# debug aaa accounting through debug auto-config

• debug aaa accounting through debug auto-config, page 1

# debug aaa accounting through debug auto-config

# debug aaa accounting

To display information on accountable events as they occur, use the **debugaaaaccounting** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa accounting

no debug aaa accounting

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC
- **Usage Guidelines** The information displayed by the **debugaaaaaccounting** command is independent of the accounting protocol used to transfer the accounting information to a server. Use the **debugtacacs** and **debugradius** protocol-specific commands to get more detailed information about protocol-level issues.

You can also use the **showaccounting** command to step through all active sessions and to print all the accounting records for actively accounted functions. The **showaccounting** command allows you to display the active "accountable events" on the system. It provides systems administrators a quick look at what is happening, and may also be useful for collecting information in the event of a data loss of some kind on the accounting server. The **showaccounting** command displays additional data on the internal state of the authentication, authorization, and accounting (AAA) security system if **debugaaaaccounting** is turned on as well.

Examples

The following is sample output from the **debugaaaaccounting** command:

Router# debug aaa accounting

16:49:21: AAA/ACCT: EXEC acct start, line 10
16:49:32: AAA/ACCT: Connect start, line 10, glare
16:49:47: AAA/ACCT: Connection acct stop:
task\_id=70 service=exec port=10 protocol=telnet address=172.31.3.78 cmd=glare bytes\_in=308
bytes\_out=76 paks\_in=45 paks\_out=54 elapsed\_time=14

Command	Description
debug aaa authentication	Displays information on accountable events as they occur.
debug aaa authorization	Displays information on AAA/TACACS+ authorization.
debug radius	Displays information associated with the RADIUS.
debug tacacs	Displays information associated with the TACACS.

# debug aaa authentication

To display information on authentication, authorization, and accounting (AAA) TACACS+ authentication, use the **debugaaaauthentication** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa authentication

no debug aaa authentication

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	15.0(1)M	This command was introduced in a release earlier than Cisco IOS Release 15.0(1)M.
	12.2(33)SRC	This command was integrated into a release earlier than Cisco IOS Release 12.2(33)SRC.
	12.2(33)SXI	This command was integrated into a release earlier than Cisco IOS Release 12.2(33)SXI.
	Cisco IOS XE	This command was integrated into a release earlier than Cisco IOS XE
	Release 2.1	Release 2.1.

**Use the debugaaaauthentication** command to learn the methods of authentication being used.

**Examples** The following is sample output from the **debugaaaauthentication** command. A single EXEC login that uses the "default" method list and the first method, TACACS+, is displayed.

Router# debug aaa authentication Nov 17 03:06:40.805 PST: AAA/BIND(0000000F): Bind i/f Nov 17 03:06:40.805 PST: AAA/AUTHEN/LOGIN (0000000F): Pick method list 'default'

# debug aaa authorization

To display information on authentication, authorization, and accounting (AAA) TACACS+ authorization, use the **debugaaaauthorization**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa authorization

no debug aaa authorization

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC
- **Use this command to learn the methods of authorization being used and the results of these methods.**

**Examples** The following is sample output from the**debugaaaauthorization**command. In this display, an EXEC authorization for user "carrel" is performed. On the first line, the username is authorized. On the second and third lines, the attribute value (AV) pairs are authorized. The debug output displays a line for each AV pair that is authenticated. Next, the display indicates the authorization method used. The final line in the display indicates the status of the authorization process, which, in this case, has failed.

```
Router# debug aaa authorization

2:23:21: AAA/AUTHOR (0): user='carrel'

2:23:21: AAA/AUTHOR (0): send AV service=shell

2:23:21: AAA/AUTHOR (0): send AV cmd*

2:23:21: AAA/AUTHOR (342885561): Method=TACACS+

2:23:21: AAA/AUTHOR/TAC+ (342885561): user=carrel

2:23:21: AAA/AUTHOR/TAC+ (342885561): send AV service=shell

2:23:21: AAA/AUTHOR/TAC+ (342885561): send AV cmd*

2:23:21: AAA/AUTHOR (342885561): Post authorization status = FAIL

The aaaauthorization command causes a request packet containing a series of AV pairs to be sent to the
```

TACACS+ daemon as part of the authorization process. The daemon responds in one of the following three ways:

- Accepts the request as is
- Makes changes to the request
- · Refuses the request, thereby refusing authorization

The table below describes AV pairs associated with the **debugaaaauthorization** command that may appear in the debug output.

Table 1: Attribute Value Pairs for Authorization

Attribute Value	Description
service=arap	Authorization for the AppleTalk remote access (ARA) protocol is being requested.

ſ

Attribute Value	Description
service=shell	Authorization for EXEC startup and command authorization is being requested.
service=ppp	Authorization for PPP is being requested.
service=slip	Authorization for SLIP is being requested.
protocol=lcp	Authorization for LCP is being requested (lower layer of PPP).
protocol=ip	Used with service=slip to indicate which protocol layer is being authorized.
protocol=ipx	Used with service=ppp to indicate which protocol layer is being authorized.
protocol=atalk	Used with service=ppp or service=arap to indicate which protocol layer is being authorized.
protocol=vines	Used with service=ppp for VINES over PPP.
protocol=unknown	Used for undefined or unsupported conditions.
cmd=x	Used with service=shell, if cmd=NULL, this is an authorization request to start an EXEC. If cmd is not NULL, this is a command authorization request and will contain the name of the command being authorized. For example, cmd=telnet.
cmd-arg=x	Used with service=shell. When performing command authorization, the name of the command is given by a $cmd=x$ pair for each argument listed. For example, $cmd-arg=archie.sura.net$ .
acl=x	Used with service=shell and service=arap. For ARA, this pair contains an access list number. For service=shell, this pair contains an access class number. For example, acl=2.
inacl=x	Used with service=ppp and protocol=ip. Contains an IP input access list for SLIP or PPP/IP. For example, inacl=2.
outacl=x	Used with service=ppp and protocol=ip. Contains an IP output access list for SLIP or PPP/IP. For example, outacl=4.

I

Attribute Value	Description
addr=x	Used with service=slip, service=ppp, and protocol=ip. Contains the IP address that the remote host should use when connecting via SLIP or PPP/IP. For example, addr=172.30.23.11.
routing=x	Used with service=slip, service=ppp, and protocol=ip. Equivalent in function to the /routing flag in SLIP and PPP commands. Can either be true or false. For example, routing=true.
timeout=x	Used with service=arap. The number of minutes before an ARA session disconnects. For example, timeout=60.
autocmd=x	Used with service=shell and cmd=NULL. Specifies an autocommand to be executed at EXEC startup. For example, autocmd=telnet yxz.com.
noescape=x	Used with service=shell and cmd=NULL. Specifies a noescape option to the username configuration command. Can be either true or false. For example, noescape=true.
nohangup=x	Used with service=shell and cmd=NULL. Specifies a nohangup option to the username configuration command. Can be either true or false. For example, nohangup=false.
priv-lvl=x	Used with service=shell and cmd=NULL. Specifies the current privilege level for command authorization as a number from 0 to 15. For example, priv-lvl=15.
zonelist=x	Used with service=arap. Specifies an AppleTalk zonelist for ARA. For example, zonelist=5.
addr-pool=x	Used with service=ppp and protocol=ip. Specifies the name of a local pool from which to get the address of the remote host.

# debug aaa cache filterserver

To help troubleshoot your filter cache configurations, use the **debugaaacachefilterserver** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa cache filterserver

no debug aaa cache filterserver

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(13)T	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRC	This command was integrated into Cisco IOS Release 12.2(33)SRC.

#### **Examples**

I

The following is sample output from the debugaaacachefilterserver command:

Router# debug aaa cache filterserver

AAA/FLTSV:	need "myfilter" (fetch), call 0x612DAC64	
AAA/FLTSV:	send req, call 0x612DAC50	
AAA/FLTSV:	method SERVER GROUP myradius	
AAA/FLTSV:	recv reply, call 0x612DAC50 (PASS)	
AAA/FLTSV:	create cache	
AAA/FLTSV:	add attr "call-inacl"	
AAA/FLTSV:	add attr "call-inacl"	
AAA/FLTSV:	add attr "call-inacl"	
AAA/FLTSV:	skip attr "filter-cache-refresh"	
AAA/FLTSV:	skip attr "filter-cache-time"	
AAA/CACHE:	set "AAA filtserv cache" entry "myfilter" refresh? no	
AAA/CACHE:	set "AAA filtserv cache" entry "myfilter" cachetime 15	
AAA/FLTSV:	add attr to list "call-inacl" call 0x612DAC64	
AAA/FLTSV:	add attr to list "call-inacl" call 0x612DAC64	
AAA/FLTSV:	add attr to list "call-inacl" call 0x612DAC64	
AAA/FLTSV:	PASS call 0x612DAC64	
AAA/CACHE:	timer "AAA filtserv cache", next in 10 secs (0 entries	
AAA/CACHE:	timer "AAA filtserv cache", next in 10 secs (1 entry)	
AAA/CACHE:	destroy "AAA filtserv cache" entry "myfilter"	
AAA/CACHE: timer "AAA filtserv cache", next in 10 secs (0 entries)		

٦

Command	Description
aaa authorization cache filterserver	Enables AAA authorization caches and the downloading of ACL configurations from a RADIUS filter server.

# debug aaa cache group

To debug the caching mechanism and ensure that entries are cached from authentication, authorization, and accounting (AAA) server responses and found when queried, use the **debugaaacachegroup** command in privileged EXEC mode.

debug aaa cache group

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debug information for all cached entries is displayed.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(28)SB	This command was introduced.
	12.2(33)SRC	This command was integrated into Cisco IOS Release 12.2(33)SRC.
	15.0(1)M	This command was integrated into Cisco IOS Release 15.0(1)M.

**Use this command to display debug information about cached entries.** 

**Examples** The following example displays the debug information about all cached entries:

Router# debug aaa cache group

#### **Related Commands**

I

Command	Description
clear aaa cache group	Clears an individual entry or all entries in the cache.
show aaa cache group	Displays cache entries stored by the AAA cache.

# debug aaa common-criteria

To troubleshoot authentication, authorization, and accounting (AAA) common criteria password security policy information, use the **debug aaa common-criteria** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa common-criteria no debug aaa common-criteria

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Conditional debugging for this command is disabled.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	15.0(2)SE	This command was introduced.

### **Use this command to display debug information about AAA common criteria policies.**

Examples

 $\bar{\mathbf{s}}$  The following example displays the debug information about AAA common criteria:

Device> enable
Device# debug aaa common-criteria
AAA common-criteria debugs debugging is on
\*Aug 6 08:21:06.554: AAA CC: User flags:2,Policy flags:4
\*Aug 6 08:21:06.554: AAA CC: Increment ref count to 1 for test
\*Aug 6 08:21:06.554: AAA CC: User test linked to CC policy test

Command	Description
aaa common-criteria policy	Configures a AAA common criteria security policy.
show aaa common-criteria policy	Displays common criteria security policy details.

I

# debug aaa dead-criteria transaction

	To display authentication, authorization, and accounting (AAA) dead-criteria transaction values, use the <b>debugaaadead-criteriatransaction</b> command in privileged EXEC mode. To disable dead-criteria debugging, use the <b>no</b> form of this command.		
	debug aaa dead-cri	teria transaction	
	no debug aaa dead	-criteria transaction	
Syntax Description	<b>ion</b> This command has no arguments or keywords.		
Command Default	If the command is not	ot configured, debugging is not turned on.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.3(6)	This command was introduced.	
	12.3(7)T	This command was integrated into Cisco IOS Release 12.3(7)T. The command output includes two new fields: Current Tries and Elapsed Time.	
Usage Guidelines	Dead-criteria transac displayed are estima explained in the tabl	ction values may change with every AAA transaction. Some of the values that can be ted outstanding transaction, retransmit tries, and dead-detect intervals. These values are e below.	
Examples	The following exam	ple shows dead-criteria transaction information for a particular server group:	
	Router# debug aaa AAA Transaction d *Nov 14 23:44:17. Current Max Tries *Nov 14 23:44:17. 317s, Current Max *Nov 14 23:44:17. Transaction: 6 The table below des	<pre>dead-criteria transaction ebugs debugging is on 403: AAA/SG/TRANSAC: Computed Retransmit Tries: 10, Current Tries: 3, 10 403: AAA/SG/TRANSAC: Computed Dead Detect Interval: 10s, Elapsed Time: Interval: 10s 403: AAA/SG/TRANSAC: Estimated Outstanding Transaction: 6, Current Max cribes the significant fields shown in the display.</pre>	
	Table 2: debug aaa dea	ad-criteria transaction Field Descriptions	

Field	Description	
AAA/SG/TRANSAC	AAA server-group transaction.	

1

Field	Description
Computed Retransmit Tries	Currently computed number of retransmissions before the server is marked as dead.
Current Tries	Number of successive failures since the last valid response.
Current Max Tries	Maximum number of tries since the last successful transaction.
Computed Dead Detect Interval	Period of inactivity (the number of seconds since the last successful transaction) that can elapse before the server is marked as dead. The period of inactivity starts when a transaction is sent to a server that is considered live. The dead-detect interval is the period that the router waits for responses from the server before the router marks the server as dead.
Elapsed Time	Amount of time that has elapsed since the last valid response.
Current Max Interval	Maximum period of inactivity since the last successful transaction.
Estimated Outstanding Transaction	Estimated number of transaction that are associated with the server.
Current Max Transaction	Maximum transaction since the last successful transaction.

Command	Description
radius-server dead-criteria	Forces one or both of the criteriaused to mark a RADIUS server as deadto be the indicated constant.
show aaa dead-criteria	Displays dead-criteria detection information for an AAA server.

# debug aaa per-user

To display debugging information about PPP session per-user activities, use the**debugaaaper-user**command in privileged EXEC mode. To turn off debugging, use the **no** form of this command.

debug aaa per-user

no debug aaa per-user

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	11.3 T	This command has existed since Cisco IOS Release 11.3 T.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** The per-user module is responsible for installing per-user attributes for PPP sessions.

**Examples** The following example displays the configuration commands that were generated by the per-user process:

```
Router# debug aaa per-user
AAA/PER-USER: line=[ip access-list standard Virtual-Access2#31]
AAA/PER-USER: line=[deny 10.0.0.2 0.0.0.0]
AAA/PER-USER: line=[permit any]
The fields in the display are self-explanatory.
```

Command	Description
debug aaa authorization	Displays information on AAA TACACS+ authorization.
debug ppp	Displays information on traffic and exchanges in an internetwork implementing the PPP.
debug radius	Displays information associated with RADIUS.
debug tacacs	Displays information associated with TACACS.

## debug aaa pod

To display debug messages related to packet of disconnect (POD) packets, use the **debugaaapod** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa pod

no debug aaa pod

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** Debugging for POD packets is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)T	This command was introduced.
	12.2(2)XB	Support for the voice applications as well as support for the Cisco AS5350, Cisco AS5400 and the Cisco 3600 series was added.
	12.2(2)XB1	Support for the Cisco AS5800 was added.
	12.2(11)T	Support for the Cisco AS5850 was added. This command was integrated into Cisco IOS Release 12.2(11)T.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

### **Examples**

The following example shows output from a successful POD request when using the **showdebug** command:

```
Router# debug aaa pod
AAA POD packet processing debugging is on
Router# show debug
General OS:
  AAA POD packet processing debugging is on
Router#

## **Related Commands**

ſ

Command	Description
aaa pod server	Enables the POD feature.

# debug aaa redundancy

To display debug output that displays authentication, authorization, and accounting (AAA) redundancy events during session activation, session synchronization to the standby device, and dynamic session updates to the standby device, use the **debugaaaredundancy** command in privileged EXEC mode. To disable debugging for AAA redundancy, use the **no** form of this command.

debug aaa redundancy

no debug aaa redundancy

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(31)SB2	This command was introduced.
	12.2(33)SRC	This command was integrated into Cisco IOS Release 12.2(33)SRC.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** This command displays the AAA synchronization data for the session synchronization to the standby device. This information might be useful for diagnosing any AAA problems related to the session synchronization.

**Examples** The following example shows sample output from the **debugaaaredundancy**command collected while a session is activated and synchronized to the standby device:

The table below describes the significant fields shown in the display.

#### Table 3: debug aaa redundancy Field Descriptions

Field	Description
(000000B)	AAA unique ID for the session.
Adding sync avp	Adding synchronization attribute-value pair.
[AAA Unique ID]	The AAA synchronization data type.

Command	Description
debug ccm-manager	Displays debugging information about Cisco CallManager.

# debug aaa sg-server selection

To obtain information about why the RADIUS and TACACS+ server group system in a router is choosing a particular server, use the **debugaaasg-serverselection**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa sg-server selection

no debug aaa sg-server selection

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is not turned on.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(1)	This command was introduced.
	12.2(28)SB	This command was extended for RADIUS server load balancing to show which server is selected on the basis of a load balancing algorithm.
	12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.
	12.2(33)SRC	This command was integrated into Cisco IOS Release 12.2(33)SRC.

 Examples The following example shows that debugging has been set to display information about server selection: Router# debug aaa sg-server selection The following two debug outputs display the behavior of RADIUS transactions within a server group with the server-reorder-on-failure feature configured.
 Examples In the following sample output, the RADIUS server-reorder-on-failure feature is configured. The server retransmits are set to 0 (so each server is attempted only once before failover to the next configured server), and the transmissions per transaction are set to 4 (the transmissions will stop on the third failover). The third server in the server group (192.0.2.118) has accepted the transaction on the third transmission (second failover). 00:38:35: %SYS-5-CONFIG-I: Configured from console by console

### Examples

In the following sample output, the RADIUS server load balancing feature is enabled with a batch size of 3. The server selection, based on the load balancing algorithm, is shown as five access-requests that are being sent to the server group.

Route:	r# <b>debug aa</b>	a sg-server selection		
Jul 1	6 03:15:05:	AAA/SG/SERVER SELECT:	Obtaining least loaded server.	
Jul 10	5 03:15:05:	AAA/SG/SERVER SELECT:	[3] transactions remaining in batch. Reusing server.	
Jul 1	6 03:15:05:	AAA/SG/SERVER SELECT:	Obtaining least loaded server.	
Jul 10	5 03:15:05:	AAA/SG/SERVER SELECT:	[2] transactions remaining in batch. Reusing server.	
Jul 1	6 03 <b>:</b> 15:05:	AAA/SG/SERVER SELECT:	Obtaining least loaded server.	
Jul 10	5 03:15:05:	AAA/SG/SERVER SELECT:	[1] transactions remaining in batch. Reusing server.	
Jul 1	6 03 <b>:</b> 15:05:	AAA/SG/SERVER SELECT:	Obtaining least loaded server.	
Jul 10	5 03:15:05:	AAA/SG/SERVER SELECT:	No more transactions in batch. Obtaining a new server.	
Jul 1	6 03:15:05:	AAA/SG/SERVER_SELECT:	Obtaining a new least loaded server.	
Jul 1	6 03:15:05:	AAA/SG/SERVER SELECT:	Server[0] load: 3	
Jul 1	6 03 <b>:</b> 15:05:	AAA/SG/SERVER SELECT:	Server[1] load: 0	
Jul 1	6 03:15:05:	AAA/SG/SERVER_SELECT:	Server[2] load: 0	
Jul 1	6 03:15:05:	AAA/SG/SERVER_SELECT:	Selected Server[1] with load 0	
Jul 1	6 03 <b>:</b> 15:05:	AAA/SG/SERVER_SELECT:	[3] transactions remaining in batch.	
Jul 1	6 03:15:05:	AAA/SG/SERVER_SELECT:	Obtaining least loaded server.	
Jul 16 03:15:05: AAA/SG/SERVER SELECT: [2] transactions remaining in batch. Reusing server.				

The field descriptions are self-explanatory.

Command	Description
load-balance	Enables RADIUS server load balancing for named RADIUS server groups.
radius-server load-balance	Enables RADIUS server load balancing for the global RADIUS server group.
radius-server retry method reorder	Specifies the reordering of RADIUS traffic retries among a server group.
radius-server transaction max-tries	Specifies the maximum number of transmissions per transaction that may be retried on a RADIUS server.
test aaa group	Tests RADIUS load balancing server response manually.
## debug aaa test

To show when the idle timer or dead timer has expired, when test packets are being sent, server response status, and the server state for RADIUS server load balancing, use the **debugaaatest** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aaa test no debug aaa test

**Syntax Description** This command has no arguments or keywords.

**Command Default** Debugging is not enabled.

Command Modes Privileged EXEC

Command HistoryReleaseModification12.2(28)SBThis command was introduced.12.4(11)TThis command was integrated into Cisco IOS Release 12.4(11)T.12.2(33)SRCThis command was integrated into Cisco IOS Release 12.2(33)SRC.

#### **Examples**

In the following sample output, the RADIUS server load balancing feature is enabled. The idle timer has expired.

Router# debug aaa test
Router#
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) quarantined.
Jul 16 00:07:01: AAA/SG/TEST: Sending test request(s) to server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Sending 1 Access-Requests, 1 Accounting-Requests in current
batch.
Jul 16 00:07:01: AAA/SG/TEST(Req#: 1): Sending test AAA Access-Request.
Jul 16 00:07:01: AAA/SG/TEST(Req#: 1): Sending test AAA Acceunting-Request.
Jul 16 00:07:01: AAA/SG/TEST: Obtained Test response from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Obtained Test response from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Necessary responses received from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) marked ALIVE. Idle timer set
for 60 sec(s).
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) removed from quarantine.

### **Related Commands**

Command	Description
load-balance	Enables RADIUS server load balancing for named RADIUS server groups.

Command	Description
radius-server host	Enables RADIUS automated testing for load balancing.
radius-server load-balance	Enables RADIUS server load balancing for the global RADIUS server group.
test aaa group	Tests RADIUS load balancing server response manually.

## debug acircuit

To display errors and events that occur on the attachment circuits (the circuits between the provider edge (PE) and customer edge (CE) routers), use the**debugacircuit** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug acircuit {error| event}

no debug acircuit {error| event}

### **Syntax Description**

error	Displays errors that occur in attachment circuits.
event	Displays events that occur in attachment circuits.

### **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(23)S	This command was introduced.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
	12.2(15)T	This command was integrated into Cisco IOS Release 12.2(15)T.
	12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
	12.2(27)SBC	Support for this command was integrated into Cisco IOS Release 12.2(27)SBC.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** Use the **debugacircuit** command to identify provisioning events, setup failures, circuit up and down events, and configuration failures on attachment circuits.

An attachment circuit connects a PE router to a CE router. A router can have many attachment circuits. The attachment circuit manager controls all the attachment circuits from one central location. Therefore, when you enable the debug messages for the attachment circuit, you receive information about all the attachment circuits.

**Examples** 

**es** The following is sample output from the **debugacircuitevent** command when you enable an interface:

Router# debug acircuit event \*Jan 28 15:19:03.070: ACLIB: ac cstate() Handling circuit UP for interface Se2/0

\*Jan 28 15:19:03.070: ACLIB [11.0.1.1, 200]: pthru intf handle circuit up() calling acmgr circuit up \*Jan 28 15:19:03.070: ACLIB [11.0.1.1, 200]: Setting new AC state to Ac-Connecting \*Jan 28 15:19:03.070: ACMGR: Receive <Circuit Up> msg \*Jan 28 15:19:03.070: Se2/0 ACMGR: circuit up event, SIP state chg down to connecting, action is service request \*Jan 28 15:19:03.070: Se2/0 ACMGR: Sent a sip service request \*Jan 28 15:19:03.070: ACLIB [11.0.1.1, 200]: AC updating switch context. \*Jan 28 15:19:03.070: Se2/0 ACMGR: Rcv SIP msg: resp connect forwarded, hdl 9500001D, 12ss\_hdl 700001E \*Jan 28 15:19:03.070: Se2/0 ACMGR: service connected event, SIP state chg connecting to connected, action is respond forwarded \*Jan 28 15:19:03.070: ACLIB: pthru intf response hdl is 9500001D, response is 1 \*Jan 28 15:19:03.070: ACLIB [11.0. $\overline{1}$ .1,  $\overline{2}$ 00]: Setting new AC state to Ac-Connected The following is sample output from the **debugacircuitevent** command when you disable an interface: Router# debug acircuit event \*Jan 28 15:25:57.014: ACLIB: SW AC interface INTF-DOWN for interface Se2/0 \*Jan 28 15:25:57.014: ACLIB [11.0.1.1, 200]: Setting new AC state to Ac-Idle \*Jan 28 15:25:57.014: ACLIB: SW AC interface INTF-DOWN for interface Se2/0 \*Jan 28 15:25:57.014: Se2/0 ACMGR: Receive <Circuit Down> msg \*Jan 28 15:25:57.014: Se2/0 ACMGR: circuit down event, SIP state chg connected to end, action is service disconnect \*Jan 28 15:25:57.014: Se2/0 ACMGR: Sent a sip service disconnect

The following example shows output from the **debugacircuit** command for an xconnect session on an Ethernet interface:

```
Router# debug acircuit
```

23:28:35: ACLIB [10.0.3.201, 5]: SW AC interface UP for Ethernet interface Et2/1 23:28:35: ACLIB [10.0.3.201, 5]: pthru\_intf\_handle\_circuit\_up() calling acmgr\_circuit\_up 23:28:35: ACLIB [10.0.3.201, 5]: Setting new AC state to Ac-Connecting 23:28:35: ACLIB [10.0.3.201, 5]: SW AC interface UP for Ethernet interface Et2/1 23:28:35: ACLIB [10.0.3.201, 5]: pthru intf handle circuit up() ignoring up event. Already connected or connecting. 23:28:35: ACMGR: Receive <Circuit Up> msg 23:28:35: Et2/1 ACMGR: circuit up event, SIP state chg down to connecting, action is service request 23:28:35: Et2/1 ACMGR: Sent a sip service request 23:28:37: %LINK-3-UPDOWN: Interface Ethernet2/1, changed state to up 23:28:38: %LINEPROTO-5-UPDOWN: Line protocol on Interface Ethernet2/1, changed state to up 23:28:53: Et2/1 ACMGR: Rcv SIP msg: resp connect forwarded, hdl D6000002, sss hdl 9E00000F 23:28:53: Et2/1 ACMGR: service connected event, SIP state chg connecting to connected, action is respond forwarded 23:28:53: ACLIB: pthru\_intf\_response hdl is D6000002, response is 1 23:28:53: ACLIB [10.0.3.201, 5]: Setting new AC state to Ac-Connected The command output is self-explanatory.

#### **Related Commands**

Command	Description
debug vpdn	Displays errors and events relating to L2TP configuration and the surrounding Layer 2 tunneling infrastructure.
debug xconnect	Displays errors and events related to an xconnect configuration.

I

## debug acircuit checkpoint

To enable the display of attachment circuit checkpoints, use the debug acircuit checkpoint command in privileged EXEC mode. To disable the display of these messages, use the no form of this command.

debug acircuit checkpoint

no debug acircuit checkpoint

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging of attachment circuit checkpoints is disabled.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(25)8	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRC	This command was integrated into Cisco IOS Release 12.2(33)SRC.

**Usage Guidelines** Use this command when Any Transport over MPLS (AToM) is configured for nonstop forwarding/stateful switchover (NSF/SSO) and Graceful Restart.

Use debug commands with caution. They use a significant amount of CPU resources and can affect system performance.

#### Examples

The **debugacircuitcheckpoint** command is issued on the active route processor (RP):

```
Router# debug mpls l2transport checkpoint
Router# debug acircuit checkpoint
Router# show debug
ATOM HA:
  AToM checkpointing events and errors debugging is on
AC HA:
 Attachment Circuit Checkpoint debugging is on
Router# conf terminal

### **Related Commands**

Command	Description
debug mpls l2transport checkpoint	Enables the display of AToM events when AToM is configured for NSF/SSO and Graceful Restart.

# debug adjacency

To enable the display of information about the adjacency database, use the **debug adjacency**command in privileged EXEC mode. To disable the display of these events, use the **no** form of this command.

debug adjacency [epoch| ipc| state| table] [ *prefix* ] [ *interface* ] [connectionid *id*] [link {ipv4| ipv6| mpls}] no debug adjacency [epoch| ipc| state| table] [ *prefix* ] [ *interface* ] [connectionid *id*] [link {ipv4| ipv6| mpls}]

### **Syntax Description**

epoch	(Optional) Displays adjacency epoch events.
ipc	(Optional) Displays interprocess communication (IPC) events for adjacencies.
state	(Optional) Displays adjacency system state machine events.
table	(Optional) Displays adjacency table operations.
prefix	(Optional) Displays debugging events for the specified IP address or IPv6 address.
	Note On the Cisco 10000 series routers, IPv6 is supported in Cisco IOS Release 12.2(28)SB and later releases.
interface	(Optional) Displays debugging events for the specified interface. For line cards, you must specify the line card if_number (interface number). Use the <b>show cef interface</b> command to obtain line card if_numbers.
connectionid id	(Optional) Displays debugging events for the specified client connection identification number.
link {ipv4   ipv6   mpls	(Optional) Displays debugging events for the specified link type (IP, IPv6, or Multiprotocol Label Switching [MPLS] traffic).
	Note On the Cisco 10000 series routers, IPv6 is supported in Cisco IOS Release 12.2(28)SB and later releases.

**Command Default** Debugging events are not displayed.

**Command Modes** Privileged EXEC

Command History	Release	Modification	
	12.0(7)XE	This command was introduced on the Cisco 7600 series routers.	
	12.1(1)E	This command was implemented on the Cisco 7600 series routers.	
	12.2(14)SX	This command was implemented on the Supervisor Engine 720.	
	12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S, and the <i>prefix</i> , <i>interface</i> , <b>connectionid</b> <i>id</i> , and <b>link</b> { <b>ipv4</b>   <b>ipv6</b>   <b>mpls</b> } keywords and arguments were added.	
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB and implemented on the Cisco 10000 series routers.	
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.	

#### **Usage Guidelines**

Because debugging output is assigned high priority in the CPU process, you should use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Also, you should use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

You can use any combination of the *prefix*, *interface*, **connectionid**, and **link** {**ipv4** | **ipv6** | **mpls**} keywords and arguments (in any order) as a filter to enable debugging for a specified subset of adjacencies.

Note

On the Cisco 10000 series routers, IPv6 is supported in Cisco IOS Release 12.2(28)SB and later releases.

#### Examples

The following example shows how to display information on the adjacency database:

### Router# debug adjacency

\*Jan 27 06:22:50.543: ADJ-ios\_mgr: repopulate adjs on up event for Ethernet3/0 \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 (incomplete) no src set: init/update from interface \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 (incomplete) no src set: set bundle to IPv6 adjacency oce \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 (incomplete) no src set: allocated, setup and inserted OK \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 (incomplete) no src set: allocated, setup and inserted OK \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 (incomplete) src IPv6 ND: source IPv6 ND added OK \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 (incomplete) src IPv6 ND: computed macstring (len 14): OK \*Jan 27 06:22:50.543: ADJ: IPV6 adj out of Ethernet3/0, addr FE80::20C:CFFF:FEDF:6854 src IPv6 ND: made complete (macstring len 0 to 14/0 octets) 00:04:40: %LINK-3-UPDOWN: Interface Ethernet3/0, changed state to up 00:04:41: %LINEPROTO-5-UPDOWN: Line protocol on Interface Ethernet3/0, changed

### **Related Commands**

Command	Description
clear adjacency	Clears the Cisco Express Forwarding adjacency table.
clear arp-cache	Deletes all dynamic entries from the ARP cache.
show adjacency	Displays Cisco Express Forwarding adjacency table information.
show mls cef adjacency	Displays information about the hardware Layer 3 switching adjacency node.

# debug adjacency (vasi)

To display debugging information for the VRF-Aware Service Infrastructure (VASI) adjacency, use the **debugadjacency** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug adjacency {vasileft| vasiright} number

**no debug interface** {**vasileft**| **vasiright**} *number* 

Syntax Description	vasileft	Displays information about the vasileft interface.
	vasiright	Displays information about the vasiright interface.
	number	Identifier of the VASI interface. The range is from 1 to 256.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Release 2.6	This command was introduced.
Freedon		
Examples	The following is sample output from the	debugadjacencycommand:
	Router# <b>debug adjacency veasileft</b> Condition 1 set	1
Related Commands	dahara ang	Digries debugging information for the VACI
	debug vasi	Displays debugging information for the VASI.
	debug interface (vasi)	Displays debugging information for the VASI interface descriptor block.
	interface (vasi)	Configures VASI virtual interface.
	show vasi pair	Displays the status of a VASI pair.

## debug alarm-interface

To show real-time activities in the data channel or the management channel of the Alarm Interface Controller (AIC), use the **debugalarm-interface** command in privileged EXEC mode. To disable debugging output, use the**no** form of this command.

debug alarm-interface *slot-number* {data| management}

no debug alarm-interface *slot-number* {data| management}

### **Syntax Description** Router chassis slot where the AIC network module slot-number is installed. data Displays AIC serial data channel and asynchronous craft port communication activity. Displays IOS-to-AIC communication activity. management **Command Default** No default behavior or values **Command Modes** Privileged EXEC **Command History** Release Modification 12.2(2)XG This command was introduced for the Cisco 2600 series and the Cisco 3600 series. 12.2(8)T This command was integrated into Cisco IOS Release 12.2(8)T. **Usage Guidelines** This command allows you to observe the management channel activity from the AIC in the specified slot. Such activity shows that the software running on the AIC CPU has reached a minimum level of working order. **Examples** The following is sample output from the debugalarm-interface command: Router# debug alarm-interface AIC Slot 1:STATUS received The following is sample output from the debugalarm-interface1data command: Router# debug alarm-interface 1 data AIC Slot 1:STATUS received aic fastsend:particle count=1, len=1504 aic pak to txring:scattered particle count=1, tx bytes=1504, leftover=0 aic interrupt:# 30419 gstar=0x1000000

### **Related Commands**

Command	Description
alarm-interface	Enters the alarm interface mode and configures the AIC.
reset	Resets the AIC CPU.

## debug alps ascu

To enable debugging for airline product set (ALPS) agent set control units (ASCUs) use the **debugalpsascu** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug alps ascu {event| packet| detail| all| format {ipars| router| both}} [*interface* [*ascu id*]] no debug alps ascu {event| packet| detail| all| format {ipars| router| both}} [*interface* [*ascu id*]]

### **Syntax Description**

event	Displays ASCU events or protocol errors.
packet	Displays sent or received packets.
detail	Displays all ASCU protocol events.
all	Enables event, packet, and detail debugging.
format ipars router both	Specifies how to display ASCU addresses and the hexadecimal data in the debug output:
	• <b>ipars</b> Displays only the IPARS hexadecimal output.
	• router Displays only the router hexadecimal output.
	• <b>both</b> Displays both the IPARS and router hexadecimal output.
	The only difference between the IPARS output and the router output is the format of the hexadecimal data.
interface	(Optional) Enables debugging on a specified interface. Applies only to the <b>event</b> , <b>packet</b> , <b>detail</b> , and <b>all</b> keywords.
ascu id	(Optional) Enables debugging for a specified ASCU.

**Command Default** Debugging is off.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	11.3(6)T	This command was introduced for limited availability.
	12.0(1)	This command was available for general release.
	12.0(5)T	This command was modified.
	12.1(2)T	The <b>format</b> , <b>ipars</b> , <b>router</b> , and <b>both</b> keywords were added. The output for this command was modified to include IPARS and router formats.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

### **Usage Guidelines**

To enable debugging for a group of ASCUs, enter a separate command for each ASCU interface and IA combination.

The *interface* option applies only to the event, packet, detail, and all keywords.

Note

To specify the particular debug tracing level (event, packet, detail or all) *and* the format (router, pairs or both), you must configure the debugalpsascucommand two times: once to configure the debug tracing level and once to configure the format.

```
Examples
```

The following output is from the **debugalpsascuevent** command, showing events or protocol errors in **router** format for ASCU 42 on interface Serial7:

Router# debug alps ascu format router Router# debug alps ascu event Serial7 42

```
ALPS ASCU: T1 expired for ascu 42 on i/f Serial7 ALPS ASCU: DOWN event while UP for ascu 42 on i/f Serial7 : C1 count = 1 \,
```

Note

If you specify the **ipars** or **both** format for the **event** or **detail** tracing level, both the IPARS and router formats will be displayed.

The following output is from the **debugalpsascuevent** command, showing events or protocol errors in **ipars** format for ASCU 42 on interface Serial7:

```
Router# debug alps ascu format ipars
Router# debug alps ascu event Serial7 42
ALPS ASCU: T1 expired for ascu 42/2F on i/f Serial7
ALPS ASCU: DOWN event while UP for ascu 42/2F on i/f Serial7 : C1 count = 1
```

The following output is from the **debugalpsascudetail** command, showing all protocol events in **router** format for ASCU 42 on interface Serial6:

Router# debug alps ascu format router Router# debug alps ascu detail Serial6 42 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42 on i/f Serial6 ALPS ASCU: ALC GO AHD MSG rcvd from ascu 42 on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42 on i/f Serial6 ALPS ASCU: ALC GO AHD MSG rcvd from ascu 42 on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42 on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (14 bytes + CCC) from ascu 42 on i/f Serial6 ALPS ASCU: ALC GO AHD MSG rcvd from ascu 42 on i/f Serial6 ALPS ASCU: ALC GO AHD MSG rcvd from ascu 42 on i/f Serial6 ALPS ASCU: ALC GO AHD MSG rcvd from ascu 42 on i/f Serial6 ALPS ASCU: Tx ALC DATA MSG (14 bytes + CCC + 0 pad bytes) to ascu 42 on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (3 bytes + CCC + 0 pad bytes) to ascu 42 on i/f Serial6

Note

If you specify the **ipars** or **both** format for the **event** or **detail** tracing level, both the IPARS and router formats will be displayed.

The following output is from the **debugalpsascudetail** command, showing all protocol events in **both** format for ASCU 42 on interface Serial6:

Router# debug alps ascu format both Router# debug alps ascu detail Serial6 42 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: ALC GO AHD MSG revd from ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: ALC GO AHD MSG revd from ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (+ 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC DATA MSG (14 bytes + CCC) from ascu 42/2F on i/f Serial6 ALPS ASCU: ALC GO AHD MSG revd from ascu 42/2F on i/f Serial6 ALPS ASCU: ALC GO AHD MSG revd from ascu 42/2F on i/f Serial6 ALPS ASCU: ALC GO AHD MSG revd from ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC DATA MSG (14 bytes + CCC + 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC DATA MSG (3 bytes + CCC + 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (3 bytes + CCC + 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (3 bytes + CCC + 0 pad bytes) to ascu 42/2F on i/f Serial6 ALPS ASCU: Tx ALC POLL MSG (3 bytes + CCC + 0 pad bytes) to ascu 42/2F on i/f Serial6 The following output is from the debugalpsascupacket command, showing all packets sent or received in router format for ASCU 42 on interface Serial6:

Router# debug alps ascu packet format router Serial6 42

ALPS ASCU: Tx ALC SERVICE MSG (18 bytes + CCC + 0 pad bytes) to ascu 42 on i/f Serial6 02321D26 0C261616 140C0D18 26163135 0611C6 ALPS ASCU: Rx ALC DATA MSG (14 bytes + CCC) from ascu 42 on i/f Serial6, fwd ckt RTP MATIP 42607866 65717866 65717966 755124 ALPS ASCU: Tx ALC DATA MSG (14 bytes + CCC + 0 pad bytes) to ascu 42 on i/f Serial6 022038 26253138 26253139 263511E4

The following output is from the **debugalpsascupacket** command, showing all packets sent or received in **ipars** format for ASCU 42 on interface Serial6:

## debug alps peer

To enable event or packet debugging for airline product set (ALPS) peers, use the **debugalpspeer**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug alps peer {event| packet} [ ip-address ]
no debug alps peer {event| packet} [ ip-address ]

### **Syntax Description**

event	Specifies debugging for an event.
packet	Specifies debugging for a packet.
ip-address	(Optional) Remote peer IP address.

**Command Default** If no IP address is specified, then debugging is enabled for every peer connection.

### **Command Modes** Privileged EXEC

Command History	Release	Modification
	11.3(6)T	This command was introduced for limited availability.
	12.0(1)	This command was available for general release.
	12.0(5)T	The <b>packet</b> keyword was added. The format for the output was modified for consistency.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
Usage Guidelines	To enable debugging for	r a single remote ALPS peer, specify the peer IP address.
	To enable debugging for	r a set of remote peers, enter the command for each peer IP address.
Examples	The following is sample	e output from the debugalpspeerpacket command:

#### Router# debug alps peer packet

ALPS PEER:Peer (10.227.50.106, MATIP A CKT-1) - TX Peer Data Msg (18 bytes) 040A5320: 01 00001241 040A5330:45546B5F 6F4F7757 67477B5B 51 ALPS PEER:Peer (10.227.50.106, MATIP A CKT-1) - RX Peer Data Msg (18 bytes) 04000550: 01000012 4145546B 5F6F4F77 04000560:5767477B 5B51

# debug alps peer event

To enable event debugging for airline product set (ALPS) peers, use the **debugalpspeerevent**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug alps peer event ipaddr

no debug alps peer event ipaddr

Syntax Description	ipaddr		Peer IP address.
Command Default	If no IP address is specified, debuggi	ng is enabled for	every peer connection.
	Privileged EXEC		
<b>Command History</b>	Release	Modification	
	11.3 T	This command	was introduced.
	12.2(33)SRA	This command	was integrated into Cisco IOS Release 12.2(33)SRA.
Usage Guidelines	To enable debugging for a single rem To enable debugging for a set of reme	ote ALPS peer, s ote peers, enter tl	specify the peer IP address. ne command for each peer IP address.
Examples	The following is sample output from Router# debug alps peer event	the <b>debugalpsp</b> o	eerevent command:
	ALPS PEER: FSM - Peer 200.100.2 ALPS PEER: peer 200.100.25.2 cl ALPS PEER: Promiscuous peer cre ALPS PEER: TCP Listen - passive ALPS PEER: FSM - Peer 200.100.2 ALPS PEER: peer 200.100.25.2 op	5.2, Event ALF osed - closing ated for 200.1 open 200.100. 5.2, Event ALF ened OK.	S_CLOSED_IND, State OPENED peer circuits. 00.25.2 25.2(11003) -> 10000 S_OPEN_IND, State DISCONN

## debug alps snmp

To enable debugging for airline product set (ALPS) Simple Network Management Protocol (SNMP) agents, use the **debugalpssnmp**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug alps snmp

no debug alps snmp

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging for SNMP agents is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	11.3(6)T	This command was introduced for limited availability.
	12.0(1)T	This command was available for general release.
	12.0(5)T	This command was added to the documentation.
	12.1(2)T	The output for this command was modified to reflect MIB and SNMP changes.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

### **Examples**

The following output is from the **debugalpssnmp** command. The first line shows a circuit event status change. The second line shows an ASCU status change. The third line shows a peer connection status change.

Router# debug alps snmp

ALPS CktStatusChange Notification for circuit CKT-1 ALPS AscuStatusChange Notification for ascu (Serial3, 41) PeerConnStatusChange Notification for peer (10.227.50.106, MATIP\_A\_CKT-1) The following output shows that an open failure has occurred on circuit 1:

ALPS CktOpenFailure Notification for circuit CKT1 The following output shows that a partial rejection to an ALPS circuit peer open request has occurred on circuit 1:

```
ALPS CktPartialReject Notification for ascu (Serial2, 41) on circuit CKT1
```

# debug ancp

To enable the display of debugging information related to the Access Node Control Protocol (ANCP), use the **debugancp**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ancp {adjacency| details| errors| events| neighbor| packets [brief]| port-event {details| events}| port-management {details| events}}

no debug ancp {adjacency| details| errors| events| neighbor| packets [brief]| port-event {details| events}| port-management {details| events}}

### **Syntax Description**

adjacency	Displays information about adjacency messages on an ANCP server.
details	Displays detailed static configuration information relating to ANCP and dynamic line conditions.
errors	Displays information about ANCP protocol errors.
events	Displays information about ANCP protocol events.
neighbor	Displays information about ANCP neighbors.
packets	Displays information about ANCP control packets.
brief	(Optional) Displays static configuration information for ANCP control packets.
port-event	Displays ANCP event messages (port up and port down) related to data ports.
port-management	Displays ANCP operations, administration, and maintenance (OAM) messages.

### **Command Modes** Privileged EXEC (#)

### **Command History**

Release	Modification
12.2(28)ZV	This command was introduced on the Cisco 10000 series router.
12.2(31)ZV1	This command was modified. L2CP was replaced with ANCP.
Cisco IOS XE Release 2.4	This command was integrated into Cisco IOS XE Release 2.4.

ſ

	Release	Modification
	Cisco IOS XE Release 3.2S	This command was modified. The <b>port-event</b> and <b>port-management</b> keywords were added.
Usage Guidelines	You can use the <b>debugconditionint</b>	erface command to conditionalize all the debug commands where the
	ANCP TCP connections are termina	ated.
Examples	The following is sample output from t	the <b>debugancpadjacency</b> command. The output fields are self-explanatory.
	Router# debug ancp adjacency *Sep 20 08:23:53.833: Sending *Sep 20 08:23:53.834: ANCP: U *Sep 20 08:23:53.834: ANCP: U Ethernet0/0.1 TCB 50C2050 *Sep 20 08:23:53.836: ANCP: Re 50C2050 *Sep 20 08:23:53.836: ANCP: 2 *Sep 20 08:23:53.837: Capabil *Sep 20 08:23:53.837: Sending 50C2050 *Sep 20 08:23:53.837: ANCP: U *Sep 20 08:23:53.837: ANCP: U *Sep 20 08:23:53.837: ANCP: U *Sep 20 08:23:53.837: ANCP 2 Ethernet0/0.1 TCB 50C2050 *Sep 20 08:23:53.837: ANCP AD nbr. The table below describes the significant fields shown in the display.

Table 4: debug ancp events Field Descriptions

Field	Description
Received adjacency message	Adjacency message received from the ANCP neighbor. Adjacency protocol messages synchronize the Network Access Server and access nodes.
2 capability tlv(s) received	Supported capability type-length-values are included in the adjacency message.

The following is sample output from the **debugancpport-eventdetails** command. The output fields are self-explanatory.

Router# debug ancp port-event details \*Sep 20 08:24:55.608: ANCP: Found db entry based on access-loop-circuit-id alcid1, received in Port UP message \*Sep 20 08:24:55.608: Advance 12 bytes (aligned) to next TLV. \*Sep 20 08:24:55.609: ANCP: Processing DSL\_LINE\_ATTRIBUTES sub-TLVs: PORT UP \*Sep 20 08:24:55.609: ANCP: Port UP: received DSL Line Attrs, tlv length in msg 32 aligned len 32 \*Sep 20 08:24:55.609: DSL TYPE received. 4 Advance 8 bytes (aligned) to next sub-TLV. \*Sep 20 08:24:55.609: \*Sep 20 08:24:55.609: ACTUAL DATA RATE UP received. 7878 \*Sep 20 08:24:55.609: Advance 8 bytes (aligned) to next sub-TLV. \*Sep 20 08:24:55.609: ACTUAL\_DATA\_RATE\_DN received. 9090 \*Sep 20 08:24:55.610: Advance 8 bytes (aligned) to next sub-TLV. The following is sample output from the **debugancpport-managementdetails** command. The output fields are self-explanatory.

Router# debug ancp port-management details \*Sep 20 08:29:22.263: 3120 3500 0000 0000 8001 0034 0000 0000 0000 0000 0000 0000 0900 0000 0000 0020 0500 0001 0010 0001 0006 616C 6369 6431 0000 \*Sep 20 08:29:22.266: ANCP PORT MGMT: Ethernet0/0.1 Port Mgmt message, Total TLVs : 1 \*Sep 20 08:29:22.266: ANCP\_PORT\_MGMT: Received Access-Loop-Cir-ID alcid1 \*Sep 20 08:29:22.266: ANCP PORT MGMT: Received Result: success(0x3) Code: Specified access line does not exist(0x500) \*Sep 20 08:29:22.266: Advance 12 bytes (aligned) to next TLV.

### **Related Commands**

I

Command	Description
debug condition interface	Limits the output for some <b>debug</b> commands on the basis of interface, VC, or VLAN.
show ancp neighbor	Displays statistics of ANCP neighbor information and neighborship information with local ANCP ports.
show ancp status	Displays ANCP-related information for the ANCP endpoints configured on a BRAS interface.

## debug appfw

To display debug messages about Cisco IOS Firewall events, use the **debugappfw**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appfw {application *protocol*| function-trace| object-creation| object-deletion| events| timers| detailed}

no debug appfw {application *protocol*| function-trace| object-creation| object-deletion| events| timers| detailed}

### **Syntax Description**

application <i>protocol</i>	Displays messages about protocol events of firewall-inspected applications, including details about the protocol's packets. Currently, the only supported protocol is HTTP. (Issue the <b>http</b> keyword.)	
function-trace	Displays messages about software functions called by Cisco IOS Firewall.	
object-creation	Displays messages about software objects that are being created by Cisco IOS Firewall. Cisco IOS Firewall-inspected sessions begin when the object is created.	
object-deletion	Displays messages about software objects that are being deleted by Cisco IOS Firewall. Cisco IOS Firewall-inspected sessions close when the object is deleted.	
events	Displays messages about Cisco IOS software events, including Cisco IOS Firewall packet processing.	
timers	Displays messages about Cisco IOS Firewall timer events, such as an idle timeout by the Cisco IOS Firewall.	
detailed	Detailed information for all other enabled Cisco IOS Firewall debugging is displayed.	
	<b>Note</b> This keyword should be used in conjunction with other Cisco IOS Firewall debugging commands.

# debug apple arp

To enable debugging of the AppleTalk Address Resolution Protocol (AARP), use the **debugapplearp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple arp [type number]

no debug apple arp [type number]

Syntax Description	type	(Optional) Interface type.
	number	(Optional) Interface number.
		,
Command Modes	Privileged EXEC	
Usage Guidelines	This command is helpful when you experience problems communicating with a node on the network you control (a neighbor). If the <b>debugapplearp</b> display indicates that the router is receiving AARP probes, you can assume that the problem does not reside at the physical layer.	
Examples	The following is sample output from the <b>debugapplearp</b> command: Router# <b>debug apple arp</b> Ether0: AARP: Sent resolve for 4160.26 Ether0: AARP: Reply from 4160.26(0000.0c00.0453) for 4160.154(0000.0c00.8ea9) Ether0: AARP: Resolved waiting request for 4160.26(0000.0c00.0453) Ether0: AARP: Reply from 4160.19(0000.0c00.0082) for 4160.154(0000.0c00.8ea9) Ether0: AARP: Reply from 4160.19(0000.0c00.0082) for 4160.154(0000.0c00.8ea9) Ether0: AARP: Reply from 4160.19(0000.0c00.0082) for 4160.154(0000.0c00.8ea9) Explanations for representative lines of output follow. The following line indicates that the router has requested the hardware MAC address of the host at network address 4160.26: Ether0: AARP: Sent resolve for 4160.26 The following line indicates that the host at network address 4160.26 has replied, giving its MAC address (0000.0c00.0453). For completeness, the message also shows the network address to which the reply was sen and its hardware MAC address (also in parentheses).	
	Ether0: AARP: Reply from 4160.26(0000.0c00.0 The following line indicates that the MAC address re	453) for 4160.154(0000.0c00.8ea9) quest is complete:
	Ether0: AARP: Resolved waiting request for 4	160.26(0000.0c00.0453)

## debug apple domain

To enable debugging of the AppleTalk domain activities, use the **debugappledomain**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple domain

no debug apple domain

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

**Usage Guidelines** Use the **debugappledomain** command to observe activity for domains and subdomains. Use this command in conjunction with the **debugappleremap** command to observe interaction between remapping and domain activity. Messages are displayed when the state of a domain changes, such as creating a new domain, deleting a domain, and updating a domain.

**Examples** The following is sample output from the **debugappledomain** command intermixed with output from the **debugappleremap** command; the two commands show related events:

Router# debug apple domain Router# debug apple remap AT-REMAP: RemapProcess for net 30000 domain AURP Domain 1 AT-REMAP: ReshuffleRemapList for subdomain 1 AT-REMAP: Could not find a remap for cable 3000-3001 AT-DOMAIN: atdomain DisablePort for Tunnel0 AT-DOMAIN: CleanUpDomain for domain 1 [AURP Domain 1] AT-DOMAIN: Disabling interface Ethernet1 AT-DOMAIN: atdomain DisablePort for Ethernet1 AT-DOMAIN: CleanUpDomain for domain 1 [AURP Domain 1] AT-DOMAIN: CleanSubDomain for inbound subdomain 1 AT-REMAP: Remap for net 70 inbound subdomain 1 has been deleted AT-DOMAIN: DeleteAvRemapList for inbound subdomain 1 AT-DOMAIN: DeleteRemapTable for subdomain 1 AT-DOMAIN: DeleteAvRemapList for inbound subdomain 1 AT-DOMAIN: CleanSubDomain for outbound subdomain 1 AT-DOMAIN: DeleteRemapTable for subdomain 1 AT-REMAP: RemapProcess for net 30000 domain AURP Domain 1 Remapped Net 10000 AT-REMAP: Remap for net 50 outbound subdomain 1 has been deleted AT-DOMAIN: DeleteAvRemapList for outbound subdomain 1 AT-DOMAIN: DeleteAvRemapList for outbound subdomain 1 AT-DOMAIN: CleanUpDomain for domain 1 [AURP Domain 1] AT-DOMAIN: CleanSubDomain for inbound subdomain 1 AT-DOMAIN: DeleteRemapTable for subdomain 1 AT-DOMAIN: DeleteAvRemapList for inbound subdomain 1 AT-DOMAIN: CleanSubDomain for outbound subdomain 1 AT-DOMAIN: DeleteRemapTable for subdomain 1 AT-DOMAIN: DeleteAvRemapList for outbound subdomain 1

Related Commands	Command	Description
	debug apple remap	Enables debugging of the AppleTalk remap activities.

## debug apple eigrp-all

To enable debugging output from the Enhanced IGRP routines, use the **debugappleeigrp-all**privileged EXEC command. The **no** form of this command disables debugging output.

debug apple eigrp-all

no debug apple eigrp-all

**Syntax Description** This command has no arguments or keywords.

Command History	Release	Modification
	10.0	This command was introduced.
	12.2(13)T	This command is no longer supported in Cisco IOS Mainline relesaes or in Technology-based(T-train) releases. It might continue to appear in 12.2S-family releases.

### **Usage Guidelines**

The **debugappleeigrp-all** command can be used to monitor acquisition of routes, aging route table entries, and advertisement of known routes through Enhanced IGRP.

∕!∖ Caution

Because the **debugappleeigrp-all** command can generate many messages, use it only when the CPU utilization of the router is less than 50 percent.

**Examples** 

The following is sample output from the **debugappleeigrp-all**command:

Table 5: debug apple eigrp Field Descriptions

Field	Description
atigrp2_router:	AppleTalk address of the neighbor.

I

Field	Description
AT:	Indicates that this is an AppleTalk packet.
Ethernet2:	Name of the interface through which the router received the packet.
src=	Name of the interface sending the Enhanced IGRP packet, as well at its AppleTalk address.
dst=	Cable range of the destination of the packet.
size=	Size of the packet (in bytes).

# debug apple errors

I

To display errors occurring in the AppleTalk network, use the **debugappleerrors** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug apple errors [type number]

**no debug apple errors** [type number]

Syntax Description	type	(Optional) Interface type.
	number	(Optional) Interface number.
Command Madaa		
Commanu Moues	Privileged EXEC	
Usage Guidelines	In a stable AppleTalk network, the <b>debugappleerrors</b> command produces little output. To solve encapsulation problems, enable <b>debugappleerrors</b> and <b>debugapplepacket</b> together.	
Examples	The following is sample output from the <b>debugappleerrors</b> command when a router is brought up with a zone that does not agree with the zone list of other routers on the network: Router# <b>debug apple errors</b> %AT-3-ZONEDISAGREES: Ethernet0: AppleTalk port disabled; zone list incompatible with 4160.19 %AT-3-ZONEDISAGREES: Ethernet0: AppleTalk port disabled; zone list incompatible with 4160.19 %AT-3-ZONEDISAGREES: Ethernet0: AppleTalk port disabled; zone list incompatible with 4160.19 %AT-3-ZONEDISAGREES: Ethernet0: AppleTalk port disabled; zone list incompatible with 4160.19 %AT-3-ZONEDISAGREES: Ethernet0: AppleTalk port disabled; zone list incompatible with 4160.19 Most of the output suggests, a single error message indicates zone list incompatibility; this message is sent out periodically until the condition is corrected or the <b>debugappleerrors</b> command is turned off. Most of the other messages that the <b>debugappleerrors</b> command can generate are obscure or indicate a serious problem with the AppleTalk network. Some of these other messages follow. In the following message, RTMPRsp, RTMPReq, ATP, AEP, ZIP, ADSP, or SNMP could replace NBP, and "llap dest not for us" could replace "wrong encapsulation":	
	Packet discarded, src 4160.12-254,dst 4160.19 In the following message, in addition to an invalid ecl AEP echo reply, unknown echo function, invalid ping packet type:	9-254, NBP, wrong encapsulation ho packet error, other possible errors are unsolicited g packet, unknown ping function, and bad responder
	Ethernet0: AppleTalk packet error; no source AT: pak_reply: dubious reply creation, dst 41 AT: Unable to get a buffer for reply to 4160. Processing error, src 4160.12-254,dst 4160.19	address available 160.19 19 9-254,AEP, invalid echo packet

The **debugappleerrors** command can print out additional messages when other debugging commands are also turned on. When you turn on both the **debugappleerrors** and **debugappleevents** commands, the following message can be generated:

Proc err, src 4160.12-254, dst 4160.19-254, ZIP, NetInfo Reply format is invalid In the preceding message, in addition to the NetInfo Reply format is invalid error, other possible errors are NetInfoReply not for me, NetInfoReply ignored, NetInfoReply for operational net ignored, NetInfoReply from invalid port, unexpected NetInfoReply ignored, cannot establish primary zone, no primary has been set up, primary zone invalid, net information mismatch, multicast mismatch, and zones disagree.

When you turn on both the **debugappleerrors** and **debugapplenbp**commands, the following message can be generated:

#### Processing error, ..., NBP, NBP name invalid

In the preceding message, in addition to the NBP name invalid error, other possible errors are NBP type invalid, NBP zone invalid, not operational, error handling brrq, error handling proxy, NBP fwdreq unexpected, No route to srcnet, Proxy to "\*" zone, Zone "\*" from extended net, No zone info for "\*", and NBP zone unknown.

When you turn on both the **debugappleerrors** and **debugapplerouting**commands, the following message can be generated:

#### Processing error,...,RTMPReq, unknown RTMP request

In the preceding message, in addition to an unknown RTMP request error, other possible errors are RTMP packet header bad, RTMP cable mismatch, routed RTMP data, RTMP bad tuple, and Not Req or Rsp.
#### debug aaa accounting through debug auto-config

# debug apple events

To display information about AppleTalk special events, neighbors becoming reachable or unreachable, and interfaces going up or down, use the **debugappleevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple events [type number]

**no debug apple events** [type number]

Syntax Description	type	(Optional) Interface type.
	number	(Optional) Interface number.

### **Command Modes** Privileged EXEC

**Usage Guidelines** Only significant events (for example, neighbor and route changes) are logged.

The **debugappleevents** command is useful for solving AppleTalk network problems because it provides an overall picture of the stability of the network. In a stable network, the **debugappleevents** command does not return any information. If the command generates numerous messages, those messages can indicate possible sources of the problems.

When configuring or making changes to a router or interface for AppleTalk, enable the **debugappleevents** command to alert you to the progress of the changes or to any errors that might result. Also use this command periodically when you suspect network problems.

The **debugappleevents** command is also useful to determine whether network flapping (nodes toggling online and offline) is occurring. If flapping is excessive, look for routers that only support 254 networks.

When you enable the **debugappleevents**command, you will see any messages that the **appleevent-logging**configuration command normally displays. Turning on the **debugappleevents**command, however, does not cause the **appleevent-logging**command to be maintained in nonvolatile memory. Only turning on the **appleevent-logging** command explicitly stores it in nonvolatile memory. Furthermore, if the **appleevent-logging** command is already enabled, turning on or off the **debugappleevents** command does not affect the **appleevent-logging** command.

# **Examples** The **debugappleevents** command is useful in tracking the discovery mode state changes through which an interface progresses. When no problems are encountered, the state changes progress as follows:

- 1 Line down.
- 2 Restarting.
- 3 Probing (for its own address [node ID] using AARP).
- 4 Acquiring (sending out GetNetInfo requests).
- 5 Requesting zones (the list of zones for its cable).

- **6** Verifying (that the router's configuration is correct. If not, a port configuration mismatch is declared).
- 7 Checking zones (to make sure its list of zones is correct).
- **8** Operational (participating in routing).

Explanations for individual lines of output follow.

The following message indicates that a port is set. In this case, the zone multicast address is being reset.

Ether0: AT: Resetting interface address filters The following messages indicate that the router is changing to restarting mode:

%AT-5-INTRESTART: Ether0: AppleTalk port restarting; protocol restarted Ether0: AppleTalk state changed; unknown -> restarting The following message indicates that the router is probing in the startup range of network numbers (65280 to 65534) to discover its network number:

Ether0: AppleTalk state changed; restarting -> probing

The following message indicates that the router is enabled as a nonrouting node using a provisional network number within its startup range of network numbers. This type of message only appears if the network address the router will use differs from its configured address. This is always the case for a discovery-enabled router; it is rarely the case for a nondiscovery-enabled router.

%AT-6-ADDRUSED: Ether0: AppleTalk node up; using address 65401.148 The following messages indicate that the router is sending out GetNetInfo requests to discover the default zone name and the actual network number range in which its network number can be chosen:

Ether0: AppleTalk state changed; probing -> acquiring %AT-6-ACQUIREMODE: Ether0: AT port initializing; acquiring net configuration Now that the router has acquired the cable configuration information, the following message indicates that it restarts using that information:

Ether0: AppleTalk state changed; acquiring -> restarting The following messages indicate that the router is probing for its actual network address:

Ether0: AppleTalk state changed; restarting -> line down Ether0: AppleTalk state changed; line down -> restarting Ether0: AppleTalk state changed; restarting -> probing The following message indicates that the router has found an actual network address to use:

\*AT-6-ADDRUSED: Ether0: AppleTalk node up; using address 4160.148 The following messages indicate that the router is sending out GetNetInfo requests to verify the default zone name and the actual network number range from which its network number can be chosen:

Ether0: AppleTalk state changed; probing -> acquiring %AT-6-ACQUIREMODE: Ether0: AT port initializing; acquiring net configuration The following message indicates that the router is requesting the list of zones for its cable:

Ether0: AppleTalk state changed; acquiring -> requesting zones The following messages indicate that the router is sending out GetNetInfo requests to make sure its understanding of the configuration is correct:

Ether0: AppleTalk state changed; requesting zones -> verifying AT: Sent GetNetInfo request broadcast on Ethernet0

The following message indicates that the router is rechecking its list of zones for its cable:

Ether0: AppleTalk state changed; verifying -> checking zones The following message indicates that the router is now fully operational as a routing node and can begin routing:

Ether0: AppleTalk state changed; checking zones -> operational A nondiscovery-enabled router can come up when no other router is on the wire; however, it must assume that its configuration (if accurate syntactically) is correct, because no other router can verify it. Notice that the last line indicates this situation.

The following is sample output from the **debugappleevents** command that describes a discovery-enabled router coming up when there is no seed router on the wire:

```
Router# debug apple events

Ether0: AT: Resetting interface address filters

%AT-5-INTRESTART: Ether0: AppleTalk port restarting; protocol restarted

Ether0: AppleTalk state changed; unknown -> restarting

Ether0: AppleTalk state changed; restarting -> probing

%AT-6-ADDRUSED: Ether0: AppleTalk node up; using address 65401.148

Ether0: AppleTalk state changed; probing -> acquiring

AT: Sent GetNetInfo request broadcast on Ether0

AT: Sent GetNetInfo request broadcast on Ether0
```

When you attempt to bring up a nonseed router without a seed router on the wire, it never becomes operational; instead, it hangs in the acquiring mode and continues to send out periodic GetNetInfo requests.

When a nondiscovery-enabled router is brought up on an AppleTalk internetwork that is in compatibility mode (set up to accommodate extended as well as nonextended AppleTalk) and the router has violated internetwork compatibility:

The following three configuration command lines indicate the part of the configuration of the router that caused the configuration mismatch:

lestat(config)# interface ethernet 0
lestat(config-if)# apple cab 41-41
lestat(config-if)# apple zone Marketing

The router shown had been configured with a cable range of 41-41 instead of 40-40, which would have been accurate. Additionally, the zone name was configured incorrectly; it should have been "Marketing," rather than being misspelled as "Markting."

# debug apple nbp

To display debugging output from the Name Binding Protocol (NBP) routines, use the **debugapplenbp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple nbp [type number]

no debug apple nbp [type number]

Syntax Description	type	(Optional) Interface type.
	number	(Optional) Interface number.
Command Modes	Privileged EXEC	
Usage Guidelines	To determine whether the router is receiving NBP lookups from a node on the AppleTalk network, enable <b>debugapplenbp</b> at each node between the router and the node in question to determine where the problem lies.	
<u></u>		
Caution	Because the <b>debugapplenbp</b> command can generate of the router is less than 50 percent.	many messages, use it only when the CPU utilization
Examples	The following is sample output from the debugappl Router# debug apple nbp AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:ciscoRou AT: LkUp =:ciscoRouter@Low End SW Lab AT: NBP ctrl = LkUp-Reply, ntuples = 1, id = 78 AT: 4160.154, skt 254, enum 1, name: lestat AT: NBP ctrl = LkUp, ntuples = 1, id = 78 AT: 4160.19, skt 2, enum 0, name: =:IPADDRES AT: NBP ctrl = LkUp, ntuples = 1, id = 79 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 83 AT: 4160.19, skt 2, enum 0, name: =:ciscoRou AT: LkUp =:ciscoRouter@Low End SW Lab AT: NBP ctrl = LkUp, ntuples = 1, id = 84 AT: 4160.19, skt 2, enum 0, name: =:IPADDRES AT: NBP ctrl = LkUp, ntuples = 1, id = 85 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 85 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: NBP ctrl = LkUp, ntuples = 1, id = 77 AT: 4160.19, skt 2, enum 0, name: =:IPGATEWA AT: LkUp =:ciscoRouter@Low End SW Lab	enbp command: ster@Low End SW Lab = 77 .Ether0:ciscoRouter@Low End SW Lab SS@Low End SW Lab AY@Low End SW Lab SS@Low End SW Lab AY@Low End SW Lab AY@Low End SW Lab :: ster@Low End SW Lab

I

The table below describes the fields in the first line of output.

Field	Description
AT: NBP	Indicates that this message describes an AppleTalk NBP packet.
ctrl = LkUp	Identifies the type of NBP packet. Possible values are as follows: • LkUpNBP lookup request.
	• LkUp-ReplyNBP lookup reply.
ntuples = 1	Indicates the number of name-address pairs in the lookup request packet. Range: 1 to 31 tuples.
id = 77	Identifies an NBP lookup request value.

The table below describes the fields in the second line of output.

Table 7: debug apple nbp Field Descriptions--Second Line of Output

Field	Description
AT:	Indicates that this message describes an AppleTalk packet.
4160.19	Indicates the network address of the requester.
skt 2	Indicates the internet socket address of the requester. The responder will send the NBP lookup reply to this socket address.
enum 0	Indicates the enumerator field. Used to identify multiple names registered on a single socket. Each tuple is assigned its own enumerator, incrementing from 0 for the first tuple.

Field	Description
name: =:ciscoRouter@Low End SW Lab	Indicates the entity name for which a network address has been requested. The AppleTalk entity name includes three components:
	• Object (in this case, a wildcard character [=], indicating that the requester is requesting name-address pairs for all objects of the specified type in the specified zone).
	• Type (in this case, ciscoRouter).
	• Zone (in this case, Low End SW Lab).

The third line in the output essentially reiterates the information in the two lines above it, indicating that a lookup request has been made regarding name-address pairs for all objects of the ciscoRouter type in the Low End SW Lab zone.

Because the router is defined as an object of type ciscoRouter in zone Low End SW Lab, the router sends an NBP lookup reply in response to this NBP lookup request. The following two lines of output show the response of the router:

AT: NBP ctrl = LkUp-Reply, ntuples = 1, id = 77 AT: 4160.154, skt 254, enum 1, name: lestat.Ether0:ciscoRouter@Low End SW Lab In the first line, ctrl = LkUp-Reply identifies this NBP packet as an NBP lookup request. The same value in the id field (id = 77) associates this lookup reply with the previous lookup request. The second line indicates that the network address associated with the entity name of the router (lestat.Ether0:ciscoRouter@Low End SW Lab) is 4160.154. The fact that no other entity name/network address is listed indicates that the responder only knows about itself as an object of type ciscoRouter in zone Low End SW Lab.

# debug apple packet

I

To display per-packet debugging output, use the **debugapplepacket** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple packet [type number]

**no debug apple packet** [type number]

Syntax Description		1
Syntax Description	type	(Optional) Interface type.
	number	(Optional) Interface number.
Command Modes	Privileged EXEC	
Usage Guidelines	<b>Guidelines</b> With this command, you can monitor the types of packets being slow switched. It displays at least of debugging output per AppleTalk packet processed.	
	The output reports information online when a packet	is received or a transmission is attempted.
	When invoked in conjunction with the <b>debugapplerouting</b> , <b>debugapplezip</b> , and <b>debugapplenbp</b> the <b>debugapplepacket</b> command adds protocol processing information in addition to generic pa It also reports successful completion or failure information.	
	When invoked in conjunction with the <b>debugappleerrors</b> command, the <b>debugapplepacket</b> command reports packet-level problems, such as those concerning encapsulation.	
$\triangle$		
Caution	Because the <b>debugapplepacket</b> command can general utilization of the router is less than 50 percent.	ate many messages, use it only when the CPU
Examples	The following is sample output from the <b>debugapple</b> Router# <b>debug apple packet</b> Ether0: AppleTalk packet: enctype SNAP, size AT: src=Ethernet0:4160.47, dst=4160-4160, siz	<b>packet command:</b> 60, encaps00000000000000000000000 ze=10, 2 rtes, RTMP pkt sent
	AT: 21P Extended reply rovd from 4160.19 AT: 21P Extended reply rovd from 4160.19 AT: src=Ethernet0:4160.47, dst=4160-4160, siz Ether0: AppleTalk packet: enctype SNAP, size Ether0: AppleTalk packet: enctype SNAP, size The table below describes the fields in the first line of	ze=10, 2 rtes, RTMP pkt sent 60, encaps0000000000000000000000 60, encaps000000000000000000000000 f output.

#### Table 8: debug apple packet Field Descriptions--First Line of Output

Field	Description
Ether0:	Name of the interface through which the router received the packet.
AppleTalk packet	Indicates that this is an AppleTalk packet.
enctype SNAP	Encapsulation type for the packet.
size 60	Size of the packet (in bytes).
encaps000000000000000000000000000000000000	Encapsulation.

The table below describes the fields in the second line of output.

Table 9: debug apple packet Field Descriptions--Second Line of Output

Field	Description
AT:	Indicates that this is an AppleTalk packet.
src=Ethernet0:4160.47	Name of the interface sending the packet and its AppleTalk address.
dst=4160-4160	Cable range of the destination of the packet.
size=10	Size of the packet (in bytes.)
2 rtes	Indicates that two routes in the routing table link these two addresses.
RTMP pkt sent	Type of packet sent.

The third line indicates the type of packet received and its source AppleTalk address. This message is repeated in the fourth line because AppleTalk hosts can send multiple replies to a given GetNetInfo request.

# debug apple remap

To enable debugging of the AppleTalk remap activities, use the **debugappleremap**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple remap

no debug apple remap

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** Use the **debugappleremap**command with the **debugappledomain** command to observe activity between domains and subdomains. Messages from the **debugappleremap** command are displayed when a particular remapping function occurs, such as creating remaps or deleting remaps.

# **Examples** The following is sample output from the **debugappleremap** command intermixed with output from the **debugappledomain** command; the two commands show related events.

Router# debug apple remap
Router# debug apple domain
AT-REMAP: RemapProcess for net 30000 domain AURP Domain 1
AT-REMAP: ReshuffleRemapList for subdomain 1
AT-REMAP: Could not find a remap for cable 3000-3001
AT-DOMAIN: atdomain DisablePort for Tunnel0
AT-DOMAIN: CleanUpDomain for domain 1 [AURP Domain 1]
AT-DOMAIN: Disabling interface Ethernet1
AT-DOMAIN: atdomain DisablePort for Ethernet1
AT-DOMAIN: CleanupDomain for domain 1 [AURP Domain 1]
AT-DOMAIN: CleanSubDomain for inbound subdomain 1
AT-REMAP: Remap for net 70 inbound subdomain 1 has been deleted
AT-DOMAIN: DeleteAvRemapList for inbound subdomain 1
AT-DOMAIN: DeleteRemapTable for subdomain 1
AT-DOMAIN: DeleteAvRemapList for inbound subdomain 1
AT-DOMAIN: CleanSubDomain for outbound subdomain 1
AT-DOMAIN: DeleteRemapTable for subdomain 1
AT-REMAP: RemapProcess for net 30000 domain AURP Domain 1 Remaped Net 10000
AT-REMAP: Remap for net 50 outbound subdomain 1 has been deleted
AT-DOMAIN: DeleteAvRemapList for outbound subdomain 1
AT-DOMAIN: DeleteAvRemapList for outbound subdomain 1
AT-DOMAIN: CleanUpDomain for domain 1 [AURP Domain 1]
AT-DOMAIN: CleanSubDomain for inbound subdomain 1
AT-DOMAIN: DeleteRemapTable for subdomain 1
AT-DOMAIN: DeleteAvRemapList for inbound subdomain 1
AT-DOMAIN: CleanSubDomain for outbound subdomain 1
AT-DOMAIN: DeleteRemapTable for subdomain 1
AT-DOMAIN: DeleteAvRemapList for outbound subdomain 1

# debug apple routing

To enable debugging output from the Routing Table Maintenance Protocol (RTMP) routines, use the **debugapplerouting** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple routing [type number]

**no debug apple routing** [type number]

### Syntax Description (Optional) Interface type. type number (Optional) Interface number. **Command Modes** Privileged EXEC **Usage Guidelines** This command can be used to monitor acquisition of routes, aging of routing table entries, and advertisement of known routes. It also reports conflicting network numbers on the same network if the network is misconfigured. ∕!∖ Caution Because the **debugapplerouting** command can generate many messages, use it only when router CPU utilization is less than 50 percent. Examples The following is sample output from the **debugapplerouting** command: Router# debug apple routing AT: src=Ethernet0:4160.41, dst=4160-4160, size=19, 2 rtes, RTMP pkt sent AT: src=Ethernet1:41069.25, dst=41069, size=427, 96 rtes, RTMP pkt sent AT: src=Ethernet2:4161.23, dst=4161-4161, size=427, 96 rtes, RTMP pkt sent AT: Route ager starting (97 routes) AT: Route ager finished (97 routes) AT: RTMP from 4160.19 (new 0,old 94,bad 0,ign 0, dwn 0) AT: RTMP from 4160.250 (new 0,old 0,bad 0,ign 2, dwn 0) AT: RTMP from 4161.236 (new 0,old 94,bad 0,ign 1, dwn 0) AT: src=Ethernet0:4160.41, dst=4160-4160, size=19, 2 rtes, RTMP pkt sent

The table below describes the fields in the first line of sample **debugapplerouting** output.

