Specifies the upstream port to be configured. Upstream port values start with 0 and end with a value that depends on the number of upstream ports on the cable interface line card.
--------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

Cable modems are not required to maintain their power spectral density after a modulation rate change (**no cable upstream maintain-psd**)

**Note** In Cisco IOS Release 12.2(15)BC2 and later releases, this command is automatically removed from the configuration when you configure an upstream for a TDMA-only or mixed TDMA/A-TDMA configuration.

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
12.2(15)CX	This command was introduced to support DOCSIS 2.0 operations on the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line card.
12.2(15)BC2	Support was added for DOCSIS 2.0 operations on the Cisco uBR-MC5X20S/U cable interface line cards.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel maintain-psd</b> command.

### Usage Guidelines

Use this command to specify whether DOCSIS 2.0 CMs should maintain their power spectral density when the Cisco CMTS changes their upstream modulation rate in an upstream channel descriptor (UCD) message. When you configure an upstream with the **cable upstream maintain-psd** command, the Cisco CMTS sets TLV 15 (Maintain Power Spectral Density) to ON in the UCD messages it sends to the CMs on that upstream.

When TLV 15 is on, and when the new UCD specifies a new upstream modulation rate for the CM, the CM must change its transmit power level to keep its power spectral density as close as possible to what it was before the modulation rate change. The CM must maintain this power spectral density until the CMTS sends a power adjustment command in a Ranging-Response (RNG-RSP) message.

The default configuration (**no cable upstream maintain-psd**) configures TLV 15 to OFF, and CMs are not required to maintain their power spectral density after a modulation rate change. However, per the DOCSIS specifications, the CMs continue to maintain constant total input power on the upstream.

**Note** This command affects only DOCSIS 2.0 CMs that are online an upstream that is configured for the DOCSIS 2.0 A-TDMA-only mode. This command has no effect on DOCSIS 1.0 and DOCSIS 1.1 CMs, which will continue to maintain constant total input power on the upstream, per the DOCSIS 1.x specifications.

## Examples

The following example shows how to configure four upstreams on a cable interface line card to require cable modems to maintain a constant power spectral density after a modulation rate change.

```
Router# configure terminal
Router(config)# interface cable c6/1/0
Router(config-if)# cable upstream 0 maintain-psd
Router(config-if)# cable upstream 1 maintain-psd
Router(config-if)# cable upstream 2 maintain-psd
Router(config-if)# cable upstream 3 maintain-psd
Router(config-if)# exit
Router(config)# exit
Router#
```

The following example shows how to configure an upstream for the default behavior, which is that CMs are not required to maintain a constant power spectral density after a modulation rate change, but do continue to maintain constant total input power levels on the upstream.

```
Router# configure terminal
Router(config)# interface cable c5/1/0
Router(config-if)# no cable upstream 0 maintain-psd
Router(config-if)# exit
Router(config)# exit
Router#
```

## Related Commands

Command	Description
<b>cable upstream docsis-mode</b>	Configures an upstream to use either DOCSIS 1.x or DOCSIS 2.0 modulation profiles.

# cable upstream max-channel-power-offset

To set the power budget offset value on the Cisco CMTS router for the reduced upstream channel set assignment, use the **cable upstream max-channel-power-offset** command in cable interface configuration mode. To disable this configuration, use the **no** form of this command.

**cable upstream max-channel-power-offset** *dB-value*  
**no cable upstream max-channel-power-offset** *dB-value*

<b>Syntax Description</b>	<p><i>dB-value</i> Decibel value for the upstream channel transmit power. The valid range is from 1 to 6. The default is 3.</p> <p><b>Note</b> Effective with Cisco IOS Release 12.2(33)SCH1 and Cisco IOS Release 12.2(33)SCG5, the valid range is from 0 to 6.</p>
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** The power budget offset is configured with the default value of 3 dB.

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

Release	Modification
Cisco IOS Release 12.2(33)SCE3	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The threshold value specified for the power budget offset (max-channel-power-offset) must be less than the power threshold value (power-adjust continue) that determines the value of the Ranging Status field in the Ranging Response (RNG-RSP) messages that the Cisco CMTS router sends to the cable modem. You can specify the power threshold value using the **cable upstream power-adjust** command.

**Examples** The following example shows how to enable the Cisco CMTS router to reduce the channel set assignment based on the total power budget of the cable modem in Cisco IOS Release 12.2(33)SCE3:

```
Router# configure terminal
Router(config)# interface cable 7/0/0
Router (config-if)# cable upstream max-channel-power-offset 5
```

Command	Description
<b>cable tx-power-headroom</b>	Specifies the extended transmit power on the Cisco CMTS router.
<b>show cable modem</b>	Displays transmit power values for each assigned upstream channel along with cable modem details.

# cable upstream max-codes-per-subframe

To specify the upper limit to override the maximum value of codes-per-subframe defined in the individual modulation profile setting for an upstream channel, use the **cable upstream max-codes-per-subframe** command in cable interface configuration mode. To specify the default value of 2 to maximum codes-per-subframe, use the **no** form of this command.

**cable upstream** *n* **max-codes-per-subframe** *code*

**no cable upstream** *n* **max-codes-per-subframe**

## Syntax Description

<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>code</i>	Specifies the number of codes-per-subframe. Valid values range from 1 to 128, with a default value of 2.

## Command Default

The maximum codes per subframe setting cannot be applied if the Synchronous Code Division Multiple Access (S-CDMA) is not configured.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command is applicable only for S-CDMA channels. You should configure S-CDMA to apply the the maximum codes-per-subframe setting. The number of codes-per-subframe should not exceed the number of active codes.

## Examples

The following example sets the number of codes-per-subframe to 128 on the upstream port 0:

```
Router(config)# interface cable 7/0/4
Router(config-if)# cable upstream 0 max-codes-per-subframe 128
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable upstream active-codes</b>	Specifies the number of active codes allowed on an upstream channel.
<b>cable upstream codes-per-minislot</b>	Specifies the number of codes-per-minislot allowed on an upstream channel.
<b>cable upstream spreading-interval</b>	Specifies the spreading interval for S-CDMA on an upstream channel.

## cable upstream max-interleave-step

To specify the upper limit to override the maximum interleave step for each burst defined in the modulation profile for the upstream channel, use the **cable upstream max-interleave-step** command in cable interface configuration mode. To specify the default interleave step size of 1, use the **no** form of this command.

**cable upstream** *n* **max-interleave-step** *max-interleave-step*  
**no cable upstream** *n* **max-interleave-step**

Syntax Description		
	<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
	<i>max-interleave-step</i>	Specifies the maximum number of interleave steps. Valid values range from 1 to 31, with a default value of 1.

**Command Default** The maximum interleave step setting cannot be applied if the Synchronous Code Division Multiple Access (S-CDMA) feature is not configured.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command is applicable only for S-CDMA channels and the command limits the maximum number of interleave steps for a given upstream port. The *max-interleave-step* value should be less than the *spreading-interval* value specified using the **cable upstream spreading-interval** command.

**Examples** The following example sets the number of interleave steps to 31 on the upstream port 0:

```
Router(config)# interface cable 7/0/4
Router(config-if)# cable upstream 0 max-interleave-steps 31
Router(config-if)#
```

Related Commands	Command	Description
	<b>cable upstream active-codes</b>	Specifies the number of active codes that can be configured on an upstream channel.
	<b>cable upstream codes-perminislot</b>	Specifies the number of codes-per-minislot allowed on an upstream channel.
	<b>cable upstream max-codes-per-subframe</b>	Specifies the upper limit and the maximum value of codes-per-subframe defined in the individual modulation profile setting for an upstream channel.

Command	Description
<b>cable upstream spreading-interval</b>	Specifies the spreading interval for SCDMA on an upstream channel.

## cable upstream max-logical-chans

To specify the number of logical channels on a physical port, use the **cable upstream max-logical-chans** command in cable interface configuration mode. To disable the use of multiple logical channels, use the **no** form of this command.

**cable upstream** *n* **max-logical-chans** *code*  
**no cable upstream** *n* **max-logical-chans**

<b>Syntax Description</b>	<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
	<i>code</i>	Specifies the number of logical channels per port. Valid values are 1 and 2.

**Command Default** The maximum logical channels setting cannot be applied if the Synchronous Code Division Multiple Access (S-CDMA) is not configured.

**Command Modes** Interface configuration (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **cable upstream max-logical-chans** command limits the number of logical channels per port on an upstream channel. The default value is 1.

When two logical channels are configured through **cable upstream max-logical-chans** command, both logical channels are mapped to the same physical port specified and the physical upstream bandwidth is shared between the two logical channels. However, from the cable modem perspective, each logical channel appears as an independent upstream channel.

When multiple logical channels are configured, the upstream related commands are categorized into two groups: physical port level and logical channel level.

### Physical Port Level

Physical port level commands use the format of **cable upstream** *n*, where *n* denotes the physical port number.

### Logical Channel Level

Logical channel level commands use the format of **cable upstream** *n m*, where *n* denotes the physical port number, and *m* denotes the logical channel index number of 0 or 1.

**Note** Multiple logical channels and Spectrum groups cannot be configured on the same upstream port.

The following commands are supported at the logical channel level:

- **cable upstream active-codes**
- **cable upstream attribute-mask**
- **cable upstream codes-per-minislot**
- **cable upstream concatenation**
- **cable upstream data-backoff**
- **cable upstream description**
- **cable upstream differential-encoding**
- **cable upstream docsis-mode**
- **cable upstream equalization-coefficient**
- **cable upstream fec**
- **cable upstream fragment-force**
- **cable upstream fragmentation**
- **cable upstream freq-adjust**
- **cable upstream max-codes-per-subframe**
- **cable upstream max-interleave-step**
- **cable upstream modulation-profile**
- **cable upstream power-adjust**
- **cable upstream range-backoff**
- **cable upstream rate-adapt**
- **cable upstream rate-limit**
- **cable upstream scheduling type**
- **cable upstream scrambler**
- **cable upstream shutdown**
- **cable upstream spreading-interval**
- **cable upstream threshold**
- **cable upstream unfrag-slot-jitter**

**Note** The above logical channel level commands are not available at the physical port level, when logical channels are configured. However, the **cable upstream shutdown** and **cable upstream threshold** commands operate both at the physical and at the logical channel level.

The physical upstream port level commands such as **cable upstream frequency** and **cable upstream channel-width** affects all logical channels configured under a physical port.

## Examples

The following example sets two logical channels on the upstream port 0:

```
Router(config)# interface cable 7/0/4
Router(config-if)# cable upstream 0 max-logical-chans 2
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable upstream attribute-mask</b>	Specifies the upstream attribute mask in hexadecimal format.

Command	Description
<b>cable upstream codes-per-minislot</b>	Specifies the number of codes-per-minislot allowed on an upstream channel.
<b>cable upstream concatenation</b>	Enables DOCSIS concatenation at the CMTS.
<b>cable upstream data-backoff</b>	Specifies automatic or fixed start and stop values for data backoff.
<b>cable upstream description</b>	Assigns arbitrary labels to the upstreams on the cable interfaces.
<b>cable upstream differential-encoding</b>	Enables differential encoding on upstream traffic to a specified cable interface.
<b>cable upstream docsis-mode</b>	Configures an upstream to use DOCSIS 1.x or DOCSIS 2.0 or DOCSIS 3.0 modulation profiles.
<b>cable upstream equalization-coefficient</b>	Enables the use of a DOCSIS 1.x or DOCSIS 2.0 or DOCSIS 3.0 pre-equalization coefficient on an upstream port.
<b>cable upstream fec</b>	Enables upstream forward error correction.
<b>cable upstream fragment-force</b>	Specifies that a cable interface line card should fragment DOCSIS frames on an upstream when the frame exceeds a particular size.
<b>cable upstream fragmentation</b>	Enables fragmentation of DOCSIS frames on a particular upstream.
<b>cable upstream freq-adjust</b>	Specifies the percentage of frequency adjustment packets that is required to change the adjustment method from the regular power-adjustment method to the noise power-adjustment method.
<b>cable upstream max-codes-per-subframe</b>	Specifies the upper limit to override the maximum value of codes-per-subframe defined in the individual modulation profile setting of an upstream channel.
<b>cable upstream max-interleave-step</b>	Specifies the upper limit to override the maximum interleave step for each burst defined in the modulation profile for the upstream channel.
<b>cable upstream modulation-profile</b>	Assigns up to three modulation profiles to an upstream port.
<b>cable upstream power-adjust</b>	Controls power-adjustment methods on the Cisco CMTS.
<b>cable upstream range-backoff</b>	Specifies automatic or configured initial ranging backoff calculation.
<b>cable upstream rate-adapt</b>	Enables and configures upstream utilization optimization.
<b>cable upstream rate-limit</b>	Specifies DOCSIS rate limiting for an upstream port on a cable interface line card.
<b>cable upstream scheduling type</b>	Enables various scheduler modes.
<b>cable upstream scrambler</b>	Enables the cable upstream scrambler.

Command	Description
<b>cable upstream shutdown</b>	Disables the upstream port.
<b>cable upstream spreading-interval</b>	Specifies the spreading interval for S-CDMA on an upstream channel.
<b>cable upstream threshold</b>	Configures the upstream for the CNR or SNR and FEC threshold values to be used in determining the allowable noise levels.
<b>cable upstream unfrag-slot-jitter</b>	Specifies how much jitter can be tolerated on the corresponding upstream due to unfragmentable slots.

## cable upstream max-ports

To configure the maximum number of upstreams on a MAC domain on a cable interface line card, use the **cable upstream max-ports** command in cable interface configuration mode. To reset the card to its default value of 4 upstreams per MAC domain, use the **no** form of this command.

**cable upstream max-ports** *n*  
**no cable upstream max-ports**

### Syntax Description

<i>n</i>	The valid range is 0 to 8, with a default of 4.
----------	-------------------------------------------------

### Command Default

4

### Command Modes

Interface configuration (cable interface only)

### Command Modes

Release	Modification
12.2(15)BC1	This command was introduced to support the Cisco uBR-MC5X20S cable interface line card.
12.2(15)BC2	Support was added for the Cisco uBR-MC5X20U cable interface line card.
12.2(33)SCE	The minimum number of max-ports supported was changed from 1 to 0.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to specify how many upstreams a MAC domain will support on the cable interface line card, before using the **cable upstream connector** command to assign upstreams to physical ports on the card. The MAC domains on a card can be configured for different maximum upstream values.

After using this command, the valid range for upstreams on that cable interface will be from 0 to one less than the maximum port value. For example, if you use the **cable upstream max-ports 6** command to specify a maximum of 6 upstreams for the MAC domain, the valid range for upstreams will be 0 to 5.

The total of max-ports on each interface should not be greater than the total number of upstream channels in the line card. For example, the Cisco uBR-MC3GX60V line card that has a total of 60 upstream channels can have a maximum of 60 max-ports and the Cisco UBR-MC20X20V line card that has a total of 20 upstream channels can have a maximum of 20 max-ports.

If the max-port exceeds the number of upstream channels on a line card, the total number of ports that can be unshut is limited to the actual number of channels available on the line card and the remaining ports remain as shutdown.

The **cable upstream connector** command fails when all the upstream channels are mapped. For example, with Cisco uBR-MC3GX60V line card, if 60 upstream ports are mapped to connectors, adding more upstream ports to connectors fail. When you configure a total of 120 ports and unshut the first 60 ports but map the last 60 ports to connectors, none of the ports work because the port is either shutdown or has no connector mapped to it.

## Examples

The following example shows how to configure all MAC domains on a Cisco uBR-MC5X20S card for a maximum number of 6 upstreams.

```
Router# configure terminal

Router(config)# interface cable c6/1/0
Router(config-if)# cable upstream max-ports 1
Router(config-if)# interface cable c6/1/1
Router(config-if)# cable upstream max-ports 2
Router(config-if)# interface cable c6/1/2
Router(config-if)# cable upstream max-ports 3
Router(config-if)# interface cable c6/1/3
Router(config-if)# cable upstream max-ports 6
Router(config-if)# interface cable c6/1/4
Router(config-if)# cable upstream max-ports 8
Router(config-if)# exit
Router(config)# exit
Router#
```

## Related Commands

Command	Description
<b>cable upstream connector</b>	Maps an upstream port to a physical port on the cable interface line card for use with a particular downstream.

## cable upstream min-bwreq-ops

To configure the number of reserved minislots for contention, use the **cable upstream min-bwreq-ops** command in cable interface configuration mode.

**cable upstream min-bwreq-ops** {scqam | ofdma} percent tenths\_of\_a\_percent

Syntax Description		
	<b>scqam</b>	Specifies the percent of bandwidth request opportunities in SCQAM maps.
	<b>ofdma</b>	Specifies the percent of bandwidth request opportunities in OFDMA maps.
	<i>percent</i>	Specifies the minimum bandwidth request opportunities in 0% to 20%.
	<i>tenths_of_a_percent</i>	Specifies the minimum bandwidth request opportunities in 0 to 9 tenths of a percent.

**Command Default** No default behavior or values

**Command Modes** Interface configuration (cable interface only)

Command History	Release	Modification
	IOS XE Amsterdam 17.3.1w	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure the number of reserved minislots for contention:

```
Router> enable
Router# configure terminal
Router(config)# interface Cable 7/0/1
Router(config-if)# cable upstream min-bwreq-ops ofdma 5 0
```

## cable upstream minimal-voice-jitter

To configure the shortest jitter allowed, use the **cable upstream minimal-voice-jitter** command. To reset the jitter value to default, use the no form of the command.

**no**  
**cable upstream** *n* **minimal-voice-jitter** *jitter*

<b>Syntax Description</b>	<i>n</i> Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For cBR Series Converged Broadband Routers, the valid range is from 0 to 15.				
	<i>jitter</i> Specifies the shortest jitter allowed.				
<b>Command Default</b>	The default jitter value is 2000 ms.				
<b>Command Modes</b>	Interface configuration—cable interface only (config-if) MAC domain profile configuration (config-profile-md)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th style="border-top: 1px solid black; border-bottom: 1px solid black;">Release</th> <th style="border-top: 1px solid black; border-bottom: 1px solid black;">Modification</th> </tr> </thead> <tbody> <tr> <td style="border-bottom: 1px solid black;">IOS-XE 3.15.OS</td> <td style="border-bottom: 1px solid black;">This command was implemented on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.				

### Example

The following sample shows an example of the **cable upstream minimal-voice-jitter** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # cable upstream 0 minimal-voice-jitter 2500
Router(config-profile-md)#end
```

The following sample shows an example of the **no cable upstream minimal-voice-jitter** command.

```
Router# conf t
Router(config)# cable profile mac-domain MD1
Router(config-profile-md) # no cable upstream 0 minimal-voice-jitter 2500
Router(config-profile-md)#end
```

## cable upstream minislot-size

To specify the minislot size (in ticks) for a specific upstream interface, use the **cable upstream minislot-size** command in cable interface configuration mode. To reset the minislot size to the default for the current channel width setting, use the **no** form of this command.

**cable upstream *n* minislot-size *size***  
**no cable upstream *n* minislot-size**

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>size</i>	Specifies the minislot size in time ticks. Valid minislot sizes are: <ul style="list-style-type: none"> <li>• <b>1</b>—(32 symbols at 6.4MHz channel width) Supported by the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X and Cisco uBR-MC5X20S /U cable interface line cards when operating in Advanced TDMA (A-TDMA) DOCSIS 2.0 only mode.</li> <li>• <b>2</b> (32 symbols at at 3.2 MHz channel width)</li> <li>• <b>4</b> (64 symbols at 3.2 MHz channel width)</li> <li>• <b>8</b> (128 symbols at 3.2 MHz channel width)</li> <li>• <b>16</b> (256 symbols at 3.2 MHz channel width)</li> <li>• <b>32</b> (512 symbols at 3.2 MHz channel width)</li> <li>• <b>64</b> (1024 symbols at 3.2 MHz channel width)</li> <li>• <b>128</b> (2048 symbols at 3.2 MHz channel width)</li> </ul>

### Command Default

The default settings vary, depending on the upstream's channel width. The default values were changed in Cisco IOS Release 12.2(15)BC1 and later releases to better optimize data and voice traffic on the upstream.

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
11.3(6) NA	This command was introduced.
12.2(15)CX	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line cards, including support for minislot size of 1 to support DOCSIS 2.0 A-TDMA and mixed modulation profiles.
12.2(15)BC1	The default minislot size was reduced to optimize the upstream for data and Voice-over-IP (VoIP) traffic. The previous defaults produced 16 bytes per minislot when using QPSK modulation and a 1.6 MHz channel width, and the new defaults produce 8 bytes per minislot with the same configuration.
12.2(15)BC2	Support was added for the minislot size of 1 to support DOCSIS 2.0 A-TDMA and mixed modulation profiles on the Cisco uBR-MC5X20S/U cable interface line cards.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is <b>us-channel minslot-size</b> command.

**Usage Guidelines**

The minislot size determines the minimum amount of information that can be transmitted on the upstream. How much a particular minislot size can contain depends on the modulation profile and channel width being used, with higher-bandwidth settings allowing larger amounts of data.

Because DOCSIS specifications require that the minislot size contain at least 32 symbols, you might need to change the minislot size whenever you change the channel width or modulation of an upstream, to meet the DOCSIS requirements.

**Note** In Cisco IOS Release 12.2(15)CX, Cisco IOS Release 12.2(15)BC2, and later releases, manually changing the minislot size is not needed on the Cisco uBR-MC16U/X, Cisco uBR-MC28C, and Cisco uBR-MC28U/X cards, because these cards automatically change the minislot size when the channel width is changed, to produce 32 symbols per minislot, as required by the DOCSIS specifications.

The table below lists the default minislot sizes for each channel width for Cisco IOS releases before and after Cisco IOS Release 12.2(15)BC1.

**Table 20: Default Minislot Sizes**

Releases Earlier than Cisco IOS Release 12.2(15)BC1 (creates 64 symbols and 16 bytes per minislot)		Cisco IOS Release 12.2(15)BC1 and Later Releases (creates 32 symbols and 8 bytes per minislot)	
Channel Width	Default Minislot Size (in Ticks)	Channel Width	Default Minislot Size (in Ticks)
0.2 MHz	64	0.2 MHz	32
0.4 MHz	32	0.4 MHz	16
0.8 MHz	16	0.8 MHz	8
1.6 MHz	8	1.6 MHz	4
3.2 MHz	4	3.2 MHz	2
		6.4 MHz (DOCSIS 2.0 only)	1 <sup>6</sup>

<sup>6</sup> You must be using a 6.4 MHz channel width if using a minislot size of 1 tick. Otherwise, you will violate the DOCSIS requirements that each minislot should contain 32 symbols.

**Increasing the Minislot Size for High Bandwidth Users**

The DOCSIS specifications allow a maximum burst limit of 255 minislots, which could require increasing the minislot size from the default values if you are offering service level agreements (SLAs) that offer guaranteed upstream speeds of 2 Mbps or greater, or if you are allowing maximum concatenation bursts greater than 2000 bytes. This is because the default minislot sizes might not accommodate the largest bursts that are possible with these configurations.

The default minislot sizes provide for 8 or 16 bytes per minislot, depending on Cisco IOS release. If the default setting provides 8 bytes per minislot, then the maximum possible burst is 8 bytes \* 255 minislots, or 2040 total bytes, which might not be sufficient for certain users with high guaranteed upstream speeds. You should increase the minislot size to accommodate the expected maximum burst transmissions, adding in approximately 10 percent for overhead.

**Caution** Using values of 64 or 128 for higher symbol rates such as 1280 kilosymbols/second or 2560 kilosymbols/second can cause performance problems. Depending on your current setting's symbol rate, you should select the minislot size (in ticks) that yields a minislot size of 32 or 64 symbols.

### Examples

The following example shows how to set the minislot size on upstream port 4 to 16:

```
Router# configure terminal
Router(config)# interface cable 3/0
Router(config-if)# cable upstream 4 minislot-size 16
Router(config-if)# exit
Router(config)# exit
Router#
```

### Related Commands

Command	Description
<b>cable modulation-profile</b>	Defines a modulation profile for use on the router.
<b>cable upstream channel-width</b>	Specifies an upstream channel width for an upstream port.
<b>cable upstream docsis-mode</b>	Configures an upstream to use either DOCSIS 1.x or DOCSIS 2.0 modulation profiles.
<b>cable upstream equalization-coefficient</b>	Enables the use of a DOCSIS 1.1 pre-equalization coefficient on an upstream.
<b>cable upstream modulation-profile</b>	Assigns one or two modulation profiles to an upstream port.
<b>show cable hop</b>	Displays CM configuration settings.
<b>show cable modulation-profile</b>	Displays the modulation profile information for a Cisco CMTS.
<b>show interface cable mac-schedule</b>	Displays the current time-slot scheduling state and statistics.
<b>show interface cable sid</b>	Displays cable interface information.

## cable upstream modulation-profile

To assign up to three modulation profiles to an upstream port, use the **cable upstream modulation-profile** command in cable interface configuration mode. To set the upstream modulation profile to the single default profile based on the DOCSIS-mode setting of the upstream, use the no form of this command.

**cable upstream *n* modulation-profile *primary-profile-number* [*secondary-profile-number*]**  
**[*tertiary-profile-number*]**

**no cable upstream *n* modulation-profile *primary-profile-number* [*secondary-profile-number*]**  
**[*tertiary-profile-number*]**

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>primary-profile number</i>	Specifies the number identifying the primary modulation profile for the upstream port. The primary modulation profile is used when the upstream is operating with nominal noise conditions. The valid values depend on the cable interface being used and the mode of operation.
<i>secondary-profile-number</i>	(Optional) Specifies the secondary modulation profile for the upstream port, which is used when noise on the upstream increases to the point that the primary modulation profile can no longer be used. The valid values are the same ranges as the primary modulation profile.  The secondary modulation profile should specify a more robust performance profile (in terms of coping with noise) than the primary profile. The secondary profile is used for both basic and advanced dynamic modulation.
<i>tertiary-profile-number</i>	(Optional) Specifies the tertiary modulation profile for the upstream port, which is used when noise on the upstream increases to the point that the secondary modulation profile can no longer be used.  The tertiary modulation profile is only available for the basic dynamic modulation. You cannot use the tertiary modulation profile when a spectrum group is defined for the upstream.

### Command Default

Default modulation profiles are created, using profile numbers 1, 21, 41, 101, 121, 201, 221, 241, 321, and 381 depending on the DOCSIS mode and the cable interface line cards being used. See the table for a list of the valid ranges for the individual cable interface cards.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
11.3 NA	This command was first introduced.
12.0(7)XR2 and 12.1(1a)T1	This command was introduced into the Cisco IOS Release 12.0 and Release 12.1 trains, replacing the previous version of the <b>cable upstream modulation-profile</b> command.

Release	Modification
12.1(3a)EC1	This command was modified to add the optional <i>secondary-profile-number</i> parameter to enable the Dynamic Upstream Modulation feature.
12.1(5)EC	This command was introduced for the Cisco uBR7100 series universal broadband routers.
12.1(7)CX1	This command was enhanced for the Cisco uBR-MC16S line card.
12.2(4)BC1	Support for this command was added for the Cisco IOS Release 12.2 BC train.
12.2(8)BC2	Support for this command was added for the Cisco uBR-MC16S and Cisco uBR-LCP2-MC16S line cards.
12.2(11)CY, 12.2(11)BC3	Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.
12.2(15)CX	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X cable interface line card, including DOCSIS 2.0 ATDMA and mixed modulation profiles.
12.2(15)BC2	Support was added for DOCSIS 2.0 ATDMA and mixed modulation profiles on the Cisco uBR-MC5X20S/U/H cable interface line cards.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.3(23)BC7	This command was modified to add the optional <i>tertiary-profile-number</i> parameter to enable Three Step Dynamic Upstream Modulation feature.
12.2(33)SCC	Support was added for DOCSIS 2.0 S-CDMA and DOCSIS 3.0 S-CDMA modulation profiles using 1.6 MHz, 3.2 MHz, and 6.4 MHz channel widths on the Cisco UBR-MC20X20V cable interface line card.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel modulation-profile</b> command.

### Usage Guidelines

The **cable upstream modulation-profile** command assigns up to three modulation profiles to an upstream port, depending on the type of cable interface and Cisco IOS software release being used. The third modulation profile is only available for the basic dynamic modulation and is unavailable when a spectrum group is defined for the upstream.

#### Static Modulation Profile (single profile)

The **cable upstream modulation-profile** command assigns a single modulation profile to an upstream port on the Cisco uBR7100 series routers and on all cable interface line cards that are available for the Cisco CMTS routers. This modulation profile affects all CMs and set-top boxes that are using that upstream port.

#### Dynamic Upstream Modulation (up to three profiles)

The **cable upstream modulation-profile** command assigns up to three modulation profiles to an upstream port to use the Dynamic Upstream Modulation feature. You must assign at least two profiles to activate the Dynamic Upstream Modulation feature. This feature operates differently, depending on the Cisco IOS software release and the cable interface line card that is providing the upstream port:

- The upstream port is on a Cisco uBR7100 series router or on a Cisco uBR-MC28U/X, or Cisco uBR-MC16U/X line card that is used on Cisco CMTS router running Cisco IOS Release 12.3(23)BC7 or later release.

When using the Dynamic Upstream Modulation feature, the primary modulation profile is the default profile. The line card monitors the signal-to-noise ratio (SNR) value and forward error correction (FEC) counters for the upstream, to track the upstream signal quality. For a dual modulation profile, the line card monitors the SNR value, carrier-to-noise ratio (CNR) value, and FEC counters to track the upstream signal quality.

When the noise on the upstream exceeds the threshold(s) for the primary profile, the upstream switches to the secondary profile in a dual modulation profile. Whereas, in a three modulation profile setup, the upstream can switch from primary profile to the secondary profile or directly to the tertiary profile based on the SNR, and FEC counter thresholds. Two separate thresholds are used for switching between the primary profile and the secondary profile and from secondary profile to the tertiary profile.

When the noise conditions improve (defined as a SNR value that is 3 dB greater than the threshold value and FEC counters that are below the threshold values), the upstream automatically switches back to the primary modulation profile. For a Three Step Dynamic Upstream Modulation, the user can configure the threshold values and FEC counters for the upgrade. However, there is no direct upgrade from tertiary profile to the primary profile. The upgrade follows a sequential order, from tertiary profile to secondary profile and then to the primary profile.

For example, in a dual modulation profile, the primary modulation profile could be configured for 16-QAM (or mixed 16-QAM and QPSK) operation and the secondary profile for QPSK operation. If noise conditions on the upstream threaten to force CMs offline, the upstream switches to the secondary profile to implement QPSK operation. When the noise ingress conditions are solved, the upstream switches back to 16-QAM operation.

In a Three Step Dynamic Upstream Modulation, the primary modulation profile could be configured for 64-QAM operation, the secondary modulation profile for 16-QAM operation (or mixed 64-QAM and 16-QAM), and the tertiary modulation profile for QPSK. If the noise conditions increase, the upstream switches to the secondary profile to implement 16-QAM (or mixed profile) operation and then to the tertiary modulation profile to implement QPSK operation. When the noise ingress conditions are improved, the upstream switches back to 16-QAM operation (or mixed 64-QAM and 16-QAM), and then to the 64-QAM operation, on further improvement of noise conditions.

---

**Note** For more information on this form of the Dynamic Upstream Modulation feature, see the chapter, [Spectrum Management for the Cisco Cable Modem Termination System](#).

---

When Dynamic Upstream Modulation is enabled and spectrum groups are configured on the same interface, the line cards respond to excessive noise by first switching to the secondary modulation profile. If the noise conditions worsen, the line card changes the modulation or frequency hopping in an attempt to find a new upstream channel, and if that fails, the line card reduces the channel width.

---

**Note** The default priority of switching modulation profile is frequency (F), modulation (M), and channel-width (C). However, it is user configurable and can be changed to MFC or FCM.

---

- The upstream port is on a Cisco uBR-MC16U/X line card that is used on Cisco CMTS routers using Cisco IOS Release 12.1(7)CX1 or later release, or on a Cisco uBR-MC5X20S/U/H line card.

The Dynamic Upstream Modulation feature on the Cisco uBR-MC16U/X line card is identical to other line cards except that the spectrum management hardware onboard the Cisco uBR-MC16U/X or Cisco uBR-MC5X20S/U/H line card uses the CNR value (you can use only the CNR value for a dual profile configuration) in conjunction with the SNR value. The CNR value is a more accurate description of noise conditions on the upstream. Because of this, these line cards switch back to the primary modulation profile when noise conditions improve to a CNR value that is only 3 dB greater than the threshold value (assuming FEC counters are also below the threshold values).

**Note** If the Cisco CMTS router is running Cisco IOS Release 12.1(3a)EC1 or a later Cisco IOS release, the Dynamic Upstream Modulation feature on the Cisco uBR-MC16U/X line card operates the same as it does on the other line cards.

When Dynamic Upstream Modulation is enabled and spectrum groups are configured on the same interface, the line cards take corrective action in response to excessive noise, as determined by the **cable upstream hop-priority** command (either frequency hopping or changing to the secondary modulation profile). If the noise conditions worsen, the line card takes the second corrective action that has been defined, and if that fails, the line card takes the last corrective action.

**Note** The Dynamic Upstream Modulation feature uses the SNR, CNR, and FEC thresholds for 64-QAM, 16-QAM, and QPSK operation to determine when to switch modulation profiles. We recommend the use of 64-QAM, 16-QAM, and QPSK for primary, secondary, and tertiary profiles in a Three Step Dynamic Upstream Modulation. For dual profile configuration, we recommend the use of 16-QAM or mixed 16-QAM and QPSK modulation for primary profile and QPSK modulation for the secondary profile. However, this is optional. Both modulation profiles can be either QPSK or QAM. It is not mandatory that one is QAM and the other QPSK, but modulation profile switchover is tied to the QAM and QPSK thresholds.

**Tip** Modulation profiles must be first created using the **cable modulation-profile** command before they can be assigned using the **cable upstream modulation-profile** command.

### Modulation Profile Ranges

The valid range for modulation profiles depends on the cable interface used and the type of modulation profile created.

The table below lists the valid ranges according to cable interface and modulation type.

**Table 21: Supported Channel Widths and DOCSIS Modes for Cable Interfaces**

Cable Interface	DOCSIS 1.X (TDMA)	Mixed DOCSIS 1.X/2.0	DOCSIS 2.0 (A-TDMA)	DOCSIS 3.0 (S-CDMA)
Cisco uBR-MC16U/X <sup>1</sup> , Cisco uBR-MC28U/X	41 to 50 (default is 41)	141 to 150 (default is 141)	241 to 250 (default is 241)	N/A
Cisco uBR10-MC5X20S/U/H	21 to 30 (default is 21)	121 to 130 (default is 121)	221 to 230 (default is 221)	N/A

Cable Interface	DOCSIS 1.X (TDMA)	Mixed DOCSIS 1.X/2.0	DOCSIS 2.0 (A-TDMA)	DOCSIS 3.0 (S-CDMA)
Cisco UBR-MC20X20V <sup>8</sup>	21 to 30 (default is 21)	121 to 130 (default is 121)	221 to 230 (default is 221)	1 to 400 (default is 381)

<sup>7</sup> Supports 6,400,000 Hz (5,120,000) symbols/sec) while operating in DOCSIS 2.0 (A-TDMA-only) mode .

<sup>8</sup> The UBR-MC20X20V cable interface line card has three variants, UBR-MC20X20V-0D, UBR-MC20X20V-5D, and UBR-MC20X20V-20D. The UBR-MC20X20V-0D line card supports 20 upstreams and zero (no) downstreams. The UBR-MC20X20V-5D line card supports 20 upstreams and five downstreams, and the UBR-MC20X20V-20D line card supports 20 upstreams and 20 downstreams.

In addition to the legacy modulation profile number schemes, the new global modulation profile scheme introduced in Cisco IOS Release 12.2(33)SCC, allows you to assign any modulation profile number to any DOCSIS-mode up to 400, without any restrictions.

The global modulation profile mode allows you to create and configure DOCSIS 3.0 channel type 4SR (scdma-d3). When an upstream's DOCSIS mode is changed into scdma-d3 , it is initially assigned to the system created default modulation profile as shown in the table.

**Note** Though you can assign any number between 1 to 400 to any modulation profile, the default modulation profile number assigned to an upstream channel for a given channel type will remain the same. That is, modulation profile numbers 21, 121, 221, 321, and 381 will be applicable for TDMA, mixed, A-TDMA, S-CDMA, and DOCSIS 3.0 S-CDMA channel types.

All the existing and previously defined modulation profiles are converted to the new format. However, all the newly created modulation profiles, which are outside of the legacy number space range, will be lost when you revert to the legacy modulation profile.

For more details on the new global modulation profile scheme, refer to the **cable modulation-profile global-scheme** command.

## Examples

The following example assigns the primary modulation profile 2, the secondary modulation profile 1, and the tertiary modulation profile 4 to the upstream port 0 on the cable interface line card in slot 3. This automatically enables the Dynamic Upstream Modulation feature for all CMs using that upstream.

```
Router(config)#interface cable 3/0
Router(config-if)#cable upstream 0 modulation-profile 2 1 4
Router(config-if)#
```

The following example assigns the primary modulation profile 2 and the secondary modulation profile 1, to the upstream port 0 on the cable interface line card in slot 3. This automatically enables the Dynamic Upstream Modulation feature for all CMs using that upstream.

```
Router(config)#interface cable 3/0
Router(config-if)#cable upstream 0 modulation-profile 2 1
Router(config-if)#
```

Related Commands	Command	Description
	<b>cable modulation-profile</b>	Creates a cable modulation profile.
	<b>cable modulation-profile global-scheme</b>	Defines a global modulation profile for use on the router.
	<b>cable upstream hop-priority</b>	Determines the order of the corrective actions to be taken when ingress noise exceeds the allowable value for an upstream.  This command is related to the <b>cable upstream modulation-profile</b> command only when using advanced dynamic modulation configuration, that is, when spectrum group is defined for the upstream channel.
	<b>show cable modulation-profile</b>	Displays the cable modulation profiles that have been created.

# cable upstream ofdma-prof-mgmt active-scs-threshold-pct

To specify the active subcarrier percent below RxMER threshold, use the **cable upstream ofdma-prof-mgmt active-scs-threshold-pct** command in cable interface configuration mode.

**cable upstream ofdma-prof-mgmt active-scs-threshold-pct** *percent*

## Syntax Description

<i>percent</i>	Specify the active subcarrier percent below RxMER threshold. The valid range is from 0 to 100 percent.
----------------	--------------------------------------------------------------------------------------------------------

## Command Default

None

## Command Modes

Interface configuration (cable interface only)

## Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to configure the active subcarrier percent below RxMER threshold.

```
Router(config)# cable upstream ofdma-prof-mgmt active-scs-threshold-pct 30
```

## Related Commands

Command	Description
<b>cable upstream ofdma-prof-mgmt prof-upgrade-auto</b>	Disable the automatic profile downgrade.
<b>cable upstream ofdma-prof-mgmt mer-margin-qdb</b>	Configure the offset.
<b>cable upstream ofdma-prof-mgmt exempt-mslot-pct</b>	Configure the percentage of minislot average RxMER that can be ignored in the recommended profile calculation.
<b>show cable ofdma-prof-mgmtrxmer-poll-interval</b>	Configure the RxMER poll interval.

# cable upstream ofdma-prof-mgmt downgrade

To configure the OFDMA profile downgrade, use the **cable upstream ofdma-prof-mgmt downgrade** command in cable interface configuration mode.

```
cable upstream ofdma-prof-mgmt downgrade { enable | hold-down minutes | interval seconds |
min-cws value | partial-hold-down value | partial-threshold value | rxmer-enable |
rxmer-exempt-mslot-pct value | rxmer-invalid-enable | threshold value }
```

## Syntax Description

<b>downgrade</b>	Configuration options to enable profile management downgrade and specify the downgrade interval, threshold value, hold-down time and min codewords needed for evaluation.
<b>enable</b>	Enable codeword error downgrade. To disable this feature, use no form of this command.
<b>hold-down</b> <i>minutes</i>	Specifies the time after a profile downgrade to defer modem from consideration by upgrade algorithms.
<b>interval</b> <i>seconds</i>	Specifies the downgrade assessment interval.
<b>min-cws</b> <i>value</i>	Specifies the minimum number of codewords required within downgrade interval to consider modem for profile downgrade.
<b>partial-hold-down</b>	Time in minutes that upgrade is disabled after a downgrade to partial-mode
<b>partial-threshold</b> <i>value</i>	Specifies the codeword error threshold above which to trigger profile downgrade to partial mode in hundredths of a percentage.
<b>rxmer-enable</b>	Enables RxMER downgrade.
<b>rxmer-exempt-mslot-pct</b> <i>value</i>	Specifies the number of minislots that can be below minimum IUC and not trigger downgrade.
<b>rxmer-invalid-enable</b>	Enable downgrade to partial based on invalid RxMER data.
<b>threshold</b> <i>value</i>	Specifies the codeword error threshold above which to trigger profile downgrade in hundredths of a percentage.

## Command Default

None.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
Cisco IOS XE Gibraltar 16.12.1x	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Gibraltar 16.12.1y	The <b>partial-threshold</b> and <b>partial-hold-down</b> options are added.
Cisco IOS XE Amsterdam 17.3.1w	The <b>rxmer-enable</b> and <b>rxmer-exempt-mslot-pct</b> options are added.

Release	Modification
Cisco IOS XE Cupertino 17.9.1y	The <b>rxmer-invalid-enable</b> option is added.

## Examples

The following example shows how to enable the codeword error threshold feature.

```
Router(config)# cable upstream ofdma-prof-mgmt downgrade enable
```

## cable upstream ofdma-prof-mgmt exempt-mslot-pct

To specify the percentage of minislot average RxMER that can be ignored in the recommended profile calculation, use the **cable upstream ofdma-prof-mgmt exempt-mslot-pct** command in cable interface configuration mode.

**cable upstream ofdma-prof-mgmt exempt-mslot-pct** *percent*

<b>Syntax Description</b>	<i>percent</i> Specify the minislot average RxMER that can be ignored in the recommended profile calculation in percentage. The valid range is from 0 to 100 percent.
---------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** None

**Command Modes** Interface configuration (cable interface only)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure the percentage of minislot average RxMER.

```
Router(config)# cable upstream ofdma-prof-mgmt exempt-mslot-pct 30
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable upstream ofdma-prof-mgmt prof-upgrade-auto</b>	Disable the automatic profile downgrade.
	<b>cable upstream ofdma-prof-mgmt mer-margin-qdb</b>	Configure the offset.
	<b>show cable ofdma-prof-mgmtrxmer-poll-interval</b>	Configure the RxMER poll interval.

## cable upstream ofdma-prof-mgmt mer-margin-qdb

To configure the offset in quarter-decibel (DB), when RxMER is mapped to the ideal bit loading, use the **cable upstream ofdma-prof-mgmt mer-margin-qdb** command in global configuration mode.

**cable upstream ofdma-prof-mgmt mer-margin-qdb** *quarter-decibel*

### Syntax Description

<i>quarter-decibel</i>	Quarter-decibel to configure the offset. The valid value is from 0 to 40 quarter-DB.
------------------------	--------------------------------------------------------------------------------------

### Command Default

0 quarter-DB

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This configured value (quarter-DB) is added to the RxMER values collected by CMTS before using the above mapping table, thus giving a user more control in selecting the recommended profiles.

### Examples

The following example shows how to configure the offset:

```
Router(config)# cable upstream ofdm-prof-mgmt mer-margin-qdb 20
```

### Related Commands

Command	Description
<b>cable upstream ofdma-prof-mgmt exempt-mslot-pct</b>	Specify the minislots average RxMER in percentage.
<b>cable upstream ofdma-prof-mgmt prof-upgrade-auto</b>	Disable the automatic profile downgrade.
<b>show cable ofdma-prof-mgmtrxmer-poll-interval</b>	Configure the RxMER poll interval.

