C O N T E N T S

Preface

This preface describes who should read the *Cisco Service Control Application for Broadband Reference Guide*, how it is organized, its document conventions, and how to obtain documentation and technical assistance. This guide assumes a basic familiarity with the concept of the Cisco Service Control solution, the Service Control Engine (SCE) platforms, and related components.

This guide provides information about the data structures created and used by SCA BB. It is intended for:

- The administrator who is responsible for daily operation of the Cisco Service Control solution
- Integrators who are developing applications on top of SCA BB

Document Revision History

Cisco Service Control Release	Part Number	Publication Date
Release 3.1.5	OL-8410-06	November, 2007

Description of Changes

Updated Default Service Configuration Reference Tables, page 1-1

Cisco Service Control Release	Part Number	Publication Date
Release 3.1.5LA	OL-8410-05	August, 2007

Description of Changes

Added the following new features:

- DSCP ToS Classification (see ToS CSV Files, page 5-5)

Cisco Service Control Release	Part Number	Publication Date
Release 3.1.0	OL-8410-04	May, 2007

Description of Changes

Added the following new features:

- NetFlow (see NetFlow Records: Formats and Field Contents, page 3-1)
- Virtual Links Usage RDR, page 2-26 (see also Table VLINK_INI, page 4-12)
- Unidirectional Classification (see Protocols Identified on Unidirectional Flows, page 1-37)

Cisco Service Control Release	Part Number	Publication Date
Release 3.0.5	OL-8410-03	November, 2006

Description of Changes

Added the following new feature:

- Quota State Restore RDRs, page 2-33

Cisco Service Control Release	Part Number	Publication Date
Release 3.0	OL-8410-03	May, 2006

Description of Changes

Added the following new feature:

- Media Flow RDR, page 2-39 (see also Table RPT_MEDIA, page 4-7)

Added the following section to the document:

- SCE Subscriber Template CSV File, page 5-6

Cisco Service Control Release	Part Number	Publication Date
Release 3.0	OL-8410-03	December, 2005

Description of Changes

Created the *Cisco Service Control Application for Broadband Reference Guide*.

Chapters 1, 2, 3 of this document are based on Appendixes B, C, D of the Release 2.5.5 *Cisco Service Control Application for Broadband User Guide*.

Organization

The major sections of this guide are as follows:

Table 1   ***Documentation Organization***

Chapter	Title	Description
Chapter 1	Default Service Configuration Reference Tables	Describes the default service configuration provided with the Cisco Service Control Application for Broadband (SCA BB).
Chapter 2	Raw Data Records: Formats and Field Contents	Lists the various RDRs produced by the Service Control Engine (SCE) platform and gives their structure, describes the columns and fields of each RDR, and states under what conditions each kind of RDR is generated. Also provides field-content information for fields generated by Service Control components (such as tags), and a description of the Periodic RDR Zero Adjustment Mechanism.
Chapter 3	NetFlow Records: Formats and Field Contents	Lists the RDRs whose data can be generated as NetFlow records and describes the fields that may be contained in a NetFlow record.
Chapter 4	Database Tables: Formats and Field Contents	Presents the different database tables used for storing RDRs (after their conversion by an adapter), and a description of the table columns (field names and types).
Chapter 5	CSV File Formats	Describes the location and structure of CSV files pertaining to service configuration, subscriber management, and data collection management.
Chapter 6	SCA BB Proprietary MIB Reference	Describes that part of the Cisco SCE proprietary MIB that provides configuration and runtime status for SCA BB.

Related Publications

The following publications are available for the Cisco Service Control Application for Broadband:

- *Cisco Service Control Application for Broadband User Guide*
- *Cisco Service Control Application for Broadband Service Configuration API Programmer Guide*
- *Cisco Service Control Management Suite Collection Manager User Guide*
- *Cisco Service Control Management Suite Subscriber Manager User Guide*
- *Cisco Service Control Application Reporter User Guide*
- The SCE platform installation and configuration guides:
  - *Cisco SCE 1000 2xGBE Installation and Configuration Guide*
  - *Cisco SCE 2000 4xGBE Installation and Configuration Guide*
  - *Cisco SCE 2000 4/8xFE Installation and Configuration Guide*
- *Cisco Service Control Engine (SCE) CLI Command Reference*
- *Cisco Service Control Engine (SCE) Software Configuration Guide*

To view Cisco documentation or obtain general information about the documentation, refer to the following sources:

- Obtaining Documentation and Submitting a Service Request, page x
- The Cisco Information Packet that shipped with your SCE 2000 platform

Conventions

This document uses the following conventions:

Table 2 Documentation Conventions

Convention	Description
boldface font	Commands and keywords are in **boldface** .
italic font	Arguments for which you supply values are in *italics* .
[ ]	Elements in square brackets are optional.
{x	y	z}	Alternative keywords are grouped in braces and separated by vertical bars.
[x	y	z]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
string	A nonquoted set of characters. Do not use quotation marks around the string, or the string will include the quotation marks.
`screen` font	Terminal sessions and information that the system displays are in `screen` font.
`boldface screen` font	Information you must enter is in **`boldface screen`** font.
`italic screen` font	Arguments for which you supply values are in *`italic screen`* font.
<>	Nonprinting characters, such as passwords, are in angle brackets.
[ ]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

Note Means *reader take note*. Notes contain helpful suggestions or references to materials not covered in this manual.

Caution Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Warning **Means *reader be warned*. In this situation, you might do something that could result in bodily injury.**

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.

Default Service Configuration Reference Tables

This chapter describes the default service configuration provided with the Cisco Service Control Application for Broadband (SCA BB). The default service configuration serves as a starting point for creating a service configuration tailored to customers' needs.

Filter Rules

Filter rules allow you to instruct the Service Control Engine (SCE) platform to ignore some types of flow based on the flow's Layer 3 and Layer 4 properties, and transmit the flows unchanged.

The following table lists the filter rules defined in the default service configuration.

Table 1-1   Filter Rules

Flow Filter Name	Default State	Description
ICMP Filter	Active	Applies to ICMP packets, packets bypass the policy engine and are mapped to CoS BE
DNS (to network)	Active	Applies to UDP packets, network-side port is equal to 53, packets bypass the policy engine and are mapped to CoS BE
DNS (to subscriber)	Active	Applies to UDP packets, subscriber-side port is equal to 53, packets bypass the policy engine and are mapped to CoS BE
net-bios (to network)	Active	Applies to UDP packets, network-side port is equal to 137, packets bypass the policy engine and are mapped to CoS BE
net-bios (to subscriber)	Active	Applies to UDP packets, subscriber-side port is equal to 137, packets bypass the policy engine and are mapped to CoS BE
eDonkey UDP (to network)	Inactive	Applies to UDP packets, network-side ports in the range 4661 to 4665, packets bypass the policy engine and are mapped to CoS BE
eDonkey UDP (to subscriber)	Inactive	Applies to UDP packets, subscriber-side ports in the range 4661 to 4665, packets bypass the policy engine and are mapped to CoS BE
eMule UDP (to network)	Inactive	Applies to UDP packets, network-side ports in the range 4670 to 4674, packets bypass the policy engine and are mapped to CoS BE

Table 1-1   Filter Rules (continued)

Flow Filter Name	Default State	Description
eMule UDP (to subscriber)	Inactive	Applies to UDP packets, subscriber-side ports in the range 4670 to 4674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 2 (to network)	Inactive	Applies to UDP packets, network-side ports in the range 5670 to 5674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 2 (to subscriber)	Inactive	Applies to UDP packets, subscriber-side ports in the range 5670 to 5674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 3 (to network)	Inactive	Applies to UDP packets, network-side ports in the range 5780 to 5784, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 3 (to subscriber)	Inactive	Applies to UDP packets, subscriber-side ports in the range 5780 to 5784, packets bypass the policy engine and are mapped to CoS BE
BGP Filter	Inactive	Applies to TCP packets, network-side port is equal to 179, packets bypass the policy engine and are mapped to CoS BE
DHCP Filter	Inactive	Applies to UDP packets, network-side ports in the range 67 to 68, packets bypass the policy engine and are mapped to CoS BE
OSPF Filter	Inactive	Applies to OSPFIGP packets, packets bypass the policy engine and are mapped to CoS BE
IS-IS Filter	Inactive	Applies to ISIS packets, packets bypass the policy engine and are mapped to CoS BE
IGRP Filter	Inactive	Applies to IGP packets, packets bypass the policy engine and are mapped to CoS BE

Table 1-1   Filter Rules (continued)

Flow Filter Name	Default State	Description
EIGRP Filter	Inactive	Applies to EIGRP packets, packets bypass the policy engine and are mapped to CoS BE
HSRP Filter 1	Inactive	Applies to UDP packets, network-side IP is equal to 224.0.0.2, packets bypass the policy engine and are mapped to CoS BE
HSRP Filter 2	Inactive	Applies to UDP packets, network-side port is equal to 1985, packets bypass the policy engine and are mapped to CoS BE
HSRP Filter 3	Inactive	Applies to UDP packets, subscriber-side port is equal to 1985, packets bypass the policy engine and are mapped to CoS BE
RIP Filter 1	Inactive	Applies to UDP packets, network-side IP is equal to 224.0.0.9, packets bypass the policy engine and are mapped to CoS BE
RIP Filter 2	Inactive	Applies to UDP packets, network-side port is equal to 520, packets bypass the policy engine and are mapped to CoS BE
RIP Filter 3	Inactive	Applies to UDP packets, subscriber-side port is equal to 520, packets bypass the policy engine and are mapped to CoS BE
RADIUS Filter	Inactive	Applies to UDP packets, network-side port is equal to 1812, packets bypass the policy engine and are mapped to CoS BE
RADIUS Filter (early deployment)	Inactive	Applies to UDP packets, network-side ports in the range 1645 to 1646, packets bypass the policy engine and are mapped to CoS BE

Information About Protocols

Protocols are divided into four groups:

- Generic Protocols—These protocols are used for transactions that were not mapped to a service by one of the more specific protocol types.

- Signature-Based Protocols—Protocols classified according to a Layer 7 application signature. This group includes the most common protocols, such as HTTP and FTP, and a large group of popular P2P protocols.

- IP Protocols—Protocols (such as ICMP), other than TCP and UDP protocols, identified according to the IP protocol number of the transaction.

- Port-Based Protocols—TCP and UDP protocols that are classified according to their well-known ports. The default configuration includes more than 600 common port-based protocols.

  You may add new protocols (for example, to classify a new gaming protocol that uses a specific port) and edit or remove existing ones.

The tables in the following sections list the protocols defined in the default service configuration.

Generic Protocols

The three generic protocols (IP, TCP, and UDP) serve as default containers for classifying transactions of the relevant type (IP, TCP, or UDP) that were not classified as belonging to a more specific protocol.

A transaction is classified as belonging to one of the generic protocols if it meets *both* the following conditions:

- It was not classified as belonging to a signature-based protocol.
- It was not classified as belonging to an IP or port-based protocol that is specifically mapped to a service.

Table 1-2   Generic Protocols

Protocol Name	ID	Description
Generic IP	10	Any non-TCP/UDP transaction where the related IP protocol is not specifically mapped to a service.
Generic TCP	0	Any TCP transaction that does not match any signature-based protocol, and where the related port-based protocol (if it exists) is not specifically mapped to a service1.
Generic UDP	1	Any UDP transaction that does not match any signature-based protocol, and where the related port-based protocol (if it exists) is not specifically mapped to a service.

Signature-Based Protocols

A transaction is classified as belonging to one of the signature-based protocols if it is carried on the protocol's well-known port or matches the protocol's signature.

Note   The next table only lists signature-based protocols that are not P2P, VoIP, or SIP protocols (these protocols are listed in the following tables). However, the Signature-Based Protocols Filter in the Console lists all signature-based protocols.

Table 1-3   Signature-Based Protocols

Protocol Name	ID	TCP Ports	UDP Ports
Audio over HTTP	1041		
Baidu Movie	1043		
Behavioral Upload/Download

See note following table | 127 | | |
Binary over HTTP	1042		
CUWorld	117		
Club Box	1038		
DHCP Sniff	33		
DHT	106		
DNS	933		
DingoTel	42		
FTP	4	21	
Flash	1033		
Flash YouTube	1034		
Flash MySpace	1035		
Flash Yahoo	1036		
Fring	1052		
Generic Non-Established TCP

See note following table | 126 | | |
Google Talk	1030		
GoogleEarth	118		
HTTP Browsing	2	80, 8080	
HTTP Tunnel	55		
Hopster	115		
ICQ	119		
IRC	62		
Jabber	116		

Table 1-3   Signature-Based Protocols   (continued)

Protocol Name	ID	TCP Ports	UDP Ports
MMS	6	1755	
MS Push Mail	1048		
Mobile MMS	46		
MyJabber	1056		
Napster	32		
NNTP	15	119	
NTP	54		
POP3	9	110	
QQ	52		
RTSP Streaming	5	554, 1554, 7070	
SMTP	8	25	
SSDP	53		
STUN	114		
Sling	112		
UC	48		
Video over HTTP	1040		
Yahoo Messenger	40	5000-5001	5000-5001
iTunes	30		
imap	59	143	143
radius	738		
tftp	60	69	69

Note   Behavioral Upload/Download—Transactions that have download packet flow characteristics and do not match a more specific signature are classified to this protocol. This protocol applies to downloads both from the network side and from the subscriber side.

Note   Generic Non-Established TCP—TCP flows that are not established properly (syn-ack is missing) are mapped to this protocol.

Table 1-4   *Signature-Based P2P Protocols*

Protocol Name	ID	TCP Ports	UDP Ports
AntsP2P	113		
BBC iPlayer	1057		
BaiBao	43		
Behavioral P2P	1044		
BitTorrent	24	6881-6889	
Dijjer	120		
DirectConnect	19	411-413	
Entropy	125		
Exosee	121		
FastTrack KaZaA File Transfer	14		
FastTrack KaZaA Networking	13	1214	
Feidian	1037		
Filetopia	31		
Freenet	107		
Furthur	123		
Gnutella File Transfer	12		
Gnutella Networking	11	6346-6349	
Hotline	20		
Joost	1046		
Konspire2b	1031	6085	6085
Kontiki	124		
KuGoo	1050		
LOCO	5123		
Manolito	22		
Mute	34		
NeoNet	37		
NodeZilla	35		
Pando	1049		
PeerEnabler	122		
Poco	51		
PPLive	44		
PPStream	49		
QQ-Live	1032		
Rodi	111		

Table 1-4   Signature-Based P2P Protocols (continued)

Protocol Name	ID	TCP Ports	UDP Ports
Share	27		
Soulseek	29		
TVAnts	109		
Thunder	50		
Warez/FileCroc	39		
Waste	36		
WebThunder	1055		
WinMX/OpenNap	16	6257, 6699	6257
Winny	17	7742-7745, 7773	
Zattoo	1047		
eDonkey	18	4661-4665, 4672-4673, 4711, 5662, 5773, 5783	4661-4665, 4672-4673, 4711, 5662, 5773, 5783
eMuleEncrypted	105		
guruguru	66		
kuro	67		
soribada	69		
v-share	71		

Table 1-5   Signature-Based VoIP Protocols

Protocol Name	ID	TCP Ports	UDP Ports
Fring VoIP	1053		
H323	28	1720	
ICQ VoIP	110		
MGCP	38		2427, 2727
MSN Messenger VoIP	1054		
PTT Winphoria	61		
Primus	108		
RTP	57		
SIP	23	5060-5061	5060-5061
Skinny	41		
Skype	25		
Yahoo Messenger VoIP	45	33033	
Yahoo VoIP over SIP	1039		

Note   The protocols ICQ VoIP, Primus, SIP, and Yahoo VoIP over SIP are also signature-based SIP protocols.

IP Protocols

This section lists the IP protocols supported by SCA BB.

