

BGP Commands

This chapter describes the commands used to configure and monitor Border Gateway Protocol (BGP) on Cisco NCS 5000 Series Routers using Cisco IOS XR software. The commands in this module configure IP Version 4 (IPv4), IP Version 6 (IPv6), Virtual Private Network Version 4 (VPNv4) routing sessions.

For detailed information about BGP concepts, configuration tasks, and examples, see the Implementing BGP chapter in the *BGP Configuration Guide for Cisco NCS 5000 Series Routers*.

Note Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

- accept-own, on page 7
- additional-paths install backup, on page 8
- additional-paths receive, on page 9
- additional-paths selection, on page 11
- additional-paths send, on page 13
- address-family (BGP), on page 15
- advertise best-external, on page 18
- advertise permanent-network, on page 19
- advertisement-interval, on page 20
- af-group, on page 21
- aggregate-address, on page 22
- aigp, on page 24
- aigp send-cost-community, on page 25
- allocate-label, on page 27
- allowas-in, on page 29
- allowconfedas-in, on page 30
- as-format, on page 31
- as-override, on page 32
- as-path-loopcheck out disable, on page 33
- attribute large-community, on page 34
- attribute-filter group, on page 35
- bfd (BGP), on page 36
- bgp as-path-loopcheck, on page 37

- bgp attribute-download, on page 38
- bgp auto-policy-soft-reset disable, on page 40
- bgp bestpath as-path ignore, on page 41
- bgp bestpath compare-routerid, on page 42
- bgp bestpath cost-community ignore, on page 43
- bgp bestpath med always, on page 44
- bgp bestpath med confed, on page 45
- bgp bestpath med missing-as-worst, on page 47
- bgp bestpath origin-as allow invalid, on page 48
- bgp bestpath origin-as use validity, on page 49
- bgp client-to-client reflection disable, on page 50
- bgp cluster-id, on page 52
- bgp confederation identifier, on page 54
- bgp confederation peers, on page 56
- bgp dampening, on page 58
- bgp default local-preference, on page 60
- bgp enforce-first-as disable, on page 61
- bgp fast-external-fallover disable, on page 62
- bgp graceful-restart, on page 63
- bgp graceful-restart graceful-reset, on page 64
- bgp graceful-restart purge-time, on page 65
- bgp graceful-restart restart-time, on page 66

- socket send-buffer-size, on page 389
- soft-reconfiguration inbound, on page 390
- speaker-id, on page 392
- svd platform enable, on page 393
- table-policy, on page 395
- timers (BGP), on page 397
- timers bgp, on page 399
- transport (rpki-server), on page 401
- ttl-security, on page 402
- update limit, on page 404
- update limit address-family, on page 405
- update limit sub-group, on page 406
- update in error-handling basic disable, on page 407
- update in error-handling extended, on page 408
- update in labeled-unicast equivalent, on page 409

I

- update out logging, on page 410
- update-source, on page 411
- update wait-install, on page 413
- use, on page 414
- username (rpki-server), on page 418
- vrf (BGP), on page 419
- weight, on page 420

L

accept-own

To enable handling of self-originated VPN routes containing ACCEPT_OWN community attribute, use the **accept-own** command in neighbor VPNv4 or VPNv6 address family configuration mode. To disable this functionality, either use the **no** form of this command or use the command with **inheritance-disable** keyword.

accept-own [inheritance-disable] no accept-own

Syntax Description	inheri	tance-disable	Disables handling of self-originated VPN routes containing ACCEPT_OWN community attribute and prevents inheritance of Accept Own from a parent configuration.		
Command Default	Disable	ed			
Command Modes	Neighb	or address fam	nily VPNv4		
	Neighb	or address fam	nily VPNv6		
Command History	Release Modification				
	Releas	e 6.0 This cor	nmand was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	Task ID	Operation			
	bgp	read, write			

This example shows how to enable handling of accept-own community:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)#accept-own
```

additional-paths install backup

To install a backup path into the forwarding table and provide prefix independent convergence (PIC) in case of a PE-CE link failure, use the **additional-paths install backup** command in an appropriate address family configuration mode. To prevent installing the backup path, use the **no** form of this command. To disable prefix independent convergence, use the **disable** keyword.

Note

This feature is not supported.

additional-paths install backup [disable] no additional-paths install backup

Syntax Description	disable Disables installing backup path into the forwarding table.				
Command Default	None				
Command Modes	VRF IPv4 address family configuration				
	VRF IPv6 address family configuration VPNv4 address family configuration				
	VPNv6 address family configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	Task Operations ID				
	bgp read, write				
Examples	The following example shows how to enable installing a backup path into the forwarding table in VPNv4 address family mode:				

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family vpnv4 unicast

additional-paths receive

To configure receive capability of multiple paths for a prefix to the capable peers, use the **additional-paths receive** command in address-family configuration mode. To disable receive capability, use the **no** form of this command. To disable add-path receive capability for all neighbors belonging to a particular VRF address-family, use the **disable** option.

additional-paths receive [disable] no additional-paths receive

Syntax Description	disable Disables advertising additional paths receive capability.				
	Note Use the disable keyword option to disable add-path receive capability for all neighbors belonging to a specified VRF address-family.				
Syntax Description	This command has no keywords or arguments.				
Command Default	None				
Command Modes	IPv4 address family configuration IPv6 address family configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	Use the additional-paths receive command to allow add-path receive capability to be negotiated for a specified address family. When the additional-paths receive command is configured, the receive capability is automatically enabled for all internal BGP neighbors for a specified address family. When this command is either not configured or explicitly disabled, none of the neighbors are allowed to negotiate receive capability for the address family. After enabling the receive capability, the session needs to be reset for the configuration to take into effect.				
Task ID	Task Operation				
	bgp read, write				
	This example shows how to enable additional paths receive capability under VPNv4 unicast address family:				

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:routerconfig)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# additional-paths receive
```

This example shows how to disable additional paths receive capability for all neighbors belonging to a particular VRF address-family (vrf1):

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config-bgp)#vrf vrf1
RP/0/RP0/CPU0:router(config-bgp-vrf)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-vrf-af)#additional-paths receive disable

additional-paths selection

To configure additional paths selection mode for a prefix, use the **additional-paths selection** command in address-family configuration mode. To disable the additional-paths selection mode for a prefix, use the **no** form of this command. To disable the additional-paths selection mode for a particular VRF address-family, use the **disable** option.

additional-paths selection {route-policy route-policy-name | disable} no additional-paths selection route-policy route-policy-name

Syntax Description	route-po	olicy route-p	olicy-name	Specifies	the name of a route policy used for additional paths selection.		
	disable			Disables a	add-path selection for a particular VRF address-family.		
Command Default	None						
Command Modes	IPv4 add	ress family c	onfiguration				
	IPv6 add	ress family c	onfiguration				
Command History	Release	Modific	ation				
	Release	6.0 This con	nmand was in	troduced.			
Usage Guidelines	To configure additional paths selection mode for some or all prefixes, use the additional-paths selection command by specifying a route-policy. Use the additional-path selection command with an appropriate route-policy to calculate backup paths and						
	to enable <i>Unipath</i> I	Prefix Indep	bendent Conv kup section in	ergence (P	PIC) functionality. Refer <i>BGP Prefix Independent Convergence</i> <i>ifiguration Guide for Cisco NCS 5000 Series Routers</i> for details		
Task ID	Task ID	Operation					
		read, write					
Examples	This exar	nple shows ł	now to enable	selection	of additional paths:		
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# additional-paths selection route-policy ap1						
	This example shows how to disable add-path selection for a particular VRF address-family (vrf1):						
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config-bgp)# vrf vrf1						

RP/0/RP0/CPU0:router(config-bgp-vrf)#address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-vrf-af)#additional-paths selection disable

This example shows how to enable add-path selection for a particular VRF address-family (vrf2):

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config-bgp)#vrf vrf2
RP/0/RP0/CPU0:router(config-bgp-vrf)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-vrf-af)#additional-paths selection route-policy ap2

additional-paths send

To configure send capability of multiple paths for a prefix to the capable peers, use the **additional-paths send** command in address-family configuration mode. To disable the send capability, use the **no** form of this command.

additional-paths send [disable] no additional-paths send

Syntax Description	disable Disables advertising additional paths send capability.					
	Note Use the disable option to disable add-path send capability for all neighbors belonging to a particular VRF address-family.					
Command Default	None					
Command Modes	- IPv4 address family configuration					
	IPv6 address family configuration					
Command History	Release Modification					
	Release 6.0 This command was introduced.					
Usage Guidelines	Use the additional-paths send command to allow add-path send capability to be negotiated for a specified address family. When the additional-paths send command is configured, the send capability is automatically enabled for all internal BGP neighbors for the specified address family. When the command is either not configured or explicitly disabled, none of the neighbors are allowed to negotiate send capability for the address family.					
	After enabling the send capability, the session needs to be reset for the configuration to take into effect.					
Task ID	Task Operation ID					
	bgp read, write					
	This example shows how to enable additional paths send capability under VPNv4 4 unicast address family:					
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:routerconfig)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# additional-paths send					
	This example shows how to enable add-path selection for a particular VRF address-family (vrf1):					

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config-bgp)#vrf vrf1
```

RP/0/RP0/CPU0:router(config-bgp-vrf)#address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-vrf-af)#additional-paths send disable

address-family (BGP)

ipv6 unicast

yes

To enter various address family configuration modes while configuring Border Gateway Protocol (BGP), use the **address-family** command in an appropriate configuration mode. To disable support for an address family, use the **no** form of this command.

address-family {ipv4 {unicast} | ipv6 {unicast}} no address-family Syntax Description ipv4 unicast Specifies IP Version 4 (IPv4) unicast address prefixes. ipv6 unicast Specifies IP Version 6 (IPv6) unicast address prefixes. **Command Default** An address family must be explicitly configured in the router configuration mode for the address family to be active in BGP. Similarly, an address family must be configured under the neighbor for the BGP session to be established for that address family. An address family must be configured in router configuration mode before it can be configured under a neighbor. Router configuration **Command Modes** Neighbor configuration Neighbor group configuration **Command History** Release Modification Release 6.0 This command was introduced. Use the **address-family** command to enter various address family configuration modes while configuring **Usage Guidelines** BGP routing sessions. When you enter the **address-family** command from router configuration mode, you enable the address family and enter global address family configuration mode. The IPv4 unicast address family must be configured in router configuration mode before configuring the IPv4 labeled-unicast address family for a neighbor in neighbor configuration mode. The IPv4 unicast address family must be configured in router configuration mode before configuring the IPv4 labeled-unicast address family for a neighbor in neighbor configuration mode. The IPv6 unicast address family must be configured in router configuration mode before configuring the IPv6 labeled-unicast address family for a neighbor in neighbor configuration mode. Table 1: Address Family Submode Support Supported in Router Submode | Supported in Neighbor Submode | Comments Address Family ipv4 unicast yes yes

yes

Task ID Task Operations ID bgp read, write **Examples** The following example shows how to place the router in global address family configuration mode for the IPv4 address family: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# The following example shows how to activate IPv4 multicast for neighbor 10.0.0.1 and place the router in neighbor address family configuration mode for the IPv4 multicast address family: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router# router bgp 1 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 multicast RP/0/RP0/CPU0:router(config-bgp-af)# exit RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.0.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# The following example shows how to place the router in global address family configuration mode for the IPv4 tunnel address family: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # router bgp 12 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 tunnel RP/0/RP0/CPU0:router(config-bgp-af)# The following example shows how to place the router in global address family link-state configuration mode: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family link-state link-state RP/0/RP0/CPU0:router(config-bgp-af)#

The following example shows how to exchange link-state information with a BGP neighbor:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.0.2
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family link-state link-state
RP/0/RP0/CPU0:router(config-bgp-nbr-af)#
```

The following example shows how to place the router in flowspec sub-address family configuration mode for the IPv4 address family:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 flowspec
RP/0/RP0/CPU0:router(config-bgp-af)#

advertise best-external

To advertise the best–external path to the iBGP and route-reflector peers, when a locally selected bestpath is from an internal peer, use the **advertise best-external** command in an appropriate address family configuration mode. To prevent advertising the best–external path, use the **no** form of this command. To disable advertising the best–external path, use the **disable** keyword.

advertise best-external [disable] no advertise best-external

Syntax Description	disable Disables best–external configuration for the VRF.		
Command Default	None		
Command Modes	IPv4 a	ddress family	configuration
	IPv6 a	ddress family	configuration
Command History	Relea	se Modifi	cation
	Releas	se 6.0 This co	ommand was introduced.
Usage Guidelines	No spe	cific guidelir	es impact the use of this command.
Task ID	Task ID	Operations	
	bgp	read, write	
Examples		llowing exam s family mod	ple shows how to enable advertising the best–external path VPNv4 unicast e:
			nter# configure

RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# advertise best-external

advertise permanent-network

To identify the peers to whom the permanent paths must be advertised, use the **advertise permanent-network** command in the neighbor address family configuration mode. To stop advertising the permanent p, use the **no** form of this command. The permanent paths will always be advertised to peers having advertise permanent-network configuration, even if a different best-path is available. The permanent path is not advertised to peers that are not configured to receive permanent path.

The permanent path supports only prefixes in IPv4 unicast and IPv6 unicast address-families under the default Virtual Routing and Forwarding (VRF).

advertise permanent-network no advertise permanent-network

Syntax Description This command has no arguments or keywords.

Command Modes Neighbor address-family configuration.

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

sk ID	Task ID	Operations
	bgp	read, write

Examples

This example shows how to advertise permanent path:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.1.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 4713
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# advertise permanent-network

advertisement-interval

To set the minimum interval between the sending of Border Gateway Protocol (BGP) routing updates, use the **advertisement-interval** command in an appropriate configuration mode. To remove the **advertisement-interval** command from the configuration file and restore the system to its default interval values, use the **no** form of this command.

advertisement-interval seconds no advertisement-interval [seconds]

-					
Syntax Description	seconds Minimum interval between sending BGP routing updates (in seconds). Range is 0 to 600.				
Command Default	Default minimum interval:				
	For internal BGP (iBGP) peers is 0 seconds				
	For external BGP (eBGP) peers is 30 seconds				
	For customer edge (CE) peers is 0 seconds				
Command Modes	Neighbor configuration				
	Neighbor group configuration				
	Session group configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	If this command configures a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.				
Task ID	Task Operations ID				
	bgp read, write				
Examples	The following example shows how to set the minimum time between sending BGP routing updates to 10 seconds:				
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 5 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.1.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 100 RP/0/RP0/CPU0:router(config-bgp-nbr)# advertisement-interval 10</pre>				

af-group

To create an address family group for Border Gateway Protocol (BGP) neighbors and enter address family group configuration mode, use the **af-group** command in XR Config mode. To remove an address family group, use the **no** form of this command.

af-group *af-group-name* address-family no af-group

Syntax Description					
Syntax Description	aj-gro	up-name	Address family group name.		
	addre	ess-family	Enters address family configuration mode.		
	ipv4 u	ınicast	Specifies IP Version 4 (IPv4) unicast address prefixes.		
	ipv6 u	ınicast	Specifies IP Version 6 (IPv6) unicast address prefixes.		
Command Default	No BG	P address f	amily group is configured.		
Command Modes	XR Co	onfig mode			
Command History	Relea	se Mod	ification		
	Releas	se 6.0 This	command was introduced.		
Usage Guidelines	Use the af-group command to group address family-specific neighbor commands within an IPv4 or IPv6 address family. Neighbors that have address family configuration are able to use the address family group. Further, neighbors inherit the configuration parameters of the entire address family group.				
	You ca	nnot define	two address family groups with the same name in different address families.		
Task ID	Task ID	Operation	S		
	bgp	read, write			
Examples	group	configuratio	mple shows how to create address family group group1 and enter address family on mode for IPv4 unicast. Group1 contains the next-hop-self feature, which is bors that use address family group1.		
	RP/0/F	RP0/CPU0:r	outer(config)# router bgp 100 outer(config-bgp)# af-group group1 address-family ipv4 unicast outer(config-bgp-afgrp)# next-hop-self		

aggregate-address

To create an aggregate entry in a Border Gateway Protocol (BGP) routing table, use the **aggregate-address** command in an appropriate configuration mode. To remove the **aggregate-address** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

aggregate-address address/mask-length [as-set] [as-confed-set] [summary-only] [route-policy route-policy-name]

no aggregate-address

Syntax Description	address Aggregate address.					
	/mask-length	Aggregate address mask length. (Optional) Generates autonomous system set path information and community information from contributing paths.				
	as-set					
	as-confed-set	(Optional) Generates autonomous system confederation set path information from contributing paths.				
	summary-only	(Optional) Filters all more-specific routes from updates.				
	route-policy route-policy-name	(Optional) Specifies the name of a route policy used to set the attributes of the aggregate route.				
Command Default	When you do not specify this com	mand, no aggregate entry is created in the BGP routing table.				
Command Modes	- IPv4 address family configuration					
	IPv6 address family configuration					
Command History	Release Modification					
	Release 6.0 This command was introduced.					
Usage Guidelines	You can implement aggregate routing in BGP either by redistributing an aggregate route into BGP using the network command or the aggregate-address command.					
	Use the aggregate-address command without optional arguments to create an aggregate entry in the BGP routing table if any more-specific BGP routes are available that fall in the specified range. The aggregate route is advertised as coming from your autonomous system and has the atomic aggregate attribute set to show that information might be missing. (By default, the atomic aggregate attribute is set unless you specify the as-set keyword.)					
	Use of the as-set keyword creates an aggregate entry using the same rules that the command follows without this keyword. However, the advertised path for this route is an AS_SET, a set of all autonomous systems contained in all paths that are being summarized.					
	Do not use this form of the aggregate-address command when aggregating many paths because this route must be continually withdrawn and updated as autonomous system path reachability information for the summarized routes changes.					

Use the as-confed-set keyword to create an AS_CONFED_SET in the autonomous system path of the aggregate from any confederation segments in the paths being summarized. This keyword takes effect only if the as-set keyword is also specified.

Use of the summary-only keyword creates an aggregate entry (for example, 10.0.0.0/8) but suppresses advertisements of more-specific routes to all neighbors. If you want to suppress only advertisements to certain neighbors, use the route-policy (BGP) command in neighbor address family configuration mode with caution. If a more-specific route leaks out, all BGP speakers (the local router) prefer that route over the less-specific aggregate you generate (using longest-match routing).

Use the **route-policy** keyword to specify a routing policy for the aggregate entry. The **route-policy** keyword is used to select which more-specific information to base the aggregate entry on and which more-specific information to suppress. You can also use the keyword to modify the attributes of the aggregate entry.

RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast

RP/0/RP0/CPU0:router(config-bgp-af)# aggregate-address 10.0.0.0/8 as-set

shows how to create an aggregate address. The path advertised for this route

Task ID	Task	Operations	
	ID		
	bgp	read, write	
Examples		utonomous sy	ple shows how to create an aggregate address. The path advertised for th stem set consisting of all elements contained in all paths that are being
	RP/0/F	RP0/CPU0:rou	ater(config)# router bgp 100

BGP Commands

aigp

To enable sending and receiving of accumulated interior gateway protocol (AiGP) attribute per eBGP neighbor, use the **aigp**command in appropriate configuration mode. To disable this functionality, either use the **disable** keyword or use the **no** form of this command.

aigp [disable] no aigp

Syntax Description	disable Disables sending or receiving AiGP attribute.
Command Default	Send or recive of AiGP attribute is disabled for eBGP neighbors
Command Modes	- IPv4 address family configuration
	IPv6 address family configuration
	Neighbor address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Operation
bgp	read, write

Examples

Task ID

The following example shows how to enable AiGP send and receive capability under neighbor address family (IPv4 unicast):

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# aigp

aigp send-cost-community

To send Accumulated Interior Gateway Protocol (AiGP) value in cost community, use the **aigp send-cost-community** command in appropriate configuration mode. To disable sending AiGP value in cost community, either use the **no** form of this command or the **disable** keyword.

aigp send-cost-community {cost-id | disable} poi {igp-cost | pre-bestpath} [transitive] no aigp send-cost-community

Syntax Description	cost-c	omm-id		Specifies the Cost community ID. The range is 0 to 255.
	poi			Point of insertion for bestpath calculation.
	igp-co	ost		Configures that cost community be used after iGP distance to next hop.
	pre-b	estpath		Configures cost community as first step in best path calculation.
	transi	itive		(Optional) Enables transitive cost community
	disabl	le		Disables sending AiGP value in cost community.
Command Default	Sendin	ıg AiGP valu	e in cost community is di	sabled
Command Modes	Neight	oor address fa	amily configuration	
Command History	Relea	se Modif	ication	
	Releas	se 6.0 This c	ommand was introduced.	
Usage Guidelines	keywo	rd is not requ	ired for iBGP sessions. H	figured either to be pre-bestpath or after igp cost. The transitive lowever, the transitive keyword is required for eBGP sessions and advertise to the eBGP neighbors.
Task ID	Task ID	Operation		
	bgp	read, write		
Examples		-	nple shows how to enable mily (IPv4 unicast):	sending AiGP value in cost community ID 254 under
	RP/0/F	RP0/CPU0:ro	uter# configure uter(config)# router 1 uter(config-bgp)# nei g	

RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# aigp send-cost-community 254 I

allocate-label

To allocate Multiprotocol Label Switching (MPLS) labels for specific IPv4 unicast or IPv6 unicast or VPN routing and forwarding (VRF) IPv4 unicast routes so that the BGP router can send labels with BGP routes to a neighboring router configured for labeled- or VPN routing and forwarding (VRF) IPv6 unicast sessions, use the **allocate-label** command in the appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

	Note This feature is not supported.
	allocate-label {route-policy route-policy-name all} no allocate-label {route-policy route-policy-name all}
Syntax Description	all Allocates labels for all prefixes
	route-policy <i>route-policy-name</i> Uses a route policy to select prefixes for label allocation.
Command Default	No default behavior or values
Command Modes	IPv4 address family configuration
	IPv6 address family configuration
	VRF IPv4 address family configuration
	VRF IPv6 address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the allocate-label command with a route policy to trigger BGP to allocate labels for all or a filtered set of global IPv4 routes (as dictated by the route policy). The command enables autonomous system border routers (ASBRs) that have labeled IPv4 unicast sessions to exchange Multiprotocol Label Switching (MPLS) labels with the IPv4 routes to the other autonomous system (AS) in Layer 3 Virtual Private Network (L3VPN) inter-AS deployments.

route-policy-name command when the route policy is a pass-all policy.

See *MPLS Configuration Guide for Cisco NCS 5000 Series Routers* for information on using the **allocate-label** command for L3VPN inter-AS deployments and carrier-supporting-carrier IPv4 BGP label distribution.

I

Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to enable allocating labels for IPv4 routes:
	<pre>RP/0/RP0/CPU0:router(config) # router bgp 6 RP/0/RP0/CPU0:router(config-bgp)# address family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# allocate-label route-policy policy_A</pre>

allowas-in

To allow an AS path with the provider edge (PE) autonomous system number (ASN) a specified number of times, use the **allowas-in** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

allowas-in [as-occurrence-number] no allowas-in [as-occurrence-number]

Syntax Description	<i>as-occurrence-number</i> (Optional) Number of times a PE ASN is allowed. Range is 1 to 10.
Command Default	No default behavior or values
Command Modes	Address family group configuration
	Neighbor address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Hub and spoke VPN networks require looping back of routing information to the hub PE thro customer edge (CE). See <i>MPLS Configuration Guide for Cisco NCS 5000 Series Routers</i> for

age Guidelines Hub and spoke VPN networks require looping back of routing information to the hub PE through the hub customer edge (CE). See *MPLS Configuration Guide for Cisco NCS 5000 Series Routers* for information on hub and spoke VPN networks. This looping back, in addition to the presence of the PE ASN, causes the looped-back information to be dropped by the hub PE.

The **allowas-in** command prevents the looped-back information from being dropped by replacing the neighbor autonomous system number (ASN) with the PE ASN in the AS path. This allows the VPN customer to see a specified number of occurrences of the PE ASN in the AS path.

ask ID	Task ID	Operations
	bgp	read,
		write

Examples

The following example shows how to allow five occurrences of the PE ASN:

RP/0/RP0/CPU0:router(config) # router bgp 6
RP/0/RP0/CPU0:router(config-bgp) # af-group group_1 address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # allowas-in 5

allowconfedas-in

To enable peer routers in the same confederation to learn from each other for a specified number of times, use the **allowconfedas-in** command in neighbor address family configuration mode.

allowconfedas-in confederation-as-count

Syntax Description	confede	eration-as-count	nt Number of times a provider edge (PE) confederation AS number is allowed
			Range: 1 to 10. Default: 3
Command Default	Peers within the same Confederation will not		Confederation will not learn each other's routes.
Command Modes	Neighbor address-family configuration		ly configuration
Command History	Releas	e Modific	cation
	Release 7.11.1	e This con introduc	ommand was uced.
Task ID	Task ID	Operation	
	bgp	read, write	

Examples

In this example, the peer routers in the same confederation learn from each other thrice:

```
Router# router bgp 65001
Router(config-bgp)# bgp confederation peers 65002
Router(config-bgp)# bgp confederation identifier 100
Router(config-bgp)# neighbor 198.51.100.3
Router(config-bgp-nbr)# address-family ipv4 unicast
Router(config-bgp-nbr-af)# allowconfedas-in 1
```

as-format

I

	To configure the router's Autonomous system number (ASN) notation to asdot format, use the as-format command in XR Config mode. To restore the system to its default condition, use the no form of this command.
	as-format asdot no
Syntax Description	asdot Specifies the Autonomous system number (ASN) notation to asdot format.
Command Default	The default value, if the as-format command is not configured, is asplain.
Command Modes	XR Config mode
Command History	Release Modification
Usage Guidelines	Release 6.0 This command was introduced.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to configure the ASN notation to the asdot format:
	RP/0/RP0/CPU0:router(config)# as-format asdot

RP/0/RP0/CPU0:router(config) # as-format asdot

as-override

To configure a provider edge (PE) router to override the autonomous system number (ASN) of a site with the ASN of a provider, use the **as-override** command which works for both VRF and non-VRF neighbor address family configuration mode. To restore the system to its default condition, use the **no** form of this command.

as-override [inheritance-disable] no as-override [inheritance-disable]

Syntax Description	inheritance-disable (Optional) Prevents the as-override command from being inherited from a parent group.
Command Default	Automatic override of the ASN is disabled.
Command Modes	VRF and non-VRF neighbor address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the as-override command in conjunction with the site-of-origin (SoO) feature, identifying the site where a route originated, and preventing routing loops between routers within a VPN.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to configure an ASN override:
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 6 RP/0/RP0/CPU0:router(config-bgp)# vrf vrf_A RP/0/RP0/CPU0:router(config-bgp-vrf)# neighbor 192.168.70.24 RP/0/RP0/CPU0:router(config-bgp-vrf-nbr)# remote-as 10 RP/0/RP0/CPU0:router(config-bgp-vrf-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-vrf-nbr-af)# as-override</pre>

as-path-loopcheck out disable

To disable AS PATH loop checking for outbound updates, use the **as-path-loopcheck out disable** command in an appropriate address family configuration mode. To re-enable the default AS PATH loop checking, use the **no** form of this command.

as-path-loopcheck out disable no as-path-loopcheck out disable

Syntax Description This command has no keywords or arguments.

Command Default AS PATH loop checking for outbound updates is enabled if there is only one neighbor and disabled if there are multiple neighbors in the update group.

Command Modes IPv4 address family

Command History

IPv6 address family

Release

Release 6.0 This command was introduced.

Modification

Usage Guidelines Configure the as-path-loopcheck out disable command to disable the default behavior of PE router not announcing BGP routes to the CE router if the routes contain an AS number matching the AS number of the receiving CE router.

sk ID	Task ID	Operation
	bgp	read, write

This example shows how to configure **as-path-loopcheck out disable** under IPv6 unicast address family:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#as-path-loopcheck out disable
```

attribute large-community

To specify the large community BGP path attributes in the created attribute filter and the action to be taken on the update message received from the BGP neighbor, use the **attribute large-community** command in the BGP attribute-filter group command mode.

attribu	te large-co	mmunity { discard treat-as-withdraw }
discard		Specifies that the large-community BGP path attribute received in a BGP update message from the neighbor must be discarded.
treat-a	as-withdraw	Indicates that the entire BGP update message that contains the large-community attribute has to be treated as a 'withdraw' message for the Network Layer Reachability Information (NLRI) contained in the update message.
None		
BGP attribute-filter group mode		
Release		Modification
Releas	e 6.3.1	This command was introduced.
None.		
Task ID	Operation	
bgp	read, write	
	discar treat-a None BGP at Releas Releas None. Task ID	discard treat-as-withdraw None BGP attribute-filter g Release Release 6.3.1 None. Task Operation ID bgp read,

The following example creates the attribute-filter named dogbert and specifies the large-community attribute and the action to discard. The dogbert attribute-filter is applied to the BGP neighbor 10.10.10.3. If the large-community BGP path attribute is received in a BGP update message from the neighbor 10.10.10.3, then the attribute will be discarded before further processing of the message.

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 3
RP/0/RP0/CPU0:router(config-bgp)#attribute-filter group dogbert
RP/0/RP0/CPU0:router(config-bgp-attrfg)#attribute large-community discard
RP/0/RP0/CPU0:router(config-bgp-attrfg)#neighbor 10.10.10.3
RP/0/RP0/CPU0:router(config-bgp-nbr)#update in filtering
RP/0/RP0/CPU0:router(config-nbr-upd-filter)#attribute-filter group dogbert

attribute-filter group

To configure attribute-filter group command mode, use the attribute-filter group command in an appropriate configuration mode. To disable attribute-filter group command mode, use the no form of this command.

attribute-filter group group-name no attribute-filter group group-name

Syntax Description	group-name Specifies the name of the attribute-filter group.			
Command Default	Attribute-filter group command mode is disabled.			
Command Modes	Router configuration			
	Neighbor configuration			
Command History	Release Modification			
	Release 6.0 This command was introduced.			

Usage Guidelines Use the **attribute-filter group** command in neighbor configuration mode to configure a specific attribute filter group for a BGP neighbor.

k ID	Task ID	Operation
	bgp	read, write

This example shows how to configure the attribute-filter group command mode:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#attribute-filter group ag_discard_med
RP/0/RP0/CPU0:router(config-bgp-attrfg)#
```

