

MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels feature allows a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) to span service providers and autonomous systems. This module explains how to configure an MPLS VPN Inter-AS network so that the Autonomous System Boundary Routers (ASBRs) exchange IPv4 routes with MPLS labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPN-IPv4 routes by using multihop, multiprotocol, external Border Gateway Protocol (eBGP).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The network must be properly configured for MPLS VPN operation before you configure MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels.

The table below lists the Cisco 12000 series line card support in Cisco IOS S releases.

Table 1: Cisco 12000 Series Line Card Support in Cisco IOS S Releases

Type	Line Cards	Cisco IOS Release Supported
ATM	4-Port OC-3 ATM	12.0(22)S
	1-Port OC-12 ATM	12.0(23)S
	4-Port OC-12 ATM	12.0(27)S
	8-Port OC-3 ATM	
Channelized interface	2-Port CHOC-3	12.0(22)S
	6-Port Ch T3 (DS1)	12.0(23)S
	1-Port CHOC-12 (DS3)	12.0(27)S
	1-Port CHOC-12 (OC-3)	
	4-Port CHOC-12 ISE	
	1-Port CHOC-48 ISE	
Electrical interface	6-Port DS3	12.0(22)S
	12-Port DS3	12.0(23)S
	6-Port E3	12.0(27)S
	12-Port E3	
Ethernet	3-Port GbE	12.0(23)S
		12.0(27)S

Type	Line Cards	Cisco IOS Release Supported
Packet over SONET (POS)	4-Port OC-3 POS	12.0(22)S
	8-Port OC-3 POS	12.0(23)S
	16-Port OC-3 POS	12.0(27)S
	1-Port OC-12 POS	
	4-Port OC-12 POS	
	1-Port OC-48 POS	
	4-Port OC-3 POS ISE	
	8-Port OC-3 POS ISE	
	16-Port OC-3 POS ISE	
	4-Port OC-12 POS ISE	
	1-Port OC-48 POS ISE	

Restrictions for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

- For networks configured with eBGP multihop, you must configure a label switched path (LSP) between nonadjacent routers.
- The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding or distributed Cisco Express Forwarding and MPLS.

Information About MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

MPLS VPN Inter-AS Introduction

An autonomous system is a single network or group of networks that is controlled by a common system administration group and that uses a single, clearly defined routing protocol.

As VPNs grow, their requirements expand. In some cases, VPNs need to reside on different autonomous systems in different geographic areas. Also, some VPNs need to extend across multiple service providers (overlapping VPNs). Regardless of the complexity and location of the VPNs, the connection between autonomous systems must be seamless to the customer.

Benefits of MPLS VPN Inter-AS

An MultiprotocolLabel Switching (MPLS) VPN Inter-AS provides the following benefits:

- Allows a VPN to cross more than one service provider backbone: Service providers running separate autonomous systems can jointly offer MPLS VPN services to the same customer. A VPN can begin at one customer site and traverse different VPN service provider backbones before arriving at another site of the same customer. Previously, MPLS VPN could traverse only a single Border Gateway Protocol (BGP) autonomous system service provider backbone. This feature allows multiple autonomous systems to form a continuous (and seamless) network between customer sites of a service provider.
- Allows a VPN to exist in different areas: A service provider can create a VPN in different geographic areas. Having all VPN traffic flow through one point (between the areas) allows for better rate control of network traffic between the areas.
- Allows confederations to optimize Internal Border Gateway Protocol (IBGP) meshing: IBGP meshing in an autonomous system is more organized and manageable. An autonomous system can be divided into multiple, separate subautonomous systems and then classify them into a single confederation (even though the entire VPN backbone appears as a single autonomous system). This capability allows a service provider to offer MPLS VPNs across the confederation because it supports the exchange of labeled VPN-IPv4 Network Layer Reachability Information (NLRI) between the subautonomous systems that form the confederation.

Information About Using MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

This feature can configure a MPLS VPN Inter-AS network so that the ASBRs exchange IPv4 routes with MPLS labels of the PE routers. RRs exchange VPN-IPv4 routes by using multihop, multiprotocol, External Border Gateway Protocol (eBGP). This method of configuring the Inter-AS system is often called MPLS VPN Inter-AS--IPv4 BGP Label Distribution.