## cable upstream ofdma-prof-mgmt prof-upgrade-auto

To disable the auto profile management for OFDMA upstream channels, use the **no cable upstream ofdma-prof-mgmt prof-upgrade-auto** command in global configuration mode. If disabled, profile changes will not be implemented automatically by the system.

**no cable upstream ofdma-prof-mgmt prof-upgrade-auto**

### Command Default

The automatic profile management is enabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to disable automatic profile management.

```
Router(config)# no cable upstream ofdma-prof-mgmt prof-upgrade-auto
```

### Related Commands

Command	Description
<b>cable upstream ofdma-prof-mgmt exempt-mslot-pct</b>	Specify the minislot average RxMER in percentage.
<b>cable upstream ofdma-prof-mgmt mer-margin-qdb</b>	Configure the offset.
<b>show cable ofdma-prof-mgmt-rxmer-poll-interval</b>	Configure the RxMER poll interval.

# cable upstream ofdma-prof-mgmt rxmer-poll-interval

To configure the interval at which to send periodic Receive Modulation Error Ratio (RxMER) probes and periodic equalization probes, use the **cable upstream ofdma-prof-mgmt rxmer-poll-interval** command in global configuration mode.

**cable upstream ofdma-prof-mgmt rxmer-poll-interval***interval*

**no cable upstream ofdma-prof-mgmt rxmer-poll-interval**

## Syntax Description

<i>interval</i>	RxMER poll interval in minutes. The valid range is from 5 to 1440 minutes. A value of 1440 disables periodic probing.
-----------------	-----------------------------------------------------------------------------------------------------------------------

## Command Default

60 minutes

## Command Modes

Global configuration (config)

## Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The CMTS uses upstream probing to collect RxMER data per CM. This occurs during registration and periodically thereafter. The collected RxMER data is averaged per minislot and used to compute the recommended IUCs for each CM.

The **no cable upstream ofdma-prof-mgmt rxmer-poll-interval** command sets the rxmer-poll-interval to 1440, which is the value to disable the feature. The rxmer data is also not displayed after disabling the feature.

## Examples

The following example shows how to configure the offset:

```
Router(config)# cable upstream ofdm-prof-mgmt rxmer-poll-interval 20
```

## Related Commands

Command	Description
<b>cable upstream ofdma-prof-mgmt exempt-mslot-pct</b>	Specify the minislot average RxMER in percentage.
<b>cable upstream ofdma-prof-mgmt prof-upgrade-auto</b>	Disable the automatic profile downgrade.
<b>cable upstream ofdma-prof-mgmt mer-margin-qdb</b>	Configure the offset.

## cable upstream power-adjust

To control power-adjustment methods on the Cisco CMTS, use the **cable upstream power-adjust** command in cable interface configuration mode or MAC domain profile configuration mode. To return to the default values, use the **no** form of this command.

**cable upstream** *n* **power-adjust** {**continue** *pwr-level* | **noise** *perc-pwr-adj* | **threshold** *value*}  
**no cable upstream** *n* **power-adjust** {**continue** | **noise** | **threshold**}

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<b>continue</b> <i>pwr-level</i>	Specifies the power threshold value that determines the value of the Ranging Status field in the Ranging Response (RNG-RSP) messages that the CMTS sends to the CM. The valid range is from 2 to 15 dB, with a default of 4 dB.
<b>threshold</b> <i>value</i>	Specifies the power adjustment threshold. The threshold range is from 0 to 10 dB, with a default of 1 dB.
<b>noise</b> <i>perc-pwr-adj</i>	Specifies the percentage of power adjustment packets that is required to change the adjustment method from the regular power-adjustment method to the noise power-adjustment method, which uses an averaging algorithm to smooth out wide jumps in the power level. The valid range is 10 to 100 percent, with a default of 30 percent.

### Command Default

The **continue** option defaults to 4 dB, the **noise** option defaults to 30 percent, and the **threshold** option defaults to 1 dB.

### Command Modes

Interface configuration (cable interface only)

MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.0(7)T	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS XE Fuji 16.7.1	This command was modified to support MAC domain profile configuration on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

When a CM comes online, it sets itself for the optimal power level, as determined by the CMTS. As the CMTS periodically polls each CM, the CMTS examines the CM's power level and orders the CM to adjust its power level to adapt to current total attenuation between it and the CMTS. These power adjustments can be required because of temperature variations, upstream frequency hopping, or increased attenuation that has been added either intentionally or unintentionally. The **cable upstream power-adjust** command controls how the CMTS makes these power adjustments.

---

**Note** To set the upstream power level on the CMTS, see the **cable upstream power-level** command.

---

### Setting the threshold Option

The **threshold** option specifies the allowable range between the target upstream power for a CM and the actual receive power that the CMTS is measuring for that CM. If the CM receive power level is above or below the target power level by a value that is greater than the **threshold** option, the CMTS will command the CM to change its power level. When the CMTS receive power level for a CM falls within the **threshold** range of the target power level, the CMTS stops commanding the CM to change its power level.

For example, the default **threshold** value of 1 dB means that the CM must be 1 dB above or below its target power range before the CMTS will command it to change its power level. If the CM is within 1 dB of its target power level, the CMTS does not adjust the CM's power level.

---

**Note** The **threshold** parameter can be set from 0 dB to 10 dB with a default of 1 dB. However, do not set the **threshold** to 0 dB because this means that the CMTS will command all CMs to continually change their power levels until the CMTS measures the power levels at exactly 0 dBmV. Cisco recommends that you set the **threshold** parameter to a minimum of its default value of 1 dB so that the CMs do not change their power levels continually for minuscule RF plant variations.

---

### Setting the continue Option

The **continue** option specifies the maximum allowable range for the CM's power level, in relation to its target power level. The CM can operate even at its maximum transmit power level, as long as it is within the **continue** range. The **continue** parameter can be set from 2 dB to 15 dB, with a default of 4 dB. For example, with the value of 2 dB, the CM can operate within 2 dB of its target power level, even if it is transmitting at its maximum power level.

The **continue** option works together with the **threshold** option to control the CM's operation. If the CM is within the **threshold** range, the CMTS sets the Ranging Status field of its RNG-RSP messages to SUCCESS. If the CM is outside the **threshold** range, but within the **continue** range, the CMTS sets the Ranging Status field to CONTINUE.

---

**Note** Cisco recommends designing the network so that CMs are at least 6 dB from the CM's maximum transmit power level. This will accommodate new services, changing modulation schemes, different channel widths, customer-installed passives, temperature variations, and other non-linearities. DOCSIS specifies a minimal power range of +8 dBmV to +55 dBmV for 16-QAM operation and +8 dBmV to +58 dBmV maximum power level for QPSK operation. Cisco CMs typically have a maximum power level of +60 dBmV, which exceeds the DOCSIS standards.

---

---

**Tip** If a number of CMs are transmitting close to their maximum transmit power, try increasing the **continue** range to allow the CMTS to continue adjusting the CM's power levels. This situation can happen when systems use high value taps, such as 29 dB taps, in the design of the plant.

---

---

**Note** When the CM requires 16 successive power adjustments that are greater than the value of the **continue** option, the CMTS re-initializes the CM and starts to rescan downstream carriers, as per the DOCSIS specification.

---

### Determining if the CM has Reached Its Maximum Power Level

Per the DOCSIS specification, the CMTS does not adjust the CM power level by commanding the CM to set itself to an absolute power level. Instead, the CMTS changes the CM power levels by commanding the CM to make relative power adjustments, using increments of +/-0.25 dB (or multiples thereof).

If the CMTS commands a CM to adjust its power level by a particular amount, but the measured power level afterwards shows that the CM has made a smaller adjustment than requested, the **show cableflap-list** and **show cable modem** commands show an exclamation point (!) for that particular CM. This typically indicates that the CM has reached its maximum power level.

If the CM has not reached its maximum power level, but the **show cable flap-list** and **show cable modem** commands still show an exclamation point (!) for that CM, the problem could be a fault in the upstream path of the cable network. This fault is typically found as amplifier misalignment, where one upstream amplifier is adjusted with too much input attenuation, and the next has too little. The amplifier with too little attenuation enters non-linear operation and begins serious intermodulation.

Another possible cause is a faulty CM or a faulty connection between the CM and cable network. For example, a faulty coaxial cable or bad F-connector could also create noise problems.

---

**Note** A CM that shows an exclamation point (!) in the **show cable flap-list** and **show cable modem** displays is typically more prone to packet loss than other CMs.

---

### Setting the noise Option

The **noise** option specifies that when the number of power adjustments beyond the threshold amount exceeds a certain percentage of the total Ranging Requests for a CM, the CMTS switches into its noise power-adjustment method. The noise power-adjustment method uses an averaging algorithm to make power adjustments for a particular CM, so that if a modem is experiencing wide swings in its power levels (known as “bouncing”), the CMTS averages the power levels before sending a power adjustment to the CM. The CMTS returns to the normal power adjust method after receiving ten Ranging Request messages with power adjustments below the threshold value.

For example, the **cable upstream power-adjust noise 30** command instructs the CMTS that when 30 percent (3 out of the last 10) of the Ranging Responses for a particular CM resulted in a power adjustment beyond the threshold level, the CMTS begins using power averaging for that CM to adjust its power level.

---

**Tip** The **cable upstream power-adjust noise** command is typically not needed during normal operations, but it can help in certain situations where the cable plant is experiencing ingress noise and other interference that is forcing many CMs to frequently re-range. If the **show cable flap-list** and **show cable modem** commands show a large number of CMs with asterisks (\*), experiment with the **noise** option, so that the CMTS will average its CM power readings before sending any power adjustments to the CMs.

---

**Note** When a CM is in power averaging mode, the **show cable flap-list** and **show cable modem** commands shows an asterisk (\*) for that particular CM.

### Examples

The following example shows the commands needed so that the CMTS will begin using the power averaging adjustment method when 50 percent of Ranging Requests result in a power adjustment beyond the threshold level of 2 dB:

```
Router(config)# interface c6/0
Router(config-if)# cable upstream 0 power-adjust threshold 2
Router(config-if)# cable upstream 0 power-adjust noise 50
Router(config-if)#
```

### Related Commands

Command	Description
<b>cable upstream frequency</b>	Configures a fixed frequency of the upstream RF carrier for an upstream port.
<b>cable upstream power-level</b>	Sets the input power level for the upstream radio frequency (RF) carrier.
<b>show cable flap-list</b>	Displays a list of CMs that have exceeded the threshold number of power adjustments.
<b>show cable modem</b>	Displays CM configuration settings.

## cable upstream power-level

To set the input power level for the upstream radio frequency (RF) carrier in decibels per millivolt (dBmV), use the **cable upstream power-level** command in cable interface configuration mode. To restore the default value for this command, use the **no** form of this command.

**cable upstream *n* power-level *dbmv***  
**no cable upstream *n* power-level *dbmv***

Syntax Description		
<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.	
<i>dbmv</i>	Decibels per millivolt designating the upstream signal input power level. Valid range is –16 dBmV to +26 dBmV, depending on the cable interface and the upstream’s symbol rate (channel width).	

**Command Default** 0 dBmV

**Command Modes** Interface configuration (cable interface only)

Command History	Release	Modification
	11.3 XA	This command was introduced.
	12.2(15)BC1	The allowable range of power levels was changed so that it depends on the upstream’s channel width.
	IOS-XE 3.15.0S	This command was replaced by the <b>us-channel power-level</b> command on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The Cisco CMTS controls the output power levels of the CMs to meet the desired upstream input power level. The nominal input power level for the upstream RF carrier is specified in decibels per millivolt (dBmV). The default setting of 0 dBmV is the optimal setting for the upstream power level.

The valid range for the input power level depends on the data rate, as expressed as the symbol rate and channel width. The table below shows the valid power levels for each allowable rate, as given in the DOCSIS specification. Higher (more positive) values cause the CMs to increase their transmit power, achieving a greater carrier-to-noise ratio (CNR).

**Table 22: Allowable DOCSIS Power Levels**

Symbol Rate (Symbols per second)	Channel Width (Hz)	Allowable Power Range (dBmV)
160,000	200,000	–16 to +14
320,000	400,000	–13 to +17
640,000	800,000	–10 to +20
1,280,000	1,600,000	–7 to +23

Symbol Rate (Symbols per second)	Channel Width (Hz)	Allowable Power Range (dBmV)
2,560,000	3,200,000	-4 to +26
5,120,000 <sup>9</sup>	6,400,000	-1 to +29 (max. valid value for DOCSIS is +26)

<sup>9</sup> The 5.12 MSymbols/sec symbol rate and 6.4 MHz channel width are supported only on upstreams that are configured for DOCSIS 2.0 A-TDMA-only operation.

**Note** Some cable interfaces might allow smaller ranges of either -10 to +10 or -10 to +25 dBmV.

**Tip** You can use inline attenuators to force CMs to transmit at higher power levels and to achieve a higher CNR value on the network.

**Caution** If you increase the input power level or add inline attenuators before the CMTS, the CMs on your HFC network increase their transmit power level. Be careful if you adjust this parameter. You might violate the upstream return laser design parameters or exceed the CM's maximum transmit power level.

**Note** Do not adjust your input power level by more than 5 dB in a 30-second interval. If you increase the power level by more than 5 dB within 30 seconds, you will disrupt CM service on your network. If you decrease the power level by more than 5 dB within 30 seconds, the CMs on your network will be forced to re-range.

**Tip** When setting upstream power levels, Cisco recommends that the adjacent channels of equal bandwidth not have a large variation. The recommended maximum input power variance is 5 to 6 dB.

## Examples

The following example shows how to set the input power level for upstream port 0 to -5 dBmV:

```
Router(config)# interface cable 5/1/0
Router(config-if)# cable upstream 0 power-level -5
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable upstream fec</b>	Enables the upstream FEC.
<b>cable upstream frequency</b>	Enters a fixed frequency of the upstream RF carrier for an upstream port.
<b>cable upstream power-adjust</b>	Controls how the CMTS adjusts the CM power level so that the CMs reach the target transmit power setting.

Command	Description
<b>cable upstream shutdown</b>	Disables the upstream port.

To set the input power level for the upstream channel in decibels per millivolt (dBmV), use the **cable upstream power-level** command in cable interface configuration mode. The value in dBmV reflects the upstream RF set point's (the entry point the RF signal enter CMTS) power level. It is recommended to use the default value, zero (0) dBmV. To restore the default value for this command, use the **no** form of this command.

**Note** If an upstream controller contains both OFDMA and SC-QAM channels, the upstream channel's power level setting difference between OFDMA and SC-QAM should be within the following ranges, to avoid unexpected behavior:

- For 6.4 MHz, the difference should not be larger than 10 dB.
- For 3.2 MHz, the difference should not be larger than 7 dB.
- For 1.6 MHz, the difference should not be larger than 4 dB.

The above power setting guideline applies to iCMTS, Node RPD, 6x12 shelf RPD, and HA-Shelf RPD.

## cable upstream priority

To specify the relative priority of an upstream channel, use the **cable upstream priority** command in cable interface configuration mode. To set the default value, use the **no** form of this command.

```
cable upstream n priority value
no cable upstream n priority
```

### Syntax Description

<i>n</i>	Specifies the upstream channel. Valid values start with 0 for the first upstream channel on the cable interface line card.
<i>value</i>	Specifies the priority. Valid values are from lowest priority 0 to highest priority 7, with a default value of 0.

### Command Default

0.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1w	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example sets the priority to 1 on upstream channel 0:

```
Router(config)# interface cable 3/0/1
Router(config-if)# cable upstream 0 priority 1
Router(config-if)#
```

## cable upstream qos wfq

To configure weighted fair queuing (WFQ) parameters for optimum bandwidth utilization for upstream service flows on a cable interface, use the **cable upstream qos wfq** command in cable interface configuration mode. To disable this configuration, use the **no** form of this command.

```
cable upstream qos wfq {class | activity | weights priority0-priority7}
no cable upstream qos wfq {class | activity | weights priority0-priority7}
```

Syntax Description	class	Enables class-based weighted fair queuing.
	activity	Enables activity-based weighted fair queuing.
	weights <i>priority0-priority7</i>	Specifies custom weight values for all the eight service flow priorities in a service class. By default, the weight of a priority is equal to “priority+1.” For example, priority 0 has a weight of 1 and priority 1 has a weight of 2.  You must specify custom weight values for all the eight service flow priorities (0 to 7) when you modify the default weights of priorities. The valid range is from 1 to 255.

**Command Default** None

**Command Modes** Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	12.2(33)SCD2	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure WFQ parameters on a cable interface in slot 7, subslot 1, and port 0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 7/1/0
Router(config-if)# cable upstream qos wfq class
Router(config-if)# cable upstream qos wfq activity
Router(config-if)# cable upstream qos wfq weights 10 20 30 40 50 60 70 80
```

The following example shows how to configure WFQ parameters on a cable interface in slot 3, subslot 0, and port 0 on a Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface cable 3/0/0
Router(config-if)# cable upstream qos wfq class
Router(config-if)# cable upstream qos wfq activity
Router(config-if)# cable upstream qos wfq weights 10 20 30 40 50 60 70 80
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show interface cable mac-scheduler</b>	Displays the current scheduling state, statistics, and WFQ parameters configured on a cable interface.

## cable upstream range-backoff

To specify automatic or configured initial ranging backoff calculation, use the **cable upstream range-backoff** command in cable interface configuration mode. To set default values, use the **no** form of this command.

```
cable upstream n range-backoff {automatic | start end}
no cable upstream n range-backoff
```

### Cisco cBR Series Converged Broadband Routers

```
cable upstream n range-backoff start end
no cable upstream n range-backoff
```

#### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<b>automatic</b>	Specifies the fixed data backoff start and end values. <b>Note</b> The <b>automatic</b> setting is not supported on Cisco uBR-MC5X20S/U cable interface line cards, which should use manually configured ranging backoff instead.
<i>start</i>	Binary exponential algorithm. Sets the start value for initial ranging backoff. Valid values are from 0 to 15.
<i>end</i>	Binary exponential algorithm. Sets the end value for initial ranging backoff. Valid values are from 0 to 15.

#### Command Default

Ranging backoff is enabled with the **automatic** setting

#### Command Modes

Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

#### Command History

Release	Modification
12.1 T	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers. The <b>automatic</b> keyword was removed.

#### Usage Guidelines

The DOCSIS-specified method of contention resolution for CMs used to send data or requests on the upstream channel is a truncated binary exponential back-off with the initial backoff window and the maximum backoff window controlled by the CMTS. The Cisco CMTS router specifies backoff window values for both data and initial ranging and sends these values downstream as part of the Bandwidth Allocation Map (MAP) MAC message. The values are power-of-two values. For example, a value of 4 indicates a window between 0 and 15; a value of 10 indicates a window between 0 and 1023.

The **automatic** setting is optimized for a maximum of 250 CMs per upstream port. Set manual values for data backoff windows only when operating with more than 250 CMs per upstream port. (The **automatic** setting is not supported on Cisco uBR-MC5X20S/U cable interface line cards, which should use manually configured ranging backoff instead.)

**Tip** Use the **show controllers cable upstream** command to display the current Ranging Backoff settings.

### Examples

The following example shows how to set the range backoff to **automatic** for upstream port 2 on a Cisco uBR10012 router:

```
Router(config)# interface cable 4/0
Router(config-if)# cable upstream 2 range-backoff automatic
Router(config-if)#
```

The following example shows how to set the range backoff for upstream port 2 on a Cisco cBR-8 router:

```
Router(config)# interface cable 3/0/1
Router(config-if)# cable upstream 2 range-backoff 0 10
Router(config-if)#
```

### Related Commands

Command	Description
<b>cable insertion-interval</b>	Configures the interval between consecutive initial ranging slots on an upstream.
<b>cable upstream data-backoff</b>	Specifies automatic or fixed start and stop values for data backoff.

# cable upstream ranging-init-technique

To configure the initial ranging technique for the modem in the Multiple Transmit Channel (MTC) mode, use the **cable upstream ranging-init-technique** command in interface configuration mode. To disable the ranging initialization technique, use the **no** form of this command.

**cable upstream ranging-init-technique 1-4**  
**no cable upstream ranging-init-technique**

## Syntax Description

<i>1-4</i>	Type of ranging. <ul style="list-style-type: none"> <li>• 1—broadcast</li> <li>• 2—unicast</li> <li>• 3—broadcast or unicast</li> <li>• 4—direct use</li> </ul>
------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

The default option is 1—broadcast

## Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The ranging initialization technique is used when the modem transitions from a single channel to the multiple transit channel mode (MTC-mode), for the initial ranging on the newly added channels during registration.

Use the default value of 1 for initial ranging.

## Examples

The following example shows how to configure the initial ranging for the modem in the MTC-mode:

```
Router# configure terminal
Router(config)# interface cable 7/0/1
Router(config-if)# cable upstream ranging-init-technique 1
```

## Related Commands

Command	Description
<b>cable mtc-mode</b>	Enables the MTC-mode for a MAC interface.
<b>interface cable</b>	Specifies a cable interface.

# cable upstream ranging-poll

To change the default ranging poll interval (20 seconds) on upstream channels, use the **cable upstream ranging-poll** command in cable interface configuration mode. To disable this configuration, use the **no** form of this command.

**cable upstream ranging-poll** [*interval value* | **t4-multiplier** *timeout-value*]  
**no cable upstream ranging-poll** [*interval value* | **t4-multiplier** *timeout-value*]

<b>Syntax Description</b>	<b>interval</b> <i>value</i>	(Optional) Specifies the ranging poll interval in milliseconds. Valid values are from 20000 to 30000. The default value is 20000.
	<b>t4-multiplier</b> <i>timeout-value</i>	(Optional) Specifies T4 timeout multiplier value for the cable modems that are in the MTC mode. The valid range is from 1 to 10.

**Command Default** None

**Command Modes** Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** T4 multiplier is the T4 timeout multiplier value for cable modems that are in the MTC mode. The default value is derived from the number of channels in the modem transmit channel set. You can change the default T4 multiplier value using the **cable upstream ranging-poll** command in cable interface configuration mode. For example, DOCSIS 2.0 defines T4 timeout for the modem at 30 seconds. If the T4 multiplier value is equal to one, the cable modem will T4 time out in every 30 seconds. If you change the T4 multiplier to four, then the new T4 timeout value will be 120 seconds (4 x 30 = 120).

In the MTC mode, you can increase the T4 timeout value in order to reduce the router overhead associated with processing of ranging request (RNG-REQ) slots and ranging response (RNG-RSP) messages. If an RNG-RSP message does not contain a T4 timeout multiplier value, then the cable modem uses the default T4 timeout value.

**Note** We recommend that you do not modify the default ranging poll interval unless required. With the default configuration, a DOCSIS 2.0 cable modem in non-MTC mode performs ranging on one upstream channel every 20 seconds.

## Examples

The following example shows how to change the default ranging poll interval and the T4 timeout multiplier value on a cable interface line card:

```
Router# configure terminal  
Router(config)# interface cable 7/1/0  
Router(config-if)# cable upstream ranging-poll interval 24000 t4-multiplier 4
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable mtc-mode</b>	Enables the Multiple Transmit Channel mode (MTC) for a MAC interface.

## cable upstream rate-adapt (global)

To globally enable upstream utilization optimization on all cable modem upstream flows, use the **cable upstream rate-adapt** command in global configuration mode. To disable global upstream utilization optimization, use the **no** form of this command.

**cable upstream rate-adapt** [**local** | **priority** *value* | **rate** *number*]

**no cable upstream rate-adapt** [**local** | **priority** *value* | **rate** *number*]

### Syntax Description

<b>local</b>	(Optional) Specifies upstream utilization optimization is enabled on a specific upstream.
<b>priority</b> <i>value</i>	(Optional) Specifies upstream utilization optimization is enabled if an upstream flow meets or exceeds a defined priority. The valid range is 0–7.
<b>rate</b> <i>number</i>	(Optional) Specifies upstream utilization optimization is enabled if an upstream flow meets or exceeds the set minimum max-rate of the flow. The valid range is 0–30000000.

### Command Default

Upstream utilization optimization is globally disabled.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If upstream utilization optimization is globally enabled, activated service flows are configured for upstream utilization optimization. The command also turns on local upstream utilization optimization so specific local upstreams can be configured to be rate-adapt enabled. Using the **priority** or **rate** option allows you to restrict upstream utilization optimization to service flows that meet or exceed specified levels for priority or rate.

### Examples

The following example enables upstream utilization optimization globally on all upstream flows.

```
Router(config)# cable upstream rate-adapt
```

### Related Commands

Command	Description
<b>cable upstream rate-adapt (interface)</b>	Enables and configures upstream utilization optimization locally.
<b>show cable rate-adapt</b>	Displays the global and local upstream utilization optimization configuration parameters.

## cable upstream rate-adapt (interface)

To enable and configure upstream utilization optimization locally, use the **cable upstream rate-adapt** command in cable interface configuration mode. To disable upstream utilization optimization on the specified upstream flow, use the **no** form of this command.

**cable upstream** *port* **rate-adapt** [**bcs** *slots* | **duration** *milliseconds* | **fcms-off** | **priority** *value* | **rate** *number*]

**no cable upstream** *port* **rate-adapt** [**bcs** *slots* | **duration** *milliseconds* | **fcms-off** | **priority** *value* | **rate** *number*]

### Syntax Description

<i>port</i>	Identifies the specific upstream flow to be optimized and configured.
<b>bcs</b> <i>slots</i>	(Optional) Specifies the number of broadcast contention minislots (BCS). MAPs that have gaps are filled with BCS. You can override the default of 10 with a larger or smaller number using the <b>bcs</b> option. The valid range is 0–80. The default is 10 BCS.
<b>duration</b> <i>milliseconds</i>	(Optional) Specifies the length of time, in milliseconds, that a flow rate-adapts. This keyword overrides the default duration. The default is 1. The valid range is 0–2000.
<b>fcms-off</b>	(Optional) Disables the forced broadcast contention minislot at the end of a filled MAP.
<b>priority</b> <i>value</i>	(Optional) Specifies the minimum priority required to enable rate-adapt on a flow. This keyword overrides any globally configured rate-adapt priority. The valid range is 0–7.
<b>rate</b> <i>number</i>	(Optional) Specifies the minimum max-rate required to enable rate-adapt on a flow. This keyword overrides any globally configured rate-adapt rate. The valid range is 0–30000000.

### Command Default

Upstream utilization optimization is not enabled on a local upstream.

### Command Modes

Interface configuration—cable interface only (config-if)

### Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If eligible, local upstream flows can utilize upstream utilization optimization.

### Examples

The following example enables and configures rate-adapt on upstream 0 with a priority of 6 and a rate of 200.

```
Router(config-if)# cable upstream 0 rate-adapt priority 6 rate 200
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable upstream rate-adapt (global)</b>	Enables upstream utilization optimization globally on all cable modem upstream flows.
<b>show cable rate-adapt</b>	Displays the global and local upstream utilization optimization configuration parameters.

## cable upstream rate-limit

To set DOCSIS rate limiting for an upstream port on a cable interface line card, use the **cable upstream rate-limit** command in cable interface configuration mode. To disable DOCSIS rate limiting for the upstream port, use the **no** form of this command.

```
cable upstream n rate-limit [token-bucket [shaping]]
no cable upstream n rate-limit
```

<b>Syntax Description</b>	<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
	<b>token-bucket shaping</b>	(Optional) Enables rate limiting for the specified upstream cable interface using the token-bucket policing algorithm. The <b>shaping</b> option enables token-bucket shaping. <b>Note</b> For Cisco cBR Series Converged Broadband Routers, rate limiting is always enabled.

**Command Default** Token-bucket algorithm with traffic shaping

**Command Modes** Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	11.3(6)NA	This command was introduced for the Cisco uBR7246VXR universal broadband routers.
	11.3(9)NA	The <b>shaping</b> keyword was added.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Upstream rate limiting allows upstream bandwidth requests from rate-exceeding CMs to be buffered without incurring TCP-related timeouts and retransmits. This enables the Cisco CMTS to enforce the peak upstream rate for each CM without degrading overall TCP performance for the subscriber CPE devices. Upstream grant shaping is per cable modem (SID).

When the **token-bucket** algorithm is configured, the Cisco CMTS automatically drops packets in violation of allowable upstream bandwidth.

Use of the default value (the upstream port's rate limit) enforces strict DOCSIS-compliant rate limiting. Cisco highly recommends to using the default setting of **token-bucket** with the **shaping** option.

This command is specific to the uBR7225VXR routers only.

### Examples

The following example shows how to configure the token bucket filter algorithm with traffic shaping on upstream port 4:

```
Router(config-if)# cable upstream 4 rate-limit token-bucket shaping
```

---

**Related Commands**

Command	Description
<b>cable downstream rate-limit</b>	Enables DOCSIS rate limiting on downstream traffic.

## cable upstream rate-limit-bwreq exempted-priority

To configure the service flow priority of the bandwidth requests that should be exempted from being throttled by the upstream (US) bandwidth request rate limiting (BRRL) feature, use the **cable upstream rate-limit-bwreq exempted-priority** command in global configuration mode. To reset the exempted priority to the default value, use the **no** form of this command.

**cable upstream rate-limit-bwreq exempted-priority** *priority*  
**no cable upstream rate-limit-bwreq**

### Syntax Description

<i>priority</i>	Service flow priority.  Bandwidth requests with this service flow priority value (and above) are exempted from being throttled by the BRRL feature. For example, if the priority value is set to 3, then bandwidth requests with priority 3, 4, 5, 6, and 7 are exempted. The valid range is from 0 to 7.
-----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

All bandwidth requests are throttled by the BRRL feature.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The upstream BRRL feature throttles incoming bandwidth requests in order to control CPU consumption by the US scheduler.

The **cable upstream rate-limit-bwreq exempted-priority** command enables you to configure an exempted priority. Any best effort (BE) service flow bandwidth requests received with this configured priority or above, is exempted from BRRL and is therefore not dropped even if high CPU consumption by the US scheduler is observed. For example, if the configured exempted priority is 4, any bandwidth request with priority 4, 5, 6, or 7 is not dropped even if high CPU consumption is observed.

Exempted service flow priority is a platform level configuration and is applicable to all line cards. If the exempted priority is set to value zero, all the BE bandwidth requests are exempted from being throttled by the BRRL feature.

### Examples

The following example shows how to configure a BRRL exempted service flow priority to value 5:

```
Router# configure terminal
Router(config)# cable upstream rate-limit-bwreq exempted-priority 5
```

## cable upstream rate-limit-ccf

To configure rate limiting parameters for upstream bonded service flows on a Cisco uBR10-MC5X20H cable interface line card, use the **cable upstream rate-limit-ccf** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**cable upstream rate-limit-ccf** [**aggregated-burst** *value* | **aggregated-throughput** *value* | **cpu-burst** *value* | **cpu-threshold** *value*]  
**no cable upstream rate-limit-ccf** [**aggregated-burst** *value* | **aggregated-throughput** *value* | **cpu-burst** *value* | **cpu-threshold** *value*]

### Syntax Description

<b>aggregated-burst</b> <i>value</i>	(Optional) Specifies the burst rate for aggregated throughput-based rate limiting in bits. The valid range is from 0 to 250000000. The default value is 8000000.
<b>aggregated-throughput</b> <i>value</i>	(Optional) Specifies the throughput value for throughput-based rate limiting in bits per second (bps). The valid range is from 0 to 540000000. The default value is 115000000.
<b>cpu-burst</b> <i>value</i>	(Optional) Specifies the CPU burst for Continuous Concatenation and Fragmentation (CCF) in percentage. The valid range is from 0 to 100. The default value is 10.
<b>cpu-threshold</b> <i>value</i>	(Optional) Specifies the CPU threshold for CCF in percentage. The valid range is from 0 to 100. The default value is 50.

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure rate limiting parameters for upstream bonded service flows on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# cable upstream rate-limit-ccf
Router(config)# cable upstream rate-limit-ccf aggregated-burst 25000
Router(config)# cable upstream rate-limit-ccf aggregated-throughput 540000
Router(config)# cable upstream rate-limit-ccf cpu-burst 30
Router(config)# cable upstream rate-limit-ccf cpu-threshold 60
```

**Related Commands**

Command	Description
<b>show cable rate-limit-ccf</b>	Displays information about rate limiting criteria configured on a Cisco uBR10-MC5X20H cable interface line card.

## cable upstream resiliency

To configure cable upstream resiliency on a cable interface line card, use the **cable upstream resiliency** command in cable interface configuration mode. To disable the configuration, use the **no** form of this command.

**cable upstream resiliency** {**channel-down-detect** *number* | **data-burst snr** *number* **ufec** *number* **cfec** *number* **hysteresis** *number* | **modem-offline-detect** *number* | **on-failure** {**disable-channel** | **extended-ranging** | **reset-modem**} | **sf-move** {**NRTPS** | **RTPS** | **UGS** | **UGS-AD**}}

**no cable upstream resiliency** {**channel-down-detect** *number* | **data-burst snr** *number* **ufec** *number* **cfec** *number* **hysteresis** *number* | **modem-offline-detect** *number* | **on-failure** {**disable-channel** | **extended-ranging** | **reset-modem**} | **sf-move** {**NRTPS** | **RTPS** | **UGS** | **UGS-AD**}}

To configure data-burst resiliency polling interval, use the **cable upstream resiliency data-burst polling-interval** command in global configuration mode. To disable the configuration, use the **no** form of this command.

**cable upstream resiliency data-burst polling-interval** *number*

**no cable upstream resiliency data-burst polling-interval** *number*

### Syntax Description

<b>channel-down-detect</b> <i>number</i>	Specifies the threshold (number of consecutive ranging misses) to determine if a channel is down. The valid values are from 8 to 64.  Starting from Cisco IOS-XE 3.15.0S, the valid values are 32-128.
<b>data-burst snr</b> <i>number</i> <b>ufec</b> <i>number</i> <b>cfec</b> <i>number</i> <b>hysteresis</b> <i>number</i>	Specifies the upstream channel data burst resiliency. <ul style="list-style-type: none"> <li>• <b>snr</b> <i>number</i>—Sets the threshold value for SNR. The valid values are from 10 to 40.</li> <li>• <b>ufec</b> <i>number</i>—Sets the threshold value for uncorrectable forward error correction (uFEC) error. The valid values are from 0 to 100.</li> <li>• <b>cfec</b> <i>number</i>—Sets the threshold value for correctable forward error correction (cFEC) error. The valid values are from 0 to 100.</li> <li>• <b>hysteresis</b> <i>number</i>—Sets the threshold value for hysteresis. The valid values are from 0 to 15.</li> </ul>
<b>modem-offline-detect</b> <i>number</i>	Specifies the threshold (number of consecutive ranging misses) to determine if a CM is offline. The valid values are from 4 to 16.
<b>on-failure</b>	Allows you to specify what should be done if the channel is down and the CM is offline.
<b>disable-channel</b>	Allows the CMTS to mark the channel as unusable when a failure is detected.
<b>extended-ranging</b>	Allows the CMTS to continue ranging when a failure is detected.
<b>reset-modem</b>	Enforces the CM to go offline when a failure is detected.

<b>sf-move</b>	Moves the upstream service flows on an impaired upstream channel to another good upstream channel in the transmit channel set of the cable modem without resetting the cable modem.  Starting from Cisco IOS-XE 3.15.0S, this option is extended to all service flows for single channel bonding groups, RTPS, NRTPS, UGS and UGS-AD.
<b>NRTPS</b>	Moves NRTPS type service flows.
<b>RTPS</b>	Moves Real-time Polling Service (RTPS) type service flows.
<b>UGS</b>	Moves Unsolicited Grant Service (UGS) type service flows.
<b>UGS-AD</b>	Moves UGS-AD type service flows.
<b>polling-interval</b> <i>number</i>	<b>Note</b> <b>polling-interval</b> keyword is for global configuration mode.  Specifies the polling interval for data-burst resiliency in seconds. The valid values are from 5 to 3600.

**Command Default**

By default, the threshold to determine if a channel is down is not enabled, the CMTS is set to continue ranging when a failure is detected and the threshold to determine if a CM is offline is set to 8.

**Command Modes**

Interface configuration (config-if) and Global configuration (config)

**Command History**

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
12.2(33)SCG	This command was modified. The <b>sf-move RTPS</b> keyword was added.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.
IOS-XE 3.18.0S	This command was modified for the Cisco cBR Series Converged Broadband Routers. The <b>data-burst snr number ufec number cfec number hysteresis number</b> keyword was added for interface configuration mode and <b>data-burst polling-interval number</b> keyword was added for global configuration mode.

**Usage Guidelines**

The **cable upstream resiliency** command is used to configure the [Upstream Channel Bonding](#) feature.

**Examples**

The following example shows how to configure upstream resiliency with different keywords on a cable interface in slot 5, subslot 1, and port 0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 5/1/0
Router(config-if)# cable upstream resiliency channel-down-detect 30
Router(config-if)# cable upstream resiliency modem-offline-detect 16
Router(config-if)# cable upstream resiliency on-failure disable-channel
Router(config-if)# cable upstream resiliency sf-move NRTPS
Router(config-if)# cable upstream resiliency sf-move RTPS
```

```
Router(config-if)# cable upstream resiliency sf-move UGS
Router(config-if)# cable upstream resiliency sf-move UGS-AD
```

The following example shows how to configure RTPS type service flow move on a cable interface in slot 7, subslot 0, and port 0 in Cisco IOS Release 12.2(33)SCG:

```
Router#show run all | i sf-move
no cable upstream resiliency sf-move RTPS
```

```
Router#configure terminal
Router(config)#interface cable 7/0/0
Router(config-if)#cable upstream resiliency sf-move RTPS
Router(config-if)#end
Router#
Router#show run interface cable 7/0/0 | i sf-move
cable upstream resiliency sf-move RTPS
```

The following example shows how to configure the upstream channel data burst resiliency:

```
Router#configure terminal
Router(config)#interface cable 0/0/1
Router(config-if)#cable upstream resiliency data-burst snr 24 ufec 1 cfec 0 hysteresis 3
Router(config-if)#end
```

The following example shows how to set a global time interval to loop all the upstream bonding modems:

```
Router#configure terminal
Router(config)#cable upstream resiliency data-burst polling-interval 60
Router(config)#end
```

#### Related Commands

Command	Description
<b>interface cable</b>	Configures cable interface.

## cable upstream resiliency recover

To automatically recover the cable modem after it is downgraded to upstream partial mode, use the **cable upstream resiliency recover** command in global configuration mode. This feature is enabled by default.

**cable upstream resiliency recover delay** *seconds* **retry** *times*

Syntax Description	Parameter	Description
	<b>delay</b> <i>seconds</i>	Specifies the time in seconds that the CMTS waits before recovering the upstream partial service cable modem.
	<b>retry</b> <i>times</i>	Specifies the times that the CMTS tries to recover the upstream partial service cable modem. Note that sometimes the CMTS fails to recover the partial service cable modem after the specified times. The retry times is recounted after the cable modem is back to partial service mode again from the full service mode. You can set the retry times to 0 to disable this feature.

**Command Default** By default, the delay time is 900 seconds and retry 3 times.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1x	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to configure the upstream resiliency recover:

```
Router#configure terminal
Router(config)#cable upstream resiliency recover 800 retry 3
```

## cable upstream rf-adapt (logical channel)

To specify the primary upstream logical channel and the secondary upstream logical channel, use the **cable upstream port logical-channel-index rf-adapt [primary | secondary]** command in cable interface configuration mode. To reset to the default settings, use the **no** form of this command.

**cable upstream port logical-channel-index rf-adapt [primary | secondary]**  
**no cable upstream port logical-channel-index rf-adapt [primary | secondary]**

### Syntax Description

<i>port</i>	Upstream port number. The valid values start with 0 for the first upstream port on the cable interface line card and ends with a value that depends on the number of upstream ports supported by the cable interface line card..
<i>logical-channel-index</i>	Logical channel index. The valid values are 0 or 1.
<b>primary</b>	(Optional) Assigns the logical channel as primary for RF adaptation. By default, logical channel 0 is set as primary.
<b>secondary</b>	(Optional) Assigns the logical channel as secondary for RF adaptation. By default, logical channel 1 is set as secondary.

### Command Default

Uses the default configuration. Logical channel 0 is primary and logical channel 1 is secondary.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

It is recommended that logical channel 0 is set as primary, and logical channel 1 is set as secondary.

### Examples

The following example shows how to configure primary and secondary logical channels:

```
Router> enable
Router# configure terminal
Router(config)# interface cable 8/0/0
Router(config-if)# cable upstream 0 max-logical-chans 2
Router(config-if)# cable upstream 0 rf-adapt
Router(config-if)# cable upstream 0 1 rf-adapt primary
Router(config-if)# cable upstream 0 0 rf-adapt secondary
```

### Related Commands

Command	Description
<b>cable rf-adapt timer</b>	Configures timers for RF adaptation.
<b>cable upstream rf-adapt</b>	Enables RF adaptation on the physical upstream channel.

Command	Description
<b>cable upstream threshold</b>	Configures the upstream for the signal-to-noise ratio (SNR) and forward error correction (FEC) threshold values to be used in determining the allowable noise levels.
<b>cable upstream threshold hysteresis</b>	Configures the hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.
<b>cable upstream threshold rf-adapt</b>	Configures the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary upstream channel.
<b>show cable modem rf-adapt</b>	Displays the RF adaptation history.
<b>show cable rf-adapt</b>	Displays the downgrade and upgrade candidate lists.

# cable upstream rf-adapt

To enable RF adaptation on the physical upstream channel, use the **cable upstream rf-adapt** command in cable interface configuration mode. To disable the RF adaptation, use the **no** form of this command.

**cable upstream port rf-adapt**  
**no cable upstream port rf-adapt**

## Syntax Description

<i>port</i>	Upstream port number. The valid values start with 0 for the first upstream port on the cable interface line card and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
-------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

By default, RF adaptation is disabled.

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable upstream port rf-adapt** command is available only when the maximum number of logical channels configured using the **cable upstream max-logical-chans** command is greater than 1.

## Examples

The following example shows how to enable RF adaptation on cable interface 8/0/0:

```
Router(config)# interface cable 8/0/0
Router(config-if)# cable upstream 0 max-logical-chans 2
Router(config-if)# cable upstream 0 rf-adapt
```

## Related Commands

Command	Description
<b>cable rf-adapt timer</b>	Configures timers for RF adaptation.
<b>cable upstream rf-adapt (logical channel)</b>	Configures the primary upstream logical channel and secondary upstream logical channel.
<b>cable upstream threshold</b>	Configures the upstream for the signal-to-noise ratio (SNR) and forward error correction (FEC) threshold values to be used in determining the allowable noise levels.
<b>cable upstream threshold hysteresis</b>	Configures the hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.

Command	Description
<b>cable upstream threshold rf-adapt</b>	Configures the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary upstream channel.
<b>show cable modem rf-adapt</b>	Displays the RF adaptation history.
<b>show cable rf-adapt</b>	Displays the downgrade and upgrade candidate lists.

# cable upstream rng-holdoff

To hold off a cable modem from initial ranging (init rl) on a logical upstream channel on the CMTS router, use the **cable upstream rng-holdoff** command in cable interface configuration mode. To disable the ranging hold-off, use the **no** form of this command.

**cable upstream** *port-number* **rng-holdoff** *priority*  
**no cable upstream** *port-number* **rng-holdoff** *priority*

## Syntax Description

<i>port-number</i>	Cable upstream port number. The valid range depends on the number of upstream channels configured in a MAC domain. For example, if the total number of upstream channels configured is 4, then the valid range for the upstream port number is from 0 to 3.
<b>rng-holdoff</b> <i>priority</i>	Specifies the ranging hold-off priority value in the hexadecimal format. The valid range is from 0 to ffffffff. The default value is 0.

## Command Default

None

## Command Modes

Interface configuration (config-if)

## Command History

Release	Modification
12.2(33)SCH	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **cable upstream rng-holdoff** command is associated with the [CM Steering on the Cisco CMTS Routers](#) feature.