This example shows how to configure the attribute filter group for a BGP neighbor:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.0.1.101
RP/0/RP0/CPU0:router(config-bgp-nbr)#remote-as 6461
RP/0/RP0/CPU0:router(config-bgp-nbr)#update in filtering
RP/0/RP0/CPU0:router(config-nbr-upd-filter)#attribute-filter group ag_discard_med
```

bfd (BGP)

To specify a bidirectional forwarding detection (BFD) **multiplier** and **minimum-interval** arguments per neighbor, use the **bfd** command in neighbor address family independent configuration mode. To return to the system defaults, use the **no** form of this command.

Previous to this enhancement, BFD could be configured only in global scope in BGP. This change makes available two new command-line arguments under neighbor address family independent configuration:

bfd {multiplier | minimum-interval} value no bfd {multiplier | minimum-interval} value

Syntax Description	multiplier value	e Specif	ies the BFD session's	multiplier value for the neighbor.		
	minimum-interv	al value Specif	ies the BFD session's	minimum-interval value for the neighbor.		
Command Default	No default per neighbor parameters are set.					
Command Modes	Neighbor address family independent configuration					
Command History	Release Modification					
	Release 6.0 This command was introduced.					
Usage Guidelines	If the minimum interval is changed using the bfd minimum-interval command, the new parameter updates all affected BFD sessions under the command mode in which the minimum interval was changed.					
	If the multiplier is changed using the bfd multiplier command, the new parameter is used to update only the BFD sessions associated with the affected neighbor gets affected.					
	The assumption is that when BFD fast-detect is enabled under neighbor address family independent configuration, the values for the multiplier and minimum-interval values are always derived from the per-neighbor values if they are configured; otherwise, they are to be taken from the global BGP configuration mode. In the event that this has not been explicitly stated, then these values are taken to be the default values Also, the bfd arguments can be configured under neighbor-group and session-group and the inheritance adheres to the standard way of BGP configuration inheritance.					
	Accordingly, there are four cases in which bfd-fast detect is enabled.					
	This is shown in table below where the BFD value is either multiplier or minimum-interval. Local indicates per NBR value, global is the BGP global value.					
	BFD value (global)	BFD value (local)	Result			
	Yes	Yes	BFD value (local)			
	Yes	No	BFD value (global)			
	No	Yes	BFD value (local)			
				4		

BFD value (default)

No

No

Examples

bgp as-path-loopcheck

To enable loop checking in the autonomous system path of the prefixes advertised by internal Border Gateway Protocol (iBGP) peers, use the **bgp as-path-loopcheck** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

bgp as-path-loopcheck no bgp as-path-loopcheck

Syntax Description	This command has no keywords or arguments.		
Command Default	When you do not specify this command, loop checking is performed only for external peers.		
Command Modes	Router	configuration	1
Command History	Releas	e Modifi	cation
	Releas	e 6.0 This co	ommand was introduced.
Usage Guidelines	No spec	cific guidelin	es impact the use of this command.
Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The fol peers:	lowing exam	ple shows how to configure an autonomous system path for loop checking iBGP
	RP/0/R	P0/CPU0:rou	ter(config)# router bgp 6

RP/0/RP0/CP00:router(config)# router bgp 6
RP/0/RP0/CPU0:router(config-bgp)# bgp as-path-loopcheck

bgp attribute-download

To enable Border Gateway Protocol (BGP) attribute download, use the **bgp attribute-download** command in an appropriate configuration mode. To disable BGP attribute download, use the **no** form of this command.

bgĮ	o atti	ribute-download
no	bgp	attribute-download

- This command has no keywords or arguments. **Syntax Description**
- BGP attribute download is not enabled. **Command Default**
- IPv4 unicast address family configuration **Command Modes**

Command History Modification Release Release 6.0 This command was introduced.

When BGP attribute download is enabled using the **bgp attribute-download** command, BGP reinstalls all **Usage Guidelines** routes whose attributes are not currently in the RIB. Likewise, if the user disables BGP attribute download using the no form of the command, BGP reinstalls previously installed routes with a null key, and removes the attributes from the RIB.

Use the **bgp attribute-download** command to enable the Netflow BGP data export function. When attribute download is enabled, BGP downloads the attribute information for prefixes (community, extended community, and as-path) to the Routing Information Base (RIB) and Forwarding Information Base (FIB). This enables FIB to associate the prefixes with attributes and send the Netflow statistics along with the associated attributes.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows the BGP routes before and after BGP attribute download is enabled and shows how to enable BGP attribute download on BGP router 50:

RP/0/RP0/CPU0:router# show route bgp

bgp auto-policy-soft-reset disable

To disable an automatic soft reset of Border Gateway Protocol (BGP) peers when their configured route policy is modified, use the **bgp auto-policy-soft-reset disable** command in an appropriate configuration mode. To re-enable automatic soft reset of BGP peers, use the **no** form of this command.

bgp auto-policy-soft-reset disable no bgp auto-policy-soft-reset disable

Syntax Description This command has no keywords or arguments.

Command Default Automatic soft reset of peers is enabled.

Command Modes Router configuration

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines If the inbound policy changes, it is not always possible to perform a soft reset. This is the case if the neighbor does not support route refresh and soft-reconfiguration inbound is not configured for the neighbor. In such instances, a message is logged in the system log indicating that a manual hard reset is needed.

sk ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to disable an automatic soft reset of BGP peers when their configured route policy is modified:

RP/0/RP0/CPU0:router(config) # router bgp 6
RP/0/RP0/CPU0:router(config-bgp) # bgp auto-policy-soft-reset disable

bgp bestpath as-path ignore

To ignore the autonomous system path length when calculating preferred paths, use the **bgp bestpath as-path ignore** command in an appropriate configuration mode. To return the software to the default state in which it considers the autonomous system path length when calculating preferred paths, use the **no** form of this command.

bgp bestpath as-path ignore no bgp bestpath as-path ignore

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** The autonomous system path length is used (not ignored) when a best path is selected.

 Release 6.0
 This command was introduced.

Usage Guidelines Use the **bgp bestpath as-path ignore** command to ignore the length of autonomous system paths when the software selects a preferred path. When the best path is selected, if this command is specified, all steps are performed as usual except comparison of the autonomous path length between candidate paths.

sk ID	Task ID	Operations
	bgp	read,
		write

Examples

The following example shows how to configure the software to ignore the autonomous system length when performing best-path selection:

RP/0/RP0/CPU0:router(config)# router bgp 65000
RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath as-path ignore

bgp bestpath compare-routerid

To compare identical routes received from external BGP (eBGP) peers during the best-path selection process and select the route with the lowest router ID, use the **bgp bestpath compare-routerid** command in an appropriate configuration mode. To disable comparing identical routes received from eBGP peers during best-path selection, use the **no** form of this command.

bgp bestpath compare-routerid no bgp bestpath compare-routerid

Modification

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** The software does not select a new best path if it is the same as the current best path (according to the BGP selection algorithm) except for the router ID.

Command Modes Router configuration

Release

Command History

Release 6.0 This command was introduced.

Usage Guidelines Use the bgp bestpath compare-routerid command to affect how the software selects the best path, in the case where there are two paths of equal cost according to the BGP selection algorithm. This command is used to force the software to select the path with the lower router ID as the best path. If this command is not used, the software continues to use whichever path is currently the best path, regardless of which has the lower router ID.

Task IDTask
IDOperations
operationsbgpread,
write

Examples

The following example shows how to configure the BGP speaker in autonomous system 500 to compare the router IDs of similar paths:

RP/0/RP0/CPU0:router(config)# router bgp 500
RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath compare-routerid

bgp bestpath cost-community ignore

	To configure a router that is running the Border Gateway Protocol (BGP) to not evaluate the cost community attribute during the best-path selection process, use the bgp bestpath cost-community ignore command in an appropriate configuration mode. To restore the system to its default condition, use the no form of this command.
	bgp bestpath cost-community ignore no bgp bestpath cost-community ignore
Syntax Description	This command has no keywords or arguments.
Command Default	The behavior of this command is enabled by default until the cost community attribute is manually configured.
Command Modes	Router configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the bgp bestpath cost-community ignore command to disable the evaluation of the cost community attribute to help isolate problems and troubleshoot issues that relate to BGP path selection. This command can also be used to delay the activation of cost community attribute evaluation so that cost community filtering can be deployed in a large network at the same time.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to configure a router to not evaluate the cost community attribute during the best-path selection process:
	RP/0/RP0/CPU0:router(config)# router bgp 500 RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath cost-community ignore

bgp bestpath med always

To allow the comparison of the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems, use the **bgp bestpath med always** command in an appropriate configuration mode. To disable considering the MED attribute in comparing paths, use the **no** form of this command.

bgp bestpath med always no bgp bestpath med always

Syntax Description This command has no keywords or arguments.

Command Default The software does not compare MEDs for paths from neighbors in different autonomous systems.

Command Modes Router configuration

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines The MED is one of the parameters that is considered by the software when selecting the best path among many alternative paths. The software chooses the path with the lowest MED.

By default, during the best-path selection process, the software makes a MED comparison only among paths from the same autonomous system. This command changes the default behavior of the software by allowing comparison of MEDs among paths regardless of the autonomous system from which the paths are received.

When the **bgp bestpath med always** command is not enabled and distributed BGP is configured, speakers calculate partial best paths only (executes the best-path steps up to the MED comparison) and send them to BGP Routing Information Base (bRIB). bRIB calculates the final best path (executes all the steps in the best-path calculation). When the **bgp bestpath med always** command is enabled and distributed BGP is configured, speakers can compare the MED across all ASs, allowing the speaker to calculate a single best path to send it to bRIB. bRIB is the ultimate process that calculates the final best path, but when the **bgp bestpath med always** command is enabled of potentially sending multiple, partial best paths

sk ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to configure the Border Gateway Protocol (BGP) speaker in autonomous system 100 to compare MEDs among alternative paths, regardless of the autonomous system from which the paths are received:

RP/0/RP0/CPU0:router(config) # router bgp 100
RP/0/RP0/CPU0:router(config-bgp) # bgp bestpath med always

bgp bestpath med confed

To enable Multi Exit Discriminator (MED) comparison among paths learned from confederation peers, use the **bgp bestpath med confed** command in an appropriate configuration mode. To disable the software from considering the MED attribute in comparing paths, use the **no** form of this command.

bgp bestpath med confed no bgp bestpath med confed

Syntax Description This command has no keywords or arguments.

Command Default The software does not compare the MED of paths containing only confederation segments, or paths containing confederation segments followed by an AS_SET, with the MED of any other paths.

Command Modes Router configuration

Release

Command History

Release 6.0 This command was introduced.

Usage Guidelines By default, the MED of the following paths is not compared with the MED of any other path:

• Paths with an empty autonomous system path

• Paths beginning with an AS_SET

Modification

- Paths containing only confederation segments
- Paths containing confederation segments followed by an AS_SET

Use the **bgp bestpath med confed** command to affect how the following types of paths are treated in the BGP best-path algorithm:

- · Paths containing only confederation segments
- Paths containing confederation segments followed by an AS_SET

The MED for paths that start with an AS_SEQUENCE or that start with confederation segments followed by an AS_SEQUENCE only is compared with the MED of other paths that share the same first autonomous system number in the autonomous system sequence (the neighbor autonomous system number). This behavior is not affected by the **bgp bestpath med confed** command.

As an example, suppose that autonomous systems 65000, 65001, 65002, and 65004 are part of a confederation, but autonomous system 1 is not. Suppose that for a particular route, the following paths exist:

- Path 1: 65000 65004, med = 2, IGP metric = 20
- Path 2: 65001 65004, med = 3, IGP metric = 10
- Path 3: 65002 1, med = 1, IGP metric = 30

If the **bgp bestpath med confed** command is enabled, the software selects path 1 as the best path because it:

- Has a lower MED than path 2
- Has a lower IGP metric than path 3

The MED is not compared with path 3 because it has an external autonomous system number (that is, an AS_SEQUENCE) in the path. If the **bgp bestpath med confed** command is not enabled, then MED is not

compared between any of these paths. Consequently, the software selects path 2 as the best path because it has the lowest IGP metric.

Task ID	Operations
bgp	read, write
	ID

Examples

The following command shows how to enable Border Gateway Protocol (BGP) software to compare MED values for paths learned from confederation peers:

RP/0/RP0/CPU0:router(config)# router bgp 210
RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath med confed

bgp bestpath med missing-as-worst

To have the software consider a missing Multi Exit Discriminator (MED) attribute in a path as having a value of infinity, making the path without a MED value the least desirable path, use the **bgp bestpath med** missing-as-worst command in an appropriate configuration mode. To disable considering the MED attribute in comparing paths, use the **no** form of this command.

bgp bestpath med missing-as-worst no bgp bestpath med missing-as-worst

This command has no keywords or arguments. Syntax Description

The software assigns a value of 0 to the missing MED, causing the path with the missing MED attribute to **Command Default** be considered as the best possible MED.

Examples

Command History

The following example shows how to direct the Border Gateway Protocol (BGP) software to consider a missing MED attribute in a path as having a value of infinity, making this path the least desirable path:

RP/0/RP0/CPU0:router(config) # router bgp 210 RP/0/RP0/CPU0:router(config-bgp) # bgp bestpath med missing-as-worst

bgp bestpath origin-as allow invalid

To permit all paths marked with an 'invalid' origin-as by RPKI to be considered for BGP best path computation, use the **bgp bestpath origin-as allow invalid** command in the router configuration mode. This configuration can also be made in the address family submode.

bgp bestpath origin-as allow invalid

Syntax Description This command has no keywords or arguments.

Command Default By default, prefixes marked with an 'invalid' origin-as are not considered for BGP best path computation when the router is performing origin-as validation.

Command Modes Router configuration

Address family configuration

 Command History
 Release
 Modification

 Release
 This command was introduced

 6.0
 This command was introduced

Usage Guidelines Configuring the bgp bestpath origin-as allow invalid command allows paths marked with an 'invalid' origin-as to be considered for best path computation. This can be limited to an address family by configuring it at the address-family submode.

This configuration takes effect only when the **bgp bestpath origin-as use validity** configuration is enabled.

Prior to Release 6.5.1, you can configure the **bgp bestpath origin-as use validity** command in default VRF only.

From Release 6.5.1 onwards, you can configure the **bgp bestpath origin-as use validity** command in any VRF.

Task ID	Task ID	Operation
	bgp	read, write

Examples

The following example shows how to permit all invalid paths to be considered for BGP best-path selection:

Router#configure Router(config)#router bgp 50000 Router(config-bgp)#bgp bestpath origin-as allow invalid

bgp bestpath origin-as use validity

To enable the BGP Origin AS Validation feature (RPKI) and allow the validity states of BGP paths to be taken into consideration in the bestpath process, use the bgp bestpath origin-as use validity command. This can be configured in router configuration mode and address family submode.

	bgp bes	bgp bestpath origin-as use validity

bgp client-to-client reflection disable

To disable reflection of routes between route-reflection clients using a Border Gateway Protocol (BGP) route reflector, use the **bgp client-to-client reflection disable** command in address family configuration mode. To re-enable client-to-client reflection, use the **no** form of this command.

bgp client-to-client reflection [cluster-id *cluster-id*] disable no bgp client-to-client reflection [cluster-id *cluster-id*] disable

cluster-id (Optional) Cluster ID for which intra-cluster route reflection is to be disabled; maximum of 4 bytes. Cluster ID can be entered either as an IP address or value. Range is 1 to 4294967295.
This command has no keywords or arguments.
Client-to-client reflection is enabled.
Address family configuration
Release Modification
Release 6.0 This command was introduced.
By default, the clients of a route reflector are not required to be fully meshed and the routes from a client are reflected to other clients. However, if the clients are fully meshed, route reflection is not required.
By default, the clients of a route reflector that are part of the same cluster are not required to be fully meshed and the routes from a client are reflected to other clients. However, if the clients are fully meshed, route reflection is not required. If the cluster-id is not specified, then this command disables intra-cluster route reflection for all clusters.
In this example, the three neighbors are fully meshed, so client-to-client reflection is disabled:
<pre>RP/0/RP0/CPU0:router(config)# router bgp 65534 RP/0/RP0/CPU0:router(config-bgp)# bgp cluster-id 2 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# bgp client-to-client reflection cluster-id 2 disable RP/0/RP0/CPU0:router(config-bgp-af)# exit RP/0/RP0/CPU0:router(config-bgp)# neighbor-group rrclients RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# remote-as 65534 RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# bgp cluster-id 2 RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-reflector-client RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# exit RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# exit RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# exit</pre>

L

Examples

In this example, the three neighbors are fully meshed, so client-to-client reflection is disabled:

RP/0/RP0/CPU0:router(config) # router bgp 65534 RP/0/RP0/CPU0:router(config-bgp) # address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-af) # bgp client-to-client reflection disable RP/0/RP0/CPU0:router(config-bgp-af) # exit RP/0/RP0/CPU0:router(config-bgp) # neighbor-group rrclients RP/0/RP0/CPU0:router(config-bgp-nbrgrp) # remote-as 65534 RP/0/RP0/CPU0:router(config-bgp-nbrgrp) # address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af) # route-reflector-client RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af) # route-reflector-client RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af) # exit

RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.253.21 use neighbor-group rrclients RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.253.22 use neighbor-group rrclients

bgp cluster-id

To configure the cluster ID if the Border Gateway Protocol (BGP) cluster has more than one route reflector, use the **bgp cluster-id** command in an appropriate configuration mode. To remove the cluster ID, use the **no** form of this command.

bgp cluster-id cluster-id no bgp cluster-id [cluster-id]

Syntax Description cluster-id Cluster ID of this router acting as a route reflector; maximum of 4 bytes. Cluster ID can be entered either as an IP address or value. Range is 1 to 4294967295.

Command Default A cluster ID is not configured.

Command Modes Router configuration

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines Together, a route reflector and its clients form a *cluster*. A cluster of clients usually has a single route reflector. In such instances, the cluster is identified by the software as the router ID of the route reflector. To increase redundancy and avoid a single point of failure in the network, a cluster might have more than one route reflector. If it does, all route reflectors in the cluster must be configured with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster.

A single route reflector can also support multiple clusters. Each cluster is identified by a unique cluster-id. The cluster-id configured by the **bgp cluster-id** command is taken as the default. If bgp cluster-id is not configured, the router ID for the default VRF identifies the default cluster. A neighbor can be associated with one cluster only, and the corresponding cluster-id is configured in neighbor configuration mode. If the cluster-id is not configured for a neighbor and the neighbor is a route reflector client, then the neighbor is assigned to the default cluster.

(ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to configure the local router as one of the route reflectors serving the cluster. Neighbor 192.168.70.24 is assigned to the default cluster with cluster-id 1.

RP/0/RP0/CPU0:router(config)# router bgp 65534
RP/0/RP0/CPU0:router(config-bgp)# bgp cluster-id 1
RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.70.24
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65534
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast

I

RP/0/RP0/CPU0:router(config-bgp-nbr-af)# route-reflector-client

bgp confederation identifier

To specify a Border Gateway Protocol (BGP) confederation identifier, use the **bgp confederation identifier** command in an appropriate configuration mode. To remove the confederation identifier, use the **no** form of this command.

bgp confederation identifier *as-number* **no bgp confederation identifier** [*as-number*]

Syntax Description	as-number	r Autonomous system (AS) number that internally includes multiple autonomous systems.
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
		• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Command Default	No confec	deration identifier is configured.
Command Modes	Router con	nfiguration
Command History	Release	Modification
	Release 6	5.0 This command was introduced.
Usage Guidelines	systems and and has a different a they are iF and that al	to reduce the internal BGP (iBGP) mesh is to divide an autonomous system into multiple autonomous nd group them into a single confederation. Each autonomous system is fully meshed within itself few connections to another autonomous system in the same confederation. Although the peers in autonomous systems have external BGP (eBGP) sessions, they exchange routing information as i BGP peers. Specifically, the confederation maintains the next hop and local preference informatio llows you to retain a single Interior Gateway Protocol (IGP) for all autonomous systems. To the orld, the confederation looks like a single autonomous system.
	confederat	ogp confederation identifier command to specify the autonomous system number for the tion. This autonomous system number is used when BGP sessions are established with external utonomous systems that are not part of the confederation.
Task ID	Task O ID	Dperations
	01	ead, vrite
Examples	4002, 400	wing example shows how to divide the autonomous system into autonomous systems 4001, 13, 4004, 4005, 4006, and 4007 with the confederation identifier 5. Neighbor 10.2.3.4 is a ide the confederation. Neighbor 172.20.16.6 is outside the routing domain confederation.

To the outside world, there appears to be a single autonomous system with the number 5.

bgp dampening

To enable Border Gateway Protocol (BGP) route dampening or change various BGP route dampening factors, use the **bgp dampening** command in an appropriate configuration mode. To disable route dampening and reset default values, use the **no** form of this command.

bgp dampening [{half-life [reuse suppress max-suppress-time] | **route-policy** route-policy-name}] **no bgp dampening** [{half-life [reuse suppress max-suppress-time] | **route-policy** route-policy-name}]

Syntax Description	half-life	(Optional) Time (in minutes) after which a penalty is decreased. Once the route has been assigned a penalty, the penalty is decreased by half after the half-life period (which is 15 minutes by default). Penalty reduction happens every 5 seconds. Range of the half-life period is from 1 to 45 minutes.				
	reuse	(Optional) Value for route reuse if the flapping route penalty decreases and falls below the reuse value. When this happens, the route is unsuppressed. The process of unsuppressing routes occurs at 10-second increments. Range is 1 to 20000.				
	suppress	(Optional) Maximum penalty value. Suppress a route when its penalty exceeds the value specified. When this happens, the route is suppressed. Range is 1 to 20000.				
	max-suppress-time	(Optional) Maximum time (in minutes) a route can be suppressed. Range is 1 to 255. If the <i>half-life</i> value is allowed to default, the maximum suppress time defaults to 60 minutes.				
	route-policy route-policy-name	(Optional) Specifies the route policy to use to set dampening parameters.				
Command Default	Route dampening is disabled.					
	half-life : 15 minutes					
	<i>reuse</i> : 750					
	suppress : 2000					
	max-suppress-time : four times half-life value					
Command Modes	IPv4 address family configuration					
	IPv6 address family configuration

Examples		0	ple shows how to set the <i>half-life</i> value to 30 minutes, the <i>reuse</i> value to 1500, to 10000, and the <i>max-suppress-time</i> to 120 minutes:
	RP/0/R	P0/CPU0:rou	ater(config)# router bgp 50 ater(config-bgp)# address-family ipv4 unicast ater(config-bgp-af)# bgp dampening 30 1500 10000 120

bgp default local-preference

To change the default local preference value, use the **bgp default local-preference** command in an appropriate configuration mode. To reset the local preference value to the default of 100, use the **no** form of this command.

bgp default local-preference value no bgp default local-preference [value]

Syntax Description *value* Local preference value. Range is 0 to 4294967295. Higher values are preferable.

Command Default Enabled with a value of 100.

Command Modes Router configuration

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines Generally, the default value of 100 allows you to easily define a particular path as less preferable than paths with no local preference attribute. The preference is sent to all networking devices in the local autonomous system.

sk ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to raise the default local preference value from the default of 100 to 200:

RP/0/RP0/CPU0:router(config)# router bgp 200
RP/0/RP0/CPU0:router(config-bgp)# bgp default local-preference 200

bgp enforce-first-as disable

To disable the software from enforcing the first autonomous system path (known as the AS path) of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, use the **bgp enforce-first-as disable** command in an appropriate configuration mode. To re-enable enforcing the first AS path of a received route from an eBGP peer to be the same as the remote autonomous system, use the **no** form of this command.

	bgp enforce-first-as disable no bgp enforce-first-as disable
Syntax Description	This command has no keywords or arguments.
Command Default	By default, the software requires the first autonomous system (in the AS path) of a route received from an eBGP peer to be the same as the remote autonomous system configured.
Command Modes	Router configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	By default, the software ignores any update received from an eBGP neighbor that does not have the autonomou system configured for that neighbor at the beginning of the AS path. When configured, the command applie to all eBGP peers of the router.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows a configuration in which incoming updates from eBGP neighbors are not checked to ensure the first AS number in the AS path is the same as the configured AS number for the neighbor:
	RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# bgp enforce-first-as disable

bgp fast-external-fallover disable

To disable immediately resetting the Border Gateway Protocol (BGP) sessions of any directly adjacent external peers if the link used to reach them goes down, use the **bgp fast-external-fallover disable** command in an appropriate configuration mode. To disable this function and perform an immediate reset of BGP sessions when a link between peers is lost, use the **no** form of this command.

bgp fast-external-fallover disable no bgp fast-external-fallover disable

Syntax Description	isable Disables BGP fast external failover.	
Command Default	GP sessions of any directly adjacent external peers are immediated wn.	y reset if the link used to reach them goes
Command Modes	outer configuration	
Command History	elease Modification	
	elease 6.0 This command was introduced.	
Usage Guidelines	v default, BGP sessions of any directly adjacent external peers ar twork to recover faster when links go down between BGP peers.	•
Task ID	ask Operations	
	gp read, write	
Examples	e following example shows how to disable the automatic resetting	ng of BGP sessions:
	/0/RP0/CPU0:router(config)# router bgp 109 /0/RP0/CPU0:router(config-bgp)# bgp fast-external-fall	over disable

bgp graceful-restart

To enable graceful restart support, use the **bgp graceful-restart** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

bgp graceful-restart no bgp graceful-restart

Syntax Description This command has no keywords or arguments.

Command Default Graceful restart support is not enabled.

Command Modes Router configuration

Command History

 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines

Use the **bgp graceful-restart** command to enable graceful restart functionality on the router, and also to advertise graceful restart to neighboring routers.

Note The **bgp graceful-restart** command with no options must be used to enable graceful restart before using the **bgp graceful-restart purge-time**, **bgp graceful-restart restart-time**, **bgp graceful-restart** stalepath-time, or **bgp graceful-restart graceful-rester** commands.

When graceful restart is enabled, the BGP graceful restart capability is negotiated with neighbors in the BGP OPEN message when the session is established. If the neighbor also advertises support for graceful restart, then graceful restart is activated for that neighbor session. If the neighbor does not advertise support for graceful restart, then graceful restart is not activated for that neighbor session even though it is enabled locally.

If you enter the **bgp graceful-restart** command after some BGP sessions are established, you must restart those sessions before graceful restart takes effect. Use the **clear bgp** command to restart sessions.

)	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to enable graceful restart:

RP/0/RP0/CPU0:router(config) #router bgp 3
RP/0/RP0/CPU0:router(config-bgp)#bgp graceful-restart

bgp graceful-restart graceful-reset

To invoke a graceful restart when configuration changes force a peer reset, use the **bgp graceful-restart graceful-reset** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

bgp graceful-restart graceful-reset no bgp graceful-restart graceful-reset

Syntax Description This command has no keywords or arguments.

Command Default Graceful restart is not invoked when a configuration change forces a peer reset.

Command Modes Router configuration

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines BGP graceful restart must be enabled using the bgp graceful-restart command before enabling graceful restart graceful-restart command.

(ID	Task ID	Operations
	bgp	read,
		write

Examples

The following example shows how to enable graceful reset:

RP/0/RP0/CPU0:router(config)#router bgp 3
RP/0/RP0/CPU0:router(config-bgp)# bgp graceful-restart graceful-rest

bgp graceful-restart purge-time

To specify the maximum time before stale routes are purged from the routing information base (RIB) when the local BGP process restarts, use the **bgp graceful-restart purge-time** command in an appropriate configuration mode. To set the purge timer time to its default value, use the **no** form of this command.

bgp graceful-restart purge-time seconds no bgp graceful-restart purge-time seconds

Syntax Description	second	seconds Maximum time before stale routes are purged. Time in seconds. Range is 0 to 6000.						
Command Default	second	s : 600						
Command Modes	Router	configuration	1					
Command History	Releas	se Modifi	cation	-				
	Releas	e 6.0 This co	mmand was introduced.	-				
Usage Guidelines			must be enabled using graceful-restart purge-			t comman	d before setti	ng the purge
Task ID	Task ID	Operations						
	bgp	read, write						
Examples	The fol	lowing exam	ple shows how to chang	e the BGP pi	urge time to	800 secon	ds:	
	RP/0/R	P0/CPU0:rou	ter(config)# router	bgp 3				

RP/0/RP0/CPU0:router(config-bgp)# bgp graceful-restart purge-time 800

bgp graceful-restart restart-time

To specify a user-predicted local BGP process maximum restart time, which is advertised to neighbors during session establishment, use the **bgp graceful-restart restart-time** command in an appropriate configuration mode. To set this restart time to its default value, use the **no** form of this command.

bgp graceful-restart restart-time seconds no bgp graceful-restart restart-time seconds

Syntax Description	seconds Maximum time advertised to neighbors. Time in seconds. Range is 1 to 4095.									
Command Default	seconds	s : 120								
Command Modes	Router	configuration	n							
Command History	Releas	e Modifi	cation							
	Releas	e 6.0 This co	ommand was introduced.	1.						
Usage Guidelines	-		t must be enabled using graceful-restart restar	-			art com	mand be	fore settin	g the restart
Task ID	Task ID	Operations								
	bgp	read, write								
Examples	The fol	lowing exam	ple shows how to chang	ge the	BGP gr	aceful res	tart time	to 400 s	econds:	

RP/0/RP0/CPU0:router(config)#router bgp 3
RP/0/RP0/CPU0:router(config-bgp)# bgp graceful-restart restart-time 400

bgp graceful-restart stalepath-time

To specify the maximum time to wait for an End-of-RIB message after a neighbor restarts, use the **bgp** graceful-restart stalepath-time command in an appropriate configuration mode. To set the stalepath timer time to its default value, use the **no** form of this command.

bgp graceful-restart stalepath-time seconds no bgp graceful-restart stalepath-time seconds

Syntax Description	seconds Maximum wait time. Time in seconds. Range is 1 to 4095.
Command Default	seconds : 360
Command Modes	Router configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	BGP graceful restart must be enabled using the bgp graceful-restart command before setting the stalepath time using the bgp graceful-restart stalepath-time command. If the stalepath time is exceeded before an End-of-RIB message is received from a neighbor, paths learned from the neighbor are purged from the BGP routing table.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to change the stalepath time to 750 seconds:
	RP/0/RP0/CPU0:router(config)# router bgp 3 RP/0/RP0/CPU0:router(config-bgp)# bgp graceful-restart stalepath-time 750

bgp import-delay

To enable delay for Border Gateway Protocol (BGP) batch import processing, use the **bgp import-delay** command in an appropriate configuration mode. To disable delay in batch import processing, use the no form of this command.

bgp import-delay seconds milliseconds no bgp import-delay

<i>seconds</i> Specifies batch import processing delay in seconds. Range is 0 to 10 seconds.				
<i>milliseconds</i> Specifies batch import processing delay in milliseconds. Range is 0 to 999 seconds.				
No delay is co	onfigured.			
Address-family VPNv4 Unicast

bgp read, write				
	milliseconds No delay is co Address-famil Address-famil Address-famil Release Release No specific gu Task Operation ID bgp read,			

This example shows how to set delay in batch import processing as two seconds and zero milliseconds:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#bgp import-delay 2 0
```

bgp label-delay

To enable delay for Border Gateway Protocol (BGP) batch label processing, use the **bgp label-delay** command in an appropriate configuration mode. To disable delay in batch import processing, use the no form of this command.

bgp label-delay seconds milliseconds no bgp label-delay

Syntax Description	<i>seconds</i> Specifies batch label processing delay in seconds. Range is 0 to 10 seconds.			
	<i>milliseconds</i> Specifies batch label processing delay in milliseconds. Range is 0 to 999 seconds.			
Command Default	No delay is	configured.		
Command Modes	Address-family IPv4 Unicast			
	Address-family IPv6 Unicast			
Command History	Release	Modification		
	Release 6.0) This command was introduced.		
Usage Guidelines	No specific	guidelines impact the use of this command.		
Task ID	Task Op ID	eration		
	bgp rea	ad,		

This example shows how to set delay in batch import processing as two seconds and zero milliseconds:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#bgp label-delay 2 0

bgp log neighbor changes disable

To disable logging of Border Gateway Protocol (BGP) neighbor resets, use the **bgp log neighbor changes** disable command in an appropriate configuration mode. To re-enable logging of BGP neighbor resets, use the no form of this command.

bgp log neighbor changes disable no bgp log neighbor changes disable

This command has no keywords or arguments. **Syntax Description**

BGP neighbor changes are logged. **Command Default**

Release

Router configuration **Command Modes**

Command History

Modification Release 6.0 This command was introduced.

Logging of BGP neighbor status changes (up or down) and resets is used for troubleshooting network **Usage Guidelines** connectivity problems and measuring network stability. Unexpected neighbor resets might indicate high error rates or high packet loss in the network, and should be investigated.

Status change message logging does not substantially affect performance, unlike, for example, enabling per-BGP update debugging. If the UNIX syslog facility is enabled, messages are sent by the software to the UNIX host running the syslog daemon so that the messages can be stored and archived on disk. If the UNIX syslog facility is not enabled, the status change messages are kept in the internal buffer of the router, and are not stored to disk.

The neighbor status change messages are not tracked if the **bgp log neighbor changes disable** command is disabled, except for the last reset reason, which is always available as output of the **show bgp neighbors** command.

Up and down messages for BGP neighbors are logged by the software by default. Use the **bgp log neighbor** changes disable command to stop logging BGP neighbor changes.

Task ID Task Operations ID bgp read, write

Examples

The following example shows how to prevent the logging of neighbor changes for BGP:

RP/0/RP0/CPU0:router(config) # router bgp 65530 RP/0/RP0/CPU0:router(config-bgp)# bgp log neighbor changes disable

bgp maximum neighbor

To control the maximum number of neighbors that can be configured on the router, use the **bgp maximum neighbor** command in an appropriate configuration mode. To set the neighbor limit to the default value, use the **no** form of this command.

bgp maximum neighbor *limit* no maximum neighbor *[limit]*

Syntax Description	limit	Maximum number of neighbors. Range is 1 to 15000.
Command Default	Defaul	lt limit is 10000

Command Modes Router configuration

Release

Release 6.0	This command was introduced.

Modification

Usage Guidelines Any attempt to configure the neighbor limit below 1 or above 15000 fails. Similarly, attempting to configure the limit below the number of neighbors currently configured fails. For example, if there are 3250 neighbors configured, you cannot set the *limit* below 3250.

ask ID	Task ID	Operations
	bgp	write

Examples

Command History

The following example shows how to change the default maximum neighbor limit and set it to 1200:

RP/0/RP0/CPU0:router(config)#router bgp 65530
RP/0/RP0/CPU0:router(config-bgp)# bgp maximum neighbor 1200

bgp multipath as-path

To ignore as-path onwards while computing multipath, use the **bgp multipath as-path** command in XR Config mode.

bgp multipath as-path ignore onwards

Syntax Description	ignore		Ignores as-path related check for multipath selection.	
	onware	ds	Ignores everything as-path onwards for multipath selection.	
Command Default	No defa	ult behavior o	values	
Command Modes	XR Con	nfig mode		
Command History	Releas	e Modifica	tion	
	Release 6.0 This command was introduced.			
Usage Guidelines	When multiple connected routers start ignoring as-path onwards while computing multipath, it causes routed loops. Therefore, you should not configure the bgp multipath as-path ignore onwards command on routed that can form a loop.			
Task ID	Task ID	Operations		
	bgp	read, write		
Examples	RP/0/RE RP/0/RE	PO/CPU0:route PO/CPU0:route	ow to ignore as-path while computing multipath. er# configure er(config)# router bgp 100 er(config-bgp)# bgp multipath as-path ignore onwards	

bgp origin-as validation enable

To enable origin-AS validation, use the **bgp origin-as validation enable** command, in address-family configuration mode.

bgp origin-as validation enable

This command has no arguments or keywords.

Command Default The BGP origin-AS validation disabled.

Command Modes Router configuration

Address family configuration

	Modification
Release 6.6.1	This command was introduced

Usage Guidelines None

Task ID	Task ID	Operation
	bgp	read, write

Examples

The following example shows how to enable origin-AS validation in address-family configuration mode:

```
Router#configure
Router(config)#router bgp 50000
Router(config-bgp)#address-family ipv4 unicast
Router(config-bgp-af)#bgp origin-as validation enable
```

bgp origin-as validation signal ibgp

To signal origin-AS validity towards iBGP peers, use the **bgp origin-as validation signal ibgp** command, in Router configuration mode.

bgp origin-as validation signal ibgp

Syntax Description	ibgp	Specifies that the signal origin-AS validity is directed towards iBGP peers.
Command Default	By def	ault, origin-AS validation is not signaled towards iBGP peers.

Command Modes Router configuration

Address family configuration

Command History	Release	Modification
	Release 6.6.1	This command was introduced

Usage Guidelines None Task ID Task

Task
IDOperationbgpread,
write

Examples

The following example shows how to signal the validation of origin-AS towards iBGP peers in router configuration mode:

Router#configure Router(config)#router bgp 50000 Router(config-bgp)#bgp origin-as validation signal ibgp

The following example shows how to signal the validation of origin-AS towards iBGP peers in address-family configuration mode:

Router#configure

Router(config)#router bgp 50000 Router(config-bgp)#address-family ipv4 unicast Router(config-bgp-af)#bgp origin-as validation signal ibgp

bgp origin-as validation time

To set the origin-AS prefix validation time, use the **bgp origin-as validation time** command, in Router configuration mode.

```
bgp origin-as validation time {prefix-validation-time | off}
```

Cuntary Description			
Syntax Description	prefix-validation-time	Sets the prefix validation time (in seconds).	
		Range for prefix validation time is 5 to 60 seconds.	
	off	Sets off the automatic prefix validation after an RPKI update.	
Command Default	The origin-AS prefix validation time is not set.		
Command Modes	Router configuration		
	Address family configu	ration	
Command History	Release Modifica	tion	
	Release This com 6.6.1	mand was introduced	
Usage Guidelines	None		
Task ID	Task Operation ID		
	bgp read, write		
Examples	The following example	shows how to set the prefix validation time in router configuration	
	Router# configure Router(config)# route Router(config-bgp)# k	er bgp 50000 ogp origin-as validation time 50	
	The following example in router configuration	shows how to set off the automatic prefix validation after an RP mode:	
	Router# configure Router(config)# route Router(config-bgp)# k	er bgp 50000 ogp origin-as validation time off	
	The following example mode:	shows how to set the prefix validation time in address-family con	
		er bgp 50000 address-family ipv4 unicast [)#bgp origin-as validation time 50	

The following example shows how to set off set off the automatic prefix validation after an RPKI update in address-family configuration mode:

Router#configure Router(config)#router bgp 50000 Router(config-bgp)#address-family ipv4 unicast Router(config-bgp-af)#bgp origin-as validation time off

bgp policy propagation input flow-tag

To match packets based on an incoming source, destination IP address or action (such as redirect, drop, PBTS) and redirect it to a specific VRF, use the **bgp policy propagation input flow-tag** command in the interface configuration mode.

bgp policy propagation input flow-tag { destination | source}

Syntax Description	bgp policy propagation inpu flow-tag	ut Enables flow-tag policy propagation on the specified interfaces.
	destination	The packets are matched based on an incoming destination IP address and redirected to a specific VRF.
	source	The packets are matched based on an incoming source IP address and redirect it to a specific VRF.
Command Default	None	
Command Modes	Router configuration	
	Interface configuration	
Command History	Release Modification	
	Release 6.0 This command w	vas introduced.
Usage Guidelines		flow-tag to a specified interface. The packets are matched based on an incoming or action (such as redirect, drop, PBTS) and redirected to a specific VRF.
_	Note You will not be able to er	nable both QPPB and flow tag feature simultaneously on an interface.
Task ID	Task Operation ID	
	bgp read, write	

bgp redistribute-internal

To allow the redistribution of internal Border Gateway Protocol (iBGP) routes into an Interior Gateway Protocol (IGP), such as Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF), use the **bgp redistribute-internal** command in an appropriate configuration mode. To disable the redistribution of iBGP routes into IGPs, use the **no** form of this command.

bgp redistribute-internal no bgp redistribute-internal

Syntax Description	This command has no keywords or arguments.		
Command Default	By default, iBGP routes are not redistributed into IGPs.		
Command Modes	Router configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use of the bgp redistribute-internal command requires the clear route * command to be issued to reinstall all BGP routes into the IP routing table.		
-	Note Redistributing iBGP routes into IGPs may cause routing loops to form within an autonomous system. Use this command with caution.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to redistribute iBGP routes into OSPF:		
	<pre>RP/0/RP0/CPU0:router(config)#router bgp 1 RP/0/RP0/CPU0:router(config-bgp)# bgp redistribute-internal RP/0/RP0/CPU0:router(config-bgp)# exit RP/0/RP0/CPU0:router(config)# router ospf area1 RP/0/RP0/CPU0:router(config-router)# redistribute bgp 1 RP/0/RP0/CPU0:router(config-router)# end RP/0/RP0/CPU0:router# clear route *</pre>		

bgp router-id

To configure a fixed router ID for a Border Gateway Protocol (BGP)-speaking router, use the **bgp router-id** command in an appropriate configuration mode. To disable a fixed router ID, use the **no** form of this command.

bgp router-id ip-address
no bgp router-id [{ip-address}]

Syntax Description	<i>ip-address</i> IP Version 4 (IPv4) address to use as the router ID. Normally, this should be an IPv4 address assigned to the router.			
Command Default	If no router ID is configured in BGP, BGP attempts to use the global router ID if one is configured and available. Otherwise, BGP uses the highest IP address configured on a loopback interface.			
Command Modes	Router configuration			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	If you do not use the bgp router-id command to configure a router ID, an IP address is not configured on any loopback interface, and no global router ID is configured, BGP neighbors remain down.			
	For more details on router IDs, see the BGP Configuration Guide for Cisco NCS 5000 Series Routers			
Task ID	Task Operations ID			
	bgp read, write			
Examples	The following example shows how to configure the local router with the router ID of 192.168.70.24:			
	RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)#bgp router-id 192.168.70.24			

bgp scan-time

To configure scanning intervals of Border Gateway Protocol (BGP)-speaking networking devices, use the **bgp scan-time** command in an appropriate configuration mode. To restore the scanning interval to its default value, use the **no** form of this command.

bgp scan-time seconds **no bgp scan-time** seconds

Syntax Description	seconds Scanning interval (in seconds) of BGP routing information. Range is 5 to 3600 seconds.
eynax becomption	seconds Scanning interval (in seconds) of DOT fouring information. Range is 5 to 5000 seconds.
Command Default	The default scanning interval is 60 seconds.
Command Modes	Router configuration
	IPv4 address family configuration
	IPv6 address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the bgp scan-time command to change how frequently the software processes scanner tasks, such a conditional advertisement, dynamic MED changes, and periodic maintenance tasks.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to set the scanning interval for IPv4 unicast to 20 seconds:
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 64500 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# bgp scan-time 20</pre>
	This example shows how to set the scanning interval to 20 seconds:
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 64500 RP/0/RP0/CPU0:router(config-bgp-af)# bgp scan-time 20</pre>

bgp update-delay

To set the maximum initial delay for a Border Gateway Protocol (BGP)-speaking router to send the first updates, use the **bgp update-delay** command in an appropriate configuration mode. To restore the initial delay to its default value, use the **no** form of this command.

bgp update-delay seconds [always] nobgp update-delay [seconds][always]

Syntax Description	seconds Delay in seconds for the router to send the first updates. Range is 0 to 3600.
	always (Optional) Specifies that the router always wait for the update delay time, even if all neighbors have finished sending their initial updates sooner.
Command Default	120 seconds
Command Modes	Router configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	When BGP is started, it waits a specified period of time for its neighbors to establish peering sessions and to complete sending their initial updates. After all neighbors complete their initial updates, or after the update delay timer expires, the best path is calculated for each route, and the software starts sending advertisements out to its peers. This behavior improves convergence time. If the software were to advertise a route as soon as it learned it, it would have to readvertise the route each time it learned a new path that was preferred over all previously learned paths. Use the bgp update-delay command to tune the maximum time the software waits after the first neighbor
	is established until it starts calculating best paths and sending out advertisements.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to set the maximum initial delay to 240 seconds:
	RP/0/RP0/CPU0:router(config)# router bgp 64530 RP/0/RP0/CPU0:router(config-bgp)# bgp update-delay 240

bgp write-limit

To modify the upper bounds on update message queue lengths or to enable desynchronization, use the **bgp** write-limit command in an appropriate configuration mode. To return the bounds to their default values and to disable desynchronization, use the **no** form of this command.

bgp write-limit group-limit global-limit [desynchronize] no bgp write-limit [group-limit global-limit] [desynchronize]

Syntax Description	<i>group-limit</i> Per-update group limit on the number of update messages the software queues. Range is 500 to 100000000. Group limit cannot be greater than the global limit.		
	global-limit	Global limit on the number of update messages the software queues. Range is 500 to 100000000.	
	desynchronize	(Optional) Enables desynchronization.	
Command Default	group-limit : 50,	000	
	global-limit : 25	0,000	
	Desynchronizati	onis off.	
Command Modes	Router configura	ation	
Command History	Release Mo	odification	
	Release 6.0 Th	is command was introduced.	
Usage Guidelines	of messages the Gateway Protoc addition, this co use and speed uj updates significa can cause a sign	ite-limit command to configure both a per-update group and a global limit on the number software queues when updating peers. Increasing these limits can result in faster Border ol (BGP) convergence, but also may result in higher memory use during convergence. In mmand can be used to enable desynchronization. Desynchronization can decrease memory p convergence for the fastest neighbors if one or more neighbors in an update group process antly slower than other neighbors in the same group. However, enabling desynchronization ificant degradation in overall convergence time, especially if the router is experiencing high For this reason, enabling desynchronization is discouraged.	
Task ID	Task Operatio	ons	
	bgp read, write		
Examples		xample shows how to configure BGP to operate with a per-update group limit of and a global limit of 27,000 messages:	
	RP/0/RP0/CPU0	router(config)# router bgp 65000	

RP/0/RP0/CPU0:router(config-bgp)#bgp write-limit 9000 27000

bmp-activate

To enable Border Gateway Protocol (BGP) Monitoring Protocol (BMP) logging for a neighbor, use the **bmp-activate server** command in neighbor configuration mode. To disable BMP logging for a neighbor, use the **no** form of this command.

bmp-activate server server-id

Syntax Description	server <i>server-id</i> Enables monitoring by the BMP server specified by the <i>server-id</i> variable. You can configure multiple bmp-activate commands under same neighbor with different server IDs to enable monitoring by multiple BMP servers.		
Command Default	No default behavior or values		
Command Modes	Neighbor configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.		
Task ID	Task Operations ID		
	bgp read		
Examples	The following example shows how to activate BMP on a neighbor with IP address 1.1.1.1, which is monitored by BMP server with server ID as 4:		
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# neighbor 1.1.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# bmp-activate server 4		

bmp server

To configure Border Gateway Protocol (BGP) Monitoring Protocol (BMP) server and to enter BMP server configuration mode, use the **bmp server** command in XR Config mode. To remove a particular BMP server configuration, use **no** form of this command.

bmp server {*server-id* | **all**}

Syntax Description	server-id	Specifies BMP server ID. Server ID range is 1 to 8.
	all	Specifies all BMP servers.
	description LINE	Specifies BMP server description. Description can be up to 250 alphanumeric characters.
	dscp	Sets IP DiffServ CodePoint (DSCP).
		The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: default, ef, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cs1, cs2, cs3, cs4, cs5, cs6, or cs7.
	host host-name	Specifies the hostname of BMP server.
		The hostname of the BMP server can be specified in IP address format (standard dot-decimal notation for IPv4 or colon-hexadecimal notation for IPv6) format or the string name which can be resolved into an IP address by the router.
	initial-delay delay-time	Sets the delay, in seconds, before initial connect request is sent to a BMP server. The delay that you can set ranges from 1 to 3600 seconds. The default is 7 seconds.
	initial-refresh {delay skip}	Delay to initiate route refresh requests to BMP enabled neighbors.
		Configures the initial refresh options to handle refresh requests sent by the router to its BMP-enabled neighbors.
		Sets the delay, in seconds, before an initial refresh request is sent by the router to its BMP-enabled neighbors. The delay range is 1 to 3600 seconds with a default of 1 second. The default is not to skip refresh requests.
		Configures the router to skip sending any refresh requests to its BMP-enabled neighbors.

	precedence	Sets the precedence values in the IP header. The precedence value can be a number from 0 to 7, or it can be one of the following keywords:	
		critical —Set packets with critical precedence (5)	
		flash — Set packets with flash precedence (3)	
		flash-override —Set packets with flash override precedence (4)	
		immediate —Set packets with immediate precedence (2)	
		internet —Set packets with internetwork control precedence (6)	
		network —Set packets with network control precedence (7)	
		priority —Set packets with priority precedence (1)	
		routine —Set packets with routine precedence (0)	
		The default is internet (6).	
	shutdown	Shuts down the TCP connection to BMP server.	
	stats-reporting-period	Specifies statistics reporting period, in seconds, to BMP servers. The reporting period that you can set ranges from 1 to 3600 seconds.	
		The default is 0.	
	update-source type	Specifies the source (physical or virtual interface) to reach the BMP server.	
	interface-path-id	Note Use the show interfaces command to see a list of all interfaces currently configured on the router.	
		For more information about the syntax for the router, use the question mark (?) online help function.	
	vrf vrf-nameSpecifies VPN routing and forwarding (VRF) instance.		
Command Default	For default values refer Syntax Description table.		
Command Modes	XR Config mode		
Command History	Release Modification Release 6.0 This command was introduced. No specific guidelines impact the use of this command.		
· · · · · ·			
Usage Guidelines			
Task ID	Task Operations ID		
	bgp read		
Examples	This example shows how to configure initial refresh delay of 30 seconds for BGP neighbors on BMP server with server ID as 4:		

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# bmp server 4 initial-refresh delay 30

This example shows how to configure hostname of BMP server as 192.168.10.1:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# bmp server 8 host 192.168.10.1 port 56

This example shows how to configure tenGigE at location 0/0/0/1 as source interface to reach BMP server:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# bmp server 5 update-source tenGigE 0/0/0/1

capability additional-paths receive

To advertise capability of receiving additional paths to the peer, use the **capability additional-paths receive** command in neighbor or neighbor-group or session-group configuration mode. To disable the capability of receiving additional paths, use the **no** form of this command.

capability additional-paths receive [disable] no capability additional-paths receive

Syntax Description	disable Disables advertising capability of receiving additional paths.		
Command Default	Capability is disabled.		
Command Modes	Neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the capability additional-paths receive command to selectively enable or disable additional paths receive capability negotiation for a particular neighbor or neighbor-group or session-group. Configuring additional-paths receive command in global address-family mode is a pre-requisite for negotiating additional paths receive capability with the peer.		
	If you enter the capability additional-paths receive command after some BGP sessions are established, you must restart those sessions for the new configuration to take effect. Use the clear bgp command to restart sessions.		
Task ID	Task Operation		

 Task ID
 Task Operation

 ID
 ID

 bgp read, write

The following example shows how to advertise capability of receiving additional paths:

RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)#capability additional-paths receive

capability additional-paths send

To advertise capability of sending additional paths to the peer, use the **capability additional-paths send** command in neighbor or neighbor-group or session-group configuration mode. To disable the capability of sending additional paths, use the **no** form of this command.

capability additional paths send [disable] no capability additional paths send

Syntax Description	disable Disables advertise additional paths send capability		
Command Default	Capability is disabled.		
Command Modes	Neighbor configuration Neighbor group configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the capability additional paths send command to selectively enable or disable additional paths send capability negotiation for a particular neighbor or neighbor-group or session-group. Configuring the additional-paths send command in global address-family mode is a pre-requisite for negotiating additional paths send capability with the peer.		
	You must restart the BGP sessions for the new configuration to take effect. Use the clear bgp command to restart sessions.		

Task IDTask
IDOperation
operationbgpread,
write

The following example shows how to advertise capability of sending additional paths to the peer:

RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)# capability additional-paths send

capability orf prefix

To advertise prefix list-based Outbound Route Filter (ORF) capability to the Border Gateway Protocol (BGP) peer, use the **capability orf prefix** command in an appropriate configuration mode. To remove the **capability orf prefix** command from the configuration file and restore the system to its default condition in which the software does not advertise the capability, use the **no** form of this command.

capability orf prefix {receive | send | both | none} no capability orf prefix [{receive | send | both | none}]

Syntax Description	receive Sets the capability to receive the ORF from a specified neighbor.		
	send Sets the capability to send the ORF to a specified neighbor.		
	both Sets the capability to receive and send the ORF from or to a specified neighbor.		
	none Sets the capability to no for ORF receive or send from or to a specified neighbor.		
Command Default	The routing device does not receive or send route prefix filter lists.		
Command Modes	IPv4 address family group configuration		
	IPv6 address family group configuration		
	IPv4 neighbor address family configuration		
	IPv4 neighbor group address family configuration		
	IPv6 neighbor group address family configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	The advertisement of the prefix list ORF capability by a BGP speaker indicates whether the speaker can sprefix lists to the specified neighbor and whether it accepts prefix lists from the neighbor. The speaker see a prefix list if it indicated the ability to send them, and if the neighbor indicated it was willing to accept the Similarly, the neighbor sends a prefix list to the speaker if it indicated the ability to send them and the speaker indicated the willingness to accept them.		
	Note The capability orf and prefix list filter specified by orf route-policy must be explicitly configured.		

If the neighbor sends a prefix list and the speaker accepts it, the speaker applies the received prefix list, plus any locally configured outbound filters, to limit its outbound routing updates to the neighbor. Increased filtering prevents unwanted routing updates between neighbors and reduces resource requirements for routing update generation and processing.

Use the **capability orf prefix** command to set whether to advertise send and receive capabilities to the specified neighbor.

