

Configuring ePBR L3

This chapter describes how to configure Enhanced Policy-based Redirect (ePBR) on Cisco NX-OS devices.

- Information About ePBR L3, on page 1
- Guidelines and Limitations for ePBR L3, on page 4
- Configuring ePBR L3, on page 8
- Configuration Examples for ePBR L3, on page 15
- Additional References, on page 23

Information About ePBR L3

Enhanced Policy-based Redirect (ePBR) in Elastic Services Re-direction (ESR) provides traffic redirection and service chaining across the NX-OS and fabric topologies by leveraging policy-based redirect solution and achieves service chaining without adding extra headers, and avoids latency in using extra headers.

ePBR enables application-based routing and provides a flexible, device-agnostic policy-based redirect solution without impacting application performance. The ePBR service flow includes the following tasks:

Licensing Requirements

For a complete explanation of Cisco NX-OS licensing recommendations and how to obtain and apply licenses, see the *Cisco NX-OS Licensing Guide* and the *Cisco NX-OS Licensing Options Guide*.

Configuring ePBR Service and Policy

You must first create an ePBR service which defines the attributes of service end points. Service end points are the service appliances such as firewall, IPS, etc., that can be associated with switches. You can also define probes to monitor the health of the service end points and can define the forward and reverse interfaces where the traffic policies are applied. ePBR also supports load balancing along with service chaining. ePBR allows you to configure multiple service end points as a part of the service configuration.

Beginning with Cisco NX-OS Release 10.2(1)F, the VRF of every service in a chain may either be unique or may be exactly identical. The service endpoints and interfaces defined for a service, should pertain to the VRF defined for the service.

Service end-point interfaces having an existing IPv4 PBR policy cannot be used inside an IPv4 ePBR service. Similarly service end-point interfaces having an existing ipv6 PBR policy cannot be used inside an IPv6 ePBR service.

After creating the ePBR service, you must create an ePBR policy. The ePBR policy allows you to define traffic selection, redirection of traffic to the service end point and various fail-action mechanisms on the end point health failure. You may use IP access-list end points with permit access control entries (ACE) to define the traffic of interest to match and take the appropriate action.

The ePBR policy supports multiple ACL match definitions. A match can have multiple services in a chain which can be sequenced by a sequence number. This allows flexibility to add, insert, and modify elements in a chain in a single service policy. In every service sequence, you can define the fail action method such as drop, forward, and bypass. The ePBR policy allows you to specify source or destination-based load balancing and bucket counts in order to have granular load balancing of traffic.

Applying ePBR to an Interface

After creating the ePBR policy you need to apply the policy on an interface. This allows you to define the interface at which the traffic ingresses into the NX-OS or Nexus fabric. You can also apply the policy in both the forward and reverse directions. There may only be two IPv4/IPv6 policies applied to the interface, one in the forward and one in the reverse direction.

Beginning with Cisco NX-OS Release 10.2(1)F, ePBR supports policy application on layer-3 port-channel sub-interfaces

Beginning with Cisco NX-OS Release 10.2(1)F, the interface on which the ePBR policy is applied may be on a different VRF than the VRF of the services in the chain.

ePBR IPv4 policies cannot be applied to an interface on which an IPv4 PBR policy is already applied. ePBR IPv6 policies cannot be applied to an interface on which an IPv6 PBR policy is already applied.

Creating Bucket and Load Balancing

ePBR computes the number of traffic buckets based on the service that has maximum number of service-end-points in the chain. If you configure the load balance buckets, your configuration will have the precedence. ePBR supports load balancing methods of source IP and destination IP but does not support L4-based source or destination load balancing methods.

ePBR Object Tracking, Health Monitoring, and Fail-Action

ePBR creates SLA and Track objects based on the probe types configured in the service and supports various probes and timers such as ICMP, TCP, UDP, DNS, and HTTP. ePBR also supports user defined tracks, which allows you to create tracks with various parameters including milli second probes in associating with ePBR.

ePBR monitors the health of the end points by provisioning IP SLA probes and object tracks to track the IP SLA reachability when you apply the ePBR probe configuration.

You can configure the ePBR probe options for a service or for each of the forward or reverse end points. You can also configure frequency, timeout, retry up and down counts, and source loopback interface so that they can be used for source IP of an IP SLA session. The retry-up and down counts are used as multipliers for the frequency to determine **delay-up** and **delay-down** intervals. Once the service endpoint is initially detected as failed or recovered, the system will act on these events after the expiry of these intervals. You can define

any type of tracks and associate them with the forward or the reverse end points. The same track objects is re-used for all policies using the same ePBR service.

You can define tracks separately and assign the track ID to each service-end point in ePBR. If you do not assign any user-defined track to an endpoint, ePBR will create a track using probe method for the end point. If no probe method is defined at the end point level, the probe method configured for the service level will be used.

ePBR supports the following fail-action mechanisms for its service chain sequences:

- Bypass
- Drop on Fail
- Forward

Bypass of a service sequence indicates that the traffic must be redirected to the next service sequence when there is a failure of the current sequence.

Drop on fail of a service sequence indicates that the traffic must be dropped when all the service-end-points of the service become unreachable.

Forward is the default option and indicates that upon failure of the current service, traffic should use the regular routing tables. This is the default fail-action mechanism.

Note

Symmetry is maintained when fail-action bypass is configured for all the services in the service chain. In other fail-action scenarios, when there are one or more failed services, symmetry is not maintained in the forward and the reverse flow.

ePBR Session-based Configuration

ePBR sessions allow addition, deletion or modification of the following aspects of in-service services or policies. The in-service refers to a service that is associated with a policy that has been applied to an active interface or a policy that is being modified and currently configured on an active interface.

- Service endpoints with their interfaces and probes
- Reverse endpoints and probes
- Matches under policies
- · Load-balance methods for matches
- Match sequences and fail-action

Note In ePBR Sessions, you cannot move interfaces from one service to another service in the same session. To move interfaces from one service to another service, perform the following steps:

- **1.** Use a session operation to first remove it from the existing service.
- 2. Use a second session operation to add it to the existing service.

ePBR Multi-Site

Beginning with Cisco NX-OS Release 10.2(1)F, service-chaining in a VXLAN multisite fabric can be achieved by using the following configuration and topology guidelines.

- Endpoints in a service or services in the chain may be distributed across different leaf switches, in the same or different site.
- Every service should be in its unique VRF, which is different from the tenant VRF context in which the ePBR policy is applied.
- To segregate traffic for different tenant VRFs, the VLANs used for the services would be required to be segregated and new services and policies would need to be defined.
- Tenant VRF routes should be leaked to each of the service VRFs on every leaf switch hosting the services, to allow traffic to be routed back at the end of the service chain to its destination, in the tenant VRF.
- VNIs should be symmetrically allocated across different leaf switches and sites.
- The ePBR policy should be enabled on all layer-3 VNIs of the service VRFs being used, on all leaf switches hosting services and on the border leaf or border gateway switches, if it is acting as transit for multi-site.
- The service chain may be isolated to one site entirely, with traffic arriving from different sites. Although this scenario doesn't involve multi-site distribution of service devices, the layer-3 VNIs of the service VRFs on the border gateways or border leafs should only be treated as multi-site transit and the ePBR policy should be applied on them. The ePBR policy should be also applied on the host or tenant facing interfaces in the remote sites where the traffic is arriving from.

