

Configuring the FlexVPN Server

This module describes FlexVPN server features, IKEv2 commands required to configure the FlexVPN server, remote access clients, and the supported RADIUS attributes.

Security threats, as well as cryptographic technologies to help protect against such threats, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

- Finding Feature Information, page 1
- Restrictions for the FlexVPN Server, page 2
- Information About the FlexVPN Server, page 2
- How to Configure the FlexVPN Server, page 12
- Configuration Examples for the FlexVPN Server, page 22
- Additional References for Configuring the FlexVPN Server, page 26
- Feature Information for Configuring the FlexVPN Server, page 27

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for the FlexVPN Server

Dual-Stack Tunnel Interface and VRF-Aware IPsec

When configuring a dual-stack tunnel interface in a VPN routing and forwarding (VRF)-aware IPsec scenario, you cannot use the **ip vrf forwarding** command to configure an Inside VPN routing and forwarding (IVRF) instance because this is not a valid configuration. Use the **vrf forwarding** *vrf-name* command to define the IVRF of the tunnel interface, where the *vrf-name* argument is defined using the **vrf definition** command with IPv4 and IPv6 address families inside the definition.

Information About the FlexVPN Server

Peer Authentication Using EAP

The FlexVPN server supports peer authentication using the Extensible Authentication protocol (EAP) and acts as a pass-through authenticator relaying EAP messages between the client and the backend EAP server. The backend EAP server is typically a RADIUS server that supports EAP authentication.

While a FlexVPN client authenticates the FlexVPN client using EAP, the FlexVPN server must authenticate the FlexVPN server by using certificates.

The FlexVPN server is configured to authenticate FlexVPN clients that use EAP by configuring the **authentication remote eap** command in IKEv2 profile configuration mode. FlexVPN clients authenticate using EAP by skipping the AUTH payload in the IKE_AUTH request.

If the **query-identity** keyword is configured, the FlexVPN server queries the EAP identity from the client; otherwise, the FlexVPN client's IKEv2 identity is used as the EAP identity. However, if the **query-identity** keyword is not configured and the FlexVPN client's IKEv2 identity is an IPv4 or IPv6 address, the session is terminated because IP addresses cannot be used as the EAP identity.

The FlexVPN server starts the EAP authentication by passing the FlexVPN client's EAP identity to the EAP server; the FlexVPN server then relays EAP messages between the remote access (RA) client and the EAP server until the authentication is complete. If the authentication succeeds, the EAP server is expected to return the authenticated EAP identity to the FlexVPN server in the EAP success message.

After EAP authentication, the EAP identity used for the IKEv2 configuration is obtained from the following sources in the given order:

- The EAP identity provided by the EAP server with the EAP success message.
- The EAP identity queried from the client when the **query-identity** keyword is configured.
- The FlexVPN client IKEv2 identity used as the EAP identity.

The figure below shows IKEv2 exchange for EAP authentication without the query-identity keyword.

Figure 1: IKEv2 Exchange Without the query-identity Keyword

IKEv2 RA client	IKEv2 RA server	RADIUS-EAP server
HDR, SAi1, KEi, Ni →		8
	← HDR, SAr1, KEr, Nr, [CERTREQ]	
HDR, SK {IDi, [CERTREQ,] [IDr,] SAi2, TSi, TSr} →		
	RADIUS Access-Request/ EAP-Message/EAP- Response/(EAP-ID(IKEv2- ID)) →	
	101 Y 100 Y	← RADIUS Access- Challenge/EAP-Message/ EAP-Request/(EAP- method)
	← HDR, SK {IDr, [CERT,] AUTH, EAP(EAP- Request(EAP-method))}	
HDR, SK {EAP(EAP- Response(EAP-method)} →		
	RADIUS Access-Request/EAP- Message/EAP- Response/EAP-method) →	
		← RADIUS Access- Accept/EAP-Message/EAP- Success (other attributes))
	← HDR, SK {EAP (success)}	
HDR, SK {AUTH} →		
	← HDR, SK {AUTH, SAr2, TSi, TSr }	

The figure below shows the IKEv2 exchange for EAP authentication with the query-identity keyword.

Figure 2: IKEv2 Exchange with the query-identity Keyword

IKEv2 RA client	IKEv2 RA server	RADIUS-EAP server
HDR, SAi1, KEi, Ni →		
0.0000000000000000000000000000000000000	← HDR, SAr1, KEr, Nr, [CERTREQ]	
HDR, SK {IDi, [CERTREQ,] [IDr,] SAi2, TSi, TSr} →		
	← HDR, SK {IDr, [CERT,] AUTH, EAP (EAP-request (Identity)) }

	← HDR, SK {EAP (success)}	
HDR, SK {AUTH} →		
	← HDR, SK {AUTH, SAr2, TSi, TSr }	

IKEv2 Configuration Mode

IKEv2 configuration mode allows IKE peers to exchange configuration information such as IP addresses and routes. The configuration information is obtained from IKEv2 authorization. Both pull and push models are supported. The pull model involves the exchange of configuration requests and replies; the push model involves the exchange of configuration sets and acknowledgements.

