MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

The MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses feature allows a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) to span service providers and autonomous systems. This module explains how to enable Autonomous System Boundary Routers (ASBRs) to use Exterior Border Gateway Protocol (EBGP) to exchange IPv4 Network Layer Reachability Information (NLRI) in the form of VPN-IPv4 addresses.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

- Before you configure EBGP routing between autonomous systems or subautonomous systems in an MPLS VPN, ensure that you have properly configured all MPLS VPN routing instances and sessions. The configuration tasks outlined in this section build from those configuration tasks. Perform the following tasks as described in the Configuring MPLS Layer 3 VPNs module:

- Define VPN routing instances
- Configure BGP routing sessions in the MPLS core
- Configure PE-to-PE routing sessions in the MPLS core
- Configure BGP PE-to-CE routing sessions
- Configure a VPN-IPv4 EBGp session between directly connected ASBRs
- This feature is supported on the Cisco 12000 series router line cards listed in the table below.

Table 1 *Cisco 12000 Series Line Card Support Added for Cisco IOS Releases*

Type	Line Cards	Cisco IOS Release Added
Packet over SONET (POS)	4-Port OC-3 POS	12.0(16)ST
	1-Port OC-12 POS	12.0(17)ST
	8-Port OC-3 POS	12.0(22)S
	16-Port OC-3 POS	
	4-Port OC-12 POS	
	1-Port OC-48 POS

Restrictions for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Multihop VPN-IPv4 EBGp is not supported.

Information About MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

- [MPLS VPN Inter-AS Introduction, page 3](#)
- [Benefits of MPLS VPN Inter-AS, page 3](#)
- [Use of Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 4](#)
- [Information Exchange in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 4](#)

MPLS VPN Inter-AS Introduction

An autonomous system is a single network or group of networks that is controlled by a common system administration group and that uses a single, clearly defined routing protocol.

As VPNs grow, their requirements expand. In some cases, VPNs need to reside on different autonomous systems in different geographic areas. Also, some VPNs need to extend across multiple service providers (overlapping VPNs). Regardless of the complexity and location of the VPNs, the connection between autonomous systems must be seamless to the customer.

Benefits of MPLS VPN Inter-AS

An MPLS VPN Inter-AS provides the following benefits:

- Allows a VPN to cross more than one service provider backbone: Service providers running separate autonomous systems can jointly offer MPLS VPN services to the same customer. A VPN can begin at one customer site and traverse different VPN service provider backbones before arriving at another site of the same customer. Previously, MPLS VPN could traverse only a single BGP autonomous system service provider backbone. This feature allows multiple autonomous systems to form a continuous (and seamless) network between customer sites of a service provider.
- Allows a VPN to exist in different areas: A service provider can create a VPN in different geographic areas. Having all VPN traffic flow through one point (between the areas) allows for better rate control of network traffic between the areas.
- Allows confederations to optimize IBGP meshing: Internal Border Gateway Protocol (IBGP) meshing in an autonomous system is more organized and manageable. An autonomous system can be divided into multiple, separate subautonomous systems and then classify them into a single confederation (even though the entire VPN backbone appears as a single autonomous system). This capability allows a service provider to offer MPLS VPNs across the confederation because it supports the exchange of labeled VPN-IPv4 NLRI between the subautonomous systems that form the confederation.

Use of Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Separate autonomous systems from different service providers can communicate by exchanging IPv4 NLRI in the form of VPN-IPv4 addresses. The ASBRs use EBGP to exchange that information. Then an Interior Gateway Protocol (IGP) distributes the network layer information for VPN-IPv4 prefixes throughout each VPN and each autonomous system. Routing information uses the following protocols:

- Within an autonomous system, routing information is shared using an IGP.
- Between autonomous systems, routing information is shared using an EBGP. An EBGP allows a service provider to set up an interdomain routing system that guarantees the loop-free exchange of routing information between separate autonomous systems.

The primary function of an EBGP is to exchange network reachability information between autonomous systems, including information about the list of autonomous system routes. The autonomous systems use EBGP border edge routers to distribute the routes, which include label switching information. Each border edge router rewrites the next hop and labels. See the [Information Exchange in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 4](#) section for more information.

Interautonomous system configurations supported in an MPLS VPN are as follows:

- **Interprovider VPN--** MPLS VPNs that include two or more autonomous systems, connected by separate border edge routers. The autonomous systems exchange routes using EBGP. No IGP or routing information is exchanged between the autonomous systems.
- **BGP confederations--** MPLS VPNs that divide a single autonomous system into multiple subautonomous systems, and classify them as a single, designated confederation. The network recognizes the confederation as a single autonomous system. The peers in the different autonomous systems communicate over EBGP sessions; however, they can exchange route information as if they were IBGP peers.

Information Exchange in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

This section contains the following topics:

- [Transmission of Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 4](#)
- [Exchange of VPN Routing Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 6](#)
- [Packet Forwarding Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses, page 8](#)
- [Use of a Confederation for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 10](#)

Transmission of Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

The figure below illustrates one MPLS VPN consisting of two separate autonomous systems. Each autonomous system operates under different administrative control and runs a different IGP. Service providers exchange routing information through EBGP border edge routers (ASBR1, ASBR2).

Figure 1 *EBGP Connection Between Two MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses*

This configuration uses the following process to transmit information:

SUMMARY STEPS

1. The provider edge router (PE-1) assigns a label for a route before distributing that route. The PE router uses the multiprotocol extensions of BGP to transmit label mapping information. The PE router distributes the route as a VPN-IPv4 address. The address label and the VPN identifier are encoded as part of the NLRI.
2. The two route reflectors (RR-1 and RR-2) reflect VPN-IPv4 internal routes within the autonomous system. The autonomous systems' border edge routers (ASBR1 and ASBR2) advertise the VPN-IPv4 external routes.
3. The EBGP border edge router (ASBR1) redistributes the route to the next autonomous system (ASBR2). ASBR1 specifies its own address as the value of the EBGP next-hop attribute and assigns a new label. The address ensures the following:
4. The EBGP border edge router (ASBR2) redistributes the route in one of the following ways, depending on its configuration:

DETAILED STEPS

-
- Step 1** The provider edge router (PE-1) assigns a label for a route before distributing that route. The PE router uses the multiprotocol extensions of BGP to transmit label mapping information. The PE router distributes the route as a VPN-IPv4 address. The address label and the VPN identifier are encoded as part of the NLRI.
- Step 2** The two route reflectors (RR-1 and RR-2) reflect VPN-IPv4 internal routes within the autonomous system. The autonomous systems' border edge routers (ASBR1 and ASBR2) advertise the VPN-IPv4 external routes.
- Step 3** The EBGp border edge router (ASBR1) redistributes the route to the next autonomous system (ASBR2). ASBR1 specifies its own address as the value of the EBGp next-hop attribute and assigns a new label. The address ensures the following:
- That the next-hop router is always reachable in the service provider (P) backbone network.
 - That the label assigned by the distributing router is properly interpreted. (The label associated with a route must be assigned by the corresponding next-hop router.)
- Step 4** The EBGp border edge router (ASBR2) redistributes the route in one of the following ways, depending on its configuration:
- If the IBGP neighbors are configured with the **neighbor next-hop-self** command, ASBR2 changes the next-hop address of updates received from the EBGp peer, then forwards it.
 - If the IBGP neighbors are not configured with the **neighbor next-hop-self** command, the next-hop address does not get changed. ASBR2 must propagate a host route for the EBGp peer through the IGP. To propagate the EBGp VPN-IPv4 neighbor host route, use the **redistribute connected subnets** command. The EBGp VPN-IPv4 neighbor host route is automatically installed in the routing table when the neighbor comes up. This is essential to establish the label switched path between PE routers in different autonomous systems.
-

Exchange of VPN Routing Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

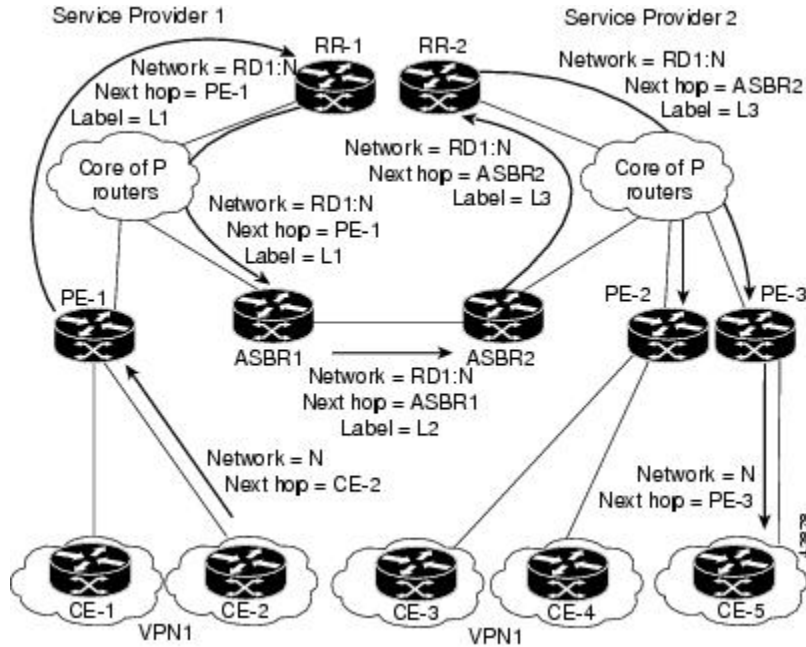

Autonomous systems exchange VPN routing information (routes and labels) to establish connections. To control connections between autonomous systems, the PE routers and EBGp border edge routers maintain a Label Forwarding Information Base (LFIB). The LFIB manages the labels and routes that the PE routers and EBGp border edge routers receive during the exchange of VPN information.

The figure below illustrates the exchange of VPN route and label information between autonomous systems. The autonomous systems use the following conditions to exchange VPN routing information:

- Routing information includes:
 - The destination network (N)
 - The next-hop field associated with the distributing router
 - A local MPLS label (L)
- An RD1: route distinguisher is part of a destination network address. It makes the VPN-IPv4 route globally unique in the VPN service provider environment.

- The ASBRs are configured to change the next-hop (next hop-self) when sending VPN-IPv4 NLRI to the IBGP neighbors. Therefore, the ASBRs must allocate a new label when they forward the NLRI to the IBGP neighbors.

Figure 2 *Exchanging Routes and Labels Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses*

The figure below illustrates the exchange of VPN route and label information between autonomous systems. The only difference is that ASBR2 is configured with the **redistribute connected** command,

which propagates the host routes to all PEs. The **redistribute connected** command is necessary because ASBR2 is not configured to change the next-hop address.

Figure 3 Exchanging Routes and Labels with the **redistribute connected** Command in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Packet Forwarding Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses

The figure below illustrates how packets are forwarded between autonomous systems in an interprovider network using the following packet forwarding method.

Packets are forwarded to their destination by means of MPLS. Packets use the routing information stored in the LFIB of each PE router and EBGp border edge router.

The service provider VPN backbone uses dynamic label switching to forward labels.

Each autonomous system uses standard multilevel labeling to forward packets between the edges of the autonomous system routers (for example, from CE-5 to PE-3). Between autonomous systems, only a single level of labeling is used, corresponding to the advertised route.

A data packet carries two levels of labels when traversing the VPN backbone:

- The first label (IGP route label) directs the packet to the correct PE router or EBGp border edge router. (For example, the IGP label of ASBR2 points to the ASBR2 border edge router.)

- The second label (VPN route label) directs the packet to the appropriate PE router or EBGP border edge router.

Figure 4 Forwarding Packets Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses

The figure below shows the same packet forwarding method as described in the figure above, except the EBGP router (ASBR1) forwards the packet without reassigning it a new label.

Figure 5 Forwarding Packets Without a New Label Assignment Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses

Use of a Confederation for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

A confederation is multiple subautonomous systems grouped together. A confederation reduces the total number of peer devices in an autonomous system. A confederation divides an autonomous system into subautonomous systems and assigns a confederation identifier to the autonomous systems. A VPN can span service providers running in separate autonomous systems or in multiple subautonomous systems that form a confederation.

In a confederation, each subautonomous system is fully meshed with other subautonomous systems. The subautonomous systems communicate using an IGP, such as Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS). Each subautonomous system also has an EBGP connection to the other subautonomous systems. The confederation EBGP (CEBGP) border edge routers forward next-hop-self addresses between the specified subautonomous systems. The next-hop-self address forces the BGP to use a specified address as the next hop rather than letting the protocol choose the next hop.

You can configure a confederation with separate subautonomous systems in either of two ways:

- You can configure a router to forward next-hop-self addresses between only the CEBGP border edge routers (both directions). The subautonomous systems (IBGP peers) at the subautonomous system border do not forward the next-hop-self address. Each subautonomous system runs as a single IGP domain. However, the CEBGP border edge router addresses are known in the IGP domains.
- You can configure a router to forward next-hop-self addresses between the CEBGP border edge routers (both directions) and within the IBGP peers at the subautonomous system border. Each subautonomous system runs as a single IGP domain but also forwards next-hop-self addresses between the PE routers in the domain. The CEBGP border edge router addresses are known in the IGP domains.

Note

The figures above illustrate how two autonomous systems exchange routes and forward packets. Subautonomous systems in a confederation use a similar method of exchanging routes and forwarding packets.

The figure below illustrates a typical MPLS VPN confederation configuration. In this confederation configuration:

- The two CEBGP border edge routers exchange VPN-IPv4 addresses with labels between the two subautonomous systems.
- The distributing router changes the next-hop addresses and labels and uses a next-hop-self address.

- IGP-1 and IGP-2 know the addresses of CEBGP-1 and CEBGP-2.

Figure 6 *EBGP Connection Between Two Subautonomous Systems in a Confederation*

In this confederation configuration:

- CEBGP border edge routers function as neighboring peers between the subautonomous systems. The subautonomous systems use EBGP to exchange route information.
- Each CEBGP border edge router (CEBGP-1, CEBGP-2) assigns a label for the route before distributing the route to the next subautonomous system. The CEBGP border edge router distributes the route as a VPN-IPv4 address by using the multiprotocol extensions of BGP. The label and the VPN identifier are encoded as part of the NLRI.
- Each PE and CEBGP border edge router assigns its own label to each VPN-IPv4 address prefix before redistributing the routes. The CEBGP border edge routers exchange VPN-IPv4 addresses with the labels. The next-hop-self address is included in the label (as the value of the EBGP next-hop attribute). Within the subautonomous systems, the CEBGP border edge router address is distributed throughout the IGP neighbors, and the two CEBGP border edge routers are known to both confederations.

How to Configure MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

- [Configuring the ASBRs to Exchange VPN-IPv4 Addresses, page 12](#)
- [Configuring EBGP Routing to Exchange VPN Routes Between Subautonomous Systems in a Confederation, page 13](#)
- [Verifying Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 16](#)

Configuring the ASBRs to Exchange VPN-IPv4 Addresses

To configure an EBGP ASBR to exchange VPN-IPv4 routes with another autonomous system, perform this task.

Note

Issue the **redistribute connected subnets** command in the IGP configuration portion of the router to propagate host routes for VPN-IPv4 EBGP neighbors to other routers and provider edge routers. Alternatively, you can specify the next-hop-self address when you configure IBGP neighbors.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default route-target filter**
5. **address-family vpnv5 [unicast]**
6. **neighbor** *peer-group-name* **remote-as** *as-number*
7. **neighbor** *peer-group-name* **activate**
8. **exit-address-family**
9. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3 router bgp <i>as-number</i> Example: Router(config)# router bgp 1	Creates an EBGP routing process and assigns it an autonomous system number. <ul style="list-style-type: none"> • The autonomous system number is passed along and identifies the router to EBGP routers in another autonomous system.

Command or Action	Purpose
<p>Step 4 <code>no bgp default route-target filter</code></p> <p>Example:</p> <pre>Router(config)# no bgp default route-target filter</pre>	<p>Disables BGP route-target filtering and places the router in configuration mode.</p> <ul style="list-style-type: none"> All received BGP VPN-IPv4 routes are accepted by the router.
<p>Step 5 <code>address-family vpnv5 [unicast]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family vpnv4</pre>	<p>Configures a routing session to carry VPNv4 addresses across the VPN backbone and places the router in address family configuration mode.</p> <ul style="list-style-type: none"> Each address has been made globally unique by the addition of an 8-byte route distinguisher (RD). The unicast keyword specifies a unicast prefix.
<p>Step 6 <code>neighbor peer-group-name remote-as as-number</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 1 remote-as 2</pre>	<p>Enters the address family configuration mode and specifies a neighboring EBGW peer group.</p> <ul style="list-style-type: none"> This EBGW peer group is identified to the specified autonomous system.
<p>Step 7 <code>neighbor peer-group-name activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 1 activate</pre>	<p>Activates the advertisement of the VPNv4 address family to a neighboring EBGW router.</p>
<p>Step 8 <code>exit-address-family</code></p> <p>Example:</p> <pre>Router(config-router-af)# exit-address-family</pre>	<p>Exits from the address family submode of the router configuration mode.</p>
<p>Step 9 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring EBGW Routing to Exchange VPN Routes Between Subautonomous Systems in a Confederation

Perform this task to configure EBGW routing to exchange VPN routes between subautonomous systems in a confederation.

**Note**

To ensure that the host routes for VPN-IPv4 EBGP neighbors are propagated (by means of the IGP) to the other routers and provider edge routers, specify the **redistribute connected** command in the IGP configuration portion of the CEBGP router. If you are using OSPF, make sure that the OSPF process is not enabled on the CEBGP interface where the “redistribute connected” subnet exists.

**Note**

In this confederation, subautonomous system IGP domains must know the addresses of CEBGP-1 and CEBGP-2. If you do not specify a next-hop-self address as part of the router configuration, ensure that the addresses of all PE routers in the subautonomous system are distributed throughout the network, not just the addresses of CEBGP-1 and CEBGP-2.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *sub-autonomous-system*
4. **bgp confederation identifier** *as-number*
5. **bgp confederation peers** *sub-autonomous-system*
6. **no bgp default route-target filter**
7. **address-family vpnv4** [*unicast*]
8. **neighbor** *peer-group-name* **remote-as** *as-number*
9. **neighbor** *peer-group-name* **next-hop-self**
10. **neighbor** *peer-group-name* **activate**
11. **exit-address-family**
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<p>router bgp <i>sub-autonomous-system</i></p> <p>Example:</p> <pre>Router(config)# router bgp 2</pre>	<p>Creates an EBGP routing process and assigns it an autonomous system number and enters the router in configuration mode.</p> <ul style="list-style-type: none"> The subautonomous system number is passed along to identify the router to EBGP routers in other subautonomous systems.
Step 4	<p>bgp confederation identifier <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# bgp confederation identifier 100</pre>	<p>Defines an EBGP confederation by specifying a confederation identifier associated with each subautonomous system.</p> <ul style="list-style-type: none"> The subautonomous systems appear as a single autonomous system.
Step 5	<p>bgp confederation peers <i>sub-autonomous-system</i></p> <p>Example:</p> <pre>Router(config-router)# bgp confederation peers 1</pre>	<p>Specifies the subautonomous systems that belong to the confederation (identifies neighbors of other subautonomous systems within the confederation as special EBGP peers).</p>
Step 6	<p>no bgp default route-target filter</p> <p>Example:</p> <pre>Router(config-router)# no bgp default route-target filter</pre>	<p>Disables BGP route-target community filtering. All received BGP VPN-IPv4 routes are accepted by the router.</p>
Step 7	<p>address-family vpnv4 [unicast]</p> <p>Example:</p> <pre>Router(config-router)# address-family vpnv4</pre>	<p>Configures a routing session to carry VPNv4 addresses across the VPN backbone. Each address is made globally unique by the addition of an 8-byte RD. Enters address family configuration mode.</p> <ul style="list-style-type: none"> The unicast keyword specifies a unicast prefix.
Step 8	<p>neighbor peer-group-name remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 1 remote-as 1</pre>	<p>Enters the address family configuration mode and specifies a neighboring EBGP peer group.</p> <ul style="list-style-type: none"> This EBGP peer group is identified to the specified subautonomous system.

Command or Action	Purpose
<p>Step 9 <code>neighbor peer-group-name next-hop-self</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 1 next-hop-self</pre>	<p>Advertises the router as the next hop for the specified neighbor.</p> <ul style="list-style-type: none"> If a next-hop-self address is specified as part of the router configuration, the redistribute connected command need not be used.
<p>Step 10 <code>neighbor peer-group-name activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor R activate</pre>	<p>Activates the advertisement of the VPNv4 address family to a neighboring PE router in the specified subautonomous system.</p>
<p>Step 11 <code>exit-address-family</code></p> <p>Example:</p> <pre>Router(config-router-af)# exit-address- family</pre>	<p>Exits from the address family submode of the router configuration mode.</p>
<p>Step 12 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Verifying Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Perform this task to display the VPN-IPv4 LFIB entries.

SUMMARY STEPS

- `enable`
- `show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]`
- `show mpls forwarding-table [network {mask | length} | labels label [-label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]`
- `disable`

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [summary] [labels]</code></p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all labels</pre>	<p>Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the all and labels keywords to display information about all VPNv4 labels.
<p>Step 3 <code>show mpls forwarding-table [network {mask length} labels label [-label] interface interface next-hop address lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>Displays the contents of the MPLS LFIB (such as VPNv4 prefix/length and BGP next-hop destination for the route).</p>
<p>Step 4 <code>disable</code></p> <p>Example:</p> <pre>Router# disable</pre>	<p>Exits to user EXEC mode.</p>

Examples

The sample output from the `show mpls forwarding-table` command shows how the VPN-IPv4 LFIB entries appear:

```
Router# show mpls forwarding-table
Local Outgoing Prefix Bytes tag Outgoing Next Hop
tag tag or VC or Tunnel Id switched interface
33 33 10.120.4.0/24 0 Hs0/0 point2point
35 27 100:12:10.200.0.1/32 \
0 Hs0/0 point2point
```

In this example, the Prefix field appears as a VPN-IPv4 RD, plus the prefix. If the value is longer than the width of the Prefix column (as illustrated in the last line of the example), the output automatically wraps onto the next line in the forwarding table, preserving column alignment.

Configuration Examples for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Configuring MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses Example

The network topology in the figure below shows two autonomous systems, which are configured as follows:

- Autonomous system 1 (AS1) includes PE1, P1, and EBGP1. The IGP is OSPF.
- Autonomous system 2 (AS2) includes PE2, P2, and EBGP2. The IGP is IS-IS.
- CE1 and CE2 belong to the same VPN, which is called VPN1.
- The P routers are route reflectors.
- EBGP1 is configured with the **redistribute connected subnets** command.
- EBGP2 is configured with the **neighbor next-hop-self** command.

Configuring MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses in a Confederation Example

The network topology in the figure below shows a single internet service provider, which is partitioning the backbone with confederations. The autonomous system number of the provider is 100. The two autonomous systems run their own IGPs and are configured as follows:

- Autonomous system 1 (AS1) includes PE1, P1, ASBR1. The IGP is OSPF.
- Autonomous system 2 (AS2) includes PE2, P2, ASBR2. The IGP is IS-IS.
- CE1 and CE2 belong to the same VPN, which is called VPN1.
- The P routers are route reflectors.
- ASBR1 is configured with the **redistribute connected subnets** command.
- ASBR2 is configured with the **neighbor next-hop-self** command.

Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 2 Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Feature Name	Releases	Feature Information
MPLS VPN--Interautonomous System Support	12.1(5)T 12.0(16)ST 12.0(17)ST 12.0(22)S	<p>This feature enables an MPLS VPN to span service providers and autonomous systems. This feature explains how to configuring the Inter-AS using the ASBRs to exchange VPN-IPv4 Addresses.</p> <p>This feature uses no new or modified commands.</p>

MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels feature allows a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) to span service providers and autonomous systems. This module explains how to configure an MPLS VPN Inter-AS network so that the Autonomous System Boundary Routers (ASBRs) exchange IPv4 routes with MPLS labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPN-IPv4 routes by using multihop, multiprotocol, external Border Gateway Protocol (eBGP).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The network must be properly configured for MPLS VPN operation before you configure MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels.

Restrictions for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

- For networks configured with eBGP multihop, you must configure a label switched path (LSP) between nonadjacent routers.
- The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding or distributed Cisco Express Forwarding and MPLS.

Information About MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

- [MPLS VPN Inter-AS Introduction, page 3](#)
- [Benefits of MPLS VPN Inter-AS, page 3](#)
- [Information About Using MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels, page 38](#)
- [Benefits of MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels, page 38](#)
- [How the Inter-AS Works When ASBRs Exchange IPv4 Routes with MPLS Labels, page 39](#)

MPLS VPN Inter-AS Introduction

An autonomous system is a single network or group of networks that is controlled by a common system administration group and that uses a single, clearly defined routing protocol.

As VPNs grow, their requirements expand. In some cases, VPNs need to reside on different autonomous systems in different geographic areas. Also, some VPNs need to extend across multiple service providers

(overlapping VPNs). Regardless of the complexity and location of the VPNs, the connection between autonomous systems must be seamless to the customer.

Benefits of MPLS VPN Inter-AS

An MPLS VPN Inter-AS provides the following benefits:

- Allows a VPN to cross more than one service provider backbone: Service providers running separate autonomous systems can jointly offer MPLS VPN services to the same customer. A VPN can begin at one customer site and traverse different VPN service provider backbones before arriving at another site of the same customer. Previously, MPLS VPN could traverse only a single BGP autonomous system service provider backbone. This feature allows multiple autonomous systems to form a continuous (and seamless) network between customer sites of a service provider.
- Allows a VPN to exist in different areas: A service provider can create a VPN in different geographic areas. Having all VPN traffic flow through one point (between the areas) allows for better rate control of network traffic between the areas.
- Allows confederations to optimize IBGP meshing: Internal Border Gateway Protocol (IBGP) meshing in an autonomous system is more organized and manageable. An autonomous system can be divided into multiple, separate subautonomous systems and then classify them into a single confederation (even though the entire VPN backbone appears as a single autonomous system). This capability allows a service provider to offer MPLS VPNs across the confederation because it supports the exchange of labeled VPN-IPv4 NLRI between the subautonomous systems that form the confederation.

Information About Using MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

This feature can configure a MPLS VPN Inter-AS network so that the ASBRs exchange IPv4 routes with MPLS labels of the PE routers. RRs exchange VPN-IPv4 routes by using multiprotocol, multiprotocol, External Border Gateway Protocol (eBGP). This method of configuring the Inter-AS system is often called MPLS VPN Inter-AS--IPv4 BGP Label Distribution.

Benefits of MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

An Inter-AS system can be configured so that the ASBRs exchange the IPv4 routes and MPLS labels has the following benefits:

- Saves the ASBRs from having to store all the VPN-IPv4 routes. Using the route reflectors to store the VPN-IPv4 routes and forward them to the PE routers results in improved scalability compared with configurations where the ASBR holds all of the VPN-IPv4 routes and forwards the routes based on VPN-IPv4 labels.
- Simplifies the configuration at the border of the network by having the route reflectors hold the VPN-IPv4 routes.
- Enables a non-VPN core network to act as a transit network for VPN traffic. You can transport IPv4 routes with MPLS labels over a non-MPLS VPN service provider.
- Eliminates the need for any other label distribution protocol between adjacent LSRs. If two adjacent label switch routers (LSRs) are also BGP peers, BGP can handle the distribution of the MPLS labels. No other label distribution protocol is needed between the two LSRs.

How the Inter-AS Works When ASBRs Exchange IPv4 Routes with MPLS Labels

A VPN service provider network to exchange IPv4 routes with MPLS labels can be configured. The VPN service provider network can be configured as follows:

- Route reflectors exchange VPN-IPv4 routes by using multihop, multiprotocol eBGP. This configuration also preserves the next-hop information and the VPN labels across the autonomous systems.
- A local PE router (for example, PE1 in the figure below) needs to know the routes and label information for the remote PE router (PE2). This information can be exchanged between the PE routers and ASBRs in one of two ways:
 - Internal Gateway Protocol (IGP) and Label Distribution Protocol (LDP): The ASBR can redistribute the IPv4 routes and MPLS labels it learned from eBGP into IGP and LDP and vice versa.
 - Internal Border Gateway Protocol (iBGP) IPv4 label distribution: The ASBR and PE router can use direct iBGP sessions to exchange VPN-IPv4 and IPv4 routes and MPLS labels.

Alternatively, the route reflector can reflect the IPv4 routes and MPLS labels learned from the ASBR to the PE routers in the VPN. This is accomplished by the ASBR exchanging IPv4 routes and MPLS labels with the route reflector. The route reflector also reflects the VPN-IPv4 routes to the PE routers in the VPN. For example, in VPN1 of the figure below, RR1 reflects to PE1 the VPN-IPv4 routes it learned and IPv4 routes and MPLS labels learned from ASBR1. Using the route reflectors to store the VPN-IPv4 routes and forward them through the PE routers and ASBRs allows for a scalable configuration.

- [BGP Routing Information, page 39](#)
- [Types of BGP Messages and MPLS Labels, page 40](#)
- [How BGP Sends MPLS Labels with Routes, page 40](#)

BGP Routing Information

BGP routing information includes the following items:

- A network number (prefix), which is the IP address of the destination.
- Autonomous system path, which is a list of the other autonomous systems through which a route passes on its way to the local router. The first autonomous system in the list is closest to the local

router; the last autonomous system in the list is farthest from the local router and usually the autonomous system where the route began.

- Path attributes, which provide other information about the autonomous system path, for example, the next hop.

Types of BGP Messages and MPLS Labels

MPLS labels are included in the update messages that a router sends. Routers exchange the following types of BGP messages:

- Keepalive messages--Routers exchange keepalive messages to determine if a neighboring router is still available to exchange routing information. The router sends these messages at regular intervals. (Sixty seconds is the default for Cisco routers.) The keepalive message does not contain routing data; it contains only a message header.
- Notification messages--When a router detects an error, it sends a notification message.
- Open messages--After a router establishes a TCP connection with a neighboring router, the routers exchange open messages. This message contains the number of the autonomous system to which the router belongs and the IP address of the router that sent the message.
- Update messages--When a router has a new, changed, or broken route, it sends an update message to the neighboring router. This message contains the NLRI, which lists the IP addresses of the usable routes. The update message includes any routes that are no longer usable. The update message also includes path attributes and the lengths of both the usable and unusable paths. Labels for VPN-IPv4 routes are encoded in the update message as specified in RFC 2858. The labels for the IPv4 routes are encoded in the update message as specified in RFC 3107.

How BGP Sends MPLS Labels with Routes

When BGP (eBGP and iBGP) distributes a route, it can also distribute an MPLS label that is mapped to that route. The MPLS label mapping information for the route is carried in the BGP update message that contains the information about the route. If the next hop is not changed, the label is preserved.