Task ID

Note Sending a receive capability can adversely affect performance, because updates sent to that neighbor cannot be replicated for any other neighbors. If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values. Task Operations ID bgp read, write Examples The following example shows how to configure the capability orf prefix command: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # route-policy orfqq RP/0/RP0/CPU0:router:(config-rpl)# if orf prefix in (10.0.0.0/8 ge 20) then RP/0/RP0/CPU0:router(config-rpl)# pass RP/0/RP0/CPU0:router(config-rpl)# endif RP/0/RP0/CPU0:router(config-rpl)# if orf prefix in (1910::16 ge 120) then RP/0/RP0/CPU0:router(config-rpl)# pass RP/0/RP0/CPU0:router(config-rpl)# endif RP/0/RP0/CPU0:router(config-rpl) # end-policy RP/0/RP0/CPU0:router(config) # router bgp 65530 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.101.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65534

> RP/0/RP0/CPU0:router(config-bgp-nbr-af) # route-policy pass-all out RP/0/RP0/CPU0:router(config-bgp-nbr-af)# capability orf prefix both

RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast

RP/0/RP0/CPU0:router(config-bgp-nbr-af)# orf route-policy orfqq

capability suppress 4-byte-as

To suppress 4-byte AS capability from being advertised to the BGP peer, use the **capability suppress 4-byte-as** command in the appropriate configuration mode. To remove the **capability suppress 4-byte-as** command from the configuration and restore the system to the default condition, in which the software advertises the capability, use the **no** form of this command.

capability suppress 4-byte-as [inheritance-disable] no capability suppress 4-byte-as

Syntax Description	inheritance-disable Prevents capability suppress 4-type-as being inherited from the parent. 4-byte-as capability is advertised to the BGP peer.		
Command Default			
Command Modes	Neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines Ca	By default, the software advertises the 4-byte AS capability to BGP peers. To override this default behavior, use the capability suppress 4-byte-as command under the command modes listed in the "Command Modes" section. If configured under the neighbor group or session group, all neighbors using the group inherit the configuration. Use the no option to remove the command.   Minimum time between advertisement runs is 30 seconds
```

clear bgp

To reset a group of Border Gateway Protocol (BGP) neighbors, use the **clear bgp** command in XR EXEC mode.

	clear bgp [{ipv4 {unicast} ipv6 {unicast multicast}}]		
Syntax Description	ipv4 (Optional) Specifies IP Version 4 address prefixes.		
	unicast (Optional) Specifies unicast address prefixes.		
	mdt (Optional) Specifies IPv4 multicast distribution tree (MDT) address prefixes.		
	ipv6 (Optional) Specifies IP Version 6 address prefixes.		
Command Default	No default behavior or values		
Command Modes	XR EXEC mode		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the clear bgp command to reset the sessions of the specified group of neighbors (hard reset); it removes the TCP connection to the neighbor, removes all routes received from the neighbor from the BGP table, a then re-establishes the session with the neighbor.		
	If the graceful keyword is specified, the routes from the neighbor are not removed from the BGP table immediately, but are marked as stale. After the session is re-established, any stale route that has not been received again from the neighbor is removed.		
Task ID	Task Operations ID		
	bgp execute		
Examples	The following example shows how to hard reset neighbor 10.0.0.1:		
	RP/0/RP0/CPU0:router# clear bgp 10.0.0.1		

BGP Commands

clear bgp dampening

To clear Border Gateway Protocol (BGP) route dampening information and unsuppress the suppressed routes, use the **clear bgp dampening** command in XR EXEC mode.

clear bgp dampening

Syntax Description	ipv4	Specifies IP Version 4 address prefixes.		
	unicast	Specifies unicast address prefixes.		
	ipv6	Specifies IP Version 6 address prefixes.		
	ip-address	(Optional) IP address of the network about which to clear dampening information.		
	/mask-length	/mask-length (Optional) Network mask applied to the IP address.		
Command Default	If no IP address is specified, dampening information for all routes is cleared.			
Command Modes	XR EXEC mode			
Command History	Release Modification			
	Release 6.0 T	Release 6.0 This command was introduced.		
Usage Guidelines		e clear bgp dampening command for an individual address-family. The all option for es with clear bgp dampening should never be used during normal functioning of the system.		
	clear bgp ipv4 unicast dampening prefix x.x.x./y			
Task ID	Task Opera ID	tions		
	bgp execu	ite		
Examples	The following IPv4 unicast p	example shows how to clear the route dampening information for all 172.20.0.0/16 aths:		
	RP/0/RP0/CPU	0:router# clear bgp ipv4 unicast dampening 172.20.0.0/16		

clear bgp external

To clear all Border Gateway Protocol (BGP) external peers, use the **clear bgp external** command in XR EXEC mode.

clear bgp external

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	graceful	(Optional) Clears all external peers with a hard reset and a graceful restart. This option is available when an address family is not specified.
Command Default	No default behavior or value	
Command Modes	- XR EXEC mode	
Command History	Release Modification	
	Release 6.0 This command was introduced.	
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task Operations ID	
	bgp execute	
Examples	The following example shows how to clear a	Il BGP external peers:
	RP/0/RP0/CPU0:router# clear bgp extern	nal

clear bgp flap-statistics

To clear Border Gateway Protocol (BGP) flap counts for a specified group of routes, use the **clear bgp flap-statistics** command in XR EXEC mode.

clear bgp flap-statistics

Syntax Description	ipv4	Specifies IP Version 4 address prefixes.		
	unicast	unicastSpecifies unicast address prefixes.ipv6Specifies IP Version 6 address prefixes.network(Optional) Network for which flap counts are to be cleared./mask-length(Optional) Network mask of the network for which flap counts are to be cleared.ip-address(Optional) Neighbor address. Clears only flap statistics for routes received from this neighbor.		
	ipv6			
	network			
	/mask-length			
	ip-address			
Command Default	No default beh	fault behavior or value		
Command Modes	- XR EXEC mode			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	No specific gu	delines impact the use of this command.		
Task ID	Task Opera ID	tions		
	bgp execu	te		
Examples	The following example shows how to clear the flap count for all routes (in all address families) originating in autonomous system 1:			
	RP/0/RP0/CPU	:router#clear bgp all all flap-statistics regexp _1\$		
	The following neighbor 172.2	example shows how to clear the flap count for all IPv4 unicast routes received from 0.1.1:		
	RP/0/RP0/CPU	:router# clear bgp ipv4 unicast flap-statistics 172.20.1.1		

clear bgp nexthop performance-statistics

To reset the number of received notifications and the cumulative processing time for the Border Gateway Protocol (BGP) next hop, use the **clear bgp nexthop performance-statistics** command in XR EXEC mode.

clear bgp nexthop performance-statistics

Syntax Description	ipv4 Specifies IP Version 4 address prefixes.		
	unicast Specifies unicast address prefixes.		
	mdt Specifies IPv4 multicast distribution tree (MDT) address prefixes.		
	ipv6 Specifies IP Version 6 address prefixes.		
	ipv4 { unicast labeled-unicast } For VRF, specifies IPv4 unicast or labeled-unicast address families.		
	ipv6 unicast For VRF, specifies IPv6 unicast address families.		
Command Default	No default behavior or values		
Command Modes	XR EXEC mode		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the clear bgp nexthop performance-statistics command to reset the total number of notifications received from the Routing Information Base (RIB) and the cumulative next-hop processing time. The following information is cleared from the show bgp nexthops command output:		
	Total critical notifications received		
	Total noncritical notifications receivedBest path deleted after last walk		
	Best path changed after last walk		
	• Next-hop table total number of critical and noncritical notifications (Notf) and the time of the last notification received from the RIB (LastRIB) columns (only entries that have a status of unreachable [UR])		
Task ID	Task Operations ID		
	bgp execute		
Examples	The following example shows how to clear next-hop performance statistics:		
	RP/0/RP0/CPU0:router# clear bgp vrf vrf_A nexthop performance statistics		

clear bgp nexthop registration

To reregister a specified next hop with the Routing Information Base (RIB), use the **clear bgp nexthop registration** command in XR EXEC mode.

clear bgp nexthop registration nexthop-address nexthop-address

Syntax Description	ipv4	Specifies IP Version 4 address prefixes.	
	unicast	Specifies unicast address prefixes.	
	ipv6	Specifies IP Version 6 address prefixes.	
	ipv4 { unicast labeled-unicas	t } For VRF, specifies IPv4 unicast or labeled-unicast address families.	
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.	
	nexthop-address	Address of the next hop.	
Command Default	No default behavior or values		
Command Modes	XR EXEC mode		
Command History	Release Modification		
	Release 6.0 This command was in	ntroduced.	
Usage Guidelines	Use the clear bgp nexthop registration command to perform an asynchronous registration of the next hop with the RIB. The show bgp nexthops command output shows a critical notification as the LastRIBEvent for the next hop when the clear bgp nexthop registration command is used.		
Task ID	Task Operations ID		
	bgp execute		
Examples	The following example shows how	v to reregister the next hop with the RIB:	
	RP/0/RP0/CPU0:router# clear h	ogp nexthop registration 10.1.1.1	

clear bgp peer-drops

To clear the connection-dropped counter, use the clear bgp peer-drops command in XR EXEC mode.

	clear bgp peer-drops {*ip-address}		
Syntax Description	* Specifies all BGP neighbors.		
	<i>ip-address</i> IP address of a specific network neighbor.		
Command Default	No default behavior or values		
Command Modes	XR EXEC mode		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.		
Task ID	Task Operations ID		
	bgp execute		
Examples	The following example shows how to clear the connection-dropped counter for all BGP neighbors:		
	RP/0/RP0/CPU0:router# clear bgp peer-drops *		

clear bgp performance-statistics

To clear the performance statistics for all address families, use the **clear bgp performance-statistics** command.

clear bgp performance-statistics

Syntax Description	vrf	Specifie	s VPN routing and forwarding (VRF).	-
	vrf-name	Name of	f a VRF.	-
	all	For VRI	F, specifies all VRFs.	-
Syntax Description	This comm	nand has n	to keywords or arguments.	
Command Default	No default	behavior	or values	
Command Modes	XR EXEC	mode		
Command History	Release	Modifi	cation	
	Release 6.	0 This co	ommand was introduced.	
Usage Guidelines	No specifie	c guideline	es impact the use of this command.	
Task ID	Task O ID	perations		
	bgp ex	xecute		
Examples	The follow	ving exam	ple shows how to clear the performan	ce statistics for all address families:

RP/0/RP0/CPU0:router# clear bgp performance-statistics

clear bgp self-originated

To clear Border Gateway Protocol (BGP) routes that are self-originated, use the **clear bgp self-originated** command in XR EXEC mode.

clear bgp {ipv4{unicast } | ipv6 {unicast }} self-originated

	_		
Syntax Description	ipv4		Specifies IP Version 4 address prefixes.
	unicas	st	Specifies unicast address prefixes.
	ipv6		Specifies IP Version 6 address prefixes.
	all		For VRF, specifies all VRFs.
	ipv4	{ unicast la	abeled-unicast } For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 u	ınicast	For VRF, specifies IPv6 unicast address families.
Command Default	No def	ault behavior	or values
Command Modes	- XR EX	XEC mode	
Command History	Release Modification		
	Releas	se 6.0 This co	ommand was introduced.
Usage Guidelines	Self-originated routes are routes locally originated by the network command, redistribute command, or aggregate-address command.		
Task ID	Task ID	Operations	
	bgp	execute	
Examples	The following example shows how to clear self-originated IPv4 routes:		
	RP/0/R		

clear bgp shutdown

To clear all Border Gateway Protocol (BGP) neighbors that shut down due to low memory, use the **clear bgp shutdown** command in XR EXEC mode.

clear bgp {ipv4{unicast } | ipv6 {unicast}}

Suntax Description	Syntax Description ipv4 Specifies IP Version 4 address prefixes.			
Syntax Description	ipv4	Specifies IP Version 4 address prefixes.		
	unicast	Specifies unicast address prefixes.		
	ipv6	Specifies IP Version 6 address prefixes.		
	<pre>ipv4 { unicast labeled-unicast }</pre>	For VRF, specifies IPv4 unicast or labeled-unicast address families.		
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.		
Command Default	No default behavior or values			
Command Modes	XR EXEC mode			
Command History	Release Modification			
	Release 6.0 This command was introd	duced.		
Usage Guidelines	No specific guidelines impact the use	of this command.		
Task ID	Task Operations ID			
	bgp execute			
Examples	The following example shows how to clear all shut-down BGP neighbors:			
	RP/0/RP0/CPU0:router# clear bgp	shutdown		

clear bgp soft

To soft reset a group of Border Gateway Protocol (BGP) neighbors, use the **clear bgp soft** command in XR EXEC mode.

	clear bgp {ipv4{unicast } ipv6	all {unicast}} soft		
Syntax Description	ipv4	Specifies IP Version 4 address prefixes.		
	unicast	Specifies unicast address prefixes.		
	ipv6	Specifies IP Version 6 address prefixes.		
	<pre>ipv4 { unicast labeled-unicast }</pre>	For VRF, specifies IPv4 unicast or labeled-unicast address families.		
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.		
	vpnv6 unicast	Specifies VPNv6 unicast address families.		
Command Default	No default behavior or value			
Command Modes	XR EXEC mode			
Command History	Release Modification			
	Release 6.0 This command was introd	luced.		
Usage Guidelines	Use the clear bgp soft command to trigger a soft reset of the specified address families for the specified group of neighbors. This command is useful if you change the inbound or outbound policy for the neighbors, or any other configuration that affects the sending or receiving of routing updates.			
	If an outbound soft reset is triggered, BGP resends all routes for the address family to the given neighbors.			
	If an inbound soft reset is triggered, BGP by default sends a REFRESH request to the neighbor, if the neighbor has advertised the ROUTE_REFRESH capability. To determine whether the neighbor has advertised the ROUTE_REFRESH capability, use the show bgp neighbors command, and look for the following line of output:			
	Received route refresh capabil	ity from peer.		
	If the neighbor does not support route refresh, but the soft-reconfiguration inbound command is configured for the neighbor, then BGP uses the routes cached as a result of the soft-reconfiguration inbound command to perform the soft reset.			
	If you want BGP to use the cached routes even if the neighbor supports route refresh, you can use the always keyword when configuring the soft-reconfiguration inbound command.			
	e 11	refresh and the soft-reconfiguration inbound command is not not possible. In this case, an error is printed.		

I

	Note By default, if the configuration for an inbound or outbound route policy is changed, BGP performs an automatic soft reset. Use the bgp auto-policy-soft-reset disable command to disable this behavior.
Task ID	Task Operations ID
	bgp execute
Examples	The following example shows how to trigger an inbound soft clear for IPv4 unicast routes received from neighbor 10.0.0.1:
	RP/0/RP0/CPU0:router# clear bgp ipv4 unicast 10.0.0.1 soft in

clear bgp vrf rpki validation

To clear the Border Gateway Protocol (BGP) resource public key infrastructure (RPKI) origin-validation table, use the **clear bgp rpki validation** command in XR EXEC mode.

	clear bgp v	<pre>rfvrf-name rpki validation [ipv4 ipv6]</pre>		
Syntax Description	vrf vrf-name	Specifies VPN routing and forwarding (VRF) instance.		
	Ipv4	Clears trigger origin validation walk for the IPv4 table.		
	Ipv6	Clears trigger origin validation walk for the IPv6 table.		
Command Default	No default be	havior or values.		
Command Modes	XR EXEC mo	ode		
Command History	Release Modification			
	Release 6.0 This command was introduced			
	Release 6.5.1	This command was modified. The vrf -name keyword-argument combination were added.		
Usage Guidelines	None			
Task ID	Task Oper ID	ation		
	bgp read, write			

Example

TThe following example shows how to clear the BGP RPKI origin-validation table.

Router#clear bgp vrf vrf1 rpki validation

cluster-id allow-equal

To enable a router to accept BGP routes which have the same first cluster-ID as the router's own cluster-ID in the list of cluster-IDs, use the **cluster-id allow-equal** command in BGP neighbor address-family configuration mode. To revert to the default behaviour, use the **disable** option, or **no** form of this command.

cluster-id allow-equal [disable]

Syntax Description Specifies that BGP routes which have the same first cluster-ID as the router's own cluster-ID in disable the list of cluster-IDs, is rejected. A router rejects BGP routes which have the same first cluster-ID as the router's own cluster-ID in the list of **Command Default** cluster-IDs. BGP neighbor address-family configuration. **Command Modes Command History** Modification Release Release This command was introduced. 6.6.3 To avoid routing loops, the cluster-id allow-equal configuration must be done with care. **Usage Guidelines** The following example shows how to enable a router to accept BGP routes which have the same first cluster-ID as the router's own cluster-ID in the list of cluster-IDs. Router(config) # router bgp 100 Router(config-bgp) # neighbor 10.1.1.1 Router(config-bgp-nbr)# address-family ipv4 unicast Router(config-bgp-nbr-af)# cluster-id allow-equal The following example shows how to disable a router from accepting BGP routes from the same cluster-ID as the router's own cluster-ID in the list of cluster-IDs. Router(config) # router bgp 100 Router(config-bgp)# neighbor 10.1.1.1 Router(config-bgp-nbr)# address-family ipv4 unicast Router(config-bgp-nbr-af)# cluster-id allow-equal disable

default-information originate (BGP)

To allow origination of a default route to be redistributed into the Border Gateway Protocol (BGP) from another protocol, use the **default-information originate** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

default-information originate no default-information originate

Syntax Description	This command has no arguments or keywords.
--------------------	--

Command Default BGP does not permit redistribution of a default route into BGP.

Command Modes Router configuration

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines Use the redistribute command to redistribute routes from another protocol into BGP. By default, if these routes include the default route (0.0.0.0/0 for IPv4 or ::/0 for IPv6), the default route is ignored. Use the default-information originate command to change this behavior so that the default route is not ignored and is redistributed into BGP along with the other routes for the protocol being redistributed.

sk ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to configure BGP to redistribute the default route into BGP:

RP/0/RP0/CPU0:router(config)#router bgp 164
RP/0/RP0/CPU0:router(config-bgp)# default-information originate

default-martian-check disable

To disable the Martian check on the IPv4 and IPv6 prefixes, use the **default-martian-check disable** command in the address-family configuration mode. To enable the Martian check on the IPv4 and IPv6 prefixes, use the **no** form of this command.

default-martian-check disable no default-martian-check disable

Syntax Description	This command has no keywords or arguments.			
Command Default	None			
Command Modes	IPv4 address family configuration mode.			
	IPv6 address family configuration mode.			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	No specific guidelines impact the use of this command.			
Task ID	Task Operations ID			
	bgp read, write			
Examples	This example shows how to disable Martian check for an IPv4 address prefix.			
	<pre>RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 multicast RP/0/RP0/CPU0:router(config-bgp-af)# default-martian-check disable</pre>			
	This example shows how to disable Martian check for an IPv6 address prefix.			

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv6 multicast
RP/0/RP0/CPU0:router(config-bgp-af)# default-martian-check disable

default-metric (BGP)

To set default metric values for the Border Gateway Protocol (BGP), use the **default-metric** command in an appropriate configuration mode. To disable metric values, use the **no** form of this command.

default-metric value no default-metric [value]

Syntax Description	<i>value</i> Default metric value appropriate for the specified routing protocol. Range is 1 to 4294967295.				
Command Default	A metric is not set.				
Command Modes	Router configuration				
	VRF configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	Use the default-metric command to set the Multi Exit Discriminator (MED) to advertise to peers for routes that do not already have a metric set (routes that were received with no MED attribute).				
_	Note The metric values that you apply using the default-metric command take effect only for a new prefix which gets into the BGP table. The metrics for the existing prefixes in the BGP table remain the same. Also, when you remove the default-metric command from the configuration, the metrics which were previously assigned for prefixes are not updated. To get out of this condition, clear the BGP neighborship.				
Task ID	Task Operations ID				
	bgp read, write				
Examples	The following example shows how to set the BGP default metric:				
	RP/0/RP0/CPU0:router(config)# router bgp 109 RP/0/RP0/CPU0:router(config-bgp)# default-metric 10				

default-originate

To cause a Border Gateway Protocol (BGP) speaker (the local router) to send the default route 0.0.0/0 to a neighbor for use as a default route, use the **default-originate** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

default-originate [{inheritance-disable | route-policy route-policy-name}] no default-originate [{inheritance-disable | route-policy route-policy-name}]

Syntax Description	inheritance-disable (Optional) Prevents the default-originate command characteristics being inherited from a parent group.	(Optional) Prevents the default-originate command characteristics from being inherited from a parent group.	
	route-policy <i>route-policy-name</i> (Optional) Specifies the name of a route policy. The route policy arroute 0.0.0.0 to be injected conditionally. IPv6 address family is support		
Command Default	The default route is not advertised to BGP neighbors.		
Command Modes	IPv4 neighbor address family configuration		
	IPv6 neighbor address family configuration		
	IPv4 neighbor group address family configuration		
	IPv6 neighbor group address family configuration		
	IPv4 address family group configuration		
	IPv6 address family group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	The default-originate command does not require the presence of the default route (0.0.0.0/0 for IPv4 for IPv6) in the local router. When the default-originate command is used with a route policy, the de route is advertised if any route in the BGP table matches the policy.		
	In the L2VPN EVPN address-family group configuration mode, you can configure either default-orig or default-originate inheritance-disable commands.	inate	
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to unconditionally advertise the route 0.0.0.0/0 to the neighbor 172.20.2.3:		

I

```
RP/0/RP0/CPU0:router(config) # router bgp 109
RP/0/RP0/CPU0:router(config-bgp)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.2.3
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 200
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# default-originate
```

The following example shows how to advertise the route 0.0.0/0 to the neighbor 172.20.2.3 only if a route exists in the BGP table that matches the route policy called default-default-policy:

```
RP/0/RP0/CPU0:router(config) # router bgp 109
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.2.3
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 200
RP/0/RP0/CPU0:router(config-bgp-nbr) # address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # default-originate route-policy default-default-policy
```

description (BGP)

To annotate a neighbor, neighbor group, VPN routing and forwarding (VRF) neighbor, or session group, use the description command in an appropriate configuration mode. To remove the annotation, use the no form of this command.

description text **no description** [{*text*}]

Syntax Description	<i>text</i> Meaningful description or comment. Maximum of 80 characters.		
Command Default	No comment or description exists.		
Command Modes	Neighbor group configuration		
	Neighbor configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the description command to provide a description of a neighbor, neighbor group, VRF neighbor, or session group. The description is used to save user comments and does not affect software function.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to configure the description "Our best customer" on the neighbor 192.168.13.4:		
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 65000 RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.13.4		

RP/0/RP0/CPU0:router(config-bgp-nbr)#description Our best customer

distance bgp

To allow the use of external, internal, and local administrative distances that could be used to prefer one class of routes over another, use the **distance bgp** command in an appropriate configuration mode. To disable the use of administrative distances, use the **nono** form of this command.

distance bgp *external-distance internal-distance local-distance* **no distance bgp** [*external-distance internal-distance*]

Syntax Description	<i>external-distance</i> Administrative distance for Border Gateway Protocol (BGP) external routes. External routes are routes for which the best path is learned from a neighbor external to the autonomous system. Range is 1 to 255. Routes with a distance of 255 are not installed in the routing table.	
	<i>internal-distance</i> Administrative distance for BGP internal routes. Internal routes are those routes that are learned from another BGP entity within the same autonomous system. Range is 1 to 255. Routes with a distance of 255 are not installed in the routing table.	
	<i>local-distance</i> Administrative distance for BGP local routes. The <i>local-distance</i> argument applies to locally generated aggregate routes (such as the routes generated by the aggregate-address command) and backdoor routes installed in the routing table. Range is 1 to 255. Routes with a distance of 255 are not installed in the routing table.	_
Command Default	external-distance : 20	
	internal-distance : 200	
	local-distance : 200	
Command Modes	IPv4 address family configuration	
	IPv6 address family configuration	
Command History	Release Modification	
	Release 6.0 This command was introduced.	
Usage Guidelines	Use the distance bgp command if another protocol is known to be able to provide a better route to a node than was actually learned using external BGP, or if some internal routes should be preferred by BGP.	
	Note Changing the administrative distance of BGP internal routes is considered risky and is not recommended. One problem that can arise is the accumulation of routing table inconsistencies, which can interfere with routing.	
	An administrative distance is a rating of the trustworthiness of a routing information source. Numerically, an administrative distance is an integer from 1 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.	

I

Task ID	Task ID	Operations	
	bgp	read, write	
Examples		U	ple shows that iBGP routes are preferable to locally generated routes, so the nce values are set accordingly:
	RP/0/R	RP0/CPU0:rou	ater(config)# router bgp 109 ater(config-bgp)# address-family ipv4 unicast ater(config-bgp-af)#distance bgp 20 20 200

distribute bgp-ls (ISIS)

To distribute ISIS link-state data using BGP LS, use the **distribute bgp-ls** command in XR Config mode. To stop link-state distribution, use the **no** form of this command.

```
distribute bgp-ls [instance-id value] [level \{1 \mid 2\}] [throttle time] no distribute bgp-ls
```

Syntax Description	instance-id value	(Optional) Specifies the instance identifier defined by the router isis command. Range is from 1 to 65535.
		If the instance-id is not configured, the system assigned instance-id for the ISIS process will be used.
	level 1 2	(Optional) Displays IS-IS link-state database for Level 1 or Level 2 independently.
	throttle	(Optional) Specifies throttle update, in seconds. Range is from 5 to 20 seconds.
Command Default	None	
Command Modes	XR Config mode	
Command History	Release Modifi	cation
	Release This co 6.1.1	ommand was introduced.
Usage Guidelines	No specific guideline	es impact the use of this command.
Task ID	Task Operations ID	
	isis read, write	
Examples	This example shows	how to distribute ISIS link-state information using BGP LS:
		ter# configure ter(config)# router isis foo ter(config-isis)# distribute bgp-ls instance-id 32 level 2 throttle 5

distribute bgp-ls (OSPF)

To distribute OSPFv2 and OSPFv3 link-state data using BGP LS, use the **distribute bgp-ls** command in XR Config mode. To stop link-state distribution, use the **no** form of this command.

distribute bgp-ls [instance-id value] [throttle time] no distribute bgp-ls

Syntax Description	instance-id value	(Optional) Specifies the instance identifier defined by the router ospf command. Range
oyntax becomption	instance-iu vatue	is from 1 to 65535.
		If the instance-id is not configured, the system assigned instance-id for the OSPF process is used.
	throttle	(Optional) Specifies throttle time between successive link-state advertisement (LSA) updates. Range is from 0 to 3600.
Command Default	BGP distribution is c	lisabled.
Command Modes	XR Config mode	
Command History	Release Modifi	cation
	Release This co 6.1.1	ommand was introduced.
Usage Guidelines	No specific guideline	es impact the use of this command.
Task ID	Task Operations ID	
	ospf read, write	
Examples	This example shows	how to distribute OSPF link-state information using BGP LS:
		ter# configure ter(config)# router ospf 100 ter(config-ospf)# distribute bgp-1s instance-id 32 throttle 10

domain-distinguisher

To configure globally unique identifier ASN for IGP domain, use the **domain-distinguisher** command in address-family link-state configuration mode. To remove unique identifier, use the **no** form of this command.

domain-distinguisher *unique-id* no domain-distinguisher

Syntax Description	<i>unique-id</i> Specifies four-octet unique identifier ASN. Range is from 1 to 4294967295.		
Command Default	None		
Command Modes	Address-family link-state configuration.		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	This example shows how to configure a unique identifier ASN:		
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family link-state link-state RP/0/RP0/CPU0:router(config-bgp-af)# domain-distinguisher 1234		

dmz-link-bandwidth

To originate a demilitarized zone (DMZ) link bandwidth extended community for the link to an eBGP neighbor, use the **dmz-link-bandwidth** command in an Neighbor configuration mode. To stop origination of the DMZ link bandwidth extended community, use the **no** form of this command.

dmz-link-bandwidth [{inheritance-disable}] no dmz-link-bandwidth

Syntax Description	inheri	tance-disable	e (Optional) Prevents the dmz-link-bandwidth command from being inherited from a parent group.	
Command Default	BGP d	BGP does not originate the DMZ link bandwidth extended community.		
Command Modes	Neight	oor configurat	ion	
Command History	Releas	se Modifi	cation	
	Releas	Release 6.0 This command was introduced.		
Usage Guidelines	Use the dmz-link-bandwidth command to advertise the bandwidth of links that are used to exit an autonomous system.			
Task ID	Task ID	Operations		
	bgp	read, write		
Examples	This ex	ample shows	s how to advertise the bandwidth of links to eBGP neighbors from router bgp 1:	
	RP/0/R	P0/CPU0:rou	nter(config)# router bgp 1 nter(config-bgp)#neighbor 10.67.89.01 nter(config-bgp-nbr)#dmz-link-bandwidth	

L

dscp (BGP)

To set the differentiated services code point (DSCP) value, use the **dscp** command in the appropriate configuration mode. To remove the dscp command from the configuration file and restore the system to its default interval values, use the no form of this command.

dscp value **no dscp** [{*value*}]

Syntax Description	 value Value of the DSCP. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: default, ef, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cs1, cs2, cs3, cs4, cs5, cs6, or cs7. 				
Command Default	No default behavior or values				
Command Modes	Neighbor configuration				
	Neighbor session group configuration				
	Neighbor group configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				

Usage Guidelines

Use the **dscp** command to change the minimum and maximum packet thresholds for the DSCP value.

Table 2: dscp Default Settings, on page 121 lists the DSCP default settings used by the dscp command. The DSCP value, corresponding minimum threshold, maximum threshold, and mark probability are listed. The last row of the table (the row labeled "default") shows the default settings used for any DSCP value not specifically shown in the table.

Table 2: ds	cp Default	Settings
-------------	------------	----------

DSCP (Precedence)	Minimum Threshold	Maximum Threshold	Mark Probability
afl1	32	40	1/10
af12	28	40	1/10
af13	24	40	1/10
af21	32	40	1/10
af22	28	40	1/10
af23	24	40	1/10
af31	32	40	1/10

DSCP (Precedence)	Minimum Threshold	Maximum Threshold	Mark Probability
af32	28	40	1/10
af33	24	40	1/10
af41	32	40	1/10
af42	28	40	1/10
af43	24	40	1/10
cs1	22	40	1/10
cs1	24	40	1/10
cs3	26	40	1/10
cs4	28	40	1/10
cs5	30	40	1/10
cs6	32	40	1/10
cs7	34	40	1/10
ef	36	40	1/10
default	20	40	1/10

Task ID

Task Operations

ID bgp read, write

Examples

The following example shows how to set the DSCP value to af32:

RP/0/RP0/CPU0:router(config) # router bgp 5
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.1.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)#remote-as 100
RP/0/RP0/CPU0:router(config-bgp-nbr)# dscp af32

dynamic-med interval

To customize advertisement of Route Distinguisher (RD) updates to neighbors, use the **dynamic-med-interval** command in BGP address family configuration mode for IPv4, IPv6, VPNv4, and VPNv6 unicast address families. To undo this command configuration, use the **no** form of this command.

dynamic-med interval interval-value no dynamic-med interval interval-value

Syntax Description interval *interval-value* Specifies interval (in seconds) between two consecutive update generation to neighbors.

Command Default The default value of dynamic-med interval is 600 seconds.

Command Modes BGP address family configuration mode

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

Task ID

Task
IDOperationbgpread,
write

Example

The following example shows how to customize rd-advertisement of updates to neighbors:

```
Router# configure
Router(config)# router bgp 100
Router(config-bgp)# address-family ipv4 unicast
Router(config-bgp-af)# dynamic-med interval 2
Router(config-bgp-nbr-af)# commit
```

ebgp-multihop

To accept and attempt Border Gateway Protocol (BGP) connections to external peers residing on networks that are not directly connected, use the **ebgp-multihop** command in an appropriate configuration mode. To disable connections to external peers and allow only direct connections between neighbors, use the **no** form of this command.

ebgp-multihop [{*ttl-value*}] [<u>mpls</u>] no ebgp-multihop [{*ttl-value*}] [<u>mpls</u>]

Syntax Description	<i>ttl-value</i> (Optional) Time-to-live (TTL) value. Range is 1 to 255 hops.		
	mpls (Optional) Disables BGP label rewrite.		
Command Default	Default TTL value is 255.		
Command Modes	Neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the ebgp-multihop command to enable multihop peerings with external BGP neighbors. The BGP protocol states that external neighbors must be directly connected (one hop away). The software enforces this by default; however, the ebgp-multihop command can be used to override this behavior.		
	Use of the mpls option in the ebgp-multihop command prevents BGP from enabling MPLS on the peering interface and also prevents allocation of Implicit-NULL rewrite labels for nexthop addresses learned from the peer. This is useful in some scenarios in which MPLS forwarding labels to the nexthops have already been learned via BGP labeled-unicast or LDP.		
	If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to allow a BGP connection to neighbor 172.20.16.6 of up to 255 hops away:		
	RP/0/RP0/CPU0:router(config)# router bgp 109 RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.16.6		

RP/0/RP0/CPU0:router(config-bgp-nbr)# ebgp-multihop

ebgp-recv-extcommunity-dmz

To enable the router to receive the demilitarized zone (DMZ) link bandwidth extended community from an eBGP neighbor, use the **ebgp-recv-extcommunity-dmz** command in the neighbor configuration mode, neighbor group or session group configuration mode. To prevent the router from receiving DMZ link bandwidth extended community from an eBGP neighbor, use the **no** form of this command.

ebgp-recv-extcommunity-dmz no ebgp-recv-extcommunity-dmz

Syntax Description	This co	mmand has	no arguments or keywords.	
Command Default	The rou	The router does not receive the link bandwidth community.		
Command Modes	Neighbor configuration			
	Neighb	or Group co	nfiguration	
	Session	n Group conf	figuration	
Command History	Releas	se Mod	lification	
	Releas	se 6.1.2 This	s command was introduced.	
Task ID	Task ID	Operations	-	
	bgp	read, write	-	
Examples	The fol neighb	-	- nple shows how to receive the link bandwidth community attributes from an eBGP	

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.67.89.01
RP/0/RP0/CPU0:router(config-bgp-nbr)#ebgp-recv-extcommunity-dmz

ebgp-send-extcommunity-dmz

To enable the router to advertise demilitarized zone (DMZ) link bandwidth extended community to an eBGP neighbor, use the **ebgp-send-extcommunity-dmz** command in the neighbor configuration mode, neighbor group or session group configuration mode. To prevent the router from advertising DMZ link bandwidth extended community to an eBGP neighbor, use the **no** form of this command.

ebgp-send-extcommunity-dmz no ebgp-send-extcommunity-dmz{cumulative | inheritance-disabled}

Syntax Description	cumulative	(Optional) Sends cumulative demilitarized zone (DMZ) link bandwidth extended community of all multipaths to the eBGP neighbour.
	inheritance-disabled	(Optional) Prevents the inheritance of the ebgp-send-extcommunity-dmz command from the parent.
Command Default	The router does not adv	vertise the link bandwidth community.
Command Modes	Neighbor configuration	1
	Neighbor Group config	guration
	Session Group configu	ration
Command History	Release Modificat	tion
	Release 6.0 This com	mand was introduced.
Task ID	Task Operations ID	
	bgp read, write	
Examples	The following example	shows how to advertise the link bandwidth community to an eBGP neighbor:
	RP/0/RP0/CPU0:route	r(config)# router bgp 1 r(config-bgp)#neighbor 10.1.1.1 r(config-bgp-nbr)#ebgp-send-extcommunity-dmz
	The following example multipaths to an eBGP	e shows how to advertise cumulative community DMZ link bandwidth of all neighbour:
	RP/0/RP0/CPU0:route	r(config)# router bgp 1 r(config-bgp)#neighbor 10.1.1.1 r(config-bgp-nbr)#ebgp-send-extcommunity-dmz cumulative

The following example shows how to advertise cumulative community DMZ link bandwidth of all multipaths to an eBGP neighbour:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.1.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)#ebgp-send-extcommunity-dmz cumulative
inheritance-disabled

I

export route-policy

To configure an export route policy, use the **export route-policy** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

export route-policy policy-name
no export route-policy [{policy-name}]

Syntax Description	<i>policy-name</i> Name of the configured route policy.
Command Default	No default behavior or values
Command Modes	Global VRF IPv4 address family configuration
	Global VRF IPv6 address family configuration
Command History	Release Modification

Release 6.0 This command was introduced.

Usage Guidelines Use the **export route-policy** command to define the conditions that allow specified routes to be tagged with specified route-targets.

sk ID	Task ID	Operations
	bgp	read, write
	ip-services	read, write

Examples

The following example shows how to configure an export route policy:

RP/0/RP0/CPU0:router(config) # vrf vrf-1
RP/0/RP0/CPU0:router(config-vrf)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-vrf-af)# export route-policy policy-A

export route-target

To configure a VPN routing and forwarding (VRF) export route-target extended community, use the **export route-target** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

export route-target [{as-number:nn ip-address:nn}]
no export route-target [{as-number:nn ip-address:nn}]

Syntax Description	as-number:nn	(Optional) <i>as-number</i> —Autonomous system (AS) number of the route-target extended community.		
		• as-number		
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.		
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.		
		• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.		
		• <i>nn</i> —32-bit number		
	ip-address:nn	(Optional) IP address of the route-target extended community.		
		• <i>ip-address</i> —32-bit IP address		
		• nn —16-bit number		
Command Default	No default beh	avior or values		
Command Modes	Global VRF IPv4 address family configuration			
	Global VRF IP	v6 address family configuration		
Command History	Release N	Iodification		
	Release 6.0 T	his command was introduced.		
Usage Guidelines	edge (PE) route	rget extended communities are associated with prefixes when advertised to remote provider ers. The remote PE routers import the route-target extended communities into a VRF instance port route-targets that match the exported route-target extended communities.		
	To specify mul each command	tiple route targets, enter export route target configuration mode then enter one route target for line.		
Task ID	Task ID Op	erations		
	bgp rea wr

chassis/all line cards.
Router(config)# commit

ibgp policy out enforce-modifications

To allow an outbound route policy for an internal BGP (iBGP) peer to modify all BGP route attributes, only when an iBGP route is sent to another iBGP peer (only on route-reflectors), use the **ibgp policy out enforce-modifications** command in XR Config mode. To disable this feature, use the **no** form of this command.

ibgp policy out enforce-modifications no ibgp policy out enforce-modifications

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** ibgp policy out enforce-modifications is disabled.

Command Modes XR Config mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines Use the ibgp policy out enforce-modifications command to set and modify BGP route attributes for updates to iBGP peers.

If the **ibgp policy out enforce-modifications command** is configured under router BGP configuration, then all the changes made by the outbound policy for an iBGP peer will be present in an update message sent to the peer.

Task IDTask IDOperationsIDbgpread, write

Examples

The following example shows how to set the ibgp policy out enforce-modifications:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 6500
RP/0/RP0/CPU0:router(config-bgp)# ibgp policy out enforce-modifications

import route-policy

To configure an import route policy, use the **import route-policy** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

import route-policy policy-name
no import route-policy [{policy-name}]

Syntax Description	<i>policy-name</i> Name of the configured route policy.	
Command Default	No default behavior or values	
Command Modes	Global VRF IPv4 address family configuration Global VRF IPv6 address family configuration	
Command History	Release Modification	

Release 6.0 This command was introduced.

Usage Guidelines Use the **import route-policy** command to define the conditions that allow specified routes to be imported into the VPN routing and forwarding (VRF) instance if the routes are tagged with specified route-targets.

Task ID	Operations
bgp	read, write
ip-services	read, write

Examples

The following example shows how to allow only policy-B to be imported to VRF:

RP/0/RP0/CPU0:router(config)# vrf vrf-1
RP/0/RP0/CPU0:router(config-vrf)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-vrf-af)# import route-policy policy-B

import route-target

To configure a VPN routing and forwarding (VRF) import route-target extended community, use the **import route-target** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

import route-target [{as-number:nn ip-address:nn}]
noimport route-target [{as-number:nn ip-address:nn}]

Syntax Description	as-number:nn (Optional) Autonomous system (AS) number of the route-target extended community.				
	• as-number				
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.				
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.				
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.				
	• nn —32-bit number				
	<i>ip-address:nn</i> (Optional) IP address of the route-target extended community.				
	• <i>ip-address</i> —32-bit IP address				
	• <i>nn</i> —16-bit number				
Command Default	No default behavior or values				
Command Modes	Global VRF IPv4 address family configuration				
	Global VRF IPv6 address family configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	Use the import route-target command to specify that prefixes associated with the configured import route-target extended communities are imported into the VRF instance.				
	To specify multiple route targets, enter import route target configuration mode, then enter one route target fo each command line.				
Task ID	Task ID Operations				
	bgp read, write				
	ip-services read, write				

Examples The following example shows how to specify an import route-target:

RP/0/RP0/CPU0:router(config) #vrf vrf-1
RP/0/RP0/CPU0:router(config-vrf)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-vrf-af)# import route-target 500:99

ignore-connected-check

To enable the software to bypass the directly connected next hop check for single-hop eBGP peering, use the **ignore-connected-check** command in an appropriate configuration mode. To re-enable the directly connected next hop check, use the **no** form of this command.

ignore-connected-check [{inheritance-disable}] no ignore-connected-check

Syntax Description	inheritance-disable Prevents the ignore-connected-check command from being inherited from the parent.		
Command Default	Ability to bypass the directly connected next hop check is disabled.		
Command Modes	Neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to enable ignore-connected check configuration for neighbor 10.2.3.4:		
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4 RP/0/RP0/CPU0:router(config-bgp-nbr)# ignore-connected-check</pre>		

keychain (BGP)

To apply key chain-based authentication on a TCP connection between two Border Gateway Protocol (BGP) neighbors, use the **keychain** command in an appropriate configuration mode. To disable key chain authentication, use the **no** form of this command.

keychain name
no keychain [{name}]

Syntax Description	<i>name</i> Key chain name configured using the keychain command. The name must be a maximum of 32 alphanumeric characters.			
Command Default	When this command is not specified in the appropriate configuration mode, key chain authentication is not enabled on a TCP connection between two BGP neighbors.			
Command Modes	Neighbor configuration			
	Neighbor group configuration			
	Session group configuration			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
-	If this command is configured for a neighbor group or a session group, a neighbor using the group inherits the configuration. Values of commands configured specifically for a neighbor override inherited values. Note BGP only supports HMAC-MD5 and HMAC-SHA1-12 cryptographic algorithms.			
Task ID	Task Operations ID			
	bgp read, write			
Examples	The following example shows how to configure neighbor 172.20.1.1 to use the key chain authentication configured in the keychain_A key chain:			
	RP/0/RP0/CPU0:router(config)# router bgp 140 RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1			

RP/0/RP0/CPU0:router(config-bgp-nbr) # keychain keychain_A

keychain-disable

	Note Effective with Release 3.9.0, the keychain-disable command was replaced by the keychain inheritance-disable command. See the keychain inheritance-disable, on page 143 command for more information.		
	To override any inherited key chain configuration from a neighbor group or session group for Border Gateway Protocol (BGP) neighbors, use the keychain-disable command in an appropriate configuration mode. To disable overriding any inherited key chain command, use the no form of this command.		
	keychain-disable no keychain-disable		
Syntax Description	This command has no arguments or keywords.		
Command Default	Configured key chains for neighbor and session groups are inherited.		
Command Modes	Neighbor configuration		
	eighbor group configuration		
	Session group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	you specify a key chain on a neighbor group or session group, all users of the group inherit the key chain. becifying a different keychain command specifically on a neighbor that uses the group overrides the herited value. Specifying keychain-disable on a neighbor that uses the group disables key chain thentication for the neighbor.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to disable key chain authentication for neighbor 172.20.1.1, preventing it from inheriting the key chain keychain_A from session group group1:		
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 140 RP/0/RP0/CPU0:router(config-bgp)# session-group group1 RP/0/RP0/CPU0:router(config-bgp-sngrp)# keychain keychain_A RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit RP/0/RP0/CPU0:router(config-bgp)#neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2</pre>		

I

RP/0/RP0/CPU0:router(config-bgp-nbr)#use session-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr)# keychain-disable

keychain inheritance-disable

To override any inherited key chain configuration from a neighbor group or session group for Border Gateway Protocol (BGP) neighbors, use the **keychain inheritance-disable** command in an appropriate configuration mode. To disable overriding any inherited key chain command, use the **no** form of this command.

keychain inheritance-disable no keychain inheritance-disable

Syntax Description This command has no arguments or keywords.

Command Default Configured key chains for neighbor and session groups are inherited.

Command Modes Neighbor configuration

Neighbor group configuration

Session group configuration

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines If you specify a key chain on a neighbor group or session group, all users of the group inherit the key chain. Specifying a different keychain command specifically on a neighbor that uses the group overrides the inherited value. Specifying keychain inheritance-disable on a neighbor that uses the group disables key chain authentication for the neighbor.

 Task ID
 Task Operations ID

 bgp
 read, write

Examples

The following example shows how to disable key chain authentication for neighbor 172.20.1.1, preventing it from inheriting the key chain keychain_A from session group group1:

RP/0/RP0/CPU0:router(config) #router bgp 140 RP/0/RP0/CPU0:router(config-bgp) # session-group group1 RP/0/RP0/CPU0:router(config-bgp-sngrp) # keychain keychain_A RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 2 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group group1 RP/0/RP0/CPU0:router(config-bgp-nbr) # keychain inheritance-disable

local-as

To allow customization of the autonomous system number for external Border Gateway Protocol (eBGP) neighbor peerings, use the **local-as** command in an appropriate configuration mode. To disable customization of local autonomous system values for eBGP neighbor peerings, use the **no** form of this command.

local-as {as-number [no-prepend [replace-as [dual-as]]] | inheritance-disable} no local-as [{as-number [no-prepend [replace-as [dual-as]]] | inheritance-disable}]

Syntax Description	as-number	Valid autonomous system number.	
		Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.	
		Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.	
		Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.	
		Cannot be the autonomous system number to which the neighbor belongs.	
	no-prepend	(Optional) Specifies that local autonomous system values are not prepended to announcements from the neighbor.	
	replace-as	(Optional) Specifies that prepend only local autonomous system values to announcements to the neighbor.	
	dual-as	(Optional) Dual-AS mode.	
	inheritance-disable Prevents local AS from being inherited from the parent.		
Command Default	The BGP autonomous system number specified in the router bgp command is used, except when confederations are in use. The confederation autonomous system is used for external neighbors in an autonomou system that is not part of the confederation.		
Command Modes	Neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release Mo	dification	
	Release 6.0 Thi	s command was introduced.	
Usage Guidelines	system number sp with the router b command). How	the autonomous system number the local BGP uses to peer with each neighbor. The autonomous becified with this command cannot be the local BGP autonomous system number (specified gp command) or the autonomous system number of the neighbor (specified with the remote-as ever, from Release 5.2.2, the autonomous system number for local-as and remote-as can be nakes the resulting neighbor peering being treated as iBGP. This command cannot be specified	

for internal neighbors or for external neighbors in an autonomous system that is part of a confederation.

If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

In case the router is an ASBR and adding the **local-as** configuration changes the BGP neighbor from being an eBGP to iBGP, incremental addition of the **local-as** command is not supported. Remove the neighbor configuration, then configure the entire neighbor, including **remote-as** configuration and the new **local-as** configuration, in one commit.

D	Task ID	Operations
	bgp	read, write

Examples

The following example shows BGP using autonomous system 30 for the purpose of peering with neighbor 172.20.1.1:

RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 300
RP/0/RP0/CPU0:router(config-bgp-nbr)# local-as 30

match flow-tag

To identify specific flow-tag values as match criteria in a class-map, use the **match flow-tag** command in class-map configuration mode. To remove a specific flow tag value from the matching criteria for a class-map, use the **no** form of this command.

match flow-tag {flow-tag number }
no match flow-tag {flow-tag number }

Syntax Description	<i>flow-tag number</i> A flow-tag number. Range is from 1 to 63.		
Command Default	No match criteria is specified.		
Command Modes	Class-map configuration		
Command History	tory Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.		
Task ID	Task ID Operation		
	class-map read,		

Flow-tag for a route

write

This example uses the**show route** command to display the flow-tag for a given route.

maximum-paths (BGP)

To control the maximum number of parallel routes that Border Gateway Protocol (BGP) installs in the routing table, use the **maximum-paths** command in an appropriate configuration mode. To set the maximum number of parallel routes the software installs to the default value, use the **no** form of this command.

maximum-paths { { ebgp | ibgp | eibgp } maximum [unequal-cost] }

no maximum-paths { { **ebgp** | **ibgp** | **eibgp** } *maximum* [**unequal-cost**] }

Syntax Description	ebgp	Specifies external BGP multipath peers.			
	ibgp	Specifies internal BGP multipath peers.			
	eibgp	Specifies internal and external BGP multipath peers. eiBGP allows simultaneous use of internal and external paths.			
	maximum	Maximum number of parallel routes that BGP installs in the routing table. Range is 2 to 8.			
	unequal-cost	(Optional) Allows iBGP multipaths to have different BGP next-hop Interior Gateway Protocol (IGP) metrics. This option is available when the ibgp keyword is used.			
Command Default	One path is inst	talled in the routing table.			
Command Modes	IPv4 address family configuration				
	IPv6 address fa	mily configuration			
Command History	Release Mo	odification			
	Release The 6.0	is command was introduced.			
Usage Guidelines	for each prefix. are equal cost (peers that are e	num-paths command to allow the BGP protocol to install multiple paths into the routing table Multiple paths are installed for external peers that are from the same autonomous system and according to the BGP best-path algorithm). Similarly, multiple paths are installed for internal qual cost based on the BGP best-path algorithm. The IGP metric to the BGP next hop is the st-path IGP metric unless the router is configured for unequal cost iBGP multipath or eiBGP			

• The **maximum-paths** command with the **eibgp** keyword cannot be configured if the **ibgp** or **ebgp** keywords have been configured, because the **eibgp** keyword is a superset of the **ibgp** or **ebgp** keywords.

I

Task ID	Task ID	Operations	
	bgp	read, write	
Examples		lowing exam 4 unicast rou	ple shows how to allow a maximum of four paths to a destination installed into ting table:
			couter bgp 109 config-bgp)# address-family ipv4 unicast
	Router	(config)#(c	config-bgp-af)# maximum-paths ebgp 4

maximum-prefix (BGP)

To control how many prefixes can be received from a neighbor, use the **maximum-prefix** command in an appropriate configuration mode. To set the prefix limits to the default values, use the **no** form of this command.

maximum-prefix *maximum* [{*threshold*}] [{**discard-extra-paths**}] [{**warning-only**}] [**restart** *time-interval*]

no maximum-prefix maximum [{threshold}] [{**discard-extra-paths**}] [{**warning-only**}] [**restart** time-interval]

Syntax Description	maximum	Maximum number of prefixes allowed from this neighbor. Range is from1 to 4294967295.
		Note When using additional-paths feature, each path with a unique path ID received from a peer is counted separately for the purpose of maximum-prefix functionality. Hence, the <i>maximum</i> value should be configured appropriately when the peer is capable of sending additional-paths.
	discard-extra-paths	(Optional) Drops all the excess prefixes received from the neighbor when the prefixes exceed the configured maximum value.
	threshold	(Optional) Integer specifying at what percentage of the <i>maximum</i> argument value the software starts to generate a warning message. Range is from1 to 100.
	warning-only	(Optional) Instructs the software to only generate a log message when the <i>maximum</i> argument value is exceeded, and not to terminate the peering.

I

	restart time-interval	(Optional) Sets the time interval (in minutes) after which peering session should be reestablished.		
		Configure restart time interval in minutes. Range is from 1 to 65535.		
Command Default	The default threshold, when a warning message is generated.	, is 75 percent.		
Command Modes	IPv4 address family group, neighbor address family, and neighbor	ghbor group address family configuration		
	IPv6 address family group, neighbor address family, and neighbor	ghbor group address family configuration		
	IPv4 tunnel address family group, neighbor group address family	mily, and neighbor address family configuration		
	IPv4 flowspec under neighbor address family, neighbor group address family, and address family group configuration			
	IPv6 flowspec under neighbor address family, neighbor group address family, and address family group configuration			
	VPNv4 flowspec under neighbor address family, neighbor group address family, and address family group configuration			
	VPNv6 flowspec under neighbor address family, neighbor group address family, and address family group configuration			
	L2VPN EVPN under neighbor address family, neighbor grou configuration	up address family, and address family group		
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	Use the maximum-prefix command to configure a maximum to receive from a neighbor. It adds another mechanism (beside from a peer.	-		
	When the number of received prefixes exceeds the maximum peering, by default, after sending a cease notification to the ne is configured, the software writes only a log message, but co terminated, the peer stays down until the clear bgp commanis used.	ighbor. 	bgp read, write
Examples	This example shows the maximum number of IP Version 6 (IPv6) unicast prefixes allowed from neighbor 192.168.40.25 set to 5000, threshold value 80%, and restart time interval 20 minutes:
	<pre>RP/0/RP0/CPU0:router(config)#router bgp 100 RP/0/RP0/CPU0:router(config-bgp)#neighbor 192.168.40.25 RP/0/RP0/CPU0:router(config-bgp-nbr)#remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family ipv6 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)#maximum-prefix 5000 80 restart 20</pre>
	This example shows the maximum number of IP Version 4 (IPv4) unicast prefixes allowed from the neighbor 192.168.40.24 set to 1000:
	<pre>RP/0/RP0/CPU0:router(config-bgp)# router bgp 109 RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# maximum-prefix 1000</pre>
	The following example shows how to configure discard extra paths:
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router ban 10

```
RP/0/RP0/CPU0:router(config)#router bgp 10
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)#maximum-prefix 5000 discard-extra-paths
```

mpls activate (BGP)

To enable Multiprotocol Label Switching (MPLS) on an interface basis for ASBR and CSC configurations whenever a bgp confederation configuration is used, use the **mpls activate** command in bgp configuration mode. This is needed for InterAS (option B and C) and Carrier Supporting Carrier (CSC) configurations with confederations.

The normal InterAS and CSC configurations (without confederations) do not need to enable this.

To restore the system to its default condition, use the **no** form of this command.

mpls activate *interface id* **no mpls activate** *interface id*

Syntax Description	<i>interface id</i> Name of the interface.
Command Default	No default behavior or values
Command Modes	Router configuration
	Neighbor configuration
	IPv4 address family group configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	The mpls activate command enables MPLS on the interface specified and also adds the implicit null rewrite corresponding to the peer associated with the interface. The interface specified must be the one corresponding to the inter-AS ASBR or CSC peer.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to activate MPLS for CSC (with confederations):
	<pre>router bgp 2002 bgp confederation peers 1 ! bgp confederation identifier 4589 bgp router-id 4.4.4.4 address-family ipv4 unicast allocate-label all ! address-family vpnv4 unicast retain route-target all</pre>

This example shows how to configure mvpn and enable PIM/PIM6 connection:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#mvpn

neighbor (BGP)

To enter neighbor configuration mode for configuring Border Gateway Protocol (BGP) routing sessions, use the **neighbor** command in an appropriate configuration mode. To delete all configuration for a neighbor and terminate peering sessions with the neighbor, use the **no** form of this command.

neighbor *ip-address* no neighbor *ip-address*

Syntax Description	<i>ip-address</i> IPv4 or IPv6 IP address of the BGP-speaking neighbor.				
Command Default	Neighbor mode is not specified.				
Command Modes	Router configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	From router configuration mode, you can use this command to enter neighbor configuration mode.				
	From neighbor configuration mode, you can enter address family configuration for the neighbor by using the address-family command, which allows you to configure routing sessions for IP Version 4 and IP Version 6 address prefixes.				

The **neighbor** command does not cause the neighbor to be configured and does not result in a peering to be established with the neighbor. To create the neighbor, you configure a remote autonomous system number by entering the **remote-as** command, or the neighbor can inherit a remote autonomous system from a neighbor group or session group if the **use** command is applied.

Ŵ

Note A neighbor must have must a remote autonomous system number, and an IP address and address family must be enabled on the neighbor.

Unlike IPv4, IPv6 must be enabled before any IPv6 neighbors can be defined. Enable IPv6 in router configuration mode using the **address-family** command.

Note Configuration for the neighbor cannot occur (peering is not established) until the neighbor is given a remote as-number and neighbor address.

The **no** form of this command causes the peering with the neighbor to be terminated and all configuration that relates to the neighbor to be removed.

Task ID	Task ID	Operations	
	bgp	read, write	
Examples	routing	process 1 an	ple shows how to place the router in neighbor configuration mode for BGP d configure the neighbor IP address 172.168.40.24 as a BGP peer:
	RP/0/R	P0/CPU0:rou	uter(config)# router bgp 1 uter(config-bgp)# neighbor 172.168.40.24 uter(config-bgp-nbr)# remote-as 65000
		•	ple shows how to enable IPv6 for BGP, then place the router in neighbor for an IPv6 neighbor, 3000::1, and configure neighbor 3000::1 as a BGP peer:
	RP/0/R RP/0/R RP/0/R RP/0/R	P0/CPU0:rou P0/CPU0:rou P0/CPU0:rou P0/CPU0:rou	<pre>iter(config) # router bgp 100 iter(config-bgp)# address-family ipv6 unicast iter(config-bgp-af)# exit iter(config-bgp)# neighbor 3000::1 iter(config-bgp-nbr)# remote-as 2002 iter(config-bgp-nbr)# address-family ipv6 unicast</pre>

neighbor-group

To create a neighbor group and enter neighbor group configuration mode, use the **neighbor-group** command in XR Config mode. To remove a neighbor group and delete all configuration associated with the group, use the **no** form of this command.

neighbor-group name no neighbor-group name

- **Syntax Description** *name* Neighbor group name.
- **Command Default** No neighbor group mode is specified.

Command Modes XR Config mode

Command History Release Modification Release 6.0 This command was introduced.

Usage Guidelines The neighbor-group command puts the router in neighbor group configuration mode and creates a neighbor group.

A neighbor group helps you apply the same configuration to one or more neighbors. After a neighbor group is configured, each neighbor can inherit the configuration through the **use** command. If a neighbor is configured to use a neighbor group, the neighbor, by default, inherits the entire configuration of the neighbor group, which includes the address family-independent and address family-specific configurations. The inherited configuration can be overridden if you directly configure commands for the neighbor or if you configure session groups or address family groups with the **use** command.

From neighbor group configuration mode, you can configure address family-independent parameters for the neighbor group. To enter address family-specific configuration for the neighbor group, use the **address-family** command when in the neighbor group configuration mode.

Note If an address family is configured for a neighbor group, neighbors that use the neighbor group attempt to exchange routes in that address family.

The **no** form of this command ordinarily causes all configuration for the neighbor group to be removed. If using the **no** form would result in a neighbor losing its remote autonomous system number, the configuration is rejected. In this scenario, the neighbor configuration must be either removed or configured with a remote autonomous system number before the neighbor group configuration can be removed.

Note Neighbor groups should not be configured with a mixture of IPv4 and IPv6 address families, because such a neighbor group is not usable by any neighbor. Note that within the Cisco IOS XR system configuration architecture, it is possible to create such a neighbor group; however, any attempt to use it is rejected.

Task ID	Task Operatior ID		
	bgp	read, write	

Examples

The following example shows how to create a neighbor group called group1 that has IP Version 4 (IPv4) unicast and IPv4 multicast activated along with various configuration features. The neighbor group is used by neighbor 10.0.0.1 and neighbor 10.0.0.2, which allows them to inherit the entire group1 configuration.

```
RP/0/RP0/CPU0:router(config) # router bgp 65530
RP/0/RP0/CPU0:router(config-bgp) # neighbor-group group1
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# remote-as 65535
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# advertisement-interval 2
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# send-community-ebgp
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# next-hop-self
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# use neighbor-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.0.2
RP/0/RP0/CPU0:router(config-bgp-nbr)# use neighbor-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr)# exit
```

neighbor internal-vpn-client

To preserve the iBGP-CE (customer edge) attributes inside the VPN attribute set (ATTR-SET) and send it across to the core, use the neighbor internal-vpn-client command in the VRF neighbor configuration mode. To disable the command, use the **no** form of this command.

neighbor ip-address internal-vpn-client

no neighbor ip-address internal-vpn-client

Syntax Description	neighbor <i>ip-address</i> IP address of the neighboring device.					
	interr	nal-vpn-client	Stacks the iBGP-CE	neighbor path in the	VPN attribute s	set.
Command Default	None					
Command Modes	VRF n	eighbor config	guration			
Command History	Relea	se Modifie	cation			
	Releas	se 6.0 This co	mmand was introduced.			
Usage Guidelines	act as a interna	an internal VP 11 BGP VRF li	N client to the CE devic	es connected interna	lly. This comm	nake the entire VPN cloud and is used so that existing pmous system override for

network (BGP)

To specify that the Border Gateway Protocol (BGP) routing process should originate and advertise a locally known network to its neighbors, use the **network** command in an appropriate configuration mode. To disable originating or advertising the network to neighbors, use the **no** form of this command.

network {*ip-address/prefix-length ip-address mask*} [**route-policy** *route-policy-name*] **no network**{*ip-address/prefix-length ip-address mask*} [**route-policy** *route-policy-name*]

Syntax Description	ip- add	dress	Network that BGP advertises.
	/ prefi.	x-length	Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
	ip-ada	lress mask	Network mask applied to the <i>ip-address</i> argument.
	route	policy route-policy-name	(Optional) Specifies a route policy to use to modify the attributes of the network.
Command Default	No net	works are specified.	
Command Modes	IPv4 a	ddress family configuration	n
	IPv6 a	ddress family configuration	n
Command History	Releas	se Modification	
	Releas	se 6.0 This command was	introduced.
Usage Guidelines	for the	1	nmand is originated and advertised to neighbors only if there exists a route le. That is, there must be a route learned using local or connected networks, such as IS-IS or OSPF.
		han the available system render the system render the configured.	esources on the router, no limit exists on the number of network commands
Task ID	Task ID	Operations

I

RP/0/RP0/CPU0:router(config-bgp-af) # network 172.20.0.0/16

network backdoor

To set the administrative distance on an external Border Gateway Protocol (eBGP) route to that of a locally sourced BGP route, causing it to be less preferred than an Interior Gateway Protocol (IGP) route, use the **network backdoor** command in an appropriate configuration mode. To disable setting the administrative distance to the value for locally sourced BGP routes, use the **no** form of this command.

network {*ip-address/prefix-length ip-address mask*} **backdoor no network** {*ip-address/prefix-length ip-address mask*} **backdoor**

Syntax Description	<i>ip-address</i> N	letwork that provides a backdoor route.				
	/ prefix-length Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.					
	mask Network mask applied to the <i>ip-address</i> argument.					
Command Default	No backdoor rout	es are installed.				
Command Modes	IPv4 address fam	ily configuration				
	IPv6 address fam	ily configuration				
Command History	Release Moo	lification				
	Release 6.0 This	s command was introduced.				
Usage Guidelines	route for the netw	network backdoor command does not cause BGP to originate a network, even if an IGP rork exists. Ordinarily, the backdoor network would be learned through both an eBGP and st-path selection algorithm does not change when a network is configured as a backdoor				
Task ID	Task Operation ID	15				
	bgp read, write					
Examples	The following exa a backdoor netwo	ample shows IP Version 4 (IPv4) unicast network 192.168.40.0/24 configured as ork:				
	RP/0/RP0/CPU0:	couter(config)# router bgp 109 couter(config-bgp)# address-family ipv4 unicast couter(config-bgp-af)# network 192.168.40.0/24 backdoor				

next-hop-self

To disable next-hop calculation and insert your own address in the next-hop field of Border Gateway Protocol (BGP) updates, use the **next-hop-self** command in an appropriate configuration mode. To enable next-hop calculation, use the **no** form of this command.

next-hop-self [{inheritance-disable}]
no next-hop-self [{inheritance-disable}]

Syntax Description	inheritance-disable (Optional) Allows a next-hop calculation override when this feature may be inherited from a neighbor group or address family group.				
Command Default	When this command is not specified, the software calculates the next hop for BGP updates accepted by the router.				
Command Modes	IPv4 address family group configuration				
	IPv6 address family group configuration				
	IPv4 neighbor address family configuration				
	IPv4 neighbor group address family configuration				
	IPv6 neighbor group address family configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
	Use the next-hop-self command to set the BGP next-hop attribute of routes being advertised over a peering session to the local source address of the session.				
	This command is useful in nonmeshed networks in which BGP neighbors may not have direct access to all other neighbors on the same IP subnet.				
	If this command is configured for a neighbor group or address family group, a neighbor using the group inherits the configuration. Configuring the command specifically for a neighbor overrides any inherited value.				
	Configuring the next-hop-self command under IPv4 labeled-unicast, IPv6 labeled-unicast, or VRF labeled-unicast address family configuration mode enables next-hop-self for labeled prefixes advertised to an iBGP peer.				
Task ID	Task Operations ID				
	bgp read, write				

Examples

The following example shows how to set the next hop of the update field for all IP Version 4 (IPv4) unicast routes advertised to neighbor 172.20.1.1 to an address of the local router:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# next-hop-self
```

The following example shows how to disable the **next-hop-self** command for neighbor 172.20.1.1. If not overridden, the next hop would be inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# next-hop-self
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# next-hop-self inheritance-disable
```

next-hop-unchanged

To disable overwriting of the next hop before advertising to external Border Gateway Protocol (eBGP) peers, use the **next-hop-unchanged** command in an appropriate configuration mode. To enable overwriting of the next hop, use the **no** form of this command.

next-hop-unchanged [{inheritance-disable}]
no next-hop-unchanged [{inheritance-disable | multipath}]

Syntax Description	inheri	tance-disable	(Optional) Allows overwriting of the next hop before advertising to eBGP peers when this feature may be inherited from a neighbor group or address family group.
	multij	path	(Optional) Disables overwriting of next-hop calculation for multipath prefixes.
ommand Default	Overw	riting of the n	ext hop is allowed.
ommand Modes	IPv4 ac	dress family	configuration
	IPv6 ac	dress family	configuration
Command History	Releas	se Modifi	cation
	Releas	se 6.0 This co	ommand was introduced.
Jsage Guidelines	Use the	e next-hop-u	nchanged command to propagate the next hop unchanged for multihop eBGP peering
	should		and should not be configured on a route reflector, and the next-hop-self command o modify the next-hop attribute for a route reflector when this feature is enabled for a

RP/0/RP0/CPU0:router(config-bgp-afgrp) # exit

The following example shows how to disable the overwriting of next hops for multipath prefixes:

```
RP/0/RP0/CPU0:router(config) # router bgp 100
RP/0/RP0/CPU0:router(config-bgp) # af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # next-hop-unchanged multipath
RP/0/RP0/CPU0:router(config-bgp-afgrp) # exit
```

nexthop resolution prefix-length minimum

To set minimum prefix-length for nexthop resolution, use the **nexthop resolution prefix-length minimum** command in an appropriate configuration mode. To disable the minimum prefix-length for nexthop resolution, use the **no** form of this command.

nexthop resolution prefix-length minimum *prefix-length-value* **no nexthop resolution prefix-length minimum** *prefix-length-value*

Syntax Description	<i>prefix-length-value</i> Sets the minimum prefix-length. Range is 0 to 32.				
Command Default	Nexthop resolution for minimum prefix-length is disabled.				
Command Modes	VPNv4 Unicast address family				
	VRF IPv4 Unicast address family				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	Task Operation ID				
	bgp read, write				

This example shows how to set the minimum prefix-length for nexthop resolution as 32:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#nexthop resolution prefix-length minimum 32
```

nexthop route-policy

To specify that BGP routes are resolved using only next hops whose routes match specific characteristics, use the **nexthop route-policy** command in the appropriate configuration mode. To remove the **nexthop route-policy** command from the configuration file and restore the system to its default behavior, use the **no** form of this command.

nexthop route-policy *route-policy-name* **no nexthop route-policy** *route-policy-name*

	·					
Syntax Description	route-policy-	name Route policy to use for filtering based on next hops.				
Command Default	No default behavior or values					
Command Modes	IPv4 address family configuration					
	IPv6 address family configuration					
	VRF address	family configuration				
Command History	Release	Modification				
	Release 6.0	This command was introduced.				
	Release 7.11.1	This command was modified. This command is extended to VRF address-family configuration mode.				
Usage Guidelines	Use the next	hop route-policy command to configure route policy filtering using next hops.				
		t-hop tracking feature allows you to specify that BGP routes are resolved using only next hops have the following characteristics:				
	• The sour	the aggregate routes, the prefix length must be greater than a specified value. The protocol must be from a selected list, ensuring that BGP routes are not used to resolve next t could lead to oscillation.				
	This route policy filtering is possible because RIB identifies the source protocol of a route that resolves a next hop as well as the mask length associated with the route.					
	hops that are invalid next h	attach point supports matching using the protocol name and mask length. BGP marks all next rejected by the route policy as invalid, and no best path is calculated for the routes that use the op. The invalid next hops continue to stay in the active cache and can be displayed as part of p nexthop command with an invalid status.				
Task ID	Task Oper ID	ations				
	bgp read, write					

Examples

The following example shows how to specify the route policy nexthop_A as the policy to use for filtering next hops:

```
Router(config)# router bgp 109
Router(config-bgp)# address-family ipv4 unicast
Router(config-bgp-af)# nexthop route-policy nexthop_A
```

The following example shows how to specify the route policy nexthop_A as the policy to use for filtering next hops in the VRF address family configuration mode:

```
Router(config)# router bgp 500
Router(config-bgp)# vrf vrf10
Router(config-bgp-vrf)# address-family ipv4 unicast
Router(config-bgp-vrf-af)# nexthop route-policy nh-route-policy
```

nexthop trigger-delay

To specify the delay for triggering next-hop calculations, use the **nexthop trigger-delay** command in the appropriate configuration mode. To set the trigger delay to the default value, use the **no** form of this command.

nexthop trigger-delay {critical *delay* | **non-critical** *delay*} **no nexthop trigger-delay** {critical *delay* | **non-critical** *delay*}

Syntax Description	critical	Specifies critical next-hop events. For example, when the next hop is unreachable.					
	delay	Trigger delay, in milliseconds. Range is 0 to 4294967295.					
	non-critical	Specifies noncritical next-hop events. For example, Interior Gateway Protocol (IGP) metric changes.					
Command Default	critical : 3000	critical : 3000 msec for all address families, except VPNv4 and VPNv6 address families					
	critical: 50 m	sec for VPNv4 and VPNv6 address families					
	non-critical:	10000 msec for all address families					
Command Modes	All address fa	milies					
Command History	Release	Modification					
	Release 7.10.	1 The default value of critical delay for VPN address family was changed from 0 msec to 50 msec.					
	Release 6.0	This command was introduced.					
Usage Guidelines	to converge. T in fewer inter	hop trigger-delay command to allow for a dynamic way for Interior Gateway Protocol (IGP) This convergence allows BGP to accumulate all notifications and trigger fewer walks, resulting process communications (IPCs) to the Routing Information Base (RIB) for route addition, modification and fewer updates to peers.					
	Note A high a	<i>lelay</i> value can be configured to effectively turn off next-hop tracking.					
	The non-crit	ical <i>delay</i> value must always be set to at least equal or greater than the critical <i>delay value</i>					
	•	build be slightly higher than the time it takes for the IGP to settle into a steady state after some invergence time).					
Task ID	Task Opera ID	ations					
	bgp read, write						

Examples The following example shows how to set the critical next-hop trigger delay to 3500 milliseconds:

RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# nexthop trigger-delay critical 3500

To specify Outbound Route Filter (ORF) and inbound filtering criteria, use the **orf route-policy** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

orf route-policy route-policy-name no orf route-policy route-policy-name

Syntax Description	<i>route-policy-name</i> Name of the route policy.
Command Default	No ORF route policy is defined.
Command Modes	IPv4 address family group configuration
	IPv6 address family group configuration
	IPv4 neighbor address family configuration
	IPv4 neighbor group address family configuration
	IPv6 neighbor group address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to configure outbound and inbound filtering criteria:
	<pre>RP/0/RP0/CPU0:router(config)#router bgp 6 RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)#orf route-policy policy_A</pre>

password (BGP)

To enable Message Digest 5 (MD5) authentication on a TCP connection between two Border Gateway Protocol (BGP) neighbors, use the **password** command in an appropriate configuration mode. To disable MD5 authentication, use the **no** form of this command.

password {clear | encrypted} password
no password [{clear password | encrypted password}]

Syntax Description clear Specifies that an unencrypted password follows. The password must be a case-sensitive, clear-text unencrypted password. **encrypted** Specifies that an encrypted password follows. The password must be a case-sensitive, encrypted password. Password of up to 80 characters. The password can contain any alphanumeric characters. password However, if the first character is a number or the password contains a space, the password must be enclosed in double quotation marks; for example, "2 password." When this command is not specified in the appropriate configuration mode, MD5 authentication is not enabled **Command Default** on a TCP connection between two BGP neighbors. Neighbor configuration **Command Modes** Neighbor group configuration Session group configuration **Command History** Modification Release Release 6.0 This command was introduced. Configure a password to enable authentication between two BGP peers. Use the **password** command to **Usage Guidelines** verify each segment sent on the TCP connection between the peers. The same password must be configured on both networking devices, otherwise a connection cannot be made. The authentication feature uses the MD5 algorithm. Specifying this command causes the software to generate and check the MD5 digest on every segment sent on the TCP connection. Configuring a neighbor password does not cause the existing session for a neighbor to end. However, until the new password is configured on the remote router, the local BGP process does not receive keepalive messages from the remote device. If the password is not updated on the remote device by the end of the hold time, the session ends. The hold time can be changed using the **timers** command or the **timers bgp** command.

If this command is configured for a neighbor group or neighbor address family group, a neighbor using the group inherits the configuration. Values of commands configured specifically for a neighbor overrides inherited values.

password (rpki-server)

To specify a SSH password for the RPKI cache-server, use the **password** command in rpki-server configuration mode. To remove the SSH passwords, use the **no** form of this command.

password password no password password

 Syntax Description
 password
 Enters a password to be used for the SSH transport mechanism.

 Command Default
 Password is not configured.

 Command Modes
 RPKI server configuration

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines SSH expects to use an authentication method to connect to a remote server. The SSH authentication method to connect to RPKI server is password-based. So, the RPKI cache-server must be configured with username and password. A username and password must be configure for each server configured under BGP that uses the SSH transport

Task ID	Task Opera ID		
	bgp	read, write	

This example shows how to configure a username (*rpki-user*) and password (*rpki-ssh-pass*) for the RPKI cache-server SSH transport mechanism:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#username rpki-user
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#password rpki-ssh-pass
```

password-disable

To override any inherited password configuration from a neighbor group or session group for Border Gateway Protocol (BGP) neighbors, use the **password-disable** command in an appropriate configuration mode. To disable overriding any inherited password command, use the **no** form of this command.

password-disable no password-disable

Syntax Description	This command has no arguments or keywords.
Command Default	Configured passwords for neighbor and session groups are inherited.
Command Modes	Neighbor configuration

Neighbor group configuration

Session group configuration

Command History	Release	Modification
	Release 6.0	This command was introduced.

If you specify a password on a neighbor group or session group, all users of the group inherit the password. **Usage Guidelines** Specifying a different **password** command specifically on a neighbor that uses the group overrides the inherited value. Specifying **password-disable** on a neighbor that uses the group disables password authentication for the neighbor.

k ID	Task ID	Operations
	bgp	read,
		write

Examples

The following example shows how to disable MD5 authentication for neighbor 172.20.1.1, preventing it from inheriting the password password1 from session group group1:

RP/0/RP0/CPU0:router(config) # router bgp 140 RP/0/RP0/CPU0:router(config-bgp)# session-group group1 RP/0/RP0/CPU0:router(config-bgp-sngrp)# password clear password1 RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2 RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group group1 RP/0/RP0/CPU0:router(config-bgp-nbr)# password-disable

permanent-network

To define a prefix set as permanent, use the **permanent-network** command in the global address family configuration mode. To remove a prefix set as permanent, use the **no** form of this command. The **permanent-network** command uses a route-policy to identify the set of prefixes (networks) for which permanent paths needs to be created.

The permanent network feature supports only prefixes in IPv4 unicast and IPv6 unicast address-families under the default Virtual Routing and Forwarding (VRF).

permanent-network route-policy route-policy-name no permanent-network

Syntax Description	route-policy <i>route-policy-name</i> Specifies a configured routing policy.
Command Default	None
Command Modes	Address-family configuration.
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operations ID
	bgp read, write
Examples	This example shows how to define permanent path for a route policy named POLICY-PERMANENT-NETWORK-IPv4:
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-af)# permanent-network route-policy POLICY-PERMANENT-NETWORK

I

precedence

•	To set the precedence level, use the precedence command in the appropriate configuration mode. To remove the precedence command from the configuration file and restore the system to its default interval values, use the no form of this command.		
	precedence value no precedence [value]		
Syntax Description	<i>value</i> Value of the precedence. The precedence value can be a number from 0 to 7, or it can be one of the following keywords:		
	routine —Set packets with routine precedence (0)		
	priority —Set packets with priority precedence (1)		
	immediate —Set packets with immediate precedence (2)		
	flash — Set packets with flash precedence (3)		
	flash-override —Set packets with flash override precedence (4)		
	critical —Set packets with critical precedence (5)		
	internet —Set packets with internetwork control precedence (6)		
	network —Set packets with network control precedence (7)		
Command Default	No default behavior or values		
Command Modes	Neighbor configuration		
	Neighbor session group configuration		
	Neighbor group configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the precedence command to set the precedence value.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to set the precedence to 2:		
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 5 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.1.1.1</pre>		

RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 100
RP/0/RP0/CPU0:router(config-bgp-nbr)# precedence 2

I

preference (rpki-server)

To specify a preference value for the RPKI cache-server, use the **preference** command rpki-server configuration mode. To remove the preference value, use the **no** form of this command.

preference *preference-value* **no preference** *preference-value*

prefer	ence-value	Specifies	a RPKI cache preference value. Range is 1 to 10.
		Note	A lower value is recommended.
Prefere	ence value i	is not set.	
RPKI s	server conf	iguration	
Releas	se Mod	lification	
Releas	se 6.0 This	command v	vas introduced.
No spe	cific guide	lines impact	the use of this command.
Task ID	Operatio	n	
bgp	read, write		
	 Prefere RPKI s Releas Releas No spe Task ID 	Preference value i RPKI server conf Release Mod Release 6.0 This No specific guide Task Operatio ID bgp read,	Note Preference value is not set. RPKI server configuration Release Modification Release 6.0 This command w No specific guidelines impact Task Operation ID bgp bgp read,

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#username rpki-user
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#password rpki-ssh-pass
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#preference 1

purge-time (rpki-server)

To configure the time BGP waits to keep routes from RPKI cache-server after the cache session drops, use the **purge-time** command in rpki-server configuration mode. To remove the purge-time configuration, use the no form of this command.

purge-time time-in-seconds no purge-time time-in-seconds

Syntax Description	time-in-sec	<i>conds</i> Sets the purge time in seconds. Range is 30 to 360 seconds.
Command Default	Sets a defau	It value of 60 seconds.
Command Modes	RPKI server	r configuration
Command History	Release	Modification
	Release 6.0	This command was introduced.

When a cache session is dropped then a "purge-timer" is started for that cache. If the session re-establishes **Usage Guidelines** within the timer interval, then the purge timer is stopped and no further action is taken. If the cache session does not re-establish within the timer interval, only then does BGP remove all ROAs from the cache.

sk ID	Task ID	Operation
	bgp	read, write

This example shows how to set the purge-time for RPKI cache as 30 seconds:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config) #router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki cache 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bqp-rpki-cache)#username rpki-user
RP/0/RP0/CPU0:router(config-bgp-rpki-cache) #password rpki-ssh-pass
RP/0/RP0/CPU0:router(config-bgp-rpki-cache) #preference 1
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#purge-time 30
```

To configure a route distinguisher, use the **rd** command in VRF configuration mode. To disable the route distinguisher, use the **no** form of this command.

rd {as-number : nn | ip-address : nn | auto} no rd {as-number : nn | ip-address : nn | auto}

Syntax Description	<i>as-number:nn</i> • <i>as-number</i> —16-bit Autonomous system (AS) number of the route distinguisher
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
	• nn —32-bit number
	<i>ip-address:nn</i> IP address of the route distinguisher.
	• <i>ip-address</i> —32-bit IP address
	• nn —16-bit number
	auto Automatically assigns a unique route distinguisher.
Command Default Command Modes	No default behavior or values VRF configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the rd command to make the prefix unique across multiple VRFs.
	Auto assignment of route distinguishers can be done only if a router ID is assigned using the bgp router-id command in BGP router configuration mode. The unique router ID is used for automatic route distinguisher generation.
	The following are restrictions when configuring route distinguishers:
	 BGP router-id must be configured before rd auto can be configured Route distinguisher cannot be changed or removed when an IPv4 unicast address family is configured
	 Route distinguisher cannot be changed or removed when rd auto is configured under a VRF. BGP router-id cannot be changed or removed when rd auto is configured under a VRF.

I

Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The foll instance	e	ple shows how to automatically assign a unique route distinguisher to VRF
	RP/0/RI	P0/CPU0:rou	ater(config)# router bgp 1 ater(config-bgp)# vrf vrf-1 ater(config-bgp-vrf)# rd auto

receive-buffer-size

To set the size of the receive buffers for a Border Gateway Protocol (BGP) neighbor, use the **receive-buffer-size** command in an appropriate configuration mode. To remove the **receive-buffer-size** command from the configuration file and restore the system to its default condition in which the software uses the default size, use the **no** form of this command.

receive-buffer-size socket-size [bgp-size]
no receive-buffer-size [socket-size] [bgp-size]

Syntax Description	socket-size Size, in bytes, of the receive-side socket buffer. Range is 512 to 131072.
	<i>bgp-size</i> (Optional) Size, in bytes, of the receive buffer in BGP. Range is 512 to 131072.
Command Default	socket-size : 32,768 bytes
	<i>bgp-size</i> : 4,032 bytes
Command Modes	Neighbor configuration
	Neighbor group configuration
	Session group configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
-	Using larger buffers can improve convergence time because it allows the software to process a larger number of packets simultaneously. However, allocating larger buffers consumes more memory on the router.
	Note Increasing the socket buffer size uses more memory only when more messages are waiting to be processed by the software. In contrast, increasing the BGP buffer size uses extra memory indefinitely.
	If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to set the receive buffer sizes for neighbor 172.20.1.1 to be 65,536 bytes for the socket buffer and 8192 bytes for the BGP buffer:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# receive-buffer-size 65536 8192

redistribute (BGP)

To redistribute routes from one routing domain into Border Gateway Protocol (BGP), use the **redistribute** command in an appropriate configuration mode. To disable route redistribution, use the **no** form of this command.