Table 10: debug apple routing Field Descriptions--First Line of Output

Field	Description
AT:	Indicates that this is AppleTalk debugging output.
src=Ethernet0:4160.41	Indicates the source router interface and network address for the RTMP update packet.

Field	Description
dst=4160-4160	Indicates the destination network address for the RTMP update packet.
size=19	Displays the size of this RTMP packet (in bytes).
2 rtes	Indicates that this RTMP update packet includes information on two routes.
RTMP pkt sent	Indicates that this type of message describes an RTMP update packet that the router has sent (rather than one that it has received).

The following two messages indicate that the ager has started and finished the aging process for the routing table and that this table contains 97 entries:

AT: Route ager starting (97 routes) AT: Route ager finished (97 routes) The table below describes the fields in the following line of the **debugapplerouting** command output:

AT: RTMP from 4160.19 (new 0,old 94,bad 0,ign 0, dwn 0)

Table 11: debug apple routing Field Descriptions

Field	Description
AT:	Indicates that this is AppleTalk debugging output.
RTMP from 4160.19	Indicates the source address of the RTMP update the router received.
new 0	Displays the number of routes in this RTMP update packet that the router did not already know about.
old 94	Displays the number of routes in this RTMP update packet that the router already knew about.
bad 0	Displays the number of routes the other router indicates have gone bad.
ign 0	Displays the number of routes the other router ignores.
dwn 0	Displays the number of poisoned tuples included in this packet.

# debug apple zip

I

To display debugging output from the Zone Information Protocol (ZIP) routines, use the **debugapplezip** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug apple zip [type number]

**no debug apple zip** [type number]

Syntax Description	type	(Optional) Interface type
	number	(Optional) Interface number.
Command Modes	Privileged EXEC	
Usage Guidelines	This command reports significant events such as the di information similar to that generated by the debug ap instead of Routing Table Maintenance Protocol (RTM	iscovery of new zones and zone list queries. It generates ple routing command, but generates it for ZIP packets IP) packets.
	You can use the <b>debugapplezip</b> command to determine network. You can detect the existence of a ZIP storm name corresponding to a network number that all the	he whether a ZIP storm is taking place in the AppleTalk when you see that no router on a cable has the zone routers have in their routing tables.
Examples	The following is sample output from the <b>debugapple</b>	<b>zip</b> command:
	Router# <b>debug apple zip</b> AT: Sent GetNetInfo request broadcast on Ethe AT: Recvd ZIP cmd 6 from 4160.19-6 AT: 3 query packets sent to neighbor 4160.19 AT: 1 zones for 31902, ZIP XReply, src 4160.1 AT: net 31902, zonelen 10, name US-Florida The first line indicates that the router has received an	er0 19 RTMP update that includes a new network number and
	is now requesting zone information:	
	AT: Sent GetNetInfo request broadcast on Ethe The second line indicates that the neighbor at address	er0 4160.19 replies to the zone request with a default zone:
	AT: Recvd ZIP cmd 6 from 4160.19-6 The third line indicates that the router responds with th for other zones on the network:	nree queries to the neighbor at network address 4160.19
	AT: 3 query packets sent to neighbor 4160.19 The fourth line indicates that the neighbor at network indicating that one zone has been assigned to network	address 4160.19 responds with a ZIP extended reply, 31902:
	AT: 1 zones for 31902, ZIP XReply, src 4160.1	9

1

The fifth line indicates that the router responds that the zone name of network 31902 is US-Florida, and the zone length of that zone name is 10:

AT: net 31902, zonelen 10, name US-Florida

# debug appn all

	To turn on all possible debugging messages for Advanced Peer-to-Peer Networking (APPN), use the <b>debugappnall</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command.
	debug appn all
	no debug appn all
Syntax Description	This command has no arguments or keywords.
Command Modes	Privileged EXEC
Usage Guidelines	This command shows all APPN events. Use other forms of the <b>debugappn</b> command to display specific types of events.
<u></u>	
Caution	Because the <b>debugappnall</b> command can generate many messages and alter timing in the network node, use it only when instructed by authorized support personnel.
Caution	Debugging output takes priority over other network traffic. The <b>debugappnall</b> command generates more output than any other <b>debugappn</b> command and can alter timing in the network node. This command can severely diminish router performance or even render it unusable. In virtually all cases, it is best to use specific <b>debugappn</b> commands.
Examples	Refer to the documentation for specific <b>debugappn</b> commands for examples and explanations.

### Re V

ſ

Note

Refer to the other forms of the **debugappn** command to enable specific debug output selectively.

Command	Description
debug appn cs	Displays the APPN CS component activity.
debug appn ds	Displays debugging information on APPN DS component activity.
debug appn hpr	Displays information related to HPR code execution.

I

٦

Command	Description
debug appn ms	Displays debugging information on APPN MS component activity.
debug appn nof	Displays information on APPN NOF component activity.
debug appn pc	Displays debugging information on APPN PC component activity.
debug appn ps	Displays debugging information on APPN PS component activity.
debug appn scm	Displays debugging information on APPN SCM component activity.
debug appn ss	Displays SS events.
debug appn ss	Displays debugging information on APPN TRS component activity.

## debug appn cs

To display Advanced Peer-to-Peer Networking (APPN) Configuration Services (CS) component activity, use the **debugappncs** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn cs

no debug appn cs

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The CS component is responsible for defining link stations, ports, and connection networks. It is responsible for the activation and deactivation of ports and link stations and handles status queries for these resources.

**Examples** The following is sample output from the **debugappncs** command. In this example a link station is being stopped.

Router# debug appn cs Turned on event 008000FF Router# appn stop link PATTY APPN: ----- CS ----- Deg STOP\_LS message APPN: ----- CS ----- FSM LS: 75 17 5 8 APPN: ----- CS ----- Sending DEACTIVATE\_AS - station PATTY APPN: ----- CS ----- deactivate\_as\_p->ips\_header.lpid = A80A60 APPN: ----- CS ----- deactivate\_as\_p->ips\_header.lpid = A80A60 APPN: ----- CS ----- deactivate\_as\_p->ips\_header.lpid = A80A60 APPN: ----- CS ----- Bending DESTROY\_TG to PC - station PATTY - lpid=A80A60 APPN: ----- CS ----- Bending DESTROY\_TG - station PATTY APPN: ----- CS ----- FSM LS: 22 27 8 0 APPN: ----- CS ----- Sending TG update for LS PATTY to TRS APPN: ----- CS ----- ENTERING XID\_PROCESSING: 4 %APPN-6-APPNSENDMSG: Link Station PATTY stopped The table below describes the significant fields and messages shown in the display.

Table	12:	debug	appn	CS	Field	Descri	ptions

Field	Description
APPN	APPN debugging output.
CS	CS component output.
Deq	CS received a message from another component.
FSM LS	Link station finite state machine is being referenced.
Sending	CS is sending a message to another component.

1

Command	Description
debug appn all	Turns on all possible debugging messages for APPN.

## debug appn ds

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Directory Services (DS) component activity, use the **debugappnds** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn ds no debug appn ds

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The DS component manages searches for resources in the APPN network. DS is also responsible for registration of resources within the network.

**Examples** The following is sample output from the **debugappnds** command. In this example a search has been received.

```
Router# debug appn ds
Turned on event 080000FF
APPN: NEWDS: LS: search from: NETA.PATTY

APPN: NEWDS: LSfsm parent: 00A89940 row: 3 col: 1 inp: 80840000
APPN: NEWDS: send locate to node: NETA.PATTY
The table below describes the significant fields shown in the display.
```

#### Table 13: debug appn ds Field Descriptions

Field	Description
APPN	APPN debugging output.
NEWDS	DS component output.
search from	Locate was received from NETA.PATTY.
LSfsm_	Locate Search finite state machine is being referenced.

I

1

Field	Description
PQenq	Message was sent to another component.
Rcvd	Message was received from another component.
send locate	Locate will be sent to NETA.PATTY.

Command	Description
debug appn all	Turns on all possible debugging messages for APPN.

# debug appn hpr

To display debugging information related to High Performance Routing (HPR) code execution, use the **debugappnhpr**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn hpr

no debug appn hpr

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

Examples

I

The following is sample output from the **debugappnhpr** command:

Poutor# dobug ann har

The table below describes the significant fields shown in the display.

Table 14: debug appn hpr Field Descriptions

Field	Description
APPN	APPN debugging output.

1

Field	Description
NCL	Network control layer debugging output. Network control layer is the component that handles ANR packets.
ncl_port_fsm	Network control layer port finite state machine has been invoked.
ncl_assign_anr	ANR label has been assigned to an activating link station.
ncl_populate_anr	System is updating the ANR record with information specific to the link station.
ncl_ls_fsm	Network control layer link finite state machine has been invoked.
rtp_send	RTP is about to send a packet.
hpr timer	Debugging output related to an HPR timer.
rtt start time	RTP is measuring the round-trip time for an HPR status request packet. This is the start time.
NCL_SND_MSG	Network control layer has been requested to send a packet.
process_nlp_from_rtp	Network control layer has been requested by RTP to send a packet.
rtt end time	RTP is measuring the round-trip time for an HPR status request packet. This is the time.
round trip time	Round-trip time for this HPR status exchange has been computed.

Command	Description
debug appn all	Turns on all possible debugging messages for APPN.

# debug appn ms

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Management Services (MS) component activity, use the **debugappnms** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn ms

no debug appn ms

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The MS component is responsible for generating, sending, and forwarding network management information in the form of traps and alerts to a network management focal point, such as Netview, in the APPN network.

**Examples** The following is sample output from the **debugappnms** command. In this example an error occurred that caused an alert to be generated.

Router# debug appn ms
APPN: MSS00 Deq ALERT MSU msg
APPN: MSP70 ALERT MV FROM APPN WITH VALID LGTH
APPN: MSCPL Find Active FP

## debug appn nof

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Node Operator Facility (NOF) component activity, use the **debugappnnof** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn nof

no debug appn nof

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC
- **Usage Guidelines** The NOF component is responsible for processing commands entered by the user such as start, stop, show, and configuration commands. NOF forwards these commands to the proper component and waits for the response.
- **Examples** The following is sample output from the **debugappnnof** command. In this example, an APPN connection network is being defined.

```
Router# debug appn nof

Turned on event 010000FF

Router# config term

Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# appn connection-network NETA.CISCO

Router(config-appn-cn)# port TRO

Router(config)#

APPN: ----- NOF ----- Define Connection Network Verb Received

APPN: ----- NOF ----- send define_cn_t ips to cs

APPN: ----- NOF ----- waiting for define_cn rsp from cs

router(config)#
```

The table below describes the significant fields shown in the display.

rubie iei uebug uppii nei i ieiu beeenpiiene
----------------------------------------------

Field	Description
APPN	APPN debugging output.
NOF	NOF component output.
Received	Configuration command was entered.
send	Message was sent to CS.
waiting	Response was expected from CS.

1

Command	Description
debug appn all	Turns on all possible debugging messages for APPN.

### debug appn pc

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Path Control (PC) component activity, use the **debugappnpc** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn pc

no debug appn pc

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC
- Usage Guidelines The PC component is responsible for passing Message Units (MUs) between the Data Link Control (DLC) layer and other APPN components. PC implements transmission priority by passing higher priority MUs to the DLC before lower priority MUs.
- **Examples** The following is sample output from the **debugappnpc** command. In this example an MU is received from the network.

```
Router# debug appn pc

Turned on event 040000FF

APPN: ----- PC----PC Deq REMOTE msg variant_name 2251

APPN: --PC-- mu received to PC lpid: A80AEC

APPN: --PC-- mu received from p_cep_id: 67C6F8

APPN: ---- PC Deq LSA_IFS from DLC

APPN: ---PCX dequeued a DATA.IND

APPN: --- PC processing DL_DATA.ind

APPN: --PC-- mu error_checker with no error, calling frr

APPN: --PC-- calling frr for packet received on LFSID: 1 2 3

APPN: ---- PC----PC is sending MU to SC A90396

APPN: sc: Send mu.snf: 8, th.b0: 2E, rh.b1: 90, dcf: 8

The table below describes the significant fields shown in the display.
```

Field	Description
APPN	APPN debugging output.
PC	PC component output.
Deq REMOTE	Message was received from the network.
mu received	Message is an MU.
DATA.IND	MU contains data.

I

1

Field	Description
sending MU	MU is session traffic for an ISR session. The MU is forwarded to the Session Connector component for routing.

Command	Description
debug appn all	Turns on all possible debugging messages for APPN.

## debug appn ps

I

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Presentation Services (PS) component activity, use the **debugappnps** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn ps no debug appn ps

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The PS component is responsible for managing the Transaction Programs (TPs) used by APPN. TPs are used for sending and receiving searches, receiving resource registration, and sending and receiving topology updates.

**Examples** The following is sample output from the **debugappnps** command. In this example a CP capabilities exchange is in progress.

Router	# dek	oug a	appn	ps
Turned	on e	event	200	)000FF
APPN:		CCA		CP CAPABILITIES TP has started
APPN:		CCA		About to wait for Partner to send CP CAP
APPN:		CCA		Partner LU name: NETA.PATTY

APPN:		CCA		CGID: 78
APPN:		CCA		About to send cp cp session act to SS
APPN:		CCA		Waiting for cp_cp_session_act_rsp from SS
APPN:		CCA		Received cp cp session act rsp from SS
APPN:		CCA		About to send CP_CAP to partner
APPN:		CCA		Send to partner completed with rc=0, 0
APPN:		RCA		Allocating conversation
APPN:		RCA		Sending CP_CAPABILITIES
APPN:		RCA		Getting conversation attributes
APPN:		RCA		Waiting for partner to send CP_CAPABILITIES
APPN:		RCA		Normal processing complete with cgid = 82
APPN:		RCA		Deallocating CP_Capabilities conversation
The tab	ole bel	low c	lescr	ibes the significant fields shown in the display.

Table 18: debug appn ps Field Descriptions

Field	Description
APPN	APPN debugging output.
CCA	CP Capabilities TP output.
RCA	Receive CP Capabilities TP output.

1

Command	Description
debug appn all	Turns on all possible debugging messages for APPN.

### debug appn scm

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Session Connector Manager (SCM) component activity, use the **debugappnscm**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn scm

no debug appn scm

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The SCM component is responsible for the activation and deactivation of the local resources that route an intermediate session through the router.

**Examples** The following is sample output from the **debugappnscm** command. In this example an intermediate session traffic is being routed.

Router# debug appn scm Turned on event 020000FF Router# APPN: ---- SCM----SCM Deg a MU APPN: ---- SCM----SCM send ISR INIT to SSI APPN: ----- SCM-----(i05) Enter compare\_fqpcid() APPN: ----- SCM-----Adding new session\_info table entry. addr=A93160 APPN: ---- SCM----SCM Deq ISR CINIT message APPN: ----- SCM----- (i05) Enter compare fqpcid() APPN: ---- SCM----SCM sends ASSIGN\_LFSID to ASM APPN: ----- SCM-----SCM Rcvd sync ASSIGN\_LFSID from ASM APPN: ---- SCM----SCM PQenq a MU to ASM APPN: ----- SCM Deq a MU APPN: ----- SCM----- (i05) Enter compare\_fqpcid() APPN: ---- SCM----SCM PQenq BIND rsp to ASM The table below describes the significant fields shown in the display.

٦

### debug appn ss

To display session services (SS) events, use the **debugappnss** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn ss

no debug appn ss

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

**Usage Guidelines** The SS component generates unique session identifiers, activates and deactivates control point-to-control point (CP-CP) sessions, and assists logical units (LUs) in initiating and activating LU-LU sessions.

**Examples** The following is sample output from the **debugappnss** command. In this example CP-CP sessions between the router and another node are being activated.

```
Router# debug appn ss
Turned on event 100000FF
APPN: ---- SS ---- Deq ADJACENT CP CONTACTED message
APPN: ---- SS ---- Deq SESSST_SIGNAL message

Field	Description
APPN	APPN debugging output.
SS	SS component output.

Command	Description		
debug appn all	Turns on all possible debugging messages for APPN.		

# debug appn trs

To display debugging information on Advanced Peer-to-Peer Networking (APPN) Topology and Routing Services (TRS) component activity, use the **debugappntrs** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug appn trs

no debug appn trs

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The TRS component is responsible for creating and maintaining the topology database, creating and maintaining the class of service database, and computing and caching optimal routes through the network.

**Examples** The following is sample output from the **debugappntrs** command:

Router#	de	ebug	aŗ	pn	trs	
Turned	on	ever	nt	400	0000	FF

APPN:	 TRS	 Received a QUERY CPNAME

1

The table below describes the significant fields shown in the display.

Table 21: debug appn trs Field Descriptions

Field	Description
APPN	APPN debugging output.
TRS	TRS component output.
# debug arap

To display AppleTalk Remote Access Protocol (ARAP) events, use the **debugarap** command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug arap {internal| memory| mnp4| v42bis} [*linenum* [aux| console| tty| vty]] no debug arap {internal| memory| mnp4| v42bis} [*linenum* [aux| console| tty| vty]]

### **Syntax Description**

internal	Debugs internal ARA packets.
memory	Debugs memory allocation for ARA.
mnp4	Debugs low-level asynchronous serial protocol.
v42bis	Debugs V.42bis compression.
linenum	(Optional) Line number. The number ranges from 0 to 999, depending on what type of line is selected.
aux	(Optional) Auxiliary line.
console	(Optional) Primary terminal line.
tty	(Optional) Physical terminal asynchronous line.
vty	(Optional) Virtual terminal line.

**Command Modes** Privileged EXEC

**Usage Guidelines** Use the **debugarap** command with the **debugcallback** command on access servers to debug dialin and callback events.

Use the **debugmodem** command to help catch problems related to ARAP autodetection (that is, **autoselectarap**). These problems are very common and are most often caused by modems, which are the most common cause of failure in ARAP connection and configuration sessions.

**Examples** The following is sample output from the **debugarapinternal** command:

Router# debug arap internal

ARAP: ----- SRVRVERSION ------ARAP: ----- ACKing 0 -----arapsec\_local\_account\_setting up callback ARAP: ------ ACKing 1 ------ARAP: ----- AUTH\_RESPONSE -----

```
arap_startup initiating callback ARAP 2.0
ARAP: ------ CALLBACK ------
TTY7 Callback process initiated, user: dialback dialstring 40
TTY7 Callback forced wait = 4 seconds
TTY7 ARAP Callback Successful - await exec/autoselect pickup
TTY7: Callback in effect
ARAP: ------ STARTINFOFROMSERVER ------
ARAP: ----- ACKing 0 ------
ARAP: ----- ZONELISTINFO ------
ARAP: ----- ZONELISTINFO ------
ARAP: ----- ZONELISTINFO -------
ARAP: ----- ZONELISTINFO -------
ARAP: ------ ZONELISTINFO -------
ARAP: ------ ZONELISTINFO -------
```

Command	Description
debug callback	Displays callback events when the router is using a modem and a chat script to call back on a terminal line.
debug modem	Observes modem line activity on an access server.

# debug archive config timestamp

To enable debugging of the processing time for each integral step of a configuration replace operation and the size of the configuration files being handled, use the **debug archive config timestamp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug archive config timestamp no debug archive config timestamp

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC (#)

**Command History** 

Release	Modification
12.3(7)T	This command was introduced.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was implemented on the Cisco 10000 series.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB and implemented on the Cisco 10000 series.
Cisco IOS XE Release 3.98	This command was integrated into Cisco IOS XE Release 3.9S.

### Examples

The following is sample output from the **debug archive config timestamp** command:

```
Device# debug archive config timestamp
Device# configure replace disk0:myconfig force
Timing Debug Statistics for IOS Config Replace operation:
       Time to read file slot0:sample 2.cfg = 0 msec (0 sec)
       Number of lines read:55
                           :1054
       Size of file
Starting Pass 1
       Time to read file system:running-config = 0 msec (0 sec)
       Number of lines read:93
       Size of file
                           :2539
       Time taken for positive rollback pass = 320 msec (0 sec)
       Time taken for negative rollback pass = 0 msec (0 sec)
       Time taken for negative incremental diffs pass = 59 msec (0 sec)
       Time taken by PI to apply changes = 0 msec (0 sec)
       Time taken for Pass 1 = 380 msec (0 sec)
```

1

```
Starting Pass 2
Time to read file system:running-config = 0 msec (0 sec)
Number of lines read:55
Size of file :1054
Time taken for positive rollback pass = 0 msec (0 sec)
Time taken for negative rollback pass = 0 msec (0 sec)
Time taken for Pass 2 = 0 msec (0 sec)
Total number of passes:1
Rollback Done
```

Command	Description
debug archive versioning	Enables debugging of the Cisco configuration archive activities.

# debug archive log config persistent

	To turn on debugging of configuration logging persistent events and display the results, use the <b>debugarchivelogconfigpersistent</b> command in privileged EXEC mode. To disable the debugging and disp of the archive events, use the <b>no</b> form of this command.	
	debug archive log con	fig persistent
	no debug archive log o	config persistent
Syntax Description	This command has no arguments or keywords.	
Command Default	If this command is not entered, there is no debugging or display of the configuration logging persistent events in the archive.	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2(33)SRA	This command was introduced.
	12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

**Usage Guidelines** The configuration logger feature must be enabled in order for the debug capability to work.

Examples

I

The following example turns on the debugging feature and displays the configuration logging persistent events:

Router# debug archive config log persistent Router# archive log config persistent save Configuration logging persistent save triggered. Saving the config log to disk0:IOS-Config-Logger-database'. Command 'interface eth0' saved Command 'ip address 10.1.1.1 255.255.255.0' saved Command 'no shut' saved Router#

٦

Command	Description
archive log config persistent save	Saves the persisted commands in the configuration log to the Cisco IOS secure file system.

# debug archive versioning

To enable debugging of the Cisco configuration archive activities, use the **debug archive versioning** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug archive versioning

no debug archive versioning

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.3(7)T	This command was introduced.
	12.2(25)8	This command was integrated into Cisco IOS Release 12.2(25)S.
	12.2(28)SP	This command was integrated into Cisco IOS Palaosa 12 2(20)SP
	12.2(28)3B	
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(31)SB2	This command was implemented on the Cisco 10000 series.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB and implemented on the Cisco 10000 series.
	12.2(33)SRE	This command was modified. It was integrated into Cisco IOS Release 12.2(33)SRE.
	Cisco IOS XE Release 3.9S	This command was integrated into Cisco IOS XE Release 3.9S.

### **Examples**

I

The following is sample output from the **debug archive versioning** command:

Device# debug archive versioning
Jan 9 06:46:28.419:backup\_running\_config
Jan 9 06:46:28.419:Current = 7
Jan 9 06:46:28.443:Writing backup file disk0:myconfig-7
Jan 9 06:46:29.547: backup worked

٦

Command	Description
debug archive config timestamp	Enables debugging of the processing time for each integral step of a configuration replace operation and the size of the configuration files being handled.

# debug arp

To enable debugging output for Address Resolution Protocol (ARP) transactions, use the **debug arp** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug arp [vrf vrf-name| global] [arp-entry-event| arp-table-event| ha| interface-interaction]

no debug arp [vrf vrf-name| global] [arp-entry-event| arp-table-event| ha| interface-interaction]

### **Syntax Description**

I

vrf vrf-name	(Optional) Enables debug trace for a specific VPN routing and forwarding (VRF) instance.
global	(Optional) Enables global VRF debugging.
arp-entry-event	(Optional) ARP entry events for which a debug trace is enabled. Keywords are as follows:
	• <b>dynamic</b> —Enables debugging output for dynamic ARP entry events.
	• <b>interface</b> —Enables debugging output for interface ARP entry events.
	• <b>static</b> —Enables debugging output for static ARP entry events.
	• <b>subblocking</b> —Enables debugging output for ARP subblocking events.
arp-table-event	(Optional) ARP entry events for which a debug trace is enabled. Keywords are as follows:
	• <b>database</b> —Enables debugging output for ARP database operations.
	• <b>table</b> —Enables debugging output for ARP table operations.
	• <b>timer</b> —Enables debugging output for ARP timer operations.
ha	(Optional) Enables debug trace for ARP high availability (HA) events.
	<b>Note</b> This keyword is available only on HA-capable platforms (that is, Cisco networking devices that support dual Route Processors [RPs]).

interface-interaction	(Optional) ARP interface interaction for which a debug trace is enabled. Keywords are as follows:
	• <b>adjacency</b> —Enables debugging output for ARP interface events and Cisco Express Forwarding adjacency interface events.
	• <b>application</b> —Enables debugging output for ARP application interface events.

**Command Default** Debugging output is disabled for ARP transactions. To enable ARP packet debugging, use this command without a keyword.

**Command Modes** Privileged EXEC (#)

Command HistoryReleaseModification10.3This command was introduced.12.4(11)TThe following keywords were added: adjacency, application, dynamic, ha,<br/>interface, static, subblocking, table, and timer.12.2(33)SREThis command was modified. The database keyword was added.15.1(1)SYThis command was modified. The vrf vrf-name keyword-argument pair and<br/>global keyword were added.

# Usage Guidelines The debugging information shows whether the device is sending ARP packets and receiving ARP packets. Use this command when only some nodes on a TCP/IP network are responding. The amount of debug information displayed is filtered based on an interface, an access list, or both, as specified by the debug list command. To list the debugging options enabled on this device, use the show debugging command. Examples The following example shows how to enable ARP packet debugging filtered on ARP table entries for the host at 192.0.2.10: Device (config) # access-list 10 permit host 192.0.2.10 Device# debug list 10 Device# debug list 10

The following is sample output from the **debug arp** command:

IP ARP: sent req src 192.0.2.7 0000.0c01.e117, dst 192.0.2.96 0000.0000.0000 IP ARP: rcvd rep src 192.0.2.96 0800.2010.b908, dst 192.0.2.7 IP ARP: rcvd req src 172.16.6.10 0000.0c00.6fa2, dst 192.0.2.62 IP ARP: rep filtered src 192.0.2.7 aa92.1b36.a456, dst 255.255.255 ffff.ffff.ffff IP ARP: rep filtered src 192.0.2.240 0000.0c00.6b31, dst 192.0.2.7 0800.2010.b908 In the output, each line of output represents an ARP packet that the device has sent or received. Explanations for the individual lines of output follow.

The first line indicates that the device at IP address 192.0.2.7 and with the MAC address 0000.0c01.e117 sent an ARP request for the MAC address of the host at 192.0.2.96. The series of zeros (0000.0000.0000) following this address indicate that the device is currently unaware of the MAC address.

IP ARP: sent req src 192.0.2.7 0000.0c01.e117, dst 192.0.2.96 0000.0000.0000 The second line indicates that the device at IP address 192.0.2.7 receives a reply from the host at 192.0.2.96 indicating that the host MAC address is 0800.2010.b908:

IP ARP: rcvd rep src 192.0.2.96 0800.2010.b908, dst 192.0.2.7 The third line indicates that the device receives an ARP request from the host at 172.16.6.10 requesting the MAC address for the host at 192.0.2.62:

IP ARP: rcvd req src 172.16.6.10 0000.0c00.6fa2, dst 192.0.2.62 The fourth line indicates that another host on the network attempted to send the device an ARP reply for its own address. The device ignores meaningless replies. Usually, meaningless replies happen if a bridge is being run in parallel with the device and is allowing ARP to be bridged. This condition indicates a network misconfiguration.

IP ARP: rep filtered src 192.0.2.7 aa92.1b36.a456, dst 255.255.255.255 ffff.ffff.ffff The fifth line indicates that another host on the network attempted to inform the device that it is on network 192.0.2.240, but the device does not know that the network is attached to a different device interface. The remote host (probably a PC or an X terminal) is misconfigured. If the device were to install this entry, the device would deny service to the real machine on the proper cable.

IP ARP: rep filtered src 192.0.2.240 0000.0c00.6b31, dst 192.0.2.7 0800.2010.b908 The following example shows that debugging information related to vpn1 on Ethernet interface 0/0 will be logged:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet0/0
Device(config-if)# vrf forwarding vpn1
Device(config-if)# end
Device# debug arp vrf vpn1
```

Command	Description
access-list (extended-ibm)	Configures the extended access list mechanism for filtering frames by both source and destination addresses and arbitrary bytes in the packet.
debug list	Enables filtering of debug trace on a per-interface or per-access list basis.
show debugging	Lists the debugging options enabled on this device.

I

٦

# debug ase

I

Note

Effective with Cisco IOS Release 12.4(24), the debugase command is not available in Cisco IOS software.

To gather Automatic Signature Extraction (ASE) error, log, messaging, reporting, status, and timer information, use the **debugase** command in privileged EXEC mode. To disable error, log, messaging, reporting, status, and timer information, use the **no** form of this command.

debug ase {errors| log| messages| reports| status| timing} no debug ase {errors| log| messages| reports| status| timing}

Syntax Description	errors	Displays ASE error information.
	log	Displays ASE logging information.
	messages	Displays ASE messaging information.
	reports	Displays ASE reports.
	status	Displays ASE status information.
	timing	Displays ASE timer information.
	L	
Command Default	Disabled	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.4(15)T	This command was introduced.
	12.4(24)	This command was removed.

**Usage Guidelines** This command is used on the Cisco 1800, 2800, and 7200 series routers, Cisco 7301 router, and Integrated Services Routers (ISRs) as ASE sensors.

I

1

Command	Description
ase collector	Enters the ASE collector server IP address so that the ASE sensor has IP connectivity to the ASE collector.
ase enable	Enables the ASE feature on a specified interface.
ase group	Identifies the TIDP group number for the ASE feature.
ase signature extraction	Enables the ASE feature globally on the router.
clear ase signature	Clears ASE signatures that were detected on the router.
show ase	Displays the ASE run-time status, which includes the TIDP group number.

# debug asnl events

To trace event logs in the Application Subscribe Notify Layer (ASNL), use the **debugasnlevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug asnl events

no debug asnl events

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(4)T	This command was introduced.

**Usage Guidelines** This command traces the event logs in the ASNL, which serves as the interface layer between the application and protocol stacks. Event logs are generated during normal subscription processing, when the application responds to the notification request and when the session history table is updated.

**Examples** The following example shows the ASNL subscription table being generated and the associated subscription timers as the application responds to the subscription request. The response timer is started to determine if the application responds to the notification request. If the application that made the subscription does not respond to the notification request within 5 seconds, the system automatically removes the subscription. The session-history-record deletion timer is also started. When the timer expires, the history record is removed from the active subscription table.

Router# debug asnl events

record deletion_timer of 15 minutes
*May 4 06:26:34.667://-1//ASNL:SUB1:/asnl_notify_ack:ret=0x0
```

Command	Description
clear subscription	Clears all active subscriptions or a specific subscription.
show subscription	Displays information about ASNL-based and non-ASNL-based SIP subscriptions.
subscription asnl session history	Specifies how long to keep ASNL subscription history records and how many history records to keep in memory.

# debug asp packet

To display information on all asynchronous security protocols (ASPs) operating on the router, use the **debugasppacket**command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug asp packet

no debug asp packet

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Usage Guidelines** The router uses asynchronous security protocols from companies including ADT Security Systems, Inc., Adplex, and Diebold to transport alarm blocks between two devices (such as a security alarm system console and an alarm panel). The alarm blocks are transported in pass-through mode using BSTUN encapsulation.

**Examples** The following is partial sample output from the **debugasppacket** command for asynchronous security protocols when packet debugging is enabled on an asynchronous line carrying Diebold alarm traffic. In this example, two polls are sent from the Diebold alarm console to two alarm panels that are multidropped from a single EIA/TIA-232 interface. The alarm panels have device addresses F0 and F1. The example trace indicates that F1 is responding and F0 is not responding. At this point, you need to examine the physical link and possibly use a datascope to determine why the device is not responding.

ADI-T	Packet is being sent.

I

٦

Field	Description
Data ( <i>n</i> bytes)	Type and size of the packet.
F1FF4c42	Alarm panel device address.

# debug aspp event

To display asynchronous point of sale (APOS) event debug messages, use the **debugasppevent**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aspp event

no debug aspp event

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(2)T	This command was introduced.

Usage Guidelines The debugasppevent command should be used with the debugaspppacket command to display all available details of the APOS call flow.

**Examples** 

The following is sample output from the **debugasppevent** command for a simple transaction:

Router# debug aspp event ASPP event debugging is on Router# ASPP APOS: Serial0/1: Serial HayesAT: state = DISCONNECTED ASPP APOS: Serial0/1: Received HayesAT DIAL: state = DISCONNECTED ASPP APIP: Serial0/1: Serial ENABLE: state = CONNECTING ASPP APIP: Serial0/1: Network ENABLE: state = CONNECTING ASPP APOS: Serial0/1: Send HayesAT CONNECT 9600: state = CONNECTED ASPP APOS: Serial0/1: Response timer expired: state = CONNECTED ASPP APOS: Serial0/1: Response timer expired: state = CONNECTED ASPP APOS: Serial0/1: Serial DATA: state = CONNECTED ASPP APIP: Serial0/1: Serial DATA: state = CONNECTED ASPP APIP: Serial0/1: Network DATA: state = CONNECTED ASPP APOS: Serial0/1: Serial ACK: state = CONNECTED ASPP APOS: Serial0/1: Disconnect timer expired: state = DISCONNECT WAIT ASPP APIP: Serial0/1: Serial DISABLE: state = DISCONNECTING ASPP APIP: Serial0/1: Network DISABLE: state = DISCONNECTING

The table below describes the significant fields shown in the display.

Table 23: debug aspp event Field Descriptions

Field	Description
Serial ENABLE:	Enable event received from the serial interface.

1

Field	Description
Network ENABLE:	Enable event received from the network.
Send HayesAT CONNECT	Interpreted version of the Hayes AT command that is sent to the serial interface.
Response timer expired	The response timer has expired.
Serial DATA:	Data received from the serial interface.
Network DATA:	Data received from the network.
Disconnect timer expired	Hayes AT event is received by the serial interface.
Serial ACK:	Acknowledgment received from the serial interface.
Serial DISABLE:	Disable event received from the serial interface.
Network DISABLE:	Disable event received from the network.

Command	Description	
debug aspp packet	Displays APOS packet debug messages.	

# debug aspp packet

To display asynchronous point of sale (APOS) packet debug messages, use the **debugaspppacket**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug aspp packet

no debug aspp packet

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(2)T	This command was introduced.

**Usage Guidelines** The **debugaspppacket**command should be used with the **debugasppevent** command to display all available details of the APOS call flow.

Examples

The following is sample output from the **debugaspppacket**command for a simple transaction:

```
Router# debug aspp packet

ASPP event debugging is on

Router#

ASPP:Serial1/7:ADI-rx:Data (14 bytes): 415456302644325331313D35300D

ASPP:Serial1/7:ADI-tx:Data (2 bytes): 300D

ASPP:Serial1/7:ADI-rx:Data (27 bytes): 4154583453393D3153373D323444543138303039

ASPP:Serial1/7:ADI-tx:Data (3 bytes): 31320D

ASPP:Serial1/7:ADI-tx:Data (1 bytes): 05

ASPP:Serial1/7:ADI-rx:Data (5 bytes): 0212340325

ASPP:Serial1/7:ADI-tx:Data (1 bytes): 06

ASPP:Serial1/7:ADI-rx:Data (1 bytes): 04
```

The table below describes the significant fields shown in the display.

Table 24: debug aspp packet Field Descriptions

Field	Description
ASPP	Indicates that this is an ASPP debug message.
Serial1/7:	The interface that received or transmitted the packet.

I

1

Field	Description
ADI-rx	Indicates a received packet.
ADI-tx	Indicates a transmitted packet.

Command	Description
debug aspp event	Displays APOS event debug messages.

# debug async async-queue

To display debug messages for asynchronous rotary line queueing, use the **debugasyncasync-queue**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug async async-queue

no debug async async-queue

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(1)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

### **Examples**

The following example starts the asynchronous rotary line queueing debugging display:

Route	c#	debug async as	sync-queue
*Mar	2	03:50:28.377:	AsyncQ: First connection to be queued - starting the AsyncQ manager
*Mar	2	03:50:28.377:	AsyncQ: Enabling the AsyncQ manager
*Mar	2	03:50:28.377:	AsyncQ: Started the AsyncQ manager process with pid 98
*Mar	2	03:50:28.381:	AsyncQ: Created a Waiting TTY on TTY66 with pid 99
*Mar	2	03:50:30.164:	WaitingTTY66: Did Authentication on waiting TTY (VTY)
*Mar	2	03:50:30.168:	AsyncQ: Received ASYNCQ MSG ADD
*Mar	2	03:50:30.168:	AsyncQ: New queue, adding this connection as the first element
*Mar	2	03:50:34.920:	AsyncQ: Created a Waiting TTY on TTY67 with pid 100
*Mar	2	03:50:36.783:	WaitingTTY67: Did Authentication on waiting TTY (VTY)
*Mar	2	03:50:36.787:	AsyncQ: Received ASYNCQ MSG ADD
*Mar	2	03:50:36.787:	AsyncQ: Queue exists, adding this connection to the end of the queue

# **Related Commands**

I

Command	Description
debug ip tcp transactions	Enables the IP TCP transactions debugging display to observe significant transactions such as state changes, retransmissions, and duplicate packets.
debug modem	Enables the modem debugging display to observe modem line activity on an access server.

# debug atm autovc

To display information about autoprovisioned ATM permanent virtual circuit (PVC) events and errors, use the debug atm autovc command in privileged EXEC mode. To disable the display of information about autoprovisioned ATM PVC events and errors, use the no form of this command.

debug atm autovc {event| error| all}

no debug atm autovc {event| error| all}

### Syntax Description

all	Displays all autoprovisioned PVC events and errors.
error	Displays all autoprovisioned PVC errors.
event	Displays all autoprovisioned PVC events.

### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(15)B	This command was introduced.
	15.0(1)M	This command was integrated into Cisco IOS Release 15.0(1)M.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

### Examples

The following example shows output for the debug atm autovc command for all autoprovisioned PVC events and errors:

Router# debug atm autovc all AutoVC all debugging is on 00:09:03:AutoVC (ATM1/0):1/101 enqueued This message indicates that there is incoming traffic on PVC 1/101 and the PVC is enqueued to be processed.

00:09:03:AutoVC(ATM1/0):process VC 1/101 This message indicates that PVC 1/101 is in the process of being autoprovisioned.

00:09:03:AutoVC(ATM1/0.1):bring up vc 1/101 This message indicates that PVC 1/101 is being brought up.

00:09:03:%ATM-5-UPDOWN:Interface ATM1/0.1, Changing autovc 1/101 to UP This message indicates that the PVC was brought up successfully.

### **Related Commands**

ſ

Command	Description
create on-demand	Configures ATM PVC autoprovisioning, which enables a PVC or range of PVCs to be created automatically on demand.

# debug atm bundle error

To display debug messages for switched virtual circuit (SVC) bundle errors, use the **debugatmbundleerror** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug atm bundle error

no debug atm bundle error

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

### **Examples**

The following example provides output for the **debugatmbundleerror**command:

Router# debug atm bundle error

Command	Description
debug atm bundle events	Displays SVC bundle events.

# debug atm bundle events

To display switched virtual circuit (SVC) bundle events, use the **debugatmbundleevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug atm bundle events

no debug atm bundle events

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

### **Examples**

The following example provides output for the **debugatmbundleevents**command:

### Router# debug atm bundle events 01:14:35:BUNDLE EVENT(test):b\_update\_vc for four with bstate 1, vc\_state4 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x01 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x02 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x04 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x08 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x10 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x20 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x40 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x40 0 01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x80 0 -01:14:35:BUNDLE EVENT(test):bmupdate active precedence 0x80 0 -01:1

 Table 25: debug atm bundle events Field Descriptions

Field	Description
01:14:35	Local time on the router in hours:minutes:seconds.
BUNDLE EVENT(test)	Bundle event for bundle by that name.
b_update_vc for four with bstate 1, vc_state 1	Test describing the bundle event.

I

1

Command	Description
debug atm bundle error	Displays debug messages for SVC bundle errors.

# debug atm cell-packing

To enable the display of ATM cell relay cell-packing debugging information, use the debug atm cell-packing command in privileged EXEC mode. To disable the display of debugging information, use the no form of this command.

debug atm cell-packing

no debug atm cell-packing

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

 Command History
 Release
 Modification

 12.0(25)S
 This command was introduced.

 12.2(33)SRA
 This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Examples** 

The following example enables debugging for ATM virtual circuits (VCs) that have been configured with cell packing:

Router# debug atm cell-packing ATM Cell Packing debugging is on 00:09:04: ATM Cell Packing: vc 1/100 remote mncp 22 validated The following example enables debugging for permanent virtual paths (PVPs) that have been configured with cell packing:

Router# debug atm cell-packing ATM Cell Packing debugging is on 00:12:33: ATM Cell Packing: vp 1 remote mncp 22 validated The output indicates that the router received the MNCP information from the remote PE router.

Command	Description
atm mcpt-timers	Creates cell-packing timers that specify how long the PE router can wait for cells to be packed into an MPLS or L2TPv3 packet.
cell-packing	Enables the packing of multiple ATM cells into a single MPLS or L2TPv3 packet.

٦

Command	Description
show atm cell-packing	Displays information about the VCs and VPs that have ATM cell relay over MPLS or L2TPv3 cell packing enabled.

# debug atm events

To display ATM events, use the **debugatmevents**command in privileged EXEC mode. To disable event debugging output, use the **no** form of this command.

debug atm events

no debug atm events

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** ATM event debugging is disabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XJ	This command was introduced on the Cisco 1700 series routers.
	12.1(5)XR1	This command was implemented on the Cisco IAD2420 Series.
	12.2(4)T	This command was integrated into Cisco IOS Release 12.2(4)T.

**Usage Guidelines** This command displays ATM events that occur on the ATM interface processor and is useful for diagnosing problems in an ATM network. It provides an overall picture of the stability of the network. In a stable network, the **debugatmevents** command does not return any information. If the command generates numerous messages, the messages can indicate the possible source of problems.

When configuring or making changes to a router or interface for ATM, enable the **debugatmevents**command. Doing so alerts you to the progress of the changes or to any errors that might result. Also use this command periodically when you suspect network problems.

### **Examples**

### The following is sample output from the **debugatmevents** command:

### Router# debug atm events

RESET(ATM4/0): PLIM type is 1, Rate is 100Mbps aip\_disable(ATM4/0): state=1 config(ATM4/0) aip\_love\_note(ATM4/0): asr=0x201 aip\_enable(ATM4/0) aip\_love\_note(ATM4/0): asr=0x4000 aip\_enable(ATM4/0): restarting VCs: 7 aip\_setup\_vc(ATM4/0): vc:1 vpi:1 vci:1 aip\_love\_note(ATM4/0): asr=0x200 aip\_setup\_vc(ATM4/0): asr=0x200 aip\_setup\_vc(ATM4/0): asr=0x200 aip\_setup\_vc(ATM4/0): vc:3 vpi:3 vci:3

```
aip_love_note(ATM4/0): asr=0x200
aip_setup_vc(ATM4/0): vc:4 vpi:4 vci:4
aip_love_note(ATM4/0): asr=0x200
aip_setup_vc(ATM4/0): vc:6 vpi:6 vci:6
aip_love_note(ATM4/0): asr=0x200
aip_setup_vc(ATM4/0): vc:7 vpi:7 vci:7
aip_love_note(ATM4/0): asr=0x200
aip_setup_vc(ATM4/0): vc:11 vpi:11 vci:11
aip_love_note(ATM4/0): asr=0x200
The table below describes the significant fields shown in the display.
```

# Table 26: debug atm events Field Descriptions

Field	Description
PLIM type	Indicates the interface rate in megabits per second (Mbps). Possible values are:
	• 1 = TAXI(4B5B) 100 Mbps
	• 2 = SONET 155 Mbps
	• 3 = E3 34 Mbps
state	Indicates current state of the ATM Interface Processor (AIP). Possible values are:
	• 1 = An ENABLE will be issued soon.
	• 0 = The AIP will remain shut down.
asr	Defines a bitmask, which indicates actions or completions to commands. Valid bitmask values are:
	• $0x0800 = AIP$ crashed, reload may be required.
	• $0x0400 = AIP$ detected a carrier state change.
	• 0x0n00 = Command completion status. Command completion status codes are:
	• n = 8 Invalid Physical Layer Interface Module (PLIM) detected
	• $n = 4$ Command failed
	• n = 2 Command completed successfully
	• $n = 1$ CONFIG request failed
	• n = 0 Invalid value

The following line indicates that the AIP was reset. The PLIM TYPE detected was 1, so the maximum rate is set to 100 Mbps.

1

RESET(ATM4/0): PLIM type is 1, Rate is 100Mbps

The following line indicates that the AIP was given a shutdown command, but the current configuration indicates that the AIP should be up:

### aip disable(ATM4/0): state=1

The following line indicates that a configuration command has been completed by the AIP:

### aip love note(ATM4/0): asr=0x201

The following line indicates that the AIP was given a no shutdown command to take it out of shutdown:

### aip enable(ATM4/0)

The following line indicates that the AIP detected a carrier state change. It does not indicate that the carrier is down or up, only that it has changed.

### aip love note(ATM4/0): asr=0x4000

The following line of output indicates that the AIP enable function is restarting all permanent virtual circuits (PVCs) automatically:

aip\_enable (ATM4/0): restarting VCs: 7 The following lines of output indicate that PVC 1 was set up and a successful completion code was returned:

aip\_setup\_vc(ATM4/0): vc:1 vpi:1 vci:1
aip\_love\_note(ATM4/0): asr=0x200

# debug atm ha-error

To debug ATM) high-availability (HA errors on a networking device, use the **debugatmha-error** command in privileged EXEC mode. To disable the display of debugging output, use the **no** form of this command.

debug atm ha-error

no debug atm ha-error

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is disabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification	
	12.0(22)S	This command was introduced on Cisco 7500, 10000, and 12000 series Internet routers.	
	12.2(18)S	This command was integrated into Cisco IOS Release 12.2(18)S on Cisco 7500 series routers.	
	12.2(20)S	Support was added for the Cisco 7304 router. The Cisco 7500 series router is not supported in Cisco IOS Release 12.2(20)S.	
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.	
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.	
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.	

### **Examples**

The following example displays debug messages regarding ATM HA errors on the networking device:

Router# debug atm ha-error

### **Related Commands**

Command	Description
debug atm ha-events	Debugs ATM HA events on the networking device.
debug atm ha-state	Debugs ATM HA state information on the networking device.

	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

#### Examples

I

The following example displays debug messages regarding the ATM HA state on the networking device:

Router# debug atm ha-state

#### **Related Commands**

Command	Description
debug atm ha-error	Debugs ATM HA errors on the networking device.
debug atm ha-events	Debugs ATM HA events on the networking device.

## debug atm l2transport

To enable the display of debugging information related to ATM over MPLS, use the debug atm l2transport command in privileged EXEC mode. To disable the display of debugging information, use the no form of this command.

debug atm l2transport

no debug atm l2transport

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging of ATM over MPLS is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(25)S	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

```
Examples The following example shows the events and messages when configuring ATM Cell Relay over MPLS in VP mode.
```

```
Router# debug atm l2transport

ATM L2transport Events and Errors debugging is on

Router# show debug

ATM L2transport:

ATM L2transport Events and Errors debugging is on

Router(config-if)# atm pvp 24 l2transport

Router(cfg-if-atm-l2trans-pvp)# xconnect 11.11.11.11 700 pw-class vp

Router(cfg-if-atm-l2trans-pvp)# end

00:14:51: ATM L2trans(ATM1/0): VP 24 is created

00:14:51: ATM L2trans(ATM1/0): VP 24, response is connect forwarded

The following example shows the events and messages when deleting a PVP.
```

Router(config-if)# no atm pvp 24 l2transport 00:14:37: ATM L2trans(ATM1/0): ckt\_type 10, ckt\_id 1000024 DOWN 00:14:37: ATM L2trans(ATM1/0): ckt\_type 10, ckt\_id 1000024 DOWN 00:14:37: ATM L2trans(ATM1/0): remove xconnect circuit\_type=10, circuit\_id=1000024 00:14:37: ATM L2trans(ATM1/0): ckt type 10, ckt id 1000024 DOWN

## **Related Commands**

ſ

Command	Description
show mpls l2transport vc	Displays information about AToM circuits that have been enabled to route Layer 2 packets on a router.

## debug atm lfi

To display multilink PPP (MLP) over ATM link fragmentation and interleaving (LFI) debug information, use the **debugatmlfi** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug atm lfi no debug atm lfi

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(7)T	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.

#### **Examples**

The following examples show output from the **debugatmlfi** command. Each example is preceded by an explanation of the output.

• The following output indicates that the packet has dequeued from the per-VC queue that is associated with the virtual circuit (VC):

00:17:27: MLP-ATM(Virtual-Access3) pak dequeued from per VC Q 15/200,qcount:0

• The following output indicates that the packet is enqueued on the per-VC queue associated with the VC:

00:17:27: MLP-ATM(Virtual-Access3) pak enqueued to per VC Q 15/200, qcount:0

• The following output indicates that the packet has dequeued from the MLP bundle queue:

00:17:27: MLP-ATM(Virtual-Access3) pak dequeued from MP Bundle 15/200, qcount:0

• The following output indicates that PPP over ATM (PPPoA) encapsulation cannot be added to the packet for some reason:

00:17:27: MLP-ATM(Virtual-Access3) encapsulation failure - dropping packet

• The following output indicates that the VC could not be found on the virtual access interface associated with the PPPoA session:

00:17:27: MLP-ATM(Virtual-Access3) No VC to transmit- dropping packet

• When a permanent virtual circuit (PVC) has been deleted, the following output indicates that MLP has been deconfigured successfully:

00:17:27: MLP-ATM(Virtual-Access3) mlp de-configured for PVC 15/200

• If the changing of any PVC parameters requires re-creation of the PVC, the following output is generated during the re-creation of the PVC:

00:17:27: MLP-ATM(Virtual-Access3) MLPoATM re-configured for PVC 15/200

• The following output indicates that the MLP over ATM structure associated with a VC has failed to allocate memory:

00:17:27: MLP-ATM(Virtual-Access3) Memory allocation error

• The following output is generated when MLP over ATM is first configured on a PVC:

00:17:27: MLP-ATM(Virtual-Access3) MLPoATM configured for PVC 15/200

#### **Related Commands**

Command	Description
show multilink ppp	Displays bundle information for MLP bundles.

# debug atm native

To display ATM switched virtual circuit (SVC) signaling events, use the debugatmnative command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug atm native {[api]| [conn]| [error]| [filter]}

no debug atm native

#### **Syntax Description**

n	арі	(Optional) Native ATM application programming interface (API). Displays events that occur as a result of the exchange between the native ATM API and the signaling API.
	conn	(Optional) Native ATM connection manager. Displays internal connection manager events for the native ATM API.
	error	(Optional) Native ATM error. Displays errors that occur during the setup of an ATM SVC.
	filter	(Optional) Native ATM filter. Displays the internal network service access point (NSAP) filter events of the native ATM API.

#### **Command Default** No default behavior or values

#### **Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	12.2(8)T	This command was introduced.
Usage Guidelines	Native ATM API is the lay clients use the native ATM	rer above the signaling API. Static map and Resource Reservation Protocol (RSVP) I API to interact with the signaling API to create ATM SVCs.
	Use the <b>debugatmnative</b> of	command to diagnose problems in the creation of static map and RSVP ATM SVCs.
Examples	The following is sample o	utput for the <b>debugatmnative</b> command with the <b>api</b> keyword:
	Router# <b>debug atm nati</b> 0:24:59:NATIVE ATM :as	. <b>ve api</b> sociate endpoint

I

00:24:59:NATIVE ATM :ID (3) prep outgoing call, conn type 0 00:24:59:NATIVE ATM :ID (3) set connection attribute for 5 00:24:59:NATIVE ATM :ID (3) query connection attribute 8 00:24:59:NATIVE ATM :ID (3) set connection attribute for 8 00:24:59:NATIVE ATM :ID (3) set connection attribute for 9 00:24:59:NATIVE ATM :ID (3) set connection attribute for 10 00:24:59:NATIVE ATM :ID (3) set connection attribute for 7 00:24:59:NATIVE ATM :ID (3) set connection attribute for 6 00:24:59:NATIVE ATM :ID (3) set connection attribute for 2 00:24:59:NATIVE ATM :ID (3) set connection attribute for 0 00:24:59:NATIVE ATM :ID (3) query connection attribute 12 00:24:59:NATIVE ATM :ID (3) set connection attribute for 12 00:24:59:NATIVE ATM :ID (3) query connection attribute 13 00:24:59:NATIVE ATM :ID (3) set connection attribute for 13 00:24:59:NATIVE ATM :ID (3) connect outgoing call 00:24:59:NATIVE ATM :ID (3) callback, CONNECT received

# debug atm nbma

To display setup and teardown events for ATM switched virtual circuits (SVCs) configured using the Resource Reservation Protocol (RSVP), use the **debugatmnbma**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug atm nbma [api]

no debug atm nbma

Syntax Description	арі	(Optional) Nonbroadcast multiaccess (NBMA) ATM application programming interface (API). Displays events that occur as a result of the exchange between RSVP and the NBMA API.
Command Default	No default behavior or values	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(8)T	This command was introduced.
Usage Guidelines	Use the <b>debugatmnbma</b> command to dia The RSVP application creates SVCs by u	gnose problems in the creation of RSVP SVCs. sing the NBMA API. The <b>debugatmnbma</b> command with
	the <b>api</b> keyword displays events that occur	as a result of the exchange between RSVP and the NBMA API.
Examples	The following is sample output for the <b>de</b>	bugatmnbma command:
	Router# <b>debug atm nbma api</b> 00:52:50:NBMA-ATM-API - atm_setup_r 00:52:50:NBMA_ATM-API - nbma_atm_fi 00:52:50:NBMA_ATM-API - nbma_atm_fi 00:52:50:NBMA_ATM-API - nbma_atm_ca 00:52:50:NBMA_ATM-API - rcv_outgoin 00:52:50:NBMA_ATM-API - nbma_svc_lc	eq ll_blli ll_bhli llbackMsg - NATIVE_ATM_OUTGOING_CALL_ACTIVE g_call_active okup

## debug atm oam cc

To display ATM operation, administration, and maintenance (OAM) F5 continuity check (CC) management activity, use the **debugatmoamcc**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug atm oam cc [interface atm number]

no debug atm oam cc [interface atm number]

Syntax Description	interface atm number	(Optional) Number of the ATM interface.
Command Default	No default behavior or values	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(2)XB	This command was introduced.
	12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.

**Examples** 

The following sample output for the **debugatmoamcc** command records activity beginning with the entry of the**oam-pvcmanagecc** command and ending with the entry of the**nooam-pvcmanagecc** command. The ATM 0 interface is specified, and the "both" segment direction is specified. The output shows an activation request sent and confirmed, a series of CC cells sent by the routers on each end of the segment, and a deactivation request and confirmation.

```

#### Table 27: debug atm oam cc Field Descriptions

Field	Description
00:15:05	Time stamp.
CC ACTIVATE MSG (ATM0)	Message type and interface.
0	Source.
1	Sink.
VC 1/40	Virtual circuit identifier.
Direction:3	Direction in which the cells are traveling. May be one of the following values:
	1 local router is the sink.
	2 local router is the source.
	3 both routers operate as the source and sink.

#### **Related Commands**

Command	Description
oam-pvc manage cc	Configures ATM OAM F5 CC management.
show atm pvc	Displays all ATM PVCs and traffic information.

# debug atm oc3 pom

To display debug messages for ATM-OC3 Provisioning Object Manager (POM) network modules, use the debugatmoc3pom command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug atm oc3 pom {data| flow| pa| sar| sfp| trace}

no debug atm oc3 pom {data| flow| pa| sar| sfp| trace}

#### **Syntax Description**

data	Displays debug messages for incoming packet indications.
flow	Displays debug messages for flow control indications.
ра	Displays debug messages for online insertion or removal (OIR) of the ATM-OC3 POM network module.
sar	Displays debug messages for blocking commands sent to the segmentation and reassembly (SAR) and their acknowledgments.
sfp	Displays debug messages for OIR of modules in the SFP port of the network module.
trace	Displays debug messages that give the hexadecimal representation of commands sent to the SAR and their acknowledgments.

**Command Modes** Privileged EXEC

#### **Command History** Modification Release 12.4(2)T This command was introduced.

#### **Usage Guidelines**

#### debug atm oc3 pom data command

Use the debugatmoc3pomdata command to display the incoming packet indications. Each incoming packet transferred by direct memory access (DMA) to the host memory by the SAR will cause a packet indication.

#### debug atm oc3 pom flow command

Use the debugatmoc3pomflow command to display flow control indications.

When traffic sent to the SAR exceeds the peak cell rate for a particular virtual circuit (VC), the SAR indicates this to the host by sending flow control indications. These indications inform the host that either the high watermark or the low watermark has been reached for that VC queue.

When a high watermark is received from the SAR, indicating that the VC queue is full, the host will stop sending packets to the SAR until a low watermark indication is received. A low watermark indicates that the VC queue has been drained sufficiently to receive additional packets.

#### debug atm oc3 pom pa command

Use the **debugatmoc3pompa**command on those platforms supporting OIR to display the indications generated when the port adapter (the ATM-OC3 POM network module) is subjected to OIR. This command is used principally during the port adapter initialization phase.

#### debug atm oc3 pom sar command

Use the **debugatmoc3pomsar** command to display blocking commands or indications sent to or received from the SAR. This includes commands or indications of the creation or deletion of virtual circuits or virtual paths.

#### debug atm oc3 pom sfp command

Use the **debugatmoc3pomsfp** command to display the indications generated when a module in the SFP port is subjected to OIR.

#### debug atm oc3 pom trace command

Use the **debugatmoc3pomtrace** command to display the hexadecimal representation of commands sent to or received from the SAR. To facilitate debugging, use this command in conjunction with the **debugatmoc3pomsar** command.

#### **Examples**

Examples

The following is sample output from the **debugatmoc3pomdata** command:

```
Router# debug atm oc3 pom data

DATA debugging is on

Router#

*Jun 27 22:03:17.996: Packet Indication:

*Jun 27 22:03:17.996: word 0: 0x00007D24

*Jun 27 22:03:17.996: word 1: 0x00002F02

*Jun 27 22:03:17.996: word 2: 0xEE323464

*Jun 27 22:03:17.996: word 3: 0x006C006D

The table below describes the significant fields shown in the display.
```

#### Table 28: debug atm oc3 pom data Field Descriptions

Field	Description
Jun 27 22:03:17.996:	Date or time stamp of packet DMA transfer.
word [0 - 3]: 0xXXXXXXXX	Hexadecimal representation of four-word acknowledgment from the SAR when a packet is transferred by DMA to the host memory by the SAR.

#### **Examples** The following example illustrates the output from the **debugatmoc3pomflow** command:

```
Router# debug atm oc3 pom flow
FLOW CNTL INDICATION debugging is on
Router#
*Jun 27 15:14:13.123: Flow Indication:
*Jun 27 15:14:13.123:
                        word 0: 0x0000001
*Jun 27 15:14:13.123:
                        word 1: 0x300012C0
*Jun 27 15:14:13.123:
                        word 2: 0x18001060
*Jun 27 15:14:13.123:
                        word 3: 0x00080021
*Jun 27 15:14:13.456: Flow Indication:
*Jun 27 15:14:13.456:
                        word 0: 0x0000001
*Jun 27 15:14:13.456:
                        word 1: 0x300012C0
*Jun 27 15:14:13.456:
                        word 2: 0x18001060
*Jun 27 15:14:13.456:
                        word 3: 0x00090022
```

The table below describes the significant fields shown in the display.

Table 29: debug atm oc3 pom flow Field Descriptions

Field	Description
Jun 27 15:14:13.456:	Date or time stamp of flow indication
word [0 - 3]: 0xXXXXXXXX	Hexadecimal representation of four-word indication sent by the SAR to the host that a high watermark or low watermark event has occurred.
word 3: 0x00XXYYYY	When XX is 08, a high watermark has been received by the host. The host will stop queueing packets for the VC.
	When XX is 09, a low watermark has been received by the host. The host will resume sending packets to the VC.
	YYYY is the running count of flow indication events sent to the host.

#### **Examples**

The following examples illustrate the output from the debugatmoc3pompa command.

The first example gives the output when the network module is removed:

```
Router# debug atm oc3 pom pa
PA debugging is on
*Jun 27 22:40:56.110: %OIR-6-REMCARD: Card removed from slot 2, interfaces disabled
*Jun 27 22:40:56.122: *** Freed 6146 buffers
The second example gives the output when the network module is inserted, and gives the values of internal
registers of the module:
```

```
*Jun 27 22:41:08.654: %OIR-6-INSCARD: Card inserted in slot 2, interfaces administratively
shut down
*Jun 27 22:41:11.402: sar_base_addr 0x5C800000
*Jun 27 22:41:11.402: PCI_MEMBAR2_REG after configuring:0x5E000008
*Jun 27 22:41:11.402: PCI_MEMBAR3_REG after configuring:0x5F000000
*Jun 27 22:41:11.402: PCI_MEMBAR3_REG after configuring:0x5F000000
*Jun 27 22:41:11.402: PCI_COMMAND_REG: Offset= 0x4; value= 0x2A00006
```

\*Jun 27 22:41:11.402: FPGA Base address is 0x5C900000 \*Jun 27 22:41:11.402: FPGA PCI config Reg is 0x02200002

Examples

#### The following examples illustrate the output from the debugatmoc3pomsar command.

The first example displays command indications for setting up a VC and opening the reassembly channel and the segmentation channel in the SAR:

```
Router# debug atm oc3 pom sar
SAR debugging is on
Router# configure terminal
Router(config)# interface atm 2/0
Router(config-if)# pvc 2/2
Router(config-if)# pvc 2/2
Router(config-if)# *Jun 27 22:12:28.816: ATM2/0: Setup_VC: vc:3 vpi:2 vci:2
*Jun 27 22:12:28.816: ATM2/0: Open_Channel(RSY): CH (1), VPI (2), VCI (2)
*Jun 27 22:12:28.816: ATM2/0: Open_Channel(RSY): CH (1), VPI (2), VCI (2)
*Jun 27 22:12:28.816: ATM2/0: Open_Channel(SEG): CH (1), VPI (2), VCI (2)
*Jun 27 22:12:28.816: ATM2/0: Open_Channel(SEG): CH (1), VPI (2), VCI (2)
*Jun 27 22:12:28.820: ATM2/0: Setup_Cos: vc:3 wred_name:- max_q:0
```

The second example displays the commands sent to the SAR and the acknowledgements returned when the VC is deleted and the segmentation and reassembly channels are closed:

```
Router (config-if) # no pvc 2/2

Router (config-if) #

*Jun 27 22:12:59.016: ATM2/0: Sent pending EOP successfully

*Jun 27 22:12:59.016: ATM2/0: Close_Channel(RSY): Chan_ID (0x104)

*Jun 27 22:12:59.016: ATM2/0: Close_Channel(RSY): Chan_ID (0x104) CLOSE

*Jun 27 22:12:59.016: ATM2/0: Close_Channel: CLOSE_PENDING

*Jun 27 22:12:59.016: ATM2/0: Close_Channel(SEG): Chan_ID (0x105)

*Jun 27 22:12:59.016: ATM2/0: Close_Channel: CLOSE
```

Examples

The following examples illustrate the output from the **debugatmoc3pomsfp** command.

The first example gives the output when the module is removed from the SFP port:

Router# debug atm oc3 pom sfp
SFP debugging is on
\*Jun 27 22:27:40.792: SFP TX FAULT detected
\*Jun 27 22:27:40.808: SFP LOS detected
\*Jun 27 22:27:40.812: SFP removal detected
\*Jun 27 22:27:41.464: NM-1A-OC3-POM: SFP 2/0 - Removed unique
\*Jun 27 22:27:43.464: %LINK-3-UPDOWN: Interface ATM2/0, changed state to down
\*Jun 27 22:27:44.464: %LINEPROTO-5-UPDOWN: Line protocol on Interface ATM2/0, changed state
to down
The second example gives the output when the module is inserted in the SFP port.

\*Jun 27 22:27:47.776: SFP LOS cleared \*Jun 27 22:27:47.776: SFP TX FAULT detected \*Jun 27 22:27:48.276: SFP present detected \*Jun 27 22:27:48.276: SFP TX FAULT cleared \*Jun 27 22:27:48.496: Set the Container\_id to 17 \*Jun 27 22:27:50.496: %LINK-3-UPDOWN: Interface ATM2/0, changed state to up \*Jun 27 22:27:51.496: %LINEPROTO-5-UPDOWN: Line protocol on Interface ATM2/0, changed state to up

#### Examples

The first example illustrates the output from the **debugatmoc3pomtrace** command when it is run without the **debugatmoc3sar** command being activated:

1

Router# **debug atm oc3 pom trace** SAR CMD/ACK debugging is on

```
Router# configure terminal
Router (config) # interface atm 2/0
router(config-if) # pvc 2/2
Router(config-if-atm-vc) # exit
Router(config-if)#
*Jun 27 22:15:09.284: Command Sent:

                        word 3: 0x0001003D
*Jun 27 22:15:09.284: ACK received = 200 usecs
```

The table below describes the significant fields shown in the display.

Table 30: debug atm oc3 pom trace Field Descriptions

Field	Description
Jun 27 22:15:09.284:	Date or time stamp for the command dialog.
word [0 - n]: 0xXXXXXXXX	Hexadecimal representation of the <b>n-word</b> command sent to the SAR (under Command Sent:) and the four-word acknowledgment returned by the SAR (under Command Indication:).
ACK received	Time (in microseconds) between sending the command to the SAR and receiving the acknowledgment.

The second example illustrates the output from the **debugatmoc3pomtrace** command run in conjunction with the **debugatmoc3pomsar** command.

In this example, each command sent to the SAR is displayed by the **debugatmoc3pomsar** command. Then the hexadecimal representation of the command and its acknowledgement are displayed by the **debugatmoc3pomtrace** command.

```
Router# debug atm oc3 pom trace

## debug atm t3e3

To display debug messages for ATM T3/E3 network modules, use the **debugatmt3e3** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug atm t3e3 {data| flow| pa| sar| trace}

no debug atm t3e3 {data| flow| pa| sar| trace}

#### **Syntax Description**

data	indications.
flow	Displays debug messages for flow control indications.
ра	Displays debug messages for online insertion or removal (OIR) of the ATM T3/E3 network module.
sar	Displays debug messages for blocking commands sent to the segmentation and reassembly (SAR) and their acknowledgments.
trace	Displays debug messages that give the hexadecimal representation of commands sent to the SAR and their acknowledgments.

### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.4(15)T	This command was introduced.

#### Usage Guidelines debug atm t3e3 data command

Use the **debugatmt3e3data** command to display the incoming packet indications. Each incoming packet transferred by direct memory access (DMA) to the host memory by the SAR will cause a packet indication.

#### debug atm t3e3 flow command

Use the debugatmt3e3flow command to display flow control indications.

When traffic sent to the SAR exceeds the peak cell rate for a particular virtual circuit (VC), the SAR indicates this to the host by sending flow control indications. These indications inform the host that either the high watermark or the low watermark has been reached for that VC queue.

When a high watermark is received from the SAR, indicating that the VC queue is full, the host will stop sending packets to the SAR until a low watermark indication is received. A low watermark indicates that the VC queue has been drained sufficiently to receive additional packets.

#### debug atm t3e3 pa command

Use the **debugatmt3e3pa**command on those platforms supporting OIR to display the indications generated when the port adapter (the ATM T3/E3 network module) is subjected to OIR. This command is used principally during the port adapter initialization phase.

#### debug atm t3e3 sar command

Use the **debugatmt3e3sar** command to display blocking commands or indications sent to or received from the SAR. This includes commands or indications of the creation or deletion of virtual circuits or virtual paths.

#### debug atm t3e3 trace command

Use the **debugatmt3e3trace** command to display the hexadecimal representation of commands sent to or received from the SAR. To facilitate debugging, use this command in conjunction with the **debugatmt3e3sar** command.

#### Examples

**Examples** 

The following is sample output from the **debugatmt3e3data** command:

```
Router# debug atm t3e3 data

DATA debugging is on

Router#

*Jun 27 22:03:17.996: Packet Indication:

*Jun 27 22:03:17.996: word 0: 0x00007D24

*Jun 27 22:03:17.996: word 1: 0x00002F02

*Jun 27 22:03:17.996: word 2: 0xEE323464

*Jun 27 22:03:17.996: word 3: 0x006C006D

The table below describes the significant fields shown in the display.
```

#### Table 31: debug atm t3e3 data Field Descriptions

Field	Description
Jun 27 22:03:17.996:	Date or time stamp of packet DMA transfer.
word [0 - 3]: 0xXXXXXXXX	Hexadecimal representation of four-word acknowledgment from the SAR when a packet is transferred by DMA to the host memory by the SAR.

#### **Examples**

The following example illustrates the output from the **debugatmt3e3flow** command:

Router# debug atm t3e3 flow FLOW CNTL INDICATION debugging is on Router# \*Jun 27 15:14:13.123: Flow Indication: \*Jun 27 15:14:13.123: word 0: 0x00000001 \*Jun 27 15:14:13.123: word 1: 0x30012C0 \*Jun 27 15:14:13.123: word 2: 0x18001060 \*Jun 27 15:14:13.456: Flow Indication: \*Jun 27 15:14:13.456: word 0: 0x0000001 \*Jun 27 15:14:13.456: word 1: 0x300012C0 \*Jun 27 15:14:13.456: word 2: 0x18001060 \*Jun 27 15:14:13.456: word 3: 0x00090022 The table below describes the significant fields shown in the display.

#### Table 32: debug atm t3e3 flow Field Descriptions

Field	Description
Jun 27 15:14:13.456:	Date or time stamp of flow indication
word [0 - 3]: 0xXXXXXXXX	Hexadecimal representation of four-word indication sent by the SAR to the host that a high watermark or low watermark event has occurred.
word 3: 0x00XXYYYY	When XX is 08, a high watermark has been received by the host. The host will stop queueing packets for the VC.
	When XX is 09, a low watermark has been received by the host. The host will resume sending packets to the VC.
	YYYY is the running count of flow indication events sent to the host.

#### **Examples**

The following examples illustrate the output from the debugatmt3e3pa command.

The first example gives the output when the network module is removed:

Router# debug atm t3e3 pa PA debugging is on \*Jun 27 22:40:56.110: %OIR-6-REMCARD: Card removed from slot 2, interfaces disabled \*Jun 27 22:40:56.122: \*\*\* Freed 6146 buffers The second example gives the output when the network module is inserted, and gives the values of internal registers of the module:

\*Jun 27 22:41:08.654: %OIR-6-INSCARD: Card inserted in slot 2, interfaces administratively
shut down
\*Jun 27 22:41:11.402: sar base\_addr 0x5C800000
\*Jun 27 22:41:11.402: PCI\_MEMBAR2\_REG after configuring:0x5E000008
\*Jun 27 22:41:11.402: PCI\_MEMBAR3\_REG after configuring:0x5F000000
\*Jun 27 22:41:11.402: PCI\_COMMAND\_REG: Offset= 0x4; value= 0x2A00006
\*Jun 27 22:41:11.402: FFGA Base address is 0x5C90000
\*Jun 27 22:41:11.402: FFGA PCI config Reg is 0x02200002

#### **Examples**

The following examples illustrate the output from the **debugatmt3e3sar** command.

The first example displays command indications for setting up a VC and opening the reassembly channel and the segmentation channel in the SAR:

Router# **debug atm t3e3 sar** SAR debugging is on Router# **configure terminal** Router(config)# **interface atm 2/0** Router(config-if)# **pvc 2/2** 

Router(config-if-atm-vc)# exit
Router(config-if)#
\*Jun 27 22:12:28.816: ATM2/0: Setup\_VC: vc:3 vpi:2 vci:2
\*Jun 27 22:12:28.816: ATM2/0: Open\_Channel(RSY): CH (1), VPI (2), VCI (2)
\*Jun 27 22:12:28.816: ATM2/0: HI/LO watermarks: 526/263; PeakRate: 149760
\*Jun 27 22:12:28.816: ATM2/0: Open\_Channel(SEG): CH (1), VPI (2), VCI (2)
\*Jun 27 22:12:28.820: ATM2/0: Setup\_Cos: vc:3 wred\_name:- max\_q:0

The second example displays the commands sent to the SAR and the acknowledgements returned when the VC is deleted and the segmentation and reassembly channels are closed:

```
Router(config-if)# no pvc 2/2
Router(config-if)#
*Jun 27 22:12:59.016: ATM2/0: Sent pending EOP successfully
*Jun 27 22:12:59.016: ATM2/0: Close_Channel(RSY): Chan_ID (0x104)
*Jun 27 22:12:59.016: ATM2/0: Close_Channel(RSY): Chan_ID (0x104) CLOSE
*Jun 27 22:12:59.016: ATM2/0: Close_Channel: CLOSE PENDING
*Jun 27 22:12:59.016: ATM2/0: Close_Channel(SEG): Chan_ID (0x105)
*Jun 27 22:12:59.016: ATM2/0: Close_Channel: CLOSE
```

#### Examples

The first example illustrates the output from the **debugatmt3e3trace** command when it is run without the **debugatmt3e3sar** command being activated:

```
Router# debug atm t3e3 trace
SAR CMD/ACK debugging is on
Router# configure terminal
Router (config) # interface atm 2/0
router(config-if) # pvc 2/2
Router(config-if-atm-vc)# exit
Router(config-if)#

*Jun 27 22:15:09.284: Command Indication:
*Jun 27 22:15:09.284:
                         word 0: 0x00010000
*Jun 27 22:15:09.284:
                         word 1: 0x00011110
*Jun 27 22:15:09.284:
                         word 2: 0x0200000
*Jun 27 22:15:09.284:
                         word 3: 0x0001003D
*Jun 27 22:15:09.284: ACK received = 200 usecs
```

The table below describes the significant fields shown in the display.

Field	Description
Jun 27 22:15:09.284:	Date or time stamp for the command dialog.
word [0 - n]: 0xXXXXXXXX	Hexadecimal representation of the <b>n-word</b> command sent to the SAR (under Command Sent:) and the four-word acknowledgment returned by the SAR (under Command Indication:).
ACK received	Time (in microseconds) between sending the command to the SAR and receiving the acknowledgment.

#### Table 33: debug atm t3e3 trace Field Descriptions

The second example illustrates the output from the **debugatmt3e3trace** command run in conjunction with the **debugatmt3e3sar** command.

In this example, each command sent to the SAR is displayed by the **debugatmt3e3sar** command. Then the hexadecimal representation of the command and its acknowledgement are displayed by the **debugatmt3e3trace** command.

```
Router# debug atm t3e3 trace
SAR CMD/ACK debugging is on
Router# debug atm t3e3 sar
SAR debugging is on
Router# configure terminal
Router(config) # interface atm 2/0

## debug audit

To display debug messages for the audit subsystem, use the **debugaudit** command in privileged EXEC mode. To disable debugging for the audit subsystem, use the **no** form of this command.

debug audit

no debug audit

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

Command HistoryReleaseModification12.2(18)SThis command was introduced.12.0(27)SThis feature was integrated into Cisco IOS Release 12.0(27)S.12.2(27)SBCThis command was integrated into Cisco IOS Release 12.2(27)SBC.12.2(33)SRAThis command was integrated into Cisco IOS Release 12.2(33)SRA.

# **Usage Guidelines** Audit files allow you to track changes that have been made to your router. Each change is logged as a syslog message, and all syslog messages are kept in the audit file, which is kept in the audit subsystem.