ACL Refresh

ePBR session ACL refresh allows you to update the policy generated ACLs, when the user-provided ACL gets modified or added or deleted with ACEs. On the refresh trigger, ePBR will identify the policies that are impacted by this change and create or delete or modify the buckets' generated ACLs for those policies.

For ePBR scale values, see Cisco Nexus 9000 Series NX-OS Verified Scalability Guide.

Guidelines and Limitations for ePBR L3

ePBR has the following guidelines and limitations:

- Beginning with Cisco Nexus NX-OS Release 10.1(2), ePBR with IPv4 and IPv6 is supported on N9K-C93108TC-FX3P switch.
- Beginning with Cisco NX-OS Release 10.1(1) each match statement under ePBR policy can support three action types redirect, drop, and exclude. There can be only one drop and/or exclude match statement per policy. The ACE rules for the traffic, which needs to be excluded or dropped in the forward as well as the reverse directions, should be manually added to the match access-list that is used with the action of exclude or drop. The statistics for the exclude and drop match access-list may display traffic hit counters for both directions.
- ePBR policies require at least one match with redirect action.

- Beginning with Cisco NX-OS Release 10.1(1), ePBR with IPv4, IPv6 and ePBR over VXLAN are supported on below platform switches: N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX, N9K-C93180YC-FX3S, N9K-C93360YC-FX3, and N9K-C93108TC-FX3P.
- When fail-action is specified in any match statement, probe is mandatory in the configuration.
- Whenever there is OTM track changes ePBR statistics is reset due to RPM reprogramming.
- Do not share the same user defined ACL across multiple match statements in the ePBR configuration.
- Symmetry in traffic is maintained only when fail-action bypass is configured for ePBR Service. For the other fail-actions such as forward/drop in the service chain, symmetry is not maintained for the forward and reverse flow of traffic.
- Unique layer-4 source and destination port parameters should be specified for the match filters if traffic is required to match any source and any destination IP as per the match access-list definition, and is required to be redirected to devices distributed in a VXLAN environment in both forward and reverse directions or service-chained through one-arm devices.
- Feature ePBR and feature ITD cannot co-exist with the same ingress interface.
- With scaled ePBR configuration, it is recommended to remove the policies before you use the **no feature epbr** command.
- It is recommended that you classify probe traffic in a separate CoPP class. Otherwise, probe traffic will go in the default CoPP class and might be dropped causing IP SLA bouncing for probe traffic. For information on CoPP configuration for IP SLA, see Configuring CoPP for IP SLA Packets.
- ePBR is supported on the Cisco Nexus 9500 and Cisco Nexus 9300 platform switches with EX, FX, and FX2 line cards.
- ePBRv4 over VXLAN and NX-OS ePBR are supported on Cisco Nexus 9500 series switches.
- ePBRv6 over VXLAN is not supported on Cisco Nexus 9500 series switches.
- Beginning with Cisco NX-OS Release 9.3(5) Catena feature is deprecated.
- If you want to remove the ePBR service endpoint which is configured to a port-channel that is removed from the system, perform the following steps:
- **1.** Delete the existing ePBR policy.
- 2. Delete the existing ePBR service.
- 3. Reconfigure the ePBR service endpoint to the required port-channel.
- Please do not modify the dynamically created access-list entries of ePBR that begin with the name "epbr_". These access-lists are reserved for ePBR internal use.

Note Modifying these prefix strings can cause the ePBR to not function properly and would impact ISSU.

• Router ACLs may be enabled alongside layer-3 ePBR policies on supported layer-3 interfaces, only when statistics is not enabled for either ePBR policies or the router ACLs. See **Guidelines and Limitations**

for Policy-Based Routing in the Policy-based routing chapter of *Cisco Nexus 9000 Series NX-OS Unicast Routing Configuration Guide* for details on this limitation.

- On Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX switches, before
 performing ISSD from Cisco NX-OS, Release 10.2 and later releases to Release 10.1 disable ePBR
 policies and proceed with downgrade.
- ePBR policy definition can be applied to a maximum of 32 interfaces of supported interface types across forward and reverse directions.
- Configuration rollback and configuration replace are supported only when the ePBR policy is not
 associated with any interfaces and the ePBR service definitions are not used in any active ePBR policy
 in both the source and target configurations. However, configuration rollback and configuration replace
 do not support policy to interface association and disassociation.
- Disabling the atomic update may allow more TCAM resources to be made available for the ePBR policies, but it may cause possible disruption in traffic during configuration changes to the policies or during fail-over and recovery of service endpoints. For further details, see **Atomic ACL Updates** section of *Cisco Nexus 9000 Series NX-OS Security Configuration Guide*.
- Unique policies are generated for every interface that is configured with an ePBR policy. Additionally
 unique policies are also generated for every service interface that needs to steer the traffic to the next
 service function inside a service-chain configured for a match inside an ePBR policy. The scale of
 supported EPBR policies may vary with the available ACL labels in the system for PBR policies. For
 further details on ACL labels sizes, see Maximum Label Sizes Supported for ACL Types section of *Cisco Nexus 9000 Series NX-OS Security Configuration Guide*.
- For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address.

The following guidelines and limitations apply to ePBR over VXLAN feature:

- In VXLAN fabric, service chaining cannot be done to devices within same VLAN. All devices must be
 present in separate VLANs.
- When every service in the chain is in the same VRF, ePBR is only supported at a single site in a VXLAN multisite fabric.
- When every service in the chain is in the same VRF:
 - Active/Standby chain is supported with two service nodes with no restrictions.
 - Active/Standby chain with three or more service nodes in chain requires no two nodes of different type behind same service leaf.
 - In VXLAN fabric you cannot stitch traffic from one service in a leaf and come back later to the same leaf.

Note

These restrictions are not applicable if every service in the chain is in a different VRF context.

When service endpoints are distributed in a VXLAN environment or on VPC peers, the service endpoints
must be configured in an identical order on all switches.

- For service-endpoints distributed in a VXLAN environment, you must configure source loopback interfaces for the probe, so that a unique source IP may be used for IP SLA sessions.
- The ePBR policy should always be originally applied on host or tenant facing interfaces. The ePBR policy should be applied on Layer-3 VNI interfaces pertaining to the tenant or service VRFs only as the transit interfaces.

The following guidelines and limitations apply to the match ACL feature:

- Only ACEs with the permit method are supported in the ACL. ACEs with any other method (such as deny or remark) are ignored.
- · A maximum of 256 permit ACEs are supported in one ACL.
- Layer-4 ACE rules with port operations other than port equality operations are not supported.
- ACEs with object-groups specified as address-groups or port-groups in either source or destination parameters are not supported.