When you issue the **neighbor send-label** command on both BGP routers, the routers advertise to each other that they can then send MPLS labels with the routes. If the routers successfully negotiate their ability to send MPLS labels, the routers add MPLS labels to all outgoing BGP updates.

How to Configure MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

To configure MPLS VPN Inter-AS with ASBRs exchanging IPv4 routes and MPLS labels, perform the tasks in the following sections:

The figure below shows the following sample configuration:

- The configuration consists of two VPNs.
- The ASBRs exchange the IPv4 routes with MPLS labels.
- The route reflectors exchange the VPN-IPv4 routes using multihop MPLS eBGP.
- The route reflectors reflect the IPv4 and VPN-IPv4 routes to the other routers in their autonomous system.

- [Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels, page 41](#)
- [Configuring the Route Reflectors to Exchange VPN-IPv4 Routes, page 43](#)
- [Configuring the Route Reflector to Reflect Remote Routes in Its Autonomous System, page 45](#)
- [Verifying the MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels Configuration, page 48](#)

Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels

Perform this task to configure the ASBRs to exchange IPv4 routes and MPLS labels. This configuration procedure uses ASBR1 as an example.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *as-number***
4. **neighbor {*ip-address* | *peer-group-name*} remote-as *as-number***
5. **address-family ipv4 [*multicast* | *unicast* | *mdt* | *vrf vrf-name*]**
6. **neighbor {*ip-address* | *peer-group-name*} activate**
7. **neighbor *ip-address* send-label**
8. **exit-address-family**
9. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

Command or Action	Purpose
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	Enters global configuration mode.
<p>Step 3 <code>router bgp as-number</code></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
<p>Step 4 <code>neighbor {ip-address peer-group-name} remote-as as-number</code></p> <p>Example:</p> <pre>Router(config-router)# neighbor hh.0.0.1 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 5 <code>address-family ipv4 [multicast unicast mdt vrf vrf-name]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4</pre>	<p>Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The mdt keyword specifies an IPv4 multicast distribution tree (MDT) address family session. The vrf vrf-name keyword and argument specify the name of the VPN routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands.
<p>Step 6 <code>neighbor {ip-address peer-group-name} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor hh.0.0.1 activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 7 <code>neighbor ip-address send-label</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor hh.0.0.1 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.

Command or Action	Purpose
Step 8 <code>exit-address-family</code> Example: <pre>Router(config-router-af)# exit-address-family</pre>	Exits address family configuration mode.
Step 9 <code>end</code> Example: <pre>Router(config-router-af)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring the Route Reflectors to Exchange VPN-IPv4 Routes

Perform this task to enable the route reflectors to exchange VPN-IPv4 routes by using multihop, multiprotocol eBGP.

This procedure also specifies that the next hop information and the VPN label are to be preserved across the autonomous systems. This procedure uses RR1 as an example of the route reflector.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `neighbor {ip-address | peer-group-name} remote-as as-number`
5. `neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]`
6. `address-family vpnv4 [unicast]`
7. `neighbor {ip-address | peer-group-name} activate`
8. `neighbor {ip-address | peer-group-name} next-hop unchanged`
9. `exit-address-family`
10. `end`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535. <p>The autonomous system number identifies RR1 to routers in other autonomous systems.</p>
Step 4	neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i> Example: <pre>Router(config-router)# neighbor bb.bb.bb.bb remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	neighbor {<i>ip-address</i> <i>peer-group-name</i>} ebgp-multihop [<i>ttl</i>] Example: <pre>Router(config-router)# neighbor bb.bb.bb.bb ebgp-multihop 255</pre>	<p>Accepts and attempts BGP connections to external peers residing on networks that are not directly connected.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>ttl</i> argument specifies the time-to-live in the range from 1 to 255 hops.
Step 6	address-family vpnv4 [unicast] Example: <pre>Router(config-router)# address- family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.

	Command or Action	Purpose
Step 7	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor bb.bb.bb.bb activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 8	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} next-hop unchanged</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ip-address next-hop unchanged</pre>	<p>Enables an eBGP multihop peer to propagate the next hop unchanged.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the next hop. The <i>peer-group-name</i> argument specifies the name of a BGP peer group that is the next hop.
Step 9	<p>exit-address-family</p> <p>Example:</p> <pre>Router(config-router-af)# exit- address-family</pre>	<p>Exits address family configuration mode.</p>
Step 10	<p>end</p> <p>Example:</p> <pre>Router(config-router)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Configuring the Route Reflector to Reflect Remote Routes in Its Autonomous System

Perform this task to enable the RR to reflect the IPv4 routes and labels learned by the ASBR to the PE routers in the autonomous system.

This is accomplished by making the ASBR and PE router route reflector clients of the RR. This procedure also explains how to enable the RR to reflect the VPN-IPv4 routes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** {*ip-address* | *peer-group-name*} **activate**
6. **neighbor** *ip-address* **route-reflector-client**
7. **neighbor** *ip-address* **send-label**
8. **exit-address-family**
9. **address-family vpnv4** [**unicast**]
10. **neighbor** {*ip-address* | *peer-group-name*} **activate**
11. **neighbor** *ip-address* **route-reflector-client**
12. **exit-address-family**
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 100	Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

	Command or Action	Purpose
Step 4	<p>address-family ipv4 [multicast unicast vrf <i>vrf-name</i>]</p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard IPv4 address prefixes.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The vrf <i>vrf-name</i> keyword and argument specify the name of the VRF instance to associate with subsequent IPv4 address family configuration mode commands.
Step 5	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i> activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ee.ee.ee.ee activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 6	<p>neighbor <i>ip-address</i> route-reflector-client</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ee.ee.ee.ees route-reflector-client</pre>	<p>Configures the router as a BGP route reflector and configures the specified neighbor as its client.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP neighbor being configured as a client.
Step 7	<p>neighbor <i>ip-address</i> send-label</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ee.ee.ee.ee send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.
Step 8	<p>exit-address-family</p> <p>Example:</p> <pre>Router(config-router-af)# exit-address- family</pre>	<p>Exits address family configuration mode.</p>
Step 9	<p>address-family vpnv4 [unicast]</p> <p>Example:</p> <pre>Router(config-router)# address-family vpn4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.

Command or Action	Purpose
<p>Step 10 <code>neighbor {ip-address peer-group-name} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ee.ee.ee.ee activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 11 <code>neighbor ip-address route-reflector-client</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ee.ee.ee.ee route-reflector-client</pre>	<p>Enables the RR to pass iBGP routes to the neighboring router.</p>
<p>Step 12 <code>exit-address-family</code></p> <p>Example:</p> <pre>Router(config-router-af)# exit-address-family</pre>	<p>Exits address family configuration mode.</p>
<p>Step 13 <code>end</code></p> <p>Example:</p> <pre>Router(config-router-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Verifying the MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels Configuration

If you use ASBRs to distribute the IPv4 labels and route reflectors to distribute the VPN-IPv4 routes, use the following procedures to help verify the configuration:

The figure below shows the configuration that is referred to in the next several sections.

- [Verifying the Route Reflector Configuration, page 49](#)
- [Verifying that CE1 Can Communicate with CE2, page 50](#)
- [Verifying that PE1 Can Communicate with CE2, page 51](#)
- [Verifying that PE2 Can Communicate with CE2, page 53](#)
- [Verifying the ASBR Configuration, page 54](#)

Verifying the Route Reflector Configuration

Perform this task to verify the route reflector configuration.

SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name } [summary] [labels]**
3. **disable**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

Command or Action	Purpose
<p>Step 2 <code>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name } [summary] [labels]</code></p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all summary</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the all and summary keywords to verify that a multihop, multiprotocol eBGP session exists between the route reflectors and that the VPNv4 routes are being exchanged between the route reflectors. <p>The last two lines of the command output show the following information:</p> <ul style="list-style-type: none"> Prefixes are being learned from PE1 and then passed to RR2. Prefixes are being learned from RR2 and then passed to PE1. Use the all and labels keywords to verify that the route reflectors exchange VPNv4 label information.
<p>Step 3 <code>disable</code></p> <p>Example:</p> <pre>Router# disable</pre>	<p>(Optional) Exits to user EXEC mode.</p>

Verifying that CE1 Can Communicate with CE2

Perform this task to verify that router CE1 has NLRI for router CE2.

SUMMARY STEPS

- enable**
- show ip route** [*ip-address* [*mask*] [**longer-prefixes**]] | [**protocol** [*protocol-id*]] | [**list** [*access-list-number* | *access-list-name*]]
- disable**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>show ip route</code> [<i>ip-address</i> [<i>mask</i>] [longer-prefixes]] [protocol [<i>protocol-id</i>]] [list [<i>access-list-number</i> <i>access-list-name</i>]]</p> <p>Example:</p> <pre>Router# show ip route nn.nn.nn.nn</pre>	<p>Displays the current state of the routing table.</p> <ul style="list-style-type: none"> Use the <i>ip-address</i> argument to verify that CE1 has a route to CE2. Use this command to verify the routes learned by CE1. Make sure that the route for CE2 is listed.

Command or Action	Purpose
Step 3 <code>disable</code> Example: Router# <code>disable</code>	(Optional) Exits to privileged EXEC mode.

Verifying that PE1 Can Communicate with CE2

Perform this task to verify that router PE1 has NLRI for router CE2.

SUMMARY STEPS

1. `enable`
2. `show ip route vrf vrf-name [connected] [protocol [as-number] [tag] [output-modifiers]] [list number [output-modifiers]] [profile] [static []] [summary output-modifiers]] [supernets-only [output-modifiers]] [traffic-engineering [output-modifiers]]`
3. `show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [ip-prefix | length [longer-prefixes] [output-modifiers]] [network-address mask] longer-prefixes [output-modifiers]] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [tags]`
4. `show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]`
5. `show mpls forwarding-table [{network {mask | length} | labels label [-label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]]] [detail]`
6. `show ip bgp [network] [network-mask] [longer-prefixes]`
7. `show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]`
8. `disable`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: Router> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

Command or Action	Purpose
<p>Step 2 <code>show ip route vrf vrf-name [connected] [protocol [as-number] [tag] [output-modifiers]] [list number [output-modifiers]] [profile] [static []] [summaryoutput-modifiers]] [supernets-only [output-modifiers]] [traffic-engineering [output-modifiers]]</code></p> <p>Example:</p> <pre>Router# show ip route vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays the IP routing table associated with a VRF.</p> <ul style="list-style-type: none"> Use this command to verify that router PE1 learns routes from router CE2 (nn.nn.nn.nn).
<p>Step 3 <code>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [ip-prefix length [longer-prefixes] [output-modifiers]] [network-address mask] longer-prefixes [output-modifiers]] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [tags]</code></p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 vrf vpn1 nn.nn.nn.nn</pre> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all nn.nn.nn.nn</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the <code>vrf</code> or <code>all</code> keyword to verify that router PE2 is the BGP next-hop to router CE2.
<p>Step 4 <code>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</code></p> <p>Example:</p> <pre>Router# show ip cef vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays entries in the Forwarding Information Base (FIB) or displays a summary of the FIB.</p> <ul style="list-style-type: none"> Use this command to verify that the Cisco Express Forwarding entries are correct.
<p>Step 5 <code>show mpls forwarding-table [{network {mask length} labels label [-label] interface interface next-hop address lsp-tunnel [tunnel-id]]] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>(Optional) Displays the contents of the MPLS LFIB.</p> <ul style="list-style-type: none"> Use this command to verify the IGP label for the BGP next hop router (autonomous system boundary).

Command or Action	Purpose
Step 6 <code>show ip bgp [network] [network-mask] [longer-prefixes]</code> Example: <pre>Router# show ip bgp ff.ff.ff.ff</pre>	(Optional) Displays entries in the BGP routing table. <ul style="list-style-type: none"> Use the show ip bgp command to verify the label for the remote egress PE router (PE2).
Step 7 <code>show ip bgp vpnv4 { all rd route-distinguisher vrf vrf-name } [summary] [labels]</code> Example: <pre>Router# show ip bgp vpnv4 all labels</pre>	(Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> Use the all and summary keywords to verify the VPN label of CE2, as advertised by PE2.
Step 8 <code>disable</code> Example: <pre>Router# disable</pre>	(Optional) Exits to user EXEC mode.

Verifying that PE2 Can Communicate with CE2

Perform this task to ensure that PE2 can access CE2.

SUMMARY STEPS

- `enable`
- `show ip route vrf vrf-name [connected] [protocol [as-number] [tag] [output-modifiers]] [list number [output-modifiers]] [profile] [static [output-modifiers]] [summary[output-modifiers]] [supernets-only [output-modifiers]] [traffic-engineering [output-modifiers]]`
- `show mpls forwarding-table [vrf vrf-name] [{network {mask | length} | labels label [-label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]]] [detail]`
- `show ip bgp vpnv4 { all | rd route-distinguisher | vrf vrf-name } [summary] [labels]`
- `show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]`
- `disable`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.

Command or Action	Purpose
<p>Step 2 <code>show ip route vrf vrf-name [connected] [protocol [as-number] [tag] [output-modifiers]] [list number [output-modifiers]] [profile] [static [output-modifiers]] [summary[output-modifiers]] [supernets-only [output-modifiers]] [traffic-engineering [output-modifiers]]</code></p> <p>Example:</p> <pre>Router# show ip route vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays the IP routing table associated with a VRF.</p> <ul style="list-style-type: none"> Use this command to check the VPN routing and forwarding table for CE2. The output provides next-hop information.
<p>Step 3 <code>show mpls forwarding-table [vrf vrf-name] [{network {mask length} labels label [-label] interface interface next-hop address lsp-tunnel [tunnel-id]}] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays the contents of the LFIB.</p> <ul style="list-style-type: none"> Use the vrf keyword to check the VPN routing and forwarding table for CE2. The output provides the label for CE2 and the outgoing interface.
<p>Step 4 <code>show ip bgp vpnv4 { all rd route-distinguisher vrf vrf-name } [summary] [labels]</code></p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all labels</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the all and labels keywords to check the VPN label for CE2 in the multiprotocol BGP table.
<p>Step 5 <code>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</code></p> <p>Example:</p> <pre>Router# show ip cef vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays entries in the FIB or displays a summary of the FIB.</p> <ul style="list-style-type: none"> Use this command to check the Cisco Express Forwarding entry for CE2. The command output shows the local label for CE2 and the outgoing interface.
<p>Step 6 <code>disable</code></p> <p>Example:</p> <pre>Router# disable</pre>	<p>(Optional) Exits to user EXEC mode.</p>

Verifying the ASBR Configuration

Perform this task to verify that the ASBRs exchange IPv4 routes with MPLS labels or IPv4 routes without labels as prescribed by a route map.

- [Verifying the ASBR Configuration , page 55](#)

Verifying the ASBR Configuration

SUMMARY STEPS

1. **enable**
2. **show ip bgp** [*network*] [*network-mask*] [**longer-prefixes**]
3. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
4. **disable**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 show ip bgp [<i>network</i>] [<i>network-mask</i>] [longer-prefixes]</p> <p>Example:</p> <pre>Router# show ip bgp ff.ff.ff.ff</pre>	<p>(Optional) Displays entries in the BGP routing table.</p> <ul style="list-style-type: none"> • Use this command to check that: <ul style="list-style-type: none"> ◦ ASBR1 receives an MPLS label for PE2 from ASBR2. ◦ ASBR1 receives IPv4 routes for RR2 without labels from ASBR2. ◦ ASBR2 distributes an MPLS label for PE2 to ASBR1. ◦ ASBR2 does not distribute a label for RR2 to ASBR1.
<p>Step 3 show ip cef [vrf <i>vrf-name</i>] [<i>network</i> [<i>mask</i>]] [longer-prefixes] [detail]</p> <p>Example:</p> <pre>Router# show ip cef ff.ff.ff.ff</pre> <p>Example:</p> <pre>Router# show ip cef bb.bb.bb.bb</pre>	<p>(Optional) Displays entries in the FIB or displays a summary of the FIB.</p> <ul style="list-style-type: none"> • Use this command from ASBR1 and ASBR2 to check that: <ul style="list-style-type: none"> ◦ The Cisco Express Forwarding entry for PE2 is correct. ◦ The Cisco Express Forwarding entry for RR2 is correct.
<p>Step 4 disable</p> <p>Example:</p> <pre>Router# disable</pre>	<p>(Optional) Exits to user EXEC mode.</p>

Configuration Examples for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

- [Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over an MPLS VPN Service Provider Examples, page 56](#)
- [Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over a Non-MPLS VPN Service Provider Examples, page 61](#)

Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over an MPLS VPN Service Provider Examples

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over an MPLS VPN service provider included in this section are as follows:

The figure below shows two MPLS VPN service providers. The service provider distributes the VPN-IPv4 routes between the route reflectors. The MPLS VPN service providers distribute the IPv4 routes with MPLS labels between the ASBRs.

The configuration example shows the following two techniques you can use to distribute the VPN-IPv4 routes and the IPv4 routes with MPLS labels of the remote RRs and PEs to the local RRs and PEs:

- Autonomous system 100 uses the RRs to distribute the VPN-IPv4 routes learned from the remote RRs. The RRs also distribute the remote PE address and label learned from ASBR1 using IPv4 labels.
- In Autonomous system 200, the IPv4 routes that ASBR2 learned are redistributed into IGP.

- [Route Reflector 1 Configuration Example \(MPLS VPN Service Provider\), page 56](#)
- [ASBR1 Configuration Example \(MPLS VPN Service Provider\), page 58](#)
- [Route Reflector 2 Configuration Example \(MPLS VPN Service Provider\), page 59](#)
- [ASBR2 Configuration Example \(MPLS VPN Service Provider\), page 59](#)

Route Reflector 1 Configuration Example (MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPN-IPv4 routes with RR2 using multiprotocol, multihop eBGP.
- The VPN-IPv4 next-hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
 - The VPN-IPv4 routes learned from RR2
 - The IPv4 routes and MPLS labels learned from ASBR1

Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over a Non-MPLS VPN Service Provider Examples

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over a non MPLS VPN service provider included in this section are as follows:

The figure below shows two MPLS VPN service providers that are connected through a non MPLS VPN service provider. The autonomous system in the middle of the network is configured as a backbone autonomous system that uses LDP or Tag Distribution Protocol (TDP) to distribute MPLS labels. Traffic engineering tunnels can also be used instead of TDP or LDP to build the LSP across the non MPLS VPN service provider.

- [Route Reflector 1 Configuration Example \(Non-MPLS VPN Service Provider\)](#), page 61

ASBR3 Configuration Example (Non-MPLS VPN Service Provider)

ASBR3 belongs to a non MPLS VPN service provider. ASBR3 exchanges IPv4 routes and MPLS labels with ASBR1. ASBR3 also passes the routes learned from ASBR1 to ASBR4 through RR3.

**Note**

Do not redistribute eBGP routes learned into iBGP if you are using iBGP to distribute the routes and labels. This is not a supported configuration.

Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 4 *Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels*

Feature Name	Releases	Feature Configuration Information
MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels	12.0(21)ST	This module explains how to configure an MPLS VPN Inter-AS network so that the ASBRs exchange IPv4 routes with MPLS labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPN-IPv4 routes by using multihop, multiprotocol, external Border Gateway Protocol (eBGP).

MPLS VPN Carrier Supporting Carrier Using LDP and an IGP

Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Carrier Supporting Carrier (CSC) enables one MPLS VPN-based service provider to allow other service providers to use a segment of its backbone network. This module explains how to configure the MPLS VPN CSC network using MPLS Label Distribution Protocol (LDP) to distribute MPLS labels and an Interior Gateway Protocol (IGP) to distribute routes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN CSC with LDP and IGP

- The provider edge (PE) routers of the backbone carrier require 128 MB of memory.
- The backbone carrier must enable the PE router to check that the packets it receives from the customer edge (CE) router contain only the labels that the PE router advertised to the CE router. This prevents data spoofing, which occurs when a packet from an unrecognized IP address is sent to a router.

Restrictions for MPLS VPN CSC with LDP and IGP

The following features are not supported with this feature:

- ATM MPLS
- Carrier supporting carrier traffic engineering
- Carrier supporting carrier quality of service (QoS)
- RSVP aggregation
- VPN Multicast between the customer carrier and the backbone carrier network

The following router platforms are supported on the edge of the MPLS VPN:

- Cisco 7200 series
- Cisco 7500 series
- Cisco 12000 series

See the table below for Cisco 12000 series line card support added for Cisco IOS releases.

Table 5 *Cisco12000 Series Line Card Support Added for Cisco IOS Releases*

Type	Line Cards	Cisco IOS Release Added

Information About MPLS VPN CSC with LDP and IGP

- [MPLS VPN CSC Introduction, page 75](#)
- [Benefits of Implementing MPLS VPN CSC, page 75](#)
- [Configuration Options for MPLS VPN CSC with LDP and IGP, page 76](#)
- [Customer Carrier Is a BGP MPLS VPN Service Provider, page 79](#)

MPLS VPN CSC Introduction

Carrier supporting carrier is where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

A backbone carrier offers Border Gateway Protocol and Multiprotocol Label Switching (BGP/MPLS) VPN services. The customer carrier can be either:

- An Internet service provider (ISP)
- A BGP/MPLS VPN service provider

Benefits of Implementing MPLS VPN CSC

The MPLS VPN CSC network provides the following benefits to service providers who are backbone carriers and to customer carriers.

Benefits to the Backbone Carrier

- The backbone carrier can accommodate many customer carriers and give them access to its backbone. The backbone carrier does not need to create and maintain separate backbones for its customer carriers. Using one backbone network to support multiple customer carriers simplifies the backbone carrier's VPN operations. The backbone carrier uses a consistent method for managing and maintaining the backbone network. This is also cheaper and more efficient than maintaining separate backbones.
- The MPLS VPN carrier supporting carrier feature is scalable. Carrier supporting carrier can change the VPN to meet changing bandwidth and connectivity needs. The feature can accommodate unplanned growth and changes. The carrier supporting carrier feature enables tens of thousands of VPNs to be set up over the same network, and it allows a service provider to offer both VPN and Internet services.
- The MPLS VPN carrier supporting carrier feature is a flexible solution. The backbone carrier can accommodate many types of customer carriers. The backbone carrier can accept customer carriers who

are ISPs or VPN service providers or both. The backbone carrier can accommodate customer carriers that require security and various bandwidths.

Benefits to the Customer Carriers

- The MPLS VPN carrier supporting carrier feature removes from the customer carrier the burden of configuring, operating, and maintaining its own backbone. The customer carrier uses the backbone network of a backbone carrier, but the backbone carrier is responsible for network maintenance and operation.
- Customer carriers who use the VPN services provided by the backbone carrier receive the same level of security that Frame Relay or ATM-based VPNs provide. Customer carriers can also use IPsec in their VPNs for a higher level of security; it is completely transparent to the backbone carrier.
- Customer carriers can use any link layer technology (SONET, DSL, Frame Relay, and so on) to connect the CE routers to the PE routers and the PE routers to the P routers. The MPLS VPN carrier supporting carrier feature is link layer independent. The CE routers and PE routers use IP to communicate, and the backbone carrier uses MPLS.
- The customer carrier can use any addressing scheme and still be supported by a backbone carrier. The customer address space and routing information are independent of the address space and routing information of other customer carriers or the backbone provider.

Configuration Options for MPLS VPN CSC with LDP and IGP

The backbone carrier offers BGP and MPLS VPN services. The customer carrier can be one of the two types of service providers described in the following sections, which explain how the backbone and customer carriers distribute IPv4 routes and MPLS labels.

- [Customer Carrier Is an ISP, page 76](#)

Customer Carrier Is an ISP

This section explains how a BGP/MPLS VPN service provider (backbone carrier) can provide a segment of its backbone network to a customer who is an ISP.

Consider the following example:

An ISP has two sites: one in California, the other in Maine. Each site is a point of presence (POP). The ISP wants to connect these sites using a VPN service provided by a backbone carrier. The figure below illustrates this situation.

Figure 9 Sample BGP/MPLS Backbone Carrier Supporting an ISP

Note

The CE routers in the figures are CE routers to the backbone carrier. However, they are PE routers to the customer carrier.

In this example, only the backbone carrier uses MPLS. The customer carrier (ISP) uses only IP. As a result, the backbone carrier must carry all the Internet routes of the customer carrier, which could be as many as 100,000 routes. This poses a scalability problem for the backbone carrier. To solve the scalability problem, the backbone carrier is configured as follows:

- The backbone carrier allows only internal routes of the customer carrier (IGP routes) to be exchanged between the CE routers of the customer carrier and the PE routers of the backbone carrier.
- MPLS is enabled on the interface between the CE router of the customer carrier and the PE router of the backbone carrier.

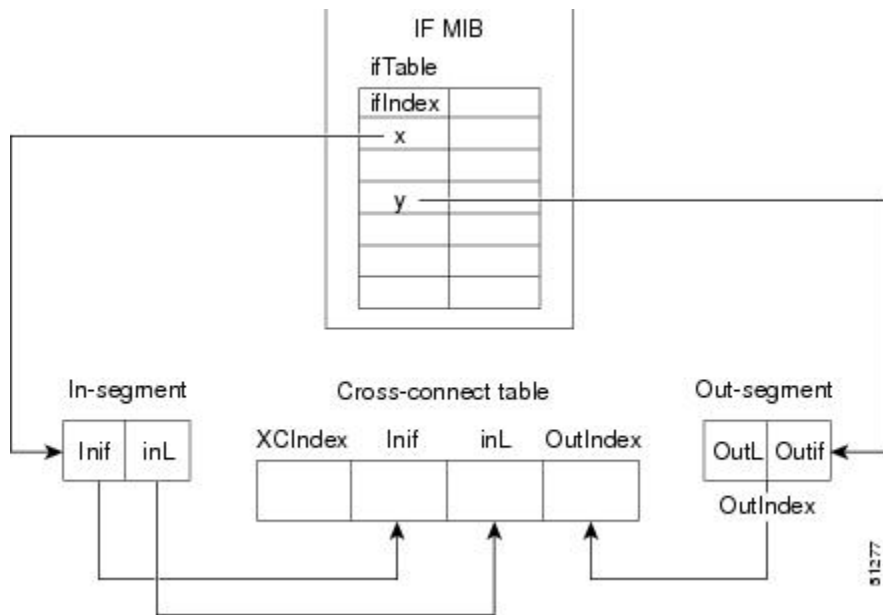

Internal and external routes are differentiated this way:

- Internal routes go to any of the routers within the ISP.
- External routes go to the Internet.

The number of internal routes is much lower than the number of external routes. Restricting the routes between the CE routers of the customer carrier and the PE routers of the backbone carrier significantly reduces the number of routes that the PE router needs to maintain.

Because the PE routers do not have to carry external routes in the VRF routing table, they can use the incoming label in the packet to forward the customer carrier Internet traffic. Adding MPLS to the routers provides a consistent method of transporting packets from the customer carrier to the backbone carrier. MPLS allows the exchange of an MPLS label between the PE and the CE routers for every internal customer carrier route. The routers in the customer carrier have all the external routes either through internal Border Gateway Protocol (iBGP) or route redistribution to provide Internet connectivity. The figure below shows how information is exchanged when the network is configured in this manner.

Figure 10 Backbone Carrier Exchanging Routing Information with a Customer Carrier Who Is an ISP

In the figure below, routes are created between the backbone carrier and the customer carrier sites. ASBR2 receives an Internet route that originated outside the network. All routers in the ISP sites have all the external routes through IBGP connections among them.

Figure 11 Establishing a Route Between a Backbone Carrier and a Customer Carrier Who Is an ISP

The table below describes the process of establishing the route, which can be divided into two distinct steps:

- The backbone carrier propagates the IGP information of the customer carrier, which enables the customer carrier routers to reach all the customer carrier routers in the remote sites.
- Once the routers of the customer carriers in different sites are reachable, external routes can be propagated in the customer carrier sites, using IBGP without using the backbone carrier routers.

Table 6 Establishing a Route Between the Backbone Carrier and the Customer Carrier ISP

Step	Description
1	CSC-CE2 sends the internal routes within site 2 to CSC-PE2. The routes include the route to ASBR2.
2	CSC-PE2 sends the routing information for site 2 to CSC-PE1, using MPLS VPN processes. CSC-PE1 gets one label (called L3), which is associated with the route to the VPN-IP address for ASBR2. CSC-PE1 gets another label (called L2), which is associated with the route to CSC-PE2.
3	CSC-PE1 sends the routing information associated with internal routes from site 2 to CSC-CE1. CSC-PE1 also sends the label binding information. As a result, CSC-CE1 gets the route to ASBR2 with CSC-PE1 as the next hop. The label associated with that route is called L1.
4	CSC-CE1 distributes the routing information through site 1. Every router in site 1 gets a route for every internal destination in site 2. Therefore, every router in site 1 can reach routers in site 2 and learn external routes through IBGP.

Step	Description
5	ASBR2 receives an Internet route.
6	The IBGP sessions exchange the external routing information of the ISP, including a route to the Internet. Every router in site 1 knows a route to the Internet. Every router in site 1 knows a route to the Internet, with ASBR2 as the next hop of that route.

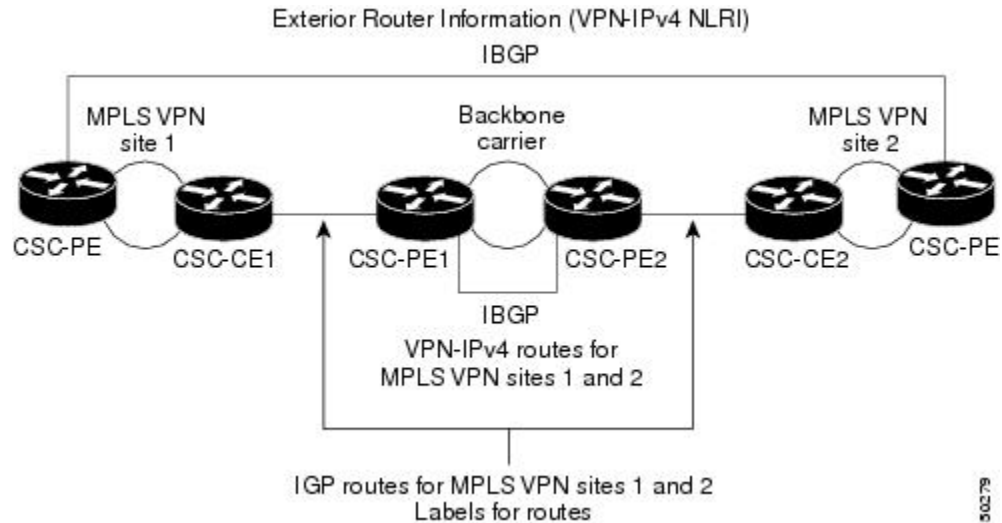

Customer Carrier Is a BGP MPLS VPN Service Provider

When a backbone carrier and the customer carrier both provide BGP/MPLS VPN services, the method of transporting data is different from when a customer carrier provides only ISP services. The following list highlights those differences:

- When a customer carrier provides BGP/MPLS VPN services, its external routes are VPN-IPv4 routes. When a customer carrier is an ISP, its external routes are IP routes.
- When a customer carrier provides BGP/MPLS VPN services, every site within the customer carrier must use MPLS. When a customer carrier is an ISP, the sites do not need to use MPLS.

