

# Troubleshooting ISG with Session Monitoring and Distributed Conditional Debugging

---

Intelligent Services Gateway (ISG) is a software feature set that provides a structured framework in which edge devices can deliver flexible and scalable services to subscribers. This document describes ISG session monitoring and distributed conditional debugging. Conditional debugging facilitates debug filtering for ISG and is available as distributed conditional debugging.

- [Additional References, page 12](#)
- [Feature Information for Distributed Conditional Debugging, page 12](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

# Prerequisites for ISG Session Monitoring and Distributed Conditional Debugging

Before using the information in this module, it is recommended that you be familiar with the use of Cisco IOS **debug** commands and conditional debugging. See the "Additional References" section to find information about these topics.

## Restrictions for Distributed Conditional Debugging

Conditions that are set for an active session take effect only when the session is terminated and reestablished.

### Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use the Cisco IOS **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users, or on a debug chassis with a single active session. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

## Information About ISG Session Monitoring and Distributed Conditional Debugging

### ISG Session and Flow Monitoring

ISG introduces a mechanism that allows an administrator to monitor ISG sessions and flows continuously. The **show interface monitor** command, which displays interface statistics, and the **show process cpu monitor** command, which displays information about CPU usage, both update the information in their displays at specified intervals. These commands also provide the ability to freeze or clear the information in the display.

### ISG Distributed Conditional Debugging

#### Benefits of Enhanced Conditional Debugging for the ISG Platforms

Because thousands of user sessions run on the ISG platforms, it is not practical to troubleshoot a problem with a session by enabling the various component **debug** commands that are available and trace through the messages for a single session or user. Instead, it is more practical to filter debugging messages for a single session or call across the various components that a session traverses. For this reason, the conditional debugging previously offered in the software has been enhanced to facilitate debug filtering for ISG and is available as distributed conditional debugging.

## Cisco IOS XE Software Components Supported by Distributed Conditional Debugging

The following components are supported for ISG distributed conditional debugging:

- Authentication, authorization, and accounting (AAA) and RADIUS
- Feature Manager
- Policy Manager
- PPP
- PPP over Ethernet (PPPoE)
- Session Manager
- Virtual Private Dialup Network (VPDN)

See Table 1 and Table 2 for specific commands that are supported for distributed conditional debugging.

# How to Enable ISG Session Monitoring and Distributed Conditional Debugging

## Monitoring ISG Sessions and Flows

Perform this task to monitor interface and CPU statistics. The **show** commands are not required and may be entered in any order.

### SUMMARY STEPS

1. **enable**
2. **show interface** *type number* **monitor** [**interval seconds**]
3. **show processes cpu monitor** [**interval seconds**]

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>show interface</b> <i>type number</i> <b>monitor</b> [ <i>interval seconds</i> ]  <b>Example:</b>  Router# show interface gigabitethernet 3/0/0 monitor interval 10	Displays interface statistics that are updated at specified intervals.
<b>Step 3</b>	<b>show processes cpu monitor</b> [ <i>interval seconds</i> ]  <b>Example:</b>  Router# show processes cpu monitor	Displays detailed CPU utilization statistics that are updated at specified intervals.

## Configuring Distributed Conditional Debugging

Two main tasks are required for configuring distributed conditional debugging: enabling conditional debugging, and issuing one or more supported **debug** commands. These required tasks are described in the following sections:

### ISG Debug Condition Commands

The table below lists the **debug condition** commands that you can issue at the EXEC prompt to enable distributed conditional debugging. You can set more than one condition.

**Table 1: Supported Conditional Debug Commands**

Command	Purpose
<b>debug condition domain</b> <i>domain-name</i>	Filters messages on the specified domain name.
<b>debug condition interface</b> {Fast Ethernet   Gigabit Ethernet   TenGigabit Ethernet} <i>vlan-id ID</i>	Filters messages on the specified VLAN identifier.
<b>debug condition mac-address</b> <i>hexadecimal-MAC-address</i>	Filters messages on the specified MAC address.
<b>debug condition portbundle</b> <b>ip</b> <i>IP-address</i> <b>bundle</b> <i>bundle-number</i>	Filters messages on the specified Port-Bundle Host Key (PBHK).
<b>debug condition session-id</b> <i>session-ID</i>	Filters messages on the specified session identifier.  <b>Note</b> The session identifier can be obtained by entering the <b>show subscriber session</b> command.
<b>debug condition username</b> <i>email-address</i>	Filters messages on the specified Internet username.

## Debug Commands That Are Supported by ISG Conditional Debug

The table below lists the Cisco IOS debugging commands that are supported for distributed conditional debugging. The commands are listed by component. One or more of these commands can be issued after enabling one of the **debug condition** commands listed in [Debug Commands That Are Supported by ISG Conditional Debug](#), on page 5.