Benefits of MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

An Inter-AS system can be configured so that the ASBRs exchange the IPv4 routes and MPLS labels has the following benefits:

- Saves the ASBRs from having to store all the VPN-IPv4 routes. Using the route reflectors to store the VPN-IPv4 routes and forward them to the PE routers results in improved scalability compared with configurations where the ASBR holds all of the VPN-IPv4 routes and forwards the routes based on VPN-IPv4 labels.
- Simplifies the configuration at the border of the network by having the route reflectors hold the VPN-IPv4 routes.
- Enables a non-VPN core network to act as a transit network for VPN traffic. You can transport IPv4 routes with MPLS labels over a non-MPLS VPN service provider.

- Eliminates the need for any other label distribution protocol between adjacent LSRs. If two adjacent label switch routers (LSRs) are also BGP peers, BGP can handle the distribution of the MPLS labels. No other label distribution protocol is needed between the two LSRs.

How the Inter-AS Works When ASBRs Exchange IPv4 Routes with MPLS Labels

A VPN service provider network to exchange IPv4 routes with MPLS labels can be configured. The VPN service provider network can be configured as follows:

- Route reflectors exchange VPN-IPv4 routes by using multihop, multiprotocol eBGP. This configuration also preserves the next-hop information and the VPN labels across the autonomous systems.
- A local PE router (for example, PE1 in the figure below) needs to know the routes and label information for the remote PE router (PE2). This information can be exchanged between the PE routers and ASBRs in one of two ways:
 - Internal Gateway Protocol (IGP) and Label Distribution Protocol (LDP): The ASBR can redistribute the IPv4 routes and MPLS labels it learned from eBGP into IGP and LDP and vice versa.
 - Internal Border Gateway Protocol (iBGP) IPv4 label distribution: The ASBR and PE router can use direct iBGP sessions to exchange VPN-IPv4 and IPv4 routes and MPLS labels.

Alternatively, the route reflector can reflect the IPv4 routes and MPLS labels learned from the ASBR to the PE routers in the VPN. This is accomplished by the ASBR exchanging IPv4 routes and MPLS labels with the route reflector. The route reflector also reflects the VPN-IPv4 routes to the PE routers in the VPN. For example, in VPN1 of the figure below, RR1 reflects to PE1 the VPN-IPv4 routes it learned and IPv4 routes and MPLS labels learned from ASBR1. Using the route reflectors to store the VPN-IPv4 routes and forward them through the PE routers and ASBRs allows for a scalable configuration.

BGP Routing Information

BGP routing information includes the following items:

- A network number (prefix), which is the IP address of the destination.

- Autonomous system path, which is a list of the other autonomous systems through which a route passes on its way to the local router. The first autonomous system in the list is closest to the local router; the last autonomous system in the list is farthest from the local router and usually the autonomous system where the route began.
- Path attributes, which provide other information about the autonomous system path, for example, the next hop.

Types of BGP Messages and MPLS Labels

MPLS labels are included in the update messages that a router sends. Routers exchange the following types of BGP messages:

- Keepalive messages--Routers exchange keepalive messages to determine if a neighboring router is still available to exchange routing information. The router sends these messages at regular intervals. (Sixty seconds is the default for Cisco routers.) The keepalive message does not contain routing data; it contains only a message header.
- Notification messages--When a router detects an error, it sends a notification message.
- Open messages--After a router establishes a TCP connection with a neighboring router, the routers exchange open messages. This message contains the number of the autonomous system to which the router belongs and the IP address of the router that sent the message.
- Update messages--When a router has a new, changed, or broken route, it sends an update message to the neighboring router. This message contains the NLRI, which lists the IP addresses of the usable routes. The update message includes any routes that are no longer usable. The update message also includes path attributes and the lengths of both the usable and unusable paths. Labels for VPN-IPv4 routes are encoded in the update message as specified in RFC 2858. The labels for the IPv4 routes are encoded in the update message as specified in RFC 3107.

How BGP Sends MPLS Labels with Routes

When BGP (eBGP and iBGP) distributes a route, it can also distribute an MPLS label that is mapped to that route. The MPLS label mapping information for the route is carried in the BGP update message that contains the information about the route. If the next hop is not changed, the label is preserved.

When you issue the **neighbor send-label** command on both BGP routers, the routers advertise to each other that they can then send MPLS labels with the routes. If the routers successfully negotiate their ability to send MPLS labels, the routers add MPLS labels to all outgoing BGP updates.