The following guidelines and limitations apply to inter-VRF service chaining:

- Beginning with Cisco NX-OS 10.2(1)F Release, every service in a chain should either exist in the same VRF or completely unique VRFs.
- In version 10.2(1)F, fail-action bypass mechanism is not supported when every service in the chain exists in a unique VRF.
- From Cisco NX-OS 10.2(2)F Release, fail-action bypass is supported when the services in the chain are in unique VRFs.
- If the services are in a different VRF than the VRF context of the interface on which the ePBR policy is applied, the user should ensure that the tenant routes are leaked to every service VRF, in order to ensure that the traffic is able to route back to the tenant VRF, at the end of the service chain.
- From Cisco NX-OS Release 10.2(2)F, PBR allows multiple backup next-hops related to different VRFs to be configured for a route-map sequence. This allows ePBR to enable fail-action bypass from service pertaining to one VRF to another effectively.
- Beginning with Cisco NX-OS Release 10.2(3)F, to minimize traffic disruptions during session operations of endpoint additions, service sequence additions, deletions, and modifications, it is recommended to have load-balance buckets configured ahead and avoid modification to the load-balance configuration. Ensure that the configured buckets for load-balance are greater than the number of endpoints configured in services for every sequence in the chain.

The following guidelines and limitations applies if you are using source IP-based load balancing and load-balancing traffic to more than 1 endpoint:

- The source IPv4 subnet mask of the ACE inside the match access-list cannot be /32, or the subnet mask of the source IPv6 address inside the match access-list cannot be /128.
- The destination IPv4 subnet mask of the ACE inside the match access-list cannot be /32, or the subnet mask of the source IPv6 address inside the match access-list cannot be /128.
- The subnet masks for the source address or destination address inside the match access-list, based on the load-balance method, must be compatible with the buckets configured for the match or must be compatible with the number of buckets required, based on the number of endpoints in the services being used for the match.

Configuring ePBR L3

Before you begin

Make sure you have configured IP SLA and PBR features before configuring the ePBR feature.

Configuring ePBR Service, Policy, and Associating to an Interface

The following section provides information about configuring the ePBR Service, ePBR Policy, and associating the policy on to an interface.

SUMMARY STEPS

- 1. configure terminal
- 2. epbr service service-name
- **3.** [no] probe {icmp | *l*4-proto port-number [control status] | http get [*url-name* | dns hosthost-name ctp} [frequency *freq-num* | timeout seconds | retry-down-count down-count | retry-up-count *up-count* | source-interface *src-intf*
- 4. vrf vrf-name
- **5.** service-endpoint {ip ipv4 address | ipv6 ipv6 address } [interface interface-name interface-number]
- 6. probe track track ID
- 7. reverse ip ip address interface interface-name interface-number
- 8. exit
- **9. epbr policy** *policy-name*
- **10.** match { [ip address *ipv4 acl-name*] | [ipv6 address *ipv6 acl-name*] } [redirect | drop | exclude]
- **11. [no] load-balance [method { src-ip | dst-ip}] [buckets** *sequence-number*]
- **12.** sequence-number set service service-name [fail-action { bypass | drop | forward }]
- **13.** interface interface-name interface-number
- **14.** epbr { ip | ipv6} policy policy-name [reverse]
- 15. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal	Enters configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	epbr service service-name	Creates a new ePBR service.
	<pre>Example: switch(config)# epbr service firewall</pre>	
Step 3	[no] probe {icmp <i>l</i> 4-proto port-number [control status] http get [<i>url-name</i> dns hosthost-name ctp} [frequency freq-num timeout seconds retry-down-count	Configures the probe for the ePBR service. The probe types supported are ICMP, TCP, UDP, DNS, and HTTP, CTP.