The following table describes the conditions when the initiator and the responder send different configuration payload types:

Table 1: Configuration Payload Types

Configuration Payload Type	Sent By	When
CFG_REQUEST	Initiator	The initiator is the FlexVPN client or if the config-exchange request command is enabled in the IKEv2 profile.
CFG_REPLY	Responder	The responder receives the CFG_REQUEST.
CFG_SET	Initiator and responder	Initiator—The config-exchange set send command is enabled in the IKEv2 profile. Responder—The CFG_REQUEST is not received, the configuration data is available, and the config-exchange set send command is enabled in the IKEv2 profile.
CFG_ACK	Initiator and responder	Initiator—The config-exchange set accept command is enabled in the IKEv2 profile. Responder—The config-exchange set accept command is enabled in the IKEv2 profile.

The commands to send configuration requests and configuration set payloads are enabled by default.

Depending on your release, the IKEv2 initiator can trigger a configuration mode when the initiator is a FlexVPN client, or any static tunnel interface initiating IKEv2 can trigger configuration mode by enabling the **config-mode** command in the IKEv2 profile.

The IKEv2 FlexVPN server supports the following standard IPv4 configuration attributes:

- INTERNAL_IP4_ADDRESS
- INTERNAL_IP4_NETMASK
- INTERNAL_IP4_DNS
- INTERNAL IP4 NBNS
- INTERNAL_IP4_SUBNET

The IKEv2 FlexVPN server supports the following standard IPv6 configuration attributes:

- INTERNAL_IP6_ADDRESS
- INTERNAL_IP6_DNS
- INTERNAL_IP6_SUBNET

Note

IPv6 configuration attributes are only supported by the Microsoft Windows IKEv2 client.

The INTERNAL_IP4_SUBNET and INTERNAL_IP6_SUBNET configuration attributes, controlled by the **route set** and **aaa attribute list** commands in the IKEv2 authorization policy, are not supported when you configure a static virtual tunnel interface (SVTI)-to-SVTI tunnel. In such cases, static routing or dynamic routing must be used instead of the IKEv2-based route exchange.

The IKEv2 FlexVPN server supports the following standard common configuration attribute:

• APPLICATION_VERSION

Note

This attribute is only sent for Cisco Anyconnect and FlexVPN clients.

The IKEv2 FlexVPN server supports the following Cisco Unity configuration attributes:

- MODECFG BANNER
- MODECFG_DEFDOMAIN
- MODECFG SPLITDNS NAME
- MODECFG BACKUPSERVERS
- MODECFG_PFS
- MODECFG SMARTCARD REMOVAL DISCONNECT

Note

The Cisco Unity attributes are sent only for Cisco Anyconnect and FlexVPN clients.

The IKEv2 FlexVPN server supports the following Cisco FlexVPN configuration attributes:

- MODECFG_CONFIG_URL
- MODECFG CONFIG VERSION

Note

The Cisco FlexVPN attributes are sent only for Cisco FlexVPN clients.

The INTERNAL IP4 ADDRESS attribute value is derived from the following sources in the given order:

- The Framed-IP-Address attribute received in AAA user authorization.
- The local IP address pool.
- The DHCP server.

The DHCP server, if configured, allocates addresses only if the local IP address pool is not configured. However, if an error occurs when allocating IP addresses from the local pool, the next address source DHCP server is not used for allocating the addresses.

The value for INTERNAL IP4 NETMASK attribute is derived as follows:

- If the IP address is obtained from the DHCP server, the netmask is also obtained from the DHCP server.
- If the IP address is obtained from either the Framed-IP-Address attribute in AAA user authorization or the local IP address pool, the netmask is derived from the IPv4 netmask attribute received in the user or group authorization. If the netmask is not available, the INTERNAL_IP4_NETMASK attribute is not included in the configuration reply. If the netmask is available, the INTERNAL_IP4_NETMASK attribute is included only if the INTERNAL_IP4_ADDRESS attribute is included in the configuration reply.

An IPv4 address is allocated and included in the reply only if the client requests an address. If the client requests multiple IPv4 addresses, only one IPv4 address is sent in the reply. If available, the remaining attributes are included in the reply even though the client does not request them. If the client requests an IPv4 address and the FlexVPN server is unable to assign an address, an INTERNAL_ADDRESS_FAILURE message is returned to the client.

IKEv2 Authorization

IKEv2 authorization provides a policy for an authenticated session by using the AAA. The policy can be defined locally or on the RADIUS server, and contains local and/or remote attributes. The username for authorization can either be derived from the peer identity using the **name-mangler** keyword or be directly specified in the command. IKEv2 authorization is mandatory only if the peer requests an IP address via configuration mode.