How to Configure MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

To configure MPLS VPN Inter-AS with ASBRs exchanging IPv4 routes and MPLS labels, perform the tasks in the following sections:

The figure below shows the following sample configuration:

- The configuration consists of two VPNs.

- The ASBRs exchange the IPv4 routes with MPLS labels.
- The route reflectors exchange the VPN-IPv4 routes using multihop MPLS eBGP.
- The route reflectors reflect the IPv4 and VPN-IPv4 routes to the other routers in their autonomous system.

Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels

Perform this task to configure the ASBRs to exchange IPv4 routes and MPLS labels. This configuration procedure uses ASBR1 as an example.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *as-number***
4. **neighbor {*ip-address* | *peer-group-name*} remote-as *as-number***
5. **address-family ipv4 [*multicast* | *unicast* | *mdt* | *vrf vrf-name*]**
6. **neighbor {*ip-address* | *peer-group-name*} activate**
7. **neighbor *ip-address* send-label**
8. **exit-address-family**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	<p>router bgp <i>as-number</i></p> <p>Example:</p> <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i></p> <p>Example:</p> <pre>Router(config-router)# neighbor hh.0.0.1 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	<p>address-family ipv4 [multicast unicast mdt vrf <i>vrf-name</i>]</p> <p>Example:</p> <pre>Router(config-router)# address-family ipv4</pre>	<p>Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes.</p> <ul style="list-style-type: none"> The multicast keyword specifies IPv4 multicast address prefixes. The unicast keyword specifies IPv4 unicast address prefixes. The mdt keyword specifies an IPv4 multicast distribution tree (MDT) address family session. The vrf <i>vrf-name</i> keyword and argument specify the name of the VPN routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands.
Step 6	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor hh.0.0.1 activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 7	<p>neighbor <i>ip-address</i> send-label</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor hh.0.0.1 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.

	Command or Action	Purpose
Step 8	exit-address-family Example: <pre>Router(config-router-af) # exit-address-family</pre>	Exits address family configuration mode.
Step 9	end Example: <pre>Router(config-router-af) # end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring the Route Reflectors to Exchange VPN-IPv4 Routes

Perform this task to enable the route reflectors to exchange VPN-IPv4 routes by using multihop, multiprotocol eBGP.

This procedure also specifies that the next hop information and the VPN label are to be preserved across the autonomous systems. This procedure uses RR1 as an example of the route reflector.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **neighbor** {*ip-address* | *peer-group-name*} **ebgp-multihop** [*ttl*]
6. **address-family vpnv4** [**unicast**]
7. **neighbor** {*ip-address* | *peer-group-name*} **activate**
8. **neighbor** {*ip-address* | *peer-group-name*} **next-hop unchanged**
9. **exit-address-family**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: <pre>Router(config)# router bgp 100</pre>	<p>Configures a BGP routing process and places the router in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535. <p>The autonomous system number identifies RR1 to routers in other autonomous systems.</p>
Step 4	neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i> Example: <pre>Router(config-router)# neighbor bb.bb.bb.bb remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	neighbor {<i>ip-address</i> <i>peer-group-name</i>} ebgp-multihop [<i>tth</i>] Example: <pre>Router(config-router)# neighbor bb.bb.bb.bb ebgp-multihop 255</pre>	<p>Accepts and attempts BGP connections to external peers residing on networks that are not directly connected.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>tth</i> argument specifies the time-to-live in the range from 1 to 255 hops.
Step 6	address-family vpnv4 [unicast] Example: <pre>Router(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 7	neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor.

	Command or Action	Purpose
	<p>Example:</p> <pre>Router(config-router-af)# neighbor bb.bb.bb.bb activate</pre>	<ul style="list-style-type: none"> The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 8	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} next-hop unchanged</p> <p>Example:</p> <pre>Router(config-router-af)# neighbor ip-address next-hop unchanged</pre>	<p>Enables an eBGP multihop peer to propagate the next hop unchanged.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the next hop. The <i>peer-group-name</i> argument specifies the name of a BGP peer group that is the next hop.
Step 9	<p>exit-address-family</p> <p>Example:</p> <pre>Router(config-router-af)# exit-address-family</pre>	<p>Exits address family configuration mode.</p>
Step 10	<p>end</p> <p>Example:</p> <pre>Router(config-router)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Configuring the Route Reflector to Reflect Remote Routes in Its Autonomous System

Perform this task to enable the RR to reflect the IPv4 routes and labels learned by the ASBR to the PE routers in the autonomous system.