Connected

redistribute connected [metric metric-value] [route-policy route-policy-name] **no redistribute connected** [metric metric-value] [route-policy route-policy-name]

Intermediate System-to-Intermediate System (IS-IS)

redistribute isis *process-id* [{level | {1 | 1-inter-area | 2}}] [metric *metric-value*] [route-policy *route-policy-name*] no redistribute isis *process-id* [{level | {1 | 1-inter-area | 2}}] [metric *metric-value*] [route-policy *route-policy-name*]

Open Shortest Path First (OSPF) redistribute ospf process-id no redistribute ospf process-id

OSPFv3

redistribute ospf process-id no redistribute ospf process-id

Static

redistribute static [metric metric-value] [route-policy route-policy-name] no redistribute static [metric metric-value] [route-policy route-policy-name]

Syntax Description	connected	Redistributes connected routes. Connected routes are established automatically when IP is enabled on an interface.
	metric metric-value	(Optional) Specifies the Multi Exit Discriminator (MED) attribute used for the redistributed route. Range is 0 to 4294967295. Use a value consistent with the destination protocol.
		By default, the Interior Gateway Protocol (IGP) metric is assigned to the route. For connected and static routes the default metric is 0.
	route-policy route-policy-name	(Optional) Specifies a configured routing policy to filter redistributed routes. A route policy is used to filter the importation of routes from this source routing protocol to BGP.
	process-id	For the isis keyword, an IS-IS instance name from which routes are to be redistributed.
		For the ospf keyword, an OSPF instance name from which routes are to be redistributed.
		The <i>process-id</i> value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

	match { internal external [1 2]	(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one or more of the following:
	nssa-external [1 2]}	 internal —Routes that are internal to a specific autonomous system (intraand inter-area OSPF routes). external [1 2]—Routes that are external to the autonomous system, but are
		 imported into OSPF as Type 1 or Type 2 external routes. nssa-external [1 2]—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 not-so-stubby area (NSSA) external routes.
		For the external and nssa-external options, if a type is not specified, then both Type 1 and Type 2 are assumed.
	isis	Specifies that routes are distributed from the IS-IS protocol.
		Redistribution from IS-IS is allowed under IPv4 unicast, IPv4 multicast, IPv6 unicast, and IPV6 multicast address-families. Redistribution is not allowed under VPNv4 and VPNv6 address-families.
	level { 1 1-inter-area 2 }	(Optional) Specifies the IS-IS level from which routes are redistributed. It can be one of the following:
		 1 —Routes are redistributed from Level 1 routes. 1-inter-area —Routes are redistributed from Level 1 interarea routes. 2 —Routes are redistributed from Level 2 routes.
	ospf	Specifies that routes are distributed from the OSPF protocol. You must be in IPv4 unicast or multicast address family configuration mode or in VRF IPv4 address family configuration mode.
	ospfv3	Specifies that routes are distributed from the OSPFv3 protocol. You must be in IPv6 unicast or multicast address family configuration mode or in VRF IPv4 address family configuration mode.
	static	Redistributes IP static routes.
Command Default	Route redistribution is d	lisabled.
	For IS-IS, the default is	to redistribute Level 1 and Level 2 routes.
	For OSPF, the default is	to redistribute internal, external, and NSSA external routes of Type 1 and Type 2.
	For OSPFv3, the default	t is to redistribute internal, external, and NSSA external routes of Type 1 and Type 2
	By default, the Interior C the default metric is 0.	Gateway Protocol (IGP) metric is assigned to the route. For connected and static routes
	metric <i>metric-value</i> : 0	
	match { internal ext match all routes.	ternal $[1 2]$ nssa-external $[1 2]$: If no match is specified, the default is to
Command Modes	IPv4 address family con	figuration, both unicast and multicast (connected , isis , ospf , and static are supported)

I

	IPv isis,		s family configuration, both unic	ast and multicast (connected,
	-	fv3, static ar	e supported)	
Command History	Re	lease	Modification	
	Re	lease 6.0	This command was introduced.	
Usage Guidelines				
	Note		-	using both command keywords for setting or matching of attributes rough the route policy first, followed by the keyword matching and
	redi	istributio		ated independently of the others. Changing or removing ot affect the redistribution capability of other protocols or other
	the	routing p	-	mand are not affected by the redistribute command; that is, command takes precedence over the policy specified through

refresh-time (rpki-server)

To configure the time BGP waits in between sending periodic serial queries to the RPKI server, use the **refresh-time** command in rpki-server configuration mode. To remove the refresh-time configuration, use the **no** form of this command.

refresh-time {*time-in-seconds* | **off**} **no refresh-time** {*time-in-seconds* | **off**}

Syntax Description	off Specifies not to send serial queries periodically.
	<i>time-in-seconds</i> Sets the refresh-time in seconds. Range is 30 to 3600 seconds.
Command Default	Sets a default value of 600 seconds.
Command Modes	RPKI cache configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operation ID
	bgp read,

This example shows how to set the refresh-time for BGP to wait in between sending periodic serial queries to the server as 30 seconds:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#username rpki-user
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#password rpki-ssh-pass
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#preference 1
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#purge-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#refresh-time 30
```

I

remote-as (BGP)

To create a Border Gateway Protocol (BGP) neighbor and begin the exchange of routing information, use the **remote-as** command in an appropriate configuration mode. To delete the entry for the BGP neighbor, use the **no** form of this command.

remote-as *as-number* no remote-as [*as-number*]

Syntax Description	as-number Autonomous system (AS) to which the neighbor belongs.			
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.			
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.			
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.			
Command Default	No BGP neighbors exist.			
Command Modes	Neighbor configuration			
	Neighbor group configuration			
	Session group configuration			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	Use the remote-as command to create a neighbor and assign it a remote autonomous system number. A neighbor must have a remote autonomous system number before any other commands can be configured for it. Removing the remote autonomous system from a neighbor causes the neighbor to be deleted. You cannot remove the autonomous system number if the neighbor has other configuration.			
	Note We recommend that you use the no neighbor command rather than the no remote-as command to delete a neighbor.			
	A neighbor specified with a remote autonomous system number that matches the autonomous system number			

A neighbor specified with a remote autonomous system number that matches the autonomous system number specified in the **router bgp** command identifies the neighbor as internal to the local autonomous system. Otherwise, the neighbor is considered external.

Configuration of the **remote-as** command for a neighbor group or session group using the **neighbor-group** command or **session-group** command causes all neighbors using the group to inherit the characteristics configured with the command. Configuring the command directly for the neighbor overrides the value inherited from the group.

In the neighbor configuration submode, configuring use of a session group or neighbor group for which **remote-as** is configured creates a neighbor and assigns it an autonomous system number if the neighbor has not already been created.

Note

Do not combine remote-as commands and no use neighbor-group commands, or remote-as commands and no use session-group commands, in the same configuration commit.

Task IDTask
IDOperations
operations
operationsbgpread,
write

Examples

The following example shows how to assign autonomous system numbers on two neighbors, neighbor 10.0.0.1, (internal) and neighbor 192.168.0.1 (external), setting up a peering session that shares routing information between this router and each of these neighbors:

RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # session-group group2
RP/0/RP0/CPU0:router(config-bgp-sngrp) # remote-as 1
RP/0/RP0/CPU0:router(config-bgp-sngrp) #exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr) #use session-group group2

The following example shows how to configure a session group called group2 with an autonomous system number 1. Neighbor 10.0.0.1 is created when it inherits the autonomous system number 1 from session group group2.

```
RP/0/RP0/CPU0:router(config) #router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # session-group group2
RP/0/RP0/CPU0:router(config-bgp-sngrp) # remote-as 1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group group2
```

remove-private-as

To remove private autonomous system numbers from autonomous system paths when generating updates to external neighbors, use the **remove-private-as** command in an appropriate configuration mode. To place the router in the default state in which it does not remove private autonomous system numbers, use the **no** form of this command.

remove-private-as [inheritance-disable] [entire-aspath] no remove-private-as [inheritance-disable] [entire-aspath]

Syntax Description	inheritance-disable	(Optional) Permits the feature to be disabled from a neighbor group or address family group instead of being inherited.
	entire-aspath	(Optional) Removes the entire private autonomous system numbers from an autonomous system path only if all ASes in the path are private.
Command Default		is not specified in the appropriate configuration mode, private autonomous system oved from updates sent to external neighbors.
Command Modes	- IPv4 address family g	group configuration
	IPv6 address family g	group configuration
	IPv4 neighbor addres	as family configuration
	IPv4 neighbor group	address family configuration
	IPv6 neighbor group	address family configuration
Command History	Release Modific	cation
	Release 6.0 This con	mmand was introduced.
Usage Guidelines	This feature is available	ble for external BGP (eBGP) neighbors only.
		ssed to the external neighbor, the software drops any private autonomous system numbers, g or in the middle of the AS_SEQUENCE.
		sed in a BGP confederation, the element following the confederation portion of the path, if a sequence, is considered the leading sequence.
	The private autonome	ous system values range from 64512 to 65535.
		onfigured for a neighbor group or address family group, all neighbors using the group ion. Values of commands configured specifically for a neighbor override inherited values.

Task ID Task Dperations ID bgp read, write

Examples

The following example shows a configuration that removes the private autonomous system number from the IP Version 4 (IPv4) unicast updates sent to 172.20.1.1:

```
RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# remove-private-as
```

The following example shows how to disable the remove private autonomous system number feature for neighbor 172.20.1.1, preventing this feature from being automatically inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp) # af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # remove-private-as
RP/0/RP0/CPU0:router(config-bgp-afgrp) # exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # remove-private-as inheritance-disable
```

replace as-path all

To replace BGP AS path with custom values, use the **replace as-path all** command in route-policy configuration mode.

```
replace as-path all { none auto / x' } [ n ] [ parameter ]
Syntax Description
                       none
                                 Replaces AS path with null or empty value.
                       auto
                                 Replaces AS path based on the route policy. For inbound route policy, replaces AS path with AS
                                 path of neighbor from where the prefix is received. For outbound route policy, replaces AS path
                                 with the configured local AS path.
                       'x'
                                 Replaces AS path with specified value, where 'x' is a single AS number or a sequence of AS
                                 numbers separated by space.
                                 (Optional) Repeats replacing the AS path for specified number of times. The range is from 2 to
                       п
                                 64. This option is supported only for the auto and 'x' parameters.
                       parameter (Optional) Parameter name used along with repeat option. The parameter name must be preceded
                                 with a "$". You can attach the route policy configured with the parameter to a neighbor and specify
                                 the number of times the AS path replacement should be repeated.
                      No default behavior or values

                       Release 7.5.2
                                          This command was
                                          introduced.
                      Use the replace as-path all command to replace the BGP AS path with specified custom values.
Usage Guidelines
                      When you remove the route policy from a neighbor, the associated replace as-path all configuration is also
                      removed.
Task ID
                       Task ID
                                    Operations
                       route-policy read,
                                    write
                      The following example shows how to use the replace as-path all command to replace the AS path
                      with auto:
```

```
Router(config) #route-policy aspath-auto
Router(config-rpl) # replace as-path all auto
Router(config-rpl) # end-policy
Router(config) # router bgp 65530
```

Router(config-bgp)# neighbor 111.0.0.1
Router(config-bgp-nbr)# address-family ipv4 unicast
Router(config-bgp-nbr-af)# route-policy aspath-auto out

response-time (rpki-server)

To configure the time BGP waits for a response from the RPKI cache-server after sending a serial or reset query, use the **response-time** command in rpki-server configuration mode. To remove the response-time configuration, use the **no** form of this command.

response-time {*time-in-seconds* | **off**} **no response-time** {*time-in-seconds* | **off**}

Syntax Description	off		Specifies to wait indefinitely for a response from the RPKI cache.		
	time-ii	n-seconds	Specifies the response-time in seconds. Range is 30 to 3600 seconds.		
Command Default	Sets a default value of 30 seconds.				
Command Modes	RPKI s	server confi	guration		
Command History	Releas	se Mod	ification		
	Releas	se 6.0 This	command was introduced.		
Usage Guidelines	No spe	cific guidel	ines impact the use of this command.		
Task ID	Task ID	Operation	 1		
	bgp	read, write	_		

This example shows how to set the time for BGP to wait for a response from the RPKI server as 30 seconds, after sending a serial or reset query:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 72.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#username rpki-user
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#password rpki-ssh-pass
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#preference 1
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#purge-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#refresh-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#response-time 30
```

Syntax Description

retain local-label

To retain the local label until the network is converged, use the **retain local-label** command in an appropriate address family configuration mode. To disable the retaining of the local label, use the **no** form of this command.

retain local-label minutes no retain local-label

Syntax Description	<i>minutes</i> Local retention time in minutes. The range is 3 to 60 minutes. The default retention time is 5 minutes.
Command Default	minutes : 5
Command Modes	L2VPN address family configuration
	VPNv4 address family configuration

VPNv6 address family configuration

Command History	Release	Modification
	Release 6.0	This command was introduced.

No specific guidelines impact the use of this command. **Usage Guidelines**

k ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to enable local label retention for 5 minutes:

> RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# retain local-label 5

retain route-target

To accept received updates with specified route targets, use the **retain route-target** command in an appropriate configuration mode. To disable the retaining of routes tagged with specified route targets, use the **no** form of this command.

retain route-target {all | route-policy route-policy-name} no retain route-target [{all | route-policy route-policy-name}]

Syntax Description	all Accepts received updates containing at least one route target.					
	route-policy <i>router-policy-name</i> Accepts received updates accepted by a specified route filter policy.					
Command Default	The default is to accept all route targets.					
Command Modes	VPNv4 address family configuration					
	VPNv6 address family configuration					
Command History	Release Modification					
	Release 6.0 This command was introduced.					
Usage Guidelines	Use the retain route-target command to configure a route reflector (RR) to retain routes tagged with specific route targets (RT).					
	The retain route-target is a required command for Inter-AS option B ASBR. By default, an Inter-AS option B ASBR needs the retain route-target configured to get VPNv4 BGP table from PE routers, either with the all or with the route-policy option.					
	A provider edge (PE) router is not required to hold all VPNv4 routes. The PE router holds only routes that match the import RT of the VPNs configured on it, but a RR must retain all VPNv4 routes because it may peer with PE routers and different PEs may require different RT-tagged VPNv4 routes. Configuring an RR to hold only routes that have a defined set of RT communities and configuring some of these RRs to service a different set of VPNs provides scalability to the RRs. A PE can be configured to peer with all RRs that service the VPN routing and forwarding (VRF) instances configured on the PE. When a new VRF is configured with an RT for which the PE does not already hold routes, the PE issues route refresh requests to the RRs and gets the relevant VPN routes.					
	The route-policy <i>route-policy-name</i> keyword and argument takes the policy name that lists the extended communities that a path should have for the RR to retain the path.					
Task ID	Task Operations ID					
	bgp read,					

write

Examples

The following example shows how to configure RR to retain all routes with the route filter policy ft-policy-A:

RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# retain route-target route-filter ft-policy-A

route-policy (BGP)

To apply a routing policy to updates advertised to or received from a Border Gateway Protocol (BGP) neighbor, use the **route-policy** command in an appropriate configuration mode. To disable applying routing policy to updates, use the **no** form of this command.

route-policy *route-policy-name* [{*parameter1, parameter2, ..., parametern*}] {**in** | **out**} **no route-policy** *route-policy-name* [{*parameter1, parameter2, ..., parametern*}] {**in** | **out**}

Syntax Description	route-policy-name	Name of route policy. Up to 16 parameters can follow the route-policy-name, enclosed in brackets ([]).				
	in	Applies policy to inbound routes.				
	out	Applies policy to outbound routes.				
Command Default	No policy is applie	No policy is applied.				
Command Modes	— IPv4 address famil	IPv4 address family group configuration				
	IPv6 address famil	IPv6 address family group configuration				
	IPv4 neighbor address family configuration					
	IPv4 neighbor group address family configuration					
	IPv6 neighbor group address family configuration					
Command History	Release Modification					
	Release 6.0 This	command was introduced.				
Usage Guidelines						
Usage Guidelines	-	icy command to specify a routing policy for an inbound or outbound route. The policy can utes or modify route attributes. The route-policy command is used to define a policy.				

neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor

override inherited values.

BGP Commands

I

Task ID	Task ID	Operations	
	bgp	read, write	
Examples		llowing examp from neighbo	ple shows how to apply the In-Ipv4 policy to inbound IP Version 4 (IPv4) unicast r 172.20.1.1:
	RP/0/R RP/0/R RP/0/R	RP0/CPU0:rou RP0/CPU0:rou RP0/CPU0:rou	<pre>iter(config)# router bgp 1 iter(config-bgp)# neighbor 172.20.1.1 iter(config-bgp-nbr)# remote-as 1 iter(config-bgp-nbr)# address-family ipv4 unicast iter(config-bgp-nbr-af)# route-policy In-Ipv4 in</pre>

router bgp

To configure the Border Gateway Protocol (BGP) routing process, use the **router bgp** command in XR Config mode. To remove all BGP configurations and terminate the BGP routing process, use the **no** form of this command.

router bgp as-number [instance instance-name]
no router bgp [{as-number}]

Syntax Description	as-number	Number that identifies the autonomous system (AS) in which the router resides.	
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.	
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.	
		• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.	
	instance instance-nam	Specifies an instance and instance name. The maximum length for the instance name is 32 characters.	
		The router bgp instance <i>instance-name</i> command replaced the distributed speaker command.	
Command Default	No BGP routi	ing process is enabled.	
Command Modes	XR Config m	ode	
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	Use the router bgp command to set up a distributed routing core that automatically guarantees the loop-free exchange of routing information between autonomous systems.		
Task ID	Task Opera ID	ations	
	bgp read, write	*	
	rib read, write		
Examples	The following	g example shows how to configure a BGP process for autonomous system 120:	
	RP/0/RP0/CPU	U0:router(config)# router bgp 120	

rpki server

To enter resource public key infrastructure (RPKI) cache-server (rpki-sever) configuration mode and enable rpki parameters configuration, use the **rpki server** command in Router BGP configuration mode. To remove the rpki-server configuration mode and delink cache-server from the cache list, use the **no** form of this command.

rpki server {host-nameip-address}
no rpki server {host-nameip-address}

Syntax Description	host-ne	ame Host name of the RPKI cache database.			
	ip-add	<i>ress</i> IP Address of the RPKI cache databse.			
Command Default	RPKI s	erver configuration is disabled.			
Command Modes	Router BGP configuration				
Command History	Releas	se Modification			
	Releas	e 6.0 This command was introduced.			
Usage Guidelines	No spec	cific guidelines impact the use of this command			
Task ID	Task ID	Operation			
		read,			

This example shows how to configure an rpki cache-server database and enter rpki-server configuration mode:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#
```

selective-vrf-download disable

To disable selective VRF download (SVD) on a line card to enable download all prefixes and labels to the line card, use the **selective-vrf-download disable** command in XR Config mode. To enable the SVD, use the **no** form of this command.

selective-vrf-download disable no selective-vrf-download disable

Syntax Description	This command has	s no keywords or arguments.
--------------------	------------------	-----------------------------

Command Default SVD is enabled.

Command Modes XR Config mode

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines You must failover the active RP or reload the router after disabling SVD for the configuration change to get activated.

Task ID Task ID Operation ip-services read, write

This example shows how to disable selective vrf download:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#selective-vrf-download disable

send-buffer-size

To set the size of the send buffers for a Border Gateway Protocol (BGP) neighbor, use the **send-buffer-size** command in an appropriate configuration mode. To set the size of the send buffers to the default values, use the **no** form of this command.

send-buffer-size socket-size [{bgp-size}]
no send-buffer-size [{socket-size}] [{bgp-size}]

Syntax Description	socket-size Size, in bytes, of the send-side socket buffer. Range is 4096 to 131072.
	<i>bgp-size</i> (Optional) Size, in bytes, of the BGP process send buffer. Range is 4096 to 131072.
Command Default	socket-size : 10240 bytes
	<i>bgp-size</i> : 4096 bytes
	Use the socket send-buffer-size command to change the defaults.
Command Modes	Neighbor configuration
	VRF neighbor configuration
	Neighbor group configuration
	Session group configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the send-buffer-size command to increase the buffer size employed when sending updates to a neighbor. Using larger buffers can improve convergence time because the software can process more packets simultaneously. However, allocating larger buffers uses more memory on the router.
	Note Increasing the socket buffer size uses more memory only when more messages are waiting to be processed by the software. In contrast, increasing the BGP buffer size uses more memory indefinitely.
	If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.
Task ID	Task Operations ID
	bgp read, write

Examples

The following example shows how to set the send buffer sizes for neighbor 172.20.1.1 to be 8192 bytes for both the socket buffer and the BGP buffer:

RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# send-buffer-size 8192 8192

send-community-ebgp

To specify that community or large community attributes should be sent to an external Border Gateway Protocol (eBGP) neighbor, use the **send-community-ebgp** command in an appropriate configuration mode. To disable sending community or large community attributes to an eBGP neighbor, use the **no** form of this command.

send-community-ebgp [{inheritance-disable}]
no send-community-ebgp [{inheritance-disable}]

Syntax Description	inheritance-disable (Optional) Allows configuration inherited from a neighbor group or address family group to be overridden.				
Command Default	Community (COMM) attributes are NOT sent to eBGP peers (including PE-CE peers).				
Command Modes	- IPv4 address family group configuration				
	IPv6 address family group configuration				
	IPv4 neighbor address family configuration				
	IPv4 neighbor group address family configuration				
	IPv6 neighbor group address family configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
	ReleaseThis command supports large communities.6.3.1				
Usage Guidelines	Use the send-community-ebgp command to control whether community or large community attributes are sent to eBGP neighbors. This command cannot be configured for iBGP neighbors as community or large community attributes are always sent to iBGP neighbors.				
	When IOS XR BGP updates community or large community attributes for eBGP VPN peers (VPNv4 or VPNv6), there is no need to configure the send-community-ebgp command separately. The community or large community attributes are updated by default.				
	If this command is configured for a neighbor group or address family group, all neighbors using the group inherit the configuration. Configuring the command specifically for a neighbor overrides inherited values.				
Task ID	Task Operations ID				
	bgp read, write				

Examples

The following example shows how to disable the router that sends community attributes to neighbor 172.20.1.1 for IP Version 4 (IPv4) multicast routes:

```
RP/0/RP0/CPU0:router(config) #router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-community-ebgp
```

The following example shows how to disable the delivery of community attributes to neighbor 172.20.1.1, preventing this feature from being inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config) #router bgp 140
RP/0/RP0/CPU0:router(config-bgp) # af-group group1 address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # send-community-ebgp
RP/0/RP0/CPU0:router(config-bgp-afgrp) # exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr) # address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # send-community-ebgp inheritance-disable
```

send-extended-community-ebgp

To specify that extended community attributes should be sent to external Border Gateway Protocol (eBGP) neighbors, use the **send-extended-community-ebgp** command in an appropriate configuration mode. To disable sending extended community attributes to eBGP neighbors, use the **no** form of this command.

send-extended-community-ebgp [{inheritance-disable}]
no send-extended-community-ebgp [{inheritance-disable}]

Syntax Description	inheritance-disable (Optional) Allows configurations inherited from a neighbor group or address family group to be overridden.			
Command Default	Extended community (EXTCOMM) attributes are NOT sent to eBGP peers (including PE-CE peers).			
Command Modes	- IPv4 address family group configuration			
	IPv6 address family group configuration			
	IPv4 neighbor address family configuration			
	IPv4 neighbor group address family configuration			
	IPv6 neighbor group address family configuration			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	Use the send-extended-community-ebgp command to control whether extended community attributes are sent to eBGP neighbors. This command cannot be used for iBGP neighbors as extended community attributes are always sent to iBGP neighbors.			
	When IOS XR BGP updates community attributes for eBGP VPN peers (VPNv4 or VPNv6), there is no need to configure the send-extended-community-ebgp command separately. The community attributes are updated by default.			
	If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.			
Task ID	Task Operations ID			
	bgp read, write			
Examples	The following example shows how to configure the router to send extended community attributes to neighbor 172.20.1.1 for IP Version 4 (IPv4) multicast routes:			

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-extended-community-ebgp
```

The following example shows how to disable the delivery of extended community attributes to neighbor 172.20.1.1, preventing this feature from being automatically inherited from address family group group 1:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# af-group group1 address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# send-extended-community-ebgp
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-extended-community-ebgp inheritance-disable
```

session-group

To create a session group and enter session group configuration mode, use the **session-group** command inXR Config mode. To remove a session group and delete all configurations associated with it, use the **no** form of this command.

session-group name
no session-group name

- **Syntax Description** name Name of the session group.
- **Command Default** No session groups are created.

Command Modes XR Config mode

Command History Release Modification Release 6.0 This command was introduced.

Usage Guidelines Use the session-group command to create a session group from which neighbors can inherit configuration that is address family-independent. That is, session groups cannot have address family-specific configuration. This command enters the session group configuration mode in which configuration for a session group is entered.

Many commands can be configured in both session group configuration mode and neighbor configuration mode.

Use of session groups saves time and reduces the router configuration size. Because the configuration of a session group can be inherited by any number of neighbors, use of the group can eliminate the need to copy long or complex configurations on each of a large number of neighbors. A neighbor can inherit all configuration from a session group simply by configuring the **use** command. Specific inherited session group configuration commands can be overridden for a specific neighbor by explicitly configuring the command for the specific neighbor.

The **no** form of this command causes all of the configuration for the session group to be removed. You cannot use the **no** form of this command if removing the group would leave one or more neighbors without a configured remote autonomous system number.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows a session group called group1 that is used by two neighbors, 10.0.0.1 and 10.0.0.2. Because group1 is a session group, it contains only address family-independent configuration. And because group1 is used by neighbors 10.0.0.1 and 10.0.0.2, they inherit the configuration of the group.

RP/0/RSP0RP0/CPU0:router(config) # router bgp 1 RP/0/RSP0RP0/CPU0:router(config-bgp) # session-group group1 RP/0/RSP0RP0/CPU0:router(config-bgp-sngrp) # remote-as 1 RP/0/RSP0RP0/CPU0:router(config-bgp-sngrp) # advertisement-interval 2 RP/0/RSP0RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RSP0RP0/CPU0:router(config-bgp) # neighbor 10.0.0.1 RP/0/RSP0RP0/CPU0:router(config-bgp-nbr) # use session-group group1 RP/0/RSP0RP0/CPU0:router(config-bgp-nbr) # exit RP/0/RSP0RP0/CPU0:router(config-bgp-nbr) # exit RP/0/RSP0RP0/CPU0:router(config-bgp) # neighbor 10.0.0.2 RP/0/RSP0RP0/CPU0:router(config-bgp-nbr) # use session-group group1

The following example shows a session group called group1 used by two neighbors, 10.0.0.1 and 10.0.0.2. Because group1 is a session group, it contains only address family-independent configuration. And because group1 is used by neighbors 10.0.0.1 and 10.0.0.2, they inherit the configuration of the group. However, the **password password1** configuration from group1 is overridden for neighbor 10.0.0.2, using the **password-disable** command in the neighbor 10.0.0.2 configuration submode.

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # session-group group1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # remote-as 1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # advertisement-interval 2
RP/0/RP0/CPU0:router(config-bgp-sngrp) # password password1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr) # exit
RP/0/RP0/CPU0:router(config-bgp-nbr) # exit
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group group1
```

session-open-mode

To establish a Border Gateway Protocol (BGP) session with a specific TCP open mode, use the **session-open-mode** command in an appropriate configuration mode. To restore the default state, use the **no** form of this command.

session-open-mode {active-only | both | passive-only}
no session-open-mode [{active-only | both | passive-only}]

Syntax Description active-only Ensures that the BGP session can be established only when the request is initiated by the local end (active-open request) and all passive-open requests (from the other end) are rejected by the local BGP.

both Allows BGP sessions to be established from both incoming or outgoing TCP connection requests, with one being rejected in the event of a request collision.

passive-only Ensures that the local BGP does not initiate any TCP open requests and the session can be established only when the request comes from the remote end.

Command Default The default is **both**.

Command Modes Neighbor configuration

Neighbor group configuration

Session group configuration

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines

BGP, by default, tries to initiate an active TCP connection whenever a new neighbor is configured. A remote neighbor may also initiate the TCP connection before the local BGP can initiate the connection. This initiation of a TCP connection by a remote neighbor is considered a passive-open request and it is accepted by the local BGP. This default behavior can be modified using the **session-open-mode** command.

Note The BGP connection is not opened and, as a result the BGP session, is not established if both the peering neighbors use the same nondefault TCP session open mode—active-only or passive-only. If both ends are configured with active-only, each neighbor rejects the TCP open request from the other end. One neighbor must be configured as passive-only or both. Similarly, if both neighbors are configured with passive-only, neither neighbor initiates the TCP open request and the BGP session is not established. Again, one neighbor must be configured as active-only or both. There is one exception. A connection open request from a neighbor that is configured with the TCP session open mode to be passive-only is processed to detect whether there is a connection collision before the request is rejected. This exception enables the local BGP to reset the session if the remote neighbor goes down and it is not detected by the local router.

Use the **session-open-mode** command when it may be necessary to preconfigure a neighbor that does not exist. Ensure that BGP does not spend any time actively trying to set up a TCP session with the neighbor. A BGP session does not come up between two neighbors, both of which configure the same nondefault value (**active-only** or **passive-only** keyword) for this command.

Task ID	Operations
bgp	read,
C1	write

Examples

The following example shows how to enable a BGP session on router bgp 1:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# neighbor 45.67.89.01
RP/0/RP0/CPU0:router(config-bgp-nbr)# session-open-mode active-only

I

set flow-tag

To set the flow-tag value for the PBR BGP, use the **set flow-tag** command in route-policy configuration mode.

	set flow-tag {numberparameter}
Syntax Description	number Flow-tag value. Range is from 1 to 63.
	parameter Parameter name. The parameter name must be preceded with a "\$."
Command Default	No default behavior or values
Command Modes	Route-policy configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the set flow-tag command to set the flow-tag to classify packets.
	This command is supported at the BGP table-policy attachpoint. Prefixes are marked for subsequent processing in the forwarding plane. After flow-tag propagation through Border Gateway Protocol (BGP), flow-tag is enabled on an interface, corresponding traffic shaping and policing is completed using packet classification based on the flow-tag value.
Task ID	Task ID Operations
	route-policy read, write
Examples	This example shows how to use set flow-tag command:
	<pre>RP/0/RP0/CPU0:router(config)# route-policy policy_1 RP/0/RP0/CPU0:router(config-rpl)# set flow-tag 12 RP/0/RP0/CPU0:router(config-rpl)# end-policy</pre>

show bgp

To display entries in the Border Gateway Protocol (BGP) routing table, use the **show bgp** command in XR EXEC mode.

show bgp [{ipv4 {unicast} | ipv6 {unicast}}]

is unicast.

ipv4	(Optional) Specifies IP Version 4 address prefixes.			
unicast	(Optional) Specifies unicast address prefixes.			
ipv6	(Optional) Specifies IP Version 6 address prefixes.			
<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.			
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.			
If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.				
XR EXEC mode				
Release Modification				
Release 6.0 This command was intr	roduced.

	s used to specify the default address family for the sessions and the set o specify the default subaddress family for the session. See the <i>System</i>			
	unicast ipv6 ipv4 { unicast labeled-unicast } ipv6 unicast If no address family or subaddress fa specified using the set default-afi a XR EXEC mode Release Modification Release 6.0 This command was inti Release The command output w 6.3.1 The set default-afi command i			

BGP contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for an address family or a subaddress family, each matching routing table is examined in turn.

I

	Note Running the show bgp command immediately after configuring a large and complex route policy may result in timeout of the system database shown through an error message (SYSDB-G-TIMEOUT_EDM). It is recommended, that the show command be run, after the new route policy takes effect.
	Use the show bgp <i>ip-address</i> { $mask \mid l prefix-length$ } command to display detailed information for a specific route. If the mask and prefix length are omitted, the details of the longest matching prefix for the IP address are displayed.
	Use the show bgp command to display all routes in the specified BGP routing table. Use the show bgp <i>ip-address</i> { <i>mask</i> <i>l prefix-length</i> } longer-prefixes command to display those routes more specific than a particular prefix.
	Use the unknown-attributes keyword to display details of any transitive attributes associated with a route that are not understood by the local system.
	Use the show bgp <i>ip-address/prefix-length</i> detail command to display details of the specified prefix.
Task ID	Task Operations ID
	bgp read
Examples	The following is sample output from the show bgp command in XR EXEC mode with the BGP Persistence or long lived graceful restart (LLGR) status: RP/0/RP0/CPU0:router# show bgp vpnv4 uni rd 2:1 3.0.0.0/24 [KBGP routing table entry for 3.0.0.0/24, Route Distinguisher: 2:1 Versions: Process bRIB/RIB SendTblVer Speaker 350584 350584 Local Label: 16010 Last Modified: Jun 23 06:22:12.821 for 00:03:27 Paths: (1 available, best #1) Not advertised to any peer Path #1: Received by speaker 0 Not advertised to any peer 6913, (Received from a RR-client), (long-lived stale) 4.4.4.4 (metric 3) from 3.3.3.3 (4.4.4.4) Received Label 16000 Origin EGP, localpref 100, valid, internal, best, group-best, import-candidate, not-in-vrf Received Path ID 0, Local Path ID 1, version 350584 Extended community: RT:2:1 Originator: 4.4.4.4, Cluster list: 3.3.3.3
	The following is the sample output from the show bgp < <i>IP address</i> > command displaying the graceful-shutdown community and the graceful-shut path attribute with BGP graceful maintenance feature activated: RP/0/0/CPU0:R4#show bgp 5.5.5.5 10.10.10.1 from 10.10.10.1 (192.168.0.5) Received Label 24000 Origin incomplete, metric 0, localpref 100, valid, internal, best, group-best, import-candidate Received Path ID 0, Local Path ID 1, version 4

Processed 8 prefixes, 8 paths

This table describes the significant fields shown in the display.

Field	Description				
BGP router identifier	3GP identifier for the local system.				
local AS number	Autonomous system number for the local system.				
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.				
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.				
	• Range for 4-byte Autonomous system numbers (ASNs) in asdot format is 1.0 to 65535.65535.				
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.				

Field	Description					
BGP table state	State of the BGP database.					
Table ID	BGP database identifier.					
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.					
Dampening enabled	Dampening is enabled for the routes in this BGP routing table.					
BGP scan interval	Interval (in seconds) between BGP scans for the specified address family and subaddress family.					
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):					
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.					
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.					
	*—Path is valid.					
	The second character may be (in order of precedence):					
	>—Path is the best path to use for that network.					
	d—Path is dampened.					
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.					
	The third character may be:					
	i—Path was learned by an internal BGP (iBGP) session.					
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:					
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.					
	e—Path originated from an Exterior Gateway Protocol (EGP).					
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.					
Network	IP prefix and prefix length for a network.					
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.					
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit discriminator (MED) metric.					

L

Field	Description
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the path origin code.

The following is sample output from the **show bgp** command with the network specified:

```

```

This table describes the significant fields shown in the display.

Field	Description				
BGP router table entry	Network that is being displayed.				
Versions	List of the network versions in each BGP process.				
Process	Name of the BGP process.				
bRIB/RIB	Version of the network for sending to the RIB. You can compare this version with the bRIB/RIB version for the process (at the top of show bgp summary) to verify whether the network has been sent to the RIB.				
SendTblVer	Version of the network for advertising to neighbors. This can be compared with the neighbor version to determine whether the network has been advertised to a particular neighbor.				

Table 4: show bgp prefix length Field Descriptions

I

Field	Description				
Last Modified	Timestamp when this route was last modified.				
Paths	List of paths for the network (that is, routes to reach the network). The number of paths and the index of the best path are given.				
not advertised to any peer	Best path was received with a NO_ADVERTISE community and is not advertised to any neighbor.				
not advertised to EBGP peer	Best path was received with a NO_EXPORT community and is not advertised to any eBGP neighbor.				
not advertised outside local AS	Best path was received with a LOCAL_AS community and is not advertised to peers outside the local AS.				
Advertisements of this net are suppressed by an aggregate	Network is a more-specific prefix of a configured aggregate and has been suppressed. It is not advertised to any neighbors unless they have an unsuppress-map configured.				
Advertised to update-groups	List of update-groups to which the net has been advertised. Update-groups that have only one peer are not listed here.				
Advertised to peers	List of neighbors to which the net has been advertised to. Neighbors that are in one of the update-groups listed above are not listed separately. Only neighbors that are in unique update-groups are listed.				
Received by speaker 0	BGP process where the path originated. This is always "speaker 0" for standalone mode. It will be the speaker-id when BGP is in distributed model.				
AS Path	Autonomous system (AS) path that was received for the path. If the AS path is empty, then "Local" is displayed. This is the case for paths that are local generated on this router or on a neighboring router within the same AS.				
aggregated by	If the path is an aggregate, the router-id of the router that performed the aggregation.				
suppressed due to dampening	Path has been suppressed due to the configured path dampening.				
history entry	Path is withdrawn, but a copy is kept to store the dampening information.				
Received from a RR-client Path was received from a route reflector client.					
received-only	If soft reconfiguration inbound is configured, the path was received but dropped by inbound policy, or was accepted and modified. In either event, the received-only value is a copy of the original, unmodified path.				
received & used	If soft reconfiguration inbound is configured, the path was received and accepted by inbound policy, but not modified.				
stale	Neighbor from which the path was received is down, and the path is kept and marked as stale to support graceful restart.				

I

Field	DescriptionNext hop for the path. If the next hop is known by a mechanism outside BGP (for example, for redistributed paths), then 0.0.0.0 is displayed. After the next hop, the neighbor from whom the path was received is displayed, along with the neighbor's router-id. If the path was locally generated (for example, an aggregate or redistributed path), then 0.0.0.0 is displayed for the neighbor address.				
<nexthop> from <neighbor> (<router-id>)</router-id></neighbor></nexthop>					
Origin	IGP: the path originated from an IGP.				
	EGP: the path originated from an EGP.				
	incomplete: the origin of the path is unknown.				
metric	MED value of the path.				
localpref	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.				
weight	Locally assigned weight (if not 0) of the path. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.				
valid	Path is valid and can be considered in the best-path calculation.				
redistributed	Path is redistributed through a redistribute command.				
aggregated	Path is a locally generated aggregate created due to an aggregate-address command.				
local	Path is a local network source due to a network command.				
internal	Path was received from an iBGP neighbor.				
external	Path was received from an eBGP neighbor.				
atomic-aggregate	Path was received with the atomic-aggregate flag set. Some path information has been removed through aggregation.				
best	Path is the best path for the network and is used for routing and advertised to peers.				
multipath	Path is a multipath and is installed into the RIB along with the best path.				
Community	List of communities attached to the path.				
Extended community	List of extended communities attached to the path.				
Originator	Originator of the path within the AS Cluster list if the path is reflected.				
AS Cluster list	List of RR clusters the path has passed through if the path is reflected				
Dampinfo	Penalty and reuse information if the path is dampened.				
penalty Current penalty for the path.					

Field Description			
flapped	Number of times the path has flapped and the time since the first flap.		
reuse in	Time until the path is re-used (undampened).		
half life	Configured half-life for the path.		
suppress value	Penalty at which the path is suppressed.		
reuse value	Penalty at which the path is re-used.		
Maximum suppress time	Maximum length of time for which the path can be suppressed.		

