

RESTCONF Protocol

This chapter describes how to configure the HTTP-based Representational State Transfer Configuration Protocol (RESTCONF). RESTCONF provides a programmatic interface based on standard mechanisms for accessing configuration data, state data, data-model-specific Remote Procedure Call (RPC) operations and events, defined in the YANG model.

- Prerequisites for the RESTCONF Protocol, on page 1
- Restrictions for the RESTCONF Protocol, on page 1
- Information About RESTCONF Programmable Interface, on page 2
- How to Configure RESTCONF Programmable Interface, on page 4
- Configuration Examples for RESTCONF Programmable Interface, on page 9
- Additional References for the RESTCONF Protocol, on page 12
- Feature Information for the RESTCONF Protocol, on page 13

Prerequisites for the RESTCONF Protocol

• Enable the Cisco IOS-HTTP services for RESTCONF. For more information, see Examples for RESTCONF RPCs

Restrictions for the RESTCONF Protocol

The following restrictions apply to the RESTCONF protocol:

- Notifications and event streams
- YANG patch
- Optional query parameters, such as, filter, start-time, stop-time, replay, and action
- The RESTCONF feature is not supported on a device running dual IOSd configuration or software redundancy.

Information About RESTCONF Programmable Interface

Overview of RESTCONF

This section describes the protocols and modelling languages that enable a programmatic way of writing configurations to a network device.

- RESTCONF—Uses structured data (XML or JSON) and YANG to provide a REST-like APIs, enabling you to programmatically access different network devices. RESTCONF APIs use HTTPs methods.
- YANG—A data modelling language that is used to model configuration and operational features. YANG
 determines the scope and the kind of functions that can be performed by NETCONF and RESTCONF
 APIs.

In releases prior to Cisco IOS XE Fuji 16.8.1, an operational data manager (based on polling) was enabled separately. In Cisco IOS XE Fuji 16.8.1 and later releases, operational data works on platforms running NETCONF (similar to how configuration data works), and is enabled by default. For more information on the components that are enabled for operational data queries or streaming, see the GitHub respository, and view *-oper in the naming convention.

HTTPs Methods

The HTTPS-based RESTCONF protocol (RFC 8040), is a stateless protocol that uses secure HTTP methods to provide CREATE, READ, UPDATE, and DELETE (CRUD) operations on a conceptual datastore containing YANG-defined data, which is compatible with a server that implements NETCONF datastores.

The following table shows how the RESTCONF operations relate to NETCONF protocol operations:

OPTIONS	SUPPORTED METHODS
GET	Read
PATCH	Update
PUT	Create or Replace
POST	Create or Operations (reload, default)
DELETE	Deletes the targeted resource
HEAD	Header metadata (no response body)

RESTCONF Root Resource

- A RESTCONF device determines the root of the RESTCONF API through the link element: /.well-known/host-meta resource that contains the RESTCONF attribute.
- A RESTCONF device uses the RESTCONF API root resource as the initial part of the path in the request URI.

Example:

Example of URIs:

- GigabitEthernet0/0/2 https://10.104.50.97/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet=0%2F0%2F2
- fields=name –
 https://10.104.50.97/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthemet=0%2F0%2F2?fields=name
- depth=1 https://10.85.116.59/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet?depth=1
- Name and IP https://10.85.116.59/restconf/data/Cisco-IOS-XE-native:native/interface?fields=GigabitEthemet/ip/address/primary;name
- MTU (fields) https://10.104.50.97/restconf/data/Cisco-IOS-XE-native:native/interface?fields=GigabitEthernet(mtu)
- MTU https://10.85.116.59/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet=3/mtu
- Port-Channel https://10.85.116.59/restconf/data/Cisco-IOS-XE-native:native/interface/Port-channel
- "Char" to "Hex" conversion chart: http://www.columbia.edu/kermit/ascii.html

RESTCONF API Resource

The API resource is the top-level resource located at +restconf. It supports the following media types:

Note

Media is the type of YANG formated RPC that is sent to the RESCONF server (XML or JSON).