IKEv2 authorization types are as follows:

- User authorization—Use the **aaa authorization user** command in the IKEv2 profile to enable user authorization. User authorization is based on the user-specific portion of the peer IKE identity such as fgdn-hostname. The attributes from user authorization are called user attributes.
- Group authorization—Use the **aaa authorization group** command in the IKEv2 profile to enable group authorization. Group authorization is based on the generic portion of the peer IKE identity such as fqdn-domain. The attributes from group authorization are called group attributes.
- Implicit user authorization—Use the **aaa authorization user cached** command in the IKEv2 profile to enable implicit user authorization. Implicit authorization is performed as part of EAP authentication or when obtaining the AAA preshared key. The attributes from implicit user authorization are called cached attributes.

Note

Depending on your release, the **aaa authorization user cached** command may or may not be available. Explicit user authorization is performed only when implicit user authorization does not return any attributes or does not have the Framed-IP-Address attribute.

Merging and Overriding Attributes

Attributes from different sources are merged before they are used. The precedence of merging attributes is as follows:

- When merging duplicate attributes, the source of the attribute has a higher precedence.
- When merging user and cached attributes, user attributes have higher precedence.

When merging merged-user-attributes and group attributes, merged-user attributes have a higher
precedence, by default. However, this precedence can be reversed using the aaa author group override
command.

IKEv2 Authorization Policy

An IKEv2 authorization policy defines the local authorization policy and contains local and/or remote attributes. Local attributes, such as VPN routing and forwarding (VRF) and the QOS policy, are applied locally. Remote attributes, such as routes, are pushed to the peer via the configuration mode. Use the **crypto ikev2 authorization policy** command to define the local policy. The IKEv2 authorization policy is referred from the IKEv2 profile via the **aaa authorization** command.

IKEv2 Name Mangler

The IKEv2 name mangler is used to derive the username for IKEv2 authorization and obtain the AAA preshared key from the peer IKE identity.

IKEv2 Multi-SA

The IKEv2 Multi-SA feature allows an IKEv2 Dynamic Virtual Tunnel Interface (DVTI) session on the IKEv2 responder to support multiple IPsec Security Associations (SA). The maximum number of IPsec SAs per DVTI session is either obtained from AAA authorization or configured on the IPsec profile. The value from AAA has a higher priority. Any change to the *max-flow-limit* argument in the IPsec profile is not applied to the current session but is applied to subsequent sessions. The IKEv2 Multi-SA feature makes the configuration of the IKEv2 profile in the IPsec profile optional. This optional configuration allows IPsec DVTI sessions using the same virtual template to have different IKEv2 profiles, thus saving the number of virtual template configurations.

The IKEv2 Multi-SA feature allows multiple IPsec SAs that have non-any-any proxies. However, when the IPsec SA proxies are any-any, a single IPsec SA is allowed.

For more information, see the "Multi-SA Support for Dynamic Virtual Tunnel Interfaces for IKEv2" module in the *Security for VPNs with IPsec Configuration Guide*.

Supported RADIUS Attributes

The following tables list the RADIUS attributes supported by the IKEv2 FlexVPN server:

- The Scope field defines the direction of the attribute and the usage on the FlexVPN server or client.
 - Inbound—FlexVPN server to RADIUS
 - Outbound—RADIUS to the FlexVPN server
 - Local—Used locally by the FlexVPN server
 - Remote—Pushed to the client by the FlexVPN server

- The "Local configuration" field specifies the IKEv2 authorization policy command that is used to configure the attribute locally on the FlexVPN server.
- Cisco AV Pair is a Cisco Vendor Specific Attribute (VSA) with vendor-id 9 and vendor-type 1. The VSAs are encapsulated in the Radius IETF attribute 26 Vendor-Specific. The Cisco AV pair is specified as a string of format "protocol:attribute=value".

Example:

cisco-avpair = "ipsec:ipv6-addr-pool=v6-pool"

Table 2: Inbound and Bidirectional IETF RADIUS Attributes

Attribute	Scope
User-Name	Inbound and outbound (bidirectional)
User-Password	Inbound
Calling-Station-Id	Inbound
Service-Type	Inbound
EAP-Message	Bidirectional
Message-Authenticator	Bidirectional

Table 3: Outbound IETF and Cisco AV Pair RADIUS Attributes

Attribute	Туре	Scope	Local configuration
Tunnel-Type	IETF	Local	N/A
Tunnel-Medium-Type	IETF	Local	N/A
Tunnel-Password	IETF	Local	N/A
ipsec:ikev2-password-local	Cisco AV Pair	Local	N/A
ipsec:ikev2-password-remote	Cisco AV Pair	Local	N/A
ipsec:addr-pool	Cisco AV Pair	Local	pool
ipsec:group-dhcp-server	Cisco AV Pair	Local	dhcp server
ipsec:dhcp-giaddr	Cisco AV Pair	Local	dhep giaddr
ipsec:dhcp-timeout	Cisco AV Pair	Local	dhcp timeout
ipsec:ipv6-addr-pool	Cisco AV Pair	Local	ipv6 pool