down-count retry-up-count up-count source-interface src-inff The options are as follows: Example: switch (config)# probe icmp • frequency-Specifies the frequency of the probe in seconds. The range is from 1 to 604800. • retry-down-count -Specifies the number of recounts undertaken by the probe when the node goes down. The range is from 1 to 5. • retry-down-count -Specifies the number of recounts undertaken by the probe when the node goes down. The range is from 1 to 5. Step 4 vrf vrf-name Specifies the length of the timeout period in seconds. The range is from 1 to 604800. Step 5 service-endpoint [ip ipv4 address] ipv6 ipv6 address] [Interface interface-name interface-number] Configures service endpoint for the ePBR service. Example: switch (config=vrf) # service-endpoint 1p interface interface-number] Configures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service. Step 6 probe track track ID Example: switch (config=vrf) # probe track 30 Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. You can assign track ID to each endpoint. Step 7 reverse ip p address interface-name interface-namebr Defines the reverse IP address where the traffic policies are applied. switch (config=vrf) # exit Step 10 exit UP configured to match the forward IP address. Step 8 exit exit Profigure for policy files at PIC (soufigured to match the forward IP address.		Command or Action	Purpose
sre-inff Example: • frequency—Specifies the frequency of the probe in seconds. The range is from 1 to 604800. switch(config)# probe 1cmp • retry-down-count—Specifies the number of recounts undertaken by the probe when the node goes down. The range is from 1 to 5. switch(config)# probe 1cmp • retry-down-count—Specifies the number of recounts undertaken by the probe when the node goes down. The range is from 1 to 5. switch(config)# vrf tenant_A Specifies the length of the timeout period in seconds. The range is from 1 to 604800. Step 4 vrf vrf.name Example: switch(config-vrf)# service-endpoint [ip ipv4 address] [interface number] Example: Specifies the VRF for the ePBR service. Step 5 service-endpoint [ip ipv4 address] [interface number] Example: service.endpoint 1p vz1x.1.1.2.00 interface number] Example: service.endpoint 1p vz1x.1.2.1.2.01 interface interface-name interface.number Defines a track separately and assign an existing track ID Example: switch(config-vrf)# probe track 30 Step 7 reverse ip ip address interface interface-name interfaces number Example: witch(config-vrf)# exit seconds.2.0.200 witch(config-vrf)# exit configuret		down-count retry-up-count up-count source-interface	The options are as follows:
switch(config)4 grobe icmp • retry-down-count—Specifies the number of recounts undertaken by the probe when the node goes down. The range is from 1 to 5. • retry-up-count—Specifies the number of recounts undertaken by the probe when the node comes back up. The range is from 1 to 5. • retry-up-count—Specifies the number of recounts undertaken by the probe when the node comes back up. The range is from 1 to 5. • retry-up-count—Specifies the length of the timeout period in seconds. The range is from 1 to 5. Step 4 vrf vrf.name Example: switch(config) + vrf tenant_A Step 5 service-endpoint (1p [pv4 address] ipv6 ipv6 address) [interface interface-number] Example: switch(config-vrf) # service-endpoint ip 172.16.1.200 interface VLANI00 Step 6 probe track track ID Example: switch(config-vrf) # probe track 30 Step 7 reverse ip ip address interface interface-name interface-name interface-name interface-name interface-name interface-name interface-name interface-name interface-name interface vIAN201 Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit Example: Switch (config-vrf) # exit Step 8 exit Example: Switch (config-vrf) # exit Step 9 ephr policy name Example: Switch (config) + ephr policy tenant_x-Redirect Step 10<		src-intf Example:	• frequency—Specifies the frequency of the probe in seconds. The range is from 1 to 604800.
step 4 • retry-up-count — Specifies the number of recounts undertaken by the probe when the node comes back up. The range is from 1 to 5. • timeout — Specifies the length of the timeout period in seconds. The range is from 1 to 604800. Step 4 vrf vrf-name Example: switch(config) # vrf tenant_A Specifies the VRF for the ePBR service. Step 5 service-endpoint {ip ipv4 address ipv6 ipv6 address}] [interface interface-name interface-name] Configures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service. You can repeat steps 2 to 5 to configure another ePBR service. Step 6 probe track track ID Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. Step 7 reverse ip ip address interface interface-name interface-name interface-name interface-name interface-name interface-name interface VLAN201 Defines a track separately and assign an existing track ID to each endpoint. Step 7 reverse ip ip address interface interface-name interface-name interface VLAN201 Defines the reverse IP and interfaces where the traffic policies are applied. Note For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address. switch(config-vrf) # reverse ip 172,16,30,200 interface vLAN201 step 8 exit Exis VRF configuration mode and enters global configuration mode. switch(config) #		switch(config)# probe icmp	• retry-down-count —Specifies the number of recounts undertaken by the probe when the node goes down. The range is from 1 to 5.
step 4 vrf vrf.name Example: switch(config) * vrf tenant_A Step 5 service-endpoint {ip ipv4 address ipv6 ipv6 address } {interface interface-name interface-number] Example: switch(config) * vrf tenant_A Step 5 service-endpoint {ip ipv4 address ipv6 ipv6 address } {interface interface-name interface-number] Example: switch(config-vrf) * service-endpoint ip 172.16.1.200 interface VLANI00 Step 6 probe track track ID Example: switch(config-vrf) * probe track 30 Step 7 reverse ip in address interface interface-name interface-name interface-number Example: switch(config-vrf) * reverse ip 172.16.30.200 switch(config-vrf) * everse ip 172.16.30.200 Defines the reverse IP and interfaces where the traffic policies are applied. Note For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address. Step 8 esit example: switch(config-vrf) * everse ip 172.16.30.200 switch(config-vrf) * everse ip 172.16.30.200 Defines the eVBR policy. switch(config-vrf) * everse ip 172.16.30.200 Step 8 esit Example: Switch(config) * epbr policy Tenant_A-Redirect Step 9 epbr policy-name Exis VRF confi			• retry-up-count —Specifies the number of recounts undertaken by the probe when the node comes back up. The range is from 1 to 5.
Step 4 Vrf vrf-name Specifies the VRF for the ePBR service. Step 5 service-endpoint {ip ipv4 address ipv6 ipv6 address} [interface interface-name interface-name] Configures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service. Step 5 service-endpoint {ip ipv4 address ipv6 ipv6 address} [interface interface-name interface-name] Configures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service. Step 6 probe track track ID Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. You can assign track ID to each service-endpoint. Step 7 reverse ip ip address interface interface-name interface-name interface-name interface vLAN201 Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit Example: switch (config-vrf) # reverse ip 172,16,30,200 interface VLAN201 Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit Example: switch (config-vrf) # reverse ip 172,16,30,200 interface vLAN201 Defines the reverse IP and interfaces set boddress Step 9 epbr policy policy-name Exits VRF configuration mode and enters global configuration mode. switch (config) # eptr policy Tenant_A-Redirect Configures the ePBR policy. Step 10 match { [ip address ipv4 acl-name] [ipv6 address WBB Matches an			• timeout —Specifies the length of the timeout period in seconds. The range is from 1 to 604800.
Example: switch (config) # vrf tenant_AConfigures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service.Step 5service-endpoint {ip ip/4 address ip/6 ip/6 address } [interface interface-number] Example: switch (config-vrf) # service-endpoint ip 172.16.1200 interface VLANIO0Configures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service.Step 6probe track track ID Example: switch (config-vrf) # probe track 30Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. You can assign track ID to each endpoint.Step 7reverse ip ip address interface interface-name interface-numberDefines the reverse IP and interfaces where the traffic policies are applied.Step 8exit Example: switch (config-vrf) # reverse ip 172.16.30.200 interface VLAN201Exit K VRF configuration mode and enters global configuration mode.Step 9epbr policy policy-name Example: switch (config) # epbr policy Tenant_A-RedirectConfigures the ePBR policy.Step 10match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Example: switch (config) # match ip address WEBMatches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude	Step 4	vrf vrf-name	Specifies the VRF for the ePBR service.
Step 5 service-endpoint {ip ipv4 address ipv6 ipv6 address} [interface interface-name interface-number] Configures service endpoint for the ePBR service. You can repeat steps 2 to 5 to configure another ePBR service. Step 6 probe track track ID Example: switch (config-vrf) # probe track 30 Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. You can assign track ID to each endpoint. Step 7 reverse ip ip address interface interface-name interface-number Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit Example: switch (config-vrf) # probe track 30 Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit Example: switch (config-vrf) # everse ip 172,16,30,200 interface VLAN201 Defines the reverse IP address must be explicitly configured to match the forward IP address. Step 8 exit Example: switch (config) # epbr policy remant_A-Redirect Exits VRF configuration mode and enters global configuration mode. Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] [redirect drop exclude] Configures the ePBR policy. Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] [redirect drop exclude] For on e-and traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude		<pre>Example: switch(config)# vrf tenant_A</pre>	
[Interface interface-name interface-number] Example: switch (config-vrf) # service-endpoint ip 172.16.1.200 interface VLANI00You can repeat steps 2 to 5 to configure another ePBR service.Step 6probe track track ID Example: switch (config-vrf) # probe track 30Defines a track separately and assign an existing track ID to each service-endpoint in ePBR.Step 7reverse ip ip address interface interface-name interface-numberDefines the reverse IP and interfaces where the traffic policies are applied.Step 8exit Example: switch (config-vrf) # reverse ip 172.16.30.200 interface VLAN201Defines the reverse IP and interfaces where the traffic policies are applied.Step 8exit Example: switch (config-vrf) # reverse ip 172.16.30.200 interface VLAN201Configuration mode and enters global configuration mode.Step 9epbr policy policy-name Example: switch (config) # epbr policy Tenant_A-RedirectConfigures the ePBR policy.Step 10match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Example: switch (config) # match ip address WEBMatches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude	Step 5	service-endpoint { ip <i>ipv4 address</i> ipv6 <i>ipv6 address</i> }	Configures service endpoint for the ePBR service.
Switch (config-vrf) # service-endpoint ip 172.16.1.200 interface VLAN100 Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. You can assign track ID to each endpoint. Step 6 probe track track ID Example: switch (config-vrf) # probe track 30 Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. You can assign track ID to each endpoint. Step 7 reverse ip ip address interface interface-name interface-number Defines the reverse IP and interfaces where the traffic policies are applied. Step 7 reverse ip interface		[interface interface-name interface-number] Example:	You can repeat steps 2 to 5 to configure another ePBR service
Step 6 probe track track ID Defines a track separately and assign an existing track ID Example: switch (config-vrf) # probe track 30 Defines a track separately and assign an existing track ID to each service-endpoint in ePBR. Step 7 reverse ip ip address interface interface-name interface-name interface-namber You can assign track ID to each endpoint. Step 7 reverse ip ip address interface interface-name interface-name interface number Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address. Step 8 exit Exits VRF configuration mode and enters global configuration mode. switch (config-vrf) # exit Step 10 match {[ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [ipv6 address ipv6 acl-name] } [ipv6 address ipv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude		<pre>switch(config-vrf)# service-endpoint ip 172.16.1.200 interface VLAN100</pre>	
Example: switch (config-vrf) # probe track 30to each service-endpoint in ePBR. You can assign track ID to each endpoint.Step 7reverse ip ip address interface interface-name interface-numberDefines the reverse IP and interfaces where the traffic policies are applied.Step 7reverse ip ip address interface interface-name interface-numberDefines the reverse IP and interfaces where the traffic policies are applied.Step 8example: switch (config-vrf) # reverse ip 172.16.30.200 interface VLAN201Defines the reverse IP and interfaces where the forward IP address.Step 8exit Example: switch (config-vrf) # exitExits VRF configuration mode and enters global configuration mode.Step 9epbr policy policy-name Example: switch (config) # epbr policy Tenant_A-RedirectConfigures the ePBR policy.Step 10match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Example: switch (config) # match ip address webMatches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude	Step 6	probe track track ID	Defines a track separately and assign an existing track ID
switch (config-vrf) # probe track 30You can assign track ID to each endpoint.Step 7reverse ip in address interface interface-name interface-numberDefines the reverse IP and interfaces where the traffic policies are applied.Step 7reverse ip in address interface interface-name interface-numberDefines the reverse IP and interfaces where the traffic policies are applied.Step 8Example: switch (config-vrf) # reverse ip 172.16.30.200 interface VLAN201Note For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address.Step 8exit Example: switch (config-vrf) # exitExits VRF configuration mode and enters global configuration mode.Step 9epbr policy policy-name Example: switch (config) # epbr policy Tenant_A-RedirectConfigures the ePBR policy.Step 10match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Example: switch (config) # match ip address WEBMatches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude		Example:	to each service-endpoint in ePBR.
Step 7 reverse ip ip address interface interface-name interface-name interface-number Defines the reverse IP and interfaces where the traffic policies are applied. Step 7 Example: switch(config-vrf)# reverse ip 172.16.30.200 interface VLAN201 Defines the reverse IP and interfaces where the traffic policies are applied. Step 8 exit For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address. Step 8 exit Example: switch(config-vrf)# exit Exits VRF configuration mode and enters global configuration mode. Step 9 epbr policy policy-name Configures the ePBR policy. Example: switch(config)# epbr policy Tenant_A-Redirect Configures the ePBR policy. Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude		<pre>switch(config-vrf)# probe track 30</pre>	You can assign track ID to each endpoint.
Example: switch (config-vrf)# reverse ip 172.16.30.200 interface VLAN201Note For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address.Step 8exit Example: switch (config-vrf)# exitExits VRF configuration mode and enters global configuration mode.Step 9epbr policy policy-name Example: switch (config)# epbr policy Tenant_A-RedirectConfigures the ePBR policy.Step 10match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Example: 	Step 7	reverse ip <i>ip address</i> interface <i>interface-name interface-number</i>	Defines the reverse IP and interfaces where the traffic policies are applied.
Step 8 exit Example: switch (config-vrf) # exit Exits VRF configuration mode and enters global configuration mode. Step 9 epbr policy policy-name Configures the ePBR policy. Example: switch (config) # epbr policy Tenant_A-Redirect Configures the ePBR policy. Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 address ipv6 acl-name] } [redirect drop exclude] Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude		<pre>Example: switch(config-vrf)# reverse ip 172.16.30.200 interface VLAN201</pre>	Note For one-arm service devices, the reverse IP address must be explicitly configured to match the forward IP address.
Example: switch(config-vrf)# exitconfiguration mode.Step 9epbr policy policy-name Example: switch(config)# epbr policy Tenant_A-RedirectConfigures the ePBR policy.Step 10match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Example: switch(config)# match ip address WEBMatches an IPv4 or IPv6 address against an IP or IPv6 	Step 8	exit	Exits VRF configuration mode and enters global
Step 9 epbr policy policy-name Configures the ePBR policy. Example: switch(config) # epbr policy Tenant_A-Redirect Configures the ePBR policy. Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] [ipv6 address ipv6 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude		<pre>Example: switch(config-vrf)# exit</pre>	configuration mode.
Example: switch(config) # epbr policy Tenant_A-Redirect Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude witch(config) # match ip address WEB match ip address WEB	Step 9	epbr policy policy-name	Configures the ePBR policy.
switch(config) # epbr policy Tenant_A-Redirect Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] [ipv6 address ipv6 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude switch(config) # match ip address WEB match ip address WEB		Example:	
Step 10 match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the incoming interface. Exclude option is used to exclude switch (config) # match ip address WEB web		<pre>switch(config)# epbr policy Tenant_A-Redirect</pre>	
switch(config) # match ip address WEB incoming interface. Exclude option is used to exclude	Step 10	<pre>match { [ip address ipv4 acl-name] [ipv6 address ipv6 acl-name] } [redirect drop exclude] Evample:</pre>	Matches an IPv4 or IPv6 address against an IP or IPv6 ACLs. Redirect is the default action for a match traffic. Drop is used when the traffic needs to be dropped on the
		switch(config)# match ip address WEB	incoming interface. Exclude option is used to exclude