Table 1-6   IP Protocols

IP Protocol Number	Protocol Name	Protocol ID
0	HOPOPT	756
1	ICMP	757
2	IGMP	758
3	GGP	759
4	IP	760
5	ST	761
6	Generic TCP	0
7	CBT	762
8	EGP	763
9	IGP	764
10	BBN-RCC-MON	765
11	NVP-II	766
12	PUP	767
13	ARGUS	768
14	EMCON	769
15	XNET	770
16	CHAOS	771
17	Generic UDP	1
18	MUX	772
19	DCN-MEAS	773
20	HMP	774
21	PRM	775
22	XNS-IDP	776
23	TRUNK-1	777
24	TRUNK-2	778
25	LEAF-1	779
26	LEAF-2	780
27	RDP	781
28	IRTP	782
29	ISO-TP4	783
30	NETBLT	784
31	MFE-NSP	785
32	MERIT-INP	786

Table 1-6   IP Protocols (continued)

IP Protocol Number	Protocol Name	Protocol ID
33	SEP	787
34	3PC	788
35	IDPR	789
36	XTP	790
37	DDP	791

Protocols Identified on Unidirectional Flows

When unidirectional classification is enabled, the protocols listed in the following table can be detected on unidirectional flows.

- When a unidirectional flow (inbound or outbound) passes through the SCE platform it is matched against this set of protocol signatures.

- When a bidirectional flow passes through the SCE platform the protocol library tries to match it to one of its standard (bidirectional) protocol signatures.

Table 1-8   Unidirectionally-Detected Protocols

Services

Services are the building blocks of service configurations. Classification of a transaction to a service determines the accounting and control that applies to the transaction. Services are organized in a hierarchal structure used for both accounting and control.

The following table lists the services defined in the default service configuration. Both service usage counters, which are used to accumulate information about transactions classified to the service, have the same name.

Table 1-9   Installed Services

Name	ID	Name of Parent Service	Global Usage Counter and Subscriber Usage Counter
Default Service	0		Default Service*
Generic	1	Default Service	Default Service*
Generic TCP	2	Generic	Generic TCP
Generic UDP	3	Generic	Generic UDP
Generic IP	6	Generic	Generic IP
Behavioral Upload/Download	39	Generic	Behavioral Upload/Download
E-Mail	4	Default Service	E-Mail*
POP3	21	E-Mail	E-Mail*
SMTP	22	E-Mail	E-Mail*
IMAP	23	E-Mail	E-Mail*
MS Push Mail	47	E-Mail	**Global** : MS Push Mail **Subscriber** : E-Mail*
Browsing	7	Default Service	Browsing*
HTTP	16	Browsing	Browsing*
HTTP Download	44	HTTP	**Global** : HTTP Download **Subscriber** : Browsing*
HTTPS	17	Browsing	Browsing*
Newsgroups	8	Default Service	Newsgroups

Table 1-9   Installed Services (continued)

Name	ID	Name of Parent Service	Global Usage Counter and Subscriber Usage Counter
MMS	20	Streaming	Streaming*
Tunneling	38	Default Service	Tunneling

Note An asterisk is appended to a service usage counter name whenever the counter applies to more than one service.

RDR Settings

SCE platforms generate and transmit Raw Data Records (RDRs) that contain a wide variety of information and statistics, depending on the configuration of the system.

Table 1-10   Default RDR Settings

RDR Family	RDR Name	State	Rate	Rate Limit	Notes
Usage	Link	ON	Every 5 minutes		
	Package	ON	Every 5 minutes		
	Subscriber	ON	Every 10 minutes	200 per second	
	Virtual Links	OFF	Every 10 minutes		Default is ON for service configurations created in Virtual Links mode.
Transaction	Transaction	ON		250 per second	All services have the same relative weight.
Transaction Usage	Transaction Usage (TUR)	OFF			No threshold.
	Interim TUR	OFF			
	Media Flow	ON			
Quota	Breach	OFF			
	Remaining	OFF	Every 5 minutes	100 per second	
	Threshold	OFF			Generate RDR when balance goes below 10 MB.
	Restore Quota	OFF			Generated upon subscriber introduction.
Log	Block	ON		20 per second	
Real-Time Subscriber	Real-Time Subscriber Usage	ON	Every 1 minutes	100 per second	Enable for each subscriber separately, using CLI.

Table 1-10   Default RDR Settings (continued)

RDR Family	RDR Name	State	Rate	Rate Limit	Notes
Real-Time Signaling	Flow Signaling	OFF			
	Attack Signaling	OFF			
Malicious Traffic	Malicious Traffic	ON	Every 60 seconds		Only generated during attack.

Rules

Rules are set of configurable instructions telling the application how to handle flows classified to a service.

The default service configuration contains a single rule for the default service. Until you create other rules, the default service rule applies to all traffic processed by the SCE platform.

The default service rule places no restrictions on traffic:

- Flows are routed through the default BWCs, which have unlimited BW.

- No quota limitations are applied to the flows and external quota management mode is selected.

System Mode

The default System Operational Mode is Report Only, which means that the system is used for reporting but does not control traffic.

The default System Topological Mode is Duplex, which means that all inbound and outbound traffic goes through the SCE platform.

Note   When unidirectional classification is enabled, there are some changes to the default service configuration:
There are no predefined flavors.
No service elements include a specified flavor.
Periodic quota management mode is selected.

C H A P T E R 2

Raw Data Records: Formats and Field Contents

This chapter contains a list of the Raw Data Records (RDRs) produced by the SCE platform and a full description of the fields contained in each RDR.

The chapter also contains field-content information for those fields that are generated by Service Control components.

Raw Data Records Overview

RDRs are the collection of fields that are sent by the Service Control Engine (SCE) platforms to the Cisco Service Control Management Suite (SCMS) Collection Manager (CM).

Fields that are common to many of the RDRs are described in the next section, before the individual RDRs are described.

Universal RDR Fields

This section contains descriptions of fields that are common to many RDRs. The first two fields, SUBSCRIBER_ID and PACKAGE_ID, appear in almost all the RDRs. The other fields are listed in alphabetic order.

- SUBSCRIBER_ID—The subscriber identification string, introduced through the subscriber management interfaces. It may contain up to 40 characters. For unknown subscribers this field may contain an empty string.

- PACKAGE_ID—The ID of the Package assigned to the subscriber whose traffic is being reported. An assigned Package ID is an integer value between 0 and maximum_number_of_packages. The value maximum_number_of_packages is reserved for unknown subscribers.

- ACCESS_STRING—A Layer 7 property, extracted from the transaction. For possible values, see String Fields, page 2-47.

- BREACH_STATE—This field indicates whether the subscriber's quota was breached.

    - 0—Not breached

    - 1—Breached

- CLIENT_IP—The IP address of the client side of the reported session. (The client side is defined as the initiator of the networking session.) The IP address is in a 32-bit binary format.

- CLIENT_PORT—For TCP/UDP-based sessions, the port number of the client side (initiator) of the networking session. For non-TCP/UDP sessions, this field has the value zero.

- CONFIGURED_DURATION—For periodic RDRs, the configured period, in seconds, between successive RDRs.

- END_TIME—Ending time stamp of this RDR. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970.

- FLAVOR_ID—For protocol signatures that have flavors, this field contains the ID of the flavor associated with this session.

- INFO_STRING—A Layer 7 property extracted from the transaction. For possible values, see String Fields, page 2-47.

- INITIATING_SIDE—On which side of the SCE platform the initiator of the transaction resides.
  - 0—The subscriber side
  - 1—The network side
- PROTOCOL_ID—This field contains the unique ID of the protocol associated with the reported session.

✎
Note   The PROTOCOL_ID will be the Generic IP / Generic TCP / Generic UDP protocol ID value, according to the specific transport protocol of the transaction, unless a more specific protocol definition (such as a signature-based protocol or a port-based protocol), which matches the reported session, is assigned to a service.

- PROTOCOL_SIGNATURE—This field contains the ID of the protocol signature associated with this session.
- REPORT_TIME—Ending time stamp of this RDR. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970.
- SERVER_IP—Contains the destination IP address of the reported session. (The destination is defined as the server or the listener of the networking session.) The IP address is in a 32-bit binary format.
- SERVER_PORT—For TCP/UDP-based sessions, this field contains the destination port number of the networking session. For non-TCP/UDP sessions, this field contains the IP protocol number of the session flow.
- SERVICE_ID—This field indicates the service classification of the reported session. For example, in the Transaction RDR this field indicates which service was accessed, and in the Breaching RDR this field indicates which service was breached.
- TIME_FRAME—The system supports time-dependent policies, by using different rules for different time frames. This field indicates the time frame during which the RDR was generated. The field's value can be in the range 0 to 3, indicating which of the four time frames was used.
- ZONE_ID—This field contains the ID of the zone associated with this session.

✎
Note   All volumes in RDRs are reported in L3 bytes.

Transaction RDR

The TRANSACTION_RDR may be generated at the end of a session, according to a user-configurable sampling mechanism—configuring number-of-transaction-RDRs-per-second sets the number of Transaction RDRs generated per-second. This RDR is not generated for sessions that were blocked by a rule.

The RDR tag of the TRANSACTION_RDR is **0xf0f0f010 / 4042321936.**

The following table lists the RDR fields and their descriptions.

Table 2-1   Transaction RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	INT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
SKIPPED_SESSIONS	INT32	The number of unreported sessions since the previous RDR *plus one*. The default value is 1. A value of 2 means that *one* RDR was unreported.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
ACCESS_STRING	STRING	See Universal RDR Fields, page 2-2.
INFO_STRING	STRING	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.

Table 2-1   Transaction RDR Fields (continued)

RDR Field Name	Type	Description
TIME_FRAME	INT8	See Universal RDR Fields, page 2-2.
SESSION_UPSTREAM_ VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_ VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated downstream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber usage counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package usage counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See Universal RDR Fields, page 2-2.
ZONE_ID	INT32	See Universal RDR Fields, page 2-2.
FLAVOR_ID	INT32	See Universal RDR Fields, page 2-2.
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.

Transaction Usage RDR

The TRANSACTION_USAGE_RDR is generated at the end of a session, for all transactions on packages and services that are configured to generate such an RDR. This RDR is not generated for sessions that were blocked by a rule.

> **Note**   By default, packages and services are *disabled* from generating this RDR.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the TRANSACTION_USAGE_RDR is **0xf0f0f438 / 4042323000.**

The following table lists the RDR fields and their descriptions.

Table 2-2   Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
SKIPPED_SESSIONS	INT32	Reason for RDR generation: • 0 (INTERIM)—Interim Transaction Usage RDR • 1 (SESSION_END)—Normal Transaction Usage RDR for a flow that had no interim Transaction Usage RDRs • 2 (LAST_TUR)—The last Transaction Usage RDR for a flow that had interim Transaction Usage RDRs
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
ACCESS_STRING	STRING	See Universal RDR Fields, page 2-2.
INFO_STRING	STRING	See Universal RDR Fields, page 2-2.

Table 2-2   Transaction Usage RDR Fields (continued)

RDR Field Name	Type	Description
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See Universal RDR Fields, page 2-2.
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated stream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber usage counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package usage counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See Universal RDR Fields, page 2-2.
ZONE_ID	INT32	See Universal RDR Fields, page 2-2.
FLAVOR_ID	INT32	See Universal RDR Fields, page 2-2.
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.

HTTP Transaction Usage RDR

The HTTP_TRANSACTION_USAGE_RDR is generated at the end of an HTTP session, for all transactions on packages and services that are configured to generate a Transaction Usage RDR. This RDR is not generated for sessions that were blocked by a rule.

Note   By default, packages and services are *disabled* from generating this RDR.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the HTTP_TRANSACTION_USAGE_RDR is **0xf0f0f43C / 4042323004.**

The following table lists the RDR fields and their descriptions.

Table 2-3   HTTP Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR. Since an HTTP Transaction Usage RDR is generated only at the end of a flow, this field always has the value 1.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
ACCESS_STRING	STRING	See Universal RDR Fields, page 2-2.

TIME_FRAME	INT8	See Universal RDR Fields, page 2-2.
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated stream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber usage counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package usage counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See Universal RDR Fields, page 2-2.
ZONE_ID	INT32	See Universal RDR Fields, page 2-2.
FLAVOR_ID	INT32	See Universal RDR Fields, page 2-2.
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.
USER_AGENT	STRING	The user agent field extracted from the HTTP transaction.
HTTP_URL	STRING	The URL extracted from the HTTP transaction.

RTSP Transaction Usage RDR

The RTSP_TRANSACTION_USAGE_RDR is generated at the end of a session, for all RTSP transactions on packages and services that are configured to generate a Transaction Usage RDR. This RDR is not generated for sessions that were blocked by a rule.

Note   By default, packages and services are *disabled* from generating this RDR.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the RTSP_TRANSACTION_USAGE_RDR is **0xf0f0f440 / 4042323008.**

The following table lists the RDR fields and their descriptions.

Table 2-4   RTSP Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR. Since an RTSP Transaction Usage RDR is generated only at the end of a flow, this field always has the value 1.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
ACCESS_STRING	STRING	See Universal RDR Fields, page 2-2.
INFO_STRING	STRING	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.

Table 2-4   RTSP Transaction Usage RDR Fields (continued)

RDR Field Name	Type	Description
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See Universal RDR Fields, page 2-2.
SESSION_UPSTREAM_ VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_ VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated stream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber usage counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package usage counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See Universal RDR Fields, page 2-2.
ZONE_ID	INT32	See Universal RDR Fields, page 2-2.
FLAVOR_ID	INT32	See Universal RDR Fields, page 2-2.
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.
RTSP_SESSION_ID	STRING	RTSP session ID as seen on an RTSP SETUP request.
RTSP_URL	STRING	RTSP URL.
RESPONSE_DATE	STRING	RTSP DESCRIBE date.
TOTAL_ENCODING_RATE	UINT32	Sum of encoding rates of data flows.
NUMBER_OF_VIDEO_ STREAMS	UINT8	Number of video streams for this RTSP session.

Table 2-4   *RTSP Transaction Usage RDR Fields (continued)*

RDR Field Name	Type	Description
NUMBER_OF_AUDIO_ STREAMS	UINT8	Number of audio streams for this RTSP session.
SESSION_TITLE	STRING	Title for this RTSP stream.
SERVER_NAME	STRING	Name of the RTSP server.

VoIP Transaction Usage RDR

The VOIP_TRANSACTION_USAGE_RDR is generated at the end of a session, for all transactions on packages and services that are configured to generate such an RDR. This RDR is not generated for sessions that were blocked by a rule.

Note   By default, packages and services are *disabled* from generating this RDR.

The VoIP Transaction Usage RDR is enabled automatically when the Transaction Usage RDR is enabled; both RDRs will be generated when the session ends. Currently, the VoIP Transaction Usage RDR is generated for H323, Skinny, SIP, and MGCP sessions.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the VOIP_TRANSACTION_USAGE_RDR is **0xf0f0f46a / 4042323050.**

The following table lists the RDR fields and their descriptions.

Table 2-5   VoIP Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR. Since a VoIP Transaction Usage RDR is generated only at the end of a flow, this field always has the value 1.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
ACCESS_STRING	STRING	See Universal RDR Fields, page 2-2.
INFO_STRING	STRING	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.

Table 2-5   VoIP Transaction Usage RDR Fields (continued)

RDR Field Name	Type	Description
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See Universal RDR Fields, page 2-2.
SESSION_UPSTREAM_ VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_ VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated downstream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber usage counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package usage counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See Universal RDR Fields, page 2-2.
ZONE_ID	INT32	See Universal RDR Fields, page 2-2.
FLAVOR_ID	INT32	See Universal RDR Fields, page 2-2.
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.
APPLICATION_ID	UINT32	The ITU-U vendor ID of the application. A value of 0xFFFFFFFF indicates that this field was not found in the traffic.

Table 2-5   VoIP Transaction Usage RDR Fields (continued)

RDR Field Name	Type	Description
UPSTREAM_PACKET_LOSS	UINT16	The average fractional upstream packet loss for the session, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFF indicates that this field is undefined (no RTCP flows were opened).
DOWNSTREAM_PACKET_ LOSS	UINT16	The average fractional downstream packet loss for the session, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFF indicates that this field is undefined (no RTCP flows were opened).
UPSTREAM_AVERAGE_ JITTER	UINT32	The average upstream jitter for the session in units of 1/65 millisecond, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFFFFFF indicates that this field is undefined (no RTCP flows were opened).
DOWNSTREAM_AVERAGE_ JITTER	UINT32	The average downstream jitter for the session in units of 1/65 millisecond, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFFFFFF indicates that this field is undefined (no RTCP flows were opened).
CALL_DESTINATION	STRING	The Q931 Alias address of the session destination. A value of N/A indicates that this field was not found in the traffic.
CALL_SOURCE	STRING	The Q931 Alias address of the session source. A value of N/A indicates that this field was not found in the traffic.

