

BGP Restart Neighbor Session After Max-Prefix Limit Reached

The BGP Restart Session After Max-Prefix Limit Reached feature adds the **restart** keyword to the **neighbor maximum-prefix** command. This allows a network operator to configure the time interval at which a peering session is reestablished by a device when the number of prefixes that have been received from a peer has exceeded the maximum prefix limit.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About BGP Neighbor Session Restart After Max-Prefix Limit Reached

Prefix Limits and BGP Peering Sessions

Use the **neighbor maximum-prefix** command to limit the maximum number of prefixes that a device running BGP can receive from a peer. When the device receives too many prefixes from a peer and the maximum-prefix limit is exceeded, the peering session is disabled or brought down. The session stays down until the network operator manually brings the session back up by entering the **clear ip bgp** command, which clears stored prefixes.

BGP Neighbor Session Restart with the Maximum Prefix Limit

The **restart** keyword was added to the **neighbor maximum-prefix** command so that a network operator can configure a device to automatically reestablish a BGP neighbor peering session when the peering session has been disabled or brought down. The time interval at which peering can be reestablished automatically is configurable. The *restart-interval* for the **restart** keyword is specified in minutes; range is from 1 to 65,535 minutes.

Subcodes for BGP Cease Notification

Border Gateway Protocol (BGP) imposes maximum limits on the maximum number of prefixes that are accepted from a peer for a given address family. This limitation safeguards the device from resource depletion caused by misconfiguration, either locally or on the remote neighbor. To prevent a peer from flooding BGP with advertisements, a limit is placed on the number of prefixes that are accepted from a peer for each supported address family. The default limits can be overridden through configuration of the maximum-prefix limit command for the peer for the appropriate address family.

The following subcodes are supported for the BGP cease notification message:

- Maximum number of prefixes reached
- Administrative shutdown
- Peer de-configured
- Administrative reset

A cease notification message is sent to the neighbor and the peering with the neighbor is terminated when the number of prefixes received from the peer for a given address family exceeds the maximum limit (either set by default or configured by the user) for that address family. It is possible that the maximum number of prefixes for a neighbor for a given address family has been configured after the peering with the neighbor has been established and a certain number of prefixes have already been received from the neighbor for that address family. A cease notification message is sent to the neighbor and peering with the neighbor is terminated immediately after the configuration if the configured maximum number of prefixes is fewer than the number of prefixes that have already been received from the neighbor for the address family.

How to Configure a Device to Reestablish a Neighbor Session After the Maximum Prefix Limit Has Been Exceeded

Configuring a Router to Reestablish a Neighbor Session After the Maximum Prefix Limit Reached

Perform this task to configure the time interval at which a BGP neighbor session is reestablished by a device when the number of prefixes that have been received from a BGP peer has exceeded the maximum prefix limit.

The network operator can configure a device running BGP to automatically reestablish a neighbor session that has been brought down because the configured maximum-prefix limit has been exceeded. No intervention from the network operator is required when this feature is enabled.