This is accomplished by making the ASBR and PE router route reflector clients of the RR. This procedure also explains how to enable the RR to reflect the VPN-IPv4 routes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** {*ip-address* | *peer-group-name*} **activate**
6. **neighbor** *ip-address* **route-reflector-client**
7. **neighbor** *ip-address* **send-label**
8. **exit-address-family**
9. **address-family vpnv4** [**unicast**]
10. **neighbor** {*ip-address* | *peer-group-name*} **activate**
11. **neighbor** *ip-address* **route-reflector-client**
12. **exit-address-family**
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Router(config)# router bgp 100	Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	address-family ipv4 [multicast unicast vrf <i>vrf-name</i>] Example: Router(config-router)# address-family ipv4	Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard IPv4 address prefixes. <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The vrf <i>vrf-name</i> keyword and argument specify the name of the VRF instance to associate with subsequent IPv4 address family configuration mode commands.
Step 5	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: <pre>Router(config-router-af)# neighbor ee.ee.ee.ee activate</pre>	Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 6	neighbor <i>ip-address</i> route-reflector-client Example: <pre>Router(config-router-af)# neighbor ee.ee.ee.ee route-reflector-client</pre>	Configures the router as a BGP route reflector and configures the specified neighbor as its client. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP neighbor being configured as a client.
Step 7	neighbor <i>ip-address</i> send-label Example: <pre>Router(config-router-af)# neighbor ee.ee.ee.ee send-label</pre>	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.
Step 8	exit-address-family Example: <pre>Router(config-router-af)# exit-address-family</pre>	Exits address family configuration mode.
Step 9	address-family vpn4 [unicast] Example: <pre>Router(config-router)# address-family vpn4</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 10	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: <pre>Router(config-router-af)# neighbor ee.ee.ee.ee activate</pre>	Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.

	Command or Action	Purpose
Step 11	neighbor ip-address route-reflector-client Example: <pre>Router(config-router-af)# neighbor ee.aa.bb.cc route-reflector-client</pre>	Enables the RR to pass iBGP routes to the neighboring router.
Step 12	exit-address-family Example: <pre>Router(config-router-af)# exit-address-family</pre>	Exits address family configuration mode.
Step 13	end Example: <pre>Router(config-router-af)# end</pre>	(Optional) Exits to privileged EXEC mode.

Verifying the MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels Configuration

If you use ASBRs to distribute the IPv4 labels and route reflectors to distribute the VPN-IPv4 routes, use the following procedures to help verify the configuration:

The figure below shows the configuration that is referred to in the next several sections.

Verifying the Route Reflector Configuration

Perform this task to verify the route reflector configuration.

SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name } [summary] [labels]**
3. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name } [summary] [labels] Example: Router# show ip bgp vpnv4 all summary	(Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> • Use the all and summary keywords to verify that a multihop, multiprotocol eBGP session exists between the route reflectors and that the VPNv4 routes are being exchanged between the route reflectors. The last two lines of the command output show the following information: <ul style="list-style-type: none"> • Prefixes are being learned from PE1 and then passed to RR2. • Prefixes are being learned from RR2 and then passed to PE1. <ul style="list-style-type: none"> • Use the all and labels keywords to verify that the route reflectors exchange VPNv4 label information.
Step 3	disable Example: Router# disable	(Optional) Exits to user EXEC mode.

Verifying that CE1 Can Communicate with CE2

Perform this task to verify that router CE1 has NLRI for router CE2.

SUMMARY STEPS

1. **enable**
2. **show ip route** [*ip-address* [*mask*] [**longer-prefixes**]] | [**protocol** [*protocol-id*]] | [**list** [*access-list-number* | *access-list-name*]
3. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip route [<i>ip-address</i> [<i>mask</i>] [longer-prefixes]] [protocol [<i>protocol-id</i>]] [list [<i>access-list-number</i> <i>access-list-name</i>] Example: Router# show ip route nn.nn.nn.nn	Displays the current state of the routing table. <ul style="list-style-type: none"> • Use the <i>ip-address</i> argument to verify that CE1 has a route to CE2. • Use this command to verify the routes learned by CE1. Make sure that the route for CE2 is listed.
Step 3	disable Example: Router# disable	(Optional) Exits to privileged EXEC mode.