Table 2-5   VoIP Transaction Usage RDR Fields (continued)

RDR Field Name	Type	Description
UPSTREAM_PAYLOAD_ TYPE	UINT8	The upstream RTP payload type for the session. A value of 0xFF indicates that this field was not available (no RTP flows were opened).
DOWNSTREAM_PAYLOAD_ TYPE	UINT8	The downstream RTP payload type for the session. A value of 0xFF indicates that this field is undefined (no RTP flows were opened).
CALL_TYPE	UINT8	The call type (taken from H225 packet). A value of 0xFF indicates that this field is undefined (no RTP flows were opened).
MEDIA_CHANNELS	UINT8	The number of data flows that were opened during the session.

Note   **Packet Loss**
This field is taken from the RTCP field "fraction lost". It is the average value of all RTCP packets seen during the flow life for the specified direction. The value is the numerator of a fraction whose denominator is 256. To get the packet loss value as percentage, divide this value by 2.56.

Average Jitter
This field is taken from the RTCP field "interval jitter". The reported value is the average value of all RTCP packets seen during the flow life for the specified direction. This value is multiplied by the NTP time-stamp delta (middle 32 bits) and divided by the RTCP time-stamp delta to convert it to normal time units. These two time stamps are also taken from the RTCP packet. The reported value is the average jitter in units of 1/65536 second. To convert to milliseconds divide by 65.536.

For more information about the RCP/RTCP standard, refer to RFC 1889.

Subscriber Usage RDR

The SUBSCRIBER_USAGE_RDR is generated periodically, at user-configured intervals, for each subscriber. A separate RDR is generated for each service usage counter. The RDR is generated only if the subscriber consumed resources associated with the service usage counter during the current reporting period.

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic SUBSCRIBER_USAGE_RDR generation point. Whether or not a Subscriber Usage RDR *for a particular subscriber* is actually generated depends on the following:

- If the subscriber consumed resources associated with a service usage counter since the previous RDR generation point, a Subscriber Usage RDR is generated.

- If the subscriber did *not* consume resources associated with a service usage counter since the previous RDR generation point, *no* Subscriber Usage RDR is generated.

> **Note**   Unlike other Usage RDRs, the generation logic for Subscriber Usage RDRs does NOT use the zeroing methodology (as described in Periodic RDR Zero Adjustment Mechanism, page 2-52).

Subscriber Usage RDRs may also be generated in the following situation:

- The subscriber performed a logout in a subscriber-integrated installation or was un-introduced from the SCE platform:

  - If the subscriber consumed resources associated with a service usage counter since the previous Subscriber Usage RDR, a Subscriber Usage RDR is generated.

  - If the subscriber did not consume resources since the previous RDR, no RDR is generated for that service usage counter.

The RDR tag of the SUBSCRIBER_USAGE_RDR is **0xf0f0f000 / 4042321920.**

The following table lists the RDR fields and their descriptions.

Table 2-6   Subscriber Usage RDR

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	INT16	See Universal RDR Fields, page 2-2.
SERVICE_USAGE_ COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 counters in the subscriber scope.
BREACH_STATE	UINT8	See Universal RDR Fields, page 2-2. Holds the breach state of a service. However, this RDR reports usage counters, which cannot be breached, so the value is always zero.

Table 2-6   Subscriber Usage RDR (continued)

RDR Field Name	Type	Description
REASON	UINT8	Reason for RDR generation: • 0—Period time passed • 1—Subscriber logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
CONFIGURED_DURATION	INT32	See Universal RDR Fields, page 2-2.
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See Universal RDR Fields, page 2-2.
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on both links of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on both links of all sessions, in kilobytes, for the current reporting period.
SESSIONS	UINT16	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	UINT16	Aggregated number of session seconds for the reported service, for the current reporting period.

Real-Time Subscriber Usage RDR

The REALTIME_SUBSCRIBER_USAGE_RDR is generated periodically, at user-configured intervals, for each subscriber that has real-time monitoring enabled. A separate RDR is generated for each service usage counter. The RDR is generated only if the subscriber consumed resources associated with the service usage counter during the current reporting period.

Note   A Real-Time Subscriber Usage RDR will be generated only for those subscribers with real-time monitoring enabled. For information about enabling real-time monitoring, see the "Additional Management Tools and Interfaces" chapter of the *Cisco Service Control Application for Broadband User Guide.*

At fixed, user-configurable intervals (for example, every 5 minutes), there is a periodic REALTIME_SUBSCRIBER_USAGE_RDR generation point. The REALTIME_SUBSCRIBER_USAGE_RDR reports the same usage information as the SUBSCRIBER_USAGE_RDR, but is generated more frequently to provide a more detailed picture of subscriber activity. It is used by the Cisco Service Control Application Reporter to generate reports on the activities of single subscribers over time.

Whether or not a Real-Time Subscriber Usage RDR *for a particular subscriber* is actually generated depends on the following:

- If the subscriber consumed resources associated with a service usage counter since the previous RDR generation point, a Real-Time Subscriber Usage RDR is generated.

- If the subscriber did *not* consume resources associated with a service usage counter since the previous RDR generation point, *no* Real-Time Subscriber Usage RDR is generated now.

  However, the generation logic for Subscriber Usage RDRs uses the zeroing methodology (as described in Periodic RDR Zero Adjustment Mechanism, page 2-52; if the subscriber consumes resources associated with the service usage counter at some later time, this will cause the *immediate* generation of either one or two zero-consumption Real-Time Subscriber Usage RDRs. (In addition to the eventual generation of the Real-Time Subscriber Usage RDR associated with this latest consumption of resources).

  – If there was only one interval (for example, 0805–0810) for which there was no subscriber consumption of resources, only one zero-consumption Real-Time Subscriber Usage RDR is generated.

  – If there were multiple consecutive intervals (for example, 0805–0810, 0810–0815, 0815–0820, 0820–0825) for which there was no subscriber consumption of resources, two zero-consumption Real-Time Subscriber Usage RDRs are generated: one for the first such time interval (0805–0810) and one for the last (0820–0825).

Real-Time Subscriber Usage RDRs may also be generated in the following situation:

- The subscriber performed a logout in a subscriber-integrated installation or was un-introduced from the SCE platform:

  – If the subscriber consumed resources associated with a service usage counter since the previous Real-Time Subscriber Usage RDR, a Real-Time Subscriber Usage RDR is generated and then a zero-consumption Real-Time Subscriber Usage RDR is generated.

  – If the subscriber did not consume resources since the previous RDR, no RDR is generated for that service usage counter.

A zero-consumption Real-Time Subscriber Usage RDR will also be generated for a subscriber in the following situation:

- The subscriber performed a login in a subscriber-integrated installation or was introduced from the SCE platform:
  - Before the first Real-Time Subscriber Usage RDRs reporting actual consumption are generated, a zero-consumption Real-Time Subscriber Usage RDR is generated.

The RDR tag of the REALTIME_SUBSCRIBER_USAGE_RDR is **0xf0f0f002 / 4042321922.**

The following table lists the RDR fields and their descriptions.

Table 2-7   Real-Time Subscriber Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	INT16	See Universal RDR Fields, page 2-2.
SERVICE_USAGE_ COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 counters in the subscriber scope.
AGGREGATION_OBJECT_ID	INT16	Externally assigned: • 0—Offline subscriber • 1—Online subscriber
BREACH_STATE	UINT8	See Universal RDR Fields, page 2-2. Holds the breach state of a service. However, this RDR reports usage counters, which cannot be breached, so the value is always zero.
REASON	UINT8	Reason for RDR generation: • 0—Period time passed • 1—Subscriber logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
CONFIGURED_DURATION	INT32	See Universal RDR Fields, page 2-2.

Table 2-7   *Real-Time Subscriber Usage RDR Fields (continued)*

RDR Field Name	Type	Description
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See Universal RDR Fields, page 2-2.
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on both links of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on both links of all sessions, in kilobytes, for the current reporting period.
SESSIONS	UINT16	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	UINT16	Aggregated number of session seconds for the reported service, for the current reporting period.

Link Usage RDR

The LINK_USAGE_RDR is generated periodically, at user-configured intervals, for each link. A separate RDR is generated for each service usage counter. The RDR is generated only if resources associated with the service usage counter were consumed during the current reporting period.

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic LINK_USAGE_RDR generation point. Whether or not a Link Usage RDR is actually generated depends on the following:

- If network resources associated with a service usage counter were consumed since the previous RDR generation point, a Link Usage RDR is generated.

- If network resources associated with a service usage counter were *not* consumed since the previous RDR generation point, *no* Link Usage RDR is generated.

  However, the generation logic for Link Usage RDRs uses the zeroing methodology (as described in Periodic RDR Zero Adjustment Mechanism, page 2-52); if network resources associated with the service are again consumed at some later time, this will cause the immediate generation of either one or two zero-consumption Link Usage RDRs. (In addition to the eventual generation of the Link Usage RDR associated with this latest consumption of network resources).

  - If there was only one interval (for example, 0830–0900) for which there was no consumption of network resources, only one zero-consumption Link Usage RDR is generated.

  - If there were multiple consecutive intervals (for example, 0830–0900, 0900–0930, 0930–1000, 1000–1030) for which there was no consumption of network resources, two zero-consumption Link Usage RDR are generated: one for the first such time interval (0830–0900) and one for the last (1000–1030).

> **Note**   A separate RDR is generated for each link (on a single traffic processor) in the SCE platform, where each RDR represents the total traffic processed and analyzed by that processor (for the specified service usage counter). To compute the total traffic in any given time frame, take the sum of traffic of the RDRs of all the processors.

The RDR tag of the LINK_USAGE_RDR is **0xf0f0f005 / 4042321925.**

The following table lists the RDR fields and their descriptions.

Table 2-8   Link Usage RDR Fields

RDR Field Name	Type	Description
LINK_ID	INT8	A numeric value associated with the reported network link. Possible values are 0 and 1 (referring to physical links 1 and 2 respectively). For future use.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR. Possible values are 0 to 3.
SERVICE_USAGE_ COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.

Table 2-8   Link Usage RDR Fields (continued)

RDR Field Name	Type	Description
CONFIGURED_DURATION	INT32	See Universal RDR Fields, page 2-2.
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See Universal RDR Fields, page 2-2.
UPSTREAM_VOLUME	INT32	Aggregated upstream volume of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume of all sessions, in kilobytes, for the current reporting period.
SESSIONS	INT32	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	INT32	Aggregated number of session seconds for the reported service, for the current reporting period.
CONCURRENT_SESSIONS	INT32	Concurrent number of sessions using the reported service at this point in time.
ACTIVE_SUBSCRIBERS	INT32	Concurrent number of subscribers using the reported service at this point in time.
TOTAL_ACTIVE_ SUBSCRIBERS	INT32	Concurrent number of subscribers in the system at this point in time.

Package Usage RDR

The PACKAGE_USAGE_RDR is generated periodically, at user-configured intervals, for each package usage counter. A separate RDR is generated for each service usage counter. The RDR is generated only if resources associated with the service usage counter were consumed during the current reporting period. The RDR contains aggregated network usage information for all subscribers to the package or group of packages represented by the package usage counter.

At fixed, user-configurable intervals (for example, every 5 minutes), there is a periodic PACKAGE_USAGE_RDR generation point. Whether or not a Package Usage RDR is actually generated depends on the following:

- If network resources associated with a service usage counter were consumed by a subscriber of the Package since the previous RDR generation point, a Package Usage RDR is generated.

- If a subscriber of the Package has not consumed network resources associated with a service usage counter since the previous RDR generation point, no Package Usage RDR is generated.

   However, the generation logic for Package Usage RDRs uses the zeroing methodology (as described in Periodic RDR Zero Adjustment Mechanism, page 2-52; if network resources associated with the service usage counter are again consumed by any subscriber of the package at some later time, this will cause the immediate generation of either one or two zero-consumption Package Usage RDRs. (In addition to the eventual generation of the Package Usage RDR associated with this latest consumption of network resources).

   - If there was only one interval (for example, 0805–0810) for which there was no consumption of network resources by any subscriber of the package, only one zero-consumption Package Usage RDR is generated.

   - If there were multiple consecutive intervals (for example, 0805–0810, 0810–0815, 0815–0820, 0820–0825) for which there was no consumption of network resources by any subscriber of the package, two zero-consumption Package Usage RDR are generated: one for the first such time interval (0805–0810) and one for the last (0820–0825).

Note   Each traffic processor in the SCE platform generates a separate RDR, where each RDR represents the total traffic processed and analyzed by that processor (for the specified service usage counter). To compute the total traffic (for a package) in any given time frame, take the sum of the traffic of the RDRs of all the processors.

The RDR tag of the PACKAGE_USAGE_RDR is **0xf0f0f004 / 4042321924.**

The following table lists the RDR fields and their descriptions.

Table 2-9   Package Usage RDR Fields

RDR Field Name	Type	Description
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package usage counters.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.
SERVICE_USAGE_ COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global usage counters.

Table 2-9   Package Usage RDR Fields (continued)

RDR Field Name	Type	Description
CONFIGURED_DURATION	INT32	See Universal RDR Fields, page 2-2.
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See Universal RDR Fields, page 2-2.
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on both links (for a single processor) of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on both links (for a single processor) of all sessions, in kilobytes, for the current reporting period.
SESSIONS	INT32	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	INT32	Aggregated number of session seconds for the reported service, for the current reporting period.
CONCURRENT_SESSIONS	INT32	Concurrent number of sessions using the reported service in the reported package at this point in time.
ACTIVE_SUBSCRIBERS	INT32	Concurrent number of subscribers using the reported service in the reported package at this point in time.
TOTAL_ACTIVE_ SUBSCRIBERS	INT32	Concurrent number of subscribers in the system at this point in time.

Virtual Links Usage RDR

The VIRTUAL_LINKS_USAGE_RDR is generated periodically, at user-configured intervals, for each service usage counter. A separate RDR is generated for each virtual link. The RDR is generated only if resources associated with the virtual link were consumed during the current reporting period. The RDR contains aggregated network usage information for all subscribers to the same virtual link.

At fixed, user-configurable intervals (for example, every 5 minutes), there is a periodic VIRTUAL_LINKS_USAGE_RDR generation point. Whether or not a Virtual Links Usage RDR is actually generated depends on the following:

- If network resources associated with the service usage counter were consumed by any subscriber of the virtual link since the previous RDR generation point, a Virtual Links Usage RDR is generated.

- If no subscriber of the virtual link has consumed network resources associated with the service usage counter since the previous RDR generation point, no Virtual Links Usage RDR is generated.

  However, the generation logic for Virtual Links Usage RDRs uses the zeroing methodology (as described in Periodic RDR Zero Adjustment Mechanism, page 2-52); if network resources associated with the service usage counter are again consumed by subscribers of the virtual link at some later time, this will cause the immediate generation of either one or two zero-consumption Virtual Links Usage RDRs. (In addition to the eventual generation of the Virtual Links Usage RDR associated with this latest consumption of network resources by subscribers of the virtual link.)

  - If there was only one interval (for example, 0805–0810) for which there was no consumption of network resources by any subscriber of the virtual link, only one zero-consumption Virtual Links Usage RDR is generated.

  - If there were multiple consecutive intervals (for example, 0805–0810, 0810–0815, 0815–0820, 0820–0825) for which there was no consumption of network resources by any subscriber of the virtual link, two zero-consumption Virtual Links Usage RDR are generated: one for the first such time interval (0805–0810) and one for the last (0820–0825).

Note Each traffic processor in the SCE platform generates a separate RDR, where each RDR represents the total traffic processed and analyzed by that processor (for the specified service usage counter and the specified virtual link). To compute the total traffic (for a virtual link) in any given time frame, take the sum of the traffic of the RDRs of all the processors.

The RDR tag of the VIRTUAL_LINKS_USAGE_RDR is **0xf0f0f006 / 4042321926.**

The following table lists the RDR fields and their descriptions.