Examples

The following example is sample output from the **debugaudit**command:

Router# debug audit

\*Sep 14 18:37:31.535:disk0:/forensics.log -> File not found \*Sep 14 18:37:31.535:%AUDIT-1-RUN VERSION:Hash: 24D98B13B87D106E7E6A7E5D1B3CE0AD User: \*Sep 14 18:37:31.583:%AUDIT-1-RUN CONFIG:Hash: 4AC2D776AA6FCA8FD7653CEB8969B695 User: \*Sep 14 18:37:31.587:Audit:Trying to hash nvram:startup-config \*Sep 14 18:37:31.587:Audit:nvram:startup-config Done. \*Sep 14 18:37:31.587:Audit:Trying to hash nvram:private-config \*Sep 14 18:37:31.591:Audit:nvram:private-config Done. \*Sep 14 18:37:31.591:Audit:Trying to hash nvram:underlying-config \*Sep 14 18:37:31.591:Audit:nvram:underlying-config Done. \*Sep 14 18:37:31.591:Audit:Trying to hash nvram:persistent-data \*Sep 14 18:37:31.591:Audit:nvram:persistent-data Done. \*Sep 14 18:37:31.595:Audit:Trying to hash nvram:ifIndex-table \*Sep 14 18:37:31.595:Audit:Skipping nvram:ifIndex-table \*Sep 14 18:37:31.595:%AUDIT-1-STARTUP CONFIG:Hash: 95DD497B1BB61AB33A629124CBFEC0FC User: \*Sep 14 18:37:31.595:Audit:Trying to hash filesystem disk0: \*Sep 14 18:37:31.775:Audit:Trying to hash attributes of disk0:c7200-p-mz.120-23.S \*Sep 14 18:37:32.103:Audit:disk0:c7200-p-mz.120-23.S DONE

#### **Related Commands**

Command	Description
audit filesize	Changes the size of the audit file.
audit interval	Changes the time interval that is used for calculating hashes.

# debug authentication

To display debugging information about the Authentication Manager, use the **debugauthentication** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug authentication {[feature *feature-name*]| {all| detail| errors| events| sync}}

no debug authentication  $\{[feature \textit{feature-name}]| \{all| detail| errors| events| sync}\}\}$ 

## **Syntax Description**

feature feature-name	Displays debugging information about specific features. To display the valid feature names, use the question mark (?) online help function.
all	Displays all debugging information about the Authentication Manager and all features.
detail	Displays detailed debugging information.
errors	Displays debugging information about Authentication Manager errors.
events	Displays debugging information about Authentication Manager events.
sync	Displays debugging information about Authentication Manager stateful switchovers (SSOs) or In Service Software Upgrades (ISSUs).

## **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI	This command was introduced.
	15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
	Cisco IOS XE Release 3.2SE	This command was modified. The detail keyword was added.

#### **Usage Guidelines**

I

Use the debug authentication command to troubleshoot the Authentication Manager.

1

## Examples

The following example shows sample output from the **debug authentication** command when the **feature** and **events** keywords are configured:

Device# **debug authentication feature mda events** Auth Manager mda events debugging is on

#### **Related Commands**

Command	Description
debug access-session	Displays debugging information about Session Aware Networking sessions.
debug dot1x	Displays 802.1x debugging information.

# debug auto-config

To enable debugging for autoconfiguration applications, use the **debugauto-config** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug auto-config {all| errors| events| parser}

no debug auto-config {all| errors| events| parser}

Syntax Description	all	Displays all autoconfiguration debug trace.
	errors	Displays autoconfiguration errors.
	events	Displays autoconfiguration events.
	parser	Displays autoconfiguration parser.

**Command Default** Disabled

**Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	12.3(8)XY	This command was introduced on the Communication Media Module.
	12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T.
	12.4(3)	This command was integrated into Cisco IOS Release 12.4(3).

#### **Examples**

I

The following example shows the **debugauto-config** command used to enable debugging for autoconfiguration applications and to display autoconfiguration events:

1

Table 34: debug auto-config Field Descriptions		
Field	Description	

Field	Description	
0x628C8164	Identifies the application handle, an auto-generated number for debugging.	
0x11	Displays the state of the application. State values are as follows:	
	0x11Registered and enabled.	
	0x1Download application enabled.	
	0x10Download application registered.	

#### **Related Commands**

Command	Description
auto-config	Enables autoconfiguration or enters auto-config application configuration mode for the SCCP application.
debug sccp config	Enables SCCP event debugging.
show auto-config	Displays the current status of autoconfiguration applications.

#### Cisco IOS Debug Command Reference - Commands A through D

# debug auto-ip-ring

I

To display debugging information about a device in an auto-IP ring, use the **debug auto-ip-ring** command in privileged EXEC mode. To disable the debugging output, use the **no** form of this command.

debug auto-ip-ring {*ring-id* {errors | events} | errors | events}

no debug auto-ip-ring {*ring-id* {errors | events} | errors | events}

Syntax Description	ring-id	Auto-IP ring identification number.
	errors	Enables debugging output for auto-IP ring errors.
	events	Enables debugging output for auto-IP ring events.
Command Default	Auto-IP ring debugging is disabled.	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Release 3.10S	This command was introduced.
	15.3(3)8	This command was integrated into Cisco IOS Release15.3(3)S
Usage Guidelines	To display debugging output for errors the <b>debug auto-ip-ring</b> command witl	or events on all the auto-IP-enabled node interfaces for a device, use hout the <i>ring-id</i> argument.
	To display debugging output for errors or events for a specific auto-IP ring, use the <b>debug auto-ip-r</b> command with the <i>ring-id</i> argument	
<b>Examples</b> The following is sample output for the <b>debug auto-ip-ring</b> command:		debug auto-ip-ring command:
	Device> <b>enable</b> Device# <b>debug auto-ip-ring 1 errors</b> Auto IP Ring errors debugging is on for the ring id : 1	
	*Jul 26 11:30:40.541: (Eth need admin intervention	ernet0/0) priority (value:1) conflict detected,

1

A conflict is detected in this example because the auto-IP TLV priority that is sent from the device and the priority that is received from the neighbor device is the same.

#### **Related Commands**

Command	Description
auto-ip-ring	Enables the auto-IP functionality on the interfaces of a device.
show auto-ip-ring	Displays auto-IP ring information.

## debug autoupgrade

To display the debug output of the Cisco Auto-Upgrade Manager (AUM), use the **debug autoupgrade** command in privileged EXEC mode. To disable debug output, use the **no** form of this command.

debug autoupgrade

no debug autoupgrade

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** The debug output is disabled.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.4(15)T	This command was introduced.
	Cisco IOS XE Release 3.9S	This command was integrated into Cisco IOS XE Release 3.9S.

# **Usage Guidelines** Use the **debug autoupgrade** command when you encounter a problem with AUM and provide the output to TAC. Run the **debug autoupgrade** command and then run AUM to view the debug messages.

#### **Examples** The following example shows how to enable the debugging of Cisco Auto-Upgrade Manager:

Device# debug autoupgrade Auto Upgrade Manager debugging ON Device# Device# upgrade automatic getversion tftp://10.1.0.1/username/aaa Image not found. Device# Jun 14 14:23:08.251 IST: AUM: Currently running software: flash:c3825-adventerprisek9-mz.CALVIN\_AUM\_EFT1 Jun 14 14:23:08.251 IST: AUM: Reload type:2 hour:0 min:0 Jun 14 14:23:08.251 IST: AUM: Disk management: 1 Jun 14 14:23:08.251 IST: AUM: Get image tftp://10.1.0.1/username/aaa from local server and upgrade: Jun 14 14:23:08.251 IST: AUM: Extracted image name: aaa Jun 14 14:23:08.39 IST: AUM: get image info: failed to open url Jun 14 14:23:08.39 IST: AUM: get image info: failed to open url Jun 14 14:23:08.39 IST: AUM: get image info: image size unknown

1

## **Related Commands**

Command	Description
upgrade automatic getversion	Downloads a Cisco software image directly from www.cisco.com or from a non-Cisco server.

# debug backhaul-session-manager session through debug channel packets

• debug backhaul-session-manager session through debug channel packets, page 165

# debug backhaul-session-manager session through debug channel packets

I

# debug backhaul-session-manager session

To debug all the available sessions or a specified session, use the **debugbackhaul-session-managersession** command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug backhaul-session-manager session {state| xport} {all session-id}

no debug backhaul-session-manager session {state| xport} {all session-id}

Syntax Description	state	Shows information about state transitions. Possible states are as follows:
		SESS_SET_IDLE: A session-set has been created.
		SESS_SET_OOS: A session(s) has been added to session-group(s). No ACTIVE notification has been received from Virtual Switch Controller (VSC).
		SESS_SET_ACTIVE_IS: An ACTIVE notification has been received over one in-service session-group. STANDBY notification has not been received on any available session-group(s).
		SESS_SET_STNDBY_IS: A STANDBY notification is received, but there is no in-service active session-group available.
		SESS_SET_FULL_IS: A session-group in-service that has ACTIVE notification and at least one session-group in-service that has STANDBY notification.
		SESS_SET_SWITCH_OVER: An ACTIVE notification is received on session-group in-service, which had received STANDBY notification.
	xport	Provides traces for all packets (protocol data units (PDUs)), application PDUs, and also session-manager messages.
	all	All available sessions.
	session-id	A specified session.

**Command Default** Debugging for backhaul-session-manager session is not enabled.

**Command Modes** Privileged EXEC

New State :BSM_SET_ACTIVE_IS
   Active-Grp :g-11
   Session-Grp :g-11
   Old State :Group-None
   New State
                :Group-Active
   Event rcvd :BSM ACTIVE_TYPE
```

```
Related Commands
```

Command	Description
debug backhaul-session-manager session	Debugs all available sessions or a specified session.

# debug backup

To monitor the transitions of an interface going down then back up, use the **debugbackup**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug backup

no debug backup

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

# **Usage Guidelines** The **debugbackup**command is useful for monitoring dual X.25 interfaces configured as primary and backup in a Telco data communication network (DCN).

**Examples** The following example shows how to start the **debugbackup** command:

Router# debug backup

## **Related Commands**

I

Command	Description
backup active interface	Activates primary and backup lines on specific X.25 interfaces.
show backup	Displays interface backup status.

# debug bert

To display information on the bit error rate testing (BERT) feature, use the **debugbert** command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug bert no debug bert

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(2)XD	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** The **debugbert** command output is used primarily by Cisco technical support representatives. The **debugbert** command displays debugging messages for specific areas of executed code.

**Examples** The following is output from the **debugbert** command:

Router# debug bert Bit Error Rate Testing debugging is on Router# no debug bert Bit Error Rate Testing debugging is off

## **Related Commands**

Command	Description
bert abort	Aborts a bit error rate testing session.
bert controller	Starts a bit error rate test for a particular port on a Cisco AS5300 router.
bert profile	Sets up various bit error rate testing profiles.

# debug bfd

To display debugging messages about Bidirectional Forwarding Detection (BFD), use the **debug bfd** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

## Cisco IOS Release 12.2(18)SXE, 12.4(4)T, and 12.2(33)SRA

debug bfd {event| packet [ip-address| ipv6-address]}
no debug bfd {event| packet [ip-address| ipv6-address]}

## Cisco IOS Release 12.0(31)S

debug bfd {event| packet [ *ip-address* ]| ipc-error| ipc-event| oir-error| oir-event} no debug bfd {event| packet [ *ip-address* ]| ipc-error| ipc-event| oir-error| oir-event}

## **Syntax Description**

event	Displays debugging information about BFD state transitions.
packet	Displays debugging information about BFD control packets.
ip-address	(Optional) Displays debugging information about BFD only for the specified IP address.
ipv6-address	(Optional) Displays debugging information about BFD only for the specified IPv6 address.
ipc-error	(Optional) Displays debugging information with interprocess communication (IPC) errors on the Route Processor (RP) and line card (LC).
ipc-event	(Optional) Displays debugging information with IPC events on the RP and LC.
oir-error	(Optional) Displays debugging information with online insertion and removal (OIR) errors on the RP and LC.
oir-event	(Optional) Displays debugging information with OIR events on the RP and LC.

**Command Modes** Privileged EXEC

I

#### Command History

Release	Modification
12.2(18)SXE	This command was introduced.
12.0(31)S	This command was integrated into Cisco IOS Release 12.0(31)S.
12.4(4)T	This command was integrated into Cisco IOS Release 12.4(4)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRE	This command was modified. Support for IPv6 was added.
15.1(2)T	This command was modified. Support for IPv6 was added to Cisco IOS Release 15.1(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
15.1(1)SY	This command was modified. Support for IPv6 was added to Cisco IOS Release 15.1(1)SY.

#### **Usage Guidelines**

Note

The debug bfd command can be used to troubleshoot the BFD feature.

Because BFD is designed to send and receive packets at a very high rate of speed, consider the potential effect on system resources before enabling this command, especially if there are a large number of BFD peers. The **debug bfd packet** command should be enabled only on a live network at the direction of Cisco Technical Assistance Center personnel.

#### Examples

The following example shows output from the **debug bfd packet** command. The IP address has been specified in order to limit the packet information to one interface:

```
Router# debug bfd packet 172.16.10.5
BFD packet debugging is on

```

I

The following example shows output from the **debug bfd event** command when an interface between two BFD neighbor routers fails and then comes back online:

Field	Description
bfd_neighbor - action:DESTROY	The BFD neighbor will tear down the BFD session.
Session [172.16.10.1, 172.16.10.2, Fa0/1,1]	IP addresses of the BFD neighbors holding this session that is carried over FastEthernet interface 0/1.
event DETECT TIMER EXPIRED	The BFD neighbor has not received BFD control packets within the negotiated interval and the detect timer has expired.
state UP -> FAILING	The BFD event state is changing from Up to Failing.
Session [172.16.10.1, 172.16.10.2, Fa0/1,1], event RX IHY 0	The BFD session between the neighbors indicated by the IP addresses that is carried over FastEthernet interface 0/1 is changing state from Failing to Down. The I Hear You (IHY) bit value is shown as 0 to indicate that the remote system is tearing down the BFD session.
event RX IHY 0, state DOWN -> INIT	The BFD session is still considered down, and the IHY bit value still is shown as 0, and the session state changes from DOWN to INIT to indicate that the BFD session is again initializing, as the interface comes back up.
event RX IHY 1, state INIT -> UP	The BFD session has been reestablished, and the IHY bit value changes to 1 to indicate that the session is live. The BFD session state changes from INIT to UP.

#### Table 35: debug bfd event Field Descriptions

The following example shows output from the **debug bfd packet** command when an interface between two BFD neighbor routers fails and then comes back online. The diagnostic code changes from 0 (No Diagnostic) to 1 (Control Detection Time Expired) because no BFD control packets could be sent (and therefore detected by the BFD peer) after the interface fails. When the interface comes back online, the diagnostic code changes back to 0 to signify that BFD packets can be sent and received by the BFD peers.

```
Router# debug bfd packet
```

```
23:03:25: Rx IP: src 172.16.10.2, plen 24. BFD: diag 0, H/D/P/F (0/0/0/0), mult 3, len 24,
loc/rem discr 5 1, tx 1000000, rx 100007

loc/rem discr 1 5, tx 1000000, rx 1000008
23:03:25: Tx IP: dst 172.16.10.2, plen 24. BFD: diag 1, H/D/P/F (1/0/0/0), mult 5, len 24,
loc/rem discr 1 5, tx 1000000, rx 1000008
```

The table below describes the significant fields shown in the display.

#### Table 36: debug bfd packet Field Descriptions

Field	Description
Rx IP: src 172.16.10.2	The router has received this BFD packet from the BFD router with source address 172.16.10.2.
plen 24	Length of the BFD control packet, in bytes.
diag 0	A diagnostic code specifying the local system's reason for the last transition of the session from Up to some other state.
	State values are as follows:
	• 0No Diagnostic
	• 1Control Detection Time Expired
	• 2Echo Function Failed
	• 3Neighbor Signaled Session Down
	• 4Forwarding Plane Reset
	• 5Path Down
	• 6Concentrated Path Down
	• 7Administratively Down

I

Field	Description
H/D/P/F (0/0/0)	H bitHear You bit. This bit is set to 0 if the transmitting system either is not receiving BFD packets from the remote system or is tearing down the BFD session. During normal operation the I Hear You bit is set to 1.
	D bitDemand Mode bit. If the Demand Mode bit set, the transmitting system wants to operate in demand mode. BFS has two modesasynchronous and demand. The Cisco implementation of BFD supports only asynchronous mode.
	P bitPoll bit. If the Poll bit is set, the transmitting system is requesting verification of connectivity or of a parameter change.
	F bitFinal bit. If the Final bit is set, the transmitting system is responding to a received BFC control packet that had a Poll (P) bit set.
mult 3	Detect time multiplier. The negotiated transmit interval, multiplied by the detect time multiplier, determines the detection time for the transmitting system in BFD asynchronous mode.
	The detect time multiplier is similar to the hello multiplier in IS-IS, which is used to determine the hold timer: (hellointerval) * (hellomultiplier) = hold timer. If a hello packet is not received within the hold-timer interval, a failure has occurred.
	Similarly, for BFD: (transmit interval) * (detect multiplier) = detect timer. If a BFD control packet is not received from the remote system within the detect-timer interval, a failure has occurred.
len 24	The BFD packet length.
loc/rem discr 5 1	The values for My Discriminator (local) and Your Discriminator (remote) BFD neighbors.
	• My DiscriminatorUnique, nonzero discriminator value generated by the transmitting system, used to demultiplex multiple BFD sessions between the same pair of systems.
	• Your DiscriminatorThe discriminator received from the corresponding remote system. This field reflects the received value of My Discriminator, or is zero if that value is unknown.

I

Field	Description
tx 1000000	Desired minimum transmit interval.
rx 100007	Required minimum receive interval.

# debug bgp ipv6 dampening

To display debugging messages for IPv6 Border Gateway Protocol (BGP) dampening, use the debug bgp ipv6 dampening command in privileged EXEC mode. To disable debugging messages for IPv6 BGP dampening, use the **no** form of this command.

debug bgp ipv6 {unicast| multicast} dampening [prefix-list prefix-list-name] no debug bgp ipv6 {unicast| multicast} dampening [prefix-list prefix-list-name]

**Syntax Description** 

I

unicast	Specifies IPv6 unicast address prefixes.
multicast	Specifies IPv6 multicast address prefixes.
prefix-list prefix-list-name	(Optional) Name of an IPv6 prefix list.

**Command Default** Debugging for IPv6 BGP dampening packets is not enabled.

Command Modes Privileged EXEC

Release	Modification
12.2(2)T	This command was introduced.
12.0(21)ST	This command was integrated into Cisco IOS Release 12.0(21)ST.
12.0(22)S	This command was integrated into Cisco IOS Release 12.0(22)S.
12.2(13)T	The <b>prefix-list</b> keyword was added.
12.0(24)S	The <b>prefix-list</b> keyword was added.
12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(25)SG	This command was integrated into Cisco IOS Release 12.2(25)SG.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Series Routers.
	Release         12.2(2)T         12.0(21)ST         12.0(22)S         12.0(22)S         12.2(13)T         12.0(24)S         12.2(14)S         12.2(28)SB         12.2(25)SG         12.2(33)SRA         12.2(33)SXH         Cisco IOS XE Release 2.1

#### Usage Guidelines

The **debug bgp ipv6 dampening**command is similar to the **debug ip bgp dampening**command, except that it is IPv6-specific.

Use the **prefix-list** keyword and an argument to filter BGP IPv6 dampening debug information through an IPv6 prefix list.

**Note** By default, the network server sends the output from debug commands and system error messages to the console. To redirect debugging output, use the **logging** command options within global configuration mode. Destinations are the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server.

#### **Examples**

The following is sample output from the **debug bgp ipv6 dampening**command:

#### Router# debug bgp ipv6 dampening

00:13:28:BGP(1):charge penalty for 2000:0:0:1::/64 path 2 1 with halflife-time 15 reuse/suppress 750/2000 00:13:28:BGP(1):flapped 1 times since 00:00:00. New penalty is 1000 00:13:28:BGP(1):charge penalty for 2000:0:0:1:1::/80 path 2 1 with halflife-time 15 reuse/suppress 750/2000 00:13:28:BGP(1):flapped 1 times since 00:00:00. New penalty is 1000 00:13:28:BGP(1):charge penalty for 2000:0:0:5::/64 path 2 1 with halflife-time 15 reuse/suppress 750/2000 00:13:28:BGP(1):flapped 1 times since 00:00:00. New penalty is 1000 00:16:03:BGP(1):charge penalty for 2000:0:0:1::/64 path 2 1 with halflife-time 15 reuse/suppress 750/2000 00:16:03:BGP(1):flapped 2 times since 00:02:35. New penalty is 1892 00:18:28:BGP(1):suppress 2000:0:0:1:1:::/80 path 2 1 for 00:27:30 (penalty 2671) 00:18:28:halflife-time 15, reuse/suppress 750/2000 00:18:28:BGP(1):suppress 2000:0:0:1::/64 path 2 1 for 00:27:20 (penalty 2664) 00:18:28:halflife-time 15, reuse/suppress 750/2000

The following example shows output for the **debug bgp ipv6 dampening**command filtered through the prefix list named marketing:

```
Router# debug bgp ipv6 dampening prefix-list marketing
00:16:08:BGP(1):charge penalty for 2001:0DB8::/64 path 30 with halflife-time 15
reuse/suppress 750/2000
00:16:08:BGP(1):flapped 1 times since 00:00:00. New penalty is 10
The table below describes the fields shown in the display.
```

#### Table 37: debug bgp ipv6 dampening Field Descriptions

Field	Description
penalty	Numerical value of 1000 assigned to a route by a router configured for route dampening in another autonomous system each time a route flaps. Penalties are cumulative. The penalty for the route is stored in the BGP routing table until the penalty exceeds the suppress limit. If the penalty exceeds the suppress limit, the route state changes from history to damp.

Field	Description
flapped	Number of times a route is available, then unavailable, or vice versa.
halflife-time	Amount of time (in minutes) by which the penalty is decreased after the route is assigned a penalty. The halflife-time value is half of the half-life period (which is 15 minutes by default). Penalty reduction happens every 5 seconds.
reuse	The limit by which a route is unsuppressed. If the penalty for a flapping route decreases and falls below this reuse limit, the route is unsuppressed. That is, the route is added back to the BGP table and once again used for forwarding. The default reuse limit is 750. Routes are unsuppressed at 10-second increments. Every 10 seconds, the router determines which routes are now unsuppressed and advertises them to the world.
suppress	Limit by which a route is suppressed. If the penalty exceeds this limit, the route is suppressed. The default value is 2000.
maximum suppress limit (not shown in sample output)	Maximum amount of time (in minutes) a route is suppressed. The default value is four times the half-life period.
damp state (not shown in sample output)	State in which the route has flapped so often that the router will not advertise this route to BGP neighbors.

# **Related Commands**

I

Command	Description
debug bgp ipv6 updates	Displays debugging messages for IPv6 BGP update packets.

# debug bgp ipv6 updates

To display debugging messages for IPv6 Border Gateway Protocol (BGP) update packets, use the debug bgp ipv6 updates command in privileged EXEC mode. To disable debugging messages for IPv6 BGP update packets, use the **no** form of this command.

debug bgp ipv6 {unicast| multicast} updates [ *ipv6-address* ] [prefix-list *prefix-list-name*] [in| out] no debug bgp ipv6 {unicast| multicast} updates [ *ipv6-address* ] [prefix-list *prefix-list-name*] [in| out]

## **Syntax Description**

unicast	Specifies IPv6 unicast address prefixes.
multicast	Specifies IPv6 multicast address prefixes.
ipv6-address	(Optional) The IPv6 address of a BGP neighbor.
	This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
prefix-list prefix-list-name	(Optional) Name of an IPv6 prefix list.
in	(Optional) Indicates inbound updates.
out	(Optional) Indicates outbound updates.

**Command Default** Debugging for IPv6 BGP update packets is not enabled.

# **Command Modes** Privileged EXEC

12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Series Routers.

#### **Usage Guidelines**

The **debug bgp ipv6 updates**command is similar to the **debug ip bgp updates**command, except that it is IPv6-specific.

Use the **prefix-list** keyword to filter BGP IPv6 updates debugging information through an IPv6 prefix list.

Note

By default, the network server sends the output from **debug** commands and system error messages to the console. To redirect debugging output, use the **logging** command options within global configuration mode. Destinations are the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. For complete information on **debug** commands and redirecting debugging output, refer to the Release 12.2 *Cisco IOS Debug Command Reference*.

#### Examples

The following is sample output from the **debug bgp ipv6 updates**command:

```
Router# debug bgp ipv6 updates
14:04:17:BGP(1):2000:0:0:2::2 computing updates, afi 1, neighbor version 0, table version
1. starting at ::
14:04:17:BGP(1):2000:0:0:2::2 update run completed, afi 1, ran for 0ms, neighbor version
0, start version 1, throttled to 1
14:04:19:BGP(1):sourced route for 2000:0:0:2::1/64 path #0 changed (weight 32768)
14:04:19:BGP(1):2000:0:0:2::1/64 route sourced locally
14:04:19:BGP(1):2000:0:0:2:1::/80 route sourced locally
14:04:19:BGP(1):2000:0:0:3::2/64 route sourced locally
14:04:19:BGP(1):2000:0:0:4::2/64 route sourced locally
14:04:22:BGP(1):2000:0:0:2::2 computing updates, afi 1, neighbor version 1, table version
6. starting at :
14:04:22:BGP(1):2000:0:0:2::2 send UPDATE (format) 2000:0:0:2::1/64, next 2000:0:0:2::1,
metric 0, path
14:04:22:BGP(1):2000:0:0:2::2 send UPDATE (format) 2000:0:0:2:1::/80, next 2000:0:0:2::1,
metric 0, path
14:04:22:BGP(1):2000:0:0:2::2 send UPDATE (prepend, chgflags:0x208) 2000:0:0:3::2/64, next
 2000:0:0:2::1, metric 0, path
14:04:22:BGP(1):2000:0:0:2::2 send UPDATE (prepend, chgflags:0x208) 2000:0:0:4::2/64, next
 2000:0:0:2::1, metric 0, path
The following is sample output from the debug bgp ipv6 updates command filtered through the prefix list
named sales:
```

```
Router# debug bgp ipv6 updates prefix-list sales
00:18:26:BGP(1):2000:8493:1::2 send UPDATE (prepend, chgflags:0x208) 7878:7878::/64, next
2001:0DB8::36C, metric 0, path
The table below describes the significant fields shown in the display.
```

1

Field	Description
BGP(1):	BGP debugging for address family index (afi) 1.
afi	Address family index.
neighbor version	Version of the BGP table on the neighbor from which the update was received.
table version	Version of the BGP table on the router from which you entered the <b>debug bgp ipv6 updates</b> command.
starting at	Starting at the network layer reachability information (NLRI). BGP sends routing update messages containing NLRI to describe a route and how to get there. In this context, an NLRI is a prefix. A BGP update message carries one or more NLRI prefixes and the attributes of a route for the NLRI prefixes; the route attributes include a BGP next hop gateway address, community values, and other information.
route sourced locally	Indicates that a route is sourced locally and that updates are not sent for the route.
send UPDATE (format)	Indicates that an update message for a reachable network should be formatted. Addresses include prefix and next hop.
send UPDATE (prepend, chgflags:0x208)	Indicates that an update message about a path to a BGP peer should be written.

## Table 38: debug bgp ipv6 updates Field Descriptions

## **Related Commands**

Command	Description
debug bgp ipv6 dampening	Displays debugging messages for IPv6 BGP dampening packets.

# debug bgp l2vpn evpn updates

To display information related to the Boarder Gateway Protocol (BGP) update messages, use the **debug bgp l2vpn evpn updates** command in privileged EXEC mode. To disable the display of such debugging information, use the **no** form of this command.

debug bgp l2vpn evpn updates [ *ip-address* ] [{*access-list*| *expanded-access-list*} [in| out]| events| in| out] no debug bgp l2vpn evpn updates [ *ip-address* ] [{*access-list*| *expanded-access-list*} [in| out]| events| in| out]

## **Syntax Description**

ip-address	(Optional) BGP neighbor address in the format A.B.C.D.
access-list	(Optional) Number of the access list used to filter debugging messages. The range is from 1 to 199.
expanded-access-list	(Optional) Number of the expanded access list used to filter debugging messages. The range is from 1300 to 2699.
events	(Optional) Specifies debugging messages for BGP update events.
in	Specifies debugging messages for inbound BGP update information.
out	Specifies debugging messages for outbound BGP update information.

# **Command Modes** Privileged EXEC (#)

00:46:59: BGP(4): Applying map to find origin for prefix 49.0202.2222 00:46:59: BGP(4): Applying map to find origin for prefix 49.0202.3333

## **Related Commands**

Command	Description
debug bgp nsap dampening	Displays debug messages for BGP NSAP prefix dampening events.
debug bgp nsap updates	Displays debug messages for BGP NSAP prefix update packets.

This command was integrated into Cisco IOS Release 12.2(33)SRB.

This command was integrated into Cisco IOS XE Release 2.6.

# debug bgp nsap dampening

To display debug messages for Border Gateway Protocol (BGP) network service access point (NSAP) prefix address dampening, use the **debugbgpnsapdampening** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug bgp nsap dampening [filter-list access-list-number]

**no debug bgp nsap dampening** [**filter-list** *access-list-number*]

Syntax Description	filter-list access-list-number	(Optional) Displays debug messages for BGP NSAP dampening events that match the access list. The acceptable access list number range is from 1 to 199.
Command Default	Debugging for BGP NSAP dampening events is not enabled.	
Command Modes	Privileged EXEC	
<b>Command History</b>	Release	Modification
	12.2(8)T	This command was introduced.

**Usage Guidelines** The **debugbgpnsapdampening**command is similar to the **debugipbgpdampening**command, except that it is specific to the NSAP address family.

Note

12.2(33)SRB

Cisco IOS XE 2.6

By default, the network server sends the output from **debug** commands and system error messages to the console. To redirect debug output, use the **logging** command options within global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server.

## **Examples**

The following example shows output for the debugbgpnsapdampeningcommand:

Router# **debug bgp nsap dampening** 16:21:34: BGP(4): Dampening route-map modified. Only one line of output is displayed unless the**bgpdampening** command is configured with a route map in NSAP address family configuration mode. The following example shows output for the **debugbgpnsapdampening** command when a route map is configured:

```
20:07:19: BGP(4): charge penalty for 49.0404 path 65202 65404 with halflife-time 15
reuse/suppress 750/2000
20:07:19: BGP(4): flapped 1 times since 00:00:00. New penalty is 1000
20:08:59: BGP(4): charge penalty for 49.0404 path 65202 65404 with halflife-time 15
reuse/suppress 750/2000
20:10:04: BGP(4): flapped 2 times since 00:01:39. New penalty is 1928
20:10:04: BGP(4): charge penalty for 49.0404 path 65202 65404 with halflife-time 15
reuse/suppress 750/2000
20:10:04: BGP(4): flapped 3 times since 00:02:44. New penalty is 2839
20:10:48: BGP(4): suppress 49.0404 path 65202 65404 for 00:28:10 (penalty 2752)
20:10:48: halflife-time 15, reuse/suppress 750/2000
The table below describes the significant fields shown in the display.
```

Table 39: debug bgp nsap dampening Field Descriptions

Field	Description
penalty	Numerical value of 1000 assigned to a route by a router configured for route dampening in another autonomous system each time a route flaps. Penalties are cumulative. The penalty for the route is stored in the BGP routing table until the penalty exceeds the suppress limit. If the penalty exceeds the suppress limit, the route state changes from history to damp.
halflife-time	Amount by which the penalty is decreased after the route is assigned a penalty. The half-life-time value is half of the half-life period (which is 15 minutes by default). Penalty reduction occurs every 5 seconds.
flapped	Number of times a route is available, then unavailable, or vice versa.
reuse	The limit by which a route is unsuppressed. If the penalty for a flapping route decreases and falls below this reuse limit, the route is unsuppressed. That is, the route is added back to the BGP table and once again used for forwarding. The default reuse limit is 750. Unsuppressing of routes occurs at 10-second increments. Every 10 seconds, the router learns which routes are now unsuppressed and advertises them throughout the network.
suppress	Limit by which a route is suppressed. If the penalty exceeds this limit, the route is suppressed. The default value is 2000.
maximum suppress limit (not shown in sample output)	Maximum amount of time a route is suppressed. The default value is four times the half-life period.

Field	Description
damp state (not shown in sample output)	State in which the route has flapped so often that the router will not advertise this route to BGP neighbors.

## **Related Commands**

ſ

Command	Description
debug bgp nsap	Displays debug messages for BGP NSAP packets.
debug bgp nsap updates	Displays debug messages for BGP NSAP update events.

# debug bgp nsap updates

To display debug messages for Border Gateway Protocol (BGP) network service access point (NSAP) prefix address update packets, use the debugbgpnsapupdates command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug bgp nsap updates [ *ip-address* ] [in| out] [filter-set *clns-filter-set-name*] no debug bgp nsap updates [ *ip-address* ] [in| out] [filter-set clns-filter-set-name]

Syntax Description	ip-address	(Optional) The IP address of a BGP neighbor.
	in	(Optional) Indicates inbound updates.
	out	(Optional) Indicates outbound updates.
	filter-set clns-filter-set-name	(Optional) Name of a Connectionless Network Service (CLNS) filter set.

**Command Default** Debugging for BGP NSAP prefix update packets is not enabled.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(8)T	This command was introduced.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
	Cisco IOS XE 2.6	This command was integrated into Cisco IOS XE Release 2.6.

**Usage Guidelines** The debugbgpnsapupdatescommand is similar to the debugipbgpupdatescommand, except that it is specific to the NSAP address family.

> Use the *ip-address* argument to display the BGP update debug messages for a specific BGP neighbor. Use the *clns-filter-set-name* argument to display the BGP update debug messages for a specific NSAP prefix.

By default, the network server sends the output from **debug** commands and system error messages to the console. To redirect debug output, use the **logging** command options within global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server.

### Examples

#### The following example shows output for the debugbgpnsapupdatescommand:

Router# debug bgp nsap updates
02:13:45: BGP(4): 10.0.3.4 send UPDATE (format) 49.0101, next 49.0303.3333.3333.3333.3333.00,
metric 0, path 65202 65101
02:13:45: BGP(4): 10.0.3.4 send UPDATE (format) 49.0202, next 49.0303.3333.3333.3333.3333.00,
metric 0, path 65202
02:13:45: BGP(4): 10.0.3.4 send UPDATE (format) 49.0303, next 49.0303.3333.3333.3333.3333.00,
metric 0, path
02:13:45: BGP(4): 10.0.2.2 send UPDATE (format) 49.0404, next 49.0303.3333.3333.3333.3333.00,
metric 0, path 65404

The table below describes the significant fields shown in the display.

#### Table 40: debug bgp nsap updates Field Descriptions

Field	Description
BGP(4):	BGP debug for address family index (afi) 4.
route sourced locally (not shown in display)	Indicates that a route is sourced locally and that updates are not sent for the route.
send UPDATE (format)	Indicates that an update message for a reachable network should be formatted. Addresses include NSAP prefix and next hop.
rcv UPDATE (not shown in display)	Indicates that an update message about a path to a BGP peer has been received. Addresses include NSAP prefix.

#### **Related Commands**

Command	Description
debug bgp nsap	Displays debug messages for BGP NSAP packets.
debug bgp nsap dampening	Displays debug messages for BGP NSAP prefix dampening events.

# debug bgp vpnv6 unicast

To display Border Gateway Protocol (BGP) virtual private network (VPN) debugging output, use the **debug bgp vpnv6 unicast**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug bgp vpnv6 unicast no debug bgp vpnv6

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

Command HistoryReleaseModification12.2(33)SRBThis command was introduced.12.2(33)SBThis command was integrated into Cisco IOS Release 12.2(33)SB.12.2(33)SXIThis command was integrated into Cisco IOS Release 12.2(33)SXI.

## **Usage Guidelines**

Use the debug bgp vpnv6 unicast command to help troubleshoot the BGP VPN.

**Note** By default, the network server sends the output from debug commands and system error messages to the console. To redirect debugging output, use the logging command options within global configuration mode. Destinations are the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. For complete information on debug commands and redirecting debugging output, refer to the Cisco IOS Debug Command Reference, Release 12.4.

## **Examples** The following example enables BGP debugging output for IPv6 VPN instances:

Router# debug bgp vpnv6 unicast

# debug bri-interface

To display debugging information on ISDN BRI routing activity, use the **debugbri-interface** command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug bri-interface

no debug bri-interface

**Syntax Description** This command has no arguments or keywords.

Command Modes Privileged EXEC

**Usage Guidelines** The**debugbri-interface** command indicates whether the ISDN code is enabling and disabling the B channels when attempting an outgoing call. This command is available for the low-end router products that have a multi-BRI network interface module installed.

∕!∖ Caution

Because the **debugbri-interface**command generates a substantial amount of output, use it only when traffic on the IP network is low, so other activity on the system is not adversely affected.

#### Examples

The following is sample output from the **debugbri-interface** command:

```
Router# debug bri-interface
BRI: write sid: wrote 1B for subunit 0, slot 1.
BRI: write_sid: wrote 15 for subunit 0, slot 1.
BRI: write sid: wrote 17 for subunit 0, slot 1.
BRI: write sid: wrote 6 for subunit 0, slot 1.
BRI: write sid: wrote 8 for subunit 0, slot 1.
BRI: write sid: wrote 11 for subunit 0, slot 1.
BRI: write_sid: wrote 13 for subunit 0, slot 1.
BRI: write sid: wrote 29 for subunit 0, slot
                                              1.
BRI: write sid: wrote 1B for subunit 0, slot 1.
BRI: write_sid: wrote 15 for subunit 0, slot
                                             1.
BRI: write sid: wrote 17 for subunit 0, slot
                                              1.
BRI: write_sid: wrote 20 for subunit 0, slot 1.
BRI: Starting Power Up timer for unit = 0.
BRI: write sid: wrote 3 for subunit 0, slot 1.
BRI: Starting T3 timer after expiry of PUP timeout for unit = 0, current state is F4.
BRI: write sid: wrote FF for subunit 0, slot 1.
BRI: Activation for unit = 0, current state is F7.
BRI: enable channel B1
BRI: write sid: wrote 14 for subunit 0, slot 1.
%LINK-3-UPDOWN: Interface BRI0: B-Channel 1, changed state to up
%LINK-5-CHANGED: Interface BRI0: B-Channel 1, changed state to up.!!!
BRI: disable channel B1
BRI: write sid: wrote 15 for subunit 0, slot 1.
LINK-3-UP\overline{D}OWN: Interface BRIO: B-Channel 1, changed state to down
%LINK-5-CHANGED: Interface BRI0: B-Channel 1, changed state to down
%LINEPROTO-5-UPDOWN: Line protocol on Interface BRI0: B-Channel 1, changed state to down
```

The following line indicates that an internal command was written to the interface controller. The subunit identifies the first interface in the slot.

BRI: write\_sid: wrote 1B for subunit 0, slot 1. The following line indicates that the power-up timer was started for the named unit:

BRI: Starting Power Up timer for unit = 0. The following lines indicate that the channel or the protocol on the interface changed state:

```
%LINK-3-UPDOWN: Interface BRI0: B-Channel 1, changed state to up
%LINK-5-CHANGED: Interface BRI0: B-Channel 1, changed state to up.!!!
%LINEPROTO-5-UPDOWN: Line protocol on Interface BRI0: B-Channel 1, changed state to down
The following line indicates that the channel was disabled:
```

BRI: disable channel B1 Lines of output not described are for use by support staff only.

#### **Related Commands**

Command	Description
debug isdn event	Displays ISDN events occurring on the user side (on the router) of the ISDN interface.
debug isdn q921	Displays data link-layer (Layer 2) access procedures that are taking place at the router on the D channel (LSPD).
debug isdn q931	Displays information about call setup and teardown of ISDN network connections (Layer 3) between the local router (user side) and the network.

.
```

Command	Description
call-home diagnostic-signature	Downloads, installs, and uninstalls diagnostic signature files on a device.
show call-home diagnostic-signature statistics	Displays statistics and attributes of a diagnostic signature file on a device.

# debug call-mgmt

To display debugging information for call accounting, including modem and time slot usage, for active and recent calls, use the **debugcall-mgmt** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call-mgmt

no debug call-mgmt

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

## **Examples**

The following is sample output after the **debugcall-mgmt** command has been enabled:

```
Router# debug call-mgmt
Call Management debugging is on
Router#
Dec 26 13:57:27.710: msg to_calls_mgmt: msg type CPM_NEW_CALL_CSM_CONNECT received Dec 26 13:57:27.714: In actv_c_proc_message,
   access type CPM INSERT NEW CALL,
   call type CPM_ISDN_ANALOG:
     CSM completed connecting a new modem call
Dec 26 13:57:45.906: msg to calls mgmt: msg type CPM NEW CALL ISDN CONNECT received

The table below describes the significant fields shown in the display.

Table 41: debug call-mgmt Field Descriptions

Field	Description
CPM_NEW_CALL_CSM_CONNECT	Indicates the arrival of a new call.
access type CPM_INSERT_NEW_CALL, call type CPM_ISDN_ANALOG:	Indicates that the new call is an analog ISDN B channel call (either a voice call or a call over an analog modem), rather than a digital (V.110) call.
CC-Slot#7, DSX1-Ctrlr#17, DS0-Timeslot#1 Mdm-Slot#1, Mdm-Port#3, TTY#219	Indicates that the call is connected via the B channel on Serial7/17:1 to the asynchronous modem resource 1/03 (interface async1/03, also known as line tty219).
Dec 26 13:58:25.682: Call mgmt per minute statistics: active list length: 1 history list length: 3	Displays periodic statistics that give the allocation state of each DSX1 interface present in the system, as well as the number of current (active) and recent (history) calls.
Dec 26 13:58:26.538: msg_to_calls_mgmt: msg type CPM_VOICE_CALL_REJ_NO_MOD_ AVAIL received	Indicates that the analog ISDN B channel call has been disassociated from a modem.

I

Field	Description
access type CPM_REMOVE_DISC_CALL, call type CPM_ISDN_ANALOG: Removed a disconnected ISDN analog call	Indicates that the analog ISDN B channel call has been disconnected.
CC-Slot#7, DSX1-Ctrlr#17, DS0-Timeslot#1 Dec 26 13:58:26.538: Mdm-Slot#1, Mdm-Port#3, TTY#219	Indicates that the call has been disconnected via the B channel on Serial7/17:1 to the asynchronous modem resource 1/03 (interface async1/03, also known as line tty219).

# debug call fallback detail

To display details of the call fallback, use the **debugcallfallbackdetail** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call fallback detail

no debug call fallback detail

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)T	This command was introduced.
	12.2(2)XB1	This command was implemented on the Cisco AS5850 platform.
	12.2(4)T	This command was implemented on the Cisco 7200 series routers.
	12.2(4)T3	This command was implemented on the Cisco 7500 series routers routers.
	12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T.

# **Usage Guidelines** Every time a call request is received, the **debugcallfallbackdetail** command displays in the command-line interface (CLI) cache lookup and call acceptance/rejection information. Use this command to monitor call requests as they enter the call fallback subsystem.

If you have a large amount of calls in your router, enabling this command can cause delays in your routing functions as the debug statistics are constantly compiled and sent to your terminal. Also, debug messages on your terminal may make for difficult CLI configuring.

**Examples** The following example depicts a call coming in to 10.1.1.4 with codec g729r8. Because there is no cache entry for this destination, a probe is sent and values are inserted into the cache. A lookup is performed again, entry is found, and a fallback decision is made to admit the call.

```
Router# debug call fallback detail
When cache is empty:
debug call fallback detail:
2d19h:fb_lookup_cache:10.1.1.4, codec:g729r8
2d19h:fb_lookup_cache:No entry found.
2d19h:fb_check:no entry exists, enqueueing probe info... 10.1.1.4, codec:g729r8
2d19h:fb_main:Got FB_APP_INQ event
```

2d19h:fb\_main:Dequeued prob info: 10.1.1.4, codec:g729r8
2d19h:fb\_lookup\_cache:l0.1.1.4, codec:g729r8
2d19h:fb\_lookup\_cache:No entry found.
2d19h:fb\_cache\_insert:insert:l0.1.1.4, codec:g729r8
2d19h:fb\_cache\_insert:returning entry:10.1.1.4, codec:g729r8
2d19h:fb\_initiate\_probe:Creating probe... 10.1.1.4, codec:g729r8
2d19h:fb\_lookup\_cache:l0.1.1.4, codec:g729r8
2d19h:fb\_lookup\_cache:l0.1.1.4, codec:g729r8
2d19h:fb\_lookup\_cache:Found entry.
2d19h:fb\_check:returned FB\_CHECK\_TRUE, 10.1.1.4, codec:g729r8
2d19h:fb\_main:calling callback function with:TRUE
The following example depicts a call coming in to 10.1.1.4 with codec g729r8. A lookup is performed, entry
is found, and a fallback decision is made to admit the call.

Router# debug call fallback detail
When cache is full:
2d19h:fb\_lookup\_cache:10.1.1.4, codec:g729r8
2d19h:fb\_lookup\_cache:Found entry.
2d19h:fb\_check:returned FB\_CHECK\_TRUE, 10.1.1.4, codec:g729r8
2d19h:fb\_main:calling callback function with:TRUE

# debug call fallback probe

To display details of the call fallback probes, use the **debugcallfallbackprobe** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call fallback probe

no debug call fallback probe

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)T	This command was introduced.
	12.2(2)XA	The <b>callfallback</b> and <b>callfallbackreject-cause-code</b> commands were introduced.
	12.2(2)XB1	This command was implemented on the Cisco AS5850 platform.
	12.2(4)T	This command was implemented on the Cisco 7200 series routers.
	12.2(4)T3	This command was implemented on the Cisco 7500 series routers.

**Usage Guidelines** Every time a probe is received, the **debugcallfallbackprobe** command displays in the command-line interface (CLI) network traffic information collected by the probe. Use this command to monitor the network traffic information the probes carry as they enter the call fallback subsystem and log cache entries.

If you have frequent return of probes to your router, enabling this command can cause delays in your routing functions as the debug statistics are constantly compiled and sent to your terminal. Also, debug messages on your terminal may make for difficult CLI configuring.

**Examples** The following example depicts a call coming in to 10.1.1.4 and codec type g729r8. Because there is no cache entry for this IP address, a g729r8 probe is initiated. The probe consists of 20 packet returns with an average delay of 43 milliseconds. The "jitter out" is jitter from source to destination router and "jitter in" is jitter from destination to source router. The delay, loss, and Calculated Planning Impairment Factor (ICPIF) values following g113\_calc\_icpif are the instantaneous values, whereas those values following "New smoothed values" are the values after applying the smoothing with weight 65.

Router# debug call fallback probe

I

2d19h:fb initiate probe:Probe payload is 32

2d19h:fb main:NumOfRTT=20, RTTSum=120, loss=0, delay=43, jitter in=0, jitter out=0-> 10.1.1.4, codec:g729r8

2d19h:g113\_calc\_icpif(delay (w/codec delay)=43, loss=0, expect\_factor=10) Icpif=0

2d19h:fb\_main:Probe timer expired, 10.1.1.4, codec:g729r8 2d19h:fb\_main:NumOfRTT=20, RTTSum=120, loss=0, delay=43, jitter in=0, jitter out=0-> 10.1.1.4, codec:g729r8

2d19h:g113\_calc\_icpif(delay (w/codec delay)=43, loss=0, expect\_factor=10) Icpif=0 2d19h:fb\_main:New smoothed values:inst\_weight=65, ICPIF=0, Delay=43, Loss=0 -> 10.1.1.4, codec:g729r8

# debug call filter detail

The table below describes the significant fields shown in the display.
```

Table 43: debug call filter inout Field Descriptions

Field	Description
gcfm_generate_guid:	Shows that a GUID has been generated.
gcfm_percall_register:	Shows components that have been registered for the call.
gcfm_percall_notify_condition:	Shows that a component has been notified of the call.
gcfm_check_percall_status:	Shows the status of a component of the call.

I

1

Field	Description
gcfm_percall_register:	Shows that a component has been registered.
gcfm_clear_condition:	Shows that a condition is cleared for a component.
gcfm_percall_deregister:	Shows that a component has been deregistered.
gcfm_terminate_track_guid:	Shows that the router is no longer tracking the GUID.

Command	Description
debug call filter detail	Displays the details of the debug trace inside the GCFM.
debug condition match-list	Runs a filtered debug on a voice call.
show call filter components	Displays the components used for filtering calls.

# debug call rsvp-sync events

To display events that occur during Resource Reservation Protocol (RSVP) setup, use the **debugcallrsvp-syncevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call rsvp-sync events

no debug call rsvp-sync events

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(3)XI1	This command was introduced.
	12.1(5)T	This command was integrated into Cisco IOS Release 12.1(5)T.
	12.2(2)XB1	This command was implemented on the Cisco AS5850.
	12.2(11)T	Support for the command was implemented in Cisco AS5850 images.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** It is highly recommended that you log the output from the **debugcallrsvp-syncevents** command to a buffer, rather than sending the output to the console; otherwise, the size of the output could severely impact the performance of the gateway.

**Examples** 

The following example shows a portion of sample output for a call initiating RSVP when using the **debugcallrsvp-syncevents** command:

00:03:25: Parameters: localip: 10.19.101.117 :localport: 16660 00:03:25: Parameters: remoteip: 10.19.101.116 :remoteport: 17568 00:03:25: QoS Primitive Event for Call id 0x1 : QoS Listen 00:03:25: Lookup to be done on hashkey 0x1 in hash table 0x61FC2498 00:03:25: Hashed entry 0x1 in call table 0x61FC2498 00:03:25: Parameters: localip: 10.19.101.117 00:03:25: Parameters: localip: 10.19.101.117 00:03:25: goSpcb : 0x61FC34D8 00:03:25: Response Status : 0 Starting timer for call with CallId 0x1 for 10000 secs 00:03:25: Handling QoS Primitive QoS Listen

00:03:25: Establishing RSVP RESV state : rsvp request reservation() 00:03:25: For streams from 10.19.101.116:17568 to 10.19.101.117:16660 00:03:25: RSVP Confirmation required 00:03:25: QoS Primitive Event for Call id 0x1 : QoS Resv 00:03:25: Lookup to be done on hashkey 0x1 in hash table 0x61FC2498 00:03:25: Hashed entry 0x1 in call table 0x61FC2498 00:03:25: Initiating RVSP PATH messages to be Sent : reg invoke rsvp advertise sender() 00:03:25: Advertizing for streams to 10.19.101.116:17568 from 10.19.101.117:16660 00:03:25: RESV notification event received is : 2 00:03:25: Received RESVCONFIRM 00:03:25: RESV CONFIRM message received from 10.19.101.116 for RESV setup from 10.19.101.117 00:03:25: RESV event received is : 0 00:03:25: RESV message received from 10.19.101.116:17568 for streams from 10.19.101.117:16660 00:03:25: RESERVATIONS ESTABLISHED : Callid: 1 Stop timer and notify Session Protocol of Success (ie. if notification requested) 00:03:25: Invoking spQoSresvCallback with Success

Command	Description
call rsvp-sync	Enables synchronization between RSVP and the H.323 voice signaling protocol.
call rsvp-sync resv-timer	Sets the timer for RSVP reservation setup.
debug call rsvp-sync func-trace	Displays messages about the software functions called by RSVP synchronization.
show call rsvp-sync conf	Displays the RSVP synchronization configuration.
show call rsvp-sync stats	Displays statistics for calls that attempted RSVP reservation.

# debug call rsvp-sync func-trace

To display messages about software functions called by Resource Reservation Protocol (RSVP), use the **debugcallrsvp-syncfunc-trace** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call rsvp-sync func-trace

no debug call rsvp-sync func-trace

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(3)XI1	This command was introduced.
	12.1(5)T	This command was integrated into Cisco IOS Release 12.1(5)T.
	12.2(2)XB1	This command was implemented on the Cisco AS5850.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** It is highly recommended that you log the output from the **debugcallrsvp-syncfunc-trace** command to a buffer, rather than sending the output to the console; otherwise, the size of the output could severely impact the performance of the gateway.

Examples

The following example shows a portion of sample output for a call initiating RSVP when using the **debugcallrsvp-syncfunc-trace** command in conjunction with the **debugcallrsvp-syncevents** command:

00:03:41: Entering Function QoS\_Listen 00:03:41: Parameters:localip:10.10.101.116 :localport:17568 00:03:41: remoteip:10.10.101.117 :remoteport:0 00:03:41: Entering Function qos\_dequeue\_event 00:03:41: Entering Function process\_queue\_event 00:03:41: Entering Function get\_pcb 00:03:41: Entering Function hash\_tbl\_lookup 00:03:41: Entering Function hash\_tbl\_lookup 00:03:41: Entering Function hash\_func 00:03:41: Entering Function hash\_func 00:03:41: Entering Function hash\_func 00:03:41:Entering Function qos\_dequeue\_pcb 00:03:41: Entering Function qos\_initialize pcb

00:03:41: Entering Function hash_func
00:03:41: Doing RSVP Listen :rsvp_add_ip_listen_api()
```

Command	Description
call rsvp-sync	Enables synchronization between RSVP and the H.323 voice signaling protocol.
call rsvp-sync resv-timer	Sets the timer for RSVP reservation setup.
debug call rsvp-sync events	Displays the events that occur during RSVP synchronization.
show call rsvp-sync conf	Displays the RSVP synchronization configuration.
show call rsvp-sync stats	Displays statistics for calls that attempted RSVP reservation.

# debug call threshold

To see details of the trigger actions, use the **debugcallthreshold** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call threshold module

no debug call threshold

<b>Svntax</b>	Desc	cription

ax Description	module	The <i>module</i> argument can be one of the following:
		• core Traces the resource information.
		• detail Traces for detail information.

Command Default Disabled

## **Command Modes** Privileged EXEC

**Command History Modification** Release 12.2(2)XA This command was introduced. 12.2(4)T The command was integrated into Cisco IOS Release 12.2(4)T. Support for the Cisco AS5300, Cisco AS5350, and Cisco AS5400 is not included in this release. 12.2(2)XB1 This command was implemented on the Cisco AS5850 platform. 12.2(8)T This command was integrated into Cisco IOS Release 12.2(8)T and implemented on Cisco 7200 series routers. 12.2(11)T Support for this command was implemented on Cisco AS5850, Cisco AS5800, Cisco AS5300, Cisco AS5350, and Cisco AS5400 series images.

## **Examples**

The following is sample output from the **debug call threshold core** command: Router# **debug call threshold core** RSCCAC Core info debugging is on The following is sample output from the **debugcallthresholddetail** command:

Router# **debug call threshold detail** All RSCCAC info debugging is on

# debug call treatment action

To debug the call treatment actions, use the **debugcalltreatmentaction** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug call treatment action

no debug call treatment action

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(2)XA	This command was introduced.
	12.2(4)T	The command was integrated into Cisco IOS Release 12.2(4)T.
	12.2(2)XB1	This command was implemented on the Cisco AS5850 platform.
	12.2(8)T	This command was integrated into Cisco IOS Release 12.2(8)T and implemented on Cisco 7200 series routers.
	12.2(11)T	Support for this command was implemented on Cisco AS5850, Cisco AS5800, Cisco AS5300, Cisco AS5350, and Cisco AS5400 series images.

**Examples** 

Debug actions are performed on calls by call treatment. The following sample output shows that call treatment is turned on:

1

Router# **debug call treatment action** Call treatment action debugging is on

# debug callback

To display callback events when the router is using a modem and a chat script to call back on a terminal line, use the **debugcallback** command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug callback

no debug callback

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

**Usage Guidelines** This command is useful for debugging chat scripts on PPP and AppleTalk Remote Access Protocol (ARAP) lines that use callback mechanisms. The output provided by the **debugcallback** command shows you how the call is progressing when used with the **debugppp** or **debugarap** commands.

**Examples** The following is sample output from the **debugcallback** command:

Router# debug callback

```
TTY7 Callback process initiated, user: exec_test dialstring 123456
TTY7 Callback forced wait = 4 seconds
TTY7 Exec Callback Successful - await exec/autoselect pickup
TTY7: Callback in effect
```

Related Commands	Command	Description
	debug cable env	Displays ARAP events.
	debug ppp	Displays information on traffic and exchanges in an internetwork implementing the PPP.

1

# debug capf-server

To collect debug information about the CAPF server, use the **debugcapf-server** command in privileged EXEC mode. To disable collection of debug information, use the **no** form of this command.

debug capf-server {all| error| events| messages}

no debug capf-server

Syntax Description	all	Collect all CAPF information available.
	error	Collect only information about CAPF errors.
	events	Collect only information about CAPF status events.
	messages	Collect only CAPF system messages.
Command Default	Collection of CAPF debug info	mation is disabled.
Command Modes	Privileged EXEC	
<b>Command History</b>	Cisco IOS Release	Modification
	12.4(4)XC	This command was introduced.
	12.4(9)T	This command was integrated into Cisco IOS Release 12.4(9)T.
Usage Guidelines	This command is used with Cise	co Unified CallManager Express phone authentication.
Examples	The following example shows d	ebug messages for the CAPF server.
	Router# debug capf-server a 001891: .Jul 21 18:17:07.01 IP:10.10.10.194 So cket:3 DeviceType:Phone has 001892: .Jul 21 18:17:20.49 001893: .Jul 21 18:17:20.49 001894: .Jul 21 18:17:20.49 001895: .Jul 21 18:17:21.49 001895: .Jul 21 18:17:22.55 001896: .Jul 21 18:17:22.55 001897: .Jul 21 18:17:22.55 001898: .Jul 21 18:17:22.55 001898: .Jul 21 18:17:22.55 001899: .Jul 21 18:17:22.77 0019001: .Jul 21 18:17:22.77	<pre>11 .4: %IPPHONE-6-UNREGISTER_NORMAL: ephone-1:SEP000E325C9A43 s unregistered normally. b5: New Connection from phone, socket 1 b5: Created New Handshake Process 99: SSL Handshake Error -6983 99: SSL Handshake Error -6983 99: SSL Handshake Error -6983 55: SSL Handshake Successful 55: ephone_capf_send_auth_req: 55: ephone_capf_ssl_write: 12 bytes 11: ephone_capf_handle_phone_msg: msgtype 2 11: ephone_capf_process_auth_res msgt: SEP000E325C9A43_AuthMode 2</pre>

# debug cas

To debug channel-associated signaling (CAS) messages and to debug the establishment of a time-division multiplexing (TDM) connection between a DS0 and a digital modem, use the **debugcas** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cas slot slot number port port number

no debug cas slot slot number port port number

Syntax Description	slot slot number	Slot and slot number. Valid values are 0 and 1.			
	port port number	Port and port number. Valid values are 0 and 1.			

**Command Default** Disabled

## **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(7)T	This command was introduced for the Cisco AS5200 and AS5300 platforms.
	12.2(2)T	This command was integrated into Cisco IOS Release 12.2(2)T and support was added for the Cisco 2600 series and Cisco 3600 series platforms.
	12.3(1)	This command was integrated into Cisco IOS Release 12.3(1) and support was added for the Cisco 2600 XM series, Cisco 2691, and Cisco 3700 series platforms.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** 

When the NM-xCE1T1PRI network module is used with an NM-xDM and a DS0-group is configured under the controller, you can use the **debugcas** command to debug CAS signaling messages and the establishment of a TDM connection between a DS0 and a digital modem. Use the **debugcas** command to identify and troubleshoot call connection problems on a T1/E1 interface. With this command, you can trace the complete sequence of incoming and outgoing calls.

#### Examples

The following shows an example session to enable debugging CAS and generate troubleshooting output:

Router# show debug

Router# debug cas slot 1 port 0

CAS debugging is on Router# debug-cas is on at slot(1) dsx1(0) Router# **show debug** 

CAS debugging is on The following example shows output for the first outgoing call:

Router# p 1.1.1.2 Type escape sequence to abort. Sending 5, 100-byte ICMP Echos to 1.1.1.2, timeout is 2 seconds: \*Mar 2 00:17:45: dsx1 alloc cas channel: channel 0 dsx1 timeslot 1(0/0): TX SEIZURE (ABCD=0001)(0/0): RX SEIZURE ACK (ABCD=1101)(0/1): RX IDLE (ABCD=1001) (0/2): RX IDLE (ABCD=1001) (0/3): RX IDLE (ABCD=1001) (0/4): RX IDLE (ABCD=1001) (0/5): RX IDLE (ABCD=1001) (0/6): RX IDLE (ABCD=1001)(0/7): RX IDLE (ABCD=1001)(0/8): RX IDLE (ABCD=1001)(0/9): RX IDLE (ABCD=1001)(0/10): RX IDLE (ABCD=1001)(0/11): RX IDLE (ABCD=1001)  $(\overline{0}/12)$ : RX IDLE (ABCD=1001)  $(\overline{0}/13)$ : RX IDLE (ABCD=1001)(0/14): RX IDLE (ABCD=1001)(0/16): RX IDLE (ABCD=1001)(0/17): RX\_IDLE (ABCD=1001)(0718): RX\_IDLE (ABCD=1001)(0719): RX\_IDLE (ABCD=1001)(0/20): RX\_IDLE (ABCD=1001)(0/21): RX IDLE (ABCD=1001).(0/22): RX IDLE (ABCD=1001)(0/23): RX IDLE (ABCD=1001)(0/24): RX IDLE (ABCD=1001)(0/25): RX IDLE (ABCD=1001)(0/26): RX IDLE (ABCD=1001)(0727): RX IDLE (ABCD=1001)(0728): RX\_IDLE (ABCD=1001)(0728): RX\_IDLE (ABCD=1001)(0730): RX\_IDLE (ABCD=1001)...(0/0): RX ANSWERED (ABCD=0101). Success rate is 0 percent (0/5) Router# \*Mar 2 00:18:13.333: %LINK-3-UPDOWN: Interface Async94, changed state to up \*Mar 2 00:18:13.333: %DIALER-6-BIND: Interface As94 bound to profile Dil \*Mar 2 00:18:14.577: %LINEPROTO-5-UPDOWN: Line protocol on Interface Async94, changed state to up Router# p 1.1.1.2 Type escape sequence to abort. Sending 5, 100-byte ICMP Echos to 1.1.1.2, timeout is 2 seconds: 11111 Success rate is 100 percent (5/5), round-trip min/avg/max = 160/180/236 ms The following example shows that the call is cleared on the router: Router# clear int dialer 1 Router# (0/0): TX IDLE (ABCD=1001)(0/0): RX IDLE (ABCD=1001)

(0/0): TX IDLE (ABCD=1001)(0/0): RX IDLE (ABCD=1001) \*Mar 2 00:18:28.617: %LINK-5-CHANGED: Interface Async94, changed state to reset \*Mar 2 00:18:28.617: %DIALER-6-UNBIND: Interface As94 unbound from profile Di1 \*Mar 2 00:18:29.617: %LINEPROTO-5-UPDOWN: Line protocol on Interface Async94, changed state to down et2-c3745-1# \*Mar 2 00:18:33.617: %LINK-3-UPDOWN: Interface Async94, changed state to down The following example shows a subsequent outbound CAS call:

Router# p 1.1.1.2 Type escape sequence to abort. Sending 5, 100-byte ICMP Echos to 1.1.1.2, timeout is 2 seconds: \*Mar 2 00:18:40: dsx1 alloc cas channel: channel 5 dsx1\_timeslot 6(0/5): TX SEIZURE (ABCD=0001) (0/5): RX SEIZURE\_ACK (ABCD=1101)....(0/5): RX ANSWERED (ABCD=0101). Success rate is 0 percent (0/5) Router# \*Mar 2 00:19:08.841: %LINK-3-UPDOWN: Interface Async93, changed state to up \*Mar 2 00:19:08.841: %DIALER-6-BIND: Interface As93 bound to profile Di1

\*Mar 2 00:19:10.033: %LINEPROTO-5-UPDOWN: Line protocol on Interface Async93, changed state
to up
Router# p 1.1.1.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 1.1.1.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 160/167/176
ms

The following example shows the call cleared by the switch:

Router#
(0/5): TX IDLE (ABCD=1001)(0/5): RX IDLE (ABCD=1001)
\*Mar 2 00:19:26.249: %LINK-5-CHANGED: Interface Async93, changed state to reset
\*Mar 2 00:19:26.249: %DIALER-6-UNBIND: Interface As93 unbound from profile Di1

to down
Router#
\*Mar 2 00:19:31.249: %LINK-3-UPDOWN: Interface Async93, changed state to down
The following example shows an incoming CAS call:

```
Router#
(0/0): RX SEIZURE (ABCD=0001)
*Mar 2 00:22:40: dsx1_alloc_cas_channel: channel 0 dsx1_timeslot
1(0/0): TX SEIZURE_ACK (ABCD=1101)(0/0): TX ANSWERED (AECD=0101)
Router#
*Mar 2 00:23:06.249: %LINK-3-UPDOWN: Interface Async83, changed state to up
*Mar 2 00:23:06.249: %DIALER-6-BIND: Interface As83 bound to profile Di1
*Mar 2 00:23:07.653: %LINEPROTO-5-UPDOWN: Line protocol on Interface Async83, changed state
to up
```

Command	Description
show debug	Displays information about the types of debugging that are enabled for your router.

# debug ccaal2 session

To display the ccaal2 function calls during call setup and teardown, use the **debugccaal2session**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccaal2 session

no debug ccaal2 session

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging for ATM Adaptation Layer type 2 (AAL2) sessions is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(1)XA	This command was introduced for the Cisco MC3810 series.
	12.1(2)T	This command was integrated in Cisco IOS Release 12.1(2)T.
	12.2(2)T	Support for this command was implemented on the Cisco 7200 series routers.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Use this command when troubleshooting an AAL2 trunk setup or teardown problem.** 

**Examples** 

The following example shows sample output from the **debugccaal2session**command for a forced shutdown of a voice port:

```
Router# debug ccaal2 session
CCAAL2 Session debugging is on
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config) # voice-port 2/0:0
Router(config-voiceport) # shutdown
00:32:45:ccaal2 call disconnect:peer tag 0
00:32:45:ccaal2_evhandle_call_disconnect:Entered
00:32:45:ccaal2_call_cleanup:freeccb 1, call_disconnected 1
00:32:45:starting incoming timer:Setting accept_incoming to FALSE and
00:32:45:timer 2:(0x622F6270)starts - delay (70000)
00:32:45:ccaal2 call cleanup:Generating Call record
00:32:45:cause=81 tcause=81
                                cause text=unspecified
00:32:45:ccaal2_call_cleanup:ccb 0x63FF1700, vdbPtr 0x62DFF2E0
freeccb_flag=1, call_disconnected_flag=1
00:32:45:%LINK-3-UPDOWN:Interface recEive and transMit2/0:0(1),
changed state to Administrative Shutdown
```

The following example shows sample output from the **debugccaal2session**command for a trunk setup on a voice port:

Command	Description
show debug	Shows which debug commands are enabled.

# debug cce dp named-db urlfilter

	To enable debug informat Classification module, use debugging output, use the	ion of the Common Classification Engine Data-Plane (CCE DP) URL Filtering the <b>debugccedpnamed-dburlfilter</b> command in privileged EXEC mode. To disable <b>no</b> form of this command.
	debug cce dp named-db no debug cce dp named-	urlfilter db urlfilter
Syntax Description	This command has no key	words or arguments.
Command Default	No debugging information	n is generated for the the CCE DP URL Filtering Classification module.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.4(15)XZ	This command was introduced.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

## **Examples**

The following is sample output from the **debugccedpnamed-dburlfilter**command at the time that a URL request to the untrusted domain www.example.com was made:

```
Router# debug cce dp named-db urlfilter
CCE DP Named DB URLF functionality debugging is on
Router#
*Apr 4 10:38:08.043: CCE* FUNC: cce dp named db urlf pkt classify -- Didn't get token
*Apr 4 10:38:08.043: CCE* FUNC: cce_dp_urlf_truncate_url -- Truncating URL upto script before sending to the trend for classification
*Apr 4 10:38:08.043: CCE* FUNC: urlf_trend_find_cache_entry -- The host tree in bucket
1248 is empty
*Apr 4 10:38:08.043: CCE* FUNC: cce_dp_named_db_urlf_pkt_classify -- Didn't find in cache
*Apr 4 10:38:08.051: CCE FUNC: urlf trend store response -- Host node with given domain
name not found.
*Apr 4 10:38:08.051: CCE FUNC: urlf trend store response -- Create domain type cache
entry.
*Apr 4 10:38:08.051: CCE FUNC: cache size limit check -- New cache size=73, existing cache
 size=0, cache size limit=131072000
*Apr 4 10:38:08.051: CCE FUNC: create domain cache entry -- Domain cache entry 0x65EE0ED0
 created.
*Apr 4 10:38:08.051: CCE FUNC: create_and_insert_domain_cache_entry --
*Apr 4 10:38:08.051: Domain cache entry 0x65EE0ED0 created and inserted into host tree
with root=0x65EE0ED0, root left=0x0, root right=0x0; new node left=0x0, new node right=0x0
*Apr 4 10:38:08.051: CCE FUNC: cce_dp_named_db_urlf_gen_match_token -- pushing match-info
 token - class 0xC000000E; filter 45; category 21
*Apr 4 10:38:08.051: CCE FUNC: cce_dp_named_db_urlf_non_pkt_classify -- Class 0x65C5D484
matched
*Apr 4 17:38:08.051: %URLF-4-URL BLOCKED: Access denied URL 'http://www.example.com/',
client 1.0.0.118:3056 server 192.168.0.30:8080
```

٦

*Apr	4	10:38:08.055:	CCE*	FUNC:	cce	dp	named	db	urlf	pkt	classify	 Didn't	get	token

# debug ccfrf11 session

To display the ccfrf11 function calls during call setup and teardown, use the **debugccfrf11session** command in privileged EXEC mode. To disable debugging output, use the **no**form of this command.

debug ccfrf11 session

no debug ccfrf11 session

- **Syntax Description** This command has no keywords or arguments.
- Command Modes Privileged EXEC

**Command History** 

story	Release	Modification
	12.0(3)XG	This command was introduced for the Cisco 2600 and Cisco 3600 series routers.
	12.0(4)T	This command was integrated into Cisco IOS Release 12.0(4)T.
	12.0(7)XK	This command was first supported on the Cisco MC3810 series.
	12.1(2)T	Support for this command was implemented in Cisco MC3810 images.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** Use this command to display debug information about the various FRF.11 VoFR service provider interface (SPI) functions. Note that this debug command does not display any information regarding the proprietary Cisco switched-VoFR SPI.

This debug is useful only when the session protocol is "frf11-trunk."

## **Examples**

The following is sample output from the **debugccfrf11session** command:

## Router# debug ccfrf11 session

INCOMING CALL SETUP (port setup for answer-mode): \*Mar 6 18:04:07.693:ccfrf11 process timers:scb (0x60EB6040) timer (0x60EB6098) expired 6 18:04:07.693:Setting\_accept\_incoming to TRUE 6 18:04:11.213:ccfrf11\_incoming\_request:peer tag 800:callingNumber=+2602100, \*Mar \*Mar calledNumber=+3622110 \*Mar 6 18:04:11.213:ccfrf11\_initialize\_ccb:preffered\_codec set(-1)(0) 6 18:04:11.213:ccfrf11 evhandle\_incoming\_call\_setup\_request:calling +2602100, \*Mar called +3622110 Incoming Tag 800 6 18:04:11.217:ccfrf11\_caps\_ind:PeerTag = 800 \*Mar codec(preferred) = 4, fax\_rate = 2, vad = 2 \*Mar 6 18:04:11.217: \*Mar 6 18:04:11.217: cid = 30, config bitmask = 0, codec bytes = 20, signal type=2 6 18:04:11.217: required bandwidth 8192 \*Mar \*Mar 6 18:04:11.217:ccfrf11\_caps\_ind:Bandwidth reservation of 8192 bytes succeeded. \*Mar 6 18:04:11.221:ccfrf11\_evhandle\_call\_connect:Entered

Command	Description
debug call rsvp-sync events	Displays the ccswvoice function calls during call setup and teardown.
debug ccswvoice vofr-session	Displays the ccswvoice function calls during call setup and teardown.
debug vtsp session	Displays the first 10 bytes (including header) of selected VoFR subframes for the interface.

# debug cch323

To provide debugging output for various components within the H.323 subsystem, use the **debugcch323commandinprivilegedEXECmode.** To disable debugging output, use the **no**form of this command.

debug cch323 {all| error| h225| h245| nxe| ras| rawmsg| session}

no debug cch323

## **Syntax Description**

all	Enables all debug cch323 commands.
error	Traces errors encountered in the H.323 subsystem and can be used to help troubleshoot problems with H.323 calls.
h225	Traces the state transition of the H.225 state machine on the basis of the processed event.
h245	Traces the state transition of the H.245 state machine on the basis of the processed events.
nxe	Displays Annex E events that have been transmitted and received.
ras	Traces the state transition of the Registration, Admission, and Status (RAS) state machine on the basis of the processed events.
rawmsg	Troubleshoots raw message buffer problems.
session	Traces general H.323 events and can be used to troubleshoot H.323 problems.

## Command Modes Priv

Privileged EXEC

Command History	Release	Modification
	11.3(6)NA2	The debug cch323 command and the following keywords were introduced: h225, h245, and ras.
	12.2(2)XA	The nxe keyword was added.

Release	Modification
12.2(4)T	The following keywords were introduced: all, error, rawmsg, and session. The nxe keyword was integrated into Cisco IOS Release 12.2(4)T on all Cisco H.323 platforms. This command does not support the Cisco access server platforms in this release.
12.2(2)XB1	This command was implemented on the Cisco AS5850.

## **Usage Guidelines**

#### The debug cch323 Command with the all Keyword

When used with the **debugcch323** command, the **all** keyword provides debug output for various components within the H.323 subsystem.

The debugcch323 command used with the all keyword enables the following debugcch323 commands:

error	Enables a CCH323 Service Provider Interface (SPI) trace.
h225	Enables an H225 state machine debugging trace.
h245	Enables an H245 state machine debugging trace.
nxe	Enables an Annex E debugging trace.
ras	Enables a RAS state machine debugging trace.
rawmsg	Enables a CCH323 RAWMSG debugging trace.
session	Enables a Session debugging trace.

Â

Caution

#### The debug cch323 Command with the error Keyword

When used with the **debugcch323** command, the **error** keyword allows you to trace errors encountered in the H.323 subsystem.

Note

There is little or no output from this command when there is a stable H.323 network.

### The debug cch323 Command with the h225 Keyword

When used with the **debugcch323** command, the **h225** keyword allows you to trace the state transition of the H.225 state machine on the basis of the processed event.

The definitions of the different states of the H.225 state machine follow:

Using the **debugcch323all** command could slow your system and flood the TTY if there is significant call traffic.
- H225\_IDLE--This is the initial state of the H.225 state machine. The H.225 state machine is in this state before issuing a call setup request (for the outbound IP call case) or when ready to receive an incoming IP call.
- H225\_SETUP--This is the call setup state. The state machine changes to this state after sending out a call setup request or after receiving an incoming call indication.
- H225\_ALERT--This is the call alerting state. The state machine changes to this state after sending the alerting message or after receiving an alerting message from the peer.
- H225\_CALLPROC--This is the call proceeding state.
- H225\_ACTIVE--This is the call connected state. In this state, the call is active. The state machine changes to this state after sending the connect message to the peer or after receiving the connect message from the peer.
- H225\_WAIT\_FOR\_ARQ--This is the state in which the H.225 state machine is waiting for the completion
  of the Admission Request (ARQ) process from the RAS state machine.
- H225\_WAIT\_FOR\_DRQ--This is the state in which the H.225 state machine is waiting for the completion of the Disengage Request (DRQ) process from the RAS state machine.
- H225\_WAIT\_FOR\_H245--This is the state in which the H.225 state machine is waiting for the success or failure from the H.245 state machine.

The definitions of the different events of the H.225 state machine follow:

- H225\_EVENT\_NONE--There is no event.
- H225\_EVENT\_ALERT--This event instructs the H.225 state machine to send an alert message to the peer.
- H225\_EVENT\_ALERT\_IND--This event indicates to the H.225 state machine that an alert message arrived from the peer.
- H225\_EVENT\_CALLPROC--This event instructs the H.225 state machine to send a call proceeding message to the peer.
- H225\_EVENT\_CALLPROC\_IND--This event indicates to the H.225 state machine that a call proceeding message has been received from the peer.
- H225\_EVENT\_REJECT--This event instructs the H.225 state machine to reject the call setup request from the peer.
- H225\_EVENT\_REJECT\_IND--This event indicates to the H.225 state machine that a call setup request to the peer has been rejected.
- H225\_EVENT\_RELEASE--This event instructs the H.225 state machine to send a release complete message to the peer.
- H225\_EVENT\_RELEASE\_IND--This event indicates to the H.225 state machine that a release complete message has been received from the peer.
- H225\_EVENT\_SETUP--This event instructs the H.225 state machine to send a setup message to the peer.
- H225\_EVENT\_SETUP\_IND--This event indicates to the H.225 state machine that a setup message has been received from the peer.

- H225\_EVENT\_SETUP\_CFM--This event instructs the H.225 state machine to send a connect message to the peer.
- H225\_EVENT\_SETUP\_CFM\_IND--This event indicates to the H.225 state machine that a connect message arrived from the peer.
- H225\_EVENT\_RAS\_SUCCESS--This event indicates to the H.225 state machine that the pending RAS operation succeeded.
- H225\_EVENT\_RAS\_FAILED--This event indicates to the H.225 state machine that the pending RAS operation failed.
- H225\_EVENT\_H245\_SUCCESS--This event indicates to the H.225 state machine that the pending H.245 operation succeeded.
- H225\_EVENT\_H245\_FAILED--This event indicates to the H.225 state machine that the pending H.245 operation failed.

### The debug cch323 Command with the h245 Keyword

When used with the **debugcch323** command, the **h245** keyword allows you to trace the state transition of the H.245 state machine on the basis of the processed event.

The H.245 state machines include the following three state machines:

- Master slave determination (MSD) state machine
- Capability exchange (CAP) state machine
- Open logical channel (OLC) state machine

The state definitions follow:

- H245\_MS\_NONE--This is the initial state of the MSD state machine.
- H245\_MS\_WAIT--In this state, an MSD message is sent, and the device is waiting for the reply.
- H245\_MS\_DONE-- The result is in.
- H245\_CAP\_NONE--This is the initial state of the CAP state machine.
- H245\_CAP\_WAIT--In this state, a CAP message is sent, and the device is waiting for the reply.
- H245\_CAP\_DONE--The result is in.
- H245 OLC NONE--This is the initial state of the OLC state machine.
- H245\_OLC\_WAIT--In this state, an OLC message is sent, and the device is waiting for the reply.

1

• H245\_OLC\_DONE--The result is in.

The event definitions follow:

- H245\_EVENT\_MSD--Send MSD message.
- H245\_EVENT\_MS\_CFM--Send MSD acknowledge message.
- H245\_EVENT\_MS\_REJ--Send MSD reject message.
- H245\_EVENT\_MS\_IND--Received MSD message.
- H245\_EVENT\_CAP--Send CAP message.

- H245\_EVENT\_CAP\_CFM--Send CAP acknowledge message.
- H245\_EVENT\_CAP\_REJ--Send CAP reject message.
- H245\_EVENT\_CAP\_IND--Received CAP message.
- H245\_EVENT\_OLC--Send OLC message.
- H245\_EVENT\_OLC\_CFM--Send OLC acknowledge message.
- H245\_EVENT\_OLC\_REJ--Send OLC reject message.
- H245\_EVENT\_OLC\_IND--Received OLC message.

### The debug cch323 Command with the nxe Keyword

When used with the **debugcch323** command, the **nxe** keyword allows you to display the Annex E events that have been transmitted and received.

### The debug cch323 Command with the ras Keyword

When used with the **debugcch323** command, the **ras** keyword allows you to trace the state transition of the RAS state machine based on the processed events.

RAS operates in two state machines. One global state machine controls the overall RAS operation of the gateway. The other state machine is a per-call state machine that controls the active calls.

The definitions of the different states of the RAS state machine follow:

- CCH323\_RAS\_STATE\_NONE--This is the initial state of the RAS state machine.
- CCH323\_RAS\_STATE\_GRQ--The state machine is in the Gatekeeper Request (GRQ) state. In this state, the gateway is discovering a gatekeeper.
- CCH323\_RAS\_STATE\_RRQ--The state machine is in the Registration Request (RRQ) state. In this state, the gateway is registering with a gatekeeper.
- CCH323\_RAS\_STATE\_IDLE--The global state machine is in the idle state.
- CCH323\_RAS\_STATE\_URQ--The state machine is in the Unregistration Request (URQ) state. In this state, the gateway is in the process of unregistering with a gatekeeper.
- CCH323\_RAS\_STATE\_ARQ--The per-call state machine is in the process of admitting a new call.
- CCH323 RAS STATE ACTIVE--The per-call state machine is in the call active state.
- CCH323\_RAS\_STATE\_DRQ--The per-call state machine is in the process of disengaging an active call.

The definitions of the different events of the RAS state machine follow:

- CCH323\_RAS\_EVENT\_NONE--Nothing.
- CCH323\_RAS\_EVENT\_GWUP--Gateway is coming up.
- CCH323\_RAS\_EVENT\_GWDWN--Gateway is going down.
- CCH323\_RAS\_EVENT\_NEWCALL--New call.
- CCH323\_RAS\_EVENT\_CALLDISC--Call disconnect.
- CCH323\_RAS\_EVENT\_GCF--Received Gatekeeper Confirmation (GCF).
- CCH323\_RAS\_EVENT\_GRJ--Received Gatekeeper Rejection (GRJ).

- CCH323\_RAS\_EVENT\_ACF--Received Admission Confirmation (ACF).
- CCH323\_RAS\_EVENT\_ARJ--Received Admission Reject (ARJ).
- CCH323\_RAS\_EVENT\_SEND\_RRQ--Send Registration Request (RRQ).
- CCH323\_RAS\_EVENT\_RCF--Received Registration Confirmation (RCF).
- CCH323\_RAS\_EVENT\_RRJ--Received Registration Rejection (RRJ).
- CCH323\_RAS\_EVENT\_SEND\_URQ--Send Unregistration Request (URQ).
- CCH323\_RAS\_EVENT\_URQ--Received URQ.
- CCH323\_RAS\_EVENT\_UCF--Received Unregister Confirmation (UCF).
- CCH323\_RAS\_EVENT\_SEND\_UCF--Send UCF.
- CCH323\_RAS\_EVENT\_URJ--Received Unregister Reject (URJ).
- CCH323\_RAS\_EVENT\_BCF--Received Bandwidth Confirm (BCF).
- CCH323\_RAS\_EVENT\_BRJ--Received Bandwidth Rejection (BRJ).
- CCH323\_RAS\_EVENT\_DRQ--Received Disengage Request (DRQ).
- CCH323\_RAS\_EVENT\_DCF--Received Disengage Confirm (DCF).
- CCH323\_RAS\_EVENT\_SEND\_DCF--Send DCF.
- CCH323\_RAS\_EVENT\_DRJ--Received Disengage Reject (DRJ).
- CCH323\_RAS\_EVENT\_IRQ--Received Interrupt Request (IRQ).
- CCH323\_RAS\_EVENT\_IRR--Send Information Request (IRR).
- CCH323\_RAS\_EVENT\_TIMEOUT--Message timeout.

### The debug cch323 Command with the rawmsg Keyword

When used with the **debugcch323** command, the **rawmsg** keyword allows you to troubleshoot raw message buffer problems.

∕!∖

Caution

Using the **debugcch323** command with the **rawmsg** keyword could slow your system and flood the TTY if there is significant call traffic.

### The debug cch323 Command with the session Keyword

Used with the debugcch323 command, the session keyword allows you to trace general H.323 events.

∕!∖

Caution

Using the **debugcch323session** command could slow your system and flood the TTY if there is significant call traffic.

# Examples

# Examples

The **debugcch323all** command and keyword combination provides output for the following keywords: **error**, **h225**, **h245**, **nxe**, **ras**, **rawmsg**, and **session**. Examples of output for each keyword follow.

1

Examples The following is sample output from a typical **debugcch323error** request on a Cisco 3640 router: Router# debug cch323 error cch323 h225 receiver:received msg of unknown type 5 **Examples** The following is sample output from a typical **debugcch323h225** request on a Cisco 3640 router: Router# debug cch323 h225 20:59:17:Set new event H225\_EVENT\_SETUP 20:59:17:H225 FSM:received event H225\_EVENT\_SETUP while at state H225\_IDLE 20:59:17:Changing from H225\_IDLE state to H225\_SETUP state 20:59:17:cch323 h225 receiver:received msg of type SETUPCFM CHOSEN 20:59:17:H225 FSM:received event H225\_EVENT\_SETUP\_CFM\_IND while at state H225 SETUP 20:59:17:Changing from H225\_SETUP state to H225\_ACTIVE state 20:59:17:Set new event H225\_EVENT\_H245\_SUCCESS 20:59:17:H225 FSM:received event H225 EVENT H245 SUCCESS while at state H225 ACTIVE 20:59:20:Set new event H225\_EVENT\_RELEASE 20:59:20:H225 FSM:received event H225 EVENT RELEASE while at state H225 ACTIVE 20:59:20:Changing from H225\_ACTIVE state to H225\_WAIT\_FOR\_DRQ state 20:59:20:Set new event H225\_EVENT\_RAS\_SUCCESS 20:59:20:H225 FSM:received event H225\_EVENT\_RAS\_SUCCESS while at state H225 WAIT FOR DRQ 20:59:20:Changing from H225 WAIT FOR DRQ state to H225 IDLE state The table below describes the significant fields shown in the display.

Field	Description
H225_EVENT_SETUP	This event instructs the H.225 state machine to send a setup message to the peer.
H225_IDLE	The initial state of the H.225 state machine. The H.225 state machine is in this state before issuing a call setup request (for the outbound IP call case) or when ready to receive an incoming IP call.
H225_SETUP	The call setup state. The state machine changes to this state after sending out a call setup request or after receiving an incoming call indication.
SETUPCFM_CHOSEN	The H225 connect message that has been received from a remote H323 endpoint.
H225_EVENT_SETUP_CFM_IND	This event indicates to the H.225 state machine that a connect message arrived from the peer.
H225_ACTIVE	The call connected state. In this state, the call is active. The state machine changes to this state after sending the connect message to the peer or after receiving the connect message from the peer.

#### Table 44: debug cch323 h225 Field Descriptions

Field	Description
H225_EVENT_H425_SUCCESS	This event indicates to the H.225 state machine that the pending H.245 operation succeeded.
H225_EVENT_RELEASE	This event instructs the H.225 state machine to send a release complete message to the peer.
H225_WAIT_FOR_DRQ	The state in which the H.225 state machine is waiting for the completion of the DRQ process from the RAS state machine.
H225_EVENT_RAS_SUCCESS	This event indicates to the H.225 state machine that the pending RAS operation succeeded.
H225 FSM	The finite state machine.

#### Examples

The following is sample output from a typical **debugcch323h245** request on a Cisco 3640 router:

I

H245\_OLC\_WAIT 20:58:23:changing from H245\_OLC\_WAIT state to H245\_OLC\_DONE state The table below describes the significant fields shown in the display.

### Table 45: debug cch323 h245 Field Descriptions

Field	Description
H245_EVENT_MSD	Send MSD event message to the state machine.
H245 MS FSM	An H225 master slave determination finite state machine.
H245_MS_NONE	The initial state of the MSD state machine.
H245_MS_WAIT	In this state, a MSD message is sent, and the device is waiting for the reply.
H245_EVENT_CAP	Send CAP event message.
H245 CAP FSM	This is the H245 terminal CAP finite state machine.
H245_CAP_NONE	The initial state of the CAP state machine.
H245_CAP_WAIT	In this state, a CAP message is sent, and the device is waiting for the reply.
M_H245_MS_DETERMINE _INDICATION	The MSD message that has been received by an H245 terminal from a remote H323 endpoint.
H245_EVENT_MS_IND	Received MSD event message.
M_H245_CAP_TRANSFER_INDICATION	A CAP message that has been received by the H245 terminal from an H323 remote endpoint.
H245_EVENT_CAP_IND	Received CAP event message.
M_H245_MS_DETERMINE_CONFIRM	A confirmation message that the H245 master slave termination message was sent.
H245_EVENT_MS_CFM	Send MSD acknowledge event message.
H245_MS_DONE	The result is in.
M_H245_CAP_TRANSFER_CONFIRM	An indication to the H245 terminal that the CAP message was sent.
H245_EVENT_CAP_CFM	Send CAP acknowledge event message.
H245_CAP_DONE	The result is in.
H245_EVENT_OLC	Send OLC event message.

Field	Description
H245_OLC_NONE	The initial state of the OLC state machine.
H245_OLC_WAIT	In this state, an OLC message is sent, and the device is waiting for the reply.
M_H245_UCHAN_ESTABLISH_INDICATION	The OLC message received by an H245 terminal from a remote H323 endpoint.
H245_EVENT_OLC_IND	Received OLC event message.
M_H245_UCHAN_ESTAB_ACK	The OLC message acknowledgment received by an H245 terminal from a remote H323 endpoint.
H245_EVENT_OLC_CFM	Send OLC acknowledge event message.
H245 OLC FSM	The OLC finite state machine of the H245 terminal.
H245_EVENT_OLC_CFM	Send OLC acknowledge event message.
H245_OLC_DONE	The result is in.

### Examples

The following is sample output from a debugcch323nxe request:

#### Router# debug cch323 nxe

Tahle 46: debu	a cch323 ras Fie	ld Descrintions
10010 40. 0000	9 0011020 143 110	a Desemptions

Field	Description
CCH323_RAS_EVENT_SEND_RRQ	Send RRQ event message.
CCH323_RAS_STATE_IDLE	The global state machine is in the idle state.
CCH323_RAS_STATE_RRQ	The state machine is in the RRQ state. In this state, the gateway is registering with a gatekeeper.
RCF_CHOSEN	A registration confirm message that has been received from a gatekeeper.
CCH323_RAS_EVENT_RCF	Received RCF event message.
CCH323_RAS_EVENT_NEWCALL	New call event.
CCH323_RAS_STATE_ARQ	The per-call state machine is in the process of admitting a new call.
ACF_CHOSEN	ACF message that has been received from a gatekeeper.
CCH323_RAS_EVENT_ACF	Received ACF event message.

Field	Description
CCH323_RAS_STATE_ACTIVE	The per-call state machine is in the call active state.
CCH323_RAS_EVENT_CALLDISC	Call disconnect event message.
CCH323_RAS_STATE_DRQ	The per-call state machine is in the process of disengaging an active call.
DCF_CHOSEN	The disengage confirm message that has been received from a gatekeeper.
CCH323_RAS_EVENT_DCF	Received DCF event message.
CCH323_RAS_EVENT_IRR	Send IRR event message.

#### Examples

The following is sample output from a typical debugcch323rawmsg request on a Cisco 3640 router:

Router# debug cch323 rawmsg

#### Examples

Following are two examples of output using the **debugcch323session** command and keyword combination. The first example is for a call setup on an originating gateway. The second example is for a call setup on a terminating gateway.

The following is sample output from a typical **debugcch323session** request for a call setup on an originating gateway:

```
Router# debug cch323 session
00:33:49:cch323_call_setup:gw_id=1, callID=16
00:33:49:cch323_get_new_ccb:ccb (0x81D12D2C) is in use

# Related Commands

Command	Description
clear h323 gateway	Clears the H.323 gateway counters.
debug h323-annexg	Displays all pertinent AnnexG messages that have been transmitted and received.
debug voip rawmsg	Displays the raw message owner, length, and pointer.
show h323 gateway	Displays statistics for H.323 gateway messages that have been sent and received and displays the reasons for which H.323 calls have been disconnected.

# debug cch323 capacity

To track the call capacity of the gatekeeper, use the **debugcch323capacity** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cch323 capacity

no debug cch323 capacity

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(11)T	This command was introduced.

Usage Guidelines Use the debugcch323capacity command to track the maximum and current call capacity values in the Registration, Admission, and Status (RAS) Protocol messages and to debug capacity-related problems while sending RAS messages. This command is entered on the gateway to monitor the call capacity of the gatekeeper.

The command lists the values for current and maximum call capacity provided by the trunk group capacity resource manager if and when the H.323 Service Provider Interface (SPI) requests the information for all or specific groups of circuits.

Examples

The following is sample output from the **debugcch323capacity** command:

```
Router# debug cch323 capacity
Call Capacity Information tracing is enabled
5d00h: cch323 process carrier update: Registered = 1, Event = 1, Reason = 1
5d00h: cch323 process carrier update: CarrierId = CARRIERA NEWENGLAND
5d00h: cch323_fill_crm_CallCapacities: Reason = 1, GroupID = CARRIERA_NEWENGLAND
5d00h: Capacity Details:
                                   Maximum Channels in Group:
                                                                  23
                                  23,
      Max. Voice Calls(In) :
                                          Max. Voice Calls(Out):
                                                                    23
      Active Voice Calls(In):
                                  5,
                                          Active Voice Calls(Out):
      Max. Voice Calls(to GK):
                                  23,
                                          Avail. Voice Calls(to GK):
                                                                       11
```

The gatekeeper displays this output when trunk groups are added, deleted, or modified or when circuits in a trunk group are deactivated or activated (similar to ISDN layer 2 down/up).

1

```
5d00h: cch323_process_carrier_update: Registered = 1,Event = 1,Reason = 1
5d00h: cch323_process_carrier_update: CarrierId = CARRIERA_NEWENGLAND
```

The table below describes the significant fields shown in the display.

Table 47: debug cch323 capac	ity Update Field Descriptions
------------------------------	-------------------------------

Field	Description
Registered	Gateway registration:
	• 0=Gateway is not registered to the gatekeeper
	• 1=Gateway is registered to the gatekeeper at the time of the change
Event	Carriers updated:
	• 0=All carriers updated
	• 1=Single carrier updated
Reason	Reason for the update notification:
	• 0=CURRENT_CAPACITY_UPDATE
	• 1=MAX_CAPACITY_UPDATE
	• 2=BOTH_CAPACITY_UPDATE
CarrierID	ID of the trunk group or carrier to which the change applies.

The gatekeeper displays this output whenever call capacity information is sent to the gatekeeper.

Command Default Disabled

**Command Modes** Privileged EXEC

 Release
 Modification

 11.3(6)NA2
 This command was introduced.

 12.2(2)XB1
 This command was implemented on the Cisco AS5850.

 12.2(11)T
 This command was integrated into Cisco IOS Release 12.2(11)T.

### Usage Guidelines State Descriptions

The state definitions of the different states of the H.225 state machine are as follows:

- H225\_IDLE--This is the initial state of the H.225 state machine. The H.225 state machine is in this state before issuing a call setup request (for the outbound IP call case) or ready to receive an incoming IP call.
- H225\_SETUP--This is the call setup state. The state machine transitions to this state after sending out a call setup request, or after the reception of an incoming call indication.
- H225\_ALERT--This is the call alerting state. The state machine transitions to this state after sending the alerting message or after the reception of an alerting message from the peer.
- H225\_CALLPROC--This is the call proceeding state.
- H225\_ACTIVE--This is the Call connected state. In this state, the call is active. The state machine transitions to this state after sending the connect message to the peer or after the reception of the connect message from the peer.
- H225\_WAIT\_FOR\_ARQ--This is the state where the H.225 state machine is waiting for the completion of the ARQ process from the Registration, Admission, and Status Protocol (RAS) state machine.

- H225\_WAIT\_FOR\_DRQ--This is the state where the H.225 state machine is waiting for the completion
  of the DRQ process from the RAS state machine.
- H225\_WAIT\_FOR\_H245--This is the state where the H.225 state machine is waiting for the success or failure from the H.245 state machine.

### **Events Description**

The event definitions of the different events of the H.225 state machine are as follows:

- H225\_EVENT\_NONE-- No event.
- H225\_EVENT\_ALERT--This event indicates the H.225 state machine to send an alerting message to the peer.
- H225\_EVENT\_ALERT\_IND--This event indicates the H.225 state machine that an alerting message is received from the peer.
- H225\_EVENT\_CALLPROC--This event indicates the H.225 state machine to send a call proceeding message to the peer.
- H225\_EVENT\_CALLPROC\_IND--This event indicates the H.225 state machine that a call proceeding message is received from the peer.
- H225\_EVENT\_REJECT--This event indicates the H.225 state machine to reject the call setup request from the peer.
- H225\_EVENT\_REJECT\_IND--This event indicates the H.225 state machine that a call setup request to the peer is rejected.
- H225\_EVENT\_RELEASE--This event indicates the H.225 state machine to send a release complete message to the peer.
- H225\_EVENT\_RELEASE\_IND--This event indicates the H.225 state machine that a release complete message is received from the peer.
- H225\_EVENT\_SETUP--This event indicates the H.225 state machine to send a setup message to the peer.
- H225\_EVENT\_SETUP\_IND--This event indicates the H.225 state machine that a setup message is received from the peer.
- H225\_EVENT\_SETUP\_CFM--This event indicates the H.225 state machine to send a connect message to the peer.
- H225\_EVENT\_SETUP\_CFM\_IND--This event indicates the H.225 state machine that a connect message from the peer.
- H225\_EVENT\_RAS\_SUCCESS--This event indicates the H.225 state machine that the pending RAS operation is successful.
- H225\_EVENT\_RAS\_FAILED--This event indicates the H.225 state machine that the pending RAS operation failed.
- H225\_EVENT\_H245\_SUCCESS--This event indicates the H.225 state machine that the pending H.245 operation is successful.
- H225\_EVENT\_H245\_FAILED--This event indicates the H.225 state machine that the pending H.245 operation failed.

### **Examples** The following is sample output from the **debugcch323h225** command:

 Release
 Modification

 11.3(6)NA2
 This command was introduced.

 12.2(2)XB1
 This command was implemented on the Cisco AS5850.

 12.2(11)T
 This command was integrated into Cisco IOS Release 12.2(11)T.

**Usage Guidelines** 

The H.245 state machines include the following three state machines:

- Master SlaveDetermination (MSD) state machine
- Capability Exchange (CAP) state machine
- Open Logical Channel (OLC) state machine

### **State Definitions**

The definitions are as follows:

- H245\_MS\_NONE-- This is the initial state of the master slave determination state machine.
- H245 MS WAIT--In this state, a Master Slave Determination message is sent, waiting for the reply.

- H245\_MS\_DONE-- The result is in.
- H245 CAP NONE--This is the initial state of the capabilities exchange state machine.
- H245\_CAP\_WAIT--In this state, a cap exchange message is sent, waiting for reply.
- H245\_CAP\_DONE--The result is in.
- H245\_OLC\_NONE--This is the initial state of the open logical channel state machine.

- H245\_OLC\_WAIT: OLC message sent, waiting for reply.
- H245\_OLC\_DONE: OLC done.

### **Event definitions**

- H245\_EVENT\_MSD--Send MSD message
- H245\_EVENT\_MS\_CFM--Send MSD acknowledge message
- H245 EVENT MS REJ--Send MSD reject message
- H245\_EVENT\_MS\_IND-- Received MSD message
- H245\_EVENT\_CAP--Send CAP message
- H245\_EVENT\_CAP\_CFM--Send CAP acknowledge message
- H245\_EVENT\_CAP\_REJ--Send CAP reject
- H245\_EVENT\_CAP\_IND--Received CAP message
- H245\_EVENT\_OLC--Send OLC message
- H245\_EVENT\_OLC\_CFM--Send OLC acknowledge message
- H245\_EVENT\_OLC\_REJ--Send OLC reject message
- H245\_EVENT\_OLC\_IND--Received OLC message

Examples

The following is sample output from the **debugcch323h245** command:

The table below describes the significant fields shown in the display.

٦

Field	Description
Request	Request Type0 for preauthentication, 1 for disconnect.
Preauth id	Identifier for the preauthentication request.
EndPt Type	Call Origin End Point Type1 for IP address, 2 for IZCT value.
EndPt	Call Origin End Point ValueAn IP address or IZCT value.
Resource Service	Resource Service Type1 for Reservation, 2 for Query.
Call_origin	Answer.
Call_type	Voice over IP (VoIP).
Calling_num	Calling Party Number (CLID).
Called_num	Called Party Number (DNIS).
Protocol	0 for H.323, 1 for SIP.
function reports	Various identifiers and status reports for executed functions.

 12.2(11)T
 This command was integrated into Cisco IOS Release 12.2(11)T.

# **Usage Guidelines** RAS operates in two state machines. One global state machine controls the overall RAS operation of the Gateway. The other state machine is a per call state machine that controls the active calls.

### State definitions

The state definitions of the different states of the RAS state machine follow:

- CCH323 RAS STATE NONE--This is the initial state of the RAS state machine.
- CCH323\_RAS\_STATE\_GRQ--The state machine is in the Gatekeeper Request (GRQ) state. In this state, the gateway is in the process of discovering a gatekeeper.
- CCH323\_RAS\_STATE\_RRQ--The state machine is in the Registration Request (RRQ) state. In this state, the gateway is in the process of registering with a gatekeeper.
- CCH323\_RAS\_STATE\_IDLE--The global state machine is in the idle state.
- CCH323\_RAS\_STATE\_URQ--The state machine is in the Unregistration Request (URQ) state. In this state, the gateway is in the process of unregistering with a gatekeeper.
- CCH323\_RAS\_STATE\_ARQ--The per call state machine is in the process of admitting a new call.
- CCH323\_RAS\_STATE\_ACTIVE--The per call state machine is in the call active state.

I

• CCH323\_RAS\_STATE\_DRQ--The per call state machine is in the process of disengaging an active call.

### **Event Definitions**

These are the event definitions of the different states of the RAS state machine:

- CCH323\_RAS\_EVENT\_NONE--Nothing.
- CCH323\_RAS\_EVENT\_GWUP--Gateway is coming up.
- CCH323\_RAS\_EVENT\_GWDWN--Gateway is going down.
- CCH323\_RAS\_EVENT\_NEWCALL--New call.
- CCH323\_RAS\_EVENT\_CALLDISC--Call disconnect.
- CCH323\_RAS\_EVENT\_GCF--Received Gatekeeper Confirmation (GCF).
- CCH323\_RAS\_EVENT\_GRJ--Received Gatekeeper Rejection (GRJ).
- CCH323\_RAS\_EVENT\_ACF--Received Admission Confirmation (ACF).
- CCH323\_RAS\_EVENT\_ARJ--Received Admission Rejection (ARJ).
- CCH323\_RAS\_EVENT\_SEND\_RRQ--Send Registration Request (RRQ).
- CCH323\_RAS\_EVENT\_RCF--Received Registration Confirmation (RCF).
- CCH323\_RAS\_EVENT\_RRJ--Received Registration Rejection (RRJ).
- CCH323\_RAS\_EVENT\_SEND\_URQ--Send URQ.
- CCH323\_RAS\_EVENT\_URQ--Received URQ.
- CCH323 RAS EVENT UCF--Received Unregister Confirmation (UCF).
- CCH323\_RAS\_EVENT\_SEND\_UCF--Send Unregister Confirmation (UCF).
- CCH323 RAS EVENT URJ--Received Unregister Reject (URJ).
- CCH323\_RAS\_EVENT\_BCF--Received Bandwidth Confirm (BCF).
- CCH323\_RAS\_EVENT\_BRJ--Received Bandwidth Rejection (BRJ).
- CCH323\_RAS\_EVENT\_DRQ--Received Disengage Request (DRQ).
- CCH323\_RAS\_EVENT\_DCF--Received Disengage Confirm (DCF).
- CCH323\_RAS\_EVENT\_SEND\_DCF--Send Disengage Confirm (DCF).
- CCH323\_RAS\_EVENT\_DRJ--Received Disengage Reject (DRJ).
- CCH323\_RAS\_EVENT\_IRQ--Received Interrupt Request (IRQ).
- CCH323\_RAS\_EVENT\_IRR--Send Information Request (IRR).
- CCH323\_RAS\_EVENT\_TIMEOUT--Message timeout.

**Examples** 

The following is sample output from the **debugcch323preauth** command:

### **Related Commands**

Command	Description
debug ephone video	Sets video debugging for the Cisco Unified IP phone.
show call active video	Displays call information for SCCP video calls in progress.
show call history video	Displays call history information for SCCP video calls.
show debugging	Displays information about the types of debugging that are enabled for your router.

1

# debug ccm-manager

To display debugging information about Cisco CallManager, use the **debugccm-manager** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccm-manager {backhaul {errors| events| packets}| config-download {all| errors| events| packets| tone| xml}| errors| events| music-on-hold {errors| events| packets}| packets}

no debug ccm-manager

Syntax Description	backhaul	<ul> <li>Enables debugging of the Cisco CallManager backhaul. The keywords are as follows:</li> <li>errorsDisplays Cisco CallManager backhaul errors.</li> <li>eventsDisplays Cisco CallManager backhaul events.</li> <li>packetsDisplays Cisco CallManager packets.</li> </ul>
	config-download	<ul> <li>Enables debugging of the Cisco CallManager configuration download. The keywords are as follows:</li> <li>allDisplays all Cisco CallManager configuration parameters.</li> <li>errorsDisplays Cisco CallManager configuration errors.</li> <li>eventsDisplays Cisco CallManager configuration events.</li> <li>packetsDisplays Cisco CallManager configuration packets.</li> <li>toneDisplays Cisco CallManager downloaded custom tones.</li> <li>xmlDisplays the Cisco CallManager configuration XML parser.</li> </ul>
	errors	Displays errors related to Cisco CallManager.
	events	Displays Cisco CallManager events, such as when the primary Cisco CallManager server fails and control is switched to the backup Cisco CallManager server.

music-on-hold	Displays music on hold (MOH). The keywords are as follows:
	• errorsDisplays MOH errors.
	• eventsDisplays MOH events.
	• packets Displays MOH packets.
packets	Displays Cisco CallManager packets.

# **Command Modes** Privileged EXEC

## **Command History**

Release	Modification	
12.1(3)T	This command was introduced for Cisco CallManager Version 3.0 and the Cisco VG200.	
12.2(2)XA	This command was implemented on Cisco 2600 series and Cisco 3600 series routers.	
12.2(2)XN	Support for enhanced MGCP voice gateway interoperability was added to Cisco CallManager Version 3.1 for the Cisco 2600 series, Cisco 3600 series, and Cisco VG200.	
12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T and implemented on the Cisco IAD2420 series.	
12.2(15)XJ	The <b>tone</b> keyword was added for the following platforms: Cisco 2610XM, Cisco 611XM, Cisco 2620XM, Cisco 2621XM, Cisco 2650XM, Cisco 2651XM, Cisco 2691, Cisco 3640A, Cisco 3660, Cisco 3725, and Cisco 3745.	
12.3(4)T	The <b>tone</b> keyword was added.	
12.3(14)T	New output was added relating to the SCCP protocol.	
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.	

### **Examples**

The following is sample output from the debugccm-managerevents command:

# Router# debug ccm-manager events

```
*Feb 28 22:56:05.873: cmapp_mgcpapp_go_down: Setting mgc status to NO_RESPONSE
*Feb 28 22:56:05.873: cmapp_host_fsm: New state DOWN for host 0 (172.20.71.38)
*Feb 28 22:56:05.873: cmapp_mgr_process_ev_active_host_failed: Active host 0 (172.20.71.38)
failed

The following lines show the conversion of XML data into router configuration information for the endpoint:
```

\*Jan 9 09:44:45.579: cmapp\_sccp\_gw\_start\_element\_handler: Unit has been set to 1 \*Jan 9 09:44:45.579: cmapp\_sccp\_gw\_start\_element\_handler: Subunit has been set to 0 \*Jan 9 09:44:45.579: cmapp\_sccp\_gw\_start\_element\_handler: Endpoint has been set to 0 \*Jan 9 09:44:45.579: cmapp\_sccp\_gw\_start\_element\_handler: Endpoint has been set to 1 \*Jan 9 09:44:45.579: cmapp\_sccp\_gw\_start\_element\_handler: Endpoint has been set to 2 \*Jan 9 09:44:45.579: cmapp\_sccp\_gw\_start\_element\_handler: Endpoint has been set to 2

*Jan	9	09:44:45.579:	cmapp sccp gw start element handler: Subunit has been set to 1	
*Jan	9	09:44:45.579:	cmapp sccp gw start element handler: Endpoint has been set to	0
*Jan	9	09:44:45.579:	cmapp sccp gw start element handler: Endpoint has been set to	1
*Jan	9	09:44:45.579:	<pre>cmapp sccp gw start element handler: Unit has been set to 2</pre>	
The table below describes the significant fields shown in the displays.				

# Table 50: debug ccm-manager Field Descriptions

Field	Description
nn :nn :nn :	Timestamp time in hours (military format), minutes, and seconds that indicates when the Cisco CallManager event occurred.
cmapp_error message:	The Cisco CallManager routine in which the error event occurred.
LocaleName	Region name, such as United Kingdom.
low frequency level	DTMF low frequency.
high frequency level	DTMF high frequency.
operation	Special operations, such as uLaw.

# **Related Commands**

ſ

Command	Description
show ccm-manager	Displays a list of Cisco CallManager servers, their current status, and their availability.

1

# debug ccsip all

To enable all Session Initiation Protocol (SIP)-related debugging, use the **debugccsipall** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug ccsip all

no debug ccsip all

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	12.1(1)T	This command was introduced.
	12.1.(3)T	The output of this command was changed.
	12.2(2)XA	Support was added for the Cisco AS5350 and Cisco AS5400 universal gateways.
	12.2(2)XB1	This command was implemented on the Cisco AS5850 universal gateway.
	12.2(8)T	This command was integrated into Cisco IOS Release 12.2(8)T and implemented on Cisco 7200 series routers.
	12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T. Support for the Cisco AS5300 universal access server, Cisco AS5350, Cisco AS5400, and Cisco AS5850 universal gateway is not included in this release.

Usage Guidelines

The **debugccsipall** command enables the following SIP debug commands:

- debug ccsip events
- debug ccsip error
- debug ccsip states
- · debug ccsip messages
- debug ccsip calls

**Examples** 

The following example displays debug output from one side of the call:

Router# debug ccsip all

```
All SIP call tracing enabled
Router1#

### **Related Commands**

I

Command	Description
debug ccsip calls	Shows all SIP SPI call tracing.
debug ccsip error	Shows SIP SPI errors.
debug ccsip events	Shows all SIP SPI events tracing.
debug ccsip info	Shows all SIP SPI message tracing.
debug ccsip states	Shows all SIP SPI state tracing.

## debug ccsip calls

To show all Session Initiation Protocol (SIP) Service Provider Interface (SPI) call tracing, use the **debugccsipcalls** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug ccsip calls

no debug ccsip calls

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values

Command Modes Privileged EXEC

**Command History** 

12.1(1)T	This command was introduced.
12.1(3)T	The output of this command was changed.
12.2(2)XA	Support was added for the Cisco AS5350 and Cisco AS5400 universal gateways.
12.2(2)XB1	This command was introduced on the Cisco AS5850 universal gateway.
12.2(8)TThis command was integrated into Cisco IOS Release 12.2(8)T and on Cisco 7200 series routers.	
12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T. Support for the Cisco AS5300 universal access server, Cisco AS5350, Cisco AS5400, and Cisco AS5850 universal gateway is not included in this release.

**Usage Guidelines** This command traces the SIP call details as they are updated in the SIP call control block.

**Examples** 

The following example displays debug output from one side of the call:

### **Related Commands**

Command	Description		
debug ccsip all	Enables all SIP-related debugging.		
debug ccsip error	Shows SIP SPI errors.		
debug ccsip events	Shows all SIP SPI events tracing.		

I

Command	Description
debug ccsip info	Shows all SIP SPI message tracing.
debug ccsip states	Shows all SIP SPI state tracing.

# debug ccsip dhcp

To display debugging related information on Session Initiation Protocol (SIP) and Dynamic Host Configuration Protocol (DHCP) interaction, when SIP parameters are provisoned by DHCP, use the **debugccsipdhcp** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug ccsip dhcp

no debug ccsip dhcp

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

Command History	12.4(22)YB	This command was introduced.				
	15.0(1)M	This command was integrated in Cisco IOS Release 15.0(1)M.				

**Usage Guidelines** The debug ccsip dhcp command can be enabled by executing the command itself or by issuing the debug ccsip all command.

Examples

The following example displays debug output from the debug ccsip dhcp command:

```
Router# debug ccsip dhcp

#### **Related Commands**

Command	Description
debug ccsip all	Enables all SIP-related debugging
debug ccsip calls	Displays all SIP SPI call tracing.
debug ecsip error	Displays SIP SPI errors.
debug ccsip events	Displays all SIP SPI events tracing.
debug ccsip in	Displays all SIP SPI message tracing.
debug ccsip states	Displays all SIP SPI state tracing.

# debug ccsip error

To show Session Initiation Protocol (SIP) Service Provider Interface (SPI) errors, use the **debugccsiperror** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug ccsip error

no debug ccip error

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	12.1(1)T	This command was introduced.
	12.2(2)XA	Support was added for the Cisco AS5350 and Cisco AS5400 universal gateways.
	12.2(2)XB1	This command was implemented on the Cisco AS5850 universal gateway.
	12.2(8)T	This command was integrated into Cisco IOS Release 12.2(8)T and implemented on Cisco 7200 series routers.
	12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T. Support for the Cisco AS5300 universal access server, Cisco AS5350, Cisco AS5400, and Cisco AS5850 universal gateway is not included in this release.

#### **Usage Guidelines**

This command traces all error messages generated from errors encountered by the SIP subsystem.

#### **Examples**

The following example displays debug output from one side of the call:

Router1# debug ccsip error SIP Call error tracing is enabled Router1# \*Mar 6 14:16:41: CCSIP-SPI-CONTROL: act idle call setup \*Mar 6 14:16:41: act idle call setup:Not using Voice Class Codec 6 14:16:41: act idle call setup: preferred codec set[0] type :g711ulaw bytes: 160 \*Mar \*Mar 6 14:16:41: REQUEST CONNECTION TO IP:166.34.245.231 PORT:5060 \*Mar 6 14:16:41: CCSIP-SPI-CONTROL: act\_idle\_connection\_created \*Mar 6 14:16:41: CCSIP-SPI-CONTROL: act\_idle\_connection\_created: Connid(1) created to 166.34.245.231:5060, local port 55674 \*Mar 6 14:16:41: sipSPIAddLocalContact \*Mar 6 14:16:41: CCSIP-SPI-CONTROL: sip stats method \*Mar 6 14:16:41: HandleUdpSocketReads : Msg enqueued for SPI with IPaddr: 166.34.245.231:5060 \*Mar 6 14:16:41: CCSIP-SPI-CONTROL: act sentinvite new message

### **Related Commands**

I

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip calls	Shows all SIP SPI call tracing.
debug ccsip events	Shows all SIP SPI events tracing.
debug ccsip info	Shows all SIP SPI message tracing.
debug ccsip states	Shows all SIP SPI state tracing.

## debug ccsip events

To enable tracing of events that are specific to service provider interface (SPI), use the debugccsipevents command in privileged EXEC mode. To disable debugging output, use the no form of this command. debug ccsip events no debug ccsip events **Syntax Description** This command has no arguments or keywords. **Command Default** No default behavior or values **Command Modes** Privileged EXEC **Command History** 12.1(1)TThis command was introduced. 12.2(2)XA Support was added for the Cisco AS5350 and Cisco AS5400 universal gateways. This command was introduced on the Cisco AS5850 universal gateway. 12.2(2)XB1 12.2(11)T This command was integrated into Cisco IOS Release 12.2(11)T. 12.2(15)TMuch of the information formerly found in the output of the **debugccsipevents** command is now reported in the output of the debugccsipinfo and debugccsipmediacommands. The debugccsipeventscommand now displays only the debugging information specifically related to SIP events. **Usage Guidelines** This command previously traced all events posted to Session Initiation Protocol (SIP) SPI from all interfaces and also provided general SIP SPI information. Beginning with Cisco IOS Release 12.2(15)T, the debugccsipevents command displays only debugging information specifically related to SIP SPI events. Media stream and SIP SPI information is now reported in the debugccsipmedia and debugccsipinfo command output. Note This command is intended for use by Cisco technicians only.

Examples

The following is sample output from the **debugccsipevents** command for a Cisco 3660:

Router# **debug ccsip events** SIP Call events tracing is enabled

Rout	er	ŧ							
Nov	15	18:20:25.779:	Queued	event	from	SIP	SPI	:	SIPSPI EV CC CALL SETUP
Nov	15	18:20:25.779:	Queued	event	from	SIP	SPI	:	SIPSPI EV CREATE CONNECTION
Nov	15	18:20:25.783:	Queued	event	from	SIP	SPI	:	SIPSPI EV SEND MESSAGE
Nov	15	18:20:25.815:	Queued	event	from	SIP	SPI	:	SIPSPI EV CREATE CONNECTION
Nov	15	18:20:25.819:	Queued	event	from	SIP	SPI	:	SIPSPI EV SEND MESSAGE
Nov	15	18:20:28.339:	Queued	event	from	SIP	SPI	:	SIPSPI EV CLOSE CONNECTION
Nov	15	18:20:28.339:	Queued	event	from	SIP	SPI	:	SIPSPI EV SEND MESSAGE
Nov	15	18:20:50.844:	Queued	event	from	SIP	SPI	:	SIPSPI EV CLOSE CONNECTION
Nov	15	18:20:50.844:	Queued	event	from	SIP	SPI	:	SIPSPI_EV_SEND_MESSAGE
Nov	15	18:20:50.848:	Queued	event	from	SIP	SPI	:	SIPSPI_EV_CC_CALL_DISCONNECT

### **Related Commands**

ſ

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip info	Enables tracing of general SIP SPI information.
debug ccsip media	Enables tracing of SIP call media streams.

# debug ccsip feature

	To filter the DEBUG CCS in privileged EXEC mode	IP INFO debugs based on various features, use the <b>debug ccsip feature</b> command. To disable filtering of the INFO debugs, use the <b>no</b> form of this command.
	debug ccsip feature <i>featu</i> no debug ccsip	rre-name1[feature-name2][feature-name3][feature-name]
Syntax Description	feature-name	The feature for which you want to enable debugging messages. You must specify at least one feature name from the available list.
Command Default	All features are selected.	
Command Modes	Privileged EXEC#	
Command History	Release	Modification
	15.3(3)M	This command was introduced.

### **Usage Guidelines**

The table below shows the full list of features for which you can enable debugging messages. You can specify any combination of these features, in any order you choose.

Feature Name	Description
audio	Enables audio debugging.
cac	Enables call admission control (CAC) debugging.
config	Enables configuration debugging.
control	Enables control debugging.
dtmf	Enables Dual Tone Multi-Frequency (DTMF) debugging.
fax	Enables fax debugging.
line	Enables SIP Cisco Call Manager Express line debugging.
misc-features	Enables miscellaneous feature debugging.
miscellaneous	Enables misc (catch all) debugging.

Feature Name	Description
parse	Enables parse debugging.
registration	Enables SIP registration debugging.
sdp-negotiation	Enables Session Description Protocol (SDP) negotiation debugging.
sdp-passthrough	Enables SDP-passthrough debugging.
sip-profiles	Enables SIP-profiles debugging.
sip-transport	Enables SIP transport debugging.
srtp	Enables Secure Real-Time Transport Protocol (SRTP) debugging.
supplementary-services	Enables supplementary services debugging.
transcoder	Enables transcoder debugging.
video	Enables video debugging.

To activate feature debugging you must first enable CCSIP debugging using either the **debug ccsip info** or **debug ccsip all** command.

### **Examples**

I

The following example shows how to enable CCSIP feature debugging for audio, fax, DTMF, CAC and SIP registration:

```
Device# debug ccsip info
SIP Call info tracing is enabled
Device# debug ccsip feature audio cac dtmf fax registration
audio debugging for ccsip info is enabled (active)
fax debugging for ccsip info is enabled (active)
dtmf debugging for ccsip info is enabled (active)
cac debugging for ccsip info is enabled (active)
registration debugging for ccsip info is enabled (active)
```

### debug ccsip info

To enable tracing of general service provider interface (SPI) information, use the **debugccsipinfo**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccsip info

no debug ccsip info

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

nand History	Release	Modification
	12.2(15)T	This command was introduced.

Usage Guidelines Beginning in Cisco IOS Release 12.2(15)T, the debugccsipinfocommand is a separate option that displays general SIP SPI information for debug purposes. In past releases, this output was part of the debugccsipeventscommand.

Note

This command is intended for use by Cisco technicians only.

Examples

Com

The following is sample output from the **debugccsipinfo** command for a Cisco 3660:

#### **Related Commands**

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip events	Enables tracing of events that are specific to SIP SPI.
debug ccsip media	Enables tracing of SIP call media streams.

# debug ccsip level

I

To enable filtering of the DEBUG CCSIP INFO messages based on importance, use the **debug ccsip level** command in privileged EXEC mode. To disable filtering of the INFO debugs, use the **no** form of this command.

debug ccsip level {critical| info| notify| verbose}

Syntax Description	critical		Enables critical level debugging (Severity 1).
	info		Enables information level debugging (Severity 3).
	notify		Enables notification level debugging (Severity 2).
	verbose		Enables verbose level debugging (Severity 4).
Command Default	Verbose-level debugging is	s enabled.	
Command Modes	Privileged EXEC#		
Command History	Release	Modification	
	15.3(3)M	This command was introduce	ed.
Usage Guidelines	This command sets the lev	vel of debugging messages. Only one level of	debug messages can be set.
	When critical-level debugging is selected (Severity 1), messages are generated for specific errors such as resource failures. This information is used by the engineer to troubleshoot the system. When notify-level debugging is selected (Severity 2), messages include information on important milestones that were reached and important processing steps that were met. When information-level debugging is selected, (Severity 3), messages contain all details needed to understand workflow. When verbose-level debugging is selected, (Severity 4), messages contain a high level of detail, which might not be useful when troubleshooting issues		
Examples	The following example sho	ows how to enable debugging messages for c	ritical level events only:
	Device# <b>debug ccsip le</b> critical mode tracing	<b>vel critical</b> for ccsip info is enabled (active)	

## debug ccsip media

To enable tracing of Session Initiation Protocol (SIP) call media streams, use the **debugccsipmedia**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccsip media

no debug ccsip media

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

nand History	Release	Modification
	12.2(15)T	This command was introduced.

Usage Guidelines Beginning in Cisco IOS Release 12.2(15)T, the debugccsipmediacommand is a separate option that displays debugging information specific to SIP media stream processing. In past releases, this output was part of the debugccsipeventscommand.

Note

This command is intended for use by Cisco technicians only.

#### Examples

Com

The following is sample output from the **debugccsipmedia** command for a Cisco 3660:

#### Router# debug ccsip media

#### **Related Commands**

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip events	Enables tracing of events that are specific to SIP SPI.
debug ccsip info	Enables tracing of general SIP SPI events.

Media Dest Addr/Port : 172.18.193.190:19148

# debug ccsip messages

To show all Session Initiation Protocol (SIP) Service Provider Interface (SPI) message tracing, use the **debugccsipmessages** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug ccsip messages

no debug ccsip messages

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.1(1)T	This command was introduced.
	12.1.(3)T	The output of this command was changed.
	12.2(2)XA	Support was added for the Cisco AS5350 and Cisco AS5400 universal gateways.
	12.2(2)XB1	This command was implemented on the Cisco AS5850 universal gateway.
	12.2(8)T	This command was implemented on Cisco 7200 series routers.
	12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T. Support for the Cisco AS5300 universal access server, Cisco AS5350, Cisco AS5400, and Cisco AS5850 universal gateway is not included in this release.
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	IOS Release XE 2.5	This command was integrated into Cisco IOS XE Release 2.5.

#### **Usage Guidelines**

This command traces the Session Initiation Protocol (SIP) messages exchanged between the SIP UA client (UAC) and the access server.

#### Examples

The following example shows debug output from one side of the call:

Router1# debug ccsip messages SIP Call messages tracing is enabled Router1# \*Mar 6 14:19:14: Sent: INVITE sip:3660210@166.34.245.231;user=phone;phone-context=unknown SIP/2.0 Via: SIP/2.0/UDP 166.34.245.230:55820 From: "3660110" <sip:3660110@166.34.245.230> To: <sip:3660210@166.34.245.231;user=phone;phone-context=unknown> Date: Sat, 06 Mar 1993 19:19:14 GMT Call-ID: ABBAE7AF-823100E2-0-1CD274BC@172.18.192.194 Cisco-Guid: 2881152943-2184249568-0-483551624 User-Agent: Cisco VoIP Gateway/ IOS 12.x/ SIP enabled CSeq: 101 INVITE Max-Forwards: 6 Timestamp: 731427554 Contact: <sip:3660110@166.34.245.230:5060;user=phone> Expires: 180 Content-Type: application/sdp Content-Length: 138 v=0o=CiscoSystemsSIP-GW-UserAgent 5596 7982 IN IP4 166.34.245.230 s=SIP Call t=0 0 c=IN IP4 166.34.245.230 m=audio 20762 RTP/AVP 0 \*Mar 6 14:19:14: Received: SIP/2.0 100 Trying Via: SIP/2.0/UDP 166.34.245.230:55820 From: "3660110" <sip:3660110@166.34.245.230> To: <sip:3660210@166.34.245.231;user=phone;phone-context=unknown> Date: Mon, 08 Mar 1993 22:45:12 GMT Call-ID: ABBAE7AF-823100E2-0-1CD274BC@172.18.192.194 Timestamp: 731427554 Server: Cisco VoIP Gateway/ IOS 12.x/ SIP enabled CSeq: 101 INVITE Content-Length: 0 \*Mar 6 14:19:14: Received: SIP/2.0 180 Ringing Via: SIP/2.0/UDP 166.34.245.230:55820 From: "3660110" <sip:3660110@166.34.245.230> To: <sip:3660210@166.34.245.231;user=phone;phone-context=unknown> Date: Mon, 08 Mar 1993 22:45:12 GMT Call-ID: ABBAE7AF-823100E2-0-1CD274BC@172.18.192.194 Timestamp: 731427554 Server: Cisco VoIP Gateway/ IOS 12.x/ SIP enabled CSeq: 101 INVITE Content-Type: application/sdp Content-Length: 138 v=0o=CiscoSystemsSIP-GW-UserAgent 1193 7927 IN IP4 166.34.245.231 s=SIP Call t=0 0 c=IN IP4 166.34.245.231 m=audio 20224 RTP/AVP 0 \*Mar 6 14:19:16: Received: SIP/2.0 200 OK Via: SIP/2.0/UDP 166.34.245.230:55820 From: "3660110" <sip:3660110@166.34.245.230> To: <sip:3660210@166.34.245.231;user=phone;phone-context=unknown>;tag=27DBC6D8-1357 Date: Mon, 08 Mar 1993 22:45:12 GMT Call-ID: ABBAE7AF-823100E2-0-1CD274BC@172.18.192.194 Timestamp: 731427554 Server: Cisco VoIP Gateway/ IOS 12.x/ SIP enabled Contact: <sip:36602100166.34.245.231:5060;user=phone> CSeq: 101 INVITE Content-Type: application/sdp

#### **Related Commands**

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip calls	Shows all SIP SPI call tracing.
debug ccsip error	Shows SIP SPI errors.
debug ccsip events	Shows all SIP SPI events tracing.
debug ccsip states	Shows all SIP SPI state tracing.

Shows all SIP SPI state tracing.

debug ccsip states

# debug ccsip non-call

To enable non-call-context tracing, use the debug ccsip non-call command in privileged EXEC mode. To disable debugging output, use the **no**form of this command or the **undebug ccsip non-call** command. debug ccsip non-call no debug ccsip non-call **Syntax Description** This command has no arguments or keywords. **Command Default** No default behavior or values **Command Modes** Privileged EXEC (#) **Command History** 15.4(2)T This command was introduced. Cisco IOS XE Release 3.12S This command was integrated into Cisco IOS XE Release 3.12S. **Usage Guidelines** Use the debug ccsip non-call command to enable debugging of non-call-context trace messages (OPTIONS, REGISTER, SUBSCRIBE, and NOTIFY). Usually, SIP debugs contain unrelated debugs that are not useful in debugging. This command will give you the control to enable or disable debugs without any call context; if a message is not part of any call, the debugs are not printed. Examples Device# debug ccsip non-call SIP Out-of-Dialog tracing is enabled **Related Commands** Command Description Shows all SIP SPI call tracing. debug ccsip calls debug ccsip error Shows SIP SPI errors. Shows all SIP SPI events tracing. debug ccsip events debug ccsip info Shows all SIP SPI message tracing.

# debug ccsip preauth

To enable diagnostic reporting of authentication, authorization, and accounting (AAA) preauthentication for Session Initiation Protocol (SIP) calls, use the **debugccsippreauth** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccsip preauth

no debug ccsip preauth

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(11)T	This command was introduced.

### **Examples**

The following example shows debug output for a single SIP call:

The table below describes the significant fields shown in the display.

ſ

Field	Description
Request	Request Type0 for preauthentication, 1 for disconnect.
Preauth id	Identifier for the preauthentication request.
EndPt Type	Call Origin End Point Type1 for IP address, 2 for Interzone ClearToken (IZCT) value.
EndPt	Call Origin End Point ValueAn IP address or IZCT value.
Resource Service	Resource Service Type1 for Reservation, 2 for Query.
Call_origin	Answer.
Call_type	Voice over IP (VoIP).
Calling_num	Calling Party Number (CLID).
Called_num	Called Party Number (DNIS).
Protocol	0 for H.323, 1 for SIP.
function reports	Various identifiers and status reports for executed functions.

### Table 51: debug ccsip preauth Field Descriptions

# debug ccsip states

To show all Session Initiation Protocol (SIP) Service Provider Interface (SPI) state tracing, use the **debugccsipstates** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccsip states

no debug ccsip states

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values

**Command Modes** Privileged EXEC (#)

Release	Modification
12.1(1)T	This command was introduced.
12.2(2)XA	Support was added for the Cisco AS5350 and Cisco AS5400 universal gateways.
12.2(2)XB1	This command was implemented on the Cisco AS5850 universal gateway.
12.2(8)T	This command was implemented on Cisco 7200 series routers.
12.2(11)T	This command was integrated into Cisco IOS Release 12.2(11)T. Support for the Cisco AS5300 universal access server, Cisco AS5350, Cisco AS5400, and Cisco AS5850 universal gateway is not included in this release.
12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	Release         12.1(1)T         12.2(2)XA         12.2(2)XB1         12.2(8)T         12.2(11)T         12.2SX

### **Usage Guidelines** This command traces the state machine changes of SIP SPI and displays the state transitions.

Examples

The following example shows all SIP SPI state tracing:

```
Router1# debug ccsip states
SIP Call states tracing is enabled
Router1#
*Jan 2 18:34:37.793:0x6220C634 :State change from (STATE_NONE, SUBSTATE_NONE) to (STATE_IDLE,
SUBSTATE_NONE)
*Jan 2 18:34:37.797:0x6220C634 :State change from (STATE_IDLE, SUBSTATE_NONE) to (STATE_IDLE,
SUBSTATE_CONNECTING)
```

\*Jan 2 18:34:37.797:0x6220C634 :State change from (STATE\_IDLE, SUBSTATE\_CONNECTING) to (STATE\_IDLE, SUBSTATE\_CONNECTING) \*Jan 2 18:34:37.801:0x6220C634 :State change from (STATE\_IDLE, SUBSTATE\_CONNECTING) to (STATE\_SENT\_INVITE, SUBSTATE\_NONE) \*Jan 2 18:34:37.809:0x6220C634 :State change from (STATE\_SENT\_INVITE, SUBSTATE\_NONE) to (STATE\_RECD\_PROCEEDING, SUBSTATE\_PROCEEDING PROCEEDING) \*Jan 2 18:34:37.853:0x6220C634 :State change from (STATE\_RECD\_PROCEEDING, SUBSTATE\_PROCEEDING\_PROCEEDING) to (STATE\_RECD\_PROCEEDING, SUBSTATE\_PROCEEDING\_ALERTING) \*Jan 2 18:34:38.261:0x6220C634 :State change from (STATE\_RECD\_PROCEEDING, SUBSTATE\_PROCEEDING\_ALERTING) to (STATE\_ACTIVE, SUBSTATE\_NONE) \*Jan 2 18:35:09.860:0x6220C634 :State change from (STATE\_ACTIVE, SUBSTATE\_NONE) to (STATE\_DISCONNECTING, SUBSTATE\_NONE) \*Jan 2 18:35:09.868:0x6220C634 :State change from (STATE\_DISCONNECTING, SUBSTATE\_NONE) to (STATE\_DISCONNECTING, SUBSTATE\_NONE)

\*Jan 2<sup>-</sup>18:28:38.404: Queued event from SIP SPI :SIPSPI\_EV\_CLOSE\_CONNECTION

#### **Related Commands**

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip calls	Shows all SIP SPI call tracing.
debug ccsip error	Shows SIP SPI errors.
debug ccsip events	Shows all SIP SPI events tracing.
debug ccsip info	Shows all SIP SPI message tracing.

# debug ccsip transport

To enable tracing of the Session Initiation Protocol (SIP) transport handler and the TCP or User Datagram Protocol (UDP) process, use the **debugccsiptransport**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccsip transport

no debug ccsip transport

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.3(8)T	This command was introduced.
	12.2 SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

# **Use the debugccsiptransport** command to debug issues related to connection and transport usage and to see the flow of the messages being sent or received.

#### **Examples**

The following is sample output from the **debugccsiptransport** command for a Cisco 3660:

1w1d: //18/8E16980D800A/SIP/Transport/sipSPISendInvite: Sending Invite to the transport laver lwld: //18/8E16980D800A/SIP/Transport/sipSPIGetSwitchTransportFlag: Return the Global configuration, Switch Transport is TRUE 1wld: //18/8E16980D800A/SIP/Transport/sipSPITransportSendMessage: msg=0x64082D50, addr=172.18.194.183, port=5060, sentBy\_port=0, is\_req=1, transport=1, switch=1, callBack=0x614FAB58 1wld: //18/8E16980D800A/SIP/Transport/sipSPITransportSendMessage: Proceedable for sending msg immediately lwld: //18/8E16980D800A/SIP/Transport/sipTransportLogicSendMsg: switch transport is 1 lwld: //-1/xxxxxxxxx/SIP/Transport/sipTransportGetInterfaceMtuSize: MTU size for remote address 172.18.194.183 is 500 lwld: //-1/xxxxxxxxx/SIP/Transport/sipTransportVerifyMsgForMTUThreshold: Interface MTU Size 500, Msg Size 1096 1wld: //18/8E16980D800A/SIP/Transport/sipTransportLogicSendMsg: Switching msg=0x64082D50 transport UDP->TCP lwld: //-1/xxxxxxxx/SIP/Transport/sipTransportSetAgeingTimer: Aging timer initiated for holder=0x64084058,addr=172.18.194.183 1wld: //-1/xxxxxxxx/SIP/Transport/sipCreateConnHolder: Created new holder=0x64084058, addr=172.18.194.183

Iwld: //-1/xxxxxxxxxx/SIP/Transport/sipTransportPostSendMessage: Posting send for
msg=0x64082D50, addr=172.18.194.183, port=5060, connId=1 for TCP
```

The table below describes the significant fields shown in the display.

Field	Description
Sending Invite to the transport layer	Indicates that the SIP signaling state machine has invoked transport layer operations such as transport arbitration logic and the connection management interface.
switch transport is 1	Indicates that the gateway has been provisioned to enable the transport switching functionality based on the message size. 1 is true and 0 is false.
MTU size for remote address	Indicates that the bound outgoing Ethernet interface that sends the message to the given remote address is configured for an MTU size of the indicated value.
Interface MTU Size 500, Msg Size 1096	Indicates that the size of the message is larger than the size of the MTU; thus transport switching (from UDP to TCP) should be enabled.
Switching msg= transport UDP->TCP	Indicates that transport switching from UDP to TCP is occurring for the handled message because of the large size of the message.
Aging timer initiated for holder	Indicates that the connection algorithm is started; that is, the counter begins to age out the TCP or UDP connection if inactivity occurs.
Posting TCP conn create request	Indicates a request for a TCP connection from a lower TCP process.

Table 52: debug ccsip transport Field Descriptions

I

1

Field	Description
sipSPITransportSendMessage:msg=0x64082D50, addr=transport=1, switch=1, callBack=0x614FAB58	<ul> <li>Indicates all the transport related attributes that the SIP signaling state machine originally gives to the transport layer to send out the message. The attributes are:</li> <li>transport: 1 for UDP; 2 for TCP.</li> <li>switch (switching transport enabled or disabled for large messages): 1 for enabled; 0 for disabled.</li> </ul>
Posting send for msg=0x64082D50, addr=for TCP	Indicates that all transport and connection related operations are complete. The message is sent out on the network targeted to the given address, port, and transport.

#### **Related Commands**

Command	Description
debug ccsip all	Enables all SIP-related debugging.
debug ccsip info	Enables tracing of general SIP SPI information.
transport switch	Enables switching between UDP and TCP transport mechanisms globally for large SIP messages.
voice-class sip transport switch	Enables switching between UDP and TCP transport mechanisms for large SIP messages for a specific dial peer.

# debug ccswvoice vo-debug

To display detailed debugging information related to ccswvoice function calls during call setup and teardown, use the **debugccswvoicevo-debug** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccswvoice vo-debug

no debug ccswvoice vo-debug

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

Command HistoryReleaseModification11.3(1)MAThis command was introduced on the Cisco MC3810 networking device.12.0(7)XKThis command was implemented on the Cisco 3600 series router.12.1(2)TThis command was integrated into Cisco IOS Release 12.1(2)T.

**Usage Guidelines** Use this command when attempting to troubleshoot a Vo call that uses the "cisco-switched" session protocol. This command provides the same information as the **debugccswvoicevo-session** command, but includes additional debugging information relating to the calls.

**Examples** The following shows sample output from the **debugccswvoicevo-debug** command:

Router# debug ccswvoice vo-debug
2w2d: ccswvoice: callID 529927 pvcid -1 cid -1 state NULL event O/G SETUP

2w2d: ccswvoice: callID 529927 pvcid 1 cid 15 state RELEASE event I/C RELCOMP
2w2d: ccswvo store call history entry: cause=10 cause text=normal call clearing.

Related Commands	Command	Description
	debug ccswvoice vo-session	Displays the first 10 bytes (including header) of selected VoFR subframes for the interface .

debug ccswvoice vo-debug

٦

# debug ccswvoice vofr-debug

To display the ccswvoice function calls during call setup and teardown, use the **debugccswvoicevofr-debug** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ccswvoice vofr-debug

no debug ccswvoice vofr-debug

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

12.1(2)T

 Release
 Modification

 12.0(3)XG
 This command was introduced on the Cisco 2600 and Cisco 3600 series routers.

 12.0(4)T
 This command was integrated into Cisco IOS Release 12.0(4)T.

 12.0(7)XK
 This command was implemented on the Cisco MC3810 networking device.

**Usage Guidelines** Use this command when troubleshooting a VoFR call that uses the "cisco-switched" session protocol. This command provides the same information as the **debugccswvoicevofr-session** command, but includes additional debugging information relating to the calls.

**Examples** 

The following shows sample output from the **debugccswvoicevofr-debug** command:

Router# debug ccswvoice vofr-debug CALL TEARDOWN: 3640 vofr(config-voiceport)# \*Mar 1 03:02:08.719:ccswvofr bridge drop:dropping bridge calls src 17 dst 16 dlci 100 cid 9 state ACTIVE \*Mar 1 03:02:08.727:ccswvofr:callID 17 dlci 100 cid 9 state ACTIVE event O/G REL \*Mar 1 03:02:08.735:ccswvofr:callID 17 dlci 100 cid 9 state RELEASE event I/C RELCOMP 1 03:02:08.735:ccswvofr store call history entry:cause=22 tcause=22 \*Mar cause text=no circuit. 3640\_vofr(config-voiceport)# CALL\_SETUP (outgoing): \*Mar 1 03:03:22.651:ccswvofr:callID 23 dlci -1 cid -1 state NULL event O/G SETUP 1 03:03:22.651:ccswvofr out callinit setup:callID 23 using dlci 100 cid 10 \*Mar \*Mar 1 03:03:22.659:ccswvofr:calIID 23 dlci 100 cid 10 state O/G INIT event I/C PROC \*Mar 1 03:03:22.667:ccswvofr:callID 23 dlci 100 cid 10 state O/G PROC event I/C CONN ccfrf11\_caps\_ind:codec(preferred) = 0

This command was integrated into Cisco IOS Release 12.1(2)T.

#### **Related Commands**

anas	Command	Description
	debug ccswvoice vo-debug	Displays detailed debugging information related to ccswvoice function calls during call setup and teardown.

### debug cdapi

To display information about the Call Distributor Application Programming Interface (CDAPI), use the **debugcdapi**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdapi {detail| events}

no debug cdapi {detail| events}

#### **Syntax Description**

detail	Displays when applications register or become unregistered with CDAPI, when calls are added or deleted from the CDAPI routing table, and when CDAPI messages are created and freed.
events	Displays the events passing between CDAPI and an application or signalling stack.

#### **Command Default** Debugging output is disabled.

#### Command Modes Privileged EXEC

Command HistoryReleaseModification12.0(6)TThis command was introduced.12.1(5)XM2This command was implemented on the Cisco AS5350 and Cisco AS5400.12.3(2)TThis command was integrated into Cisco IOS Release 12.3(2)T. This<br/>command was enhanced to show V.110 call types.12.3(4)TThis command was integrated into Cisco IOS Release 12.2(33)SRA12.2(33)SRAThis command was integrated into Cisco IOS Release 12.2(33)SRA.

#### **Usage Guidelines**

The **detail** keyword is useful for determining if messages are being lost (or not freed). It is also useful for determining the size of the raw messages passed between CDAPI and other applications to ensure that the correct number of bytes is being passed.

The **events** keyword is useful for determining if certain ISDN messages are not being received by an application and if calls are not being directed to an application.

The following bandwidths are supported:

- 56 kbps
- 64 kbps

#### **Examples**

The following Media Gateway Control Protocol (MGCP) packet received example shows V.110 call debugging output for the **debugcdapidetail** command. In this example, the modem is not yet in STEADY STATE.

The table below describes the significant fields shown in the displays.

Table 53: debug cdapi Field Descriptions

Field	Description
L:b:64, nas/bt	The bearer type parameter includes v.110 and v.120 for V.110 and V.120 calls.
Call Type	Call types are V.110, V.120, and modem.

#### **Related Commands**

Command	Description
debug mgcp packet	Displays the MGCP signaling message received and sent to the called agent.
debug voip rawmsg	Displays the raw message owner, length, and pointer.

### debug cdma pdsn a10 ahdlc

To display debug messages for Asynchronous High-Level Data Link Control (AHDLC), use the **debugcdmapdsna10ahdlc**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn a10 ahdlc [errors] events]

no debug cdma pdsn a10 ahdlc [errors| events]

Syntax Description	errors	(Optional) Displays details of AHDLC packets in error.
	events	(Optional) Displays AHDLC events.

**Command Default** If the command is entered without any optional keywords, all of the types of debug information are enabled.

#### **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(2)XC	This command was introduced.
	12.2(8)BY	Keywords were made optional.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

#### **Examples**

The following is sample output from the **debugcdmapdsna10ahdlc**command:

Router# debug cdma pdsn a10 ahdlc errors

ahdlc error packet display debugging is on Router# debug cdma pdsn al0 ahdlc events ahdlc events display debugging is on Router# \*Jan 1 00:18:30:%LINK-3-UPDOWN:Interface Virtual-Access1, changed state to up \*Jan 1 00:18:30:\*\*\*\*\*OPEN AHDLC\*\*\*\*\* \*Jan 1 00:18:30: ahdlc\_mgr\_channel\_create \*Jan 1 00:18:30: ahdlc\_mgr\_allocate\_available\_channel: \*Jan 1 00:18:30:ahdlc:tell h/w open\_channel 9 from engine 0

### debug cdma pdsn a10 gre

To display debug messages for A10 Generic Routing Encapsulation (GRE) interface errors, events, and packets, use the **debugcdmapdsna10gre**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn a10 gre [errors| events| packets] [tunnel-key key]

no debug cdma pdsn a10 gre [errors| events| packets]

Syntax Description	errors	(Optional) Displays A10 GRE errors.	
	events	(Optional) Displays A10 GRE events.	
	packets	(Optional) Displays transmitted or received A10 GRE packets.	
	tunnel-key key	(Optional) Specifies the GRE key.	
Command Default	If the command is entered	ed without any optional keywords, all of the types of debug information are enabled.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(3)XS	This command was introduced.	
	12.2(8)BY	The <b>tunnel-key</b> keyword was added and the existing keywords were made optional.	
	12.3(4)TThis command was integrated into Cisco IOS Release 12.3(4)T.		

#### **Examples**

The following is sample output from the debugcdmapdsna10greeventstunnel-keycommand:

Router# debug cdma pdsn al0 gre events tunnel-key 1

Router# **show debug** CDMA: CDMA PDSN A10 GRE events debugging is on for tunnel key 1 PDSN# \*Mar 1 04:00:57.847:CDMA-GRE:CDMA-Ix1 (GRE/CDMA) created with src 5.0.0.2 dst 0.0.0.0 \*Mar 1 04:00:57.847:CDMA-GRE:(in) found session 5.0.0.2-4.0.0.1-1 \*Mar 1 04:00:59.863:CDMA-GRE:(in) found session 5.0.0.2-4.0.0.1-1 \*Mar 1 04:01:59.863:CDMA-GRE:(in) found session 5.0.0.2-4.0.0.1-1 \*Mar 1 04:01:01.879:CDMA-GRE:(in) found session 5.0.0.2-4.0.0.1-1

1

### debug cdma pdsn a10 ppp

To display debug messages for A10 Point-to-Point protocol (PPP) interface errors, events, and packets, use the **debugcdmapdsna10ppp**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn a10 ppp [errors| events| packets]

no debug cdma pdsn a10 ppp [errors| events| packets]

Syntax Description	errors	(Optional) Displays A10 PPP errors.
	events	(Optional) Displays A10 PPP events.
	packets	(Optional) Displays transmitted or received A10 PPP packets.

**Command Default** If the command is entered without any optional keywords, all of the types of debug information are enabled.

### Command Modes Privileged EXEC

<b>Command History</b>	Release	Modification
	12.1(3)XS	This command was introduced.
	12.2(8)BY	Keywords were made optional.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

#### **Examples**

The following is sample output from the **debugcdmapdsna10ppp**command:

Router# debug cdma pdsn a10 ppp errors CDMA PDSN A10 errors debugging is on Router# debug cdma pdsn a10 ppp events CDMA PDSN A10 events debugging is on

Router# debug cdma pdsn a10 ppp packets

CDMA PDSN A10 packet debugging is on Router# **show debug**

### debug cdma pdsn a11

To display debug messages for A11 interface errors, events, and packets, use the **debugcdmapdsna11** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn a11 [errors| events| packets] [mnid]

no debug cdma pdsn a11 [errors| events| packets]

#### **Syntax Description**

errors	(Optional) Displays A11 protocol errors.
events	(Optional) Displays A11 events.
packets	(Optional) Displays transmitted or received packets.
mnid	(Optional) Specifies the ID of the mobile station.

**Command Default** If the command is entered without any optional keywords, all of the types of debug information are enabled.

#### **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XS	This command was introduced.
	12.2(8)BY	The <i>mnid</i> argument was added and the existing keywords were made optional.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

#### **Examples**

The following is sample output from the **debugcdmapdsna11** commands:

Router# debug cdma pdsn all errors CDMA PDSN All errors debugging is on Router# show debug ld2lh:CDMA-RP:(in) rp\_msgs, code=1, status=0 ld2lh:CDMA-RP:(enqueue req) type=1 homeagent=5.0.0.2 coaddr=4.0.0.1 ld2lh: id=0xBEF750F0-0xBA53E0F lifetime=65535 ld2lh:CDMA-RP:len=8, 00-00-00-00-00-00-F1 convert to 0000000000001 (14 digits), type=IMSI ld2lh:CDMA-RP:(req) process\_rp\_req, homeagent=5.0.0.2 coaddr=4.0.0.1 ld2lh: lifetime=65535 id=BEF750F0-BA53E0F imsi=000000000001 ld2lh:CDMA-RP:(req) rp\_req\_create, 5.0.0.2-4.0.0.1-1 imsi=0000000000001 ld2lh:CDMA-RP:(out) rp\_reply session=5.0.0.2 coa=4.0.0.1 key=1

## debug cdma pdsn accounting

To display debug messages for accounting events, use the **debugcdmapdsnaccounting** command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug cdma pdsn accounting

no cdma pdsn accounting

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XS	This command was introduced.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

#### **Examples**

The following is sample output from the **debugcdmapdsnaccounting** command:

Router# debug cdma pdsn accounting

CDMA PDSN accounting debugging is on
Router#

## debug cdma pdsn accounting flow

To display debug messages for accounting flow, use the **debugcdmapdsnaccountingflow**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn accounting flow

no debug cdma pdsn accounting flow

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	12.2(2)XC	This command was introduced.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

**Examples** 

The following is sample output from the **debugcdmapdsnaccountingflow**command:

Router# debug cdma pdsn accounting flow

CDMA PDSN flow based accounting debugging is on pdsn-6500# 01:59:40:CDMA-SM:cdma\_pdsn\_flow\_acct\_upstream sess id 1 flow type 0 bytes 100 addr 20.20.20.1 01:59:40:CDMA-SM:cdma\_pdsn\_flow\_acct\_downstream sess id 1 flow type 0 bytes 100 addr 20.20.20.1

# debug cdma pdsn accounting time-of-day

To display the timer value, use the **debugcdmapdsnaccounting** time-of-day command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn accounting time-of-day

no debug cdma pdsn accounting time-of-day

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XS	This command was introduced.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

#### **Examples**

The following is sample output from the **debugcdmapdsnaccountingtime-of-day**command:

Router# debug cdma pdsn accounting time-of-day

CDMA PDSN accounting time-of-day debugging is on Feb 15 19:13:23.634:CDMA-TOD:Current timer expiring in 22 seconds Feb 15 19:13:24.194:%SYS-5-CONFIG\_I:Configured from console by console Router# Feb 15 19:13:45.635:CDMA-TOD:Timer expired...Rearming timer Feb 15 19:13:45.635:CDMA-TOD:Gathering session info Feb 15 19:13:45.635:CDMA-TOD:Found 0 sessions

### debug cdma pdsn cluster

To display the error messages, event messages, and packets received, use the debugcdmapdsncluster command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn cluster message [error| events| packets] redundancy [error| events| packets]

no debug cdma pdsn cluster message [error| events| packets] redundancy [error| events| packets]

#### **Syntax Description**

message	Displays cluster messages for errors, events and packets received.
redundancy	Displays redundancy information for errors, events, and sent or received packets.
error	Displays either cluster or redundancy error messages.
events	Displays either all cluster or all redundancy events.
packets	Displays all transmitted or received cluster or redundancy packets.

#### **Command Default** No default behavior or values

**Command Modes** Privileged EXEC

**Command History** Release **Modification** 12.1(3)XS This command was introduced. 12.3(4)T This command was integrated into Cisco IOS Release 12.3(4)T.

**Usage Guidelines** This debug is only allowed on PDSN c6-mz images, and helps to monitor prepaid information.

**Examples** The following is sample output from the debugcdmapdsnclustercommand:

> Router# debug cdma pdsn cluster ? message Debug PDSN cluster controller messages redundancy Debug PDSN cluster controller redundancy

# debug cdma pdsn ipv6

To display IPV6 error or event messages, use the debug cdma pdsn IPV6 command in privileged EXEC mode. To disable debug messages, use the no form of this command.

debug cdma pdsn ipv6

no debug cdma pdsn ipv6

**Syntax Description** There are no arguments or keywords for this command.

**Command Default** No default behavior or values.

Command History	Release	Modification
	12.3(14)YX	This command was introduced.
	12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.

**Usage Guidelines** The following example illustrates the **debugcdmapdsnipv6**command:

Router# debug cdma pdsn ipv6

## debug cdma pdsn prepaid

To display debug messages about prepaid flow, use the **debugcdmapdsnprepaid** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn prepaid no debug cdma pdsn prepaid

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	12.2(8)BY	This command was introduced.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

**Usage Guidelines** This debug is *only* allowed on PDSN c6-mz images, and helps to monitor prepaid information.

**Examples** 

The following is sample output from the **debugcdmapdsnprepaid**command:

Router	rr# debug cdma pdsn prepaid			
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Initialized the authorization request
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added username into A-V list
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added CLID into A-V list
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added session id for prepaid
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added correlation id into A-V list
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added auth reason for prepaid into A-V list
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added USER ID for prepaid
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Added service id for prepaid
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Built prepaid VSAs
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Sent the request to AAA
*Mar	1	00:09:38.391:	CDMA-PREPAID:	Auth_reason: CRB_RSP_PEND_INITIAL_QUOTA
*Mar	1	00:09:38.395:	CDMA-PREPAID:	Received prepaid response: status 2
*Mar	1	00:09:38.395:	CDMA-PREPAID:	AAA authorised parms being processed
*Mar	1	00:09:38.395:	CDMA-PREPAID:	Attr in Grp Prof: crb-entity-type
*Mar	1	00:09:38.395:	(0x4B000000) CD	MA/PREPAID: AAA_AT_CRB_ENTITY_TYPE

*Mar	1	00:09:38.395:	CDMA-PREPAID:	Retrieved attributes successfully
*Mar	1	00:09:38.395:	CDMA-PREPAID:	Reset duration to 120, mn 9.3.0.1
*Mar	1	00:09:38.395:	CDMA-PREPAID: :	Started duration timer for 120 sec

# debug cdma pdsn qos

To display debug messages about quality of service features, use the **debugcdmapdsnqos** command in privileged EXEC mode. To disable debug messages, use the **no** form of this command.

debug cdma pdsn qos

no debug cdma pdsn qos

**Syntax Description** There are no arguments or keywords for this command.

**Command Default** There are no default values for this command.

Command History	Release	Modification
	12.3(8)XW	This command was introduced.
	12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.

**Examples** There are currently no sample outputs for this command.

## debug cdma pdsn resource-manager

To display debug messages that help you monitor the resource-manager information, use the **debugcdmapdsnresource-manager** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn resource-manager [error| events]

no debug cdma pdsn resource-manager [error| events]

Syntax Description	errors	Displays Packet Data Service node (PDSN) resource manager errors.
	events	Displays PDSN resource manager events.
<b>Command Default</b>	No default behavior or values	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(8)BY	This command was introduced.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.
Examples	The following is sample output fi	rom the debugcdmapdsresource-managercommand:

Router# debug cdma pdsn resource-manager

errors CDMA PDSN resource manager errors events CDMA PDSN resource manager events

### debug cdma pdsn selection

To display debug messages for the intelligent Packet Data Serving Node (PDSN) selection feature, use the **debugcdmapdsnselection**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn selection {errors| events| packets}

no debug cdma pdsn selection {errors| events| packets}

#### **Syntax Description**

errors	Displays PDSN selection errors.
events	Displays PDSN selection events.
packets	Displays transmitted or received packets.

**Command Default** No default behavior or values

#### Command Modes Privileged EXEC

 Command History
 Release
 Modification

 12.1(3)XS
 This command was introduced.

 12.3(4)T
 This command was integrated into Cisco IOS Release 12.3(4)T.

#### **Examples**

The following is sample output from the **debugcdmapdsnselection**command with the keyword **events** specified:

#### Router# debug cdma pdsn selection events

CDMA PDSN selection events debugging is on Router# 00:27:46: CDMA-PSL: Message(IN) pdsn 51.4.2.40 interface 70.4.2.40 00:27:46: Keepalive 10 00:27:46: Count 0 00:27:46: Capacity 16000 00:27:46: Weight 0 00:27:46: Hostname 11 7206-PDSN-2 00:27:46: CDMA-PSL: Reset keepalive, pdsn 51.4.2.40 current 10 new 10 00:27:46: CDMA-PSL: Message processed, pdsn 51.4.2.40 tsize 0 pendings 0 00:27:47: CDMA-PSL: Send KEEPALIVE, len 32 00:27:47: CDMA-PSL: Message(OUT) dest 224.0.0.11 00:27:47: Keepalive 10 00:27:47: Count 1 00:27:47: Capacity 16000 00:27:47: Weight 0

# debug cdma pdsn service-selection

To display debug messages for service selection, use the **debugcdmapdsnservice-selection**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command. **debug cdma pdsn service-selection no debug cdma pdsn service-selection** 

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XS	This command was introduced.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

**Examples** 

The following is sample output from the **debugcdmapdsnservice-selection** command:

Router# debug cdma pdsn service-selection CDMA PDSN service provisioning debugging is on Router# 1d02h:%LINK-3-UPDOWN:Interface Virtual-Access3, changed state to up 1d02h:Vi3 CDMA-SP:user\_class=1, ms\_ipaddr\_req=1, apply\_acl=0 1d02h:Vi3 CDMA-SP:Adding simple ip flow, user=bsip, mn=6.0.0.2, 1d02h:%LINEPROTO-5-UPDOWN:Line protocol on Interface Virtual-Access3, changed state to up

### debug cdma pdsn session

To display debug messages for Session Manager errors, events, and packets, use the **debugcdmapdsnsession**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdma pdsn session [errors| events]

no debug cdma pdsn session [errors| events]

Syntax Description	errors	(Optional) Displays session protocol errors.
	events	(Optional) Displays session events.

**Command Default** If the command is entered without any optional keywords, all of the types of debug information are enabled.

#### **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XS	This command was introduced.
	12.2(8)BY	Keywords were made optional.
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.

#### Examples

The following is sample output from the **debugcdmapdsnsession**command:

```
Router# debug cdma pdsn session events
CDMA PDSN session events debugging is on
Router# debug cdma pdsn session errors
CDMA PDSN session errors debugging is on
Router# show debug
CDMA:
        CDMA PDSN session events debugging is on
        CDMA PDSN session errors debugging is on
Router#
*Jan 1 00:22:27:CDMA-SM:create_session 5.5.5.5-4.4.4.5-2
*Jan 1 00:22:27:CDMA-SM:create_tunnel 5.5.5.5-4.4.4.5
*Jan 1 00:22:27:%LINK-3-UPDOWN:Interface Virtual-Access1, changed state to up
*Jan 1 00:22:30:%LINEPROTO-5-UPDOWN:Line protocol on Interface Virtual-Access1, changed
state to up
```

### debug cdp

To enable debugging of the Cisco Discovery Protocol (CDP), use the **debugcdp**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cdp {packets| adjacency| events}

no debug cdp {packets| adjacency| events}

#### **Syntax Description**

packets	Enables packet-related debugging output.
adjacency	Enables adjacency-related debugging output.
events	Enables output related to error messages, such as detecting a bad checksum.

#### **Command Modes** Privileged EXEC (#)

<b>Command History</b>	Release	Modification
	12.4(2)T	This command was introduced in a release earlier than Cisco IOS Release 12.4(2)T.
	12.2(55)SE	This command was modified. The debug output was enhanced to display location Type-Length-Values (TLVs), location-server TLVs, and application TLV-related debugs.
Usage Guidelines	Use <b>debugcdp</b> comm and various CDP eve	nands to display information about CDP packet activity, activity between CDP neighbors, ents.

Examples

The following is sample output from the **debugcdppackets**, **debugcdpadjacency**, and **debugcdpevents** commands:

Router# debug cdp packets CDP packet info debugging is on Router# debug cdp adjacency CDP neighbor info debugging is on Router# debug cdp events CDP events debugging is on CDP-PA: Packet sent out on Ethernet0 CDP-PA: Packet received from gray.cisco.com on interface Ethernet0 CDP-AD: Deleted table entry for violet.cisco.com, interface Ethernet0 CDP-AD: Interface Ethernet2 coming up CDP-EV: Encapsulation on interface Serial2 failed

I

٦

#### **Related Commands**

Command	Description
cdp tlv	Configures location support in CDP.
show cdp tlv	Displays information about CDP TLVs.
# debug cdp ip

I

	To enable debug output for the IP routing information that is carried and processed by the Cisco Discovery Protocol (CDP), use the <b>debugcdpip</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command.
	debug cdp ip no debug cdp ip
Syntax Description	This command has no arguments or keywords.
Command Modes	Privileged EXEC
Usage Guidelines	CDP is a media- and protocol-independent device-discovery protocol that runs on all Cisco routers. You can use the <b>debugcdpip</b> command to determine the IP network prefixes CDP is advertising and whether
	Use the <b>debugcdpip</b> command with the <b>debugiprouting</b> command to debug problems that occur when on-demand routing (ODR) routes are not installed in the routing table at a hub router. You can also use the <b>debugcdpip</b> command with the <b>debugcdppacket</b> and <b>debugcdpadjacency</b> commands along with encapsulation-specific debug commands to debug problems that occur in the receipt of CDP IP information.
Examples	The following is sample output from the <b>debugcdpip</b> command. This example shows the transmission of IP-specific information in a CDP update. In this case, three network prefixes are being sent, each with a different network mask.
	CDP-IP: Writing prefix 172.1.69.232.112/28 CDP-IP: Writing prefix 172.19.89.0/24 CDP-IP: Writing prefix 11.0.0.0/8 In addition to these messages, you might see the following messages:
	• This message indicates that CDP is attempting to install the prefix 172.16.1.0/24 into the IP routing table:
	CDP-IP: Updating prefix 172.16.1.0/24 in routing table
	• This message indicates a protocol error occurred during an attempt to decode an incoming CDP packet:
	<ul> <li>CDP-IP: IP TLV length (3) invalid</li> <li>This message indicates the receipt of the IP prefix 172.16.1.0/24 from a CDP neighbor connected via Ethernet interface 0/0. The neighbor IP address is 10.0.01.</li> </ul>

CDP-IP: Reading prefix 172.16.1.0/24 source 10.0.0.1 via Ethernet0/0

٦

Command	Description
debug ip routing	Displays information on RIP routing table updates and route cache updates.

## debug cef

To enable the display of information about Cisco Express Forwarding events, use the **debugcef**command in privileged EXEC mode. To disable the display of Cisco Express Forwarding events, use the **no** form of this command.

debug cef {all| assert| background| broker| consistency-check| elog| epoch| fib [attached export| subblock]| hardware {notification| queries}| hash| high-availability| interest| interface| iprm| issu| loadinfo| memory| non-ip| path [extension| list| scope]| subtree context| switching background| table| xdr}

no debug cef {all| assert| background| broker| consistency-check| elog| epoch| fib [attached export| subblock]| hardware {notification| queries}| hash| high-availability| interest| interface| iprm| issu| loadinfo| memory| non-ip| path [extension| list| scope]| subtree context| switching background| table| xdr}

all	Displays debug messages for all Cisco Express Forwarding events.
assert	Displays debug messages for Cisco Express Forwarding assert events.
background	Displays debug messages for Cisco Express Forwarding background events.
broker	Displays debug messages for Cisco Express Forwarding broker events.
consistency-check	Displays debug messages for Cisco Express Forwarding consistency checker events.
elog	Displays debug messages for Cisco Express Forwarding elog events.
epoch	Displays debug messages for Cisco Express Forwarding epoch events.
fib [attachedexport   subblock]	Displays debug messages for Cisco Express Forwarding Forwarding Information Base entry events.
hardware {notification   queries}	Displays debug messages for Cisco Express Forwarding hardware API notifications or hardware API queries.
hash	Displays debug messages for Cisco Express Forwarding load-balancing hash algorithms.

#### **Syntax Description**

I

1

high-availability	Displays debug messages for Cisco Express Forwarding high availability events.
interest	Displays debug messages for Cisco Express Forwarding interest list events.
interface	Displays debug messages for Cisco Express Forwarding interface events.
iprm	Displays debug messages for Cisco Express Forwarding IP rewrite manager events. (This keyword is not available in Cisco IOS Release 12.2(33)SRA.)
issu	Displays debug messages for Cisco Express Forwarding In Service Software Upgrade (ISSU) events.
loadinfo	Displays debug messages for Cisco Express Forwarding loadinfo events.
memory	Displays debug messages for Cisco Express Forwarding memory events.
non-ip	Displays debug messages for Cisco Express Forwarding non-IP entry events.
path [extension   list   scope]	Displays debug messages for Cisco Express Forwarding path events.
subtree context	Displays debug messages for Cisco Express Forwarding subtree context events.
switching background	Displays debug messages for Cisco Express Forwarding switching background events.
table	Displays debug messages for Cisco Express Forwarding table events.
xdr	Displays debug messages for Cisco Express Forwarding External Data Representation (XDR) events.

**Command Default** Debugging information about Cisco Express Forwarding events is not displayed.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(25)S	This command was introduced.
		The <b>debugceffibattachedexport</b> command rerplaces the <b>debugipcefadjfib</b> command.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB and implemented on the Cisco 10000 series routers.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

# **Usage Guidelines** Because debugging output is assigned high priority in the CPU process, you should use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, you should use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

#### **Examples**

The following is sample output from the debugcefall command:

Router# <b>debug cef all</b>

Command	Description
cef table consistency-check	Enables Cisco Express Forwarding consistency checker table values by type and parameter.
clear cef table	Clears the Cisco Express Forwarding tables.
clear ip cef inconsistency	Clears Cisco Express Forwarding inconsistency statistics and records found by the Cisco Express Forwarding consistency checkers.
debug ip cef table	Enables the collection of events that affect entries in the Cisco Express Forwarding tables.
show cef table consistency-check	Displays Cisco Express Forwarding consistency checker table values.
show ip cef inconsistency	Displays Cisco Express Forwarding IP prefix inconsistencies.

# debug cell-hwic driver

To debug the Cisco IOS driver for the cellular interface, use the **debugcell-hwicdriver**command in EXEC mode.

debug cell-hwic *slotwic\_slotport* driver {crcdump| errdump| errors}

**Syntax Description** 

slot/wic_slot/port	Numeric values that indicate the router slot, WAN interface card (WIC) slot, and port.
crcdump	CRC error details.
errdump	Other error details.
errors	Errors debugging.

Command Default None

Command Modes EXEC (#)

Command History	Release	Modification
	12.4(11)XV	This command was introduced.
	12.4(15)T	This command was integrated into Cisco IOS Release 12.4(15)T.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

**Usage Guidelines** Use this command for debugging purposes only.

#### **Related Commands**

Command	Description
debug cellular messages async	Debugs cellular async.
debug cellular messages data	Prints Cisco IOS data path debug messages.
debug cellular firmware	Displays Cisco IOS firmware information.

Command	Description
debug cellular messages management	Prints management path messages, such as CnS.
debug cellular messages dm	Prints diagnostics monitor (DM) messages from the Qualcomm CDMA chipset.
debug cell-hwic virt-con	Redirects the Nios II console driver messages to display them in the Cisco IOS router console environment.

# debug cell-hwic firmware

To see the Cisco IOS firmware information, use the debugcell-hwicfirmwarecommand in EXEC mode.

debug cellular slotwic\_slotport firmware

Syntax Description	slot/wic_slot/port	Numeric values that indicate the router slot, WAN interface card (WIC) slot, and port.

Command Default None

# debug cellular messages sms

I

To debug SMS data path errors received on the modem, use the **debug cellular messages sms** command in privileged EXEC mode.

debug cellular unit messages sms

Syntax Description	<i>unit</i> EHWIC Router slot a fixed platform, the	C Router slot, WIC slot, and port separated by slashes (for example, $0/1/0$ . For platform, the number is 0.	
Command Default	Privileged EXEC (#)		
Command Modes			
Command History	Release	Modification	
	Cisco IOS Release 15.3(3)M	This command was introduced.	
lleano Guidolinos	Use this command to collect dobug SMS	massage information for avaluation	
osage dulueilles	Use this command to conect debug SMS	message mormation for evaluation.	
Examples	The following example shows the debugg	ging of SMS messaging data on the modem:	
	Device# debug cellular 0/0/0 messages	sms	

## debug cell-hwic virt-con

To redirect the Nios II console driver messages to display them in the Cisco IOS router console environment, use the **debugcell-hwicvirt-con**command in EXEC mode.

debug cell-hwic slotwic slotport virt-con {clear| disable| dump-data-structs| log| monitor| wrapper-on| wrapper-off}

#### **Syntax Description**

slot/wic_slot/port	Numeric values that indicate the router slot, WAN interface card (WIC) slot, and port.
clear	(Optional) Clears all virtual console debug log messages.
disable	(Optional) Disables virtual console real-time debug monitoring.
dump-data-structurs	(Optional) Dumps virtual console data structures.
log	(Optional) Displays virtual console messages from the debug log.
monitor	(Optional) Enables monitoring of real-time virtual console debug messages.
wrapper-on	(Optional) Disables wraparound for virtual console log messages.
wrapper-off	(Optional) Enables wraparound for virtual console log messages.

**Command Default** There is no default for this command.

**Command Modes** 

EXEC (#)

Command History	Release	Modification
	12.4(11)XV	This command was introduced.
	12.4(15)T	This command was integrated into Cisco IOS Release 12.4(15)T.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Release	Modification
12.4(22)YB1	This command was integrated into Cisco IOS Release 12.4(22)YB1.

#### **Usage Guidelines**

Use this command for debugging purposes only.

#### **Related Commands**

ſ

Command	Description
debug cellular messages all	Prints all Cisco IOS driver debug messages.
debug cellular messages async	Debugs cellular async.
debug cellular messages data	Prints Cisco IOS data path debug messages.
debug cell-hwic driver	Debugs the Cisco IOS driver.
debug cell-hwic firmware	Displays Cisco IOS firmware information.
debug cellular messages management	Prints management path messages, such as CnS.
debug cellular messages dm	Prints diagnostics monitor (DM) messages from the Qualcomm CDMA chipset.

## debug cem ls errors

To debug connection errors or null data structures, use the debug cem ls errors command in privileged EXEC mode. To disable this form of debugging, use the no form of this command.

debug cem ls errors

no debug cem ls errors

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification	
	12.2(33)SRC	This command was introduced on the Cisco 7600 series routers.	

- **Use the show debug command to see debug information.**
- **Examples** The following command turns on CEM local switching error debugging:

Router# debug cem ls errors

<b>Related Commands</b>	Command	Description
	debug cem ls events	Enables debugging of events relating to CEM local switching.

## debug cem ls events

To debug CEM local switching events, use the debug cem ls events command in privileged EXEC mode. To disable this form of debugging, use the no form of this command.

debug cem ls events

no debug cem ls events

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC (#)

I

Command History	Release	Modification	
	12.2(33)SRC	This command was introduced on the Cisco 7600 series routers.	

- **Use the show debug command to see debug information.**
- **Examples** The following command turns on debugging for CEM local switching events.

Router# debug cem ls events

Related Commands	Command	Description	
	debug cem ls errors	Enables debugging of connection errors or null data structures.	

### debug ces-conn

To display information from circuit emulation service (CES) clients, use the **debugces-conn**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ces-conn [all| errors| events]

no debug ces-conn

#### **Syntax Description**

all	(Optional) Displays all error and event information.
errors	(Optional) Displays only error information.
events	(Optional) Displays only event information.

#### **Command Default** No default behavior or values

#### **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(5)XM	This command is supported on Cisco 3600 series routers.
	12.2(4)T	This command was integrated into Cisco IOS Release 12.2(4)T.

#### Examples

The following example shows debug output for a CES connection:

```
Router# debug ces-conn all
CES all debugging is on
Router#
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router (config) # connect conn1 t1 3/0 1 atm1/0 1/100
Router (config) # connect conn1 t1 3/0 1 atm1/0 1/100
Router (config) # exit
Router (config) #
*Mar 6 18:32:27:CES CLIENT:vc QoS parameters are PCR = 590, CDV =
5000, CAS_ENABLED = 1,partial fill = 0, multiplier = 8,cbr rate = 64,
clock recovery = 0,service_type = 3, error method = 0,sdt_size = 196,
billing count = 0
*Mar 6 18:32:27:CES CLIENT:attempt 1 to activate segment>
```

## debug cfm

To enable debugging of the data path of Ethernet connectivity fault management (CFM) on Cisco Catalyst 6500 series switches, use the **debug cfm** command in privileged EXEC mode. To disable the debugging function, use the **no** form of this command.

debug cfm {all| api| cfmpal| common| db| isr}

no debug cfm {all| api| cfmpal| common| db| isr}

#### **Syntax Description**

all	Specifies all Catalyst 6500 switch-specific route processor and switch processor (RP/SP) events.
арі	Specifies Catalyst 6500 switch-specific application program interface (API) events.
cfmpal	Specifies general Catalyst 6500 switch debugging.
common	Specifies common Catalyst 6500 switch RP/SP components.
db	Specifies Catalyst 6500 switch CFM database debugging.
isr	Specifies Catalyst 6500 switch-specific ingress CFM packet debugging.

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI2	This command was introduced.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

#### **Usage Guidelines**

The output from this command is a log of activity.

Use this command to troubleshoot Ethernet CFM on Cisco Catalyst 6500 series switches.

1

#### **Examples** The following example shows output of the **debug cfm all** command:

#### Device# debug cfm all

CFM DB events debugging is on CFM Ingress ISR events debugging is on CFMPAL events debugging is on CFM API events debugging is on CFM RP/SP COMMON events debugging is on

## debug channel events

To display processing events on Cisco 7000 series routers that occur on the channel adapter interfaces of all installed adapters, use the **debugchannelevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug channel events

no debug channel events

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(3)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage GuidelinesThis command displays CMCC adapter events that occur on the Channel Interface Processor (CIP) or Channel<br/>Port Adapter (CPA) and is useful for diagnosing problems in an IBM channel attach network. It provides an<br/>overall picture of the stability of the network. In a stable network, the debugchannelevents command does<br/>not return any information. If the command generates numerous messages, the messages can indicate the<br/>possible source of the problems. To observe the statistic message (cip\_love\_letter) sent every 10 seconds, use<br/>the debugchannellove command.

When configuring or making changes to a router or interface that supports IBM channel attach, enable the **debugchannelevents** command. Doing so alerts you to the progress of the changes or to any errors that might result. Also use this command periodically when you suspect network problems.

#### **Examples** The following sample output is from the **debugchannelevents** command:

Router# debug channel events Channel3/0: cip\_reset(), state administratively down Channel3/0: cip\_reset(), state up Channel3/0: sending nodeid Channel3/0: sending command for vc 0, CLAW path C700, device C0 The following line indicates that the CIP is being reset to an administrative down state:

Channel3/0: cip\_reset(), state administratively down The following line indicates that the CIP is being reset to an administrative up state:

Channel3/0: cip\_reset(), state up

The following line indicates that the node ID is being sent to the CIP. This information is the same as the "Local Node" information under the **showextendedchannel***slot/portsubchannels* command. The CIP needs to send this information to the host mainframe.

#### Channel3/0: sending nodeid

The following line indicates that a Common Link Access for Workstations (CLAW) subchannel command is being sent from the Route Processor (RP) to the CIP. The value vc 0 indicates that the CIP will use virtual circuit number 0 with this device. The virtual circuit number also shows up when you use the **debugchannelpackets**command.

Channel3/0: sending command for vc 0, CLAW path C700, device C0 The following is a sample output that is generated by the **debugchannelevents**command when a CMPC+ IP TG connection is activated with the host:

1d05h:Channel4/2:Received route UP for tg (768) 1d05h:Adding STATIC ROUTE for vc:768 The following is a sample output from the **debugchannelevents**command when a CMPC+ IP TG connection is deactivated:

```
1d05h:Channel4/2:Received route DOWN for tg (768) 1d05h:Deleting STATIC ROUTE for vc:768
```

Command	Description
debug channel ilan	Displays CIP love letter events.
debug channel packets	Displays per-packet debugging output.

## debug channel ilan

To display messages relating to configuration and bridging using Cisco Mainframe Channel Connection (CMCC) internal LANs and to help debug source-route bridging (SRB) problems related to CMCC internal LANs, use the **debugchannelilan** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug channel ilan no debug channel ilan

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	11.0(3)	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** The debug channel ilan command displays events related to CMCC internal LANs. This command is useful for debugging problems associated with CMCC internal LAN configuration. It is also useful for debugging problems related to SRB packet flows through internal LANs.

**Examples** The following is sample output from the **debugchannelilan** command:

Router# debug channel ilan Channel internal LANs debugging is on The following line indicates that a packet destined for the CMCC via a configured internal MAC adapter configured on an internal LAN was dropped because the Logical Link Control (LLC) end station in Cisco IOS software did not exist:

CIP ILAN (Channel3/2-Token): Packet dropped - NULL LLC The following line indicates that a packet destined for the CMCC via a configured internal MAC adapter configured on an internal LAN was dropped because the CMCC had not yet acknowledged the internal MAC adapter configuration command:

Channel3/2: ILAN Token-Ring 3 - CIP internal MAC adapter not acknowledged DMAC(4000.7000.0001) SMAC(0c00.8123.0023)

٦

Command	Description
debug channel events	Displays processing that occurs on the channel adapter interfaces of all installed adapters.
debug source bridge	Displays information about packets and frames transferred across a source-route bridge.

## debug channel love

To display Channel Interface Processor (CIP) love letter events, use the **debugchannellove** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug channel love

no debug channel love

**Syntax Description** This command has no arguments or keywords.

Command Modes Privileged EXEC

Usage Guidelines This command displays CIP love letter events (an operating status or configuration message) that occur on the CIP interface processor and is useful for diagnosing problems in an IBM channel attach network. It provides an overall picture of the stability of the network. In a stable network, the **debugchannellove** command returns a statistic message (cip\_love\_letter) that is sent every 10 seconds. This command is valid for the Cisco 7000 series routers only.

**Examples** The following is sample output from the **debugchannellove** command:

Router# debug channel love Channel3/1: love letter received, bytes 3308 Channel3/0: love letter received, bytes 3336 cip\_love\_letter: received ll, but no cip\_info The following line indicates that data was received on the CIP:

Channel3/1: love letter received, bytes 3308 The following line indicates that the interface is enabled, but there is no configuration for it. It does not normally indicate a problem, just that the Route Processor (RP) got statistics from the CIP but has no place to store them.

cip\_love\_letter: received ll, but no cip\_info

Command	Description
debug channel events	Displays processing that occurs on the channel adapter interfaces of all installed adapters.
debug channel packets	Displays per-packet debugging output.

## debug channel packets

To display per-packet debugging output, use the **debugchannelpackets** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug channel packets

no debug channel packets

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Usage Guidelines The debugchannelpackets command displays all process-level Channel Interface Processor (CIP) packets for both outbound and inbound packets. The output reports information when a packet is received or a transmission is attempted. You will need to disable fast switching and autonomous switching to obtain debugging output. This command is useful for determining whether packets are received or sent correctly.

This command is valid for the Cisco 7000 series routers only.

**Examples** The following is sample output from the**debugchannelpackets** command:

Router# debug channel packets

```
(Channel3/0)-out size = 104, vc = 0000, type = 0800, src 172.24.0.11, dst 172.24.1.58
(Channel3/0)-in size = 48, vc = 0000, type = 0800, src 172.24.1.58, dst 172.24.15.197
(Channel3/0)-in size = 48, vc = 0000, type = 0800, src 172.24.1.58, dst 172.24.15.197
(Channel3/0)-out size = 71, vc = 0000, type = 0800, src 172.24.15.197, dst 172.24.1.58
(Channel3/0)-in size = 44, vc = 0000, type = 0800, src 172.24.1.58, dst 172.24.15.197
The table below describes the significant fields shown in the display.
```

Table 54: debug channel	packets Field	Descriptions
-------------------------	---------------	--------------

Field	Description
(Channel3/0)	Interface slot and port.
in/out	"In" is a packet from the mainframe to the router. "Out" is a packet from the router to the mainframe.
size =	Number of bytes in the packet, including internal overhead.
vc =	Value from 0 to 511 that maps to the <b>claw</b> interface configuration command. This information is from the MAC layer.

I

Field	Description
type =	Encapsulation type in the MAC layer. The value 0800 indicates an IP datagram.
SIC	Origin, or source, of the packet, as opposed to the previous hop address.
dst	Destination of the packet, as opposed to the next-hop address.

debug channel packets

# debug clns esis events through debug dbconn tcp

• debug clns esis events through debug dbconn tcp, page 385

# debug clns esis events through debug dbconn tcp

# debug clns esis events

To display uncommon End System-to-Intermediate System (ES-IS) events, including previously unknown neighbors, neighbors that have aged out, and neighbors that have changed roles (ES-IS, for example), use the **debugclnsesisevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug clns esis events

no debug clns esis events

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

**Examples** The following is sample output from the **debugcInsesisevents** command:

Router# debug clns esis events

ES-IS: ISH from aa00.0400.2c05 (Ethernet1), HT 30 ES-IS: ESH from aa00.0400.9105 (Ethernet1), HT 150 ES-IS: ISH sent to All ESS (Ethernet1): NET 49.0001.AA00.0400.6904.00, HT 299, HLEN 20 The following line indicates that the router received a hello packet (ISH) from the IS at MAC address aa00.0400.2c05 on Ethernet interface 1. The hold time (or number of seconds to consider this packet valid before deleting it) for this packet is 30 seconds.

ES-IS: ISH from aa00.0400.2c05 (Ethernet1), HT 30 The following line indicates that the router received a hello packet (ESH) from the ES at MAC address aa00.0400.9105 on the Ethernet interface 1. The hold time is 150 seconds.

ES-IS: ESH from aa00.0400.9105 (Ethernet1), HT 150 The following line indicates that the router sent an IS hello packet on the Ethernet interface 0 to all ESs on the network. The network entity title (NET) address of the router is 49.0001.0400.AA00.6904.00; the hold time for this packet is 299 seconds; and the header length of this packet is 20 bytes.

ES-IS: ISH sent to All ESs (Ethernet1): NET 49.0001.AA00.0400.6904.00, HT 299, HLEN 20

# debug clns esis packets

To enable display information on End System-to-Intermediate System (ES-IS) packets that the router has received and sent, use the **debugcInsesispackets** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug clns esis packets

no debug clns esis packets

**Syntax Description** This command has no arguments or keywords.

Command Modes Privileged EXEC

**Examples** 

The following is sample output from the**debugcInsesispackets** command:

Router# debug clns esis packets

ES-IS: ISH sent to All ESS (Ethernet0): NET 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00, HT 299, HLEN 33 ES-IS: ISH sent to All ESS (Ethernet1): NET 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00, HT 299, HLEN 34 ES-IS: ISH from aa00.0400.6408 (Ethernet0), HT 299 ES-IS: ISH sent to All ESS (Tunnel0): NET 47.0005.80ff.ef00.0000.0001.5940.1600.0906.4023.00, HT 299, HLEN 34 IS-IS: ESH from 0000.0c00.bda8 (Ethernet0), HT 300

The following line indicates that the router has sent an IS hello packet on Ethernet interface 0 to all ESs on the network. This hello packet indicates that the NET of the router is

47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00. The hold time for this packet is 299 seconds. The packet header is 33 bytes in length.

ES-IS: ISH sent to All ESs (Ethernet0): NET 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00, HT 299, HLEN 33

The following line indicates that the router has sent an IS hello packet on Ethernet interface 1 to all ESs on the network. This hello packet indicates that the NET of the router is

47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00. The hold time for this packet is 299 seconds. The packet header is 33 bytes in length.

ES-IS: ISH sent to All ESS (Ethernet1): NET 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00, HT 299, HLEN 34 The following line indicates that the router received a hello packet on Ethernet interface 0 from an intermediate system, aa00.0400.6408. The hold time for this packet is 299 seconds.

ES-IS: ISH from aa00.0400.6408 (Ethernet0), HT 299 The following line indicates that the router has sent an IS hello packet on Tunnel interface 0 to all ESs on the network. This hello packet indicates that the NET of the router is 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00. The hold time for this packet is 299 seconds. The packet header is 33 bytes in length.

ES-IS: ISH sent to All ESs (TunnelO): NET 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00, HT 299, HLEN 34

1

The following line indicates that on Ethernet interface 0, the router received a hello packet from an end system with an SNPA of 0000.0c00.bda8. The hold time for this packet is 300 seconds.

IS-IS: ESH from 0000.0c00.bda8 (Ethernet0), HT 300

# debug clns events

To display Connectionless Network Service (CLNS) events that are occurring at the router, use the **debugcInsevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug clns events

no debug clns events

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

Examples

The following is sample output from the**debugcInsevents** command:

```
Router# debug clns events
CLNS: Echo PDU received on Ethernet3 from 39.0001.2222.2222.200!
CLNS: Sending from 39.0001.3333.3333.333.00 to 39.0001.2222.2222.200
via 2222.2222.2222 (Ethernet3 0000.0c00.3a18)
CLNS: Forwarding packet size 117
from 39.0001.2222.2222.202
to 49.0002.0001.AAA.AAAA.AAAA.00
via 49.0002 (Ethernet3 0000.0c00.b5a3)
CLNS: RD Sent on Ethernet3 to 39.0001.2222.2222.200 @ 0000.0c00.3a18,
redirecting 49.0002.0001.AAAA.AAAA.AAAA.00 to 0000.0c00.b5a3
```

The following line indicates that the router received an echo protocol data unit (PDU) on Ethernet interface 3 from source network service access point (NSAP) 39.0001.2222.2222.00. The exclamation point at the end of the line has no significance.

CLNS: Echo PDU received on Ethernet3 from 39.0001.2222.2222.200! The following lines indicate that the router at source NSAP 39.0001.3333.3333.3333.00 is sending a CLNS echo packet to destination NSAP 39.0001.2222.2222.200 via an IS with system ID 2222.2222.2222. The packet is being sent on Ethernet interface 3, with a MAC address of 0000.0c00.3a18.

CLNS: Sending from 39.0001.3333.3333.300 to 39.0001.2222.2222.00 via 2222.2222.2222 (Ethernet3 0000.0c00.3a18)

The following lines indicate that a CLNS echo packet 117 bytes in size is being sent from source NSAP 39.0001.2222.2222.2222.00 to destination NSAP 49.0002.0001.AAAA.AAAAA.AAAA.00 via the router at NSAP 49.0002. The packet is being forwarded on the Ethernet interface 3, with a MAC address of 0000.0c00.b5a3.

CLNS: Forwarding packet size 117 from 39.0001.2222.2222.2222.00 to 49.0002.0001.AAAA.AAAA.AOO via 49.0002 (Ethernet3 0000.0c00.b5a3)
The following lines indicate that the router sent a redirect packet on the Ethernet interface 3 to the NSAP 39.0001.2222.2222.2222.00 at MAC address 0000.0c00.3a18 to indicate that NSAP 49.0002.0001.AAAA.AAAAAAAO can be reached at MAC address 0000.0c00.b5a3.

CLNS: RD Sent on Ethernet3 to 39.0001.2222.2222.2000 @ 0000.0c00.3a18, redirecting 49.0002.0001.AAAA.AAAA.AAAA.00 to 0000.0c00.b5a3

# debug clns igrp packets

To display debugging information on all ISO-IGRP routing activity, use the **debugcInsigrppackets** privileged EXEC command. The **no** form of this command disables debugging output.

debug clns igrp packets

no debug clns igrp packets

**Syntax Description** This command has no arguments or keywords.

Command History	Release	Modification
	10.0	This command was introduced.
	12.2(13)T	This command is no longer supported in Cisco IOS Mainline or Technology-based (T) releases. It may continue to appear in Cisco IOS 12.2S-family releases.

### **Examples**

The following is sample output from the debugclnsigrppackets command:

```
Router# debug clns igrp packets
ISO-IGRP: Hello sent on Ethernet3 for DOMAIN green1
ISO-IGRP: Received hello from 39.0001.3333.3333.3333.00, (Ethernet3), ht 51
ISO-IGRP: Originating level 1 periodic update
ISO-IGRP: Advertise dest: 2222.2222.2222
ISO-IGRP: Sending update on interface: Ethernet3
ISO-IGRP: Originating level 2 periodic update
ISO-IGRP: Advertise dest: 0001
ISO-IGRP: Sending update on interface: Ethernet3
ISO-IGRP: Received update from 3333.3333.3333 (Ethernet3)
ISO-IGRP: Opcode: area
ISO-IGRP: Received level 2 adv for 0001 metric 1100
ISO-IGRP: Opcode: station
ISO-IGRP: Received level 1 adv for 3333.3333.3333 metric 1100
The following line indicates that the router is sending a hello packet to advertise its existence in the
DOMAIN green1 domain:
```

ISO-IGRP: Hello sent on Ethernet3 for DOMAIN\_green1 The following line indicates that the router received a hello packet from a certain network service access point (NSAP) on Ethernet interface 3. The hold time for this information is 51 seconds.

ISO-IGRP: Received hello from 39.0001.3333.3333.333.00, (Ethernet3), ht 51 The following lines indicate that the router is generating a Level 1 update to advertise reachability to destination NSAP 2222.2222.2222 and that it is sending that update to all systems that can be reached through Ethernet interface 3:

```
ISO-IGRP: Originating level 1 periodic update
ISO-IGRP: Advertise dest: 2222.2222.2222
ISO-IGRP: Sending update on interface: Ethernet3
```

I

The following lines indicate that the router is generating a Level 2 update to advertise reachability to destination area 1 and that it is sending that update to all systems that can be reached through Ethernet interface 3:

ISO-IGRP: Originating level 2 periodic update ISO-IGRP: Advertise dest: 0001 ISO-IGRP: Sending update on interface: Ethernet3 The following lines indicate that the router received an update from NSAP 3333.3333.3333 on Ethernet interface 3. This update indicated the area that the router at this NSAP could reach.

ISO-IGRP: Received update from 3333.3333.3333 (Ethernet3)
ISO-IGRP: Opcode: area

The following lines indicate that the router received an update advertising that the source of that update can reach area 1 with a metric of 1100. A station opcode indicates that the update included system addresses.

ISO-IGRP: Received level 2 adv for 0001 metric 1100 ISO-IGRP: Opcode: station

# debug clns packet

To display information about packet receipt and forwarding to the next interface, use the **debugcInspacket** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug clns packet

no debug clns packet

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

### **Examples** The following is sample output from the **debugcInspacket** command:

```
Router# debug clns packet
CLNS: Forwarding packet size 157
    from 47.0023.0001.0000.0003.0001.1920.3614.3002.00 STUPI-RBS
    to 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4017.00
    via 1600.8906.4017 (Ethernet0 0000.0c00.bda8)
CLNS: Echo PDU received on Ethernet0 from
47.0005.80ff.ef00.0000.0001.5940.1600.8906.4017.00!
CLNS: Sending from 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00 to
    47.0005.80ff.ef00.0000.0001.5940.1600.8906.4017.00
    via 1600.8906.4017 (Ethernet0 0000.0c00.bda8)
```

In the following lines, the first line indicates that a Connectionless Network Service (CLNS) packet of size 157 bytes is being forwarded. The second line indicates the network service access point (NSAP) and system name of the source of the packet. The third line indicates the destination NSAP for this packet. The fourth line indicates the next hop system ID, interface, and subnetwork point of attachment (SNPA) of the router interface used to forward this packet.

```
CLNS: Forwarding packet size 157
from 47.0023.0001.0000.0003.0001.1920.3614.3002.00 STUPI-RBS
to 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4017.00
via 1600.8906.4017 (Ethernet0 0000.0c00.bda8)
```

In the following lines, the first line indicates that the router received an echo protocol data unit (PDU) on the specified interface from the source NSAP. The second line indicates which source NSAP is used to send a CLNS packet to the destination NSAP, as shown on the third line. The fourth line indicates the next hop system ID, interface, and SNPA of the router interface used to forward this packet.

```
CLNS: Echo PDU received on Ethernet0 from
47.0005.80ff.ef00.0000.0001.5940.1600.8906.4017.00!
CLNS: Sending from 47.0005.80ff.ef00.0000.0001.5940.1600.8906.4023.00 to
47.0005.80ff.ef00.0000.0001.5940.1600.8906.4017.00
via 1600.8906.4017 (Ethernet0 0000.0c00.bda8)
```

# debug clns routing

To display debugging information for all Connectionless Network Service (CLNS) routing cache updates and activities involving the CLNS routing table, use the **debugcInsrouting** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug clns routing

no debug clns routing

**Syntax Description** This command has no arguments or keywords.

Command Modes Privileged EXEC

**Examples** 

The following is sample output from the **debugcInsrouting** command:

Router# debug clns routing CLNS-RT: cache increment:17

CLNS-RT: Cache increment:17 CLNS-RT: Add 47.0023.0001.0000.0003.0001 to prefix table, next hop 1920.3614.3002 CLNS-RT: Aging cache entry for: 47.0023.0001.0000.0003.0001.1920.3614.3002.06 CLNS-RT: Deleting cache entry for: 47.0023.0001.0000.0003.0001.1920.3614.3002.06 The following line indicates that a change to the routing table has resulted in an addition to the fast-switching cache:

CLNS-RT: cache increment:17

The following line indicates that a specific prefix route was added to the routing table, and indicates the next hop system ID to that prefix route. In other words, when the router receives a packet with the prefix 47.0023.0001.0000.0003.0001 in the destination address of that packet, it forwards that packet to the router with the MAC address 1920.3614.3002.

CLNS-RT: Add 47.0023.0001.0000.0000.0003.0001 to prefix table, next hop 1920.3614.3002 The following lines indicate that the fast-switching cache entry for a certain network service access point (NSAP) has been invalidated and then deleted:

CLNS-RT: Aging cache entry for: 47.0023.0001.0000.0003.0001.1920.3614.3002.06 CLNS-RT: Deleting cache entry for: 47.0023.0001.0000.0000.0003.0001.1920.3614.3002.06

# debug cls message

To display information about Cisco Link Services (CLS) messages, use the **debugclsmessage**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cls message

no debug cls message

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC
- **Usage Guidelines** The **debugclsmessage**command displays the primitives (state), selector, header length, and data size.

**Examples** The following is sample output from the**debugclsmessage**command. For example, CLS-->DLU indicates the direction of the flow that is described by the status. From CLS to dependent logical unit (DLU), a request was established to the connection endpoint. The header length is 48 bytes, and the data size is 104 bytes.

```
Router# debug cls message
(FRAS Daemon:CLS-->DLU):
    ID_STN.Ind to uSAP: 0x607044C4 sel: LLC hlen: 40, dlen: 54
(FRAS Daemon:CLS-->DLU):
    ID_STN.Ind to uSAP: 0x6071B054 sel: LLC hlen: 40, dlen: 46
(FRAS Daemon:DLU-->SAP):
    REQ_OPNSTN.Req to pSAP: 0x608021F4 sel: LLC hlen: 48, dlen: 104
(FRAS Daemon:CLS-->DLU):
```

REQ\_OPNSTN.Cfm(NO\_REMOTE\_STN) to uCEP: 0x607FFE84 sel: LLC hlen: 48, dlen: 104 The status possibilities include the following: enabled, disabled, request open station, open station, close station, activate SA, deactivate service access point (SAP), XID, exchange identification (XID) station, connect station, signal station, connect, disconnect, connected, data, flow, unnumbered data, modify SAP, test, activate ring, deactivate ring, test station, and unnumbered data station.

Command	Description
debug fras error	Displays information about FRAS protocol errors.
debug fras message	Displays general information about FRAS messages.
debug fras state	Displays information about FRAS data-link control state changes.

# debug cls vdlc

I

	To display information about Cisco Link Services (CLS) Virtual Data Link Control (VDLC), use the <b>debugclsvdlc</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command.		
	debug cls vdlc		
	no debug cls vdlc		
Syntax Description	This command has no arguments or keywords.		
Command Modes	Privileged EXEC		
Usage Guidelines	The <b>debugclsmessage</b> command displays primitive state transitions, selector, and source and destination MAC and service access points (SAPs).		
	Also use the <b>showels</b> command to display additional information on CLS VDLC.		
<u> </u>	Use the <b>debugclsvdlc</b> command with caution because it can generate a substantial amount of output.		
Examples	The following messages are sample output from the <b>debugclsvdlc</b> command. In the following scenario, the systems network architecture (SNA) service pointalso called <i>nativeservicepoint(NSP)</i> is setting up two connections through VDLC and data-link switching (DLSw): one from NSP to VDLC and one from DLSw to VDLC. VDLC joins the two.		
	The NSP initiates a connection from 4000.05d2.0001 as follows:		
	VDLC: Req Open Stn Req PSap 0x7ACE00, port 0x79DF98 4000.05d2.0001(0C)->4000.1060.1000(04) In the next message, VDLC sends a test station request to DLSw for destination address 4000.1060.1000.		
	VDLC: Send UFrame E3: 4000.05d2.0001(0C)->4000.1060.1000(00) In the next two messages, DLSw replies with test station response, and NSP goes to a half-open state. NSP is waiting for the DLSw connection to VDLC.		
	VDLC: Sap to Sap TEST_STN_RSP VSap 0x7B68C0 4000.1060.1000(00)->4000.05d2.0001(0C) VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC_OPENING->VDLC_HALF_OPEN The NSP sends an exchange identification (XID) and changes state as follows:		
	VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC_HALF_OPEN->VDLC_XID_RSP_PENDING VDLC: CEP to SAP ID_REQ 4000.05d2.0001(0C)->4000.1060.1000(04) via bridging SAP (DLSw) In the next several messages, DLSw initiates its connection, which matches the half-open connection with NSP:		
	VDLC: Req Open Stn Req PSap 0x7B68C0, port 0x7992A0 4000.1060.1000(04)->4000.05d2.0001(0C)		

VDLC: two-way connection established VDLC: 4000.1060.1000(04)->4000.05d2.0001(0C): VDLC IDLE->VDLC OPEN In the following messages, DLSw sends an XID response, and the NSP connection goes from the state XID Response Pending to Open. The XID exchange follows: VDLC: CEP to CEP ID RSP 4000.1060.1000(04)->4000.05d2.0001(0C) VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC\_XID\_RSP\_PENDING->VDLC\_OPEN VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC\_OPEN->VDLC\_XID\_RSP\_PENDING VDLC: CEP to CEP ID REQ 4000.05d2.0001(0C)->4000.1060.1000(04) VDLC: CEP to CEP ID RSP 4000.1060.1000(04) ->4000.05d2.0001(0C) VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC XID RSP PENDING->VDLC OPEN VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC\_OPEN->VDLC\_XID\_RSP\_PENDING VDLC: CEP to CEP ID\_REQ 4000.05d2.0001(0C)->4000.1060.1000(04) VDLC: CEP to CEP ID RSP 4000.1060.1000(04)->4000.05d2.0001(0C) VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC XID RSP PENDING->VDLC OPEN VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC\_OPEN->VDLC\_XID\_RSP\_PENDING VDLC: CEP to CEP ID\_REQ 4000.05d2.0001(0C)->4000.1060.1000(04) VDLC: CEP to CEP ID RSP 4000.1060.1000(04) ->4000.05d2.0001(0C) VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC XID RSP PENDING->VDLC OPEN VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC\_OPEN->VDLC\_XID\_RSP\_PENDING VDLC: CEP to CEP ID REQ 4000.05d2.0001(0C)->4000.1060.1000(04) When DLSw is ready to connect, the front-end processor (FEP) sends a set asynchronous balanced mode extended (SABME) command as follows: VDLC: CEP to CEP CONNECT REQ 4000.1060.1000(04)->4000.05d2.0001(0C) VDLC: 4000.05d2.0001(0C)->4000.1060.1000(04): VDLC XID RSP PENDING->VDLC OPEN In the following messages, NSP accepts the connection and sends an unnumbered acknowledgment (UA) to the FEP: VDLC: CEP to CEP CONNECT RSP 4000.05d2.0001(0C)->4000.1060.1000(04) VDLC: FlowReq QUENCH OFF 4000.1060.1000(04)->4000.05d2.0001(0C) The following messages show the data flow:

Command	Description
debug cls message	Displays information about CLS messages.

# debug cme-xml

To generate debug messages for the Cisco Unified CallManager Express XML application, use the **debugcme-xml** command in privileged EXEC mode. To disable debugging, use the **no** form of the command.

debug cme-xml

no debug cme-xml

- **Syntax Description** This command has no keywords or arguments.
- **Command Modes** Privileged EXEC

I

 Command History
 Cisco IOS Release
 Modification

 12.4(4)XC
 This command was introduced.

 12.4(9)T
 This command was integrated into Cisco IOS Release 12.4(9)T.

**Usage Guidelines** The **showfb-its-log** command displays the contents of the XML event table.

**Examples** The following example shows the progress of an XML request that has been sent to Cisco Unified CallManager Express:

loute	erŧ	🗄 aebug cme-xm.	L
Aug	5	06:27:25.727:	CME got a raw XML message.
Aug	5	06:27:25.727:	doc 0x63DB85E8, doc->doc type 3, req 0x655FDCD0
Aug	5	06:27:25.727:	CME extracted a XML document
Aug	5	06:27:25.727:	Response buffer 0x63DCFD58, len = 4096
Aug	5	06:27:25.727:	First Tag ID SOAP HEADER TAG ID 58720257
Aug	5	06:27:25.727:	First Attribute ID SOAP ENV ATTR 50331649
Aug	5	06:27:25.727:	cme xml process soap header
Aug	5	06:27:25.727:	cme_xml_process_soap_body
Aug	5	06:27:25.731:	cme xml process axl
Aug	5	06:27:25.731:	cme xml process request
Aug	5	06:27:25.731:	cme_xml_process_ISgetGlobal
Aug	5	06:27:25.731:	CME XML sent 811 bytes response.

Related Commands	Command	Description
	show fb-its-log	Displays Cisco Unified CallManager Express XML API information.

# debug cns config

To turn on debugging messages related to the Cisco Networking Services (CNS) configuration agent, use the **debugcnsconfig** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cns config {agent| all| connection| notify}

no debug cns config {agent| all| connection| notify}

# **Syntax Description**

agent	Displays debugging messages related to the CNS configuration agent.
all	Displays all debugging messages.
connection	Displays debugging messages related to configuration connections.
notify	Displays debugging messages related to CNS configurations.

# **Command Default** No default behavior or values

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(2)T	This command was introduced.
	12.0(18)ST	This command was integrated into Cisco IOS Release 12.0(18)ST.
	12.2(8)T	This command was implemented on the Cisco 2600 and Cisco 3600 series.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

### **Usage Guidelines**

Use this command to turn on or turn off debugging messages related to the CNS Configuration Agent.

### **Examples** In the following example, debugging messages are enabled for CNS configuration processes:

### Router# debug cns config all

00:04:09: config\_id\_get: entered 00:04:09: config\_id\_get: Invoking cns\_id\_mode\_get() 00:04:09: config\_id\_get: cns\_id\_mode\_get() returned INTERNAL 00:04:09: config\_id\_get: successful exit cns\_config\_id=minnal,cns\_config\_id\_len=6 00:04:09: cns\_establish\_connect\_intf(): The device is already connected with the config server 00:04:09: cns\_initial\_config\_agent(): connecting with port 80 00:04:09: pull\_config() entered 00:04:09: cns\_config\_id(): returning config\_id=minnal 00:04:09: Message finished 150 readend 00:04:09: %CNS-4-NOTE: SUCCESSFUL\_COMPLETION -Process= "CNS Initial Configuration Agent", ipl= 0, pid= 82 00:04:10: %SYS-5-CONFIG I: Configured from console by console

Command	Description
cns config cancel	Cancels a CNS configuration.
cns config initial	Starts the initial CNS Configuration Agent.
cns config partial	Starts the partial CNS Configuration Agent.
cns config retrieve	Gets the configuration of a routing device using CNS.
debug cns event	Displays information on CNS events.
debug cns exec	Displays information on CNS management.
debug cns xml-parser	Displays information on the CNS XML parser.
show cns config	Displays information about the CNS Configuration Agent.

# debug cns events

To turn on debugging messages related to the Cisco Networking Services (CNS) Event Gateway, use the **debugcnsevent** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cns event {agent| all| connection| subscriber}

no debug cns event {agent| all| connection| subscriber}

Syntax Description	agent	Displays debugging messages related to the event agent.
	all	Displays all debugging messages.
	connection	Displays debugging messages related to event connections.
	subscriber	Displays debugging messages related to subscribers.
Command Default	No default behavior or v	values
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(2)T	This command was introduced.
	12.0(18)ST	This command was integrated into the Cisco IOS Release 12.0(18)ST.
	12.2(8)T	This command was implemented on Cisco 2600 series and Cisco 3600 series routers.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
Usage Guidelines	Use this command to tu	rn on or turn off debugging messages related to the CNS Event Gateway.
Examples	In the following exampl	e, debugging messages about all CNS Events are enabled:
	Router# debug cns event all	
	00:09:14: %CNS-4-NOT -Process= "CNS Initi 00:09:14: event_agen	E: SUCCESSFUL_COMPLETION al Configuration Agent", ipl= 0, pid= 82 t():event_agent starting

```
00:09:14: event agent open connection(): attempting socket connect to Primary Gateway
00:09:14: event agent open connection():cns socket connect() succeeded:return code=0

Command	Description
cns event	Configures the CNS Event Gateway.
show cns event	Displays information about the CNS Event Agent.

# debug cns exec

To display debugging messages about Cisco Networking Services (CNS) exec agent services, use the **debugcnsexec** command in privileged EXEC mode. To disable debugging output, use the **no** or **undebug** form of this command.

debug cns exec {agent| all| decode| messages}

no debug cns exec {agent| all| decode| messages}

undebug cns exec {agent| all| decode| messages}

# **Syntax Description**

agent	Displays debugging messages related to the exec agent.
all	Displays all debugging messages.
decode	Displays debugging messages related to image agent connections.
messages	Displays debugging output related to messages generated by exec agent services.

# **Command Default** Debugging output is disabled.

**Command Modes** Privileged EXEC (#)

# Command HistoryReleaseModification12.3(1)This command was introduced.12.2(25)SThis command was integrated into Cisco IOS Release 12.2(25)S.12.2(33)SRAThis command was integrated into Cisco IOS Release 12.2(33)SRA.12.2(33)SBThis command was integrated into Cisco IOS Release 12.2(33)SB.12.2(33)SXIThis command was integrated into Cisco IOS Release 12.2(33)SXI.

### Usage Guidelines

Use the **debug cns exec** command to troubleshoot CNS exec agent services.

# **Examples** The following example shows a debugging message for the CNS exec agent when a response has been posted to HTTP:

Router# debug cns exec agent

4d20h: CNS exec agent: response posted

# **Related Commands**

I

Command	Description	
cns exec	Configures CNS Exec Agent services.	

# debug cns image

To display debugging messages about Cisco Networking Services (CNS) image agent services, use the **debug cns image** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cns image {agent| all| connection| error}

no debug cns image {agent| all| connection| error}

### **Syntax Description**

agent	Displays debugging messages related to the image agent.	
all	Displays all debugging messages.	
connection	Displays debugging messages related to image agent connections.	
error	Displays debugging messages related to errors generated by image agent services.	

# **Command Default** If no keyword is specified, all debugging messages are displayed.

**Command Modes** Privileged EXEC (#)

# Command HistoryReleaseModification12.3(1)This command was introduced.12.2(31)SB2This command was integrated into Cisco IOS Release 12.2(31)SB2.12.2(33)SRBThis command was integrated into Cisco IOS Release 12.2(33)SRB.12.2(33)SBThis command was integrated into Cisco IOS Release 12.2(33)SB.12.2(33)SIThis command was integrated into Cisco IOS Release 12.2(33)SB.12.2(33)SXIThis command was integrated into Cisco IOS Release 12.2(33)SXI.

### **Usage Guidelines**

Use the debug cns image command to troubleshoot CNS image agent services.

# debug cns management

Γ

To display information about Cisco Networking Services (CNS) management, use the debug cns management command in privileged EXEC mode. To disable debugging output, use the no form of this command.

debug cns management {snmp| xml}

no debug cns management {snmp| xml}

# **Syntax Description**

snmp	Displays debugging messages related to nongranular Simple Network Management Protocol (SNMP) encapsulated CNS-management events.
xml	Displays debugging messages related to granular eXtensible Markup Language (XML) encapsulated CNS-management events.

### **Command Modes** Privileged EXEC

### **Command History**

1

Command	Description	
cns event	Configures the CNS event gateway, which provides CNS event services to Cisco IOS clients.	
debug cns config	Displays information on CNS configurations.	
debug cns xml-parser	Displays information on the CNS XML parser.	
show debugging	Displays information about the types of debugging that are enabled for your router.	
show running-config	Displays the current running configuration.	

# debug cns xml

To turn on debugging messages related to the Cisco Networking Services (CNS) eXtensible Markup Language (XML) parser, use the **debugcnsxml** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cns xml {all| decode| dom| parser}

no debug cns xml {all| decode| dom| parser}

# **Syntax Description**

all	Displays all CNS debugging.
decode	Reports usage of common XML decoding library functions by applications and reports the decoded contents.
dom	Displays failures in the Document Object Model (DOM) infrastructure messages tree built by the XML parser.
parser	Displays failures and progress of the parsing of an XML message by the XML parser.

# **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(2)T	This command was introduced. This command replaces the <b>debugcnsxml-parser</b> command.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

### **Examples**

In the following example, debugging messages for the CNS XML parser are enabled:

Router# debug cns xml parser

Command	Description
cns event	Configures the CNS Event Gateway.
show cns event	Displays information about the CNS Event Agent.

# debug compress

To debug compression, enter the **debugcompress** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug compress

no debug compress

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Disabled.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	10.0	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

# **Usage Guidelines** Use this command to display output from the compression and decompression configuration you made. Live traffic must be configured through the Cisco 2600 access router with a data compression Advanced Interface Module (AIM) installed for this command to work.

**Examples** The following example is output from the **debugcompress** command, which shows that compression is taking place on a Cisco 2600 access router using data compression AIM hardware compression is configured correctly:

Router# debug compress COMPRESS debugging is on Router#compr-in:pak:0x810C6B10 npart:0 size:103 pak:0x810C6B10 start:0x02406BD4 size:103 npart:0 compr-out:pak:0x8118C8B8 stat:0x00000000 npart:1 size:71 lcb:0xED pak:0x8118C8B8 start:0x0259CD3E size:71 npart:1 mp:0x8118A980 start:0x0259CD3E size:71 decmp-in:pak:0x81128B78 start:0x0255AF44 size:42 npart:1 hdr:0xC035 pak:0x81128B78 start:0x0255AF44 size:42 npart:1 mp:0x81174480 start:0x0255AF44 size:42 decmp-out:pak:0x8118C8B8 start:0x025B2C42 size:55 npart:1 stat:0 pak:0x8118C8B8 start:0x025B2C42 size:55

The table below describes the significant fields shown in the display.

1

Field	Description	
compr-in	Indicates that a packet needs to be compressed.	
compr-out	Indicates completion of compression of packet.	
decmp-in	Indicates receipt of a compressed packet that needs to be decompressed.	
decmp-out	Indicates completion of decompression of a packet.	
pak:0x810C6B10	Provides the address in memory of a software structure that describes the compressed packet.	
start:0x02406BD4 size:103 npart:0	The "npart:0" indicates that the packet is contained in a single, contiguous area of memory. The start address of the packet is 0x02406bd4 and the size of the packet is 103.	
start:0x0259CD3E size:71 npart:1	The "npart:1" indicates that the packet is contained in 1 or more regions of memory. The start address of the packet is 0x0259CD3E and the size of the packet is 71.	
mp:0x8118A980 start:0x0259CD3e size:71	Describes one of these regions of memory.	
mp:0x8118A980	Provides the address of a structure describing this region.	
start 0x0259CD3E	Provides the address of the start of this region.	

# Table 55: debug compress Field Descriptions

Command	Description
debug frame-relay	Displays debugging information about the packets that are received on a Frame Relay interface.
debug ppp	Displays information on traffic and exchanges in an internetwork implementing the PPP.
show compress	Displays compression statistics.
show diag	Displays hardware information including DRAM, SRAM, and the revision-level information on the line card.

# debug condition

To filter debugging output for certain **debug** commands on the basis of specified conditions, use the**debug condition** command in privileged EXEC mode. To remove the specified condition, use the **no** form of this command.

**debug condition** {**called** *dial-string*| **caller** *dial-string*| **calling** *tidimsi string*| **domain** *domain-name*| **fex** *fabric-extender-number* **module** *module-number*| **interface** *interface-id*| **ip** *ip-address*| **mac-address** *hexadecimal-MAC-address*| **module** *module-number*| **portbundle ip** *ip-address* **bundle** *bundle-number*| **session-id** *session-number*| **switch** *switch-number* **module** *module-number*| **username** *username*| **vcid** *vc-id*| **vlan** *vlan-id*}

**no debug condition** {*condition-id*| **all**}

### **Syntax Description**

called dial-string	Filters output on the basis of the called party number.
caller dial-string	Filters output on the basis of the calling party number.
<b>calling</b> <i>tidi/imsi-string</i>	Filters debug messages for general packet radio service (GPRS) tunneling protocol (GTP) processing on the gateway GPRS support node (GGSN) based on the tunnel identifier (TID) or international mobile system identifier (IMSI) in a Packet Data Protocol (PDP) Context Create Request message.
domain domain-name	Filters output on the basis of the specified domain.
<b>fex</b> fabric-extender-number <b>module</b> module-number	Filters output on the basis of the specified fabric extender and specified module.
interface interface-id	Filters output on the basis of the specified interface ID.
ip ip-address	Filters output on the basis of the specified IP address.
mac-address hexadecimal-mac-address	Filters messages on the specified MAC address.
module module-number	Filters output on the basis of the specified module number.
portbundle ip ip-address	Filters output on the basis of the port-bundle host key (PBHK) that uniquely identifies the session.
bundle bundle-number	Specifies the port bundle.
session-id session-number	Filters output on the specified Intelligent Service Architecture (ISA) session identifier.

1

switch switch-number module module-number	Filters output on the basis of the specified switch and specified module.
username username	Filters output on the basis of the specified username.
vcid vc-id	Filters output on the basis of the specified VC ID.
vlan vlan-id	Filters output on the basis of the specified VLAN ID.
condition-id	ID number of the condition to be removed.
all	Removes all debugging conditions, and conditions specified by the <b>debug condition interface</b> command. Use this keyword to disable conditional debugging and reenable debugging for all interfaces.

**Command Default** All debugging messages for enabled protocol-specific **debug** commands are generated.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	11.3(2)AA	This command was introduced.
	12.0(23)S	This command was modified. The <b>vcid</b> and <b>ip</b> keywords were added to support the debugging of Any Transport over MPLS (AToM) messages.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
	12.2(15)T	This command was integrated into Cisco IOS Release 12.2(15)T.
	12.3(2)XB	This command was modified. Support was added on the GGSN.
	12.3(8)T	This command was modified. The <b>calling</b> keyword and <i>tid/imsi-string</i> argument were added.
	12.2(28)SB	This command was modified. The ability to filter output on the following conditions was added: domain, MAC address, PBHK, and ISA session ID.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	15.2(2)T	This command was modified. The <b>vlan</b> <i>vlan-id</i> keyword and argument and the <b>interface</b> <i>interface-id</i> keyword and argument were added.

### **Usage Guidelines**

Use the **debug condition** command to restrict the debug output for some commands. If any **debug condition** commands are enabled, output is generated only for interfaces associated with the specified keyword. In addition, this command enables debugging output for conditional debugging events. Messages are displayed as different interfaces meet specific conditions.

If multiple **debug condition** commands are enabled, output is displayed if at least one condition matches. All the conditions do not need to match.

The **no** form of this command removes the debug condition specified by the condition identifier. The condition identifier is displayed after you use a **debug condition** command or in the output of the **show debug condition** command. If the last condition is removed, debugging output resumes for all interfaces. You will be asked for confirmation before removing the last condition or all conditions.

Not all debugging output is affected by the **debug condition** command. Some commands generate output whenever they are enabled, regardless of whether they meet any conditions.

The following components are supported for Intelligent Service Architecture (ISA) distributed conditional debugging:

- Authentication, authorization, and accounting (AAA) and RADIUS
- ATM components
- · Feature Manager
- Policy Manager
- PPP
- PPP over Ethernet (PPPoE)
- Session Manager
- Virtual Private Dialup Network (VPDN)

Ensure that you enable TID/IMSI-based conditional debugging by entering **debug condition calling** before configuring **debug gprs gtp** and **debug gprs charging**. In addition, ensure that you disable the **debug gprs gtp** and **debug gprs charging** commands using the **no debug all** command before disabling conditional debugging using the **no debug condition** command. This will prevent a flood of debugging messages when you disable conditional debugging.

### **Examples**

**Examples** In the following example, the router displays debugging messages only for interfaces that use a username of user1. The condition identifier displayed after the command is entered identifies this particular condition.

Router# **debug condition username user1** Condition 1 set

**Examples** 

The following example specifies that the router should display debugging messages only for VC 1000:

Router# debug condition vcid 1000 Condition 1 set 01:12:32: 1000 Debug: Condition 1, vcid 1000 triggered, count 1 01:12:32: 1000 Debug: Condition 1, vcid 1000 triggered, count 1

The following example enables other debugging commands. These debugging commands will only display information for VC 1000.

Router# **debug mpls l2transport vc event** AToM vc event debugging is on Router# **debug mpls l2transport vc fsm** 

AToM vc fsm debugging is on The following commands shut down the interface on which VC 1000 is established:

Router (config) # interface serial3/1/0 Router (config-if) # shut The debugging output shows the change to the interface where VC 1000 is established:

01:15:59: ATOM MGR [13.13.13.13, 1000]: Event local down, state changed from established to remote ready 01:15:59: ATOM MGR [13.13.13, 1000]: Local end down, vc is down 01:15:59: ATOM SMGR [13.13.13, 1000]: Processing imposition update, vc\_handle 6227BCF0, update\_action 0, remote\_vc\_label 18 01:15:59: ATOM SMGR [13.13.13, 13, 1000]: Imposition Disabled 01:15:59: ATOM SMGR [13.13.13, 13, 1000]: Processing disposition update, vc\_handle 6227BCF0, update\_action 0, local\_vc\_label 755 01:16:01:%LINK-5-CHANGED: Interface Serial3/1/0, changed state to administratively down 01:16:02:%LINEPROTO-5-UPDOWN: Line protocol on Interface Serial3/1/0, changed state to down

Command	Description
debug condition interface	Limits output for some debugging commands based on the interfaces.

# debug condition application voice

To display debugging messages for only the specified VoiceXML application, use the **debugconditionapplicationvoice**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug condition application voice application-name

no debug condition application voice application-name

Syntax Description	application-name		Name of the VoiceXML application for which you want to display all enabled debugging messages.
Command Default	If this command is not	configured, debugging message	s are enabled for all VoiceXML applications.
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(11)T	This command was int AS5300, Cisco AS535	roduced for the Cisco 3640, Cisco 3660, Cisco 0, and Cisco AS5400.

It does not filter messages for any other debug comman such as the debugvoipivr command or the debugvoiceivr command.</li> <li>This command filters debugging output for all VoiceXML applications except the application named the command. When this command is configured, the gateway displays debugging messages only for the specified VoiceXML application.</li> </ul>		te <b>debugvxml</b> and <b>debughttpclient</b> commands, except <b>ror</b> , <b>debugvxmlbackground</b> , <b>debughttpclienterror</b> , bes not filter messages for any other debug commands <b>gvoiceivr</b> command. iceXML applications except the application named in , the gateway displays debugging messages only for
	To Inter debuggi VoiceXML docur VoiceXML Progr	ment. For more information abour ammer's Guide.	at the <cisco-debug> element, refer to the Cisco</cisco-debug>
	• To see debugging such as the <b>debu</b> turned on, you do is configured and	g output for VoiceXML application gvxmlcommand or the debught o not see debugging messages ev l the <cisco-debug> element is en</cisco-debug>	ons, you must first configure global <b>debug</b> commands <b>tpclient</b> command. If no global <b>debug</b> commands are en if the <b>debugconditionapplicationvoice</b> command nabled in the VoiceXML document.
	• This command ca	an be configured multiple times	to display output for more than one application.
	• To see which deb	bug conditions have been set, use	the showdebugcondition command.

1

**Examples** The following example disables debugging output for all applications except the myapp1 application, if the <cisco-debug> element is enabled in the VoiceXML documents that are executed by myapp1:

Router# debug condition application voice myapp1

Command	Description
debug http client	Displays debugging messages for the HTTP client.
debug vxml	Displays debugging messages for VoiceXML features.
show debug condition	Displays the debugging conditions that have been enabled for VoiceXML application.

# debug condition glbp

To display debugging messages about Gateway Load Balancing Protocol (GLBP) conditions, use the **debugconditionglbp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug condition glbp** *interface-type interface-number* group [ *forwarder* ] **no debug condition glbp** *interface-type interface-number* group [ *forwarder* ]

# Syntax Description

interface-type	Interface type for which output is displayed.
interface-number	Interface number for which output is displayed.
group	GLBP group number in the range from 0 to 1023.
forwarder	(Optional) Number in the range from 1 to 255 used to identify a virtual MAC address.

# Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(14)S	This command was introduced.
	12.2(15)T	This command was integrated into Cisco IOS Release 12.2(15)T.
	12.2(17b)SXA	This command was integrated into Cisco IOS Release 12.2(17b)SXA.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

# Examples

The following is sample output from the **debugconditionglbp**command:

Router# debug condition glbp fastethernet 0/0 10 1 Condition 1 set 5d23h: Fa0/0 GLBP10.1 Debug: Condition 1, glbp Fa0/0 GLBP10.1 triggered, count 1

Command	Description
debug glbp errors	Displays debugging messages about GLBP errors.
debug glbp events	Displays debugging messages about GLBP events.

٦

Command	Description
debug glbp packets	Displays debugging messages about GLBP packets.
debug glbp terse	Displays a limited range of debugging messages about GLBP errors, events, and packets.
# debug condition interface

To limit output for some debug commands on the basis of the interface, virtual circuit (VC), or VLAN, use the **debugconditioninterface** command in privileged EXEC mode. To remove the interface condition and reset the interface so that it must be triggered by a condition, use the **no** form of this command.

debug condition interface interface-type interface-number [dlci dlci] [vc {vci| vpivci}] [vlan-id vlan-id] no debug condition interface interface-type interface-number [dlci dlci] [vc {vci| vpivci}] [vlan-id vlan-id]

# **Syntax Description**

interface-type interface-number	Interface type and number. For more information, use the question mark (?) online help function.
dlci dlci	(Optional) Specifies the data-link connection identifier (DLCI), if the interface to be debugged is a Frame Relay-encapsulated interface.
<b>vc</b> { <i>vci</i>   <i>vpi</i> / <i>vci</i> }	(Optional) Specifies the virtual channel identifier (VCI) or virtual path identifier/virtual channel identifier (VPI/VCI) pair, if the interface to be debugged is an ATM-encapsulated interface.
vlan-id vlan-id	(Optional) Specifies the VLAN ID, if the interface to be debugged is ATM, Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

**Command Default** All debugging messages for enabled **debug** commands are displayed.

# **Command Modes** Privileged EXEC (#)

I

<b>Command History</b>	Release	Modification
	12.2(11)T	This command was introduced.
	12.0(28)S	This command was modified. The <b>dlci</b> and <b>vc</b> keywords were added for additional Frame Relay and ATM functionality.
	12.2(25)S	This command was modified. It was integrated into Cisco IOS Release 12.2(25)S.
	12.2(27)SBC	This command was modified. It was integrated into Cisco IOS Release 12.2(27)SBC.

Release	Modification
12.2(28)SB	This command was modified. It was integrated into Cisco IOS Release 12.2(28)SB, and the ability to filter debug output on the basis of VLAN ID was added.
12.4(9)T	This command was modified. It was integrated into Cisco IOS Release 12.4(9)T.
12.2(33)SRE	This command was modified. It was integrated into Cisco IOS Release 12.2(33)SRE.
Cisco IOS XE 2.5	This command was modified. It was integrated into Cisco IOS XE Release 2.5.

### **Usage Guidelines**

Use this command to restrict the debugging output for some commands on the basis of an interface or virtual circuit. When you enter this command, debugging output is disbaled for all interfaces except the specified interface or virtual circuit. In addition, this command enables conditional debugging to limit output for specific debugging events. Messages are displayed as different interfaces meet specific conditions.

The no form of this command performs the following functions:

- Disables the **debugconditioninterface** command for the specified interface. Output is no longer generated for the interface, assuming that the interface meets no other applicable conditions. If the interface meets other conditions that have been set by another **debugcondition** command, debugging output will still be generated for the interface.
- If some other **debugcondition** command has been enabled, output is stopped for that interface until the condition is met on the interface. You will be asked for confirmation before the last condition or all conditions are removed.

Not all debugging output is affected by the **debugcondition** command. Some commands generate output whenever they are enabled, regardless of whether they meet any conditions. The commands that are affected by the **debugcondition** commands are generally related to dial access functions, where a large amount of output is expected. Output from the following commands is controlled by the **debugcondition** command:

- debug aaa
- debug atm
- · debug dialer events
- · debug frame-relay
- debug isdn
- debug modem
- debug ppp

One or more ATM-encapsulated interfaces must be enabled, and one or more of the following **debug** commands must be enabled to use conditional debugging with ATM:

• debug atm arp

- debug atm counters
- debug atm errors
- debug atm events
- debug atm oam
- debug atm packet
- debug atm state

One or more of the following **debug** commands must be enabled to use conditional debugging with Frame Relay:

- · debug frame-relay adjacency
- debug frame-relay ipc
- · debug frame-relay lmi
- debug frame-relay packet
- · debug frame-relay pseudowire

### **Examples**

In the following example, only **debug** command output related to serial interface 1 is displayed. The condition identifier for this command is 1.

```
Router# debug condition interface serial 1 Condition 1 set
```

The following example shows how to enable an ATM interface, specifies an IP address for the interface, turns on conditional debugging for that interface with a VPI/VCI pair of 255/62610, and verifies that debugging has been enabled:

```
Router> enable
Password:
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config) # interface atm 2/0
Router(config-if) # ip address 209.165.201.2 255.255.255.0
Router(config-if) # pvc 255/62610
Router(config-if-atm-vc)# no shutdown
Router(config-if) # exit
Router(config) # exit
2w3d: %SYS-5-CONFIG I: Configured from console by console
Router# debug condition interface atm 2/0 vc 255/62610
Condition 1 set
2w3d: ATM VC Debug: Condition 1, atm-vc 255/62610 AT2/0 triggered, count 1
Router# show debug condition
Condition 1: atm-vc 255/62610 AT2/0 (1 flags triggered)
        Flags: ATM VC
```

The following example shows how to enable Frame Relay conditional debugging on Frame Relay DLCI 105:

Router# debug condition interface serial 4/3 dlci 105 Router# debug frame-relay packet

The following example shows how to disable the conditional debugging on VC. A warning message is displayed when the last condition is removed.

```
Router> enable
Router# no debug condition interface atm 1/0 vc 4335
```

1

This condition is the last interface condition set. Removing all conditions may cause a flood of debugging messages to result, unless specific debugging flags are first removed. Proceed with removal? [yes/no]: **y** Condition 1 has been removed

Command	Description
debug condition	Limits output for some debug commands on the basis of specific conditions.
debug frame-relay	Displays debugging information about the packets received on a Frame Relay interface.
show debug condition	Displays the debugging filters that have been enabled for VoiceXML. applications, ATM-enabled interfaces, or Frame Relay interfaces

# debug condition match-list

To run a filtered debug on a voice call, use the debugconditionmatch-list command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug condition match-list *number* {exact-match| partial-match}

no debug condition match-list number {exact-match| partial-match}

# **Syntax Description**

number	Numeric label that uniquely identifies the match list. Range is 1 to 16. The number for the match list is set using the <b>callfiltermatch-list</b> command.
exact-match	All related debug output is filtered until all conditions in the match list are explicitly met. This is the best choice for most situations because the output is the most concise.
partial-match	No related debug output is filtered until there is a single explicit match failure. As long as zero or more conditions are met, debug output will not be filtered. This choice is useful in debugging call startup problems like digit collection, but is not ideal for many situations because there is much debug output until matches explicitly fail.