The following is sample output from the **show bgp** command with the *ip-address/prefix-length* **detail** options:

```

The **show bgp** command output displays 'import suspect' when potential import oscillation has been detected for the prefix. Import of such a prefix is not affected. However, import of the prefix can be dampened in future if the oscillation continues. If the oscillation stops during the next import run, the prefix will no longer be marked 'import supect'.

This is sample output of **show bgp {ipv4 | vpnv4} unicast summary** when the **update wait-install** command was configured for an address family. The output displays the "RIBAckVer" field.

RP/0/RP0/CPU0:router#show bgp summary

Originator: 15.1.1.1, Cluster list: 55.1.1.1, 75.1.1.1, 45.1.1.1

This table describes the significant fields shown in the display:

Field	Description
accept-own-self	The Accept Own path in the customer VRF contains the "accept-own-self" keyword/flag.
accept-own	The Accept Own path contains the "accept-own" keyword/flag.
Community:accept-own	List of communities attached to the path: accept-own.
Extended community	List of extended communities attached to the path.
Cluster list	Router ID or cluster ID of all route reflectors through which the route has passed.

The output of **show bgp {vpnv4 | vpnv6} unicast rd** command may display the optional BGP attribute not-in-vrf. If a path in a VPNvX net is marked as not-in-vrf, it may be due to any of the following conditions:

- The RD of the VPNvX net is not the same as any of the RDs configured for VRFs on the router.
- The RD of the VPNvX net is the same as the RD configured for a specific VRF on the router, but the path is not imported to the specified VRF. For example, the route-targets attached to the path do not match any of the **import route-target** [*as-number:nn* | *ip-address:nn*] configured for VRF, *vrf_1*.

If the not-in-vrf net is set, it indicates that the path does not belong to the VRF.

This is sample output from the **show bgp ipv4 unicast** command showing the status of the permanent network:

```
RP/0/RP0/CPU0:router# show bgp ipv4 unicast 1.0.0.0/24

   Last Message Enqueued: 20 secs
   Slow Detection State: Dynamic Detected Slow Peer
----More----
```

Where:

- *Refresh State* indicates the state of the refresh sub-group. The states can be any of the following:
 - Not-In-Refresh: Refresh sub-group is not present
 - RR: Refresh sub-group is processing refresh request update
 - SLOW: Refresh sub-group is processing slow peer update
 - RTC: Refresh sub-group is processing RTC incremental update
 - SLOW-RTC: Refresh sub-group is processing both slow peer and RTC incremental update
- Last Message Enqueued indicates the time since the last update message was enqueued to the neighbor address-family. If this time exceeds the neighbor address-family slow peer detection threshold time, then it meets one of the conditions for detection of slow peer.
- *Slow Detection State* indicates the operational type of slow peer. The type can be any of the following:
 - Static Slow Peer: Neighbor address-family is static slow peer
 - Dynamic Detected Slow Peer: Neighbor address-family is dynamic detected slow peer
 - Not slow peer: Neighbor address-family is not a slow peer

show bgp update in error process

To display process level update inbound error-handling information, use the **show bgp update in error process**command in XR EXEC mode.

show bgp update in error process [{brief|detail}]

Syntax Description	brief (Optional) Displays brief information on process level update generation.
	detail (Optional) Displays detailed information on process level update generation.
Command Default	None
Command Modes	XR EXEC mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operations ID
	bgp read

RP/0/RP0/CPU0:router#show bgp update in error process

```
Basic Update error-handling:
EBGP: [Enabled]
IBGP: [Enabled]
Extended Update error-handling:
EBGP: [Disabled]
IBGP: [Disabled]
Malformed Update messages: 0
Neighbors that received malformed Update messages: 0
Last malformed Update received: --- (never)
```

show bgp update out filter-group

To display update generation information at filter-group level, **show bgp update out filter-group** command in XR EXEC mode.

show bgp [afi safi] update out filter-group [fg-process-id] [{ brief detail }]
afi safi Specifies the address family and subsequent address family identifiers.
<i>fg-process-id</i> Specifies the filter-group process ID in $\langle x.y \rangle$ format. Range is $\langle 0.15 \rangle$. $\langle 0.4294967295 \rangle$.
brief (Optional) Displays brief information on filter-group level update generation
detail (Optional) Displays detailed information on filter-group level update generation.
None
XR EXEC mode
Release Modification
Release 6.0 This command was introduced.
No specific guidelines impact the use of this command.
Task Operations

This example displays sample output from show bgp update out filter-group command:

I

show bgp update out process

To display process level update generation information, use the **show bgp update out process** command in XR EXEC mode.

RP/0/RP0/CPU0:router#**show bgp update in error**

```
VRF "default"
 Malformed Update messages: 0
 Neighbors that received malformed Update messages: 0
 Last malformed update received: --- (never)
```

show bgp advertised

To display advertisements for neighbors or a single neighbor, use the **show bgp advertised**command in XR EXEC mode.

show bgp [ipv4 { all | labeled-unicast | mdt | multicast | tunnel | unicast }] advertised [neighbor
ip-address] [standby] [summary]

show bgp [ipv6 { all | labeled-unicast | multicast | unicast}] advertised [neighbor ip-address]
[standby] [summary]

show bgp [all { all | labeled-unicast | multicast | tunnel | unicast }] advertised [neighbor
ip-address] [standby] [summary]

show bgp [vpnv4unicast [rd rd-address]] advertised [neighbor ip-address] [standby] [summary]

show bgp [vpnv6unicast [rd rd-address]] advertised [neighbor ip-address] [standby] [summary]

show bgp [vrf {vrf-name | all} [{ ipv4 | {labeled-unicast | unicast} | ipv6 unicast}]] advertised
[neighbor ip-address] [standby] [summary]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines

Note The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each address family and subaddress family combination that is configured. The address family and subaddress family options specify the routing table to be examined. If the

all keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp advertised** command to display the routes that have been advertised to peers or a specific peer. To preview advertisements that would be sent to a peer under a particular policy, even if the corresponding update messages have not been generated yet, use the **show bgp policy** command.

Note

When you issue the **show bgp advertised** command, a route is not displayed in the output unless an advertisement for that route has already been sent (and not withdrawn). If an advertisement for the route has not yet been sent, the route is not displayed.

Use the **summary** keyword to display a summary of the advertised routes. If you do not specify the **summary** keyword, the software displays detailed information about the advertised routes.

Note The **show bgp advertised** command does not display the application of any outbound policy in the route details it displays. Consequently, this command provides only an indication of whether a particular route has been advertised, rather than details of which attributes were advertised. Use the **show bgp policy sent-advertisements** command to display the attributes that are advertised.

Task ID Task Operations ID bgp read

Examples

The following is sample output from the **show bgp advertised** command in XR EXEC mode:

RP/0/RP0/CPU0:router# show bgp advertised neighbor 10.0.101.4 summary

Network	Next Hop	From	AS Path
1.1.1.0/24	10.0.101.1	10.0.101.1	2 3 222 333 444 555 i
1.1.2.0/24	10.0.101.1	10.0.101.1	34567i

1.1.7.0/24	10.0.101.1	10.0.101.1	3 5 i
1.1.8.0/24	10.0.101.1	10.0.101.1	77 88 99 99 99 i

This table describes the significant fields shown in the display.

Table 5: show	bgp advertised	neighbor su	ummary Field	Descriptions
---------------	----------------	-------------	--------------	--------------

Field	Description
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
From	IP address of the peer that advertised this route.

L

Field	Description
AS Path	AS path of the peer that advertised this route.
Local	Indicates the route originated on the local system.
Local Aggregate	Indicates the route is an aggregate created on the local system.
Advertised to	Indicates the peer to which this entry was advertised. This field is used in the output when displaying a summary of the advertisements to all neighbors.

The following is sample output from the **show bgp advertised** command for detailed advertisement information:

```
RP/0/RP0/CPU0:router# show bgp advertised neighbor 172.72.77.1
```

```
172.16.0.0/24 is advertised to 172.72.77.1

   origin: IGP aggregator: 172.74.84.1 (1)
   aspath:
```

This table describes the significant fields shown in the display.

Table 6: show bgp advertised neighbor Field Descriptions

Field	Description
is advertised to	IP address of the peer to which this route has been advertised. If the route has been advertised to multiple peers, the information is shown separately for each peer.
neighbor	IP address of the peer that advertised this route, or one of the following: Local—Route originated on the local system. Local Aggregate—Route is an aggregate created on the local system.
neighbor router id	BGP identifier for the peer, or the local system if the route originated on the local system.
Not advertised to any peer	Indicates the no-advertise well-known community is associated with this route. Routes with this community are not advertised to any BGP peers.

I

Field	Description
Not advertised to any EBGP peer	Indicates the no-export well-known community is associated with this route. Routes with this community are not advertised to external BGP peers, even if those external peers are part of the same confederation as the local router.
Not advertised outside the local AS	Indicates the local-AS well-known community is associated with this route. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
(Received from a RR-client)	Path was received from a route reflector client.
(received-only)	This path is not used for routing purposes. It is used to support soft reconfiguration, and records the path attributes before inbound policy was applied to a path received from a peer. A path marked "received-only" indicates that either the path was dropped by inbound policy, or the path information was modified by inbound policy and a separate copy of the modified path is used for routing.
(received & used)	Indicates that the path is used both for soft reconfiguration and routing purposes. A path marked "received and used," implies the path information was not modified by inbound policy.
valid	Path is valid.
redistributed	Path is locally sourced through redistribution.
aggregated	Path is locally sourced through aggregation.
local	Path is locally sourced through the network command.
confed	Path was received from a confederation peer.
best	Path is selected as best.
multipath	Path is one of multiple paths selected for load-sharing purposes.
dampinfo	Indicates dampening information:
	Penalty—Current penalty for this path.
	Flapped—Number of times the route has flapped.
	In—Time (hours:minutes:seconds) since the router noticed the first flap.
	Reuse in—Time (hours:minutes:seconds) after which the path is made available. This field is displayed only if the path is currently suppressed.

Field	Description
Attributes after inbound policy was applied	Displays attributes associated with the received route, after any inbound policy has been applied.
	AGG—Aggregator attribute is present.
	AS—AS path attribute is present.
	ATOM—Atomic aggregate attribute is present.
	COMM—Communities attribute is present.
	EXTCOMM—Extended communities attribute is present.
	LOCAL—Local preference attribute is present.
	MET—Multi Exit Discriminator (MED) attribute is present.
	next hop—IP address of the next system used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
	ORG—Origin attribute is present.
origin	Origin of the path:
	IGP—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	EGP—Path originated from an Exterior Gateway Protocol.
	incomplete—Origin of the path is not clear. For example, a route that is redistributed into BGP from an IGP.
neighbor as	First autonomous system (AS) number in the AS path.
aggregator	Indicates that the path was received with the aggregator attribute. The autonomous system number and router-id of the system that performed the aggregation are shown.
metric	Value of the interautonomous system metric, otherwise known as the MED metric.
localpref	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system
aspath	AS path associated with the route.

Field	Description
community	Community attributes associated with the path. Community values are displayed in AA:NN format, except for the following well-known communities:
	Local-AS—Community with value 4294967043 or hex 0xFFFFF03. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
	no-advertise—Community with value 4294967042 or hex 0xFFFFF02. Routes with this community value are not advertised to any BGP peers.
	no-export—Community with value 4294967041 or hex 0xFFFFFF01. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation with the local router.
Extended community	Extended community attributes associated with the path. For known extended community types, the following codes may be displayed:
	RT—Route target community
	SoO—Site of Origin community
	LB—Link Bandwidth community
Originator	Router ID of the originating router when route reflection is used.
Cluster lists	Router ID or cluster ID of all route reflectors through which the route has passed.

show bgp af-group

To display information about Border Gateway Protocol (BGP) configuration for address family groups, use the **show bgp af-group** command in XR EXEC mode.

show bgp af-group group-name {configuration [defaults] [nvgen] | inheritance | users}

Syntax Description	group-name	Name of the address family group to display.
	configuration	(Optional) Displays the effective configuration for the af-group, including any settings that have been inherited from af-groups used by this af-group.
	defaults	(Optional) Displays all configuration settings, including any default settings.
	nvgen	(Optional) Displays output in the format of show running-config output.
		If the defaults keyword is also specified, the output is not suitable for cutting and pasting into a configuration session.
	inheritance	Displays the af-groups from which this af-group inherits configuration settings.
	users	Displays the neighbors, neighbor groups, and af-groups that inherit configuration from this af-group.
Command Default	No default beh	avior or value
Command Modes	XR EXEC mo	de
Command History	Release Modification	
	Release 6.0 T	This command was introduced.
Usage Guidelines	Use the show bgp af-group command with the <i>group-name</i> configuration argument and keed display the effective configuration of an af-group, taking into account any configuration that may from other af-groups through the use af-group command. The source of each command is sho	
	Default config	s keyword is specified, all configuration for the af-group, including default values, is shown. uration is identified in the show output. Use the nvgen keyword to display configuration the style of the show running-config command. This output is suitable for cutting and pasting tion sessions.
		bgp af-group command with the <i>group-name</i> inheritance argument and keyword to display nily groups from which the specified af-group inherits configuration.
	Use the show neighbors, neig	bgp af-group command with the <i>group-name</i> users argument and keyword to display the ghbor groups, and af-groups that inherit configuration from the specified af-group.
Task ID	Task Opera ID	tions

Examples The following af-group configuration is used in the examples:

```
af-group group3 address-family ipv4 unicast
remove-private-AS
soft-reconfiguration inbound
!
af-group group1 address-family ipv4 unicast
use af-group group2
maximum-prefix 2500 75 warning-only
default-originate
soft-reconfiguration inbound disable
!
af-group group2 address-family ipv4 unicast
use af-group group3
send-community-ebgp
send-extended-community-ebgp
capability orf prefix both
```

The following is sample output from the **show bgp af-group** command with the **configuration** keyword in XR EXEC mode. The source of each command is shown in the right column. For example, **default-originate** is configured directly on **af-group group1**, and the **remove-private-AS** command is inherited from af-group group2, which in turn inherits it from af-group group3.

```
RP/0/RP0/CPU0:router# show bgp af-group group1 configuration
```

```
af-group group1 address-family ipv4 unicastcapability orf prefix both[a:group2]default-originate[]maximum-prefix 2500 75 warning-only[]remove-private-AS[a:group2 a:group3]send-community[a:group2]send-extended-community[a:group2
```

The following is sample output from the show bgp af-group command with the users keyword:

RP/0/RP0/CPU0:router# show bgp af-group group2 users

IPv4 Unicast: a:group1

The following is sample output from the **show bgp af-group** command with the **inheritance** keyword. This example shows that the specified af-group group1 directly uses the group2 af-group, which in turn uses the group3 af-group:

```
RP/0/RSP0RP0/CPU0:router# show bgp af-group group1 inheritance
IPv4 Unicast: a:group2 a:group3
```

Table 7: show bgp af-group Field Descriptions, on page 251 describes the significant fields shown in the display.

This table describes the significant fields shown in the display.

Table 7: show bgp af-group Field Descriptions

Field	Description
[]	Configures the command directly on the specified address family group.
a:	Indicates the name that follows is an address family group.
n:	Indicates the name that follows is a neighbor group.
[dflt]	Indicates the setting is not explicitly configured or inherited, and the default value for the setting is used. This field may be shown when the defaults keyword is specified.
<not set></not 	Indicates that the configuration is disabled by default. This field may be shown when the defaults keyword is specified.

show bgp attribute-key

To display all existing attribute keys, use the show bgp attribute-keycommand in XR EXEC mode.

show bgp {ipv4 | ipv6 | all | vpnv4 unicast | }
attribute-key [standby]

<u> </u>				
Syntax Description	ipv4		(Optional) Specifies IP Version 4 address prefixes.	
	unicast		(Optional) Specifies unicast address prefixes.	
	all		(Optional) For address family, specifies prefixes for all address families.	
	ipv6		(Optional) Specifies IP Version 6 address prefixes.	
	ipv4 { unicas }	t labeled-unicast	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.	
	ipv6 unicast		(Optional) For VRF, specifies IPv6 unicast address families.	
Command Default		If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.		
Command Modes	XR EXEC mo	de

This table describes the significant fields shown in the display.

Table 8: show bgp attribute-key Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.

Field	Description		
local AS number	Autonomous system number for the local system.		
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.		
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.		
BGP scan interval	Interval (in seconds) between scans.		
Status codes	Status of the table entry. The status is displayed as a three-character field beginning of each line in the table. The first character may be (in order of precedence):		
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.		
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.		
	*—Path is valid.		
	The second character may be (in order of precedence):		
	>—Path is the best path to use for that network.		
	d—Path is dampened.		
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.		
	The third character may be:		
	i-Path was learned by an internal BGP (iBGP) session.		
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:		
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.		
	e-Entry originated from an Exterior Gateway Protocol (EGP).		
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.		
Network	IP prefix and prefix length for a network.		
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.		
AttrKey	Key associated with the route attribute.		
Processed <i>n</i> prefixes, <i>n</i> paths	Number of prefixes and number of paths processed for the table.		

show bgp cidr-only

To display routes with nonnatural network masks, also known as classless interdomain routing (CIDR) routes, use the **show bgp cidr-only** command in XR EXEC mode.

show bgp cidr-only [standby]

Syntax Description	ipv4 (Optional) Specifies the IP Version 4 address family.
	unicast (Optional) Specifies the unicast address family.
Command Default	If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used. This command is applicable only for IPv4 prefixes. If the default address family is not IPv4, then the ipv4 keyword must be used.
Command Modes	XR EXEC mode
Command History	Release Modification
	Release 6.0 This command was introduced.
-	Note The set default-afi command is used to specify the default address family for the session, and the set
	default-safi command is used to specify the default subaddress family for the session. See the <i>System</i> <i>Management Command Reference for Cisco NCS 5000 Series Routers</i> for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

```

This table describes the significant fields shown in the display.

Field	Description		
BGP router identifier	BGP identifier for the local system.		
local AS number	Autonomous system number for the local system.		
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.		
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.		
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.		
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):		
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.		
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.		
	*—Path is valid.		
	The second character may be (in order of precedence):		
	>—Path is the best path to use for that network.		
	d—Path is dampened.		
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.		
	The third character may be:		
	i-Path was learned by an internal BGP (iBGP) session.		

Table 9: show bgp cidr-only Field Descriptions

Field	Description			
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:			
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.			
	e-Entry originated from an Exterior Gateway Protocol (EGP).			
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.			
Network	IP prefix and prefix length for a network.			
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.			
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.			
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system			
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.			
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.			

show bgp community

To display routes that have the specified Border Gateway Protocol (BGP) communities, use the **show bgp community** command in XR EXEC mode.

show bgp [ipv4 {unicast}]
show bgp [ipv6 {unicast}]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC mode

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines

Ø

Note

The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or the subaddress family, each matching routing table is examined in turn.

If more than seven communities are required, it is necessary to configure a route policy and use the show bgp route-policy, on page 354 command.

Use the **exact-match** keyword to display only those routes with a set of communities exactly matching the list of specified communities. If you omit the **exact-match** keyword, those routes containing at least the specified communities are displayed.

Task ID Task Operations ID

bgp read

This table describes the significant fields shown in the display.

Table 10: show bgp community Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.

Field Description			
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.		
Status codes	Status of the table entry. The status is displayed as a three character field at the beginning of each line in the table. The first character may be (in order of precedence):		
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.		
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.		
	*—Path is valid.		
	The second character may be (in order of precedence):		
	>—Path is the best path to use for that network.		
	d—Path is dampened.		
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.		
	The third character may be:		
	i-Path was learned by an internal BGP (iBGP) session.		
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:		
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.		
	e-Path originated from an Exterior Gateway Protocol (EGP).		
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.		
Network	IP prefix and prefix length for a network.		
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.		
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.		
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.		
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.		
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.		

show bgp convergence

To display whether a specific address family has reached convergence, use the **show bgp convergence** command in XR EXEC mode.

show bgp [ipv4 {unicast}]
show bgp [ipv6 {unicast}]

Syntax Description	ipv4	(Optional) Specifies the IP Version 4 address family.
	unicast	(Optional) Specifies the unicast address family.
	ipv6	(Optional) Specifies the IP Version 6 address family.

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC mode

Command History	Release	Modification	

Release 6.0 This command was introduced.

Usage Guidelines

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

Border Gateway Protocol (BGP) contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp convergence** command to see if there is any pending work for BGP to perform. The software checks the following conditions to determine whether the specified address family has converged. If all the conditions are true, the address family is considered converged.

- All received updates have been processed and best routes selected.
- All selected routes have been installed in the global Routing Information Base (RIB).
- All selected routes have been advertised to peers, including any peers that are not established (unless those peers have been administratively shut down). See the **shutdown (BGP)** command for more information about administrative shutdown.

Note

While testing that all selected routes have been advertised to peers, the **show bgp convergence**command checks the size of the write queue for each neighbor. Because this queue is shared by all address families, there is a small possibility that the command indicates the address family has not converged when, in fact, it has converged. This could happen if the neighbor write queue contained messages from some other address family.

If the specified address family has not converged, the **show bgp convergence** command output does not indicate the amount of work that is pending. To display this information, use the**show bgp summary** command.

Task ID	Task ID	Operations
	bgp	read

Examples

The following shows the result of using the **show bgp convergence** command for an address family that has converged:

RP/0/RP0/CPU0:router# show bgp convergence

```
Converged.
All received routes in RIB, all neighbors updated.
All neighbors have empty write queues.
```

The following shows the result of using the **show bgp convergence** command for an address family that has not converged:

RP/0/RP0/CPU0:router# show bgp convergence

```
Not converged.
Received routes may not be entered in RIB.
One or more neighbors may need updating.
```

This table describes the significant fields shown in the display.

Table 11: show bgp convergence Field Descriptions

Field	Description
Converged/Not converged	Specifies whether or not all routes have been installed in the RIB and updates have been generated and sent to all neighbors.
[All] Received routes	For convergence, all routes must have been installed into the RIB and all updates must have been generated. For non-convergence, some routes may not be installed in the RIB, or some routes that have been withdrawn have not yet been removed from the RIB, or some routes that are up to date in the RIB have not been advertised to all neighbors.
[All One or more] neighbors	Specifies the status of neighbor updating.

show bgp dampened-paths

To display Border Gateway Protocol (BGP) dampened routes, use the **show bgp dampened-paths** command in XR EXEC mode.

	show bgp [ipv4 {unicast}] show bgp [ipv6 {unicast multicast}]			
Syntax Description	ipv4 (Optional) Specifies IP Version 4 address prefixes.			
	unicast (Optional) Specifies unicast address prefixes.			
	ipv6 (Optional) Specifies IP Version 6 address prefixes.			
	ipv6 unicast (Optional) For VRF, specifies IPv6 unicast address families.			
Command Default	If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.			
Command Modes	XR EXEC mode			
Command History	Release Modification			
	Release 6.0 This command was introduced.			
Usage Guidelines	The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the <i>System Management Command Reference for Cisco NCS 5000 Series Routers</i> for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default address family is unicast.			
	BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the all keyword is specified for the address family or for the subaddress family, each matching routing table is examined in turn.			
Task ID	Task Operations ID			
	bgp read

```

This table describes the significant fields shown in the display.

Table 12: show bgp dampened-paths Field Descriptions

Field	Description		
BGP router identifier	BGP identifier for the local system.		
local AS number	Autonomous system number for the local system.		
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.		
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.		
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.		
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.		
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):		
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.		
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.		
	*—Path is valid.		
	The second character may be (in order of precedence):		
	>—Path is the best path to use for that network.		
	d—Path is dampened.		
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.		
	The third character may be:		
	i—Path was learned by an internal BGP (iBGP) session.		

Field	Description		
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:		
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.		
	e-Path originated from an Exterior Gateway Protocol (EGP).		
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.		
Network	IP prefix and prefix length for a network.		
From	Neighbor from which the route was received.		
Reuse	Time (in hours:minutes:seconds) after which the path is made available.		
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.		

show bgp flap-statistics

To display information about Border Gateway Protocol (BGP) paths that have flapped, use the show bgp flap-statistics command in XR EXEC mode.

show	bgp	[ipv4	{unicast}]f	lap-statistics
show	bgp	[ipv6	{unicast}]	flap-statistics

Syntax Description	ipv4	(Optional) Specifies IP Version	n 4 address prefixes.	
	unicast	(Optional) Specifies unicast ad	ldress prefixes.	
	ipv6	(Optional) Specifies IP Version	n 6 address prefixes.	
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.		
Command Default		ss family or subaddress family is s sing the set default-afi and set de	1	5
Command Modes	- XR EXEC	mode		
Command History Release Modification				
	Release 6.	0 This command was introduced.		
Usage Guidelines	- •			
_	defau <i>Mana</i> for the	e set default-afi and set default t address family is IPv4. If you do	the default subaddress family <i>Cisco NCS 5000 Series Routers</i> -safi commands. If you do no	
		ins a separate routing table for each s family and subaddress family op		to be examined. If the all keyword

is specified for the address family or subaddress family, each matching routing table is examined in turn. Flap statistics are maintained only for paths if dampening is enabled using the **bgp dampening** command. If dampening is not enabled, the **show bgp flap-statistics** command does not display any paths.

If no arguments or keywords are specified, the software displays flap statistics for all paths for the specified address family. You can use the regexp, filter-list, cidr-only, and longer-prefixes options to limit the set of paths displayed.

If you specify a network address without a mask or prefix length, the longest matching prefix for the network address is displayed. When displaying flap statistics for a single route, use the **detail** keyword to display dampening parameters for the route.

```

This table describes the significant fields shown in the display.

Table 13: show bgp flap-statistics Field Descriptions

Field	Description
BGP route identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.

I

Field	Description	
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.	
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.	
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):	
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.	
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.	
	*—Path is valid.	
	The second character may be (in order of precedence):	
	>—Path is the best path to use for that network.	
	d—Path is dampened.	
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.	
	The third character may be:	
	i-Path was learned by an internal BGP (iBGP) session.	
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:	
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.	
	e-Path originated from an Exterior Gateway Protocol (EGP).	
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.	
Network	IP prefix and prefix length for a network that is dampened.	
From	IP address of the peer that advertised this route.	
Flaps	Number of times the route has flapped.	
Duration	Time (in hours:minutes:seconds) since the first flap.	
Reuse	Time (in hours:minutes:seconds) after which the path is made available.	
Path	Autonomous system path of the route that is being dampened.	
Half life	Half-life value used when dampening this route. The half-life is the amount of time that must elapse to reduce the reuse penalty by half. The half-life value is specified using the bgp dampening command.	

Field	Description
Suppress	Suppress value used to dampen this route. The suppress value is the value that the penalty must exceed for the route to be suppressed. The suppress value can be configured using the bgp dampening command.
Reuse penalty	Reuse penalty used to dampen this route. The penalty must fall below the reuse penalty for the route to be unsuppressed. The reuse penalty can be configured using the bgp dampening command.
Max supp. time	Maximum length of time that the route may be suppressed due to dampening. The maximum suppress time can be configured using the bgp dampening command.

show bgp inconsistent-as

To display Border Gateway Protocol (BGP) routes originated from more than one autonomous system, use the **show bgp inconsistent-as** command in XR EXEC mode.

show bgp [ipv4 {unicast}]
show bgp [ipv6 {unicast}]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
Command Default		amily or subaddress family is specified, the default address family and subaddress family g the set default-afi and set default-safi commands are used.
<u> </u>	VP EVEC mo	de

Command Modes XR EXEC mode

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines

Ŵ

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or for the subaddress family, each matching routing table is examined in turn.

Use the **show bgp inconsistent-as**command to search through all prefixes in the specified BGP routing table and display the paths for any prefix that has inconsistent originating autonomous system numbers. The originating autonomous system is the last autonomous system number displayed in the path field and should be the same for all paths.

If a prefix has one or more paths originating from different autonomous systems, all paths for that prefix are displayed.

Task ID Task Operations ID read bgp **Examples** The following is sample output from the show bgp inconsistent-as command in XR EXEC mode: RP/0/RP0/CPU0:router# show bgp inconsistent-as BGP router identifier 172.20.1.1, local AS number 1820 BGP main routing table version 1129 BGP scan interval 60 secs Status codes: s suppressed, d damped, h history, * valid, > best i - internal, S stale Origin codes: i - IGP, e - EGP, ? - incomplete Next Hop LocPrf Weight Path Network Metric * 10.0.0.0 172.16.232.55 0 0 300 88 90 99 ? *> 172.16.232.52 2222 0 400 ? * 172.16.0.0 172.16.232.55 0 0 300 90 99 88 200 ? *> 172.16.232.52 2222 0 400 ? * 192.168.199.0 0 300 88 90 99 ? 172.16.232.55 0 *> 172.16.232.52 2222 0 400 ?

This table describes the significant fields shown in the display.

Table 14: show bgp inconsistent-as Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description						
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):						
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.						
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.						
	*—Path is valid.						
	The second character may be (in order of precedence):						
	>—Path is the best path to use for that network.						
	d—Path is dampened.						
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.						
	The third character may be:						
	i-Path was learned by an internal BGP (iBGP) session.						
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:						
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.						
	e-Path originated from an Exterior Gateway Protocol (EGP).						
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.						
Network	IP prefix and prefix length for a network.						
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.00 indicates that the router has a non-BGP route to this network.						
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.						
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.						
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.						
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.						

show bgp labels

To display Border Gateway Protocol (BGP) routes and their incoming and outgoing labels, use the **show bgp labels**command in XR EXEC mode.

This table describes the significant fields shown in the display.

Table 15: show bgp labels Field Descriptions

Field	Description
BGP Route Distinguisher	BGP route distinguisher.
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP table state	State of the BGP routing table.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.

Field	Description					
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.					
Rcvd Label	Received label.					
Local Label	Local label.					

show bgp large-community

To display routes that have the specified Border Gateway Protocol (BGP) large-communities, use the **show bgp large-community** command in XR EXEC mode mode.

show bgp [ipv4 {unicast | multicast | labeled-unicast | all | tunnel | mdt }] large-community
large-community-list [exact-match]
show bgp [ipv6 { unicast | multicast | labeled-unicast | all }] large-community
large-community-list [exact-match]
show bgp [all { unicast | multicast | labeled-unicast | all | tunnel }] large-community
large-community-list [exact-match]
show bgp [vpnv4 unicast [rd rd-address]] large-community large-community-list [
exact-match]
show bgp [vrf { vrf-name | all } [{ ipv4 | { unicast | labeled-unicast } | ipv6 unicast }]]
large-community large-community-list [exact-match]
show bgp [vpnv6 unicast [rd rd-address]] large-community large-community-list [
exact-match]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.					
	unicast	(Optional) Specifies unicast address prefixes.					
	multicast	(Optional) Specifies multicast address prefixes.					
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.					
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.					
	tunnel	(Optional) Specifies tunnel address prefixes.					
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.					
	ipv6	(Optional) Specifies IP Version 6 address prefixes.					
	all	(Optional) For address family, specifies prefixes for all address families.					
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.					
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.					
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.					
	vrf-name	(Optional) Name of a VRF.					
	all	(Optional) For VRF, specifies all VRFs.					
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.					
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.					

	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address	(Optional) Specifies VPNv6 unicast address families.					
	large-community	Indicates that only routes with large community-list is displayed.	Indicates that only routes with large communities specified by large-community-list is displayed.They are specified as three non negative decimal integers separated by colons. For example, 1:2:3. Each integer is stored in 32 bits. The possible range for each integer is 0 to 4294967295.(Optional) Displays those routes that have communities exactly matching the specified communities.					
	large-community-list	colons. For example, 1:2:3. Each integer is st

show bgp l2vpn vpls

N

To display L2VPN information on BGP summary, routes for a specified bridge group domain, advertised routes, routes with a specific route distinguisher, BGP neighbor connections, nexthops, and BGP process, use the **show bgp l2vpn vpls** command in XR EXEC mode.

	Note This feature is not supported.
	show bgp l2vpn vpls {summary rd neighbors nexthops bdomain advertised process}
Syntax Description	summary Displays the summary of BGP neighbor status.
	rd Displays routes with a specific route distinguisher.
	neighbors Displays detailed information on TCP and BGP neighbor connections.
	nexthops Shows nexthop related information.
	bdomain Displays routes for a specified Bridge Group:domain
	advertised Shows advertised routes.
	process Displays BGP process information.
Command Default	No default behavior or values
Command Modes	XR EXEC mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operation ID
	bgp read

Example

The following example is sample output from the show bgp l2vpn vpls command:

show bgp neighbor-group

To display information about the Border Gateway Protocol (BGP) configuration for neighbor groups, use the **show bgp neighbor-group** command in XR EXEC mode.

show bgp neighbor-group group-name {configuration [defaults] [nvgen] | inheritance | users}

Syntax Description	group-name	Name of the address family group to display.			
	configuration	(Optional) Displays the effective configuration for the neighbor group, including any configuration inherited by this neighbor group.			
	defaults	(Optional) Displays all configuration, including default configuration.			
	nvgen	(Optional) Displays output in show running-config command output.			
		If the defaults keyword is also specified, the output is not suitable for cutting and pasting into a configuration session.			
	inheritance	Displays the af-groups, session groups, and neighbor groups from which this neighbor group inherits configuration.			
	users	Displays the neighbors and neighbor groups that inherit configuration from this neighbor group.			
Command Default	No default beh	avior or value

  use af-group group2
  weight 100
```

The following is sample output from the **show bgp neighbor-group** command with the **configuration** keyword:

```
neighbor-group group1
remote-as 1982
                                   []
timers 30 90
                                   [n:group2 n:group3]
dmzlink-bw
                                   [n:group2 n:group3 s:group3]
 address-family ipv4 unicast
                                   []
 capability orf prefix both
                                   [n:group2 a:group2]
 remove-private-AS
                                   [n:group2 a:group2 a:group3]
  send-community-ebgp
                                   [n:group2 a:group2]
                                   [n:group2 a:group2]
  send-extended-community-ebgp
                                   [n:group2 a:group2 a:group3]
  soft-reconfiguration inbound
  weight 100
                                   [n:group2]
```

RP/0/RP0/CPU0:router# show bgp neighbor-group group1 configuration

The configuration source is shown to the right of each command. In the output, the **remote-as** command is configured directly on neighbor group group1, and the **send-community-ebgp** command is inherited from neighbor group group2, which in turn inherits the setting from af-group group2.

The following is sample output from the **show bgp neighbor-group** command with the **users** keyword. This output shows that the group1 neighbor group inherits session (address family-independent configuration parameters) from the group2 neighbor group. The group1 neighbor group also inherits IPv4 unicast configuration parameters from the group2 neighbor group:

RP/0/RP0/CPU0:router# show bgp neighbor-group group2 users
Session: n:group1
IPv4 Unicast: n:group1

The following is sample output from the **show bgp neighbor-group** command with the **inheritance** keyword. This output shows that the specified neighbor group group1 inherits session (address family-independent configuration) from neighbor group group2, which inherits its own session from neighbor group group3. Neighbor group group3 inherited its session from session group group3. It also shows that the group1 neighbor-group inherits IPv4 unicast configuration parameters from the group2 neighbor group, which in turn inherits them from the group2 af-group, which itself inherits them from the group3 af-group:

```
RP/0/RP0/CPU0:router# show bgp neighbor-group group1 inheritance
```

Session: n:group2 n:group3 s:group3 IPv4 Unicast: n:group2 a:group3 a:group3

This table describes the significant fields shown in the display.

Field	Description
[]	Configures the command directly on the specified address family group.
s:	Indicates the name that follows is a session group.
a:	Indicates the name that follows is an address family group.
n:	Indicates the name that follows is a neighbor group.
[dflt]	Indicates the setting is not explicitly configured or inherited, and the default value for the setting is used. This field may be shown when the defaults keyword is specified.
<not set></not 	Indicates that the default is for the setting to be disabled. This field may be shown when the defaults keyword is specified.

Table 16: show bgp neighbor-group Field Descriptions

show bgp neighbors

To display information about Border Gateway Protocol (BGP) connections to neighbors, use the **show bgp neighbors** command in XR EXEC mode.

	show bgp n	-statistics received {prefix-filter routes} routes}] [standby] eighbors ip-address [{configuration [defaults] nvgen inheritance}][standby]		
Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.		
	unicast	(Optional) Specifies unicast address prefixes.		
	ipv6	(Optional) Specifies IP Version 6 address prefixes.		
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.		
	in	(Optional) Displays BGP inbound messages.		
	out	(Optional) Displays BGP outbound messages.		
	standby	Displays standby BGP information.		
Command Default	If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.			
Command Modes	XR EXEC mode			
Command History	Release	Modification		
	Release 7.9.1	This command displays the slow peer configuration state and slow peer detection or processing information.		
	Release 6.0	This command was introduced.		

Usage Guidelines

Note The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify which routing table should be examined. If the **all**

keyword is specified for address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp neighbors** command to display detailed information about all neighbors or a specific neighbor. Use the **performance-statistics** keyword to display information about the work related to specific neighbors done by the BGP process.

Use the **show bgp neighbors** command with the *ip-address* **received prefix-filter** argument and keyword to display the Outbound Route Filter (ORF) received from a neighbor.

Use the **advertised-routes** keyword to display a summary of the routes advertised to the specified neighbor.

Use the **dampened-routes** keyword to display routes received from the specified neighbor that have been suppressed due to dampening. For more details, see the **show bgp dampened-paths** command.

To display information about flapping routes received from a neighbor, use the **flap-statistics** keyword. For more details, see the **show bgp flap-statistics** command.

To display the routes received from a neighbor, use the **routes** keyword. For more details, see the **show bgp** command.

Use the **show bgp neighbor** command with the *ip-address* **configuration** argument and keyword to display the effective configuration of a neighbor, including configuration inherited from session groups, neighbor groups, or af-groups through application of the **use** command. Use the **defaults** keyword to display the value of all configurations for the neighbor, including default configuration. Use the **nvgen** keyword to display configuration output format of the **show running-config** command. Output in this format is suitable for cutting and pasting into a configuration session. Use the **show bgp neighbors** command with the *ip-address* **inheritance** argument and keyword to display the session groups, neighbor groups, and af-groups from which the specified neighbor inherits configuration.

Task ID	Task ID	Operations

bgp read

The following is the sample output from the **show bgp neighbors** command with the *ip-address* and **configuration** argument and keyword to display graceful maintenance feature attributes:

RP/0/0/CPU0:R1#show bgp neighbor 12.12.12.5 Graceful Maintenance locally active, Local Pref=45, AS prepends=3 . . . For Address Family: IPv4 Unicast GSHUT Community attribute sent to this neighbor ***** RP/0/0/CPU0:R1#show bgp neighbor 12.12.12.5 configuration Mon Feb 2 14:30:41.042 PST neighbor 12.12.12.5 remote-as 1 [] graceful-maintenance 1 ٢1 gr-maint local-preference 45 [] gr-maint as-prepends 3 [] gr-maint activate []

RP/0/RP0/CPU0:router# show bgp neighbors 3.3.3.3

Examples

The following is sample output from the **show bgp neighbors** command with BGP Persistence or long lived graceful restart (LLGR) status:

BGP neighbor is 3.3.3.3 Remote AS 30813, local AS 30813, internal link Remote router ID 3.3.3.3 BGP state = Established, up for 2d19h NSR State: NSR Ready BFD enabled (initializing) Last read 00:00:01, Last read before reset 2d19h Hold time is 180, keepalive interval is 60 seconds Configured hold time: 180, keepalive: 60, min acceptable hold time: 3 Last write 00:00:03, attempted 19, written 19 Second last write 00:01:03, attempted 19, written 19 Last write before reset 2d19h, attempted 19, written 19 Second last write before reset 2d19h, attempted 19, written 19 Last write pulse rcvd Nov 19 09:24:38.035 last full not set pulse count 66013 Last write pulse rcvd before reset 2d19h Socket not armed for io, armed for read, armed for write Last write thread event before reset 2d19h, second last 2d19h Last KA expiry before reset 2d19h, second last 2d19h Last KA error before reset 00:00:00, KA not sent 00:00:00 Last KA start before reset 2d19h, second last 2d19h Precedence: internet Non-stop routing is enabled Graceful restart is enabled Restart time is 120 seconds Stale path timeout time is 150 seconds Multi-protocol capability received Neighbor capabilities: Route refresh: advertised (old + new) and received (old + new) Graceful Restart (GR Awareness): advertised and received 4-byte AS: advertised and received Address family IPv4 Unicast: advertised and received Address family VPNv4 Unicast: advertised and received Address family VPNv6 Unicast: advertised and received Address family RT Constraint: advertised and received Received 51634 messages, 0 notifications, 0 in queue Sent 33017 messages, 2 notifications, 0 in queue Minimum time between advertisement runs is 0 secs For Address Family: IPv4 Unicast BGP neighbor version 204 Update group: 0.2 Filter-group: 0.2 No Refresh request being processed AF-dependent capabilities: Graceful Restart capability advertised Local restart time is 120, RIB purge time is 600 seconds Maximum stalepath time is 150 seconds Graceful Restart capability received Remote Restart time is 120 seconds Neighbor preserved the forwarding state during latest restart Route refresh request: received 0, sent 0 Policy for incoming advertisements is pass Policy for outgoing advertisements is pass 0 accepted prefixes, 0 are bestpaths Cumulative no. of prefixes denied: 0. The following is sample output from the **show bgp neighbors** command:

RP/0/RP0/CPU0:router# show bgp neighbors 10.0.101.1

```
BGP neighbor is 10.0.101.1, remote AS 2, local AS 1, external link
Description: routem neighbor
Remote router ID 10.0.101.1
BGP state = Established, up for 00:00:56
TCP open mode: passive only
BGP neighbor is 1.1.1.2
Remote AS 300, local AS 100, external link
Remote router ID 0.0.0
BGP state = Idle (LC/FIB for the neighbor in reloading)
Last read 00:00:00, Last read before reset 00:05:12
```

```
Hold time is 180, keepalive interval is 60 seconds
Configured hold time: 180, keepalive: 60, min acceptable hold time: 3
BFD enabled (session initializing)
Last read 00:00:55, hold time is 180, keepalive interval is 60 seconds
DMZ-link bandwidth is 1000 Mb/s
Neighbor capabilities:
  Route refresh: advertised
   4-byte AS: advertised and received
  Address family IPv4 Unicast: advertised and received
  Address family IPv4 Multicast: advertised and received
Received 119 messages, 0 notifications, 0 in queue
Sent 119 messages, 22 notifications, 0 in queue
Minimum time between advertisement runs is 60 seconds
For Address Family: IPv4 Unicast
BGP neighbor version 137
Update group: 1.3
Community attribute sent to this neighbor
AF-dependant capabilities:
  Outbound Route Filter (ORF) type (128) Prefix-list:
    Send-mode: advertised
    Receive-mode: advertised
Route refresh request: received 0, sent 0
Policy for incoming advertisements is pass-all
Policy for outgoing advertisements is pass-all
5 accepted prefixes, 5 are bestpaths
Prefix advertised 3, suppressed 0, withdrawn 0, maximum limit 1000000
Threshold for warning message 75%
For Address Family: IPv4 Multicast
BGP neighbor version 23
Update group: 1.2
Route refresh request: received 0, sent 0
Policy for incoming advertisements is pass-all
Policy for outgoing advertisements is pass-all
2 accepted prefixes, 2 are bestpaths
Prefix advertised 0, suppressed 0, withdrawn 0, maximum limit 131072
Threshold for warning message 75%
Connections established 9; dropped 8
Last reset 00:02:10, due to User clear requested (CEASE notification sent - administrative
reset)
Time since last notification sent to neighbor: 00:02:10
Error Code: administrative reset
Notification data sent:
   None
```

This table describes the significant fields shown in the display.

Tabl	e 1	17:	show	bgp	neigh	bors	Field	d E	Description	s
------	-----	-----	------	-----	-------	------	-------	-----	-------------	---

Field	Description
BGP neighbor	IP address of the BGP neighbor and its autonomous system number. If the neighbor is in the same autonomous system as the router, then the link between them is internal; otherwise, it is considered external.
Description	Neighbor specific description.

I

Field	Description
remote AS	• Number of the autonomous system to which the neighbor belongs.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535
	 Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
local AS	Autonomous system number of the local system.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
internal link	Neighbor is an internal BGP peer.
external link	Neighbor is an external BGP peer.
Administratively shut down	Neighbor connection is disabled using the shutdown command.
remote router ID	Router ID (an IP address) of the neighbor.
Neighbor under common administration	Neighbor is internal or a confederation peer.
BGP state	Internal state of this BGP connection.
BFD enabled	Status of bidirectional forwarding detection.
TCP open mode	TCP mode used in establishing the BGP session. The following valid TCP mode are supported:
	 default—Accept active/passive connections passive-only—Accept only passive connections active-only—Accept only active connections initiated by the router
Last read	Time since BGP last read a message from this neighbor.
hold time	Hold time (in seconds) used on the connection with this neighbor.
keepalive interval	Interval for sending keepalives to this neighbor.
DMZ-link bandwidth	DMZ link bandwidth for this neighbor.

Field	Description
Neighbor capabilities	BGP capabilities advertised and received from this neighbor. The following valid BGP capabilities are supported:
	• Multi-protocol
	• Route refresh
	• Graceful restart
	• Outbound Route Filter (ORF) type (128) Prefix
Route refresh	Indicates that the neighbor supports dynamic soft reset using the route refresh capability.
4-byte AS	Indicates that the neighbor supports the 4-byte AS capability.
Address family	Indicates that the local system supports the displayed address family capability. If "received" is displayed, the neighbor also supports the displayed address family.
Received	Number of messages received from this neighbor, the number of notification messages received and processed from this neighbor, and the number of messages that have been received, but not yet processed.
Sent	Number of messages sent to this neighbor, the number of notification messages generated to be sent to this neighbor, and the number of messages queued to be sent to this neighbor.
Minimum time between advertisement runs	Advertisement interval (in seconds) for this neighbor.
For Address Family	Information that follows is specific to the displayed address family.
BGP neighbor version	Last version of the BGP database that was sent to the neighbor for the specified address family.
Update group	Update group to which the neighbor belongs.
Route reflector client	Indicates that the local system is acting as a route reflector for this neighbor.
Inbound soft reconfiguration allowed	Indicates that soft reconfiguration is enabled for routes received from this neighbor.
	Note If the neighbor has route refresh capability, then soft configuration received-only routes are not stored by the local system unless "override route refresh" is displayed.
eBGP neighbor with no inbound or outbound policy: defaults to drop	Indicates that the neighbor does not have an inbound or outbound policy configured using the route-policy (BGP) command. Hence, no routes are accepted from or advertised to this neighbor.

I

Field	Description
Private AS number removed from updates to this neighbor	Indicates that remove-private-AS is configured on the specified address family for this neighbor.
NEXT_HOP is always this router	Indicates that next-hop-self is configured on the specified address family for this neighbor.
Community attribute sent to this neighbor	Indicates that send-community-ebgp is configured on the specified address family for this neighbor.
Extended community attribute sent to this neighbor	Indicates that send-extended-community-ebgp is configured on the specified address family for this neighbor.
Default information originate	Indicates that default-originate is configured on the specified address family for this neighbor, together with the policy used, if one was specified in the default-originate configuration. An indication of whether the default route has been advertised to the neighbor is also shown.
AF-dependant capabilities	BGP capabilities that are specific to a particular address family. The following valid AF-dependent BGP capabilities are supported:
	• route refresh capability
	• route refresh capability OLD value
Outbound Route Filter	Neighbor has the Outbound Route Filter (ORF) capability for the specified address family. Details of the capabilities supported are also shown:
	Send-mode—"advertised" is shown if the local system can send an outbound route filter to the neighbor. "received" is shown if the neighbor can send an outbound route filter to the local system.
	Receive-mode—"advertised" is shown if the local system can receive an outbound route filter from the neighbor. "received" is shown if the neighbor can receive an outbound route filter from the local system.
Graceful Restart Capability	Indicates whether graceful restart capability has been advertised to and received from the neighbor for the specified address family.
Neighbor preserved the forwarding state during latest restart	Indicates that when the neighbor connection was last established, the neighbor indicated that it preserved its forwarding state for the specified address family.
Local restart time	Restart time (in seconds) advertised to this neighbor.
RIB purge time	RIB purge time (in seconds) used for graceful restarts.
Maximum stalepath time	Maximum time (in seconds) a path received from this neighbor may be marked as stale if the neighbor restarts.
Remote Restart time	Restart time received from this neighbor.
Route refresh request	Number of route refresh requests sent and received from this neighbor.

Field	Description			
Outbound Route Filter (ORF)	"sent" indicates that an outbound route filter has been sent to this neighbor. "received" indicates that an outbound route filter has been received from this neighbor.			
	Note A received outbound route filter may be displayed using the show bgp neighbors command with the received prefix-filter keywords.			
First update is deferred until ORF or ROUTE-REFRESH is received	If the local system advertised the receive capability and the neighbor has advertised send capability, no updates are generated until specifically asked by the neighbor (using a ROUTE-REFRESH or ORF with immediate request).			
Scheduled to send the Prefix-list filter	Indicates the local system is due to send an outbound route filter request in order to receive updates from the neighbor.			
Inbound path policy	Indicates if an inbound path policy is configured.			
Outbound path policy	Indicates if an outbound path policy is configured.			
Incoming update prefix filter list	Indicates a prefix list is configured to filter inbound updates from the neighbor.			
Default weight	Default weight for routes received from the neighbor.			
Policy for incoming advertisements	Indicates a route policy is configured to be applied to inbound updates from the neighbor.			
Policy for outgoing advertisements	Indicates a route policy is configured to be applied to outbound updates to the neighbor.			
Туре	Indicates whether the condition map selects routes that should be advertised, or routes that should not be advertised:			
	Exist—Routes advertised if permitted by the condition route map.			
	Non-exist—Routes advertised if denied by the condition route map.			
accepted prefixes	Number of prefixes accepted.			
Prefix advertised	Number of prefixes advertised to the neighbor during the lifetime of the current connection with the neighbor.			
suppressed	Number of prefix updates that were suppressed because no transitive attributes changed from one best path to the next.			
	Note Update suppression occurs only for external BGP neighbors.			
withdrawn	Number of prefixes withdrawn from the neighbor during the lifetime of the current connection with the neighbor.			

Field	Description
maximum limit	Maximum number of prefixes that may be received from the neighbor. If "(warning-only)" is displayed, a warning message is generated when the limit is exceeded, otherwise the neighbor connection is shut down when the limit is exceeded.
Threshold for warning message	Percentage of maximum prefix limit for the neighbor at which a warning message is generated.
Connections established	Number of times the router has established a BGP peering session with the neighbor.
dropped	Number of times that a good connection has failed or been taken down.
Last reset due to	Reason that the connection with the neighbor was last reset.
Time since last notification sent to neighbor	Amount of time since a notification message was last sent to the neighbor.
Error Code	Type of notification that was sent. The notification data, if any, is also displayed.
Time since last notification received from neighbor	Amount of time since a notification message was last received from the neighbor.
Error Code	Type of notification that was received. The notification data received, if any, is also displayed
External BGP neighbor may be up to <n> hops away</n>	Indicates ebgp-multihop is configured for the neighbor.
External BGP neighbor not directly connected	Indicates that the neighbor is not directly attached to the local system.
Notification data sent:	Data providing more details on the error along with the error notification sent to the neighbor.

The following is sample output from the **show bgp neighbors** command with the **advertised-routes** keyword:

Router# show bgp neighbors 172.20.16.178 routes

```
BGP router identifier 172.20.16.181, local AS number 1
BGP main routing table version 27
BGP scan interval 60 secs

This table describes the significant fields shown in the display.