Verifying that PE1 Can Communicate with CE2

Perform this task to verify that router PE1 has NLRI for router CE2.

SUMMARY STEPS

1. **enable**
2. **show ip route vrf** *vrf-name* [**connected**] [*protocol* [*as-number*] [*tag*] [*output-modifiers*]] [**list number** [*output-modifiers*]] [**profile**] [**static** [[]] [**summary***output-modifiers*]] [**supernets-only** [*output-modifiers*]] [**traffic-engineering** [*output-modifiers*]]
3. **show ip bgp vpnv4** {**all** | **rd** *route-distinguisher* | **vrf** *vrf-name*} [*ip-prefix* | *length*] [**longer-prefixes**] [*output-modifiers*]] [**network-address** *mask*] [**longer-prefixes**] [*output-modifiers*]] [**cidr-only**] [**community**] [**community-list**] [**dampened-paths**] [**filter-list**] [**flap-statistics**] [**inconsistent-as**] [**neighbors**] [**paths** [*line*]] [**peer-group**] [**quote-regexp**] [**regexp**] [**summary**] [**tags**]
4. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
5. **show mpls forwarding-table** [{*network* {*mask* | *length*} | **labels** *label* [-*label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
6. **show ip bgp** [*network*] [*network-mask*] [**longer-prefixes**]
7. **show ip bgp vpnv4** {**all** | **rd** *route-distinguisher* | **vrf** *vrf-name*} [**summary**] [**labels**]
8. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>show ip route vrf <i>vrf-name</i> [connected] [<i>protocol</i> [<i>as-number</i>] [<i>tag</i>] [<i>output-modifiers</i>]] [list number [<i>output-modifiers</i>]] [profile] [static [[]] [summary<i>output-modifiers</i>]] [supernets-only [<i>output-modifiers</i>]] [traffic-engineering [<i>output-modifiers</i>]]</p> <p>Example:</p> <pre>Router# show ip route vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays the IP routing table associated with a VRF.</p> <ul style="list-style-type: none"> • Use this command to verify that router PE1 learns routes from router CE2 (nn.nn.nn.nn).
Step 3	<p>show ip bgp vpnv4 {all rd <i>route-distinguisher</i> vrf <i>vrf-name</i>} [<i>ip-prefix</i> <i>length</i>] [longer-prefixes] [<i>output-modifiers</i>]] [network-address <i>mask</i>] [longer-prefixes] [<i>output-modifiers</i>]] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [<i>line</i>]] [peer-group] [quote-regexp] [regexp] [summary] [tags]</p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> • Use the vrf or all keyword to verify that router PE2 is the BGP next-hop to router CE2.

	Command or Action	Purpose
	<p>Example:</p> <pre>Router# show ip bgp vpnv4 all nn.nn.nn.nn</pre>	
Step 4	<p>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</p> <p>Example:</p> <pre>Router# show ip cef vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays entries in the Forwarding Information Base (FIB) or displays a summary of the FIB.</p> <ul style="list-style-type: none"> Use this command to verify that the Cisco Express Forwarding entries are correct.
Step 5	<p>show mpls forwarding-table [{network {mask length} labels label [-label] interface interface next-hop address lsp-tunnel [tunnel-id]}] [detail]</p> <p>Example:</p> <pre>Router# show mpls forwarding-table</pre>	<p>(Optional) Displays the contents of the MPLS LFIB.</p> <ul style="list-style-type: none"> Use this command to verify the IGP label for the BGP next hop router (autonomous system boundary).
Step 6	<p>show ip bgp [network] [network-mask] [longer-prefixes]</p> <p>Example:</p> <pre>Router# show ip bgp ff.ff.ff.ff</pre>	<p>(Optional) Displays entries in the BGP routing table.</p> <ul style="list-style-type: none"> Use the show ip bgp command to verify the label for the remote egress PE router (PE2).
Step 7	<p>show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [summary] [labels]</p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all labels</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the all and summary keywords to verify the VPN label of CE2, as advertised by PE2.
Step 8	<p>disable</p> <p>Example:</p> <pre>Router# disable</pre>	<p>(Optional) Exits to user EXEC mode.</p>

Verifying that PE2 Can Communicate with CE2

Perform this task to ensure that PE2 can access CE2.

