

L2VPN Advanced VPLS

The L2VPN Advanced VPLS feature introduces the following enhancements to Virtual Private LAN Services:

- Ability to load-balance traffic across multiple core interfaces using equal cost multipaths (ECMP)
- Support for redundant provide edge switches
- Command line interface enhancements to facilitate configuration of the L2VPN Advanced VPLS feature

The L2VPN Advanced VPLS feature uses Virtual Switch System (VSS) and Flow Aware Transport (FAT) pseudowires to achieve PE redundancy and load-balancing. The following sections explain the concepts and configuration tasks for this feature.

- Finding Feature Information, page 1
- Prerequisites for L2VPN Advanced VPLS, page 2
- Restrictions for L2VPN Advanced VPLS, page 2
- Information About L2VPN Advanced VPLS, page 3
- How to Configure L2VPN Advanced VPLS, page 3
- Configuration Examples for L2VPN Advanced VPLS, page 11
- Additional References for L2VPN Advanced VPLS, page 13
- Feature Information for L2VPN Advanced VPLS, page 14

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for L2VPN Advanced VPLS

- This feature requires that you understand how VPLS works. For information about VPLS, see "VPLS Overview" section in the *Cisco 7600 Series Ethernet Services Plus (ES+) and Ethernet Services Plus T (ES+T) Line Card* Configuration Guide.
- Configuring the L2VPN Advanced VPLS feature works with MPLS Traffic Engineering tunnels with
 explicit paths and Generic Routing Encapsulation (GRE tunnels) with static routes to the tunnel
 destination. For information and configuration steps for MPLS traffic engineering and GRE tunnels, see
 the following documents:
 - MPLS Traffic Engineering and Enhancements
 - Implementing Tunnels
- This features requires two Cisco 6500 series routers be configured as a virtual switch system.
- This features requires nonstop forwarding and stateful switchover.

Restrictions for L2VPN Advanced VPLS

- The ping and traceroute commands that support the Any Transport over MPLS Virtual Circuit Connection Verification (VCCV) feature are not supported over FAT pseudowires.
- The VPLS Autodiscovery feature is not supported with the L2VPN Advanced VPLS feature.
- In Cisco IOS Release 12.2(33)SXI4, the following types of configurations are supported:
 - MPLS core with configuration of PE routers through the **neighbor** command under transport vpls mode.
 - MPLS core with configuration of PE routers through MPLS traffic engineering tunnels using explicit paths.
 - IP core with configuration of PE routers through MPLS over GRE tunnels.

Other configuration methods, including using the **route-via** command, BGP autodiscovery, or explicit VLAN assignment to a PE egress port, are not supported.

- Load-balancing is not supported in the core routers when the core uses IP to transport packets.
- The maximum number of links per bundle is limited to eight.
- The maximum number of port channels is limited to 32.
- The maximum number of VPLS neighbors is limited to 60 minus the number of neighbors configured with the load-balanceflow command.
- In Cisco IOS Release 12.2(33)SXI4, the L2VPN Advanced VPLS feature is supported on the Cisco Catalyst 6500 series switches with Supervisor 720-10GE engine.
- The L2VPN Advanced VPLS feature supports the following line cards and shared port adapters (SPAs):
 - 7600-SIP-400 (core facing)

- Gigabit and 10-gigabit Ethernet SPAs (2X1GE-V1, 2X1GE-V2 and 1X10GE-V2 SPA)
- Packet over Sonet (POS) SPAs (2XOC3, 4XOC3, 1XOC12 and 1XOC48)

Information About L2VPN Advanced VPLS

FAT Pseudowires and Their Role in Load-Balancing

FAT pseudowires are used to load-balance traffic in the core when equal cost multipaths are used. The MPLS labels add an additional label to the stack, called the flow label, which contains the flow information of a VC. For more information about FAT pseudowires, see PWE3 Internet-Draft *Flow Aware Transport of MPLS Pseudowires* (draft-bryant-filsfils-fat-pw).

Virtual Switch Systems

Two Cisco 6500 series switches can be connected to form one logical switch. One switch is designated as the master, while the other is the slave. The two switches are connected by a virtual switch link (VSL). The two switches are used for link redundancy, load-balancing, and failover.

For more information on virtual switch systems, see the "Configuring VSS" section in the *Catalyst 6500 Release 12.2SXH and Later Software Configuration Guide*.