Table 2-10   Virtual Links Usage RDR Fields

RDR Field Name	Type	Description
VLINK_ID	INT16	The virtual link ID
VLINK_DIRECTION	INT8	The virtual link direction: • 0—Upstream • 1—Downstream
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Table 2-10   Virtual Links Usage RDR Fields (continued)

RDR Field Name	Type	Description
SERVICE_USAGE_ COUNTER_ID	UINT16	Each service is mapped to a counter. There are 1024 global usage counters.
CONFIGURED_DURATION	INT32	See Universal RDR Fields, page 2-2.
DURATION	INT32	Not implemented (always the same as CONFIGURED_DURATION).
END_TIME	INT32	See Universal RDR Fields, page 2-2.
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on the virtual link (for a single processor) of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on the virtual link (for a single processor) of all sessions, in kilobytes, for the current reporting period.
SESSIONS	INT32	Reserved for future use.
SECONDS	INT32	Reserved for future use.
CONCURRENT_SESSIONS	INT32	Reserved for future use.
ACTIVE_SUBSCRIBERS	INT32	Reserved for future use.
TOTAL_ACTIVE_ SUBSCRIBERS	INT32	Concurrent number of subscribers in the system at this point in time.

Blocking RDR

The SERVICE_BLOCK_RDR is generated each time a transaction is blocked, and the profile and the rate/quota limitations indicate that this RDR should be generated.

- A Blocking RDR is generated when a session is blocked. A session may be blocked for various reasons; for example, access is blocked or concurrent session limit is reached.
- Generation of Blocking RDRs is subject to two limitations:
  - Quota—The maximum number of Blocking RDRs that SCA BB can generate for a subscriber in a specific aggregation period (day, week, month, and so forth). The quota is package-dependent; its value is set according to the package assigned to the subscriber.
  - Rate—The global, maximum number of Blocking RDRs that an SCE platform can generate per second. The rate is a global value that sets an upper limit for the total number of RDRs that are generated for all subscribers.

The RDR tag of the SERVICE_BLOCK_RDR is **0xf0f0f040 / 4042321984.**

The following table lists the RDR fields and their descriptions.

Table 2-11   Blocking RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
ACCESS_STRING	STRING	See Universal RDR Fields, page 2-2.
INFO_STRING	STRING	See Universal RDR Fields, page 2-2.

Table 2-11   Blocking RDR Fields (continued)

RDR Field Name	Type	Description
BLOCK_REASON	UINT8	Indicates the reason why this session was blocked. For possible values and their interpretation, see Block Reason (uint8), page 2-46.
BLOCK_RDR_COUNT	INT32	Total number of blocked flows reported so far (from the beginning of the current time frame).
REDIRECTED	INT8	Indicates whether the flow has been redirected after being blocked. • 0—Not redirected • 1—Redirected Redirection is performed only for HTTP and RTSP flows that were mapped to a rule ordering them to be blocked and redirected.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.

Quota Breach RDR

The QUOTA_BREACH_RDR is generated each time a bucket is breached for the first time in a session.

This RDR does not have a rate limit; it is generated whenever a quota breach occurs, provided that the RDR is enabled.

This RDR is generated subject to the following conditions:

- One of the Subscriber's buckets was depleted.
- Quota Breach RDRs are enabled.
- This is the first time this subscriber has breached this bucket.

The RDR tag of the QUOTA_BREACH_RDR is **0xf0f0f022 / 4042321954.**

The following table lists the RDR fields and their descriptions.

Table 2-12   Quota Breach RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
BUCKET_ID	UINT8	1 to 16, according to the number of the breached bucket.
END_TIME	INT32	See Universal RDR Fields, page 2-2.
BUCKET_QUOTA	INT32	The remaining quota in the indicated bucket: • Volume bucket—Kilobytes • Number of sessions bucket—Integer
AGGREGATION_PERIOD_ TYPE	UINT8	Defines how often the bucket is refilled. Gor possible values and their interpretations, see Periodic RDR Zero Adjustment Mechanism, page 2-52.

Remaining Quota RDR

The REMAINING_QUOTA_RDR is generated periodically, at user-configured intervals, if the RDR is enabled.

Note   A Remaining Quota RDR will be generated only for those subscribers *whose policy requires the generation of such an RDR.*

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic REMAINING_QUOTA_RDR generation point. If REMAINING_QUOTA_RDRs are enabled, they will be generated at the specified times.

You can set total limit enforcement on the number of these RDRs that are generated per second.

This RDR is also generated after a subscriber performs a logout in a subscriber-integrated installation or is un-introduced from the SCE platform, or when the subscriber's package-ID is changed.

The RDR tag of the REMAINING_QUOTA_RDR is **0xf0f0f030 / 4042321968.**

The following table lists the RDR fields and descriptions.

Table 2-13   Remaining Quota RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
RDR_REASON	UINT8	• 0—Period time passed • 1—Logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
END_TIME	INT32	See Universal RDR Fields, page 2-2.
REMAINING_QUOTA_1 through REMAINING_QUOTA_16	INT32	The remaining quota in the bucket that was breached, in kilobytes. There are sixteen Remaining Quota fields, one for each bucket.
TOTAL_VOLUME_USAGE	UINT32	Total Volume Usage for all services that are not quota provisioned, in kilobytes, for the current reporting period.

Quota Threshold Breach RDR

The QUOTA_THRESHOLD_BREACH_RDR is generated each time a bucket exceeds the global threshold.

This RDR does not have a rate limit; it is generated whenever a threshold is exceeded, provided that the RDR is enabled.

The RDR tag of the QUOTA_THRESHOLD_BREACH_RDR is **0xf0f0f031 / 4042321969.**

The following table lists the RDR fields and their descriptions.

Table 2-14   Quota Threshold Breach RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
BUCKET_ID	UINT8	1 to 16, according to the number of the breached bucket.
GLOBAL_THRESHOLD	UINT32	The globally configured threshold in kilobytes.
END_TIME	INT32	See Universal RDR Fields, page 2-2.
BUCKET_QUOTA	INT32	The remaining quota in the indicated bucket in kilobytes.

Quota State Restore RDRs

The QUOTA_STATE_RESTORE_RDR is generated each time a subscriber is introduced.

The RDR tag of the QUOTA_STATE_RESTORE_RDR is **0xF0F0F032 / 4042321970.**

The following table lists the RDR fields and their descriptions.

Table 2-15   Quota State Restore RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
RDR_REASON	UINT8	The reason that the RDR was sent: • 0—Subscriber introduced (currently, the only available value)
END_TIME	INT32	See Universal RDR Fields, page 2-2.

DHCP RDR

The DHCP_RDR is generated each time a DHCP message of a specified type is intercepted.

Note   DHCP RDRs are generated only if activated by a subscriber integration system, such as the SCMS Subscriber Manager (SM) DHCP LEG.

For each message read, the Cisco Service Control Application for Broadband (SCA BB) extracts several option fields. You can configure which fields to extract. An RDR will be generated even if none of the fields were found.

The RDR tag of the DHCP_RDR is **0xf0f0f042 / 4042321986.**

The following table lists the RDR fields and descriptions.

Table 2-16   DHCP RDR Fields

RDR Field Name	Type	Description
CPE_MAC	STRING	A DHCP protocol field.
CMTS_IP	UINT32	A DHCP protocol field.
ASSIGNED_IP	UINT32	A DHCP protocol field.
RELEASED_IP	UINT32	A DHCP protocol field.
TRANSACTION_ID	UINT32	A DHCP protocol field.
MESSAGE_TYPE	UINT8	DHCP message type.
OPTION_TYPE_0 through OPTION_TYPE_7	UINT8	A list of DHCP options extracted from the message.
OPTION_TYPE_0 through OPTION_TYPE_7	STRING	The values associated with the above DHCP options.
END_TIME	INT32	See Universal RDR Fields, page 2-2.

RADIUS RDR

The RADIUS_RDR is generated each time a RADIUS message of a specified type is intercepted.

Note   RADIUS RDRs are generated only if activated by a subscriber integration system, such as the SCMS-SM RADIUS LEG.

For each message read, SCA BB extracts several option fields. You can configure which fields to extract. An RDR will be generated even if none of the fields were found.

The RDR tag of the RADIUS_RDR is **0xf0f0f043 / 4042321987.**

The following table lists the RDR fields and descriptions.

Table 2-17   RADIUS RDR Fields

RDR Field Name	Type	Description
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
RADIUS_PACKET_CODE	UINT8	The type of the RADIUS message intercepted.
RADIUS_ID	UINT8	The RADIUS transaction ID.
ATTRIBUTE_VALUE_1 through ATTRIBUTE_VALUE_20	STRING	Attributes extracted from the message. Sent as string format TLV. The last attribute field filled takes the value 0.

Flow Start RDR

The FLOW_START_RDR is generated when a flow starts, for any flow on packages and services that are configured to generate such an RDR.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the FLOW_START_RDR is **0xf0f0f016 / 4042321942.**

The following table lists the RDR fields and their descriptions.

Table 2-18   ***Flow Start RDR Fields***

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
IP_PROTOCOL	UINT8	IP protocol type.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
START_TIME	UINT32	Flow start time.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
BREACH_STATE	INT8	See Universal RDR Fields, page 2-2.
FLOW ID	UINT32	Internal flow ID.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Flow End RDR

The FLOW_END_RDR is generated when a flow stops, for any flow that generated a FLOW_START_RDR.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the FLOW_END_RDR is **0xf0f0f018 / 4042321944.**

The following table lists the RDR fields and their descriptions.

Table 2-19   Flow End RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
IP_PROTOCOL	UINT8	IP protocol type.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
START_TIME	UINT32	Flow start time.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
BREACH_STATE	INT8	See Universal RDR Fields, page 2-2.
FLOW ID	UINT32	Internal flow ID.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Ongoing Flow RDR

The FLOW_ONGOING_RDR is generated at set time intervals during the life of a flow, for any flow that generated a FLOW_START_RDR, if the system is configured to issue such RDR.

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the FLOW_ONGOING_RDR is **0xf0f0f017 / 4042321943.**

The following table lists the RDR fields and their descriptions.

Table 2-20   Ongoing Flow RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
PACKAGE_ID	UINT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
IP_PROTOCOL	UINT8	IP protocol type.
SERVER_IP	UINT32	See Universal RDR Fields, page 2-2.
SERVER_PORT	UINT16	See Universal RDR Fields, page 2-2.
CLIENT_IP	UINT32	See Universal RDR Fields, page 2-2.
CLIENT_PORT	UINT16	See Universal RDR Fields, page 2-2.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2.
START_TIME	UINT32	Flow start time.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.
BREACH_STATE	INT8	See Universal RDR Fields, page 2-2.
FLOW ID	UINT32	Internal flow ID.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Media Flow RDR

The MEDIA_FLOW_RDR is generated at the end of every SIP or Skype media flow:

- For SIP, this RDR is generated when a media channel is closed.

- For Skype, this RDR is generated when an end-of-call is detected.

Note   SIP includes all SIP based applications (such as Vonage and Yahoo Messenger VoIP).

The RDR tag of the MEDIA_FLOW_RDR is **0xF0F0F46C / 4042323052.**

The following table lists the RDR fields and their descriptions.

Table 2-21   Media Flow RDR Fields

Field name	Type	Description
SUBSCRIBER_ID	String	See Universal RDR Fields, page 2-2.
PACKAGE_ID	INT16	See Universal RDR Fields, page 2-2.
SERVICE_ID	INT32	See Universal RDR Fields, page 2-2.
PROTOCOL_ID	INT16	See Universal RDR Fields, page 2-2.
DESTINATION_IP	UINT32	SIP: Destination IP address of RTP flow. Skype: Destination IP address of Skype flow.
DESTINATION_PORT	UINT16	SIP: Destination port of RTP flow. Skype: Destination port of Skype flow.
SOURCE_IP	UINT32	SIP: Source IP address of RTP flow. Skype: Source IP address of Skype flow.
SOURCE_PORT	UINT16	SIP: Source port of RTP flow. Skype: Source port of Skype flow.
INITIATING_SIDE	INT8	See Universal RDR Fields, page 2-2. For Skype, this is the initiating side of the flow (not necessarily the initiating side of the voice call).

Table 2-21   Media Flow RDR Fields (continued)

Field name	Type	Description
ZONE_ID	Int32	See Universal RDR Fields, page 2-2.
FLAVOR_ID	Int32	See Universal RDR Fields, page 2-2.
SIP_DOMAIN	String	SIP: Domain name extracted from SIP header.
SIP_USER_AGENT	String	SIP: User-Agent field extracted from SIP header.
START_TIME	UINT32	Flow start time.
REPORT_TIME	UINT32	See Universal RDR Fields, page 2-2.
DURATION_SECONDS	INT32	SIP: The active duration of the RTP flow, not including aging time. Skype: The time between the start-of-call and end-of-call detection events.
UPSTREAM_VOLUME	UINT32	SIP: The upstream volume of the RTP flow. Skype: The upstream volume between the start-of-call and end-of-call detection events.
DOWNSTREAM_VOLUME	UINT32	SIP: The downstream volume of the RTP flow. Skype: The downstream volume between the start-of-call and end-of-call detection events.
IP_PROTOCOL	UINT8	IP protocol type: • 6—TCP • 17—UDP
FLOW_TYPE	INT8	• 0—All Skype flows • 1—Audio (SIP) • 2—Video (SIP)
SESSION_ID	UINT32	SIP: The flow-context ID of the control flow. Skype: The flow-context ID of the flow.

Table 2-21   Media Flow RDR Fields (continued)

Field name	Type	Description
UPSTREAM_JITTER	UINT32	SIP: The average upstream jitter for the session, taken from the RTCP flow: N/A (0xFFFFFFFF) if RTCP flow is missing. Skype: N/A (0xFFFFFFFF).
DOWNSTREAM_JITTER	UINT32	SIP: The average downstream jitter for the session, taken from the RTCP flow: N/A (0xFFFFFFFF) if RTCP flow is missing. Skype: N/A (0xFFFFFFFF).
UPSTREAM_PACKET_LOSS	UINT16	SIP: The average fractional upstream packet loss for the session, taken from the RTCP flow: N/A (0xFFFF) if RTCP flow is missing. Skype: N/A (0xFFFF).
DOWNSTREAM_PACKET_ LOSS	UINT16	SIP: The average fractional downstream packet loss for the session, taken from the RTCP flow: N/A (0xFFFF) if RTCP flow is missing. Skype: N/A (0xFFFF).
UPSTREAM_PAYLOAD_ TYPE	UINT8	SIP: The upstream RTP payload type for the session. Skype: N/A (0xFF).
DOWNSTREAM_PAYLOAD_ TYPE	UINT8	SIP: The downstream RTP payload type for the session. Skype: N/A (0xFF).

Note   **Packet Loss**
This field is taken from the RTCP field "fraction lost". It is the average value of all RTCP packets seen during the flow life for the specified direction. The value is the numerator of a fraction whose denominator is 256. To get the packet loss value as percentage, divide this value by 2.56.

Average Jitter
This field is taken from the RTCP field "interval jitter". The reported value is the average value of all RTCP packets seen during the flow life for the specified direction. This value is multiplied by the NTP time-stamp delta (middle 32 bits) and divided by the RTCP time-stamp delta to convert it to normal time units. These two time stamps are also taken from the RTCP packet. The reported value is the average jitter in units of 1/65536 second. To convert to milliseconds divide by 65.536.

For more information about the RCP/RTCP standard, refer to RFC 1889.

Attack Start RDR

The ATTACK_START_RDR is generated at the beginning of an attack for all attack types that are configured to generate such an RDR. (To enable and configure the generation of these RDRs, see "The Service Security Dashboard" in the "Using the Service Configuration Editor: Additional Options" chapter of the *Cisco Service Control Application for Broadband User Guide.*)

The RDR tag of the ATTACK_START_RDR is **0xf0f0f019 / 4042321945.**

The following table lists the RDR fields and their descriptions.