An upstream channel descriptor (UCD) message includes type, length, value (TLV) 18 and 19 for an upstream logical channel based on the channel class ID and ranging hold-off priority configuration. If a ranging hold-off priority value is not configured, the value of TLV 18 becomes zero. If an upstream channel class ID is configured and a ranging hold-off priority value is not configured, the UCD message includes TLV 18 and 19, and the value of TLV 18 becomes zero.

## Examples

The following example shows how to specify a ranging hold-off priority value for a logical upstream channel on a cable interface line card on the cisco uBR10012 router:

```
Router# config terminal
Router(config)# interface cable 5/0/0
Router(config-if)# cable upstream 0 rng-holdoff ff
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a cable modem or a group of cable modems from DOCSIS load balance.

Command	Description
<b>cable upstream chan-class-id</b>	Configures a channel class ID for a logical upstream channel on the CMTS router.
<b>show cable modem verbose</b>	Displays information about the registered and unregistered cable modems connected to the CMTS router.

## cable upstream scheduling type

To enable various scheduler modes, use the **cable upstream scheduling type** command in interface configuration mode (cable interface only). The no form of this command reverts the scheduler to the default ‘docsis’ style scheduling mode.

**cable upstream *n* scheduling type [ugs | rtps | nrtps] mode [llq | docsis]**  
**no cable upstream *n* scheduling type [ugs | rtps | nrtps] mode [llq | docsis]**

### Syntax Description

<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 15.
<b>ugs</b>	(Optional) Selects scheduling for UGS.
<b>rtps</b>	(Optional) Selects scheduling for rtPS.
<b>nrtps</b>	(Optional) Selects scheduling for nrtPS.
<b>mode</b>	Enables the selection of packet-based Low Level Queueing (LLQ) or TDM-based DOCSIS scheduling.
<b>llq</b>	(Optional) Selects LLQ scheduling.
<b>docsis</b>	(Optional) Selects DOCSIS scheduling.

### Command Default

The only default is **docsis**.

### Command Modes

Interface configuration—cable interface only (config-if)  
 MAC domain profile configuration (config-profile-md)

### Command History

Release	Modification
12.3(13)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Any combination of **ugs**, **rtps**, **nrtps**, **llq**, and **docsis** is allowed.

#### Restrictions:

- To ensure proper operation, Call Admission Control (CAC) must be enabled. When the Low Latency Queueing (LLQ) option is enabled, it is possible for the upstream path to be filled with so many calls that it becomes unusable, making voice quality unacceptable. CAC must be used to limit the number of calls to ensure acceptable voice quality, as well as to ensure traffic other than voice traffic.
- Even if CAC is not enabled, the default (DOCSIS) scheduling mode blocks traffic after a certain number of calls.

## Examples

The following example shows how to enable LLQ-type (packet-based) scheduling for UGS services on upstream port 4 on a Cisco CMTS interface:

```
Router(config-if)# cable upstream 4 scheduling type ugs mode llq
```

The following example shows how to enable standard DOCSIS (TDM-based) scheduling for rtPS services on upstream port 4 on a Cisco CMTS interface:

```
Router(config-if)# cable upstream 4 scheduling type rtps mode docsis
```

## Related Commands

Command	Description
<b>show interface cable mac-scheduler</b>	Use this command to confirm whether LLQ scheduling is enabled.

# cable upstream scrambler

To enable the cable upstream scrambler, use the **cable upstream scrambler** command in cable interface configuration mode. To restore the default configuration value for this command, use the **no** form of this command.

**cable upstream *n* scrambler**  
**no cable upstream *n* scrambler**

## Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
----------	-----------------------------------------------------------------------------------------------------------------------------

## Command Default

Disabled

## Command Modes

Interface configuration (cable interface only)

## Command History

Release	Modification
11.3 XA	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command causes CMs to enable their pseudo-random scrambler circuitry to improve the robustness of the upstream receiver on the line card.

The scrambler on the upstream radio frequency (RF) carrier enables CMs on the HFC network to use built-in scrambler circuitry for upstream data transmissions. The scrambler circuitry improves reliability of the upstream receiver on the cable interface line card. The upstream scrambler is activated by default and should not be disabled under normal circumstances.

**Caution** Scrambler must be activated for normal operation. Deactivate only for prototype CMs that do not support scrambler.

## Examples

The following example shows how to activate the upstream scrambler:

```
Router(config-if)# cable upstream 0 scrambler#
```

## Related Commands

Command	Description
<b>cable upstream fec</b>	Enables the upstream FEC.
<b>cable upstream frequency</b>	Enters a fixed frequency of the upstream RF carrier for an upstream port.

Command	Description
<b>cable upstream power-level</b>	Sets the input power level for the upstream RF carrier in decibels per millivolt (dBmV).
<b>cable upstream shutdown</b>	Disables the upstream port.

## cable upstream-sharing

To specify the upstream sharing scheme for all CBR-CCAP-LC-G2-R line cards in a chassis, use the **cable upstream-sharing** command in global configuration mode.

```
cable upstream-sharing { 128x8 | 256x4 }
```

---

### Command Default

The default upstream sharing mode is **256x4**.

---

### Command Modes

Global configuration (config)

---

### Command History

Release	Modification
Cisco IOS XE Gibraltar 16.12.1w	This command was introduced.

---

### Usage Guidelines

The **cable upstream-sharing** command allows you to choose the preferred upstream sharing mode for CBR-CCAP-LC-G2-R line cards. The **256x4** mode allows 256 sqam channels and 1:4 sharing ratio per line card. The **128x8** mode allows 128 sqam channels and 1:8 sharing ratio per line card. This command allows you to choose between a higher number of upstream channels at a smaller sharing ratio or a lower number of upstream channels at a larger sharing ratio.

---

### Caution

After toggling the mode the **cable upstream-sharing** command requires a chassis reload to take effect. If the RPD and upstream configuration doesn't match the new mode, the cBR rejects the incompatible configurations after chassis reload. We recommend you to modify the startup config to accommodate the new mode before reloading the chassis.

---

### Note

The **cable upstream-sharing** command affects only upstream A-TDMA.

# cable upstream shutdown

To disable a single upstream physical or logical channel port, use the **cable upstream shutdown** command in cable interface configuration mode. To enable the upstream port, use the **no** form of this command.

## Physical Channel

**cable upstream *n* shutdown**  
**no cable upstream *n* shutdown**

## Logical Channel

**cable upstream *n m* shutdown**  
**no cable upstream *n m* shutdown**

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>m</i>	Specifies the logical channel index of 0 or 1.

### Command Default

Upstream port is enabled

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
11.3 XA	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCC	This command was modified with the addition of logical channel index.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **cable upstream shutdown** command shuts down a single upstream physical or logical port without affecting any of the other upstream or downstream ports on the cable interface.

**Note** The **cable upstream shutdown** command exists at both physical and logical channel level with minor variations in the command syntax.

When multiple logical channels are configured, the upstream related CLIs are categorized into two groups: physical port level and logical channel level. Logical channel level commands use the format of **cable upstream *n m* shutdown**, where *n* denotes the physical port number, and *m* denotes the logical channel index number.

When multiple logical channels are configured, the **cable upstream shutdown** command at the physical level shuts down the upstream physical port and all the logical channels configured under that physical port. To shut down the entire interface, use the **shutdown** command in cable interface configuration mode.

### Examples

The following example shows how to disable the upstream port for the physical channel:

```
Router(config-if)# cable upstream 0 shutdown
```

The following example shows how to disable the upstream port for the logical channel:

```
Router(config-if)# cable upstream 0 0 shutdown
```

### Related Commands

Command	Description
<b>shutdown</b>	Shuts down (disables) an interface and all of its ports.

## cable upstream spectrum-group

To assign a spectrum group to a single upstream on a cable interface line card, use the **cable upstream spectrum-group** command in interface configuration mode. To remove a spectrum group from an upstream, use the **no** form of this command.

**cable upstream** *n* **spectrum-group** *group-number*  
**no cable upstream** *n* **spectrum-group** *group-number*

### Syntax Description

<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
<i>group-number</i>	Specifies the spectrum group for which you are specifying a parameter value or specifies the number of the spectrum group you wish to remove from your router configuration. Valid range is from 1 to 32, or from 1 to 40, depending on the Cisco IOS software release.

### Command Default

No default behavior or values.

### Command Modes

Interface configuration

### Command History

Release	Modification
11.3 NA	This command was introduced.
12.2(15)BC2	The maximum number of spectrum groups was increased from 32 to 40 groups per router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers. This command is replaced by <b>us-channel spectrum-group</b> command.

### Usage Guidelines

This command assigns a spectrum group to a single upstream on the cable interface line card. To configure the spectrum groups, use the set of **cable spectrum-group** commands in global configuration mode.

**Note** You can also spectrum groups to all of the upstreams on the cable interface using the **cable spectrum-group (interface configuration)** command.

### Examples

The following example shows how to assign spectrum group 12 to the first upstream on the cable interface line card in slot 5/0:

```
Router(config)# interface cable 5/0
Router(config-if)# cable upstream 0 spectrum-group 12
Router(config-if)# exit
Router(config)#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable modulation-profile</b>	Configures preset modulation profiles that you can apply to one or more upstream cable interfaces when you identify and configure spectrum groups.
<b>cable spectrum-group (global configuration)</b>	Creates and configures a spectrum group.
<b>cable spectrum-group (interface configuration)</b>	Assigns a spectrum group to all of the upstreams on a cable interface line card.
<b>cable spectrum-group hop period</b>	Sets the minimum frequency-hop interval for a cable spectrum group.
<b>cable spectrum-group hop threshold</b>	Specifies a hop threshold for a cable spectrum group.
<b>cable spectrum-group shared</b>	Specifies the upstream ports in a spectrum group can share the same upstream frequency.
<b>cable upstream hopping blind</b>	Disengages the advanced spectrum management features of the Cisco uBR-MC16S and Cisco uBR-MC5X20S/U cable interface line cards by enabling blind frequency hopping behavior.

## cable upstream spreading-interval

To specify the spreading interval for Synchronous Code Division Multiple Access (S-CDMA) channels on an upstream channel, use the **cable upstream spreading-interval** command in cable interface configuration mode. To set the spreading interval value to its default setting, use the **no** form of this command.

**cable upstream** *n* **spreading-interval** *spreading-interval*  
**no cable upstream** *n* **spreading-interval**

<b>Syntax Description</b>	<i>n</i>	Specifies the upstream port. Valid values start with 0 for the first upstream port on the cable interface line card.
	<i>spreading-interval</i>	Specifies the spreading interval for S-CDMA channels. Valid values range from 1 to 32, with a default value of 16.

**Command Default** The spreading-interval setting cannot be applied if S-CDMA is not configured.

**Command Modes** Interface configuration (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command is applicable only for S-CDMA channels. You should configure S-CDMA to apply the spreading-interval.

**Examples** The following example sets the spreading interval to 32 on the upstream port 0:

```
Router(config)# interface cable 7/0/4
Router(config-if)# cable upstream 0 spreading-interval 32
Router(config-if)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable upstream active-codes</b>	Specifies the number of active codes that can be configured on an upstream channel.
	<b>cable upstream codes-per-minislot</b>	Specifies the number of codes-per-minislot allowed on an upstream channel.

## cable upstream threshold

To configure the upstream for the carrier-to-noise ratio (CNR) or signal-to-noise ratio (SNR) and forward error correction (FEC) threshold values to be used in determining the allowable noise levels, use the **cable upstream threshold** command in cable interface configuration mode. To return to the default values, use the **no** form of the command.

### Cisco IOS Releases 12.2(8)BC2 and Earlier

**cable upstream** *n* **threshold** **cnr-profile1** *cnr-threshold1* **cnr-profile2** *cnr-threshold2* **corr-fec** *fec-corrected* **uncorr-fec** *fec-uncorrected*

**no cable upstream** *n* **threshold** **cnr-profile1** *cnr-threshold1* **cnr-profile2** *cnr-threshold2* **corr-fec** *fec-corrected* **uncorr-fec** *fec-uncorrected*

### Cisco IOS Releases 12.3(23)BC, 12.2(33)SCA and Later

#### Physical Channel

**lcable upstream** *n* **threshold** {**cnr-profiles** *cnr-threshold1* *cnr-threshold2* | **snr-profiles** *snr-threshold1* *snr-threshold2* | **hysteresis** *hysteresis-value* | **corr-fec** *fec-corrected* | **uncorr-fec** *fec-uncorrected*}

**no cable upstream** *n* **threshold** {**cnr-profiles** | **snr-profiles** | **hysteresis** | **corr-fec** | **uncorr-fec**}

#### Logical Channel

**cable upstream** *n* *m* **threshold** {**snr-profiles** *snr-threshold1* *snr-threshold2* | **corr-fec** *fec-corrected* | **uncorr-fec** *fec-uncorrected*}

**no cable upstream** *n* *m* **threshold** {**snr-profiles** | **corr-fec** | **uncorr-fec**}

### Syntax Description

<i>n</i>	Upstream port number. The valid values range from 0 to 3.
<i>m</i>	Logical channel index of 0 or 1.
<b>cnr-profiles</b>	Specifies the CNR threshold in dB.
<i>cnr-threshold1</i>	CNR threshold for the primary modulation profile specified for the upstream. The valid values range from 5 to 35 dB, with a default value of 25 dB.  To bypass both the primary and secondary CNR thresholds, set the first parameter ( <i>cnr-threshold1</i> ) to 0. This disallows the second parameter ( <i>cnr-threshold2</i> ), enabling you to bypass both the CNR thresholds.
<i>cnr-threshold2</i>	CNR threshold for the secondary modulation profile specified for the upstream. The valid values range from 5 to 35 dB, with a default value of 15 dB. The secondary threshold value must be lesser than the primary threshold.  If the first parameter ( <i>cnr-threshold1</i> ) is set to 0, then the second parameter ( <i>cnr-threshold2</i> ) is not allowed.
<b>snr-profiles</b>	Specifies the SNR threshold in dB.

<i>snr-threshold1</i>	SNR threshold for the primary modulation profile specified for the upstream. This value is also used by the Cable Modem Upstream RF Adaptation feature. The valid values range from 5 to 35 dB, with a default value of 25 dB. You can bypass the primary SNR threshold ( <i>snr-threshold1</i> ) by setting it to 0.
<i>snr-threshold2</i>	SNR threshold for the secondary modulation profile specified for the upstream. The valid values range from 5 to 35 dB, with a default value of 15 dB. The secondary threshold value must be lesser than the primary threshold. Though, you can bypass the primary SNR threshold ( <i>snr-threshold1</i> ) by setting it to 0, you must enter the second parameter ( <i>snr-threshold2</i> ).
<b>hysteresis</b> <i>hysteresis-value</i>	Specifies the hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds. The threshold is specified in dB, with a valid range of 0 to 10 dB, and a default value of 3 dB. You can bypass the <b>hysteresis</b> threshold by setting the value to 0.
<b>corr-fec</b> <i>fec-corrected</i>	Specifies the allowable number of correctable FEC errors for the upstream. The <i>fec-corrected</i> parameter is given as a percentage of total packets received on the upstream during the polling period, with a valid range of 1 to 30, and a default of 3. You can bypass the <b>corr-fec</b> threshold by setting the value to 0.
<b>uncorr-fec</b> <i>fec-uncorrected</i>	Specifies the allowable number of uncorrectable FEC errors for the upstream. The <i>fec-uncorrected</i> parameter is given as a percentage of total packets received on the upstream during the polling period, with a valid range of 1 to 30, and a default of 1. You can bypass the <b>uncorr-fec</b> threshold by setting the value to 0.

**Command Default**

Uses the default values.

**Command Modes**

Interface configuration (config-if)

**Command History**

Release	Modification
12.1(7)CX1	This command was introduced for Cisco CMTS routers using the Cisco uBR-MC16S cable interface line card.
12.2(8)BC2	Support was added for the Cisco uBR10012 router and the Cisco uBR-LCP2-MC16S cable interface line card. Also, the ranges and defaults for the correctable and uncorrectable FEC error thresholds were changed.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.

Release	Modification
12.2(33)SCC	This command was modified with the addition of <b>snr-profiles</b> keyword option and support was added for Cisco uBR-MC5X20H cable interface line card. Also, this command is used at both physical and logical channel level with slight variations in the command syntax for the uBR10012 router.
IOS-XE 3.15.OS	This command was replaced by the <b>us-channel threshold</b> command.

**Usage Guidelines**

Separate CNR or SNR thresholds are assigned to the primary and secondary modulation profiles. Both profiles, however, are assigned the same correctable and uncorrectable FEC values.

**Note** The uncorrectable FEC error count includes packets that have header checksum errors and “no unique word detected” errors.

The **hysteresis** keyword of the **cable upstream threshold** command configures a hysteresis value to prevent upstream channels from becoming unstable and continuously changing between modulation profiles.

- The hysteresis value is used in dynamic modulation, frequency hopping, and dynamic channel-width changes.
- The hysteresis value is used in conjunction with CNR or SNR thresholds to determine channel configuration upgrade criteria for both advanced and basic spectrum management features.

The range and defaults for the correctable and uncorrectable FEC error thresholds were changed in Cisco IOS Release 12.2(8)BC2.

From Cisco IOS Release 12.2(33)SCC onwards, you can configure two logical channels on a single physical port for the uBR10012 router. When you configure logical channels, the upstream related commands are categorized into two groups: physical port level and logical channel level.

**Physical Port Level**

Physical port level commands use the format of **cable upstream***n*, where *n* denotes the physical port number.

**Logical Channel Level**

Logical channel level commands use the format of **cable upstream***n m*, where *n* denotes the physical port number, and *m* denotes the logical channel index number of 0 or 1.

The following restrictions and conditions applies to both physical and logical channel configurations:

- You can bypass both the primary and secondary CNR thresholds by setting the first parameter to 0. This disallows the second parameter, enabling you to bypass both the CNR thresholds.
- If you provide the primary CNR threshold, then you must enter the secondary CNR threshold also.
- You can bypass the primary SNR threshold by setting it to 0. However, you must enter the second parameter. This is required as each threshold is used independently in Three Step Dynamic Upstream Modulation feature.
- You can bypass the **hysteresis**, **corr-fec**, and **uncorr-fec** thresholds by setting their values to 0.
- For normal plant use, we recommend that the uncorrectable FEC threshold remain at its default of 1 percent to avoid an unacceptable number of errors on the channel.

### Cisco IOS Releases 12.2(8)BC2 and Earlier

The following example shows upstream 5 configured with the CNR threshold for the primary modulation profile set to 20 dB, the CNR threshold for the secondary modulation profile set to 10 dB, the correctable FEC error rate set to 5 percent of total packets received on the upstream, and the uncorrectable FEC error rate set to 1 percent of total packets received on the upstream:

```
Router(config)#interface cable 3/0
Router(config-if)# cable upstream 5 threshold cnr-profile1 20 cnr-profile2 10 corr-fec 5
uncorr-fec 1
Router(config-if)#
```

### Cisco IOS Releases 12.3(23)BC, 12.2(33)SCA and Later

The following example shows upstream 5 configured with the CNR threshold for the primary modulation profile set to 20 dB, the CNR threshold for the secondary modulation profile set to 10 dB, the correctable FEC error rate set to 5 percent of total packets received on the upstream, and the uncorrectable FEC error rate set to 1 percent of total packets received on the upstream:

```
Router(config)#interface cable 3/0
Router(config-if)# cable upstream 5 threshold cnr-profiles 20 10
Router(config-if)# cable upstream 5 threshold corr-fec 5
Router(config-if)# cable upstream 5 threshold uncorr-fec 1
Router(config-if)#
```

The following example shows upstream 5 configured with the SNR threshold for the primary modulation profile set to 20 dB, the SNR threshold for the secondary modulation profile set to 10 dB, the correctable FEC error rate set to 5 percent of total packets received on the upstream, and the uncorrectable FEC error rate set to 1 percent of total packets received on the upstream:

```
Router(config)# interface cable 3/0
Router(config-if)# cable upstream 5 threshold snr-profiles 20 10
Router(config-if)# cable upstream 5 threshold corr-fec 5
Router(config-if)# cable upstream 5 threshold uncorr-fec 1
Router(config-if)#
```

### SNR Example on the Cisco uBR10012 Router Only

The following example shows upstream 5 and logical channel 1 configured with the SNR threshold for the primary modulation profile set to 20 dB, the SNR threshold for the secondary modulation profile set to 10 dB, the correctable FEC error rate set to 5 percent of total packets received on the upstream, and the uncorrectable FEC error rate set to 1 percent of total packets received on the upstream:

```
Router(config)#interface cable 7/0/0
Router(config-if)# cable upstream 5 1 threshold snr-profiles 20 10
Router(config-if)# cable upstream 5 1 threshold corr-fec 5
Router(config-if)# cable upstream 5 1 threshold uncorr-fec 1
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable modulation-profile</b>	Creates a cable modulation profile.
<b>cable modulation-profile global-system</b>	Creates a global cable modulation profile that allows to assign any number from 1 to 400 for modulation profiles, irrespective of the DOCSIS mode.
<b>cable upstream hop-priority</b>	Determines the order of the corrective actions to be taken when ingress noise exceeds the allowable value for an upstream.
<b>cable upstream modulation-profile</b>	Configures an upstream for one modulation profile (static profile) or two modulation profiles (dynamic upstream modulation).
<b>cable upstream threshold rf-adapt</b>	Configures the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary upstream channel.
<b>show cable hop</b>	Displays the current hop period and threshold for an upstream, along with other statistics.
<b>show cable modulation-profile</b>	Displays the cable modulation profiles that have been created.

## cable upstream threshold hysteresis

To configure a hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds, use the **cable upstream threshold hysteresis** command in cable interface configuration mode. To use the default hysteresis value, use the **no** form of this command.

**cable upstream *n* threshold hysteresis *hysteresis-in-dB***  
**no cable upstream *n* threshold hysteresis**

Syntax Description	<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
	<i>hysteresis-in-dB</i>	Specifies the hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.  The valid values are from 0 to 10 dB.

**Command Default** The default value of hysteresis is 3 dB.

**Command Modes** Interface configuration (cable interface only)

Command History	Release	Modification
	12.3(23)BC7	This command was first introduced.
	IOS-XE 3.15.OS	This command was replaced by the <b>us-channel threshold hysteresis</b> command.

**Usage Guidelines** The **cable upstream threshold hysteresis** command can be used to configure a hysteresis value to prevent upstream (US) channels from becoming unstable and continuously changing between modulation profiles.

- The hysteresis value is used in dynamic modulation, frequency hopping, and dynamic channel-width changes.
- The hysteresis value is used in conjunction with carrier-to-noise ratio (CNR) or signal-to-noise ratio (SNR) thresholds to determine channel configuration upgrade criteria for both advanced and basic spectrum management features.
- The hysteresis value is used for cable modem upstream RF adaptation upgrades from the secondary to the primary upstream channel.

### Examples

The following example configures a hysteresis value to be used in conjunction with the SNR and CNR thresholds for dynamic modulation upgrade.

```
Router(config)#interface cable 3/0
Router(config-if)#cable upstream 0 threshold hysteresis 5
Router(config-if)#
```

## Related Commands

Command	Description
<b>cable modulation-profile</b>	Creates a cable modulation profile.
<b>cable upstream hop-priority</b>	Determines the order of the corrective actions to be taken when ingress noise exceeds the allowable value for an upstream.  <b>Note</b> This command is related to the cable upstream threshold hysteresis command only when using advanced dynamic modulation configuration, that is, when spectrum group is defined for the upstream channel.
<b>cable upstream threshold</b>	Configures the upstream for the carrier-to-noise ratio (CNR) or signal-to-noise ratio (SNR) and forward error correction (FEC) threshold values to be used in determining the allowable noise levels.
<b>cable upstream threshold rf-adapt</b>	Configures the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary upstream channel.
<b>show cable modulation-profile</b>	Displays the cable modulation profiles that have been created.

## cable upstream threshold rf-adapt

To configure the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary, use the **cable upstream threshold rf-adapt** command in cable interface configuration mode. To use the default rf-adapt value, use the **no** form of this command.

**cable upstream port threshold rf-adapt threshold1-in-percent**  
**no cable upstream port threshold rf-adapt**

Syntax Description		
	<i>port</i>	Upstream port number. The valid values start with 0 for the first upstream port on the cable interface line card and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
	<i>threshold1-in-percent</i>	RF adaptation threshold value in percentage. The valid range is from 1 to 50. The value 0 indicates the RF adaptation threshold is bypassed. The default value is 10 percent.

**Command Default** The default value is 10 percent.

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	12.2(33)SCF	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The rf-adapt threshold represents a percentage of affected modems relative to the total modem population on a given upstream channel. If the rf-adapt threshold is bypassed, then it is ignored while determining if a downgrade candidate should be relocated. The rf-adapt threshold is applied only to the physical channel and is used to prevent relocation of modems that are downgrade candidates.

The rf-adapt value is used by the upstream RF adaptation application to prevent the relocation of more than *x*% of the total modem population on that upstream channel, during PHY layer impairment.

**Examples** The following example shows how to configure the rf-adapt threshold for cable modem upstream RF adaptation.

```
Router(config)# interface cable 8/0/0
Router(config-if)# cable upstream 0 threshold rf-adapt 25
```

Related Commands	Command	Description
	<b>cable rf-adapt timer</b>	Configures timers for RF adaptation.
	<b>cable upstream rf-adapt</b>	Enables RF adaptation on the physical upstream channel.

Command	Description
<b>cable upstream rf-adapt (logical channel)</b>	Configures the primary upstream logical channel and secondary upstream logical channel.
<b>cable upstream threshold</b>	Configures the upstream for the signal-to-noise ratio (SNR) and forward error correction (FEC) threshold values to be used in determining the allowable noise levels.
<b>cable upstream threshold hysteresis</b>	Configures the hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.
<b>show cable modem rf-adapt</b>	Displays the RF adaptation history.
<b>show cable rf-adapt</b>	Displays the downgrade and upgrade candidate lists.

## cable upstream timing-adjust

To enable upstream timing adjustment for a specified cable interface, use the **cable upstream timing-adjust** command in cable interface configuration mode. To return to the default values, use the **no** form of this command.

```
cable upstream n timing-adjust {continue sec | threshold sec}
no cable upstream n timing-adjust {continue sec | threshold sec}
```

Syntax Description		
	<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card.
	<b>continue</b> <i>sec</i>	Sets the minimum timing adjustment that sets <b>continue</b> ranging status in seconds. The range for <i>sec</i> is 2 to 64 seconds. Default value is 2 seconds.
	<b>threshold</b> <i>sec</i>	Sets the timing adjustment threshold in seconds. Valid threshold value is 1 to 32 seconds. Default is 1 second.

**Command Default** 2 seconds for **continue** and 1 second for **threshold**

**Command Modes** Interface configuration (cable interface only)

Command History	Release	Modification
	11.3 NA	This command was introduced.
	12.0(12)SC	This command was supported on the 12.0 SC release.
	12.1(3)T	This command was supported on the 12.1 T release.
	12.1(3a)EC	This command was removed and no longer supported on the 12.1 EC and later releases (including those releases, such as 12.1 CX, that are based on the 12.1 EC train).
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** To verify whether or not upstream timing adjustment is configured and activated, enter the **show running-config** command and look for the cable interface configuration information. If upstream timing adjustment is enabled, either or both of the **continue** and **threshold** timing adjustment entries are displayed in the **show running-config** output. If both the **continue** and **threshold** upstream timing adjustments are disabled, no timing adjustment entry is displayed in the **show running-config** output.

If you are having trouble, make sure that the cable connections are not loose or disconnected; the cable interface line card is firmly seated in its chassis slot; the captive installation screws are tight; and you have entered the correct slot and port numbers.

---

**Note** The **cable timing-adjust** command is applicable only on Cisco IOS Release 12.0(12)SC and Cisco IOS Release 12.1(3)T. It is deprecated and removed on Cisco IOS Release 12.1(3a)EC, 12.1(4)CX, and later releases.

---

## Examples

The following example shows how to set the upstream time adjustment ranging value to 5 seconds:

```
CMTS01(config-if)# cable upstream 0 time-adjust continue 5
```

The following example shows how to set the threshold value to the default of 12 seconds:

```
CMTS01(config-if)# cable upstream 0 time-adjust threshold 12
```

## cable upstream unfrag-slot-jitter

To control how much jitter can be tolerated on the corresponding upstream due to unfragmentable slots, use the **cable upstream unfrag-slot-jitter** command in cable interface configuration mode. To disallow all jitter, use the **no** form of this command.

```
cable upstream n unfrag-slot-jitter [limit jitter | cac-enforce]
no cable upstream n unfrag-slot-jitter [limit jitter | cac-enforce]
```

Syntax Description		
	<i>n</i>	Specifies the upstream port number. Valid values start with 0 for the first upstream port on the cable interface line card. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 15.
	<b>limit</b> <i>jitter</i>	Specifies the allowable jitter limit caused by unfragmentable slots, in microseconds (0 to 4,294,967,295).
	<b>cac-enforce</b>	Rejects service flows requesting jitter less than the fragmentable slot jitter.

**Command Default** By default, the limit is 0 microseconds and the **cac-enforce** option is enabled.

**Command Modes** Interface configuration—cable interface only (config-if)  
MAC domain profile configuration (config-profile-md)

Command History	Release	Modification
	12.1(4)CX	This command was introduced.
	12.2(4)BC1	Support was added to the Release 12.2 BC train.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command controls how much jitter due to unfragmented slots is to be tolerated on each port. If the specified value for the tolerated limit is less than the size of a maximum unfragmentable slot, the MAC scheduler automatically blocks the slots in the scheduling table so that the unfragmentable slot can be accommodated in the blocked space and avoid causing excessive jitter to CBR slots.

The **cac-enforce** option enforces the rule that service flows requesting run-time jitter less than unfragmentable slot jitter should be rejected.

### Examples

The following example shows the jitter being set to 10 milliseconds (10,000 microseconds) for upstream port 0 on cable interface 2/0:

```
Router# configure terminal
Router(config)# interface c2/0
Router(config-if)# cable upstream 0 unfrag-slot-jitter limit 10000
Router(config-if)#
```

# cable util-interval

To set the load and utilization interval of upstream and downstream physical channels, use the **cable util-interval** command in global configuration mode. To remove the utilization interval, use the **no** form of this command.

**cable util-interval** *interval*

**no cable util-interval** *interval*

## Syntax Description

<i>interval</i>	Utilization interval for the upstream and downstream channels. The valid range is 1–86400 seconds.  <b>Note</b> In Cisco IOS XE Dublin 17.12.1y and later, <ul style="list-style-type: none"> <li>The maximum supported value is 2000 seconds. If you configure a value greater than 2000 seconds, it is still considered as 2000 seconds. This is because the maximum supported value for the utilization interval of <b>downstream</b> channels is 2000. (Maximum supported value for the utilization interval for <b>upstream</b> channels remains to be 86400 seconds).</li> <li>The <b>docsIf31CmtsDsOfdmChanUtilization</b> and <b>docsIfCmtsChannelUtUtilization</b> MIBs refresh rate is 30 seconds. If the interval value is less than 30 seconds, then the <b>docsIfCmtsChannelUtUtilization</b> MIB value is updated as per the configured <b>cable util interval</b>. For example if <b>cable util interval</b> is configured as 10 seconds, then the MIB is updated every 10 seconds.</li> </ul>
-----------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Command Default

The utilization interval is not set by default.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCD2	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Gibraltar 16.10.1c	The behavior of this command was updated on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Dublin 17.12.1y	The behavior of this command is updated on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Table 23: Release Wise Usage Guidelines

Release	Release Wise Usage Guidelines
<b>IOS-XE 3.15.0S</b>	<p>The <b>cable util-interval</b> command configures the same value as the <b>docsIfCmtsChannelUtilizationInterval</b> and <b>ccwbRFChanUtilInterval</b> objects.</p> <p>The <i>interval</i> is used to determine the number of samples that are used to calculate a running average value of utilization. The samples are collected every 10 seconds and a maximum of 30 samples can be stored. It means that when the <i>interval</i> is set to 300, utilization is calculated using the last 30 samples.</p> <p>The unit of <i>interval</i> is seconds and it is not recommended to set a smaller value as it may cause frequent utilization calculation that will consume more resources on both, the PRE or SUP and cable line card.</p> <p>A value between 60–300 seconds or greater is recommended.</p> <p><b>Note</b> You must set the utilization interval value for the <b>docsIfCmtsChannelUtilizationInterval</b> object.</p>
<b>Cisco IOS XE Gibraltar 16.10.1c</b>	<p>In Cisco IOS XE Gibraltar 16.10.1c release, this command does not have effect on OFDM channel utilization from <b>docsIfCmtsChannelUtilizationInterval</b> object, use <b>ccwbRFChanUtilInterval</b> object instead in this case. Each time the MIB query is performed, utilization is calculated using the last 30 samples and the value is returned.</p> <p>For SCQAM channel, both MIB objects update at the end of the interval that is configured by this command.</p>
<b>Cisco IOS XE Dublin 17.12.1y and later</b>	<p>Starting with Cisco IOS XE Dublin 17.12.1y, use the <b>cable util-interval</b> value to determine number of samples that you need to collect. These samples are used to calculate rolling avg utilization value.</p>

## Examples

The following example shows how to set the utilization interval for the upstream and downstream channels:

```
Router# configure terminal
Router(config)# cable util-interval 300
```

## Related Commands

Command	Description
<b>show running-config</b>	Displays the running configuration for each of the cable interfaces.

## cable vc-map

To map a cable modem to a particular permanent virtual connection (PVC) on an Asynchronous Transfer Mode (ATM) interface, use the **cable vc-map** command in global configuration mode. To remove this mapping, use the **no** form of this command.

**cable vc-map** *mac-address atm-interface vpi/vci* [*cust-name*]

**no cable vc-map** *mac-address*

**no cable vc-map customer** *cust-name*

### Syntax Description

<i>mac-address</i>	Specifies the hardware (MAC) address for the cable modem whose traffic is to be mapped.
<i>atm-interface</i>	Specifies the outbound ATM interface to which this cable modem should be mapped.
<i>vpi/vci</i>	Specifies the virtual path identifier (VPI) and virtual channel identifier (VCI) on the ATM interface to which this cable modem should be mapped.
<i>cust-name</i>	(Optional) Identifies the customer for this PVC. The <i>cust-name</i> can be any arbitrary alphanumeric string, up to 127 characters long.
<b>customer</b> <i>cust-name</i>	(Optional) Deletes all PVCs belong to this customer. The <i>cust-name</i> can be any arbitrary alphanumeric string, up to 127 characters long.

### Command Default

None

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(11)BC3	This command was introduced for Cisco uBR7100 series and Cisco uBR7246VXR universal broadband routers.
12.2(15)BC2	Support for the <b>customer</b> option was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command maps a cable modem, on the basis of its hardware (MAC) address, to a particular PVC on an ATM interface.

**Note** To use this command, you must first enable the use of Layer 2 tunnels, using the **cable l2-vpn-service atm-vc** command. Then use the **cable vc-map** command to enable the mapping of individual cable modems to specific PVCs.

**Examples**

The following example shows how to enable the use of Layer 2 tunnels and then map specific CMs to specific PVCS:

```
Router# config terminal
Router(config)# cable l2-vpn-service atm-vc
Router(config)# cable vc-map 0007.0e03.69f9 ATM2/0 1/1
Router(config)# cable vc-map 0010.7bed.9c95 ATM2/0 1/2
Router(config)# exit
Router#
```

The following example shows the same configuration as above, but with the addition of a customer name that identifies the customer that is using each particular PVC:

```
Router# config terminal
Router(config)# cable l2-vpn-service atm-vc
Router(config)# cable vc-map 0007.0e03.69f9 ATM2/0 1/1 ENTERPRISE-CO1
Router(config)# cable vc-map 0010.7bed.9c95 ATM2/0 1/2 ENTERPRISE-CO2
Router(config)# exit
Router#
```

**Related Commands**

Command	Description
<b>cable l2-vpn-service atm-vc</b>	Enables the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems, so that individual CPE traffic can be routed to a particular PVC on an ATM interface.
<b>debug cable l2-vpn</b>	Displays debugging messages for the Layer 2 mapping of cable modems to a particular PVC on an ATM interface.
<b>show cable l2-vpn vc-map</b>	Displays the mapping of one or all cable modems to PVCs on the ATM interfaces.

# cable video

To enter the video configuration mode, use the **cable video** command in global configuration mode.

## **cable video**

### Syntax Description

This command has no keywords or arguments.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to enter the video configuration mode.

### Examples

The following example shows how to enter the video configuration mode:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#
```

# cable video source-switch

To switch to another valid multicast source in certain scenarios, such as maintenance, use the **cable video source-switch** command in privileged EXEC mode.

**cable video source-switch** {**from-group** *group IP address* **from-source** *source IP address* | **to-group** *new group IP address* **to-source** *source IP address*}

Syntax Description		
<b>from-group</b> <i>group IP address</i>	Force source switch from a given multicast group.	
<b>from-source</b> <i>source IP address</i>	Force source switch from a given multicast source.	
<b>to-group</b> <i>group IP address</i>	Force source switch to this multicast group.	
<b>to-source</b> <i>source IP address</i>	Force source switch to this multicast source.	

**Command Default** None.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Normally, the system automatically switches to the next valid source IP when the current source goes down or fails for some reasons. Only use this command in certain scenarios, such as maintenance.

**Examples** The following example shows how to enable wideband auto-reset mode:

```
Router# cable video source-switch to-group 238.11.3.103 to-source 176.52.1.10
%%Current sessions with this source will be reset.
Service will be affected. Is this OK to continue? [Yes/No][confirm]y

1048781 126      Remap      SSM      176.51.1.10,238.11.3.103      0      1
ACTIVE-PSI ON      2404203 2383890 CLEAR      -      SESS_PME1.1.8.184
1048780 127      Data-Piping SSM      176.51.1.10,238.11.3.77      0      -
ACTIVE-PSI ON      2404782 0      CLEAR      -      rw.1.8.185
1048678 140      Remap      SSM      176.52.1.10,238.11.3.85      0      1
ACTIVE-PSI ON      2403607 2384815 CLEAR      -      SESS_PME2.1.8.336
1048679 141      Remap      UDP      174.101.1.2      49500 1      OFF
          ON      0      0      CLEAR      -      uni1.3.0.1.21.49500
```

## cable vrf-steering cable-modem

To steer or direct the cable modems to the first sub-bundle interface that is configured to use the virtual routing and forwarding (VRF) instance, use the **cable vrf-steering cable-modem** command in the cable subinterface configuration mode. To disable this feature, use the **no** form of this command.

**cable vrf-steering cable-modem** *vrf-name*  
**no cable vrf-steering cable-modem** *vrf-name*

<b>Syntax Description</b>	<i>vrf-name</i> VRF instance name.
---------------------------	------------------------------------

**Command Default** Configure a sub-bundle using the **ip vrf forwarding** command first to enable this command.

**Command Modes** Subinterface configuration (config-if)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCF	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to direct the cable modems to the specified VRF:

**Note** Create an ACL and route-map to steer the CPEs from the CM interface to the global interface before you steer the CM to the first sub-bundle interface. Use the **ip access-list extended** *access-list name* and **route-map** *route map name* **permit** commands to create an ACL and route-map respectively on the Cisco uBR10012 routers. Use **ip policy route-map** *route map name* command to attach the route-map to the CM's subbundle interface.

```
Router(config-if)#cable vrf-steering cable-modem vrfA
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable source-route</b>	Configures the VRF source route on the cable modem's subinterface configuration mode.
	<b>ip vrf</b>	Defines a VRF instance and enters the interface configuration mode.
	<b>show ip arp vrf</b>	Displays which VRF contains a specific cable modem in the ARP table.

## cable wideband auto-reset

To enable wideband auto-reset mode on the CMTS, use the **cable wideband auto-reset** command in global configuration mode. To disable wideband auto-reset mode, use the **no** form of this command.

**cable wideband auto-reset**  
**no cable wideband auto-reset**

**Syntax Description** This command has no keywords or arguments.

**Command Default** Wideband auto-reset mode is disabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(21)BC	This command was introduced for the uBR10012 router.
	12.3(23)BC	This command was updated.
	12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to enable wideband auto-reset mode on the CMTS. If wideband auto-reset mode is enabled, wideband cable modems registered on a cable interface as traditional DOCSIS modems (DOCSIS 1.x/2.0 modems) are auto-reset when the cable interface becomes wideband-capable. When a wideband cable modem auto-resets, it deregisters on the CMTS as a traditional DOCSIS cable modem and immediately attempts to re-register as a wideband cable modem.

A cable interface is considered wideband-capable when at least one fully configured and operational wideband channel has been associated with the interface's traditional DOCSIS (narrowband) channel.

For a fully configured wideband CMTS, wideband cable modems may register as traditional DOCSIS modems for a variety of reasons, such as cable interface line card boot order or line card online insertion and removal (OIR). Rather than defer wideband cable modem registration, wideband cable modems are permitted to register as traditional DOCSIS modems.

If a wideband-capable modem registers as a traditional DOCSIS modem, it registers on a primary downstream channel that has been assigned with the **downstream cable** command to the modem's fiber node if the fiber node is configured. If the modem's fiber node is not configured, the wideband-capable modem can register on any downstream channel that is visible to it (as a traditional cable modem does).

**Note** In Cisco IOS Release 12.3(21)BC, the primary downstream channel is a traditional DOCSIS downstream channel for the fiber node. Beginning in Cisco IOS Release 12.3(23)BC, either an RF channel from the SPA or a Cisco uBR10-MC5X20 downstream channel serves as a primary channel in a fiber node. Beginning in Cisco IOS Release 12.3(23)BC if the primary downstream channel for this fiber node is assigned from a SPA downstream, then the **downstream cable** command is not required.

When and if a cable interface becomes wideband capable, wideband cable modems that have registered as traditional DOCSIS modems are reset for CMTS routers with wideband auto-reset mode enabled. These modems are only reset when the interface first becomes wideband-capable and are not reset again if they subsequently fail to register as wideband cable modems.

### Examples

The following example shows how to enable wideband auto-reset mode:

```
Router# configure terminal
Router(config)# cable wideband auto-reset
```

### Related Commands

Command	Description
<b>cable bundle</b>	Configures a cable interface to belong to a virtual bundle interface.
<b>downstream cable</b>	Assigns a primary downstream channel for a fiber node.

## ca-interface

To configure the conditional access interface for session based scrambling, use the **ca-interface** command in the DVB scrambling configuration mode. To disable conditional access interface configuration, use the **no** form of this command.

**ca-interface linecard** *slot/bay ip\_address*  
**no ca-interface linecard** *slot/bay*

<i>slot/bay</i>	Specifies the slot and bay of the linecard.
<i>ip_address</i>	Specifies the IP for the conditional access interface.

**Command Default** None

**Command Modes** DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the conditional access interface:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ca-interface linecard 7/0 1.24.10.8
```

**Related Commands**

Command	Description
<b>dvb</b>	Enters DVB scrambling configuration mode.
<b>strong-pairing-enforce</b>	Switches on the NDS strong pairing enforcement
<b>mgmt-ip</b>	Configures the management IP for EIS/Broadcast ECMG.
<b>scramble-video-audio</b>	Scrambles only video and audio pids.
<b>route-ecmg</b>	Configures the route to the ECMG server.
<b>check-scg-at-prov</b>	Enables Check SCG at provision time.
<b>tier-based</b>	Enters the tier-based scrambling configuration mode.
<b>ecmg</b>	Enters the ECM Generator configuration mode.

Command	Description
eis	Enters the Event Information Scheduler configuration mode.

## ca-system-id

To configure the CA system ID, use the **ca-system-id** command in the DVB scrambling ECMG configuration mode. To void the CA system ID configuration, use the **no** form of this command.

**ca-system-id** *id sub\_id*  
**no ca-system-id** *id sub\_id*

<i>id</i>	Specifies the CA system ID in Hex.
<i>sub_id</i>	Specifies the CA sub system ID in Hex.

**Command Default** None

**Command Modes** DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the CA system ID:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#ca-system-id 950 1234
```

### Related Commands

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>auto-channel-id</b>	Enables automatic channel ID selection.
<b>connection</b>	Configures the ECMG connection.
<b>ecm-pid-source</b>	Configures the source of ECM PID.
<b>type</b>	Configures the ECMG type.
<b>mode</b>	Configures the application mode of ECMG.
<b>desc-rule</b>	Configures the descriptor rule.
<b>overrule</b>	Overrules the default settings.