- Application/YANG-Data+XML OR Application/YANG-Data+JSON
- The API resource contains the RESTCONF root resource for the RESTCONF DATASTORE and OPERATION resources. For example:

```
The client may then retrieve the top-level API resource, using the
  root resource "/restconf".

    GET /restconf HTTP/1.1
    Host: example.com
    Accept: application/yang-data+json

The server might respond as follows:

    HTTP/1.1 200 OK
    Date: Thu, 26 Jan 2017 20:56:30 GMT
    Server: example-server
    Content-Type: application/yang-data+json

{
      "ietf-restconf:restconf" : {
       "data" : {},
       "operations" : {},
       "yang-library-version" : "2016-06-21"
      }
    }
}
```

For more information, refer to RFC 3986

Methods

Methods are HTTPS operations (GET/PATCH/POST/DELETE/OPTIONS/PUT) performed on a target resource. A YANG-formated RPC invokes a particular method on a given resource that pertains to a target YANG model residing in the RESTCONF server. The uniform resource identifier (URI) acts as a location identification for a given resource, so that the client RESTCONF method can locate that particular resource to take an action specified by an HTTPS method or property.

For more information, see RFC 8040 - RESTCONF Protocol

How to Configure RESTCONF Programmable Interface

Authentication of NETCONF/RESTCONF Using AAA

Before you begin

NETCONF and RESTCONF connections must be authenticated using authentication, authorization, and accounting (AAA). As a result, RADIUS or TACACS+ users defined with privilege level 15 access are allowed access into the system.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- 4. aaa group server radius server-name
- **5. server-private** *ip-address* **key** *key-name*
- 6. ip vrf forwarding vrf-name

- 7. exit
- 8. aaa authentication login default group group-name local
- 9. aaa authentication login list-name none
- 10. aaa authorization exec default group group-name local
- 11. aaa session-id common
- **12. line console** *number*
- 13. login authentication authentication-list
- **14**. end

DETAILED STEPS

	Command or Action	Purpose		
Step 1	enable	Enables privileged EXEC mode		
	Example:	• Enter your password if prompted.		
	Device> enable			
Step 2	configure terminal	Enters global configuration mode.		
	Example:			
	Device# configure terminal			
Step 3	aaa new-model	Enables AAA.		
	Example:			
	Device(config)# aaa new-model			
Step 4	aaa group server radius server-name	Adds the RADIUS server and enters server group RADIUS		
	Example:	configuration mode.		
	Device(config)# aaa group server radius ISE	• The <i>server-name</i> argument specifies the RADIUS server group name.		
Step 5	server-private ip-address key key-name	Configures a IP address and encryption key for a private		
	Example:	RADIUS server.		
	Device(config-sg-radius)# server-private 172.25.73.76 key Cisco123			
Step 6	ip vrf forwarding vrf-name	Configures the virtual routing and forwarding (VRF)		
	Example:	reference of a AAA RADIUS or TACACS+ server group.		
	Device(config-sg-radius)# ip vrf forwarding Mgmt-intf			
Step 7	exit	Exits server group RADIUS configuration mode and		
	Example:	returns to global configuration mode.		
	Device(config-sg-radius)# exit			
Step 8	aaa authentication login default group group-name local	Sets the specified group name as the default local AAA		
	Example:	authentication during login.		

	Command or Action	Purpose
	Device(config)# aaa authentication login default group ISE local	
Step 9	aaa authentication login list-name none Example: Device(config) # aaa authentication login NOAUTH none	Specifies that no authentication is required while logging into a system.
Step 10	<pre>aaa authorization exec default group group-name local Example: Device(config)# aaa authorization exec default group ISE local</pre>	Runs authorization to determine if an user is allowed to run an EXEC shell.
Step 11	<pre>aaa session-id common Example: Device(config) # aaa session-id common</pre>	Ensures that session identification (ID) information that is sent out for a given call will be made identical.
Step 12	<pre>line console number Example: Device(config) # line console 0</pre>	Identifies a specific line for configuration and enter line configuration mode.
Step 13	<pre>login authentication authentication-list Example: Device(config-line) # login authentication NOAUTH</pre>	Enables AAA authentication for logins.
Step 14	<pre>end Example: Device(config-line)# end</pre>	Exits line configuration mode and returns to privileged EXEC mode.

Enabling Cisco IOS HTTP Services for RESTCONF

Perform this task to use the RESTCONF interface.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. restconf
- 4. ip http secure-server
- 5. end

DETAILED STEPS

	Command or Action	Purpose			
Step 1	enable	Enables privileged EXEC mode.			