Attribute	Туре	Scope	Local configuration
ipsec:route-set=interface	Cisco AV Pair	Local	route set interface
ipsec:route-set=prefix	Cisco AV Pair	Local	N/A
ipsec:route-accept	Cisco AV Pair	Local	route accept any
ip:interface-config	Cisco AV Pair	Local	aaa attribute list
ipsec:ipsec-flow-limit	Cisco AV Pair	Local	ipsec flow-limit
Framed-IP-Address	IETF	Remote	N/A
Framed-IP-Netmask	IETF	Remote	netmask
ipsec:dns-servers	Cisco AV Pair	Remote	DNS
ipsec:wins-servers	Cisco AV Pair	Remote	wins
ipsec:route-set=access-list	Cisco AV Pair	Remote	route set access-list
ipsec:addrv6	Cisco AV Pair	Remote	n/a
ipsec:prefix-len	Cisco AV Pair	Remote	n/a
ipsec:ipv6-dns-servers-addr	Cisco AV Pair	Remote	ipv6 dns
ipsec:route-set=access-list ipv6	Cisco AV Pair	Remote	route set access-list ipv6
ipsec:banner	Cisco AV Pair	Remote	banner
ipsec:default-domain	Cisco AV Pair	Remote	def-domain
ipsec:split-dns	Cisco AV Pair	Remote	split-dns
ipsec:ipsec-backup-gateway	Cisco AV Pair	Remote	backup-gateway
ipsec:pfs	Cisco AV Pair	Remote	pfs
ipsec:include-local-lan	Cisco AV Pair	Remote	include-local-lan
ipsecsmartcard+removal-disconnect	Cisco AV Pair	Remote	smartcard-removal- disconnect
ipsec:configuration-url	Cisco AV Pair	Remote	configuration url
ipsec:configuration-version	Cisco AV Pair	Remote	configuration version

Supported Remote Access Clients

The FlexVPN server interoperates with the Microsoft Windows7 IKEv2 client, Cisco IKEv2 AnyConnect client, and Cisco FlexVPN client.

Microsoft Windows7 IKEv2 Client

The Microsoft Windows 7 IKEv2 client sends an IP address as the Internet Key Exchange (IKE) identity that prevents the Cisco IKEv2 FlexVPN server from segregating remote users based on the IKE identity. To allow the Windows 7 IKEv2 client to send the email address (user@domain) as the IKE identity, apply the hotfix documented in KB975488 (http://support.microsoft.com/kb/975488) on Microsoft Windows 7 and specify the email address string in either the Username field when prompted or the CommonName field in the certificate depending on the authentication method.

For certificate-based authentication, the FlexVPN server and Microsoft Windows 7 client certificates must have an Extended Key Usage (EKU) field as follows:

- For the client certificate, EKU field = client authentication certificate.
- For the server certificate, EKU field = server authentication certificate
- The certificates can be obtained from the Microsoft Certificate Server or the IOS CA server.

For EAP authentication, the Microsoft Windows 7 IKEv2 client expects an EAP identity request before any other EAP requests. Ensure that you configure the **query-identity** keyword in the IKEv2 profile on the IKEv2 FlexVPN server to send an EAP identity request to the client.

Cisco IKEv2 AnyConnect Client

For certificate-based authentication, the FlexVPN server and the AnyConnect client certificates must have an Extended Key Usage (EKU) field as follows:

- For the client certificate, EKU field = client authentication certificate
- For the server certificate, EKU field = server authentication certificate

If the FlexVPN server authenticates to AnyConnect client using certificates, a SubjectAltName extension is required in the FlexVPN server certificate that contains the server's IP address or fully qualified domain name (FQDN). Additionally, HTTP certified URLs must be disabled on the FlexVPN server using the **no crypto ikev2 http-url cert** command.

The following example displays the XML tags specific to EAP-MD5 authentication of IKEv2 sessions in the AnyConnect client profile:

For more information, refer to AnyConnect client 3.0 documentation at this link: http://www.cisco.com/en/US/docs/security/vpn_client/anyconnect/anyconnect30/release/notes/anyconnect30rn.html#wp1268255.

How to Configure the FlexVPN Server

Configuring the IKEv2 Profile for the FlexVPN Server

This task describes the IKEv2 profile commands required for configuring the FlexVPN server in addition to the basic IKEv2 profile commands. Refer to the "Configuring IKEv2 Profile (Basic)" task in the *Configuring Internet Key Exchange Version 2 (IKEv2) and FlexVPN Site-to-Site* feature module for information about configuring the basic IKEv2 profile.