Table 2-22   Attack Start RDR Fields

RDR Field Name	Type	Description
ATTACK_ID	UINT32	Unique attack ID.
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
ATTACKING_IP	UINT32	The IP address related to the attack (for example: in a DDoS, this will be the IP address under attack; in a scan this will be the IP address of the source of the scan).
ATTACKED_IP	UINT32	The other IP address related to the attack, if one exists; otherwise, 0xFFFFFFFF.
ATTACKED_PORT	UINT16	Attacked port: 0xFFFF if not present.
ATTACKING_SIDE	INT8	On which side of the SCE ATTACKING_IP resides: • 0—Subscriber • 1—Network
IP_PROTOCOL	UINT8	IP protocol type.
ATTACK_TYPE	UINT32	To whom ATTACKING_IP belongs: • 0—Attacked • 1—Attacker
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.
ATTACK_TIME	UINT32	Time since attack started in seconds.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.

Attack End RDR

The ATTACK_END_RDR is generated at the end of an attack for any attack that caused the generation of an ATTACK_START_RDR.

The RDR tag of the ATTACK_END_RDR is **0xf0f0f01a / 4042321946.**

The following table lists the RDR fields and their descriptions.

Table 2-23   Attack End RDR Fields

RDR Field Name	Type	Description
ATTACK_ID	UINT32	Unique attack ID.
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
ATTACKING_IP	UINT32	The IP address related to the attack (for example: in a DDoS, this will be the IP address under attack; in a scan this will be the IP address of the source of the scan).
ATTACKED_IP	UINT32	The other IP address related to the attack, if one exists; otherwise, 0xFFFFFFFF.
ATTACKED_PORT	UINT16	Attacked port: 0xFFFF if not present.
ATTACKING_SIDE	INT8	On which side of the SCE ATTACKING_IP resides: • 0—Subscriber • 1—Network
IP_PROTOCOL	UINT8	IP protocol type.
ATTACK_TYPE	UINT32	To whom ATTACKING_IP belongs: • 0—Attacked • 1—Attacker
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.
ATTACK_TIME	UINT32	Time since attack started in seconds.
REPORT_TIME	INT32	See Universal RDR Fields, page 2-2.

Malicious Traffic Periodic RDR

The MALICIOUS_TRAFFIC_PERIODIC_RDR is generated when an attack is detected, periodically, at user-configured intervals, for the duration of the attack, and at the end of the attack. The MALICIOUS_TRAFFIC_PERIODIC_RDR reports the details of the attack or malicious traffic.

The RDR tag of the MALICIOUS_TRAFFIC_PERIODIC_RDR is **0xf0f0f050 / 4042322000.**

The following table lists the RDR fields and their descriptions.

Table 2-24   Malicious Traffic Periodic RDR Fields

RDR Field Name	Type	Description
ATTACK_ID	INT32	Unique attack ID.
SUBSCRIBER_ID	STRING	See Universal RDR Fields, page 2-2.
ATTACK_IP	UINT32	The IP address related to this attack.
OTHER_IP	UINT32	The other IP address related to this attack, if such exists (if this is a DOS attack), or -1 otherwise.
PORT_NUMBER	UINT16	The port number related to this attack, if such exists (if this is an IP scan, for example), or -1 otherwise.
ATTACK_TYPE	INT32	Who ATTACK_IP belongs to: • 0—Attacked • 1—Attacker
SIDE	INT8	The IP address side: • 0—Subscriber • 1—Network
IP_PROTOCOL	UINT8	IP protocol type: • 0—Other • 1—ICMP • 6—TCP • 17—UDP
CONFIGURED_DURATION	INT32	See Universal RDR Fields, page 2-2.
DURATION	INT32	Indicates the number of seconds that have passed since the previous MALICIOUS_TRAFFIC_RDR.
END_TIME	INT32	See Universal RDR Fields, page 2-2.

Table 2-24   Malicious Traffic Periodic RDR Fields (continued)

RDR Field Name	Type	Description
ATTACKS	INT8	The number of attacks in the current reporting period. Since this report is generated per attack, the value is 0 or 1.
MALICIOUS_SESSIONS	UINT32	Aggregated number of sessions for the reported attack, for the current reporting period.
		If the SCE platform blocks the attack, this field takes the value -1.

Note You can identify the type of attack (scan, DDOS, or DOS) from Malicious Traffic Periodic RDR data:

Scan—OTHER_IP=-1 and ATTACK_TYPE=1 (the RDR contains the source (attacker) IP address)

DDOS attack—OTHER_IP=-1 and ATTACK_TYPE=0 (the RDR contains the destination (attacked) IP address)

DOS attack—OTHER_IP contains an IP address (the RDR contains two IP addresses)

Information About RDR Enumeration Fields

The following sections list possible values for the RDR enumeration fields.

- Block Reason (uint8), page 2-46
- String Fields, page 2-47
- Aggregation Period (uint8), page 2-49
- Time Frames (uint16), page 2-49

Block Reason (uint8)

The BLOCK_REASON field is a bit field. The following table lists the meanings of the bits of this field.

Table 2-25   Block Reason Field Bit Values

Bits Number	Value and Description
7 (msb)	Always ON.
6	- 0—The action of the effective rule is block. - 1—The concurrent session limit of the effective rule was reached.
5	- 0—The effective rule was in pre-breach state. - 1—The effective rule was in post-breach state.
4 to 0 (lsb)	The number of the breached bucket (1 to 16).

String Fields

The following table lists the ACCESS_STRING and INFO_STRING field values.

Table 2-26   String Field Values

Name	TR ACCESS_STRING	TR INFO_STRING	Description
PROTOCOL_TCP_GENERIC	Null	Null	
PROTOCOL_UDP_GENERIC	Null	Null	
PROTOCOL_HTTP_BROWSING	Host name	URL	
PROTOCOL_FTP	Null	Null	
PROTOCOL_RTSP	Host name	Null	
PROTOCOL_MMS	Null	Null	
PROTOCOL_SMTP	Server IP	Sender	
PROTOCOL_POP3	Server name	Login name	
PROTOCOL_IP_GENERIC	Null	Null	Non–TCP/UDP transaction
PROTOCOL_GNUTELLA_NETWORKING	Null	Null	Peer to peer
PROTOCOL_GNUTELLA_FILE_TRANSFER	Null	Null	Peer to peer
PROTOCOL_FASTTRACK_NETWORKING	Null	Null	Peer to peer
PROTOCOL_NNTP	Null	Group name	
PROTOCOL_NAP_WINMX_TRANSFER	Null	Null	Peer to peer
PROTOCOL_WINNY	Null	Null	Peer to peer
PROTOCOL_EDONKEY	Null	Null	Peer to peer
PROTOCOL_DIRECT_CONNECT	Null	Null	Peer to peer
PROTOCOL_HOTLINE	Null	Null	Peer to peer
PROTOCOL_DYNAMIC_SIGNATURE	Null	Null	
PROTOCOL_MANOLITO	Null	Null	Peer to peer
PROTOCOL_SIP	SIP Method	SIP Domain	

Table 2-26   String Field Values   (continued)

Name	TR ACCESS_STRING	TR INFO_STRING	Description
PROTOCOL_ BITTORRENT	Null	Null	Peer to peer
PROTOCOL_SKYPE	Null	Null	Peer to peer
PROTOCOL_VONAGE	SIP Method	SIP Subscriber ID	
PROTOCOL_SHARE	Null	Null	Peer to peer
PROTOCOL_H323	Null	Is FastStart	
PROTOCOL_ SOULSEEK	Null	Null	Peer to peer
PROTOCOL_ITUNES	Null	Null	Peer to peer
PROTOCOL_ FILETOPIA	Null	Null	Peer to peer
PROTOCOL_ NAPSTER	Null	Null	Peer to peer
PROTOCOL_DHCP	Null	Null	
PROTOCOL_MUTE	Null	Null	Peer to peer
PROTOCOL_ NODEZILLA	Null	Null	Peer to peer
PROTOCOL_WASTE	Null	Null	Peer to peer
PROTOCOL_NEONET	Null	Null	Peer to peer
PROTOCOL_MGCP	Null	Null	
PROTOCOL_WAREZ	Null	Null	Peer to peer

Aggregation Period (uint8)

The following table lists the AGG_PERIOD field values.

Table 2-27   AGG_PERIOD Field Values

Name	Value	Description
AGGREGATE_HOURLY	0	Hourly aggregate—Every hour, on the hour.
AGGREGATE_DAILY	1	Daily aggregate—Every day at midnight.
AGGREGATE_WEEKLY	2	Deprecated in 3.0.
AGGREGATE_MONTHLY	3	Deprecated in 3.0.
EXTERNAL_QUOTA_ PROVISION	4	The quota is externally provisioned and managed by a third-party source.

Time Frames (uint16)

The following table lists the TIME_FRAME field values.

Table 2-28   Time Frame Field Values

Name	Value	Description
TIME_FRAME_0 through TIME_FRAME_3	0–3	ID of active time frame. A number from 0 to 3 that indicates the time frame internal index.

RDR Tag Assignment Summary

The following table summarizes RDR tag assignments.

Table 2-29   RDR Tag Assignments

RDR Name	Default Category (explained in the following table)	Tag Value (decimal)	Tag Value (hexa)
SUBSCRIBER USAGE RDR (NUR)	CM-DB (1)	4,042,321,920	F0 F0 F0 00
REALTIME SUBSCRIBER USAGE RDR (SUR)	CM-DB (1)	4,042,321,922	F0 F0 F0 02
PACKAGE USAGE RDR	CM-DB (1)	4,042,321,924	F0 F0 F0 04
LINK USAGE RDR	CM-DB (1)	4,042,321,925	F0 F0 F0 05
VIRTUAL LINK RDR	CM-DB (1)	4,042,321,926	F0 F0 F0 06
TRANSACTION RDR	CM-DB (1)	4,042,321,936	F0 F0 F0 10
TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,000	F0 F0 F4 38
HTTP TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,004	F0 F0 F4 3C
RTSP TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,008	F0 F0 F4 40
VOIP TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,050	F0 F0 F4 6A
BLOCKING RDR	CM-CSV (1)	4,042,321,984	F0 F0 F0 40
QUOTA BREACH RDR	QP (4)	4,042,321,954	F0 F0 F0 22
REMAINING QUOTA RDR	QP (4)	4,042,321,968	F0 F0 F0 30
QUOTA THRESHOLD RDR	QP (4)	4,042,321,969	F0 F0 F0 31
QUOTA STATE RESTORE RDR	QP (4)	4,042,321,970	F0 F0 F0 32
RADIUS RDR	SM (3)	4,042,321,987	F0 F0 F0 43
DHCP RDR	SM (3)	4,042,321,986	F0 F0 F0 42
FLOW START RDR	RT (2)	4,042,321,942	F0 F0 F0 16
FLOW END RDR	RT (2)	4,042,321,944	F0 F0 F0 18
MEDIA FLOW RDR	CM-DB (1)	4,042,323,052	F0 F0 F4 6C
FLOW ONGOING RDR	RT (2)	4,042,321,943	F0 F0 F0 17
ATTACK_START RDR	RT (2)	4,042,321,945	F0 F0 F0 19

Table 2-29   RDR Tag Assignments (continued)

RDR Name	Default Category (explained in the following table)	Tag Value (decimal)	Tag Value (hexa)
ATTACK_END RDR	RT (2)	4,042,321,946	F0 F0 F0 1A
MALICIOUS TRAFFIC RDR	DC-DB (1)	4,042,322,000	F0 F0 F0 50

RDR categories are the mechanism by which different types of RDRs can be sent to different collectors. You can configure the RDR categories using the SCE CLI. For more information, see the "Raw Data Formatting: The RDR Formatter and NetFlow Exporting" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

Table 2-30   RDR Tag Default Categories

Default Category	Intended Destination and Use
CM-DB (1)	The CM database. Used by the SCA Reporter to generate reports.
CM-CSV (1)	The CM. Stored as CSV files.
RT (2)	Other network devices. Typically used for functionality that requires a real-time response, such as QoS, provisioning, and deletion.
SM (3)	SM's DHCP and RADIUS legs.
QP (4)	External quota provisioning systems. Used as notifications of the SCE Subscribers API.

Periodic RDR Zero Adjustment Mechanism

The Periodic RDRs (or Network Usage RDRs) include the Link Usage, Package Usage, and Real-Time Subscriber Usage RDRs. When there is traffic for a particular service or package, the appropriate Usage RDRs are generated periodically, according to user-configured intervals. The RDR includes a time stamp of the end of the interval during which the traffic was recorded.

When there is *no* traffic (and therefore no consumed resources) for a particular service or package during a given period of time, the SCA BB application uses the Periodic RDR Zero Adjustment Mechanism, also called the zeroing methodology, to reduce the number of Usage RDRs generated for that service or package. This technique also simplifies collection for external systems by reducing the number of RDRs that they need to handle.

Note   Unlike other Usage RDRs, the generation logic for Subscriber Usage RDRs does *not* use the zeroing methodology.

The zeroing methodology algorithm works as follows: for any number of consecutive time intervals having no traffic for a particular service or package, zero-consumption RDRs are generated for the first and last zero-consumption time intervals, but not for the intermediate time intervals. These two zero-consumption RDRs are generated when the next traffic arrives.

Example 1

The Real-Time Subscriber Usage RDR (for a given subscriber) has a generation period of 30 minutes. There is subscriber traffic during the interval 1200–1230, no subscriber traffic during the following five intervals (1230–1300, 1300–1330, 1330–1400, 1400–1430, 1430–1500), and the next subscriber traffic occurs at 1522. The following Real-Time Subscriber Usage RDRs are generated:

- At 1230, one RDR with the values of the consumed resources for the interval 1200–1230, and with the time stamp 1230.

- At 1522, one zero-consumption RDR having the time stamp (1300) of the end of the first interval (1230–1300) with no traffic for that subscriber.

- At 1522, one zero-consumption RDR having the time stamp (1500) of the end of the last interval (1430–1500) with no traffic for that subscriber.

  No RDR is generated for the three intermediate zero-consumption intervals (1300–1330, 1330–1400, and 1400–1430).

- At 1530, one RDR with the values of the consumed resources for the interval 1500–1530, and with the time stamp 1530.

Example 2

The Real-Time Subscriber Usage RDR (for a given subscriber) has a generation period of 30 minutes. There is subscriber traffic during the interval 1200–1230, no subscriber traffic during the following interval 1230–1300, and the next subscriber traffic occurs at 1322. The following Real-Time Subscriber Usage RDRs are generated:

- At 1230, one RDR with the values of the consumed resources for the interval 1200–1230, and with the time stamp 1230.

- At 1322, one zero-consumption RDR having the time stamp (1300) of the single interval (1230–1300) with no traffic for that subscriber.

- At 1330, one RDR with the values of the consumed resources for the interval 1300–1330, and with the time stamp 1330.

C H A P T E R **3**

NetFlow Records: Formats and Field Contents

This chapter describes the fields that may be contained in a NetFlow record.

NetFlow records can be generated for the data contained in the following RDRs:

NetFlow

- The Cisco Service Control Application for Broadband (SCA BB) supports NetFlow v5 and v9.
- For more information about NetFlow, refer to:
  - RFC 3954

NetFlow Field Types

The following table lists the possible fields in a NetFlow record and their descriptions.

Table 3-1   NetFlow Fields

Field Type	Value	Length (Bytes)	Description
scTag	32769	4	
scTrafficProcessorId	32770	1	
scSourceIpSample	32771	1	
scDestinationIpSample	32772	1	
scFlowContextId	32773	4	
scSubscriberId	32774	64	The subscriber identification string, introduced through the subscriber management interfaces. For an unknown subscriber this field may contain an empty string. The string is padded with zeros.
scPackageId	32775	4	The ID of the service configuration package/profile assigned to the subscriber.
scServiceId	32776	4	The service classification of the reported session.
scProtocolId	32777	2	The unique ID of the protocol associated with the reported session. The PROTOCOL_ID will be the Generic IP / Generic TCP / Generic UDP protocol ID value, according to the specific transport protocol of the transaction, unless a more specific protocol definition (such as a signature-based or a port-based protocol) that matches the reported session is assigned to a service.