Table 18: show bgp neighbors routes Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i-Path was learned by an internal BGP (iBGP) session.

Field	Description				
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:				
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.				
	e-Path originated from an Exterior Gateway Protocol (EGP).				
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.				
Network	IP prefix and prefix length for a network.				
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BC route to this network.				
Metric	Value of the interautonomous system metric, otherwise known as the Multi Ex Discriminator (MED) metric.				
LocPrf	Local preference value. This is used to determine the preferred exit point from t local autonomous system. It is propagated throughout the local autonomous system				
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.				
Path	Autonomous system path to the destination network. At the end of the path is th origin code for the path.				

The following is sample output from the **show bgp neighbors** command with the **dampened-routes** keyword:

Router# show bgp neighbors 10.0.101.1 flap-statistics

```
BGP router identifier 10.0.0.5, local AS number 1
BGP main routing table version 48
Dampening enabled
BGP scan interval 60 secs
Status codes: s suppressed, d damped, h history, * valid, > best
             i - internal, S stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Table 19: show bgp neighbors dampened-routes Field Descriptions

Field	Description				
BGP router identifier	BGP identifier for the local system.				
local AS number	Autonomous system number for the local system.				
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.				
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.				
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.				
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):				
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.				
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.				
	*—Path is valid.				
	The second character may be (in order of precedence):				
	>—Path is the best path to use for that network.				
	d—Path is dampened.				
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.				
	The third character may be:				
	i—Path was learned by an internal BGP (iBGP) session.				
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:				
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.				
	e-Path originated from an Exterior Gateway Protocol (EGP).				
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.				
Network	IP prefix and prefix length for a network.				
From	Neighbor from which the route was received.				
Reuse	Time (in hours:minutes:seconds) after which the path is made available.				

Field	Description
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

The following is sample output from the **show bgp neighbors** command with the **flap-statistics** keyword:

```
Router# show bgp neighbors 10.0.101.2 performance-statistics
```

```
BGP neighbor is 10.0.101.2, remote AS 1
Read 3023 messages (58639 bytes) in 3019 calls (time spent: 1.312 secs)
Read throttled 0 times
Processed 3023 inbound messages (time spent: 0.198 secs)
Wrote 58410 bytes in 6062 calls (time spent: 3.041 secs)
Processing write list: wrote 0 messages in 0 calls (time spent: 0.000 secs)
Processing write queue: wrote 3040 messages in 3040 calls (time spent: 0.055 secs)
Received 3023 messages, 0 notifications, 0 in queue
Sent 3040 messages, 0 notifications, 0 in queue
```

This table describes the significant fields shown in the display.

Field	Description			
BGP route identifier	BGP identifier for the local system.			
local AS number	Autonomous system number for the local system.			
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.			
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.			
BGP scan interval	Interval (in seconds) between when the BGP process scans for the specified address family and subaddress family.			

Field	Description				
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):				
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.				
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.				
	*—Path is valid.				
	The second character may be (in order of precedence):				
	d—Path is dampened.				
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.				
	The third character may be:				
	i-Path was learned by an internal BGP (iBGP) session.				
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:				
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network command.				
	e-Path originated from an Exterior Gateway Protocol (EGP).				
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.				
Network	IP prefix and prefix length for a network.				
From	IP address of the peer that advertised this route.				
Flaps	Number of times the route has flapped.				
Duration	Time (in hours:minutes:seconds) since the router noticed the first flap.				
Reuse	Time (in hours:minutes:seconds) after which the path is made available.				
Path	Autonomous system path to reach the destination network.				

The following is sample output from the **show bgp neighbors** command with the **performance-statistics** keyword:

```
Router# show bgp neighbors 10.0.101.2 performance-statistics
BGP neighbor is 10.0.101.2, remote AS 1
Read 3023 messages (58639 bytes) in 3019 calls (time spent: 1.312 secs)
Read throttled 0 times
Processed 3023 inbound messages (time spent: 0.198 secs)
Wrote 58410 bytes in 6062 calls (time spent: 3.041 secs)
Processing write list: wrote 0 messages in 0 calls (time spent: 0.000 secs)
```

Processing write queue: wrote 3040 messages in 3040 calls (time spent: 0.055 secs) Received 3023 messages, 0 notifications, 0 in queue Sent 3040 messages, 0 notifications, 0 in queue

This table describes the significant fields shown in the display.

Table 21: show bgp neighbors performance-statistics Field Descriptions

Field	Description					
Read	Indicates the number of messages received from the neighbor, the total size of received messages, the number of read operations performed, and the real time spen (in seconds) by the process performing read operations for this neighbor.					
Read throttled	Number of times that reading from the TCP connection to this neighbor has been throttled. Throttling is due to a backlog of messages that have been read but not processed.					
inbound messages	Number of read messages that have been processed, and the real time spent processing inbound messages for this neighbor.					
Wrote	Amount of data that has been sent to this neighbor, number of write operations performed, and the real time spent by the process performing write operations for this neighbor.					
Processing write list	Number of messages written from the write list to this neighbor, number of times the write list has been processed, and real time spent processing the write list.					
	Note Write lists typically contain only update messages.					
Processing write queue	Number of messages written from the write queue to this neighbor, number of times the write queue has been processed, and real time spent processing the write queue					
Received	Number of messages received from this neighbor, number of notification messages received and processed from this neighbor, and number of messages that have been received, but not yet processed.					
Sent	Number of messages sent to this neighbor, number of notification messages generated to be sent to this neighbor, and number of messages queued to be sent to this neighbor.					

The following is sample output from the **show bgp neighbors** command with the **configuration** keyword:

Router# show bgp neighbors 10.0.101.1 configuration

```
neighbor 10.0.101.1
remote-as 2
                               []
bfd fast-detect
                               []
address-family ipv4 unicast
                               []
 policy pass-all in
                               []
 policy pass-all out
                               []
 address-family ipv4 multicast []
 policy pass-all in
                               []
 policy pass-all out
                               []
```

This table describes the significant fields shown in the display.

Table 22: show bgp neighbors configuration Field Descriptions

Field Description	
neighbor	IP address configuration of the neighbor.
remote-as	Remote autonomous system configured on the neighbor.
bfd fast-detect	BFD parameter configured on the neighbor.
address-family	Address family and subsequent address family configured on the router.
route-policy pass-all in	Route policy configured for inbound updates.
route-policy pass-all out	Route policy configured for outbound updates.

The following sample output shows sample output from **show bgp neighbors** command with additional paths send and receive capabilities advertised to neighbors:

```
BGP neighbor is 80.0.0.30
 Remote AS 100, local AS 100, internal link
Remote router ID 33.33.33.33
 BGP state = Established, up for 19:54:12
 NSR State: None
 Last read 00:00:25, Last read before reset 19:54:54
 Hold time is 180, keepalive interval is 60 seconds
 Configured hold time: 180, keepalive: 60, min acceptable hold time: 3
 Last write 00:00:02, attempted 19, written 19
 Second last write 00:01:02, attempted 19, written 19
 Last write before reset 19:54:54, attempted 29, written 29
 Second last write before reset 19:54:59, attempted 19, written 19
 Last write pulse rcvd Nov 11 12:58:03.838 last full not set pulse count 2407
 Last write pulse rcvd before reset 19:54:54
 Socket not armed for io, armed for read, armed for write
 Last write thread event before reset 19:54:54, second last 19:54:54
 Last KA expiry before reset 00:00:00, second last 00:00:00
 Last KA error before reset 00:00:00, KA not sent 00:00:00
 Last KA start before reset 19:54:54, second last 19:54:59
 Precedence: internet
 Non-stop routing is enabled
 Graceful restart is enabled
 Restart time is 120 seconds
 Stale path timeout time is 360 seconds
                             Adv

Minimum time between advertisement runs is 0 secs
For Address Family: IPv4 Unicast
BGP neighbor version 13
Update group: 0.9
NEXT HOP is always this router
AF-dependant capabilities:
  Graceful Restart capability advertised and received
    Neighbor preserved the forwarding state during latest restart
    Local restart time is 120, RIB purge time is 600 seconds
    Maximum stalepath time is 360 seconds
    Remote Restart time is 120 seconds
  Additional-paths Send: advertised and received
  Additional-paths Receive: advertised and received
Route refresh request: received 0, sent 0
0 accepted prefixes, 0 are bestpaths
Prefix advertised 10, suppressed 0, withdrawn 0, maximum limit 524288
Threshold for warning message 75%
AIGP is enabled
An EoR was received during read-only mode
Last ack version 13, Last synced ack version 0
Outstanding version objects: current 0, max 1
Additional-paths operation: Send and Receive
For Address Family: IPv4 Labeled-unicast
BGP neighbor version 13
Update group: 0.4 (Update Generation Throttled)
AF-dependant capabilities:
  Graceful Restart capability advertised and received
    Neighbor preserved the forwarding state during latest restart
    Local restart time is 120, RIB purge time is 600 seconds
    Maximum stalepath time is 360 seconds
    Remote Restart time is 120 seconds
  Additional-paths Send: received

This sample output from the **show bgp neighbor** command with the **configuration** keyword displays TCP MSS configuration:

Router#show bgp neighbor 10.0.0.2 configuration

neighbor 10.0.0.2
remote-as 1 []
tcp-mss 400 [n:n1]
address-family IPv4 Unicast []

The sample output from the **show bgp neighbor** with the **detail** keyword displays the neighbor address-family slow peer configuration state and slow peer detection or processing information.

```
Router# show bgp neighbors 20.1.154.1 detail
Thu Dec 1 02:40:40.301 UTC
BGP neighbor is 20.1.154.1
Remote AS 1, local AS 1, internal link
Remote router ID 20.1.154.1
Cluster ID 1.1.1.1
BGP state = Established, up for 04:31:32
Previous State: Active
```

```
Last Received Message: Update
  NSR State: None
. . .
For Address Family: IPv6 Labeled-unicast
 BGP neighbor version 0
  Update group: 0.2 Filter-group: 0.60 No Refresh request being processed
  Route-Reflector Client
  Inbound soft reconfiguration allowed (override route-refresh)
 AF-dependent capabilities:
   Additional-paths Send: advertised
   Additional-paths Receive: advertised
  Route refresh request: received 0, sent 0
  Slow Peer State: Dynamic
   Detected state: TRUE, Detection threshold: 120
   Detection Count: 3, Recovery Count: 2
   Processing slow peer: FALSE
   Dynamic Trigger Count: 163, Dynamic Process Count: 1
```

Where:

- *Slow Peer State* indicates the effective configuration state (considering both global and neighbor address-family configuration) of neighbor address-family. *Slow Peer State* can be *Static* or *Dynamic* or *Detection-only* or *None*.
- *Detected State* indicates if the slow peer event is triggered for this neighbor address-family. *TRUE* if the neighbor address-family slow peer event is triggered, else *FALSE*.
- *Detection threshold* is the effective threshold configured (considering both global and neighbor address-family configuration) for the neighbor address-family. Threshold is used in determining if the peer (neighbor address-family) is slow.
- *Processing slow peer* indicates slow peer processing state of the neighbor address-family. *TRUE* if neighbor address-family is processed as slow peer else *FALSE*.

show bgp nexthops

To display statistical information about the Border Gateway Protocol (BGP) next hops, use the **show bgp nexthops** command in XR EXEC mode.

show bgp nexthops A.B.C.D.aigp-value[statistics] [speaker speaker-id] [standby]

ipv4	(Optional) Specifies IP Version 4 address prefixes.			
-P · ·	(Optional) specifies if version 4 address prefixes.			
unicast	(Optional) Specifies unicast address prefixes.			
ipv6	(Optional) Specifies IP Version 6 address prefixes.			
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.			
No default beł	avior or value			
XR EXEC mo	de			
Release M	Nodification			
Release 6.0 7	This command was introduced.			
The show bgp nexthops command displays statistical information about next-hop notifications, the time spent processing the notifications, and details about each next-hop that has been registered with the Routing Information Base (RIB).				
The next-hop information is displayed for all active speaker processes in distributed mode. Each speaker displays a set of next-hops that belongs to the prefixes received by the speaker and next hops that belong to best paths that were received by other speaker processes. Use the speaker <i>speaker-id</i> keyword and argument to display information for only the specified speaker process. T he distributed mode must be defined using the distributed speaker command for the speaker keyword to be available.

This table describes the significant fields shown in the display.

Table 23: show bgp vrf all nexthops Field Descriptions

Field	Description
VRF	Name of the VRF.
Total Nexthop Processing Time Spent	Time spent processing trigger delays for critical and noncritical events for the VRF or address family. The time is specified in seconds.

Field	Description			
Maximum Nexthop Processing	Time that has passed since the nexthop notification was received that resulted in spending the maximum amount of processing time for all notifications. Time that has passed since the last nexthop notification was received.			
Last Notification Processing				
IPv4 Unicast is active.	VRF specified output that indicates the IPv4 unicast address family is active within the VRF.			
Nexthop Count	Number of next hops for the VRF or address family.			
Critical Trigger Delay	Configured critical trigger delay.			
Non-critical Trigger Delay	Configured noncritical trigger delay.			
Total Critical Notifications Received	Number of critical notifications received.			
Total Non-critical Notifications Received	Number of noncritical notifications received.			
Bestpaths Deleted After Last Walk	Number of best paths deleted due to the last notification.			
Bestpaths Changed After Last Walk	Number of best paths modified due to the last notification.			
Next Hop	IP address of the next hop.			
Status	Status of the next hop.			
Metric	IGP metric of the next hop.			
Notf	Number of critical and noncritical notifications received.			
LastRIBEvent	When the last notification was received from the RIB.			
RefCount	The number of neighbors or prefixes that refer to the next hop in address family/all format.			
Address Family	Name of the address family.			

show bgp paths

To display all the Border Gateway Protocol (BGP) paths in the database, use the **show bgp paths** command in XR EXEC mode.

show	bgp	paths	[detail]	[debug]	regexp	regular-expression]
------	-----	-------	----------	---------	--------	---------------------

Syntax Description	detail (Optional) Displays detailed attribute information.
	debug(Optional) Displays attribute process ID, hash bucket, and hash chain ID attribute information.
	regexp <i>regular-expression</i> (Optional) Specifies an autonomous system path that matches the regular expression.
Command Default	No default behavior or values
Command Modes	XR EXEC mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the show bgp paths command to display information about AS paths and the associated attributes with which the paths were received.
	If no options are specified, all stored AS paths are displayed with the number of routes using each path.
	Note The AS path information is stored independently of the address family, making it possible that routes from different address families could be using the same path.
	Use the <i>regular-expression</i> argument to limit the output to only those paths that match the specified regular expression. See the for information on regular expressions.
	Use the detail keyword to display detailed information on the attributes stored with the AS path.
Task ID	Task Operations ID
	bgp read
Examples	The following is sample output from the show bgp paths command:
	RP/0/RP0/CPU0:router# show bgp paths detail
	Proc AttributesRefcountMetric PathSpk 0 ORG AS LOCAL70 i

Spk 0	ORG	AS LOCAL COMM EXTCOMM	3	0	21 i		
Spk 0	MET	ORG AS	3	55	2 i		
Spk 0	ORG	AS	3	0	2 10	11	i
Spk 0	ORG	AS COMM	3	0	2 10	11	i
Spk 0	MET	ORG AS ATOM	3	2	23	4 ?	
Spk 0	MET	ORG AS	3	1	23	4 e	
Spk 0	MET	ORG AS	3	0	23	4 i	

This table describes the significant fields shown in the display.

Table 24: show bgp paths Field Descriptions

Field	Description
Proc	ID of the process in which the path is stored. This is always "Spk 0."
Attributes	Attributes that are present. The following may appear:
	MET —Multi Exit Discriminator (MED) attribute is present.
	ORG—Origin attribute is present.
	AS—AS path attribute is present.
	LOCAL—Local preference attribute is present.
	AGG—Aggregator attribute is present.
	COMM—Communities attribute is present.
	ATOM—Atomic aggregate attribute is present.
	EXTCOMM—Extended communities attribute is present.
NeighborAS	Autonomous system number of the neighbor, or 0, if the path information originated locally.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Refcount	Number of routes using a path.
Metric	Value of the interautonomous system metric, otherwise known as the MED metric.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.

show bgp policy

To display information about Border Gateway Protocol (BGP) advertisements under a proposed policy, use the **show bgp policy** command in XR EXEC mode.

show bgp policy

Syntax Description	ipv4	(Optional) Specifies IP Versi	on 4 address prefixes.	
	unicast	(Optional) Specifies unicast	address prefixes.	
	ipv6	(Optional) Specifies IP Vers	on 6 address prefixes.	
	ipv6 unicast	(Optional) For VRF, specifie	s IPv6 unicast address families.	
Command Default	specified. If no	o address family or subaddress	ed if the neighbor <i>ip-address</i> family is specified, the default and set default-safi commands a	address family and subaddress
Command Modes	XR EXEC mo	ode		
Command History	Release	Modification		
	Release 6.0	This command was introduced.		
Usage Guidelines	-			

Note

The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp policy** command to display routes that would be advertised to neighbors under a proposed policy. Unlike in the **show bgp advertised** command, the information displayed reflects any modifications made to the routes when executing the specified policy.

Use the **neighbor** keyword to limit the output to routes advertised to a particular neighbor. Use the **sent-advertisements** keyword to change the output in two ways:

• If a policy is not specified explicitly, any policy configured on the neighbor (using the **route-policy** (**BGP**) command) is executed before displaying the routes.

• Only routes that have already been advertised to the neighbor (and not withdrawn) are displayed. Routes that have not yet been advertised are not displayed.

Use the summary keyword to display abbreviated output.

Task ID	Task ID	Operations
	bgp	read

Examples

The following is sample output from the **show bgp policy** command with the **summary** keyword in XR EXEC mode:

RP/0/RP0/CPU0:router# show bgp policy summary

Network 172.16.1.0/24	Next Hop 10.0.101.1	From 10.0.101.1	Advertised to 10.0.101.2 10.0.101.3
172.17.0.0/16	0.0.0.0	Local	10.0.101.1 10.0.101.2 10.0.101.3

This table describes the significant fields shown in the display.

Table 25: show bgp policy summary Field Descriptions

Field	Description
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
From	IP address of the peer that advertised this route.
Local	Indicates the route originated on the local system.
Local Aggregate	Indicates the route is an aggregate created on the local system.
Advertised to	Indicates the neighbors to which this route was advertised.

The following is sample output from the show bgp policy command in XR EXEC mode:

RP/0/RP0/CPU0:router# show bgp policy

```
aspath:
  Attributes after outbound policy was applied:
   next hop: 10.4.0.1

```

This table describes the significant fields shown in the display.

Table 26: show bgp policy Field Descriptions

Field	Description
Is advertised to	IP address of the peer to which this route is advertised. If the route is advertised to multiple peers, information is shown separately for each peer.
neighbor	IP address of the peer that advertised this route, or one of the following:
	Local—Route originated on the local system.
	Local Aggregate—Route is an aggregate created on the local system.
neighbor router id	BGP identifier for the peer, or the local system if the route originated on the local system.
Not advertised to any peer	Indicates the no-advertise well-known community is associated with this route. Routes with this community are not advertised to any BGP peers.
Not advertised to any EBGP peer	Indicates the no-export well-known community is associated with this route. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation as the local router.
Not advertised outside the local AS	Indicates the local-AS well-known community is associated with this route. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
(Received from a RR-client)	Path was received from a route reflector client.
(received-only)	Path is not used for routing purposes. It is used to support soft reconfiguration, and records the path attributes before inbound policy was applied to a path received from a peer. A path marked "received-only" indicates that either the path was dropped by inbound policy, or that a copy of path information was created and then modified for routing use.
(received & used)	Indicates that the path is used both for soft reconfiguration and routing purposes. A path marked "(received & used)", implies the path information was not modified by inbound policy.
valid	Path is valid.
redistributed	Path is locally sourced through redistribution.
aggregated	Path is locally sourced through aggregation.
local	Path is locally sourced through the network command.
confed	Path was received from a confederation peer.
best	Path is selected as best.

Field	Description
multipath	Path is one of multiple paths selected for load-sharing purposes.
dampinfo	Indicates dampening information:
	Penalty—Current penalty for this path.
	Flapped—Number of times the route has flapped.
	In—Time (hours:minutes:seconds) since the network first flapped.
	Reuse in—Time (hours:minutes:seconds) after which the path is available. This field is displayed only if the path is currently suppressed.
Attributes after inbound policy was applied	Displays attributes associated with the received route, after any inbound policy has been applied.
	AGG—Aggregator attribute is present.
	AS—AS path attribute is present.
	ATOM—Atomic aggregate attribute is present.
	COMM—Communities attribute is present.
	EXTCOMM—Extended communities attribute is present.
	LOCAL—Local preference attribute is present.
	MET—Multi Exit Discriminator (MED) attribute is present.
	next hop—IP address of the next system used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
	ORG—Origin attribute is present.
origin	Origin of the path:
	IGP—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	EGP—Path originated from an Exterior Gateway Protocol.
	incomplete—Origin of the path is not clear; in example, a route that is redistributed into BGP from an IGP.
neighbor as	First autonomous system (AS) number in the AS path.
aggregator	Indicates that the path was received with the aggregator attribute. The AS number and router-id of the system that performed the aggregation are shown.
metric	Value of the interautonomous system metric, otherwise known as the MED metric.
localpref	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system
aspath	AS path associated with the route.

Field	Description
community	Community attributes associated with the path. Community values are displayed in AA:NN format, except for the following well-known communities:
	Local-AS—Community with value 4294967043 or hex 0xFFFFFF03. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
	no-advertise—Community with value 4294967042 or hex 0xFFFFF02. Routes with this community value are not advertised to any BGP peers.
	no-export—Community with value 4294967041 or hex 0xFFFFF61. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation as the local router.
Extended community	Extended community attributes associated with the path. For known extended community types, the following codes may be displayed:
	RT—Route target community
	SoO—Site of Origin community
	LB—Link Bandwidth community
Originator	Router ID of the originating router when route reflection is used.
Cluster lists	Router ID or cluster ID of all route reflectors through which the route has passed.
Attributes after outbound policy was	Displays attributes associated with the received route, after any outbound policy has been applied.
applied	AGG—Aggregator attribute is present.
	AS—AS path attribute is present.
	ATOM—Atomic aggregate attribute is present.
	COMM—Communities attribute is present.
	EXTCOMM—Extended communities attribute is present.
	LOCAL—Local preference attribute is present.
	MET—Multi Exit Discriminator (MED) attribute is present.
	next hop—IP address of the next system used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
	ORG—Origin attribute is present.

show bgp process

To display Border Gateway Protocol (BGP) process information, use the **show bgp process** command in XR EXEC mode.

show bgp [{ipv4 | {unicast} | ipv6 | {unicast} | {unicast}}]

Syntax Description	ipv4 (Op	otional) Specifies IP Version 4.
	unicast (Op	ptional) Specifies the unicast subaddress family.
	ipv6 (Op	ptional) Specifies IP Version 6.
Command Default	If no address	s family or subaddress family is specified, the default address family and subaddress family
	specified usi	ing the set default-afi and set default-safi commands are used.
Command Modes	specified usi	
	_	
Command Modes Command History	XR EXEC n	node

Usage Guidelines

Note

The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

Use the **show bgp process** command to display status and summary information for the Border Gateway Protocol (BGP) process. The output shows various global and address family-specific BGP configurations. A summary of the number of neighbors, update messages, and notification messages sent and received by the process is also displayed.

Use the **detail** keyword to display detailed process information. The detailed process information shows the memory used by each of various internal structure types.

Use the **performance-statistics** keyword to display a summary or detail of work done by the BGP processes. The summary display shows the real time spent performing certain operations and the time stamps for state transitions during initial convergence.

Task ID	Task Operations ID
	bgp read
Examples	The following is sample output from the show bgp process command:
	RP/0/RP0/CPU0:router# show bgp process
	BGP Process Information BGP is operating in STANDALONE mode Autonomous System: 1 Router ID: 10.0.0.5 (manually configured) Cluster ID: 10.0.0.5 Fast external fallover enabled Neighbor logging is enabled Enforce first AS enabled Default local preference: 100 Default keepalive: 60 Update delay: 120 Generic scan interval: 60
	Address family: IPv4 Unicast Dampening is enabled Client reflection is enabled Scan interval: 60 Main Table Version: 150 IGP notification: IGPs notified
	Node Process Nbrs Estab Rst Upd-Rcvd Upd-Sent Nfn-Rcvd Nfn-Sent node0_0_CPU0 Speaker 3 2 1 20 10 0 0

This table describes the significant fields shown in the display.

Table 27: show bgp process Field Descriptions

Field	Description
BGP is operating in	Indicates BGP is operating in standalone mode. This is the only supported mode.
Autonomous System	Autonomous system number for the local system.
	 Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535. Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295. Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Router ID	BGP identifier assigned to the local system. If this is explicitly configured using the bgp router-id command, "manually configured" is displayed. If the router ID is not manually configured, it is determined from a global router ID. If no global ID is available, the router ID is shown as 0.0.0.
Confederation ID	Confederation identifier for the local system.

Field	Description
Cluster ID	Cluster identifier for the local system. If this is manually configured using the bgp cluster-id command, "manually configured" is displayed.
Default metric	Default metric. This is controlled by the default-metric command.
Fast external fallover enabled	Indicates whether fast external fallover is enabled. This is controlled by the bgp fast-external-fallover disable command.
Neighbor logging enabled	Indicates whether logging of peer connection up and down transitions is enabled. This is controlled by the bgp log neighbor changes disable command.
Enforce first AS enabled	Indicates that strict checking of the first AS number in paths received from external BGP peers is enabled. This is controlled by the bgp enforce-first-as disable command.
iBGP to IGP redistribution	Indicates internal redistribution is enabled using the bgp redistribution-internal command.
Treating missing MED as worst	Indicates missing Multi Exit Discriminator (MED) metric values are treated as worst in the route selection algorithm. This is controlled by the bgp bestpath med missing-as-worst command.
Always compare MED is enabled	Indicates that the MED is always used during the route selection algorithm, even when paths are received from external BGP neighbors in different autonomous systems. This is controlled by the bgp bestpath med always command.
AS Path ignore is enabled	Indicates that the AS path length is ignored by the route selection algorithm. This is controlled by the bgp bestpath as-path ignore command.
Comparing MED from confederation peers	Indicates that the MED values are used in the route selection algorithm when comparing routes received from confederation peers. This is controlled by the bgp bestpath med confed command.
Comparing router ID for eBGP paths	Indicates that the router ID is used as a tiebreaker by the route selection algorithm when comparing identical routes received from different external BGP neighbors. This is controlled by the bgp bestpath compare-routerid command.
Default local preference	Default local preference value used for BGP routes. This is controlled by the bgp default local-preference command.
Default keepalive	Default keepalive interval. This is controlled by the timers bgp command.

Field	Description
Graceful restart enabled	Indicates that the graceful restart capability is enabled. The configuration commands affecting graceful restart behavior are:• bgp graceful-restart• bgp graceful-restart purge-time• bgp graceful-restart stalepath-time• bgp graceful-restart restart-time• bgp graceful-restart graceful-restert
Update delay	Maximum time that a BGP process stays in read-only mode.
Generic scan interval	Interval (in seconds) between BGP scans for address family-independent tasks. This is controlled by the bgp scan-time command.
Dampening	Indicates whether dampening is enabled for the specified address family. This is controlled by the dampening command.
Client reflection	Indicates whether client-to-client route reflection is enabled for the specified address family. This is controlled by the bgp client-to-client reflection disable command.
Scan interval	Interval (in seconds) between BGP scans for the given address family. This is controlled by the bgp scan-time command in address family configuration mode.
Main Table Version	Last version of the BGP database that was installed into the main routing table.
IGP notification	Indicates whether Interior Gateway Protocols (IGP) have been notified of BGP convergence for the specified address family.
Node	Node on which the process is executing.
Process	Type of BGP process.
Speaker	Speaker process. A speaker process is responsible for receiving, processing, and sending BGP messages to configured neighbors.
Nbrs	Number of neighbors for which the process is responsible.
Estab	Number of neighbors that have connections in the established state for this process.
Rst	Number of times this process was restarted.
Upd-Rcvd	Number of update messages received by the process.
Upd-Sent	Number of update messages sent by the process.
Nfn-Rcvd	Number of notification messages received by the process.
Nfn-Sent	Number of notification messages sent by the process.

The following is sample output from the **show bgp process** command with the Graceful Maintenance feature enabled:

The following is sample output from the **show bgp process** command with the **detail** keyword:

RP/0/RP0/CPU0:router# show bgp all all process detail

```

This table describes the significant fields shown in the display.

Table 28: show bgp process detail Field Descriptions

Field	Description	
BGP is operating in	Indicates whether BGP is operating in standalone mode.	
Autonomous System	Autonomous system number for the local system.	
Router ID	BGP identifier assigned to the local system. If this is explicitly configured using the bgp router-id command, "manually configured" is displayed. If the router ID is not manually configured, it is determined from a global router ID. If the global ID is not available, the router ID is shown as 0.0.0.	
Confederation ID	Confederation identifier for the local system.	
Cluster ID	Cluster identifier for the local system. If this is manually configured using the bgp cluster-id command, "manually configured" is displayed.	
Default metric	Default metric.	
Fast external fallover enabled	Indicates whether fast external fallover is enabled.	
Neighbor logging enabled	Indicates whether logging of peer connection up and down transitions is enabled.	
Enforce first AS enabled	Indicates that strict checking of the first autonomous system (AS) number in paths received from external BGP peers is enabled.	
iBGP to IGP redistribution	Indicates internal redistribution is enabled using the bgp redistribution-internal command.	
Treating missing MED as worst	Indicates missing MED metric values are treated as worst in the route selection algorithm. This is controlled by the bgp bestpath med missing-as-worst command.	
Always compare MED is enabled	Indicates that the MED is always used during the route selection algorithm, even when paths are received from external BGP neighbors in different autonomous systems. This is controlled by the bgp bestpath med always command.	
AS Path ignore is enabled	Indicates that the AS path length is ignored by the route selection algorithm. This is controlled by the bgp bestpath as-path ignore command.	
Comparing MED from confederation peers	Indicates that the MED values are used in the route selection algorithm when comparing routes received from confederation peers. This is controlled by the bgp bestpath med confed command.	

Field	Description
Comparing router ID for eBGP paths	Indicates that the router ID is used as a tiebreaker by the route selection algorithm when comparing identical routes received from different external BGP neighbors. This is controlled by the bgp bestpath compare-routerid command.
Default local preference	Default local preference value used for BGP routes.
Default keepalive	Default keepalive interval. This is controlled by the timers bgp command.
Graceful restart enabled	Indicates that the graceful restart capability is enabled. The configuration commands affecting graceful restart behavior are: • bgp graceful-restart • bgp graceful-restart purge-time • bgp graceful-restart stalepath-time • bgp graceful-restart restart-time
	bgp graceful-restart graceful-reset
Update delay	Maximum time that a BGP process stays in read-only mode.
Generic scan interval	Interval (in seconds) between BGP scans for address family-independent tasks. This is controlled by the bgp scan-time command.
BGP Speaker Process	Speaker process responsible for receiving, processing and sending BGP messages.
Node	Node on which the specified process is executing.
Neighbors	Number of neighbors for which the specified process is responsible.
established	Number of neighbors that have connections in the established state for the specified process.
Updates	Number of update messages sent and received by the specified process.
Notifications	Number of notification messages sent and received by the specified process.
Attributes	Number of unique sets of attribute information stored in the specified process and the amount of memory used by the attribute information.
AS Paths	Number of unique autonomous system paths stored in the specified process and the amount of memory used by the AS path information.
Communities	Number of unique sets of community information stored in the specified process and the amount of memory used by them.
Extended communities	Number of unique sets of extended community information stored in the specified process and the amount of memory used by them.
Route Reflector Entries	Number of unique sets of route reflector information stored in the specified process and the amount of memory used by them.
Nexthop Entries	Number of entries and memory usage for cached next- hop information.

Field	Description
Update messages queued	Total number of update messages queued to be sent across all neighbors for which the specified process is responsible.
Address family	Specified address family.
Dampening	Indicates whether dampening is enabled for the specified address family.
Client reflection	Indicates whether client-to-client route reflection is enabled for the specified address family. This is controlled by the bgp client-to-client reflection disable command.
Scan interval	Interval (in seconds) between BGP scans for the given address family. This is controlled by the bgp scan-time command.
Main Table Version	Last version of the local BGP database for the specified address family that was injected into the main routing table.
IGP notification	Indicates whether IGPs have been notified of BGP convergence for the specified address family.
RIB has converged	Indicates whether the main routing table version has converged and the version at which it converged.
State	BGP system state for the specified address family and process. This may be one of the following:
	read-only mode—Initial set of updates is being recovered. In this mode, route selection is not performed, routes are not installed in the global RIB, and updates are not advertised to peers.
	best-path calculation mode—Route selection is being performed for the routes that were received while in read-only mode.
	import mode—Routes are imported from one VRF to another VRF once the best paths are calculated. This mode is supported in VPNv4 unicast address family mode.
	RIB update mode—Routes that were selected in best-path calculation mode are being installed in the global RIB.
	label allocation mode: Labels are allocated for the received prefixes based on the requirement.
	normal mode—Best paths are sent to the peers for routes that exist in the RIB. The route selection, import processing, RIB updates, and label allocation are performed as new updates are received.
BGP Table Version	Last version used in the BGP database for received routes.
Attribute download	Indicates whether the RIB attribute download is enabled.
Network Entries	Number of sets of prefix information held in the specified BGP process for the specified address family.

Field	Description
Soft Reconfig Entries	Number of sets of prefix information that are present only for the purpose of supporting soft reconfiguration.
Dampened Paths	Number of routes that are suppressed due to dampening for the specified address family.
History Paths	Number of routes that are currently withdrawn, but are being maintained to preserve dampening information.
Prefixes (Allocated/Freed)	Number of sets of prefix information for the specified address family that have been allocated and freed during the lifetime of the process.
Paths (Allocated/Freed)	Number of sets of route information for the specified address family that have been allocated and freed during the lifetime of the process.
Prefixes (Number/Memory Used)	Number of sets of prefix information currently allocated for the specified address family, and the amount of memory used by them.
Paths (Number/Memory Used)	Number of sets of route information currently allocated for the specified address family, and the amount of memory used by them.

The following is sample output from the **show bgp process** command with the **performance-statistics** keyword:

RP/0/RP0/CPU0:router# show bgp process performance-statistics detail

This table describes the significant fields shown in the display.

Field	Description
BGP is operating in	Indicates whether BGP is operating in standalone mode.
Autonomous system	Autonomous system number for the local system.
Router ID	BGP identifier assigned to the local system. If this is explicitly configured using the bgp router-id command, "manually configured" is displayed. If the router ID is not manually configured, it is determined from a global router ID. If the global ID is not available, the router ID is shown as 0.0.0.
Confederation ID	Confederation identifier for the local system.
Cluster ID	The cluster identifier for the local system. If this is manually configured using the bgp cluster-id command, "manually configured" is displayed.
Default metric	Default metric.
Fast external fallover enabled	Indicates whether fast external fallover is enabled.

Table 29: show bgp process performance-statistics Field Descriptions

Field	Description
Neighbor logging enabled	Indicates whether logging of peer connection up and down transitions is enabled. This is controlled by the bgp log neighbor changes disable command.
Enforce first AS enabled	Indicates that strict checking of the first AS number in paths received from external BGP peers is enabled.
iBGP to IGP redistribution	Indicates internal redistribution is enabled using the bgp redistribution-internal command.
Treating missing MED as worst	Indicates missing MED metric values are treated as worst in the route selection algorithm. This is controlled using the bgp bestpath med missing-as-worst command.
Always compare MED is enabled	Indicates that the MED is always used during the route selection algorithm, even when paths are received from external BGP neighbors in different autonomous systems. This setting is controlled by the bgp bestpath med always command.
AS Path ignore is enabled	Indicates that the AS path length is ignored by the route selection algorithm. This is controlled by the bgp bestpath as-path ignore command.
Comparing MED from confederation peers	Indicates that the MED values are used in the route selection algorithm when comparing routes received from confederation peers. This is controlled by the bgp bestpath med confed command.
Comparing router ID for eBGP paths	Indicates that the router ID is used as a tiebreaker by the route selection algorithm when comparing identical routes received from different external BGP neighbors. This is controlled by the bgp bestpath compare-routerid command.
Default local preference	Default local preference value used for BGP routes.
Default keepalive	Default keepalive interval. This setting is controlled by the timers bgp command.
Graceful restart enabled	Indicates that the graceful restart capability is enabled. The configuration commands affecting graceful restart behavior are: bgp graceful-restart , bgp graceful-restart purge-time , bgp graceful-restart stalepath-time , bgp graceful-restart restart-time , and bgp graceful-restart graceful-rest .
Update delay	Maximum time that a BGP process stays in read-only mode.
Generic scan interval	Interval (in seconds) between BGP scans for address family-independent tasks. This setting is controlled by the bgp scan-time command in router configuration mode.
Address family	Specified address family.
Dampening	Indicates whether dampening is enabled for the specified address family.

Field	Description
Client reflection	Indicates whether client-to-client route reflection is enabled for the specified address family. This is controlled by the bgp client-to-client reflection disable command.
Scan interval	Interval (in seconds) between BGP scans for the given address family. This is controlled by the bgp scan-time command.
Main Table Version	Last version of the local BGP database for the specified address family that was injected into the main routing table.
IGP notification	Indicates whether IGPs have been notified of BGP convergence for the specified address family.
Node	Node on which the process is executing.
Process	BGP process.
Speaker	Speaker process. The speaker process is responsible for receiving, processing and sending BGP messages.
Read	Real time (in seconds) spent reading messages from peers by this process.
Write	Real time (in seconds) spent writing messages to peers by this process.
Inbound	The real time (in seconds) spent processing messages read from peers by this process.
Config	Real time (in seconds) spent processing configuration commands by this process.
Data	Real time (in seconds) spent providing operational data by this process.
Conv	Indicates whether the process has converged after the initial update.
Nbr Estab	Time stamp (in seconds) recording the time when the first neighbor became established.
Bestpath	Time stamp (in seconds) recording the time the best-path calculation mode was entered.
RIB Inst	Time stamp (in seconds) recording the time RIB update mode was entered.
Read/Write	Time stamp (in seconds) recording the time normal mode was entered.
Last Upd	Time stamp (in seconds) recording the time the last update was sent to a neighbor.
Address Family IPv4 Unicast converged in <i>n</i> seconds	Indicates that BGP has reached initial convergence for the IPv4 unicast address family. The time taken for convergence is shown.
Update wait-install enabled	Indicates the update wait-install was configured.

This table describes the significant fields shown in the display.

Table 30: show bgp process performance-statistics detail Field Descriptions

Field	Description
Process	The specified process.
Location	Node in which the specified process is executing.
Neighbors	Number of neighbors for which the specified process is responsible.
established	Number of neighbors that have connections in the established state for the specified process.
Updates	Number of update messages sent and received by the specified process.
Notifications	Number of notification messages sent and received by the specified process.
Attributes	Number of unique sets of attribute information stored in the specified process and the amount of memory used by the attribute information.
AS Paths	Number of unique autonomous system paths stored in the specified process, and the amount of memory used by the AS path information.
Communities	Number of unique sets of community information stored in the specified process and the amount of memory used by them.
Extended communities	Number of unique sets of extended community information stored in the specified process and the amount of memory used by them.
Route Reflector Entries	Number of unique sets of route reflector information stored in the specified process and the amount of memory used by them.
Route-map Cache Entries	Number of entries and memory usage for cached results for applying a route map.
Filter-list Cache Entries	Number of entries and memory usage for cached results for applying an AS path filter list.
Next Hop Cache Entries	Number of entries and memory usage for cached next-hop information.
Update messages queued	Number of update messages queued to be sent across all neighbors for which the specified process is responsible.
Read	Indicates the number of messages read by the process, the total size of read messages, the number of read operations performed, and the real time spent by the process performing read operations.
Read throttled	Number of times that reading from TCP has been throttled due to a backlog of messages read but not processed.
inbound messages	Number of read messages that have been processed and the real time spent processing inbound messages.

Field	Description
Wrote	Amount of data that has been written by the process, the number of write operations performed, and the real time spent by the process performing write operations.
Processing write list	Number of messages written from write lists, the number of times the write list has been processed, and the real time spent processing the write list.
	Note Write lists typically contain only update messages.
Processing write queue	Number of messages written from write queues, number of times the write queue has been processed, and the real time spent processing the write queue.
Socket setup	Number of socket setup operations performed and the real time spent during socket setup operations.
Configuration	Number of configuration requests received by the process and the real time spent processing configuration requests.
Operational data	Number of requests for operational data (for show commands) received by the process and the real time spent processing operation data requests
State	BGP system state for the specified address family and process. This may be one of the following:
	read-only mode—Initial set of updates is being recovered. In this mode, route selection is not performed, routes are not installed in the global RIB, and updates are not advertised to peers.
	best-path calculation mode—Route selection is being performed for the routes that were received while in read-only mode.
	import mode—Routes are imported from one VRF to another VRF once the best paths are calculated. This mode is supported in VPNv4 unicast address family mode.
	RIB update mode—Routes that were selected in best-path calculation mode are being installed in the global RIB.
	label allocation mode: Labels are allocated for the received prefixes based on the requirement.
	normal mode—Best paths are sent to the peers for routes that exist in the RIB. The route selection, import processing, RIB updates, and label allocation are performed as new updates are received.
BGP Table Version	Last version used in the BGP database for received routes.
Network Entries	Number of sets of prefix information held in the specified BGP process for the specified address family.
Soft Reconfig Entries	Number of sets of prefix information that are present only for the purpose of supporting soft reconfiguration.

Field	Description
Dampened Paths	Number of routes that are suppressed due to dampening for the specified address family.
History Paths	Number of routes that are currently withdrawn, but are being maintained to preserve dampening information.
Prefixes (Allocated/Freed)	Number of sets of prefix information for the specified address family that have been allocated and freed during the lifetime of the process.
Paths (Allocated/Freed)	Number of sets of route information for the specified address family that have been allocated and freed during the lifetime of the process.
Prefixes (Number/Memory Used)	Number of sets of prefix information currently allocated for the specified address family and amount of memory used by them.
Paths (Number/Memory Used)	Number of sets of route information currently allocated for the specified address family and amount of memory used by them.
Updates generated	Number of prefixes for which updates have been generated, the number of messages used to advertise the updates, the number of update generation runs performed, and the real time spent generating updates for the specified address family.
Scanner	Number of times the scanner has run for the specified address family and real time spent in scanner processing.
RIB Update	Number of global routing information base update runs performed for the specified address family, number of prefixes installed, withdrawn, or modified in the global RIB during these runs, and real time spent performing these runs.
Process has converged	Indicates whether the process has reached initial convergence for the specified address family.
First neighbor established	Time stamp (in seconds) recording the time the first neighbor in the process was established.
Entered DO_BESTPATH mode	Time stamp (in seconds) recording the time best-path calculation mode was entered.
Entered DO_RIBUPD mode	Time stamp (in seconds) recording the time RIB update mode was entered.
Entered Normal mode	Time stamp (in seconds) recording the time normal mode was entered.
Last UPDATE sent	Time stamp (in seconds) recording the time the last update was sent to a neighbor.

--More-

show bgp regexp

To display routes matching the autonomous system path regular expression, use the**show bgp regexp** command in XR EXEC mode.

show bgp regexp regular-expression

Syntax Description	ipv4	(Optional) Specifies IP	Version 4 address prefixes.	
	unicast	(Optional) Specifies uni	cast address prefixes.	
	ipv6	(Optional) Specifies IP	Version 6 address prefixes.	
	regular-exp	pression Regular expression to m	atch the BGP autonomous system paths.	
Command Default		as family or subaddress family is sing the set default-afi and 	specified, the default address family and fault-safi commands are used.	subaddress family
Command Modes	XR EXEC 1	mode		
Command History	Release	Modification		
	Release 6.0) This command was introduced.		
Usage Guidelines	-			

Note

The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp regexp** command to display all routes in the specified BGP table whose autonomous system path is matched by the specified regular expression.

Note

e If the regular expression contains spaces and parentheses, it must be specified and surrounded by quotation marks.