	Command or Action	Purpose
		certain traffic from service-chaining on the incoming interface.
		You can repeat this step to match multiple ACLs based on the requirement.
Step 11	[no] load-balance [method { src-ip dst-ip}] [buckets sequence-number]	Computes the load balance method and the number of buckets to be used by the ePBR service.
	Example:	
	<pre>switch(config)# load-balance method src-ip mask-position 3</pre>	
Step 12	<pre>sequence-number set service service-name [fail-action { bypass drop forward}]</pre>	Computes the fail-action mechanism.
	Example:	
	<pre>switch(config)# set service firewall fail-action drop</pre>	
Step 13	interface interface-name interface-number	Configures an interface and enters interface configuration
	Example:	mode.
	<pre>switch(config)# interface vlan 2010</pre>	
Step 14	epbr { ip ipv6} policy policy-name [reverse]	An interface may be associated at any time with one or
	Example:	more of the following:
	<pre>switch(config-if)# epbr ip policy</pre>	• an IPV4 policy in the forward direction
	Tenant_A-Redirect	• an IPv4 policy in the reverse direction
		• an IPv6 policy in the forward direction
		• an IPv6 policy in the reverse direction
Step 15	exit	Exits interface configuration mode and returns to global
	Example:	configuration mode.
	<pre>switch(config-if) # end</pre>	

Modifying a Service Using ePBR Session

The following steps explain how to modify a service using ePBR session.