The figure below shows how information is exchanged when MPLS VPN services reside on all customer carrier sites and on the backbone carrier.

Figure 12 Backbone Carrier Exchanging Information with a Customer Carrier Who Is an MPLS VPN Service Provider

In the example shown in the figure below, routes are created between the backbone carrier and the customer carrier sites.

Figure 13 *Establishing a Route Between a Backbone Carrier and a Customer Carrier Who Is an MPLS VPN Service Provider*

The table below describes the process of establishing the route.

Table 7 *Establishing a Route Between the Backbone Carrier and Customer Carrier Site*

Step	Description
1	CE2 sends all the internal routes within site 2 to CSC-PE2.
2	CSC-PE2 sends the routing information for site 2 to CSC-PE1, using MPLS VPN processes. CSC-PE1 gets one label (called L3), which is associated with the route to the VPN-IP address for PE2. CSC-PE1 gets another label (called L2), which is associated with the route to CSC-PE2.
3	CSC-PE1 sends the routing information associated with internal routes from site 2 to CSC-CE1. CSC-PE1 also sends the label binding information. As a result, CSC-CE1 gets the route to PE2 with CSC-PE1 as the next hop. The label associated with that route is called L1.
4	CE1 distributes the routing and labeling information through site 1. Every router in site 1 gets a route for every internal destination in site 2. Therefore, PE1 can establish an MP-IBGP session with PE2.
5	CE2 advertises the internal routes of MPLS VPN site 2 to PE2.

Step	Description
6	PE2 allocates labels for all the VPN routes (regular MPLS VPN functionality) and advertises the labels to PE1, using MP-IBGP.
7	PE1 can forward traffic from VPN site 1 that is destined for VPN site 2.

How to Configure MPLS VPN CSC with LDP and IGP

- [Configuring the Backbone Carrier Core, page 81](#)
- [Configuring the CSC-PE and CSC-CE Routers, page 88](#)
- [Verifying the Carrier Supporting Carrier Configuration, page 91](#)

Configuring the Backbone Carrier Core

Configuring the backbone carrier core requires configuring connectivity and routing functions for the CSC core and the CSC-PE routers.

Configuring and verifying the CSC core (backbone carrier) involves the following tasks:

- [Prerequisites, page 81](#)
- [Verifying IP Connectivity and LDP Configuration in the CSC Core, page 81](#)
- [Configuring VRFs for CSC-PE Routers, page 84](#)
- [Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier, page 86](#)

Prerequisites

Before you configure a backbone carrier core, configure the following on the CSC core routers:

- An IGP routing protocol--BGP, OSPF, IS-IS, EIGRP, static, and so on. For information, see [Configuring a Basic BGP Network](#), [Configuring OSPF](#), [Configuring a Basic IS-IS Network](#), and [Configuring EIGRP](#).
- Label Distribution Protocol (LDP). For information, see [MPLS Label Distribution Protocol](#).

Verifying IP Connectivity and LDP Configuration in the CSC Core

Perform this task to verify IP connectivity and LDP configuration in the CSC core. For a configuration example for this task, see the [Verifying IP Connectivity and LDP Configuration in the CSC Core, page 81](#).

SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show mpls forwarding-table** [*network* {*mask* | *length*} | **labels** *label* [-*label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]] [**vrf** *vrf-name*] [**detail**]
5. **show mpls ldp discovery** [**vrf** *vrf-name* | **all**]
6. **show mpls ldp neighbor** [[**vrf** *vrf-name*] [*address* | *interface*] [**detail**] | **all**]
7. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
8. **show mpls interfaces** [[**vrf** *vrf-name*] [*interface*] [**detail**] | **all**]
9. **show ip route**
10. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>ping [<i>protocol</i>] {<i>host-name</i> <i>system-address</i>}</p> <p>Example:</p> <pre>Router# ping ip 10.0.0.1</pre>	<p>(Optional) Diagnoses basic network connectivity on AppleTalk, Connectionless Network Service (CLNS), IP, Novell, Apollo, VINES, DECnet, or Xerox Network System (XNS) networks.</p> <ul style="list-style-type: none"> • Use the ping ip command to verify the connectivity from one CSC core router to another.
Step 3	<p>trace [<i>protocol</i>] [<i>destination</i>]</p> <p>Example:</p> <pre>Router# trace ip 10.0.0.1</pre>	<p>(Optional) Discovers the routes that packets will actually take when traveling to their destination.</p> <ul style="list-style-type: none"> • Use the trace command to verify the path that a packet goes through before reaching the final destination. The trace command can help isolate a trouble spot if two routers cannot communicate.
Step 4	<p>show mpls forwarding-table [<i>network</i> {<i>mask</i> <i>length</i>} labels <i>label</i> [-<i>label</i>] interface <i>interface</i> next-hop <i>address</i> lsp-tunnel [<i>tunnel-id</i>]] [vrf <i>vrf-name</i>] [detail]</p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>(Optional) Displays the contents of the MPLS label forwarding information base (LFIB).</p> <ul style="list-style-type: none"> • Use the show mpls forwarding-table command to verify that MPLS packets are being forwarded.

	Command or Action	Purpose
Step 5	show mpls ldp discovery [<i>vrf vrf-name</i> all] Example: Router# show mpls ldp discovery	(Optional) Displays the status of the LDP discovery process. <ul style="list-style-type: none"> Use the show mpls ldp discovery command to verify that LDP is operational in the CSC core.
Step 6	show mpls ldp neighbor [[<i>vrf vrf-name</i>] [<i>address</i> <i>interface</i>] [detail] all] Example: Router# show mpls ldp neighbor	(Optional) Displays the status of LDP sessions. <ul style="list-style-type: none"> Use the show mpls ldp neighbor command to verify LDP configuration in the CSC core.
Step 7	show ip cef [<i>vrf vrf-name</i>] [<i>network [mask]</i>] [longer-prefixes] [detail] Example: Router# show ip cef	(Optional) Displays entries in the forwarding Information Base (FIB). <ul style="list-style-type: none"> Use the show ip cef command to check the forwarding table (prefixes, next hops, and interfaces).
Step 8	show mpls interfaces [[<i>vrf vrf-name</i>] [<i>interface</i>] [detail] all] Example: Router# show mpls interfaces	(Optional) Displays information about one or more or all interfaces that are configured for label switching. <ul style="list-style-type: none"> Use the show mpls interfaces command to verify that the interfaces are configured to use LDP.
Step 9	show ip route Example: Router# show ip route	(Optional) Displays IP routing table entries. <ul style="list-style-type: none"> Use the show ip route command to display the entire routing table, including host IP address, next hop, and interface.
Step 10	disable Example: Router# disable	(Optional) Returns to privileged EXEC mode.

- [Troubleshooting Tips, page 83](#)

Troubleshooting Tips

You can use the **ping** and **trace** commands to verify complete MPLS connectivity in the core. You also get useful troubleshooting information from the additional **show** commands.

Configuring VRFs for CSC-PE Routers

Perform this task to configure VPN routing and forwarding (VRF) instances for the backbone carrier edge (CSC-PE) routers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf *vrf-name***
4. **rd *route-distinguisher***
5. **route-target {import | export | both} *route-target-ext-community***
6. **import map *route-map***
7. **exit**
8. **interface *type number***
9. **ip vrf forwarding *vrf-name***
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip vrf <i>vrf-name</i> Example: Router(config)# ip vrf vpn1	Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	rd <i>route-distinguisher</i> Example: Router(config-vrf)# rd 100:1	Creates routing and forwarding tables. <ul style="list-style-type: none"> • The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN-IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> ◦ 16-bit AS number: your 32-bit number, for example, 101:3 ◦ 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1

Command or Action	Purpose
<p>Step 5 <code>route-target {import export both}</code> <i>route-target-ext-community</i></p> <p>Example:</p> <pre>Router(config-vrf)# route-target import 100:1</pre>	<p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> The import keyword imports routing information from the target VPN extended community. The export keyword exports routing information to the target VPN extended community. The both keyword imports routing information from and exports routing information to the target VPN extended community. The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.
<p>Step 6 <code>import map route-map</code></p> <p>Example:</p> <pre>Router(config-vrf)# import map vpn1-route-map</pre>	<p>(Optional) Configures an import route map for a VRF.</p> <ul style="list-style-type: none"> The <i>route-map</i> argument specifies the route map to be used as an import route map for the VRF.
<p>Step 7 <code>exit</code></p> <p>Example:</p> <pre>Router(config-vrf)# exit</pre>	<p>(Optional) Exits to global configuration mode.</p>
<p>Step 8 <code>interface type number</code></p> <p>Example:</p> <pre>Router(config)# interface Ethernet5/0</pre>	<p>Specifies the interface to configure and enters interface configuration mode.</p> <ul style="list-style-type: none"> The <i>type</i> argument specifies the type of interface to be configured. The <i>number</i> argument specifies the port, connector, or interface card number.
<p>Step 9 <code>ip vrf forwarding vrf-name</code></p> <p>Example:</p> <pre>Router(config-if)# ip vrf forwarding vpn1</pre>	<p>Associates a VRF with the specified interface or subinterface.</p> <ul style="list-style-type: none"> The <i>vrf-name</i> argument is the name assigned to a VRF.
<p>Step 10 <code>end</code></p> <p>Example:</p> <pre>Router(config-if)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

- [Troubleshooting Tips, page 86](#)

Troubleshooting Tips

Enter a **show ip vrf detail** command and make sure the MPLS VPN is up and associated with the right interfaces.

Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier

Perform this task to configure Multiprotocol BGP (MP-BGP) connectivity in the backbone carrier.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default ipv4-unicast**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **update-source** *interface-type*
7. **address-family vpnv4** [**unicast**]
8. **neighbor** {*ip-address* | *peer-group-name*} **send-community** **extended**
9. **neighbor** {*ip-address* | *peer-group-name*} **activate**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 100	Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

	Command or Action	Purpose
Step 4	<p>no bgp default ipv4-unicast</p> <p>Example:</p> <pre>Router(config-router)# no bgp default ipv4-unicast</pre>	<p>(Optional) Disables the IPv4 unicast address family on all neighbors.</p> <ul style="list-style-type: none"> Use the no bgp default-unicast command if you are using this neighbor for MPLS routes only.
Step 5	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.5.5.5 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 6	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} update-source <i>interface-type</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.2.0.0 update-source loopback0</pre>	<p>Allows BGP sessions to use a specific operational interface for TCP connections.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>interface-type</i> argument specifies the interface to be used as the source.
Step 7	<p>address-family vpnv4 [unicast]</p> <p>Example:</p> <pre>Router(config-router)# address- family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 8	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} send-community extended</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.1 send-community extended</pre>	<p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 9	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.4.0.0 activate</pre>	<p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.

Command or Action	Purpose
Step 10 end Example: Router(config-router-af)# end	(Optional) Exits to privileged EXEC mode.

- [Troubleshooting Tips, page 88](#)
- [Troubleshooting Tips, page 151](#)

Troubleshooting Tips

You can enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. If this command generates an error message, enter a **debug ip bgp x.x.x.x events** command, where *x.x.x.x* is the IP address of the neighbor.

Configuring the CSC-PE and CSC-CE Routers

To enable the CSC-PE and CSC-CE routers to distribute routes and MPLS labels, perform the following tasks:

- [Prerequisites, page 88](#)
- [Configuring LDP on the CSC-PE and CSC-CE Routers, page 88](#)
- [Enabling MPLS Encapsulation on the CSC-PE and CSC-CE Routers, page 90](#)

Prerequisites

Before you configure the CSC-PE and CSC-CE routers, you must configure an IGP on the CSC-PE and CSC-CE routers. A routing protocol is required between the PE and CE routers that connect the backbone carrier to the customer carrier. The routing protocol enables the customer carrier to exchange IGP routing information with the backbone carrier. Use the same routing protocol that the customer carrier uses. You can choose RIP, OSPF, or static routing as the routing protocol. BGP is not supported. For the configuration steps, see [Configuring MPLS Layer 3 VPNs](#).

Configuring LDP on the CSC-PE and CSC-CE Routers

MPLS LDP is required between the PE and CE routers that connect the backbone carrier to the customer carrier. You can configure LDP as the default label distribution protocol for the entire router or just for the PE-to-CE interface for VRF.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label protocol ldp**
4. **interface *type number***
5. **mpls label protocol ldp**
6. **exit**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3 mpls label protocol ldp Example: Router(config)# mpls label protocol ldp	Specifies MPLS LDP as the default label distribution protocol for the router.
Step 4 interface <i>type number</i> Example: Router(config)# interface Ethernet5/0	(Optional) Specifies the interface to configure and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument specifies the type of interface to be configured. • The <i>number</i> argument specifies the port, connector, or interface card number.
Step 5 mpls label protocol ldp Example: Router(config-if)# mpls label protocol ldp	(Optional) Specifies MPLS LDP as the default label distribution protocol for the interface.

Command or Action	Purpose
Step 6 <code>exit</code> Example: <code>Router(config-if)# exit</code>	(Optional) Exits to privileged EXEC mode.

Enabling MPLS Encapsulation on the CSC-PE and CSC-CE Routers

Every packet that crosses the backbone carrier must be encapsulated, so that the packet includes MPLS labels. You can enable MPLS encapsulation for the entire router or just on the interface of the PE or CE router. To enable the encapsulation of packets, perform the following task.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `mpls ip`
4. `interface type number`
5. `mpls ip`
6. `exit`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <code>Router> enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 <code>configure terminal</code> Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3 <code>mpls ip</code> Example: <code>Router(config)# mpls ip</code>	Enables MPLS encapsulation for the router.

Command or Action	Purpose
Step 4 <code>interface type number</code> Example: <pre>Router(config)# interface Ethernet5/0</pre>	(Optional) Specifies the interface to configure and enters interface configuration mode. <ul style="list-style-type: none"> The <i>type</i> argument specifies the type of interface to be configured. The <i>number</i> argument specifies the port, connector, or interface card number.
Step 5 <code>mpls ip</code> Example: <pre>Router(config-if)# mpls ip</pre>	(Optional) Enables MPLS encapsulation for the specified interface.
Step 6 <code>exit</code> Example: <pre>Router(config-if)# exit</pre>	(Optional) Exits to privileged EXEC mode.

Verifying the Carrier Supporting Carrier Configuration

The following commands verify the status of LDP sessions that were configured between the backbone carrier and customer carrier. Now the customer carrier ISP sites appear as a VPN customer to the backbone carrier.

SUMMARY STEPS

1. `show mpls ldp discovery vrf vrf-name`
2. `show mpls ldp discovery all`

DETAILED STEPS

Step 1 `show mpls ldp discovery vrf vrf-name`

Use this command to show that the LDP sessions are in VRF VPN1 of the PE router of the backbone carrier, for example:

Example:

```
Router# show mpls ldp discovery vrf vpn1
Local LDP Identifier:
 10.0.0.0:0
Discovery Sources:
  Interfaces:
   Ethernet1/0 (ldp): xmit/recv
     LDP Id: 10.0.0.1:0
  POS6/0 (ldp): xmit
```

Step 2 `show mpls ldp discovery all`

Use this command to list all LDP sessions in a router, for example:

Example:

```
Router# show mpls ldp discovery all
Local LDP Identifier:
 10.10.10.10:0
Discovery Sources:
  Interfaces:
   Ethernet1/5 (ldp): xmit/recv
     LDP Id: 10.5.5.5:0
VRF vpn1: Local LDP Identifier:
 10.0.0.1:0
Discovery Sources:
  Interfaces:
   Ethernet1/0 (ldp): xmit/recv
     LDP Id: 10.0.0.1:0
 POS6/0 (ldp): xmit
```

The Local LDP Identifier field shows the LDP identifier for the local label switching router for this session. The Interfaces field displays the interfaces engaging in LDP discovery activity:

- xmit indicates that the interface is transmitting LDP discovery hello packets.
- recv indicates that the interface is receiving LDP discovery hello packets.

Configuration Examples for MPLS VPN CSC with LDP and IGP

- [MPLS VPN CSC Network with a Customer Who Is an ISP Example, page 92](#)
- [MPLS VPN CSC Network with a Customer Who Is an MPLS VPN Provider Example, page 97](#)
- [MPLS VPN CSC Network That Contains Route Reflectors Example, page 105](#)
- [MPLS VPN CSC Network with a Customer Who Has VPNs at the Network Edge Example, page 121](#)

MPLS VPN CSC Network with a Customer Who Is an ISP Example

The figure below shows a carrier supporting carrier network configuration where the customer carrier is an ISP. The customer carrier has two sites, each of which is a POP. The customer carrier connects these sites using a VPN service provided by the backbone carrier. The backbone carrier uses MPLS. The ISP sites use IP. To enable packet transfer between the ISP sites and the backbone carrier, the CE routers that connect the ISPs to the backbone carrier run MPLS.

Figure 14 Carrier Supporting Carrier Network with a Customer Carrier Who Is an ISP

The following examples show the configuration of each router in the carrier supporting carrier network. OSPF is used to connect the customer carrier to the backbone carrier.

MPLS VPN CSC Network with a Customer Who Is an MPLS VPN Provider Example

The figure below shows a carrier supporting carrier network configuration where the customer carrier is an MPLS VPN provider. The customer carrier has two sites. The backbone carrier and the customer carrier use MPLS. The IBGP sessions exchange the external routing information of the ISP.

Figure 15 Carrier Supporting Carrier Network with a Customer Carrier Who Is an MPLS VPN Provider

The following configuration examples show the configuration of each router in the carrier supporting carrier network. OSPF is the protocol used to connect the customer carrier to the backbone carrier.

MPLS VPN CSC Network That Contains Route Reflectors Example

The figure below shows a carrier supporting carrier network configuration that contains route reflectors. The customer carrier has two sites.

Figure 16 Carrier Supporting Carrier Network that Contains Route Reflectors

Note

A connection between route reflectors (RRs) is not necessary.

The following configuration examples show the configuration of each router in the carrier supporting carrier network. Note the following:

- The router IP addresses are abbreviated for ease of reading. For example, the loopback address for PE 1 is 25, which is equivalent to 10.25.25.25.
- The following list shows the loopback addresses for the CSC-PE routers:
 - CSC-PE1 (75K-37-3): loopback 0 = 10.15.15.15, loopback 1 = 10.18.18.18
 - CSC-PE2 (75K-38-3): loopback 0 = 10.16.16.16, loopback 1 = 10.20.20.20

Feature Information for MPLS VPN CSC with LDP and IGP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 8 Feature Information for MPLS VPN CSC with LDP and IGP

Feature Name	Releases	Feature Configuration Information
MPLS VPN Carrier Supporting Carrier	12.0(14)ST 12.0(16)ST 12.2(8)T 12.0(21)ST 12.0(22)S 12.0(23)S	This feature enables you to set up and create an MPLS VPN CSC network that uses LDP to transport MPLS labels and an IGP to transport routes. In 12.0(14)ST, this feature was introduced. In 12.0(16)ST, this feature was integrated. In 12.2(8)T, this feature was integrated. In 12.0(21)ST, this feature was integrated. In 12.0(22)S, this feature was integrated. In 12.0(23)S, this feature was integrated. This feature uses no new or modified commands.

Glossary

ASBR -- Autonomous System Boundary router. A router that connects one autonomous system to another.

autonomous system --A collection of networks under a common administration sharing a common routing strategy.

BGP --Border Gateway Protocol. An interdomain routing protocol that exchanges network reachability information with other BGP systems (which may be within the same autonomous system or between multiple autonomous systems).

CE router--customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. CE routers do not recognize associated MPLS VPNs.

CSC --Carrier Supporting Carrier. A hierarchical VPN model that allows small service providers, or customer carriers, to interconnect their IP or MPLS networks over an MPLS backbone. This eliminates the need for customer carriers to build and maintain their own MPLS backbone.

eBGP --external Border Gateway Protocol. A BGP between routers located within different autonomous systems. When two routers, located in different autonomous systems, are more than one hop away from one another, the eBGP session between the two routers is considered a multihop BGP.

edge router--A router that is at the edge of the network. It defines the boundary of the MPLS network. It receives and transmits packets. Also referred to as edge label switch router and label edge router.

iBGP --internal Border Gateway Protocol. A BGP between routers within the same autonomous system.

IGP --Interior Gateway Protocol. Internet protocol used to exchange routing information within a single autonomous system. Examples of common Internet IGP protocols include IGRP, OSPF, IS-IS, and RIP.

IP --Internet Protocol. Network layer protocol in the TCP/IP stack offering a connectionless internetwork service. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security. Defined in RFC 791.

LDP --Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

LFIB --Label Forwarding Information Base. Data structure used in MPLS to hold information about incoming and outgoing labels and associated Forwarding Equivalence Class (FEC) packets.

MP-BGP --Multiprotocol BGP.

MPLS --Multiprotocol Label Switching. The name of the IETF working group responsible for label switching, and the name of the label switching approach it has standardized.

NLRI --Network Layer Reachability Information. The BGP sends routing update messages containing NLRI to describe a route and how to get there. In this context, an NLRI is a prefix. A BGP update message carries one or more NLRI prefixes and the attributes of a route for the NLRI prefixes; the route attributes include a BGP next hop gateway address and extended community values.

NSF --Nonstop forwarding enables routers to continuously forward IP packets following a Route Processor takeover or switchover to another Route Processor. NSF maintains and updates Layer 3 routing and forwarding information in the backup Route Processor to ensure that IP packets and routing protocol information are forwarded continuously during the switchover and route convergence process.

PE router--provider edge router. A router that is part of a service provider's network. It is connected to a customer edge (CE) router. All MPLS VPN processing occurs in the PE router.

QoS --quality of service. Measure of performance for a transmission system that indicates its transmission quality and service availability.

RD --route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN-IPv4 prefix.

RT --route target. Extended community attribute used to identify the VRF routing table into which a prefix is imported.

SLA --Service Level Agreement given to VPN subscribers.

VPN --Virtual Private Network. A secure MPLS-based network that shares resources on one or more physical networks (typically implemented by one or more service providers). A VPN contains geographically dispersed sites that can communicate securely over a shared backbone network.

VRF --VPN routing and forwarding instance. Routing information that defines a VPN site that is attached to a PE router. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table.

MPLS VPN Carrier Supporting Carrier with BGP

Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Carrier Supporting Carrier (CSC) enables one MPLS VPN-based service provider to allow other service providers to use a segment of its backbone network. This module explains how to configure an MPLS VPN CSC network that uses Border Gateway Protocol (BGP) to distribute routes and MPLS labels.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN CSC with BGP

- You should be able to configure MPLS VPNs with end-to-end (CE-to-CE router) pings working. To accomplish this, you need to know how to configure Interior Gateway Protocols (IGPs), MPLS Label Distribution Protocol (LDP), and Multiprotocol Border Gateway Protocol (MP-BGP).
- Make sure that the CSC-PE routers and the CSC-CE routers run images that support BGP label distribution. Otherwise, you cannot run external BGP (EBGP) between them. Ensure that connectivity between the customer carrier and the backbone carrier. EBGP-based label distribution is configured on these links to enable MPLS between the customer and backbone carriers.

Restrictions for MPLS VPN CSC with BGP

On a provider edge (PE) router, you can configure an interface for either BGP with labels or LDP. You cannot enable both types of label distribution on the same interface. If you switch from one protocol to the other, then you must disable the existing protocol on all interfaces before enabling the other protocol.

This feature does not support the following:

- EBGp multihop between CSC-PE and CSC-CE routers
- EIBGP multipath load sharing

The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding or distributed Cisco Express Forwarding and MPLS.

Information About MPLS VPN CSC with BGP

- [MPLS VPN CSC Introduction, page 75](#)
- [Benefits of Implementing MPLS VPN CSC, page 75](#)
- [Benefits of Implementing MPLS VPN CSC with BGP, page 141](#)
- [Configuration Options for MPLS VPN CSC with BGP, page 141](#)

MPLS VPN CSC Introduction

Carrier supporting carrier is where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

A backbone carrier offers Border Gateway Protocol and Multiprotocol Label Switching (BGP/MPLS) VPN services. The customer carrier can be either:

- An Internet service provider (ISP)
- A BGP/MPLS VPN service provider

Benefits of Implementing MPLS VPN CSC

The MPLS VPN CSC network provides the following benefits to service providers who are backbone carriers and to customer carriers.

Benefits to the Backbone Carrier

- The backbone carrier can accommodate many customer carriers and give them access to its backbone. The backbone carrier does not need to create and maintain separate backbones for its customer carriers. Using one backbone network to support multiple customer carriers simplifies the backbone carrier's VPN operations. The backbone carrier uses a consistent method for managing and maintaining the backbone network. This is also cheaper and more efficient than maintaining separate backbones.
- The MPLS VPN carrier supporting carrier feature is scalable. Carrier supporting carrier can change the VPN to meet changing bandwidth and connectivity needs. The feature can accommodate unplanned

growth and changes. The carrier supporting carrier feature enables tens of thousands of VPNs to be set up over the same network, and it allows a service provider to offer both VPN and Internet services.

- The MPLS VPN carrier supporting carrier feature is a flexible solution. The backbone carrier can accommodate many types of customer carriers. The backbone carrier can accept customer carriers who are ISPs or VPN service providers or both. The backbone carrier can accommodate customer carriers that require security and various bandwidths.

Benefits to the Customer Carriers

- The MPLS VPN carrier supporting carrier feature removes from the customer carrier the burden of configuring, operating, and maintaining its own backbone. The customer carrier uses the backbone network of a backbone carrier, but the backbone carrier is responsible for network maintenance and operation.
- Customer carriers who use the VPN services provided by the backbone carrier receive the same level of security that Frame Relay or ATM-based VPNs provide. Customer carriers can also use IPSec in their VPNs for a higher level of security; it is completely transparent to the backbone carrier.
- Customer carriers can use any link layer technology (SONET, DSL, Frame Relay, and so on) to connect the CE routers to the PE routers and the PE routers to the P routers. The MPLS VPN carrier supporting carrier feature is link layer independent. The CE routers and PE routers use IP to communicate, and the backbone carrier uses MPLS.
- The customer carrier can use any addressing scheme and still be supported by a backbone carrier. The customer address space and routing information are independent of the address space and routing information of other customer carriers or the backbone provider.

Benefits of Implementing MPLS VPN CSC with BGP

You can configure your CSC network to enable BGP to transport routes and MPLS labels between the backbone carrier PE routers and the customer carrier CE routers using multiple paths. The benefits of using BGP to distribute IPv4 routes and MPLS label routes are:

- BGP takes the place of an IGP and LDP in a VPN forwarding/routing instance (VRF) table. You can use BGP to distribute routes and MPLS labels. Using a single protocol instead of two simplifies the configuration and troubleshooting.
- BGP is the preferred routing protocol for connecting two ISPs, mainly because of its routing policies and ability to scale. ISPs commonly use BGP between two providers. This feature enables those ISPs to use BGP.

Configuration Options for MPLS VPN CSC with BGP

The following sections explain how the backbone and customer carriers distribute IPv4 routes and MPLS labels. The backbone carrier offers BGP and MPLS VPN services. The customer carrier can be either of the following:

- [Customer Carrier Is an ISP with an IP Core](#), page 141
- [Customer Carrier Is an MPLS Service Provider With or Without VPN Services](#), page 142

Customer Carrier Is an ISP with an IP Core

The figure below shows a network configuration where the customer carrier is an ISP. The customer carrier has two sites, each of which is a point of presence (POP). The customer carrier connects these sites using a VPN service provided by the backbone carrier. The backbone carrier uses MPLS. The ISP sites use IP.

Figure 18 Network Where the Customer Carrier Is an ISP

The links between the CE and PE routers use EBGP to distribute IPv4 routes and MPLS labels. Between the links, the PE routers use multiprotocol IBGP to distribute VPNv4 routes.

Note

If a router other than a Cisco router is used as a CSC-PE or CSC-CE, that router must support IPv4 BGP label distribution (RFC 3107). Otherwise, you cannot run EBGP with labels between the routers.

Customer Carrier Is an MPLS Service Provider With or Without VPN Services

The figure below shows a network configuration where the backbone carrier and the customer carrier are BGP/MPLS VPN service providers. This is known as hierarchical VPNs. The customer carrier has two sites. Both the backbone carrier and the customer carrier use MPLS in their networks.

Figure 19 Network Where the Customer Carrier Is an MPLS VPN Service Provider

In this configuration, the customer carrier can configure its network in one of the following ways:

- The customer carrier can run IGP and LDP in its core network. In this case, the CSC-CE1 router in the customer carrier redistributes the EBGP routes it learns from the CSC-PE1 router of the backbone carrier to IGP.
- The CSC-CE1 router of the customer carrier system can run an IPv4 and labels IBGP session with the PE1 router.

How to Configure MPLS VPN CSC with BGP

- [Identifying the Carrier Supporting Carrier Topology, page 143](#)
- [Configuring the Backbone Carrier Core, page 144](#)
- [Configuring the CSC-PE and CSC-CE Routers, page 151](#)
- [Configuring the Customer Carrier Network, page 160](#)
- [Configuring the Customer Site for Hierarchical VPNs, page 164](#)

Identifying the Carrier Supporting Carrier Topology

Before you configure the MPLS VPN CSC with BGP, you need to identify both the backbone and customer carrier topology.

For hierarchical VPNs, the customer carrier of the MPLS VPN network provides MPLS VPN services to its own customers. In this instance, you need to identify the type of customer carrier as well as the topology of the customer carriers. Hierarchical VPNs require extra configuration steps, which are noted in the configuration sections.

Note

You can connect multiple CSC-CE routers to the same PE, or you can connect a single CSC-CE router to CSC-PEs using more than one interface to provide redundancy and multiple path support in CSC topology.

Perform this task to identify the carrier supporting carrier topology.

SUMMARY STEPS

1. Identify the type of customer carrier, ISP or MPLS VPN service provider.
2. (For hierarchical VPNs only) Identify the CE routers.
3. (For hierarchical VPNs only) Identify the customer carrier core router configuration.
4. Identify the customer carrier edge (CSC-CE) routers.
5. Identify the backbone carrier router configuration.