**Note**

This task attempts to reestablish a disabled BGP neighbor session at the configured time interval that is specified by the network operator. However, the configuration of the restart timer alone cannot change or correct a peer that is sending an excessive number of prefixes. The network operator will need to reconfigure the maximum-prefix limit or reduce the number of prefixes that are sent from the peer. A peer that is configured to send too many prefixes can cause instability in the network, where an excessive number of prefixes are rapidly advertised and withdrawn. In this case, the **warning-only** keyword of the **neighbor maximum-prefix** command can be configured to disable the restart capability while the network operator corrects the underlying problem.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *autonomous-system-number*
4. **neighbor** {*ip-address* | *ipv6-address* | *peer-group-name*} **peer-group**
5. **neighbor** {*ip-address* | *ipv6-address%* | *peer-group-name*} **peer-group** *peer-group-name*
6. **neighbor** {*ip-address* | *ipv6-address%* | *peer-group-name*} **remote-as** *autonomous-system-number* [**alternate-as** *autonomous-system-number...*]
7. **neighbor** {*ip-address* | *ipv6-address%* | *peer-group-name*} **remote-as** *autonomous-system-number* [**alternate-as** *autonomous-system-number...*]
8. **neighbor** {*ip-address* | *ipv6-address%* | } **maximum-prefix** *maximum* [*threshold*] [**restart** *minutes*] [**warning-only**]
9. **end**
10. **show ip bgp neighbors** *ip-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 101	Enters router configuration mode and creates a BGP routing process.
Step 4	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } peer-group Example: Device(config-router)# neighbor internal peer-group	Creates a BGP or multiprotocol BGP peer group.
Step 5	neighbor { <i>ip-address</i> <i>ipv6-address%</i> <i>peer-group-name</i> } peer-group <i>peer-group-name</i> Example: Device(config-router)# neighbor 10.4.9.5 peer-group internal	Configures a BGP neighbor to member of a peer group. <ul style="list-style-type: none"> • % keyword is the IPv6 link-local address identifier. This keyword needs to be added whenever a link-local IPv6 address is used outside the context of its interface.
Step 6	neighbor { <i>ip-address</i> <i>ipv6-address%</i> <i>peer-group-name</i> } remote-as <i>autonomous-system-number</i> [alternate-as <i>autonomous-system-number...</i>] Example: Device(config-router)# neighbor internal remote-as 100	Adds a peer group to the BGP or multiprotocol BGP neighbor table.
Step 7	neighbor { <i>ip-address</i> <i>ipv6-address%</i> <i>peer-group-name</i> } remote-as <i>autonomous-system-number</i> [alternate-as <i>autonomous-system-number...</i>]	Adds an entry to the BGP or multiprotocol BGP neighbor table.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config-router)# neighbor 10.4.9.5 remote-as 100</pre>	
Step 8	<p>neighbor {<i>ip-address</i> <i>ipv6-address%</i> } maximum-prefix <i>maximum</i> [<i>threshold</i>] [restart <i>minutes</i>] [warning-only]</p> <p>Example:</p> <pre>Device(config-router)# neighbor 10.4.9.5 maximum-prefix 1000 90 restart 60</pre>	<p>Configures the maximum-prefix limit on a router that is running BGP.</p> <ul style="list-style-type: none"> Use the restart keyword and <i>minutes</i> argument to configure the router to automatically reestablish a neighbor session that has been disabled because the maximum-prefix limit has been exceeded. The configurable range of <i>minutes</i> is from 1 to 65535 minutes. Use the warning-only keyword to configure the device to disable the restart capability to allow you to adjust a peer that is sending too many prefixes. <p>Note If the <i>minutes</i> argument is not configured, the disabled session will stay down after the maximum-prefix limit is exceeded. This is the default behavior.</p>
Step 9	<p>end</p> <p>Example:</p> <pre>Device(config-router)# end</pre>	<p>Exits router configuration mode and enters privileged EXEC mode.</p>
Step 10	<p>show ip bgp neighbors <i>ip-address</i></p> <p>Example:</p> <pre>Device# show ip bgp neighbors 10.4.9.5</pre>	<p>(Optional) Displays information about the TCP and BGP connections to neighbors.</p> <ul style="list-style-type: none"> In this example, the output from this command will display the maximum prefix limit for the specified neighbor and the configured restart timer value.

Examples

The following sample output from the **show ip bgp neighbors** command verifies that a device has been configured to automatically reestablish disabled neighbor sessions. The output shows that the maximum prefix limit for neighbor 10.4.9.5 is set to 1000 prefixes, the restart threshold is set to 90 percent, and the restart interval is set at 60 minutes.

```
Device# show ip bgp neighbors 10.4.9.5
BGP neighbor is 10.4.9.5, remote AS 101, internal link
  BGP version 4, remote router ID 10.4.9.5
  BGP state = Established, up for 2w2d
  Last read 00:00:14, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received(new)
```

```

Troubleshooting Tips

Use the **clear ip bgp** command to reset a BGP connection using BGP soft reconfiguration. This command can be used to clear stored prefixes to prevent a device that is running BGP from exceeding the maximum-prefix limit.

Display of the following error messages can indicate an underlying problem that is causing the neighbor session to become disabled. You should check the values configured for the **neighbor maximum-prefix**

command and the configuration of any peers that are sending an excessive number of prefixes. The following sample error messages are similar to the error messages that may be displayed:

```
00:01:14:%BGP-5-ADJCHANGE:neighbor 10.10.10.2 Up
00:01:14:%BGP-4-MAXPFX:No. of unicast prefix received from 10.10.10.2 reaches 5, max 6
00:01:14:%BGP-3-MAXPFXEXCEED:No.of unicast prefix received from 10.10.10.2:7 exceed limit6
00:01:14:%BGP-5-ADJCHANGE:neighbor 10.10.10.2 Down - BGP Notification sent
00:01:14:%BGP-3-NOTIFICATION:sent to neighbor 10.10.10.2 3/1 (update malformed) 0 byte
```

The **bgp dampening** command can be used to configure the dampening of a flapping route or interface when a peer is sending too many prefixes and causing network instability. Use this command only when troubleshooting or tuning a device that is sending an excessive number of prefixes. For more details about BGP route dampening, see the “Configuring Advanced BGP Features” module.

Configuration Example for BGP Restart Neighbor Session After Max-Prefix Limit Reached

Example: Configuring a Router to Reestablish a Neighbor Session After the Maximum Prefix Limit Reached

The following example sets the maximum number of prefixes allowed from the neighbor at 192.168.6.6 to 2000 and configures the device to reestablish a peering session after 30 minutes if one has been disabled:

```
Device(config)# router bgp 101
Device(config-router)# neighbor internal peer-group
Device(config-router)# neighbor 10.4.9.5 peer-group internal
Device(config-router)# neighbor internal remote-as 100
Device(config-router)# neighbor 10.4.9.5 remote-as 100
Device(config-router)# neighbor 10.4.9.5 maximum-prefix 2000 90 restart 30
Device(config-router)# end
```