SUMMARY STEPS

- 1. epbr session
- 2. epbr service service-name
- **3. [no] service-endpoint** {**ip** *ipv4 address* | **ipv6** *ipv6 address*} [**interface** *interface-name interface-number*]
- **4.** service-endpoint {ip *ipv4 address* | ipv6 *ipv6 address*} [interface *interface-name interface-number*]
- 5. reverse ip *ip address* interface *interface-name interface-number*
- 6. commit

7. abort

DETAILED STEPS

	Command or Action	Purpose
Step 1	epbr session	Enters ePBR session mode.
	Example:	
	<pre>switch(config)# epbr session</pre>	
Step 2	epbr service service-name	Specifies the configured ePBR service in the ePBR session
	Example:	mode.
	<pre>switch(config-epbr-sess)# epbr service TCP_OPTIMIZER</pre>	
Step 3	[no] service-endpoint {ip <i>ipv4</i> address ipv6 <i>ipv6</i> address} [interface interface-name interface-number]	Disables the configured service endpoint for the ePBR service.
	Example:	
	<pre>switch(config-epbr-sess-svc)# no service-end-point ip 172.16.20.200 interface VLAN200</pre>	
Step 4	service-endpoint { ip <i>ipv4 address</i> ipv6 <i>ipv6 address</i> } [interface <i>interface-name interface-number</i>]	Modifies the service endpoint and replaces the IP for the ePBR service.
	Example:	
	<pre>switch(config-epbr-sess-svc)#service-end-point ip 172.16.25.200 interface VLAN200</pre>	
Step 5	reverse ip <i>ip address</i> interface <i>interface-name interface-number</i>	Defines the reverse IP and interfaces where the traffic policies are applied.
	Example:	
	<pre>switch(config-epbr-sess-svc-ep)# reverse ip 172.16.30.200 interface VLAN201</pre>	
Step 6	commit	Completes the modification of the ePBR service using the
	Example:	ePBR session.
	<pre>switch(config-epbr-sess)# commit</pre>	Note Restart the ePBR session after you complete this step.
Step 7	abort	Aborts the session and clears or resets the current
	Example:	abandon the current session configuration in case of errors
	<pre>switch(config-epbr-sess)# abort</pre>	or unsupported configuration identified during commits
		Note Restart a new ePBR session after this with the rectified configuration.

Modifying a Policy Using ePBR Session

The following steps explain how to modify a policy using ePBR Session.

SUMMARY STEPS

- 1. epbr session
- **2. epbr policy** *policy-name*
- **3.** [no] match { [ip address *ipv4 acl-name*] | [ipv6 address *ipv6 acl-name*] [l2 address *ipv6 acl-name*]} vlan {vlan | vlan range | all} [redirect | drop | exclude] }
- **4.** match { [ip address *ipv4 acl-name*] | [ipv6 address *ipv6 acl-name*] [l2 address *ipv6 acl-name*]} vlan {vlan range | all} [redirect | drop | exclude] }
- 5. sequence-number set service service-name [fail-action { bypass | drop | forward }]
- 6. [no] load-balance [method { src-ip | dst-ip}] [buckets sequence-number]
- 7. commit
- 8. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	epbr session	Enters ePBR session mode.
	Example:	
	<pre>switch(config)# epbr session</pre>	
Step 2	epbr policy policy-name	Specifies the configured ePBR policy in the ePBR session
	Example:	mode.
	<pre>switch(config-epbr-sess)# epbr policy Tenant_A-Redirect</pre>	
Step 3	[no] match { [ip address <i>ipv4 acl-name</i>] [ipv6 address <i>ipv6 acl-name</i>] [l2 address <i>ipv6 acl-name</i>]} vlan {vlan vlan range all} [redirect drop exclude] }	Disables the IP address matching against the IP or IPv6 ACLs.
	Example:	
	<pre>switch(config-epbr-sess-pol)# no match ip address WEB</pre>	
Step 4	match { [ip address ipv4 acl-name] [ipv6 address ipv6acl-name] [l2 address ipv6 acl-name]} vlan {vlan vlanrange all} [redirect drop exclude] }	Modifies the IP address matching against the IP or IPv6 ACLs.
	Example:	
	<pre>switch(config-epbr-sess-pol)# match ip address HR</pre>	
Step 5	<pre>sequence-number set service service-name [fail-action { bypass drop forward }]</pre>	Adds, modifies, or deletes sequences for a match, or modifies the fail-action for an existing sequence.
	Example:	
	<pre>switch(config-epbr-sess-pol-match)# set service firewall fail-action drop</pre>	

	Command or Action	Purpose
Step 6	[no] load-balance [method { src-ip dst-ip}] [buckets sequence-number]	Computes the load balance method and the number of buckets to be used by the ePBR service.
	<pre>Example: switch(config-epbr-sess-pol-match)# load-balance method src-ip mask-position 3</pre>	Note On omitting this configuration in the session context while modifying the service-chain for an existing match, the load-balance configuration for the match will be reset to default
Step 7	commit Example:	Completes the modification of the ePBR policy using the ePBR session.
Step 8	end Example: switch(config-epbr-sess)#end	Exits the ePBR session mode.

Updating the Access-list Used by ePBR Policies

The following steps explain how to update the access-list used by ePBR policies:

SUMMARY STEPS

- 1. epbr session access-list acl-name refresh
- **2**. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	epbr session access-list acl-name refresh	Updates or refreshes the policy generated ACLs.
	Example:	
	<pre>switch(config)# epbr session access-list WEB refresh</pre>	
Step 2	end	Exits the global configuration mode.
	Example:	
	<pre>switch(config)# end</pre>	

ePBR Show Commands

The following list provides the show commands associated with ePBR.

SUMMARY STEPS

- **1.** show epbr policy policy-name [reverse]
- 2. show epbr statistics *policy-name* [reverse]

- **3**. show tech-support epbr
- 4. show running-config epbr
- 5. show startup-config epbr

DETAILED STEPS

	Command or Action	Purpose
Step 1	show epbr policy policy-name [reverse]	Displays information on the ePBR policy applied in forward
	Example:	or reverse direction.
	switch# show epbr policy Tenant_A-Redirect	
Step 2	show epbr statistics <i>policy-name</i> [reverse]	Displays the ePBR policy statistics.
	Example:	
	switch# show ePBR statistics policy pol2	
Step 3	show tech-support epbr	Displays the technical support information for ePBR.
	Example:	
	switch# show tech-support epbr	
Step 4	show running-config epbr	Displays the running configuration for ePBR.
	Example:	
	switch# show running-config epbr	
Step 5	show startup-config epbr	Displays the startup configuration for ePBR
	Example:	
	switch# show startup-config epbr	

Verifying ePBR Configuration

To verify the ePBR configuration, use the following commands:

Command	Purpose
show ip/ipv6 policy vrf <context></context>	Displays the IPv4/IPv6 route-map policies created for the Layer-3 ePBR policy, at the interfaces at which service chain is applied and the relevant end-point interfaces of the service-chain.
show route-map dynamic <route-map name=""></route-map>	Displays the next-hops configured for traffic re-direction for specific bucket access-lists, used for forwarding traffic at every point in the service chain.
show ip/ipv6 access-list <access-list name=""> dynamic</access-list>	Displays the traffic match criteria for a bucket access-list.
show ip sla configuration dynamic	Displays the IP SLA configuration generated by ePBR, for the service-end-points in the chain, when probes are enabled.