How to Configure L2VPN Advanced VPLS

Enabling Load-Balancing with ECMP and FAT Pseudowires

The following steps explain how to enable load-balancing at the provider edge (PE) device and on the core device.

To enable load-balancing on the edge device, issue the **load-balance flow** command. The load-balancing rules are configured through the **port-channel load-balance** command parameters.

To enable core load-balancing, issue the **flow-label enable** command on both PE devices. You must issue the **load-balance flow** command with the **flow-label enable** command.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. pseudowire-class name
- 4. encapsulation mpls
- 5. load-balance flow
- 6. flow-label enable
- **7.** end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	pseudowire-class name	Establishes a pseudowire class with a name that you specify and enters pseudowire class configuration mode.
	Example:	
	Device(config)# pseudowire-class class1	
Step 4	encapsulation mpls	Specifies the MPLS tunneling encapsulation type.
	Example:	
	Device(config-pw)# encapsulation mpls	
Step 5	load-balance flow	Enables load-balancing on ECMPs.
	Example:	
	Device(config-pw)# load-balance flow	
Step 6	flow-label enable	Enables the imposition and disposition of flow labels for the pseudowire.
	Example:	
	Device(config-pw)# flow-label enable	
Step 7	end	Exits pseudowire class configuration mode and enters privileged EXEC mode.
	Example:	
	Device(config-pw)# end	
	1	1

Enabling Port-Channel Load-Balancing

The following task explains how to enable port channel load-balancing, which sets the load-distribution method among the ports in the bundle. If the **port-channel load-balance** command is not configured, load-balancing occurs with default parameters.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. port-channel load-balance method
- 4. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	port-channel load-balance method	Specifies the load distribution method among the ports in a bundle.
	Example:	
	Device(config) # port-channel load-balance src-mac	
Step 4	exit	Exits global configuration mode and enters privileged EXEC mode.
	Example:	
	Device(config)# exit	

Explicitly Specifying the PE Routers As Part of Virtual Ethernet Interface Configuration

There are several ways to specify the route through which traffic should pass.

- Explicitly specify the PE routers as part of the virtual Ethernet interface configuration
- Configure an MPLS Traffic Engineering tunnel
- Configure a GRE tunnel

The following task explains how to explicitly specify the PE routers as part of the virtual Ethernet interface configuration.

This tasks includes steps for configuring the LAN port for Layer 2 Switching. For more information, see the "Configuring LAN Ports for Layer 2 Switching." task.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. interface virtual-ethernet num
- 4. transport vpls mesh
- **5. neighbor** *remote-router-id* [**pw-class** *pw-class-name*]
- 6. exit
- 7. switchport
- 8. switchport mode trunk
- 9. switchport trunk allowed vlan {add | except | none | remove} vlan [,vlan[,vlan[,...]]
- 10. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface virtual-ethernet num	Creates a virtual Ethernet interface and enters interface configuration mode.
	Example:	
	Device(config)# interface virtual-ethernet 1	

	Command or Action	Purpose
Step 4	transport vpls mesh	Create a full mesh of pseudowires and enters VPLS transport mode.
	Example:	
	<pre>Device(config-if)# transport vpls mesh</pre>	
Step 5	neighbor remote-router-id [pw-class pw-class-name]	Specifies the PE routers to be used in the pseudowire.
	Example:	
	Device(config-if-transport)# neighbor 10.19.19.19 pw-class 1	
Step 6	exit	Exits VPLS transport configuration mode and enters interface configuration mode.
	Example:	
	<pre>Device(config-if-transport)# exit</pre>	
Step 7	switchport	Configures the port for Layer 2 switching.
	Example:	
	<pre>Device(config-if)# switchport</pre>	
Step 8	switchport mode trunk	Enables permanent trunking mode and negotiates to convert the link into a trunk link.
	Example:	
	<pre>Device(config-if)# switchport mode trunk</pre>	
Step 9	switchport trunk allowed vlan {add except none remove} vlan [,vlan[,vlan[,]]	Configures the list of VLANs allowed on the trunk.
	Example:	
	<pre>Device(config-if)# switchport trunk allowed vlan except 10, 20</pre>	
Step 10	end	Exits interface configuration mode and returns to privileged EXEC mode.
	Example:	
	Device(config)# end	

Configuring an MPLS Traffic Engineering Tunnel

There are several ways to specify the route through which traffic should pass.