*Table 2: Debug Commands Supported by ISG Distributed Conditional Debugging*

<b>AAA Debug Commands</b>
<b>debug aaa accounting</b>
<b>debug aaa authentication</b>
<b>debug aaa authorization</b>
<b>debug aaa id</b>
PPP Debug Commands
<b>debug ppp authentication</b>
<b>debug ppp bap error</b>
<b>debug ppp bap events</b>
<b>debug ppp bap negotiation</b>
<b>debug ppp cbcp</b>
<b>debug ppp error</b>
<b>debug ppp mppe detailed</b>
<b>debug ppp mppe events</b>
<b>debug ppp mppe pack</b>
<b>debug ppp multi data</b>
<b>debug ppp multi events</b>
<b>debug ppp multi frag</b>
<b>debug ppp negotiation</b>
<b>debug ppp pack</b>
<b>debug ppp subscriber</b>

<b>AAA Debug Commands</b>
PPPoE Debug Commands
<b>debug pppoe data</b>
<b>debug pppoe error</b>
<b>debug pppoe event</b>
<b>debug pppoe packet</b>
Session Manager Debug Commands
<b>debug subscriber aaa authorization event</b>
<b>debug subscriber aaa authorization fsm</b>
<b>debug subscriber error</b>
<b>debug subscriber event</b>
Feature Manager Debug Commands
<b>debug subscriber feature access-list error</b>
<b>debug subscriber feature access-list event</b>
<b>debug subscriber feature compression detail</b>
<b>debug subscriber feature compression error</b>
<b>debug subscriber feature compression event</b>
<b>debug subscriber feature detail</b>
<b>debug subscriber feature error</b>
<b>debug subscriber feature event</b>
<b>debug subscriber feature interface-config error</b>
<b>debug subscriber feature interface-config event</b>
<b>debug subscriber feature modem-on-hold detail</b>
<b>debug subscriber feature modem-on-hold error</b>
<b>debug subscriber feature modem-on-hold event</b>

<b>AAA Debug Commands</b>
<b>debug subscriber feature portbundle error</b>
<b>debug subscriber feature portbundle event</b>
<b>debug subscriber feature portbundle packet</b>
<b>debug subscriber feature qos-policy error</b>
<b>debug subscriber feature qos-policy event</b>
<b>debug subscriber feature static-routes error</b>
<b>debug subscriber feature static-routes event</b>
<b>debug subscriber feature traffic-classification detail</b>
<b>debug subscriber feature traffic-classification error</b>
<b>debug subscriber feature traffic-classification event</b>
Policy Manager Debug Commands
<b>debug subscriber fsm</b>
<b>debug subscriber policy condition</b>
<b>debug subscriber policy detail</b>
<b>debug subscriber policy error</b>
<b>debug subscriber policy event</b>
<b>debug subscriber policy fsm</b>
<b>debug subscriber policy rule</b>
<b>debug subscriber session error</b>
<b>debug subscriber session event</b>
VPDN Debug Commands
<b>debug vpdn call event</b>
<b>debug vpdn call fsm</b>
<b>debug vpdn error</b>

<b>AAA Debug Commands</b>
<b>debug vpdn event</b>
<b>debug vpdn event disconnect</b>

## Restrictions

The **debug condition session-id** command filters a session only after the session has been established. The session identifier is a unique dynamic number generated internally by the Cisco IOS software and assigned to each session when the session is established.

In VPDN, the **debug** commands and messages associated with tunnels cannot be filtered because they are not associated with a session, but are displayed during the tunnel-establishment phase. The debugging messages will be displayed even if filtering is enabled by one of the conditions.

If multiple conditions are set, the debugging messages corresponding to all the sessions that meet any of the conditions will be displayed. Some conditions, such as domain name, will trigger debugging messages for all the sessions that belong to the particular domain.

## Enabling Distributed Conditional Debugging

Perform this task to enable distributed conditional debugging for ISG.

### SUMMARY STEPS

1. **enable**
2. **debug condition** *command*
3. **debug** *command*

### DETAILED STEPS

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>debug condition</b> <i>command</i></p> <p><b>Example:</b></p> <pre>Router# debug condition username user@cisco.com</pre>	<p>Enter one or more of the <b>debug condition</b> commands listed in <a href="#">Enabling Distributed Conditional Debugging, on page 8</a> to enable distributed conditional debugging.</p>

	Command or Action	Purpose
<b>Step 3</b>	<p><code>debug</code> <i>command</i></p> <p><b>Example:</b></p> <pre>Router# debug subscriber aaa authorization fsm</pre>	Enter one or more of the supported <b>debug</b> commands from <a href="#">Enabling Distributed Conditional Debugging, on page 8</a> .