Command	Purpose
show track dynamic	Displays the tracks generated by ePBR, for the service-end-points in the chain, when probes are enabled.

Configuration Examples for ePBR L3

Example: ePBR NX-OS Configuration

The following topology illustrates ePBR NX-OS configuration.

Figure 1: ePBR NX-OS Configuration

Example: Use-Case: Create a Service Chain for Web Traffic in Forward Direction Only

The following configuration example shows how to create a service chain for web traffic in forward direction only.

```
IP access list web traffic
        10 permit tcp any any eq www
ePBR service FW1
  service-end-point ip 10.1.1.2 interface Vlan10
    reverse interface Vlan11
ePBR service FW2
  service-end-point ip 12.1.1.2 interface Vlan12
   reverse interface Vlan13
ePBR service Web_cache
  service-end-point ip 16.1.1.2 interface Vlan16
    reverse interface Vlan17
ePBR policy tenant_1
  match ip address web-traffic
   10 set service FW1
    20 set service FW2
    30 set service Web cache
interface Eth1/8
  ePBR ip policy tenant 1
```

The following example shows how to verify the configuration of service chain creation for web traffic in forward direction.

```
switch# show ePBR policy tenant_1
Policy-map : tenant_1
Match clause:
    ip address (access-lists): web-traffic
Service chain:
    service FW1, sequence 10, fail-action No fail-action
    IP 10.1.1.2
    service FW2, sequence 20, fail-action No fail-action
    IP 12.1.1.2
    service Web_cache, sequence 30, fail-action No fail-action
    IP 16.1.1.2
Policy Interfaces:
    Eth1/8
```

Example: Use-Case : Load Balance TCP Traffic Using ePBR in Forward Direction Only

The following configuration example shows how to load balance TCP traffic using ePBR in forward direction only.

The following example shows how to verify the configuration of load balance TCP traffic using EPBR in forward direction.

```
switch# show ePBR policy tenant_1
Policy-map : tenant_1
Match clause:
    ip address (access-lists): tcp_traffic
Service chain:
    service TCP_Optimizer, sequence 10, fail-action No fail-action
    IP 20.1.1.2
    IP 20.1.1.3
    IP 20.1.1.4
Policy Interfaces:
    Eth1/8
```

Example: Use-Case: Create a Service Chain for Web Traffic in Both Directions

The following configuration example shows how to create a service chain for web traffic in both forward and reverse directions.

```
IP access list web_traffic
10 permit tcp any any eq www
```

ePBR service FW1

```
service-end-point ip 10.1.1.2 interface Vlan10
    reverse ip 11.1.1.2 interface Vlan11
ePBR service FW2
  service-end-point ip 12.1.1.2 interface Vlan12
    reverse ip 13.1.1.2 interface Vlan13
ePBR service Web cache
  service-end-point ip 16.1.1.2 interface Vlan16
   reverse ip 17.1.1.2 interface Vlan17
ePBR policy tenant 1
  match ip address web-traffic
    10 set service FW1
    20 set service FW2
   30 set service Web_cache
interface Eth1/8
  ePBR ip policy tenant 1
interface Eth1/18
  ePBR ip policy tenant 1 reverse
```

The following example shows how to verify the configuration of service chain creation for web traffic in both forward and reverse directions.

```
switch# show ePBR policy tenant 1
Policy-map : tenant 1
 Match clause:
   ip address (access-lists): web-traffic
 Service chain:
   service FW1, sequence 10, fail-action No fail-action
     IP 10.1.1.2
   service FW2, sequence 20, fail-action No fail-action
     IP 12.1.1.2
   service Web cache, sequence 30, fail-action No fail-action
     IP 16.1.1.2
  Policy Interfaces:
   Eth1/8
switch# show ePBR policy tenant 1 reverse
Policy-map : tenant 1
 Match clause:
   ip address (access-lists): web-traffic
  Service chain:
   service Web cache, sequence 30, fail-action No fail-action
     IP 17.1.1.2
   service FW2, sequence 20, fail-action No fail-action
     IP 13.1.1.2
    service FW1, sequence 10, fail-action No fail-action
     IP 11.1.1.2
  Policy Interfaces:
    Eth1/18
```

Example: Use-Case: Load Balance TCP Traffic Using ePBR in Both Directions

The following configuration example shows how to load balance TCP traffic using ePBR in both forward and reverse directions.

```
ePBR service TCP_Optimizer
service-interface Vlan20
service-end-point ip 20.1.1.2
reverse ip 20.1.1.22
```

```
service-end-point ip 20.1.1.3
  reverse ip 20.1.1.23
  service-end-point ip 20.1.1.4
  reverse ip 20.1.1.24
ePBR policy tenant_1
  match ip address tcp_traffic
    10 set service TCP_Optimizer
interface Eth1/8
  ePBR ip policy tenant_1
interface Eth1/18
  ePBR ip policy tenant 1 reverse
```

The following example shows how to verify the configuration of load balance TCP traffic using ePBR in both directions.

```
switch# show ePBR policy tenant_1
Policy-map : tenant_1
 Match clause:
   ip address (access-lists): tcp traffic
  Service chain:
   service TCP Optimizer, sequence 10, fail-action No fail-action
     IP 20.1.1.2
     IP 20.1.1.3
     IP 20.1.1.4
  Policy Interfaces:
   Eth1/8
switch# show ePBR policy tenant_1 reverse
Policy-map : tenant 1
 Match clause:
   ip address (access-lists): tcp traffic
  Service chain:
   service TCP_Optimizer, sequence 10, fail-action No fail-action
     IP 20.1.1.22
      IP 20.1.1.23
      IP 20.1.1.24
  Policy Interfaces:
   Eth1/18
```

Example: ePBR Policy Creation with VXLAN Fabric

The following example/topology shows how to configure ePBR over VXLAN fabric.