# channel-group

To add an interface (Gigabit Ethernet or Fast Ethernet) to an EtherChannel Group, and to associate that interface with an EtherChannel link, use the **channel-group** command in interface configuration mode.

To remove an EtherChannel interface from the EtherChannel group, use the **no** form of this command.

**channel-group** *n*  
**no channel-group** *n*

## Cisco cBR Series Converged Broadband Routers

**channel-group** *n*  
**link** *link-id* | **mode** {**active** | **passive**} [**link** *link-id*]  
**no channel-group** *n*

### Syntax Description

<i>n</i>	The identifying number for the EtherChannel group with which to associate this interface. An EtherChannel group can be identified in the range of 1 to 64.  Each group can have up to four interfaces on the Cisco uBR10012 and Cisco uBR7200 series routers, only one of which is the primary.  Each group can have up to eight interfaces on the Cisco cBR series routers, only one of which is the primary.
<b>link</b> <i>link-id</i>	Assigns a link identifier used for load balancing.  • <i>link-id</i> —Load balancing link identifier. The range is from 1 to 8.
<b>mode</b>	Specifies the Etherchannel mode for the interface.
<b>active</b>	Enables Link Aggregation Control Protocol (LACP) unconditionally.
<b>passive</b>	Enables LACP only if an LACP device is detected.

### Command Default

By default, the **channel-group** command has the following behaviors:

- EtherChannel groups and ports are not defined.
- EtherChannel groups and ports are disabled (**off** mode) once configured, and must be enabled.
- The first port assigned to an EtherChannel group is the bundle primary.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(11)BC3	This command was introduced on the Cisco uBR7246VXR router.
12.2(9a)BC	This command was introduced on the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.

Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **no** form of this command also removes the associated EtherChannel ports within the EtherChannel group. For additional information, refer to the EtherChannel on the Cisco CMTS Routers feature document on Cisco.com.

The Cisco cBR series routers support the channel group configuration on the Ten Gigabit Ethernet interface.

### Examples

The following example creates an EtherChannel link with a channel group identifier of 1 on the specified port. If this is the first port assigned to EtherChannel group 1, it becomes the primary in that EtherChannel group.

```
Router(config-if)# channel-group etherchannel 1
```

The following example creates an EtherChannel link with a channel group identifier of 3 on the specified port on a Cisco cBR-8 router:

```
Router(config)# interface port-channel 3
Router(config-if)# exit
Router(config)# interface TenGigabitEthernet 5/1/0
Router(config-if)# channel-group 3 mode active
```

### Related Commands

Command	Description
<b>show interface port-channel</b>	Displays the EtherChannel interfaces and channel identifiers, with their mode and operational status.

## channel-id (cable configuration file)

To create a DOCSIS configuration file that specifies the upstream channel ID for a CM configuration file, use the **channel-id** command in cable config-file configuration mode. To remove the channel ID specification, use the **no** form of this command.

**channel-id** *upstreamchan-id*  
**no channel-id**

### Syntax Description

<i>upstreamchan-id</i>	Specifies the upstream channel ID. Valid range is 0 to 255, depending on the number of actual upstream ports on the cable interface being used.
------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------

### Command Default

If no upstream channel ID is specified, the CM uses the upstream channel from the Upstream Channel Description (UCD) messages it receives on the downstream channel.

### Command Modes

Cable configuration file (config-file)

### Command History

Release	Modification
12.1(2)EC1	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command sets the Upstream Channel ID Configuration Setting field in the DOCSIS configuration file. Typically, the CM uses the upstream channel ID that is specified by the CMTS during the registration process, but this command overrides that setting and forces the CM to use the upstream channel specified in the DOCSIS configuration file. If that upstream does not exist, or if the upstream cannot be obtained for some reason, the CM cannot come online.

**Note** If you are using a telco-return CM, the upstream channel must be 0.

### Examples

The following example shows how to set the upstream channel ID for the configuration file to 3. If the CM cannot obtain this upstream channel, it does not come online.

```
Router(config)# cable config-file channeloverride.cm
Router(config-file)# channel-id 3
Router(config-file)# exit
```

Related Commands	Command	Description
	<b>cable config-file</b>	Creates a DOCSIS configuration file and enters configuration file mode.
	<b>access-denied</b>	Disables access to the network.
	<b>cpe max</b>	Specifies CPE information.
	<b>download</b>	Specifies download information for the configuration file.
	<b>frequency</b>	Specifies downstream frequency.
	<b>option</b>	Provides config-file options.
	<b>privacy</b>	Specifies privacy options for baseline privacy images.
	<b>service-class</b>	Specifies service class definitions for the configuration file.
	<b>snmp manager</b>	Specifies Simple Network Management Protocol (SNMP) options.
	<b>timestamp</b>	Enables time-stamp generation.

# check-scg-at-prov

To enable Check SCG at provision time, use the **check-scg-at-prov** command in the DVB scrambling configuration mode. To disable Check SCG at provision time, use the **no** form of this command.

**check-scg-at-prov**  
**no check-scg-at-prov**

**Command Default** None

**Command Modes** DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

When SCG checking at the time of provisioning is enabled, the Simulcrypt Synchroniser (SCS) does not provision the SCG from EIS if the elementary streams or services in the incoming stream do not match the streams or services in SCG provisioning message. When this configuration is disabled, the input transport stream is verified only during scrambling.

The following is an example of how to enable Check SCG at provision time:

```
Router>enable
Router#configure terminal
Router (config)#cable video
Router (config-video)#encryption
Router (config-video-encrypt)#dvb
Router (config-video-encrypt-dvb)#check-scg-at-prov
```

**Related Commands**

Command	Description
<b>dvb</b>	Enters DVB scrambling configuration mode.
<b>strong-pairing-enforce</b>	Switches on the NDS strong pairing enforcement
<b>mgmt-ip</b>	Configures the management IP for EIS/Broadcast ECMG.
<b>scramble-video-audio</b>	Scrambles only video and audio pids.
<b>route-ecmg</b>	Configures the route to the ECMG server.
<b>ca-interface</b>	Configures the conditional access interface.
<b>tier-based</b>	Enters the tier-based scrambling configuration mode.
<b>ecmg</b>	Enters the ECM Generator configuration mode.

Command	Description
eis	Enters the Event Information Scheduler configuration mode.

# class

To configure the redundancy class for the redundancy group, use the **class** command in line card redundancy configuration mode. To remove the configuration, use the **no** form of this command.

**class 1:N**  
**no class**

## Syntax Description

<b>1:N</b>	Specifies N+1 redundancy class for the redundancy group.
------------	----------------------------------------------------------

## Command Default

None.

## Command Modes

Line card redundancy configuration (config-red-lc)

## Command History

Release	Modification
IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

You cannot change the class while group has members. Remove all the members to change the class.

## Examples

The following example shows how to configure 1:N redundancy class on Cisco cBR-8 Series Converged Broadband Routers:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# class 1:N
Class set to 1:N for Redundancy group (0)
Router(config-red-lc)#
```

## Related Commands

Command	Description
<b>description</b>	Adds a description to the line card group.
<b>linecard-group internal-switch</b>	Creates a line card group for the line card.
<b>member slot</b>	Adds a slot to the redundancy group.
<b>redundancy</b>	Enters redundancy configuration mode.
<b>show redundancy linecard</b>	Displays information about a line card or a line card group.

# clear cable admission control counters

To reset all the resource counters on the Cisco CMTS to zero, use the **clear cable admission control counters** command in privileged EXEC mode.

**clear cable admission control counters**

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.3(13a)BC	This command was introduced.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The counters are also set to zero when a given resource is reconfigured. Counters can be displayed using the **show cable admission-control** command.

For additional information, refer to the Admission Control for the Cisco CMTS feature documents on Cisco.com.

**Examples** The following example resets configured admission control counters to zero, whether configured in global or interface configuration mode:

```
Router# clear cable admission control counters
```

Related Commands	Command	Description
	<b>cable admission-control</b>	Configures the CPU and memory thresholds for the Cisco CMTS and supporting broadband processing engines (BPEs)
	<b>cable admission-control event</b>	Configures and enables Admission Control event types on the Cisco CMTS.
	<b>cable admission-control ds-bandwidth</b>	Configures Admission Control downstream bandwidth thresholds on the Cisco CMTS.
	<b>cable admission-control us-bandwidth</b>	Configures Admission Control upstream bandwidth thresholds on the Cisco CMTS.
	<b>debug cable admission-control</b>	Enables automatic Admission Control troubleshooting processes on the Cisco CMTS.

Command	Description
<b>show cable admission-control</b>	Displays the current Admission Control configuration and status on the Cisco CMTS, or on a specified interface.

## clear cable arp-filter

To reset Address Resolution Protocol (ARP) filter statistics displayed by the **show cable arp-filter** command, use the **clear cable arp-filter** command in privileged EXEC mode.

**clear cable arp-filter** {**bundle number cable slot/port** | **slot/subslot/port**}

Syntax Description	
<b>bundle number</b>	Resets the ARP filter statistics for the specified virtual bundle interface, where <i>number</i> is a value from 1 to 255.
<b>cable slot/port</b>	(Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies removal of CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable slot/subslot/port</b>	(Cisco uBR10012 Router) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>cable slot/subslot/port</b>	(Cisco cBR Series Routers) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot number of the card. Valid slots are 0 to 3 and 6 to 9 on the Cisco cBR-8router.</li> <li>• <i>subslot</i>—Subslot number of the card. The valid value is 0 on the Cisco cBR-8router.</li> <li>• <i>port</i>—Downstream port number. The valid range is from 0 to 15 on the Cisco cBR-8router.</li> </ul>

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.3(17a)BC	This command was introduced.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use the **clear cable arp-filter** command to clear the ARP filter statistics that are displayed using the **show cable arp-filter** command.

### Examples

This example shows cable ARP filter statistics for virtual bundle interface number 10, followed by a clearing of the ARP filter statistics on that bundle and the resulting display of cleared statistics.

```
Router# show cable arp-filter bundle 10
ARP Filter statistics for Bundle10:
  Replies Rcvd: 3069 total. 3062 unfiltered, 7 filtered
  Requests Forwarded: 1175 total. 1175 unfiltered, 0 filtered
  Requests Sent For IP: 0 total. 0 unfiltered, 0 filtered
Router# clear cable arp-filter bundle 10
Router# show cable arp-filter bundle 10
ARP Filter statistics for Bundle10:
  Replies Rcvd: 0 total. 0 unfiltered, 0 filtered
  Requests Forwarded: 0 total. 0 unfiltered, 0 filtered
  Requests Sent For IP: 0 total. 0 unfiltered, 0 filtered
```

### Related Commands

Command	Description
<b>cable arp filter</b>	Controls the number of ARP packets that are allowable for each SID on a cable interface.
<b>clear arp-cache</b>	Refreshes dynamically created entries from the ARP cache.
<b>show cable arp-filter</b>	Displays the total number of ARP replies and requests that have been sent and received, including the number of requests that have been filtered.

# clear cable bgsync counters

To clear the background synchronization information on the Cisco CMTS, use the **clear cable bgsync counters** command in global configuration mode.

**clear cable bgsync counters**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Global configuration mode (config)

## Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0S	This command is implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use the **clear cable bgsync counters** command to clear the background synchronization information statistics on the Cisco CMTS.

## Examples

The following example shows how to clear the background synchronization counters on the Cisco CMTS:

```
Router# configure terminal
Router(config)# clear cable bgsync counters
Router(config)#
```

## Related Commands

Command	Description
<b>cable bgsync</b>	Sets the data intervals for background synchronization on the Cisco CMTS.
<b>cable bgsync active</b>	Activates background synchronization process on the Cisco CMTS.
<b>show cable bgsync</b>	Displays the information on the background synchronization process.

# clear cable cmc

To clear the Cisco CMC information, use the **clear cable cmc** command in privileged EXEC mode.

```
clear cable cmc {all mac-address}
```

Syntax Description	all	Specifies that the information on all Cisco CMCs must be cleared.
	<i>mac-address</i>	MAC address of the Cisco CMC for which the information must be cleared.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)CX	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **clear cable cmc** clears the Cisco CMC. When this command is used, the Cisco CMTS clears all the running data of the Cisco CMC from current database and disconnects the Generic Control Protocol (GCP) connection. Therefore, the Cisco CMC reboots.

The following example shows how to clear the information for all Cisco CMCs:

```
Router# clear cable cmc all
```

The following example shows how to clear the information on the Cisco CMC with the MAC address 0010.2024.7035:

```
Router# clear cable cmc 0010.2024.7035
```

## Related Commands

Command	Description
<b>cable cmc</b>	Configures the downstream RF power and FRx on the Cisco CMC.
<b>show cable cmc</b>	Displays the Cisco CMC information.

# clear cable dsg

To reset counters related to DOCSIS Set-top Gateway (DSG) tunnels, use the **clear cable dsg** command in privileged EXEC mode.

**clear cable dsg**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7100 series and Cisco uBR7246VXR routers.
12.3(13a)BC	This command is obsolete.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

DSG operation is disabled using the **no cable dsg** command, but this does not clear out the DSG-related counter (“mapping entry is used”), so that you can retain its value in case you intend to restart DSG operations again. If, however, you want to reset those counters to zero, use the **clear cable dsg** command.

**Note** This command resets the “mapping entry is used” counters for all DSG tunnels and interfaces on the router.

## Examples

The following example shows how to clear the DSG counters for all cable interfaces on the router, and shows an example of the **show cable dsg** command showing the counters after they have been cleared.

```
Router# show cable dsg stats

DSG statistics information
DSG keepalive is set
Vendor: DDD, Tunnel count: 1
Vendor: BBB, Tunnel count: 2
Vendor name is DDD, tunnel MAC is 0001.0002.0003
Group address is 226.2.2.2, source address is *
  Interface is Cable5/1, mapping entry is used 2
    Received 5968 packets, forwarded 5289 packets
    Dropped 679 packets, last second rate 16878 bits/sec
Router# clear cable dsg

Router# show cable dsg stats

DSG statistics information
Vendor: DDD, Tunnel count: 1
Vendor: BBB, Tunnel count: 2
Vendor name is DDD, tunnel MAC is 0001.0002.0003
```

## clear cable dsg

```

Group address is 226.2.2.2, source address is *
Interface is Cable5/1, mapping entry is used 0
Received 5968 packets, forwarded 5289 packets
Dropped 679 packets, last second rate 16878 bits/sec

```

## Related Commands

Command	Description
<b>clear cable dsg</b>	Enables the DOCSIS Set-Top Gateway (DSG) on a cable interface, and configures its tunnel-mapping parameters.
<b>clear cable dsg keepalive</b>	Enables keepalive messages over DOCSIS Set-Top Gateway (DSG) tunnels on a cable interface.
<b>debug cable dsg</b>	Enables the display of debugging messages for the operation of the DOCSIS Set-Top Gateway (DSG) feature.
<b>show cable dsg</b>	Displays the current DOCSIS Set-Top Gateway (DSG) tunneling parameters.

## clear cable flap-list

To reset the flap-list table for a specific CM or for all CMs connected to the Cisco CMTS router, use the **clear cable flap-list** command in privileged EXEC mode.

```
clear cable flap-list {mac-addr | all} [save-counters]
```

Syntax Description		
	<i>mac-addr</i>	Specifies the 48-bit MAC address (hardware address) of an individual CM to be cleared from the flap-list table.
	<b>all</b>	Removes all CMs from the flap-list table.
	<b>save-counters</b>	(Optional) Preserves the flap-list counters that are displayed by the <b>show cable flap-list</b> command and by using SNMP requests to access the CISCO-CABLE-SPECTRUM-MIB.

**Command Default** Clears the flap-list counters.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	11.3 NA	This command was introduced.
	11.3(7)NA	The <b>save-counters</b> option was supported on the Cisco uBR7200 series routers.
	12.1(5)EC1	Support was added for the Cisco uBR7100 series routers.
	12.2(4)BC1	Support for this command (without the <b>save-counters</b> option) was added for the Cisco uBR10012 router.
	12.2(15)BC2	The <b>save-counters</b> option was supported on the Cisco uBR10012 router.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Cable modems are removed from the flap-list table after the number of days (between 1 and 60) specified by the **cable flap-list aging** global configuration command. Use the **clear cable flap-list** command to remove individual CMs from the flap-list while retaining flapping activity for other CMs, or to clear the entire flap-list table.

**Examples** The following example shows how to remove all the CMs from the flap-list table:

```
Router# clear cable flap-list all
```

## Related Commands

Command	Description
<b>cable flap-list aging</b>	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
<b>cable flap-list insertion-time</b>	Sets the insertion time interval that determines whether a CM is placed in the flap list.
<b>cable flap-list miss-threshold</b>	Specifies miss threshold for recording a flap-list event.
<b>cable flap-list power-adjust threshold</b>	Specifies the power-adjust threshold for recording a CM flap-list event.
<b>cable flap-list size</b>	Specifies the maximum number of CMs that can be listed in the flap-list table.
<b>clear cable modem counters</b>	Zeroes the CM counters, including flap-list counters.
<b>clear cable modem reset</b>	Removes a CM from the Station Maintenance List and resets it.
<b>debug cable flap</b>	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
<b>ping docsis</b>	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
<b>show cable flap-list</b>	Displays the current contents of the flap list.

# clear cable hop

To clear the forward error corrections (FEC) hop counters on one or all cable interfaces on a Cisco CMTS, use the **clear cable hop** command in privileged EXEC mode.

```
clear cable hop [cable {slot/port | slot/subslot/port} [upstream uport]]
```

## Cisco cBR Series Converged Broadband Routers

```
clear cable hop [upstream-cable {slot/card/port} [us-channel {physical us-channel number} ] ]
```

Syntax Description	
<b>cable</b> <i>slot/port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies removal of CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>upstream</b> <i>uport</i>	(Optional) Clears the hop counters on a specific upstream port on a specific cable interface. The valid values for <i>uport</i> start with 0 for the first upstream port on the cable interface line card.
<b>upstream-cable</b> <i>slot/card/port</i>	(Optional) Clears the hop counters on a specific upstream-cable controller. The valid values start with 0 for the first upstream port on the cable interface line card.
<b>us-channel</b> <i>physical us-channel number</i>	(Optional) Clears upstream channel information. Valid values are 0 to 11.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(15)BC1	This command was introduced.
	12.3(BC)	This command was integrated into Cisco IOS Release 12.3BC.

Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers. <ul style="list-style-type: none"> <li>• The <b>upstream-cable</b> keyword was added.</li> <li>• The <b>us-channel</b> keyword was added.</li> </ul>

### Usage Guidelines

The **clear cable hop** command clears the correctable and uncorrectable forward error corrections (FEC) counters that are displayed by the **show cable hop** command. You can clear the counters for all interfaces on the Cisco CMTS, for one specific interface (one downstream and its associated upstreams), or for a specific upstream on a cable interface.

### Examples

The following example shows how to clear the frequency hop counters on all cable interfaces on the Cisco CMTS, along with sample output from the **show cable hop** command that shows the counters being cleared:

```
Router# show cable hop

Upstream      Port      Poll Missed Min      Missed Hop  Hop      Corr      Uncorr
Port          Status    Rate Poll   Poll   Poll   Thres  Period  FEC      FEC
              (ms) Count Sample Pcnt  Pcnt  (sec)  Errors  Errors
Cable3/0/U0   15.008 Mhz 1000 * * *set to fixed frequency * * * 2238  133
Cable3/0/U1   admindown 1000 * * * frequency not set * * * 0     0
Cable3/0/U2   admindown 1000 * * * frequency not set * * * 0     0
Cable3/0/U3   admindown 1000 * * * frequency not set * * * 0     0
Router# clear cable hop

Router# show cable hop

Upstream      Port      Poll Missed Min      Missed Hop  Hop      Corr      Uncorr
Port          Status    Rate Poll   Poll   Poll   Thres  Period  FEC      FEC
              (ms) Count Sample Pcnt  Pcnt  (sec)  Errors  Errors
Cable3/0/U0   15.008 Mhz 1000 * * *set to fixed frequency * * * 0     0
Cable3/0/U1   admindown 1000 * * * frequency not set * * * 0     0
Cable3/0/U2   admindown 1000 * * * frequency not set * * * 0     0
Cable3/0/U3   admindown 1000 * * * frequency not set * * * 0     0
Router#
```

The following example shows how to clear the frequency hop counters on a specific cable interface on the Cisco CMTS:

```
Router# clear cable hop c5/0

Router#
```

The following example shows how to clear the frequency hop counters on a specific upstream on the Cisco CMTS:

```
Router# clear cable hop c5/1/0 upstream 2

Router#
```

The following example shows how to clear the frequency hop counters on a specific upstream on the Cisco cBR Series Converged Broadband Routers:

```
Router# clear cable hop upstream-cable 3/0/3 us-channel 2
Router#
```

**Related Commands**

Command	Description
<b>show cable hop</b>	Displays cable-hop statistics on a Cisco CMTS.
<b>show cable modem</b>	Displays CM configuration settings.

# clear cable host

To clear the host from the router's internal address tables, use the **clear cable host** command in privileged EXEC mode.

```
clear cable host {ip-addressmac-address | name fqdn}
```

## Cisco cBR Series Converged Broadband Routers

```
clear cable host {ip-addressmac-address | vrf {VPN Routing/Forwarding instance name ip-address}}
```

### Syntax Description

<i>ip-address</i>	IPv4 or IPv6 address for the device to be cleared.
<i>mac-address</i>	MAC address for the device to be cleared.
<b>name</b> <i>fqdn</i>	Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the <b>show cable modem domain-name</b> command has been run for the first time to update the cable DNS cache on the CMTS router.
<b>vrf</b>	Specifies VPN Routing/Forwarding instance.
<i>VPN Routing/Forwarding instance name</i>	VPN Routing/Forwarding instance name.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
11.3 NA	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.1(5)EC1	Support was added for the Cisco uBR7100 series universal broadband router.
12.2(4)BC1	Support was added for the Cisco uBR10012 universal broadband router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> <li>• Support for the Cisco uBR7225VXR router was added.</li> <li>• Support for specifying the IPv6 address of a CM or CPE device was added.</li> <li>• The <b>name</b> keyword option was added for specifying the fully-qualified domain name of a CM.</li> </ul>
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>vrf</b> keyword was added.

**Usage Guidelines**

This command removes a host's IP, MAC address, or domain name from the router's internal address tables. This might be necessary to allow a new host to come online from the previous host's CM.

**Note** If the cleared host continues communicating through the CM, the Cisco CMTS adds the host back to its internal address tables, and the **show interface cable interface modem** command shows it as having a "static" address. To block the host from any further access, use the **cable source-verify dhcp** command, so that the host cannot access the network unless it obtains an IP address from an authorized DHCP server.

**Note** In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** (not supported for cBR routers) command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

**Examples**

The following example shows how to remove a host's MAC address from the internal address tables on the Cisco CMTS router:

```
Router# clear cable host 0050.7366.17ab
```

The following example shows how to remove a host's domain name from the internal address tables on the Cisco CMTS router:

```
Router# clear cable host cisco
```

The following example shows how to remove a VPN Routing/Forwarding instance on the Cisco cBR Series Converged Broadband Routers:

```
Router# clear cable host vrf cisco 3046:1829:fefb::ddd1
```

**Related Commands**

Command	Description
<b>cable device</b>	Configures the access list for a CM device or host.
<b>cable host access-group</b>	Configures the access list for the specified hosts.
<b>show cable device access-group</b>	Display the CMs and the hosts behind the CMs on the network.
<b>show cable host access-group</b>	Displays only the hosts behind the CMs on the network.

# clear cable ipc-stats

To clear the active database and reset all IPC statistics in the active database to zero, use the **clear cable ipc-stats** command in privileged EXEC mode.

**clear cable ipc-stats**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** You must enable the Cable IPC Statistics Collection tool using the **cable ipc-stats** command before using the **clear cable ipc-stats** command.

**Examples** The following example shows how to clear the active database using the **clear cable ipc-stats** command on a Cisco CMTS router:

```
Router# clear cable ipc-stats
cr10k ipc stats is cleared at 03:38:54 PDT Fri Oct 9 2009
Router#
```

Related Commands	Command	Description
	<b>cable ipc-stats</b>	Enables the Cable IPC Statistics Collection tool on a Cisco CMTS router.
	<b>show cable ipc-stats</b>	Displays statistics of all the IPC messages on a Cisco CMTS router.

# clear cable load-balance

To clear the counters or state machine used to track load-balancing operations, use the **clear cable load-balance** command in privileged EXEC mode.

```
clear cable load-balance { counters | state | move-history cable
slot/subslot/controller-interface-index }
```

Syntax Description	counters	Clears all load balancing statistical counters.
	state	Clears all state information in the load balancing state machine. This command will also put all cable interfaces and their upstream channels in the “up” state, unless they are explicitly shut down using the <b>shutdown</b> interface configuration command.
	move-history	Clears all of the move history entries for one mac-domain.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 17.6.1w	This command was updated. The <b>move-history</b> option was introduced.

## Examples

The following example shows how to clear all of the counters that track load-balancing operations, resetting them all to zero:

```
Router# clear cable load-balance counters
```

The following example shows how to clear the state machine that is used for load-balancing operations:

```
Router# clear cable load-balance state
```

The following example shows how to clear all the move history entries for one mac-domain:

```
Router# clear cable load-balance move-history cable slot/subslot/controller-interface-index
```

## Related Commands

Command	Description
<b>cable load-balance exclude</b>	Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations.
<b>cable load-balance group (global configuration)</b>	Creates and configures a load-balance group.
<b>cable load-balance group (interface configuration)</b>	Assigns a downstream to a load-balance group.
<b>cable load-balance group interval</b>	Configures the frequency of the load-balancing policy updates.
<b>cable load-balance group policy ugs</b>	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
<b>cable load-balance group threshold</b>	Configures the threshold values that a load-balance group should use for load-balancing operations.
<b>cable upstream load-balance group</b>	Assigns an upstream to a load-balance group.
<b>show cable load-balance</b>	Displays real-time statistical and operational information for load-balancing operations.
<b>show cable load-balance docsis-group x move-history</b>	Provides detailed information on modem movement through load balancing.

## clear cable load-balance error-statistics

To clear all the failure counters in the error statistics, use the **clear cable load-balance error-statistics** command in privileged EXEC mode.

**clear cable load-balance error-statistics**

**no clear cable load-balance error-statistics**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None.

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCI	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Example

The following example shows how to clear all the failure counters in the error statistics.

```
Router# clear cable load-balance error-statistics
```

### Related Commands

<b>Command</b>	<b>Description</b>
<b>show cable load-balance</b>	Displays real-time configuration, statistical and operational information for load balancing operations on the router.
<b>show cable load-balance docsis-group</b>	Displays real-time configurational, statistical, and operational information of the DOCSIS group operations on the router.
<b>cable load-balance docsis30-dynamic-enable</b>	Enables the DOCSIS 3.0 dynamic load balancing on the Cisco CMTS.
<b>show cable load-balance statistics error</b>	Displays information of the DOCSIS 3.0 and DOCSIS 2.0 load balance failure.

# clear cable logging

To remove all error messages about bad IP source addresses on the cable interfaces from the error log buffer, or to clear the downstream index buffer, use the **clear cable logging** command in privileged EXEC mode.

```
clear cable logging {badipsource | downstream-index}
```

## Cisco cBR Series Converged Broadband Routers

```
clear cable logging {badipsource | downstream-index | layer2events | overlapip}
```

### Syntax Description

<b>badipsource</b>	Clears the log buffer for BADIPSOURCE messages.
<b>downstream-index</b>	Clears the log buffer for downstream index messages.
<b>layer2events</b>	Clears the layer 2 event messages.
<b>overlapip</b>	Clears the overlap ip messages.

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.1(13)EC	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.
12.2(11)CY	Support was added for the Cisco uBR10012 universal broadband router.
12.2(11)BC2	Support was added to the Release 12.2 BC train for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCG	The <b>downstream-index</b> keyword was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **clear cable logging badipsource** command creates a circular buffer that contains the BADIPSOURCE error messages that the Cisco CMTS generates when it discovers a CM or CPE device using an unauthorized IP address. When the buffer becomes full, the oldest messages are deleted to make room for newer messages.

When you have viewed all of the error messages in the current buffer, use the **clear cable logging** command to clear out the buffer to make room for newer messages.

### Examples

The following example shows how to clear the log buffer that contains the bad IP source address error messages:

```
Router# show cable logging summary
Cable logging: BADIPSOURCE Enabled
                Total buffer size (bytes): 1000000
                Used buffer size (bytes) : 36968
                Logged messages       : 231
```

```
Router# clear cable logging badipsource
```

```
Router# show cable logging summary
Cable logging: BADIPSOURCE Enabled
                Total buffer size (bytes): 1000000
                Used buffer size (bytes) : 0
                Logged messages       : 0
```

```
Router#
```

The following example shows how to clear the log buffer that contains the downstream index messages:

```
Router# show cable logging downstream-index
```

```
Cable logging: Enabled
                Total buffer size (bytes): 1000000
                Used buffer size (bytes) : 36968
                Logged messages       : 231
```

```
Router# clear cable logging downstream-index
```

```
Router# show cable logging downstream-index
Cable logging: Enabled
                Total buffer size (bytes): 1000000
                Used buffer size (bytes) : 0
                Logged messages       : 0
```

```
Router#
```

## Related Commands

<b>cable logging badipsource</b>	Logs error messages about bad IP source addresses on the cable interfaces.
<b>cable logging layer2events</b>	Logs layer 2 messages.
<b>cable logging overlapip</b>	Logs overlap IP messages.
<b>cable logging downstream-index</b>	Logs buffer messages about the downstream indexes.
<b>cable source-verify</b>	Enables verification of IP addresses for CMs and CPE devices on the upstream.
<b>show cable logging</b>	Displays the log of error and buffer messages on the cable interfaces.

## clear cable modem attribute-masks

To clear the cable modem attribute masks, use the **clear cable modem attribute-masks** command in privileged EXEC mode.

```
clear cable modem {mac-addr|ip-addr | cable slot/port {all | oui string | reject}} attribute-masks
clear cable modem {mac-addr|ip-addr | cable slot/subslot/port {all | oui string | reject}}
attribute-masks
clear cable modem {mac-addr|ip-addr | cable slot/subslot/cable-interface-index {all | oui string |
reject}} attribute-masks
```

### Syntax Description

<i>mac-addr</i>	Specifies the MAC address for the CM.
<i>ip-addr</i>	Specifies the IP address for the CM.
<b>cable</b> <i>slot/port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies removal of CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>cable</b> <i>slot/subslot/cable-interface-index</i>	(Optional—Cisco cBR Series Converged Broadband Routers) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. The valid range is from 0 to 3 and 6 to 9.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. The valid subslot is 0. Depending on the platform and cable interface line card, subslots 0 to 1 could be added.</li> <li>• <i>cable-interface-index</i>— Specifies the cable line card MAC domain. Valid range is from 0 to 15, depending on the cable interface line card</li> </ul>
<b>all</b>	Resets the flapping counters for all CMs.

<b>oui string</b>	Resets the flapping counters for all CMs that match the specified Organization Unique Identifier (OUI). The string parameter can be either the three-byte hexadecimal string (such as 00.00.0C).
<b>reject</b>	Resets the flapping counters for all CMs that are currently in one of the reject states.
<b>attribute-masks</b>	Specifies the attribute mask bitmap in hexadecimal format. Example: 0-FFFFFFF

**Command Default** None

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command clears the cable modem attribute masks.

**Examples** The following example shows how to clear cable modem attribute masks for CMs:

```
Router# clear cable modem all attribute-masks
Router# clear cable modem oui SA attribute-masks
Router# clear cable modem c5/0/0 offline attribute-masks
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable upstream attribute-mask</b>	This command specifies an upstream attribute mask in hexadecimal format.

## clear cable modem cm-status

To reset the cable modem status events to zero, use the **clear cable modem cm-status** command in privileged EXEC mode.

### Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

**clear cable modem** [*ip address* *mac address* | **cable** *slot/port*] **cm-status**

### Cisco uBR10012 Universal Broadband Router

**clear cable modem** [*ip address* *mac address* | **cable** *slot/subslot/cable-interface-index*] **cm-status**

### Cisco cBR Series Converged Broadband Routers

**clear cable modem** [*ip address* *mac address* | **cable** *slot/subslot/ cable-interface-index*] **cm-status**

Syntax Description	
<i>ip-address</i>	(Optional) IP address of a CM.
<i>mac-address</i>	(Optional) MAC address of a CM.
<b>cable</b> <i>slot/ subslot/ cable-interface-index</i>	<p>(Optional) Cable interface on the Cisco uBR10012 router. The following are the valid values:</p> <ul style="list-style-type: none"> <li>• <i>slot</i> = 5 to 8</li> <li>• <i>subslot</i> = 0 or 1</li> <li>• <i>cable-interface-index</i> <ul style="list-style-type: none"> <li>• Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. <b>cable</b> <i>slot/port</i>	<p>(Optional) Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7225VXR and Cisco uBR7246VXR routers, where:</p> <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the line card resides.</li> </ul> <p>Cisco uBR7246VXR router—The valid range is from 3 to 6</p> <p>Cisco uBR7225VXR router—The valid range is from 1 to 2</p> <ul style="list-style-type: none"> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul>
<b>cm-status</b>	Resets the CM status events to zero for the specified CM's.

### Command Modes

Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	12.2(33)SCC	This command was modified to clear the basic receive-statistics of all event code types for a specific CM or a group of CMs.
	12.2(33)SCD	This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Related Commands	Command	Description
	<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
	<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
	<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
	<b>clear cable modem name</b>	Removes or resets CMs by domain name.
	<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

# clear cable modem counters

**Note** Effective with Cisco IOS Release 12.2(15)BC1, the **clear cable modem counters** command is replaced by the **clear counters** command. See the **clear counters** command in the Cisco IOS software command reference documentation for more information.

To reset the cable modem (CM) flap-list counters to zero, use the **clear cable modem counters** command in privileged EXEC mode.

**clear cable modem** *{mac-addr|ip-addr | [cable {slot/portslot/subslot/port}] {all | oui string | reject}}*  
**counters**

## Syntax Description

<i>mac-addr</i>	Specifies the 48-bit hardware address (MAC address) of an individual CM.
<i>ip-addr</i>	Specifies the IP address of an individual CM.
<b>cable</b> <i>slot/port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies removal of CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>all</b>	Resets the flapping counters for all CMs.
<b>oui</b> <i>string</i>	Resets the flapping counters for all CMs that match the specified Organization Unique Identifier (OUI). The <i>string</i> parameter can be either the three-byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.
<b>reject</b>	Resets the flapping counters for all CMs that are currently in one of the reject states. (See the <b>show cable modem</b> command for a description of these states.)

## Command Default

None

**Command Modes**

Privileged EXEC (#)

**Command History**

Release	Modification
12.1 T	This command was introduced.
12.2(11)BC2	Support was added for the <b>oui</b> and <b>reject</b> options.
12.2(11)BC3	Support for clearing the counters for a particular cable interface was added.
12.2(15)BC1	This command was replaced by the <b>clear counters</b> command.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Examples**

The following example shows how to clear the counters for the CM at IP address 172.16.23.45:

```
Router# clear cable modem 172.16.23.45 counters
```

The following example shows how to clear the counters for all CMs that have an OUI that has been defined as having the vendor name of Cisco using the **cable modem vendor** command:

```
Router# clear cable modem oui Cisco counters
```

The following example shows how to clear the counters for all CMs that are currently in one of the reject states:

```
Router# clear cable modem reject counters
```

**Note** If running Cisco IOS Release 12.2(15)BC1 or later, use the **clear cable modem flap-counters** command to clear the CM flap-list counters.

**Related Commands**

Command	Description
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
<b>clear cable modem flap-counters</b>	Resets the CM flap-list counters to zero.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.
<b>clear counters</b>	Resets interface counters and those counters associated with the <b>show cable modem counters</b> command.

## clear cable modem delete

To remove one or more cable modems (CMs) from the internal address and routing tables on a CMTS router and stop DOCSIS station maintenance messages, use the **clear cable modem delete** command in privileged EXEC mode.

**clear cable modem** *{ip-addr|mac-addr}* **delete**

**clear cable modem** [**cable** *{slot/portslot/subslot/port}*] **{all|non-bonding-capable [legacy-ranging] | offline | oui** *string* **| reject | wideband [registered-traditional-docsis] }** **delete**

### Cisco cBR Series Converged Broadband Routers

**clear cable modem** *{ip-addr | cable | {slot/subslot/cable interface index}mac-addr | all | cm-status | non-bonding-capable | {delete | legacy-ranging | reset} | reject | {attribute-masks | cm-status | delete | flap-counters | rcs-counts | reset | rf-adapt | service-type-id | voice} | offline | {attribute-masks | cm-status | delete | flap-counters | rcs-counts | rf-adapt | service-type-id | voice} | online | {attribute-masks | cm-status | delete | flap-counters | rcs-counts | rf-adapt | service-type-id | voice} | oui | {string} | rcs-counts [Integrated-Cable] | wideband | {delete | registered-traditional-docsis | reset}}*

#### Syntax Description

<i>ip-addr</i>	Specifies removal of an individual CM by its IPv4 or IPv6 address.
<i>mac-addr</i>	Specifies removal of an individual CM by its 48-bit hardware address (MAC address).
<b>cable</b> <i>slot/ port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies removal of CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/ cable interface index</i>	(Optional— Cisco cBR Series Converged Broadband Routers) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>— Specifies the chassis slot number of the cable interface line card. The valid range is from 0 to 3 and 6 to 9.</li> <li>• <i>port</i>—Specifies the secondary slot number of the cable interface line card. The valid subslot is 0.</li> <li>• <i>cable-interface-index</i>— Specifies the cable line card MAC domain. Valid range is from 0 to 15, depending on the cable interface line card.</li> </ul>

<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Specifies removal of CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>all</b>	Specifies removal of all CMs or all CMs associated with a specified cable interface.
<b>non-bonding-capable</b>	Specifies removal of all narrowband CMs that are not capable of downstream channel bonding or all such CMs associated with a specified interface.
<b>legacy-ranging</b>	(Optional) Specifies removal of narrowband CMs that are accessed with legacy initial ranging or all such CMs associated with a specified interface.
<b>offline</b>	Specifies removal of all offline CMs or all such CMs associated with a specified interface.
<b>offline</b>	Specifies removal of all online CMs or all such CMs associated with a specified interface.
<b>oui</b> <i>string</i>	Specifies removal of all CMs that match the specified Organization Unique Identifier (OUI) or all such CMs associated with a specified interface. The <i>string</i> parameter can be either the three-byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.
<b>reject</b>	Specifies removal of all CMs that are currently in one of the reject states or all such CMs associated with a specified interface. (See the <b>show cable modem</b> command for a description of these states.)
<b>rcs-counts</b>	Specifies removal of MDD, QAM/FEC failure and recovery counts.
<b>wideband</b>	Specifies removal of all wideband CMs or or all such CMs associated with a specified interface.
<b>registered-traditional-docsis</b>	(Optional) Specifies removal of all wideband CMs that are registered as traditional DOCSIS CMs or all such CMs associated with a specified interface.

**Command Default** None

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(11)BC3	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 universal broadband routers.

Release	Modification
12.2(15)BC1	The <b>clear cable modem delete</b> keyword option was added.
12.3(23)BC	Support was added for the <b>non-bonding-capable</b> , <b>legacy-ranging</b> , <b>wideband</b> , and <b>registered-traditional-docsis</b> keyword options.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> <li>• Support for the Cisco uBR7225VXR router was added.</li> <li>• Support for specifying the IPv6 address of a CM was added.</li> </ul>
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command removes one or more CMs from the CMTS router memory, which causes the CMTS router to stop all DOCSIS station maintenance messages for the specified CMs until they time out and reattempt initial ranging.

### Caution

The **clear cable modem all delete** command should normally be used only on a test or lab network. If used on a large network, it could impact service for a significant period of time, as it would force all CMs to simultaneously reset and reregister with the Cisco CMTS. In addition, if HCCP N+1 redundancy has also been configured, using the **clear cable modem delete** command can trigger a switchover to one or more Protect interfaces, unless **no keepalive** has also been configured on the cable interfaces.

### Examples

The following example shows how to delete the CM at IP address 172.23.45.67:

```
Router# clear cable modem 172.23.45.67 delete
```

The following example shows how to delete all CMs that have a OUI that has been defined as having the vendor name of Cisco using the **clear cable modem vendor** command:

```
Router# clear cable modem oui Cisco delete
```

The following example shows how to delete all CMs that are currently in one of the reject states:

```
Router# clear cable modem reject delete
```

### Related Commands

Command	Description
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
<b>clear cable modem flap -counters</b>	Resets the CM flap-list counters to zero.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
<b>clear cable modem name</b>	Removes or resets CMs by domain name.

Command	Description
<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.
<b>show cable modem</b>	Displays information for the registered and unregistered CMs.

## clear cable modem device-class

To reset the cable modems by device class type, use the **clear cable modem device-class** command in privileged EXEC mode.

**clear cable modem** [**Cable** *slot/port/cable-interface-index*] **device-class** {**DVA** {**delete** | **reset**} | **MTA** {**delete** | **reset**} | **PS** {**delete** | **reset**} | **RTR** {**delete** | **reset**} | **STB** {**delete** | **reset**}}

### Syntax Description

<i>Cable slot/port/cable-interface-index</i>	Specifies the cable modems on the specified cable interface. <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. The valid range is from 0 to 9.</li> <li>• <i>port</i>—Specifies the sub slot number of the cable interface line card. The valid subslot is 0.</li> <li>• <b>delete</b>—Removes the cable modems matching the MTA device class.</li> </ul>
<b>DVA</b>	Removes or resets the cable modems for DVA devices. <ul style="list-style-type: none"> <li>• <b>reset</b>—Resets the cable modems matching the DVA device class.</li> <li>• <b>delete</b>—Removes the cable modems matching the DVA device class.</li> </ul>
<b>MTA</b>	Removes or resets the cable modems for MTA devices. <ul style="list-style-type: none"> <li>• <b>reset</b>—Resets the cable modems matching the MTA device class.</li> <li>• <b>delete</b>—Removes the cable modems matching the MTA device class.</li> </ul>
<b>PS</b>	Removes or resets the cable modems for PS devices. <ul style="list-style-type: none"> <li>• <b>reset</b>—Resets the cable modems matching the PS device class.</li> <li>• <b>delete</b>—Removes the cable modems matching the PS device class.</li> </ul>

<b>RTR</b>	Removes or resets the cable modems for Erouter devices. <ul style="list-style-type: none"> <li>• <b>reset</b>—Resets the cable modems matching the RTR device class.</li> <li>• <b>delete</b>—Removes the cable modems matching the RTR device class.</li> </ul>
<b>STB</b>	Removes or resets the cable modems for STB devices. <ul style="list-style-type: none"> <li>• <b>reset</b>—Resets the cable modems matching the STB device class.</li> <li>• <b>delete</b>—Removes the cable modems matching the STB device class.</li> </ul>

**Command Default** None

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCJ1	This command was introduced in Cisco uBR Series router.
	3.18.1SP	This command was introduced in Cisco cBR Series Converged Broadband Router.