#### **Command Default** No default behavior or values

**Command Modes** Privileged EXEC

#### **Command History** Release Modification 12.3(4)T This command was introduced.

# Examples

I

In this output example, the following configuration was used:

```
call filter match-list 1 voice
incoming calling-number 8288807
incoming called-number 6560729
incoming port 7/0:D
```

The following is sample output for the **debugconditionmatch-list1** command. The next several lines match the above conditions.

Router# debug condition match-list 1

07:22:19://-1/3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0:0/vtsp\_gcfm\_incoming\_cond\_notify: add incoming port cond success: 7/0:D 07:22:19://-1/3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0:0/vtsp\_gcfm\_incoming\_cond\_notify: add incoming dialpeer tag success:1 07:22:19://-1/3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0:0/vtsp\_update\_dsm\_stream\_mgr\_filter\_flag: cannot find dsp\_stream\_mgr\_t 07:22:19://-1/3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0/vtsp\_update\_dsm\_stream\_mgr\_filter\_flag: update dsp\_stream\_mgr\_t\_debug\_flag 07:22:19: //49/3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0/vtsp\_update\_dsm\_stream\_mgr\_filter\_flag: .cdb 0x6482C518, CallID=49 07:22:19: //49/3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0/vtsp\_do\_call\_setup\_ind: Call ID=98357, guid=3COB9468-15C8-11D4-8013-000A8A389BA8/VTSP: (7/0:D):0:0/vtsp\_do\_call\_setup\_ind: The table below describes the significant fields shown in the display.

### Table 56: debug condition match-list Field Descriptions

Field	Description
3C0B9468-15C8-11D4-8013-000A8A389BA8	Shows the global unique identifier (GUID).
VTSP:	Identifies the voice telephony service provider (VTSP) module.
(7/0:D):0:0:0	Shows the port name, channel number, DSP slot, and DSP channel number for the VTSP module.

Command	Description
call filter match-list voice	Creates a call filter match list for debugging voice calls.
debug call filter inout	Displays the debug trace inside the GCFM.
show call filter match-list	Displays call filter match lists.

# debug condition standby

I

To filter the output of the **debugstandby**command on the basis of interface and Hot Standby Router Protocol (HSRP) group number, use the**debugconditionstandby**command in privileged EXEC mode. To remove the specified filter condition, use the **no** form of this command.

debug condition standby interface group-number

no debug condition standby interface group-number

Syntax Description	interface	Filters output on the basis of the interface.
	group-number	Filters output on the basis of HSRP group number. The range is 0 to 255 for HSRP Version 1 and 0 to 4095 for HSRP Version 2.
Command Default	All debugging messages for	the <b>debugstandby</b> command aregenerated.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(2)	This command was introduced.
Usage Guidelines	Use the <b>debugconditionsta</b> the <b>debugconditionstandby</b> numbers specified. The inter can be any group (0 to 255	<b>ndby</b> command to restrict the debug output for the <b>debugstandby</b> command. If ycommand is enabled, output is generated only for the interfaces and HSRP group face you specify must be a valid interface capable of supporting HSRP. The group for HSRPv1 and 0 to 4095 for HSRPv2).
	Use the <b>no</b> form of this command to remove the HSRP debug condition. If the last condition is removed, debugging output resumes for all interfaces. You will be asked for confirmation before removing the last condition or all conditions.	
	debugging output resumes f condition or all conditions.	imand to remove the HSRP debug condition. If the last condition is removed, or all interfaces. You will be asked for confirmation before removing the last
	debugging output resumes f condition or all conditions. You can set debug condition during the initialization of a	in and to remove the HSRP debug condition. If the last condition is removed, or all interfaces. You will be asked for confirmation before removing the last is for groups that do not exist, which allows you to capture debug information new group.

### Examples

In the following example, the router displays debugging messages only for Ethernet interface 0/0 that are part of HSRP group 23:

```
Router# debug standby
HSRP debugging is on
Router# debug condition standby ethernet0/0 23
Condition 1 set
00:27:39: HSRP: Et0/0 Grp 23 Hello out 10.0.0.1 Active pri 100 vIP 172.16.6.5
00:27:42: HSRP: Et0/0 Grp 23 Hello out 10.0.0.1 Active pri 100 vIP 172.16.6.5
00:27:45: HSRP: Et0/0 Grp 23 Hello out 10.0.0.1 Active pri 100 vIP 172.16.6.5
00:27:48: HSRP: Et0/0 Grp 23 Hello out 10.0.0.1 Active pri 100 vIP 172.16.6.5
00:27:51: HSRP: Et0/0 Grp 23 Hello out 10.0.0.1 Active pri 100 vIP 172.16.6.5
The following example shows how to remove an HSRP debug condition:
```

```
Router# no debug condition standby ethernet0/0 23
This condition is the last hsrp condition set.
Removing all conditions may cause a flood of debugging
messages to result, unless specific debugging flags
are first removed.
Proceed with removal? [yes/no]: Y
Condition 1 has been removed.
```

Command	Description
debug condition interface	Limits output for some debugging commands based on the interfaces.
debug standby	Displays HSRP state changes.
debug standby errors	Displays error messages related to HSRP.
debug standby events	Displays events related to HSRP.
debug standby events icmp	Displays debugging messages for the HSRP ICMP redirects filter.
debug standby packets	Displays debugging information for packets related to HSRP.

# debug condition voice-port

To display debug output for a specified port, use the **debugconditionvoice-port** command in privileged EXEC mode. To enable debugging messages for all voice ports, use the **no** form of this command.

debug condition voice-port port-number

no debug condition voice-port port-number

Syntax Description	port-number	Voice port for which you want to display all enabled debugging messages.	
		<b>Note</b> Syntax for the <i>port-number</i> argument is platform-dependent; type ? to determine available options for argument syntax.	
Command Default			
	Debugging messages are e	abled for all voice ports.	
Command Modes	Privileged EXEC(#)		
Command History	Release	Modification	
	12.4(6)T	This command was introduced.	
Usage Guidelines	This command filters out of this command is configure To display debugging outp commands are turned on, command is enabled.	bugging output for all voice ports except the port specified in the command. When , the gateway displays debugging messages only for the specified port. , you must first enable the <b>debugvoipapplicationstcappall</b> command. If no <b>debug</b> o debugging messages are displayed even if the <b>debugconditionvoice-port</b>	
	The <b>debugconditionvoice-port</b> command can be configured multiple times to display output for more than one voice port. This command differs from the <b>debugvoipapplicationstcappport</b> command, which can be configured to display output for only one voice port.		
	To display which debug conditions have been set, use the <b>showdebug</b> command.		
	Before disabling condition the logging buffer.	first disable any debugging commands; otherwise output for all ports could flood	
Examples	The following example fil	rs debugging output so that output only for ports 2/1 and 2/3 is displayed:	
	Router# <b>debug conditio</b> Condition 1 set *Mar 1 22:24:15.102:	<pre>voice-port 2/1 Debug: Condition 1, voice-port 2/1 triggered, count 1</pre>	

1

Command	Description
debug sccp all	Displays debugging information for SCCP.
debug voip application stcapp all	Displays debugging information for the components of the STCAPP.
debug voip application stcapp port	Enables STCAPP debugging for a specific port.
show debug	Displays the types of debugging and the debugging conditions that are enabled on your router.

# debug condition vrf

To limit debug output to a specific Virtual Routing and Forwarding (VRF) instance, use the debugconditionvrfcommand in privileged EXEC mode. To remove the debug condition, use the undebug version of the command . debug condition vrf vrf-name undebug condition vrf vrf-name **Syntax Description** Name of a VRF. vrf-name **Command Modes** Privileged EXEC (#) **Command History** Release Modification Cisco IOS XE Release 3.2S This command was introduced. **Usage Guidelines** Use this command to limit debug output to a single VRF. EIGRP does not support the **debugconditionvrf** command. Note **Examples** The following example shows how to limit debugging output to VRF red: Router# debug condition vrf red **Related Commands** Command Description vrf definition Defines a virtual routing and forwarding instance.

1

# debug condition xconnect

To conditionally filter debug messages related to xconnect configurations, use the **debugconditionxconnect** command in privileged EXEC configuration mode. To disable the filtering of xconnect debug messages, use the **no** form of this command.

**debug condition xconnect** {**fib** *type*| **interface** *type number* [*dlci*| **vp** *number*| **vc** *number*]| **peer** *ip-address* **vcid** *vcid*| **segment** *segment-id*}

**no debug condition xconnect** {**fib** *type*| **interface** *type number* [*dlci*| **vp** *number*| **vc** *number*]| **peer** *ip-address* **vcid** *vcid*| **segment** *segment-id*}

syntax Description	fib type	Filters control-plane and data-plane debug messages for the xconnect segment pair specified by matching against the Forwarding Information Base (FIB) Interface Descriptor Block (IDB) information associated with a particular interface on a line card.
	interface type number	Filters control-plane and data-plane debug messages for the xconnect segment pair specified by the interface type and number on a Route Processor.
	dlci	(Optional) The Frame Relay data-link connection identifier (DLCI) for the xconnect segment pair associated with a Frame Relay segment.
	vp number	(Optional) The ATM virtual path (VP) number for the xconnect segment pair associated with an ATM segment.
	vc number	(Optional) The ATM virtual circuit (VC) number for the xconnect segment pair associated with an ATM segment.
	peer	Filters control-plane and data-plane debug messages for the xconnect segment pair specified by the remote peer IP address and the pseudowire virtual circuit ID (VCID).
	ip-address	The IP address of the remote peer router.
	vcid vcid	The VCID of the xconnect pseudowire.
	segment	Filters data-plane debug messages for the xconnect segment pair specified by a segment ID.
	segment-id	The segment ID. The segment ID value can be found in the output of the <b>showssmid</b> command.

**Command Default** Debug messages are not filtered.

Command Modes Privileged EXEC

Comma

nd History	Release	Modification
	12.2(28)SB	This command was introduced.
	15.3(1)S	This command was integrated in Cisco IOS Release 15.3(1)S.

**Usage Guidelines** Use the **debugconditionxconnect** command to specify conditions for filtering the debug messages displayed by related subscriber service switch (SSS), xconnect, and attachment circuit **debug** commands.

**Examples** The following example sets filter conditions that allow related **debug** commands to display debug messages for only the xconnect segment pair specified by the remote peer IP address and the pseudowire VCID:

debug condition xconnect peer 10.0.0.1 vcid 100 The following example sets filter conditions that allow related **debug** commands to display debug messages for only the xconnect segment pair specified by the serial interface number and DLCI:

debug condition xconnect interface serial 0/0 100 The following example sets filter conditions that allow related **debug** commands to display debug messages for only the xconnect segment pair specified by the port mode ATM interface number:

debug condition xconnect interface atm 0/0 The following example sets filter conditions that allow related **debug** commands to display debug messages for only the xconnect segment pair specified by the VP mode ATM interface number:

debug condition xconnect interface atm 0/0 vp 1 The following example sets filter conditions that allow related **debug** commands to display debug messages for only the xconnect segment pair specified by the VC mode ATM interface number:

debug condition xconnect interface atm 0/0 vc 1/40The following example finds the segment ID associated with an L2TPv3 xconnect segment pair and sets filter conditions that allow related **debug** commands to display debug messages for only that xconnect segment pair:

Router# show ssm id ! Segment-ID: 8193 Type: L2TPv3[8] ! Router# debug conditional xconnect segment 8193

٦

Command	Description
debug acircuit	Displays errors and events that occur on the attachment circuits.
debug sss aaa authorization event	Displays messages about AAA authorization events that are part of normal call establishment.
debug sss aaa authorization fsm	Displays information about AAA authorization state changes.
debug sss error	Displays diagnostic information about errors that may occur during SSS call setup.
debug sss event	Displays diagnostic information about SSS call setup events.
debug sss fsm	Displays diagnostic information about the SSS call setup state.
debug xconnect	Displays debug messages related to an xconnect configuration.
show ssm id	Displays SSM information for switched Layer 2 segments.

# debug configuration lock

To enable debugging of the Cisco IOS configuration lock, use the **debugconfigurationlock** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug configuration lock

no debug command lock

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command HistoryReleaseModification12.3(14)TThis command was introduced.12.0(31)SThis command was integrated into Cisco IOS Release 12.0(31)S.12.2(33)SRAThis command was integrated into Cisco IOS Release 12.2(33)SRA.12.2SXThis command is supported in the Cisco IOS Release 12.2SX train. Support<br/>in a specific 12.2SX release of this train depends on your feature set, platform,<br/>and platform hardware.12.2(33)SBThis command was integrated into Cisco IOS Release 12.2(33)SB.

### **Examples**

The following is sample output with **debugconfigurationlock** enabled (assuming that the feature is enabled using the **configurationmodeexclusivemanual** command in global configuration mode):

```
Router# debug configuration lock
Session1 from console
Router# configure terminal lock
Configuration mode locked exclusively. The lock will be cleared once you exit out of
configuration mode using end/exit
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#
Parser : LOCK REQUEST in EXCLUSIVE mode
Parser: <configure terminal lock> - Config. Lock requested by process <3> client <PARSER
Client>
Parser: <configure terminal lock> - Config. Lock acquired successfully !
Router (config) #
Session2 VTY (User from session2 is trying to enter single user config (exclusive) config
mode)
_____
Router# c
onfigure terminal lock
```

Configuration mode locked exclusively by user 'unknown' process '3' from terminal '0'. Please try later.

Command	Description
configuration mode exclusive	Enables single-user (exclusive) access functionality for the Cisco IOS CLI.
show configuration lock	Displays information about the lock status of the running configuration file during a configuration replace operation.

# debug confmodem

To display information associated with the discovery and configuration of the modem attached to the router, use the **debugconfmodem**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug confmodem

no debug confmodem

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

I

**Usage Guidelines** The **debugconfmodem** command is used in debugging configurations that use the **modemautoconfig** command.

**Examples** The following is sample output from the**debugconfmodem**command. In the first three lines, the router is searching for a speed at which it can communicate with the modem. The remaining lines show the actual sending of the modem command.

Router# debug confmodem TTY4:detection speed(115200) response -----TTY4:detection speed(57600) response -----TTY4:detection speed(38400) response ---OK---TTY4:Modem command: --AT&F&C1&D2S180=3S190=1S0=1--TTY4: Modem configuration succeeded TTY4: Done with modem configuration

# debug conn

To display information from the connection manager, time-division multiplexing (TDM) and digital signal processor (DSP) clients, use the debugconn command in privileged EXEC mode. To disable debugging output, use the no form of this command. debug conn no debug conn **Syntax Description** This command has no arguments or keywords. **Command Default** No default behavior or values **Command Modes** Privileged EXEC **Command History** Release Modification 12.1(5)XM This command is supported on Cisco 3600 series routers.

12.2(4)T	This command is supported on Cisco 2600 series routers and was integrated into Cisco IOS Release 12.2(4)T.

### **Examples**

The following example shows connection manager debugging output:

```
Router# debug conn
Connection Manager debugging is on
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# connect conn1 t1 3/0 1 t1 4/0 1
```

```
Router(config-tdm-conn) # exit

# debug content-scan

Note

Effective with Cisco IOS Release 15.4(2)T, the **debug content-scan** command is replaced by the **debug cws** command. See the **debug cws** command for more information.

To enable content scan debugging, use the **debug content-scan** command in privileged EXEC mode. To disable content scan debugging, use the **no** form of this command.

**debug content-scan** {access-list {access-list-number | extended-access-list-number | access-list-name}}| control-plane| errors | events | function-trace | packet-path}

**no debug content-scan** {access-list {access-list-number | extended-access-list-number | access-list-name}}| control-plane | errors | events | function-trace | packet-path}

access-list	Enables debugging of content scan access control lists (ACLs).
access-list-number	Access list number. The range is from 1 to 199.
extended-access-list-number	Extended access list number. The range is from 1300 to 2699.
access-list-number	Access list name.
control-plane	Enables debugging of content scan control plane messages.
errors	Enables debugging of content scan errors.
events	Enables debugging of content scan events.
function-trace	Enables debugging of content scan function trace.
packet-path	Enables debugging of content scan packet path.

**Syntax Description** 

# **Command Modes** Privileged EXEC (#)

 Command History
 Release
 Modification

 15.2(1)T1
 This command was introduced.

 15.2(4)M
 This command was modified. The access-list and control-plane keywords and the access-list-number, extended-access-list-number, and access-list-name arguments were added.

 15.4(2)T
 This command was replaced by the debug cws command.

**Usage Guidelines** The content scanning process redirects client web traffic to the ScanSafe web server. You must configure ACLs by using the ip access-list extended command before you enable the debugging of content-scan ACLs. The **debug content-scan access-list** command enables the conditional debugging for content scan. The conditional debugging does not work for existing sessions when you enable content scan; the ACL match occurs after the first packet is received. **Examples** The following example shows how to enable extended ACL 149 and the debugging of content scan ACL 149: Device (config) # ip access-list extended 149 Device(config-ext-nacl) # permit ip host 10.1.0.1 Device(config-ext-nacl)# end Device# debug content-scan access-list 149 Content-scan ACL based conditional debugging is on The following is sample output from the **debug content-scan access-list 149** command: Device# debug content-scan access-list 149 Content-scan ACL based conditional debugging is on Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH: Checking if it's a web trafficSrc IP:10.1.0.1(3646), Dst IP: 198.51.100.195(80), index:4 Feb 19 19:01:02.887: Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH: Populating user/usergroup infoSrc IP:10.1.0.1(3646), Dst IP: 198.51.100.195(80) Feb 19 19:01:02.887: CONT-SCAN-EVE:Username Received: defpmuser Src IP:10.1.0.1(E3E) Dst IP: 198.51.100.195(50) Pak:2033BCA0 Feb 19 19:01:02.887: CONT-SCAN-EVE:Usergroup from pmap Src IP:10.1.0.1(E3E) Dst IP: 198.51.100.195(50) Pak:2033BCA0 Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH: Protocol not configuredSrc IP:10.1.0.1(3646), Dst IP: 198.51.100.195(80) Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:Adding session into HashSrc IP:10.1.0.1(3646), Dst IP: 198.51.100.195(80) Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:Free port equals source port for src\_ip 10.1.0.1(3646) dst ip 198.51.100.195(80) 2033BCA0 Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:session enqueued 21ED1DE0 for src ip 10.1.0.1(3646) dst ip 198.51.100.195(80) Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:Inserting Ingress session 21ED1DE0 in hash table at 1646 Src IP:10.1.0.1(3646), Dst IP: 198.51.100.195(80) Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:Inserting Egress session 21ED1DE0 in hash table at 1629 Src IP:10.1.0.1(3646), Dst IP: 198.51.100.195(80) Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:timer wheel started for 21ED1DE0 for src ip 10.1.0.1 (3646) Feb 19 19:01:02.887: CONT-SCAN-EVE:1 Usergroups from auth proxy Src IP:10.1.0.1(E3E), Dst IP: 198.51.100.195(50), cs entry:21ED1DE0 Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:conx 21EE2024 ingress fd 1073741847 Feb 19 19:01:02.887: CONT-SCAN-PAK-PATH:CONT SCAN: received fdl: 1073741847 and tcp flags = 0x2, payload len = 0Feb 19 19:01:02.887: CONT-SCAN-EVE:1 Usergroups found Src IP:10.1.0.1(E3E), Dst IP: 198.51.100.195(50), cs entry:21ED1DE0

Command	Description
content-scan out	Enables content scanning on an egress interface.
content-scan whitelisting	Enables whitelisting of incoming traffic and enters content-scan whitelisting configuration mode.

ſ

Command	Description
show content-scan	Displays content scan information.

# debug control-plane

To display debugging output from the control-plane routines, use the **debugcontrolplane** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug control-plane [all| host| port-filtering| queue-thresholding| log]

no debug control-plane [all| host| port-filtering| queue-thresholding| log]

Syntax Description	all	(Optional) Displays all events on all control-plane interfaces.
	host	(Optional) Displays all events on the control-plane host interface.
	port-filtering	(Optional) Displays TCP/IP protocol port-filtering events.
	queue-thresholding	(Optional) Displays TCP/IP protocol queue-thresholding events.
	log	(Optional) Displays control-plane logging events.

**Command Default** The default is debugging off.

**Command Modes** Privileged EXEC

<b>Command History</b>	Release	Moditication
	12.4(4)T	This command was introduced.
	12.4(6)T	The <b>log</b> keyword was added to support control plane logging.

**Usage Guidelines** Use the **debugcontrolplane** command if you want to display the debugging output from the control-plane routines.

**Examples** The following example show a display from the **debugcontrol-plane** command:

Router# **debug control-plane** Control-plane infrastructure events debugging is on Router# cp\_receive\_classify - marking pak host ingress pak marked cef-exception The following example shows a display from the **debugcontrol-plane** command using the port-filtering option:

Router# debug control-plane port-filtering

TCP/IP Port filtering events debugging is on Dropped UDP dport 1243 sport 62134 saddr 209.165.200.225 The table below describes the significant fields shown in the display.

### Table 57: debug control plane field descriptions

Field	Description
dport	UPD destination port.
sport	UPD source port.
saddr	Source address of the IP packets.

# **Related Commands**

Command	Description
clear control-plane	Clears packet counters for control-plane interfaces and subinterfaces.
control-plane	Enters control-plane configuration mode, which allows users to associate or modify attributes or parameters that are associated with the control plane of the device.
show control-plane cef-exception counters	Displays the control plane packet counters for the control plane CEF-exception subinterface.
show control-plane cef-exception features	Displays the configured features for the control plane CEF-exception subinterface.
show control-plane counters	Displays the control-plane packet counters for the aggregate control-plane interface.
show control-plane features	Displays the configured features for the aggregate control-plane interface.
show control-plane host counters	Displays the control plane packet counters for the control plane host subinterface.
show control-plane host features	Displays the configured features for the control plane host subinterface.
show control-plane host open-ports	Displays a list of open TCP/UDP ports that are registered with the port-filter database.

show control-plane transit counters	Displays the control plane packet counters for the
	control plane transit subinterface.

# debug cops

To display a one-line summary of each Common Open Policy Service (COPS) message sent from and received by the router, use the **debugcops** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cops [detail] no debug cops [detail]

Syntax Description	detail	(Optional) Displays additional debug information,
		including the contents of COPS and Resource
		Reservation Protocol (RSVP) messages.

**Command Default** COPS process debugging is not enabled.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(1)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
Usage Guidelines	To generate a complete reco enter the additional comma	ord of the policy process, enter this command and, after entering a carriage return, nd debug ip rsvp policy.
Examples	This first example displays events.	the one-line COPS message summaries, as the router goes through six different
	Router# <b>debug cops</b> COPS debugging is on	
Examples	The router becomes config	ured to communicate with a policy server:
	Router# configure termi Enter configuration com Router(config)# ip rsvp Router(config)# 15:13:45:COPS: 0pened T 15:13:45:COPS: ** SENDI 15:13:45:COPS: ** RECEL 15:13:45:COPS: ** RECEL	<pre>.nal mands, one per line. End with CNTL/Z. policy cops servers 2.0.0.1 CCP connection to 2.0.0.1/3288 NG MESSAGE ** age, Client-type:1, Length:28. Handle:[NONE] VED MESSAGE **</pre>

	15:13:45:COPS CAT message, Client-type:1, Length:16. Handle:[NONE] Router(config)#
Examples	The router receives a Path message:
	15:13:53:COPS:** SENDING MESSAGE ** 15:13:53:COPS REQ message, Client-type:1, Length:216. Handle:[ 00 00 04 01] 15:13:53:COPS:** RECEIVED MESSAGE ** 15:13:53:COPS DEC message, Client-type:1, Length:104. Handle:[ 00 00 04 01] Router(config)#
Examples	The router receives a unicast FF Resv message:
	<pre>15:14:00:COPS:** SENDING MESSAGE ** 15:14:00:COPS REQ message, Client-type:1, Length:148. Handle:[ 00 00 05 01] 15:14:00:COPS:** RECEIVED MESSAGE ** 15:14:00:COPS DEC message, Client-type:1, Length:64. To see an example where the **debugcops** command is used along with the **debugiprsvppolicy** command, refer to the second example of the **debugiprsvppolicy** command.

Command	Description
debug ip rsvp policy	Displays debugging messages for RSVP policy processing.

# debug cot

To display information about the Continuity Test (COT) functionality, use the debugcot command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug cot {api| dsp| queue| detail}

no debug cot {api| dsp| queue| detail}

## **Syntax Description**

Г

api	Displays information about the COT application programming interface (API).
dsp	Displays information related to the COT/Digital Signal Processor configuration (DSP) interface. Typical DSP functions include data modems, voice codecs, fax modems and codecs, and low-level signaling such as channel-associated signaling (CAS)/R2.
queue	Display information related to the COT internal queue.
detail	Display information about COT internal detail; summary of the <b>debugcotapi</b> , <b>debugcotdsp</b> , and <b>debugcotqueue</b> commands.

#### **Command Modes** Privileged EXEC

### **Command History**

Release	Modification
11.3(7)	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

## **Examples**

The following is sample output from the **debugcotapi** command:

Router# debug cot api COT API debugging is on 08:29:55: cot\_request\_handler(): CDB@0x60DEDE14, req(COT\_CHECK\_TONE\_ON): shelf 0 slot 0 appl\_no 1 ds0 1 freqTX 2010 freqRX 1780 key 0xFFF1 duration 60000 08:29:55: 08:29:55: The table below describes the significant fields shown in the display.

Field	Description
CDB	Internal controller information.
req	Type of COT operation requested.
shelf	Shelf ID of the COT operation request.
slot	Designates the slot number, 1 to 4.
appl-no	Hardware unit that provides the external interface connections from a router to the network.
ds0	Number of the COT operation request.
key	COT operation identifier.
duration	Timeout duration of the COT operation.
freqTX	Requested transmit tone frequency.
freqRX	Requested receive tone frequency.

The following is sample output from the **debugcotdsp** command:

```
Router# debug cot dsp
Router#
00:10:42:COT:DSP (1/1) Allocated
00:10:43:In cot_callback
00:10:43: returned key 0xFFF1, status = 0
00:10:43:COT:Received DSP Q Event
00:10:43:COT:DSP (1/1) Done
00:10:43:COT:DSP (1/1) De-allocated
The table below describes the significant fields shown in the display.
```

### Table 59: debug cot dsp Field Descriptions

I

Field	Description
DSP (1/1) Allocated	Slot and port of the DSP allocated for the COT operation.
Received DSP Q Event	Indicates the COT subsystem received an event from the DSP.
DSP (1/1) Done	Slot and port of the DSP transitioning to IDLE state.
DSP (1/1) De-allocated	Slot and port of the DSP de-allocated after the completion of the COT operation.

The following is sample output from the debugcotqueue command:

```
Router# debug cot queue
Router#
00:11:26:COT(0x60EBB48C):Adding new request (0x61123DBC) to In
Progress Q
00:11:26:COT(0x60EBB48C):Adding COT(0x61123DBC) to the Q head
00:11:27:In cot_callback
00:11:27: returned key 0xFFF1, status = 0
The table below describes the significant fields shown in the display.
```

### Table 60: debug cot api Field Descriptions

Field	Description

# debug cpp event

Note

Effective with Release 12.3(4)T, the **debugcppevent** command is no longer available in Cisco IOS 12.3(T) releases.

To display general Combinet Proprietary Protocol (CPP) events, use the **debugcppevent** command in privileged EXEC mode. The **no**form of this command disables debugging output.

debug cpp event

no debug cpp event

**Syntax Description** This command has no arguments or keywords.

Command History	Release	Modification
	11.2	This command was introduced.
	12.3(4)T	This command is no longer available in Cisco IOS 12.(3)T releases.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** CPP allows a router to engage in negotiation over an ISDN B channel to establish connections with a Combinet bridge.

The debugcppevent command displays events such as CPP sequencing, group creation, and keepalives.

**Examples** One or more of the messages in the table below appear when you use the **debugcppevent** command. Each message begins with the short name of the interface the event occurred on (for example, SERIAL0:1 or BRI0:1) and might contain one or more packet sequence numbers or remote site names.

### Table 61: debug cpp event Messages

Message	Description
BRI0:1: negotiation complete	Call was set up on the interface (in this example, BRI0:1).
BRI0:1: negotiation timed out	Call timed out.
BRI0:1: sending negotiation packet	Negotiation packet was sent to set up the call.

1

Message	Description
BRI0:1: out of sequence packet - got 10, range 1 8	Packet was received that was out of sequence. The first number displayed in the message is the sequence number received, and the following numbers are the range of valid sequence numbers.
BRI0:1: Sequence timer expired - Lost 11 Trying sequence 12	Timer expired before the packet was received. The first number displayed in the message is the sequence number of the packet that was lost, and the second number is the next sequence number.
BRI0:1: Line Integrity Violation	Router fails to maintain keepalives.
BRI0:1: create cpp group ber19 destroyed cpp group ber19	Dialer group is created on the remote site (in this example, ber19).

Command	Description
debug cpp negotiation	Displays CPP negotiation events.
debug cpp packet	Displays CPP packets.

# debug cpp negotiation

Note

Effective with Release 12.3(4)T, the **debugcppnegotiation** command is no longer available in Cisco IOS 12.3T releases.

To display Combinet Proprietary Protocol (CPP) negotiation events, use the **debugcppnegotiation**command in privileged EXEC mode. The **no**form of this command disables debugging output.

debug cpp negotiation

no debug cpp negotiation

**Syntax Description** This command has no arguments or keywords.

Command History	Release	Modification
	11.2	This command was introduced.
	12.3(4)T	This command is no longer available in Cisco IOS 12.3T releases.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** CPP allows a router to engage in negotiation over an ISDN B channel to establish connections with a Combinet bridge.

The **debugcppnegotiation**command displays events such as the type of packet and packet size being sent.

**Examples** The following is sample output from the **debugcppnegotiation** command. In this example, a sample connection is shown.

Router# debug cpp negotiation %LINK-3-UPDOWN: Interface BRI0: B-Channel 2, changed state to down %LINK-3-UPDOWN: Interface BRI0, changed state to up %SYS-5-CONFIG\_I: Configured from console by console %LINK-3-UPDOWN: Interface BRI0: B-Channel 1, changed state to up BR0:1:(I) NEG packet - len 77 attempting proto:2 ether id:0040.f902.c7b4 port 1 number:5559876 port 2 number:5559876 origination port:1 remote name:ber19 password is correct The table below describes the significant fields in the display.

1

# Table 62: debug CPP negotiation Field Descriptions

Field	Description
BR0:1 (I) NEG packet - len 77	Interface name, packet type, and packet size.
attempting proto:	CPP protocol type.
ether id:	Ethernet address of the destination router.
port 1 number:	ISDN phone number of remote B channel #1.
port 2 number:	ISDN phone number of remote B channel #2.
origination port:	B channel 1 or 2 called.
remote name:	Remote site name to which this call is connecting.
password is correct	Password is accepted so the connection is established.

Command	Description
debug cot	Displays information about the COT functionality.
debug cpp packet	Displays CPP packets.

# debug cpp packet

Note

Effective with Release 12.3(4)T, the **debugcpppacket**command is no longer available in Cisco IOS 12.3T Releases.

To display Combinet Proprietary Protocol (CPP) packets, use the **debugcpppacket**command in privileged EXEC mode. The **no**form of this command disables debugging output.

debug cpp packet

no debug cpp packet

**Syntax Description** This command has no arguments or keywords.

Command History	Release	Modification
	11.2	This command was introduced.
	12.3(4)T	This command is no longer available in Cisco IOS 12.3T releases.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** CPP allows a router to engage in negotiation over an ISDN B channel to establish connections with a Combinet bridge.

The debugcpppacketcommand displays the hexadecimal values of the packets.

**Examples** The following is sample output from the **debugcpppacket** command. This example shows the interface name, packet type, packet size, and the hexadecimal values of the packet.

Router# debug cpp packet BR0:1:input packet - len 60 00 00 00 00 00 00 00 40 F9 02 C7 B4 08 0.!6 00 01 08 00 06 04 00 02 00 40 F9 02 C7 B4 83 6C A1 02!!! Success rate is 80 percent (4/5), round-trip min/avg/max = 64/66/68 ms BR0:1 output packet - len 116 06 00 00 40 F9 02 C7 B4 00 00 0C 3E 12 3A 08 00 45 00 00 64 00 01 00 00 FF 01 72 BB 83 6C A1 01

Command	Description
debug cot	Displays information about the COT functionality.
debug cpp negotiation	Displays CPP negotiation events.
#### debug credentials

To set debugging on the credentials service that runs between the Cisco Unified Survivable Site Remote Telephony (Cisco Unified SRST) router and Cisco CallManager, use the **debugcredentials** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug credentials no debug credentials

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

 Command History
 Cisco IOS Release
 Modification

 12.3(14)T
 This command was introduced for Cisco SRST 3.3.

**Use this command to monitor Cisco CallManager while it requests certificates from the Cisco Unified SRST** router.

**Examples** The following is sample output showing the credentials service that runs between the Cisco Unified SRST router and Cisco CallManager. The credentials service provides Cisco CallManager with the certificate from the Cisco Unified SRST router.

```
Router# debug credentials
Credentials server debugging is enabled
Router#
May 25 12:08:17.944: Credentials service: Start TLS Handshake 1 10.5.43.174 4374
May 25 12:08:17.948: Credentials service: TLS Handshake returns OPSSLReadWouldBlockErr
May 25 12:08:18.948: Credentials service: TLS Handshake returns OPSSLReadWouldBlockErr
May 25 12:08:19.948: Credentials service: TLS Handshake returns OPSSLReadWouldBlockErr
May 25 12:08:20.964: Credentials service: TLS Handshake completes
The table below describes the significant fields shown in the display.
```

#### Table 63: debug credentials Field Descriptions

Field	Description
Start TLS Handshake 1 10.5.43.174 4374	Indicates the beginning of the TLS handshake between the secure SRST router and Cisco CallManager. In this example, 1 indicates the socket, 10.5.43.174 is the IP address, and 4374 is the port of Cisco CallManager.
TLS Handshake returns OPSSLReadWouldBlockErr	Indicates that the handshake is in process.

1

Field	Description
TLS Handshake completes	Indicates that the TLS handshake has finished and that the Cisco CallManager has received the secure SRST device certificate.

#### **Related Commands**

Command	Description
credentials (SRST)	Provides the Cisco Unified SRST router certificate to Cisco CallManager and enters credentials configuration mode.
ip source-address (credentials)	Enables the Cisco Unified SRST router to receive messages from Cisco CallManager through the specified IP address and port.
show credentials	Displays the credentials settings on the Cisco Unified SRST router that are supplied to Cisco CallManager for use during secure SRST fallback.
show debugging	Displays information about the types of debugging that are enabled for your router.
trustpoint (credentials)	Specifies the name of the trustpoint that is to be associated with the Cisco Unified SRST router certificate.

#### debug crm

To troubleshoot the Carrier Resource Manager (CRM), use the **debugerm** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crm [all| default| detail| error [call [informational]| software [informational]]| function| inout] no debug crm

#### **Syntax Description**

all	(Optional) Displays all CRM debugging messages.
default	(Optional) Displays detail, error, and inout information. This option also runs if no keywords are added.
detail	(Optional) Displays non-inout information related to call processing, such as call updates or call acceptance checking.
error	(Optional) Displays CRM error messages.
call	(Optional) Displays call processing errors.
informational	(Optional) Displays minor errors and major errors. Without the <b>informational</b> keyword, only major errors are displayed.
software	(Optional) Displays software errors.
function	(Optional) Displays CRM function names and exit points from each function so that call processing can be traced within the CRM subsystem.
inout	(Optional) Displays information from the functions that form the external interfaces of CRM to other modules or subsystems.

#### **Command Default** Debugging is not enabled.

**Command Modes** Privileged EXEC

**Command History** 

Release	Modification
12.2(11)T	This command was introduced.

٦

	Release	Modification	
	12.3(8)T	The all, default, detail, error, call, informational, software, function, and inoutkeywords were added.	
Usage Guidelines	Disable console loggin command generates a	ng and use buffered logging before using the <b>debugcrm</b> command. Using the <b>debugcrm</b> large volume of debugs, which can affect router performance.	
Examples	The following is sample output from the <b>debugcrmall</b> command for an incoming ISDN call on a trunk group:		
	Router# <b>debug crm</b>	all	
	01:21:23: //-1/xxx 01:21:23: //-1/xxx RouteLabel=202 Capacity Update, Max Capacity m 01:21:23: //-1/xxx Increment the CarrierID=2023 Update is for 01:21:23: //-1/xxx IncomingVoiceC Router# 01:21:48: //-1/xxx	<pre>xxxxxxxx/CRM/crm_send_periodic_update: xxxxxxxx/CRM/print_event: 3, CarrierType=TDM, EventType=Single RouteLabel Update, EventReason=Both ask 0x0000001F, Current Capacity Mask 0x0000001F xxxxxxxx/CRM/crm_call_update: call count , TrunkGroupLabel=2023 TrunkGroupLabel, Mask=0x00000001 xxxxxxxxx/CRM/crm_call_update: alls=1 xxxxxxxx/CRM/crm send periodic update:</pre>	
	01:21:48: //-1/xxx RouteLabel=202 Capacity Update, Max Capacity m 01:22:13: //-1/xxx 01:22:13: //-1/xxx	<pre>xxxxxxxx/CRM/print_event: 3, CarrierType=TDM, EventType=Single RouteLabel Update, EventReason=Both ask 0x0000001F, Current Capacity Mask 0x0000001F xxxxxxxx/CRM/crm_send_periodic_update: xxxxxxxxx/CRM/print_event:</pre>	
	Capacity Update, Max Capacity m Router# 01:22:18: //-1/xxx Decrement the CarrierID=2023 Update is for 01:22:18: //-1/xxx	<pre>XXXXXXXX/CRM/print_event: 3, CarrierType=TDM, EventType=Single RouteLabel Update, EventReason=Both ask 0x0000001F, Current Capacity Mask 0x0000001F xxxxxxxx/CRM/crm_call_update: call count , TrunkGroupLabel=2023 TrunkGroupLabel, Mask=0x00000001 xxxxxxxx/CRM/crm_call_update: alls=0</pre>	
	The table below desci	ribes the significant fields shown in the display.	

Field	Description
//-1/xxxxxxxxx/CRM/print_event:	The format of this message is //callid/GUID/CRM/function name:
	• CallEntry ID is -1. This indicates that the CallEntry ID is unavailable.
	• GUID is xxxxxxxxxxxxxxxxx. This indicates that the GUID is unavailable.
	• CRM is the module name.
	• Theprint_event:field shows that the CRM is showing the print event function.
RouteLabel	Either the trunk group label or carrier ID.
CarrierType	Indicates the type of trunk.
EventType	Indicates if a single route or all routes are updated.
EventReason	Shows the reason for this event being sent.

#### Table 64: debug crm all Field Descriptions

#### **Related Commands**

ſ

Command	Description
max-calls	Specifies the maximum number of calls the trunk group can handle.

#### debug crypto ace b2b

To enable IPSec VPN SPA debugging for a Blade Failure Group, use the debug crypto ace b2b command in privileged EXEC mode.

#### debug crypto ace b2b

- **Command Default** No default behavior or values.
- **Command Modes** Privileged EXEC (#)

# Command History Release Modification 12.2(18)SXE2 This command was introduced. 12.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA. 12.2SX This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

#### **Examples**

The following example enables IPSec VPN SPA debugging for a Blade Failure Group:

Router# **debug crypto ace b2b** ACE B2B Failover debugging is on

#### **Related Commands**

Command	Description
linecard-group feature card	Assigns a group ID to a Blade Failure Group.
show crypto ace redundancy	Displays information about a Blade Failure Group.
show redundancy linecard-group	Displays the components of a Blade Failure Group.

# debug crypto ace boot

To enable ACE boot API debugging, use the debug crypto ace boot command in privileged EXEC mode. To disable ACE boot API debugging, use the **no** form of this command.

debug crypto ace boot

no debug crypto ace boot

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

I

The following example enables ACE boot API debugging:

Router# **debug crypto ace boot** ACE Boot debugging is on

## debug crypto ace cfgmon

To enable ACE CFGMON transactions debugging, use the debug crypto ace cfgmon command in privileged EXEC mode. To disable ACE CFGMON transactions debugging, use the **no** form of this command.

debug crypto ace cfgmon

no debug crypto ace cfgmon

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** The following example enables ACE CFGMON transaction debugging:

Router# **debug crypto ace cfgmon** ACE CFGMON Transactions debugging is on

	To enable ACE Crypto engine command in privileged EXEC <b>no</b> form of this command.	congestion manager debugging, use the debug crypto ace congestion-mgr mode. To disable ACE Crypto engine congestion manager debugging, use the	

Router# **debug crypto ace congestion-mgr** ACE Crypto Engine Congestion Manager debugging is on

## debug crypto ace dpd

To enable ACE DPD debugging, use the debug crypto ace dpd command in privileged EXEC mode. To disable ACE DPD debugging, use the **no** form of this command.

debug crypto ace dpd

no debug crypto ace dpd

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

The following example enables ACE DPD debugging:

Router# **debug crypto ace dpd** ACE-DPD debugging is on

#### debug crypto ace error

To enable error logging debugging, use the debug crypto ace error command in privileged EXEC mode. To disable ACE error logging debugging, use the **no** form of this command.

debug crypto ace error

no debug crypto ace error

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

I

The following example enables error log debugging:

Router# **debug crypto ace error** ACE Error logging debugging is on

## debug crypto ace hapi

To enable ACE HAPI transactions debugging, use the debug crypto ace hapi command in privileged EXEC mode. To disable ACE HAPI transactions debugging, use the **no** form of this command.

debug crypto ace hapi

no debug crypto ace hapi

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** The following example enables ACE HAPI transaction debugging:

Router# **debug crypto ace hapi** ACE HAPI transactions debugging is on

# debug crypto ace ikea

To enable ACE IKEA transactions debugging, use the debug crypto ace ikea command in privileged EXEC mode. To disable ACE IKEA transactions debugging, use the **no** form of this command.

debug crypto ace ikea

no debug crypto ace ikea

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

Examples

I

The following example enables ACE IKEA transaction debugging:

Router# **debug crypto ace ikea** ACE IKEA transactions debugging is on

## debug crypto ace invspi

To enable ACE invalid SPI debugging, use the debug crypto ace invspi command in privileged EXEC mode. To disable ACE invalid SPI debugging, use the **no** form of this command.

debug crypto ace invspi

no debug crypto ace invspi

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** The following example enables ACE invalid SPI debugging:

Router# **debug crypto ace invspi** ACE Invalid SPI debugging is on

## debug crypto ace ipd

To enable ACE IPD debugging, use the debug crypto ace ipd command in privileged EXEC mode. To disable ACE IPD debugging, use the **no** form of this command.

debug crypto ace ipd

no debug crypto ace ipd

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

I

The following example enables ACE IPD debugging:

Router# **debug crypto ace ipd** ACE IPD debugging is on

## debug crypto ace mace

To enable multi-ACE messages debugging, use the debug crypto ace mace command in privileged EXEC mode. To disable multi-ACE messages debugging, use the **no** form of this command.

debug crypto ace mace

no debug crypto ace mace

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** The following example enab

The following example enables multi-ACE debugging:

Router# **debug crypto ace mace** MULTI-ACE messages debugging is on

# debug crypto ace pcp

To enable ACE PCP transactions debugging, use the debug crypto ace pcp command in privileged EXEC mode. To disable ACE PCP transaction debugging, use the **no** form of this command.

debug crypto ace pcp

no debug crypto ace pcp

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

<b>Command History</b>	Release	Modification
	12.2(33)SXI5	This command was introduced.

Examples

I

The following example enables ACE PCP transactions debugging:

Router# **debug crypto ace pcp** ACE PCP Transactions debugging is on

## debug crypto ace polo

To enable ACE policy loader debugging, use the debug crypto ace polo command in privileged EXEC mode. To disable ACE policy loader debugging, use the **no** form of this command.

debug crypto ace polo

no debug crypto ace polo

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** The following example enables ACE policy loader debugging:

Router# **debug crypto ace polo** ACE Policy Loader debugging is on

#### debug crypto ace propcfg

To enable ACE propagate configuration debugging, use the debug crypto ace properfy command in privileged EXEC mode. To disable ACE propagate configuration debugging, use the **no** form of this command.

debug crypto ace propcfg

no debug crypto ace propcfg

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

Examples

I

The following example enables ACE propagate configuration debugging:

Router# **debug crypto ace propcfg** ACE Propagate Config debugging is on

## debug crypto ace qos

To enable ACE QoS debugging, use the debug crypto ace qos command in privileged EXEC mode. To disable ACE QoS debugging, use the **no** form of this command.

debug crypto ace qos

no debug crypto ace qos

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

The following example enables ACE QoS debugging:

Router# **debug crypto ace qos** ACE QoS debugging is on

#### debug crypto ace rcon

To enable ACE RCON messages debugging, use the debug crypto ace rcon command in privileged EXEC mode. To disable ACE RCON messages debugging, use the **no** form of this command.

debug crypto ace rcon

no debug crypto ace rcon

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

I

The following example enables ACE RCON messages debugging:

Router# **debug crypto ace rcon** ACE RCON messages debugging is on

## debug crypto ace redundancy

To enable ACE HA debugging, use the debug crypto ace redundancy command in privileged EXEC mode. To disable ACE HA debugging, use the **no** form of this command.

debug crypto ace redundancy

no debug crypto ace redundancy

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** The following example enables ACE HA debugging:

Router# **debug crypto ace redundancy** ACE HA debugging is on

## debug crypto ace spi

To enable ACE SPI debugging, use the debug crypto ace spi command in privileged EXEC mode. To disable ACE SPI debugging, use the **no** form of this command.

debug crypto ace spi

no debug crypto ace spi

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

**Examples** 

I

The following example enables ACE SPI debugging:

Router# **debug crypto ace spi** ACE SPI debugging is on

# debug crypto ace stats

To enable ACE stats module debugging, use the debug crypto ace stats command in privileged EXEC mode. To disable ACE stats module debugging, use the **no** form of this command.

debug crypto ace stats

no debug crypto ace stats

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SXI5	This command was introduced.

Examples

The following example enables ACE stats module debugging:

Router# **debug crypto ace stats** ACE Stats Module debugging is on

# debug crypto ace syslog

To enable ACE syslog messages debugging, use the debug crypto ace syslog command in privileged EXEC mode. To disable ACE syslog messages debugging, use the **no** form of this command.

debug crypto ace syslog

no debug crypto ace syslog

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification	
	12.2(33)SXI5	This command was introduced.	

**Examples** 

I

The following example enables ACE syslog messages debugging:

Router# **debug crypto ace syslog** ACE Syslog messages debugging is on

## debug crypto ace tftp

To enable ACE TFTP boot debugging, use the debug crypto ace tftp command in privileged EXEC mode. To disable ACE TFTP boot debugging, use the **no** form of this command.

debug crypto ace tftp

no debug crypto ace tftp

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification	
	12.2(33)SXI5	This command was introduced.	

**Examples** 

The following example enables ACE TFTP boot debugging:

Router# **debug crypto ace tftp** ACE TFTP Boot debugging is on

# debug crypto ace topn

To enable ACE-TOPN-HELPER debugging, use the debug crypto ace topn command in privileged EXEC mode. To disable ACE-TOPN-HELPER debugging, use the **no** form of this command.

debug crypto ace topn

no debug crypto ace topn

- **Syntax Description** This command has no arguments or keywords.
- Command Default None
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification	
	12.2(33)SXI5	This command was introduced.	

**Examples** 

I

The following example enables ACE-TOPN-HELPER debugging:

Router# **debug crypto ace topn** ACE-TOPN-HELPER debugging is on

## debug crypto ace warning

To enable ACE warning log debugging, use the debug crypto ace warning command in privileged EXEC mode. To disable ACE warning logging debugging, use the **no** form of this command.

debug crypto ace warning

no debug crypto ace warning

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification	
	12.2(33)SXI5	This command was introduced.	

**Examples** The following example enables ACE warning log debugging:

Router# **debug crypto ace warning** ACE Warning logging debugging is on

#### debug crypto condition unmatched

To display crypto conditional debug messages when context information is unavailable to check against debug conditions, use the debugcryptoconditionunmatched command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug crypto condition unmatched [isakmp| ipsec| ikev2| engine| gdoi-group] no debug crypto condition unmatched [isakmp| ipsec| ikev2| engine| gdoi-group]

Syntax Description	isakmp   ipsec   ikev2   engine   gdoi-group	(Optional) One or more of these keywords can be enabled to display debug messages for the specified areas. If none of these keywords are entered, debug messages for all crypto areas will be shown.
Command Default	Debug messages that do not have context information printed.	to match any debug conditions (filters) will not be

#### **Command Modes** Privileged EXEC

Comm

and History	Release	Modification
	12.3(2)T	This command was introduced.
	12.2(18)SXD	This command was integrated into Cisco IOS Release 12.2(18)SXD.
	15.1(3)T	This command was modified. The <b>gdoi-group</b> keyword was replaced by the <b>group</b> keyword of the <b>debugcryptogdoicondition</b> command.
	Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.

**Usage Guidelines** After the debugcryptocondition command has been enabled, you can use the debugcryptoconditionunmatched command to define whether the debug output is being printed when no context information is available in the code to check against the debug filters. For example, if the crypto engine's connection-ID is the filter that the debug conditions are being checked against, the debugcryptoconditionunmatched command displays debug messages in the early negotiation phase when a connection-ID is unavailable to check against debug conditions. **Examples** 

The following example shows how to enable debug messages for all crypto-related areas:

Router# debug crypto condition unmatched

٦

#### **Related Commands**

Command	Description
debug crypto gdoi condition	Defines conditional debug filters for GDOI.
debug crypto condition	Defines conditional debug filters.
show crypto debug-condition	Displays crypto debug conditions that have already been enabled in the router.
show crypto ipsec sa	Displays the settings used by current SAs.
show crypto isakmp sa	Displays all current IKE SAs at a peer.

# debug crypto ctcp

ſ

	To display information about a Cisco Tunnel Control Protocol (cTCP) session, use the <b>debugcryptoctcp</b> command in privileged EXEC mode. To turn off debugging, use the <b>no</b> form of this command		
debug crypto ctcp no debug crypto ctcp			
Syntax Description	This command has no arguments or keywords.		
Command Default	Debugging is turned off.		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	12.4(9)T	This command was intro	oduced.
	12.2SX	This command is suppor a specific 12.2SX releas and platform hardware.	ted in the Cisco IOS Release 12.2SX train. Support in e of this train depends on your feature set, platform,
Usage Guidelines Examples	You can use this command if a cTCP session fails to come up.		
Lingito	Router# <b>debug crypto ctcp</b>		
<b>Related Commands</b>	Command		Description

Command	Description
crypto ctcp	Configures cTCP encapsulation for Easy VPN.

#### debug crypto engine

To display debugging messages about crypto engines, which perform encryption and decryption, use the **debugcryptoengine** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto engine

no debug crypto engine

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** Use the debug crypto engine command to display information pertaining to the crypto engine, such as when Cisco IOS software is performing encryption or decryption operations.

The crypto engine is the actual mechanism that performs encryption and decryption. A crypto engine can be software or a hardware accelerator. Some platforms can have multiple crypto engines; therefore, the router will have multiple hardware accelerators.

**Examples** The following is sample output from the **debugcryptoengine** command. The first sample output shows messages from a router that successfully generates Rivest, Shamir, and Adelma (RSA) keys. The second sample output shows messages from a router that decrypts the RSA key during Internet Key Exchange (IKE) negotiation.

```
Router# debug crypto engine
00:25:13:CryptoEngine0:generate key pair
00:25:13:CryptoEngine0:CRYPTO GEN KEY PAIR
00:25:13:CRYPTO ENGINE:key process suspended and continued
00:25:14:CRYPTO ENGINE: key process suspended and continuedcr
Router# debug crypto engine

# debug crypto engine accelerator logs

	To enable logging of commands and associated parameters sent from the virtual private network (VPN) module driver to the VPN module hardware using a debug flag, use the <b>debugcryptoengineacceleratorlogs</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command. <b>debug crypto engine accelerator logs</b>				
	no debug crypto engine a	accelerator logs			
Syntax Description	This command has no argu	This command has no arguments or keywords.			
Command Default	The logging of commands	sent from the VPN modu	e driver to the VPN module hardware is disabled.		
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(1)XC	This command w	vas introduced on the Cisco 1720 and Cisco 1750 routers.		
	12.2(33)SRA	This command v	vas integrated into Cisco IOS Release 12.2(33)SRA.		
Usage Guidelines	Use the <b>debugcryptoengineacceleratorlogs</b> command when encryption traffic is sent to the router and a problem with the encryption module is suspected.				
	This command is intended only for Cisco TAC personnel to collect debugging information.				
Examples	The <b>debugcryptoengineacceleratorlogs</b> command uses a debug flag to log commands and associated parameters sent from the VPN module driver to the VPN module hardware as follows:				
	Router# <b>debug crypto engine accelerator logs</b> encryption module logs debugging is on				
Related Commands	Command		Description		
	crypto engine accelerato	pr	Enables or disables the crypto engine accelerator if it exists.		
	show crypto engine acce	lerator logs	Prints information about the last 32 CGX Library packet processing commands, and associated parameters sent from the VPN module driver to the VPN module hardware.		

ſ

Command	Description
show crypto engine accelerator sa-database	Prints active (in-use) entries in the platform-specific VPN module database.
show crypto engine configuration	Displays the Cisco IOS crypto engine of your router.

# debug crypto engine ism-vpn

To enable debugging for a Cisco VPN Internal Service Module (ISM), use the **debug crypto engine ism-vpn** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug crypto engine ism-vpn[init| interrupt| polo[detail| dump]| shim[detail]| tftp]

no debug crypto engine ism-vpn[init| interrupt| polo[detail| dump]| shim[detail]| tftp]

Syntax Description	init	(Optional) Enables initia Engine (ACE) appliance	l state (INIT state) debugging for an Application Control e in Cisco VPN ISM.	
	interrupt	interrupt (Optional) Enables interrupt service debugging.		
	polo	(Optional) Enables VPN	ISM polo debugging.	
	detail	(Optional) Enables detail	led debugging.	
	dump	(Optional) Enables pack	et dump polo debugging.	
	shim	(Optional) Enables VPN	ISM shim layer debugging.	
	tftp (Optional) Enables debugging for TFTP download or uploa ISM.		gging for TFTP download or upload on the Cisco VPN	
Command Modes	Privileged EXEC (#	¥)		
Command History	Release	Modification		
	15.3(2)T	This comr	nand was introduced.	
Examples	The following example shows how to enable initial state (INIT state) debugging.			
	INIT debugging i	s on		
<b>Related Commands</b>	Command		Description	
	debug crypto eng	ine ism-vpn ssl	Enables debugging for Cisco VPN ISM SSL.	
I

Command	Description			
debug crypto engine ism-vpn traffic	Enables debugging for Cisco VPN ISM traffic.

I

Command	Description			
debug crypto engine ism-vpn traffic selector	Enables debugging for specific traffic in a Cisco VPN ISM.			
debug crypto engine ism-vpn ssl	Enables debugging for Cisco VPN ISM SSL.			
show crypto engine accelerator statistic	Displays IPsec encryption statistics and error counters for the onboard hardware accelerator of a device, the IPsec VPN SPA, or the Cisco VPN ISM.			

### debug crypto engine ism-vpn traffic selector

To enable debug rules for specific traffic in Cisco VPN Internal Service Module (ISM), use the **debug crypto** engine ism-vpn traffic selector command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug crypto engine ism-vpn traffic selector** {**ipv4**| **ipv6**} {**disable** *rule-number*| **enable** *rule-number source-ip-address source-address-mask destination-ip-address destination-address-mask protocols*}

**no debug crypto engine ism-vpn traffic selector** {**ipv4**| **ipv6**} {**disable** *rule-number*| **enable** *rule-number source-ip-address source-address-mask destination-ip-address destination-address-mask protocols*}

Syntax Description	ipv4	Enables debugging rules for IPv4 addresses.
	ipv6	Enables debugging rules for IPv6 addresses.
	disable	Enables debugging rules are disabled.
	enable	Enables debugging rules are enabled.
	rule-number	A specific rule. The range is from 1 to 10.
	source-ip-address source-address-mask	Source IP address and network mask of the traffic for which rules must be enabled or disabled.
	destination-ip-address destination-address-ma	<i>tsk</i> Destination IP address and network mask of the traffic for which rules must be enabled or disabled.
	protocols	Protocols in the source and destination IP addresses of the traffic for which rules must be enabled or disabled. The range is from 0 to 155. 0 denotes all protocols.
Command Default	Cisco VPN ISM selective traffic debugging i	s not enabled.
Command Modes	Privileged EXEC (#)	
Command History	Release Mo	odification
	15.3(2)T Th	is command was introduced.

#### **Examples**

I

The following example shows how to enable the debugging of rule 0 for all protocols from source address 10.0.0.1 255.255.255.0 and destination address 10.0.2 255.255.255.0:

Device# debug crypto engine ism-vpn traffic selector enable 0 10.0.0.1 255.255.255.0 10.0.0.2 255.255.0 1 ISM-VPN Enable rule 0, s: 10.0.0.1 d: 10.0.0.2 p: 1

#### **Related Commands**

Command	Description				
debug crypto engine ism-vpn	Enables debugging for a Cisco VPN ISM.				
debug crypto engine ism-vpn traffic	Enables debugging for Cisco VPN ISM traffic.				
debug crypto engine ism-vpn ssl	Enables debugging for Cisco VPN ISM SSL.				
show crypto engine accelerator statistic	Displays IPsec encryption statistics and error counter for the onboard hardware accelerator of a device, the IPsec VPN SPA, or Cisco VPN ISM.				

# debug crypto error

To enable error debugging for a crypto area, use the **debugcryptoerror** command in privileged EXEC mode. To disable crypto error debugging, use the **no** form of this command.

debug crypto {isakmp| ipsec| engine} error

no debug crypto {isakmp| ipsec| engine} error

#### Syntax Description

isakmp	Debug messages are shown for Internet Key Exchange (IKE)-related error operations only.
ipsec	Debug messages are shown for IP Security (IPSec)-related error operations only.
engine	Debug messages are shown for crypto engine-related error operations only.

#### **Command Default** Crypto error debugging is not enabled.

#### **Command Modes** Privileged EXEC

Command History	Release	lodification		
	12.3(2)T	This command was introduced.		
	12.2(18)SXD	This command was integrated into Cisco IOS Release 12.2(!8)SXD.		

#### **Usage Guidelines**

The**debugcryptoerror**command will display only error-related debug messages; that is, an error debug will not be shown if the operation is functioning properly.

This command should be used when debug conditions cannot be determined; for example, enable this command when a random, small subset of IKE peers is failing negotiation.

Note

The global crypto command-line interfaces (CLIs) (the **debugcryptoisakmp**, **debugcryptoipsec**, and **debugcryptoengine** commands) will override the **debugcryptoerror** command. Thus, this command should not be used in conjunction with the global CLIs because you may overwhelm the router.

Note

Debug message filtering for crypto hardware engines is not supported.

Examples

I

The following example shows how to enable IPSec-related error messages:

Router# debug crypto error ipsec error

1

## debug crypto gdoi

To display information about a Group Domain of Interpretation (GDOI) configuration, use the debugcryptogdoi command in privileged EXEC mode. To disable crypto GDOI debugging, use the no form of this command.

debug crypto gdoi [all-features [all-levels]| detail| error| event| gm| infrastructure| ks [acls| coop]| packet| replay| terse]

no debug crypto gdoi [all-features [all-levels]| detail| error| event| gm| infrastructure| ks [acls| coop]| packet| replay| terse]

#### **Syntax Description**

all-features	(Optional) Displays debug data for all features in GDOI. This consists of rekey, cooperative key server, replay, and registration information (for KSs) and rekey, registration, and replay information (for GMs).
all-levels	(Optional) Displays all debug levels (detail, error, event, packet, and terse).
detail	(Optional) Displays detailed debug information.
error	(Optional) Displays information about error debugs.
event	(Optional) Displays user-level information.
gm	(Optional) Displays information about group members.
infrastructure	(Optional) Displays information about the GDOI infrastructure.
ks	(Optional) Displays information about key servers.
acls	(Optional) Displays information about implementation of ACLs.
соор	(Optional) Displays information about cooperative key servers.
packet	(Optional) Displays information about packet-level debugs (administrator-level information).
replay	(Optional) Displays information about the pseudotime stamp that is contained in a packet.
terse	(Optional) Displays lowest-level debugs (message-level information).

Note	The detail, error, event, packet, and terse
	keywords can be used with the feature
	keywords (for example, gmerror,
	infrastructureerror,
	kscoopevent, replayerror).

#### **Command Default** Debugging is turned off.

**Command Modes** Privileged EXEC (#)

J	0	m	m	an	d	HI	st	0	ry	

Release	Modification
12.4(6)T	This command was introduced.
12.4(11)T	The detail, error, event, gm, infrastructure, ks, coop, packet, replay, and terse keywords were added.
Cisco IOS XE Release 2.3	This command was integrated into Cisco IOS XE Release 2.3.
15.1(3)T	This command was modified. The <b>acls</b> and <b>replay</b> keywords were removed. The <b>all-features</b> and <b>all-levels</b> keywords were added.
Cisco IOS XE Release 3.8S	This command was modified. The <b>acls</b> and <b>replay</b> keywords were removed. The <b>all-features</b> and <b>all-levels</b> keywords were added.

# **Usage Guidelines** Using this command displays various GDOI debugs. For debugging information for cooperative key servers, use the **debugcryptogdoikscoop** command.

If you do not specify a feature (using the **all-features**, **registration**, **rekey**, **replay**, **coop**, or **infrastructure** keywords), then messages for all features are displayed. If you do not specify a level (using the **detail**, **error**, **event**, **packet**, and **terse** keywords), then the terse level (which also includes the error level) is used.

You can use this command in conjunction with the **debugcryptogdoicondition**command. When these two commands are used together, only those messages that pass through any debug level or feature (specified by the **debugcryptogdoi**command) and pass through any condition (specified by the **debugcryptogdoicondition**command) are displayed.

Examples

The following example shows group member registration debug output:

#### Router# debug crypto gdoi

### debug crypto gdoi condition

To configure conditional filters (based on groups and peers) for GDOI debugging, use the **debugcryptogdoicondition**command in privileged EXEC mode. To disable conditional filters, use the **no** form of this command.

debug crypto gdoi condition {[group group-name] [peer {address ipv4 ipv4-address-of-peer| hostname ipv4 ipv4-hostname}]] reset| unmatched}

no debug crypto gdoi condition {[group group-name] [peer {address ipv4 ipv4-address-of-peer| hostname ipv4 ipv4-hostname}]] reset| unmatched}

#### **Syntax Description**

group group-name	(Optional) Displays information for a specific group.
address ipv4 ipv4-address-of-peer	(Optional) Displays information for a specific IPv4 peer.
hostname ipv4 ipv4-hostname	(Optional) Displays information for a specific IPv4 host.
reset	(Optional) Removes all debugging conditions.
unmatched	(Optional) Displays debug messages if no context is available.

#### **Command Default** Conditional bugging is turned off.

#### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	15.1(3)T	This command was introduced.
	Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.

#### **Usage Guidelines**

This command lets you filter the number of debug messages to make it easier to identify the problem of a particular group member (GM). This command is useful when many (such as thousands of) GMs are registered to a key server on which debugging is enabled.

You can use this command in conjunction with the **debugcryptogdoi**command. When these two commands are used together, only those messages that pass through any debug level or feature (specified by the

I

	<b>debugcryptogdoi</b> command) and pass through any condition (specified by the <b>debugcryptogdoicondition</b> command) are displayed.		
	You can use this command multiple times to configure conditional debugging for any number of GMs. You can have more than one group configured and more than one GM registered to each group.		
	If no GM is specified, debug messages will appear for all GMs (this occurs automatically when all conditional filtering is removed).		
	Also, this command lets you filter per cooperative key server on each key server. This command is useful when there are many key servers in a system.		
	The <b>unmatched</b> keyword displays messages when there is insufficient information to perform conditional debugging. The <b>unmatched</b> keyword is enabled for the error, terse, and event debug levels.		
	To remove the debug messages for a GM or a key serv	ver, use the <b>no</b> form of the same command.	
Examples	The following example shows how to configure a conditional filter for a GDOI group named group1: Router# debug crypto gdoi condition group group1 The following output example shows how to configure a conditional filter for IPv4 peers:		
	Router# debug crypto gdoi condition peer		
<b>Related Commands</b>	0-mm-nd	Description	
	Command	Description	
	debug crypto condition	Defines conditional debug filters for IP Security (IPSec) tunnels.	

### debug crypto ha

To display crypto high availability debugging information, use the **debugcryptoha**command in privileged EXEC mode. To disable debugging messages, use the **no** form of this command.

debug crypto ha

no debug crypto ha

- **Syntax Description** This command has no arguments or keywords.

#### **Related Commands**

Command	Description
debug crypto ipsec ha	Enables debugging messages for IPSec high availability.
debug crypto isakmp ha	Enables debugging messages for ISAKMP high availability.

## debug crypto ipv6 ipsec

To display IP Security (IPSec) events for IPv6 networks, use the **debug crypto ipv6 ipsec** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto ipv6 ipsec

no debug crypto ipv6 ipsec

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging for IPv6 IPSec events is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(4)T	This command was introduced.
	Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Series Routers.

# **Usage Guidelines** Use this command to display IPSec events while setting up or removing policy definitions during OSPF configuration.

**Examples** The following example enables the display of IPSec events for IPv6 networks:

Router# debug crypto ipv6 ipsec

#### **Related Commands**

Command	Description
debug crypto engine	Displays debugging messages about crypto engines, which perform encryption and decryption.
debug crypto ipv6 packet	Displays debug messages for IPv6 packets allowing you to see the contents of packets outbound from a Cisco router when the remote node is not a Cisco node.
debug crypto socket	Displays communication between the client and IPSec during policy setup and removal processes.

ſ

Command	Description
debug ipv6 ospf authentication	Displays the interaction between OSPF and IPSec, including creation or removal of policies.

### debug crypto ipv6 packet

To display the contents of IPv6 packets, use the **debug crypto ipv6 packet** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto ipv6 packet

no debug crypto ipv6 packet

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging for IPv6 IPSec packets is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(4)T	This command was introduced.
	Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Series Routers.

Usage Guidelines Consult Cisco Technical Support before using this command.

Use this command to display the contents of IPv6 packets. This command is useful when the remote node is not a Cisco device and communication between the Cisco and non-Cisco router cannot be established. This command enables you to look at the contents of the packets outbound from the Cisco router.

This command examines the content of every IPv6 packet and may slow network performance.

Examples

This example shows the ouptut of each packet when the **debug crypto ipv6 packet** command is enabled:

Router# debug crypto ipv6 packet Crypto IPv6 IPSEC packet debugging is on Router# \*Oct 30 16:57:06.330: IPSECv6:before Encapsulation of IPv6 packet: 0E37A7C0: 6E000000 00285901 n....(Y. 0E37A7D0:FE800000 0000000 020A8BFF FED42C1D ....~T,. 0E37A7E0:FF020000 0000000 00000000 00000005 . . . . . . . . . . . . . . . . 0E37A7F0:03010028 01010104 00000001 8AD80000 ....(.....X.. 0E37A800:0000006 01000013 000A0028 0A0250CF ..... #### **Related Commands**

Command	Description
debug crypto engine	Displays debugging messages about crypto engines, which perform encryption and decryption.
debug crypto ipv6 ipsec	Displays IPSec events for IPv6 networks.
debug crypto socket	Displays communication between the client and IPSec during policy setup and removal processes.

# debug crypto ikev2

To enable Internet Key Exchange Version 2(IKEv2) debug messages, use the **debugcryptoikev2**command in privileged EXEC mode.

#### debug crypto ikev2 [error| terse| event| packet| detail]

no debug crypto ikev2 [error| terse| event| packet| detail]

#### **Syntax Description**

error	(Optional) Enables debug messages capturing IKEv2 errors.
terse	(Optional) Enables debug messages capturing IKEv2 message exchanges.
event	(Optional) Enables debug messages capturing IKEv2 packet description, contents, and policy matching.
packet	(Optional) Enables debug messages capturing IKEv2 packet dump.
detail	(Optional) Enables debug messages capturing IKEv2 state machine events.

#### **Command Modes** Privileged EXEC (#)

and History	Release	Modification
	15.1(1)T	This command was introduced.
	Cisco IOS XE Release 3.3S	This command was integrated into Cisco IOS XE Release 3.3S.

**Use this command to enable IKEv2 debug messages. IKEv2 uses following debug levels.** 

- Level 1--error
- Level 2--terse
- Level 3--event
- Level 4--packet
- Level 5--detail

Comm

Note

Level 1 is the lowest level and is least verbose and level 5 is highest level. Enabling debug at a higher level enables debug at all lower levels. You can selectively disable a debug level and enable conditional debug using the **debugcryptocondition** command.

Examples

The following example shows that the IKEv2 debugging is enabled:

Router# **debug crypto ikev2** debugging is on

#### **Related Commands**

Co	ommand	Description
de	bug crypto condition	Enables conditional debugging.

### debug crypto ipsec

To display IP security (IPsec) events, use the **debugcryptoipsec**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto ipsec

no debug crypto ipsec

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modifications
	11.3 T	This command was introduced.
	Cisco IOS XE Release 2.6	This command was integrated into Cisco IOS XE Release 2.6.

**Examples** 

The following is sample output from the **debugcryptoipsec** command. In this example, security associations (SAs) have been successfully established.

Router# debug crypto ipsec

IPsec requests SAs between 172.21.114.123 and 172.21.114.67, on behalf of the **permitiphost172.21.114.123host172.21.114.67** command. IPsec is configured to first use the set esp-des w/esp-md5-hmac, but it will also use ah-sha-hmac on a secondary basis.

```
00:24:30: IPSEC(sa_request): ,
  (key eng. msg.) src= 172.21.114.123, dest= 172.21.114.67,
    src_proxy= 172.21.114.123/255.255.255/0/0 (type=1),
    dest_proxy= 172.21.114.67/255.255.255.255/0/0 (type=1),
    protocol= ESP, transform= esp-des esp-md5-hmac ,
    lifedur= 120s and 4608000kb,
    spi= 0x0(0), conn_id= 0, keysize= 0, flags= 0x4
00:24:30: IPSEC(sa_request): ,
    (key eng. msg.) src= 172.21.114.123, dest= 172.21.114.67,
    src_proxy= 172.21.114.123/255.255.255/0/0 (type=1),
    dest_proxy= 172.21.114.123/255.255.255/0/0 (type=1),
    dest_proxy= 172.21.114.67/255.255.255/0/0 (type=1),
    lifedur= 120s and 4608000kb,
    spi= 0x0(0), conn_id= 0, keysize= 0, flags= 0x0.
```

Internet Key Exchange (IKE) prompts for Service Provider Interfaces (SPIs) from IPsec. For inbound security associations, IPsec controls its own SPI space.

```
00:24:34: IPSEC(key_engine): got a queue event...
00:24:34: IPSEC(spi_response): getting spi 3029740121d for SA
from 172.21.114.67 to 172.21.114.123 for prot 3
00:24:34: IPSEC(spi_response): getting spi 5250759401d for SA
from 172.21.114.67 to 172.21.114.123 for prot 2
```

IKE will verify whether IPsec accepts the SA proposal. In this example, it is the SA proposal sent by the local IPsec that is accepted first.

```
00:24:34: IPSEC(validate_proposal_request): proposal part #1,
  (key eng. msg.) dest= 172.21.114.67, src= 172.21.114.123,
  dest_proxy= 172.21.114.67/255.255.255.0/0 (type=1),
  src_proxy= 172.21.114.123/255.255.255.0/0 (type=1),
  protocol= ESP, transform= esp-des esp-md5-hmac,
  lifedur= 0s and 0kb,
  spi= 0x0(0), conn_id= 0, keysize= 0, flags= 0x4
```

After the proposal is accepted, IKE finishes the negotiations, generates the keying material, and then notifies IPsec of the new security associations (one security association for each direction).

00:24:35: IPSEC(key\_engine): got a queue event... The following output pertains to the inbound SA. The conn\_id value references an entry in the crypto engine connection table.

```
00:24:35: IPSEC(initialize_sas): ,
  (key eng. msg.) dest= 172.21.114.123, src= 172.21.114.67,
  dest_proxy= 172.21.114.123/255.255.255.255/0/0 (type=1),
  src_proxy= 172.21.114.67/255.255.255.255/0/0 (type=1),
  protocol= ESP, transform= esp-des esp-md5-hmac ,
  lifedur= 120s and 4608000 kb,
  spi= 0x120F043C(302974012), conn_id= 29, keysize= 0, flags= 0x4
The following output pertains to the outbound SA:
```

```
00:24:35: IPSEC(initialize_sas): ,
  (key eng. msg.) src= 172.21.114.123, dest= 172.21.114.67,
    src_proxy= 172.21.114.123/255.255.255.255/0/0 (type=1),
    dest_proxy= 172.21.114.67/255.255.255.255/0/0 (type=1),
    protocol= ESP, transform= esp-des esp-md5-hmac ,
    lifedur= 120s and 4608000kb,
    spi= 0x38914A4(59315364), conn_id= 30, keysize= 0, flags= 0x4
IPsec then installs the SA information into its SA database.
```

```
00:24:35: IPSEC(create_sa): sa created,
(sa) sa_dest= 172.21.114.123, sa_prot= 50,
sa_spi= 0x120F043C(302974012),
sa_trans= esp-des esp-md5-hmac, sa_conn_id= 29
sa_lifetime(k/sec)= (4445923/500)
00:24:35: IPSEC(create_sa): sa created,
(sa) sa_dest= 172.21.114.67, sa_prot= 50,
sa_spi= 0x38914A4(59315364),
sa_trans= esp-des esp-md5-hmac, sa_conn_id= 30
sa_lifetime(k/sec)= (4445923/500)
```

The following is sample output from the **debugcryptoipsec** command as seen on the peer router. In this example, IKE verifies whether IPsec will accept an SA proposal. Although the peer sent two proposals, IPsec accepted the first proposal.

```
00:26:15: IPSEC(validate_proposal_request): proposal part #1,
  (key eng. msg.) dest= 172.21.114.67, src= 172.21.114.123,
    dest_proxy= 172.21.114.67/255.255.255.255/0/0 (type=1),
    src_proxy= 172.21.114.123/255.255.255.255/0/0 (type=1),
    protocol= ESP, transform= esp-des esp-md5-hmac ,
    lifedur= 0s and 0kb,
    spi= 0x0(0), conn_id= 0, keysize= 0, flags= 0x4
IKE prompts for SPIs.
```

```
00:26:15: IPSEC(key_engine): got a queue event...
00:26:15: IPSEC(spi_response): getting spi 593153641d for SA
from 172.21.114.123 to 172.21.114.67 for prot 3
```

IKE does the remaining processing, completing the negotiation and generating keys. IKE then notifies IPsec about the new SAs.