SUMMARY STEPS

1. **enable**
2. **show ip route vrf** *vrf-name* [**connected**] [*protocol* [*as-number*] [*tag*] [*output-modifiers*]] [*list number* [*output-modifiers*]] [**profile**] [**static** [*output-modifiers*]] [**summary**[*output-modifiers*]] [**supernets-only** [*output-modifiers*]] [**traffic-engineering** [*output-modifiers*]]
3. **show mpls forwarding-table** [*vrf vrf-name*] [{*network* {*mask* | *length*} | **labels** *label* [-*label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
4. **show ip bgp vpnv4** { **all** | **rd** *route-distinguisher* | *vrf vrf-name*} [**summary**] [**labels**]
5. **show ip cef** [*vrf vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
6. **disable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Router> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>show ip route vrf <i>vrf-name</i> [connected] [<i>protocol</i> [<i>as-number</i>] [<i>tag</i>] [<i>output-modifiers</i>]] [<i>list number</i> [<i>output-modifiers</i>]] [profile] [static [<i>output-modifiers</i>]] [summary[<i>output-modifiers</i>]] [supernets-only [<i>output-modifiers</i>]] [traffic-engineering [<i>output-modifiers</i>]]</p> <p>Example:</p> <pre>Router# show ip route vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays the IP routing table associated with a VRF.</p> <ul style="list-style-type: none"> • Use this command to check the VPN routing and forwarding table for CE2. The output provides next-hop information.
Step 3	<p>show mpls forwarding-table [<i>vrf vrf-name</i>] [{<i>network</i> {<i>mask</i> <i>length</i>} labels <i>label</i> [-<i>label</i>] interface <i>interface</i> next-hop <i>address</i> lsp-tunnel [<i>tunnel-id</i>]}] [detail]</p> <p>Example:</p> <pre>Router# show mpls forwarding-table vrf vpn1 nn.nn.nn.nn</pre>	<p>(Optional) Displays the contents of the LFIB.</p> <ul style="list-style-type: none"> • Use the vrf keyword to check the VPN routing and forwarding table for CE2. The output provides the label for CE2 and the outgoing interface.
Step 4	<p>show ip bgp vpnv4 { all rd <i>route-distinguisher</i> <i>vrf vrf-name</i>} [summary] [labels]</p> <p>Example:</p> <pre>Router# show ip bgp vpnv4 all labels</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> • Use the all and labels keywords to check the VPN label for CE2 in the multiprotocol BGP table.
Step 5	<p>show ip cef [<i>vrf vrf-name</i>] [<i>network</i> [<i>mask</i>]] [longer-prefixes] [detail]</p>	<p>(Optional) Displays entries in the FIB or displays a summary of the FIB.</p>

	Command or Action	Purpose
	Example: <pre>Router# show ip cef vpn1 nn.nn.nn.nn</pre>	<ul style="list-style-type: none"> Use this command to check the Cisco Express Forwarding entry for CE2. The command output shows the local label for CE2 and the outgoing interface.
Step 6	disable Example: <pre>Router# disable</pre>	(Optional) Exits to user EXEC mode.

Verifying the ASBR Configuration

Perform this task to verify that the ASBRs exchange IPv4 routes with MPLS labels or IPv4 routes without labels as prescribed by a route map.

Verifying the ASBR Configuration

SUMMARY STEPS

- enable
- show ip bgp [network] [network-mask] [longer-prefixes]
- show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]
- disable

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip bgp [network] [network-mask] [longer-prefixes] Example: <pre>Router# show ip bgp ff.ff.ff.ff</pre>	(Optional) Displays entries in the BGP routing table. <ul style="list-style-type: none"> Use this command to check that: <ul style="list-style-type: none"> ASBR1 receives an MPLS label for PE2 from ASBR2. ASBR1 receives IPv4 routes for RR2 without labels from ASBR2. ASBR2 distributes an MPLS label for PE2 to ASBR1.

	Command or Action	Purpose
		<ul style="list-style-type: none"> ASBR2 does not distribute a label for RR2 to ASBR1.
Step 3	show ip cef [<i>vrf vrf-name</i>] [<i>network [mask]</i>] [<i>longer-prefixes</i>] [<i>detail</i>] Example: <pre>Router# show ip cef ff.ff.ff.ff</pre> Example: <pre>Router# show ip cef bb.bb.bb.bb</pre>	(Optional) Displays entries in the FIB or displays a summary of the FIB. <ul style="list-style-type: none"> Use this command from ASBR1 and ASBR2 to check that: <ul style="list-style-type: none"> The Cisco Express Forwarding entry for PE2 is correct. The Cisco Express Forwarding entry for RR2 is correct.
Step 4	disable Example: <pre>Router# disable</pre>	(Optional) Exits to user EXEC mode.