Table 3-1   NetFlow Fields (continued)

Field Type	Value	Length (Bytes)	Description
scSkipppedSessions	32778	4	The number of unreported sessions since the previous reporting record of this kind.
scInitiatingSide	32779	1	The initiating side of the transaction: • 0—Subscriber side • 1—Network side
scReportTime	32780	4	Ending time stamp of this reporting record. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970.
scTransactionDuration Millisec	32781	4	Duration, in milliseconds, of the transaction reported in this reporting record.
scTimeFrame	32782	1	Which of the four possible time frames was used for the period during which the reporting record was generated. The field takes a value in the range 0 to 3.
scSessionUpstream Volume	32783	4	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
scSessionDownstream Volume	32784	4	Downstream volume of the transaction, in bytes. The volume refers to the aggregated downstream volume on both links of all the flows bundled in the transaction.
scProtocolSignature	32785	4	The ID of the protocol signature associated with this session

Cisco Service Control Application for Broadband Reference Guide

Table 3-1 **NetFlow Fields (continued)**

Field Type	Value	Length (Bytes)	Description
scZoneId	32786	4	The ID of the zone associated with this session
scFlavorId	32787	4	For protocol signatures that have flavors, this field contains the ID of the flavor associated with this session.
scFlowCloseMode	32788	1	The reason for the end of the flow.
scAccessString	32789	128, 256, 512, 1024	A Layer 7 property, extracted from the transaction.
scInfoString	32790	128, 256, 512, 1024	A Layer 7 property, extracted from the transaction.
scClientPort	32791	2	
scServerPort	32792	2	
scSubscriberCounterId	32793	2	
scServiceUsageCounter Id	32794	2	
scBreachState	32795	1	Indicates whether the subscriber's quota was breached: • 0—The quota was not breached • 1—The quota was breached
scReason	32796	1	The reason that the reporting record was generated: • 0—Periodic record • 1—Subscriber logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
scConfiguredDuration	32797	4	Configured period, in seconds, between successive reporting records.

Table 3-1   NetFlow Fields (continued)

Field Type	Value	Length (Bytes)	Description
scDuration	32798	4	The number of seconds that have passed since the previous reporting record of this type.
scEndTime	32799	4	Ending time stamp of this reporting record. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970
scUpstreamVolume	32800	4	Aggregated upstream volume on both links of all sessions, in kilobytes, for the current reporting period.
scDownstreamVolume	32801	4	Aggregated downstream volume on both links of all sessions, in kilobytes, for the current reporting period.
scSessions	32802	4	Aggregated number of sessions for the reported service, for the current reporting period.
scSeconds	32803	4	Aggregated number of session seconds for the reported service, for the current reporting period.
scPackageCounterId	32804	2	Each package is mapped to a counter. There are 64 package usage counters.
scGeneratorId	32805	1	A numeric value identifying the processor generating the reporting record.
scServiceGlobal CounterId	32806	2	Each service is mapped to a counter. There 64 global usage counters

Table 3-1   NetFlow Fields (continued)

Field Type	Value	Length (Bytes)	Description
scConcurrentSessions	32807	4	Concurrent number of sessions using the reported service when this reporting record was generated.
scActiveSubscribers	32808	4	Concurrent number of subscribers using the reported service when this reporting record was generated.
scTotalActive Subscribers	32809	4	Concurrent number of subscribers in the system when this reporting record was generated.
scLinkId	32810	1	A numeric value associated with the reported network link: • 0—Physical link 1 • 1—Physical link 2
	32811-32818		Reserved
scAttackId	32819	4	Unique attack ID.
scAttackIp	32820	4	The IP address related to this attack.
scAttackOtherIp	32821	4	The other IP address related to this attack if it exists, -1 otherwise.
scAttackPortNumber	32822	2	The port number related to this attack if one exists (if this is an IP scan, for example), -1 otherwise.
scAttackType	32823	4	Who scAttackIp belongs to: • 0—Attacked • 1—Attacker
scAttackSide	32824	1	The IP address side: • 0—Subscriber • 1—Network

Table 3-1   NetFlow Fields (continued)

Field Type	Value	Length (Bytes)	Description
scAttackIpProtocol	32825	1	The IP protocol type: • 0—Other • 1—ICMP • 6—TCP • 17—UDP
scAttacks	32826	1	The number of attacks in the current reporting period. Since attack reports are generated per attack, the value is 0 or 1.
scAttackMaliciousSessions	32827	4	Aggregated number of sessions for the reported attack, for the current reporting period. If the SCE platform blocks the attack, this field takes the value -1.

C H A P T E R 4

Database Tables: Formats and Field Contents

Each Raw Data Record (RDR) is sent to the Cisco Service Control Management Suite (SCMS) Collection Manager (CM). On the CM, adapters convert the RDRs and store them in database tables. There is a separate table for each RDR type. This chapter presents these tables and their columns (field names and types).

For additional information, such as RDR structure, RDR column and field descriptions, and how the RDRs are generated, see Raw Data Records: Formats and Field Contents, page 2-1.

Database Tables Overview

Each RDR is routed to the appropriate adapter—the JDBC Adapter or the Topper/Aggregator (TA) Adapter—converted, and written into a database table row. There is a separate table for each RDR type, with a column designated for each RDR field.

In addition to the RDR fields that are specific to each RDR type, the tables RPT_NUR, RPT_SUR, RPT_PUR, RPT_LUR, and RPT_TR contain two universal columns: TIME_STAMP and RECORD_SOURCE. The following values are placed in these two universal columns (field numbers 1 and 2, respectively):

- TIME_STAMP—The RDR time stamp assigned by the SCMS-CM. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970.
- RECORD_SOURCE—Contains the IP address of the Service Control Engine (SCE) platform that generated the RDR.

    The IP address is in 32-bit binary format (displayed as a 4-byte integer).

Table RPT_NUR

Database table RPT_NUR stores data from SUBSCRIBER_USAGE_RDRs.

✎

Note   This table is not part of the default configuration.

These RDRs have the tag **4042321920** .

Table 4-1   Columns for Table RPT_NUR

Field Name	Type
TIME_STAMP	Date_Time
RECORD_SOURCE	Number
SUBSCRIBER_ID	String
PACKAGE_ID	Number
SUBS_USG_CNT_ID	Number
BREACH_STATE	Number
REASON	Number
CONFIGURED_DURATION	Number
DURATION	Number
END_TIME	Number
UPSTREAM_VOLUME	Number
DOWNSTREAM_VOLUME	Number
SESSIONS	Number
SECONDS	Number

Table RPT_SUR

Database table RPT_SUR stores data from REALTIME_SUBSCRIBER_USAGE_RDRs.

These RDRs have the tag **4042321922** .

Table 4-2   Columns for Table RPT_SUR

Field Name	Type
TIME_STAMP	Date_Time
RECORD_SOURCE	Number

MALICIOUS_SESSIONS	Number

Table RPT_TOPS_PERIOD0

The Topper/Aggregator (TA) Adapter generates database table RPT_TOPS_PERIOD0 for its shorter aggregation interval (by default, one hour).

Table 4-8   Columns for Table RPT_TOPS_PERIOD0

Field Name	Type
RECORD_SOURCE	Number
METRIC_ID	Number
SUBS_USG_CNT_ID	Number
TIME_STAMP	DateTime
AGG_PERIOD	Number
SUBSCRIBER_ID	String
CONSUMPTION	Number

For each Top Report, the TA Adapter sorts the subscriber/consumption pairs from the highest consumption to lowest. At the end of each report is a statistic giving the sum of all subscribers for this metric.

If the report is empty, typically when no traffic was reported for the designated service/metric pair during the aggregation period, the DB will still be updated, but the only row in the report will be the final row showing a total consumption of zero. The DB is updated to avoid the perception in the Cisco Service Control Application (SCA) Reporter that the report is not there because of a malfunction.

The possible values for the field METRIC_ID are presented in the following table.

Table 4-9   Metric_ID Values

Metric_ID	Metric
0	Up Volume
1	Down Volume
2	Combined Volume
3	Sessions
4	Seconds

Table RPT_TOPS_PERIOD1

The Topper/Aggregator (TA) Adapter generates database table RPT_TOPS_PERIOD1 for its longer aggregation interval (by default, 24 hour).

Table 4-10   Columns for Table RPT_TOPS_PERIOD1

Field Name	Type
RECORD_SOURCE	Number
METRIC_ID	Number
SUBS_USG_CNT_ID	Number
TIME_STAMP	DateTime
AGG_PERIOD	Number
SUBSCRIBER_ID	String
CONSUMPTION	Number

For each Top Report, the TA Adapter sorts the subscriber/consumption pairs from the highest consumption to lowest. At the end of each report is a statistic giving the sum of all subscribers for this metric.

If the report is empty, typically when no traffic was reported for the designated service/metric pair during the aggregation period, the DB will still be updated, but the only row in the report will be the final row showing a total consumption of zero. The DB is updated to avoid the perception in the SCA Reporter that the report is not there because of a malfunction.

The possible values for the field METRIC_ID are presented in the following table.

Table 4-11   Metric_ID Values

Metric_ID	Metric
0	Up Volume
1	Down Volume
2	Combined Volume
3	Sessions
4	Seconds

Table INI_VALUES

Database table INI_VALUES is updated whenever the service configuration is applied to the SCE platform. This table contains, for each SCE IP address, mappings between numeric identifiers and textual representation for services, packages, and other service configuration components. The mapping is represented as a standard properties file in string form, where each mapping file is stored in one row. The SCA Reporter uses the mappings contained in this table.

Table 4-12   Columns for Table INI_VALUES

Field Name	Type	Description
TIME_STAMP	DateTime	
SE_IP	String	Identification of the SCE platform where these values were applied.
VALUE_TYPE	Number	Key/Value family type.
		The possible values are:
		1—Service ID / service name
		2—Package ID / package name
		3—TCP port number / port name
		4—Time frame ID / time frame name
		5—SCE address 32-bit / dotted notation
		6—IP protocol number / IP protocol name
		7—Signature protocol ID / protocol name
		8—P2P signature protocol ID / protocol name
		11—Global service usage counter ID / counter name
		12—Subscriber service usage counter ID / counter name
		13—Package usage counter ID / counter name
		15—UDP port number / port name
		1002—VoIP signature protocol ID / protocol name
		2001—P2P subscriber service usage counter ID / counter
		2002—VoIP subscriber service usage counter ID / counter
		3001—P2P global service usage counter ID / counter
		3002—VoIP global service usage counter ID / counter
VALUE_KEY	String	Key name.
		For example: Gold, Silver, or Adult Browsing.
VALUE	Number	Numeric reference.

Table VLINK_INI

Database table VLINK_INI is updated when the CM utility *update_vlinks.sh* is run. This table contains the name and id of each virtual link defined in the SCE platform. The SCA Reporter uses the mappings contained in this table for the Virtual Links reports.

Table 4-13   Columns for Table VLINK_INI

Field Name	Type	Description
TIME_STAMP	DateTime	
SCE_IP	String	Identification of the SCE platform where these values were applied
VLINK_ID	INT16	Virtual link ID
VLINK_DIRECTION	INT8	Virtual link direction
VLINK_NAME	String	Virtual link name

Table CONF_SE_TZ_OFFSET

Database table CONF_SE_TZ_OFFSET contains the time-zone offset in minutes for each SCE platform's clock as configured by the *select-sce-tz.sh* script.

Table 4-14   Columns for Table CONF_SE_TZ_OFFSET

Field Name	Type
TIME_STAMP	DateTime
OFFSET_MIN	Number

C H A P T E R 5

CSV File Formats

The Cisco Service Control Application for Broadband (SCA BB) provides several types of Comma-Separated Value (CSV) flat files that you can review and configure using third-party applications such as Excel.

- Information About Service Configuration Entities CSV File Formats, page 5-1
- Information About Subscriber CSV File Formats, page 5-5
- Information About Collection Manager CSV File Formats, page 5-7

Information About Service Configuration Entities CSV File Formats

This section describes the file formats of the CSV files created when exporting service configuration entities into CSV files. The same format must be used for importing such entities into service configurations.

For more information about exporting and importing service configuration entities, see "Managing Service Configurations" in the "Using the Service Configuration Editor" chapter of the *Cisco Service Control Application for Broadband User Guide*.

Note There is no need to repeat the same values in subsequent rows of the CSV file. If a field is left empty in a row, the value of that field from the previous row is used.

- Service CSV Files, page 5-2
- Protocol CSV Files, page 5-2
- Zone CSV Files, page 5-2
- Information About Flavor CSV Files, page 5-3

Service CSV Files

Lines in Service CSV files have the following fixed format:

```
service name,service numeric ID,[description],sample rate,parent name,global counter
index,subscriber counter index,[flavor],initiating side,protocol,[zone]
```

- The only service that does not have a parent service is the default service.

- The default service is the parent of all other services.

- If the service will be counted with its parent, it must have a counter index of -1.

- One service can have multiple entries in the file (see the following example). There is no need to state the service properties for each of its items.

- Some fields can take a null value (see the last line of the following example).

The following is an example of a service CSV file:

```
P2P,9,,10,Default Service,9,9,,EitherSide,DirectConnect,zone1
P2P,9,,10,Default Service,9,9,flavor1,EitherSide,Manolito, zone1
,,,,,,,,EitherSide,Hotline, zone1
,,,,,,, flavor2,EitherSide,Share, zone1
Generic,1,,10,Default Service,-1,-1,No items,null,null,null
```

Protocol CSV Files

Lines in Protocol CSV files have the following fixed format:

```
protocol name,protocol index,[IP protocol],[port range],signature
```
One protocol can have multiple entries in the file (see the following example).

Port range has the format: **MinPort-MaxPort**. For example, **1024-5000** means port 1024 to port 5000.

The following is an example of a protocol CSV file:

```
HTTP Browsing,2,TCP,80-80,Generic
HTTP Browsing,2,TCP,8080-8080,Generic
HTTP Browsing,2,,,HTTP
```

Zone CSV Files

Lines in Zone CSV files have the following fixed format:

```
zone name,zone index,IP range
```

where **IP range** is an IP address in dotted notation, followed by a mask.

The following is an example of a zone CSV file:

```
zone1,1,10.1.1.0/24
,,10.1.2.0/24
```

Information About Flavor CSV Files

The format of flavor CSV files depends on the flavor type.

Each line of every flavor CSV files begins with the same three fields:

```
flavor name,flavor index,flavor type[,flavor specific field[s]]
```

The formats of the CSV files of different flavors are described in the following sections.

The following is an example of a line from a flavor CSV file:

```
HttpUrlFlavor,1,HTTP_URL
```

HTTP URL CSV Files

Lines in HTTP URL CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,host suffix,params prefix,
URI suffix,URI prefix
```

The following is an example of an HTTP URL CSV file:

```
NEWS,0,HTTP_URL,*.reuters.com,,,/news/*
,,,*.msnbc.msn.com,,,
,,,*.wired.com,,,/news/technology/*
,,,*.cbsnews.com,,,/sections/world/*
,,,*.cnn.com,,,/WORLD/*
```

HTTP User Agent CSV Files

Lines in HTTP User Agent CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,user agent
```

HTTP Composite CSV Files

Lines in HTTP Composite CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,HTTP_URL_name,HTTP_User_Agent_name
```

where **HTTP_URL_name** and **HTTP_User_Agent_name** are the names of existing flavors of types HTTP URL and HTTP User Agent respectively.

RTSP User Agent CSV Files

Lines in RTSP User Agent CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,user agent
```

RTSP Host Name CSV Files

Lines in RTSP Host Name CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,host suffix
```

RTSP Composite CSV Files

Lines in HTTP Composite CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,RTSP_Host_Name,RTSP_User_Agent_name
```

where **RTSP_Host_Name** and **RTSP_User_Agent_name** are the names of existing flavors of types RTSP Host Name and RTSP User Agent respectively.

SIP Destination Domain CSV Files

Lines in SIP Destination Domain CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,host suffix
```

SIP Source Domain CSV Files

Lines in SIP Source Domain CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,host suffix
```

SIP Composite CSV Files

Lines in HTTP Composite CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,SIP_Destination_Domain_name,
SIP_Source_Domain_name
```

where **SIP_Destination_Domain_name** and **SIP_Source_Domain_name** are the names of existing flavors of types SIP Destination Domain and SIP Source Domain respectively

SMTP Host Name CSV Files

Lines in SMTP Host Name CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,host suffix
```

ToS CSV Files

Lines in ToS CSV files have the following fixed format:

```
flavor name,flavor index,flavor type,ToS value
```

Information About Subscriber CSV File Formats

This section describes the file formats of various subscriber CSV files used by the Cisco Service Control Management Suite (SCMS) Subscriber Manager(SM). For more information about these CSV file formats, see "Subscriber Files" in the "Managing Subscribers" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*. See also the *Cisco Service Control Management Suite Subscriber Manager User Guide*.