DETAILED STEPS

Command or Action	Purpose
Step 1 Identify the type of customer carrier, ISP or MPLS VPN service provider.	Sets up requirements for configuration of carrier supporting carrier network. <ul style="list-style-type: none"> • For an ISP, customer site configuration is not required. • For an MPLS VPN service provider, the customer site needs to be configured, as well as any task or step designated “for hierarchical VPNs only.”
Step 2 (For hierarchical VPNs only) Identify the CE routers.	Sets up requirements for configuration of CE to PE connections.
Step 3 (For hierarchical VPNs only) Identify the customer carrier core router configuration.	Sets up requirements for connection configuration between core (P) routers and between P routers and edge routers (PE and CSC-CE routers).

	Command or Action	Purpose
Step 4	Identify the customer carrier edge (CSC-CE) routers.	Sets up requirements for configuration of CSC-CE to CSC-PE connections.
Step 5	Identify the backbone carrier router configuration.	Sets up requirements for connection configuration between CSC core routers and between CSC core routers and edge routers (CSC-CE and CSC-PE routers).

- [What to Do Next, page 144](#)

What to Do Next

Set up your carrier supporting carrier networks with the [Configuring the Backbone Carrier Core, page 144](#).

Configuring the Backbone Carrier Core

Configuring the backbone carrier core requires setting up connectivity and routing functions for the CSC core and the CSC-PE routers.

Configuring and verifying the CSC core (backbone carrier) involves the following tasks:

- [Prerequisites, page 144](#)
- [Verifying IP Connectivity and LDP Configuration in the CSC Core, page 144](#)
- [Configuring VRFs for CSC-PE Routers, page 147](#)
- [Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier, page 86](#)

Prerequisites

Before you configure a backbone carrier core, configure the following on the CSC core routers:

- An IGP routing protocol--BGP, OSPF, IS-IS, EIGRP, static, and so on.
- Label Distribution Protocol (LDP). For information, see [How to Configure MPLS LDP](#).

Verifying IP Connectivity and LDP Configuration in the CSC Core

Perform this task to verify IP connectivity and LDP configuration in the CSC core.

SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show mpls forwarding-table** [**vrf** *vrf-name*] [{*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
5. **show mpls ldp discovery** [**vrf** *vrf-name* | **all**]
6. **show mpls ldp neighbor** [[**vrf** *vrf-name*] [*address* | *interface*] [**detail**] | **all**]
7. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
8. **show mpls interfaces** [[**vrf** *vrf-name*] [*interface*] [**detail**] | **all**]
9. **show ip route**
10. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<p>ping [<i>protocol</i>] {<i>host-name</i> <i>system-address</i>}</p> <p>Example:</p> <pre>Router# ping ip 10.1.0.0</pre>	<p>(Optional) Diagnoses basic network connectivity on AppleTalk, CLNS, IP, Novell, Apollo, VINES, DECnet, or XNS networks.</p> <ul style="list-style-type: none"> Use the ping ip command to verify the connectivity from one CSC core router to another.
Step 3	<p>trace [<i>protocol</i>] [<i>destination</i>]</p> <p>Example:</p> <pre>Router# trace ip 10.2.0.0</pre>	<p>(Optional) Discovers the routes that packets will actually take when traveling to their destination.</p> <ul style="list-style-type: none"> Use the trace command to verify the path that a packet goes through before reaching the final destination. The trace command can help isolate a trouble spot if two routers cannot communicate.
Step 4	<p>show mpls forwarding-table [vrf <i>vrf-name</i>] [{<i>network</i> {<i>mask</i> <i>length</i>} labels <i>label</i> [- <i>label</i>] interface <i>interface</i> next-hop <i>address</i> lsp-tunnel [<i>tunnel-id</i>]}] [detail]</p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>(Optional) Displays the contents of the MPLS label forwarding information base (LFIB).</p> <ul style="list-style-type: none"> Use the show mpls forwarding-table command to verify that MPLS packets are being forwarded.

Command or Action	Purpose
<p>Step 5 <code>show mpls ldp discovery [vrf vrf-name all]</code></p> <p>Example:</p> <pre>Router# show mpls ldp discovery</pre>	<p>(Optional) Displays the status of the LDP discovery process.</p> <ul style="list-style-type: none"> Use the show mpls ldp discovery command to verify that LDP is operational in the CSC core.
<p>Step 6 <code>show mpls ldp neighbor [[vrf vrf-name] [address interface] [detail] all]</code></p> <p>Example:</p> <pre>Router# show mpls ldp neighbor</pre>	<p>(Optional) Displays the status of LDP sessions.</p> <ul style="list-style-type: none"> Use the show mpls ldp neighbor command to verify LDP configuration in the CSC core.
<p>Step 7 <code>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</code></p> <p>Example:</p> <pre>Router# show ip cef</pre>	<p>(Optional) Displays entries in the forwarding information base (FIB).</p> <ul style="list-style-type: none"> Use the show ip cef command to check the forwarding table (prefixes, next hops, and interfaces).
<p>Step 8 <code>show mpls interfaces [[vrf vrf-name] [interface] [detail] all]</code></p> <p>Example:</p> <pre>Router# show mpls interfaces</pre>	<p>(Optional) Displays information about one or more or all interfaces that are configured for label switching.</p> <ul style="list-style-type: none"> Use the show mpls interfaces command to verify that the interfaces are configured to use LDP.
<p>Step 9 <code>show ip route</code></p> <p>Example:</p> <pre>Router# show ip route</pre>	<p>(Optional) Displays IP routing table entries.</p> <ul style="list-style-type: none"> Use the show ip route command to display the entire routing table, including host IP address, next hop, interface, and so forth.
<p>Step 10 <code>disable</code></p> <p>Example:</p> <pre>Router# disable</pre>	<p>(Optional) Returns to privileged EXEC mode.</p>

- [Troubleshooting Tips, page 146](#)

Troubleshooting Tips

You can use the **ping** and **trace** commands to verify complete MPLS connectivity in the core. You also get useful troubleshooting information from the additional **show** commands.

Configuring VRFs for CSC-PE Routers

Perform this task to configure VPN forwarding/routing instances (VRFs) for the backbone carrier edge (CSC-PE) routers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf *vrf-name***
4. **rd *route-distinguisher***
5. **route-target {import | export | both} *route-target-ext-community***
6. **import map *route-map***
7. **exit**
8. **interface *type number***
9. **ip vrf forwarding *vrf-name***
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip vrf <i>vrf-name</i> Example: Router(config)# ip vrf vpn1	Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	rd <i>route-distinguisher</i> Example: Router(config-vrf)# rd 100:1	Creates routing and forwarding tables. <ul style="list-style-type: none"> • The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> ◦ 16-bit AS number: your 32-bit number, for example, 101:3 ◦ 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1

Command or Action	Purpose
<p>Step 5 <code>route-target {import export both}</code> <code>route-target-ext-community</code></p> <p>Example:</p> <pre>Router(config-vrf)# route-target import 100:1</pre>	<p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> The import keyword imports routing information from the target VPN extended community. The export keyword exports routing information to the target VPN extended community. The both keyword imports routing information from and exports routing information to the target VPN extended community. The <code>route-target-ext-community</code> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.
<p>Step 6 <code>import map route-map</code></p> <p>Example:</p> <pre>Router(config-vrf)# import map vpn1-route-map</pre>	<p>(Optional) Configures an import route map for a VRF.</p> <ul style="list-style-type: none"> The <code>route-map</code> argument specifies the route map to be used as an import route map for the VRF.
<p>Step 7 <code>exit</code></p> <p>Example:</p> <pre>Router(config-vrf)# exit</pre>	<p>(Optional) Exits to global configuration mode.</p>
<p>Step 8 <code>interface type number</code></p> <p>Example:</p> <pre>Router(config)# interface Ethernet5/0</pre>	<p>Specifies the interface to configure.</p> <ul style="list-style-type: none"> The <code>type</code> argument specifies the type of interface to be configured. The <code>number</code> argument specifies the port, connector, or interface card number.
<p>Step 9 <code>ip vrf forwarding vrf-name</code></p> <p>Example:</p> <pre>Router(config-if)# ip vrf forwarding vpn1</pre>	<p>Associates a VRF with the specified interface or subinterface.</p> <ul style="list-style-type: none"> The <code>vrf-name</code> argument is the name assigned to a VRF.
<p>Step 10 <code>end</code></p> <p>Example:</p> <pre>Router(config-if)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

- [Troubleshooting Tips, page 149](#)

Troubleshooting Tips

Enter a **show ip vrf detail** command and make sure the MPLS VPN is up and associated with the right interfaces.

Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier

Perform this task to configure Multiprotocol BGP (MP-BGP) connectivity in the backbone carrier.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default ipv4-unicast**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **update-source** *interface-type*
7. **address-family vpnv4** [**unicast**]
8. **neighbor** {*ip-address* | *peer-group-name*} **send-community** **extended**
9. **neighbor** {*ip-address* | *peer-group-name*} **activate**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 100	Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

Command or Action	Purpose
<p>Step 4 no bgp default ipv4-unicast</p> <p>Example:</p> <pre>Router(config-router)# no bgp default ipv4-unicast</pre>	<p>(Optional) Disables the IPv4 unicast address family on all neighbors.</p> <ul style="list-style-type: none"> Use the no bgp default-unicast command if you are using this neighbor for MPLS routes only.
<p>Step 5 neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.5.5.5 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 6 neighbor {<i>ip-address</i> <i>peer-group-name</i>} update-source <i>interface-type</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.2.0.0 update-source loopback0</pre>	<p>Allows BGP sessions to use a specific operational interface for TCP connections.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>interface-type</i> argument specifies the interface to be used as the source.
<p>Step 7 address-family vpnv4 [unicast]</p> <p>Example:</p> <pre>Router(config-router)# address- family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
<p>Step 8 neighbor {<i>ip-address</i> <i>peer-group-name</i>} send-community extended</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.1 send-community extended</pre>	<p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 9 neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.4.0.0 activate</pre>	<p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.

Command or Action	Purpose
Step 10 end Example: Router(config-router-af)# end	(Optional) Exits to privileged EXEC mode.

- [Troubleshooting Tips, page 88](#)
- [Troubleshooting Tips, page 151](#)

Troubleshooting Tips

You can enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. If this command is not successful, enter a **debug ip bgp x.x.x.x events** command, where *x.x.x.x* is the IP address of the neighbor.

Configuring the CSC-PE and CSC-CE Routers

Perform the following tasks to configure and verify links between a CSC-PE router and the carrier CSC-CE router for an MPLS VPN CSC network that uses BGP to distribute routes and MPLS labels.

The figure below shows the configuration for the peering with directly connected interfaces between CSC-PE and CSC-CE routers. This configuration is used as the example in the tasks that follow.

Figure 20 Configuration for Peering with Directly Connected Interfaces Between CSC-PE and CSC-CE Routers

- [Configuring CSC-PE Routers, page 151](#)
- [Configuring CSC-CE Routers, page 154](#)
- [Verifying Labels in the CSC-PE Routers, page 156](#)
- [Verifying Labels in the CSC-CE Routers, page 158](#)

Configuring CSC-PE Routers

Perform this task to configure the CSC-PE routers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** { *ip-address* | *peer-group-name* } **remote-as** *as-number*
6. **neighbor** { *ip-address* | *peer-group-name* } **activate**
7. **neighbor** *ip-address* **as-override**
8. **neighbor** *ip-address* **send-label**
9. **exit-address-family**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: <pre>Router(config)# router bgp 100</pre>	Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	address-family ipv4 [multicast unicast vrf <i>vrf-name</i>] Example: <pre>Router(config-router)# address-family ipv4 vrf vpn1</pre>	Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes. • The vrf <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.

	Command or Action	Purpose
Step 5	neighbor { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example: <pre>Router(config-router-af)# neighbor 10.0.0.1 remote-as 200</pre>	Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 6	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: <pre>Router(config-router-af)# neighbor 10.0.0.2 activate</pre>	Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 7	neighbor <i>ip-address</i> as-override Example: <pre>Router(config-router-af)# neighbor 10.0.0.2 as-override</pre>	Configures a PE router to override the autonomous system number (ASN) of a site with the ASN of a provider. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the router that is to be overridden with the ASN provided.
Step 8	neighbor <i>ip-address</i> send-label Example: <pre>Router(config-router-af)# neighbor 10.0.0.2 send-label</pre>	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.
Step 9	exit-address-family Example: <pre>Router(config-router-af)# exit- address-family</pre>	Exits address family configuration mode.
Step 10	end Example: <pre>Router(config-router)# end</pre>	(Optional) Exits to privileged EXEC mode.

- [Troubleshooting Tips, page 153](#)

Troubleshooting Tips

Enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. Make sure you see the following line in the command output under Neighbor capabilities:

```
IPv4 MPLS Label capability:advertised and received
```

Configuring CSC-CE Routers

Perform this task to configure the CSC-CE routers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **redistribute** *protocol*
6. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
7. **neighbor** {*ip-address* | *peer-group-name*} **activate**
8. **neighbor** *ip-address* **send-label**
9. **exit-address-family**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 200	Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

	Command or Action	Purpose
Step 4	<p>address-family ipv4 [multicast unicast vrf vrf-name]</p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4</pre>	<p>Specifies the IPv4 address family type and enters address family configuration mode.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The vrf vrf-name keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.
Step 5	<p>redistribute protocol</p> <p>Example:</p> <pre>Router(config-router-af)# redistribute static</pre>	<p>Redistributes routes from one routing domain into another routing domain.</p> <ul style="list-style-type: none"> The <i>protocol</i> argument specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: bgp, egp, igrp, isis, ospf, mobile, static [ip], connected, and rip. <ul style="list-style-type: none"> The static [ip] keyword redistributes IP static routes. The optional ip keyword is used when you redistribute static routes into IS-IS. The connected keyword refers to routes which are established automatically when IP is enabled on an interface. For routing protocols such as OSPF and IS-IS, these routes are redistributed as external to the autonomous system.
Step 6	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as as-number</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.5.0.2 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 7	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.3.0.2 activate</pre>	<p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 8	<p>neighbor ip-address send-label</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.2 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.

	Command or Action	Purpose
Step 9	exit-address-family Example: <pre>Router(config-router-af)# exit-address-family</pre>	Exits from the address family configuration mode.
Step 10	end Example: <pre>Router(config-router)# end</pre>	(Optional) Exits to privileged EXEC mode.

Verifying Labels in the CSC-PE Routers

Perform this task to verify the labels in the CSC-PE routers.

SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]**
3. **show mpls interfaces [all]**
4. **show ip route vrf vrf-name [prefix]**
5. **show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]**
6. **show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]**
7. **show mpls forwarding-table [vrf vrf-name] [{network {mask | length} | labels label [label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]]} [detail]**
8. **traceroute vrf [vrf-name] ip-address**
9. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

Command or Action	Purpose
<p>Step 2 <code>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [summary] [labels]</code></p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all summary</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the show ip bgp vpnv4 all summary command to check that the BGP session is up and running between the CSC-PE routers and the CSC-CE routers. Check the data in the State/PfxRcd column to verify that prefixes are learned during each session.
<p>Step 3 <code>show mpls interfaces [all]</code></p> <p>Example:</p> <pre>Router# show mpls interfaces all</pre>	<p>(Optional) Displays information about one or more interfaces that have been configured for label switching.</p> <ul style="list-style-type: none"> Use the show mpls interfaces all command to check that MPLS interfaces are up and running, and that LDP-enabled interfaces show that LDP is up and running. Check that LDP is turned off on the VRF because EBGP distributes the labels.
<p>Step 4 <code>show ip route vrf vrf-name [prefix]</code></p> <p>Example:</p> <pre>Router# show ip route vrf vpn1 10.5.5.5</pre>	<p>(Optional) Displays the IP routing table associated with a VRF.</p> <ul style="list-style-type: none"> Use the show ip route vrf command to check that the prefixes for the PE routers are in the routing table of the CSC-PE routers. <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes for the same destination learned from the CSC-CE are installed in the corresponding VRF routing table.</p>
<p>Step 5 <code>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [summary] [labels]</code></p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 vrf vpn1 labels</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the show ip bgp vpnv4 vrf vrf-name labels command to check that the prefixes for the customer carrier MPLS service provider networks are in the BGP table and have the appropriate labels. <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the labels for the same destination learned from the CSC-CE are installed in the corresponding VRF routing table.</p>
<p>Step 6 <code>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</code></p> <p>Example:</p> <pre>Router# show ip cef vrf vpn1 10.1.0.0 detail</pre>	<p>(Optional) Displays entries in the forwarding information base (FIB) or displays a summary of the FIB.</p> <ul style="list-style-type: none"> Use the show ip cef vrf and the show ip cef vrf detail commands to check that the prefixes of the PE routers are in the CEF table.

Command or Action	Purpose
<p>Step 7 <code>show mpls forwarding-table [vrf vrf-name] [{network {mask length}} labels label [label] interface interface next-hop address lsp-tunnel [tunnel-id]] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table vrf vpn1 10.1.0.0 detail</pre>	<p>(Optional) Displays the contents of the MPLS label forwarding information base (LFIB).</p> <ul style="list-style-type: none"> Use the show mpls forwarding-table command with the vrf keyword and both the vrf and detail keywords to check that the prefixes for the PE routers in the local customer MPLS VPN service provider are in the LFIB. <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the labels for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p>
<p>Step 8 <code>traceroute vrf [vrf-name] ip-address</code></p> <p>Example:</p> <pre>Router# traceroute vrf vpn2 10.2.0.0</pre>	<p>Shows the routes that packets follow traveling through a network to their destination.</p> <ul style="list-style-type: none"> Use the traceroute vrf command to check the data path and transport labels from a PE to a destination CE router. <p>Note This command works with MPLS-aware traceroute only if the backbone routers are configured to propagate and generate IP Time to Live (TTL) information. For more information, see the documentation on the mpls ip propagate-ttl command.</p> <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p>
<p>Step 9 <code>disable</code></p> <p>Example:</p> <pre>Router# disable</pre>	<p>(Optional) Exits to user EXEC mode.</p>

Verifying Labels in the CSC-CE Routers

Perform this task to verify the labels in the CSC-CE routers.

SUMMARY STEPS

- enable
- show ip bgp summary
- show ip route [address]
- show mpls ldp bindings [network {mask | length}]
- show ip cef [network [mask]] [longer-prefixes] [detail]
- show mpls forwarding table [vrf vrf-name] [{network {mask | length}} | labels label [- label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]] [detail]
- show ip bgp labels

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 show ip bgp summary</p> <p>Example:</p> <pre>Router# show ip bgp summary</pre>	<p>(Optional) Displays the status of all BGP connections.</p> <ul style="list-style-type: none"> Use the show ip bgp summary command to check that the BGP session is up and running on the CSC-CE routers.
<p>Step 3 show ip route [address]</p> <p>Example:</p> <pre>Router# show ip route 10.1.0.0</pre>	<p>(Optional) Displays IP routing table entries.</p> <ul style="list-style-type: none"> Use the show ip route to check that the loopback address of the local and remote PE routers are in the routing table. <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p>
<p>Step 4 show mpls ldp bindings [network {mask length}]</p> <p>Example:</p> <pre>Router# show mpls ldp bindings 10.2.0.0 255.255.255.255</pre>	<p>(Optional) Displays the contents of the label information base (LIB).</p> <ul style="list-style-type: none"> Use the show mpls ldp bindings command to check that the prefix of the local PE router is in the MPLS LDP bindings.
<p>Step 5 show ip cef [network [mask]] [longer-prefixes] [detail]</p> <p>Example:</p> <pre>Router# show ip cef 10.5.0.0 detail</pre>	<p>(Optional) Displays entries in the forwarding information base (FIB) or a summary of the FIB.</p> <ul style="list-style-type: none"> Use the show ip cef and the show ip cef detail commands to check that the prefixes of the local and remote PE routers are in the Cisco Express Forwarding table. <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes and the labels for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p>

Command or Action	Purpose
<p>Step 6 <code>show mpls forwarding table [vrf vrf-name] [{network {mask length} labels label [- label] interface interface next-hop address lsp-tunnel {tunnel-id}}] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table 10.2.0.0 detail</pre>	<p>(Optional) Displays the contents of the MPLS LFIB.</p> <ul style="list-style-type: none"> Use the show mpls forwarding-table and show mpls forwarding-table detail commands to check that the prefixes of the local and remote PE routers are in the MPLS forwarding table. <p>Note If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes and labels for the same destination learned from the CSC-CE are installed in the corresponding VRF routing table.</p>
<p>Step 7 <code>show ip bgp labels</code></p> <p>Example:</p> <pre>Router# show ip bgp labels</pre>	<p>(Optional) Displays information about MPLS labels from the EBGp route table.</p> <ul style="list-style-type: none"> Use the show ip bgp labels command to check that the BGP routing table contains labels for prefixes in the customer carrier MPLS VPN service provider networks.

Configuring the Customer Carrier Network

Perform the following tasks to configure and verify the customer carrier network. This requires setting up connectivity and routing functions for the customer carrier core (P) routers and the customer carrier edge (PE) routers.

- [Prerequisites, page 160](#)
- [Verifying IP Connectivity in the Customer Carrier, page 160](#)
- [Configuring a Customer Carrier Core Router as a Route Reflector, page 161](#)
- [Troubleshooting Tips, page 163](#)

Prerequisites

Before you configure an MPLS VPN CSC network that uses BGP to distribute routes and MPLS labels, you must configure the following on your customer carrier routers:

- An IGP routing protocol--BGP, OSPF, IS-IS, EIGRP, static, and so on. For information, see [Configuring a Basic BGP Network](#), [Configuring OSPF](#), [Configuring a Basic IS-IS Network](#), and [Configuring EIGRP](#).
- MPLS VPN functionality on the PE routers (for hierarchical VPNs only).
- Label Distribution Protocol (LDP) on P and PE routers (for hierarchical VPNs only). For information, see [How to Configure MPLS LDP](#).

Note

You must configure the items in the preceding list before performing the tasks in this section.

Verifying IP Connectivity in the Customer Carrier

Perform this task to verify IP connectivity in the customer carrier.

SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show ip route**
5. **disable**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 ping [<i>protocol</i>] { <i>host-name</i> <i>system-address</i> } Example: <pre>Router# ping ip 10.2.0.0</pre>	Diagnoses basic network connectivity on AppleTalk, CLNS, IP, Novell, Apollo, VINES, DECnet, or XNS networks. <ul style="list-style-type: none"> • Use the ping command to verify the connectivity from one customer carrier core router to another.
Step 3 trace [<i>protocol</i>] [<i>destination</i>] Example: <pre>Router# trace ip 10.1.0.0</pre>	Discovers the routes that packets will actually take when traveling to their destination. <ul style="list-style-type: none"> • Use the trace command to verify the path that a packet goes through before reaching the final destination. The trace command can help isolate a trouble spot if two routers cannot communicate.
Step 4 show ip route Example: <pre>Router# show ip route</pre>	Displays IP routing table entries. <ul style="list-style-type: none"> • Use the show ip route command to display the entire routing table, including host IP address, next hop, interface, and so forth.
Step 5 disable Example: <pre>Router# disable</pre>	Returns to user mode.

Configuring a Customer Carrier Core Router as a Route Reflector

Perform this task to configure a customer carrier core (P) router as a route reflector of multiprotocol BGP prefixes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family vpnv4** [unicast]
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **neighbor** *ip-address* **route-reflector-client**
8. **exit-address-family**
9. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3 router bgp <i>as-number</i> Example: <pre>Router(config)# router bgp 200</pre>	Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and labels the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4 neighbor { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example: <pre>Router(config-router)# neighbor 10.1.1.1 remote-as 100</pre>	Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.

Command or Action	Purpose
<p>Step 5 <code>address-family vpnv4 [unicast]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
<p>Step 6 <code>neighbor {ip-address peer-group-name} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.1.1.1 activate</pre>	<p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 7 <code>neighbor ip-address route-reflector-client</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.1.1.1 route-reflector-client</pre>	<p>Configures the router as a BGP route reflector and configures the specified neighbor as its client.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP neighbor being identified as a client.
<p>Step 8 <code>exit-address-family</code></p> <p>Example:</p> <pre>Router(config-router-af)# exit-address- family</pre>	<p>Exits address family configuration mode.</p>
<p>Step 9 <code>end</code></p> <p>Example:</p> <pre>Router(config-router)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Troubleshooting Tips

By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only unicast address prefixes. For neighbors to exchange other address prefix types, such as multicast and VPNv4, you must also activate neighbors using the **neighbor activate** command in address family configuration mode, as shown.

Route reflectors and clients (neighbors or internal BGP peer groups) that are defined in router configuration mode using the **neighbor route-reflector-client** command reflect unicast address prefixes to and from those clients by default. To cause them to reflect prefixes for other address families, such as multicast, define the reflectors and clients in address family configuration mode, using the **neighbor route-reflector-client** command, as shown.

Configuring the Customer Site for Hierarchical VPNs

Note

This section applies only to customer carrier networks that use BGP to distribute routes and MPLS labels.

Perform the following tasks to configure and verify the customer site for hierarchical VPNs:

Note

This section applies to hierarchical VPNs only.

- [Defining VPNs on PE Routers for Hierarchical VPNs, page 164](#)
- [Configuring BGP Routing Sessions on the PE Routers for Hierarchical VPNs, page 166](#)
- [Verifying Labels in Each PE Router for Hierarchical VPNs, page 167](#)
- [Configuring CE Routers for Hierarchical VPNs, page 168](#)
- [Verifying IP Connectivity in the Customer Site, page 170](#)

Defining VPNs on PE Routers for Hierarchical VPNs

Perform this task to define VPNs on PE routers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target** {**import** | **export** | **both**} *route-target-ext-community*
6. **import map** *route-map*
7. **ip vrf forwarding** *vrf-name*
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	<ul style="list-style-type: none"> • Enter your password if prompted.
	Router> enable	

Command or Action	Purpose
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	Enters global configuration mode.
<p>Step 3 <code>ip vrf vrf-name</code></p> <p>Example:</p> <pre>Router(config)# ip vrf vpn2</pre>	<p>Creates a VRF routing table and a Cisco Express Forwarding table and enters VRF configuration mode.</p> <ul style="list-style-type: none"> The <i>vrf-name</i> argument is a name you assign to a VRF.
<p>Step 4 <code>rd route-distinguisher</code></p> <p>Example:</p> <pre>Router(config-vrf)# rd 200:1</pre>	<p>Creates routing and forwarding tables for a VRF.</p> <ul style="list-style-type: none"> The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix.
<p>Step 5 <code>route-target {import export both} route-target-ext-community</code></p> <p>Example:</p> <pre>Router(config-vrf)# route-target export 200:1</pre>	<p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> The import keyword imports routing information from the target VPN extended community. The export keyword exports routing information to the target VPN extended community. The both keyword imports routing information from and export routing information to the target VPN extended community. The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.
<p>Step 6 <code>import map route-map</code></p> <p>Example:</p> <pre>Router(config-vrf)# import map map23</pre>	<p>Configures an import route map for a VRF.</p> <ul style="list-style-type: none"> The <i>route-map</i> argument specifies the route map to be used as an import route map for the VRF.
<p>Step 7 <code>ip vrf forwarding vrf-name</code></p> <p>Example:</p> <pre>Router(config-vrf)# ip vrf forwarding vpn2</pre>	<p>Associates a VPN VRF instance with an interface or subinterface.</p> <ul style="list-style-type: none"> The <i>vrf-name</i> argument is the name assigned to a VRF.

Command or Action	Purpose
Step 8 <code>exit</code> Example: <code>Router(config-vrf)# exit</code>	Exits to global configuration mode.

Configuring BGP Routing Sessions on the PE Routers for Hierarchical VPNs

Perform this task to configure BGP routing sessions on the PE routers for PE-to-CE router communication.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `address-family ipv4 [multicast | unicast | vrf vrf-name]`
5. `neighbor {ip-address | peer-group-name} remote-as as-number`
6. `neighbor {ip-address | peer-group-name} activate`
7. `end`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <code>Router> enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 <code>configure terminal</code> Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3 <code>router bgp <i>as-number</i></code> Example: <code>Router(config)# router bgp 200</code>	Configures the router to run a BGP process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

Command or Action	Purpose
<p>Step 4 <code>address-family ipv4 [multicast unicast vrf vrf-name]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4 multicast</pre>	<p>Specifies the IPv4 address family type and enters address family configuration mode.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The vrf vrf-name keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.
<p>Step 5 <code>neighbor {ip-address peer-group-name} remote-as as-number</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.5.5.5 remote-as 300</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 6 <code>neighbor {ip-address peer-group-name} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.1.0.0 activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 7 <code>end</code></p> <p>Example:</p> <pre>Router(config-router-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Verifying Labels in Each PE Router for Hierarchical VPNs

Perform this task to verify labels in each PE router for hierarchical VPNs.

SUMMARY STEPS

1. `enable`
2. `show ip route vrf vrf-name [prefix]`
3. `show mpls forwarding-table [vrf vrf-name] [prefix] [detail]`
4. `show ip cef [network [mask [longer-prefix]]] [detail]`
5. `show ip cef vrf vrf-name [ip-prefix]`
6. `exit`

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>show ip route vrf vrf-name [prefix]</code></p> <p>Example:</p> <pre>Router# show ip route vrf vpn2 10.5.5.5</pre>	<p>(Optional) Displays the IP routing table associated with a VRF.</p> <ul style="list-style-type: none"> Use the show ip route vrf command to check that the loopback addresses of the local and remote CE routers are in the routing table of the PE routers.
<p>Step 3 <code>show mpls forwarding-table [vrf vrf-name] [prefix] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table vrf vpn2 10.1.0.0</pre>	<p>(Optional) Displays the contents of the LFIB.</p> <ul style="list-style-type: none"> Use the show mpls forwarding-table command to check that the prefixes for the local and remote CE routers are in the MPLS forwarding table, and that the specified prefix is untagged.
<p>Step 4 <code>show ip cef [network [mask [longer-prefix]]] [detail]</code></p> <p>Example:</p> <pre>Router# show ip cef 10.2.0.0</pre>	<p>(Optional) Displays specific entries in the FIB based on IP address information.</p> <ul style="list-style-type: none"> Use the show ip cef command to check that the prefixes of the local and remote PE routers are in the Cisco Express Forwarding table.
<p>Step 5 <code>show ip cef vrf vrf-name [ip-prefix]</code></p> <p>Example:</p> <pre>Router# show ip cef vrf vpn2 10.3.0.0</pre>	<p>(Optional) Displays the Cisco Express Forwarding table associated with a VRF.</p> <ul style="list-style-type: none"> Use the show ip cef vrf command to check that the prefix of the remote CE router is in the Cisco Express Forwarding table.
<p>Step 6 <code>exit</code></p> <p>Example:</p> <pre>Router# exit</pre>	<p>(Optional) Exits to user EXEC mode.</p>

Configuring CE Routers for Hierarchical VPNs

Perform this task to configure CE routers for hierarchical VPNs. This configuration is the same as that for an MPLS VPN that is not in a hierarchical topology.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef [distributed]**
4. **interface** *type number*
5. **ip address** *ip-address mask [secondary]*
6. **exit**
7. **router bgp** *as-number*
8. **redistribute** *protocol*
9. **neighbor** {*ip-address | peer-group-name*} **remote-as** *as-number*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip cef [distributed] Example: Router(config)# ip cef distributed	Enables Cisco Express Forwarding on the route processor card. <ul style="list-style-type: none"> • The distributed keyword enables distributed Cisco Express Forwarding operation. Cisco Express Forwarding information is distributed to the line cards. Line cards perform express forwarding. Note For the Cisco ASR 1000 Series Aggregation Services Router, the distributed keyword is required.
Step 4	interface <i>type number</i> Example: Router(config)# interface loopback 0	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument specifies the type of interface to be configured. <ul style="list-style-type: none"> ◦ A loopback interface indicates a software-only interface that emulates an interface that is always up. It is a virtual interface supported on all platforms. • The <i>number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces you can create.