Perform this task to configure the IKEv2 profile for the FlexVPN Server:

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. crypto ikev2 profile profile-name
- 4. aaa authentication eap list-name
- 5. authentication {local {rsa-sig | pre-share [key {0 | 6} password}] | ecdsa-sig | eap [gtc | md5 | ms-chapv2] [username username] [password {0 | 6} password}]} | remote {eap [query-identity | timeout seconds] | rsa-sig | pre-share [key {0 | 6} password}] | ecdsa-sig}}
- **6.** Execute both or one of the following:
 - aaa authorization user {eap | psk} {cached | list aaa-listname [aaa-username | name-mangler mangler-name]}
 - aaa authorization user cert list aaa-listname {aaa-username | name-mangler mangler-name}
- **7.** Execute both or one of the following:
 - aaa authorization group [override] {eap | psk} list aaa-listname [aaa-username | name-mangler mangler-name]
 - aaa authorization group [override] cert list aaa-listname {aaa-username | name-mangler mangler-name}
- 8. config-exchange {request | set {accept | send}}
- 9. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example: Device# configure terminal	
Step 3	crypto ikev2 profile profile-name	Defines an IKEv2 profile name and enters IKEv2 profile configuration mode.
	Example: Device(config)# crypto ikev2 profile profile1	
Step 4	aaa authentication eap list-name	(Optional) Specifies AAA authentication list for EAP authentication when implementing the IKEv2 remote access server.
	Example: Device (config-ikey2-profile) # asa	• eap—Specifies the external EAP server.
	<pre>Device(config-ikev2-profile)# aaa authentication eap list1</pre>	• <i>list-name</i> —The AAA authentication list name.
Step 5	authentication {local {rsa-sig pre-share	Specifies the local or remote authentication method.
	[key {0 6} password}] ecdsa-sig eap [gtc md5 ms-chapv2] [username username]	• rsa-sig—Specifies RSA-sig as the authentication method.
	[password {0 6} password}]} remote {eap	• pre-share—Specifies the preshared key as the authentication method.
	[query-identity timeout seconds] rsa-sig pre-share [key {0 6} password}] ecdsa-sig}}	• ecdsa-sig—Specifies ECDSA-sig as the authentication method.
		• eap—Specifies EAP as the remote authentication method.
	Example: Device(config-ikev2-profile)# authentication local ecdsa-sig	• query-identity—Queries the EAP identity from the peer.
		• timeout <i>seconds</i> —Specifies the duration, in seconds, to wait for the next IKE_AUTH request after sending the first IKE_AUTH response.
		Note You can specify only one local authentication method but multiple remote authentication methods.
Step 6	Execute both or one of the following:	Specifies the AAA method list and username for user authorization.
	• aaa authorization user {eap psk} {cached list aaa-listname [aaa-username name-mangler	• user—Specifies user authorization.
		• cert—Specifies that the peers must be authenticated using certificates.
	mangler-name]}	• eap—Specifies that the peers must be authenticated using EAP.
	• aaa authorization user cert list aaa-listname {aaa-username	• psk—Specifies that the peers must be authenticated using preshared keys.
	name-mangler mangler-name} Example:	• cached—Specifies that the attributes received during EAP authentication or obtained from the AAA preshared key must be cached.
	Device(config-ikev2-profile)# aaa authorization user eap cached	• aaa-listname—AAA method list name.
		• aaa-username—Specifies the username that must be used in the AAA authorization request.

	Command or Action	Purpose	
	Example:	• name-mangler—Specifies the name mangler that derives the AAA authorization username from the peer identity.	
	Device (config-ikev2-profile) # aaa authorization user cert list list1 name-mangler mangler1	• mangler-name—Name mangler to be used.	
	name mangior mangiori	• For psk and eap authentication methods, specifying the <i>aaa-username</i> argument or the name-mangler keyword is optional and if not specified, the peer identity is used as the username.	
		 For psk and eap authentication methods, you can simultaneously configure two variants for user authorization with the cached and list keyword respectively. 	
		 Specifying the <i>aaa-username</i> argument or the name-mangler keyword is mandatory for cert authentication, as the peer identity of type distinguished name (DN) cannot be used. 	
Step 7	Execute both or one of the following:	Specifies the AAA method list and username for group authorization.	
	• aaa authorization group [override]	• group—Specifies group authorization.	
	{eap psk} list aaa-listname [aaa-username name-mangler mangler-name]	 override—(Optional) Specifies that attributes from group authorization should take precedence while merging attributes. By default, user attributes take precedence. 	
	• aaa authorization group [override] cert list aaa-listname {aaa-username	• cert—Specifies that peers must be authenticated using certificates.	
	name-mangler mangler-name}	• eap—Specifies that peers must be authenticated using EAP.	
		• psk—Specifies that peers must be authenticated using preshared keys.	
	Example: Device(config-ikev2-profile) # aaa authorization group override psk list list1	• aaa-listname—AAA method list name.	
		• aaa-username—Username that must be used in the AAA authorization request.	
	Example: Device(config-ikev2-profile) # aaa authorization group cert list list1 name-mangler mangler1	• name-mangler—Specifies the name mangler that derives the AAA authorization username from the peer identity.	
		• mangler-name—Name mangler to be used.	
		• For psk and eap authentication methods, specifying the <i>aaa-username</i> argument or the name-mangler keyword is optional and if not specified, the peer identity is used as the username.	
		 For psk and eap authentication methods, you can simultaneously configure two variants for user authorization with the cached and list keyword respectively. 	
		 Specifying the aaa-username argument or the name-mangler keyword is mandatory for cert authentication, as the peer identity of type distinguished name (DN) cannot be used. 	