Import/Export File: Format of the mappings Field

Some of the CSV files include a mappings field. This field can include one or more of the following values delimited by colons (":") or semicolons (";"):

- A single IP address in dotted notation (xx.xx.xx.xx)
- An IP address range in dotted notation (xx.xx.xx.xx/mask)
- A single VLAN (xx) as an integer in decimal notation in the range of 0 to 2044
- A VLAN range (xx-yy) where both values are integers in decimal notation in the range of 0 to 2044

✎
Note   Specifying VLAN and IP Mappings together in the same line is not allowed.

The following are examples of the mappings field:

- Multiple IP mappings— **10.1.1.0/24;10.1.2.238**
- Multiple VLAN mappings— **450:896-907**

SCE Subscriber CSV Files

Lines in SCE Subscriber CSV files have the following fixed format:

```
subscriber-id,mappings,package-id,upstream Virtual Link id,downstream Virtual Link id
```

The following is an example CSV file for use with the SCE CLI:

```
JerryS,80.179.152.159;80.179.152.179,0,1,3
ElainB,194.90.12.2,3,55,87
```

SCMS SM Subscriber CSV Files

Lines in SCMS SM Subscriber CSV files have the following fixed format:

```
subscriber-id,domain,mappings,package-id,upstream Virtual Link id,downstream Virtual Link
id
```

If no domain is specified, the default domain (subscribers) is assigned.

The following is an example CSV file for use with the SM CLI:

```
JerryS,subscribers,80.179.152.159,0,0,0
ElainB,,194.90.12.2,3,12,1
```

SCE Anonymous Group CSV Files

Lines in SCE Anonymous Group CSV files have the following fixed format:

```
anonymous-group-name,IP-range[,subscriber-template-number]
```

If no subscriber-template-number is specified, then the anonymous subscribers of that group will use the default template (equivalent to using a subscriber-template-number value of zero).

The mapping between subscriber-template-number and package-id is defined in the SCE Subscriber Template CSV file, which is described in the following section.

The following is an example of an anonymous group CSV file

```
group1,176.23.34.0/24,3
group2,10.7.0.0/16
```

SCE Subscriber Template CSV File

Lines in Subscriber Template CSV files have the following fixed format, as described below:

```
subscriber-template-number,package-id
```

SCA BB includes a default one-to-one mapping between package-id and subscriber-template-number for values from 0 to 63.

Subscriber-template-numbers can take values between 0 and 199. You can map more than one subscriber-template-number to the same package-id.

For more information about this file, see the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

Information About Collection Manager CSV File Formats

This section describes the file formats of the CSV files created by adapters of the Cisco Service Control Management Suite (SCMS) Collection Manager (CM). For more information about the CM and its adapters, see the *Cisco Service Control Management Suite Collection Manager User Guide*.

Each RDR is routed to the appropriate adapter—the Comma-Separated Value (CSV) Adapter, the Topper/Aggregator (TA Adapter), or the Real-Time Aggregating (RAG) Adapter—converted, and written to a CSV file.

CSV Adapter CSV Files

By default, the CSV Adapter writes files to subdirectories of *~/cm/adapters/CSVAdapter/csvfiles*, where each subdirectory name is the RDR tag of the RDR that generated the CSV file.

Each CSV file created by the CSV Adapter has a structure matching the RDR represented in the file. (See Raw Data Records: Formats and Field Contents, page 2-1.)

TA Adapter CSV Files

The TA Adapter receives Subscriber Usage RDRs, aggregates the data they contain, and outputs statistics to CSV files. By default, these files are created once every 24 hours, at midnight.

The name of the CSV file is the date and time of its creation. The default format of the file name is *yyyy-MM-dd_HH-mm-ss.csv* (for example, *2005-09-27_18-30-01.csv*). By default, the location of the CSV files is *~/cm/adapters/TAAdapter/csvfiles*.

By default, the fields in each row of the CSV file are as follows:

```
TIMESTAMP,TAG,subsID,svcALLup,svcALLdown,svcALLsessions,svcALLseconds,
svc0up,svc0down,svc0sessions,svc0seconds,svc1up,svc1down,svc1sessions,
svc1seconds,...,svcNup,svcNdown,svcNsessions,svcNseconds
```

where **subsID** is the Subscriber ID and **svcXY** is the aggregated volume of metric Y for service X. (The N in **svcN** is the highest service number, which is the configured number of services minus 1.)

The combined volume is not stored in the CSV file, since it is easily obtained by adding the upstream and downstream volumes.

You can configure the adapter to insert a comment at the beginning of every CSV file. This comment contains a time stamp showing when the file was created, and an explanation of its format. By default, this feature is disabled. To turn this option on, edit the file *csvadapter.conf* and change the value of **includeRecordSource**.

RAG Adapter CSV Files

The RAG Adapter processes RDRs of one or more types and aggregates the data from predesignated field positions into buckets . When a RAG Adapter bucket is flushed, its content is written as a single line into a CSV file, one file per RDR, in the adapters' CSV repository.

The name of the CSV file is the date and time of its creation. The default format of the file name is *yyyy-MM-dd_HH-mm-ss.csv* (for example, *2005-09-27_18-30-01.csv*). By default, the CSV repository is flat (all CSV files in one directory), and located at *~/cm/adapters/RAGAdapter/csvfiles*. Alternatively, you can configure the adapter to use a subdirectory structure; the CSV files are written to subdirectories of *~/cm/adapters/RAGAdapter/csvfiles*, where each subdirectory name is the RDR tag of the RDR type that was written to this CSV file.

Each line written to the CSV file may have some synthesized fields added to it, such as time stamps of the first and last RDRs that contributed to this bucket and the total number of RDRs in this bucket. Other fields may be removed altogether. Fields in the output line that are not used for aggregation will have values corresponding to the values in the first RDR that contributed to the bucket. However, the time stamp field that is prepended to the line in the CSV file will have a value corresponding to the time stamp of the last RDR in the bucket.

C H A P T E R **6**

SCA BB Proprietary MIB Reference

This chapter describes the proprietary CISCO-SCAS-BB Management Information Base (MIB) supported by the Service Control Engine (SCE) platform.

A MIB is a database of objects that can be monitored by a network management system (NMS). The SCE platform supports both the standard MIB-II and the proprietary Cisco Service Control Enterprise MIB. The CISCO-SCAS-BB MIB is the part of the Service Control Enterprise MIB that enables the external management system to monitor counters and metrics specific to the Cisco Service Control Application for Broadband (SCA BB).

- Information About SNMP Configuration and Management, page 6-1
- Information About the Service Control Enterprise MIB, page 6-3
- Information About the CISCO-SCAS-BB MIB, page 6-4
- Guidelines for Using the CISCO-SCAS-BB MIB, page 6-25

Information About SNMP Configuration and Management

This section explains how to configure the SNMP interface, and how to load the MIB files.

- Configuring the SNMP Interface on the SCE Platform, page 6-2
- Required MIB Files, page 6-2
- The Order to Load the MIB Files, page 6-2

Configuring the SNMP Interface on the SCE Platform

Before using the SNMP interface:

- Enable SNMP access on the SCE platform (by default, SNMP access is disabled).

- Set the values of SNMP parameters:

    – The community string to be used for client authentication.

    – (Optional, recommended as a security measure) An access-list (ACL) of IP addresses. This limits access to SNMP information to a set of known locations. You can define a different community string for each ACL.

    – The destination IP address to which the SCE platform will send SNMP traps.

Note   You can enable or disable specific traps.

Related Info

For more information about SNMP configuration, see "SNMP Configuration and Management" in the "Configuring the Management Interface and Security" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

Required MIB Files

To access the SNMP variables on the SCE platform, you must load the SNMP browser with a standard MIB file (*SNMPv2.mib)* and proprietary Cisco MIB files (*pcube.mib, pcubeSEMib.mib,* and *PCubeEngageMib.mib)*.

Note   You can download the CISCO-SCAS-BB MIB file (*PCubeEngageMib.mib)* and other MIB files (*pcube.mib* and *pcubeSEMib.mib)* from ftp://ftp.cisco.com/pub/mibs/.

The Order to Load the MIB Files

The SCA BB proprietary MIB uses definitions that are defined in other MIBs, such as *SNMPv2.mib* and *pcube.mib.*

This means that the order in which the MIBs are loaded is important; to avoid errors, the MIBs must be loaded in the correct order.

Load the MIBs in the following order:

1. *SNMPv2.mib*

2. *pcube.mib*

3. *pcubeSEMib.mib*
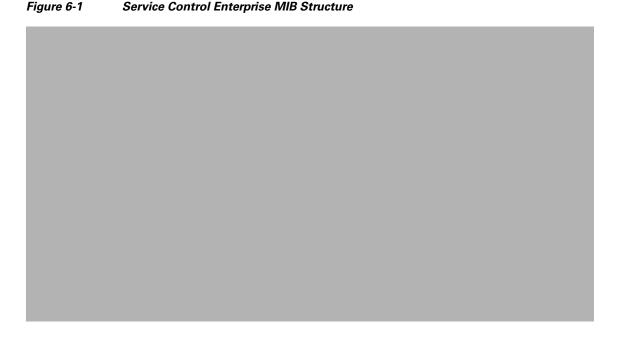

4. *PCubeEngageMib.mib*

Information About the Service Control Enterprise MIB

The Service Control Enterprise MIB includes four main groups: Products, Modules, Management, and Workgroup. The Service Control enterprise tree structure is defined in a MIB file named *pcube.mib*.

- The pcubeProducts subtree contains the sysObjectIDs of the Service Control products.

  Service Control product sysObjectIDs are defined in a MIB file named *Pcube-Products-MIB*.

- The pcubeModules subtree provides a root object identifier from which MIB modules are defined.

- The pcubeMgmt subtree contains the configuration copy MIB:

  – *pcubeConfigCopyMib* enables saving the running configuration of Cisco products. This MIB is documented in the "Proprietary MIB Reference" appendix of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

- The pcubeWorkgroup subtree contains:

  – *pcubeSeEvents* and *pcubeSEObjs* — *pcubeSeMib,* the SCE MIB, is the main MIB for the Service Control products and provides a wide variety of configuration and runtime statistics. This MIB is also documented in the "Proprietary MIB Reference" appendix of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

  – *pcubeEngageObjs* —The CISCO-SCAS-BB MIB provides configuration and runtime status for SCA BB, and is described in the following section.

The following figure illustrates the Service Control Enterprise MIB structure.

Figure 6-1   Service Control Enterprise MIB Structure

> **Note**   The following object identifier represents the Service Control Enterprise MIB: **1.3.6.1.4.1.5655** or **iso.org.dod.internet.private.enterprise.pcube**.

Information About the CISCO-SCAS-BB MIB

The CISCO-SCAS-BB MIB provides access to service usage counters through the SNMP interface. Using this MIB, a network administrator can collect usage information per service at link, package, or subscriber granularity.

The CISCO-SCAS-BB MIB is defined in the file *PCubeEngageMib.mib*.

The MIB is documented in the remainder of this chapter.

Using this Reference

This reference is divided into sections according to the MIB object groups. For each object, information is presented in the following format:

<Description of the object>

Access	access control associated with the object
Units	unit of measurement used for the object

Index

{Indexes used by the table}

Syntax

```
OBJECT DATA TYPE {
The general format of the object
}
```

pcubeEngageObjs (pcubeWorkgroup 2)

The pcubeEngageObjs objects provide current information about packages, service, and subscribers.

pcubeEngageObjs Objects

This table lists the pcubeEngageObjs objects. Each object consists of a number of subordinate object types, which are summarized in the following section.

serviceGrp	{pcubeEngageObjs 1}
linkGrp	{pcubeEngageObjs 2}
packageGrp	{pcubeEngageObjs 3}
subscriberGrp	{pcubeEngageObjs 4}
serviceCounterGrp	{pcubeEngageObjs 5}

pcubeEngageObjs Structure

This is a summary of the structure of pcubeEngageObjs. Note the table structure for objects that may have multiple entries.

serviceGrp
serviceTable—deprecated

linkGrp
linkServiceUsageTable
 linkServiceUsageEntry
  linkServiceUsageUpVolume
  linkServiceUsageDownVolume
  linkServiceUsageNumSessions
  linkServiceUsageDuration
  linkServiceUsageConcurrentSessions
  linkServiceUsageActiveSubscribers
  linkServiceUpDroppedPackets
  linkServiceDownDroppedPackets
  linkServiceUpDroppedBytes
  linkServiceDownDroppedBytes

packageGrp
packageCounterTable
 packageCounterEntry
  packageCounterIndex
  packageCounterStatus
  packageCounterName
  packageCounterActiveSubscribers
packageServiceUsageTable
 packageServiceUsageEntry
  packageServiceUsageUpVolume
  packageServiceUsageDownVolume
  packageServiceUsageNumSessions
  packageServiceUsageDuration
  packageServiceUsageConcurrentSessions
  packageServiceUsageActiveSubscribers
  packageServiceUpDroppedPackets
  packageServiceDownDroppedPackets
  packageServiceUpDroppedBytes
  packageServiceDownDroppedBytes

```
subscriberGrp
subscribersTable
 subscriberEntry
  subscriberPackageIndex
subscriberServiceUsageTable
 subscriberServiceUsageEntry
  subscriberServiceUsageUpVolume
  subscriberServiceUsageDownVolume
  subscriberServiceUsageNumSessions
  subscriberServiceUsageDuration
serviceCounterGrp
globalScopeServiceCounterTable
 globalScopeServiceCounterEntry
  globalScopeServiceCounterIndex
  globalScopeServiceCounterStatus
  globalScopeServiceCounterName
subscriberScopeServiceCounterTable
 subscriberScopeServiceCounterEntry
  subscriberScopeServiceCounterIndex
  subscriberScopeServiceCounterStatus
  subscriberScopeServiceCounterName
```

Service Group: serviceGrp (pcubeEngageObjs 1)

The Service group is deprecated. Use the Service Counter group.

serviceTable (serviceGrp 1)

Deprecated—Use the tables in the Service Counter group.

Access	not-accessible

Syntax

Counter32

Link Group: linkGrp (pcubeEngageObjs 2)

The Link Service group provides usage information per link for each global-scope service usage counter (for example, traffic statistics of a service for all subscribers using a particular link).

- linkServiceUsageTable (linkGrp 1), page 6-7
- linkServiceUsageEntry (linkServiceUsageTable 1), page 6-8
- linkServiceUsageUpVolume (linkServiceUsageEntry 1), page 6-8
- linkServiceUsageDownVolume (linkServiceUsageEntry 2), page 6-9
- linkServiceUsageNumSessions (linkServiceUsageEntry 3), page 6-9
- linkServiceUsageDuration (linkServiceUsageEntry 4), page 6-9
- linkServiceUsageConcurrentSessions (linkServiceUsageEntry 5), page 6-9
- linkServiceUsageActiveSubscribers (linkServiceUsageEntry 6), page 6-10
- linkServiceUpDroppedPackets (linkServiceUsageEntry 7), page 6-10
- linkServiceDownDroppedPackets (linkServiceUsageEntry 8), page 6-10
- linkServiceUpDroppedBytes (linkServiceUsageEntry 9), page 6-11
- linkServiceDownDroppedBytes (linkServiceUsageEntry 10), page 6-11

linkServiceUsageTable (linkGrp 1)

The Link Service Usage table provides usage information per link for each global-scope service usage counter.

Access	not-accessible

Syntax

SEQUENCE OF linkServiceUsageEntry

linkServiceUsageEntry (linkServiceUsageTable 1)

A Link Service Usage table entry containing parameters defining resource usage of one link for services included in one global-scope service usage counter.