### Examples

The following example shows how to reset the MTA device class cable modems on Cable 8/1/0:

```
Router# clear cable modem Cable 8/1/0 device-class MTA reset
```

The following example shows how to remove the STB device class cable modems on Cable 8/1/0:

```
Router# clear cable modem Cable 8/1/0 device-class STB delete
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
	<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
	<b>clear cable modem flap-counters</b>	Resets the CM flap-list counters to zero.
	<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
	<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

Command	Description
clear counters	Resets interface counters and those counters associated with the <b>show cable modem counters</b> command.

## clear cable modem flap-counters

To reset the cable modem (CM) flap-list counters to zero, use the **clear cable modem flap-counters** command in privileged EXEC mode.

**clear cable modem** *{ip-addr|mac-addr}* **flap-counters**

**clear cable modem** [**cable** *{slot/portslot/subslot/port}*] **{all | offline | oui string | reject}** **flap-counters**

Syntax	Description
<i>ip-addr</i>	Resets the flap-list counters for an individual CM by its IPv4 or IPv6 address.
<i>mac-addr</i>	Resets the flap-list counters for an individual CM by its 48-bit hardware address (MAC address).
<b>cable</b> <i>slot/port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Resets the flap-list counters for all CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Resets the flap-list counters for all CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco cBR Series Routers) Resets the flap-list counters for all CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the interface card. Valid slots are 0 to 3 and 6 to 9 on the Cisco cBR-8 router.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the interface card. Valid subslot is 0 on the Cisco cBR-8 router.</li> <li>• <i>port</i>—Specifies the cable interface index number. Valid values are 0 to 15 on the Cisco cBR-8 router.</li> </ul>
<b>all</b>	Resets the flap-list counters for all CMs or all CMs associated with a specified cable interface.
<b>offline</b>	Resets the flap-list counters for all offline CMs or for all such CMs associated with a specified interface.

## clear cable modem flap-counters

<b>oui string</b>	Resets the flap-list counters for all CMs that match the specified Organization Unique Identifier (OUI) or for all such CMs associated with a specified interface. The <i>string</i> parameter can be either the three byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.
<b>reject</b>	Resets the flap-list counters for all CMs that are currently in one of the reject states or for all such CMs associated with a specified interface. (See the <b>show cable modem</b> command for a description of these states.)

**Command Default**

None

**Command Modes**

Privileged EXEC (#)

**Command History**

Release	Modification
12.2(15)BC1	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Use the **clear cable modem flap-counters** command to reset the flap-list counters associated with the **show cable flap-list** command.

This command only resets flap-list counters. To reset other cable interface counters and those counters associated with the **show cable modem counters** command, use the **clear counters** command.

**Examples**

The following example shows how to reset the flap-list counters for the CM at IP address 172.16.23.45:

```
Router# clear cable modem 172.16.23.45 flap-counters
```

The following example shows how to reset the flap-list counters for all CMs that have a OUI that has been defined as having the vendor name of Cisco using the **cable modem vendor** command:

```
Router# clear cable modem oui Cisco flap-counters
```

The following example shows how to reset the flap-list counters for all CMs that are currently in one of the reject states:

```
Router# clear cable modem reject flap-counters
```

**Related Commands**

Command	Description
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.

Command	Description
<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
<b>clear cable modem name</b>	Removes or resets CMs by domain name.
<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.
<b>clear counters</b>	Resets interface counters and those counters associated with the <b>show cable modem counters</b> command.

## clear cable modem lock

To reset the lock on one or more cable modems (CMs), and to reinitialize them so that they can reregister with a valid DOCSIS configuration file, use the **clear cable modem lock** command in privileged EXEC mode.

**clear cable modem** {*ip-addr* | *mac-addr*} **lock**

**clear cable modem** [**cable** {*slot/port* | *slot/subslot/port*}] {**all** | *oui string*} **lock**

### Syntax Description

<i>ip-addr</i>	Resets the lock for an individual CM by its IPv4 or IPv6 address.
<i>mac-addr</i>	Resets the lock for an individual CM by its 48-bit hardware address (MAC address).
<b>cable</b> <i>slot/port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Resets the lock for all CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Resets the lock for all CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco cBR-8 Router) Resets the lock for all CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable line card. Valid slots are 0 to 3 and 6 to 9.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable line card. Valid subslot is 0.</li> <li>• <i>port</i>—Specifies the MAC domain index. Valid range is from 0 to 15.</li> </ul>
<b>all</b>	Resets the lock for all CMs or all CMs associated with a specified cable interface.
<b>oui string</b>	Resets the lock for all CMs that match the specified Organization Unique Identifier (OUI) or for all such CMs associated with a specified interface. The <i>string</i> parameter can be either the three-byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.

### Command Default

None

**Command Modes**

Privileged EXEC (#)

**Command History**

Release	Modification
12.2(15)BC1	This command was introduced.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

When you have configured the **cable dynamic-secret lock** command on a cable interface, the CMTS “locks” CMs that use a DOCSIS configuration file that fails the CMTS verification check. These CMs are allowed to come online, but with a restrictive QoS configuration that limits their service flows to 10 kbps.

Locked CMs are not allowed to reregister with a valid DOCSIS configuration file until they have been offline, without attempting to reregister, for at least 24 hours. You can manually clear the lock on a CM by using the **clear cable modem lock** command in privileged EXEC mode.

The **clear cable modem lock** command also automatically resets the CMs, so that they will reregister with the CMTS. If the CMs then reregister with a valid DOCSIS configuration file, the CMTS allows the CMs to come online with the requested QoS profiles. If the CMs violate the DOCSIS specifications again, they will be locked again.

**Note** If a CM is not manually unlocked, it remains locked until it stays offline, without attempting to reregister, for 24 hours. It can also be unlocked by using the **clear cable modem delete** command to manually remove the CM from all of the CMTS internal databases.

**Examples**

The following example shows how to reset the lock for the CM with the MAC address of 0000.0C01.0203:

```
Router# clear cable modem 0000.0C01.0203 lock
```

The following example shows how to reset the lock for the CM at IP address 172.16.23.45:

```
Router# clear cable modem 172.16.23.45 lock
```

The following example shows how to reset the locks for all CMs that have an OUI that has been defined as having the vendor name of Cisco using the **cable modem vendor** command:

```
Router# clear cable modem oui Cisco lock
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable dynamic-secret</b>	Enables the dynamic shared secret feature, so that DOCSIS configuration files are verified with a Message Integrity Check (MIC) that has been created with a dynamically generated shared secret.
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
<b>clear cable modem flap-counters</b>	Resets the CM flap-list counters to zero.
<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
<b>clear cable modem name</b>	Removes or resets CMs by domain name.
<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

# clear cable modem name

To remove or reset cable modems (CMs) by domain name, use the **clear cable modem name** command in privileged EXEC mode.

```
clear cable modem name fqdn {delete | reset}
```

Syntax Description	
<i>fqdn</i>	Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the <b>show cable modem domain-name</b> command has been run for the first time to update the cable Domain Name System (DNS) cache on the CMTS router.
<b>delete</b>	Removes the CM with the specified domain name from the Station Maintenance List.
<b>reset</b>	Removes the CM with the specified domain name from the Station Maintenance List and resets it.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCA	This command was introduced.
	12.2(33)SCD	This command was modified to remove <b>flap-counters</b> and <b>lock</b> keywords.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

**Examples** The following example shows how to delete a CM with the domain name “example”:

```
Router# clear cable modem name example delete
```

Related Commands	Command	Description
	<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
	<b>clear cable modem flap -counters</b>	Resets the CM flap-list counters to zero.
	<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
	<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
	<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

**clear cable modem name**

<b>Command</b>	<b>Description</b>
<b>show cable modem</b>	Displays information for the registered and unregistered CMs.

## clear cable modem partial-service

To reset, re-initiate or delete cable modems that are either in downstream or upstream partial service, use the **clear cable modem partial-service** command in privileged EXEC mode.

```
clear cable modem partial-service { all | d30 | d31 } [ds-partial | us-partial] { delete | reinit | reset }
```

Syntax Description		
	all	Specifies all partial service modems
	d30	Specifies Docsis 3.0 partial service modems
	d31	Specifies Docsis 3.1 partial service modems
	delete	Delete the partial service modems
	reinit	Re-initiate the partial service modems
	reset	Reset the partial service modems
	ds-partial	Specifies downstream partial service modems
	us-partial	Specifies upstream partial service modems

**Command Default** None.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.9.1w	This command is updated on the Cisco cBR Series Converged Broadband Routers. The <code>ds-partial</code> and <code>us-partial</code> keywords are added.

**Usage Guidelines** The following example shows how to reset, re-initiate or delete cable modems that are either in downstream:

```
router# clear cable modem partial-service all us-partial reset
router# clear cable modem partial-service all ds-partial reset
router# clear cable modem partial-service d30 us-partial delete
router# clear cable modem partial-service d30 us-partial reinit
```

# clear cable modem path-sel

To clear the path selection status for the cable modems, use the **clear cable modem path-sel** command in privileged EXEC mode.

**clear cable modem** [*ip address* | *mac address* | **all**] **path-sel**

Syntax Description	
<i>ip address</i>	Clears the path selection status from the specified IP address.
<i>mac address</i>	Clears the path selection status from the specified MAC address.
<b>all</b>	Clears the path selection status from all the cable modems.

**Command Default** None.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS-XE Release 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to clear the path selection status for the cable modems.

The following example shows how to clear path selection status for a particular MAC address:

```
router#show cable modem c8fb.26a6.c46a path-sel
CM c8fb.26a6.c46a Path-Sel Info: N/A
Path-Sel status has been cleared after register online.
```

Related Commands	Command	Description
	<b>show cable modem path-sel</b>	Displays the path selection status of a cable modem.
	<b>show cable mac-domain rcc</b>	Displays runtime receive channel configuration (RCC) on a cable line card interface.
	<b>show cable mac domain rcc simplified</b>	Shows detailed information for DOCSIS 3.1 capable RCC.

## clear cable modem pnm

To clear all the PNM US RxPwr information for cable modems, use the following **clear cable modem pnm us-rxpwr** command in the privileged EXEC mode.

### **clear cable modem pnm us-rxpwr**

To clear all the PNM US RxPwr information for cable modems on a specific OFDMA channel, use the following **clear cable modem pnm us-rxpwr upstream <0-15>** command in the privileged EXEC mode.

### **clear cable modem pnm us-rxpwr upstream <0-15>**

To clear all the PNM US RxPwr information for cable modems on a specific cable interface, use the following **clear cable modem [Cable<slot/0/interface>] pnm us-rxpwr Cable** command in the privileged EXEC mode.

### **clear cable modem Cable <slot/0/interface> pnm us-rxpwr**

To clear the PNM US RxPwr information for a cable modems on a specific cable interface on a specific OFDMA channel, use the following **clear cable modem [Cable<slot/0/interface>] pnm us-rxpwr upstream <0-15>** command in the privileged EXEC mode.

### **clear cable modem Cable <slot/0/interface>pnm us-rxpwr upstream<0-15>**

To clear the PNM US RxPwr information for a specific cable modem, use the following **clear cable modem [H.H.H or A.B.C.D] pnm us-rxpwr upstream** command in the privileged EXEC mode.

where [H.H.H] is a specific modem's unique MAC address, and [A.B.C.D] is a specific modem's assigned IP address.

### **clear cable modem H.H.H pnm us-rxpwr**

### **clear cable modem A.B.C.D pnm us-rxpwr**

To clear the PNM US RxPwr information for a specific cable modem on a specific US OFDMA channel, use the following **clear cable modem[H.H.H or A.B.C.D] pnm us-rxpwr upstream <0-15>** command in privileged EXEC mode.

where [H.H.H] is a specific modem's unique MAC address and [A.B.C.D] is a specific modem's assigned IP address.

where <0-15> is the upstream OFDMA channel the modem is registered on.

### **clear cable modem pnm H.H.H pnm us-rxpwr upstream <0-15>**

### **clear cable modem A.B.C.D pnm us-rxpwr upstream <0-15>**

**Table 24: Syntax Description**

Syntax	Description
interface	Interface on which the PNM RxPwr data is cleared for a specified upstream channel.

## clear cable modem pnm

Syntax	Description
mac address	MAC address of the system for which the PNM RxPwr data is cleared for a specified upstream channel.
ip address	IP address of the system for which the PNM RxPwr data is cleared for a specified upstream channel.
upstream	Modems on a particular upstream channel. The valid range is 0-15.

## clear cable modem rcs-counts

To clear the following failure and recovery event counts for all or given RF channels of a CM, use the **clear cable modem rcs-counts** command in privileged EXEC mode:

- MAC Domain Descriptor (MDD)
- QAM/forward error correction (FEC)

**clear cable modem** [**cable if** | **mac\_addr** | **ip\_addr**] **rcs-counts** [**modular-cable** *slot/bay/port nb-channel-number*]

### Cisco cBR Series Converged Broadband Routers

**clear cable modem** [**cable if** | **mac\_addr** | **ip\_addr**] **rcs-counts** [**integrated-cable** *slot/sub-slot/port rf-channel-number*]

Syntax Description		
<b>cable if</b>	(Optional) The name of the downstream interface.	
<b>mac-address</b>	(Optional) Identifies the MAC address of a CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.	
<b>ip-address</b>	(Optional) Identifies the IP address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.	
<i>slot</i>	The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.	
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).	
<i>sub-slot</i>	The valid value is 0.	
<i>sub-plot</i>	The valid value is 1.	
<i>port</i>	Specifies the interface number on the SPA.	
<i>nb-channel-number</i>	Represents the narrowband channel number.	
<i>rf-channel-number</i>	Represents the downstream RF channel number.	

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
<b>clear cable modem name</b>	Removes or resets CMs by domain name.
<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

## clear cable modem reset

To remove one or more cable modems (CMs) from the Station Maintenance List and reset them, use the **clear cable modem reset** command in privileged EXEC mode.

```
clear cable modem {ip-addrmac-addr} reset
clear cable modem [cable {slot/portslot/subslot/port}] {all | non-bonding-capable [legacy-ranging]
| oui string | reject | wideband [registered-traditional-docsis] } reset
```

Syntax Description	
<i>ip-addr</i>	Specifies removal of an individual CM by its IPv4 or IPv6 address.
<i>mac-addr</i>	Specifies removal of an individual CM by its 48-bit hardware address (MAC address).
<b>cable</b> <i>slot/port</i>	(Optional—Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies removal of all CMs on the specified cable interface and downstream port, where: <ul style="list-style-type: none"> <li><i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li><i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Specifies removal of all CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li><i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li><i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li><i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco cBR Series Routers) Specifies removal of all CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li><i>slot</i>—Specifies the chassis slot number of the interface card. Valid slots are 0 to 3 and 6 to 9 on the Cisco cBR-8 router.</li> <li><i>subslot</i>—Specifies the secondary slot number of the interface card. Valid subslot is 0 on the Cisco cBR-8 router.</li> <li><i>port</i>—Specifies the cable interface index number. Valid values are 0 to 15 on the Cisco cBR-8 router.</li> </ul>
<b>all</b>	Specifies removal of all CMs or all CMs associated with a specified cable interface.
<b>non-bonding-capable</b>	Specifies removal of all narrowband CMs that are not capable of downstream channel bonding or all such CMs associated with a specified interface.

<b>legacy-ranging</b>	(Optional) Specifies removal of narrowband CMs that are accessed with legacy initial ranging or all such CMs associated with a specified interface.
<b>oui string</b>	Specifies removal of all CMs that match the specified Organization Unique Identifier (OUI) or all such CMs associated with a specified interface. The <i>string</i> parameter can be either the three-byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.
<b>reject</b>	Specifies removal of all CMs that are currently in one of the reject states or all such CMs associated with a specified interface. (See the <b>show cable modem</b> command for a description of these states.)
<b>wideband</b>	Specifies removal of all wideband CMs or all such CMs associated with a specified interface.
<b>registered-traditional-docsis</b>	(Optional) Specifies removal of all wideband CMs that are registered as traditional DOCSIS CMs or all such CMs associated with a specified interface.

**Command Default**

None

**Command Modes**

Privileged EXEC (#)

**Command History**

Release	Modification
12.1(2) EC	This command was introduced.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.2(11)BC2	Support was added for the <b>oui</b> and <b>reject</b> options.
12.2(15)BC1	The <b>cable</b> keyword option was added.
12.3(21)BC	Support was added for the <b>wideband</b> and <b>registered-traditional-docsis</b> keyword options.
12.3(23)BC	Support was added for the <b>non-bonding-capable</b> and <b>legacy-ranging</b> keyword options.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> <li>• Support for the Cisco uBR7225VXR router was added.</li> <li>• Support for specifying the IPv6 address of a CM was added.</li> </ul>
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

This command instructs the Cisco CMTS to stop sending DOCSIS station maintenance messages to one or more CMs, which effectively terminates the link to those CMs until those CMs time out and reattempt initial ranging. A CM responds to this by resetting itself. Depending on when the CM received the last station maintenance message, it can take up to 30 seconds before the CM detects the missing station maintenance messages and resets itself.

If the **clear cable modem** *{ip-address | mac-address}* **reset** form of the command is used to reset an individual modem, the CMTS router sends a ranging stop message to the specified modem in order to command the modem to reset itself and begin initial ranging more quickly without having to wait for up to 30 seconds to realize it is no longer receiving station maintenance keep-alive opportunities. This behavior is only seen when using the **clear cable modem reset** command for a specific CM.

**Tip** You can also specify the MAC address or IP address for a CPE device or host, and the Cisco CMTS resets the CM that is associated with that CPE device in its internal database.

In some circumstances, the customer premises equipment (CPE) device behind a CM stops receiving traffic after the CM is reset. This is because the CMTS still has the CPE device listed in its address tables, but the CM does not after being reset, so the traffic passes through the CMTS but is dropped by the CM. To resolve this situation, the CPE device should simply send some type of traffic to the CM, such as a ping packet. (You can also resolve this situation by using the **clear arp-cache** command on the Cisco CMTS router to clear the router's address table, but this is not recommended because it temporarily interrupts all traffic on the router.)

**Caution** The **clear cable modem all reset** command should normally be used only on a test or lab network. If used on a large network, it could impact service for a significant period of time, as it would force all CMs to simultaneously reset and reregister with the Cisco CMTS.

**Note** The **clear cable modem all reset** command can result in the CPU utilization temporarily reaching 100 percent for a couple of minutes, as the CPU processes the command for all CMs. The CPU utilization will return to normal within a couple of minutes.

## Examples

The following example shows how to reset the CM at IP address 172.23.45.67:

```
Router# clear cable modem 172.23.45.67 reset
```

The following example shows how to reset all CMs that have an OUI that has been defined as having the vendor name of Cisco using the **cable modem vendor** command:

```
Router# clear cable modem oui Cisco reset
```

The following example shows how to reset all CMs that are currently in one of the reject states:

```
Router# clear cable modem reject reset
```

For the Cisco uBR10012 router, the following example shows how to reset all wideband CMs that are registered as traditional DOCSIS modems:

```
Router# clear cable modem wideband registered-traditional-docsis reset
```

## Related Commands

Command	Description
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.

Command	Description
<b>clear cable modem flap-counters</b>	Resets the CM flap-list counters to zero.
<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
<b>clear cable modem name</b>	Removes or resets CMs by domain name.
<b>show cable modem</b>	Displays information for registered and unregistered CMs.

## clear cable modem rf-adapt

To clear RF adaptation candidates or history information of the cable modems, use the **clear cable modem rf-adapt** command in privileged EXEC mode.

```
clear cable modem {ip-addr|mac-addr} [cable {slot/cable-interface-index|slot/subslot/cable-interface-index}
] {all | offline | reject | oui string}} rf-adapt {candidates [downgrade | upgrade] | history}
```

### Syntax Description

<i>ip-addr</i>	IPv4 or IPv6 address of the cable modem.
<i>mac-addr</i>	48-bit MAC address of the cable modem.
<b>cable</b>	Specifies the cable interface line card details. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the cable interface line card resides.</li> <li><i>subslot</i>—(Cisco uBR10012 router only) Secondary slot number of the cable interface line card.</li> <li><i>cable-interface-index</i>—Downstream port number or MAC domain index of the cable interface line card.</li> </ul>
<b>all</b>	Clears the RF adaptation history or candidate status of all cable modems.
<b>offline</b>	Clears the RF adaptation history or candidate status of all offline cable modems.
<b>reject</b>	Clears the RF adaptation history or candidate status of all cable modems in reject state.
<b>oui string</b>	Clears the RF adaptation history or candidate status of the cable modems that match the specified Organization Unique Identifier (OUI) or for all cable modems associated with a specified interface. The <i>string</i> parameter can be either the three byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.
<b>candidates</b>	Clears RF adaptation candidates.
<b>downgrade</b>	(Optional) Clears RF adaptation downgrade candidates.
<b>upgrade</b>	(Optional) Clears RF adaptation upgrade candidates.
<b>history</b>	Clears RF adaptation history.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.2(33)SCF3	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

The **clear cable modem rf-adapt** command is used to configure the [Cable Modem Upstream RF Adaptation](#) feature.

Use the **clear cable modem rf-adapt history** command to remove the history of all RF adaptation relocations for a given cable modem.

Use the **clear cable modem rf-adapt candidates** command to change the status of a cable modem or group of cable modems that are RF adaptation relocation candidates.

Using the **clear cable modem rf-adapt history** and **clear cable modem rf-adapt candidates** commands do not affect the MAC state of the cable modem.

The table below displays the interface density information.

*Table 25: Interface Density Information*

CMTS Router	Line Card	Slot	Subslot	Port	Cable Interface Index
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	0 or 4	0 to 14
	Cisco UBR-MC20X20V				0 to 4
	Cisco uBR10-MC5X20				
Cisco uBR7225VXR	All	1 or 2	0 or 1	0 or 1	—
Cisco uBR7246VXR	All	3 to 6	0 or 1	0 or 1	—

**Examples**

The following example shows how to reset the RF adaptation history for the cable modem at IP address 192.0.2.255:

```
Router# clear cable modem 192.0.2.255 rf-adapt history
```

The following example shows how to reset the RF adaptation downgrade candidates for all cable modems:

```
Router# clear cable modem all rf-adapt candidates downgrade
```

**Related Commands**

Command	Description
<b>show cable modem rf-adapt</b>	Displays the RF adaptation history.
<b>show cable rf-adapt</b>	Displays RF adaptation information of upgrade and downgrade candidates.

# clear cable modem service-type-id

To clear the cable modem service type ID, use the **clear cable modem service-type-id** command in privileged EXEC mode.

```
clear cable modem {ip | mac | name domain name | [[interface]]} {all | offline | oui oui | reject | wideband | none-bounding-capable}} service-type-id
```

## Cisco cBR Series Converged Broadband Routers

```
clear cable modem {ip | mac | [[interface]]} {all | offline | oui oui | reject}} service-type-id
```

### Syntax Description

<b>ip</b>	Specifies removal of an individual CM by its IPv4 or IPv6 address.
<b>mac</b>	Specifies removal of an individual CM by its 48-bit hardware address (MAC address).
<b>name domain name</b>	Specifies the domain name of the cable modem.
<b>interface</b>	(Optional) Resets the attribute masks of the offline CMs.
<b>all</b>	Specifies removal of all CMs or all CMs associated with a specified cable interface.
<b>offline</b>	Specifies removal of all offline CMs or all such CMs associated with a specified interface.
<b>oui oui</b>	Specifies removal of all CMs that match the specified Organization Unique Identifier (OUI) or all such CMs associated with a specified interface. The string parameter can be either the three-byte hexadecimal string (such as 00.00.0C) or a vendor name.
<b>reject</b>	Specifies removal of all CMs that are currently in one of the reject states or all such CMs associated with a specified interface.
<b>wideband</b>	Specifies removal of all wideband CMs or all such CMs associated with a specified interface.
<b>none-bounding-capable</b>	Specifies removal of all narrowband CMs that are not capable of downstream channel bonding or all such CMs associated with a specified interface.
<b>service-type-id</b>	Specifies the service type identifier.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.

**clear cable modem service-type-id**

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>name</b> , <b>wideband</b> , and <b>none-bounding-capable</b> keywords were removed.

**Usage Guidelines**

This command clears the cable modem service type ID.

**Examples**

The following example shows how to clear cable modem service type ID:

```
Router# clear cable modem all service-type-id
Router# clear cable modem oui SA service-type-id
Router# clear cable modem c3/0/0 offline service-type-id
```

**Related Commands**

Command	Description
<b>clear cable modem attribute-masks</b>	This command clears the cable modem attribute masks.
<b>show cable modem service-type-id</b>	Displays the modems having service type id.

## clear cable modem voice

To clear the voice tag that is set for a cable modem (CM), use the **clear cable modem voice** command in privileged EXEC mode.

**clear cable modem** {*ip-addr*|*mac-addr*} **voice** {**retries** | **tag**}

**clear cable modem** [**cable** *slot/subslot/port*] {**all** | **offline** | **oui** *string* | **reject**} **voice** {**retries** | **tag**}

Syntax Description	
<i>ip-addr</i>	Specifies removal of an individual CM by its IPv4 or IPv6 address.
<i>mac-addr</i>	Specifies removal of an individual CM by its 48-bit hardware address (MAC address).
<b>retries</b>	Clears the CM downstream retries record.
<b>tag</b>	Clears the CM voice tag.
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco uBR10012 Router) Specifies clearing of voice tags for CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>cable</b> <i>slot/subslot/port</i>	(Optional—Cisco cBR Series Routers) Specifies clearing of voice tags for CMs on the specified cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the interface card. Valid slots are 0 to 3 and 6 to 9 on the Cisco cBR-8 router.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the interface card. Valid subslot is 0 on the Cisco cBR-8 router.</li> <li>• <i>port</i>—Specifies the cable interface index number. Valid values are 0 to 15 on the Cisco cBR-8 router.</li> </ul>
<b>all</b>	Specifies clearing of voice tags for all CMs or all CMs associated with a specified cable interface.
<b>offline</b>	Specifies clearing of voice tags for all offline CMs or all such CMs associated with a specified interface.
<b>oui</b> <i>string</i>	Specifies clearing of voice tags for all CMs that match the specified Organization Unique Identifier (OUI) or all such CMs associated with a specified interface. The <i>string</i> parameter can be either the three byte hexadecimal string (such as 00.00.0C) or a vendor name that has been defined using the <b>cable modem vendor</b> command.
<b>reject</b>	Specifies clearing of voice tags for all CMs that are currently in one of the reject states or all such CMs associated with a specified interface. (See the <b>show cable modem</b> command for a description of these states).

**clear cable modem voice**

**Command Default** None

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Examples**

The following example shows how to clear the voice tag and retries record for the CM at IP address 172.16.23.45:

```
Router# clear cable modem 172.16.23.45 voice retries
```

**Related Commands**

<b>Commands</b>	<b>Description</b>
<b>show cable modem voice</b>	Displays the detected voice-enabled modems.
<b>test cable voice</b>	Allows you to manually set the voice tag of a cable modem.

## clear cable multicast ses-cache

To clear the multicast replication sessions cache, use the **clear cable ses-cache** command in privileged EXEC mode.

```
clear cable multicast ses-cache {all | counter | interface integrated-cable slot/subslot/port:rf-channel | modular-cable slot/ {subslotbay}/port:interface-number | wideband-cable slot/ {subslotbay}/port:wideband-channel}
```

Syntax Description		
<b>all</b>		Clears the cached multicast replication sessions for all interfaces.
<b>counter</b>		Clears multicast replication sessions cache counters.
<b>interface integrated-cable</b> <i>slot/subslot/port:rf-channel</i>		Clears the cached multicast replication sessions for a integrated-cable interface. <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where a line card resides.</li> <li>• <i>subslot</i>—(Cisco uBR10012 only) Secondary slot number of a line card.</li> <li>• <i>port</i>—Downstream port number.</li> <li>• <i>rf:channel</i>—RF channel number.</li> </ul>
<b>interface modular-cable</b> <i>slot/{subslot / bay}/port:interface-number</i>		Clears the cached multicast replication sessions for a modular-cable interface. <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where a SPA interface processor (SIP) or a line card resides.</li> <li>• <i>subslot</i>—Secondary slot for a shared port adapter (SPA) or a line card.</li> <li>• <i>bay</i>—Bay in a SIP where a SPA is located.</li> <li>• <i>port</i>—Downstream port number.</li> <li>• <i>interface-number</i>—Modular channel number.</li> </ul>
<b>interface wideband-cable</b> <i>slot/{subslot / bay}/port:wideband-channel</i>		Clears the cached multicast replication sessions for a wideband-cable interface. <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where a SPA interface processor (SIP) or a line card resides.</li> <li>• <i>subslot</i>—Secondary slot for a shared port adapter (SPA) or a line card.</li> <li>• <i>bay</i>—Bay in a SIP where a SPA is located.</li> <li>• <i>port</i>—Downstream port number.</li> <li>• <i>wideband-channel</i>—Wideband channel number.</li> </ul>

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCH	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Use the **clear cable multicast ses-cache** command to clear the multicast replication sessions configured on the interfaces.

The table below displays the valid values for an integrated-cable interface.

**Table 26: Integrated Cable Interface Density Information**

CMTS Router	Line Card	Slot	Subslot	Port	RF Channel Number
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	0 to 4	0 to 3
	Cisco UBR-MC20X20V				
	Cisco uBR10-MC5X20				
Cisco uBR7225VXR	All	1 or 2	—	0 or 1	—
Cisco uBR7246VXR	All	3 to 6	—	0 or 1	—

The table below displays the valid values for an modular-cable interface.

**Table 27: Modular Cable Interface Density Information**

Line Card	Slot	Subslot	Bay	Port	Interface Number
Cisco uBR-MC3GX60V	5 to 8	0 or 1	—	0 to 2	0 to 23
Cisco UBR-MC20X20V			—	0 to 5	
Cisco Wideband SPA	—	0 or 1 <sup>10</sup>	0 to 3	0	
Cisco Wideband SIP / Cisco SIP-600	1 or 3	—	—	—	

<sup>10</sup> Applicable to SPAs when the SIP is in Slot1 or Slot 3. The subslot is not specified from Cisco IOS Release 12.2(33)SCB onwards.

The table below displays the valid values for an wideband-cable interface.

**Table 28: Wideband Interface Density Information**

CMTS Router	Line Card	Slot	Subslot	Bay	Port	Wideband Channel
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	—	0 to 4	0 to 31
	Cisco UBR-MC20X20V			—		0 to 5
	Cisco uBR10-MC5X20			—		—
	Cisco Wideband SPA	—	0 or 1 <sup>11</sup>	0 to 3	0	—
	Cisco Wideband SIP / Cisco SIP-600	1 or 3	—	—	—	—
Cisco uBR7225VXR	All	1 to 2	—	—	0 or 1	0 to 5
Cisco uBR7246VXR	All	3 to 6	—	—	—	—

- <sup>11</sup> Applicable to SPAs when the SIP is in Slot1 or Slot 3. The subslot is not specified from Cisco IOS Release 12.2(33)SCB onwards.

### Examples

The following example clears the multicast replication session cache for all interfaces on the Cisco uBR10012 router:

```
Router# clear cable multicast ses-cache all
```

### Related Commands

Command	Description
<b>clear cable multicast ses-cache</b>	Configures the multicast replication session cache on the Cisco uBR10012 router.
<b>show cable multicast ses-cache</b>	Displays the multicast replication session cache information both at the global and interface level of the forwarding interface.

# clear cable multicast statistics counter

To reset all multicast statistics counters, use the **clear cable multicast statistics counter** command in privileged EXEC mode.

**clear cable multicast statistics counter**

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The counters are also set to zero when a given multicast resource is reconfigured. Counters are displayed using the **show cable multicast statistics** command.

## Examples

The following example shows how to reset configured multicast statistics index allocation details to zero:

```
Router# clear cable multicast statistics counter
Router#
```

## Related Commands

Command	Description
<b>show cable multicast statistics</b>	Displays the multicast statistics index allocation details.
<b>show cable multicast db</b>	Displays the contents of the multicast explicit tracking database.

## clear cable resil-rf-status

To reset flap counts and flap time for all or a given RF channel, use the **clear cable resil-rf-status** command in privileged EXEC mode.

**clear cable resil-rf-status** [**Integrated-Cable** *slot/subslot/port rf-channel-number* ]

Syntax Description	Integrated-Cable	(Optional) Specifies that the flap counts and flap time is reset for the given RF channel.
	<i>slot</i>	Slot where interface card resides. The range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router.
	<i>subslot</i>	Subslot number of the interface card. The value is 0 on the Cisco cBR-8 router.
	<i>port</i>	Port number. The range is from 0 to 7 on the Cisco cBR-8 router.
	<i>rf-channel-number</i>	Downstream RF channel number. The range is from 0 to 162 on the Cisco cBR-8 router.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>clear cable rf-status</b> command.

The following example shows how to reset the flap counts and flap time for RF channel 4:

```
Router# clear cable resil-rf-status Integrated-Cable 3/0/2 4
```

Related Commands	Command	Description
	<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
	<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
	<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
	<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

## clear cable rf-status

To reset flap counts and flap time for all or a given RF channel, use the **clear cable rf-status** command in privileged EXEC mode.

**clear cable rf-status** [**modular-cable** *slot/bay/port nb-channel-number*]

### Syntax Description

<i>slot</i>	The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the interface number on the SPA.
<i>nb-channel-number</i>	Represents the narrowband channel number.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the <b>clear cable resil-rf-status</b> command on the Cisco cBR Series Converged Broadband Routers.

### Related Commands

Command	Description
<b>clear cable flap-list</b>	Resets the flap-list table for a specific CM or for all CMs.
<b>clear cable modem delete</b>	Removes one or more CMs from the internal address and routing tables on a CMTS router and stops DOCSIS station maintenance messages.
<b>clear cable modem lock</b>	Resets the lock on one or more CMs.
<b>clear cable modem name</b>	Removes or resets CMs by domain name.
<b>clear cable modem reset</b>	Removes one or more CMs from the Station Maintenance List and resets them.

# clear cable rpd all event

To remove all events on Cisco cBR, use the **clear cable rpd all event** command.

```
clear cable rpd all event
```

This command has no arguments or keywords.

---

**Command Modes** Privileged EXEC (#)

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco RPD IOS 1.1	This command was introduced on the Cisco Remote-PHY Devices.

---

---

**Usage Guidelines** Use this command to clear RPD events.

The following example shows how to clear all RPD events.

```
Router(config)#clear cable rpd all event
Router(config)#show cable rpd event
Load for five secs: 13%/4%; one minute: 10%; five minutes: 10%
Time source is NTP, 17:43:36.424 CST Fri Apr 28 2017
RPD                eventId Level Count LastTime      Message
```

## clear cable rpd reset

To reset RPD, use the **clear cable rpd reset** command.

```
clear cable rpd { rpd_mac | all | slot id | group name | interface
TenGigabitEthernet slot/subslot/port }reset [ factory | non-volatile | soft
| hard ]
```

### Syntax Description

<b><i>rpd_mac</i></b>	Specifies the MAC address of the RPD to reset.
<b>all</b>	Resets all the RPDs.
<b>slot <i>id</i></b>	Specifies the slot of the RPDs to reset.
<b>group <i>name</i></b>	Specifies the group of the RPDs to reset.
<b>interface TenGigabitEthernet <i>slot/subslot/port</i></b>	Specifies the Ten Gigabit Ethernet interface with slot, subslot, and port of the RPDs to reset.
<b>reset</b>	Performs a hard reset together with a legacy GDM reset for backward compatibility.
<b>factory</b>	Restores the factory configuration and performs a hard reset.
<b>non-volatile</b>	Clears most non-volatile configuration and performs a hard reset.
<b>factory</b>	Performs a software reset.
<b>hard</b>	Performs hardware reset using TLV40.1.1 on: <ul style="list-style-type: none"> <li>• All RPDs</li> <li>• Specific RPD using MAC address</li> <li>• Specific RPD interface</li> <li>• Specific RPD slot</li> </ul>

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1x	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Dublin 17.12.1w	The <b>hard</b> option is introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command works only when cBR-8 router acts as the principal core of the RPD.

The following example shows how to reset RPD.

```
Router#clear cable rpd 1004.9fb1.1300 reset non-volatile
Warning: Do you really want to do this? It will clear most RPD non-volatile configuration!

Confirm to continue? [no]: yes
Router#
```

The following example shows how to reset all the RPD configured on the CBR router using the hard option:

```
Router#clear cable rpd all reset hard
```

The following example shows how to reset a specific RPD configured on the CBR router:

```
Router#clear cable rpd 1004.9fb1.1300 reset hard
```

```
Router#show cable rpd
```

```
Load for five secs: 6%/1%; one minute: 7%; five minutes: 7%
Time source is NTP, 10:08:19.582 CST Fri Aug 4 2023
```

MAC Address	IP Address	I/F	State	Role	HA	Auth Name
0018.48fe.e643	10.0.0.1	Te6/1/5	online	Pri	Act N/A	vecima-rpd
1004.9fb1.1300	10.0.0.2	Te6/1/5	offline	Pri	Act N/A	ng13-shelf-node2

```
! = PTP clock out of phaselock occurred, ^ = Default password in use
```

# clear cable secondary-ip

To clear the router's table that links secondary IP addresses to the devices that use them, use the **clear cable secondary-ip** command in privileged EXEC mode.

**clear cable secondary-ip interface cable** {*slot/portslot/subport/port*} [**all** | **sid** *sid* [*ip-address*]

Syntax Description	
<i>slot/port</i>	(Cisco uBR7100 and Cisco uBR7200 Series Routers) Specifies the cable interface and downstream port, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card.</li> <li>• <i>port</i>—Specifies the downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
<i>slot/subslot/port</i>	(Cisco uBR10012 Router) Specifies the cable interface, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>• <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>
<b>all</b>	Specifies that all IP addresses in the secondary IP address table should be cleared.
<b>sid</b> <i>sid</i>	Specifies that all IP addresses for a particular Service ID (SID) should be cleared. The valid range is 1 to 8191.
<i>ip-address</i>	(Optional) Specifies that the IP address for a particular CM or CPE device should be cleared.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.1(13)EC	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.
	12.2(11)BC1	Support was added for the Cisco uBR10012 universal broadband router.
	12.2(11)BC2	This command was removed because it is no longer needed, because of database changes.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.

Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

To support BPI and BPI+ operations with CMs and CPE devices that use secondary IP addresses, the CMTS maintains a database that links the known secondary IP addresses to the SIDs used by those devices. When the CMTS and CM need to renew their public keys, the CMTS uses this database to ensure that all IP addresses are sufficiently updated to allow proper routing and fast switching.

**Tip** You can display the list of known IP addresses per SID by using the **show interface cable sid** command.

If you encounter apparent problems with secondary IP addressing, or if you want to manually clear the table of IP addresses for a particular SID, use the **clear cable secondary-ip** command.

One possible situation that might occur is if a CM first assigns a secondary IP address to one CPE device, but later that same IP address is assigned to another CPE device behind a different CM. If this happens, the IP address will continue to show up as a secondary IP address for the original CM until that CM renews its public keys. This will not affect network connectivity for either CPE or CM. You can, however, clear the unneeded secondary IP address from the CMTS database using the **clear cable secondary-ip** command.

### Examples

The following example shows how to clear all of the secondary IP addresses for a particular cable interface:

```
Router# clear cable secondary-ip interface cable 3/0 all
```

The following example shows how to clear the secondary IP addresses for all CM and CPE devices on cable interface 1/0 that are using SID 5:

```
Router# clear cable secondary-ip interface cable 1/0 sid 5
```

The following example shows how to clear the secondary IP addresses for the CM and CPE devices on cable interface 5/0 that are using SID 113 and IP address 10.10.17.3:

```
Router# clear cable secondary-ip interface cable 5/0 sid 113 10.10.17.3
```

### Related Commands

Command	Description
<b>show interface cable sid</b>	Displays information for a particular SID, including the known secondary IP addresses.

## clear cable upstream ofdma mer-fec

To clear OFDMA MER and FEC counts, use the **clear cable upstream ofdma mer-fec** command in privileged EXEC mode.

```
clear cable upstream ofdma mer-fec { all | upstream-cable slot/card/port us-channel us_channel_number
}
```

<b>Syntax Description</b>	<b>all</b>	Clears Upstream OFDMA MER and FEC on the entire chassis.
	<b>upstream-cable</b> <i>slot/card/port</i> <b>us-channel</b> <i>us_channel_number</i>	Clears Upstream OFDMA MER and FEC on a specific OFDMA upstream channel.
<b>Command Default</b>	None	
<b>Command Modes</b>	Privileged EXEC (#)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS XE Gibraltar 16.12.1y	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to clear Upstream OFDMA MER and FEC on the entire chassis.:

```
Router# clear cable upstream ofdma mer-fec all
Check all IUCs are cleared in the entire cbr8
```

The following example shows how to clear Upstream OFDMA MER and FEC on a specific OFDMA upstream channel:

```
Router# clear cable upstream ofdma mer-fec upstream-cable 1/0/0 us-channel 15
```

# clear hccp counters

To reset the counters for one or all Hot Standby Connection-to-Connection Protocol (HCCP) groups, use the **clear hccp counters** command in privileged EXEC mode.

**clear hccp** [*group* | **all**] **counters**

Syntax Description	
<i>group</i>	Clears the counters for the specified group number. The valid range is 1 to 255.
<b>all</b>	Clears the counters for all HCCP groups.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.1(3a)EC	This command was introduced for the Cisco uBR7200 series routers.
	12.1(7)EC1	Support was added for the Cisco uBR-MC16S cable interface line card.
	12.2(4)XF1, 12.2(4)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card.
	12.2(8)BC2	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards.
	12.2(11)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.
	12.3(21)BC	This command is obsolete on the Cisco uBR7246VXR router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command clears the counters that are displayed by the **show hccp** and **show hccp interface** commands. You can clear the counters for a single HCCP group, or all HCCP groups.

## Examples

The following example shows the counters for group 1 being reset to 0:

```
Router# clear hccp 1 counters
```

The following example shows the counters for all groups being reset to 0:

```
Router# clear hccp all counters
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>hccp working</b>	Designates a cable interface on a CMTS in the specified group to be a Working CMTS.
<b>show hccp</b>	Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.
<b>show hccp interface</b>	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.

# clear hccp linecard

To clear information about the Hot Standby Connection-to-Connection Protocol (HCCP) startup and switchover flow and unused events associated with cable line cards, use the **clear hccp linecard** command in privileged EXEC mode.

**clear hccp linecard** {fsm | nullfsm} buffer

Syntax Description	Option	Description
	<b>fsm</b>	The HCCP state transition flow (startup and switchover flow). Each line card member in an HCCP group is controlled by a state machine, which controls the HCCP startup and switchover flow.
	<b>nullfsm</b>	The HCCP members that received unused or redundant events. This option is used only for debugging.
	<b>buffer</b>	Buffer for saving HCCP state transition flow.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to clear entries for the HCCP startup and switchover flow using the **clear hccp linecard** command on a Cisco CMTS router:

```
Router# clear hccp linecard fsm buffer
```

Related Commands	Command	Description
	<b>show hccp interface</b>	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.
	<b>show hccp linecard</b>	Displays line card level HCCP group information.

# clear packetcable gate counter commit

To clear the specified gate counter for PacketCable Multimedia (PCMM) or Dynamic Quality of Service (DQoS) for PC, use the **clear packetcable gate counter commit** command in Privileged EXEC mode.

**clear packetcable gate counter commit** [**dqos** | **multimedia**]

Syntax Description	Keyword	Description
	<b>dqos</b>	Clears PC DQoS gate counters.
	<b>multimedia</b>	Clears PCMM gate counters.

**Command Default** The committed gate counter is reset to zero by default with router restart, and gates are not cleared periodically by default.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
	12.2(15)BC1	Support was added for the Cisco uBR10012 router.
	12.3(13a)BC	This command was modified to support PCMM on the Cisco uBR10012 router and the Cisco uBR7246VXR router. The <b>dqos</b> and <b>multimedia</b> keywords were added.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command is used to reset the gate counter being used to track the total number of committed gates. The CMTS router maintains a count of the total number of gates committed from the router's last startup. This command can be used to either clear all the gate commit counts, or to specifically clear the counts for DQoS- or multimedia-based gates.

A **show** command is used to display the total number of gates committed on the CMTS.

## Examples

The following example shows the committed gate counter being reset to zero:

```
Router# clear packetcable gate counter commit
```

Related Commands	Command	Description
	<b>packetcable authorize vanilla-docsis-mta</b>	Allows non-DQoS MTAs to send DOCSIS DSX messages.
	<b>packetcable gate maxcount</b>	Sets the maximum number of PCMM gates in the gate database.

Command	Description
<b>packetcable multimedia</b>	Enables and displays PacketCable Multimedia processing on the Cisco CMTS.
<b>packetcable timer multimedia T1</b>	Sets the default timeout value for T1 timer used in PCMM gate processing.

# clear packetcable rks

To clear the record keeping server (RKS) entries when there are no calls associated with the RKS server, use the **clear packetcable rks** command in privileged EXEC mode.