	Command or Action	Purpose
Step 8	config-exchange {request set {accept	(Optional) Enables configuration exchange options.
	send}}	• request—Enables the configuration exchange request.
	<pre>Example: Device(config-ikev2-profile)# config-exchange set accept</pre>	• set—Enables the configuration exchange request set options.
		• accept—Accepts the configuration exchange request set.
		• send—Enables sending of the configuration exchange set.
		Note The request and set options are enabled by default.
Step 9	end	Exits IKEv2 profile configuration mode and returns to privileged EXEC mode.
	Example: Device(config-ikev2-profile)# end	

Configuring the IKEv2 Name Mangler

Perform this task to specify the IKEv2 name mangler, which is used to derive a name for authorization requests and obtain AAA preshared keys. The name is derived from specified portions of different forms of remote IKE identities or the EAP identity. The name mangler specified here is referred to in the IKEv2 profile.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. crypto ikev2 name-mangler mangler-name
- 4. dn {common-name | country | domain | locality | organization | organization-unit | state}
- 5. eap {all | dn {common-name | country | domain | locality | organization | organization-unit | state} | prefix | suffix {delimiter {. | @ | \}}}
- 6. email {all | domain | username}
- 7. fqdn {all | domain | hostname}
- 8. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example: Device# configure terminal	
Step 3	crypto ikev2 name-mangler mangler-name	Defines a name mangler and enters IKEv2 name mangler configuration mode.
	<pre>Example: Device(config) # crypto ikev2 name-mangler mangler1</pre>	
Step 4	dn {common-name country domain locality organization organization-unit	Derives the name from any of the following fields in the remote identity of type DN (distinguished name).
	state}	• common-name
	Example:	• country
	Device(config-ikev2-name-mangler) # dn state	• domain
		• locality
		• organization
		• organization-unit
		• state
Step 5	eap {all dn {common-name country domain locality organization organization-unit state} prefix suffix {delimiter {. @ \}}} Example: Device (config-ikev2-name-mangler) # eap prefix delimiter @	Derives the name from the remote identity of type EAP (Extensible Authentication Protocol).
		• all—Derives the name from the entire EAP identity.
		• dn—Derives the name from any of the following fields in the remote EAP identity of type DN:
		• common-name
		• country
		• domain
		• locality
		• organization
		• organization-unit
		• state
		• prefix —Derives the name from the prefix in the EAP identity.
		• suffix—Derives the name from the suffix in the EAP identity.
		• delimiter {. @ \}—Specifies the delimiter in the EAP identity that separates the prefix and the suffix.

	Command or Action	Purpose	
Step 6	email {all domain username}	Derives the name from the remote identity of type e-mail.	
	<pre>Example: Device(config-ikev2-name-mangler)# email username</pre>	• all—Derives the name from the entire remote IKE identity of type e-mail.	
		• domain —Derives the name from the domain part of the remote IKE identity.	
		• username —Derives the name from the username part of the remote IKE identity.	
Step 7	fqdn {all domain hostname}	Derives the name from the remote identity of type FQDN (Fully Qualified Domain Name).	
	<pre>Example: Device(config-ikev2-name-mangler)# fqdn domain</pre>	• all—Derives the name from the entire remote IKE identity of type FQDN.	
		• domain —Derives the name from the domain part of the remote IKE identity.	
		• hostname—Derives the name from the hostname part of the remote IKE identity.	
Step 8	end	Exits IKEv2 name mangler configuration mode and returns to privileged EXEC mode.	
	Example:		
	Device(config-ikev2-name-mangler)# end		

Configuring the IKEv2 Authorization Policy

Perform this task to configure the IKEv2 authorization policy.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. crypto ikev2 authorization policy policy-name
- 4. aaa attribute list list-name

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example: Device> enable	Enter your password if prompted.	
Step 2	configure terminal	Enters global configuration mode.	
	Example: Device# configure terminal		