Command or Action	Purpose
<p>Step 5 <code>ip address <i>ip-address mask</i> [secondary]</code></p> <p>Example:</p> <pre>Router(config-if)# ip address 10.8.0.0 255.255.255.255</pre>	<p>Sets a primary or secondary IP address for an interface.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address. The <i>mask</i> argument is the mask for the associated IP subnet. The secondary keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
<p>Step 6 <code>exit</code></p> <p>Example:</p> <pre>Router(config-if)# exit</pre>	<p>Exits interface configuration mode.</p>
<p>Step 7 <code>router bgp <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and enters router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
<p>Step 8 <code>redistribute <i>protocol</i></code></p> <p>Example:</p> <pre>Router(config-router)# redistribute connected</pre>	<p>Redistributes routes from one routing domain into another routing domain.</p> <ul style="list-style-type: none"> The <i>protocol</i> argument specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: bgp, connected, egp, igrp, isis, mobile, ospf, static [ip], or rip. <p>The connected keyword refers to routes that are established automatically when IP is enabled on an interface. For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes are redistributed as external to the autonomous system.</p>
<p>Step 9 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.8.0.0 remote-as 100</pre>	<p>Adds the IP address of the neighbor in the remote autonomous system to the multiprotocol BGP neighbor table of the local router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 10 <code>end</code></p> <p>Example:</p> <pre>Router(config-router)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Verifying IP Connectivity in the Customer Site

Perform this task to verify IP connectivity in the customer site.

SUMMARY STEPS

1. **enable**
2. **show ip route** [*ip-address* [*mask*]] [**longer-prefixes**] | *protocol* [*process-id*] | **list** [*access-list-number* | *access-list-name*] | **static download**
3. **ping** [*protocol*] {*host-name* | *system-address*}
4. **trace** [*protocol*] [*destination*]
5. **disable**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 show ip route [<i>ip-address</i> [<i>mask</i>]] [longer-prefixes] <i>protocol</i> [<i>process-id</i>] list [<i>access-list-number</i> <i>access-list-name</i>] static download</p> <p>Example:</p> <pre>Router# show ip route 10.5.5.5</pre>	<p>(Optional) Displays the current state of the routing table.</p> <ul style="list-style-type: none"> • Use the show ip route ip-address command to check that the loopback addresses of the remote CE routers learned through the PE router are in the routing table of the local CE routers.
<p>Step 3 ping [<i>protocol</i>] {<i>host-name</i> <i>system-address</i>}</p> <p>Example:</p> <pre>Router# ping 10.5.5.5</pre>	<p>Diagnoses basic network connectivity on Apollo, AppleTalk, Connectionless Network Service (CLNS), DECnet, IP, Novell IPX, VINES, or XNS networks.</p> <ul style="list-style-type: none"> • Use the ping command to check connectivity between customer site routers.
<p>Step 4 trace [<i>protocol</i>] [<i>destination</i>]</p> <p>Example:</p> <pre>Router# trace ip 10.5.5.5</pre>	<p>Discovers the routes that packets will actually take when traveling to their destination.</p> <ul style="list-style-type: none"> • Use the trace command to follow the path of the packets in the customer site. • To use nondefault parameters and invoke an extended trace test, enter the trace command without a destination argument. You will be stepped through a dialog to select the desired parameters.

Command or Action	Purpose
Step 5 <code>disable</code>	(Optional) Exits to user EXEC mode.
Example: <code>Router# disable</code>	

Configuration Examples for MPLS VPN CSC with BGP

The figure below shows a sample CSC topology for exchanging IPv4 routes and MPLS labels. Use this figure as a reference for configuring and verifying carrier supporting carrier routers to exchange IPv4 routes and MPLS labels.

Figure 21 Sample CSC Topology for Exchanging IPv4 Routes and MPLS Labels

The table below describes the sample configuration shown in the figure above.

Table 9 Description of Sample Configuration Shown in figure 1

Routers	Description
CE1 and CE2	Belong to an end customer. CE1 and CE2 routers exchange routes learned from PE routers. The end customer is purchasing VPN services from a customer carrier.
PE1 and PE2	Part of a customer carrier network that is configured to provide MPLS VPN services. PE1 and PE2 are peering with a VPNv4 IBGP session to form an MPLS VPN network.

Routers	Description
CSC-CE1 and CSC-CE2	<p>Part of a customer carrier network. CSC-CE1 and CSC-CE2 routers exchange IPv4 BGP updates with MPLS labels and redistribute PE loopback addresses to and from the IGP (OSPF in this example).</p> <p>The customer carrier is purchasing carrier supporting carrier VPN services from a backbone carrier.</p>
CSC-PE1 and CSC-PE2	<p>Part of the backbone carrier's network configured to provide carrier supporting carrier VPN services. CSC-PE1 and CSC-PE2 are peering with a VPNv4 IP BGP session to form the MPLS VPN network. In the VRF, CSC-PE1 and CSC-PE2 are peering with the CSC-CE routers, which are configured for carrying MPLS labels with the routes, with an IPv4 EBGp session.</p>

- [Configuring the Backbone Carrier Core Examples, page 173](#)
- [Configuring the Links Between CSC-PE and CSC-CE Routers Examples, page 175](#)
- [Configuring the Customer Carrier Network Examples, page 181](#)
- [Configuring the Customer Site for Hierarchical VPNs Examples, page 182](#)

Configuring the Backbone Carrier Core Examples

Configuration and verification examples for the backbone carrier core included in this section are as follows:

- [Verifying IP Connectivity and LDP Configuration in the CSC Core Example, page 173](#)
- [Configuring VRFs for CSC-PE Routers Example, page 175](#)
- [Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier Example, page 175](#)

Verifying IP Connectivity and LDP Configuration in the CSC Core Example

Check that CSC-PE2 is reachable from CSC-PE1 by entering the following command on CSC-CE1:

```
Router# ping 10.5.5.5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.5.5.5, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 4/4/4 ms
```

Verify the path from CSC-PE1 to CSC-PE2 by entering the following command on CSC-CE1:

```
Router# trace 10.5.5.5
Type escape sequence to abort.
Tracing the route to 10.5.5.5
 1 10.5.5.5 0 msec 0 msec *
```

Check that CSC-PE router prefixes are in the MPLS forwarding table:

```
Router# show mpls forwarding-table
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
16	2/nn	dd.dd.dd.dd/32	0	AT2/1/0.1	point2point
17	16	bb.bb.bb.bb/32[V]	30204	Etl/0	pp.0.0.1
21	Pop tag	cc.cc.cc.cc/32[V]	0	Etl/0	pp.0.0.1
22	Pop tag	nn.0.0.0/8[V]	570	Etl/0	pp.0.0.1
23	Aggregate	pp.0.0.0/8[V]	0		
2	2/nn	gg.gg.gg.gg/32[V]	0	AT3/0.1	point2point
8	2/nn	hh.hh.hh.hh/32[V]	15452	AT3/0.1	point2point
29	2/nn	qq.0.0.0/8[V]	0	AT3/0.1	point2point
30	2/nn	ss.0.0.0/8[V]	0	AT3/0.1	point2point

Check the status of LDP discovery processes in the core:

```
Router# show mpls ldp discovery
Local LDP Identifier:
  ee.ee.ee.ee:0
Discovery Sources:
Interfaces:
  ATM2/1/0.1 (ldp): xmit/rcv
  TDP Id: dd.dd.dd.dd:1
```

Check the status of LDP sessions in the core:

```
Router# show mpls ldp neighbor
Peer LDP Ident: dd.dd.dd.dd:1; Local LDP Ident ee.ee.ee.ee:1
TCP connection: dd.dd.dd.dd.646 - ee.ee.ee.ee.11007
State: Oper; Msgs sent/rcvd: 20/21; Downstream on demand
Up time: 00:14:56
LDP discovery sources:
  ATM2/1/0.1, Src IP addr: dd.dd.dd.dd
```

Check the forwarding table (prefixes, next-hops, and interfaces):

```
Router# show ip cef
Prefix          Next Hop          Interface
0.0.0.0/0       drop              Null0 (default route handler entry)
0.0.0.0/32      receive
dd.dd.dd.dd/32  dd.dd.dd.dd      ATM2/1/0.1
ee.ee.ee.ee/32  receive
224.0.0.0/4     drop
224.0.0.0/24    receive
255.255.255.255/32 receive
```

Note

Also see the [Verifying Labels in the CSC-CE Routers Examples, page 179](#).

Verify that interfaces are configured to use LDP:

```
Router# show mpls interfaces
Interface      IP          Tunnel  Operational
Ethernet0/1    Yes (ldp)   No      Yes
```

Display the entire routing table, including host IP address, next hop, interface, and so forth:

```
Router# show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
Gateway of last resort is not set
dd.0.0.0/32 is subnetted, 1 subnets
O      dd.dd.dd.dd [110/7] via dd.dd.dd.dd, 00:16:42, ATM2/1/0.1
ee.0.0.0/32 is subnetted, 1 subnets
C      ee.ee.ee.ee is directly connected, Loopback0
```

Configuring VRFs for CSC-PE Routers Example

The following example shows how to configure a VPN routing and forwarding (VRF) instance for a CSC-PE router:

```
ip cef distributed
ip vrf vpn1
rd 100:1
route target both 100:1
!
```

Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier Example

The following example shows how to configure Multiprotocol BGP (MP-BGP) for VPN connectivity in the backbone carrier:

```
ip cef distributed
ip vrf vpn1
rd 100:1
route target both 100:1
hostname csc-pe1
!
router bgp 100
no bgp default ipv4-unicast
bgp log-neighbor-changes
timers bgp 10 30
neighbor ee.0.0.0 remote-as 100
neighbor ee.0.0.0 update-source Loopback0
no auto-summary
!
address-family vpnv4
neighbor ee.0.0.0 activate
neighbor ee.0.0.0 send-community extended
bgp dampening 30
exit-address-family
!
router bgp 100
.
.
.
! (BGP IPv4 to CSC-CE router from CSC-PE router)
!
address-family ipv4 vrf vpn1
neighbor ss.0.0.2 remote-as 200
neighbor ss.0.0.2 activate
neighbor ss.0.0.2 as-override
neighbor ss.0.0.2 advertisement-interval 5
neighbor ss.0.0.2 send-label
no auto-summary
no synchronization
bgp dampening 30
exit-address-family
!
```

Configuring the Links Between CSC-PE and CSC-CE Routers Examples

This section contains the following examples:

- [Configuring the CSC-PE Routers Examples, page 176](#)
- [Configuring the CSC-CE Routers Examples, page 176](#)
- [Verifying Labels in the CSC-PE Routers Examples, page 177](#)
- [Verifying Labels in the CSC-CE Routers Examples, page 179](#)

Configuring the CSC-PE Routers Examples

The following example shows how to configure a CSC-PE router:

```

ip cef
!
ip vrf vpn1
  rd 100:1
  route-target export 100:1
  route-target import 100:1
mpls label protocol ldp
!
interface Loopback0
  ip address dd.dd.dd.dd 255.255.255.255
!
interface Ethernet3/1
  ip vrf forwarding vpn1
  ip address pp.0.0.2 255.0.0.0
!
interface ATM0/1/0
  no ip address
  no ip directed-broadcast
  no ip route-cache distributed
  atm clock INTERNAL
  no atm enable-ilmi-trap
  no atm ilmi-keepalive
!
interface ATM0/1/0.1 mpls
  ip unnumbered Loopback0
  no ip directed-broadcast
  no atm enable-ilmi-trap
  mpls label protocol ldp
  mpls atm vpi 2-5
  mpls ip
!
router ospf 100
  log-adjacency-changes
  auto-cost reference-bandwidth 1000
  redistribute connected subnets
  passive-interface Ethernet3/1
  network dd.dd.dd.dd 0.0.0.0 area 100
!
router bgp 100
  no bgp default ipv4-unicast
  bgp log-neighbor-changes
  timers bgp 10 30
  neighbor ee.ee.ee.ee remote-as 100
  neighbor ee.ee.ee.ee update-source Loopback0
!
address-family vpnv4                                     !VPNv4 session with CSC-PE2
  neighbor ee.ee.ee.ee activate
  neighbor ee.ee.ee.ee send-community extended

  exit-address-family
!
address-family ipv4 vrf vpn1
  neighbor pp.0.0.1 remote-as 200
  neighbor pp.0.0.1 activate
  neighbor pp.0.0.1 as-override
  neighbor pp.0.0.1 advertisement-interval 5
  neighbor pp.0.0.1 send-label
  no auto-summary
  no synchronization
  bgp dampening 30
  exit-address-family

```

Configuring the CSC-CE Routers Examples

The following example shows how to configure a CSC-CE router:

```

ip cef
!
mpls label protocol ldp
!
interface Loopback0
 ip address cc.cc.cc.cc 255.255.255.255
!
interface Ethernet3/0
 ip address pp.0.0.1 255.0.0.0
!
interface Ethernet4/0
 ip address nn.0.0.2 255.0.0.0
 no ip directed-broadcast
 no ip mroute-cache
 mpls label protocol ldp
 mpls ip
!
router ospf 200
 log-adjacency-changes
 auto-cost reference-bandwidth 1000
 redistribute connected subnets                !Exchange routes
 redistribute bgp 200 metric 3 subnets          !learned from PE1
 passive-interface ATM1/0
 passive-interface Ethernet3/0
 network cc.cc.cc.cc 0.0.0.0 area 200
 network nn.0.0.0 0.255.255.255 area 200
!
router bgp 200
 no bgp default ipv4-unicast
 bgp log-neighbor-changes
 timers bgp 10 30
 neighbor pp.0.0.2 remote-as 100
 neighbor pp.0.0.2 update-source Ethernet3/0
 no auto-summary
!
address-family ipv4
 redistribute connected
 redistribute ospf 200 metric 4 match internal
 neighbor pp.0.0.2 activate
 neighbor pp.0.0.2 send-label
 no auto-summary
 no synchronization
 bgp dampening 30
 exit-address-family

```

Verifying Labels in the CSC-PE Routers Examples

The following examples show how to verify the configurations of the CSC-PE routers.

Verify that the BGP session is up and running between the CSC-PE router and the CSC-CE router. Check the data in the State/PfxRcd column to verify that prefixes are learned during each session.

```

Router# show ip bgp vpnv4 all summary
BBGP router identifier 10.5.5.5, local AS number 100
BGP table version is 52, main routing table version 52
12 network entries and 13 paths using 2232 bytes of memory
6 BGP path attribute entries using 336 bytes of memory
1 BGP AS-PATH entries using 24 bytes of memory
1 BGP extended community entries using 24 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
Dampening enabled. 0 history paths, 0 dampened paths
BGP activity 16/4 prefixes, 27/14 paths, scan interval 5 secs
Neighbor      V   AS    MsgRcvd MsgSent  TblVer  InQ   OutQ  Up/Down  State/PfxRcd
10.5.5.5      4   100    7685    7686    52      0     0    21:17:04 6
10.0.0.2      4   200    7676    7678    52      0     0    21:16:43 7

```

Verify that the MPLS interfaces are up and running, and that LDP-enabled interfaces show that LDP is up and running. LDP is turned off on the VRF because EBGp distributes the labels.

```
Router# show mpls interfaces all
Interface          IP          Tunnel   Operational
GigabitEthernet6/0  Yes (ldp)  No       Yes
VRF vpn1:
Ethernet3/1        No         No       Yes
```

Verify that the prefix for the local PE router is in the routing table of the CSC-PE router:

```
Router# show ip route vrf vpn2 10.5.5.5
Routing entry for 10.5.5.5/32
  Known via "bgp 100", distance 20, metric 4
  Tag 200, type external
  Last update from pp.0.0.2 21:28:39 ago
  Routing Descriptor Blocks:
  * pp.0.0.2, from pp.0.0.2, 21:28:39 ago
    Route metric is 4, traffic share count is 1
    AS Hops 1, BGP network version 0
```

Verify that the prefix for the remote PE router is in the routing table of the CSC-PE router:

```
Router# show ip route vrf vpn2 10.5.5.5
Routing entry for 10.5.5.5/32
  Known via "bgp 100", distance 200, metric 4
  Tag 200, type internal
  Last update from 10.1.0.0 21:27:39 ago
  Routing Descriptor Blocks:
  * 10.1.0.0 (Default-IP-Routing-Table), from 10.1.0.0, 21:27:39 ago
    Route metric is 4, traffic share count is 1
    AS Hops 1, BGP network version 0
```

Verify that the prefixes for the customer carrier MPLS VPN service provider networks are in the BGP table, and have appropriate labels:

```
Router# show ip bgp vpnv4 vrf vpn2 labels

Network          Next Hop      In label/Out label
Route Distinguisher: 100:1 (vpn1)
cc.cc.cc.cc/32   pp.0.0.2     22/imp-null
bb.bb.bb.bb/32   pp.0.0.2     27/20
hh.hh.hh.hh/32   ee.0.0.0     34/35
gg.gg.gg.gg/32   ee.0.0.0     30/30
nn.0.0.0         pp.0.0.2     23/imp-null
ss.0.0.0         ee.0.0.0     33/34
pp.0.0.0         pp.0.0.2     25/aggregate(vpn1)
```

Verify that the prefix of the PE router in the local customer carrier MPLS VPN service provider is in the Cisco Express Forwarding table:

```
Router# show ip cef vrf vpn2 10.1.0.0
10.1.0.0/32, version 19, cached adjacency pp.0.0.2
0 packets, 0 bytes
  tag information set
    local tag: 27
    fast tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}
  via pp.0.0.2, 0 dependencies, recursive
    next hop pp.0.0.2, Ethernet3/1 via pp.0.0.2/32
    valid cached adjacency
    tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}

Router# show ip cef vrf vpn2 10.1.0.0 detail
10.1.0.0/32, version 19, cached adjacency pp.0.0.2
0 packets, 0 bytes
  tag information set
    local tag: 27
    fast tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}
  via pp.0.0.2, 0 dependencies, recursive
```

```

next hop pp.0.0.2, Ethernet3/1 via pp.0.0.2/32
valid cached adjacency
tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}

```

Verify that the prefix of the PE router in the local customer carrier MPLS VPN service provider is in the MPLS forwarding table:

```

Router# show mpls forwarding-table vrf vpn2 10.1.0.0
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC   or Tunnel Id    switched   interface
27     20         10.1.0.0/32[V] 958048     Et3/1     pp.0.0.2

Router# show mpls forwarding-table vrf vpn2 10.1.0.0 detail
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC   or Tunnel Id    switched   interface
27     20 10.1.0.0/32[V] 958125     Et3/1     pp.0.0.2
      MAC/Encaps=14/18, MTU=1500, Tag Stack{20}
      00B04A74A05400B0C26E10558847 00014000
      VPN route: vpn1
      No output feature configured
      Per-packet load-sharing, slots: 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

```

Verify that the prefix of the PE router in the remote customer carrier MPLS VPN service provider is in the Cisco Express Forwarding table:

```

Router# show ip cef vrf vpn2 10.3.0.0
10.3.0.0/32, version 25, cached adjacency rr.0.0.2
0 packets, 0 bytes
tag information set
  local tag: 34
  fast tag rewrite with Gi6/0, rr.0.0.2, tags imposed {35}
via ee.0.0.0, 0 dependencies, recursive
  next hop rr.0.0.2, GigabitEthernet6/0 via ee.0.0.0/32
  valid cached adjacency
  tag rewrite with Gi6/0, rr.0.0.2, tags imposed {35}

Router# show ip cef vrf vpn2 10.3.0.0 detail
hh.hh.hh.hh/32, version 25, cached adjacency rr.0.0.2
0 packets, 0 bytes
tag information set
  local tag: 34
  fast tag rewrite with Gi6/0, rr.0.0.2, tags imposed {35}
via ee.0.0.0, 0 dependencies, recursive
  next hop rr.0.0.2, GigabitEthernet6/0 via ee.0.0.0/32
  valid cached adjacency
  tag rewrite with Gi6/0, rr.0.0.2, tags imposed {35}

```

Verify that the prefix of the PE router in the remote customer carrier MPLS VPN service provider is in the MPLS forwarding table:

```

Router# show mpls forwarding-table vrf vpn2 10.3.0.0
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC   or Tunnel Id    switched   interface
34     35         hh.hh.hh.hh/32[V] 139034     Gi6/0     rr.0.0.2

Router# show mpls forwarding-table vrf vpn2 10.3.0.0 detail
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC   or Tunnel Id    switched   interface
34     35         hh.hh.hh.hh/32[V] 139034     Gi6/0     rr.0.0.2
      MAC/Encaps=14/18, MTU=1500, Tag Stack{35}
      00B0C26E447000B0C26E10A88847 00023000
      VPN route: vpn1
      No output feature configured
      Per-packet load-sharing, slots: 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

```

Verifying Labels in the CSC-CE Routers Examples

The following examples show how to verify the configurations of the CSC-CE routers.

Verify that the BGP session is up and running:

```
Router# show ip bgp summary
BGP router identifier cc.cc.cc.cc, local AS number 200
BGP table version is 35, main routing table version 35
14 network entries and 14 paths using 2030 bytes of memory
3 BGP path attribute entries using 168 bytes of memory
1 BGP AS-PATH entries using 24 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
Dampening enabled. 1 history paths, 0 dampened paths
BGP activity 17/67 prefixes, 29/15 paths, scan interval 60 secs
Neighbor      V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
pp.0.0.1      4      100   7615   7613    35    0    0  21:06:19      5
```

Verify that the loopback address of the local PE router is in the routing table:

```
Router# show ip route 10.1.0.0
Routing entry for 10.1.0.0/32
  Known via "ospf 200", distance 110, metric 101, type intra area
  Redistributing via bgp 200
  Advertised by bgp 200 metric 4 match internal
  Last update from nn.0.0.1 on Ethernet4/0, 00:34:08 ago
  Routing Descriptor Blocks:
  * nn.0.0.1, from bb.bb.bb.bb, 00:34:08 ago, via Ethernet4/0
    Route metric is 101, traffic share count is 1
```

Verify that the loopback address of the remote PE router is in the routing table:

```
Router# show ip route 10.5.5.5
Routing entry for 10.5.5.5/32
  Known via "bgp 200", distance 20, metric 0
  Tag 100, type external
  Redistributing via ospf 200
  Advertised by ospf 200 metric 3 subnets
  Last update from pp.0.0.1 00:45:16 ago
  Routing Descriptor Blocks:
  * pp.0.0.1, from pp.0.0.1, 00:45:16 ago
    Route metric is 0, traffic share count is 1
    AS Hops 2, BGP network version 0
```

Verify that the prefix of the local PE router is in the MPLS LDP bindings:

```
Router# show mpls ldp bindings 10.1.0.0 255.255.255.255
tib entry: 10.1.0.0/32, rev 20
  local binding: tag: 20
  remote binding: tsr: 10.1.0.0:0, tag: imp-null
```

Verify that the prefix of the local PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.1.0.0
10.1.0.0/32, version 46, cached adjacency nn.0.0.1
0 packets, 0 bytes
  tag information set
    local tag: 20
  via nn.0.0.1, Ethernet4/0, 0 dependencies
  next hop nn.0.0.1, Ethernet4/0
  unresolved
  valid cached adjacency
  tag rewrite with Et4/0, nn.0.0.1, tags imposed {}
```

Verify that the prefix of the local PE router is in the MPLS forwarding table:

```
Router# show mpls forwarding-table 10.1.0.0
Local  Outgoing  Prefix          Bytes tag  Outgoing     Next Hop
tag   tag or VC   or Tunnel Id   switched  interface
20    Pop tag     bb.bb.bb.bb/32  893397    Et4/0        nn.0.0.1

Router# show mpls forwarding-table 10.1.0.0 detail
Local  Outgoing  Prefix          Bytes tag  Outgoing     Next Hop
```

```

tag      tag or VC   or Tunnel Id   switched   interface
20      Pop tag     bb.bb.bb.bb/32 893524    Et4/0     nn.0.0.1
        MAC/Encaps=14/14, MTU=1504, Tag Stack{}
        00074F83685400B04A74A0708847
        No output feature configured
        Per-packet load-sharing, slots: 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

```

Verify that the BGP routing table contains labels for prefixes in the customer carrier MPLS VPN service provider networks:

```

Router# show ip bgp labels
Network      Next Hop      In Label/Out Label
cc.cc.cc.cc/32  0.0.0.0      imp-null/exp-null
bb.bb.bb.bb/32  nn.0.0.1     20/exp-null
hh.hh.hh.hh/32  pp.0.0.1     26/34
gg.gg.gg.gg/32  pp.0.0.1     23/30
nn.0.0.0       0.0.0.0      imp-null/exp-null
ss.0.0.0       pp.0.0.1     25/33
pp.0.0.0       0.0.0.0      imp-null/exp-null
pp.0.0.1/32    0.0.0.0      16/exp-null

```

Verify that the prefix of the remote PE router is in the Cisco Express Forwarding table:

```

Router# show ip cef 10.5.5.5
10.5.5.5/32, version 54, cached adjacency pp.0.0.1
0 packets, 0 bytes
  tag information set
    local tag: 26
    fast tag rewrite with Et3/0, pp.0.0.1, tags imposed {34}
  via pp.0.0.1, 0 dependencies, recursive
  next hop pp.0.0.1, Ethernet3/0 via pp.0.0.1/32
  valid cached adjacency
  tag rewrite with Et3/0, pp.0.0.1, tags imposed {34}

```

Verify that the prefix of the remote PE router is in the MPLS forwarding table:

```

Router# show mpls forwarding-table 10.5.5.5
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC  or Tunnel Id   switched   interface
26     34         hh.hh.hh.hh/32 81786     Et3/0     pp.0.0.1

Router# show mpls forwarding-table 10.5.5.5 detail
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC  or Tunnel Id   switched   interface

Configuring the Customer Carrier Network Examples

Customer carrier configuration and verification examples in this section include:

- [Verifying IP Connectivity in the Customer Carrier Example, page 181](#)
- [Configuring a Customer Carrier Core Router as a Route Reflector Example, page 182](#)

Verifying IP Connectivity in the Customer Carrier Example

Verify the connectivity from one customer carrier core router to another (from CE1 to CE2) by entering the following command:

```

Router# ping 10.2.0.0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to jj.jj.jj.jj, timeout is 2 seconds:

```

```
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 8/9/12 ms
```

Verify the path that a packet goes through on its way to its final destination from CE1 to CE2:

```
Router# trace 10.2.0.0
Type escape sequence to abort.
Tracing the route to 10.2.0.0
 0  mm.0.0.2 0 msec 0 msec 4 msec
 1  nn.0.0.2 [MPLS: Labels 20/21 Exp 0] 8 msec 8 msec 12 msec
 2  pp.0.0.2 [MPLS: Labels 28/21 Exp 0] 8 msec 8 msec 12 msec
 3  ss.0.0.1 [MPLS: Labels 17/21 Exp 0] 8 msec 8 msec 12 msec
 4  ss.0.0.2 [MPLS: Labels 16/21 Exp 0] 8 msec 8 msec 12 msec
 5  tt.0.0.1 [AS 200] [MPLS: Label 21 Exp 0] 8 msec 8 msec 8 msec
 6  tt.0.0.2 [AS 200] 8 msec 4 msec *
```

Verify the path that a packet goes through on its way to its final destination from CE2 to CE1:

```
Router# trace 10.1.0.0
Type escape sequence to abort.
Tracing the route to 10.1.0.0
 0  tt.0.0.1 0 msec 0 msec 0 msec
 1  qq.0.0.2 [MPLS: Labels 18/21 Exp 0] 8 msec 12 msec 12 msec
 2  ss.0.0.1 [MPLS: Labels 28/21 Exp 0] 8 msec 8 msec 8 msec
 3  pp.0.0.2 [MPLS: Labels 17/21 Exp 0] 12 msec 8 msec 8 msec
 4  pp.0.0.1 [MPLS: Labels 16/21 Exp 0] 12 msec 12 msec 8 msec
 5  mm.0.0.2 [AS 200] [MPLS: Label 21 Exp 0] 12 msec 8 msec 12 msec
 6  mm.0.0.1 [AS 200] 4 msec 4 msec *
```

Configuring a Customer Carrier Core Router as a Route Reflector Example

The following example shows how to use an address family to configure internal BGP peer 10.1.1.1 as a route-reflector client for both unicast and multicast prefixes:

```
router bgp 200
 address-family vpnv4
  neighbor 10.1.1.1 activate
  neighbor 10.1.1.1 route-reflector-client

router bgp 100
 address-family vpnv4
  neighbor xx.xx.xx.xx activate
  neighbor xx.xx.xx.xx route-reflector-client
  ! xx.xx.xx.xx is a PE router
  neighbor xx.xx.xx.xx send-community extended
 exit address-family
! You need to configure your peer BGP neighbor.
```

Configuring the Customer Site for Hierarchical VPNs Examples

This section contains the following configuration and verification examples for the customer site:

- [Configuring PE Routers for Hierarchical VPNs Examples, page 182](#)
- [Verifying Labels in Each PE Router for Hierarchical VPNs Examples, page 183](#)
- [Configuring CE Routers for Hierarchical VPNs Examples, page 184](#)
- [Verifying IP Connectivity in the Customer Site Examples, page 185](#)

Configuring PE Routers for Hierarchical VPNs Examples

This example shows how to configure a PE router:

```
ip cef
```

```

!
ip vrf vpn2
 rd 200:1
  route-target export 200:1
  route-target import 200:1
mpls label protocol ldp
!
interface Loopback0
 ip address bb.bb.bb.bb 255.255.255.255
!
interface Ethernet3/0
 ip address nn.0.0.1 255.0.0.0
 no ip directed-broadcast
 no ip mroute-cache
 mpls label protocol ldp
 mpls ip
!
interface Ethernet3/3
 ip vrf forwarding vpn2
 ip address mm.0.0.2 255.0.0.0
 no ip directed-broadcast
 no ip mroute-cache
!
router ospf 200
 log-adjacency-changes
 auto-cost reference-bandwidth 1000
 redistribute connected subnets
 passive-interface Ethernet3/3
 network bb.bb.bb.bb 0.0.0.0 area 200
 network nn.0.0.0 0.255.255.255 area 200
!
router bgp 200
 no bgp default ipv4-unicast
 bgp log-neighbor-changes
 timers bgp 10 30
 neighbor hh.hh.hh.hh remote-as 200
 neighbor hh.hh.hh.hh update-source Loopback0
!
address-family vpnv4                                     !VPNv4 session with PE2
 neighbor hh.hh.hh.hh activate
 neighbor hh.hh.hh.hh send-community extended
 bgp dampening 30
 exit-address-family
!
address-family ipv4 vrf vpn2
 neighbor mm.0.0.1 remote-as 300
 neighbor mm.0.0.1 activate
 neighbor mm.0.0.1 as-override
 neighbor mm.0.0.1 advertisement-interval 5
no auto-summary
no synchronization
 bgp dampening 30
 exit-address-family

```

Verifying Labels in Each PE Router for Hierarchical VPNs Examples

The following examples show how to verify the configuration of PE router in hierarchical VPNs.

Verify that the loopback address of the local CE router is in the routing table of the PE1 router:

```

Router# show ip route vrf vpn2 10.2.2.2
Routing entry for 10.2.2.2/32
  Known via "bgp 200", distance 20, metric 0
  Tag 300, type external
  Last update from mm.0.0.2 20:36:59 ago
  Routing Descriptor Blocks:
  * mm.0.0.2, from mm.0.0.2, 20:36:59 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1, BGP network version 0

```

Verify that the prefix for the local CE router is in the MPLS forwarding table, and that the prefix is untagged:

```
Router# show mpls forwarding-table vrf vpn2 10.2.2.2
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC   or Tunnel Id    switched   interface
23     Untagged   aa.aa.aa.aa/32[V] 0           Et3/3      nn.0.0.2
```

Verify that the prefix of the remote PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.5.5.5
10.5.5.5/32, version 31, cached adjacency nn.0.0.2
0 packets, 0 bytes
tag information set
  local tag: 31
  fast tag rewrite with Et3/0, nn.0.0.2, tags imposed {26}
via nn.0.0.2, Ethernet3/0, 2 dependencies
next hop nn.0.0.2, Ethernet3/0
unresolved
valid cached adjacency
tag rewrite with Et3/0, nn.0.0.2, tags imposed {26}
```

Verify that the loopback address of the remote CE router is in the routing table:

```
Router# show ip route vrf vpn2 10.2.0.0
Routing entry for 10.2.0.0/32
  Known via "bgp 200", distance 200, metric 0
  Tag 300, type internal
  Last update from hh.hh.hh.hh 20:38:49 ago
Routing Descriptor Blocks:
  * hh.hh.hh.hh (Default-IP-Routing-Table), from hh.hh.hh.hh, 20:38:49 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1, BGP network version 0
```

Verify that the prefix of the remote CE router is in the MPLS forwarding table, and that an outgoing interface exists:

```
Router# show mpls forwarding-table vrf vpn2 10.2.0.0
Local  Outgoing  Prefix          Bytes tag  Outgoing  Next Hop
tag    tag or VC   or Tunnel Id    switched   interface
None   26         jj.jj.jj.jj/32  0           Et3/0      nn.0.0.2
```

Verify that the prefix of the remote CE router is in the Cisco Express Forwarding table:

```
Router# show ip cef vrf vpn2 10.2.0.0
10.2.0.0/32, version 12, cached adjacency nn.0.0.2
0 packets, 0 bytes
tag information set
  local tag: VPN route head
  fast tag rewrite with Et3/0, nn.0.0.2, tags imposed {26 32}
via hh.hh.hh.hh, 0 dependencies, recursive
next hop nn.0.0.2, Ethernet3/0 via hh.hh.hh.hh/32
valid cached adjacency
tag rewrite with Et3/0, nn.0.0.2, tags imposed {26 32}
```

Verify that the prefix of the local PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.1.0.0
10.1.0.0/32, version 9, connected, receive
tag information set
  local tag: implicit-null
```

Configuring CE Routers for Hierarchical VPNs Examples

The following example shows how to configure a CE router:

```
ip cef distributed
interface Loopback0
ip address 10.3.0.0 255.255.255.255
!
interface FastEthernet0/3/3
 ip address mm.0.0.1 255.0.0.0
!
router bgp 300
 no synchronization
 bgp log-neighbor-changes
 timers bgp 10 30
 redistribute connected                               !Redistributing routes into BGP
 neighbor mm.0.0.2 remote-as 200                       !to send to PE1
 neighbor mm.0.0.2 advertisement-interval 5
 no auto-summary
```

Verifying IP Connectivity in the Customer Site Examples

The following examples show how to verify IP connectivity at the customer site.

Verify that the loopback address of the remote CE router, learned from the PE router, is in the routing table of the local router:

```
Router# show ip route 10.2.0.0
Routing entry for 10.2.0.0/32
  Known via "bgp 300", distance 20, metric 0
  Tag 200, type external
  Redistributing via ospf 300
  Advertised by ospf 300 subnets
  Last update from mm.0.0.1 20:29:35 ago
  Routing Descriptor Blocks:
  * mm.0.0.1, from mm.0.0.1, 20:29:35 ago
    Route metric is 0, traffic share count is 1
    AS Hops 2
```

Feature Information for MPLS VPN CSC with BGP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 10 Feature Information for MPLS VPN CSC with BGP

Feature Name	Releases	Feature Information
MPLS VPN--Carrier Supporting Carrier--IPv4 BGP Label Distribution	12.0(21)ST	This feature enables you to create an MPLS VPN CSC network that uses BGP to transport routes and MPLS labels. In 12.0(21)ST, this feature was introduced. In 12.0(22)S, this feature was integrated. In 12.0(23)S, this feature was integrated. In 12.2(13)T, this feature was integrated. 12.0(24)S, this feature was integrated. In 12.2(14)S, this feature was integrated. In 12.0(27)S, this feature was integrated. In 12.0(29)S, this feature was integrated. This feature uses no new or modified commands.

Glossary

ASBR -- Autonomous System Boundary router. A router that connects one autonomous system to another.

autonomous system --A collection of networks under a common administration sharing a common routing strategy.

BGP --Border Gateway Protocol. An interdomain routing protocol that exchanges network reachability information with other BGP systems (which may be within the same autonomous system or between multiple autonomous systems).

CE router--customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. CE routers do not recognize associated MPLS VPNs.

CSC --Carrier Supporting Carrier. A hierarchical VPN model that allows small service providers, or customer carriers, to interconnect their IP or MPLS networks over an MPLS backbone. This eliminates the need for customer carriers to build and maintain their own MPLS backbone.

eBGP --external Border Gateway Protocol. A BGP between routers located within different autonomous systems. When two routers, located in different autonomous systems, are more than one hop away from one another, the eBGP session between the two routers is considered a multihop BGP.

edge router--A router that is at the edge of the network. It defines the boundary of the MPLS network. It receives and transmits packets. Also referred to as edge label switch router and label edge router.

iBGP --internal Border Gateway Protocol. A BGP between routers within the same autonomous system.

IGP --Interior Gateway Protocol. Internet protocol used to exchange routing information within a single autonomous system. Examples of common Internet IGP protocols include IGRP, OSPF, IS-IS, and RIP.

IP --Internet Protocol. Network layer protocol in the TCP/IP stack offering a connectionless internetwork service. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security. Defined in RFC 791.

LDP --Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

LFIB --Label Forwarding Information Base. Data structure used in MPLS to hold information about incoming and outgoing labels and associated Forwarding Equivalence Class (FEC) packets.

MP-BGP --Multiprotocol BGP.

MPLS --Multiprotocol Label Switching. The name of the IETF working group responsible for label switching, and the name of the label switching approach it has standardized.

NLRI --Network Layer Reachability Information. The BGP sends routing update messages containing NLRI to describe a route and how to get there. In this context, an NLRI is a prefix. A BGP update message carries one or more NLRI prefixes and the attributes of a route for the NLRI prefixes; the route attributes include a BGP next hop gateway address and extended community values.

NSF --Nonstop forwarding enables routers to continuously forward IP packets following a Route Processor takeover or switchover to another Route Processor. NSF maintains and updates Layer 3 routing and forwarding information in the backup Route Processor to ensure that IP packets and routing protocol information are forwarded continuously during the switchover and route convergence process.

PE router--provider edge router. A router that is part of a service provider's network. It is connected to a customer edge (CE) router. All MPLS VPN processing occurs in the PE router.

QoS --quality of service. Measure of performance for a transmission system that indicates its transmission quality and service availability.

RD --route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN-IPv4 prefix.

RT --route target. Extended community attribute used to identify the VRF routing table into which a prefix is imported.

SLA --Service Level Agreement given to VPN subscribers.

VPN --Virtual Private Network. A secure MPLS-based network that shares resources on one or more physical networks (typically implemented by one or more service providers). A VPN contains geographically dispersed sites that can communicate securely over a shared backbone network.

VRF --VPN routing and forwarding instance. Routing information that defines a VPN site that is attached to a PE router. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use

the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table.

Load Sharing MPLS VPN Traffic

Load sharing distributes traffic so that no individual router is overburdened. In a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) network, you can achieve load sharing through the following methods:

- BGP multipath options
- Directly connected loopback peering
- [Finding Feature Information, page 191](#)
- [Prerequisites for Load Sharing MPLS VPN Traffic, page 191](#)
- [Restrictions for Load Sharing MPLS VPN Traffic, page 191](#)
- [Information About Load Sharing MPLS VPN Traffic, page 194](#)
- [How to Configure Load Sharing, page 197](#)
- [Configuration Examples for Load Sharing MPLS VPN Traffic, page 235](#)
- [Additional References, page 237](#)
- [Feature Information for Load Sharing MPLS VPN Traffic, page 239](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Load Sharing MPLS VPN Traffic

Before configuring load sharing, ensure that your MPLS VPN network (including MPLS VPN carrier supporting carrier or interautonomous system) is configured and working properly. See the [Prerequisites for Load Sharing MPLS VPN Traffic, page 191](#) for references related to MPLS VPNs.

Restrictions for Load Sharing MPLS VPN Traffic

- Configuring BGP multipath for eBGP and iBGP is only for basic MPLS Layer 3 VPNs. MPLS VPN Inter-AS and MPLS VPN carrier supporting carrier do not support this multipath configuration.

- With multiple iBGP paths installed in a routing table, a route reflector advertises only one of the paths (one next hop). If a router is behind a route reflector, all routers that are connected to multihomed sites are not advertised unless separate VRFs with different RDs are configured for each VRF.
- Each IP routing table entry for a BGP prefix that has multiple iBGP paths uses additional memory. We recommend not using this feature on a router with a low amount of available memory and especially when the router is carrying a full Internet routing table.
- eBGP Multipath is not supported on MPLS VPN Inter-AS with ASBRs that exchange VPNv4 routes.
- Load sharing using directly connected loopback peering does not apply to CSC networks that use LDP and an IGP to distribute routes and MPLS labels.

When you configure static routes in an MPLS or MPLS VPN environment, some variations of the **ip route** and **ip route vrf** commands are not supported. These variations of the commands are not supported in Cisco IOS releases that support the Tag Forwarding Information Base (TFIB), specifically Cisco IOS Releases 12.nT, 12.nM, and 12.0S. The TFIB cannot resolve prefixes when the recursive route over which the prefixes travel disappears and then reappears. However, the command variations are supported in Cisco IOS releases that support the MPLS Forwarding Infrastructure (MFI), specifically Cisco IOS Release 12.2(25)S and later releases. Use the following guidelines when configuring static routes.

Supported Static Routes in an MPLS Environment

The following **ip route** command is supported when you configure static routes in an MPLS environment:

ip route *destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS environment and configure load sharing with static nonrecursive routes and a specific outbound interface:

ip route *destination-prefix mask interface1 next-hop1*

ip route *destination-prefix mask interface2 next-hop2*

Unsupported Static Routes in an MPLS Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS environment:

ip route *destination-prefix mask next-hop-address*

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment and enable load sharing where the next hop can be reached through two paths:

ip route *destination-prefix mask next-hop-address*

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment and enable load sharing where the destination can be reached through two next hops:

ip route *destination-prefix mask next-hop1*

ip route *destination-prefix mask next-hop2*

Use the *interface* and *next-hop* arguments when specifying static routes.

Supported Static Routes in an MPLS VPN Environment

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are associated with the same virtual routing and forwarding (VRF) instance:

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*

- **ip route vrf** *vrf-name destination-prefix mask interface1 next-hop1*
- **ip route vrf** *vrf-name destination-prefix mask interface2 next-hop2*

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table in the MPLS cloud in the global routing table. For example, these commands are supported when the next hop is pointing to the internet gateway.

- ◦ **ip route vrf** *vrf-name destination-prefix mask next-hop-address global*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address* (This command is supported when the next hop and the interface are in the core.)

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment and enable load sharing with static nonrecursive routes and a specific outbound interfaces:

ip route *destination-prefix mask interface1 next-hop1*

ip route *destination-prefix mask interface2 next-hop2*

Unsupported Static Routes in an MPLS VPN Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the next hop can be reached through two paths:

ip route vrf *destination-prefix mask next-hop-address global*

The following **ip route** commands are not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the destination can be reached through two next hops:

ip route vrf *destination-prefix mask next-hop1 global*

ip route vrf *destination-prefix mask next-hop2 global*

The following **ip route vrf** commands are not supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

ip route vrf *vrf-name destination-prefix mask next-hop1*

ip route vrf *vrf-name destination-prefix mask next-hop2*

Supported Static Routes in an MPLS VPN Environment Where the Next Hop Resides in the Global Table on the CE Router

The following **ip route vrf** command is supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table on the customer edge (CE) side. For example, the following command is supported when the destination-prefix is the CE router's loopback address, as in EBGp multihop cases.

ip route vrf *vrf-name destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table on the CE side, and you enable load sharing with static nonrecursive routes and a specific outbound interfaces:

ip route *destination-prefix mask interface1 nexthop1*

ip route *destination-prefix mask interface2 nexthop2*

Information About Load Sharing MPLS VPN Traffic

- [Overview of Load Sharing Using BGP Multipath Options, page 194](#)
- [Load Sharing Using Directly Connected Loopback Peering, page 196](#)

Overview of Load Sharing Using BGP Multipath Options

A variety of Border Gateway Protocol (BGP) multipath options exist that enable you to configure load sharing on your MPLS VPN that uses BGP.

To load share traffic at the iBGP multipath level, it is recommended that you configure BGP labeling using the **neighbor send-label** command in router configuration mode. When you configure the iBGP multipath feature, the following message is displayed as a reminder to use the neighbor send-label command functionality:

WARNING: Using iBGP multipath feature with LDP or TE based LSPs towards the BGP nexthop, paths taken by forwarding may not be as expected. Please consider configuring BGP labeling (RFC 3107) for proper forwarding behavior.

The following sections describe some BGP multipath options:

- [Internal BGP Multipath Load Sharing, page 194](#)
- [BGP Multipath for eBGP and iBGP, page 194](#)
- [eBGP Multipath Load Sharing, page 196](#)

Internal BGP Multipath Load Sharing

When a BGP-speaking router with no local policy configured receives multiple network layer reachability information (NLRI) from the internal BGP (iBGP) for the same destination, the router chooses one iBGP path as the best path. The best path is then installed in the IP routing table of the router. The iBGP multipath feature enables the BGP-speaking router to select multiple iBGP paths as the best paths to a destination. The best paths are then installed in the IP routing table of the router. To enable iBGP multipath load sharing, you issue the **maximum-paths ibgp** command in router configuration mode. For more information about iBGP multipath load sharing, see [Configuring BGP](#).

BGP Multipath for eBGP and iBGP

The BGP multipath load sharing for both eBGP and iBGP in an MPLS VPN feature allows multihomed autonomous systems and provider edge (PE) routers to be configured to distribute traffic across both external BGP (eBGP) and iBGP paths.

BGP installs up to the maximum number of paths allowed (configured using the **maximum-paths** command). BGP uses the best path algorithm to select one multipath as the best path, inserts the best path into the routing information base (RIB), and advertises the best path to BGP peers. Other multipaths can be inserted into the RIB, but only one path is selected as the best path.

Cisco Express Forwarding uses mutlipaths to perform load balancing on a per-packet or per-source or destination pair basis. To enable the load sharing feature, configure the router with MPLS VPNs that contain VPN routing and forwarding instances (VRFs) that import both eBGP and iBGP paths. You can configure the number of multipaths separately for each VRF.

**Note**

This feature operates within the configuration parameters of the existing outbound routing policy.

- [eBGP and iBGP Multipath Load Sharing in an MPLS Network Using BGP](#), page 195
- [eBGP and iBGP Multipath Load Sharing with Route Reflectors](#), page 195

eBGP and iBGP Multipath Load Sharing in an MPLS Network Using BGP

The figure below shows an MPLS service provider network using BGP that connects two remote networks to PE1 and PE2, which are both configured for VPNv4 unicast iBGP peering. Network 2 is a multihomed network that is connected to PE1 and PE2. Network 2 also has extranet VPN services configured with Network 1. Both Network 1 and Network 2 are configured for eBGP peering with the PE routers.

You can configure PE1 so that both iBGP and eBGP paths can be selected as multipaths and imported into the VRF of Network 1. Cisco Express Forwarding uses the multipaths to perform load balancing. Traffic is distributed as follows:

- IP traffic that is sent from Network 2 to PE1 and PE2 is sent across the eBGP paths as IP traffic.
- IP traffic that is sent from PE1 to PE2 is sent across the iBGP path as MPLS traffic.
- MPLS traffic that is sent across an eBGP path is sent as IP traffic.

Any prefix that is advertised from Network 2 will be received by PE1 through route distinguisher (RD) 21 and RD22.

- The advertisement through RD21 is carried in IP packets.
- The advertisement through RD22 is carried in MPLS packets.

Both paths can be selected as multipaths for VRF1 and inserted into the VRF1 RIB.

eBGP and iBGP Multipath Load Sharing with Route Reflectors

The figure below shows a topology that contains three PE routers and a route reflector, all configured for iBGP peering. PE2 and PE3 each advertise an equal preference eBGP path to PE1. By default, the route reflector chooses only one path and advertises PE1.

For all equal preference paths to PE1 to be advertised through the route reflector, you must configure each VRF with a different RD. The prefixes received by the route reflector are recognized differently and advertised to PE1.

eBGP Multipath Load Sharing

When a router learns two identical eBGP paths for a prefix from a neighboring autonomous system, it chooses the path with the lower route ID as the best path. This best path is installed in the IP routing table. You can enable eBGP multipath, which installs multiple paths in the IP routing table when the eBGP paths are learned from a neighboring autonomous system, instead of picking one best path.

During packet switching, depending on the switching mode, either per-packet or per-destination load sharing is performed among the multiple paths. The **maximum-paths** router configuration command controls the number of paths allowed. By default, BGP installs only one path to the IP routing table.

Load Sharing Using Directly Connected Loopback Peering

You use this feature with MPLS VPN Inter-AS and MPLS VPN carrier supporting carrier (CSC) networks to load share traffic between adjacent label switched routers (LSRs) that are connected by multiple links. The LSRs could be a pair of autonomous system boundary routers (ASBRs) or a CSC-PE and a CSC-CE.

Using directly connected loopback peering allows load sharing at the IGP level, so more than one BGP session is not needed between the LSRs. No other label distribution mechanism is needed between the adjacent LSRs than BGP.

Directly connected loopback peering enables load sharing of traffic as follows:

- A BGP session is established, using the loopback addresses of the LSRs.
- MPLS is enabled on the connecting links.
- Multiple static routes to the loopback address of the adjacent LSR allow IGP load sharing.
- The outgoing label to the loopback address of the adjacent LSR is an implicit null label and is inferred by the LSR.
- Because IGP load sharing is enabled on the loopback address of the adjacent LSR, any traffic destined to a prefix that is learned over the BGP session (and recurses over the loopback) is load shared.

How to Configure Load Sharing

Configuring BGP Multipath Load Sharing for eBGP and iBGP

To configure iBGP and eBGP routes for multipath load sharing, perform the following task.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `address-family ipv4 [multicast | unicast | vrf vrf-name]`
5. `maximum-paths eibgp number-of-paths`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p><code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>

Command or Action	Purpose
<p>Step 3 <code>router bgp <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config)# router bgp 1</pre>	<p>Enters router configuration mode and configures the router to run a BGP routing process.</p>
<p>Step 4 <code>address-family ipv4 [multicast unicast vrf <i>vrf-name</i>]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4 vrf vrf1</pre>	<p>Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes.</p> <p>Note For this task you must create the VRF and specify the vrf keyword.</p> <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes. • The vrf <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.
<p>Step 5 <code>maximum-paths eibgp <i>number-of-paths</i></code></p> <p>Example:</p> <pre>Router(config-router-af)# maximum-paths eibgp 6</pre>	<p>Configures the number of parallel iBGP and eBGP routes that can be installed into a routing table.</p>

Verifying BGP Multipath Load Sharing for eBGP and iBGP

To verify the configuration of iBGP and eBGP routes for multipath load sharing, perform this task.

SUMMARY STEPS

1. `enable`
2. `show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [rib-failure] [ip-prefix/length] [longer-prefixes] [network-address [mask]] [longer-prefixes] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [labels]`

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>(Optional) Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.

Command or Action	Purpose
Step 2 <code>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [rib-failure] [ip-prefix/length [longer-prefixes]] [network-address [mask] [longer-prefixes]] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [labels]</code>	Displays attributes and multipaths for a specific network in an MPLS VPN. <ul style="list-style-type: none"> • Enter one or more keywords or arguments.
Example:	
<pre>Router# show ip bgp vpnv4 all</pre>	

Configuring eBGP Multipath Load Sharing with MPLS VPN Inter-AS

Perform this task on the ASBRs to configure eBGP Multipath for MPLS VPN interautonomous systems with ASBRs exchanging IPv4 routes and MPLS labels.

SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp *as-number*
4. neighbor {*ip-address* | *peer-group-name*} remote-as *as-number*
5. address-family ipv4 [multicast | unicast | vrf *vrf-name*]
6. maximum-paths *number-paths*
7. neighbor {*ip-address* | *peer-group-name*} activate
8. neighbor *ip-address* send-label
9. exit-address-family
10. end

DETAILED STEPS

Command or Action	Purpose
Step 1 enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Example:	
<pre>Router> enable</pre>	
Step 2 configure terminal	Enters global configuration mode.
Example:	
<pre>Router# configure terminal</pre>	

Command or Action	Purpose
<p>Step 3 <code>router bgp <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
<p>Step 4 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.0.0.1 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 5 <code>address-family ipv4 [multicast unicast vrf <i>vrf-name</i>]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4</pre>	<p>Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The vrf <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.
<p>Step 6 <code>maximum-paths <i>number-paths</i></code></p> <p>Example:</p> <pre>Router(config-router-af)# maximum-paths 2</pre>	<p>(Optional) Controls the maximum number of parallel routes an IP routing protocol can support.</p> <ul style="list-style-type: none"> The <i>number-paths</i> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table.
<p>Step 7 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.1 activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 8 <code>neighbor <i>ip-address</i> send-label</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.1 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.

	Command or Action	Purpose
Step 9	exit-address-family Example: Router(config-router-af)# exit-address-family	Exits address family configuration mode.
Step 10	end Example: Router(config-router-af)# end	(Optional) Exits to privileged EXEC mode.

Configuring eBGP Multipath Load Sharing with MPLS VPN Carrier Supporting Carrier on the CSC-PE Routers

Perform this task to configure eBGP Multipath load sharing on the CSC-PE routers that distribute BGP routes with MPLS labels.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **maximum-paths** *number-paths*
6. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
7. **neighbor** {*ip-address* | *peer-group-name*} **activate**
8. **neighbor** *ip-address* **as-override**
9. **neighbor** *ip-address* **send-label**
10. **exit-address-family**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

Command or Action	Purpose
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 <code>router bgp <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and enters router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
<p>Step 4 <code>address-family ipv4 [multicast unicast vrf <i>vrf-name</i>]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4 vrf vpn1</pre>	<p>Specifies the IPv4 address family type and enters address family configuration mode.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The vrf <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.
<p>Step 5 <code>maximum-paths <i>number-paths</i></code></p> <p>Example:</p> <pre>Router(config-router-af)# maximum-paths 2</pre>	<p>(Optional) Controls the maximum number of parallel routes an IP routing protocol can support.</p> <ul style="list-style-type: none"> On the CSC-PE router, this command is enabled in address family configuration mode. The <i>number-paths</i> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table.
<p>Step 6 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.1 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 7 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.1 activate</pre>	<p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.

	Command or Action	Purpose
Step 8	neighbor <i>ip-address</i> as-override Example: <pre>Router(config-router-af)# neighbor 10.0.0.1 as-override</pre>	Configures a PE router to override the autonomous system number (ASN) of a site with the ASN of a provider. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the router that is to be overridden with the ASN provided.
Step 9	neighbor <i>ip-address</i> send-label Example: <pre>Router(config-router-af)# neighbor 10.0.0.1 send-label</pre>	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.
Step 10	exit-address-family Example: <pre>Router(config-router-af)# exit- address-family</pre>	Exits address family configuration mode.
Step 11	end Example: <pre>Router(config-router)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring eBGP Multipath Load Sharing with MPLS VPN Carrier Supporting Carrier on the CSC-CE Routers

Perform this task to configure eBGP Multipath load sharing on the CSC-CE routers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **maximum-paths** *number-paths*
5. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
6. **redistribute** *protocol*
7. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
8. **neighbor** {*ip-address* | *peer-group-name*} **activate**
9. **neighbor** *ip-address* **send-label**
10. **exit-address-family**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 200	Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	maximum-paths <i>number-paths</i> Example: Router(config-router)# maximum-paths 2	(Optional) Controls the maximum number of parallel routes an IP routing protocol can support. <ul style="list-style-type: none"> • On the CSC-CE routers, this command is issued in router configuration mode. • The <i>number-paths</i> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table.

Command or Action	Purpose
<p>Step 5 address-family ipv4 [multicast unicast vrf vrf-name]</p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4</pre>	<p>Specifies the IPv4 address family type and enters address family configuration mode.</p> <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes. • The vrf vrf-name keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.
<p>Step 6 redistribute protocol</p> <p>Example:</p> <pre>Router(config-router-af)# redistribute static</pre>	<p>Redistributes routes from one routing domain into another routing domain.</p> <ul style="list-style-type: none"> • The <i>protocol</i> argument specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: bgp, connected, egp, igrp, isis, mobile, ospf, rip, and static [ip]. <ul style="list-style-type: none"> ◦ The static [ip] keyword redistributes IP static routes. <p>Note The optional ip keyword is used when you redistribute static routes into Intermediate System- to-Intermediate System (IS-IS).</p> <ul style="list-style-type: none"> ◦ The connected keyword refers to routes that are established automatically when IP is enabled on an interface. ◦ For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes are redistributed as external to the autonomous system.
<p>Step 7 neighbor {ip-address peer-group-name} remote-as as-number</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.2 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 8 neighbor {ip-address peer-group-name} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.2 activate</pre>	<p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 9 neighbor ip-address send-label</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.0.0.2 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighboring router.

Command or Action	Purpose
<p>Step 10 <code>exit-address-family</code></p> <p>Example:</p> <pre>Router(config-router-af)# exit-address-family</pre>	Exits address family configuration mode.
<p>Step 11 <code>end</code></p> <p>Example:</p> <pre>Router(config-router)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring DCLP for MPLS VPN Inter-AS using ASBRs to Exchange VPN-IPv4 Addresses

This section describes the following tasks you need to do to configure peering of loopback interfaces of directly connected ASBRs:

The figure below shows the loopback configuration for directly connected ASBR1 and ASBR2. This configuration is used as the example in the tasks that follow.

Figure 22 Loopback Interface Configuration for Directly Connected ASBR1 and ASBR2

- [Configuring Loopback Interface Addresses for Directly Connected ASBRs, page 206](#)
- [Configuring 32 Static Routes to the eBGP Neighbor Loopback, page 207](#)
- [Configuring Forwarding on Connecting Loopback Interfaces, page 209](#)
- [Configuring an eBGP Session Between the Loopbacks, page 210](#)
- [Verifying That Load Sharing Occurs Between Loopbacks, page 213](#)

Configuring Loopback Interface Addresses for Directly Connected ASBRs

Perform this task to configure loopback interface addresses for directly connected ASBRs.

Note

Loopback addresses need to be configured for each directly connected ASBR. That is, configure a loopback address for ASBR1 and for ASBR2 in the example shown in the figure above.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface loopback** *interface- number*
4. **ip address** *ip-address mask* [**secondary**]
5. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3 interface loopback <i>interface- number</i> Example: Router(config)# interface loopback 0	Configures a software-only virtual interface that emulates an interface that is always up and enters interface configuration mode. <ul style="list-style-type: none"> • The interface-number argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.
Step 4 ip address <i>ip-address mask</i> [secondary] Example: Router(config-if)# ip address 10.10.10.10 255.255.255.255	Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> • The <i>ip-address</i> argument is the IP address. • The <i>mask</i> argument is the mask for the associated IP subnet. • The secondary keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
Step 5 end Example: Router(config-if)# end	Exits to privileged EXEC mode.

Configuring 32 Static Routes to the eBGP Neighbor Loopback

Perform this task to configure /32 static routes to the eBGP neighbor loopback.

Note You need to configure /32 static routes on each of the directly connected ASBRs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route** *prefix mask* {*ip-address* | *interface-type interface-number* [*ip-address*]} [*distance*] [*name*] [**permanent**] [**tag tag**]
4. **end**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 configure terminal</p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 ip route <i>prefix mask</i> {<i>ip-address</i> <i>interface-type interface-number</i> [<i>ip-address</i>]} [<i>distance</i>] [<i>name</i>] [permanent] [tag tag]</p> <p>Example:</p> <pre>Router(config)# ip route 10.20.20.20 255.255.255.255 Ethernet 1/0 172.16.0.1</pre>	<p>Establishes static routes.</p> <ul style="list-style-type: none"> • The <i>prefix</i> argument is the IP route prefix for the destination. • The <i>mask</i> argument is the prefix mask for the destination. • The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the specified network. • The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number. • The <i>distance</i> argument is an administrative distance. • The <i>name</i> argument applies a name to the specified route. • The permanent keyword specifies that the route is not to be removed, even if the interface shuts down. • The tag tag keyword and argument name a tag value that can be used as a “match” value for controlling redistribution through the use of route maps.
<p>Step 4 end</p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring Forwarding on Connecting Loopback Interfaces

Perform this task to configure forwarding on the connecting loopback interfaces.

This task is required for sessions between loopbacks. In the [Configuring 32 Static Routes to the eBGP Neighbor Loopback, page 207](#) task, Ethernet 1/0 and Ethernet 0/0 are the connecting interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls bgp forwarding**
5. **exit**
6. Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>type slot/port</i> Example: Router(config)# interface ethernet 1/0	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface to be configured. • The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information. • The <i>/port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.
Step 4	mpls bgp forwarding Example: Router(config-if)# mpls bgp forwarding	Configures BGP to enable MPLS forwarding on connecting interfaces.

Command or Action	Purpose
Step 5 <code>exit</code> Example: <code>Router(config-if)# exit</code>	Exits to global configuration mode.
Step 6 Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).	
Step 7 <code>end</code> Example: <code>Router(config)# end</code>	Exits to privileged EXEC mode.

Configuring an eBGP Session Between the Loopbacks

Perform this task to configure an eBGP session between the loopbacks.

Note

You need to configure an eBGP session between loopbacks on each directly connected ASBR.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `no bgp default route-target filter`
5. `neighbor {ip-address | peer-group-name} remote-as as-number`
6. `neighbor {ip-address | peer-group-name} disable-connected-check`
7. `neighbor {ip-address | ipv6-address | peer-group-name} update-source interface-type interface-number`
8. `address-family vpv4 [unicast]`
9. `neighbor {ip-address | peer-group-name | ipv6-address} activate`
10. `neighbor {ip-address | peer-group-name} send-community [both | standard extended]`
11. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>router bgp <i>as-number</i></p> <p>Example:</p> <pre>Router(config)# router bgp 200</pre>	<p>Configures the BGP routing process.</p> <ul style="list-style-type: none"> The <i>as-number</i> indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.
Step 4	<p>no bgp default route-target filter</p> <p>Example:</p> <pre>Router(config)# no bgp default route-target filter</pre>	<p>Disables BGP route-target filtering, and enters router configuration mode.</p> <ul style="list-style-type: none"> All received BGP VPN-IPv4 routes are accepted by the router.
Step 5	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>as-number</i> argument is the autonomous system to which the neighbor belongs.
Step 6	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} disable-connected-check</p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 disable-connected-check</pre>	<p>Allows peering between loopbacks.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group.

Command or Action	Purpose
<p>Step 7 neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 update-source Loopback 0</pre>	<p>Allows BGP sessions to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>interface-type</i> argument is the interface type. The <i>interface-number</i> argument is the interface number.
<p>Step 8 address-family vpv4 [unicast]</p> <p>Example:</p> <pre>Router(config-router)# address- family vpv4</pre>	<p>Enters address family configuration mode for configuring routing protocols such as BGP, Routing Information Protocol (RIP), and static routing.</p> <ul style="list-style-type: none"> The unicast keyword specifies unicast prefixes.
<p>Step 9 neighbor { <i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i> } activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.20.20.20 activate</pre>	<p>Enables the exchange of information with a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router. The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>Note This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>
<p>Step 10 neighbor { <i>ip-address</i> <i>peer-group-name</i> } send-community [both standard extended]</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.20.20.20 send-community extended</pre>	<p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router. The <i>peer-group-name</i> argument is the name of a BGP peer group. The both keyword specifies that both standard and extended communities will be sent. The standard keyword specifies that only standard communities will be sent. The extended keyword specifies that only extended communities will be sent.
<p>Step 11 end</p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Verifying That Load Sharing Occurs Between Loopbacks

Perform this task to verify that load sharing occurs between loopbacks. You need to ensure that the MPLS Label Forwarding Information Base (LFIB) entry for the neighbor route lists the available paths and interfaces.

SUMMARY STEPS

1. enable
2. show mpls forwarding-table {mask | length} | labels label [network label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]
3. disable

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	(Optional) Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 show mpls forwarding-table {mask length} labels label [network label] interface interface next-hop address lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail] Example: Router# show mpls forwarding-table	Displays the contents of the MPLS LFIB. <ul style="list-style-type: none"> • Enter an optional keyword or argument if desired.
Step 3 disable Example: Router# disable	Exits to user EXEC mode.

Configuring DCLP for MPLS VPN Inter-AS Using ASBRs to Exchange IPv4 Routes and Labels

The following sections describe how to configure peering of loopback interfaces of directly connected ASBRs to achieve load sharing in an interautonomous system network:

The figure below shows the loopback configuration for directly connected ASBR1 and ASBR2. This configuration is used as the example in the tasks that follow.

Figure 23 Loopback Interface Configuration for Directly Connected ASBR1 and ASBR2

- [Configuring Loopback Interface Addresses for Directly Connected ASBRs, page 214](#)
- [Configuring 32 Static Routes to the eBGP Neighbor Loopback, page 215](#)
- [Configuring Forwarding on Connecting Loopback Interfaces, page 216](#)
- [Configuring an eBGP Session Between the Loopbacks, page 217](#)
- [Verifying That Load Sharing Occurs Between Loopbacks, page 220](#)

Configuring Loopback Interface Addresses for Directly Connected ASBRs

Perform this task to configure loopback interface addresses.

Note

Loopback addresses need to be configured for each directly connected ASBR. That is, configure a loopback address for ASBR1 and for ASBR2 as in the example shown in the figure above.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface loopback** *interface number*
4. **ip address** *ip-address* [*mask* [**secondary**]]
5. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3 interface loopback <i>interface number</i> Example: Router(config)# interface loopback 0	Configures a software-only virtual interface that emulates an interface that is always up and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.

Command or Action	Purpose
Step 4 <code>ip address ip-address [mask [secondary]]</code> Example: <pre>Router(config-if)# ip address 10.10.10.10 255.255.255.255</pre>	Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> • The <i>ip-address</i> argument is the IP address. • The <i>mask</i> argument is the mask for the associated IP subnet. • The secondary keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
Step 5 <code>end</code> Example: <pre>Router(config-if)# end</pre>	Exits to privileged EXEC mode.

Configuring 32 Static Routes to the eBGP Neighbor Loopback

Perform this task to configure /32 static routes to the eBGP neighbor loopback.

Note

You need to configure /32 static routes on each of the directly connected ASBRs.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip route prefix mask {ip-address | interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]`
4. `end`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 <code>configure terminal</code> Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.

Command or Action	Purpose
<p>Step 3 <code>ip route prefix mask {ip-address interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]</code></p> <p>Example:</p> <pre>Router(config)# ip route 10.20.20.20 255.255.255.255 Ethernet 1/0 172.16.0.1</pre>	<p>Establishes static routes.</p> <ul style="list-style-type: none"> • The <i>prefix</i> argument is the IP route prefix for the destination. • The <i>mask</i> argument is the prefix mask for the destination. • The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the specified network. • The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number. • The <i>distance</i> argument is an administrative distance. • The <i>name</i> argument applies a name to the specified route. • The permanent keyword specifies that the route is not to be removed, even if the interface shuts down. • The tag tag keyword and argument name a tag value that can be used as a “match” value for controlling redistribution through the use of route maps.
<p>Step 4 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring Forwarding on Connecting Loopback Interfaces

Perform this task to configure forwarding on the connecting loopback interfaces.

This task is required for sessions between loopbacks. In the [Configuring 32 Static Routes to the eBGP Neighbor Loopback, page 215](#) task, Ethernet1/0 and Ethernet0/0 are the connecting interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls bgp forwarding**
5. **exit**
6. Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).
7. **end**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 <code>interface type slot/port</code></p> <p>Example:</p> <pre>Router(config)# interface ethernet 1/0</pre>	<p>Configures an interface type and enters interface configuration mode.</p> <ul style="list-style-type: none"> The <i>type</i> argument is the type of interface to be configured. The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information. The <i>port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.
<p>Step 4 <code>mpls bgp forwarding</code></p> <p>Example:</p> <pre>Router(config-if)# mpls bgp forwarding</pre>	<p>Configures BGP to enable MPLS forwarding on connecting interfaces.</p>
<p>Step 5 <code>exit</code></p> <p>Example:</p> <pre>Router(config-if)# exit</pre>	<p>Exits to global configuration mode.</p>
<p>Step 6 Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).</p>	
<p>Step 7 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring an eBGP Session Between the Loopbacks

Perform the following tasks to configure an eBGP session between the loopbacks.

Note You need to configure an eBGP session between loopbacks on each directly connected ASBR.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **bgp log-neighbor-changes**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **disable-connected-check**
7. **neighbor** {*ip-address* | *ipv6-address* | *peer-group-name*} **update-source** *interface-type interface-number*
8. **address-family ipv4** [**unicast**] **vrf** *vrf-name*
9. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address*} **activate**
10. **neighbor** {*ip-address* | *peer-group-name*} **send-community** [**both** | **standard** | **extended**]
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 200	Configures the BGP routing process, and enters router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.
Step 4	bgp log-neighbor-changes Example: Router(config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.

Command or Action	Purpose
<p>Step 5 neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>as-number</i> argument is the number of the autonomous system to which the neighbor belongs.
<p>Step 6 neighbor {<i>ip-address</i> <i>peer-group-name</i>} disable-connected-check</p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 disable-connected-check</pre>	<p>Allows peering between loopbacks.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group.
<p>Step 7 neighbor {<i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i>} update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 update-source Loopback 0</pre>	<p>Allows BGP sessions to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>Note This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>interface-type</i> argument is the interface type. The <i>interface-number</i> argument is the interface number.
<p>Step 8 address-family ipv4 [unicast] vrf <i>vrf-name</i></p> <p>Example:</p> <pre>Router(config-router)# address- family ipv4</pre>	<p>Enters address family configuration mode for configuring routing protocols such as BGP, Routing Information Protocol (RIP), and static routing.</p> <ul style="list-style-type: none"> The unicast keyword specifies unicast prefixes. The vrf <i>vrf-name</i> keyword and argument specify the name of a VPN routing/forwarding instance (VRF) to associate with submode commands.
<p>Step 9 neighbor {<i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.20.20.20 activate</pre>	<p>Enables the exchange of information with a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router. The <i>peer-group-name</i> argument is the name of the BGP peer group. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>Note This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>

Command or Action	Purpose
<p>Step 10 <code>neighbor {ip-address peer-group-name}</code> <code>send-community [both standard extended]</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.20.20.20 send-community extended</pre>	<p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router. The <i>peer-group-name</i> argument is the name of the BGP peer group. The both keyword specifies that both standard and extended communities will be sent. The standard keyword specifies that only standard communities will be sent. The extended keyword specifies that only extended communities will be sent.
<p>Step 11 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Verifying That Load Sharing Occurs Between Loopbacks

To verify that load sharing can occur between loopbacks, ensure that the MPLS LFIB entry for the neighbor route lists the available paths and interfaces.

SUMMARY STEPS

1. `enable`
2. `show mpls forwarding-table [network {mask |length} | labels label [label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]`
3. `disable`

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>show mpls forwarding-table [network {mask length} labels label [label] interface interface next-hop address lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]</code></p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>Displays the contents of the MPLS LFIB.</p> <ul style="list-style-type: none"> Enter a keyword or argument, if desired.

Command or Action	Purpose
<p>Step 3 <code>disable</code></p> <p>Example:</p> <pre>Router# disable</pre>	Exits to user EXEC mode.

Configuring Directly Connected Loopback Peering on MPLS VPN Carrier Supporting Carrier

The following sections explain how to load balance CSC traffic by peering loopback interfaces of directly connected CSC-PE and CSC-CE routers:

The figure below shows the loopback configuration for directly connected CSC-PE and CSC-CE routers. This configuration is used as the example in the tasks that follow.

Figure 24 Loopback Interface Configuration for Directly Connected CSC-PE and CSC-CE Routers

- [Configuring Loopback Interface Addresses on CSC-PE Routers](#), page 221
- [Configuring Loopback Interface Addresses for CSC-CE Routers](#), page 223

- [Configuring 32 Static Routes to the eBGP Neighbor Loopback on the CSC-CE Router](#), page 225
- [Configuring Forwarding on CSC-PE Interfaces That Connect to the CSC-CE Loopback](#), page 226
- [Configuring Forwarding on CSC-CE Interfaces That Connect to the CSC-PE Loopback](#), page 228
- [Configuring an eBGP Session Between the CSC-PE Router and the CSC-CE Loopback](#), page 229
- [Configuring an eBGP Session Between the CSC-CE Router and the CSC-PE Loopback](#), page 232
- [Verifying That Load Sharing Occurs Between Loopbacks](#), page 234

Configuring Loopback Interface Addresses on CSC-PE Routers

Perform this task to configure loopback interface addresses on the CSC-PE router.

Note

Configuration of a loopback interface address on the CSC-PE router requires the enabling of a VRF. The CSC-CE router loopback interface does not require the enabling of a VRF.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface loopback** *interface number*
4. **ip vrf forwarding** *vrf-name*
5. **ip address** *ip-address mask* [**secondary**]
6. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3 interface loopback <i>interface number</i> Example: Router(config)# interface loopback 0	Configures a software-only virtual interface that emulates an interface that is always up, and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.
Step 4 ip vrf forwarding <i>vrf-name</i> Example: Router(config-if)# ip vrf forwarding vpn1	Associates a VRF with the specified interface or subinterface. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 5 ip address <i>ip-address mask</i> [secondary] Example: Router(config-if)# ip address 10.20.20.20 255.255.255.255	Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> • The <i>ip-address</i> argument is the IP address. • The <i>mask</i> argument is the mask for the associated IP subnet. • The secondary keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.

Command or Action	Purpose
Step 6 <code>end</code> Example: <code>Router(config)# end</code>	Exits to privileged EXEC mode.

Configuring Loopback Interface Addresses for CSC-CE Routers

Perform this task to configure loopback interface addresses for CSC-CE routers.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface loopback interface-number`
4. `ip address ip-address mask [secondary]`
5. `end`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <code>Router> enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 <code>configure terminal</code> Example: <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3 <code>interface loopback interface-number</code> Example: <code>Router(config)# interface loopback 0</code>	Configures a software-only virtual interface that emulates an interface that is always up. <ul style="list-style-type: none"> • The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.

Command or Action	Purpose
<p>Step 4 <code>ip address ip-address mask [secondary]</code></p> <p>Example:</p> <pre>Router(config-if)# ip address 10.10.10.10 255.255.255.255</pre>	<p>Sets a primary or secondary IP address for an interface.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address. The <i>mask</i> argument is the mask for the associated IP subnet. The secondary keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
<p>Step 5 <code>end</code></p> <p>Example:</p> <pre>Router(config-if)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring 32 Static Routes to the eBGP Neighbor Loopback on the CSC-PE Router

Perform the following task to configure /32 static routes to the eBGP neighbor loopback on the CSC-PE router.

SUMMARY STEPS

- `enable`
- `configure terminal`
- `ip route vrf vrf-name prefix mask {ip-address | interface-type interface-number [ip-address]} [global] [distance] [name] [permanent] [tag tag]`
- `end`

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>

Command or Action	Purpose
<p>Step 3 <code>ip route vrf vrf-name prefix mask {ip-address interface-type interface-number [ip-address]} [global] [distance] [name] [permanent] [tag tag]</code></p> <p>Example:</p> <pre>Router(config)# ip route vrf vpn1 10.10.10.10 255.255.255.255 Ethernet 1/0 172.16.0.2</pre>	<p>Establishes static routes for a VRF.</p> <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name of the VRF for the static route. • The <i>prefix</i> argument is the IP route prefix for the destination. • The <i>mask</i> argument is the prefix mask for the destination. • The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the destination network. • The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number. • The global keyword specifies that the given next hop address is in the nonVRF routing table. • The <i>distance</i> argument is an administrative distance. • The <i>name</i> argument applies a name to the specified route. • The permanent keyword specifies that the route is not to be removed, even if the interface shuts down. • The tag tag keyword and argument name a tag value that can be used as a “match” value for controlling redistribution via route maps.
<p>Step 4 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring 32 Static Routes to the eBGP Neighbor Loopback on the CSC-CE Router

Perform the following task to configure /32 static routes to the eBGP neighbor loopback for the CSC-CE router.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip route prefix mask {ip-address | interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]`
4. `end`

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 <code>ip route prefix mask {ip-address interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]</code></p> <p>Example:</p> <pre>Router(config)# ip route 10.20.20.20 255.255.255.255 Ethernet 1/0 172.16.0.1</pre>	<p>Establishes static routes.</p> <ul style="list-style-type: none"> The <i>prefix</i> argument is the IP route prefix for the destination. The <i>mask</i> argument is the prefix mask for the destination. The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the destination network. The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number. The <i>distance</i> argument is an administrative distance. The <i>name</i> argument applies a name to the specified route. The permanent keyword specifies that the route is not to be removed, even if the interface shuts down. The tag tag keyword and argument name a tag value that can be used as a “match” value for controlling redistribution via route maps.
<p>Step 4 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring Forwarding on CSC-PE Interfaces That Connect to the CSC-CE Loopback

Perform this task to configure forwarding on CSC-PE interfaces that connect to the CSC-CE loopback.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **ip vrf forwarding** *vrf-name*
5. **ip address** *ip-address mask* [**secondary**]
6. **mpls bgp forwarding**
7. **exit**
8. Repeat Steps 3 through 6 for another connecting interface (Ethernet 0/0).
9. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3 interface <i>type slot/port</i> Example: <pre>Router(config)# interface ethernet 1/0</pre>	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface to be configured. • The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information. • The <i>/port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.
Step 4 ip vrf forwarding <i>vrf-name</i> Example: <pre>Router(config-if)# ip vrf forwarding vpn1</pre>	Associates a VRF with an interface or subinterface. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.

Command or Action	Purpose
<p>Step 5 <code>ip address ip-address mask [secondary]</code></p> <p>Example:</p> <pre>Router(config-if)# ip address 172.16.0.1 255.255.255.255</pre>	<p>Sets a primary or secondary IP address for an interface.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address. The <i>mask</i> argument is the mask for the associated IP subnet. The secondary keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
<p>Step 6 <code>mpls bgp forwarding</code></p> <p>Example:</p> <pre>Router(config-if)# mpls bgp forwarding</pre>	<p>Configures BGP to enable MPLS forwarding on connecting interfaces.</p>
<p>Step 7 <code>exit</code></p> <p>Example:</p> <pre>Router(config-if)# exit</pre>	<p>Exits to global configuration mode.</p>
<p>Step 8 Repeat Steps 3 through 6 for another connecting interface (Ethernet 0/0).</p>	
<p>Step 9 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring Forwarding on CSC-CE Interfaces That Connect to the CSC-PE Loopback

Perform this task to configure forwarding on CSC-CE interfaces that connect to the CSC-PE loopback.

SUMMARY STEPS

- enable**
- configure terminal**
- interface** *typeslot/port*
- mpls bgp forwarding**
- exit**
- Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).
- end**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 <code>enable</code></p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
<p>Step 2 <code>configure terminal</code></p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 <code>interface typeslot/port</code></p> <p>Example:</p> <pre>Router(config)# interface ethernet 1/0</pre>	<p>Configures an interface type and enters interface configuration mode.</p> <ul style="list-style-type: none"> The <i>type</i> argument is the type of interface to be configured. The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information. The <i>/port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.
<p>Step 4 <code>mpls bgp forwarding</code></p> <p>Example:</p> <pre>Router(config-if)# mpls bgp forwarding</pre>	<p>Configures BGP to enable MPLS forwarding on connecting interfaces.</p>
<p>Step 5 <code>exit</code></p> <p>Example:</p> <pre>Router(config-if)# exit</pre>	<p>Exits to global configuration mode.</p>
<p>Step 6 Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).</p>	
<p>Step 7 <code>end</code></p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring an eBGP Session Between the CSC-PE Router and the CSC-CE Loopback

Perform this task to configure an eBGP session between the CSC-PE router and the CSC-CE loopback.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **bgp log-neighbor-changes**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **disable-connected-check**
7. **neighbor** {*ip-address* | *ipv6-address* | *peer-group-name*} **update-source** *interface-type interface-number*
8. **address-family ipv4** [**unicast**] **vrf** *vrf-name*
9. **ip vrf forwarding** *vrf-name*
10. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address*} **activate**
11. **neighbor** *ip-address* **send-label**
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 200	Configures the BGP routing process. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.
Step 4	bgp log-neighbor-changes Example: Router(config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.

Command or Action	Purpose
<p>Step 5 neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.10.10.10 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>as-number</i> argument is the autonomous system to which the neighbor belongs.
<p>Step 6 neighbor {<i>ip-address</i> <i>peer-group-name</i>} disable-connected-check</p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.10.10.10 disable-connected-check</pre>	<p>Allows peering between loopbacks.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group.
<p>Step 7 neighbor {<i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i>} update-source <i>interface-type</i> <i>interface-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.10.10.10 update-source Loopback 0</pre>	<p>Allows BGP sessions to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>interface-type</i> argument is the interface type. The <i>interface-number</i> argument is the interface number.
<p>Step 8 address-family ipv4 [unicast] vrf <i>vrf-name</i></p> <p>Example:</p> <pre>Router(config-router)# address- family ipv4 vrf vpn1</pre>	<p>Enters address family configuration mode for configuring routing protocols such as BGP, Routing Information Protocol (RIP), and static routing.</p> <ul style="list-style-type: none"> The ipv4 keyword configures sessions that carry standard IPv4 address prefixes. The unicast keyword specifies unicast prefixes. The vrf <i>vrf-name</i> keyword and argument specify the name of a VRF to associate with submode commands.
<p>Step 9 ip vrf forwarding <i>vrf-name</i></p> <p>Example:</p> <pre>Router(config-router-af)# ip vrf forwarding vpn1</pre>	<p>Associates a VRF with an interface or subinterface.</p> <ul style="list-style-type: none"> The <i>vrf-name</i> argument is the name assigned to a VRF.

Command or Action	Purpose
<p>Step 10 neighbor {<i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.10.10.10 activate</pre>	<p>Enables the exchange of information with a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router. The <i>peer-group-name</i> argument is the name of the BGP peer group. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>Note This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>
<p>Step 11 neighbor <i>ip-address</i> send-label</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.10.10.10 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router.
<p>Step 12 end</p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Configuring an eBGP Session Between the CSC-CE Router and the CSC-PE Loopback

Perform this task to configure an eBGP session between the CSC-CE router and the CSC-PE loopback.

SUMMARY STEPS

- enable**
- configure terminal**
- router bgp** *as-number*
- bgp log-neighbor-changes**
- neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>router bgp <i>as-number</i></p> <p>Example:</p> <pre>Router(config)# router bgp 200</pre>	<p>Configures the BGP routing process.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.
Step 4	<p>bgp log-neighbor-changes</p> <p>Example:</p> <pre>Router(config-router)# bgp log-neighbor-changes</pre>	<p>Enables logging of BGP neighbor resets.</p>
Step 5	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 remote-as 100</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>as-number</i> argument is the autonomous system to which the neighbor belongs.
Step 6	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} disable-connected-check</p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 disable-connected-check</pre>	<p>Allows peering between loopbacks.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighbor. The <i>peer-group-name</i> argument is the name of a BGP peer group.

Command or Action	Purpose
<p>Step 7 neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor 10.20.20.20 update-source Loopback 0</pre>	<p>Allows BGP sessions to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> The <i>peer-group-name</i> argument is the name of a BGP peer group. The <i>interface-type</i> argument is the interface type. The <i>interface-number</i> argument is the interface number.
<p>Step 8 address-family ipv4 [unicast] [vrf <i>vrf-name</i>]</p> <p>Example:</p> <pre>Router(config-router)# address- family ipv4</pre>	<p>Enters address family configuration mode for configuring routing protocols such as BGP, RIP, and static routing.</p> <ul style="list-style-type: none"> The ipv4 keyword configures sessions that carry standard IPv4 address prefixes. The unicast keyword specifies unicast prefixes. The vrf <i>vrf-name</i> keyword and argument specify the name of a VRF to associate with submodule commands.
<p>Step 9 neighbor { <i>ip-address</i> <i>peer-group-name</i> / <i>ipv6-address</i> } activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.20.20.20 activate</pre>	<p>Enables the exchange of information with a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router. The <i>peer-group-name</i> argument is the name of the BGP peer group. The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor. <p>Note This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>
<p>Step 10 neighbor <i>ip-address</i> send-label</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 10.20.20.20 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument is the IP address of the neighboring router.
<p>Step 11 end</p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits to privileged EXEC mode.</p>

Verifying That Load Sharing Occurs Between Loopbacks

To verify that load sharing occurs between loopbacks, ensure that the MPLS LFIB entry for the neighbor route lists the available paths and interfaces.

SUMMARY STEPS

1. **enable**
2. **show mpls forwarding-table** [**vrf** *vrf-name*] [{*network* {*mask* | *length*} | **labels** *label* [-*label*] | [**interface**] *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
3. **disable**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 show mpls forwarding-table [vrf <i>vrf-name</i>] [{<i>network</i> {<i>mask</i> <i>length</i>} labels <i>label</i> [-<i>label</i>] [interface] <i>interface</i> next-hop <i>address</i> lsp-tunnel [<i>tunnel-id</i>]}] [detail]</p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>Displays the contents of the MPLS LFIB.</p>
<p>Step 3 disable</p> <p>Example:</p> <pre>Router# disable</pre>	<p>Exits to user EXEC mode.</p>

Configuration Examples for Load Sharing MPLS VPN Traffic

- [Configuring a Router to Select eBGP or iBGP Paths as Multipaths Example, page 236](#)
- [Configuring a 32 Static Route from an ASBR to the Loopback Address of Another ASBR Examples, page 236](#)
- [Configuring BGP MPLS Forwarding on the Interfaces Connecting ASBRs Example, page 236](#)
- [Configuring VPNv4 Sessions on an ASBR Example, page 236](#)
- [Verifying VPN NLRI for a Specified Network Example, page 237](#)

Configuring a Router to Select eBGP or iBGP Paths as Multipaths Example

The following example configures a router in address family configuration mode to select six eBGP or iBGP paths as multipaths:

```
Router(config)# router bgp 100
Router(config-router)# address-family ipv4 vrf try
Router(config-router-af)# maximum-paths eibgp 6
Router(config-router-af)# end
```

Configuring a /32 Static Route from an ASBR to the Loopback Address of Another ASBR Examples

The following example configures a /32 static route from ASBR1 to the loopback address of ASBR2:

```
Router# configure terminal
Router(config)# ip route 10.20.20.20 255.255.255 e1/0 168.192.0.1
Router(config)# ip route 10.20.20.20 255.255.255 e0/0 168.192.2.1
```

The following example configures a /32 static route from ASBR2 to the loopback address of ASBR1:

```
Router# configure terminal
Router(config)# ip route vrf vpn1 10.10.10.10 255.255.255 e1/0 168.192.0.2
Router(config)# ip route vrf vpn1 10.10.10.10 255.255.255 e0/0 168.192.2.2
```

Configuring BGP MPLS Forwarding on the Interfaces Connecting ASBRs Example

The following example configures BGP/MPLS forwarding on the interfaces connecting ASBR2 with ASBR1:

```
Router# configure terminal
Router(config)# interface ethernet 1/0
Router(config-if)# ip vrf forwarding vpn1
Router(config-if)# ip address 168.192.0.1 255.255.255.255
Router(config-if)# mpls bgp forwarding
Router(config-if)# exit
Router(config)# interface ethernet 0/0
Router(config-if)# ip vrf forwarding vpn1
Router(config-if)# ip address 168.192.2.1 255.255.255.255
Router(config-if)# mpls bgp forwarding
Router(config-if)# exit
```

Configuring VPNv4 Sessions on an ASBR Example

The following example configures VPNv4 sessions on ASBR2:

```
Router# configure terminal
Router(config)# router bgp 200
Router(config-router)# bgp log-neighbor-changes
Router(config-router)# neighbor 10.10.10.10 remote-as 100
Router(config-router)# neighbor 10.10.10.10 disable-connected-check
Router(config-router)# neighbor 10.10.10.10 update-source Loopback0
!
Router(config-router)# address-family vpnv4
Router(config-router-af)# neighbor 10.10.10.10 activate
Router(config-router-af)# neighbor 10.10.10.10 send-community extended
Router(config-router-af)# end
```

Verifying VPN NLRI for a Specified Network Example

If you enter the **all** keyword with the **show ip bgp vpnv4** command, the output displays information about all VPN network layer reachability information (NLRI) for a specified network:

```
Router# show ip bgp vpnv4 all 10.22.22.0
BGP routing table entry for 10:1:22.22.22.0/24, version 19
Paths:(5 available, best #5)
Multipath: eiBGP
  Advertised to non peer-group peers:

Feature Information for Load Sharing MPLS VPN Traffic

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 11 Feature Information for Load Sharing MPLS VPN Traffic

Feature Name	Releases	Feature Configuration Information
MPLS VPN--Load Balancing Support for Inter-AS and CSC VPNs	12.0(29)S 12.4(20)T	This feature allows MPLS VPN Inter-AS and MPLS VPN CSC networks to load share traffic between adjacent LSRs that are connected by multiple links. The LSRs can be a pair of ASBRs or a CSC-PE and a CSC-CE. Using directly connected loopback peering allows load sharing at the IGP level, so more than one BGP session is not needed between the LSRs. No other label distribution mechanism is needed between the adjacent LSRs than BGP.
BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN	12.2(4)T 12.2(14)S 12.0(24)S	This feature allows multihomed autonomous systems and PE routers to be configured to distribute traffic across both external BGP (eBGP) and internal BGP (iBGP) paths.
iBGP Multipath Load Sharing	12.2(2)T 12.2(14)S	This feature enables the BGP speaking router to select multiple iBGP paths as the best paths to a destination.
eBGP Multipath	12.0(27)S	This feature installs multiple paths in the IP routing table when the eBGP paths are learned from a neighboring Autonomous System (AS), instead of picking one best path.

MPLS VPN--Inter-AS Option AB

The MPLS VPN--Inter-AS Option AB feature combines the best functionality of an Inter-AS Option (10) A and Inter-AS Option (10) B network to allow a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) service provider to interconnect different autonomous systems to provide VPN services. These networks are defined in RFC 4364 section 10 “Multi-AS Backbones,” subsections a and b, respectively.