```
clear packetcable rks {ip_addr ip_addr port | all}
```

## Syntax Description

<b>ip_addr</b> <i>ip_addr</i>	Indicates the IP address of the RKS server to be cleared.
<i>port</i>	Indicates the UDP port of the RKS server to be cleared.
<b>all</b>	Indicates that information about all RKS servers will be cleared.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(33)SCD	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **clear packetcable rks** command is used to clear the unwanted IP addresses of the RKS servers from the RKS server group list.

**Note** This command clears the IP addresses of only those RKS servers that are currently not being used. In other words, if the reference count of an RKS server is a non-zero value, that entry will not be cleared from the RKS server group list.

**Tip** You can verify the value of reference count (ref-cnt) by executing the **show packetcable event** command with the **rks-group** keyword.

## Examples

The following sample shows how to clear the RKS server with IP address 2.39.26.8 on port 1816:

```
router#
clear packetcable rks ip_addr 2.39.26.8 1816
```

The following sample shows how to clear the entries of all RKS servers:

```
router#
clear packetcable rks all
```

**Related Commands**

Command	Description
show packetcable event	Displays information about the servers that are configured on the Cisco CMTS router for PacketCable operations.

# clear pxf

To clear Parallel eXpress Forwarding (PXF) counters and statistics, use the **clear pxf** command in privileged EXEC mode.

**clear pxf** [**dma counters** | **interface** *interface* | **statistics** {**context** | **diversion** | **drop** | **ip** | **ipv6**} | **xcm counters**]

## Syntax Description

<b>dma counters</b>	(Optional) Clears the direct memory access (DMA) PXF counters.
<b>interface</b> <i>interface</i>	(Optional) Clears the PXF counters on the specified interface.
<b>statistics</b>	(Optional) Type of PXF statistics to clear. The options are: <ul style="list-style-type: none"> <li>•<b>context</b>—Current and historical loads on the PXF.</li> <li>•<b>diversion</b>—Traffic diverted from the PXF.</li> <li>•<b>drop</b>—Dropped packets and bytes.</li> <li>•<b>ip</b>—IP and ICMP statistics.</li> <li>•<b>ipv6</b>—IPv6 statistics.</li> </ul>
<b>xcm counters</b>	Clears the PXF Error Code Correction (ECC) counters.

## Command Default

Clears the PXF Error Code Correction (ECC) counters.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.0(22)S	This command was introduced on the Cisco 10000 series router.
12.2(1)XF1	This command was introduced on the Cisco uBR10012 router.
12.2(4)XF1	The <b>xcm counters</b> option was introduced to support the Performance Routing Engine (PRE1) module on the Cisco uBR10012 router.
12.3(7)XI1	This command was integrated into Cisco IOS Release 12.3(7)XI1.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC. The <b>context</b> and <b>ipv6</b> keyword options are not supported.
12.2(31)SB	This command was integrated into Cisco IOS Release 12.2(31)SB.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. The <b>ipv6</b> keyword option is not supported.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

If no interface is specified, the command clears PXF counters on all interfaces. The `clear pxf` command clears counters associated with the `show pxf dma`, `show pxf interface`, `show pxf statistics`, and `show pxf xcm` commands.

**Cisco uBR10012 Universal Broadband Router**

Not all keyword options are supported in the Cisco IOS software for the Cisco uBR10012 universal broadband router. See the command history table for the unsupported keyword options by release.

The `clear pxf xcm counters` command is supported only on the PRE1 and later processors for the Cisco uBR10012 router. This command is not supported on the PRE processor.

**Examples**

The following sample clears PXF statistics for serial interface 1/0/0:

```
router#
clear pxf interface serial 1/0/0
```

The following sample clears PXF statistics on all interfaces:

```
router#
clear pxf interface
```

**Related Commands**

Command	Description
<code>show pxf cpu statistics</code>	Displays PXF CPU statistics.
<code>show pxf dma</code>	Displays the current state of DMA buffers, error counters, and registers on the PXF engine.
<code>show pxf interface</code>	Displays a summary of the statistics accumulated by column 0 of the PXF for an interface.
<code>show pxf statistics</code>	Displays chassis-wide, summary PXF statistics
<code>show pxf xcm</code>	Displays information about the servers that are configured on the Cisco CMTS router for PacketCable operations.

# clear pxf statistics drl all

To clear all the entries in all the DRL statistics table, use the **clear pxf statistics drl all** command in privileged EXEC mode.

**clear pxf statistics drl all**

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(33)SCJ	This command was introduced.

## Example

The following example shows how to clear all the entries in all the DRL statistics table:

```
Router#clear pxf statistics drl all
```

## Related Commands

Command	Description
<b>clear pxf statistics drl max-rate</b>	Clears the DRL max-rate statistics on the WAN interface.

## clear pxf statistics drl cable-wan-ip

To clear the PXF DRL cable/wan-ip statistics table, use the **clear pxf statistics drl cable-wan-ip** command in privileged EXEC mode.

**clear pxf statistics drl cable-wan-ip**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was replaced by the <b>show platform hardware qfp active infrastructure punt sbrl</b> command on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the drop count to zero for all entries in the PXF DRL cable/wan-ip statistics table. It does not change any other value.

**Examples** The following example shows how to clear cable-wan-ip statistics:

```
Router# clear pxf statistics drl cable-wan-ip
```

Related Commands	Command	Description
	<b>clear pxf statistics drl wan-non-ip</b> (for uBR series router)	This command set the drop count to zero for all entries in the PXF DRL wan-non-ip statistics table.

## clear pxf statistics drl wan-non-ip

To clear the PXF DRL wan-non-ip statistics, use the **clear pxf statistics drl wan-non-ip** command in privileged EXEC mode.

**clear pxf statistics drl wan-non-ip**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was replaced by the <b>show platform software punt-policer clear</b> command on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command sets the drop count to zero for all entries in the PXF DRL wan-non-ip statistics table.

**Examples** The following example shows how to clear the PXF statistics in wan-non-ip:

```
Router# clear pxf statistics drl wan-non-ip
```

Related Commands	Command	Description
	<b>clear pxf statistics drl cable-wan-ip</b>	This command sets the drop count to zero for all entries in the cable or wan-ip statistics table.

## clear pxf statistics drl max-rate

To clear the DRL max-rate statistics on the WAN interface, use the **clear pxf statistics drl max-rate** command in privileged EXEC mode.

**clear pxf statistics drl max-rate**

Syntax Description	
<i>threshold</i>	The packet threshold value. The valid range is 0 to 4294967295.
<i>output modifiers</i>	The following output modifiers are used. <ul style="list-style-type: none"> <li>• begin—Begins with the line that match.</li> <li>• exclude—Excludes the lines that match.</li> <li>• include—Includes the lines that match.</li> <li>• redirect—Redirects the output to the URL.</li> <li>• section—Filters a section of the output.</li> <li>• tee—Copies output to the URL.</li> </ul>

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCH3	This command was introduced.
	IOS-XE 3.15.0S	This command was replaced by the <b>show platform software punt-policer clear</b> command on the Cisco cBR Series Converged Broadband Routers.

### Example

The following example shows how to clear DRL max-rate statistics on the WAN interface:

```
Router#clear pxf statistics drl max-rate wan
  dropped   divert_code
No max-rate WAN drops
```

Related Commands	Command	Description
	<b>service divert-rate-limit max-rate</b>	Sets per-divert-code rate limit on the WAN interface
	<b>clear pxf statistics drl max-rate</b>	Clears the DRL max-rate statistics on the WAN interface.

# clear redundancy

To clear the counters and history information that are used by the Redundancy Facility (RF) subsystem, use the **clear redundancy** command in privileged EXEC mode.

**clear redundancy** {**counters** | **history**}

## Cisco cBR Series Converged Broadband Routers

**clear redundancy** {**counters** | **history** | **idb-sync-history** | **linecard history**}

### Syntax Description

<b>counters</b>	Clears the RF counters that are maintained by the RF subsystem.
<b>history</b>	Clears the history of RF activity that is maintained by the RF subsystem.
<b>idb-sync-history</b>	Clears the Interface Descriptor Blocks (IDB) synchronization history of RF activity that is maintained by the RF subsystem.
<b>linecard history</b>	Clears the line card redundancy information. <ul style="list-style-type: none"> <li>• <b>history</b>—Clears the line card redundancy history logs.</li> </ul>

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
12.2(4)XF1	This command was introduced for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>idb-sync-history</b> and <b>linecard</b> keywords were added.

### Usage Guidelines

The **clear redundancy** command clears the following information, which is shown by the **show redundancy** command:

- **counters**—Number of messages sent and received, buffers used, and synchronization errors.
- **history**—RF subsystem activity, such as checkpoint messages sent between RF clients.
- **idb-sync-history**—(On Cisco cBR series routers) RF subsystem activity, such as IDB synchronization information.
- **linecard history**—(On Cisco cBR series routers) Line card redundancy history information.

## Examples

The following example shows how to clear the RF counters that are displayed by the **show redundancy** command:

```
Router# clear redundancy counters
```

The following example shows how to clear the RF history information that is displayed by the **show redundancy** command:

```
Router# clear redundancy history
```

The following example shows how to clear the RF IDB synchronization history information that is displayed by the **show redundancy** command on the Cisco cBR series routers:

```
Router# clear redundancy idb-sync-history
```

The following example shows how to clear the line card redundancy history information that is displayed by the **show redundancy** command on the Cisco cBR series routers:

```
Router# clear redundancy linecard history
```

## Related Commands

Command	Description
<b>show redundancy</b>	Displays the current redundancy state.

## cmc

To configure the Cisco CMC in a channel group, use the **cmc** command in channel group configuration mode. To disable the configuration, use the **no** form of the command.

**cmc** *mac-address*

**no cmc** *mac-address*

<b>Syntax Description</b>	<i>mac-address</i> MAC address of the Cisco CMC.
---------------------------	--------------------------------------------------

<b>Command Default</b>	Cisco CMC is not configured.
------------------------	------------------------------

<b>Command Modes</b>	Channel group configuration (config-ch-group)
----------------------	-----------------------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)CX	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

<b>Usage Guidelines</b>	You can configure up to four Cisco CMCs in a channel group.
-------------------------	-------------------------------------------------------------

The following example shows how to configure a Cisco CMC in a channel group:

```
Router# configure terminal
Router(config)# cable channel-group 1
Router(config-ch-group)# cmc 0010.2024.7035
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable channel-group</b>	Configures channel group.
	<b>show cable channel-group</b>	Displays the channel group information.

## connection

To configure the ECMG connection, use the **connection** command in the DVB scrambling ECMG configuration mode. To void the ECMG connection configuration, use the **no** form of this command.

**connection id** *id* **priority** *priority* *ip\_address* *port*  
**no connection id** *id*

<b>id</b> <i>id</i>	Specifies the connection ID.
<b>priority</b> <i>priority</i>	Specifies the connection priority.
<i>ip_address</i> <i>port</i>	Specifies the connection IP address and port.

### Command Default

None

### Command Modes

DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the ECMG connection:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#connection id 1 priority 1 1.200.1.81 8888
```

### Related Commands

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>auto-channel-id</b>	Enables automatic channel ID selection.
<b>ecm-pid-source</b>	Configures the source of ECM PID.
<b>ca-system-id</b>	Configures the CA system ID.
<b>type</b>	Configures the ECMG type.
<b>mode</b>	Configures the application mode of ECMG.
<b>desc-rule</b>	Configures the descriptor rule.
<b>override</b>	Overrules the default settings.

# controller downstream-oob 55d1-profile

To configure the OOB downstream controller profile, use the **controller downstream-oob 55d1-profile** command in global configuration mode.

**controller downstream-oob 55d1-profile** *id*

## Syntax Description

**Syntax Description** *id* Specifies the OOB downstream controller profile ID.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use this command to configure the OOB downstream controller profile.

## Examples

The following example shows how to enter the OOB downstream controller profile configuration mode:

```
Router# configure terminal
Router(config)# controller downstream-oob 55d1-profile 1
Router(config-profile)#
```

## Related Commands

Command	Description
<b>ds-channel</b>	Configures the OOB downstream channel.

# controller integrated-cable

To enter controller configuration mode to configure the controller interface for an integrated DOCSIS 3.0 cable interface line card, use the **controller integrated-cable** command in global configuration mode.

## Cisco uBR10012 Router and Cisco cBR Series Converged Broadband Routers

**controller integrated-cable** *slot/subslot/port*

## Cisco uBR7225VXR and Cisco uBR7246VXR Routers

**controller integrated-cable** *slot/port*

Syntax Description	
<b>integrated-cable</b> <i>slot/subslot/port</i>	<p>Identifies the cable interface.</p> <p>For the Cisco uBR10012 router:</p> <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the line card resides. The valid range is from 5 to 8.</li> <li>• <i>subslot</i>—Subslot where the line card resides. Available slots are 0 or 1.</li> <li>• <i>port</i>—Downstream controller number on the line card. Valid port values are from 0 to 4.</li> </ul> <p>For the Cisco cBR series router:</p> <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the interface card resides. The valid range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router.</li> <li>• <i>subslot</i>—Subslot where the interface card resides. The valid value is 0 on the Cisco cBR-8 router.</li> <li>• <i>port</i>—Controller port number. The valid values are from 0 to 7 on the Cisco cBR-8 router.</li> </ul>
<b>integrated-cable</b> <i>slot/port</i>	<p>Identifies the cable interface on the Cisco uBR7246VXR or Cisco uBR7225VXR router.</p> <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7246VXR router: The valid range is from 3 to 6.</li> <li>• Cisco uBR7225VXR router: The valid range is from 1 to 2.</li> </ul> </li> <li>• <i>port</i>—Downstream port number on the line card. The valid port value is 0 or 1.</li> </ul>

**Command Default** None

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	12.2(33)SCD	This command was modified. Added support for the controller interface configuration on Cisco uBR7246VXR and Cisco uBR7225VXR universal broadband routers.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to enter controller configuration mode to configure the controller interface in slot 5, subslot 1, and port 0 of the Cisco uBR10012 router:

```
Router# configure terminal
```

```
Router(config)# controller integrated-cable 5/1/0
```

The following example shows how to enter controller configuration mode to configure the controller interface in slot 3, subslot 0, and port 0 of the Cisco cBR-8 router:

```
Router# configure terminal
```

```
Router(config)# controller integrated-cable 3/0/0
```

## Related Commands

Command	Description
<b>annex modulation</b>	Sets the annex and modulation rates for each RF channel.
<b>rf-channel cable downstream channel-id</b>	Assigns a downstream channel ID to an RF channel.
<b>rf-channel frequency</b>	Sets the frequency for each RF channel.
<b>rf-channel rf-power</b>	Sets the RF power output level.
<b>rf-channel rf-shutdown</b>	Enables or disables an RF channel.

## controller modular-cable

To enter controller configuration mode to configure the wideband modular interface controller, use the **controller modular-cable** command in global configuration mode.

### Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

**controller modular-cable** *slot/subslot/bay*

### Cisco IOS Release 12.2(33)SCB and later releases

**controller modular-cable**  
*slot/bay/portslot/subslot/controller*

Syntax Description	
<i>slot/subslot/bay</i> or <i>slot/bay/port</i>	<p>The Wideband SPA slot, subslot, bay, and port.</p> <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the Wideband SIP resides. The valid values are 1 and 3.</li> <li>• <i>subslot</i>—Subslot where the Wideband SIP resides. The valid value is 0.</li> <li>• <i>bay</i>—Wideband SIP bay where the SPA resides. The valid range is from 0 to 3.</li> <li>• <i>port</i>—Port number on the SPA. The valid value is always 0.</li> </ul>
<i>slot/subslot/controller</i>	<p>Modular cable line card slot, subslot, and controller.</p> <ul style="list-style-type: none"> <li>• <i>slot</i>—Modular cable line card slot. The valid values are 5, 6, 7, and 8.</li> <li>• <i>subslot</i>—Modular cable line card subslot. The valid values are 0 and 1.</li> <li>• <i>controller</i>—Modular cable line card controller. The valid range is from 0 to 2.</li> </ul>

### Command Default

The command mode is unchanged.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command was modified. The addressing format for the modular cable interface was changed from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
12.2(33)SCE	This command was modified. This command now supports the Cisco uBR-MC3GX60V cable interface line card. The addressing format <i>slot/subslot/controller</i> for the modular-cable line card was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command indicates where the wideband modular interface controller is located and enters controller configuration mode. The modular interface controller could be either a SPA, or a Cisco uBR-MC3GX60V cable interface line card.

**Examples**

The following example shows how to enter the controller configuration mode for the Cisco Wideband SPA in slot 1, subslot 0, and bay 0.

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
```

The following example shows how to enter the controller configuration mode for the Cisco uBR-MC3GX60V line card in slot 8, subslot 1, and controller-unit-number 1.

```
Router# configure terminal

Router(config)# controller modular-cable 8/1/1
```

**Related Commands**

Command	Description
<b>annex modulation</b>	Sets the annex and modulation for the Cisco Wideband SPA.
<b>cable rf-channel</b>	Associates an RF channel on a Cisco Wideband SPA with a wideband channel.
<b>ip-address (controller)</b>	Sets the IP address of the Cisco Wideband SPA FPGA.
<b>modular-host subslot</b>	Specifies the modular-host line card for the Cisco Wideband SPA.
<b>rf-channel cable downstream channel-id</b>	Assigns a downstream channel ID to an RF channel.
<b>rf-channel description</b>	Specifies the description for each RF channel.
<b>rf-channel ip-address mac-address udp-port</b>	Sets the IP address, MAC address, and UDP port for each RF channel.
<b>rf-channel network delay</b>	Specifies the CIN delay for each RF channel.

# controller upstream-cable

To configure upstream-cable controller, use the **controller upstream-cable** command in global configuration mode. To restore the default value, use the **no** form of this command.

**controller upstream-cable** *slot/subslot/controller port number*  
**no controller upstream-cable** *slot/subslot/controller port number*

<b>Syntax Description</b>	<i>slot/subslot/controller port number</i>	The <i>slot</i> , <i>subslot</i> and <i>controller port number</i> . The valid range values are: <ul style="list-style-type: none"> <li>• <i>slot</i> - The valid range is from 0 to 9.</li> <li>• <i>subslot</i> - The valid subslot is 0.</li> <li>• <i>controller port number</i> - The valid range is from 0 to 15.</li> </ul>
---------------------------	--------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Command Default** Cable linecards are created for all the 16 controllers (0 - 15) by default.

**Command Modes** Global configuration (config)

<b>Command History</b>	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use the **controller upstream-cable** command to configure upstream-cable controller in global configuration mode.

**Examples** The following example shows how to configure upstream cable controller using **controller upstream-cable** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)#
```

<b>Related Commands</b>	Command	Description
	<b>controller integrated-cable</b>	Configures the Integrated-cable controller.

# controller upstream-oob 55d1-profile

To configure the OOB upstream controller profile, use the **controller upstream-oob 55d1-profile** command in global configuration mode.

**controller upstream-oob 55d1-profile** *id*

## Syntax Description

**Syntax Description** *id* Specifies the OOB upstream controller profile ID.

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Use this command to configure the OOB upstream controller profile.

## Examples

The following example shows how to enter the OOB upstream controller profile configuration mode:

```
Router# configure terminal
Router(config)# controller upstream-oob 55d1-profile 1
Router(config-profile)#
```

## Related Commands

Command	Description
<b>us-channel</b>	Configures the OOB upstream channel.

## cops ip dscp

To specify the Common Open Policy Service (COPS) Differentiated Services Code Point (DSCP) markings for COPS messages that are transmitted by the Cisco router, use the **cops ip dscp** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
cops ip dscp [0-63 | default | af11-af43 | cs1-cs7]
nocops ip dscp [0-63 | default | af11-af43 | cs1-cs7]
```

### Syntax Description

The values for this command specify the markings with which COPS messages are transmitted. The following values are supported for the Cisco CMTS router.

<b>0-63</b>	DSCP value ranging from 0-63.
<b>af11</b>	Use AF11 dscp (001010)
<b>af12</b>	Use AF12 dscp (001100)
<b>af13</b>	Use AF13 dscp (001110)
<b>af21</b>	Use AF21 dscp (010010)
<b>af22</b>	Use AF22 dscp (010100)
<b>af23</b>	Use AF23 dscp (010110)
<b>af31</b>	Use AF31 dscp (011010)
<b>af32</b>	Use AF32 dscp (011100)
<b>af33</b>	Use AF33 dscp (011110)
<b>af41</b>	Use AF41 dscp (100010)
<b>af42</b>	Use AF42 dscp (100100)
<b>af43</b>	Use AF43 dscp (100110)
<b>cs1</b>	Use CS1 dscp (001000) [precedence 1]
<b>cs2</b>	Use CS2 dscp (010000) [precedence 2]
<b>cs3</b>	Use CS3 dscp (011000) [precedence 3]
<b>cs4</b>	Use CS4 dscp (100000) [precedence 4]
<b>cs5</b>	Use CS5 dscp (101000) [precedence 5]
<b>cs6</b>	Use CS6 dscp (110000) [precedence 6]
<b>cs7</b>	Use CS7 dscp (111000) [precedence 7]
<b>default</b>	Use default dscp (000000)

ef	Use EF dscp (101110)
----	----------------------

**Command Default**

- This command is disabled by default.
- For messages transmitted by the Cisco router, the default DSCP value is 0.
- For incoming connections to the Cisco router, by default, the COPS engine takes the DSCP value used by the COPS server that initiates the TCP connection.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.3(13a)BC	This command was introduced to the Cisco CMTS.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

This feature allows you to change the Differentiated Services Code Point (DSCP) marking for COPS messages that are transmitted or received by the Cisco router. Cisco IOS Release 12.3(13a)BC supports this function with the **cops ip dscp** command. The **cops ip dscp** command changes the default IP parameters for connections between the Cisco router and COPS servers in the cable network.

DSCP values are used in Quality of Service (QoS) configurations on a Cisco router to summarize the relationship between DSCP and IP precedence. This command allows COPS to remark the packets for either incoming or outbound connections.

The default setting is 0 for outbound connections. On default incoming connections, the COPS engine takes the DSCP value from the COPS server initiating the TCP connection.

**Note** This feature affects all TCP connections with all COPS servers.

- The **cops ip dscp** command allows the Cisco router to re-mark the COPS packets for either incoming or outbound connections.
- This command affects all TCP connections with all COPS servers.
- This command does not affect existing connections to COPS servers. Once you issue this command, this function is supported only for new connections after that point in time.
- For messages transmitted by the Cisco router, the default DSCP value is 0.
- For incoming connections to the Cisco router, the COPS engine takes the DSCP value used by the COPS server that initiates the TCP connection, by default.

For additional information about this feature and related commands, refer to the “COPS Engine Operation on the Cisco CMTS Routers” feature document on Cisco.com.

**Examples**

The following basic example illustrates the use of this command:

The following example illustrates the **cops ip dscp** command with supported command variations:

```

Router(config)# cops ip dscp ?
<0-63>  DSCP value
af11    Use AF11 dscp (001010)
af12    Use AF12 dscp (001100)
af13    Use AF13 dscp (001110)
af21    Use AF21 dscp (010010)
af22    Use AF22 dscp (010100)
af23    Use AF23 dscp (010110)
af31    Use AF31 dscp (011010)
af32    Use AF32 dscp (011100)
af33    Use AF33 dscp (011110)
af41    Use AF41 dscp (100010)
af42    Use AF42 dscp (100100)
af43    Use AF43 dscp (100110)
cs1     Use CS1  dscp (001000) [precedence 1]
cs2     Use CS2  dscp (010000) [precedence 2]
cs3     Use CS3  dscp (011000) [precedence 3]
cs4     Use CS4  dscp (100000) [precedence 4]
cs5     Use CS5  dscp (101000) [precedence 5]
cs6     Use CS6  dscp (110000) [precedence 6]
cs7     Use CS7  dscp (111000) [precedence 7]
default Use default dscp (000000)
ef      Use EF   dscp (101110)
Router(config)# cops ip dscp 63

```

The following example specifies the COPS server and enables COPS for RSVP on the server. Both of these functions are accomplished by using the **ip rsvp policy cops** command on the Cisco uBR10012 router. By implication, the default settings for all remaining COPS for RSVP commands are accepted.

```

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip rsvp policy cops servers 161.44.130.168 161.44.129.6
Router(config)# exit

```

The following examples display three views of the COPS for RSVP configuration on the router, which can be used to verify the COPS for RSVP configuration.

The following example displays the policy server address, state, keepalives, and policy client information:

```

Router# show cops servers
COPS SERVER: Address: 161.44.135.172. Port: 3288. State: 0. Keepalive: 120 sec
Number of clients: 1. Number of sessions: 1.
COPS CLIENT: Client type: 1. State: 0.

```

The following example displays the policy server address, the ACL ID, and the client/server connection status:

```

Router# show ip rsvp policy cops
COPS/RSVP entry. ACLs: 40 60
PDPs: 161.44.135.172
Current state: Connected
Currently connected to PDP 161.44.135.172, port 0

```

The following example displays the ACL ID numbers and the status for each ACL ID:

```

Router# show ip rsvp policy
Local policy: Currently unsupported
COPS:

```

```
ACLs: 40 60 . State: CONNECTED.
ACLs: 40 160 . State: CONNECTING.
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cops listeners access-list</b>	Configures access control lists (ACLs) for inbound connections to all COPS listener applications on the Cisco CMTS.
<b>cops tcp window-size</b>	Overrides the default TCP receive window size that is used by COPS processes.
<b>debug packetcable cops</b>	Enables debugging processes for PacketCable with the COPS engine.
<b>debug packetcable gate control</b>	Enables and displays debugging processes for PacketCable gate control.
<b>debug packetcable subscriber</b>	Enables and displays debugging processes for PacketCable subscribers.
<b>show cops servers</b>	Displays COPS server addresses, port, state, keepalives, and policy client information.
<b>show debug</b>	Displays current debugging information that includes PacketCable COPS messages on the Cisco CMTS.
<b>show ip rsvp policy</b>	Displays policy server addresses, ACL IDs, and client/server connection status.

## cops listeners access-list

To configure access control lists (ACLs) for inbound connections to all Common Open Policy Service (COPS) listener applications on the Cisco CMTS router, use the **cops listeners access-list** command in global configuration mode. To remove this setting from the Cisco CMTS router, use the **no** form of this command.

```
cops listeners access-list {acl-numacl-name}
no cops listeners access-list {acl-numacl-name}
```

### Syntax Description

<i>acl-num</i>	Numeric identifier that identifies the access list to apply to the current interface. For standard access lists, the valid range is 1 to 99; for extended access lists, the valid range is 100 to 199.  For IPv4 access list number, the normal range is 1 to 199 and extended range is 1300 to 2699 on the Cisco cBR series routers.
<i>acl-name</i>	Alphanumeric identifier of up to 30 characters, beginning with a letter that identifies the ACL to apply to the current interface.

### Command Default

Access lists are not configured by default on the Cisco CMTS router.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

When using ACLs with cable monitor and the Cisco uBR10012 router, combine multiple ACLs into one ACL, and then configure cable monitor with the consolidated ACL. For more information about cable monitor on the Cisco uBR10012 router, refer to the “Cable Monitor and Intercept Features for the Cisco CMTS” documentation on Cisco.com.

### Examples

The following example illustrates a short access list configuration for the COPS listener feature:

```
Router# cops listeners access-list 40
```

### Related Commands

Command	Description
<b>cops ip dscp</b>	Specifies the COPS DSCP markings for COPS messages that are transmitted by the Cisco router
<b>cops tcp window-size</b>	Overrides the default TCP receive window size that is used by COPS processes.

Command	Description
<b>debug packetcable cops</b>	Enables debugging processes for PacketCable with the COPS engine.
<b>debug packetcable gate control</b>	Enables and displays debugging processes for PacketCable gate control.
<b>debug packetcable subscriber</b>	Enables and displays debugging processes for PacketCable subscribers.
<b>show cops servers</b>	Displays COPS server addresses, port, state, keepalives, and policy client information.
<b>show debug</b>	Displays current debugging information that includes PacketCable COPS messages on the Cisco CMTS.
<b>show ip rsvp policy</b>	Displays policy server addresses, ACL IDs, and client/server connection status.

## cops tcp window-size

To override the default TCP receive window size on the Cisco CMTS router, use the **cops tcp window-size** command in global configuration mode. This setting allows you to prevent the COPS server from sending too much data at one time. To return the TCP window size to a default setting of 4K, use the **no** form of this command.

**cops tcp window-size** *bytes*  
**no cops tcp window-size**

### Syntax Description

<i>bytes</i>	This is the TCP window size setting in bytes. This value can range from 516 to 65535 bytes.
--------------	---------------------------------------------------------------------------------------------

### Command Default

The default COPS TCP window size is 4000 bytes.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(13a)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command does not affect existing connections to COPS servers. Once you issue this command, this function is supported only for new connections after that point in time.

### Examples

The following example configures the TCP window size to be 64000 bytes.

```
Router(config)# cops tcp window-size 64000
```

### Related Commands

Command	Description
<b>cops ip dscp</b>	Specifies the Common Open Policy Service (COPS) Differentiated Services Code Point (DSCP) markings for COPS messages that are transmitted by the Cisco router

<b>debug packetcable cops</b>	Enables debugging processes for PacketCable with the COPS engine.
<b>debug packetcable gate control</b>	Enables and displays debugging processes for PacketCable gate control.
<b>debug packetcable subscriber</b>	Enables and displays debugging processes for PacketCable subscribers.

Command	Description
<b>show cops servers</b>	Displays COPS server addresses, port, state, keepalives, and policy client information.
<b>show debug</b>	Displays current debugging information that includes PacketCable COPS messages on the Cisco CMTS.
<b>show ip rsvp policy</b>	Displays policy server addresses, ACL IDs, and client/server connection status.

# core-interface

To configure the core-interface, use the **core-interface** command in RPD configuration mode. To void the core-interface configuration, use the **no** form of this command.

**core-interface tengigabitethernet** *slot/port/interface*

**no core-interface tengigabitethernet** *slot/port/interface*

<b>Syntax Description</b>	<i>slot/port/interface</i> Specifies the slot, port and interface of the core-interface.
---------------------------	------------------------------------------------------------------------------------------

<b>Command Default</b>	None
------------------------	------

<b>Command Modes</b>	RPD configuration (config-rpd)
----------------------	--------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

<b>Usage Guidelines</b>	Use this command to enter the core-interface configuration mode.
-------------------------	------------------------------------------------------------------

The following example shows how to configure the core-interface:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/0/1
Router(config-rpd-core)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>principal</b>	Specifies RPD as principal.
	<b>network-delay dlm</b>	Configures DEPI latency measurement.
	<b>rpd-ds</b>	Configures RPD downstream port.
	<b>rpd-us</b>	Configures RPD upstream port.

## cp-override

To override and specify the crypto period duration, use the **cp-override** command in the DVB scrambling EIS configuration mode. To restore the default crypto period duration, use the **no** form of this command.

**cp-override** *duration*

**no cp-override**

<i>duration</i>	Specifies the crypto period duration in seconds.
-----------------	--------------------------------------------------

### Command Default

None

### Command Modes

DVB scrambling EIS configuration mode (config-video-encrypt-dvb-eis)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

This command overrides and specifies the crypto period duration. The valid range is from 1 to 3600 seconds.

The following is an example of how to override and specify the crypto period duration:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#eis EIS-1 id 1
Router(config-video-encrypt-dvb-eis)#cp-override 60
```

### Related Commands

Command	Description
<b>overwrite-scg</b>	Enables Scrambling Control Group (SCG) overwrite.
<b>eis</b>	Enters the Event Information Scheduler configuration mode.
<b>listening-port</b>	Configures the listening TCP port.

# cpd

To enable the Control Point Discovery (CPD) feature, use the **cpd** command in global configuration mode. To disable CPD, use the **no** form of this command.

**cpd**  
**no cpd**

**Syntax Description** This command has no keywords or arguments.

**Command Default** CPD is enabled.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.3(21a)BC3	This command was introduced.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Examples** The following example shows the cpd enabled on a router:

```
Router(config)# cpd
```

Related Commands	Command	Description
	<b>cpd cr-id</b>	Configures a control relationship identifier.

## cpd cr-id

To configure a Control relationship identifier (CR ID), use the **cpd cr-id** command in global configuration mode. To disable the CR ID, use the **no** form of this command.

**cpd cr-id** *cr id number*  
**no cpd cr-id**

### Syntax Description

<i>cr id number</i>	Control relationship identifier. The valid range is from 1 to 65535.
---------------------	----------------------------------------------------------------------

### Command Default

The CR ID is configured as 1.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.3(21a)BC3	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows the control relationship identifier configured as 236:

```
Router(config)# cpd cr-id 236
```

### Related Commands

Command	Description
<b>cpd</b>	Enables CPD functionality.

## cpe max

To create a DOCSIS configuration file that specifies the maximum number of CPE devices that can use the CM to connect to the cable network, use the **cpe max** command in cable config-file configuration mode. To remove the CPE specification, use the **no** form of this command.

```
cpe max cpe-num
no cpe max
```

### Syntax Description

<i>cpe-num</i>	Specifies the number of CPEs. Valid range is 1 to 254.
----------------	--------------------------------------------------------

### Command Default

A maximum of one CPE device can use the CM to connect to the cable network.

### Command Modes

Cable config-file configuration (config-file)

### Command History

Release	Modification
12.1(2)EC1	This command was introduced.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The CM enforces the limitation imposed by the **cpe max** command, but the CMTS might enforce its own lower number of CPE devices. On Cisco CMTS routers, a *cpe-num* value of 0 enables an unlimited number of hosts, but on some CMs, this value provides only 0 hosts.

### Examples

The following example shows how to set the maximum CPE value for the configuration file:

```
Router(config)# cable config-file channeloverride.cm
Router(config-file)# cpe max 3

Router(config-file)# exit
```

### Related Commands

Command	Description
<b>cable config-file</b>	Creates a DOCSIS configuration file and enters configuration file mode.
<b>access-denied</b>	Disables access to the network.
<b>channel-id</b>	Specifies upstream channel ID.

<b>Command</b>	<b>Description</b>
<b>download</b>	Specifies download information for the configuration file.
<b>frequency</b>	Specifies downstream frequency.
<b>option</b>	Provides config-file options.
<b>privacy</b>	Specifies privacy options for baseline privacy images.
<b>service-class</b>	Specifies service class definitions for the configuration file.
<b>snmp manager</b>	Specifies Simple Network Management Protocol (SNMP) options.
<b>timestamp</b>	Enables time-stamp generation.

## cyclic-prefix

To specify the channel cyclic-prefix, use the **cyclic-prefix** command in OFDM channel profile configuration mode. To undo the cyclic-prefix assignment, use **no** form of this command.

**cyclic-prefix** [192 | 256 | 512 | 768 | 1024]

**no cyclic-prefix**

### Command Default

192

### Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to specify the channel cyclic-prefix.

### Examples

The following example shows how to specify the channel cyclic-prefix:

```
Router# configure terminal
Router(config)# cable downstream ofdm-channel-profile 21
Router(config-ofdm-chan-prof)# cyclic-prefix 1024
```

### Related Commands

Command	Description
<b>cable downstream ofdm-chan-profile</b>	Define the OFDM channel profile on the OFDM channel.
<b>description (OFDM channel profile)</b>	Specify a user defined description for the profile.
<b>interleaver-depth</b>	Specify the channel interleaver-depth.
<b>pilot-scaling</b>	Specify the value used to calculate the number of continuous pilots.
<b>profile-control</b>	Specify default modulation or profile as the channel control profile.
<b>profile-data</b>	Specify default modulation or profile as the channel data profile.
<b>profile-ncp</b>	Specify default modulation or profile as the channel ncp profile.
<b>roll-off</b>	Specify the channel roll-off value.
<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.

# default-nit-reference

To configure Network Information Table (NIT) reference, use the **default-nit-reference** command in the video configuration mode.

**default-nit-reference** *PID*

<b>Syntax Description</b>	<i>PID</i> The NIT reference PID. The reference PID must be in the range of 1 to 8190.	
<b>Command Default</b>	None	
<b>Command Modes</b>	Video configuration mode (config-video)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
<b>Usage Guidelines</b>	<p>The NIT helps in conveying information about the physical organization of the multiplexes and transport streams (TS) carried through a specific network and also the characteristics of the network.</p> <p>Use the <b>no default-nit-reference</b> command to remove the configured NIT PID.</p>	

The following example shows how to configure the NIT reference.

```
configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
cable video
  default-nit-reference ?
  <1-8190> 1-8190

  default-nit-reference 100
%%All existing sessions will be updated with default-nit-reference.
Re-configure Default NIT reference? [Yes/No][confirm]
```

# default-onid

To set the default ONID number, use the **default-onid** command in the video configuration mode.

**default-onid** *number*

<b>Syntax Description</b>	<i>number</i> The ONID number. By default, the system ONID is 0, which is commonly used in North America. If the default value of the ONID is used, the TSID must be unique. If you change the ONID, the TSID-ONID pair must be unique. The ONID must be in the range of 0 to 65535.				
<b>Command Default</b>	None.				
<b>Command Modes</b>	Video configuration mode (config-video)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 3.18.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
<b>Usage Guidelines</b>	<p>This command is used to change the default system ONID.</p> <p>The following example shows how to change the default ONID number:</p> <pre>configure terminal cable video default-onid 1580</pre>				

# default-psi-interval

To set the default Program Specific Information (PSI) interval number, use the **default-psi-interval** command in the video configuration mode.

**default-psi-interval** *number*

<b>Syntax Description</b>	<i>number</i> The PSI interval number. By default, PSI interval is 100 msec. The PSI interval must be in the range of 40 to 1000 msec.				
<b>Command Default</b>	None.				
<b>Command Modes</b>	Video configuration mode (config-video)				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 3.18.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
<b>Usage Guidelines</b>	<p>This command is used to change the default PSI interval.</p> <p>The following example shows how to change the default PSI interval:</p> <pre> <b>configure terminal</b> <b>cable video</b> <b>default-psi-interval</b> 400           </pre>				

# depi-class

To create a template of Downstream External PHY Interface (DEPI) control plane configuration settings, which different pseudowire classes can inherit, and to enter the DEPI class configuration mode, use the **depi-class** command in global configuration mode. To remove a specific DEPI class configuration, use the **no** form of this command.

**depi-class** *depi-class-name*  
**no depi-class** *depi-class-name*

## Syntax Description

<i>depi-class-name</i>	Name of the DEPI class. The <i>depi-class-name</i> argument must be specified to configure multiple sets of DEPI control parameters.
------------------------	--------------------------------------------------------------------------------------------------------------------------------------

## Command Default

No DEPI classes are defined.

## Command Modes

Global configuration (config)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **depi-class** *depi-class-name* command allows you to configure a DEPI class template that consists of configuration settings used by different pseudowire classes. The **depi-class** command enters DEPI class configuration mode, where DEPI control plane parameters are configured.

You must use the same DEPI class in the pseudowire configuration at both ends of a Layer 2 control channel.

## Examples

The following example shows how to enter DEPI class configuration mode to create a DEPI class configuration template for the class named SPA0:

```
Router# configure terminal
Router(config)# depi-class SPA0
Router(config-depi-ctrl SPA0)#
```

## Related Commands

Command	Description
<b>l2tp-class</b>	Creates a template of Layer 2 Tunnel Protocol (L2TP) control plane configuration settings that can be inherited by different pseudowire classes and enters the L2TP class configuration mode.
<b>depi-tunnel</b>	Creates a template of Downstream External PHY Interface (DEPI) tunnel configuration settings, which different pseudowire classes can inherit, and enters the DEPI data session configuration mode.
<b>show depi tunnel</b>	Displays all active control connections.

Command	Description
<b>show depi session</b>	Displays established DEPI data sessions.

# depi-tunnel

To create a template of Downstream External PHY Interface (DEPI) tunnel configuration settings, which different pseudowire classes can inherit, and to enter the DEPI data session configuration mode, use the **depi-tunnel** command in the global configuration mode or subinterface configuration mode. To remove a configured DEPI tunnel, use the **no** form of this command.

**depi-tunnel** *depi-tunnel-name*  
**no depi-tunnel** *depi-tunnel-name*

## Syntax Description

<i>depi-tunnel-name</i>	Name of the DEPI tunnel.
-------------------------	--------------------------

## Command Default

This command has no default behavior or values.

## Command Modes

Global configuration (config)

Subinterface configuration (config-subif)

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **depi-tunnel** creates a template of DEPI tunnel configuration settings. The DEPI data session inherits the control plane configuration settings of a depi-control template.

The following depi data session configuration options are available in this mode:

- l2tp-class
- depi-class
- dest-ip
- tos

## Examples

The following example shows how to create a template of DEPI tunnel configuration settings in the global configuration mode and enter the DEPI data session configuration mode:

```
Router# configure terminal
Router(config)# depi-tunnel rf6
Router(config-depi-tunnel)#
```

The following example shows how to create a template of DEPI tunnel configuration settings in the subinterface configuration mode:

```
Router(config)# interface qam 6/4.1
Router(config-subif)# depi-tunnel 0
```

Related Commands	Command	Description
	<b>l2tp-class</b>	Creates a template of Layer 2 Tunnel Protocol (L2TP) control plane configuration settings, which different pseudowire classes can inherit, and enters the L2TP class configuration mode.
	<b>depi-class</b>	Creates a template of Downstream External PHY Interface (DEPI) control plane configuration settings, which different pseudowire classes can inherit, and enters the DEPI class configuration mode.
	<b>dest-ip</b>	Assigns an IP address to the destination network.
	<b>tos</b>	Configures the Type of Service (ToS) byte in the header of Layer 2 tunneled packets.
	<b>show depi tunnel</b>	Displays all active control connections.
	<b>show depi session</b>	Displays established DEPI data sessions.

## depi cin-failover

To enable a failover when Converged Interconnect Network (CIN) failure occurs on Downstream External PHY Interface (DEPI), use the **depi cin-failover** command in global configuration mode. To disable the failover when the CIN fails on the DEPI, use the **no** form of this command.

**depi cin-failover** [**cpu-threshold** {**high** *threshold\_value* | **low** *threshold\_value*}]  
**no depi cin-failover**

### Syntax Description

<b>cpu-threshold</b>	Configures the CPU threshold on the line card.
<b>high</b>	Sets the high threshold level. Default value is 95.
<b>low</b>	Sets the low threshold level. Default value is 85.
<i>threshold_value</i>	Threshold value of CPU usage in percentage. The valid range is from 0 to 100.

### Command Default

The DEPI CIN failover configuration is disabled by default.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SCF	This command was introduced.
12.2(33)SCF4	This command was modified. The <b>cpu-threshold</b> keyword was added to the command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

If DEPI Control Plane High Availability is configured, the **depi cin-failover** command, which is configured globally, triggers a cable line card switchover when a CIN failure occurs.

The **depi cin-failover cpu-threshold** command allows you to set a CPU threshold to alter when a failover due to CIN failure is allowed to happen.

- When the **high** threshold is reached, a failover due to CIN failure is disabled.
- If (and only if) the **high** threshold was reached, the CPU will have to drop lower than the configured **low** threshold before a failover due to CIN failure is enabled again.