Command or Action	Purpose
Example:	Enter your password if prompted.
Device> enable	
configure terminal	Enters global configuration mode.
Example:	
Device# configure terminal	
restconf	Enables the RESTCONF interface on your network device.
Example:	
Device(config)# restconf	
ip http secure-server	Enables a secure HTTP (HTTPS) server.
Example:	
Device(config)# ip http secure-server	
end	Exits global configuration mode and enters privileged EXEC
Example:	mode
Device(config)# end	
	Example: Device> enable configure terminal Example: Device# configure terminal restconf Example: Device(config)# restconf ip http secure-server Example: Device(config)# ip http secure-server end Example:

Verifying RESTCONF Configuration

When a device boots up with the startup configuration, the *nginx* process will be running. However; DMI processes are not enabled.

The following sample output from the **show platform software yang-management process monitor** command shows that the *nginx* process is running:

Device# show platform software yang-management process monitor

COMMAND	PID	S	VSZ	RSS	%CPU	%MEM	ELAPSED
nginx	27026	S	332356	18428	0.0	0.4	01:34
nginx	27032	S	337852	13600	0.0	0.3	01:34

NGINX is an internal webserver that acts as a proxy webserver. It provides Transport Layer Security (TLS)-based HTTPS. RESTCONF request sent via HTTPS is first received by the NGINX proxy web serve, r and the request is transferred to the confd web server for further syntax/semantics check.

The following sample output from the **show platform software yang-management process** command shows the status of the all processes when a device is booted with the startup-configuration:

Device# show platform software yang-management process

confd	:	Not	Running
nesd	:	Not	Running
syncfd	:	Not	Running
ncsshd	:	Not	Running
dmiauthd	:	Not	Running
nginx	:	Runr	ning
ndbmand	:	Not	Running

```
pubd : Not Running
```

The *nginx* process gets restrated and DMI process are started, when the **restconf** command is configured.

The following sample output from the **show platform software yang-management process** command shows that the *nginx* process and DMI processes are up and running:

Device# show platform software yang-management process

```
confd
nesd : Running
syncfd : Running
ncsshd : Running ! NETCONF-YANG is not configured, hence ncsshd process is
in not running.
dmiauthd : Running
vtyserverutild : Running
opdatamgrd : Running
nginx : Running ! nginx process is up due to the HTTP configuration, and it is
restarted when RESTCONF is enabled.
ndbmand : Running
```

The following sample output from the show platform software yang-management process monitor command displays detailed information about all processes:

Device#show platform software yang-management process monitor

COMMAND	PID	S	VSZ	RSS S	%CPU	%MEM	ELAPSED
confd	28728	S	860396	168496	42.2	4.2	00:12
confd-startup.s	28448	S	19664	4496	0.2	0.1	00:12
dmiauthd	29499	S	275356	23340	0.2	0.5	00:10
ndbmand	29321	S	567232	65564	2.1	1.6	00:11
nesd	29029	S	189952	14224	0.1	0.3	00:11
nginx	29711	S	332288	18420	0.6	0.4	00:09
nginx	29717	S	337636	12216	0.0	0.3	00:09
pubd	28237	S	631848	68624	2.1	1.7	00:13
syncfd	28776	S	189656	16744	0.2	0.4	00:12

After AAA and the RESTCONF interface is configured, and nginx process and relevant DMI processes are running; the device is ready to receive RESTCONF requests.

Use the **show netconf-yang sessions** command to view the status of NETCONF/RESTCONF sessions:

Device# show netconf-yang sessions

Use the **show netconf-yang sessions detail** command to view detailed information about NETCONF/RESTCONF sessions:

```
Device# show netconf-yang sessions detail
```

```
R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore
Number of sessions
                     : 19
session-id
transport
                     : netconf-ssh
username
                     : admin
source-host
                    : 2001:db8::1

                     : None
```

Configuration Examples for RESTCONF Programmable Interface

Example: Configuring the RESTCONF Protocol

RESTCONF Requests (HTTPS Verbs):

The following is a sample RESTCONF request that shows the HTTPS verbs allowed on a targeted resource. In this example, the **logging monitor** command is used..

```
root:~# curl -i -k -X "OPTIONS"
"https://10.85.116.30:443/restconf/data/Cisco-IOS-XE-native:native/logging/monitor/severity"
      -H 'Accept: application/yang-data+json' \
      -u 'admin:admin'
HTTP/1.1 200 OK
Server: nginx
Date: Mon, 23 Apr 2018 15:27:57 GMT
Content-Type: text/html
Content-Length: 0
Connection: keep-alive
Allow: DELETE, GET, HEAD, PATCH, POST, PUT, OPTIONS
                                                     >>>>>>
                                                                      Allowed methods
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Accept-Patch: application/yang-data+xml, application/yang-data+json
Pragma: no-cache
root:~#
```

POST (Create) Request

The POST operation creates a configuration which is not present in the targeted device.