When different autonomous systems are interconnected in an MPLS VPN--Inter-AS Option AB configuration, the entire network configuration is scaled and simplified, and maintains IP quality of service (QoS) functions between Autonomous System Boundary Router (ASBR) peers.

In an Inter-AS Option A network, ASBR peers are connected by multiple subinterfaces with at least one interface VPN that spans the two autonomous systems. These ASBRs associate each subinterface with a VPN routing and forwarding (VRF) instance and a Border Gateway Protocol (BGP) session to signal unlabeled IP prefixes. As a result, traffic between the back-to-back VRFs is IP. In this scenario, the VPNs are isolated from each other, and because the traffic is IP, QoS mechanisms that operate on IP traffic can be applied to achieve customer Service Level Agreements (SLAs). The downside of this configuration is that one BGP session is needed for each subinterface (and at least one subinterface for each VPN), which causes scalability concerns as this network grows.

In an Inter-AS Option B network, ASBR peers are connected by one or more subinterfaces that are enabled to receive MPLS traffic. A Multiprotocol Border Gateway Protocol (MP-BGP) session is used to distribute labeled VPN prefixes between the ASBR. As a result, the traffic that flows between them is labeled. The downside of this configuration is that, because the traffic is MPLS, QoS mechanisms that can be applied only to IP traffic cannot be applied and the VRFs cannot be isolated.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information

about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN--Inter-AS Option AB

Follow the appropriate configuration tasks outlined in the following documents:

- [Configuring MPLS Layer 3 VPNs](#)
- [MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses](#)
- [MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels](#)

Before configuring the MPLS VPN--Inter-AS Option AB feature, perform these tasks:

- Enable Cisco Express Forwarding, which is required for the MPLS VPN routing and forwarding operation.
- Identify the VPNs for the MPLS VPN--Inter-AS Option AB network and configure the VRFs to which these VPNs belong. These VRFs are used for Inter-AS Option AB connections on the ASBR interface.

Restrictions for MPLS VPN--Inter-AS Option AB

- The In Service Software Upgrade (ISSU) feature can be configured only on the active Route Processor (RP) if the standby RP supports this feature. The ISSU feature can be configured if both the active and standby RP support this feature.
- Carrier Supporting Carrier (CSC) MPLS load-balancing on ASBR Option AB VRF interfaces is not supported.
- VPNv6 is not supported.

Information About MPLS VPN--Inter-AS Option AB

- [MPLS VPN--Inter-AS Option AB Introduction, page 242](#)
- [Benefits of MPLS VPN--Inter-AS Option AB, page 243](#)
- [Route Distribution and Packet Forwarding in Non-CSC Networks, page 243](#)
- [Route Distribution and Packet Forwarding for CSC, page 246](#)

MPLS VPN--Inter-AS Option AB Introduction

MPLS VPN service providers need to interconnect different autonomous systems to provide service for multiple VPN customers. The MPLS VPN--Inter-AS Option AB feature allows the different autonomous systems to interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic. This MP-BGP session signals VPN prefixes between two ASBRs for each VRF instance. The data plane traffic is on a VRF interface. This traffic can either be IP or MPLS.

**Note**

Inter-AS connections can be configured between ASBRs that either have or do not have connections between different providers.

Benefits of MPLS VPN--Inter-AS Option AB

The MPLS VPN--Inter-AS Option AB feature provides the following benefits for service providers:

- Network configuration can be simplified because only one BGP session is configured for each VRF on the ASBR.
- One BGP session reduces CPU utilization.
- Networks can be scaled because a single MP-BGP session, which is enabled globally on the router, reduces the number of sessions required by multiple VPNs, while continuing to keep VPNs isolated and secured from each other.
- IP QoS functions between ASBR peers are maintained for customer SLAs.
- Dataplane traffic is isolated on a per-VRF basis for security purposes.

Route Distribution and Packet Forwarding in Non-CSC Networks

The following sections describe MPLS VPN--Inter-AS Option AB operation:

**Note**

All imported routes are accomplished by configuring the appropriate route targets (RTs).

The following attributes describe the topology of the sample MPLS VPN--Inter-AS Option AB network shown in the figure below:

- Customer edge 1 (CE1) and CE3 belong to VPN 1.
- CE2 and CE 4 belong to VPN 2.
- Provider edge 1 (PE1) uses route distinguisher 1 (RD 1) for VPN 1 (VRF 1) and RD 2 for VPN 2 (VRF 2).
- PE2 uses RD 3 for VPN 1 (VRF 1) and RD 4 for VPN 2 (VRF 2).
- ASBR1 has VRF 1 provisioned with RD 5 and VRF 2 provisioned with RD 6.
- ASBR2 has VRF 1 provisioned with RD 7 and VRF 2 provisioned and RD 8.
- ASBR1 and ASBR2 have three links between them:
 - VRF 1
 - VRF 2
 - MP-BGP session

**Note**

The VRFs configured on the ASBRs are called Option AB VRFs. The eBGP peers on the ASBRs are called Option AB Peers.

Figure 25 *MPLS VPN Inter-AS Option AB Topology*

- [Route Distribution for VPN 1, page 244](#)
- [Packet Forwarding for VPN 1, page 245](#)
- [Route Distribution for VPN 2, page 245](#)

Route Distribution for VPN 1

A route distinguisher (RD) is an identifier attached to a route that identifies which VPN belongs to each route. Each routing instance must have a unique RD autonomous system associated with it. The RD is used to place a boundary around a VPN so that the same IP address prefixes can be used in different VPNs without having these IP address prefixes overlap.

**Note**

An RD statement is required if the instance type is a VRF.

The following process describes the route distribution process for VPN 1 in the figure above. Prefix “N” is used in this process to indicate the IP address of a VPN.

- 1 CE1 advertises the prefix N to PE1.
- 2 PE1 advertises a VPN prefix RD 1:N to ASBR1 through MP internal BGP (iBGP).
- 3 ASBR1 imports the prefix into VPN 1 and creates a prefix RD 5:N.
- 4 ASBR1 advertises the imported prefix RD 5:N to ASBR2. ASBR1 sets itself as the next hop for prefix RD 5:N and allocates a local label that is signaled with this prefix.
- 5 ASBR1 advertises the route with the export RT configured on the VRF rather than the originally received RTs. By default, ASBR1 does not advertise the source prefix RD 1:N to ASBR2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.

**Note**

In an Option 10B connection, the source prefix can be advertised to another ASBR on which ASBR1 has an Option 10B connection. An ASBR with an Option 10B connection maintains all VPNv4 routes in its BGP table.

- 1 ASBR2 receives the prefix RD 5:N and imports it into VPN 1 as RD 7:N.
- 2 ASBR2 advertises the route with the export RT configured on the VRF rather than the originally received RTs.
- 3 While importing the prefix, ASBR2 sets the next hop of RD 7:N to the ASBR1 interface IP address in VRF 1. The next hop table ID is also set to VRF 1. When installing the MPLS forwarding entry for RD 7:N, by default ASBR2 does not install the outgoing label in the forwarding process. This enables the traffic between the ASBRs to be IP.
- 4 ASBR2 advertises the imported prefix RD 7:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix. By default, ASBR2 does not advertise the source prefix RD 5:N to PE2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.
- 5 PE2 imports the RD 7:N into VRF 1 as RD 3:N.

Packet Forwarding for VPN 1

The following packet forwarding process works the same as it does in an Option A scenario. The ASBR acts like the PE by terminating the VPN and then forwards its traffic as standard IP packets with no VPN label to the next PE, which in turn repeats the VPN process. Each PE router, therefore, treats the adjacent PE router as a CE router, and the standard Layer 3 MPLS VPN mechanisms are used for route redistribution with each autonomous system; that is, the PEs use external BGP (eBGP) to distribute unlabeled IPv4 addresses to each other.

**Note**

Prefix “N” is used in this process to indicate the IP address of a VPN.

- 1 CE3 sends a packet destined for N to PE2.
- 2 PE2 encapsulates the packet with the VPN label allocated by ASBR2 and the Interior Gateway Protocol (IGP) label needed to tunnel the packet to ASBR2.
- 3 The packet arrives on ASBR2 with the VPN label. ASBR2 removes the VPN label and sends the packet as IP to ASBR1 on the VRF 1 interface.
- 4 The IP packet arrives at ASBR1 on the VRF 1 interface. ASBR1 then encapsulates the packet with the VPN label allocated by PE1 and the IGP label needed to tunnel the packet to PE1.
- 5 The packet arrives on PE1 with the VPN label. PE1 disposes the VPN label and forwards the IP packet to CE1.

Route Distribution for VPN 2

The following information describes the route distribution process for VPN 2 in the figure above:

- 1 CE2 advertises prefix N to PE1, where N is the VPN IP address.
- 2 PE1 advertises a VPN prefix RD 2:N to ASBR1 through MP-iBGP.
- 3 ASBR1 imports the prefix into VPN 2 and creates a prefix RD 6:N.
- 4 ASBR1 advertises the imported prefix RD 6:N to ASBR2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix. By default, ASBR1 does not advertise the

source prefix RD 2:N to ASBR2. This advertisement is suppressed as the prefix is being imported into an Option AB VRF.

**Note**

In the case of an Option 10B connection, the source prefix can be advertised to another ASBR on which ASBR1 has an Option 10B connection. An ASBR with an Option 10B connection maintains all VPNv4 routes in its BGP table.

- 1 ASBR2 receives the prefix RD 6:N and imports it into VPN 2 as RD 8:N.
- 2 While importing the prefix, ASBR2 sets the next hop of RD 8:N to ASBR1's interface address in VRF 2. The next hop table ID is also set to that of VRF 2. While installing the MPLS forwarding entry for RD 8:N, by default ASBR2 does not install the outgoing label in the forwarding process. This enables traffic between the ASBRs to be IP.
- 3 ASBR2 advertises the imported prefix RD 8:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix. By default, ASBR2 does not advertise the source prefix RD 6:N to PE2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.
- 4 PE2 imports the RD 8:N into VRF 2 as RD 4:N.

Route Distribution and Packet Forwarding for CSC

The following sections describe MPLS VPN--Inter-AS Option AB operation for a CSC scenario for VPN 1. These sections are similar to those found in Route Distribution and Packet Forwarding in Non-CSC Networks for VPN 1, except for the method in which MPLS labels are handled between the two ASBRs.

**Note**

VPN 2 is not shown or discussed in this section.

The figure below shows how VPN 1 provides VPN service to a small customer carrier that in turn provides a VPN service to its customer. This configuration implies that VPN 1 is used to provide a label switched path (LSP) between the PE (PE 3 and PE 4) loopback interfaces of the small customer carrier.

Figure 26 MPLS VPN Inter-AS Option AB CSC Topology

**Note**

The RD, RT, VRF, and Link provisioning in this section is the same as in the Route Distribution and Packet Forwarding in Non-CSC Networks example for VPN 1.

- [Route Distribution for VPN 1, page 247](#)
- [Packet Forwarding for VPN 1, page 247](#)

Route Distribution for VPN 1

The following information describe the route distribution process for VPN 1 in Figure 1 . Prefix “N” is used in these steps to indicate the IP address of a VPN.

- 1 CE1 advertises PE 3 loopback N to PE1.
- 2 PE1 advertises a VPN prefix RD 1:N to ASBR1 through MP-iBGP.
- 3 ASBR1 imports the prefix into VPN 1 and creates a prefix RD 5:N.
- 4 ASBR1 advertises the imported prefix RD 5:N to ASBR2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix.
- 5 ASBR1 advertises the route with the export RT configured on the VRF rather than the originally received RTs. By default, ASBR1 does not advertise the source prefix RD 1:N to ASBR2. This advertisement is suppressed as the prefix is being imported into an Option AB VRF.

**Note**

In an Option 10B connection, the source prefix can be advertised to another ASBR on which ASBR1 has an Option 10B connection. An ASBR with an Option 10B connection maintains all VPNv4 routes in its BGP table.

- 1 ASBR2 receives the prefix RD 5:N and imports it into VPN 1 as RD 7:N.
- 2 ASBR2 advertises the route with the export RT configured on the VRF rather than the originally received RTs.
- 3 While importing the prefix, ASBR2 sets the next hop of RD 7:N to the ASBR1 interface address in VRF 1. The next hop table ID is also set to that of VRF 1.

**Note**

In a CSC scenario, an outgoing MPLS label can be installed in forwarding by making a configuration change. See the [How to Configure Inter-AS Option AB, page 248](#).

- 1 While installing the MPLS forwarding entry for RD 7:N, ASBR2 installs the outgoing label during the forwarding process, which enables the traffic between the ASBRs to be MPLS traffic.
- 2 ASBR2 advertises the imported prefix RD 7:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix. By default, ASBR2 does not advertise the source prefix RD 5:N to PE2. This advertisement is suppressed as the prefix is being imported into an Option AB VRF.
- 3 PE2 imports the RD 7:N into VRF 1 as RD 3:N.

Packet Forwarding for VPN 1

The packet forwarding process shown below works the same as it does in an Option A scenario. See the Route Distribution and Packet Forwarding in Non-CSC Networks section for more information about Option A.

- 1 PE 4 sends an MPLS packet destined for N to CE2.
- 2 CE2 swaps the MPLS label and sends a packet destined for N to PE2.
- 3 PE2 encapsulates the packet with the VPN label allocated by ASBR2 and the IGP label needed to tunnel the packet to ASBR2.
- 4 The packet arrives on ASBR2 with the VPN label. ASBR2 swaps the received VPN label with the outgoing label received from ASBR1 and sends the MPLS packet on to the VRF 1 interface.
- 5 The MPLS packet arrives at ASBR1 on the VRF 1 interface. ASBR1 then swaps the received MPLS label with a label stack consisting of the VPN label allocated by PE1 and the IGP label needed to tunnel the packet to PE1.
- 6 The packet arrives on PE1 with the VPN label. PE1 disposes the VPN label and forwards the MPLS packet to CE1. CE1 in turn swaps the label and forwards the labeled packet to PE 3.

How to Configure Inter-AS Option AB

The following sections describe how to configure the Inter-AS Option AB feature on an ASBR for either an MPLS VPN or an MPLS VPN that supports CSC:

Note

If Inter-AS Option AB is already deployed in your network and you want to do Option B style peering for some prefixes (that is, implement Inter-AS Option AB+), configure the **inter-as-hybrid global** command as described in the “Configuring the Routing Policy for VPNs that Need Inter-AS Connections” section.

- [Configuring an Inter-AS Option AB Connection, page 248](#)
- [Changing an Inter-AS Option A Deployment to an Option AB Deployment, page 254](#)

Configuring an Inter-AS Option AB Connection

The following sections are required and describe how to configure an Inter-AS Option AB connection on an ASBR:

Note

See the Configuring MPLS Layer 3 VPNs feature module for more information on configuring PE and CE routers in an MPLS VPN.

- [Configuring the VRFs on the ASBR Interface for Each VPN Customer, page 248](#)
- [Configuring the MP-BGP Session Between ASBR Peers, page 250](#)
- [Configuring the Routing Policy for VPNs that Need Inter-AS Connections, page 252](#)

Configuring the VRFs on the ASBR Interface for Each VPN Customer

Use the following steps to configure the VRFs on the ASBR interface for each VPN customer so that these VPNs have connectivity over the MPLS VPN--Inter-AS Option AB network.

Note The **mpls bgp forwarding** command is used only on the ASBR interface for VRFs that support CSC.

Use all of the steps in the following procedure to configure additional VRFs that need to be configured on the ASBR interface and the VRFs that need to be configured on the peer ASBR interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip vrf forwarding** *vrf-name*
5. **mpls bgp forwarding**
6. **end**

DETAILED STEPS

Command or Action	Purpose
<p>Step 1 enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
<p>Step 2 configure terminal</p> <p>Example:</p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p>Step 3 interface <i>type number</i></p> <p>Example:</p> <pre>Router(config)# interface Ethernet 5/0</pre>	<p>Specifies the interface to configure and enters interface configuration mode.</p> <ul style="list-style-type: none"> • The <i>type</i> argument specifies the type of interface to be configured. • The <i>number</i> argument specifies the port, connector, or interface card number.
<p>Step 4 ip vrf forwarding <i>vrf-name</i></p> <p>Example:</p> <pre>Router(config-if)# ip vrf forwarding vpn1</pre>	<p>Associates a VRF with the specified interface or subinterface.</p> <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
<p>Step 5 mpls bgp forwarding</p> <p>Example:</p> <pre>Router(config-if)# mpls bgp forwarding</pre>	<p>(Optional) Configures BGP to enable MPLS forwarding on connecting interfaces for VRFs that must support MPLS traffic.</p> <ul style="list-style-type: none"> • This step applies to a CSC network only.

Command or Action	Purpose
Step 6 end Example: Router(config-if)# end	(Optional) Exits to privileged EXEC mode.

Configuring the MP-BGP Session Between ASBR Peers

BGP propagates reachability information for VPN-IPv4 prefixes among PE routers by means of the BGP multiprotocol extensions (see RFC 2283, *Multiprotocol Extensions for BGP-4*), which define support for address families other than IPv4. Using the extensions ensures that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.

Follow the steps in this section to configure the MP-BGP session on the ASBR.

Use all of the steps in the following procedure to configure the MP BGP session on the peer ASBR.

SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp *as-number*
4. neighbor { *ip-address* | *peer-group-name* } remote-as *as-number*
5. address-family vpnv4 [unicast]
6. neighbor { *ip-address* | *peer-group-name* } activate
7. neighbor { *ip-address* | *peer-group-name* } inter-as-hybrid
8. exit-address-family
9. end

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.

Command or Action	Purpose
<p>Step 3 <code>router bgp <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
<p>Step 4 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></code></p> <p>Example:</p> <pre>Router(config-router)# neighbor 192.168.0.1 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
<p>Step 5 <code>address-family vpnv4 [unicast]</code></p> <p>Example:</p> <pre>Router(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The unicast keyword specifies IPv4 unicast address prefixes.
<p>Step 6 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 192.168.0.1 activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 7 <code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} inter-as-hybrid</code></p> <p>Example:</p> <pre>Router(config-router-af)# neighbor 192.168.0.1 inter-as-hybrid</pre>	<p>Configures eBGP peer router (ASBR) as an Inter-AS Option AB peer.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. If any prefixes are imported into Option AB VRFs, then the imported paths are advertised to this peer. If any prefixes are received from this peer and are imported into Option AB VRFs, then the imported paths are advertised to iBGP peers. <p>Note Advertised routes have RTs that are configured on the VRF. Advertised routes do not have their original RTs.</p>

Command or Action	Purpose
Step 8 <code>exit-address-family</code> Example: <pre>Router(config-router-af)# exit-address-family</pre>	Exits from address family configuration mode.
Step 9 <code>end</code> Example: <pre>Router(config-router-af)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring the Routing Policy for VPNs that Need Inter-AS Connections

Use the steps in this section to configure VRFs for the VPNs that need Inter-AS connections between ASBR peers, by configuring the appropriate routing policy and Option AB configuration.

Use all of the steps in the following procedure to configure additional VPNs that need Inter-AS Option AB connectivity on this ASBR and the peer ASBR.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vrf definition vrf-name`
4. `rd route-distinguisher`
5. `address-family ipv4`
6. `route-target {import | export | both} route-target-ext-community`
7. For Inter-AS Option AB+, go to Step 10; otherwise, go to Step 8.
8. `inter-as-hybrid [csc]`
9. `inter-as-hybrid [csc] [next-hop ip-address]`
10. `inter-as-hybrid next-hop global`
11. `end`

DETAILED STEPS

Command or Action	Purpose
Step 1 <code>enable</code> Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	<p>vrf definition <i>vrf-name</i></p> <p>Example:</p> <pre>Router(config)# vrf definition vpn1</pre>	<p>Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode.</p> <ul style="list-style-type: none"> The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	<p>rd <i>route-distinguisher</i></p> <p>Example:</p> <pre>Router(config-vrf)# rd 100:1</pre>	<p>Creates routing and forwarding tables.</p> <ul style="list-style-type: none"> The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> 16-bit autonomous system number: your 32-bit number, for example, 101:3 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1
Step 5	<p>address-family ipv4</p> <p>Example:</p> <pre>Router(config-vrf)# address- family ipv4</pre>	<p>Enters VRF address family configuration mode to specify an address family for a VRF.</p> <ul style="list-style-type: none"> The ipv4 keyword specifies an IPv4 address family for a VRF.
Step 6	<p>route-target {import export both} <i>route-target-ext-community</i></p> <p>Example:</p> <pre>Router(config-vrf-af)# route- target import 100:1</pre>	<p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> The import keyword imports routing information from the target VPN extended community. The export keyword exports routing information to the target VPN extended community. The both keyword imports routing information from and exports routing information to the target VPN extended community. The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF list of import, export, or both (import and export) route-target extended communities.
Step 7	For Inter-AS Option AB+, go to Step 10; otherwise, go to Step 8.	—

Command or Action	Purpose
<p>Step 8 <code>inter-as-hybrid [csc]</code></p> <p>Example:</p> <pre>Router(config-vrf-af)# inter- as-hybrid</pre>	<p>Specifies the VRF as an Option AB VRF, which has the following effects:</p> <ul style="list-style-type: none"> • Routes imported to this VRF can be advertised to Option AB peers and VPNv4 iBGP peers. • When routes received from Option AB peers and are imported into the VRF, the next hop table ID of the route is set to the table ID of the VRF. • If the csc keyword is not used, a per-VRF label is allocated for imported routes. • When routes are received from Option AB peers and are imported next into the VRF, the learned out label can be installed only in forwarding when the csc keyword is used. <p>The csc keyword implies the following:</p> <ul style="list-style-type: none"> • A per-prefix label is allocated for imported routes. • For routes received from Option AB peers that are imported into the VRF, the learned out label is installed in forwarding.
<p>Step 9 <code>inter-as-hybrid [csc] [next-hop ip-address]</code></p> <p>Example:</p> <pre>Router(config-vrf-af)# inter- as-hybrid next-hop 192.168.1.0</pre>	<p>(Optional) Specifies the next hop IP address to be set on paths that are imported into the VRF and that are received from an Option AB peer.</p> <ul style="list-style-type: none"> • The next hop context is also set to the VRF, which imports these paths. • The csc keyword implies the following: <ul style="list-style-type: none"> ◦ A per-prefix label is allocated for imported routes. ◦ For routes received from Option AB peers that are imported into the VRF, the learned out label is installed in forwarding.
<p>Step 10 <code>inter-as-hybrid next-hop global</code></p> <p>Example:</p> <pre>Router(config-vrf-af)# inter- as-hybrid next-hop global</pre>	<p>(For Option AB+) Enables Inter-AS Option AB+.</p> <ul style="list-style-type: none"> • Specifies that the next-hop address for BGP updates to be set on paths that are imported to the VRF and that are received from an Option AB+ peer are placed in the global routing table. • The address used is the address of the interface that is at the remote end of the external BGP (eBGP) global shared link. The next-hop context is retained as global and not modified to that of the importing VRF.
<p>Step 11 <code>end</code></p> <p>Example:</p> <pre>Router(config-vrf-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Changing an Inter-AS Option A Deployment to an Option AB Deployment

In an Option A deployment, the VRF instances are back-to-back between the ASBR routers and there is direct connectivity between PE routers of different autonomous systems. The PE routers are attached by multiple physical or logical interfaces, each of which is associated with a given VPN (through a VRF instance).

In the Option AB deployment, the different autonomous systems interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic.

Use the following steps to change an MPLS VPN Inter-AS Option A deployment to an Option AB deployment.

- 1 Configure the MP-BGP session on the ASBR. BGP multiprotocol extensions are used to define support for address families other than IPv4 so that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other. See the [Configuring the MP-BGP Session Between ASBR Peers, page 250](#) for detailed configuration information.
- 2 Identify the VRFs that need an upgrade from Option A and configure them for Option AB by using the **inter-as-hybrid** command. See the [Configuring the Routing Policy for VPNs that Need Inter-AS Connections, page 252](#) for detailed configuration information.
- 3 Use the following steps in this section to remove the configuration for the eBGP (peer ASBR) neighbor.
- 4 Repeat all the steps in the following procedure to remove the configuration for additional eBGP (peer ASBR) neighbors.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4 vrf** *vrf-name*
5. **no neighbor** {*ip-address* | *peer-group-name*}
6. **exit-address-family**
7. **end**

DETAILED STEPS

Command or Action	Purpose
Step 1 enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2 configure terminal Example: Router# configure terminal	Enters global configuration mode.

Command or Action	Purpose
<p>Step 3 <code>router bgp as-number</code></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
<p>Step 4 <code>address-family ipv4 vrf vrf-name</code></p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4 vrf vpn4</pre>	<p>Configures each VRF that is identified in the MP-BGP session on the ASBR so that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.</p> <ul style="list-style-type: none"> Enters address family configuration mode to specify an address family for a VRF.
<p>Step 5 <code>no neighbor {ip-address peer-group-name}</code></p> <p>Example:</p> <pre>Router(config-router-af)# no neighbor 192.168.0.1</pre>	<p>Removes the configuration for the exchange of information with the neighboring eBGP (ASBR) router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
<p>Step 6 <code>exit-address-family</code></p> <p>Example:</p> <pre>Router(config-router-af)# exit-address-family</pre>	<p>Exits from address family configuration mode.</p>
<p>Step 7 <code>end</code></p> <p>Example:</p> <pre>Router(config-router-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Configuration Examples for MPLS VPN--Inter-AS Option AB

The following sections describe standard and CSC MPLS VPN configurations between two ASBR peers that use the Inter-AS AB feature:

- [Examples Inter-AS AB Network Configuration, page 257](#)
- [Examples Inter-AS AB CSC Configuration, page 265](#)

Examples Inter-AS AB Network Configuration

The following examples show the configuration of an Inter-AS Option AB network that uses nonoverlapping IP addresses:

- [Example CE1, page 257](#)
- [Example CE2, page 257](#)
- [Example PE1, page 258](#)
- [Example Route Reflector 1, page 259](#)
- [Example ASBR1, page 260](#)
- [Example ASBR 3, page 261](#)
- [Example PE2, page 262](#)
- [Example CE3, page 264](#)
- [Example CE4, page 264](#)

Feature Information for MPLS VPN--Inter-AS Option AB

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 12 Feature Information for MPLS VPN--Inter-AS Option AB

Feature Name	Release	Feature Information
MPLS VPN--Inter-AS Option AB	12.2(33)SRC 15.0(1)M 15.0(1)S 15.0(1)SY	<p>This feature combines the best functionality of an Inter-AS Option 10 A and Inter-AS Option 10 B network to allow an MPLS VPN service provider to interconnect different autonomous systems to provide VPN services.</p> <p>In Cisco IOS Release 12.2(33)SRC, this feature was introduced.</p> <p>In Cisco IOS Release 15.0(1)M, this feature was implemented on Cisco 1900, 2900, 3800, and 3900 series routers. These commands were introduced or modified: neighbor inter-as-hybrid, inter-as-hybrid.</p>

Feature Name	Release	Feature Information
MPLS VPN--Inter-AS Option AB +	15.0(1)SY	<p>The MPLS VPN—Inter-AS Option AB+ feature addresses the scalability concerns of MPLS VPN—Inter-AS Option A by using a single BGP session to signal VPN prefixes (as described in Inter-AS Option B). In an Inter-AS AB+ deployment, the forwarding connections between the ASBRs are maintained on a per-VRF basis while the control plane information is exchanged by a single Multiprotocol BGP session.</p> <p>In Cisco IOS Release 15.0(1)SY, this feature was introduced.</p> <p>These commands were introduced or modified: inter-as-hybrid.</p>

Glossary

ASBR -- Autonomous System Boundary router. A router that connects one autonomous system to another.

autonomous system --A collection of networks under a common administration sharing a common routing strategy.

BGP --Border Gateway Protocol. An interdomain routing protocol that exchanges network reachability information with other BGP systems (which may be within the same autonomous system or between multiple autonomous systems).

CE router--customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. CE routers do not recognize associated MPLS VPNs.

CSC --Carrier Supporting Carrier. A hierarchical VPN model that allows small service providers, or customer carriers, to interconnect their IP or MPLS networks over an MPLS backbone. This eliminates the need for customer carriers to build and maintain their own MPLS backbone.

eBGP --external Border Gateway Protocol. A BGP between routers located within different autonomous systems. When two routers, located in different autonomous systems, are more than one hop away from one another, the eBGP session between the two routers is considered a multihop BGP.

edge router--A router that is at the edge of the network. It defines the boundary of the MPLS network. It receives and transmits packets. Also referred to as edge label switch router and label edge router.

iBGP --internal Border Gateway Protocol. A BGP between routers within the same autonomous system.

IGP --Interior Gateway Protocol. Internet protocol used to exchange routing information within a single autonomous system. Examples of common Internet IGP protocols include IGRP, OSPF, IS-IS, and RIP.

IP --Internet Protocol. Network layer protocol in the TCP/IP stack offering a connectionless internetwork service. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security. Defined in RFC 791.

LDP --Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

LFIB --Label Forwarding Information Base. Data structure used in MPLS to hold information about incoming and outgoing labels and associated Forwarding Equivalence Class (FEC) packets.

MP-BGP --Multiprotocol BGP.

MPLS --Multiprotocol Label Switching. The name of the IETF working group responsible for label switching, and the name of the label switching approach it has standardized.

NLRI --Network Layer Reachability Information. The BGP sends routing update messages containing NLRI to describe a route and how to get there. In this context, an NLRI is a prefix. A BGP update message carries one or more NLRI prefixes and the attributes of a route for the NLRI prefixes; the route attributes include a BGP next hop gateway address and extended community values.

NSF --Nonstop forwarding enables routers to continuously forward IP packets following a Route Processor takeover or switchover to another Route Processor. NSF maintains and updates Layer 3 routing and forwarding information in the backup Route Processor to ensure that IP packets and routing protocol information are forwarded continuously during the switchover and route convergence process.

PE router--provider edge router. A router that is part of a service provider's network. It is connected to a customer edge (CE) router. All MPLS VPN processing occurs in the PE router.

QoS --quality of service. Measure of performance for a transmission system that indicates its transmission quality and service availability.

RD --route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN-IPv4 prefix.

RT --route target. Extended community attribute used to identify the VRF routing table into which a prefix is imported.

SLA --Service Level Agreement given to VPN subscribers.

VPN --Virtual Private Network. A secure MPLS-based network that shares resources on one or more physical networks (typically implemented by one or more service providers). A VPN contains geographically dispersed sites that can communicate securely over a shared backbone network.

VRF --VPN routing and forwarding instance. Routing information that defines a VPN site that is attached to a PE router. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table.