**Note** In Cisco IOS Release 12.2(33)SCE, DEPI CIN triggered failover is automatically enabled with control plane DEPI. The **depi cin-failover** command is introduced in Cisco IOS Release 12.2(33)SCF and is disabled by default.

### Examples

The following example shows how to configure a CIN failover:

```
Router(config)# depi
```

```
Router(config)# depi cin-failover  
Router(config)# exit
```

The following example shows how to set the CPU threshold value:

```
Router(config)# depi  
Router(config)# depi cin-failover cpu-threshold high 95 low 85  
Router(config)# exit
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show depi tunnel</b>	Displays all active control connections.
<b>show depi session</b>	Displays information about DEPI sessions.

## depi eqam-stats

To enable debugging information for Downstream External PHY Interface (DEPI) EQAM statistics on the Cisco CMTS router, use the **depi eqam-stats** command in global configuration mode. To disable debugging information, use the **no** form of this command.

**depi eqam-stats**  
**no depi eqam-stats**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The DEPI EQAM statistics configuration is enabled by default.

**Command Modes** Global configuration (config)

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Cisco RF Gateway 10 sends EQAM statistics to the Cisco CMTS router. No other EQAM supports the EQAM statistics feature.

**Examples** The following example shows how to configure DEPI EQAM statistics on the Cisco CMTS router:

```
Router# configure terminal
Router(config)# depi eqam-stats
```

Command	Description
<b>show depi session</b>	Displays information about DEPI sessions.

## desc-rule

To configure the descriptor rule, use the **desc-rule** command in the DVB scrambling ECMG configuration mode. To void the descriptor rule configuration, use the **no** form of this command.

**desc-rule** *descriptor\_name* [**id** *id*]  
**no desc-rule** *descriptor\_name*

<i>descriptor_name</i>	Specifies the descriptor name.
<i>id</i>	Specifies the descriptor ID.

**Command Default** None

**Command Modes** DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the descriptor rule:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#desc-rule desc_8_1 id 1
Router(config-video-encrypt-dvb-ecmg-desc)#
```

### Related Commands

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>do-not-insert</b>	Prohibits inserting standard descriptors.
<b>add-priv-data</b>	Adds private data to the descriptor

## description (bonding-group)

To add a description for a bonding group on the Cisco CMTS router, use the **description** command in cable interface configuration mode. To remove a description for a bonding group, use the **no** form of this command.

**description** *description*

**no description**

### Syntax Description

<i>description</i>	Specifies a description for the bonding group. The character-string can be up to 128 characters long.
--------------------	-------------------------------------------------------------------------------------------------------

### Command Default

By default, description for a bonding group does not exist.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **description** command is used to configure the [Upstream Channel Bonding](#) feature.

The **description** command adds a comment to the configuration to provide information about the bonding group.

### Examples

The following example shows how to specify a description for bonding group 1:

```
Router# configure terminal

Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface cable 8/0/0
Router(config-if)# cable upstream bonding-group 1
Router(config-upstream-bonding)# description UBG1
Router(config-upstream-bonding)# end
Router# show running interface cable 8/0/0
Building configuration...

interface Cable8/0/0
  downstream Modular-Cable 8/0/0 rf-channel 0-3
  cable ip-init apm
  cable mtc-mode
  no cable packet-cache
  cable bundle 6
  cable upstream max-ports 4
  cable upstream bonding-group 1
  description UBG1
  upstream 0
  upstream 1
```

```
upstream 2
upstream 3
attributes 80000000
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>cable fiber-node</b>	Enters cable fiber-node configuration mode to configure a fiber node.
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.

## description (cable fiber-node)

To specify a description for a fiber node, use the **description** command in cable fiber-node configuration mode. To remove a description for a fiber node, use the **no** form of this command.

**description** *description*

**no description**

### Syntax Description

<i>description</i>	Specifies a description for the cable fiber node. The character-string can be up to 80 characters long.
--------------------	---------------------------------------------------------------------------------------------------------

### Command Default

If the **description** command is not issued, a description does not exist.

### Command Modes

Cable fiber-node configuration (config-fiber-node)

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The **description** command adds a comment to the configuration to provide information about the fiber node.

### Examples

The following example shows how to specify a description for fiber node 5:

```
Router# configure terminal
Router(config)# cable fiber-node 5
Router(config-fiber-node)# description Branch office 5
```

### Related Commands

Command	Description
<b>cable fiber-node</b>	Enters cable fiber-node configuration mode to configure a fiber node.
<b>downstream cable</b>	Assigns a primary downstream channel for a fiber node.
<b>downstream modular-cable rf-channel</b>	Specifies the RF channels that are available for wideband channels on a fiber node.
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.

## description (OFDM channel profile)

To specify a user defined description for the profile, use the **description** command in OFDM channel profile configuration mode. To remove the description, use **no** form of this command.

**description** *description*

**no description**

### Syntax Description

<i>description</i>	Specify a user defined description for the profile.
--------------------	-----------------------------------------------------

### Command Default

None

### Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to specify a user defined description for the profile.

### Examples

The following example shows how to specify a user defined description for the profile:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# description 512-1k-4k
```

### Related Commands

Command	Description
<b>cable downstream ofdm-chan-profile</b>	Define the OFDM channel profile on the OFDM channel.
<b>cyclic-prefix</b>	Specify the channel cyclic-prefix.
<b>interleaver-depth</b>	Specify the channel interleaver-depth.
<b>pilot-scaling</b>	Specify the value used to calculate the number of continuous pilots.
<b>profile-control</b>	Specify default modulation or profile as the channel control profile.
<b>profile-data</b>	Specify default modulation or profile as the channel data profile.
<b>profile-ncp</b>	Specify default modulation or profile as the channel ncp profile.
<b>roll-off</b>	Specify the channel roll-off value.
<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.

## description (OFDM modulation profile)

To specify a user defined description for the profile, use the **description** command in OFDM modulation profile configuration mode. To remove the description, use **no** form of this command.

**description** *description*

**no description**

### Syntax Description

<i>description</i>	Specify a user defined description for the profile up to 64 characters.
--------------------	-------------------------------------------------------------------------

### Command Default

None

### Command Modes

OFDM modulation profile configuration (config-ofdm-mod-prof)

### Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to specify a user defined description for the profile.

### Examples

The following example shows how to specify a user defined description for the profile:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)# description 512-1k-4k
```

### Related Commands

Command	Description
<b>cable downstream ofdm-modulation-profile</b>	Define the OFDM modulation profile on the OFDM channel.
<b>assign</b>	Assign modulations to subcarriers.
<b>start-frequency</b>	(Optional) Specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width.
<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.
<b>width</b>	Specify width of profile in Hz.

## description (redundancy-linecard)

To configure description for the line card redundancy group, use the **description** command in line card redundancy configuration sub-mode. To remove the configuration, use the **no** form of this command.

**description** *group-description*  
**no description**

### Syntax Description

<i>group-description</i>	Specifies the description for the line card redundancy groups.
--------------------------	----------------------------------------------------------------

### Command Default

Description is not configured.

### Command Modes

Line card redundancy configuration (config-red-lc)

### Command History

Release	Modification
IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

The description string has a maximum limit of 127 characters.

### Examples

The following example shows how to configure redundancy group description on Cisco cBR-8 Series Converged Broadband Routers:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# description Redundancy Group0
Router(config-red-lc)#
```

### Related Commands

Command	Description
<b>class</b>	Configures redundancy class on the line card.
<b>member slot</b>	Adds a slot to the line card redundancy group.
<b>linecard-group internal-switch</b>	Creates a line card group for the line card.
<b>redundancy</b>	Configures line card redundancy.
<b>show redundancy linecard</b>	Displays information about a redundant line card or a line card group.

# dest-ip

To assign an IP address to the edge quadrature amplitude modulation (EQAM), use the **dest-ip** command in DEPI tunnel configuration mode. To remove a specific destination IP address, use the **no** form of this command.

**dest-ip** *dest-ip-address*  
**no dest-ip** *dest-ip-address*

## Syntax Description

<i>dest-ip-address</i>	IP address of the EQAM.
------------------------	-------------------------

## Command Default

This command has no default behavior or values.

## Command Modes

DEPI tunnel configuration

## Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **dest-ip** *dest-ip-address* command allows you to configure the IP address of the EQAM.

## Examples

The following example shows how to assign 1.3.4.155 as the destination IP address:

```
Router# configure terminal
Router(config)# depi-tunnel rf6
Router(config-depi-tunnel)# dest-ip 1.3.4.155
```

## Related Commands

Command	Description
<b>l2tp-class</b>	Creates a template of Layer 2 Tunnel Protocol (L2TP) control plane configuration settings, which different pseudowire classes can inherit, and enters the L2TP class configuration mode.
<b>depi-class</b>	Creates a template of Downstream External PHY Interface (DEPI) control plane configuration settings, which different pseudowire classes can inherit, and enters the DEPI class configuration mode.
<b>depi-tunnel</b>	Specifies the name of the depi-tunnel and enters the DEPI tunnel configuration mode.
<b>tos</b>	Configures the Type of Service (ToS) byte in the header of Layer 2 tunneled packets.
<b>show depi tunnel</b>	Displays all active control connections.
<b>show depi session</b>	Displays established DEPI data sessions.

# diagnostic load

To load a Field Diagnostic image to the line card for field diagnostic testing, enter the **diagnostic load** command.

**diagnostic load** {*slot slot* | *subslot slot/subslot*} **image-url** [**autostart test** {**all port** *port-number*}]

## Syntax Description

<b>slot</b>	Specifies that the line card unloading the Field Diagnostic image is in a full slot as opposed to a subslot.
<b>subslot</b>	Specifies that the line card unloading the Field Diagnostic image is in a subslot as opposed to a full slot.
<i>slot-number</i>	Specifies the number of the slot where the line card unloading the Field Diagnostic image is located on the router.
<i>subslot-number</i>	Specifies the number of the subslot where the line card unloading the Field Diagnostic image is located on the router.

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(16)BX	This command was introduced.
12.3(13)BC	This command was integrated into Cisco IOS Release 12.3(13)BC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **show diagnostic result** output will be lost once a Field Diagnostic image is successfully unloaded off a line card. If you want to retain the results of the Field Diagnostic test, enter **show diagnostic result** and copy the output into a separate file before entering **diagnostic unload** to unload the Field Diagnostic image off the line card.

Entering this command successfully will resume normal line card operation.

If a line card needs to be placed back online immediately and a Field Diagnostic test is in progress, enter **diagnostic stop** to stop the in-progress Field Diagnostic test before entering **diagnostic unload** to unload the Field Diagnostic image off the line card.

## Examples

In the following example, the Field Diagnostic image is unloaded off of the line card in slot 2. Note that the command is not successfully executed until confirmed at the screen prompt.

```
Router# diagnostic unload slot 2
*****
WARNING:All Field Diagnostics test results and information will be unavailable
to both the "show diagnostic result <target>" and "show
diagnostic content <target>" commands. To save the test results,
cancel the unloading process and enter the "show diagnostic result
<target>" command. Copy the output into a file, then re-enter the
```

```
"diagnostic unload <target>" command to restore normal line
card operation.
*****
% Are you sure that you want to perform this operation?
[no]:y FDIAG [slot 2]> Unloading the Field
Diagnostics image and restoring the original run-time image, please wait ...
FDIAG [slot 2]> Field Diagnostics image was successfully unloaded
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>diagnostic event-log size</b>	Sets the size of the event table.
<b>diagnostic load</b>	Loads the Field Diagnostic image onto the line card.
<b>diagnostic ondemand action-on-failure</b>	Sets the number of errors allowed in the Field Diagnostic test before the Field Diagnostic test is stopped.
<b>diagnostic ondemand iterations</b>	Sets the number of times each specific Field Diagnostic test will be run when a Field Diagnostic test is initiated.
<b>diagnostic start</b>	Starts Field Diagnostic testing on the line card.
<b>diagnostic stop</b>	Stops an in-progress Field Diagnostic test.
<b>show diagnostic content</b>	Shows the Field Diagnostic test list for a particular line card.
<b>show diagnostic events</b>	Displays the history of Field Diagnostic events since the last system reload.
<b>show diagnostic ondemand settings</b>	Shows the diagnostic on-demand settings.
<b>show diagnostic result</b>	Shows the results of the Field Diagnostic test.
<b>show diagnostic ood-status</b>	Displays various status information, such as line card slot and name, Field Diagnostic image status, and previous Field Diagnostic test results.

# diagnostic ondemand action-on-failure

To set an error count limit or to stop testing once a diagnostic error event is detected, use the **diagnostic ondemand action-on-failure** command.

**diagnostic ondemand action-on-failure** [**continue** *failure-limit* | **stop**]

## Syntax Description

<b>continue</b> <i>failure-limit</i>	Specifies that Field Diagnostic testing should continue on the line card after a failed test occurs. The <i>failure-limit</i> specifies the number of failed tests that can be detected before testing on the line card should stop. A <i>failure-limit</i> of 0 means testing should continue regardless of the number of failed tests.  <b>Note</b> The <i>failure-limit</i> is the number of failed tests, not errors within a single test. For example, if four errors occur during a single test, the <i>failure-limit</i> for that individual test would be 1, not 4.
<b>stop</b>	Specifies that Field Diagnostic testing should stop when an error event occurs.

## Command Default

If this command is not entered, a default *failure-limit* of 0 is used. Therefore, testing will continue regardless of the number of errors unless the **diagnostic ondemand action-on-failure** command is used to change the default setting.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(16)BX	This command was introduced.
12.3(13)BC	This command was integrated into Cisco IOS Release 12.2(13)BC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The **diagnostic ondemand action-on-failure** settings cannot be saved to a Cisco IOS configuration file. Therefore, the **diagnostic ondemand action-on-failure** command will need to be re-entered each time a router is reset or power cycled if the action-on-failure settings should be maintained.

The **show diagnostic ondemand settings** command can be used to verify the **diagnostic ondemand action-on-failure** setting.

The **show diagnostic events event-type error** command can be used to gather additional information about an error event.

## Examples

In the following example, the diagnostic on-demand iteration and action-on-failure settings are changed using **diagnostic ondemand iterations** and **diagnostic ondemand action-on-failure**. The changed settings are then confirmed using **show diagnostic ondemand settings**.

```
Router# diagnostic ondemand iterations 2
Router# diagnostic ondemand action-on-failure stop
Router# show diagnostic ondemand settings
```

```
Test iterations = 2
```

Related Commands	Command	Description
	<b>diagnostic event-log size</b>	Sets the size of the event table.
	<b>diagnostic load</b>	Loads the Field Diagnostic image onto the line card.
	<b>diagnostic ondemand action-on-failure</b>	Sets the number of errors allowed in the Field Diagnostic test before the Field Diagnostic test is stopped.
	<b>diagnostic ondemand iterations</b>	Sets the number of times each specific Field Diagnostic test will be run when a Field Diagnostic test is initiated.
	<b>diagnostic start</b>	Starts Field Diagnostic testing on the line card.
	<b>diagnostic stop</b>	Stops an in-progress Field Diagnostic test.
	<b>show diagnostic content</b>	Shows the Field Diagnostic test list for a particular line card.
	<b>show diagnostic events</b>	Displays the history of Field Diagnostic events since the last system reload.
	<b>show diagnostic ondemand settings</b>	Shows the diagnostic on-demand settings.
	<b>show diagnostic result</b>	Shows the results of the Field Diagnostic test.
	<b>show diagnostic ood-status</b>	Displays various status information, such as line card slot and name, Field Diagnostic image status, and previous Field Diagnostic test results.

# diagnostic unload

To unload the Field Diagnostic on the line card and resume normal line card operation, enter the **diagnostic unload** command.

**diagnostic unload** {**slot** *slot-number* | **subslot** *slot-number/subslot-number*}

Syntax Description	slot	Specifies that the line card unloading the Field Diagnostic image is in a full slot as opposed to a subslot.
	subslot	Specifies that the line card unloading the Field Diagnostic image is in a subslot as opposed to a full slot.
	<i>slot-number</i>	Specifies the number of the slot where the line card unloading the Field Diagnostic image is located on the router.
	<i>subslot-number</i>	Specifies the number of the subslot where the line card unloading the Field Diagnostic image is located on the router.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(16)BX	This command was introduced.
	12.3(13)BC	This command was integrated into Cisco IOS Release 12.3(13)BC.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The **show diagnostic result** output will be lost once a Field Diagnostic image is successfully unloaded off a line card. If you want to retain the results of the Field Diagnostic test, enter **show diagnostic result** and copy the output into a separate file before entering **diagnostic unload** to unload the Field Diagnostic image off the line card.

Entering this command successfully will resume normal line card operation.

If a line card needs to be placed back online immediately and a Field Diagnostic test is in progress, enter **diagnostic stop** to stop the in-progress Field Diagnostic test before entering **diagnostic unload** to unload the Field Diagnostic image off the line card.

## Examples

In the following example, the Field Diagnostic image is unloaded off of the line card in slot 2. Note that the command is not successfully executed until confirmed at the screen prompt.

```
Router# diagnostic unload slot 2

*****
WARNING:All Field Diagnostics test results and information will be
```

```

unavailable to both the "show diagnostic result <target>" and
"show diagnostic content <target>" commands.
To save the test results, cancel the unloading process and enter
the "show diagnostic result <target>" command. Copy the output
into a file, then re-enter the "diagnostic unload <target>" command
to restore normal line card operation.

```

```

*****

```

```

% Are you sure that you want to perform this operation? [no]:y
FDIAG [slot 2]> Unloading the Field Diagnostics image and restoring the original run-time
image, please wait ...

```

```

FDIAG [slot 2]> Field Diagnostics image was successfully unloaded

```

# disable-auto-restart

To disable the automatic process restart, use the **disable-auto-restart** command in the process restart configuration mode. To disable this function, use the **no** form of this command.

```
disable-auto-restart
```

```
no disable-auto-restart
```

**Command Default** None

**Command Modes** Process restart configuration (config-process-restart)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** This command disables the automatic process restart.  
The following example shows how to disable the automatic process restart.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# disable-auto-restart
```

Related Commands	Command	Description
	<b>lcha-preferred</b>	Selects the LCHA when it is possible

## do-not-insert

To prohibit inserting standard descriptors, use the **do-not-insert** command in the DVB scrambling ECMG descriptor configuration mode. To void the configuration, use the **no** form of this command.

**do-not-insert** {all | ecm-ids *id*}  
**no do-not-insert** {all | ecm-ids *id*}

<b>all</b>	Do not insert standard descriptors for all ecm ids.
<b>ecm-ids</b> <i>id</i>	Do not insert standard descriptors for specified ecm ids.

**Command Default** None

**Command Modes** DVB scrambling ECMG descriptor configuration mode (config-video-encrypt-dvb-ecmg-desc)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to prohibit inserting standard descriptors:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#desc-rule desc_8_1 id 1
Router(config-video-encrypt-dwb-ecmg-desc)#do-not-insert ecm-ids 81,82,83,84,85
```

**Related Commands**

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>add-priv-data</b>	Adds private data to the descriptor

## docsis-channel-id

To configure the downstream channel ID, use the **docsis-channel-id** command in the rf-channel configuration mode. To set the docsis channel ID to its default value, use the **no** form of this command.

**docsis-channel-id** *dcid*  
**no docsis-channel-id** *dcid*

### Syntax Description

<i>dcid</i>	Specifies a downstream channel ID. Valid values are 1 to 255 as 0 is invalid, reserved for network management.
-------------	----------------------------------------------------------------------------------------------------------------

### Command Default

The unit number of the downstream device, starting with a value of 1.

### Command Modes

rf-channel configuration—(config-rf-chan)

### Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the <b>cable downstream channel-id</b> command.

### Usage Guidelines

Use this command to ensure that each downstream channel has a unique ID when there are multiple Cisco CMTS routers at a headend facility.

#### Caution

Changing the downstream channel ID of an active channel automatically disconnects all connected CMs and forces them to go offline and reregister with the CMTS router, as required by the DOCSIS specifications.

### Examples

The following example shows how to configure the downstream channel on the cable interface line card in slot 6 of a Cisco CMTS router with a channel ID of 44:

```
Router(config)#controller integrated-Cable 3/0/0
Router(config-controller)#rf-chan 0
Router(config-rf-chan)#docsis-channel-id 1
```

The following example shows how to restore the downstream channel ID configuration to the default configuration:

```
Router(config-rf-chan)#no docsis-channel-id 1
```

# docsis-policy

To assign a policy to a DOCSIS load balancing group, use the **docsis-policy** command in the config-lb-group configuration mode. The policy becomes the default policy assigned to the CM, if the CM does not choose a different policy. To remove the assigned policy, use the **no** form of this command.

**docsis-policy** *n*  
**no** **docsis-policy**

<b>Syntax Description</b>	<i>n</i> Load balancing group policy number. The policy number can range from 0 to 4294967295.
---------------------------	------------------------------------------------------------------------------------------------

**Command Default** No default behavior or values.

**Command Modes** DOCSIS load balancing group mode (config-lb-group)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to assign a policy to a DOCSIS load balancing group on the CMTS, using the **docsis-policy** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# docsis-policy 1
Config: Last Batch 0, 63 bytes
cable load-balance docsis-group 1 index 81
docsis-policy 1
end
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable load-balance docsis-group</b>	Configures a DOCSIS load balancing group on the CMTS.
	<b>show cable load-balance docsis-group</b>	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

# docsis-version

To configure the DOCSIS version of the CM for the CMTS tag, use the **docsis-version** command in the cmts-tag configuration mode. To remove the configured DOCSIS version from the CMTS tag, use the **no** form of this command.

[**exclude**] **docsis-version** *docsis-version*  
**no** **docsis-version** *docsis-version*

Syntax Description	exclude	(Optional) Configures the CMTS tag to exclude the specified DOCSIS version.
	<i>docsis-version</i>	DOCSIS version for the CMTS tag. You can select one of the following DOCSIS versions to match the DOCSIS modems: <ul style="list-style-type: none"> <li>• docsis10 - Matches DOCSIS 1.0 modems</li> <li>• docsis11 - Matches DOCSIS 1.1 modems</li> <li>• docsis20 - Matches DOCSIS 2.0 modems</li> <li>• docsis30 - Matches DOCSIS 3.0 modems.</li> </ul>

**Command Default** No default behavior or values.

**Command Modes** CMTS tag mode (cmts-tag)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to configure the specified DOCSIS version for the CMTS tag using the **docsis-version** command:

```
Router# configure terminal

Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# docsis-version docsis10
```

Related Commands	Command	Description
	<b>cable load-balance docsis-group</b>	To configure a DOCSIS load balancing group on the CMTS.
	<b>show cable load-balance docsis-group</b>	To display real-time configuration, statistical and operational information for load balancing operations on the router.
	<b>cable tag</b>	To configure a tag for a DOCSIS load balancing group on the CMTS.

# downstream

To set downstream radio frequency (RF) channels, use the **downstream** command in the config-lb-group configuration mode. To reset the downstream RF channels, use the **no** form of this command.

## Cisco uBR7200 Series Routers

**downstream cable** {slot | /port}

**no downstream cable** {slot | /port}

## Cisco uBR10012 Router

**downstream** {**cable** {slot | /port} | **Integrated-Cable** {slot | /subslot | /bay} {**rf-channel** group list} | **Modular-Cable** {slot | /subslot | /bay} {**rf-channel** group list}}

**nodownstream** {**cable** {slot | /port} | **Integrated-Cable** {slot | /subslot | /bay} {**rf-channel** group list} | **Modular-Cable** {slot | /subslot | /bay} {**rf-channel** group list}}

## Cisco cBR Series Converged Broadband Routers

**downstream Integrated-Cable** {slot /subslot/downstream controller index } **rf-channel** group list

**no downstream Integrated-Cable** {slot /subslot/downstream controller index } **rf-channel** group list

### Syntax Description

<b>cable</b> {slot/port}	Specifies the CMTS interface slot and port numbers.
<b>cable</b> {slot/subslot/port}	Specifies the CMTS interface slot, subslot, and port numbers.
<b>Integrated-Cable</b> { <b>rf-channel</b> group list} {slot/subslot/bay}	Specifies the integrated cable interface with the list of port numbers that range in the associated RF channel. Slot, subslot, and bay numbers of the integrated cable interface is also specified.
<b>Modular-Cable</b> { <b>rf-channel</b> group list} {slot/subslot/bay}	Specifies the modular cable interface with the list of port numbers that range in the associated RF channel. It also specifies slot, subslot, and bay numbers of the modular cable interface.
<b>Integrated-Cable</b> {slot /subslot/downstream controller index } <b>rf-channel</b> group list	Specifies the downstream channels from a particular downstream controller to include in the DOCSIS load balancing group. The downstream controller is identified by a combination of slot, subslot and the downstream controller index. A list of channel numbers follows the <b>rf-channel</b> keyword.

### Command Default

No default behavior or values.

### Command Modes

DOCSIS load balancing group mode (config-lb-group)

### Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

## Examples

The following example shows how to set downstream RF channels to a DOCSIS load balancing group on the CMTS, using the **downstream** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# downstream cable 1/1
Router(config-lb-group)# downstream Integrated-Cable 5/0/0 rf-channel 2
Router(config-lb-group)# downstream Modular-Cable 1/0/0 rf-channel 4
```

The following example shows how to set downstream RF channels to a DOCSIS load balancing group on the CMTS, using the **downstream** command in Cisco cBR Series Converged Broadband Routers.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# downstream Integrated-Cable 3/0/3 rf-channel 2
```

## Related Commands

Command	Description
<b>cable load-balance docsis-group</b>	Configures a DOCSIS load balancing group on the CMTS.
<b>show cable load-balance docsis-group</b>	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

## downstream cable

To assign a primary downstream channel for a fiber node, use the **downstream cable** command in cable fiber-node configuration mode. To remove a primary downstream channel for a fiber node, use the **no** form of the command.

**downstream cable** {*slot* | /*subslot* | /*port*}

**nodownstream cable** {*slot* | /*subslot* | /*port*}

### Syntax Description

<i>slot</i>	The slot used for the cable interface line card. Valid values are 5 to 8.
<i>subslot</i>	The subslot used for the cable interface line card. Valid values are 0 or 1.
<i>port</i>	The downstream port that can be used as a primary downstream channel. Valid values are 0 to 4.

### Command Default

If the **downstream cable** command is not issued, no primary downstream channel is assigned to the fiber node.

### Command Modes

Cable fiber-node configuration

### Command History

Release	Modification
12.3(21)BC	This command was introduced for the uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

For each fiber node, a traditional DOCSIS downstream channel is used to carry MAC management and signaling messages, and the associated traditional DOCSIS upstream channel is used for return data traffic and signaling. The traditional DOCSIS downstream channel used in this way is called the *primary downstream channel*.

The **downstream cable** command assigns a primary downstream channel for a fiber node. Each fiber node must be assigned at least one primary downstream channel and can be assigned multiple primary downstream channels. Cisco IOS software decides which primary downstream channel to use for the fiber node from the set of channels assigned with **downstream cable**. Assigning more than one primary channel to a fiber node with the **downstream cable** command can be useful for load-balancing purposes.

**Note** If the primary downstream channel for the fiber node is assigned from a SPA downstream, then the **downstream cable** command is not required.

If a wideband-capable modem registers as a traditional DOCSIS 2.0 modem, it will register on a downstream channel as follows:

- If the modem's fiber node has been assigned a primary downstream channel with the **downstream cable** command, the modem registers on that downstream channel.

If the modem's fiber node has not been assigned a primary downstream channel with the **downstream cable** command, the modem can register on any downstream channel that is visible to it.

### Examples

The following example shows how to assign a primary downstream channel for fiber node 5. The primary downstream channel is the downstream port located on the cable interface line card at slot/subslot/port 6/0/0.

```
Router# configure terminal
Router(config)# cable fiber-node 5
Router(config-fiber-node)# downstream cable 6/0/0
```

### Related Commands

Command	Description
<b>cable fiber-node</b>	Enters cable fiber-node configuration mode so that you can configure a fiber node.
<b>description (cable fiber-node)</b>	Specifies a description for a fiber node.
<b>downstream modular-cable rf-channel</b>	Specifies the RF channels that are available for wideband channels on a fiber node.
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.

## downstream downstream-cable

To configure the downstream controller in the fiber node, use the **downstream downstream-cable** command in the fiber node configuration mode. To void the downstream controller configuration in the fiber node, use the **no** form of this command.

**downstream downstream-cable** *slot/subslot/port*

**no downstream downstream-cable** *slot/subslot/port*

---

**Syntax Description**     *slot/subslot/port* Specifies the slot, subslot and port of the downstream controller.

---

---

**Command Default**     None

---

**Command Modes**     Fiber node configuration (config-fiber-node)

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

---

**Usage Guidelines**     Use this command to configure the downstream controller in the fiber node.

---

**Examples**     The following example shows how to configure the downstream controller in the fiber node:

```
Router# configure terminal
Router(config)# cable fiber-node 1
Router(config-fiber-node)# downstream downstream-cable 3/0/0
```

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable fiber node</b>	Enters fiber node configuration mode.
	<b>upstream upstream-cable</b>	Configures the upstream controller in the fiber node.

## downstream downstream-cable rf-channel

To associate a set of upstream channels to the downstream channels in the Remote-PHY configuration, use the **downstream downstream-cable rf-channel** command in interface configuration mode. To void the configuration, use the **no** form of this command.

**downstream downstream-cable** *slot/subslot/port* **rf-channel** *rf-channel* [**profile name**[**upstream grouplist**]]  
**no downstream downstream-cable** *slot/subslot/port* **rf-channel** *rf-channel* [**profile name**[**upstream grouplist**]]

Syntax Description		
	<i>slot/subslot/port</i>	Specifies the slot, subslot and port of the downstream controller.
	<i>rf-channel</i>	Specifies association of the downstream channels to the channel group domain.
	<i>name</i>	Specifies the downstream controller profile.
	<i>grouplist</i>	Specifies the logical identifier of upstream channels serving these downstream RF channels.

**Command Default** None

**Command Modes** Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to associate a set of upstream channels to the downstream channels in the Remote-PHY configuration.

### Examples

The following example shows how to use the **downstream downstream-cable rf-channel** command on the Cisco cBR Series Converged Broadband Routers.

```
Router# configure terminal
Router(config)# interface cable 3/0/0
Router(config-if)# downstream downstream-cable 3/0/0 rf-channel 1 upstream 1
```

Related Commands	Command	Description
	<b>interface cable</b>	Configures a cable interface.
	<b>upstream upstream-cable us-channel</b>	Associates a set of physical upstream channels with the Mac Domain.

## downstream integrated-cable rf-channel (interface)

To associate a set of upstream channels to the integrated downstream channels on the Cisco CMTS router, use the **downstream integrated-cable rf-channel** command in interface configuration mode.

**downstream integrated-cable** *slot/subslot/port* **rf-channel** *rf-channels* [**upstream** *grouplist*]

### Syntax Description

<i>slot</i>	Identifies the chassis slot where the Cisco cable interface line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco cBR Series Converged Broadband Routers— The valid ranges are from 0 to 3 and 6 to 9.</li> </ul>
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. For Cisco cBR Series Converged Broadband Routers, the valid subslot is 0.
<i>port</i>	Downstream port (controller) number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4.</li> <li>• Cisco cBR Series Converged Broadband Routers— The valid range is from 0 to 7.</li> </ul>
<b>rf-channel</b> <i>rf-channel</i>	Specifies association of the downstream channels to the channel group domain. The valid range is from 0 to 3. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 162.
<b>upstream</b> <i>grouplist</i>	Specifies the logical identifier of upstream channels serving these downstream RF channels. The valid range is from 0 to 7. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 15.

### Command Default

No default upstream channels are configured with the integrated downstream channels.

### Command Modes

Interface configuration (config-if)

### Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0SP	This command was modified on the Cisco cBR Series Converged Broadband Routers. The <i>rf-channel</i> range is 0 to 162 now.

**Usage Guidelines**

The **downstream integrated-cable rf-channel** command is used for:

- [Configuring the Cisco UBR-MC20X20V Cable Interface Line Card](#)
- [Configuring the Cisco uBR-MC88V Cable Interface Line Card](#)

**Examples**

The following example shows how to use the **downstream integrated-cable rf-channel** command on the Cisco uBR10012 router.

```
Router# configure terminal
Router(config)# interface cable 7/0/0
Router(config-if)# downstream integrated-Cable 7/0/0 rf-channel 1 upstream 1
```

The following example shows how to use the **downstream integrated-cable rf-channel** command on the Cisco cBR Series Converged Broadband Routers.

```
Router# configure terminal
Router(config)# interface cable 3/0/0
Router(config-if)# downstream integrated-Cable 3/0/0 rf-channel 1 upstream 1
```

**Related Commands**

Command	Description
<b>cable upstream max-ports</b>	Configures the maximum number of upstreams on a MAC domain on a line card.

## downstream local upstream

To restrict the set of Cisco uBR10-MC5X20 upstreams associated with the Cisco uBR10-MC5X20 downstreams, use the **downstream local upstream** command in interface configuration mode.

**downstream local upstream** *group*

### Syntax Description

<i>group</i>	Specifies the number of upstreams associated with the Cisco uBR10-MC5X20 downstream channels.
--------------	-----------------------------------------------------------------------------------------------

### Command Default

All upstreams under the cable interface are associated with the Cisco uBR10-MC5X20 downstreams.

### Command Modes

Interface configuration mode (config-if)

### Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to restrict a set of Cisco uBR10-MC5X20 upstreams to Cisco uBR10-MC5X20 downstreams. This restricts MAC management messages (MMM) to be sent to the specified upstreams only.

### Examples

The following example shows how the **downstream local upstream** command is used in the Cisco uBR10012 router.

```
Router# configure terminal
Router (config)# interface cable 5/1/0
Router(config-if)# downstream local upstream 0-1
```

### Related Commands

Command	Description
<b>downstream cable</b>	Assigns a primary downstream channel for a fiber node.

## downstream modular-cable rf-channel (channel group)

To configure downstream RF channels for a channel group, use the **downstream modular-cable rf-channel** command in channel group configuration mode. To disable the configuration, use the **no** form of the command.

**downstream modular-cable** *slot/subslot/port* **rf-channel** *grouplist*

**no downstream modular-cable** *slot/subslot/port* **rf-channel** *grouplist*

### Syntax Description

<b>modular-cable</b> <i>slot/subslot/port</i>	Specifies the modular-cable interface. <ul style="list-style-type: none"> <li>• <i>slot</i>—Chassis slot number of the cable interface line card. The valid range is from 5 to 8.</li> <li>• <i>subslot</i>—Secondary slot number of the cable interface line card. The valid range is from 0 to 1.</li> <li>• <i>port</i>—Port number on the line card. The valid range is from 0 to 2.</li> </ul>
<b>rf-channel</b> <i>grouplist</i>	Specifies the list of downstream RF channels. <ul style="list-style-type: none"> <li>• <i>grouplist</i>—Range of downstream RF channel numbers. The valid range is from 0 to 23. The value can be one or more RF channel numbers, a range of channel numbers separated by a hyphen, or a combination of both.</li> </ul>

### Command Default

Downstream RF channels are not configured.

### Command Modes

Channel group configuration (config-ch-group)

### Command History

Release	Modification
12.2(33)CX	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

A channel group can have up to 16 downstream RF channels.

The following example shows how to configure a downstream RF channel for a channel group:

```
Router# configure terminal
Router(config)# cable channel-group 1
Router(config-ch-group)# downstream Modular-Cable 7/1/0 rf-channel 0-15
```

### Related Commands

Command	Description
<b>cable channel-group</b>	Configures channel group.
<b>show cable channel-group</b>	Displays the channel group information.

## downstream modular-cable rf-channel (interface)

To associate a set of Cisco uBR10-MC5X20 upstreams with individual modular downstream channels from the SPA into a given cable MAC domain, use the **downstream modular-cable rf-channel** command in interface configuration mode.

### Cisco IOS Release 12.3(23)BC

**downstream modular-cable** *slot/subslot/bay* **rf-channel** *rf channels* [**upstream** *group*list]

### Cisco IOS Release 12.2(33)SCB and later

**downstream modular-cable** *slot/bay/port* **rf-channel** *rf channels* [**upstream** *group*list]

### Cisco IOS Release 12.2(33)SCE and later

**downstream modular-cable** *slot/subslot/controller* **rf-channel** *rf channels* [**upstream** *group*list]

### Syntax Description

<i>slot</i>	Slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. For the Cisco uBR-MC3GX60V cable interface line card, the cable interface slot values range from 5 to 8.
<i>subslot</i>	Subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
<i>bay</i>	Bay in a SIP where a SPA is located. The valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Interface number on the SPA.
<i>controller</i>	Modular-Cable controller number. The valid values are 0 to 2. <b>Note</b> This option is available only on the Cisco uBR-MC3GX60V cable interface line card and on the Cisco router running Cisco IOS Release 12.2(33)SCE and later releases.
<b>rf-channel</b>	Specifies the association of a continuous range of RF channels within the SPA downstream.
<i>rf channels</i>	Range of RF channel physical ports on the SPA FPGA.
<b>upstream</b>	Specifies a set of ranges of upstream to allow association of a noncontiguous list of upstreams to one or more SPA downstreams. If the range is not specified, all the upstreams in the MAC domain are associated.
<i>group</i> list	Number of upstreams with the modular cable downstream channel.

### Command Default

By default, all upstream channels in an interface are associated with the modular downstream channels in the same interface.

### Command Modes

Interface configuration (**config-if**)

### Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.

Release	Modification
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for the modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
12.2(33)SCE	This command was modified to change the valid range of <i>slot</i> .
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to create primary-capable channels by associating a single or a set of Cisco uBR10-MC 5X20 upstream channels with individual modular downstream channels on a fiber node. When a primary-capable channel is created, the same modular downstream channel cannot be used as a primary-capable channel in another MAC domain. However, it can be used as non-primary-capable channel in another MAC domain.

### Examples

The following example shows how to use the **downstream modular-cable rf-channel** command on the Cisco uBR10012 router.

```
Router# configure terminal
Router (config)# interface cable 5/1/0

Router(config-if)# downstream modular-cable 1/0/0
rf-channel 0-2
upstream 0-1 4-5
```

### Related Commands

Command	Description
<b>downstream modular-cable rf-channel</b>	Specifies the RF channels that are available for wideband channels on a fiber node.
<b>rf-channel cable downstream channel-id</b>	Assigns a downstream channel ID to an RF channel.

## downstream modular-cable rf-channel

To specify the RF channels that are available for wideband channels on a fiber node, use the **downstream modular-cable rf-channel** command in cable fiber-node configuration mode. To remove RF channels that are available for wideband channels on a fiber node, use the **no** form of this command.

### Cisco IOS Release 12.3(23)BC

```
downstream modular-cable slot/subslot/bay rf-channel {rf-portlow-high}
no downstream modular-cable slot/subslot/bay rf-channel {rf-portlow-high}
```

### Cisco IOS Release 12.2(33)SCB

```
downstream modular-cable slot/bay/port rf-channel {rf-portlow-high}
no downstream modular-cable slot/bay/port rf-channel {rf-portlow-high}
```

#### Syntax Description

<i>slot</i>	The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.
<i>subslot</i>	The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the interface number on the SPA.
<i>rf-port</i>	Specifies the RF channel physical port on the Wideband SPA FPGA. Valid values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command.
<i>low-high</i>	A range of RF channel physical ports on the Wideband SPA FPGA. The <i>low</i> and <i>high</i> values are separated by a hyphen.

#### Command Default

If the **downstream modular-cable rf-channel** command is not issued, no RF channels are configured for wideband channels on the fiber node.

#### Command Modes

Cable fiber-node configuration (fiber-node)

#### Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command was modified to change the addressing format for the modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

#### Usage Guidelines

The **downstream modular-cable rf-channel** command makes RF channels available for use on a fiber node. Fiber node software configuration mirrors the physical topology of the cable network. The **cable rf-channel** command configures the RF channels that will be used for a wideband channel on a Wideband SPA.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command.

**Note** Effective with Cisco IOS Release 12.3(23)BC, the **annex modulation** command is obsolete and **annex** and **modulation** are included as keyword options in the **rf-channel frequency** command.

- For annex A and 256 QAM, each Wideband SPA supports 18 RF channels. In this case, valid values for the *rf-port* argument are 0 to 17.
- For all other cases, the SPA supports 24 RF channels. In these cases, valid values for the *rf-port* argument are 0 to 23.

A fiber node can be configured to have RF channels from one or both Wideband SPAs. However, a wideband channel cannot be comprised of RF channels from two different SPAs.

Each time the **downstream modular-cable rf-channel** command is issued for a fiber node, the set of RF channels that are available for use on that fiber node is added to in a cumulative manner. For example, if the following **downstream modular-cable rf-channel** commands were issued, the set of RF channels available for fiber node 1 is RF channels 0 to 10 on the Wideband SPA in slot/subslot/bay 1/0/0.

```
Router# configure terminal
Router(config)# cable fiber-node 1
Router(config-fiber-node)# downstream modular-cable 1/0/0 rf-channel 0-5
Router(config-fiber-node)# downstream modular-cable 1/0/0 rf-channel 6-10
```

## Examples

The following example shows how to specify that RF channels 0 to 7 on a Wideband SPA will be available for use on fiber node 5. The Wideband SPA is located in slot/subslot/bay 1/0/0.

```
Router# configure terminal
Router(config)# cable fiber-node 5
Router(config-fiber-node)# downstream modular-cable 1/0/0 rf-channel 0-7
```

## Related Commands

Command	Description
<b>cable fiber-node</b>	Enters cable fiber-node configuration mode to configure a fiber node.
<b>description (cable fiber-node)</b>	Specifies a description for a fiber node.
<b>downstream cable</b>	Assigns a primary downstream channel for a fiber node.
<b>upstream cable connector</b>	Specifies the upstream channel ports for a fiber node.

# ds-channel

To configure the OOB downstream channel, use the **ds-channel** command in the profile configuration mode. To void the OOB downstream channel configuration, use the **no** form of this command.

**ds-channel 0** {frequency *f-value* | poweradjust *p-value* | rf-mute | shutdown}

**no ds-channel 0** {frequency | poweradjust | rf-mute | shutdown}

Syntax Description	
	<i>f-value</i> Specifies the OOB downstream channel frequency value.
	<i>p-value</i> Specifies the OOB downstream channel poweradjust value.

**Command Default** None

**Command Modes** Profile configuration (config-profile)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to configure the OOB downstream channel.

**Examples** The following example shows how to configure the OOB downstream channel:

```
Router# configure terminal
Router(config)# controller downstream-oob 55d1-profile 1
Router(config-profile)# ds-channel 0 frequency 70000000
Router(config-profile)# ds-channel 0 poweradjust 1
```

Related Commands	Command	Description
	<b>controller downstream-oob 55d1-profile</b>	Configures the OOB downstream controller profile.

# duration

To specify the time period and sample rate to be used for monitoring subscribers, use the **duration** command in enforce-rule configuration mode. To reset an enforce-rule to its default values, use the **no** form of this command.