Note

Ensure that the **logging monitor** command is not availabel in the running configuration.

The following sample POST request uses the **logging monitor alerts** command.

```
Device:~# curl -i -k -X "POST"
"https://10.85.116.30:443/restconf/data/Cisco-IOS-XE-native:native/logging/monitor" \
      -H 'Content-Type: application/yang-data+json' \
      -H 'Accept: application/yang-data+json' \
      -u 'admin:admin' \
      -d $'{
   "severity": "alerts"
>
> }'
HTTP/1.1 201 Created
Server: nginx
Date: Mon, 23 Apr 2018 14:53:51 GMT
Content-Type: text/html
Content-Length: 0
Location:
https://10.85.116.30/restconf/data/Cisco-IOS-XE-native:native/logging/monitor/severity
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 14:53:51 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Etaq: 1524-495231-97239
Pragma: no-cache
Device:~#
```

PUT: (Create or Replace) Request:

If the specified command is not present on the device, the POST request creates it; however, if it is already present in the running configuration, the command will be replaced by this request.

The following sample PUT request uses the **logging monitor warnings** command.

```
Device:~# curl -i -k -X "PUT"
"https://10.85.116.30:443/restconf/data/Cisco-IOS-XE-native:native/logging/monitor/severity"
>
       -H 'Content-Type: application/yang-data+json' \
       -H 'Accept: application/yang-data+json' \
>
       -u 'admin:admin' \
       -d $'{
   "severity": "warnings"
> }'
HTTP/1.1 204 No Content
Server: nginx
Date: Mon, 23 Apr 2018 14:58:36 GMT
Content-Type: text/html
Content-Length: 0
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 14:57:46 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Etag: 1524-495466-326956
Pragma: no-cache
Device:~#
```

PATCH: (Update) Request

The following sample PATCH request uses the **logging monitor informational** command.

```
-d $'{
    "native": {
>
      "logging": {
>
       "monitor": {
         "severity": "informational"
>
       }
>
>
> }'
HTTP/1.1 204 No Content
Server: nginx
Date: Mon, 23 Apr 2018 15:07:56 GMT
Content-Type: text/html
Content-Length: 0
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 15:07:56 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Etag: 1524-496076-273016
Pragma: no-cache
Device:~#
```

GET Request (To Read)

The following sample GET request uses the **logging monitor informational** command.

DELETE Request (To Delete the Configuration)

Connection: keep-alive

Last-Modified: Mon, 23 Apr 2018 15:26:05 GMT

Cache-Control: private, no-cache, must-revalidate, proxy-revalidate

Etag: 1524-497165-473206

linux_host:~#

Pragma: no-cache

Feature Information for the RESTCONF Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for the RESTCONF Protocol

Feature Name	Releases	Feature Information
RESTCONF Protocol	Cisco IOS XE Everest 16.6.1	RESTCONF provides a programmatic interface based on standard mechanisms for accessing configuration data, state data, data-model-specific RPC operations and event notifications defined in the YANG model. This feature was introduced on the following platforms: • Cisco 4000 Series Integrated Services Router • Cisco ASR 1000 Aggregation Services Routers • Cisco Cloud Services Router 1000V Series The following commands were introduced or modified: ip http server and restconf
	Cisco IOS XE Fuji 16.8.1a	In Cisco IOS XE Fuji 16.8.1a, this feature was implemented on the following platforms: Cisco 1000 Series Integrated Services Routers Cisco ASR 900 Series Aggregation Services Routers Cisco ASR 920 Series Aggregation Services Router Cisco Catalyst 3650 Series Switches Cisco Catalyst 3850 Series Switches Cisco Catalyst 9300 Series Switches Cisco Catalyst 9400 Series Switches Cisco Catalyst 9500 and 9500-High Performance Series Switches Cisco CBR-8 Converged Broadband Router Cisco Network Convergence System 4200 Series