- Explicitly specify the PE devices as part of the virtual Ethernet interface configuration
- Configure an MPLS Traffic Engineering tunnel
- Configure a GRE tunnel

The following task explains how to configure an MPLS Traffic Engineering tunnel.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. interface tunnel number
- 4. ip unnumbered type number
- **5. tunnel destination** *ip-address*
- 6. tunnel mode mpls traffic-eng
- 7. tunnel mpls traffic-eng autoroute announce
- **8.** tunnel mpls traffic-eng path-option number {dynamic | explicit {name path-name} | identifier path-number} [lockdown]
- 9. exit
- **10. ip route** *ip-address* **tunnel** *num*

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface tunnel number	Configures an interface type and enters interface configuration mode.
	Example:	
	Device(config)# interface tunnel10	
Step 4	ip unnumbered type number	Assigns an IP address to the tunnel interface.
	Example:	An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional
	Device(config-if)# ip unnumbered loopback 0	link.
Step 5	tunnel destination ip-address	Specifies the destination for a tunnel.

	Command or Action	Purpose
	<pre>Example: Device(config-if)# tunnel destination 10.20.1.1</pre>	The <i>ip-address</i> keyword is the IP address of the host destination expressed in dotted decimal notation.
Step 6	tunnel mode mpls traffic-eng	Configures the tunnel encapsulation mode to MPLS traffic engineering.
	Example:	
	Device(config-if)# tunnel mode mpls traffic-eng	
Step 7	tunnel mpls traffic-eng autoroute announce	Configures the IGP to use the tunnel in its enhanced SPF calculation.
	Example:	
	Device(config-if)# tunnel mpls traffic-eng autoroute announce	
Step 8	tunnel mpls traffic-eng path-option number {dynamic explicit {name path-name} identifier path-number} [lockdown]	Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.
	Example:	 A dynamic path is used if an explicit path is currently unavailable.
	Device(config-if)# tunnel mpls traffic-eng path-option 1 explicit name TestPath	
Step 9	exit	Exits interface configuration mode and returns to global configuration mode.
	Example:	
	Device(config-if)# exit	
Step 10	ip route ip-address tunnel num	Creates a static route.
	Example:	
	Device(config)# ip route 10.19.19.19 255.255.255.255 tunnel10	

Configuring a GRE Tunnel

There are several ways to specify the route through which traffic should pass.

- Explicitly specify the PE devices as part of the virtual Ethernet interface configuration
- Configure an MPLS Traffic Engineering tunnel
- Configure a GRE tunnel

The following task explains how to configure a GRE tunnel. For more information on GRE tunnels, see the Implementing Tunnels module.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. interface** *type number*
- 4. tunnel mode {gre ip | gre multipoint}
- 5. mpls ip
- **6. tunnel source** {*ip-address* | *interface-type interface-number*}
- **7. tunnel destination** {hostname | ip-address}
- 8. exit
- **9. ip route** *ip-address* **tunnel** *num*

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface type number	Specifies the interface type and number and enters interface configuration mode.
	Example:	• To configure a tunnel, use tunnel for the <i>type</i> argument.
	Device(config)# interface tunnel 1	
Step 4	tunnel mode {gre ip gre multipoint}	Specifies the encapsulation protocol to be used in the tunnel.
	Example:	
	Device(config-if)# tunnel mode gre ip	
Step 5	mpls ip	Enables MPLS on the tunnel.
	Example:	
	Device(config-if)# mpls ip	
Step 6	tunnel source {ip-address interface-type interface-number}	Configures the tunnel source.

	Command or Action	Purpose
	<pre>Example: Device(config-if)# tunnel source 1.1.1.1</pre>	 Use the <i>ip-address</i> argument to specify the source IP address. Use the <i>interface-type</i> and <i>interface-number</i> arguments to specify the interface to use.
		Note The tunnel source and destination IP addresses must be defined on both PE Devices.
Step 7	tunnel destination {hostname ip-address}	Configures the tunnel destination.
	Example:	• Use the <i>hostname</i> argument to specify the name of the host destination.
	Device(config-if)# tunnel destination 3.3.3.3	• Use the <i>ip-address</i> argument to specify the IP address of the host destination.
		Note The tunnel source and destination IP addresses must be defined on both PE Devices.
Step 8	exit	Exits interface configuration mode and returns to global configuration mode.
	Example:	
	Device(config-if)# exit	
Step 9	ip route ip-address tunnel num	Creates a static route.
	Example:	
	Device(config)# ip route 10.19.19.19 255.255.255.255 Tunnel1	

Configuration Examples for L2VPN Advanced VPLS

The following sections show configuration examples for the three supported methods of configuring the L2VPN Advanced VPLS feature.