probe http get index.html source-interface loopback10

Figure 2: Configuring ePBR over VXLAN Fabric

```
epbr service s4
  service-interface Vlan120
  vrf vrf1
  probe udp 6900 control enable source-interface loopback9
  service-end-point ip 120.1.1.2
    reverse ip 120.1.1.2
epbr policy p1
 statistics
 match ip address acl1
    load-balance buckets 16 method src-ip
   10 set service s1 fail-action drop
   20 set service s2 fail-action drop
   30 set service s4 fail-action bypass
 match ip address acl2
    load-balance buckets 8 method dst-ip
    10 set service s1 fail-action drop
    20 set service s3 fail-action forward
   30 set service s4 fail-action bypass
interface Vlan100 - Vxlan L3vni interface to which the policy is applied on all service
leafs
  epbr ip policy pl
  epbr ip policy pl reverse
```

Apply forward policy on ingress interface in border leaf where traffic coming in needs to be service-chained:

```
interface Vlan30 - Traffic matching acl1
  epbr ip policy p1
  int vlan 130 - Traffic matching acl2
  epbr ip policy p1
```

Apply the reverse policy On leaf connected to server if reverse traffic flow needs to be enabled:

```
int vlan 130 - Traffic matching reverse flow for acl1
epbr ip policy p1 rev
int vlan 140 - Traffic matching reverse flow for acl1
epbr ip policy p1 rev
```

Example: Configuring ePBR Service

The following example shows how to configure ePBR service.

```
epbr service FIREWALL
  probe icmp
  vrf TENANT_A
  service-endpoint ip 172.16.1.200 interface VLAN100
      reverse ip 172.16.2.200 interface VLAN101
  service-endpoint ip 172.16.2.201 interface VLAN101
epbr service TCP_Optimizer
  probe icmp
  vrf TENANT_A
service-endpoint ip 172.16.20.200 interface VLAN200
      reverse ip 172.16.30.200 interface VLAN201
```

Example: Configuring ePBR Policy

The following example shows how to configure ePBR Policy.

```
epbr service FIREWALL
  probe icmp
  service-end-point ip 1.1.1.1 interface Ethernet1/1
    reverse ip 1.1.1.2 interface Ethernet1/2
epbr service TCP Optimizer
probe icmp
 service-end-point ip 1.1.1.1 interface Ethernet1/3
    reverse ip 1.1.1.4 interface Ethernet1/4
epbr policy Tenant_A-Redirect
match ip address WEB
  load-balance method src-ip
 10 set service FIREWALL fail-action drop
 20 set service TCP Optimizer fail-action bypass
match ip address APP
 10 set service FIREWALL fail-action drop
match ip address exclude acl exclude
match ip address drop_acl drop
```

The following example shows the output of show ePBR Policy command with fail-action drop information.

```
switch(config-if) # show epbr policy Tenant A-Redirect
Policy-map : Tenant A-Redirect
 Match clause:
    ip address (access-lists): WEB
action:Redirect
   service FIREWALL, sequence 10, fail-action Drop
     IP 1.1.1.1 track 1 [INACTIVE]
   service TCP Optimizer, sequence 20, fail-action Bypass
    IP 1.1.1.1 track 2 [INACTIVE]
Match clause:
    ip address (access-lists): APP
action:Redirect
   service FIREWALL, sequence 10, fail-action Drop
    IP 1.1.1.1 track 1 [INACTIVE]
Match clause:
   ip address (access-lists): exclude acl
action:Deny
Match clause:
   ip address (access-lists): drop acl
action:Drop
Policy Interfaces:
  Eth1/4
```

Example: Associating an Interface with ePBR Policy

The following example shows how to configure ePBR Policy.

```
interface vlan 2010
  epbr ip policy Tenant_A-Redirect
interface vlan 2011
  epbr ip policy Tenant A-Redirect reverse
```

Example: ePBR Policy applied in forward direction

The following example shows the sample Output for policy applied in forward direction.

```
show epbr policy Tenant_A-Redirect
policy-map Tenant_A-Redirect
Match clause:
    ip address (access-lists): WEB
Service chain:
    service FIREWALL , sequence 10 , fail-action drop
```

Example: ePBR Policy applied in reverse direction

The following example shows the sample Output for policy applied in reverse direction.

```
show epbr policy Tenant A-Redirect reverse
policy-map Tenant A-Redirect
Match clause:
 ip address (access-lists): WEB
 Service chain:
  service TCP_Optimizer, sequence 20 , fail-action bypass
  ip 172.16.30.200 track 15 [ UP] ]
  service FIREWALL , sequence 10 , fail-action drop
  ip 172.16.2.200 track 13 [ UP ]
  ip 172.16.2.201 track 14 [ DOWN ]
 Match clause:
  ip address (access-lists): APP
 Service chain:
  service FIREWALL , sequence 10 , fail-action drop
  ip 172.16.2.200 track 13 [ UP ]
  ip 172.16.2.201 track 14 [ DOWN ]
 Policy Interfaces:
     Vlan 2011
```

Example: User-defined Track

The following example shows to assign track ID to each end point.

```
epbr service FIREWALL
  probe icmp
  service-end-point ip 1.1.1.2 interface Ethernet1/21
probe track 30
reverse ip 1.1.1.3 interface Ethernet1/22
  probe track 40
  service-end-point ip 1.1.1.4 interface Ethernet1/23
    reverse ip 1.1.1.5 interface Ethernet1/24
```

Example: Modifying ePBR Service Using ePBR Session

The following example shows to replace the IP of ePBR service and add another service end point.

```
switch(config)#epbr session
switch(config-epbr-sess)#epbr service TCP_OPTIMIZER
switch(config-epbr-sess-svc)# no service-end-point ip 172.16.20.200 interface VLAN200
switch(config-epbr-sess-svc)#service-end-point ip 172.16.25.200 interface VLAN200
```

switch(config-epbr-sess-svc-ep)# reverse ip 172.16.30.200 interface VLAN201
switch(config-epbr-sess)#commit

Example: Modifying ePBR Policy Using EPBR Session

The following example shows to replace the IP of ePBR policy and add a service chain for the modified policy traffic.

```
switch(config)#epbr session
switch(config-epbr-sess)#epbr policy Tenant_A-Redirect
switch(config-epbr-sess-pol)# no match ip address WEB
switch(config-epbr-sess-pol)#match ip address WEB
switch(config-epbr-sess-pol-match)# 10 set service Web-FW fail-action drop load-balance
method src-ip
switch(config-epbr-sess-pol-match)# 20 set service TCP_Optimizer fail-action bypass
switch(config-epbr-sess-pol)#match ip address HR
switch(config-epbr-sess-pol-match)# 10 set service Web-FW
switch(config-epbr-sess-pol-match)# 20 set service Web-FW
switch(config-epbr-sess-pol-match)# 20 set service TCP_Optimizer
switch(config-epbr-sess-pol-match)# 20 set service TCP_Optimizer
switch(config-epbr-sess)#commit
```

Example: Displaying ePBR Statistics Policy

The following example shows the display of ePBR statistics policy.

```
switch# show epbr statistics policy pol2
Policy-map pol2, match testv6acl
Bucket count: 2
    traffic match : epbr_pol2_1_fwd_bucket_1
    two : 0
    traffic match : epbr_pol2_1_fwd_bucket_2
    two : 0
```