00:26:15: IPSEC(key\_engine): got a queue event... The following output pertains to the inbound SA:

```
00:26:15: IPSEC(initialize_sas): ,
    (key eng. msg.) dest= 172.21.114.67, src= 172.21.114.123,
    dest_proxy= 172.21.114.67/0.0.0.0/0/0 (type=1),
    src_proxy= 172.21.114.123/0.0.0.0/0/0 (type=1),
    protocol= ESP, transform= esp-des esp-md5-hmac ,
    lifedur= 120s and 4608000kb,
    spi= 0x38914A4(59315364), conn_id= 25, keysize= 0, flags= 0x4
The following output pertains to the outbound SA:
```

```
00:26:15: IPSEC(initialize_sas): ,
  (key eng. msg.) src= 172.21.114.67, dest= 172.21.114.123,
    src_proxy= 172.21.114.67/0.0.0.0/0/0 (type=1),
    dest_proxy= 172.21.114.123/0.0.0.0/0/0 (type=1),
    protocol= ESP, transform= esp-des esp-md5-hmac ,
    lifedur= 120s and 4608000kb,
    spi= 0x120F043C(302974012), conn_id= 26, keysize= 0, flags= 0x4
IPsec then installs the SA information into its SA database:
```

```
00:26:15: IPSEC(create_sa): sa created,
(sa) sa_dest= 172.21.114.67, sa_prot= 50,
sa_spi= 0x38914A4(59315364),
sa_trans= esp-des esp-md5-hmac, sa_conn_id= 25
sa_lifetime(k/sec)= (4445923/500)
00:26:15: IPSEC(create_sa): sa created,
(sa) sa_dest= 172.21.114.123, sa_prot= 50,
sa_spi= 0x120F043C(302974012),
sa_trans= esp-des esp-md5-hmac, sa_conn_id= 26
sa_lifetime(k/sec)= (4445923/500)
```

## debug crypto ipsec client ezvpn

To display information about voice control messages that have been captured by the Voice DSP Control Message Logger and about Cisco Easy VPN remote connections, use the **debugcryptoipsecclientezvpn**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto ipsec client ezvpn

no debug crypto ipsec client ezvpn

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(4)YA	This command was introduced on Cisco 806, Cisco 826, Cisco 827, and Cisco 828 routers; Cisco 1700 series routers; and Cisco uBR905 and Cisco uBR925 cable access routers.
	12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
	12.3(4)T	This command was expanded to support the Easy VPN Remote feature.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS 12.2SX family of releases. Support in a specific 12.2SX release is dependent on your feature set, platform, and platform hardware.

Usage Guidelines To force the Voice DSP Contol Message Logger to reestablish the virtual private network (VPN) connections, use the clearcryptosaandclearcryptoisakmp commands to delete the IPSec security associations and Internet Key Exchange (IKE) connections, respectively.

**Examples** The following example shows debugging messages when the Voice DSP Contol Message Logger is turned on and typical debugging messages that appear when the VPN tunnel is created:

Router# debug crypto ipsec client ezvpn

EzVPN debugging is on router# 00:02:28: EZVPN(hw1): Current State: IPSEC ACTIVE

00:02:28: EZVPN(hw1): Event: RESET 00:02:28: EZVPN(hw1): ezvpn close 00:02:28: EZVPN(hw1): New State: CONNECT REQUIRED 00:02:28: EZVPN(hw1): Current State: CONNECT REQUIRED 00:02:28: EZVPN(hw1): Event: CONNECT 00:02:28: EZVPN(hw1): ezvpn connect request 00:02:28: EZVPN(hw1): New State: READY 00:02:29: EZVPN(hw1): Current State: READY 00:02:29: EZVPN(hw1): Event: MODE CONFIG REPLY 00:02:29: EZVPN(hw1): ezvpn\_mode\_config 00:02:29: EZVPN(hw1): ezvpn parse mode config msg 00:02:29: EZVPN: Attributes sent in message: 00:02:29: Address: 10.0.0.5 00:02:29: Default Domain: cisco.com 00:02:29: EZVPN(hw1): ezvpn\_nat\_config 00:02:29: EZVPN(hw1): New State: SS OPEN 00:02:29: EZVPN(hw1): Current State: SS OPEN 00:02:29: EZVPN(hw1): Event: SOCKET READY 00:02:29: EZVPN(hw1): No state change 00:02:30: EZVPN(hw1): Current State: SS OPEN 00:02:30: EZVPN(hw1): Event: MTU CHANGED 00:02:30: EZVPN(hw1): No state change 00:02:30: EZVPN(hw1): Current State: SS OPEN 00:02:30: EZVPN(hw1): Event: SOCKET UP 00:02:30: ezvpn socket up 00:02:30: EZVPN(hw1): New State: IPSEC ACTIVE

The following example shows the typical display for a VPN tunnel that is reset with the

#### **Related Commands**

Command	Description
debug crypto ha	Displays crypto high availability debugging information.

٦

Command	Description
debug crypto isakmp ha	Enables debugging messages for ISAKMP high availability.

### debug crypto isakmp

To display messages about Internet Key Exchange (IKE) events, use the **debug crypto isakmp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto isakmp [aaa| errors| kmi number]

no debug crypto isakmp [aaa| errors| kmi]

#### **Syntax Description**

aaa	(Optional) Specifies accounting events.
errors	(Optional) Enables error events.
kmi number	(Optional) Captures key management interface (KMI) messages.

#### **Command Modes** Privileged EXEC (#)

Command History	Release	Modifications
	11.3 T	This command was introduced.
	12.2(15)T	The <b>aaa</b> keyword was added.
	12.2(18)SXD	This command was integrated into Cisco IOS Release 12.2(18)SXD.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	Cisco IOS XE Release 2.6	This command was integrated into Cisco IOS XE Release 2.6.
	15.3(2)T	This command was modified. The <b>kmi</b> <i>number</i> keyword-argument pair was added.

#### **Usage Guidelines**

IKE is a key management protocol standard that is used in conjunction with the IPsec to configure basic IPsec VPNs. IPsec can be configured without IKE, but IKE enhances IPsec by providing additional features, flexibility, and ease of configuration for the IPsec standard. IKE is a hybrid protocol that implements the Oakley key exchange and Skeme key exchange inside the Internet Security Association and Key Management Protocol (ISAKMP) framework.

The **debug crypto isakmp kmi** command must be enabled prior to any traffic that triggers sessions. This command enables capturing KMI sequence events along with timestamps for a particular IKE security association (SA) and corresponding IPsec SA. The *number* argument denotes the number of KMI messages to be captured. The KMI sequence is displayed in the output of the **show crypto isakmp peers detail** command.

#### **Examples** The fo

The following is sample output from the **debug crypto isakmp** command for an IKE peer that initiates an IKE negotiation:

IKE negotiates its own SA.

Device# debug crypto isakmp

```
20:26:58: ISAKMP (8): beginning Main Mode exchange
20:26:58: ISAKMP (8): processing SA payload. message ID = 0
20:26:58: ISAKMP (8): Checking ISAKMP transform 1 against priority 10 policy
20:26:58: ISAKMP: encryption DES-CBC
20:26:58: ISAKMP: hash SHA
20:26:58: ISAKMP: default group 1
20:26:58: ISAKMP: auth pre-share
20:26:58: ISAKMP (8): atts are acceptable. Next payload is 0
```

When IKE finds a matching policy, each peer in the network uses the IKE SA to authenticate another peer.

20:26:58: ISAKMP (8): SA is doing pre-shared key authentication 20:26:59: ISAKMP (8): processing KE payload. message ID = 0 20:26:59: ISAKMP (8): processing NONCE payload. message ID = 0 20:26:59: ISAKMP (8): SKEYID state generated 20:26:59: ISAKMP (8): processing ID payload. message ID = 0 20:26:59: ISAKMP (8): processing HASH payload. message ID = 0 20:26:59: ISAKMP (8): SA has been authenticated

Next, IKE negotiates to set up the IPsec SA by searching for a matching transform set.

```
20:26:59: ISAKMP (8): beginning Quick Mode exchange, M-ID of 767162845
20:26:59: ISAKMP (8): processing SA payload. message ID = 767162845
20:26:59: ISAKMP (8): Checking IPSec proposal 1
20:26:59: ISAKMP: transform 1, ESP DES
20:26:59: ISAKMP: attributes in Transform:
20:26:59: ISAKMP:
                       encaps is 1
20:26:59: ISAKMP:
                       SA life type in seconds
20:26:59: ISAKMP:
                       SA life duration (basic) of 600
20:26:59: ISAKMP:
                       SA life type in kilobytes
20:26:59: ISAKMP:
                       SA life duration (VPI) of
 0x0 0x46 0x50 0x0
20:26:59: ISAKMP:
                       authenticator is HMAC-MD5
20:26:59: ISAKMP (8): atts are acceptable.
```

After finding a matching IPsec transform set for the two peers, an IPsec SA is created (one SA is created for each direction).

```
20:26:59: ISAKMP (8): processing NONCE payload. message ID = 767162845

## **Related Commands**

I

Command	Description
debug crypto ha	Displays crypto high availability debugging information.
debug crypto ipsec ha	Enables debugging messages for IPSec high availability.

# debug crypto key-exchange

To show Digital Signature Standard (DSS) public key exchange messages, use the debugcryptokey-exchangecommand in privileged EXEC mode. To disable debugging output, use the no form of this command. debug crypto key-exchange no debug crypto key-exchange Syntax Description This command has no arguments or keywords. **Command Modes** Privileged EXEC **Usage Guidelines** Encryption and authentication are provided by a software service on the router called a *cryptoengine*. The crypto engine performs authentication through DSS public and private keys when a connection is set up. DSS is a means of sending a "signature" at the end of a message that positively identifies the author of the message. The signature cannot be forged or duplicated by others, so whoever received a message with a DSS signature knows exactly who sent the message. If the process of exchanging DSS public keys with a peer router by means of the **configcryptokey-exchange** command is not successful, try to exchange DSS public keys again after enabling the debugcryptokey-exchange command to help you diagnose the problem. Examples The following is sample output from the **debugcryptokey-exchange** command. The first shows output from the initiating router in a key exchange. The second shows output from the passive router in a key exchange. The number of bytes received should match the number of bytes sent from the initiating side, although the number of messages can be different. Router# debug crypto key-exchange CRYPTO-KE: Sent 4 bytes. CRYPTO-KE: Sent 2 bytes.

CRYPTO-KE: Sent 2 bytes. CRYPTO-KE: Sent 2 bytes. CRYPTO-KE: Sent 2 bytes. CRYPTO-KE: Sent 64 bytes. Router**# debug crypto key-exchange** CRYPTO-KE: Received 4 bytes. CRYPTO-KE: Received 2 bytes. CRYPTO-KE: Received 2 bytes. CRYPTO-KE: Received 49 bytes. CRYPTO-KE: Received 15 bytes.

#### **Related Commands**

Command	Description
debug crypto sesmgmt	Displays connection setup messages and their flow through the router.

1

# debug crypto mib

To display debug messages for the IP Security (IPsec) MIB subsystem, use the **debugcryptomib** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto mib [detail| error]

no debug crypto mib [detail| error]

Syntax Description	detail	(Option the IPse	hal) Displays different events as they occur in ec MIB subsystem.
		Note	Because the output for this keyword can be quite long, due consideration should be given to enabling <b>debugcryptomibdetail</b> .
	error	(Option	nal) Displays error events in the MIB agent.

**Command Default** Message notification debugging is not enabled.

## **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(4)E	This command was introduced.
	12.2(4)T	This command was integrated into Cisco IOS Release 12.2(4)T.
	12.4(4)T	The detail and error keywords were added.

### **Examples**

The following example shows IPsec MIB debug message notification being enabled:

Router# **debug crypto mib** Crypto IPSec Mgmt Entity debugging is on The following example shows that detailed information about events that are occurring in the subsystem has been requested:

Router# debug crypto mib detail The following example shows that information has been requested about error events in the MIB agent:

Router# debugcryptomiberror

1

Command	Description
show crypto mib ipsec flowmib history failure size	Displays the size of the IPSec failure history table.
show crypto mib ipsec flowmib history tunnel size	Displays the size of the IPSec tunnel history table.
show crypto mib ipsec flowmib version	Displays the IPSec Flow MIB version used by the router.

# debug crypto pki messages

To display debugging messages for the details of the interaction (message dump) between the certification authority (CA) and the router, use the **debugcryptopkimessages** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto pki messages

no debug crypto pki messages

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** The debug crypto pki messages command displays messages about the actual data being sent and received during public key infrastructure (PKI) transactions. This command is internal for use by Cisco support personnel.

You can use the show crypto ca certificates command to display information about your certificate.

**Examples** The following is sample output from the **debugcryptopkimessagescommand**:

Router# debug crypto pki messages Fingerprint: 2CFC6265 77BA6496 3AEFCB50 29BC2BF2 00:48:23:Write out pkcs#10 content:274 00:48:23:30 82 01 0E 30 81 B9 02 01 00 30 22 31 20 30 1E 06 09 2A 86 00:48:23:48 86 F7 0D 01 09 02 16 11 70 6B 69 2D 33 36 61 2E 63 69 73 00:48:23:63 6F 2E 63 6F 6D 30 5C 30 0D 06 09 2A 86 48 86 F7 OD 01 01 00:48:23:01 05 00 03 4B 00 30 48 02 41 00 DD 2C C6 35 A5 3F 0F 97 6C 00:48:23:11 E2 81 95 01 6A 80 34 25 10 C4 5F 3D 8B 33 1C 19 50 FD 91 00:48:23:6C 2D 65 4C B6 A6 B0 02 1C B2 84 C1 C8 AC A4 28 6E EF 9D 3B 00:48:23:30 98 CB 36 A2 47 4E 7E 6F C9 3E B8 26 BE 15 02 03 01 00 01 00:48:23:A0 32 30 10 06 09 2A 86 48 86 F7 OD 01 09 07 31 03 13 01 63 00:48:23:30 1E 06 09 2A 86 48 86 F7 0D 01 09 0E 31 11 14 0F 30 0D 30 00:48:23:0B 06 03 55 1D 0F 04 04 03 02 05 A0 30 0D 06 09 2A 86 48 86 00:48:23:F7 0D 01 01 04 05 00 03 41 00 2C FD 88 2C 8A 13 B6 81 88 EA 00:48:23:5C FD AE 52 8F 2C 13 95 9E 9D 8B A4 C9 48 32 84 BF 05 03 49 00:48:23:63 27 A3 AC 6D 74 EB 69 E3 06 E9 E4 9F 0A A8 FB 20 F0 02 03 00:48:23:BE 90 57 02 F2 75 8E 0F 16 60 10 6F BE 2B 00:48:23:Enveloped Data ...

Command	Description
crypto pki server	Enables a Cisco IOS certificate server and enters certificate server configuration mode.

# debug crypto pki transactions

To display debugging messages for the trace of interaction (message type) between the certification authority (CA) and the router, use the **debugcryptopkitransactions** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto pki transactions

no debug crypto pki transactions

**Syntax Description** This command has no arguments or keywords.

Command Default Disabled

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** Use the debug crypto pki transactions command to display debugging messages pertaining to public key infrastructure (PKI) certificates. The messages will show status information during certificate enrollment and verification.

You can also use the show crypto ca certificates command to display information about your certificate.

**Examples** The following example, which authenticates and enrolls a CA, contains sample output for the **debugcryptopkitransactionscommand**:

Router(config) # crypto ca authenticate msca Certificate has the following attributes: Fingerprint:A5DE3C51 AD8B0207 B60BED6D 9356FB00 % Do you accept this certificate? Command	Description
crypto ca authenticate	Authenticates the CA (by getting the certificate of the CA).
crypto ca enroll	Obtains the certificate of your router from the CA.
debug crypto pki messages	Displays debugging messages for details of the interaction (message dump) between the CA and the router.
show crypto ca certificates	Displays information about your certificate, the certificate of the CA, and any RA certificates.

# debug crypto provisioning

To display information about an easy secure device provisioning (SDP) operation, use the debugcryptoprovisioning command in privileged EXEC mode. To disable debugging output, use the no form of this command. debug crypto provisioning no debug crypto provisioning **Syntax Description** This command has no arguments or keywords. **Command Default** Debugging is not enabled. **Command Modes** Privileged EXEC **Command History** Release Modification 12.3(8)T This command was introduced. 12.3(14)T This command replaced the **debugcryptowui**command. **Usage Guidelines** For more detailed information about authentication, authorization, and accounting (AAA), use the debugaaaauthorization command. **Examples** The following is sample output from the debugcryptoprovisioning command. The output includes explanations of the process. Router# debug crypto provisioning Petitioner device ! The user starts the Welcome phase. Nov 7 03:15:48.171: CRYPTO WUI TTI: received welcome get request. ! The router generates a Rivest, Shamir, and Adelman (RSA) keypair for future enrollment. Nov 7 03:15:48.279: CRYPTO\_WUI\_TTI: keyhash 'A506BE3B83C6F4B4A6EFCEB3D584AACA' ! The TTI transaction is completed. 7 03:16:10.607: CRYPTO WUI TTI: received completion post request. Nov Registrar device !. During the introduction phase, the browser prompts for login information. 06:39:18: CRYPTO WUI TTI: received introduction post request. 06:39:18: CRYPTO WUI TTI: checking AAA authentication (ipsecca script aaalist, ttiuser) ! This happens if the user types in the wrong username or password. 06:39:19: CRYPTO WUI TTI: authentication declined by AAA, or AAA server not found - 0x3 06:39:19: CRYPTO WUI TTI: aaa query fails! ! The user re-enters login information. 06:39:19: CRYPTO WUI TTI: received introduction post request. 06:39:19: CRYPTO WUI TTI: checking AAA authentication (ipsecca script aaalist, ttiuser) 06:39:20: CRYPTO WUI TTI: checking AAA authorization (ipsecca script aaalist, ttiuser) ! The login attempt succeeds and authorization information is retrieved from the AAA database. 06:39:21: CRYPTO WUI TTI: aaa query ok!

```
! These attributes are inserted into the configuration template.
06:39:21: CRYPTO_WUI_TTI: building TTI av pairs from AAA attributes
06:39:21: CRYPTO_WUI_TTI: "subjectname" = "CN=user, O=company, C=country"
06:39:21: CRYPTO_WUI_TTI: "$1" = "ntp server 192.0.2.1"
06:39:21: CRYPTO_WUI_TTI: "$2" = "hostname user-vpn"
! The registrar stores this subject name and overrides the subject name in the subsequent
enrollment request.
06:39:21: CRYPTO_WUI_TTI: subjectname=CN=user, O=company, C=country
! The registrar stores this key information so that it may be used to automatically grant
the subsequent enrollment request.
06:39:21: CRYPTO_WUI_TTI: key_hash=A506BE3B83C6F4B4A6EFCEB3D584AACA
```

Command	Description
authentication list (tti-registrar)	Authenticates the introducer in an SDP operation.
authorization list (tti-registrar)	Specifies the appropriate authorized fields for the certificate subject name and list of template variables to be expanded into the Cisco IOS CLI snippet that is sent back to the petitioner in an SDP operation.
debug aaa authorization	Displays information on AAA TACACS+ authorization.
template config	Specifies a remote URL for a Cisco IOS CLI configuration template.
template username	Establishes a template username and password to access the configuration template on the file system.

# debug crypto sesmgmt

To show connection setup messages and their flow through the router, use the **debugcryptosesmgmt** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug crypto sesmgmt

no debug crypto sesmgmt

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

**Usage Guidelines** Encryption and authentication are provided by a software service on the router called a *cryptoengine*. The crypto engine performs authentication through Digital Signature Standard (DSS) public and private keys when a connection is set up. DSS is a means of sending a "signature" at the end of a message that positively identifies the author of the message. The signature cannot be forged or duplicated by others, so whoever receives a message with a DSS signature knows exactly who sent the message.

When connections are not completing, use the **debugcryptosesmgmt** command to follow the progress of connection messages as a first step in diagnosing the problem. You see a record of each connection message as the router discovers it, and can track its progress through the necessary signing, verifying, and encryption session setup operations. Other significant connection setup events, such as the pregeneration of Diffie-Hellman public numbers, are also shown. For information on Diffie-Hellman public numbers, refer to the *Cisco IOS Security Configuration Guide*.

Also use the **showcryptoconnections** command to display additional information on connections.

**Examples** The following is sample output from the **debugcryptosesmgmt** command. The first shows messages from a router that initiates a successful connection. The second shows messages from a router that receives a connection.

Router# debug crypto sesmgmt CRYPTO: Dequeued a message: Inititate Connection CRYPTO: DH gen phase 1 status for conn id 2 slot 0:OK CRYPTO: Signing done. Status:OK CRYPTO: ICMP message sent: s=172.21.114.163, d=172.21.114.162 CRYPTO-SDU: send nnc req: NNC Echo Request sent CRYPTO: Dequeued a message: CRM CRYPTO: DH gen phase 2 status for conn id 2 slot 0:OK CRYPTO: Verify done. Status=OK CRYPTO: Signing done. Status:OK CRYPTO: ICMP message sent: s=172.21.114.163, d=172.21.114.162 CRYPTO-SDU: recv nnc rpy: NNC Echo Confirm sent CRYPTO: Create encryption key for conn\_id 2 slot 0:OK CRYPTO: Replacing -2 in crypto maps with 2 (slot 0) Router# debug crypto sesmgmt CRYPTO: Dequeued a message: CIM CRYPTO: Verify done. Status:OK CRYPTO: ICMP message sent: s=172.21.114.162, d=172.21.114.163 CRYPTO-SDU: act\_on\_nnc\_req: NNC Echo Reply sent

1

CRYPTO: Create encryption key for conn\_id 1 slot 0:OK CRYPTO: Replacing -2 in crypto maps with 1 (slot 0) CRYPTO: Dequeued a message: CCM CRYPTO: Verify done. Status=OK

Command	Description
debug crypto key-exchange	Displays DSS public key exchange messages.

# debug csm neat

To turn on debugging for all Call Switching Module (CSM) Voice over IP (VoIP) calls, use the **debugcsmneat**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug csm neat** [*slot*| *dspm*| *dsp*| *dsp-channel*]

no debug csm neat [slot| dspm| dsp| dsp-channel]

Syntax Description	slot   dspm   dsp   dsp-channel	(Optional) Identifies the location of a particular digital signal processor (DSP) channel.
--------------------	---------------------------------	--------------------------------------------------------------------------------------------

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	Release	Modification
	12.4(9)T	This command was introduced.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

### **Usage Guidelines**

The **debugcsmneat**command turns on debugging for all CSM VoIP calls. If no arguments are specified, debugging is enabled for all voice calls.

Note

The **debugcsmneat** command does not display any information if you try to debug ISDN voice calls. To view debugging information about ISDN calls, use the **debugcdapi** command.

The nodebugcmsneat command turns off debugging information for all voice calls.

If the *slot,dspm,dsp*,or*dsp-channel* arguments are specified (if the specified DSP channel is engaged in a CSM call), CSM call-related debugging information is turned on for this channel. The **no**form of this command turns off debugging for that particular channel.

Examples

The following examples show sample output from the **debugcsmneat** command. The following shows that CSM has received an event from ISDN.

Router# debug csm neat March 18 04:05:07.052: EVENT\_FROM\_ISDN::dchan\_idb=0x60D7B6B8, call\_id=0xCF, ces=0x1 bchan=0x0, event=0x1, cause=0x0 The table below describes the significant fields shown in the display.

### Table 65: debug csm neat Field Descriptions

Field	Description
dchan_idb	Indicates the address of the hardware interface description block (IDB) for the D channel.
call_id	Indicates the call ID assigned by ISDN.
call-id	Indicates the call ID assigned by ISDN
bchan	Indicates the number of the B channel assigned for this call
cause	Indicates the ISDN event cause

The following example shows that CSM has allocated the CSM voice control block for the DSP device on slot 1 port 10 for this call.

### March 18 04:05:07.052: VDEV\_ALLOCATE: slot 1 and port 10 is allocated.

In this example, CSM must first allocate the CSM voice control block to initiate the state machine. After the voice control block has been allocated, CSM obtains from the DSP Resource Manager the actual DSP channel that will be used for the call. At that point, CSM will switch to the actual logical port number. The slot number in this example refers to the physical slot on the Cisco AS5400 access server. The port number is the logical DSP number interpreted as listed in the table below.

Logical Port	Physical DSP Channel		
0	DSPRM 1	DSP 1	DSP channel 1
1	DSPRM 1	DSP 1	DSP channel 2
2	DSPRM 1	DSP 2	DSP channel 1
3	DSPRM 1	DSP 2	DSP channel 2
4	DSPRM 1	DSP 3	DSP channel 1
5	DSPRM 1	DSP 3	DSP channel 2
6	DSPRM 1	DSP 4	DSP channel 1
7	DSPRM 1	DSP 4	DSP channel 2
8	DSPRM 1	DSP 5	DSP channel 1
9	DSPRM 1	DSP 5	DSP channel 2

#### Table 66: Logical DSP Numbers

ſ

Logical Port	Physical DSP Channel		
10	DSPRM 1	DSP 6	DSP channel 1
11	DSPRM 1	DSP 6	DSP channel 2
12	DSPRM 2	DSP 1	DSP channel 1
13	DSPRM 2	DSP 1	DSP channel 2
14	DSPRM 2	DSP 2	DSP channel 1
15	DSPRM 2	DSP 2	DSP channel 2
16	DSPRM 2	DSP 3	DSP channel 1
17	DSPRM 2	DSP 3	DSP channel 2
18	DSPRM 2	DSP 4	DSP channel 1
19	DSPRM 2	DSP 4	DSP channel 2
20	DSPRM 2	DSP 5	DSP channel 1
21	DSPRM 2	DSP 5	DSP channel 2
22	DSPRM 2	DSP 6	DSP channel 1
23	DSPRM 2	DSP 6	DSP channel 2
48	DSPRM 5	DSP 1	DSP channel 1
49	DSPRM 5	DSP 1	DSP channel 2
50	DSPRM 5	DSP 2	DSP channel 1
51	DSPRM 5	DSP 2	DSP channel 2
52	DSPRM 5	DSP 3	DSP channel 1
53	DSPRM 5	DSP 3	DSP channel 2
54	DSPRM 5	DSP 4	DSP channel 1
55	DSPRM 5	DSP 4	DSP channel 2
56	DSPRM 5	DSP 5	DSP channel 1
57	DSPRM 5	DSP 5	DSP channel 2

Logical Port	Physical DSP Channel		
58	DSPRM 5	DSP 6	DSP channel 1
59	DSPRM 5	DSP 6	DSP channel 2

The following example shows that the function csm\_vtsp\_init\_tdm() has been called with a voice control block of address 0x60B8562C. This function will be called only when the call is treated as a voice call.

March 18 04:05:07.052: csm\_vtsp\_init\_tdm (voice\_vdev=0x60B8562C) The following example shows that CSM has obtained a DSP channel from the DSP Resource Manager:

March 18 04:05:07.052: csm\_vtsp\_init\_tdm: dsprm\_tdm\_allocate: tdm slot 1, dspm 2, dsp 5, dsp\_channel 1csm\_vtsp\_init\_tdm: dsprm\_tdm\_allocate: tdm stream 5, channel 9, bank 0, bp\_channel 10

The table below describes the significant fields shown in the DSP channel initialized TDM display.

#### Table 67: debug csm neat TDM Channel Field Descriptions

Field	Description
TDM slot 1, dspm 2, dsp 5, dsp_channel 1	Indicates the physical DSP channel that will be used for this call.
TDM stream 5, channel 9, bank 0, bp_channel 10	Indicates the on-chip and backplane TDM channel assigned to this DSP channel. Stream 5, channel 9 gives the on-chip TDM channel mapped to the DSP; bank 0, bp_channel 10 means that the backplane stream 0 and backplane channel #1 are assigned to this DSP.

The following shows that CSM received an incoming call event from ISDN:

March 18 04:05:07.052: EVENT\_FROM\_ISDN: (00CF): DEV\_INCALL at slot 1 and port 20 Slot 1, port 20 means the logical DSP channel 20 (mapped to DSPRM 2, DSP 5, DSP channel 1).

The following shows that the DEV\_INCALL message been translated into a CSM\_EVENT\_ISDN\_CALL message:

March 18 04:05:07.052: CSM\_PROC\_IDLE: CSM\_EVENT\_ISDN\_CALL at slot 1, port 20 This message is passed to the CSM central state machine while it is in the CSM\_IDLE state and is in the CSM\_PROC\_IDLE procedure. The logical DSP channel port 20 on slot 1 is used to handle this call.

The following shows that CSM has invoked the vtsp\_ic\_notify() function with a CSM voice call control block 0x60B8562C.

March 18 04:05:07.052: vtsp\_ic\_notify : (voice\_vdev= 0x60B8562C) Inside this function, CSM will send a SETUP INDICATION message to the VTSP. This function will be invoked only if the call is a voice call. The following shows that CSM received a SETUP INDICATION RESPONSE message from the VTSP as an acknowledgment.

March 18 04:05:07.056: csm vtsp call setup resp (vdev info=0x60B8562C, vtsp cdb=0x60FCA114)

This means that the VTSP received the CALL SETUP INDICATION message previously sent and has proceeded to process the call.

- vdev\_info--Contains the address of the CSM voice data block.
- vtsp\_cdb--Contains the address of the VTSP call control block.

The following shows that CSM received a CALL CONNECT message from the VTSP:

March 18 04:05:07.596: csm\_vtsp\_call\_connect (vtsp\_cdb=0x60FCA114, voice\_vdev=0x60B8562C) This indicates that the VTSP received a CONNECT message for the call leg initiated to the Internet side.

- vtsp cdb--Contains the address of the VTSP call control block.
- voice\_vdev--Contains the address of the CSM voice data block.

The following shows that while CSM is in the CSM\_IC2\_RING state, it receives a SETUP INDICATION RESPONSE from the VTSP. This message is translated into CSM\_EVENT\_MODEM\_OFFHOOK and passed to the CSM central state machine.

March 18 04:05:07.596: CSM\_PROC\_IC2\_RING: CSM\_EVENT\_MODEM\_OFFHOOK at slot 1, port 20 The following shows that CSM received a CONNECT message from ISDN for the call using the logical DSP channel on slot 1 and port 20:

March 18 04:05:07.616: EVENT\_FROM\_ISDN: (00CF): DEV\_CONNECTED at slot 1 and port 20 The following shows that CSM translated the CONNECT event from ISDN into the CSM EVENT ISDN CONNECTED message, which is then passed to the CSM central state machine:

March 18 04:05:07.616: CSM\_PROC\_IC4\_WAIT\_FOR\_CARRIER: CSM\_EVENT\_ISDN\_CONNECTED at slot 1, port 20

The following shows that CSM received a CALL SETUP REQUEST from the VTSP:

May 16 12:22:27.580: csm vtsp call setup request (vtsp cdb=0x60FCFA20, vtsp sdb=0x60DFB608)

This represents a request to make an outgoing call to the PSTN.

- vtsp cdb--Contains the address of the VTSP call control block.
- vtsp\_sdb--Contains the address of the signalling data block for the signalling interface to be used to send the outgoing call.

The following shows that the physical DSP channel has been allocated for this outgoing call:

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request: tdm slot 1, dspm 5, dsp 4, dsp\_channel 1 The following shows the on-chip and backplane TDM channel assigned to this DSP channel:

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request: tdm stream 5, channel 25, bank 0, bp\_channel
27

In this sample output, tdm stream 5, channel 25, bank 0, bp\_channel 27 indicates the on-chip and backplane TDM channel assigned to this DSP channel. Stream 5, channel 25 gives the on-chip TDM channel mapped

to the DSP; bank 0, bp\_channel 27 means that the backplane stream 0 and backplane channel 1 are assigned to this DSP.

The following shows the calling number and the called number for this call.

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request: calling number: 10001, called number: 30001

The following shows that the CALL SETUP REQUEST from the VTSP has been translated into the 'CSM\_EVENT\_MODEM\_OFFHOOK message and is passed to the CSM central state machine:

May 16 12:22:27.580: CSM\_PROC\_IDLE: CSM\_EVENT\_MODEM\_OFFHOOK at slot 1, port 54 The logical DSP channel number for the DSP (slot 1, port 54) is now displayed, which maps to the physical DSP channel slot 1, dspm 5, dsp 4, dsp channel 1.

The following shows that CSM collected all the digits for dialing out:

May 16 12:22:27.580: CSM\_PROC\_OC3\_COLLECT\_ALL\_DIGIT: CSM\_EVENT\_GET\_ALL\_DIGITS at slot 1,
port 54

For PRI and for applications that do not require digit collection of outdialing digits (for example, voice calls), the intermediate digit collection states are omitted and the CSM state machine moves to this state directly, pretending that the digit collection has been done.

The following shows an information message:

March 16 12:22:27.580: CSM\_PROC\_OC3\_COLLECT\_ALL\_DIGIT: called party num: (30001) at slot
1, port 54

The following shows that CSM attempts to find a free signalling D channel to direct the outgoing call:

```
March 16 12:22:27.580: csm_vtsp_check_dchan (voice_vdev=0x60B8562C)
March 16 12:22:27.580: csm_vtsp_check_dchan (vtsp requested dchan=0x60D7ACB0,
dchan_idb=0x60E8ACF0)
March 16 12:22:27.580: csm_vtsp_check_dchan (voice_vdev=0x60B8562C)
March 16 12:22:27.580: csm_vtsp_check_dchan (vtsp requested dchan=0x60D7ACB0,
dchan_idb=0x60D7ACB0)
```

In the case of voice calls, the free signaling D channel must match the voice interface specified inside the signalling data block (vtsp\_sdb) passed from the VTSP.

The following shows that CSM has received an event from ISDN:

```
March 16 12:22:27.624: EVENT_FROM_ISDN::dchan_idb=0x60D7ACB0, call_id=0xA121, ces=0x1
bchan=0x1E, event=0x3, cause=0x0
In this sample output:
```

- dchan idb--Indicates the address of the hardware IDB for the D channel
- call id--Indicates the call id assigned by ISDN
- bchan--Indicates the number of the B channel assigned for this call
- cause--Indicates the ISDN event cause

The following shows that CSM has received a CALL PROCEEDING message from ISDN.

March 16 12:22:27.624: EVENT\_FROM\_ISDN: (A121): DEV\_CALL\_PROC at slot 1 and port 54 The following shows that the CALL PROCEEDING event received from ISDN has been interpreted as a CSM\_EVENT\_ISDN\_BCHAN\_ASSIGNED message:

March 16 12:22:27.624: CSM\_PROC\_OC4\_DIALING: CSM\_EVENT\_ISDN\_BCHAN\_ASSIGNED at slot 1, port
54

1

ISDN has assigned a B channel for this outgoing call. This B channel must be on the same PRI span as the signalling D channel allocated previously.

The following shows that the csm vtsp setup for oc function is called:

March 16 12:22:27.624: csm\_vtsp\_setup\_for\_oc (voice\_vdev=0x60B8562C) This is invoked when an outgoing call initiated by the VTSP receives a response from the ISDN stack.

The following shows that ISDN has sent a CONNECT message to CSM indicating that the call leg to the PSTN side has been established:

March 16 12:22:28.084: EVENT\_FROM\_ISDN::dchan\_idb=0x60D7ACB0, call\_id=0xA121, ces=0x1 bchan=0x1E, event=0x4, cause=0x0 March 16 12:22:28.084: EVENT\_FROM\_ISDN:(A121): DEV\_CONNECTED at slot 1 and port 54 The following shows that while CSM is in the OC5\_WAIT\_FOR\_CARRIER state, it has received the 'CONNECT' message from ISDN and has translated it into the CSM\_EVENT\_ISDN\_CONNECTED message,

which is passed to the CSM central state machine:

March 16 12:22:28.084: CSM\_PROC\_OC5\_WAIT\_FOR\_CARRIER: CSM\_EVENT\_ISDN\_CONNECTED at slot 1,
port 54

The following shows that the function vtsp\_confirm\_oc() has been called:

March 16 12:22:28.084: vtsp\_confirm\_oc : (voice\_vdev= 0x60B8562C) This is invoked after CSM received the CONNECT message from ISDN. CSM sends a confirmation of the CONNECT to the VTSP.

# debug csm tgrm

To view Call Switching Module (CSM) trunk group resource manager information, use the **debugcsmtgrm**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug csm tgrm

no debug csm tgrm

**Syntax Description** This command has no arguments or keywords.

Command Default Disabled

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(11)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

# **Usage Guidelines** Disable console logging and use buffered logging before using the **debug** csm tgrm command. Using the **debug** csm tgrm command generates a large volume of debugs, which can affect router performance.

# **Examples** The following is sample output from the **debug** csm tgrm command. The output shows that the call type is voice, the direction is incoming, and the call is accepted by the CSM.

Router# debug csm tgrm

```
Router#
00:02:25:CSM-TGRM:csm_rx_cas_event_from_neat(EVENT_DIAL_IN) - c(T1 7/1:1:3) call_type=VOICE,
dir=INCOMING
Router#
00:02:30:CSM-TGRM:csm_proc_ic3_wait_for_res_resp() c(T1 7/1:1:3) VOICE <ACCEPTED !!>
```

The table below describes the significant fields shown in the display.

### Table 68: debug csm tgrm Field Descriptions

Field	Description
call_type	Type of call: VOICE or MODEM.
dir	Direction of the call: INCOMING or OUTGOING.

I

# debug csm voice

To turn on debugging for all Call Switching Module (CSM) Voice over IP (VoIP) calls, use the **debugcsmvoice**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug csm voice** [*slot*| *dspm*| *dsp*| *dsp-channel*]

no debug csm voice [slot| dspm| dsp| dsp-channel]

### Syntax Description

cription	slot   dspm   dsp   dsp-channel	(Optional) Identifies the location of a particular digital signal processor (DSP) channel
		signal processor (DSF) channel.

Command Modes Privileged EXEC

Usage Guidelines The

The **debugcsmvoice**command turns on debugging for all CSM VoIP calls. If this command has no keyword specified, then debugging is enabled for all voice calls.

**Note** The **debugcsmvoice** command does not display any information if you try to debug isdn voice calls. To view debugging information about isdn calls, use the **debugcdapi** command.

The nodebugcmsvoice command turns off debugging information for all voice calls.

If the *slot*|*dsp*|*dsp*|*dsp*-*channel* argument is specified, then (if the specified DSP channel is engaged in a CSM call) CSM call-related debugging information will be turned on for this channel. The **no**form of this command turns off debugging for that particular channel.

#### Examples

The following examples show sample output from the **debugcsmvoice** command. The following shows that CSM has received an event from ISDN.

Router# debug csm voice Oct 18 04:05:07.052: EVENT\_FROM\_ISDN::dchan\_idb=0x60D7B6B8, call\_id=0xCF, ces=0x1 bchan=0x0, event=0x1, cause=0x0 In this example, terms are explained as follows:

- dchan\_idb--Indicates the address of the hardware interface description block (IDB) for the D channel
- call\_id--Indicates the call ID assigned by ISDN
- bchan--Indicates the number of the B channel assigned for this call
- · cause--Indicates the ISDN event cause

ſ

The following shows that CSM has allocated the CSM voice control block for the DSP device on slot 1 port 10 for this call.

Oct 18 04:05:07.052: VDEV ALLOCATE: slot 1 and port 10 is allocated.

This AS5300 access server might not be actually used to handle this call. CSM must first allocate the CSM voice control block to initiate the state machine. After the voice control block has been allocated, CSM obtains from the DSP Resource Manager the actual DSP channel that will be used for the call. At that point, CSM will switch to the actual logical port number. The slot number refers to the physical slot on the AS5300 access server. The port number is the logical DSP number interpreted as listed in the table below.

Table 69: Logical DSP Numbers	
-------------------------------	--

Logical Port Number	Physical DSP Channel
Port 0	DSPRM 1, DSP 1, DSP channel 1
Port 1	DSPRM 1, DSP 1, DSP channel 2
Port 2	DSPRM 1, DSP 2, DSP channel 1
Port 3	DSPRM 1, DSP 2, DSP channel 2
Port 4	DSPRM 1, DSP 3, DSP channel 1
Port 5	DSPRM 1, DSP 3, DSP channel 2
Port 6	DSPRM 1, DSP 4, DSP channel 1
Port 7	DSPRM 1, DSP 4, DSP channel 2
Port 8	DSPRM 1, DSP 5, DSP channel 1
Port 9	DSPRM 1, DSP 5, DSP channel 2
Port 10	DSPRM 1, DSP 6, DSP channel 1
Port 11	DSPRM 1, DSP 6, DSP channel 2
Port 12	DSPRM 2, DSP 1, DSP channel 1
Port 13	DSPRM 2, DSP 1, DSP channel 2
Port 14	DSPRM 2, DSP 2, DSP channel 1
Port 15	DSPRM 2, DSP 2, DSP channel 2
Port 16	DSPRM 2, DSP 3, DSP channel 1
Port 17	DSPRM 2, DSP 3, DSP channel 2
Port 18	DSPRM 2, DSP 4, DSP channel 1

Logical Port Number	Physical DSP Channel
Port 19	DSPRM 2, DSP 4, DSP channel 2
Port 20	DSPRM 2, DSP 5, DSP channel 1
Port 21	DSPRM 2, DSP 5, DSP channel 2
Port 22	DSPRM 2, DSP 6, DSP channel 1
Port 23	DSPRM 2, DSP 6, DSP channel 2
Port 48	DSPRM 5, DSP 1, DSP channel 1
Port 49	DSPRM 5, DSP 1, DSP channel 2
Port 50	DSPRM 5, DSP 2, DSP channel 1
Port 51	DSPRM 5, DSP 2, DSP channel 2
Port 52	DSPRM 5, DSP 3, DSP channel 1
Port 53	DSPRM 5, DSP 3, DSP channel 2
Port 54	DSPRM 5, DSP 4, DSP channel 1
Port 55	DSPRM 5, DSP 4, DSP channel 2
Port 56	DSPRM 5, DSP 5, DSP channel 1
Port 57	DSPRM 5, DSP 5, DSP channel 2
Port 58	DSPRM 5, DSP 6, DSP channel 1
Port 59	DSPRM 5, DSP 6, DSP channel 2

The following shows that the function csm\_vtsp\_init\_tdm() has been called with a voice control block of address 0x60B8562C. This function will be called only when the call is treated as a voice call.

Oct 18 04:05:07.052: csm\_vtsp\_init\_tdm (voice\_vdev=0x60B8562C) The following shows that CSM has obtained a DSP channel from the DSP Resource Manager:

Oct 18 04:05:07.052: csm\_vtsp\_init\_tdm: dsprm\_tdm\_allocate: tdm slot 1, dspm 2, dsp 5, dsp\_channel 1csm\_vtsp\_init\_tdm: dsprm\_tdm\_allocate: tdm stream 5, channel 9, bank 0, bp\_channel 10

The DSP channel has the following initialized TDM channel information:

• TDM slot 1, dspm 2, dsp 5, dsp\_channel 1--Indicates the physical DSP channel that will be used for this call.

• TDM stream 5, channel 9, bank 0, bp\_channel 10--Indicates the on-chip and backplane TDM channel assigned to this DSP channel. Stream 5, channel 9 gives the on-chip TDM channel mapped to the DSP; bank 0, bp\_channel 10 means that the backplane stream 0 and backplane channel #1 are assigned to this DSP.

The following shows that CSM has received an incoming call event from ISDN:

```
Oct 18 04:05:07.052: EVENT_FROM_ISDN: (00CF): DEV_INCALL at slot 1 and port 20
Slot 1, port 20 means the logical DSP channel 20 (mapped to DSPRM 2, DSP 5, DSP channel 1).
```

The following shows that the DEV\_INCALL message has been translated into a CSM\_EVENT\_ISDN\_CALL message:

Oct 18 04:05:07.052: CSM\_PROC\_IDLE: CSM\_EVENT\_ISDN\_CALL at slot 1, port 20 This message is passed to the CSM central state machine while it is in the CSM\_IDLE state and is in the CSM\_PROC\_IDLE procedure. The logical DSP channel port 20 on slot 1 is used to handle this call.

The following shows that CSM has invoked the vtsp\_ic\_notify() function with a CSM voice call control block 0x60B8562C.

Oct 18 04:05:07.052: vtsp\_ic\_notify : (voice\_vdev= 0x60B8562C) Inside this function, CSM will send a SETUP INDICATION message to the VTSP. This function will be invoked only if the call is a voice call.

The following shows that CSM has received a SETUP INDICATION RESPONSE message from the VTSP as an acknowledgment.

Oct 18 04:05:07.056: csm\_vtsp\_call\_setup\_resp (vdev\_info=0x60B8562C, vtsp\_cdb=0x60FCA114) This means that the VTSP has received the CALL SETUP INDICATION message previously sent and has proceeded to process the call.

- vdev\_info--Contains the address of the CSM voice data block.
- vtsp\_cdb--Contains the address of the VTSP call control block.

The following shows that CSM has received a CALL CONNECT message from the VTSP:

Oct 18 04:05:07.596: csm\_vtsp\_call\_connect (vtsp\_cdb=0x60FCA114, voice\_vdev=0x60B8562C) This indicates that the VTSP has received a CONNECT message for the call leg initiated to the Internet side.

- vtsp cdb--Contains the address of the VTSP call control block.
- voice\_vdev--Contains the address of the CSM voice data block.

The following shows that while CSM is in the CSM\_IC2\_RING state, it receives a SETUP INDICATION RESPONSE from the VTSP. This message is translated into CSM\_EVENT\_MODEM\_OFFHOOK and passed to the CSM central state machine.

Oct 18 04:05:07.596: CSM\_PROC\_IC2\_RING: CSM\_EVENT\_MODEM\_OFFHOOK at slot 1, port 20 The following shows that CSM has received a CONNECT message from ISDN for the call using the logical DSP channel on slot 1 and port 20:

Oct 18 04:05:07.616: EVENT\_FROM\_ISDN:(00CF): DEV\_CONNECTED at slot 1 and port 20

I

The following shows that CSM has translated the CONNECT event from ISDN into the CSM EVENT ISDN CONNECTED message, which is then passed to the CSM central state machine:

Oct 18 04:05:07.616: CSM\_PROC\_IC4\_WAIT\_FOR\_CARRIER: CSM\_EVENT\_ISDN\_CONNECTED at slot 1, port 20 The following shows that CSM has received a CALL SETUP REQUEST from the VTSP:

The following shows that CSW has received a CALL SETUP REQUEST from the VISF.

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request (vtsp\_cdb=0x60FCFA20, vtsp\_sdb=0x60DFB608)

This represents a request to make an outgoing call to the PSTN.

- vtsp cdb--Contains the address of the VTSP call control block.
- vtsp\_sdb--Contains the address of the signalling data block for the signalling interface to be used to send the outgoing call.

The following shows that the physical DSP channel has been allocated for this outgoing call:

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request: tdm slot 1, dspm 5, dsp 4, dsp\_channel 1 The following shows the on-chip and backplane TDM channel assigned to this DSP channel:

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request: tdm stream 5, channel 25, bank 0, bp\_channel 27

In this sample output, tdm stream 5, channel 25, bank 0, bp\_channel 27 indicates the on-chip and backplane TDM channel assigned to this DSP channel. Stream 5, channel 25 gives the on-chip TDM channel mapped to the DSP; bank 0, bp\_channel 27 means that the backplane stream 0 and backplane channel 1 are assigned to this DSP.

The following shows the calling number and the called number for this call.

May 16 12:22:27.580: csm\_vtsp\_call\_setup\_request: calling number: 10001, called number: 30001

The following shows that the CALL SETUP REQUEST from the VTSP has been translated into the ' CSM\_EVENT\_MODEM\_OFFHOOK message and is passed to the CSM central state machine:

May 16 12:22:27.580: CSM\_PROC\_IDLE: CSM\_EVENT\_MODEM\_OFFHOOK at slot 1, port 54 The logical DSP channel number for the DSP (slot 1, port 54) is now displayed, which maps to the physical DSP channel slot 1, dspm 5, dsp 4, dsp\_channel 1.

The following shows that CSM has collected all the digits for dialing out:

May 16 12:22:27.580: CSM\_PROC\_OC3\_COLLECT\_ALL\_DIGIT: CSM\_EVENT\_GET\_ALL\_DIGITS at slot 1,
port 54

For PRI and for applications that do not require digit collection of outdialing digits (for example, voice calls), the intermediate digit collection states are omitted and the CSM state machine moves to this state directly, pretending that the digit collection has been done.

The following shows an information message:

May 16 12:22:27.580: CSM\_PROC\_OC3\_COLLECT\_ALL\_DIGIT: called party num: (30001) at slot 1, port 54

The following shows that CSM attempts to find a free signalling D channel to direct the outgoing call:

```
May 16 12:22:27.580: csm_vtsp_check_dchan (voice_vdev=0x60B8562C)
May 16 12:22:27.580: csm_vtsp_check_dchan (vtsp requested dchan=0x60D7ACB0,
dchan_idb=0x60E8ACF0)
May 16 12:22:27.580: csm_vtsp_check_dchan (voice_vdev=0x60B8562C)
May 16 12:22:27.580: csm_vtsp_check_dchan (vtsp requested dchan=0x60D7ACB0,
dchan_idb=0x60D7ACB0)
```

In the case of voice calls, the free signaling D channel must match the voice interface specified inside the signalling data block (vtsp\_sdb) passed from the VTSP.

The following shows that CSM has received an event from ISDN:

```
May 16 12:22:27.624: EVENT_FROM_ISDN::dchan_idb=0x60D7ACB0, call_id=0xA121, ces=0x1
bchan=0x1E, event=0x3, cause=0x0
In this sample output:
```

- dchan idb--indicates the address of the hardware IDB for the D channel
- call id--Indicates the call id assigned by ISDN
- bchan--Indicates the number of the B channel assigned for this call
- · cause--Indicates the ISDN event cause

The following shows that CSM has received a CALL PROCEEDING message from ISDN.

May 16 12:22:27.624: EVENT\_FROM\_ISDN: (A121): DEV\_CALL\_PROC at slot 1 and port 54 The following shows that the CALL PROCEEDING event received from ISDN has been interpreted as a CSM\_EVENT\_ISDN\_BCHAN\_ASSIGNED message:

\*May 16 12:22:27.624: CSM\_PROC\_OC4\_DIALING: CSM\_EVENT\_ISDN\_BCHAN\_ASSIGNED at slot 1, port 54

ISDN has assigned a B channel for this outgoing call. This B channel must be on the same PRI span as the signalling D channel allocated previously.

The following shows that the csm\_vtsp\_setup\_for\_oc function is called:

May 16 12:22:27.624: csm\_vtsp\_setup\_for\_oc (voice\_vdev=0x60B8562C) This is invoked when an outgoing call initiated by the VTSP receives a response from the ISDN stack.

The following shows that ISDN has sent a CONNECT message to CSM indicating that the call leg to the PSTN side has been established:

May 16 12:22:28.084: EVENT\_FROM\_ISDN::dchan\_idb=0x60D7ACB0, call\_id=0xA121, ces=0x1 bchan=0x1E, event=0x4, cause=0x0

May 16 12:22:28.084: EVENT\_FROM\_ISDN: (A121): DEV\_CONNECTED at slot 1 and port 54 The following shows that while CSM is in the OC5\_WAIT\_FOR\_CARRIER state, it has received the 'CONNECT' message from ISDN and has translated it into the CSM\_EVENT\_ISDN\_CONNECTED message, which is passed to the CSM central state machine:

May 16 12:22:28.084: CSM\_PROC\_OC5\_WAIT\_FOR\_CARRIER: CSM\_EVENT\_ISDN\_CONNECTED at slot 1, port 54

The following shows that the function vtsp\_confirm\_oc() has been called:

May 16 12:22:28.084: vtsp\_confirm\_oc : (voice\_vdev= 0x60B8562C) This is invoked after CSM received the CONNECT message from ISDN. CSM sends a confirmation of the CONNECT to the VTSP.

# debug ctl-client

To collect debug information about the CTL client, use the **debugctl-client** command in privileged EXEC configuration mode. To disable collection of debug information, use the **no** form of this command.

debug ctl-client

no debug ctl-client

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Collection of CTL client debug information is disabled.
- **Command Modes** Privileged EXEC

Command History	Cisco IOS Release	Modification
	12.4(4)XC	This command was introduced.
	12.4(9)T	This command was integrated into Cisco IOS Release 12.4(9)T.

### **Usage Guidelines** This command is used with Cisco Unified CME phone authentication.

**Examples** 

The following example shows debug messages for the CTL client:

Router# debug ctl-client

001954:	.Jul	21	18:23:02.136:	ctl client create of	ctlfile:
001955:	.Jul	21	18:23:02.272:	create ctl record:	Function 0 Trustpoint ciscol
001956:	.Jul	21	18:23:02.276:	create ctl record:	record added for function 0
001957:	.Jul	21	18:23:02.276:	create ctl record:	Function 0 Trustpoint sast2
001958:	.Jul	21	18:23:02.280:	create ctl record:	record added for function 0
001959:	.Jul	21	18:23:02.280:	create ctl record:	Function 1 Trustpoint ciscol
001960:	.Jul	21	18:23:02.284:	create ctl record:	record added for function 1
001961:	.Jul	21	18:23:02.284:	create ctl record:	Function 3 Trustpoint ciscol
001962:	.Jul	21	18:23:02.288:	create ctl record:	record added for function 3
001963:	.Jul	21	18:23:02.288:	create ctl record:	Function 4 Trustpoint ciscol
001964:	.Jul	21	18:23:02.292:	create ctl record:	record added for function 4

# debug ctunnel

To display debugging messages for the IP over a Connectionless Network Service (CLNS) Tunnel feature, use the **debugctunnel** command in privileged EXEC mode. To disable debugging messages, use the **no** form of this command.

debug ctunnel

no debug ctunnel

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(5)	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

### **Examples**

I

As packets are sent over the virtual interface, the following type of output will appear on the console when the **debugctunnel** command is used:

Router# debug ctunnel

```
4d21h: CTunnel1: IPCLNP encapsulated 49.0001.1111.1111.1111.00->49.0001.2222.2222.2222.00 (linktype=7, len=89)
```

# debug custom-queue

To enable custom queueing output, use the **debugcustom-queue** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug custom-queue

no debug custom-queue

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

**Examples** 

The following is an example of enabling custom queueing output:

Router# **debug custom-queue** Custom output queueing debugging is on The following is sample output from the debug custom-queue command:

00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	1
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	1
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	1
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	2
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	2	now	1
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	1
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	1
00:27:38:	CQ:	Serial0	output	(Pk	size/Q:	232/1)	Q	#	was	1	now	1

Command	Description				
debug priority	Enables priority queueing output.				

# debug cwmp

To debug the TR-069 Agent, use the **debugcwmp** command in privileged EXEC mode. To disable, use the **no** form of this command.

debug cwmp {all| error| profile| trace}

no debug cwmp {all| error| profile| trace}

### **Syntax Description**

all	Specifies all debug messages.
error	Specifies error messages.
profile	Specifies the error and trace messages in the Cisco WAN Management Protocol (CWMP) profiles.
trace	Specifies trace message.

### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.4(20)T	This command was introduced.

#### **Examples**

The following is sample output from the **debugcwmperror** command:

Device# debug cwmp error	
CWMP ERROR: cwmp session response data -> HTTPC Response failed with httpc er	ror
The following is sample trace message output from the <b>debugcwmpprofile</b> command:	
Device# debug comp profile	

```
CWMP PROFILE: cwmp generate connection request URL -> ConnectionRequestURL = http://172.27.116.170/00000C/FTX1101A1XH/cwmp
The following is sample error message output from the debugcwmpprofile command:
```

```
Device# debug cwmp profile
CWMP PROFILE ERROR: validate_dhcp_pool_min_max_address -> Missing
InternetGatewayDevice.LANDevice.5.LANHostConfigManagement.MaxAddress
The following is sample output from the debugcwmptrace command:
```

Device# **debug cwmp trace** CWMP: cwmp\_process -> CWMP Engine started

# debug cws

To enable Cloud Web Security debugging, use the **debug cws** command in privileged EXEC mode. To disable Cloud Web Security debugging, use the **no** form of this command.

debug cws {access-list {access-list-number | extended-access-list-number | access-list-name }| control-plane| errors | events | function-trace | packet-path }

no debug cws {access-list {access-list-number | extended-access-list-number | access-list-name}| control-plane | errors | events | function-trace | packet-path}

### Syntax Description

access-list	Enables debugging of Cloud Web Security access control lists (ACLs).
access-list-number	Access list number. The range is from 1 to 199.
extended-access-list-number	Extended access list number. The range is from 1300 to 2699.
access-list-number	Access list name.
control-plane	Enables debugging of Cloud Web Security control plane messages.
errors	Enables debugging of Cloud Web Security errors.
events	Enables debugging of Cloud Web Security events.
function-trace	Enables debugging of Cloud Web Security function trace.
packet-path	Enables debugging of Cloud Web Security packet path.

### **Command Modes** Privileged EXEC (#)

### **Command History**

Release	Modification
15.4(2)T	This command was introduced. This command replaces the <b>debug content-scan</b> command.

#### **Usage Guidelines**

The content scanning process redirects client web traffic to the Cloud Web Security server.

You must configure ACLs by using the **ip access-list extended** command before you enable the debugging of Cloud Web Security ACLs. The **debug cws access-list** command enables conditional debugging for Cloud Web Security. The conditional debugging does not work for existing sessions when you enable content scan; the ACL match occurs after the first packet is received.

#### Examples

The following example shows how to enable extended ACL 149 and the debugging of Cloud Web Security ACL 149:

```
Device(config)# ip access-list extended 149
Device(config-ext-nacl)# permit ip host 10.1.0.1
Device(config-ext-nacl)# end
Device# debug cws access-list 149
Content-scan ACL based conditional debugging is on
```

The following is sample output from the **debug cws access-list 149** command:

#### Device# debug cws access-list 149

Content-scan ACL based conditional debugging is on

```

Command	Description
cws out	Enables Cloud Web Security content scanning on an egress interface.
cws whitelisting	Enables whitelisting of incoming traffic and enters Cloud Web Security whitelisting configuration mode.
show cws	Displays Cloud Web Security information.

# debug dampening

To display debug trace information messages for interface dampening, use the **debugdampening** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dampening [all| interface]

no debug dampening [all| interface]

Syntax Description	all	(Optional) Enables trace debugging for all dampening features.
	interface	(Optional) Enables trace debugging for IP event dampening.

### **Command Default** No default behavior or values.

### **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(22)S	This command was introduced.
	12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
	12.2(18)SXD	This command was integrated into Cisco IOS Release 12.2(18)SXD.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.

#### **Examples**

The following sample output is similar to the output that will be displayed when the **debugdampening** command is entered with the **interface** keyword. The sample output shows the following information:

- Ethernet interface 1/1 is configured with the IP Event Dampening feature. The half-life period is set to 30 seconds, the reuse threshold to 500, the suppress threshold to 1000, and the restart penalty to 90.
- The **shutdown** command and then the **noshutdown** command was entered on Ethernet interface 1/1. The interface was suppressed and then reused by the IP Event Dampening feature.

1

Router# debug dampening interface
00:07:17:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from UP to DOWN 00:07:17:EvD(Ethernet1/1):charge penalty 1000, new accum. penalty 1000, flap count 1 00:07:17:EvD(Ethernet1/1):accum. penalty 1000, now suppressed with a reuse intervals of 30 00:07:17:IF-EvD(Ethernet1/1):update CLNS Routing state to DOWN, interface is suppressed 00:07:17:IF-EvD(Ethernet1/1):IP Routing reports state transition from DOWN to DOWN 00:07:17:IF-EvD(Ethernet1/1):update IP Routing state to DOWN, interface is suppressed 00:07:17:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from DOWN to UP 00:07:17:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from UP to DOWN 00:07:17:EvD(Ethernet1/1):accum. penalty decayed to 1000 after 0 second(s) 00:07:17:EvD(Ethernet1/1):charge penalty 1000, new accum. penalty 2000, flap count 2 00:07:17:EvD(Ethernet1/1):accum. penalty 2000, now suppressed with a reuse intervals of 60 00:07:17:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from DOWN to UP 00:07:17:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from UP to DOWN 00:07:17:EvD(Ethernet1/1):accum. penalty decayed to 2000 after 0 second(s) 00:07:17:EvD(Ethernet1/1):charge penalty 1000, new accum. penalty 3000, flap count 3 00:07:17:EvD(Ethernet1/1):accum. penalty 3000, now suppressed with a reuse intervals of 78 00:07:17:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from DOWN to UP 00:07:17:IF-EvD(Ethernet1/1):IP Routing reports state transition from UP to UP 00:07:17:IF-EvD(Ethernet1/1):IP Routing reports state transition from UP to UP 00:07:17:IF-EvD(Ethernet1/1):IP Routing reports state transition from UP to UP 00:07:17:IF-EvD(Ethernet1/1):IP Routing reports state transition from UP to UP 00:07:17:IF-EvD(Ethernet1/1):IP Routing reports state transition from UP to UP 00:07:20:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from UP to UP 00:07:20:IF-EvD(Ethernet1/1):IP Routing reports state transition from UP to UP 00:07:47:IF-EvD:unsuppress interfaces 00:08:36:IF-EvD:unsuppress interfaces 00:08:36:EvD(Ethernet1/1):accum. penalty decayed to 483 after 79 second(s) 00:08:36:EvD(Ethernet1/1):accum. penalty 483, now unsuppressed 00:08:36:IF-EvD(Ethernet1/1):update IP Routing state to UP, interface is not suppressed 00:08:36:IF-EvD(Ethernet1/1):update CLNS Routing state to UP, interface is not suppressed 00:08:36:IF-EvD(Ethernet1/1):CLNS Routing reports state transition from UP to UP The table below describes the significant fields shown in the display.

Table 70: debug dampening Field Descriptions

Field	Description
Routing reports state transition from UP to DOWN	Displays the status of the specified interface from the perspective of the specified protocol. Interface state changes are displayed. The interface is specified within parentheses. The protocol is specified at the beginning of the message.
charge penalty 1000, new accum. penalty 1000, flap count 1	Displays the penalty assigned to the flapping interface and amount of penalty that is added to the accumulated penalty. The interface flap count is also displayed.
accum. penalty 1000, now suppressed with a reuse intervals of 30	Displays the status of the interface, accumulated penalty, and configured reuse threshold.
update CLNS Routing state to DOWN, interface is suppressed	Displays the status of the specified interface. Interface state changes and suppression status are displayed.
accum. penalty decayed to 1000 after 0 second(s)	Displays the decay rate of the accumulated penalty.
unsuppress interfaces	Indicates that dampened interfaces have been unsuppressed.

## debug data-store

To display persistant storage device (PSD)-related debugging messages for the gateway GPRS support node (GGSN), use the **debugdata-store**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug data-store

no debug data-store

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(14)YU	This command was introduced.
	12.4(2)XB	This command was integrated into Cisco IOS Release 12.4(2)XB.
	12.4(15)T	This command was integrated into Cisco IOS Release 12.4(15)T.

**Usage Guidelines** 

This command displays PSD-related debugging messages for the GGSN.

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use debug commands during periods of lower network flows and fewer users. Debugging during these periods reduces the effect these commands have on other users on the system.

**Examples** 

The following example configures a debugging session to check PSD-related parameters:

Router# debug data-store

## debug data-store detail

To display extended details for persistent storage device (PSD)-related debugging information, use the **debugdata-storedetail**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug data-store detail

no debug data-store detail

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(14)YU	This command was introduced.
	12.4(2)XB	This command was integrated into Cisco IOS Release 12.4(2)XB.
	12.4(15)T	This command was integrated into Cisco IOS Release 12.4(15)T.

**Usage Guidelines** 

This command displays PSD-related debugging messages for the GGSN.

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use debug commands during periods of lower network flows and fewer users. Debugging during these periods reduces the effect these commands have on other users on the system.

#### **Examples**

The following example configures a detailed PSD-related debugging session:

Router# debug data-store details

٦

#### **Related Commands**

Command	Description
auto-retrieve	Configures the GGSN to automatically initiate a retrieval of G-CDRs from PSDs defined in a PSD server group.
clear data-store statistics	Clears PSD-related statistics.
show data-store	Displays the status of the PSD client and PSD server-related information.
show data-store statistics	Displays statistics related to the PSD client.

## debug dbconn all

To turn on all debug flags for Database Connection, use the **debugdbconnall**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dbconn all

no debug dbconn all

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is not enabled for Database Connection.
- **Command Modes** Privileged EXEC

**Related Commands** 

I

- Usage Guidelines The debugdbconnall command displays debug output for Advanced Program-to-Program Communication (APPC), Database Connection configuration, Distributed Relational Database Architecture (DRDA), error messages, event traces, and TCP. The Database Connection debug flags are appc, config, drda, event, and tcp.
- **Examples** See the sample output provided for the **debug dbconn appc**, **debug dbconn config**, **debug dbconn drda**, **debug dbconn event**, and **debug dbconn tcp** commands.

Command	Description
debug dbconn appc	Displays APPC-related trace or error messages.
debug dbconn config	Displays trace or error messages for Database Connection configuration and control blocks.
debug dbconn drda	Displays error messages and stream traces for DRDA.
debug dbconn event	Displays trace or error messages for CTRC events related to DB2 communications.
debug dbconn tcp	Displays error messages and traces for TCP.

## debug dbconn appc

To display Advanced Program-to-Program Communication (APPC)-related trace or error messages, use the **debugdbconnappc** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dbconn appc

no debug dbconn appc

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC
- Usage Guidelines In a router with stable Database Connection, the alias\_cp\_name field in the trace message should not be blank. There should be no other APPC error message. You can use Advanced Peer-to-Peer Networking (APPN) debug commands with this debug command to track APPN-related errors.
- **Examples** The following is sample output from the **debugdbconnappc**command. In a normal situation, only the following message is displayed:

DBCONN-APPC: alias\_cp\_name is "ASH" The following error messages are displayed if there is a network configuration error or other APPN-related problem:

DBCONN-APPC-612C2B28:	APPC ei	cror:	opcod	de 0x1	, prim	nary_1	cc 0x0	0003,

V		1 4 .	1		:			

You can use the **debugappn** command to obtain more information.

The following message is displayed if a database connection is manually cleared and an outstanding APPC verb is pending:

DBCONN-APPC-%612C2B28: Canceling pending APPC verb 0x1

#### **Related Commands**

I

Command	Description
debug dbconn all	Turns on all debug flags for Database Connection.
debug dbconn config	Displays trace or error messages for Database Connection configuration and control blocks.
debug dbconn drda	Displays error messages and stream traces for DRDA.
debug dbconn event	Displays trace or error messages for Database Connection events.
debug dbconn tcp	Displays error messages and traces for TCP.

## debug dbconn config

To display trace or error messages for Database Connection configuration and control blocks, use the **debugdbconnconfig**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dbconn config

no debug dbconn config

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC
- **Usage Guidelines** Most of the messages for Database Connection and control blocks do not report any errors. If a connection is inactive and cannot be cleared, use this command with the **debugdbconnappc,debugdbconntcp**, and**debugappn** commands to locate the problem. The alias\_cp\_name field must match the configured APPN cpname.

**Examples** The following is sample output from the **debugdbconnconfig** command:

```
Router# debug dbconn config
DBCONN-CONFIG: alias cp name is "ASH
                                         ...
DBCONN-CONFIG: connection 612BDAAC matching server on 198.147.235.5:0 with
rdbname=STELLA
DBCONN-CONFIG: APPN shutdown; clearing connection 1234abcd
DBCONN-CONFIG: created server 612C2720
DBCONN-CONFIG: server 612C2720 (listen 60F72E94) is active
DBCONN-CONFIG: server 612C2720 (listen 60F72E94) is active
DBCONN-CONFIG: new connection 612BDAAC
DBCONN-CONFIG: listen 60F72E94 accepts connection 612BDAAC
DBCONN-CONFIG: server 60F74614 takes connection 612BDAAC
DBCONN-CONFIG: listen 60F72E94 releases connection 612BDAAC
DBCONN-CONFIG: server 60F74614 releases connection 612BDAAC
DBCONN-CONFIG: deleting connection 612BDAAC
DBCONN-CONFIG: listen 60F72E94 abandons connection 612BDAAC
DBCONN-CONFIG: server 612C2720 abandons connection 612BDAAC
DBCONN-CONFIG: deleting server 612C2720
DBCONN-CONFIG: daemon 60381738 takes zombie connection 612BDAAC
DBCONN-CONFIG: daemon 60381738
                                releases zombie connection 612BDAAC
```

#### **Related Commands**

Command	Description
debug dbconn all	Turns on all debug flags for Database Connection.
debug dbconn appc	Displays APPC-related trace or error messages.

ſ

Command	Description
debug dbconn event	Displays trace or error messages for Database Connection events.
debug dbconn tcp	Displays error messages and traces for TCP.

## debug dbconn drda

To display error messages and stream traces for Distributed Relational Database Architecture (DRDA), use the **debugdbconndrda**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dbconn drda

no debug dbconn drda

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is not enabled for the dbconn subsystem.
- **Command Modes** Privileged EXEC

Command History Release		Modification
	11.3(2)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### Examples

The following is sample output from the **debugdbconndrda**command:

Router# debug dbconn drda

\*Jun 30 16:09:32.363: DECONN-DRDA-62008300: DSS X'006CD0410001', length 108, in chain, REQDSS, correlator 1 \*Jun 30 16:09:32.363: DECONN-DRDA-62008300: OBJECT X'00661041', length 98, code point X'1041' \*Jun 30 16:09:32.363: DECONN-DRDA-62008300: OBJECT X'0020115E' in COLLECTION X'1041', length 28, code point X'115E' \*Jun 30 16:09:32.363: DECONN-DRDA-62008300: OBJECT X'000C116D' in COLLECTION X'1041', length 8, code point X'116D' \*Jun 30 16:09:32.363: DECONN-DRDA-62008300: OBJECT X'0013115A' in COLLECTION X'1041', length 15, code point X'115A' (skipping...)

#### **Related Commands**

Command	Description
debug dbconn all	Turns on all debug flags for Database Connection.
debug dbconn appc	Displays APPC-related trace or error messages.
debug dbconn config	Displays trace or error messages for Database Connection configuration and control blocks.

ſ

Command	Description
debug dbconn event	Displays trace or error messages for CTRC events related to DB2 communications.
debug dbconn tcp	Displays error messages and traces for TCP.

### debug dbconn event

To display trace or error messages for Cisco Transaction Connection (CTRC) events related to DATABASE2 (DB2) communications, use the **debugdbconnevent**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dbconn event

no debug dbconn event

**Syntax Description** This command has no arguments or keywords.

**Command Default** Debugging is not enabled for the dbconn subsystem.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	11.3(2)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### Examples

The following examples display output from the **debugdbconnevent** command in a variety of situations. A normal trace for the **debugdbconnevent** displays as follows:

```
Router# debug dbconn event

DBCONN-EVENT: Dispatch to 60FD6C00, from 0, msg 60F754CC, msgid 6468 'dh',

buffer 0.

DBCONN-EVENT: [*] Post to 61134240(cn), from 60EC5470(tc), msg 611419E4,

msgid 0x6372 'cr', buffer 612BF68C.

DBCONN-EVENT: Flush events called for pto 61182742, pfrom 61239837.

DBCONN-EVENT: Event discarded: to 61182742 (cn), from 61239837(ap), msg

61339273, msgid 0x6372 'cr' buffer 0.

DBCONN-EVENT: == Send to 1234abcd, from 22938acd, msg 72618394, msgid

0x6372 'cr', buffer 0.

If the following messages are displayed, contact Cisco technical support personnel:
```

DBCONN-TCPFSM-1234abcd: Cannot occur in state 2 on input 6363 ('cc') DBCONN-APPCFSM-1234abcd: Cannot occur in state 3 on input 6363 ('cc')

#### **Related Commands**

## debug decnet adj through debug dss ipx event

1

## debug decnet adj

Note	The <b>debugdecnetadj</b> command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.	
	To display debugging information on DECnet adjacencies, use the <b>debugdecnetadj</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command.	
	debug decnet adj	
	no debug decnet adj	
Syntax Description	This command has no arguments or keywords.	
Command Modes	Privileged EXEC (#)	
Examples	The following is sample output from the <b>debugdecnetadj</b> command:	
	Router# debug decnet adj DNET-ADJ: Level 1 hello from 1.3 DNET-ADJ: sending hellos DNET-ADJ: Sending hellos to all routers on interface Ethernet0, blksize 1498 DNET-ADJ: Level 1 hello from 1.3 DNET-ADJ: 1.5 adjacency initializing DNET-ADJ: sending triggered hellos DNET-ADJ: Sending hellos to all routers on interface Ethernet0, blksize 1498 DNET-ADJ: Level 1 hello from 1.3 DNET-ADJ: Level 1 hello from 1.5 DNET-ADJ: Level 1 hello from 1.5 DNET-ADJ: 1.5 adjacency down, listener timeout The following line indicates that the router is sending hello messages to all routers on this segment, which in this case is Ethernet 0:	
	DNET-ADJ: Sending hellos to all routers on interface Ethernet0, blksize 1498 The following line indicates that the router has heard a hello message from address 1.5 and is creating an adjacency entry in its table. The initial state of this adjacency will be <i>initializing</i> .	
	DNET-ADJ: 1.5 adjacency initializing The following line indicates that the router is sending an unscheduled (triggered) hello message as a result of some event, such as new adjacency being heard:	
	DNET-ADJ: sending triggered hellos The following line indicates that the adjacency with 1.5 is now up, or active:	
	DNET-ADJ: 1.5 adjacency up The following line indicates that the adjacency with 1.5 has timed out, because no hello message has been	

heard from adjacency 1.5 in the time interval originally specified in the hello message from 1.5:

DNET-ADJ: 1.5 adjacency down, listener timeout

I

The following line indicates that the router is sending an unscheduled hello message, as a result of some event, such as the adjacency state changing:

DNET-ADJ: hello update triggered by state changed in dn\_add\_adjacency

## debug decnet connects

The **debugdecnetconnects** command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.

To display debugging information of all connect packets that are filtered (permitted or denied) by DECnet access lists, use the **debugdecnetconnects** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug decnet connects

no debug decnet connects

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

**Usage Guidelines** When you use connect packet filtering, it may be helpful to use the **decnetaccess-group** configuration command to apply the following basic access list:

access-list 300 permit 0.0 63.1023 eq any You can then log all connect packets sent on interfaces to which you applied this list, in order to determine those elements on which your connect packets must be filtered.

**Note** Packet password and account information is not logged in the **debugdecnetconnects** message, nor is it displayed by the **showaccess** EXEC command. If you specify **password** or **account** information in your access list, they can be viewed by anyone with access to the configuration of the router.

#### Examples

The following is sample output from the**debugdecnetconnects** command:

#### Router# debug decnet connects

```
DNET-CON: list 300 item #2 matched src=19.403 dst=19.309 on Ethernet0: permitted
srcname="RICK" srcuic=[0,017]
dstobj=42 id="USER"
```

The table below describes significant fields shown in the output.

#### Table 71: debug decnet connects Field Descriptions

Field	Description
DNET-CON:	Indicates that this is a <b>debugdecnetconnects</b> packet.
list 300 item #2 matched	Indicates that a packet matched the second item in access list 300.
src=19.403	Indicates the source DECnet address for the packet.

I

Field	Description
dst=19.309	Indicates the destination DECnet address for the packet.
on Ethernet0:	Indicates the router interface on which the access list filtering the packet was applied.
permitted	Indicates that the access list permitted the packet.
srcname = "RICK"	Indicates the originator user of the packet.
srcuic=[0,017]	Indicates the source UIC of the packet.
dstobj=42	Indicates that DECnet object 42 is the destination.
id="USER"	Indicates the access user.