Access	not-accessible

Index

{linkModuleIndex, linkIndex, globalScopeServiceCounterIndex}

Syntax

```
SEQUENCE {
linkServiceUsageUpVolume
linkServiceUsageDownVolume
linkServiceUsageNumSessions
linkServiceUsageDuration
linkServiceUsageConcurrentSessions
linkServiceUsageActiveSubscribers
linkServiceUpDroppedPackets
linkServiceDownDroppedPackets
linkServiceUpDroppedBytes
linkServiceDownDroppedBytes
}
```

linkServiceUsageUpVolume (linkServiceUsageEntry 1)

The upstream volume of services in this service usage counter carried over the link.

Access	read-only
Units	kilobytes

Syntax

```
Counter32
```

Note Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

linkServiceUsageDownVolume (linkServiceUsageEntry 2)

The downstream volume of services in this service usage counter carried over the link.

Access	read-only
Units	kilobytes

Syntax

`Counter32`

✎

Note   Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

linkServiceUsageNumSessions (linkServiceUsageEntry 3)

The number of sessions of services in this service usage counter carried over the link.

Access	read-only
Units	sessions

Syntax

`Counter32`

linkServiceUsageDuration (linkServiceUsageEntry 4)

The aggregated session duration of services in this service usage counter carried over the link.

Access	read-only
Units	seconds

Syntax

`Counter32`

linkServiceUsageConcurrentSessions (linkServiceUsageEntry 5)

The number of concurrent sessions of services in this service usage counter carried over the link.

Access	read-only
Units	sessions

Syntax

`Counter32`

linkServiceUsageActiveSubscribers (linkServiceUsageEntry 6)

The number of active subscribers of services in this service usage counter carried over the link.

Access	read-only
Unit	subscribers

Syntax

`Counter32`

linkServiceUpDroppedPackets (linkServiceUsageEntry 7)

The number of dropped upstream packets of services in this service usage counter carried over the link.

Access	read-only
Units	packets

Syntax

`Counter32`

✎

Note   To enable the SCE application to count dropped packets and dropped bytes, disable the
`accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the
MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more
information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the
"Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software
Configuration Guide.*

linkServiceDownDroppedPackets (linkServiceUsageEntry 8)

The number of dropped downstream packets of services in this service usage counter carried over the
link.

Access	read-only
Units	packets

Syntax

`Counter32`

✎

Note   To enable the SCE application to count dropped packets and dropped bytes, disable the
`accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the
MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more
information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the
"Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software
Configuration Guide.*

linkServiceUpDroppedBytes (linkServiceUsageEntry 9)

The number of dropped upstream bytes of services in this service usage counter carried over the link.

Access	read-only
Units	bytes

Syntax

`Counter32`

Note To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

linkServiceDownDroppedBytes (linkServiceUsageEntry 10)

The link service-counter number of dropped downstream bytes of services in this service usage counter carried over the link.

Access	read-only
Units	bytes

Syntax

`Counter32`

Note To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

Package Group: packageGrp (pcubeEngageObjs 3)

The Package group provides general and usage information for each global-scope package usage counter (for example, traffic statistics of a service for all subscribers assigned to a particular package or group of packages).

packageCounterTable (packageGrp 1)

The Package Counter table provides information for each package usage counter.

Access	not-accessible

Syntax

```
SEQUENCE OF packageCounterEntry
```

packageCounterEntry (packageCounterTable 1)

A Package Counter table entry containing parameters defining one package usage counter.

Access	not-accessible

Index

{pmoduleIndex, packageCounterIndex}

Syntax

```
SEQUENCE {
packageCounterIndex
packageCounterStatus
packageCounterName
packageCounterActiveSubscribers
}
```

packageCounterIndex (packageCounterEntry 1)

The package usage counter index.

Access	not-accessible

Syntax

Integer32 *(1...1023)*

packageCounterStatus (packageCounterEntry 2)

The package usage counter status.

Access	read-only

```
Syntax
INTEGER {
0 (disabled)
1 (enabled)
}
```

packageCounterName (packageCounterEntry 3)

The name of the package usage counter.

Access	read-only

Syntax

SnmpAdminString

packageCounterActiveSubscribers (packageCounterEntry 4)

The total number of active subscribers of packages included in the package usage counter.

Access	read-only

Syntax

`Counter32`

packageServiceUsageTable (packageGrp 2)

The Package Service Usage table provides usage information for each global-scope package usage counter.

Access	not-accessible

Syntax

SEQUENCE OF packageServiceUsageEntry

packageServiceUsageEntry (packageServiceUsageTable 1)

A Package Service Usage table entry containing parameters defining resource usage of packages included in one global-scope package usage counter.

Access	not-accessible

Index

{pmoduleIndex, packageCounterIndex, globalScopeServiceCounterIndex}

Syntax

SEQUENCE {
packageServiceUsageUpVolume
packageServiceUsageDownVolume
packageServiceUsageNumSessions
packageServiceUsageDuration
packageServiceUsageConcurrentSessions
packageServiceUsageActiveSubscribers
packageServiceUpDroppedPackets
packageServiceDownDroppedPackets
packageServiceUpDroppedBytes
packageServiceDownDroppedBytes
}

packageServiceUsageUpVolume (packageServiceUsageEntry 1)

The upstream volume of packages in this package usage counter.

Access	read-only
Units	kilobytes

Syntax

`Counter32`

✎
Note   Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

packageServiceUsageDownVolume (packageServiceUsageEntry 2)

The downstream volume of packages in this package usage counter.

Access	read-only
Units	kilobytes

Syntax

`Counter32`

✎
Note   Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

packageServiceUsageNumSessions (packageServiceUsageEntry 3)

The number of sessions of packages in this package usage counter.

Access	read-only
Units	sessions

Syntax

`Counter32`

packageServiceUsageDuration (packageServiceUsageEntry 4)

The aggregated session duration seconds of packages in this package usage counter.

Access	read-only
Units	seconds

Syntax

`Counter32`

packageServiceUsageConcurrentSessions (packageServiceUsageEntry 5)

The number of concurrent sessions of packages in this package usage counter.

Access	read-only
Units	sessions

Syntax

`Counter32`

packageServiceUsageActiveSubscribers (packageServiceUsageEntry 6)

The number of active subscribers of packages in this package usage counter.

Access	read-only
Units	subscribers

Syntax

`Counter32`

packageServiceUpDroppedPackets (packageServiceUsageEntry 7)

The number of dropped upstream packets of packages in this package usage counter.

Access	read-only
Units	packets

Syntax

`Counter32`

> **Note**   To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

packageServiceDownDroppedPackets (packageServiceUsageEntry 8)

The number of dropped downstream packets of packages in this package usagecounter.

Access	read-only
Units	packets

Syntax

`Counter32`

> **Note**   To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

packageServiceUpDroppedBytes (packageServiceUsageEntry 9)

The number of dropped upstream bytes of packages in this package usage counter.

Access	read-only
Units	bytes

Syntax

`Counter32`

Note   To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

packageServiceDownDroppedBytes (packageServiceUsageEntry 10)

The number of dropped downstream bytes of packages in this package usage counter.

Access	read-only
Units	bytes

Syntax

`Counter32`

Note   To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

Subscriber Group: subscriberGrp (pcubeEngageObjs 4)

The Subscriber group provides general information for each subscriber and usage information per service usage counter for each subscriber (for example, traffic statistics of a service for a particular subscriber defined in the system).

> **Note**   To use the tables in this group, first create an entry to reference a particular subscriber in the subscribersPropertiesValueTable object of the subscriberGrp in the SCE MIB (not the CISCO-SCAS-BB MIB). Using the index of this table (spvIndex), information about the subscriber can be collected. For more information about how to access subscriber-level information using the SNMP interface, see Accessing Subscriber Information (the spvIndex), page 6-27.

- subscriberServiceUsageNumSessions (subscriberServiceUsageEntry 3), page 6-21
- subscriberServiceUsageDuration (subscriberServiceUsageEntry 4), page 6-22

subscribersTable (subscriberGrp 1)

The Subscribers Table provides information for each subscriber.

Access	not-accessible

Syntax

SEQUENCE OF subscribersEntry

subscribersEntry (subscribersTable 1)

A Subscribers Table entry containing the package index of each subscriber.

Access	not-accessible

Index

{pmoduleIndex, spvIndex}

Syntax

SEQUENCE {
subscriberPackageIndex
}

subscriberPackageIndex (subscribersEntry 1)

The package index of the subscriber's package.

Access	read-only

Syntax

Integer32 *(1...255)*

subscriberServiceUsageTable (subscriberGrp 2)

The Subscriber Service Usage table provides usage information per service usage counter for each subscriber.

Access	not-accessible

Syntax

Sequence of subscriberServiceUsageEntry

subscriberServiceUsageEntry (subscriberServiceUsageTable 1)

A Subscriber Service Usage table entry containing parameters defining resource usage by one subscriber of services included in one service usage counter.

Access	not-accessible

Index

{pmoduleIndex, spvIndex, subscriberScopeServiceCounterIndex}

Syntax

SEQUENCE {
subscriberServiceUsageUpVolume
subscriberServiceUsageDownVolume
subscriberServiceUsageNumSessions
subscriberServiceUsageDuration
}

subscriberServiceUsageUpVolume (subscriberServiceUsageEntry 1)

The upstream volume of services in this service usage counter used by this subscriber.

Access	read-only
Unit	kilobytes

Syntax

`Counter32`

Note   Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

subscriberServiceUsageDownVolume (subscriberServiceUsageEntry 2)

The downstream volume of services in this service usage counter used by this subscriber.

Access	read-only
Unit	kilobytes

Syntax

`Counter32`

Note   Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

subscriberServiceUsageNumSessions (subscriberServiceUsageEntry 3)

The number of sessions of services in this service usage counter used by this subscriber.

Access	read-only
Unit	sessions

Syntax

`Integer32` *(1...65535)*

subscriberServiceUsageDuration (subscriberServiceUsageEntry 4)

Aggregated session duration of services in this service usage counter used by this subscriber.

Access	read-only
Units	seconds

Syntax

Integer32 *(1...65535)*

Service Counter Group: serviceCounterGrp (pcubeEngageObjs 5)

The Service Counter group provides general information for each global-scope and subscriber-scope service usage counter. You can use it, for example, to read the names of the services as defined in a SCA BB service configuration.

globalScopeServiceCounterTable (serviceCounterGrp 1)

The Global-Scope Service Counter table consists of data about each service usage counter used by the link and by packages.

Access	not-accessible

Syntax

SEQUENCE OF globalScopeServiceCounterEntry

globalScopeServiceCounterEntry (globalScopeServiceCounterTable 1)

A Global-Scope Service Counter table entry containing parameters defining one global-scope service usage counter.

Access	not-accessible

Index

{pmoduleIndex, globalScopeServiceCounterIndex}

Syntax

SEQUENCE {
globalScopeServiceCounterIndex
globalScopeServiceCounterStatus
globalScopeServiceCounterName
}

globalScopeServiceCounterIndex (globalScopeServiceCounterEntry 1)

The global-scope service usage counter index.

Access	not-accessible

Syntax

Integer32 *(1...255)*

globalScopeServiceCounterStatus (globalScopeServiceCounterEntry 2)

The global-scope service usage counter status.

Access	read-only

Syntax

INTEGER {
0 (disabled)
1 (enabled)
}

globalScopeServiceCounterName (globalScopeServiceCounterEntry 3)

The name of the global-scope service usage counter.

Access	read-only

Syntax

SnmpAdminString

subscriberScopeServiceCounterTable (serviceCounterGrp 2)

The Subscriber-Scope Service Counter table consists of data about each service usage counter used by subscribers.

Access	not-accessible

Syntax

SEQUENCE OF subscriberScopeServiceCounterEntry

subscriberScopeServiceCounterEntry (subscriberScopeServiceCounterTable 1)

A Subscriber-Scope Service Counter table entry containing parameters defining one subscriber-scope service usage counter.

Access	not-accessible

Index

{pmoduleIndex, subscriberScopeServiceCounterIndex}

Syntax

SEQUENCE {
subscriberScopeServiceCounterIndex
subscriberScopeServiceCounterStatus
subscriberScopeServiceCounterName
}

subscriberScopeServiceCounterIndex (subscriberScopeServiceCounterEntry 1)

The subscriber-scope service usage counter index.

Access	not-accessible

Syntax

Integer32 *(1...255)*

subscriberScopeServiceCounterStatus (subscriberScopeServiceCounterEntry 2)

The subscriber-scope service usage counter status.

Access	read-only

Syntax

INTEGER {
0 (disabled)
1 (enabled)
}

subscriberScopeServiceCounterName (subscriberScopeServiceCounterEntry 3)

The name of the subscriber-scope service usage counter.

Access	read-only

Syntax

`SnmpAdminString`

Guidelines for Using the CISCO-SCAS-BB MIB

This section provides guidelines to help access SNMP information about the SCE platform using the CISCO-SCAS-BB MIB.

Note   Indices in SNMP start from 1; SCA BB indices start from 0. When accessing a counter in the SCA BB SNMP MIB by its index, add 1 to the index of the entity. For example, the global usage counter with index 0 will be located at globalScopeServiceCounter index 1.

Note   Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

Note   To enable the SCE application to count dropped packets and dropped bytes, disable the **accelerate-packet-drops** feature on the SCE platform; if **accelerate-packet-drops** is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF.

For more information about the accelerate-packet-drops feature, see "Counting Dropped Packets" in the "Configuring the Line Interface" chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide.*

- packageCounterTable, page 6-26
- Accessing Subscriber Information (the spvIndex), page 6-27

globalScopeServiceCounterTable and subscriberScopeServiceCounterTable

The index of a service usage counter as defined in a SCA BB service configuration is used to reference services in the CISCO-SCAS-BB MIB. Since MIB index values count from 1, but SCA BB indices count from 0, the index used in the MIB must always be one greater than the index of the service it is referencing.

For example, to get the number of upstream bytes used by a service on a link, use **LinkServiceTable.lnkServiceUpVolume** (part of the linkGrp). The value assigned to **serviceIndex** for this table must be one greater than service index defined for this service in the service configuration.

To identify or change the index of a service, go to the Advanced tab of the Service Settings dialog box in the SCA BB Console (see the "Using the Service Configuration Editor: Traffic Classification" chapter of the *Cisco Service Control Application for Broadband User Guide*). For example, to reference the P2P service (which has a (default) service index of 9) in the MIB, a **serviceIndex** of 10 (= 9 + 1) must be used.

packageCounterTable

The package index, defined in a SCA BB service configuration, is used to reference entries in **packageTable** and **packageServiceTable** (part of the **packageGrp**). As with serviceIndex the value assigned to **packageIndex** must be one greater than the package index in the service configuration.

To identify or change the index of a package, go to the Advanced tab of the Package Settings dialog box in the SCA BB Console (see the "Using the Service Configuration Editor: Traffic Control" chapter of the *Cisco Service Control Application for Broadband User Guide*). For example, to reference the default package (which has a package index of 0) in the MIB, a **packageIndex** of 1 (= 0 + 1) must be used.

Accessing Subscriber Information (the spvIndex)

In order to collect subscriber-level information using the SNMP interface, you must first create an entry in the subscriberPropertiesValuesTable part of the subscriberGrp in *pcubeSEMib* (not *PCubeEngageMib)*. After an entry in this table is created and associated with a subscriber name, its index (spvIndex) can be referred to in *PCubeEngageMib* to collect usage statistics for this subscriber.

An entry is created in the subscriberPropertiesValuesTable table by setting the entry spvRowStatus object with CreateAndGo(4) then setting the name of the subscriber in the spvSubName property and the spvIndex variable to be used as an index to the subscriber.

The fiollowing procedure demonstrates how to poll the downstream volume of subscriber "sub123" for the P2P service using *PCubeEngageMib*.

Step 1   Obtain the index of the P2P service from the SCA BB Console.

This is a one-time operation that you should perform only if services are changed in the service configuration. [In this example, assume that the P2P service index has its default value of 9.]

Step 2   Create an entry in SEMib:subscriberGrp:subscriberPropertiesValuesTable.

Step 3   Set the object indices.

- For pmoduleIndex use 1.
- Set spvIndex to the desired value. [In this example we will use 1.]

Step 4   Set spvRowStatus to 4 (using **CreateAndGo)**.

Step 5   Set spvSubName to "sub123".

Step 6   Read the subscriberServiceDownVolume property out of EngageMib:subscriberGrp:subscriberServiceTable where spvIndex is set to 1 and serviceIndex is set to 10.