	Command or Action	Purpose	
Step 3	<pre>crypto ikev2 authorization policy policy-name Example: Device (config) # crypto ikev2 authorization policy policy1</pre>	Specifies the IKEv2 authorization policy and enters IKEv2 authorization policy configuration mode.	
Step 4	<pre>aaa attribute list list-name Example: Device (config-ikev2-author-policy) # aaa attribute list list1</pre>	Specifies an AAA attribute list. Note The AAA attribute list referred to in this command should be defined in global configuration mode.	
Step 5	backup-gateway string Example: Device (config-ikev2-author-policy) # backup-gateway gateway1	Allows you to specify up to ten backup server names. This parameter is pushed to the client via the nonstandard Cisco Unity configuration attribute. This parameter specifies the backup servers that the client can use.	
Step 6	<pre>banner banner-text Example: Device (config-ikev2-author-policy) # banner This is IKEv2</pre>	Specifies the banner. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute.	
Step 7	<pre>configuration url url Example: Device (config-ikev2-author-policy) # configuration url http://www.cisco.com</pre>	Specifies the configuration URL. This parameter is sent to the clie via the nonstandard Cisco FlexVPN configuration attribute. The cli can use this URL to download the configuration.	
Step 8	<pre>configuration version version Example: Device (config-ikev2-author-policy) # configuration version 2.4</pre>	Specifies the configuration version. This parameter is sent to the clivia the nonstandard Cisco FlexVPN configuration attribute. This parameter is sent with the configuration URL to specify the versithat the client can download.	
Step 9	<pre>def-domain domain-name Example: Device (config-ikev2-author-policy) # def-domain cisco</pre>	Specifies the default domain. This parameter is sent to the client very the nonstandard Cisco Unity configuration attribute. This parameter specifies the default domain that the client can use.	
Step 10	<pre>dhcp {giaddr ip-address server {ip-address hostname} timeout seconds} Example: Device (config-ikev2-author-policy) # dhcp giaddr 192.0.2.1</pre>	Specifies the DHCP server to lease an IP address that is assigned to the remote access client. • giaddr ip-address—Specifies the gateway IP address (giaddr). • server {ip-address hostname}—Specifies the IP address or hostname of the DHCP server. The hostname is resolved during configuration. • timeout seconds—Specifies the wait time in seconds for the response from the DHCP server.	

	Command or Action	Purpose	
		Note You can specify only one DHCP server. It is assumed that the DHCP server can be reached via the global routing table, and therefore, the DHCP packets are forwarded to the global routing table.	
Step 11	<pre>[ipv6] dns primary-server [secondary-server] Example: Device(config-ikev2-author-policy) # dns 198.51.100.1 198.51.100.100</pre>	Specifies the IP addresses of primary and secondary Domain Name Service (DNS) servers that are sent to the client in the configuration reply.	
		• ipv6—(Optional) Specifies an IPv6 address for the DNS server. To specify an IPv4 address, execute the command without this keyword.	
		• primary-server—IP address of the primary DNS server.	
		• secondary-server—(Optional) IP address of the secondary DNS server.	
Step 12	include-local-lan	Includes local LAN. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute.	
	<pre>Example: Device (config-ikev2-author-policy) # include-local-lan</pre>		
Step 13	ipsec flow-limit number	Specifies the maximum number of IPsec SAs that an IKev2 dVTI session on the IKev2 responder can have. The range is from 0 to 50000.	
	Example: Device(config-ikev2-author-policy)# ipsec flow-limit 12500	By default, the command is disabled, and there is no limit on the number of IPsec flows per dVTI session. A value of 0 will not allow any IPsec SAs.	
Step 14	netmask mask	Specifies the netmask of the subnet from which the IP address is assigned to the client.	
	Example: Device (config-ikev2-author-policy) # netmask 255.255.255.0	• mask—Subnet mask address.	
Step 15	pfs	Enables Password Forward Secrecy (PFS). This parameter is sent the client via the nonstandard Cisco Unity configuration attribute. T	
	Example: Device(config-ikev2-author-policy)# pfs	parameter specifies whether the client should use PFS.	
Step 16	[ipv6] pool name	Defines a local IP address pool for assigning IP addresses to the remote access client.	
	<pre>Example: Device(config-ikev2-author-policy)# pool abc</pre>	• ipv6—(Optional) Specifies an IPv6 address pool. To specify an IPv4 address, execute the command without this keyword	
		• name—Name of the local IP address pool.	
		Note The local IP address pool must already be defined using the ip local pool command.	