## Displaying Debugging Conditions

To display the debugging conditions that have been set, perform the following task:

### SUMMARY STEPS

1. **enable**
2. **show debug condition**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>show debug condition</b></p> <p><b>Example:</b></p> <pre>Router# show debug condition</pre>	Displays conditions that have been set for debugging.

## Troubleshooting Tips

The Cisco IOS software displays messages as you set the conditions for filtering the debugging.

When a condition is set, it is assigned a number, as follows:

```
Condition 1 set
```

If a condition has already been set, the following message is displayed:

```
% Condition already set
```

The following messages and prompt are displayed when you attempt to disable the last condition using the **no** form of a **debug condition** command:

```
This condition is the last interface condition set.
Removing all conditions may cause a flood of debugging messages
to result, unless specific debugging flags are first removed.
Proceed with removal? [yes/no]: yes
Condition 1 has been removed
```

**Tip** Use the **no** form of the commands to disable all **debug** commands before disabling all of the debugging conditions that have been set.

## Configuration Examples for ISG Distributed Conditional Debugging

### Monitoring Interface Statistics Example

The following example shows sample output for the **show interface monitor** command. The display will be updated every 10 seconds.

```
Router> show interface gigabitethernet 0/0/0 monitor interval 10
Router Name:  Scale3-Router8          Update Secs: 10
Interface Name:  GigabitEthernet 0/0/0 Interface Status: UP, line is up
Line Statistics:      Total:          Rate(/s)   Delta
Input Bytes:         123456          123        7890
Input Packets:       3456            56         560
Broadcast:           1333            6          60
OutputBytes:         75717          123        1230
Output Packets:      733            44         440
Error Statistics:    Total:          Delta:
Input Errors:        0              0
CRC Errors:          0              0
Frame Errors:        0              0
Ignored:             0              0
Output Errors:       0              0
Collisions:          0              0
No. Interface Resets: 2
End = e             Clear = c             Freeze = f
Enter Command:
```

### Monitoring CPU Statistics Example

The following example shows sample output for the **show processes cpu monitor** command:

```
Router> show processes cpu monitor

CPU utilization for five seconds: 0%/0%; one minute: 0%; five minutes: 0%
PID Runtime(ms)   Invoked    uSecs   5Sec  1Min   5Min   TTY Process
  3      772         712      1084   0.08% 0.04% 0.02%   0   Exec
 67      276        4151        66   0.08% 0.03% 0.01%   0 L2TP mgmt daemon
116      604        2263       266   0.16% 0.05% 0.01%   0 IDMGR CORE

End = e      Freeze = f
```

Enter Command:

## Enabling ISG Distributed Conditional Debugging Example

The following example shows how to filter PPP, PPPoE, and Session Manager debugs for a PPPoE session with username "user@cisco.com". Only debugging messages for the defined user are displayed on the console. Any other debugging messages associated with other users will not be displayed.

```
Router# debug condition username user@cisco.com
Condition 1 set

Router# debug ppp negotiation
Router# debug pppoe event
Router# debug subscriber session event
```

## Displaying Debugging Conditions Example

The following example shows how to display debugging conditions that have been set.

```
Router# show debug condition

Condition 1: domain cisco.com (0 flags triggered)
Condition 2: username user@cisco.com (0 flags triggered)
Condition 3: ip 172.19.200.10 (0 flags triggered)
```

## Filtering Debug Output Example

In the following example, the output of the **debug subscriber packet detail** command is filtered on the basis of the username "cpe6\_1@isp.com":

```
Router# debug condition username cpe6_1@isp.com
Condition 1 set
Router# show debug

Condition 1: username cpe6_1@isp.com (0 flags triggered)

Router# debug subscriber packet detail
SSS packet detail debugging is on

Router# show debug
SSS:
  SSS packet detail debugging is on

Condition 1: username cpe6_1@isp.com (0 flags triggered)
```

## Feature Information for Distributed Conditional Debugging

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 3: Feature Information for ISG Session Monitoring and Distributed Conditional Debugging**

Feature Name	Releases	Feature Configuration Information
ISG: Instrumentation: Session and Flow Monitoring	Cisco IOS XE Release 2.2	ISG provides a mechanism for continuously monitoring interface and CPU statistics. This feature introduces the <b>show interface monitor</b> and <b>show processes cpu monitor</b> commands, which display statistics that are updated at specified intervals.
ISG: Instrumentation: Advanced Conditional Debugging	Cisco IOS XE Release 2.2	ISG provides the ability to define various conditions for filtering debug output. Conditional debugging generates very specific and relevant information that can be used for session, flow, subscriber, and service diagnostics.