Example: Configuring L2VPN Advanced VPLS—Explicitly Specifying Peer PE Devices

The following example shows how to create two VPLS domains under VLANs 10 and 20. Each VPLS domain includes two pseudowires to peer PE devices 10.2.2.2 and 10.3.3.3. Load-balancing is enabled through the **load-balance flow** and **flow-label enable** commands.

pseudowire-class cl1
 encap mpls

```
load-balance flow
flow-label enable !
port-channel load-balance src-mac !
interface virtual-ethernet 1
transport vpls mesh
neighbor 10.2.2.2 pw-class cl1
neighbor 10.3.3.3 pw-class cl1
switchport
switchport mode trunk
switchport trunk allowed vlan 10, 20
```

Example: Configuring L2VPN Advanced VPLS—Using MPLS Traffic Engineering Tunnels

The following example shows the creation of two VPLS domains and uses MPLS Traffic Engineering tunnels to specify the explicit path.

```
pseudowire-class cl1
   encap mpls
port-channel load-balance src-mac
interface Tunnel1
 ip unnumbered Loopback0
 tunnel mode mpls traffic-eng
 tunnel destination 192.168.1.1
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng path-option 1 explicit name LSP1
ip explicit-path name LSP1 enable
next-address 192.168.2.2
 next-address loose 192.168.1.1
interface Tunnel2
ip unnumbered Loopback0
 tunnel mode mpls traffic-eng
 tunnel destination 172.16.1.1
 tunnel mpls traffic-eng autoroute announce
tunnel mpls traffic-eng path-option 1 explicit name LSP2
ip explicit-path name LSP2 enable
 next-address 172.16.2.2
next-address loose 172.16.1.1
interface virtual-ethernet 1
 transport vpls mesh
neighbor 10.2.2.2 pw-class cl1
neighbor 10.3.3.3 pw-class cl1
 switchport
switchport mode trunk
switchport trunk allowed vlan 10,20
ip route 10.2.2.2 255.255.255.255 Tunnel1
ip route 10.3.3.3 255.255.255.255 Tunnel2
```

Example: Configuring L2VPN Advanced VPLS—Using MPLS over GRE Tunnels

The following example shows the creation of two VPLS domains under VLANs 10 and 20. Each VPLS domain includes two pseudowires to peer PEs 10.2.2.2 and 10.3.3.3. The pseudowires are MPLS over GRE tunnels because the core is IP.

```
pseudowire-class cl1
 encap mpls
 load-balance flow
port-channel load-balance src-mac
int tunnel 1
 tunnel mode gre ip
 mpls ip
 tunnel source 10.1.1.1
 tunnel destination 10.2.2.2
int tunnel 2
 tunnel mode gre ip
 mpls ip
 tunnel source 10.1.1.1
 tunnel destination 10.3.3.3
interface virtual-ethernet 1
 transport vpls mesh
 neighbor 10.2.2.2 pw-class cl1
 neighbor 10.3.3.3 pw-class cl1
 switchport
 switchport mode trunk
switchport trunk allowed vlan 10, 20 ip route 10.2.2.2 255.255.255.255 Tunnel1
ip route 10.3.3.3 255.255.255.255 Tunnel2
```

Feature Information for L2VPN Advanced VPLS

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for L2VPN Advanced VPLS

Feature Name	Releases	Feature Information
L2VPN Advanced VPLS	12.2(33)SXI4	The L2VPN Advanced VPLS
	15.1(1)SY	feature uses Virtual Switch System (VSS) and Flow Aware Transport (FAT) pseudowires to achieve PE redundancy and load-balancing.
		In 12.2(33)SXI4, this feature was introduced on the Cisco 6500 series router.
		The following commands were introduced:
		flow-label enable, interfacevirtual-ethernet, load-balanceflow, neighbor (VPLS transport mode), show interface virtual-ethernet, and transport vpls mesh.
		The following command was modified:
		show mpls 12transport vc