Configuration Examples for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over an MPLS VPN Service Provider Examples

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over an MPLS VPN service provider included in this section are as follows:

The figure below shows two MPLS VPN service providers. The service provider distributes the VPN-IPv4 routes between the route reflectors. The MPLS VPN service providers distribute the IPv4 routes with MPLS labels between the ASBRs.

The configuration example shows the following two techniques you can use to distribute the VPN-IPv4 routes and the IPv4 routes with MPLS labels of the remote RRs and PEs to the local RRs and PEs:

- Autonomous system 100 uses the RRs to distribute the VPN-IPv4 routes learned from the remote RRs. The RRs also distribute the remote PE address and label learned from ASBR1 using IPv4 labels.
- In Autonomous system 200, the IPv4 routes that ASBR2 learned are redistributed into IGP.

Route Reflector 1 Configuration Example (MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPN-IPv4 routes with RR2 using multiprotocol, multihop eBGP.
- The VPN-IPv4 next-hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
 - The VPN-IPv4 routes learned from RR2
 - The IPv4 routes and MPLS labels learned from ASBR1

ASBR1 Configuration Example (MPLS VPN Service Provider)

ASBR1 exchanges IPv4 routes and MPLS labels with ASBR2.

In this example, ASBR1 uses route maps to filter routes:

- A route map called OUT specifies that ASBR1 should distribute the PE1 route (ee.ee) with labels and the RR1 route (aa.aa) without labels.
- A route map called IN specifies that ASBR1 should accept the PE2 route (ff.ff) with labels and the RR2 route (bb.bb) without labels.

Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over a Non-MPLS VPN Service Provider Examples

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over a non MPLS VPN service provider included in this section are as follows:

The figure below shows two MPLS VPN service providers that are connected through a non MPLS VPN service provider. The autonomous system in the middle of the network is configured as a backbone autonomous system that uses LDP or Tag Distribution Protocol (TDP) to distribute MPLS labels. Traffic engineering tunnels can also be used instead of TDP or LDP to build the LSP across the non MPLS VPN service provider.

Route Reflector 1 Configuration Example (Non-MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPN-IPv4 routes with RR2 using multiprotocol, multihop eBGP.
- The VPN-IPv4 next-hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
 - The VPN-IPv4 routes learned from RR2
 - The IPv4 routes and MPLS labels learned from ASBR1

```

!
ip default-gateway 3.3.0.1
no ip classless
!
end

```

ASBR2 Configuration Example (Non-MPLS VPN Service Provider)

ASBR2 exchanges IPv4 routes and MPLS labels with ASBR1. However, in contrast to ASBR1, ASBR2 does not use the RR to reflect IPv4 routes and MPLS labels to PE2. ASBR2 redistributes the IPv4 routes and MPLS labels learned from ASBR1 into IGP. PE2 can now reach these prefixes.

```

ip subnet-zero
ip cef
!
mpls label protocol ldp
!
interface Loopback0
 ip address xx.xx.xx.xx 255.255.255.255
!

```

ASBR3 Configuration Example (Non-MPLS VPN Service Provider)

ASBR3 belongs to a non MPLS VPN service provider. ASBR3 exchanges IPv4 routes and MPLS labels with ASBR1. ASBR3 also passes the routes learned from ASBR1 to ASBR4 through RR3.

Note

Do not redistribute eBGP routes learned into iBGP if you are using iBGP to distribute the routes and labels. This is not a supported configuration.

```

ip subnet-zero
ip cef
!
interface Loopback0

Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 2: Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

Feature Name	Releases	Feature Configuration Information
MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels	12.0(21)ST 12.0(22)S 12.0(23)S 12.2(13)T 12.0(24)S 12.2(14)S 12.0(27)S 12.0(29)S Cisco IOS XE Release 2.5	This module explains how to configure an MPLS VPN Inter-AS network so that the ASBRs exchange IPv4 routes with MPLS labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPN-IPv4 routes by using multihop, multiprotocol, external Border Gateway Protocol (eBGP). In Cisco IOS XE Release 2.5, this feature was implemented on the Cisco ASR 1000 Series Routers. This feature uses no new or modified commands.