```
duration minutes avg-rate rate sample-interval minutes [penalty minutes] {upstream | downstream}
[enforce]
no duration
```

## Cisco cBR Series Converged Broadband Routers

```
duration minutes avg-rate rate sample-interval minutes [penalty-period minutes] {upstream |
downstream} [enforce]
no duration
```

### Syntax Description

<i>minutes</i>	Specifies the size of the sliding window (in minutes) during which subscriber usage is monitored. The valid range is 10 to 44640 with a default of 360 (6 hours).
<b>avg-rate</b> <i>rate</i>	Specifies the average sampling rate in kilobits per second for the specified duration. The valid range is 1 to 400000 kilobits with no default.
<b>sample-interval</b> <i>minutes</i>	Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The valid range is 1 to 30, with a default value of 15.
<b>penalty</b> <i>minutes</i>	(Optional) Specifies the period (in minutes) during which a cable modem (CM) can be under penalty. The valid range is 1 to 10080.
<b>penalty-period</b> <i>minutes</i>	(Optional) Specifies the period for which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile. The valid range is 1 to 10080.
<b>upstream</b>	Specifies monitoring of traffic in the upstream direction.
<b>downstream</b>	Specifies monitoring of traffic in the downstream direction.
<b>enforce</b>	(Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.

### Command Default

The **duration** value defaults to 360 minutes (6 hours), and the **sample-interval** value defaults to 15 minutes.

### Command Modes

Enforce-rule configuration (enforce-rule)

### Command History

Release	Modification
12.3(9a)BC	This command was introduced. This command replaces the <b>monitoring-duration</b> command.

Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCD2	The <b>penalty</b> keyword option was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>penalty</b> keyword was removed and <b>penalty-period</b> was added.

## Usage Guidelines

**Note** This command is applicable only after the **monitoring-basics** command is configured with the keyword **legacy**.

When you enable an enforce-rule, the CMTS router periodically checks the bandwidth being used by subscribers to determine whether any subscribers are consuming more bandwidth than that specified by the avg-rate configured in enforce-rule. The CMTS router keeps track of subscribers using a sliding window that begins at each sample interval and continues for the duration period and average rate.

For example, with the default sample interval of 15 minutes and the default sliding window period of 360 minutes, the CMTS router samples the bandwidth usage every 15 minutes and counts the total bytes transmitted at the end of each 360-minute period. Each sample interval begins a new sliding window period for which the CMTS router keeps track of the total bytes transmitted.

**Note** Changing the **duration** *minutes*, **avg-rate** *rate*, or **sample-interval** *minutes* values resets the byte counters for that particular enforce-rule and begins a new sliding window period.

When you change the configuration of a currently active enforce-rule, that rule begins using the new configuration immediately to manage the cable modems tracked by this enforce-rule.

The **penalty** duration, which is configured using this command, is unique to weekdays, and takes precedence over the global penalty duration configured using the **penalty-period** command.

When you use the **show running-configuration** command to display the configuration, the keyword options for the **duration** command are truncated. In the following example, “pen” represents **penalty**, “do” represents **downstream**, and “enf” represents **enforce**:

```
Router# show running-configuration
.
.
.
duration 10 avg-rate 1 sample-interval 10 pen 11 do enf
```

For more information about the Subscriber Traffic Management feature and to see an illustration of a sample monitoring window, refer to the Subscriber Traffic Management for the Cisco CMTS Routers feature document on Cisco.com.

## Examples

The following example shows an enforce-rule being configured for a sliding window that is 20 minutes in length, an **avg-rate** of 1 kilobit per second, and a sampling interval of every 10 minutes.

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# duration 20 avg-rate 1 sample-interval 10 penalty 11 do enf
```

The following example shows an enforce-rule being configured on a Cisco cBR Series Converged Broadband Router:

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# duration 10 avg-rate 2 sample-interval 1 penalty-period 20 downstream
enforce
```

## Related Commands

Command	Description
<b>cable qos enforce-rule</b>	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
<b>enabled (enforce-rule)</b>	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
<b>debug cable subscriber-monitoring</b>	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
<b>monitoring-basics</b>	Specifies the type of monitoring for subscriber traffic management on a Cisco CMTS router.
<b>peak-time1</b>	Specifies peak and offpeak monitoring times on a Cisco CMTS router.
<b>penalty-period</b>	Specifies the period for which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile.
<b>qos-profile registered</b>	Specifies the registered QoS profile that should be used for this enforce-rule. This command is applicable only for DOCSIS 1.0 cable modems.
<b>qos-profile enforced</b>	Specifies a QoS profile that should be enforced when users violate their registered QoS profile. This command is applicable only for DOCSIS 1.0 cable modems.
<b>service-class (enforce-rule)</b>	Specifies a service class (enforced or registered) that should be used for cable modem monitoring in an enforce-rule. This command is applicable for DOCSIS 1.1 or later cable modems.
<b>show cable qos enforce-rule</b>	Displays the QoS enforce-rules that are currently defined.
<b>show cable subscriber-usage</b>	Displays subscribers who are violating their registered QoS profiles.
<b>weekend duration</b>	Configures different subscriber monitoring options over weekends on a Cisco CMTS router.

# dvb

To enter the DVB scrambling configuration mode, use the **dvb** command in video encryption configuration mode.

## dvb

### Syntax Description

This command has no keywords or arguments.

### Command Modes

Video encryption configuration (config-video-encrypt)

### Command History

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command to enter the DVB scrambling configuration mode.

### Examples

The following example shows how to enter the DVB scrambling configuration mode:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# encryption
Router(config-video-encrypt)# dvb
Router(config-video-encrypt-dvb)#
```

# ecm-pid-source

To configure the source of ECM PID, use the **ecm-pid-source** command in the DVB scrambling ECMG configuration mode.

**ecm-pid-source** {**auto** *lower\_limit upper\_limit* | **ecm-id** | **sid**}

<b>auto</b> <i>lower_limit upper_limit</i>	ECM PID is determined internally by the system in the range between lower limit and upper limit.
<b>ecm-id</b>	ECM ID specified in the SCG will be used as the ECM PID.
<b>sid</b>	ECM PID is chosen automatically from the Service ID PID Range.

## Command Default

None

## Command Modes

DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

It is recommended to use **auto** option for the customers using:

- Session based scrambling by providing pids in the Scrambling Control Group (component based scrambling)
- Tier based scrambling

The following is an example of how to configure the source of ECM PID:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#ecm-pid-source sid
```

## Related Commands

Command	Description
<b>ecmg</b>	Enters the ECM Generator configuration mode.
<b>auto-channel-id</b>	Enables automatic channel ID selection.
<b>connection</b>	Configures the ECMG connection.

<b>Command</b>	<b>Description</b>
<b>ca-system-id</b>	Configures the CA system ID.
<b>type</b>	Configures the ECMG type.
<b>mode</b>	Configures the application mode of ECMG.
<b>desc-rule</b>	Configures the descriptor rule.
<b>override</b>	Overrules the default settings.

# ecmg

To enter the ECM Generator configuration mode, use the **ecmg** command in the DVB scrambling configuration mode. To void the ECMG configuration, use the **no** form of this command.

**ecmg** *ecmg\_name* [*id id*]

**no ecmg** *ecmg\_name*

<i>ecmg_name</i>	Specifies the ECMG name.
<i>id</i>	Specifies the ECMG ID.

**Command Default** None

**Command Modes** DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to enter the ECM Generator configuration mode:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#
```

## Related Commands

Command	Description
<b>mode</b>	Configures the application mode of ECMG.
<b>auto-channel-id</b>	Enables automatic channel ID selection.
<b>connection</b>	Configures the ECMG connection.
<b>ecm-pid-source</b>	Configures the source of ECM PID.
<b>ca-system-id</b>	Configures the CA system ID.
<b>type</b>	Configures the ECMG type.
<b>desc-rule</b>	Configures the descriptor rule.
<b>overrule</b>	Overrules the default settings.

## ecmg (Tier-based)

To configure the tier-based scrambling, use the **ecmg** command in the tier-based scrambling configuration mode. To void the tier-based scrambling configuration, use the **no** form of this command.

```
ecmg {id id | name name} access-criteria hex_access_criteria
no ecmg {id id | name name}
```

<b>id</b> <i>id</i>	Specifies the ECMG ID.
<b>name</b> <i>name</i>	Specifies the ECMG name.
<b>access-criteria</b> <i>hex_access_criteria</i>	Specifies the access criteria per ECMG.

### Command Default

None

### Command Modes

Tier-based scrambling configuration mode (config-video-encrypt-dvb-tier)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the tier-based scrambling:

```
Router>enable
Router#configure terminal
Router (config)#cable video
Router (config-video)#encryption
Router (config-video-encrypt)#dvb
Router (config-video-encrypt-dvb)#tier-based
Router (config-video-encrypt-dvb-tier)#ecmg id 1 access-criteria 1234512345
```

### Related Commands

Command	Description
<b>tier-based</b>	Enters tier-based scrambling configuration mode.
<b>enable</b>	Enables the tier-based scrambling.

# eis

To enter the Event Information Scheduler configuration mode, use the **eis** command in the DVB scrambling configuration mode. To void the Event Information Scheduler configuration, use the **no** form of this command.

**eis** *server\_name* [**id** *id*]  
**no eis** *server\_name*

<i>server_name</i>	Specifies the EIS server name.
<i>id</i>	Specifies the EIS connection ID.

**Command Default** None

**Command Modes** DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to enter the Event Information Scheduler configuration mode:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#eis EIS-1 id 1
Router(config-video-encrypt-dvb-eis)#
```

## Related Commands

Command	Description
<b>overwrite-scg</b>	Enables Scrambling Control Group (SCG) overwrite.
<b>listening-port</b>	Configures the listening TCP port.
<b>cp-override</b>	Overrules and specifies the crypto period duration.

## enable (Tier-based)

To enable the tier-based scrambling, use the **enable** command in the tier-based scrambling configuration mode. To disable the tier-based scrambling, use the **no** form of this command.

**enable**  
**no enable**

### Command Default

None

### Command Modes

Tier-based scrambling configuration mode (config-video-encrypt-dvb-tier)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

It is recommended to disable tier based scrambling before modifying any configuration under tier-based section. Enable it again after the modification is complete.

The following is an example of how to enable the tier-based scrambling:

```
Router>enable
Router#configure terminal
Router (config)#cable video
Router (config-video)#encryption
Router (config-video-encrypt)#dvd
Router (config-video-encrypt-dvb)#tier-based
Router (config-video-encrypt-dvb-tier)#enable
```

### Related Commands

Command	Description
<b>tier-based</b>	Enters tier-based scrambling configuration mode.
<b>ecmg</b>	Configures the tier-based scrambling.

## enabled (enforce-rule)

To activate an enforce-rule and begin subscriber traffic management on a Cisco CMTS router, use the **enabled** command in enforce-rule configuration mode. To disable the enforce-rule without deleting it, use the **no** form of this command.

**enabled**  
**no enabled**

**Syntax Description** This commands has no keywords or arguments.

**Command Default** Enforce-rules are disabled.

**Command Modes** Enforce-rule configuration (enforce-rule)

Command History	Release	Modification
	12.2(15)BC1	This command was introduced.
	12.3(9a)BC	This command was integrated into Cisco IOS Release 12.3(9a)BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** An enforce-rule is created and configured using the **cable qos enforce-rule** command, but it is not activated until you run the **enabled** command. Use the **no enabled** command to disable an enforce-rule without removing it from the CMTS configuration. When you disable an enforce-rule, all cable modems with that rule's registered QoS profile are no longer tracked by the Subscriber Traffic Management feature and all cable modems in penalty are moved to their registered QoS profile.

### Examples

The following example shows an enforce-rule being enabled:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# enabled
```

The following example shows an enforce-rule being disabled. The rule remains in the CMTS configuration file.

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
```

**enabled (enforce-rule)**Router (enforce-rule) # **no enabled**

Related Commands	Command	Description
	<b>cable qos enforce-rule</b>	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
	<b>qos-profile enforced</b>	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
	<b>duration</b>	Specifies the time period and sample rate to be used for monitoring subscribers.
	<b>penalty-period</b>	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
	<b>qos-profile registered</b>	Specifies the registered QoS profile that should be use for this enforce-rule.
	<b>show cable qos enforce-rule</b>	Displays the QoS enforce-rules that are currently defined.
	<b>show cable subscriber-usage</b>	Displays subscribers who are violating their registered QoS profiles.

# encrypt

To enable encryption on a virtual carrier group, use the **encrypt** command in virtual carrier group configuration mode. To disable the encryption, use the **no** form of this command.

**encrypt**  
**no encrypt**

## Command Default

None.

## Command Modes

Virtual carrier group configuration (config-video-vcg)

## Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command enables encryption on a virtual carrier group.

## Examples

The following example shows how to enable encryption on a virtual carrier group:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# encrypt
```

## Related Commands

Command	Description
<b>virtual-carrier-group</b>	Defines a virtual carrier group.
<b>virtual-edge-input-ip</b>	Defines a virtual edge input.
<b>service-type</b>	Specifies the service type of the virtual carrier group.
<b>rf-channel</b>	Specifies the virtual RF channels in a virtual carrier group.
<b>show cable video virtual-carrier-group</b>	Displays the virtual carrier group information.

# enforced qos-profile

**Note** Effective with Cisco IOS Release 12.3(9a)BC, the **enforced qos-profile** command is replaced by the **qos-profile enforced** command.

To specify a quality of service (QoS) profile that should be enforced when users violate their registered QoS profiles, use the **enforced qos-profile** command in enforce-rule configuration mode. To delete the enforced QoS profile from the enforce-rule, use the **no** form of this command.

**enforced qos-profile** *profile-id* [**no-persistence**]  
**no enforced qos-profile** *profile-id* [**no-persistence**]

## Syntax Description

<i>profile-id</i>	Specifies the QoS profile to be enforced. The valid range is 0 to 16383, with a default of 0.
<b>no-persistence</b>	(Optional) Specifies that the enforced QoS profile should not remain in force when a cable modem reboots. Instead, when a cable modem (CM) that is in the penalty period reboots, it is automatically removed from the penalty period and assigned the QoS profile that is specified in its DOCSIS configuration file.  The default is without this option, so that enforced QoS profiles remain in effect for cable modems across reboots.

## Command Default

The profile ID defaults to 0, and enforced QoS profiles are persistent across cable modem reboots.

## Command Modes

Enforce-rule configuration (enforce-rule)

## Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.3(9a)BC	This command was replaced by the <b>qos-profile enforced</b> command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

Both the originally provisioned QoS profile and the enforced QoS profile must be created on the Cisco CMTS router. This command does not support profiles that are created by the cable modem.

An enforce-rule can specify an enforced QoS profile, which is automatically applied to subscribers that transmit more traffic than what is allowed by their registered QoS profile. The enforced QoS profile remains in effect during the penalty time period (see the **penalty-period** command). At the end of the penalty period, the subscriber returns to their registered QoS profile.

If a cable modem reboots while it is in its penalty time period, it continues using the enforced QoS profile, unless the service provider has manually changed the cable modem's registered QoS profile using the **cable modem qos profile** command.

When you change the enforced QoS profile for a currently active enforce-rule, any cable modems using this rule that are currently in the penalty period continue using the previously configured enforced QoS profile. Any cable modems that enter the penalty period after this configuration change, however, use the new enforced QoS profile.

An enforced QoS profile must already have been created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message.

When the **no-persistence** option is specified, the enforced QoS profile is still automatically applied to subscribers that violate their bandwidth requirements. However, when the cable modem reboots, the Cisco CMTS router allows the cable modem to use the QoS profile that is specified in its DOCSIS configuration file.

The **no-persistence** option can be used when initially using subscriber traffic management to identify potential problem applications and users. When repeat offenders are identified, they can then be assigned enforce-rules that do not use the **no-persistence** option, so that they remain in the penalty period even if they reboot their cable modems.

---

**Note** In software releases prior to Cisco IOS Release 12.3(9a)BC, the system automatically applies the enforced QoS profile to violators only if the **enforce** keyword has been used with the **activate-rule at-byte-count** command.

---

## Examples

The following example shows profile 12 being assigned as the enforced QoS profile to an enforce-rule:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# enforced qos-profile 12
```

The following example shows profile 12 being assigned as the enforced QoS profile to an enforce-rule, but with the **no-persistence** option specified, so that the enforced QoS profile does not remain in force if the cable modem reboots:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# enforced qos-profile 12 no-persistence
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# enforced qos-profile 98
The qos profile 98 doesn't exist or it's a cm created QoS profile
```

Related Commands	Command	Description
	<b>activate-rule at-byte-count</b>	Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.
	<b>cable qos enforce-rule</b>	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
	<b>enabled (enforce-rule)</b>	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
	<b>duration</b>	Specifies the time period and sample rate to be used for monitoring subscribers.
	<b>penalty-period</b>	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
	<b>qos-profile registered</b>	Specifies the registered QoS profile that should be used for this enforce-rule.
	<b>show cable qos enforce-rule</b>	Displays the QoS enforce-rules that are currently defined.
	<b>show cable subscriber-usage</b>	Displays subscribers who are violating their registered QoS profiles.

## event-profile

To apply a GQI announce event profile to a specific LED, use the **event-profile** command in global configuration mode.

**event-profile** *name*

Syntax Description	Command	Description
	<i>name</i>	Name of the GQI announce event profile.

**Command Default** None.

**Command Modes** Global configuration mode (config).

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

### Examples

The following example shows how to apply a GQI announce event profile (gqi-led-1) to a LED (led5) using the **event-profile** command:

```
cable video
logical-edge-device led5 id 5
  gqi protocol
    event-profile gqi-led-1
```

Related Commands	Command	Description
	<b>showcable video announce-event-profile</b>	Displays the configuration of the GQI announce event profile and a list of LEDs that use the profile.
	<b>announce-event-profile</b>	Configures the GQI announce event profile.

## exception pxf

To control the core dumps that are generated when an exception occurs in one of the Parallel eXpress Forwarding (PXF) columns, use the **exception pxf** command in global configuration mode. To disable the creation of core dumps during PXF exceptions, use the **no** form of this command.

```
exception pxf {core-file filename | flash device | style {full | localized | minimal | smart}}
```

```
no exception pxf {core-file | flash | style}
```

### Syntax Description

<b>core-file</b> <i>filename</i>	Sets the filename for the core-dump file generated during a PXF exception.
<b>flash</b> <i>device</i>	Specifies the Flash memory device on which to save the core-dump file generated during a PXF exception.
<b>style</b>	Specifies the type of core-dump file to be generated during a PXF exception.
<b>full</b>	Creates a full core-dump file of all PXF columns.
<b>localized</b>	Creates a core-dump file of the PXF column that failed, along with its neighboring columns.
<b>minimal</b>	Creates a core-dump file that contains the data related to the PXF exception.
<b>smart</b>	Creates a core-dump file that contains the data related to the PXF exception.

### Command Default

The profile ID defaults to 0, and enforced QoS profiles are persistent across cable modem reboots.

### Command Modes

Enforce-rule configuration (enforce-rule)

### Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

**Note** Use the **exception pxf** command only under the direction of a technical support representative. Creating a core dump can disrupt network operations. The core dump is a large binary file that can be interpreted only by technical personnel who have access to source code and detailed memory maps.

### Examples

The following example shows how to specify that the Cisco uBR10012 router should create a minimal core-dump file for PXF exceptions, and that this file should be named `ubr10k-pxf` and be written to the `disk1` device:

```
Router# configure terminal

Router(config)# exception pxf style minimal

Router(config)# exception pxf core-file ubr10k-pxf

Router(config)# exception pxf flash disk1:

Router(config)#
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show pxf xcm</b>	Displays the current state of error checking and correcting (ECC) for the External Column Memory (XCM) on the Parallel eXpress Forwarding (PXF) processor.

## facility-alarm (ubr10012)

To set the temperature thresholds at which the Performance Routing Engine (PRE) module generates a critical, major, or minor alarm to warn of potential equipment damage, use the **facility-alarm** command in global configuration mode. To disable the temperature alarms, use the **no** form of this command.

```

facility-alarm {core-temperature | intake-temperature} {critical exceed-action shutdown | major
[temp] | minor [temp]}
no facility-alarm {core-temperature | intake-temperature} {critical exceed-action shutdown |
major [temp] | minor [temp]}

```

**Cisco cBR Series Converged Broadband Routers**  
**facility-alarm critical exceed-action shutdown**  
**no facility-alarm critical exceed-action shutdown**

### Syntax Description

<b>core-temperature</b>	Specifies the temperature threshold for the temperature sensors near the center of the PRE module.
<b>intake-temperature</b>	Specifies the temperature threshold for the temperature sensors at the air intake slots.
<b>critical exceed-action shutdown</b>	In Cisco IOS Release 12.2(11)BC1 and later releases, specifies that a critical temperature alarm should shut down the router after two minutes. This was the default behavior in previous releases.
<b>major</b> [ <i>temp</i> ]	Specifies the temperature, in degrees Centigrade, at which the PRE module generates a major alarm to warn of potential damage from excessive temperatures. The valid range for <i>temp</i> is 20 to 67 degrees Centigrade, with a default of 58 for the core temperature threshold and 54 for the intake-temperature threshold.
<b>minor</b> [ <i>temp</i> ]	Specifies the temperature, in degrees Centigrade, at which the PRE module generates a minor alarm to warn of potential damage from excessive temperatures. The valid range for <i>temp</i> is 20 to 67 degrees Centigrade, with a default of 50 for the core temperature threshold and 45 for the intake-temperature threshold.

### Command Default

If no specific temperature is given, that particular facility alarm is reset to its default value. The default core temperature thresholds are 85 (critical), 58 (major), and 50 (minor). The default intake-temperature thresholds are 72 (critical), 54 (major), and 45 (minor) degrees Centigrade.

In Cisco IOS releases previous to Cisco IOS Release 12.2(11)BC1, a critical alarm automatically shuts down the router after two minutes to prevent temperature damage. In Cisco IOS Release 12.2(11)BC1 and later, a critical alarm by default does not shut down the router.

**Note** The default temperature thresholds for the critical core and intake temperatures were changed in Cisco IOS Release 12.2(11)BC1.

**Command Modes**

Global configuration (config)

**Command History**

Release	Modification
12.2(1)XF1	This command was introduced for the Cisco uBR10012 router.
12.2(11)BC1	The <b>critical exceed-action shutdown</b> option was added. In addition, the default value for the core critical temperature threshold was raised from 57 to 67 degrees Centigrade, and the default value for the intake critical temperature threshold was raised from 60 to 85 degrees Centigrade.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

**Note** The **facility-alarm core-temperature critical** and **facility-alarm intake-temperature critical** commands are available only if the **service internal** command is defined in the configuration.

The PRE module on the Cisco uBR10012 router contains temperature sensors that monitor the temperature at the air intake slots and on the PRE module itself. The **facility-alarm** command configures the router for the temperature thresholds that will generate a minor, major, or critical alarm, so as to notify the system operators of the temperature problem before excessive heat can damage the router or any of its components.

Before Cisco IOS Release 12.2(11)BC1, a critical alarm would also automatically shut down the router after two minutes. Cisco IOS Release 12.2(11)BC1 made this automatic shutdown a configurable option, so that the system operators can decide whether or not a critical alarm should power down the router.

As a general rule, do not disable the automatic shutdown of the router unless you have a systems operator available to immediately respond to any critical temperature alarms, because this could result in system damage. Typically, the primary reason to disable the automatic shutdown would be if you are replacing the fan tray assembly and want to ensure that the router does not power down if the procedure takes longer than expected.

**Note** A line card also automatically shuts itself down if the temperature exceeds operational levels. In addition, the AC and DC PEMs also automatically power down if they exceed their operational temperature. However, high temperatures could still cause damage to other components if the problem is not quickly resolved.

**Examples**

The following example shows how to configure the Cisco uBR10012 router so that it generates a minor alarm when the intake temperature exceed 55°C:

```
Router# configure terminal
Router(config)# facility-alarm intake-temperature minor 55
```

The following example shows how to configure the Cisco uBR10012 router to automatically shut down if the high temperature continues for more than two minutes:

```
Router# configure terminal
Router(config)# service internal
Router(config)# facility-alarm core-temperature critical exceed-action shutdown
```

The following example shows how to disable the automatic shutdown feature for both the core and intake temperatures. A critical alarm is still generated when the default critical temperatures are exceeded, but the router does not automatically shut itself down:

```
Router# configure terminal
Router(config)# no facility-alarm core-temperature critical exceed-action shutdown
Router(config)# no facility-alarm intake-temperature critical exceed-action shutdown
```

The following commands disable major and minor alarms for both the core and intake temperature thresholds (but critical alarms are still generated):

```
Router# configure terminal
Router(config)# no facility-alarm core-temperature major
Router(config)# no facility-alarm core-temperature minor
Router(config)# no facility-alarm intake-temperature major
Router(config)# no facility-alarm intake-temperature minor
```

The following commands show how to disable critical temperature alarm on Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# facility-alarm critical exceed-action shutdown
Router(config)#
Router(config)# no facility-alarm critical exceed-action shutdown
Router(config)#
```

## Related Commands

Command	Description
<b>clear facility-alarm</b>	Clears some or all of the facility alarms on the Cisco uBR10012 router.
<b>show facility-alarm status</b>	Displays the current temperature thresholds that will trigger a facility alarm.

# factory-reset all

To reset the device to factory defaults, use the **factory-reset all** command in privileged EXEC mode. This method is called as Fast Factory Reset.

- Note**
- Partitions accessed by BinOS only have their file tables cleared; the file content is visible with a raw device dump.
  - The **factory-reset all** does not sanitize all the storage devices. To perform factory reset and device sanitization use the Secure Factory Reset command: **factory-reset all secure**.

## factory-reset all

**Syntax Description** This command has no keywords or arguments.

**Command Default** None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1	In this release, instead of only deleting the private configure encryption key, the command deletes all the non-admin users in ACT2.
	Cisco IOS XE Cupertino 17.9.1w	In this release, the partitions are cleared, the device is repartitioned and reformatted.  In previous releases, the partitions are retained and each partition is cleared and reformatted.
	Cisco IOS XE Everest 16.6.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The following example shows how to perform Fast Factory Reset.

### Examples

```
Router# factory-reset all
The factory reset operation is irreversible for all operations. Are you sure? [confirm]
The following will be deleted as a part of factory reset:
1: All writable file systems and personal data
2: OBFL logs
3: Licenses
4: Userdata and Startup config 5: Rommon variables
6: User Credentials
7: nvram private cfg encryption key in ACT2
```

Only this SUP will be reset. To reset peer SUP, run factory reset on peer SUP when this sup is not doing factory reset.

Current running image will be restored to bootflash after reset. If current image is a private image with sensitive data, reload with Cisco release image first.

The SUP will reload to perform factory reset.

The reset can take a while to finish with secure option.

1. DO NOT UNPLUG THE POWER OR INTERRUPT THE OPERATION!
2. DO NOT RELOAD PEER SUP!
3. DO NOT START FACTORY RESET ON PEER SUP!

Are you sure you want to continue? [confirm] **Y**

Enabling factory reset for this reload cycle

# factory-reset all secure

To perform factory reset and device sanitization use the **factory-reset all secure** command. This method is called as Secure Reset. The following folders are cleared as part of this procedure:

- User info in ACT2 is cleared.
- NVRAM that stores IOS configuration and data. For CBR-8, NVRAM and its backup are partitions on eUSB flash device.
- /bootflash/ - For CBR-8, bootflash is a partition on eUSB flash device.
- /obfl/ - For CBR8, OBFL folder is a partition on eUSB flash device.
- /csl\_p/ - For CBR8, csl\_p folder is a partition on eUSB flash device.
- /harddisk/ - For CBR8, the harddisk folder is a partition on SSD.

## factory-reset all secure

### Syntax Description

This command has no keywords or arguments.

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1	In this release, instead of only deleting the private configure encryption key, the command deletes all the non-admin users in ACT2.
Cisco IOS XE Cupertino 17.9.1w	In this release, the partitions are cleared, the device is repartitioned and reformatted.  In previous releases, the partitions are retained and each partition is cleared and reformatted.

### Usage Guidelines

The following example shows how to perform Secure Reset.

### Examples

```
Router# factory-reset all secure
The factory reset operation is irreversible for securely reset all. Are you sure? [confirm]
The following will be deleted as a part of factory reset:
1: All writable file systems and personal data
2: OBFL logs
3: Licenses
4: Userdata and Startup config
5: Rommon variables
6: User Credentials
7: nvram private cfg encryption key in ACT2

Only this SUP will be reset. To reset peer SUP, run factory reset
on peer SUP when this sup is not doing factory reset.
```

Current running image will be restored to bootflash after reset.  
If current image is a private image with sensitive data, reload  
with Cisco release image first.

The SUP will reload to perform factory reset.

The reset can take a while to finish with secure option.

1. DO NOT UNPLUG THE POWER OR INTERRUPT THE OPERATION!
2. DO NOT RELOAD PEER SUP!
3. DO NOT START FACTORY RESET ON PEER SUP!

Are you sure you want to continue? [confirm] Y

Enabling factory reset for this reload cycle

\*May 11 12:21:20.945: %IOSXEBOOT-4-FACTORY\_RESET: (rp/0): Start SECURE Factory Reset

.  
. .  
. .

# fail-to-clear

To configure fail-to-clear feature, use the **fail-to-clear** command in global configuration mode. Fail-to-clear feature is applicable only to DVB tier-based scrambling sessions.

```
fail-to-clear
```

This command has no arguments or keywords.

## Command Default

By default, this feature is not enabled.

## Command Modes

Global configuration mode (config)

## Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

The command is used to control the configured DVB-encrypted sessions to function without encryption, when encryption fails for a session. The fail-to-clear feature is applicable only to DVB tier-based scrambling.

The following example shows how to configure **fail-to-clear**.

```
Router>enable
Router#config terminal
Router(config)#cable video
Router(config-video)#mgmt-intf VirtualPortGroup 0
Router(config-video)#encryption
Router(config-video-encrypt)#linecard 7/0 ca-system dvb scrambler dvb-csa
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#mgmt-ip 10.10.1.1
Router(config-video-encrypt-dvb)#ecmg tier-ecmg-1 id 1
Router(config-video-encrypt-dvb-ecmg)#mode tier-based
Router(config-video-encrypt-dvb-ecmg)#type standard
Router(config-video-encrypt-dvb-ecmg)#ca-system-id 4748 0
Router(config-video-encrypt-dvb-ecmg)#ecm-pid-source sid
Router(config-video-encrypt-dvb-ecmg)#connection id 1 priority 1 10.10.1.1 8888
Router(config-video-encrypt-dvb-ecmg)#exit
Router(config-video-encrypt-dvb)#tier-based
Router(config-video-encrypt-dvb-tb)#ecmg id 1 access-criteria 1234512345
Router(config-video-encrypt-dvb-tb)#fail-to-clear
Router(config-video-encrypt-dvb-tb)#enable
```

## fail-to-clear-duration

To configure fail-to-clear-duration feature, use the **fail-to-clear-duration** command in global configuration mode. Fail-to-clear-duration feature is applicable only to session-based scrambling for DVB CAS encryption.

`fail-to-clear-duration duration in sec`

**Command Default** By default the duration is set to 0.

**Command Modes** Global configuration mode (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** The command is used to control the configured DVB-encrypted sessions to function without encryption for a configured duration, when encryption fails for a session. The fail-to-clear-duration feature is applicable only to session-based scrambling for DVB CAS encryption.

The following example shows how to configure **fail-to-clear-duration**.

```
Router>enable
Router#config terminal
Router(config)#cable video
Router(config-video)#mgmt-intf VirtualPortGroup 0
Router(config-video)#encryption
Router(config-video-encrypt)#linecard 7/0 ca-system dvb scrambler dvb-csa
Router(config-video-encrypt-dvb-conf)#exit
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#scramble-video-audio
Router(config-video-encrypt-dvb)#route-ecmg 10.10.1.1 255.255.255.224 TenGigabitEthernet4/1/2

Router(config-video-encrypt-dvb)#mgmt-ip 10.10.1.1
Router(config-video-encrypt-dvb)#eis eis-1 id 1
Router(config-video-encrypt-dvb-eis)#listening-port 8890
Router(config-video-encrypt-dvb-eis)#fail-to-clear-duration 400
Router(config-video-encrypt-dvb-eis)#exit
Router(config-video-encrypt-dvb)#ca-interface linecard 1/0 10.10.1.1 vrf vrf_script_red_1
Router(config-video-encrypt-dvb)#ecmg ecmg-7 id 7
```

## filter pid vcg

To configure PID rule, use the **filter pid vcg** command in video configuration mode.

**filter pid vcg** *vcg*

<b>Syntax Description</b>	<i>vcg</i> Specifies the virtual carrier group.
---------------------------	-------------------------------------------------

**Command Default** None.

**Command Modes** Video configuration (config)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

### Examples

The following example shows a filter rule for a table-based unicast session on input port number 1 with vei-ip 198.51.100.1

```
logical-edge-device led1 id 1
    protocol table-based
        virtual-edge-input-ip 198.51.100.1 input-port-number 1
        vcg vcg1
        active
table-based
    vcg vcg1
        rf-channel 2
            session unicast input-port 1 start-udp-port 49152 processing-type passthru
```

The corresponding filter rule is shown below:

```
filter pid vcg vcg1
    rf-channel 2
        vei-ip 198.51.100.1 udp-port 49152
    pid 120
    pid 20-30
```

## filter program vcg

To configure program filtering, use the **filter program vcg** command in video configuration mode.

**filter program vcg** *vcg*

### Syntax Description

<i>vcg</i>	Specifies the virtual carrier group.
------------	--------------------------------------

### Command Default

None.

### Command Modes

Video configuration (config)

### Command History

Release	Modification
IOS-XE 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

### Examples

The following example shows a program filter rule for a table-based unicast session on input port number 1 with vei-ip 198.51.100.1

```
logical-edge-device led1 id 1
    protocol table-based
        virtual-edge-input-ip 198.51.100.1 input-port-number 1
        vcg vcg1
        active
table-based
    vcg vcg1
        rf-channel 2
            session unicast input-port 1 start-udp-port 49152 processing-type passthru
```

The corresponding filter rule is shown below:

```
filter program vcg vcg1
    rf-channel 2
        vei-ip 198.51.100.1 udp-port 49152
    program 10
    program 20
    program 30-40
```

# freq-profile

To define the frequency profile for the RF port, use the **freq-profile** command in the RF channel sub configuration mode. This command is available only on CBR-D30-DS-MOD, and is not applicable for CBR-D31-DS-MOD.

**freq-profile** *value*

## Syntax Description

*value* Number of the frequency profile for the RF port. The default value is 0. The valid range for system defined values is 0-3 and for user defined values is 4-15.

## Command Default

The default value is 0.

## Command Modes

RF channel sub configuration mode (config-rf-chan)

## Command History

Release	Modification
Cisco IOS-XE Release 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

This command is used to define the QAM profile number.

The following example shows how to define the QAM profile number:

```
router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#type video
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#qam-profile 4
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srate Interleaver dcid power output
 5 TEST UP 723000000 VIDEO B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 VIDEO B 256 5361 I32-J4 169 34 ALT
```

## Related Commands

Command	Description
<b>cable downstream freq-profile</b>	Set the frequency profile for the cable interface line card.
<b>frequency</b>	Defines the RF channel radio frequency.
<b>show cable freq-profile</b>	Displays information about the frequency profile.

# frequency

To define the frequency for the RF channel, use the **frequency** command in the RF channel sub configuration mode.

**frequency** *number*

<b>Syntax Description</b>	<i>number</i> Radio frequency for the RF channel. The valid range is from 48000000-999000000.
---------------------------	-----------------------------------------------------------------------------------------------

<b>Command Default</b>	None.
------------------------	-------

<b>Command Modes</b>	RF channel sub configuration mode (config-rf-chan)
----------------------	----------------------------------------------------

<b>Usage Guidelines</b>	This command is used to define the RF channel frequency.
-------------------------	----------------------------------------------------------

The following example shows how to define the RF channel frequency:

```
router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 0 2
router(config-rf-chan)#frequency 93000000
router(config-rf-chan)#exit
router(config-controller)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 0-2
```

Chan	State	Admin	Frequency	Type	Annex	Mod	srate	Interleaver	dcid	power	output
0	UP	UP	93000000	DOCSIS	B	256	5361	I32-J4	1	34	NORMAL
1	UP	UP	99000000	DOCSIS	B	256	5361	I32-J4	2	34	NORMAL
2	UP	UP	105000000	DOCSIS	B	256	5361	I32-J4	3	34	NORMAL

## Related Commands

Command	Description
<b>controller integrated-cable</b>	Enters the controller configuration mode.
<b>rf-chan</b>	To enter the RF channel sub configuration mode.
<b>qam-profile</b>	Defines the QAM profile number.
<b>rf-output</b>	Defines the QAM output mode.
<b>type</b>	Defines the QAM data type.
<b>power-adjust</b>	Defines the channel power level.

## guardband-override (OFDM channel profile)

To configure the guard band of an OFDM channel, use the **guardband-override** command in OFDM channel profile configuration mode. To undo the guard band configuration, use **no** form of this command.

**guardband-override** *value*

**no guardband-override**

<b>Syntax Description</b>	<i>value</i> 0 to 4000000 in 50000Hz increments.
---------------------------	--------------------------------------------------

<b>Command Default</b>	None.
------------------------	-------

<b>Command Modes</b>	OFDM channel profile configuration (config-ofdm-chan-prof)
----------------------	------------------------------------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	IOS-XE 3.18.1SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines** Use this command to configure the guard band of an OFDM channel with the range of 0 to 4MHz. No guardband override is configured by default. In this case, the guard band is based on the roll off and spacing in OFDM channel profile.

**Examples** The following example shows how to specify the guard band:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# guardband-override 240000
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>cable downstream ofdm-chan-profile</b>	Define the OFDM channel profile on the OFDM channel.
	<b>cyclic-prefix</b>	Specify the channel cyclic-prefix.
	<b>description (OFDM channel profile)</b>	Specify a user defined description for the profile.
	<b>pilot-scaling</b>	Specify the value used to calculate the number of continuous pilots.
	<b>profile-control</b>	Specify default modulation or profile as the channel control profile.
	<b>profile-data</b>	Specify default modulation or profile as the channel data profile.
	<b>profile-ncp</b>	Specify default modulation or profile as the channel ncp profile.
	<b>roll-off</b>	Specify the channel roll-off value.
	<b>subcarrier-spacing</b>	Specify the spacing for specific subcarriers configured in this profile.

Command	Description
interleaver-depth	Specify the channel interleaver-depth.

# hccp authentication

To specify the authentication algorithm on a working or protect cable interface, or both use the **hccp authentication** command in cable interface configuration mode. To disable authentication on a Working CMTS or Protect CMTS, use the **no** form of this command.

```
hccp group authentication {md5 | text}
no hccp group authentication {md5 | text}
```

## Syntax Description

<i>group</i>	The group number for the specified interface. Valid values are any number from 1 to 255, inclusive.
<b>md5</b>	Authentication algorithm. In Cisco IOS Release 12.1(3a)EC, MD5 is the only authentication algorithm supported.
<b>text</b>	Unencrypted text specification. Rather than automatically encrypting the authentication key-chain when using the MD5 authentication algorithm, Cisco IOS software simply passes the authentication key-chain as standard, unencrypted text.

## Command Default

The default authentication algorithm is MD5.

## Command Modes

Interface configuration (cable interface only)

## Command History

Release	Modification
12.1(3a)EC	This command was introduced for the Cisco uBR7200 series routers.
12.1(7)EC1	Support was added for the Cisco uBR-MC16S cable interface line card.
12.2(4)XF1, 12.2(4)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card.
12.2(8)BC2	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards.
12.2(11)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.
12.2(15)BC1	Support was added for the Cisco uBR-MC5X20U/S BPE on the Cisco uBR10012 router.
12.3(17a)BC2	Support was added for the Cisco uBR-MC5X20H BPE on the Cisco uBR10012 router.
12.3(21)BC	This command is obsolete on the Cisco uBR7246VXR router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

**Usage Guidelines**

Use this command together with the **hccp authentication key-chain** command to enable and specify the type of N+1 redundancy authentication you will use in your protection scheme.

**Examples**

The following example shows how to specify MD5 as the authentication algorithm for group 1:

```
Router(config-if)# hccp 1 authentication md5
```

**Related Commands**

Command	Description
<b>hccp authentication key-chain</b>	Enables authentication on a given interface and specifies one or more keys that can be used to perform authentication for a specified group.
<b>show hccp</b>	Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.
<b>show hccp interface</b>	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.

## hccp authentication key-chain

To enable authentication and define one or more authentication keys to use in a specified group, use the **hccp authentication key-chain** command in cable interface configuration mode. To disable authentication, use the **no** form of this command. The key chains you define must match one or more key chains configured in the Working CMTS or Protect CMTS configuration file.

**hccp group authentication key-chain** *key-chain*  
**no hccp group authentication key-chain** [*key-chain*]

### Syntax Description

<i>group</i>	The group number for the specified interface. Valid values are any number from 1 to 255, inclusive.
<i>key-chain</i>	A text string matching a key chain in the Working CMTS or Protect CMTS configuration file. A key chain must have at least one key and can have up to 2,147,483,647 keys.

### Command Default

No default behavior or values

### Command Modes

Interface configuration (cable interface only)

### Command History

Release	Modification
12.1(3a)EC	This command was introduced for the Cisco uBR7200 series routers.
12.1(7)EC1	Support was added for the Cisco uBR-MC16S cable interface line card.
12.2(4)XF1, 12.2(4)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card.
12.2(8)BC2	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards.
12.2(11)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.
12.2(15)BC1	Support was added for the Cisco uBR-MC5X20U/S BPE on the Cisco uBR10012 router.
12.3(17a)BC2	Support was added for the Cisco uBR-MC5X20H BPE on the Cisco uBR10012 router.
12.3(21)BC	This command is obsolete on the Cisco uBR7246VXR router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

### Usage Guidelines

Use this command in conjunction with the **hccp authentication** command to enable and specify the type of 1+1 redundancy authentication you will use in your protection scheme.

**Note** You cannot perform authentication on a specified group until you have first defined at least one authentication key chain in global configuration mode.

### Examples

The following excerpt from a configuration file enables authentication using the MD5 algorithm and defines the authentication key “cisco1” for group 1:

```
!
key chain cisco1
  key 1
    key-string abcdefg
  key 2
    key-string 123456789
!
...
!
interface cable 3/0
  hccp 1 authentication md5
  hccp 1 authentication key-chain cisco1
!
```

### Related Commands

Command	Description
<b>hccp authentication</b>	Specifies the authentication algorithm for the Working CMTS or Protect CMTS.
<b>hccp authentication key-chain</b>	Enables authentication on a given interface and specifies one or more keys that can be used to perform authentication for a specified group.
<b>key-chain</b>	Defines one or more key chains for authentication between the Working CMTS or Protect CMTS.
<b>show hccp</b>	Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.
<b>show hccp interface</b>	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.

# hccp bypass version

To enter bypass version mode for a specific Hot Standby Connection-to-Connection Protocol (HCCP) group, in which the hardware and software version checks are not performed before switching over to a protect interface, use the **hccp bypass version** command in privileged EXEC mode.

**hccp group bypass version**

## Syntax Description

<i>group</i>	The group number for the specified interface. The valid range is 1 to 255.
--------------	----------------------------------------------------------------------------

## Command Default

Normal HCCP operations (**hccp group check version**), where hardware and software version checks are made between the Working and Protect cable interface line cards.

## Command Modes

Privileged EXEC

## Command History

Release	Modification
12.2(4)XF1, 12.2(4)BC1	This command was introduced for the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card with the Cisco RF Switch.
12.2(8)BC2	Support was added for the Cisco uBR10012 router using the Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards with the Cisco RF Switch.
12.2(11)BC1	Support was added for the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards with the Cisco RF Switch.
12.2(15)BC1	Support was added for the Cisco uBR-MC5X20U/S BPE on the Cisco uBR10012 router.
12.3(17a)BC2	Support was added for the Cisco uBR-MC5X20H BPE on the Cisco uBR10012 router.
12.3(21)BC	This command is obsolete on the Cisco uBR7246VXR router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

## Usage Guidelines

By default, the Cisco CMTS verifies that the Working and Protect cable interfaces are using the same versions of software and hardware, so as to avoid potential incompatibilities during a switchover. The hardware check verifies that the Working and Protect cable interface line cards are compatible. The software check verifies that the two cards are running the same major versions of software. If either of these two conditions is not true, the CMTS by default does not perform the switchover.

You can override these version checks for a particular HCCP group by using the **hccp bypass version** command. After you give this command, the Cisco CMTS does not check the hardware or software versions of the two cable interfaces before performing a switchover. To return to normal HCCP operations, so that version checks are made for a group, use the **hccp check version** command.