٦

## debug decnet events

Note	The <b>debugdecnetevents</b> command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.		
	To display debugging information on DECnet events, use the <b>debugdecnetevents</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command. <b>debug decnet events</b>		
	no debug decnet events		
Syntax Description	This command has no arguments or keywords.		
Command Modes	Privileged EXEC (#)		
Examples	The following is sample output from the debugdecnet events command:		
	Router# debug decnet events DNET: Hello from area 50 rejected - exceeded 'max area' parameter (45) DNET: Hello from area 50 rejected - exceeded 'max area' parameter (45) The following line indicates that the router received a hello message from a router whose area was greater than the max-area parameter with which this router was configured:		
	DNET: Hello from area 50 rejected - exceeded'max area' parameter (45) The following line indicates that the router received a hello message from a router whose node ID was greater than the max-node parameter with which this router was configured:		
	DNET: Hello from node 1002 rejected - exceeded'max node' parameter (1000)		

## debug decnet packet

ſ

Note	The <b>debugdecnetpacket</b> command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases. To display debugging information on DECnet packet events, use the <b>debugdecnetpacket</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command.		
	debug decnet packet		
	no debug decnet packet		
Syntax Description	This command has no arguments or keywords.		
Command Modes	Privileged EXEC (#)		
Examples	The following is sample output from the <b>debugdecnetpacket</b> command:		
	Router# debug decnet packet DNET-PKT: src 1.4 dst 1.5 sending to PHASEV DNET-PKT: Packet fwded from 1.4 to 1.5, via 1.5, snpa 0000.3080.cf90, TokenRing0 The following line indicates that the router is sending a converted packet addressed to node 1.5 to Phase V:		
	DNET-PKT: src 1.4 dst 1.5 sending to PHASEV The following line indicates that the router forwarded a packet from node 1.4 to node 1.5. The packet is being sent to the next hop of 1.5 whose subnetwork point of attachment (MAC address) on that interface is 0000.3080.cf90.		
	DNET-PKT: Packet fwded from 1.4 to 1.5, via 1.5, snpa 0000.3080.cf90, TokenRing0		

٦

## debug decnet routing

Note	The <b>debugdecnetrouting</b> command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.		
	To display all DECnet routing-related events occurring at the router, use the <b>debugdecnetrouting</b> command in privileged EXEC mode. To disable debugging output, use the <b>no</b> form of this command.		
	debug decnet routing		
	no debug decnet routing		
Syntax Description	This command has no arguments or keywords.		
Command Modes	Privileged EXEC (#)		
Examples	The following is sample output from the <b>debugdecnetrouting</b> command:		
	Router# debug decnet routing DNET-RT: Received level 1 routing from 1.3 on Ethernet0 at 1:16:34 DNET-RT: Sending normal routing updates on Ethernet0 DNET-RT: Sending level 1 routing updates on interface Ethernet0 DNET-RT: Level1 routes from 1.5 on Ethernet0: entry for node 5 created DNET-RT: route update triggered by after split route pointers in dn_rt_input DNET-RT: Received level 1 routing from 1.5 on Ethernet 0 at 1:18:35 DNET-RT: Sending L1 triggered routes DNET-RT: Sending L1 triggered routes DNET-RT: removing route to node 5 The following line indicates that the router has received a level 1 update on Ethernet interface 0:		
	DNET-RT: Received level 1 routing from 1.3 on Ethernet0 at 1:16:34 The following line indicates that the router is sending its scheduled updates on Ethernet interface 0:		
	DNET-RT: Sending normal routing updates on Ethernet0 The following line indicates that the route will send an unscheduled update on this interface as a result of some event. In this case, the unscheduled update is a result of a new entry created in the routing table of the interface.		
	DNET-RT: route update triggered by after split route pointers in dn_rt_input The following line indicates that the router sent the unscheduled update on Ethernet 0:		
	DNET-RT: Sending L1 triggered routes DNET-RT: Sending L1 triggered routing updates on Ethernet0 The following line indicates that the router removed the entry for node 5 because the adjacency with node 5 timed out, or the route to node 5 through a next-hop router was disconnected:		
	DNET-RT: removing route to node 5		

## debug device-sensor

To enable debugging for device sensor, use the **debug device-sensor** command in privileged EXEC mode.

debug device-sensor {errors | events}

#### **Syntax Description**

errors	Displays device sensor error messages.
events	Displays messages for events such as protocol packet arrivals, identity updates, and release events sent to the session manager.

#### **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	15.0(1)SE1	This command was introduced.
	15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.

## **Usage Guidelines** Use the **debug device-sensor** command in conjunction with the **debug authentication all** command to troubleshoot scenarios where device sensor cache entries are not being created for the connected devices.

**Examples** 

The following is sample output from the **debug device-sensor events** command. The debug output shows how Cisco Discovery Protocol packets and Type-Length-Values (TLVs) are received from the device connected to the Gigabit Ethernet interface 2/1.

#### Device# debug device-sensor events

Device# \*Nov 30 23:58:45.811: DSensor: Received cdp packet from GigabitEthernet2/1:00d0.2bdf.08a5 \*Nov 30 23:58:45.811: DSensor: SM returned no or invalid session label for GigabitEthernet2/1:00d0.2bdf.08a5 \*Nov 30 23:58:45.811: DSensor: Updating SM with identity attribute list cdp-tlv 0 00 01 00 0B 4A 41 45 30 37 34 31 31 50 53 32 cdp-tlv 00 03 00 03 32 0 2F 38 cdp-tlv 0 00 04 00 04 00 00 00 0A 00 05 00 68 57 53 2D 43 32 39 34 38 20 53 6F 66 74 77 61 72 65 cdp-tlv 0 2C 20 56 65 72 73 69 6F 6E 20 4D 63 70 53 57 3A 20 36 2E 34 28 35 2E 30 29 20 4E 6D 70 53 57 3A 20 36 2E 34 28 35 29 0A 43 6F 70 79 72 69 67 68 74 20 28 63 29 20 31 39 39 35 2D 32 30 30 33 20 62 79 20 43 69 73 63 6F 20 53 79 73 74 65 6D 73 2C 20 49 6E 63 2E 0A 00 06 00 08 57 53 2D 43 32 39 34 38 cdp-tlv 0 cdp-tlv 0 00 09 00 00 cdp-tlv 0 00 0A 00 02 00 21 cdp-tlv 0 00 0B 00 01 01 cdp-tlv 0 00 12 00 01 00

#### **Related Commands**

Command	Description
debug authentication all	Displays all debugging information about the Authentication Manager and all features.
device-sensor accounting	Adds the device sensor protocol data to the accounting records and generates additional accounting events when new sensor data is detected.

### debug dhcp

To display debugging information about the Dynamic Host Configuration Protocol (DHCP) client activities and to monitor the status of DHCP packets, use the debugdhcp command in privileged EXEC mode. To disable debugging output, use the **no** form of this command. debug dhcp [detail] no debug dhcp [detail] **Syntax Description** detail (Optional) Displays additional debugging information. **Command Modes** Privileged EXEC **Command History** Release Modification 12.0 This command was introduced. 12.3(8)T The output of this command was enhanced to display default static routes. 12.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA. **Usage Guidelines** You can also use the **debugdhcp** command to monitor the subnet allocation and releasing for on-demand address pools. For debugging purposes, the debugdhcpdetail command provides the most useful information such as the lease entry structure of the client and the state transitions of the lease entry. The debug output shows the scanned option values from received DHCP messages that are replies to a router request. The values of the op, htype, hlen, hops, server identifier option, xid, secs, flags, ciaddr, yiaddr, siaddr, and giaddr fields of the DHCP packet are shown in addition to the length of the options field. **Examples** The following examples show and explain some of the typical debugging messages you may see when using the debugdhcpdetail command. The following sample output shows when a DHCP client sends a DHCPDISCOVER broadcast message to find its local DHCP server: Router# debug dhcp detail 00:07:16:DHCP:DHCP client process started:10 00:07:16:RAC:Starting DHCP discover on Ethernet2 00:07:16:DHCP:Try 1 to acquire address for Ethernet2 00:07:16:%SYS-5-CONFIG\_I:Configured from console by console 00:07:19:DHCP:Shutting down from get netinfo() 00:07:19:DHCP:Attempting to shutdown DHCP Client 00:07:21:DHCP:allocate request

00:07:21:DHCP:new entry. add to queue 00:07:21:DHCP:SDiscover attempt # 1 for entry: The first seven lines of the following output show the current values stored in the lease entry structure for the client. 00:07:21:Temp IP addr:0.0.0.0 for peer on Interface:Ethernet2 00:07:21:Temp sub net mask:0.0.0.0 00:07:21: DHCP Lease server:0.0.0.0, state:1 Selecting 00:07:21: DHCP transaction id:582 00:07:21: Lease:0 secs, Renewal:0 secs, Rebind:0 secs 00:07:21: Next timer fires after:00:00:03 00:07:21: Retry count:1 Client-ID:cisco-0010.7b6e.afd8-Et2 00:07:21:DHCP:SDiscover:sending 308 byte length DHCP packet 00:07:21:DHCP:SDiscover 308 bytes 00:07:21: B'cast on Ethernet2 interface from 0.0.0.0 The following output shows the offered addresses and parameters sent to the DHCP client by the DHCP server via a DHCPOFFER message. The messages containing the Scan field indicate the options that were scanned from the received BOOTP packet and the corresponding values: 00:07:23:DHCP:Received a BOOTREP pkt 00:07:23:DHCP:Scan:Message type:DHCP Offer 00:07:23:DHCP:Scan:Server ID Option:10.1.1.1 = A010101 00:07:23:DHCP:Scan:Lease Time:180 00:07:23:DHCP:Scan:Renewal time:90 00:07:23:DHCP:Scan:Rebind time:157 00:07:23:DHCP:Scan:Subnet Address Option:255.255.255.0 The following output shows selected fields in the received BOOTP packet: 00:07:23:DHCP:rcvd pkt source:10.1.1.1, destination: 255.255.255.255

```
00:07:23: UDP sport:43, dport:44, length:308

00:07:23: DHCP op:2, htype:1, hlen:6, hops:0

00:07:23: DHCP server identifier:10.1.1.1

00:07:23: xid:582, secs:0, flags:8000

00:07:23: client:0.0.0, your:10.1.1.2

00:07:23: srvr: 0.0.0.0, gw:0.0.0.0

*Oct 2 06:22:24: DHCP: Adding static route to 67.2.2.2 255.255.255 via 68.8.8.1
Most fields are self-explanatory; however, fields that may need further explanation are described in the table below.
```

Table 72: debug dhcp Field Descriptions

Fields	Description
DHCP:Scan:Subnet Address Option:255.255.255.0	Subnet mask option (option 1).
DHCP server identifier:1.1.1.1	Value of the DHCP server ID option (option 54). Note that this is not the same as the siaddr field, which is the server IP address.
srvr:0.0.0.0, gw:0.0.0.0	srvr is the value of the siaddr field. gw is the value of the giaddr field.

#### **Related Commands**

Command	Description
debug ip ddns update	Enables debugging for DDNS updates.
debug ip dhcp server	Enables DHCP server debugging.
host (host-list)	Specifies a list of hosts that will receive DDNS updates of A and PTR RRs.
ip ddns update hostname	Enables a host to be used for DDNS updates of A and PTR RRs.
ip ddns update method	Specifies a method of DDNS updates of A and PTR RRs and the maximum interval between the updates.

٦

Command	Description
ip dhcp client update dns	Enables DDNS updates of A RRs using the same hostname passed in the hostname and FQDN options by a client.
ip dhcp-client update dns	Enables DDNS updates of A RRs using the same hostname passed in the hostname and FQDN options by a client.
ip dhcp update dns	Enables DDNS updates of A and PTR RRs for most address pools.
ip host-list	Specifies a list of hosts that will receive DDNS updates of A and PTR RRs.
show ip ddns update	Displays information about the DDNS updates.
show ip ddns update method	Displays information about the DDNS update method.
show ip dhcp server pool	Displays DHCP server pool statistics.
show ip host-list	Displays the assigned hosts in a list.
update dns	Dynamically updates a DNS with A and PTR RRs for some address pools.

## debug dhcp redundancy

	To display debugging inform <b>debugdhcpredundancy</b> com use the <b>no</b> form of this com	nation about DHCP proxy client redundancy events, use the nmand in privileged EXEC mode. To disable the display of debugging output, mand.	
	debug dhcp redundancy		
	no debug dhcp redundanc	y	
Syntax Description	This command has no argur	nents or keywords.	
Command Default	Debugging output is disabled for DHCP redundancy events.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(31)SB2	This command was introduced.	
	12.2(31)SRB1	This command was integrated into Cisco IOS Release 12.2(31)SRB1.	
Examples	The following example disp when the <b>debugdhcpredun</b> has sent a dynamic lease syn	lays debug messages regarding DHCP redundancy events. The last line is output <b>dancy</b> command is enabled. The line indicates that the active Route Processor inchronization message for IP address 10.1.1.1:	

```
Router# debug dhcp redundancy
*Mar 15 10:32:21: DHCPD: assigned IP address 10.1.1.1 to client
*Mar 15 10:32:21: DHCPD: dynamic sync sent for 10.1.1.1
```

#### **Related Commands**

I

Command	Description
debug ip dhcp server redundancy	Displays debugging information about DHCP server and relay agent redundancy events.

## debug dialer events

To display debugging information about the packets received on a dialer interface, use the**debugdialerevents** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dialer events

no debug dialer events

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC
- **Usage Guidelines** When dial-on-demand routing (DDR) is enabled on the interface, information concerning the cause of any call (called the *Dialingcause*) is displayed.
- **Examples** In the following example, the line of output for an IP packet lists the name of the DDR interface and the source and destination addresses of the packet:

Router# debug dialer events Dialing cause: Serial0: ip (s=172.16.1.111 d=172.16.2.22) The following line of output for a bridged packet lists the DDR interface and the type of packet (in hexadecimal). For information on these packet types, see the "Ethernet Type Codes" appendix of the Cisco IOS Bridging and IBM Networking Command Reference publication.

Dialing cause: Serial1: Bridge (0x6005) Most messages are self-explanatory; however, messages that may need some explanation are described in the table below.

Table 73: debug dialer events Message Descriptions

Message	Description
Dialer0: Already xxx call(s) in progress on Dialer0, dialing not allowed	Number of calls in progress ( <i>xxx</i> ) exceeds the maximum number of calls set on the interface.
Dialer0: No free dialer - starting fast idle timer	All the lines in the interface or rotary group are busy, and a packet is waiting to be sent to the destination.
BRI0: rotary group to xxx overloaded (yyy)	Number dialer $(xxx)$ exceeds the load set on the interface $(yyy)$ .
BRI0: authenticated host <i>xxx</i> with no matching dialer profile	No dialer profile matches <i>xxx</i> , the Challenge Handshake Authentication Protocol (CHAP) name or remote name of the remote host.

Message	Description
BRI0: authenticated host <i>xxx</i> with no matching dialer map	No dialer map matches <i>xxx</i> , the CHAP name or remote name of the remote host.
BRI0: Can't place call, verify configuration	Dialer string or dialer pool on an interface not set.

The table below describes the messages that the **debugdialerevents** command can generate for a serial interface used as a V.25*bis* dialer for DDR.

Table 74: debug dialer events	Command Message De	escriptions for DDR
-------------------------------	--------------------	---------------------

Message	Description
Serial 0: Dialer result = xxxxxxxxx	Result returned from the V.25 <i>bis</i> dialer. It is useful in debugging if calls are failing. On some hardware platforms, this message cannot be displayed due to hardware limitations. Possible values for the xxxxxxxx variable depend on the V.25 <i>bis</i> device with which the router is communicating.
Serial 0: No dialer string defined. Dialing cannot occur.	Packet is received that should cause a call to be placed. However, no dialer string is configured, so dialing cannot occur. This message usually indicates a configuration problem.
Serial 0: Attempting to dial xxxxxxxx	Packet has been received that passes the dial-on-demand access lists. That packet causes phone number xxxxxxxx to be dialed.
Serial 0: Unable to dial xxxxxxxxx	Phone call to xxxxxxxx cannot be placed. This failure might be due to a lack of memory, full output queues, or other problems.
Serial 0: disconnecting call	Router hangs up a call.
Serial 0: idle timeout Serial 0: re-enable timeout Serial 0: wait for carrier timeout	One of these three messages is displayed when a dialer timer expires. These messages are mostly informational, but are useful for debugging a disconnected call or call failure.

#### **Related Commands**

I

Command	Description
debug decnet packet	Displays debugging information about the packets received on a dialer interface.

## debug dialer forwarding

To display debugging information about the control plane at the home gateway (HGW) for Layer 2 Tunneling Protocol (L2TP) dialout, use the **debugdialerforwarding**command in privileged EXEC mode. The**no** form of this command disables debugging output.

debug dialer forwarding

no debug dialer forwarding

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** This command is disabled by default.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2 T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

# **Usage Guidelines** Use the **debugdialerforwarding** command to configure a virtual private dialout network (VPDN) on the HGW and a network access server (NAS) to dial from the HGW to the client.

An L2TP tunnel is created between the HGW and the NAS and the packets are forwarded transparently at the NAS.

**Examples** 

The following is sample output from the **debugdialerforwarding** command for dialing from the HGW to the client.

Note

DDR-FWD is debugdialerforwarding information. (DDR= dial-on-demand routing.)

```
Router# debug dialer forwarding
Dialer forwarding events debugging is on
Router# ping
Protocol [ip]:
Target IP address:1.1.1.3
Repeat count [5]:1

*Mar 2 00:33:34:%LINEPROTO-5-UPDOWN:Line protocol on Interface Virtual-Access3, changed
state to down
```

#### **Related Commands**

Command	Description
debug dialer events	Displays debugging information about events on a dialer interface.
debug dialer packets	Displays debugging information about packets received on a dialer interface.

## debug dialer map

To display debugging information about the creation and deletion of dynamic dialer maps, use the **debugdialermap** command in privileged EXEC mode. The**no** form of this command disables debugging output.

debug dialer map

no debug dialer map

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** This command is disabled by default.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(5.1)	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** 

Use the **debugdialermap** command to track large-scale dialout (LSDO) and incoming calls that use dynamic dialer maps. This command shows the whole trace including when the map is created and removed.

If an interface is configured for dial-on-demand routing (DDR), and a map to a specified address does not exist, then a dynamic dialer map is created and when the call disconnects, the dialer map is removed.

Note

Do not configure a dialer string or a dialer map on the incoming interface.

**Examples** In the following sample output from the **debugdialermap** command, a dialer map is created when an incoming call is connected and removed when that call is disconnected:

Router# **debug dialer map** Dial on demand dynamic dialer maps debugging is on Incoming call connected:

Router# \*Mar 22 12:19:15.597:%LINK-3-UPDOWN:Interface BRI0/0:1, changed state to up \*Mar 22 12:19:17.748:BR0/0:1 DDR:dialer\_create\_dynamic\_map map created for 11.0.0.1 \*Mar 22 12:19:18.734:%LINEPROTO-5-UPDOWN:Line protocol on Interface BRI0/0:1, changed state to up \*Mar 22 12:19:21.598:%ISDN-6-CONNECT:Interface BRI0/0:1 is now connected to unknown R2604

1
#### Incoming call disconnected:

```
Router#
*Mar 22 12:21:15.597:%ISDN-6-DISCONNECT:Interface BRI0/0:1 disconnected from R2604, call
```

```
Mar 22 12:21:15.645:%LINK-3-UPDOWN:Interface BRI0/0:1, changed state to down
*Mar 22 12:21:15.649:BR0/0:1 DDR:dialer_remove_dynamic_map map 11.0.0.1 removed
*Mar 22 12:21:16.647:%LINEPROTO-5-UPDOWN:Line protocol on Interface BRI0/0:1, changed state
  to down
```

#### **Related Commands**

I

Command	Description
debug dialer events	Displays debugging information about events on a dialer interface.
debug dialer packets	Displays debugging information about packets received on a dialer interface.

٦

debug dialpe	er	
Note	Effective with release command. See the <b>deb</b>	12.3(8)T, the <b>debugdialpeer</b> command is replaced by the <b>debugvoipdialpeer ougvoipdialpeer</b> command for more information.
	To view dial peer infor debugging output, use	mation, use the <b>debugdialpeer</b> command in privileged EXEC mode. To disable the <b>no</b> form of this command.
	debug dialpeer	
	no debug dialpeer	
Syntax Description	This command has no	arguments or keywords.
Command Default	Disabled	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(11)T	This command was introduced.
	12.3(8)T	This command was replaced by the <b>debugvoipdialpeer</b> command.
Usage Guidelines	Disable console loggin <b>debug</b> dialpeer commar	ng and use buffered logging before using the <b>debug</b> dialpeer command. Using the and generates a large volume of debugging messages, which can affect router performance.
Examples	The following is sampl configured on the mate original number. It sho label was att1. It shows	le output for the <b>debug</b> dialpeer command. The output shows the destination pattern ched dial-peer. Expanded string is the string after applying number translation to the wes that dial-peer 1311 was an incoming dial-peer match. It also shows that routing s that dial-peer 5108888 and 111399 are an outgoing dial-peer match.
	Router# debug dialp Router# 00:22:28: Inside dp 00:22:28: destinati 00:22:28: MatchNextP 00:22:28: Inside dp 00:22:28: Inside dp 00:22:28: Inside dp 00:22:28: Inside dp 00:22:28: destinati 00:22:28: destinati 00:22:28: dpAssocia att1	eer MatchCore: on pattn:5108880101 expanded string:5108880101 eer:Peer 1311 matched MatchCore: on pattn:5108880101 expanded string:5108880101 MatchCore: on pattn:4088880101 expanded string:4088880101 MatchCore: on pattn:4088880101 expanded string:4088880101 iteIncomingPeer_T:Matching route label

Table 75: debug dialpeer Field Descriptions

Field	Description
destination pattn	Destination pattern configured on the dial peer.
expanded string	The string after applying number translation to the original number.
Match Dest. pattern; called	Indicates that dial-peer match is going to match destination pattern against the called number.
Matching route label	The trunk group label or carrier id that is used for matching a dial peer.
MatchNextPeer	Indicates the dial peer tag that matched.
Result	Indicates the result of dial peer matching algorithm:
	0 = Successful 1 = More digits needed for a possible match -1 = No match (match failed) -2 = The digits matched, but the destination address could not be obtained

#### **Related Commands**

I

Command	Description
call-block (dial peer)	Enables blocking of incoming calls on the dial peer.
carrier-id (dial-peer)	Identifies the carrier handling the incoming call.
session target (ENUM)	Specifies the ENUM search table for the target session.
show dial-peer voice	Displays the configuration of the dial peer.
translation-profile (dial-peer)	Assigns a translation profile to the dial peer.

٦

Command	Description
trunkgroup (dial-peer)	Assigns a trunk group to the dial peer.
trunk-group-label (dial-peer)	Identifies the trunk group handling the incoming call.

## debug diameter

To display information about the Diameter Protocol, use the **debugdiameter** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug diameter [dcca| connection| error| packet| event| fsm| failover]

no debug diameter [dcca| connection| error| packet| event| fsm| failover]

#### **Syntax Description**

dcca	(Optional) Enables debugging for Diameter-Credit Control Accounting.
connection	(Optional) Enables debugging output for the connection between two Diameter nodes.
error	(Optional) Enables debugging output for Diameter errors.
packet	(Optional) Enables debugging output for Diameter data packets.
event	(Optional) Enables debugging output for Diameter events.
fsm	(Optional) Enables debugging output for the finite state machine.
failover	(Optional) Enables debugging output for Diameter redundancy.

#### **Command Modes** Privileged EXEC (#)

#### **Command History**

Release	Modification
12.4(9)T	This command was introduced.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

#### **Usage Guidelines**

Use this command to display information about any of the listed classes of information about the Diameter Protocol.

#### Examples

The following examples show output from the **debugdiameter** command:

#### **Examples**

Router# **debug diameter all** 

\*May 9 17:58:14.832: Dia Base: Diameter Peer configured. #### **Related Commands**

Command	Description
show diameter peer	Displays Diameter peer configuration information.

## debug dlsw

To enable debugging of data-link switching plus (DLSw+), use the **debugdlsw**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dlsw border-peers [interface interface| ip address ip-address]core [flow-control messages| state| xid] [circuit-number]local-circuit circuit-numberpeers [interface interface [fast-errors| fast-paks]]ip address ip-address [fast-errors| fast-paks| fst-seq| udp]reachability [error| verbose] [sna| netbios]

no debug dlsw border-peers [interface interface| ip address ip-address]core [flow-control messages| state| xid] [circuit-number]local-circuit circuit-numberpeers [interface interface [fast-errors| fast-paks]]ip address ip-address [fast-errors| fast-paks| fst-seq| udp]reachability [error| verbose] [sna| netbios]

#### **Syntax Description**

border-peers	(Optional) Enables debugging output for border peer events.
interface interface	(Optional) Specifies a remote peer to debug by a direct interface.
ip address ip-address	(Optional) Specifies a remote peer to debug by its IP address.
core	(Optional) Enables debugging output for DLSw core events.
flow-control	(Optional) Enables debugging output for congestion in the WAN or at the remote end station.
messages	(Optional) Enables debugging output of core messagesspecific packets received by DLSw either from one of its peers or from a local medium via the Cisco link services interface.
state	(Optional) Enables debugging output for state changes on the circuit.
xid	(Optional) Enables debugging output for the exchange identification state machine.
circuit-numbe r	(Optional) Specifies the circuit for which you want core debugging output to reduce the output.
local-circuit circuit-number	(Optional) Enables debugging output for circuits performing local conversion. Local conversion occurs when both the input and output data-link connections are on the same local peer and no remote peer exists.
peers	(Optional) Enables debugging output for peer events.

fast-errors	(Optional) Debugs errors for fast-switched packets.
fast-paks	(Optional) Debugs fast-switched packets.
fst-seq	(Optional) Debugs Fast-Sequenced Transport (FST) sequence numbers on fast switched packets.
udp	(Optional) Debugs User Datagram Protocol (UDP) packets.
reachability	(Optional) Enables debugging output for reachability events (explorer traffic). If no options are specified, event-level information is displayed for all protocols.
error  verbose	(Optional) Specifies how much reachability information you want displayed. The <b>verbose</b> keyword displays everything, including errors and events. The <b>error</b> keyword displays error information only. If no option is specified, event-level information is displayed.
sna   netbios	(Optional) Specifies that reachability information be displayed for only Systems Network Architecture (SNA) or Network Basic Input/Output System (NetBIOS) protocols. If no option is specified, information for all protocols is displayed.

#### **Usage Guidelines**

When you specify no optional keywords, the debug **dlsw** command enables all available DLSW debugging output.

Normally you need to use only the **error** or **verbose**option of the**debugdlswreachability**command to help identify problems. The **error** option is recommended for use by customers and provides a subset of the messages from the normal event-level debugging. The **verbose** option provides a very detailed view of events, and is typically used only by service personnel.

To reduce the amount of debug information displayed, use the **sna** or **netbios** option with the **debugdlswreachability**command if you know that you have an SNA or NetBIOS problem.

The DLSw core is the engine that is responsible for the establishment and maintenance of remote circuits. If possible, specifying the index of the specific circuit you want to debug reduces the amount of output displayed. However, if you want to watch a circuit initially come up, do not use the *circuit-number* option with the **core** keyword.

The **coreflow-control** option provides information about congestion in the WAN or at the remote end station. In these cases, DLSw sends Receiver Not Ready (RNR) frames on its local circuits, slowing data traffic on established sessions and giving the congestion an opportunity to clear.

The **corestate**option allows you to see when the circuit changes state. This capability is especially useful for determining why a session cannot be established or why a session is being disconnected.

The **coreXID**option allows you to track the exchange identification (XID)-state machine. The router tracks XID commands and responses used in negotiations between end stations before establishing a session.

#### Examples

The following examples show and explain some of the typical DLSw debugging messages you might see when using the**debugdlsw** command.

The following example enables UDP packet debugging for a specific remote peer:

Router# debug dlsw peers ip-address 1.1.1.6 udp The following message is sample output from the debugdlswborder-peerscommand:

\*Mar 10 17:39:56: CSM: delete group mac cache for group 0 \*Mar 10 17:39:56: CSM: delete group name cache for group 0 \*Mar 10 17:40:19: CSM: update group cache for mac 0000.3072.1070, group 10 \*Mar 10 17:40:22: DLSw: send\_to\_group\_members(): copy to peer 10.19.32.5 The following message is from a router that initiated a TCP connection:

The following messages occur when a CUR\_ex (CANUREACH explorer) frame is received from other peers, and the peer statements or the **promiscuous** keyword have not been enabled so that the router is not configured correctly:

22:42:44: DLSw: Not promiscuous - Rej conn from 172.20.96.1(2065) 22:42:51: DLSw: Not promiscuous - Rej conn from 172.20.99.1(2065) In the following messages, the router sends a keepalive message every 30 seconds to keep the peer connected. If three keepalive messages are missed, the peer is torn down. These messages are displayed only if keepalives are enabled (by default, keepalives are disabled):

22:44:03: DLSw: Keepalive Request sent to peer 172.20.98.1(2065) (168243148) 22:44:03: DLSw: Keepalive Response from peer 172.20.98.1(2065) (168243176) 22:44:34: DLSw: Keepalive Request sent to peer 172.20.98.1(2065) (168274148) 22:44:34: DLSw: Keepalive Response from peer 172.20.98.1(2065) (168274172) The following peer debugging messages indicate that the local peer is disconnecting from the specified remote peer because of missed peer keepalives:

0:03:24: DLSw: keepalive failure for peer on interface Serial0 0:03:24: DLSw: action\_d(): for peer on interface Serial0 0:03:24: DLSW: DIRECT aborting connection for peer on interface Serial0 0:03:24: DLSw: peer on interface Serial0, old state CONNECT, new state DISCONN The following peer debugging messages result from an attempt to connect to an IP address that does not have DLSw enabled. The local router attempts to connect in 30-second intervals:

23:13:22: action\_a() attempting to connect peer 172.20.100.1(2065)
23:13:22: DLSw: CONN: peer 172.20.100.1 open failed, rejected [9]
23:13:22: action\_a() retries: 8 next conn time: 861232504
23:13:52: action\_a() attempting to connect peer 172.20.100.1(2065)
23:13:52: DLSw: CONN: peer 172.20.100.1 open failed, rejected [9]
23:13:52: action\_a() retries: 9 next conn time: 861292536
The following peer debugging messages that indicates a remote peer statement is missing on the router (address
172.20.100.1) to which the connection attempt is sent:

23:14:52: action\_a() attempting to connect peer 172.20.100.1(2065) 23:14:52: DLSw: action\_a(): Write pipe opened for peer 172.20.100.1(2065)

I

The following two messages show that an information frame is passing through the router:

DLSw: dlsw\_tr2fct() lmac:c000.a400.0000 rmac:0800.5a29.75fe ls:5 rs:4 i:34 DLSw: dlsw\_tr2fct() lmac:c000.a400.0000 rmac:0800.5a29.75fe ls:4 rs:4 i:34

Examples

The messages in this section are based on the following criteria:

- Reachability is stored in cache. DLSw+ maintains two reachability caches: one for MAC addresses and one for NetBIOS names. Depending on how long entries have been in the cache, they are either fresh or stale.
- If a router has a fresh entry in the cache for a certain resource, it answers a locate request for that resource without verifying that it is still available. A locate request is typically a TEST frame for MAC addresses or a FIND NAME QUERY for NetBIOS.
- If a router has a stale entry in the cache for a certain resource, it verifies that the entry is still valid before answering a locate request for the resource by sending a frame to the last known location of the resource and waits for a resource. If the entry is a REMOTE entry, the router sends a CUR\_ex frame to the remote peer to verify. If the entry is a LOCAL entry, it sends either a TEST frame or a NetBIOS FIND\_NAME\_QUERY on the appropriate local port.
- By default, all reachability cache entries remain fresh for 4 minutes after they are learned. For MAC addresses, you can change this time with the **dlswtimersna-verify-interval** command. For NetBIOS names, you can change this time with the **dlswtimernetbios-verify-interval** command.
- By default, all reachability cache entries age out of the cache 16 minutes after they are learned. For MAC addresses, you can change this time with the **dlswtimersna-cache-timeout** command. For NetBIOS names, you can change the time with the **dlswtimernetbios-cache-timeout** command.

The table below describes the debug output indicating that the DLSW router received an SSP message that is flow controlled and should be counted against the window of the sender.

Dec 6 11:26:49: CSM: Received SSP CUR csex flags = 80, mac 4000.90b1.26cf, The csex flags = 80 means that this is an CUR ex (explorer). Dec 5 10:48:33: DLSw: 1620175180 decr r -  $s:\overline{27}$  so:0 r:27 ro:0

Field	Description
decr r	Decrement received count.
S	This DLSW router's granted units for the circuit.
SO	0=This DLSW router does not owe a flow control acknowledgment.
	1=This router owes a flow control acknowledgment.
r	Partner's number of granted units for the circuit.
ro	Indicates whether the partner owes flow control acknowledgment.

#### Table 76: debug dlsw Field Descriptions

The following message shows that DLSW is sending an I frame to a LAN:

Dec 5 10:48:33: DISP Sent : CLSI Msg : DATA.Req dlen: 1086 The following message shows that DLSW received the I frame from the LAN:

Dec 5 10:48:35: DLSW Received-disp : CLSI Msg : DATA.Ind dlen: 4 The following messages show that the reachability cache is cleared:

Router# clear dlsw rea

23:44:11: CSM: Clearing CSM cache 23:44:11: CSM: delete local mac cache for port 0 23:44:11: CSM: delete local name cache for port 0 23:44:11: CSM: delete remote mac cache for peer 0 23:44:11: CSM: delete remote name cash dlsw rea The next group of messages show that the DLSW reachability cache is added, and that a name query is perform

from the router MARIAN:

## debug dmsp doc-to-fax

Note

In release 12.3(8)T, the **debugdmspdoc-to-fax** command is replaced by the **debugfaxdmsp** command. See the **debugfaxdmsp** command for more information.

To display debugging messages for the doc Media Service Provider (docMSP) TIFF or text2Fax engine, use the **debugdmspdoc-to-fax**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dmsp doc-to-fax [text-to-fax| tiff-reader]

no debug dmsp doc-to-fax [text-to-fax| tiff-reader]

#### **Syntax Description**

	text-to-fax	(Optional) Displays debugging messages that occur while the DocMSP Component is receiving text packets and producing T4 fax data.
	tiff-reader	(Optional) Displays debugging messages that occur while the DocMSP Component is receiving TIFF packets and producing T4 fax data.

#### **Command Default** No default behavior or values.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(3)XI	This command was introduced on the Cisco AS5300 access server.
	12.3(8)T	This command was replaced by the <b>debugfaxdmsp</b> command in the Cisco IOS 12.3T release.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### **Examples**

The following is sample output from the **debugdmspdoc-to-fax** command:

#### Router# debug dmsp doc-to-fax Jan 1 04:58:39.898: docmsp\_call\_setup\_request: callid=18 Jan 1 04:58:39.902: docmsp\_call\_setup\_request(): ramp data dir=OFFRAMP, conf dir=SRC

#### **Related Commands**

Command	Description
debug dmsp doc-to-fax	Displays debugging messages for the doc Media Service Provider TIFF or text2Fax engine.

## debug dmvpn

To display debug Dynamic Multipoint VPN (DMVPN) session information, use the **debug dmvpn** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dmvpn {all| error| detail| packet} {all| debug-type}

no debug dmvpn {all| error| detail| packet} {all| debug-type}

#### **Syntax Description**

all	Enables all levels of debugging.
error	Enables error-level debugging.
detail	Enables detail-level debugging.
packet	Enables packet-level debugging.
all	Enables NHRP, sockets, tunnel protection, and crypto debugging.
debug-type	The type of debugging that you want to enable. The following keywords can be specified for the <i>debug-type</i> argument:
	• nhrp Enables Next Hop Resolution Protocol (NHRP) debugging only.
	• crypto Enables crypto Internet Key Exchange (IKE) and IPsec debugging.
	• tunnel Enables tunnel protection debugging.
	• <b>socket</b> Enables crypto secure socket debugging.
	The keywords can be used alone, or in any combination with each other, but each keyword can be used only once.

**Command Default** DMVPN debugging is disabled.

**Command Modes** Privileged EXEC (#)

**Command History** 

Release	Modification
12.4(9)T	This command was introduced.

Release	Modification
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
Cisco IOS XE Release 2.5	This command was modified. This command was integrated into Cisco IOS XE Release 2.5.

#### **Usage Guidelines**

You must specify both the level and the type of debugging that you want to enable. The debugging levels are all, error, detail, or packet. You can enable NHRP, crypto Internet Key Exchange (IKE) and IPsec, tunnel protection, and crypto secure socket debugging at any of the four debugging levels.

To enable conditional DMVPN debugging, you must first specify the level and type of debugging that you want to enable, and then use the **debug dmvpn condition** command to specify the conditions that you want to enable.

#### **Error-Level Debugging**

When error-level debugging is enabled with the **debug dmvpn error**command, the following debugging commands are enabled by default:

- debug crypto ipsec error
- debug crypto isakmp error
- debug nhrp error

#### **Detail-Level Debugging**

When detail-level debugging is enabled with the **debug dmvpn detail**command, the following debugging commands are enabled by default:

- debug crypto ipsec
- debug crypto isakmp
- · debug crypto sockets
- debug nhrp
- debug nhrp cache
- debug nhrp rate
- debug tunnel protection

#### **Packet-Level Debugging**

When packet-level debugging is enabled with the **debug dmvpn packet**command, the following debugging commands are enabled by default:

- debug nhrp extension
- debug nhrp packet

Note

Executing the **debug dmvpn all** command with a high number of active sessions may result in high CPU utilization and large data output.

#### **NHRP Shortcut Route Debugging**

When shortcut switching is enabled on the router, the system looks up the NHRP shortcut route in the Routing Information Base (RIB) in order to forward the packet to the next-hop in the DMVPN cloud.

The table below describes the debug messages displayed by the router when shortcut switching and NHRP debugging are both enabled.

#### Table 77: Sample Messages for Shortcut Switching and NHRP

Event	Sample Message
NHRP successfully adds a route to the RIB	*Feb 21 13:11:24.043: NHRP: Adding route entry for 172.16.99.0 to RIB *Feb 21 13:11:24.043: NHRP: Route addition to RIB successful
NHRP is unable to add a route to the RIB	*Feb 21 13:11:24.043: NHRP: Adding route entry for 172.16.99.0 to RIB *Feb 21 13:11:24.043: NHRP: Route addition to RIB failed
NHRP removes a route from the RIB	*Feb 21 13:11:24.043: NHRP: Deleting route entry for 172.16.99.0 from RIB
NHRP evicts a route from the RIB	*Mar 1 18:24:29.371: NHRP: Route entry 172.16.22.0/24 clobbered by distance
NHRP changes the administrative distance	*Mar 1 00:14:16.799: NHRP: Administrative distance changed to 240

#### **Examples**

The following example shows how to enable all debugging levels for DMVPN tunnel debugging:

Router# debug dmvpn all tunnel

#### **Related Commands**

S	Command	Description
	debug crypto error	Enables error debugging for a crypto area.
	debug crypto ipsec	Displays IPsec events.
	debug crypto isakmp	Displays messages about IKE events.
	debug dmvpn condition	Display conditional debug DMVPN session information.

1

Command	Description
debug nhrp condition	Enables NHRP conditional debugging.
debug nhrp error	Displays NHRP error-level debugging information.

## debug dmvpn condition

To display conditional debug Dynamic Multipoint VPN (DMVPN) session information, use the **debug dmvpn condition**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug dmvpn condition** {**unmatched**| **peer** {**nbma**| **tunnel** {*ipv4-address*| *ipv6-address*}}| **vrf** *vrf-name*| **interface tunnel** *tunnel-interface*}

**no debug dmvpn condition** [**unmatched**| **peer** {**nbma**| **tunnel** {*ipv4-address*| *ipv6-address*}}| **vrf** *vrf-name*| **interface tunnel** *number*]

#### **Syntax Description**

unmatched	Specifies debugging when context information is not available.
peer	Specifies information for a specific DMVPN peer.
nbma	Displays DMVPN information based on the peer mapping nonbroadcast access (NBMA) address.
tunnel	Displays DMVPN information based on the peer Virtual Private Network (VPN) address.
ipv4-address	The DMVPN peer IPv4 address.
ipv6-address	The DMVPN peer IPv6 address.
	Note Cisco IOS XE Release 2.5 does not support the ipv6-address argument.
vrf	Displays information based on the specified virtual routing and forwarding (VRF) name.
vrf-name	The VRF name.
interface	Displays DMVPN information based on a specific interface.
tunnel	Specifies the tunnel address for a DMVPN peer.
number	The tunnel interface number.

**Command Default** DMVPN conditional debugging is disabled.

**Command Modes** Privileged EXEC (#)

I

Release	Modification
12.4(9)T	This command was introduced.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.4(20)T	The <i>ipv6-address</i> argument was added.
Cisco IOS XE Release 2.5	This command was modified. It was integrated into Cisco IOS XE Release 2.5.
	Release           12.4(9)T           12.2SX           12.4(20)T           Cisco IOS XE Release 2.5

#### **Usage Guidelines**

Com

ines Conditional debugging is enabled only after the DMVPN debugging type and level have been specified using the **debug dmvpn** command.

#### **Console Output**

The following **debug dmvpn** commands do not have any console output on the Cisco 3845 and Cisco 7200 series routers:

- · debug dmvpn condition interface
- debug dmvpn condition peer
- · debug dmvpn condition unmatched
- · debug dmvpn condition vrf

**Note** When the **debug dmvpn condition unmatched** command is enabled on the Cisco 3845 and Cisco 7200 series routers, issuing the **show debugging** command does not produce any console output.

**Examples** 

The following example shows how to enable conditional DMVPN debugging for a specific peer NBMA address:

Router# debug dmvpn condition peer nbma 192.0.2.1

The following example shows how to enable conditional DMVPN debugging when context is not available to check against debugging conditions:

Router# debug dmvpn condition unmatched

The following example shows how to disable conditional debugging for a specific tunnel interface:

Router# no debug dmvpn condition interface tunnel 1

The following example shows how to disable all conditional debugging:

Router# no debug dmvpn condition

#### **Related Commands**

I

Command	Description
debug crypto error	Enables error debugging for a crypto area.
debug crypto ipsec	Displays IPsec events.
debug crypto isakmp	Displays messages about IKE events.
debug dmvpn	Displays debug DMVPN session information.
debug nhrp condition	Enables NHRP conditional debugging.
debug nhrp error	Displays NHRP error-level debugging information.

## debug dot11

To enable debugging of radio functions, use the **debugdot11** command in privileged EXEC mode. To stop or disable the debug operation, use the **no** form of this command.

debug dot11 {events| forwarding| mgmt| packets| syslog| virtual-interface}

no debug dot11 {events| forwarding| mgmt| packets| syslog| virtual-interface}

#### **Syntax Description**

events	Displays information about all radio-related events.
forwarding	Displays information about radio-forwarded packets.
mgmt	Displays information about radio access point management activity.
packets	Displays information about received or transmitted radio packets.
syslog	Displays information about the radio system log.
virtual-interface	Displays information about radio virtual interfaces.

#### **Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC (#)

#### **Command History**

ory	Release	Modification
	12.2(4)JA	This command was introduced.
	12.4(2)T	This command was integrated into Cisco IOS Release 12.4(2)T.
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

#### **Usage Guidelines**

Use this command to display debugging information about radio functions.

### **Examples** The following example shows how to enable debugging of all radio-related events:

Router# debug dot11 events

#### **Related Commands**

ſ

	Command	Description
-	debug dot11 aaa	Enables debugging of dot11 AAA operations.
	debug dot11 dot11radio	Enables radio debug options.

## debug dot11 aaa

To enable debugging of dot11 authentication, authorization, and accounting (AAA) operations, use the **debugdot11aaa**command in privileged EXEC mode. To disable or stop the debug operation, use the **no** form of this command.

debug dot11 aaa {accounting| authenticator {all| dispatcher| mac-authen| process| rxdata| state-machine| txdata}| dispatcher| manager {all| dispatcher| keys| rxdata| state-machine| supplicant| txdata}}

no debug dot11 aaa {accounting| authenticator {all| dispatcher| mac-authen| process| rxdata| state-machine| txdata}| dispatcher| manager {all| dispatcher| keys| rxdata| state-machine| supplicant| txdata}}

Syntax Description				
Syntax Description	accounting	Provides information about 802.11 AAA accounting packets.		
	authenticator	<ul> <li>Provides information about MAC and Extensible Authentication Protocol (EAP) authentication packets.</li> <li>Use the following options to activate authenticator debugging:         <ul> <li>allActivates debugging for all authenticator packets</li> </ul> </li> </ul>		
		<ul> <li>dispatcherActivates debugging for authentication request handler packets</li> </ul>		
		<ul> <li>mac-authenActivates debugging for MAC authentication packets</li> <li>processActivates debugging for authenticator process packets</li> <li>rxdataActivates debugging for EAP over LAN (EAPOL) packets from client devices</li> <li>state-machineActivates debugging for authenticator state-machine packets</li> </ul>		
		• txdataActivates debugging for EAPOL packets sent to client devices		
	dispatcher	Provides information about 802.11 AAA dispatcher (interface between association and manager) packets.		

manager	Provides information about the AAA manager. Use these options to activate AAA manager debugging:
	• allActivates all AAA manager debugging
	• <b>dispatcher</b> Activates debug information for AAA manager-authenticator dispatch traffic
	• <b>keys</b> Activates debug information for AAA manager key processing
	• <b>rxdata</b> Activates debugging for AAA manager packets received from client devices
	• state-machine Activates debugging for AAA manager state-machine packets
	• <b>supplicant</b> Activates debugging for Light Extensible Authentication Protocol (LEAP) supplicant packets
	• <b>txdata</b> Activates debugging for AAA manager packets sent to client devices.

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	Release	Modification	
	12.2(4)JA	This command was introduced.	
	12.2(15)JA	This command was modified to include the accounting, authenticator, dispatcher, and manager debugging options.	
	12.4(2)T	This command was integrated into Cisco IOS Release 12.4(2)T.	
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.	

**Use this command to display debugging information about dot11 AAA operations.** 

**Examples** The following example shows how to activate debugging for 802.11 AAA accounting packets:

Router# debug dot11 aaa accounting

٦

# Related Comma

Note

This command is not supported on repeaters.

Command	Description
admin-traffic (SSID configuration mode)	Enables CAC admission control for an SSID on the access point.
admit-traffic (QOS Class interface configuration mode)	Configures CAC admission control on the access point.
show debugging	Displays all debug settings and the debug packet headers
show dot11 ids eap	Displays all CAC radio events on the access point.
traffic-stream	Configures CAC traffic data rates and priorities for a radio interface on the access point.
## debug dot11 dot11radio

To enable radio debug options, use the **debugdot11dot11radio**command in privileged EXEC mode. To disable debug options, use the **no** form of this command.

debug dot11 dot11radio *interface* {accept-radio-firmware| dfs simulate [ *channel* ]| monitor {ack| address| beacon| crc| lines| plcp| print| probe| store}| print {hex| if| iv| lines| mic| plcp| printf| raw| shortadr}| stop-on-failure| trace {off| print| store}}

no debug dot11 dot11radio *interface* {accept-radio-firmware| dfs simulate [ *channel* ]| monitor {ack| address| beacon| crc| lines| plcp| print| probe| store}| print {hex| if| iv| lines| mic| plcp| printf| raw| shortadr}| stop-on-failure| trace {off| print| store}}

interface	The radio interface. The 2.4-GHz radio is 0. The 5-GHz radio is 1.
accept-radio-firmware	Configures the access point to disable checking the radio firmware version.
dfs simulate	Configures the access point to simulate radar generation as part of Dynamic Frequency Selection (DFS).
channel	(Optional) Radio channel to move to. Range is from 24 to 161.
monitor	Enables RF monitor mode. Use these options to turn on monitor modes:
	• <b>ack</b> Displays ACK packets. ACK packets acknowledge receipt of a signal, information, or packet.
	<ul> <li>addressDisplays packets to or from the specified IP address</li> </ul>
	• beaconDisplays beacon packets
	• crcDisplays packets with CRC errors
	• linesSpecifies a print line count
	• <b>plcp</b> Displays Physical Layer Control Protocol (PLCP) packets
	• printEnables RF monitor printing mode
	• probeDisplays probe packets
	• storeEnables RF monitor storage mode

## Syntax Description

I

1

print	Enables packet printing. Use these options to turn on packet printing:
	• hexPrints entire packets without formatting
	• ifPrints the in and out interfaces for packets
	• ivPrints the packet Wired Equivalent Privacy (WEP) IV
	• linesPrints the line count for the trace
	• micPrints the Cisco Message Integrity Check (MIC)
	• plcpDisplays the PLCP
	• printf Prints using printf instead of buginf
	• rawPrints without formatting data
	• shortadr Prints MAC addresses in short form
stop-on-failure	Configures the access point to not restart when the radio driver fails.
trace	Enables trace mode. Use these options to turn on trace modes:
	• off Turns off traces
	• printEnables trace printing
	• storeEnables trace storage

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC (#)

Command	History
oommunu	motory

Release	Modification	
12.2(4)JA	This command was introduced.	
12.4(2)T	This command was integrated into Cisco IOS Release 12.4(2)T.	
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.	

## **Usage Guidelines** Use this command to display debugging information about radio options.

## **Examples** This example shows how to begin monitoring of all packets with CRC errors:

Router# debug dot11 dot11radio 0 monitor crc

## **Related Commands**

I

Command	Description
debug dot11	Enables debugging of radio functions.
debug dot11 aaa	Enables debugging of dot11 AAA operations.

# debug dot11 ids

Use the **debugdot11idseap** privileged EXEC command to enable debugging for wireless IDS monitoring. Use the **no** form of the command to disable IDS debugging.

[no] debug dot11 ids {eap| cipher-errors}

Syntax Description	eap		Activates debugging of IDS authentication events
	cipher-errors		Activates debugging of cipher errors detected by IDS
<b>Command Default</b>	Debugging is not enabled.		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	12.3(4)JA	This command was intr	roduced.
	12.2SX	This command is suppo in a specific 12.2SX rel and platform hardware.	orted in the Cisco IOS Release 12.2SX train. Support ease of this train depends on your feature set, platform,

**Examples** 

This example shows how to activate wireless IDS debugging for authentication events:

SOAP-AP# debug dot11 ids eap

#### Related Comma

Note

This command is not supported on 1400 series bridges.

Command	Description
dot11 ids eap attempts	Configures limits on authentication attempts and EAPOL flooding on scanner access points in monitor mode
show debugging	Displays all debug settings and the debug packet headers

ſ

Command	Description
show dot11 ids eap	Displays wireless IDS statistics

# debug dot11 ids mfp

Use the debug dot11 ids mfp privileged EXEC command to debug Management Frame Protection (MFP) operations on the access point.

{[no] debug dot11 ids mfpap [all] [detectors] [events] [generators] [io] [reporting]| wds [all] [detectors] [events] [generators] [reporting] [statistics]| wlccp}

#### **Syntax Description**

ар	Debugs MFP events on the access point.
all	Debugs all MFP events.
detectors	Debugs MFP detector key management events.
events	Debugs high level MFP events.
generators	Debugs MFP generator key management events.
io	Debugs MFP IO (generate or detect frame) events.
reporting	Debugs MFP reporting events.
statistics	Debugs MFP WDS statistics received from the detectors.
wds	Debugs MFP WDS events.
wlccp	Debugs MFP WLCCP messages.

**Command Default** There are no defaults for this command.

**Command Modes** Privileged EXEC (#)

<b>Command History</b>	Release	Modification
	12.3(8)JA	This command was introduced.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

## **Examples** This example shows how to debug the MFP detectors on the access point:

ap(config) # debug dot11 ids mfp ap detectors

#### **Related Commands**

ſ

Command	Description
dot11 ids mfp	Configures MFP parameters on the access point.
show dot11 ids mfp	Displays MFP parameters on the access point.

## debug dot1x

To display 802.1X debugging information, use the **debugdot1x** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dot1x [all| errors| events| feature| packets| redundancy| registry| state-machine] no debug dot1x [all| errors| events| feature| packets| redundancy| registry| state-machine]

### **Syntax Description**

all	(Optional) Enables all 802.1X debugging messages.
errors	(Optional) Provides information about all 802.1X errors.
events	(Optional) Provides information about all 802.1X events.
feature	(Optional) Provides information about 802.1X features for switches only.
packets	(Optional) Provides information about all 802.1X packets.
redundancy	(Optional) Provides information about 802.1X redundancy.
registry	(Optional) Provides information about 802.1X registries.
state-machine	(Optional) Provides information regarding the 802.1X state machine.

## **Command Modes** Privileged EXEC

Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	The <b>authsm</b> , <b>backend</b> , <b>besm</b> , <b>core</b> , and <b>reauthsm</b> keywords were removed. The <b>errors</b> , <b>events</b> , <b>packets</b> , <b>registry</b> , and <b>state-machine</b> keywords were added.	
	12.3(2)XA	This command was integrated into Cisco IOS Release 12.3(2)XA.	
	12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.	

Release	Modification
12.3(11)T	The <b>supplicant</b> keyword was added.
12.2(25)SEE	The feature keyword was added for switches only.
12.4(6)T	The <b>redundancy</b> keyword was added. The <b>aaa</b> , <b>process</b> , <b>rxdata</b> , <b>supplicant</b> , <b>txdata</b> , and <b>vlan</b> keywords were deleted.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### **Examples**

The following is sample output for the **debugdot1x** command:

#### Router# debug dot1x

Router-871#debug dot1x all \*Nov 7 13:07:56.872: dot1x-ev:dot1x mgr pre process eapol pak: Role determination not required on FastEthernet1. \*Nov 7 13:07:56.876: dot1x-packet:dot1x mgr process eapol pak: queuing an EAPOL pkt on Authenticator Q \*Nov 7 13:07:56.876: dot1x-ev:Enqueued the eapol packet to the global authenticator queue \*Nov 7 13:07:56.876: dot1x-packet:Received an EAPOL frame on interface FastEthernet1 \*Nov 7 13:07:56.876: dot1x-ev:Received pkt saddr =000f.23c4.a401 , daddr = 0180.c200.0003, pae-ether-type = 888e.0202.0000 \*Nov 7 13:07:56.876: dot1x-packet:Received an EAPOL-Logoff packet on interface FastEthernet1 7 13:07:56.876: EAPOL pak dump rx \*Nov \*Nov 7 13:07:56.876: EAPOL Version: 0x2 type: 0x2 length: 0x0000 \*Nov 7 13:07:56.876: dot1x-sm:Posting EAPOL\_LOGOFF on Client=82AC85CC \*Nov 7 13:07:56.876: dot1x auth Fa1: during state auth authenticating, got event 7(eapolLogoff)

The fields in the output are self-explanatory.

Command	Description
clear dot1x	Clears 802.1X interface information.
identity profile default	Creates an identity profile and enters identity profile configuration mode.
show dot1x	Displays details for an identity profile.

# debug dot1x (EtherSwitch)

To enable debugging of the 802.1x protocol when an Ethernet switch network module is installed, use the **debugdot1x** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dot1x {all| authsm| backend| besm| core| reauthsm}

no debug dot1x {all| authsm| backend| besm| core| reauthsm}

#### **Syntax Description**

all	Enables debugging of all conditions.
authsm	Enables debugging of the authenticator state machine, which is responsible for controlling access to the network through 802.1x-enabled ports.
backend	Enables debugging of the interaction between the 802.1x process and the router RADIUS client.
besm	Enables debugging of the backend state machine, which is responsible for relaying authentication request between the client and the authentication server.
core	Enables debugging of the 802.1x process, which includes 802.1x initialization, configuration, and the interaction with the port manager module.
reauthsm	Enables debugging of the reauthentication state machine, which manages periodic reauthentication of the client.

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	12.1(6)EA2	This command was introduced.
	12.2(15)ZJ	This command was implemented on the following platforms: Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers.

Release	Modification
12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T on the following platforms: Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

## **Usage Guidelines** The **undebugdot1x** command is the same as the **nodebugdot1x** command.

**Related Commands** 

ſ

Command	Description
show debugging	Displays information about the types of debugging that are enabled.
show dot1x	Displays 802.1x statistics, administrative status, and operational status for the router or for the specified interface.

## debug drip event

To display debugging messages for Duplicate Ring Protocol (DRiP) events, use the **debugdripevent** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug drip event

no debug drip event

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is disabled for DRiP events.
- **Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	11.3(4)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

## Usage Guidelines When a TrBRF interface is configured on the Remote Switch Module (RSM), the DRiP protocol is activated. The DRiP protocol adds the VLAN ID specified in the router command to its database and recognizes the VLAN as a locally configured, active VLAN.

**Examples** The following is sample output from the **debugdripevent** command:

Router# **debug drip event** DRiP gets a packet from the network:

 612B92C0:
 01000C00
 00000000
 0C501900
 0000AAAA
 .....P....\*\*

 612B92D0:
 0300000C
 00020000
 00000100
 0CCCCCCC
 .....LLL

 612B92E0:
 00000C50
 19000020
 AAAA0300
 000C0102
 .....P....\*\*

 612B92F0:
 01010114
 0000002
 0000002
 00000C50
 .....P.
 .....P.

 612B9300:
 19000001
 04C00064
 04
 .....@.d.

 DRiP gets a packet from the network:
 .....@.d.

Recvd. pak DRiP recognizes that the VLAN ID it is getting is a new one from the network:

6116C840: 0100 OCCCCCC ...LLL 6116C850: 00102F72 CBFB0024 AAAA0300 000C0102 ../rK{.\$\*\*..... 6116C860: 01FF0214 0002E254 00015003 00102F72 ....bT.P.../r 6116C870: C8000010 04C00014 044003EB 14 H...@..@.k. DRIP : remote update - Never heard of this vlan

DRiP attempts to resolve any conflicts when it discovers a new VLAN. The value action = 1 means to notify the local platform of change in state.

DRIP : resolve remote for vlan 20 in VLANO DRIP : resolve remote - action = 1 The local platform is notified of change in state:

DRIP Change notification active vlan 20 Another new VLAN ID was received in the packet:

DRIP : resolve remote for vlan 1003 in Vlan0 No action is required:

DRIP : resolve remote - action = 0 Thirty seconds have expired, and DRiP sends its local database entries to all its trunk ports:

DRIP : local timer expired DRIP : transmit on 0000.0c50.1900, length = 24 612B92C0: 01000C00 0000000 0c501900 0000AAA 612B92D0: 0300000C 00020000 00000100 0ccccccc 612B92E0: 00000C50 19000020 AAAA0300 000C0102 ...P... \*\*..... 612B92F0: 01FF0114 0000003 0000002 00000C50 .....P 612B9300: 19000001 04C00064 04 ....@.d.

## debug drip packet

To display debugging messages for Duplicate Ring Protocol (DRiP) packets, use the **debugdrippacket** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug drip packet

no debug drip packet

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is not enabled for DRiP packets.
- **Command Modes** Privileged EXEC

<b>Command History</b>	Release	Modification
	11.3(4)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** Before you use this command, you can optionally use the **cleardrip** command first. As a result the DRiP counters are reset to 0. If the DRiP counters begin to increment, the router is receiving packets.

**Examples** The f

The following is sample output from the **debugdrippacket** command:

Router# **debug drip packet** The following type of output is displayed when a packet is entering the router and you use the **showdebug** command:

 039E5FC0:

## **Related Commands**

ſ

Command	Description
debug drip event	Displays debugging messages for DRiP events.

# debug dsc clock

To display debugging output for the time-division multiplexing (TDM) clock-switching events on the dial shelf controller (DSC), use the **debugdscclock** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

[execute-on] debug dsc clock [execute-on] no debug dsc clock

**Syntax Description** This command has no arguments or keywords; however, it can be used with the **execute-on** command.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	11.3(2)AA	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### Usage Guidelines

To perform this command from the router shelf on the Cisco AS5800 series platform, use the **execute-onslot***slot-number***debugdscclock** form of this command.

The **debugdscclock** command displays TDM clock-switching events on the dial shelf controller. The information displayed includes the following:

- Clock configuration messages received from trunks via NBUS
- Dial shelf controller clock configuration messages from the router shelf over the dial shelf interface link
- Clock switchover algorithm events

**Examples** 

The following example shows that the **debugdscclock** command has been enabled, and that trunk messages are received, and that the configuration message has been received:

AS5800# **debug dsc clock** Dial Shelf Controller Clock debugging is on AS5800# 00:02:55: Clock Addition msg of len 12 priority 8 from slot 1 port 1 on line 0 00:02:55: Trunk 1 has reloaded

Command	Description
execute-on	Executes commands remotely on a line card.

I

Command	Description
show dsc clock	Displays information about the dial shelf controller clock.

## debug dsip

To display debugging output for Distributed System Interconnect Protocol (DSIP) used between a router shelf and a dial shelf, use the**debugdsip** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dsip {all| api| boot| console| trace| transport}

no debug dsip {all| api| boot| console| trace| transport}

#### **Syntax Description**

all	View all DSIP debugging messages.
арі	View DSIP client interface (API) debugging messages.
boot	View DSIP booting messages that are generated when a download of the feature board image is occurring properly.
console	View DSIP console operation while debugging.
trace	Enable logging of header information concerning DSIP packets entering the system into a trace buffer. This logged information can be viewed with the <b>showdsiptracing</b> command.
transport	Debug the DSIP transport layer, the module that interacts with the underlying physical media driver.

#### **Command Modes** Privileged EXEC

# Command History Release Modification 11.3(2)AA This command was introduced. 12.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines** The **debugdsip** command is used to enable the display of debugging messages for DSIP between the router shelf and the dial shelf. Using this command, you can display booting messages generated when the download of an image occurs, view console operation, and trace logging of MAC header information and DSIP transport layer information as modules interact with the underlying physical media driver. This command can be applied to a single modem or a group of modems.

Once the **debugdsiptrace** command has been enabled, you can read the information captured in the trace buffer using the**showdsiptracing** command.

**Examples** 

The following example indicates the **debugdsiptrace** command logs MAC headers of the various classes of DSIP packets. To view the logged information, use the **showdsiptracing** command:

AS5800# debug dsip trace NIP tracing debugging is on AS5800# show dsip tracing NIP Control Packet Trace Dest:00e0.b093.2238 Src:0007.4c72.0058 Type:200B SrcShelf:1 SrcSlot:11 MsgType:0 MsgLen:82 Timestamp: 00:49:14 Dest:00e0.b093.2238 Src:0007.4c72.0028 Type:200B SrcShelf:1 SrcSlot:5 MsgType:0 MsgLen:82 Timestamp: 00:49:14

**Related Commands** 

Command	Description
debug modem	Displays information about the dial shelf, including clocking information.
show dsip tracing	Displays DSIP media header information logged using the <b>debugdsiptrace</b> command.

## debug dspapi

Note

Effective with release 12.3(8)T, the **debugdspapi**command is replaced by the **debugvoipdspapi**command. See the **debugvoipdspapi**command for more information.

To enable debugging for Digital Signal Processor (DSP) application programming interface (API) message events, use the **debugdspapi** command in privileged EXEC mode. To reset the default value for this feature, use the **no** form of this command.

debug dspapi {all| command| detail| error| notification| response}

no debug dspapi {all| command| detail| error| notification| response}

#### **Syntax Description**

all	Enables all <b>debugdspapi</b> options (command, detail, error, notification and response).
command	Displays commands sent to the DSPs.
detail	Displays additional detail for the DSP API debugs enabled.
error	Displays any DSP API errors.
notification	Displays notification messages sent from the DSP (for example, tone detection notification).
response	Displays responses sent by the DSP (for example, responses to statistic requests).

**Command Default** This command is not enabled.

**Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(5)XM	This command was introduced on the Cisco AS5300 and Cisco AS5800.
	12.1(5)XM1	This command was implemented on the Cisco AS5350 and Cisco AS5400.
	12.2(2)T	This command was implemented on the Cisco 1700, Cisco 2600 series, Cisco 3600 series, and the Cisco 3810.

Γ

	Release	Modification	
	12.2(8)T	This command was i	ntegrated into Cisco IOS Release 12.2(8)T.
	12.3(8)T	This command was r	eplaced by the <b>debugvoipdspapi</b> command.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.	
Usage Guidelines	DSP API message events used t and Texas Instrument (54x) DSI single-call debug capture.	to communicate with I Ps. This command seve	DSPs are intended for use with Connexant (Nextport) erely impacts performance and should be used only for
Examples	The following example shows how to enable debugging for all DSP API message events:		
	Router# <b>debug dspapi all</b>		
<b>Related Commands</b>	Command		Description
	Commanu		Description
	debug hpi		Enables debugging for HPI message events.

# debug dspfarm

To display digital signal processor (DSP) farm service debugging information, use the **debugdspfarm** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dspfarm {all| errors| events| packets}

no debug dspfarm

Syntax Description	all		All DSP-farm debug-trace information.	
	errors		DSP-farm errors.	
	events		DSP-farm events.	
	packets		DSP-farm packets.	
Command Default	No default behavior or	values		
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.1(5)YH	This command wa	This command was introduced on the Cisco VG200.	
	12.2(13)T	This command wa Cisco 3640, Cisco	s implemented on the Cisco 2600 series, Cisco 3620, 3660, and Cisco 3700 series.	
	12.2(33)SRA	This command wa	s integrated into Cisco IOS Release 12.2(33)SRA.	
Usage Guidelines	The router on which this command is used must be equipped with one or more digital T1/E1 packet voic trunk network modules (NM-HDVs) or high-density voice (HDV) transcoding/conferencing DSP farms (NM-HDV-FARMs) to provide DSP resources.		equipped with one or more digital T1/E1 packet voice voice (HDV) transcoding/conferencing DSP farms	
	Debugging is turned on with different levels of a	for all DSP-farm-service ses debugging for each.	ssions. You can debug multiple sessions simultaneously,	
Examples	The following is sample	e output from the <b>debugdspf</b>	armevents command:	
	Router# <b>debug dspfar</b> DSP Farm service eve *Mar 1 00:45:51: Se *Mar 1 00:45:53: Se	<b>m events</b> nts debugging is on nt 180 bytes to DSP 4 cl nt 180 bytes to DSP 4 cl	nannel 2 nannel 3

Command	Description
debug frame-relay vc-bundle	Sets debugging for SCCP and its applications at one of four levels.
dspfarm (DSP farm)	Enables DSP-farm service.
sccp	Enables SCCP and its associated transcoding and conferencing applications.
show dspfarm	Displays summary information about DSP resources.

# debug dspu activation

To display information on downstream physical unit (DSPU) activation, use the **debugdspuactivation** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dspu activation [ name ]

no debug dspu activation [ name ]

Syntax Description	name	(Optional) The host or physical unit (PU) name designation.	
Command Modes	Privileged EXEC		
Usage Guidelines	The <b>debugdspuactivation</b> command displays all DSPU activation traffic. To restrict the output to a specific host or PU, include the host or PU <i>name</i> argument. You cannot turn off debugging output for an individual PU if that PU has not been named in the <b>debugdspuactivation</b> command.		
Examples	The following is sample output from the <b>debugdspuactivation</b> command. Not all intermediate numbers are shown for the "activated" and "deactivated" logical unit (LU) address ranges.		
	Router# <b>debug dspu activation</b> DSPU: LS HOST3745 connected DSPU: PU HOST3745 activated DSPU: LU HOST3745-2 activated DSPU: LU HOST3745-3 activated		
	DSPU: LU HOST3745-253 activated DSPU: LU HOST3745-254 activated DSPU: LU HOST3745-2 deactivated DSPU: LU HOST3745-3 deactivated		
	DSPU: LU HOST3745-253 deactivated DSPU: LU HOST3745-254 deactivated DSPU: LS HOST3745 disconnected DSPU: PU HOST3745 deactivated The table below describes the significan	t fields shown in the display.	

Table 78: debug dspu activation Field Descriptions

Field	Description
DSPU	Downstream PU debugging message.
LS	Link station (LS) event triggered the message.

٦

Field	Description
PU	PU event triggered the message.
LU	LU event triggered the message.
HOST3745	Host name or PU name.
HOST3745-253	Host name or PU name and the LU address, separated by a dash.
connected activated disconnected deactivated	Event that occurred to trigger the message.

Command	Description
debug dspu packet	Displays information on a DSPU packet.
debug dspu state	Displays information on DSPU FSM state changes.
debug dspu trace	Displays information on DSPU trace activity.

# debug dspu packet

I

To display information on a downstream physical unit (DSPU) packet, use the **debugdspupacket**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dspu packet [ name ]

no debug dspu packet [ name ]

Syntax Description	name	(Optional) The host or PU name designation.
Command Modes	Privileged EXEC	
Usage Guidelines	The <b>debugdspupacket</b> command displays all DSPU output to a specific host or physical unit (PU), includ debugging output for an individual PU if that PU has	packet data flowing through the router. To restrict the e the host or PU <i>name</i> argument. You cannot turn off not been named in the debug dspu packet command.
Examples	The following is sample output from the <b>debugdspup</b>	packet command:
	<pre>Router# debug dspu packet DSPU: Rx: PU H0ST3745 data length 12 data:</pre>	0000010000 00 0000010000 00 n in the display.
	Table 79: debug dspu packet Field Descriptions	

Field	Description
DSPU: Rx:	Received frame (packet) from the remote PU to the router PU.
DSPU: Tx:	Transmitted frame (packet) from the router PU to the remote PU.
PU HOST3745	Host name or PU associated with the transmit or receive.
data length 12 data:	Number of bytes of data, followed by up to 128 bytes of displayed data.

1

Command	Description
debug drip event	Displays debugging messages for DRiP packets.
debug dspu state	Displays information on DSPU FSM state changes.
debug dspu trace	Displays information on DSPU trace activity.

# debug dspu state

I

To display information on downstream physical unit (DSPU) finite state machine (FSM) state changes, use the **debugdspustate** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dspu state [ name ]

no debug dspu state [ name ]

Syntax Description	name	(Optional) The host or physical unit (PU) name designation.
Command Modes	Privileged EXEC	
Usage Guidelines	Use the <b>debugdspustate</b> command to d debug <b>dsputrace</b> command. You cannot been named in the <b>debugdspustate</b> con	isplay only the FSM state changes. To see all FSM activity, use the turn off debugging output for an individual PU if that PU has not mand.
Examples	The following is sample output from the for the "activated" and "deactivated" log	<b>debugdspustate</b> command. Not all intermediate numbers are shown gical unit (LU) address ranges.
	Router# <b>debug dspu state</b> DSPU: LS HOST3745: input=StartLs, DSPU: LS HOST3745: input=ReqOpn.C DSPU: LS HOST3745: input=Connect. DSPU: LS HOST3745: input=Connecte DSPU: PU HOST3745: input=Actpu, R DSPU: LU HOST3745-2: input=uActlu DSPU: LU HOST3745-3: input=uActlu	Reset -> PendConOut nf, PendConOut -> Xid Ind, Xid -> ConnIn d.Ind, ConnIn -> Connected eset -> Active , Reset -> upLuActive , Reset -> upLuActive
	DSPU: LU HOST3745-253: input=uAct DSPU: LU HOST3745-254: input=uAct DSPU: LS HOST3745: input=Pustoppe DSPU: LS HOST3745: input=Disc.Cnf DSPU: LS HOST3745: input=Close.Cn DSPU: PU HOST3745: input=T2ResetP DSPU: LU HOST3745-2: input=ustopL DSPU: LU HOST3745-3: input=ustopL	<pre>lu, Reset -&gt; upLuActive lu, Reset -&gt; upLuActive d, Connected -&gt; PendDisc , PendDisc -&gt; PendClose f, PendClose -&gt; Reset u, Active -&gt; Reset u, upLuActive -&gt; Reset u, upLuActive -&gt; Reset</pre>
	DSPU: LU HOST3745-253: input=uSto DSPU: LU HOST3745-254: input=uSto The table below describes the significan	pLu, upLuActive -> Reset pLu, upLuActive -> Reset t fields shown in the display.

I

1

Table	<b>80</b> :	debug	dspu	state	Field	Descriptions
-------	-------------	-------	------	-------	-------	--------------

Field	Description
DSPU	Downstream PU debug message.
LS	Link station (LS) event triggered the message.
PU	PU event triggered the message.
LU	LU event triggered the message.
HOST3745-253	Host name or PU name and LU address.
input=input,	Input received by the FSM.
previous-state, -> current-state	Previous state and current new state as seen by the FSM.

Command	Description
debug drip event	Displays debugging messages for DRiP packets.
debug drip packet	Displays information on DSPU packet.
debug dspu trace	Displays information on DSPU trace activity.

# debug dspu trace

I

To display information on downstream physical unit (DSPU) trace activity, which includes all finite state machine (FSM) activity, use the **debugdsputrace** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dspu trace [ name ]

no debug dspu trace [ name ]

Syntax Description	name	(Optional) The host or physical unit (PU) name designation.		
Command Modes	Privileged EXEC			
Usage Guidelines	Use the <b>debugdsputrace</b> command to dis <b>debugdspustate</b> command. You cannot to been named in the <b>debugdsputrace</b> comm	play all FSM state changes. To see FSM state changes only, use the Irn off debugging output for an individual PU if that PU has not nand.		
Examples	The following is sample output from the <b>debugdsputrace</b> command:			
	Router# debug dspu trace DSPU: LS HOST3745 input = 0 ->(1, al DSPU: LS HOST3745 input = 5 ->(5, ac DSPU: LS HOST3745 input = 7 ->(5, ac DSPU: LS HOST3745 input = 7 ->(5, ac DSPU: LS HOST3745 input = 9 ->(2, al DSPU: LS HOST3745 input = 19 ->(8, ac DSPU: LS HOST3745 input = 18 ->(8, ac DSPU: LS HOST3745 input = 19 ->(8, ac DSPU: LS HOST3745 input = 18 ->(8, ac DSPU: LS HOST3745 input = 19 ->(8,	) ) ) ) ) ) ) ) ) ) ) ) ) )		
	Table 81: debug dspu trace Field Descriptions			

Field	Description
7:23:57	Time stamp.
DSPU	Downstream PU debug message.

1

Field	Description
LS	Link station (LS) event triggered the message.
PU	A PU event triggered the message.
LU	LU event triggered the message.
HOST3745-253	Host name or PU name and LU address.
in:inputs:state->(new-state, action)	<ul> <li>String describing the following:</li> <li><i>input</i>LU FSM input</li> <li><i>state</i>Current FSM state</li> <li><i>new-state</i>New FSM state</li> <li><i>action</i>FSM action</li> </ul>
<pre>input=input -&gt; (new-state,action)</pre>	<ul> <li>String describing the following:</li> <li><i>input</i>PU or LS FSM input</li> <li><i>new-state</i>New PU or LS FSM state</li> <li><i>action</i>PU or LS FSM action</li> </ul>

Command	Description
debug drip event	Displays debugging messages for DRiP packets.
debug drip packet	Displays information on DSPU packet.
debug dspu state	Displays information on DSPU FSM state changes.

## debug dss ipx event

To display debugging messages for route change events that affect Internetwork Packet Exchange (IPX) Multilayer Switching (MLS), use the **debugdssipxevent** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug dss ipx event no debug dss ipx event

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.0(5)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

#### **Examples**

The following is sample output from the**debugdssipxevent** command:

Router#

```
debug dss ipx event
DSS IPX events debugging is on
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface vlan 22
Router(config-if)# ipx access-group 800 out
05:51:36:DSS-feature:dss_ipxcache_version():idb:NULL, reason:42,
prefix:0, mask:FFFFFFF
05:51:36:DSS-feature:dss_ipx_access_group():idb:Vlan22
05:51:36:DSS-feature:dss_ipx_access_list()
05:51:36:DSS-base 05:51:33.834 dss_ipx_invalidate_interface Vl22
05:51:36:DSS-base 05:51:33.834 dss_set_ipx_flowmask_reg 2
05:51:36:MIPX mls flowmask transition from 1 to 2 due to new status of
simple IPX access list on interfaces
```

Related Commands	Command	Description