	Command or Action	Purpose	
Step 17	route set {interface interface access-list {access-list-name access-list-number expanded-access-list-number ipv6 access-list-name}}	Specifies the route set parameters to the peer via configuration mode and allows running routing protocols such as Border Gateway Protocol (BGP) over VPN. • interface—Specifies the route interface.	
	<pre>Example: Device(config-ikev2-author-policy)# route set interface</pre>	• access-list—Specifies the route access list.	
		• access-list-name—Access list name.	
		• access-list-number—Standard access list number.	
		• expanded-access-list-number—Expanded access list number.	
		• ipv6—Specifies an IPv6 access list.	
Step 18	route accept any [tag value] [distance value]	Filters the routes received from the peer and specify the tag and metric values to install these routes.	
	<pre>Example: Device(config-ikev2-author-policy)# route</pre>	• any—Accepts all routes received from the peer.	
	accept any tag 10	• tag value—(Optional) Specifies the tag ID for the static routes added by IKEv2. The range is from 1 to 497777.	
		• distance value—(Optional) Specifies the distance for the static routes added by IKEv2. The range is from 1 to 255.	
Step 19	route set remote {ipv4 ip-address mask ipv6 ip-address/mask}	Configures IP addresses of inside networks.	
	<pre>Example: Device(config-ikev2-author-policy) # route set remote ipv6 2001:DB8::1/32</pre>		
Step 20	<pre>smartcard-removal-disconnect Example: Device(config-ikev2-author-policy)# smartcard-removal-disconnect</pre>	Enables smartcard removal disconnect. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute. This parameter specifies that the client should terminate the session when the smart card is removed.	
Step 21	split-dns string	Allows you to specify up to ten split domain names. This parameter is sent to the client via the nonstandard Cisco Unity configuration	
	<pre>Example: Device(config-ikev2-author-policy)# split-dns abc1</pre>	attribute. This parameter specifies the domain names that the client should use for private networks.	
Step 22	session-lifetime seconds	Specifies the IKEv2 session lifetime.	
	<pre>Example: Device(config-ikev2-author-policy)# session-lifetime 1000</pre>	• seconds <i>seconds</i> —The range is from 120 to 25920000, which converts to two minutes to 300 days.	
Step 23	<pre>route set access-list {acl-number [ipv6] acl-name}</pre>	Specifies the subnets that are pushed to the remote peer via configuration mode.	

	Command or Action	Purpose
	Example: Device(config-ikev2-client-config-group)# route set access-list 110	 ipvo—(Optional) Specifies an IPvo access control list (ACL). To specify an IPv4 attribute, execute the command without this keyword. *acl-name—Access list name. Note You can only specify standard, simple access lists for IPv4
Step 24	wins primary-server [secondary-server]	addresses. Specifies the internal Windows Internet Naming Service (WINS)
	Example: Device(config-ikev2-author-policy)# wins 203.0.113.1 203.0.113.115	 * primary-server—IP address of the primary WINS server. * secondary-server—(Optional) IP address of the secondary WINS server.
Step 25	end	Exits IKEv2 authorization policy configuration mode and returns to privileged EXEC mode.
	Example: Device(config-ikev2-author-policy)# end	

Configuration Examples for the FlexVPN Server

Example: Configuring the FlexVPN Server

Example: Configuring the FlexVPN Server to Authenticate Peers Using EAP

This example shows how to configure the FlexVPN server to authenticate peers using EAP.

```
aaa new-model
!
aaa group server radius eap-server
  server 192.168.2.1
!
aaa authentication login eap-list group eap-server
!
crypto pki trustpoint trustpoint1
  enrollment url http://192.168.3.1:80
  revocation-check crl
!
crypto ikev2 profile ikev2-profile1
  match identity remote address 0.0.0.0
  authentication local rsa-sig
  authentication remote eap query-identity
  pki trustpoint trustpoint1
```

```
aaa authentication eap eap-list

radius-server host 192.168.2.2 key key2
```

Example: Configuring the FlexVPN Server for Group Authorization (Local AAA)

The following example shows how to configure the FlexVPN server for group authorization through the local AAA using the IKEv2 authorization policy. The authorization policy specifies standard IPv4 and IPv6 attributes, and Cisco Unity, and FlexVPN attributes to be sent to the client through configuration mode. The authorization policy also specifies per user attributes through **aaa attribute list** command for local use.

```
aaa new-model
aaa authorization network local-group-author-list local
aaa attribute list attr-list1

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	

Feature Information for Configuring the FlexVPN Server

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 4: Feature Information for Configuring the FlexVPN Server

Feature Name	Releases	Feature Information
IKEv2 headend support for remote access clients	Cisco IOS XE Release 3.5S	This features provides IKEv2 support for Anyconnect 3.0, FlexVPN hardware client, and multi SA support for VTI.
		The following commands were introduced or modified: aaa attribute list, backup-gateway, banner, config-mode set, configuration url, configuration version, def-domain, dhcp, dns, include-local-lan, max flow limit, pfs, pool, route accept, route set interface, smartcard-removal-disconnect, split-dns, subnet-acl.

Feature Information for Configuring the FlexVPN Server