```

This table describes the significant fields shown in the display.

Table 31: show bgp regexp Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Description
Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
s—Path is more specific than a locally sourced aggregate route and has been suppressed.
*—Path is valid.
The second character may be (in order of precedence):
>Path is the best path to use for that network.
d—Path is dampened.
h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
The third character may be:
i—Path was learned by an internal BGP (iBGP) session.
Origin of the path. The origin code is placed at the end of each line in the table. It can be one of the following values:
i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
e—Path originated from an Exterior Gateway Protocol (EGP).
?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
IP address of a network entity.
IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.00 indicates that the router has a non-BGP route to this network.
Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.
Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Autonomous system path to the destination network. At the end of the path is the origin code for the path.

show bgp route-policy

To display Border Gateway Protocol (BGP) information about networks that match an outbound route policy, use the **show bgp route-policy** command in XR EXEC mode.

show	bgp	route-policy	route-policy-name	[standby]	

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC mode

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines

The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 5000 Series Routers* for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined.

A route policy must be configured to use this command. When the **show bgp route-policy** command is entered, routes in the specified BGP table are compared with the specified route policy, and all routes passed by the route policy are displayed.

If a pass clause is encountered while the route policy is being applied to the route and the route policy processing completes without hitting a drop clause, the route is displayed. The route is not displayed if a drop clause is encountered, if the route policy processing completes without hitting a pass clause, or if the specified route policy does not exist.

Note

The information displayed does not reflect modifications the policy might make to the route. To display such modifications, use the **show bgp policy** command.

Fask ID	Task Operations ID		
	bgp read		
Examples	The following is samp	ble output from the sho	v bgp route-policy command in XR EXEC mode:
	RP/0/RP0/CPU0:rout	er# show bgp route-p	olicy p1

This table describes the significant fields shown in the display.

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description					
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):					
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.					
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.					
	*—Path is valid.					
	The second character may be (in order of precedence):					
	>Path is the best path to use for that network.					
	d—Path is dampened.					
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.					
	The third character may be:					
	i-Path was learned by an internal BGP (iBGP) session.					
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:					
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.					
	e-Path originated from an Exterior Gateway Protocol (EGP).					
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.					
Network	IP prefix and prefix length for a network.					
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.00 indicates that the router has a non-BGP route to this network.					
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit discriminator (MED) metric.					
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.					
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.					
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.					

show bgp session-group

To display information about the Border Gateway Protocol (BGP) configuration for session groups, use the **show bgp session-group** command in XR EXEC mode.

show bgp session-group group-name {configuration [defaults] [nvgen] | inheritance | users}

Syntax Description	group-name	Name of the session family group to display.				
	configuration	(Optional) Displays the effective configuration for the session group, including any inherited configuration.				
	defaults	(Optional) Displays all configuration, including default configuration.				
	nvgen	(Optional) Displays output in the form of the show running-config command.				
		If the defaults keyword also is specified, the output is not suitable for cutting and pasting into a configuration session.				
	inheritance	(Optional) Displays the session groups from which this session group inherits configuration.				
	users	(Optional) Display the session groups, neighbor groups, and neighbors that inherit configuration from this session group.				
Command Default	No default beh	avior or value				
Command Modes	XR EXEC mo	de				
Command History	Release N	Nodification				
	Release 6.0 T	'his command was introduced.				
Usage Guidelines	to display the e	bgp session-group command with the <i>group-name</i> configuration argument and keyword effective configuration of a session group, including any configuration inherited from other through application of the use command. The source for each configured command is also				
	Use the defaults keyword to display the value of all configuration, including default configuration. Use the nvgen keyword to display configuration in the form of the show running-config command output. Output in this form is suitable for cutting and pasting into a configuration session.					
		bgp session-group command with the <i>group-name</i> inheritance argument and keyword to sion groups from which the specified session group inherits configuration.				
		bgp session-group command with the <i>group-name</i> users argument and keyword to display neighbor groups, and session groups that inherit configuration from the specified session group.				
Task ID	Task Opera ID	tions				
	bgp read					

Examples

For the example shown here, the following configuration is used:

```
session-group group3
  advertisement-interval 5
  dmzlink-bw
!
session-group group1
  use session-group group2
  update-source Loopback0
!
session-group group2
  use session-group group3
  ebgp-multihop 2
```

The following example shows the **show bgp session-group** command with the **configuration** keyword:

```
RP/0/RP0/CPU0:router# show bgp session-group group1 configuration
session-group group1
advertisement-interval 5[s:group2 s:group3]
ebgp-multihop 2 [s:group2]
update-source Loopback0 []
dmzlink-bandwidth [s:group2 s:group3]
```

The source of each command is shown to the right of the command. For example, **update-source** is configured directly on session group group1. The **dmzlink-bandwidth** command is inherited from session group group2, which in turn inherits it from session group group3.

The following example shows the **show bgp session-group** command with the **users** keyword:

RP/0/RP0/CPU0:router# show bgp session-group group2 users

```
IPv4 Unicast:a:group1
```

The following example shows the **show bgp session-group** command with the **inheritance** keyword.

RP/0/RP0/CPU0:router# show bgp session-group group1 inheritance

Session:s:group2 s:group3

The command output shows that the session group group1 directly uses the group2 session group. The group2 session group uses the group3 session group.

This table describes the significant fields shown in the display.

Table 33: show bgp session-group Field Descriptions

Field	Description
[]	Configures the command directly on the specified session group.
s:	Indicates the name that follows is a session group.
a:	Indicates the name that follows is an address family group.

Field	Description
n:	Indicates the name that follows is a neighbor group.
[dflt]	Indicates the command is not explicitly configured or inherited, and the default value for the command is used. This field may be shown when the defaults keyword is specified.
<not set></not 	Indicates that the default is for the command to be disabled. This field may be shown when the defaults keyword is specified.

This table describes the significant fields shown in the display.

Table 34: show bgp sessions Field Descriptions

Field	Description
Neighbor	Displays neighbor IP address.
VRF	Displays information about the VRF.
Spk	Speaker process that is responsible for the neighbor. Always 0.
AS	Autonomous system.
InQ	Number of messages from a neighbor waiting to be processed.
OutQ	Number of messages waiting to be sent to a neighbor.
NBRState	State of the Border Gateway Protocol (BGP) neighbor sessions.
NSRState	State of the Border Gateway Protocol (BGP) nonstop routing (NSR).

show bgp summary

To display the status of all Border Gateway Protocol (BGP) connections, use the **show bgp summary** command in XR EXEC mode.

show bgp $[{ipv4 {unicast} | ipv6 {unicast} | [{ipv4 {unicast} | ipv6 unicast}]}]summary$

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
Command Default		amily or subaddress family is specified, the default address family and subaddress family the set default-afi and set default-safi commands are used.

This table describes the significant fields shown in the display.

Table 35: show bgp summary Field Descriptions

Field	Description
BGP router identifier	IP address of the router.
local AS number	Autonomous system number set by the router bgp, on page 203 command.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP table state	State of the BGP database.
Table ID	BGP database identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
BGP is operating in	Specifies BGP is operating in standalone mode.
Process	BGP process.
RecvTblVer	Last version used in the BGP database for received routes.
bRIB/RIB	Last version of the local BGP database that was injected into the main routing table.
LabelVer	Label version used in the BGP database for label allocation.
ImportVer	Last version of the local BGP database for importing routes.
SendTblVer	Latest version of the local BGP database that is ready to be advertised to neighbors.
Some configured eBGP neighbors do not have any policy	Some external neighbors exist that do not have both an inbound and outbound policy configured for every address family, using the route-policy (BGP) command. In this case, no prefixes are accepted and advertised to those neighbors.
Neighbor	IP address of a neighbor.
Spr	Speaker process that is responsible for the neighbor. Always 0.
AS	Autonomous system.
MsgRcvd	Number of BGP messages received from a neighbor.
MsgSent	Number of BGP messages sent to a neighbor.
TblVer	Last version of the BGP database that was sent to a neighbor.
InQ	Number of messages from a neighbor waiting to be processed.
OutQ	Number of messages waiting to be sent to a neighbor.
Up/Down	Length of time in (hh:mm:ss) that the BGP session has been in Established state, or the time since the session left Established state, if it is not established.

I

Field	Description
St/PfxRcd	If the BGP session is not established, the current state of the session. If the session is established, the number of prefixes the router has received from the neighbor.
	If the number of prefixes received exceeds the maximum allowed (as set by the maximum-prefix command), "(PfxRcd)" appears.
	If the connection has been shut down using the shutdown command, "(Admin)" appears.
	If the neighbor is external and it does not have an inbound and outbound policy configured for every address family, an exclamation mark (!) is inserted at the end of the state when using the route-policy (BGP) command.
	If the connection has been shut down due to out of memory (OOM), "(OOM)" appears.

show bgp truncated-communities

To display routes in the Border Gateway Protocol (BGP) routing table for which inbound policy or aggregation has exceeded the maximum number of communities that may be attached, use the **show bgp truncated-communities** command in XR EXEC mode.

show bgptruncated-communities standby

Syntax Description	ipv4 (Optional) Specifies IP Version 4 address prefixes.
	unicast (Optional) Specifies unicast address prefixes.
	ipv6 (Optional) Specifies IP Version 6 address prefixes.
	ipv6 unicast (Optional) For VRF, specifies IPv6 unicast address families.
Command Default	If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.
Command Modes	- XR EXEC mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	The set default-afi command is used to specify the default address family for the session, and the set default-safi command is used to specify the default subaddress family for the session. See the <i>System Management Command Reference for Cisco NCS 5000 Series Routers</i> for detailed information and syntax for the set default-afi and set default-safi commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.
	BGP contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the all keyword is specified for the address family or subaddress family, each matching routing table is examined.
	Use the show bgp truncated-communities command to display those routes in the specified BGP routing table in which the buffers used to store communities or extended communities have overflowed. An overflow occurs if an attempt is made to associate more communities or extended communities with the route than fits in a BGP update message. This can happen due to modification of communities or extended communities during aggregration or when inbound policy is applied.
Task ID	Task Operations ID
	bgp read

Examples

The following is sample output from the **show bgp truncated-communities** command:

RP/0/RP0/CPU0:router# show bgp truncated-communities

```
BGP router identifier 172.20.1.1, local AS number 1820

BGP main routing table version 3042

BGP scan interval 60 secs

Status codes: s suppressed, d damped, h history, * valid, > best

i - internal, S stale

Origin codes: i - IGP, e - EGP, ? - incomplete

Network Next Hop Metric LocPrf Weight Path

* 10.13.0.0/16 192.168.40.24 0 1878 704 701 200 ?

*> 10.16.0.0/16 192.168.40.24 0 1878 704 701 i
```

This table describes the significant fields shown in the display.

Field	Description
BGP router identifier	BGP Identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.

Table 36: show bgp truncated-communities Field Descriptions

Field	Description
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e-Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.00 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

show bgp update-group

To display Border Gateway Protocol (BGP) information for update groups, use the **show bgp update-group** command in XR EXEC mode.

show bgp [{ipv4 {unicast} | ipv6 {unicast}}]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 update groups.
	unicast	(Optional) Specifies unicast update groups.
	ipv6	(Optional) Specifies IP Version 6 update groups.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
Command Default		amily or subaddress family is specified, the default address family and subaddress family g the set default-afi and set default-safi commands are used.
Command Modes	XR EXEC mo	de
Command History	Release N	Modification
	Release 6.0 T	This command was introduced.
Usage Guidelines	default-safi c <i>Management</i> (for the set def	alt-afi command is used to specify the default address family for the session, and the set command is used to specify the default subaddress family for the session. See the <i>System</i> <i>Command Reference for Cisco NCS 5000 Series Routers</i> for detailed information and syntax fault-afi and set default-safi commands. If you do not specify a default address family, the s family is IPv4. If you do not specify a default subaddress family, the default subaddress family
		highbor is automatically assigned to an update group for each address family that is enabled on Neighbors that have similar outbound policy, such that they are sent the same updates, are placed odate group.
	Use the show belong to the u	bgp update-group command to display the update groups and a list of the neighbors that update group.
		bgp update-group neighbor command to display details about the update group to which a ngs for the specified address family.
	TT 41	nary keyword to display a summary of the neighbors belonging to the specified update group.
		similar for the same as for the show bgp summary, on page 363 command.

I

Note Update group indexes are not necessarily persistent over a process restart. If a BGP process restarts, the index of the update group to which a particular neighbor is assigned may be different, though the set of neighbors belonging to the update group is the same. Task Operations

Examples

Task ID

The following is sample output from the show bgp update-group command:

```
RP/0/RP0/CPU0:router# show bgp update-group
```

```
Update group for IPv4 Unicast, index 0.1:
Attributes:
    Internal
    Common admin
    Send communities
    Send extended communities
    Minimum advertisement interval: 300
    Update group desynchronized: 0
    Update group desynchronized: 0
    Sub-groups merged: 0
    Messages formatted: 0, replicated: 0
    Neighbors not in any sub-group:
    10.0.101.1
```

This table describes the significant fields shown in the display.

Table 37: show bgp	o update-group	Field Descriptions
--------------------	----------------	--------------------

Field	Description
Update group for	Address family to which updates in this update group apply.
index	Update group index.
Attributes	Attributes common to all members of the update group.
Unsuppress map	Unsuppress route map used to selectively unsuppress more specific routes of locally generated aggregates for members of this update group.
Outbound policy	Route policy applied to outbound updates generated for members of this update group.
Internal	Members of the update group are internal peers.
ORF Receive enabled	Members of this update group are capable of receiving an outbound route filter.
Route Reflector Client	Local system is acting as a route reflector for members of this update group.

Field	Description
Remove private AS numbers	Members of this update group have private AS numbers stripped from outbound updates.
Next-hop-self enabled	Next-Next hop for members of the update group is set to the local router.
Directly connected IPv6 EBGP	Members of this update group are directly connected external BGP IPv6-based peers.
Configured Local AS	Local autonomous system (AS) used for members of this update group.
Common admin	Peers in this update group are under common administration (internal or confederation peers).
Send communities	Communities are sent to neighbors in this update group.
Send extended communities	Extended communities is sent to neighbors in this update group.
Minimum advertisement interval	Minimum advertisement interval for members of this update group.
replicated	Number of update messages replicated for this update group.
Messages formatted	Number of update messages generated for this update group.
Neighbors in this update group	List of neighbors that use this update group for the given address family.
Update group desynchronized	Number of times an update group has been split to accommodate the slower peer. This option is disabled.
Sub-groups merged	Number of times an update group has been split and merged.
Neighbors not in any sub-group	BGP neighbor that does not belong to any subgroup.

The following is sample output from the **show bgp update-group** command with the **ipv4**, **unicast**, and **summary** keywords and the *process id.index* argument:

RP/0/RP0/CPU0:router# show bgp ipv4 unicast update-group 0.1 summary

```

This table describes the significant fields shown in the display.

Field	Description
BGP router identifier	IP address of the router.
local AS number	Autonomous system number set by the router bgp, on page 203 command.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP table state	State of the BGP database.
Table ID	BGP database identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
BGP is operating in	BGP is operating in standalone mode.
Process	BGP process.

I

Field	Description
RecvTblVer	Last version used in the BGP database for received routes.
bRIB/RIB	Last version of the local BGP database that was injected into the main routing table.
LabelVer	Label version used in the BGP database for label allocation.
ImportVer	Last version of the local BGP database for importing routes.
SendTblVer	Latest version of the local BGP database that is ready to be advertised to neighbors.
Some configured eBGP neighbors do not have any policy	Some external neighbors that exist do not have both an inbound and outbound policy configured for every address family, using the route-policy (BGP) command. In this case, no prefixes are accepted or advertised to those neighbors.
Neighbor	IP address of a neighbor.
Spr	Speaker process that is responsible for the neighbor. Always 0.
AS	Autonomous system.
MsgRcvd	Number of BGP messages received from a neighbor.
MsgSent	Number of BGP messages sent to a neighbor.
TblVer	Last version of the BGP database that was sent to a neighbor.
InQ	Number of messages from a neighbor waiting to be processed.
OutQ	Number of messages waiting to be sent to a neighbor.
Up/Down	Length of time (in hh:mm:s) that the BGP session has been in Established state, or the time since the session left Established state, if it is not established.
St/PfxRcd	If the BGP session is not established, the current state of the session. If the session is established, the number of prefixes the router has received from the neighbor.
	If the number of prefixes received exceeds the maximum allowed (as set by the maximum-prefix command), "(PfxRcd)" appears.
	If the connection has been shut down using the shutdown command, "(Admin)" appears.
	If the neighbor is external and it does not have an inbound and outbound policy configured for every address family, an exclamation mark (!) is inserted at the end of the state when using the route-policy (BGP) command.

show bgp vrf

To display Border Gateway Protocol (BGP) prefix information for VPN routing and forwarding (VRF) instances, use the **show bgp vrf** command in XR EXEC mode.

show bgp vrf { all vrf-name } { process | rpki refresh-list } { ipv4 { unicast [ipv4-address/length [
detail]] | labeled-unicast } | ipv6 { unicast } | imported-routes { neighbor | standby | vrf vrf-name
}}

Syntax Description		
Syntax Description	vrf-name	Displays imported routes for a specific VRF.
	all	Displays imported routes for all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) Specifies IP Version 4 unicast or labeled-unicast imported routes.
	ipv6 unicast	(Optional) Specifies IP Version 6 unicast imported routes.
	vrf source-vrf-name	(Optional) Displays routes imported from the specified source VRF.
	neighbor neighbor-address	(Optional) Displays preview advertisements for a specified neighbor.
	standby	(Optional) Displays information about the standby card.
	process	Displays process information.
	rpki refresh-list	Displays BGP Resource Public Key Infrastructure (RPKI) information.
Command Default	No default behavior or values	
Command Modes	XR EXEC mode	
Command History	Release	Modification
	Release 6.0	This command was introduced.
	Release 6.1	This command was modified. The process keyword and <i>rpki refresh-list</i> keyword-argument combination was added.
Usage Guidelines	the default VRF. Use the neighbor <i>neighbo</i> and which paths were learned from the specif	nmand to display all paths imported into a specified VRF from <i>ir-address</i> keyword and argument to display all imported paths fied neighbor. Use the vrf source-vrf-name keyword and belong to the specified source VRF. The neighbor cannot coexist.

This table describes the significant fields shown in the display output for show bgp vrf command.

Table 39: show bgp vrf Field Descriptions

Field	Description
BGP VRF	VRF name.
state	State of the VRF.
BGP Route Distinguisher:	Unique identifier for the BGP routing instance.
VRF Id	VRF identifier.
BGP router identifier	IP address of the router.
local AS number	Autonomous system number set by the router bgp, on page 203 command.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
BGP table state	State of the BGP database.
Table ID	Table identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
Network	Network address.
Neighbor	IP address of a neighbor.
Route Distinguisher	Unique identifier for the routing instance.
Source VRF	Source VRF for the imported route.

show protocols (BGP)

To display information about the Border Gateway Protocol (BGP) instances running on the router, use the **show protocols** command in XR EXEC mode and specify either the **bgp** or **all** keyword.

show protocols [{ipv4 | ipv6 | afi-all}] [{allprotocol}]

Syntax Description	ipv4	(Optional) Specifies the IP Version 4 address family.
	ipv6	(Optional) Specifies the IP Version 6 address family.
	afi-all	(Optional) Specifies all address families.
	all	(Optional) Specifies all protocols for a given address family.
	protocol	(Optional) Specifies a routing protocol.
		For the IPv4 address family, the options are $ bgp$, $ isis$, $ rip$, and $ ospf$
		•
		For the IPv6 address family, the options are bgp , isis , and ospfv3 .
Command Default	Default i	s IPv4.
	VD EVE	C made

Command Modes XR EXEC mode

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines Use the show protocols command to get information about the protocols running on the router and to quickly determine which protocols are active. The command is designed to summarize the important characteristics of the running protocol, and command output varies depending on the specific protocol selected. For BGP, the command output lists the protocol ID, peers with elapsed time since last reset, and miscellaneous information, such as external and internal local distances and sourced routes.

sk ID	Task ID	Operations
	bgp	read
	rib	read

Examples

The following example shows the display for the **show protocols** command using the **bgp** keyword:

RP/0/RP0/CPU0:router# **show protocols bgp** Routing Protocol "BGP 40" Address Family IPv4 Unicast:

```
Distance: external 20 internal 200 local 200
Sourced Networks:
10.100.0.0/16 backdoor
10.100.1.0/24
10.100.2.0/24
Routing Information Sources:
Neighbor State/Last update received
10.5.0.2 Idle
10.9.0.3 Idle
```

This table describes the significant fields shown in the display.

Table 40: show protocols (BGP) Field Descriptions

Field	Description
Routing Protocol:	Identifies BGP as the running protocol and displays the BGP AS number.
	 Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535. Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Address Family	Specifies the address family. This can be IPv4 Unicast, IPv4 Multicast, or IPv6 Unicast.
Distance: external	Specifies the distance BGP sets when installing eBGP routes into the RIB. eBGP routes are routes received from eBGP peers. The RIB uses the distance as a tiebreaker when several protocols install a route for the same prefix.
Distance: internal	Specifies the distance BGP sets for routes received from iBGP peers.
Distance: local	Specifies the distance BGP sets for locally generated aggregates and backdoor routes.
Sourced Networks	List of locally sourced networks. These are networks sourced using the network command.
Routing information Sources	List of configured BGP neighbors.
Neighbor	Address of a BGP neighbor.
State/Last update received	State of each neighbor and the time since the last update was received from the neighbor if it is established.

show svd role

To display selective VRF download (SVD) role information, use the **show svd role** command in XR EXEC mode.

show svd state

To display selective VRF download (SVD) state information, use the **show svd state** command in XR EXEC mode.

	show svd state
Syntax Description	This command has no keywords or arguments.
Command Default	None.
Command Modes	XR EXEC mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task ID Operation
	ip-services read
	This example shows the SVD configuration state and the SVD operational state in a line card:

RP/0/RP0/CPU0:router#show svd state
Thu Mar 10 10:45:32.184 PST
Selective VRF Download (SVD) Feature State:
SVD Configuration State Enabled
SVD Operational State Enabled

shutdown (BGP)

To disable a neighbor without removing its configuration, use the **shutdown** command in an appropriate configuration mode. To re-enable the neighbor and reestablish a Border Gateway Protocol (BGP) session, use the **no** form of this command.

shutdown [inheritance-disable] no shutdown [inheritance-disable]

Syntax Description	nheritance-disable (Optional) Overrides the value of a shutdown command inherited from group or session group.	m a neighbor
Command Default	eighbors are not shutdown.	
Command Modes	eighbor configuration	
	eighbor group configuration	
	ession group configuration	
Command History	Release Modification	
	Release 6.0 This command was introduced.	
Usage Guidelines	se the shutdown command to terminate any active session for the specified neighbor and ssociated routing information. Use of the shutdown command with a neighbor group or sesuddenly terminate a large number of BGP neighbor sessions because all neighbors using the r session group may be affected.	sion group may
	ise the show bgp summary command to display a summary of BGP neighbors. Neighbors to the shutdown command are displayed with the "Idle (Admin)" state.	hat are idle due
	this command is configured for a neighbor group or session group, all neighbors using the configuration. Values of commands configured specifically for a neighbor override inheri	
Task ID	Fask Operations D	
	pgp read, write	
Examples	he following example shows that any active session for neighbor 192.168.40.24 is disabled:	:
	P/0/RP0/CPU0:router(config)# router bgp 1 P/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24 P/0/RP0/CPU0:router(config-bgp-nbr)# shutdown P/0/RP0/CPU0:router(config-bgp-nbr)# exit	

In the following example, the session remains active for neighbor 192.168.40.24 because the inherited **shutdown** command has been overridden:

RP/0/RP0/CPU0:router(config) # router bgp 1 RP/0/RP0/CPU0:router(config-bgp) # session-group group1 RP/0/RP0/CPU0:router(config-bgp-sngrp) # shutdown RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RP0/CPU0:router(config-bgp) # neighbor 192.168.40.24 RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group group1 RP/0/RP0/CPU0:router(config-bgp-nbr) # shutdown inheritance-disable RP/0/RP0/CPU0:router(config-bgp-nbr) # exit

shutdown (rpki-server)

To shutdown RPKI cache-server, use the **shutdown** command in rpki-server configuration mode. To set that the RPKI cache be active, use the **no** form of this command.

shutdown no shutdown This command has no keywords or arguments. RPKI cache is active. **Command Default RPKI** server configuration **Command Modes Command History** Modification Release Release 6.0 This command was introduced. No specific guidelines impact the use of this command. **Usage Guidelines** Task ID Task Operation ID bgp read,

write

This command shows how to configure no shutdown of the RPKi cache configuration after other RPKI cache parameters are configured:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#username rpki-user
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#password rpki-ssh-pass
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#preference 1
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#purge-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#response-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#response-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#no shutdown
```

signalling disable

To disable BGP or LDP signaling protocol to neighbors, use the **signalling disable** command in neighbor address family (l2vpn vpls-vpws) configuration mode. To restore the system to its default condition, use the **no** form of this command.

signalling {bgp | ldp} disable **Syntax Description** Selects BGP signaling protocol to disable. bgp ldp Selects LDP signaling protocol to disable. Both BGP and LDP signaling protocols are enabled. **Command Default** Neighbor address family configuration **Command Modes Command History** Modification Release Release 6.0 This command was introduced. No specific guidelines impact the use of this command. **Usage Guidelines** Task ID Task Operation ID bgp read, write

Example

The following example shows how to disable BGP signaling protocol for neighbor 10.2.3.4:

```
RP/0/RP0/CPU0:router(config) #router bgp 100
RP/0/RP0/CPU0:router(config-bgp) #neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family l2vpn vpls-vpws
RP/0/RP0/CPU0:router(config-bgp-nbr-af)#signalling bgp disable
```

site-of-origin (BGP)

To attach a site-of-origin extended community attribute to each route received from the specified peer, use the **site-of-origin** command in VRF neighbor address family configuration mode. To restore the system to its default condition, use the **no** form of this command.

site-of-origin [{as-number:nn ip-address:nn}]

Syntax Description	<i>as-number:nn</i> • <i>as-number</i> — Autonomous system (AS) number.	
	• Range for 2-byte Autonomous system number is 1 to 65535.	
	• Range for 4-byte Autonomous system number in asplain format is 1 to 4294967295.	
	• Range for 4-byte Autonomous system number is asdot format is 1.0 to 65535.6553.	
	• nn —32-bit number	
	<i>ip-address:nn</i> IP address.	
	• <i>ip-address</i> —32-bit IP address	
	• <i>nn</i> —16-bit number	
Command Default	No default behavior or values	
Command Modes	VRF neighbor address family configuration	
Command History	Release Modification	
	Release 6.0 This command was introduced.	
Usage Guidelines	When routes are advertised to the peer, routes whose extended communities list contain the site of origin (SoO) are filtered out and not advertised to the peer. Site-of-origin uniquely identifies the site from which the provide edge (PE) router learned routes, thus filtering based on the extended community helps prevent transie routing loops from occurring in complex and mixed network topologies.	
Task ID	Task Operations ID	
	bgp read, write	
Examples	The following example shows how to configure SoO filtering:	
	<pre>RP/0/RP0/CPU0:router(config)# router bgp 6 RP/0/RP0/CPU0:router(config-bgp)# vrf vrf_A RP/0/RP0/CPU0:router(config-bgp-vrf)# neighbor 192.168.70.24</pre>	

RP/0/RP0/CPU0:router(config-bgp-vrf-nbr)# remote-as 10
RP/0/RP0/CPU0:router(config-bgp-vrf-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-vrf-nbr-af)# site-of-origin 10.0.01:20

socket receive-buffer-size

To set the size of the receive buffers for all Border Gateway Protocol (BGP) neighbors, use the **socket receive-buffer-size** command in an appropriate configuration mode. To set the size of the receive buffers to the default size, use the **no** form of this command.

socket receive-buffer-size socket-size [bgp-size]
no socket receive-buffer-size [socket-size] [bgp-size]

Syntax Description	socket-size Size (in bytes) of the receive-side socket buffers. Range is 512 to 131072.
	<i>bgp-size</i> (Optional) Size (in bytes) of the receive buffers in BGP. Range is 512 to 131072.
Command Default	socket-size : 32,768 bytes
	<i>bgp-size</i> : 4,032 bytes
Command Modes	Router configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the socket receive-buffer-size command to increase the buffer size when receiving updates from a neighbor. Using larger buffers can improve convergence time because the software can process more packets simultaneously. However, allocating larger buffers uses more memory on your router.
-	Note Increasing the socket buffer size uses more memory only when more messages are waiting to be processed by the software. In contrast, increasing the BGP buffer size uses extra memory indefinitely. Use the receive-buffer-size command on individual neighbors to change the values set by the socket receive-buffer-size command.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to set the receive buffer sizes for all neighbors to 65,536 bytes for the socket buffer and 8192 bytes for the BGP buffer:
	RP/0/RP0/CPU0:router(config)# router bgp 1 RP/0/RP0/CPU0:router(config-bgp)# socket receive-buffer-size 65536 8192

socket send-buffer-size

To set the size of the send buffers for all Border Gateway Protocol (BGP) neighbors, use the **socket send-buffer-size** command in an appropriate configuration mode. To set the size of the send buffers to the default size, use the **no** form of this command.

socket send-buffer-size socket-size [bgp-size]
no socket send-buffer-size [socket-size] [bgp-size]

Suntay Description	
Syntax Description	socket-size Size (in bytes) of the send-side socket buffers. Range is 4096 to 131072.
	<i>bgp-size</i> (Optional) Size (in bytes) of the send buffers in BGP. Range is 4096 to 131072.
Command Default	socket-size : 10240 bytes
	<i>bgp-size</i> : 4096 bytes
Command Modes	Router configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines _	Use the socket send-buffer-size command to increase the buffer size when sending updates to neighbors. Using larger buffers can improve convergence time because the software can process more packets simultaneously. However, allocating larger buffers uses more memory on your router.
	Use the send-buffer-size command on individual neighbors to change the values set by the socket send-buffer-size command.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to set the send buffer sizes for all neighbors to 8192 bytes for the socket buffer and the BGP buffer:
	RP/0/RP0/CPU0:router(config)# router bgp 1 RP/0/RP0/CPU0:router(config-bgp)# socket send-buffer-size 8192 8192

soft-reconfiguration inbound

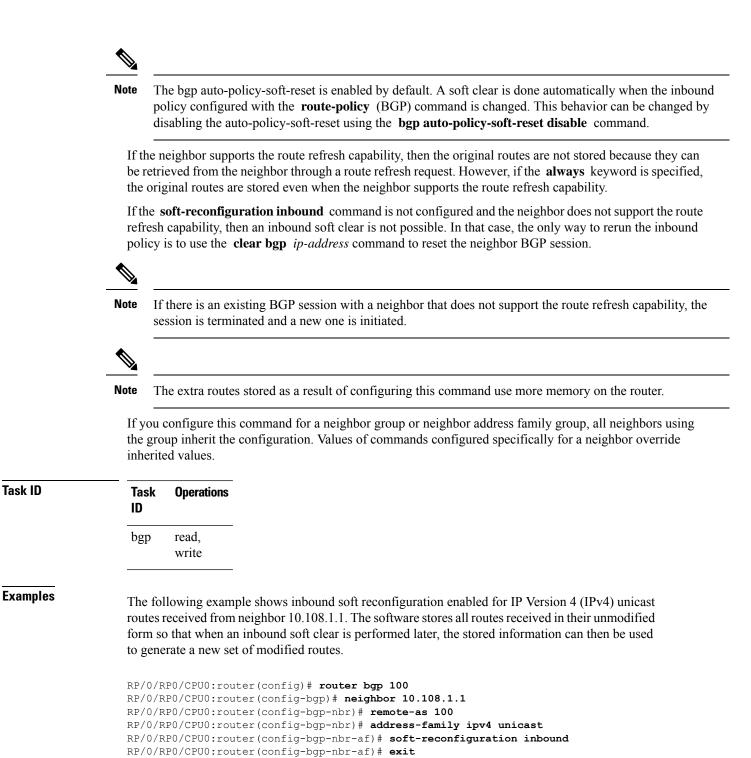

To configure the software to store updates received from a neighbor, use the **soft-reconfiguration inbound** command in an appropriate configuration mode. To disable storing received updates, use the **no** form of this command.

soft-reconfiguration inbound [{	always inheritance-disable RPKI-dropped-only
RPKI-tested-only }]	
no soft-reconfiguration inbound	[{ always inheritance-disable RPKI-dropped-only
RPKI-tested-only }]	

Syntax Description	always inheritance-disable	(Optional) Saves a copy of all received routes, even if the neighbor supports the route refresh capability.(Optional) Overrides configuration for this command that may be inherited from a	
	inheritance-disable		
		neighbor group or address family group.	
	RPKI-dropped-only	(Optional) Saves a copy of only the routes dropped by an RPKI validation-state test in neighbor-in route-policy.	
	RPKI-tested-only	(Optional) Saves a copy of only the routes tested in an RPKI validation-state test in neighbor-in route-policy.	
Command Default	Soft reconfiguration i	is not enabled.	
Command Modes	IPv4 address family g	group configuration	
	IPv6 address family group configuration		
	IPv4 neighbor address family configuration		
	IPv4 neighbor group address family configuration		
	IPv6 neighbor group	address family configuration	
Command History	Release Modific	ation	
	Release 6.0 This cor	mmand was introduced.	
Usage Guidelines	route-policy (BGP) original unmodified re after the inbound poli	me of the updates received from a neighbor, you configure an inbound policy using the command. Configuring soft reconfiguration inbound causes the software to store the oute beside a route that is modified or filtered. This allows a "soft clear" to be performed icy is changed. To perform a soft clear, use the clear bgp soft command with the . The unmodified routes are then passed through the new policy and installed in the BGP	
•			

Note If an address family group, neighbor group, or session group is configured, the configuration inside these configuration groups will not be effective unless it is applied directly or indirectly to one or more neighbors.

Task ID

speaker-id

To allocate a speaker process to a neighbor, use the **speaker-id** command in the appropriate configuration mode. To remove the speaker process from a neighbor, use the **no** form of this command.

speaker-id id
no speaker-id [id]

Syntax Description	<i>id</i> ID of the speaker process. Range is 1 to 15.
Command Default	Default is 0.
Command Modes	Neighbor configuration Session group configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operations ID
	bgp read, write
Examples	The following example shows how to allocate speaker process 3 to neighbor 192.168.40.24:
	RP/0/RP0/CPU0:router(config)# router bgp 109 RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24 RP/0/RP0/CPU0:router(config-bgp-nbr)# speaker-id 3

svd platform enable

To enable selective VRF download (SVD) for Cisco ASR 9000 Series Aggregation Services Router, use the **svd platform enable** command in System Admin Config mode. To disable selective VRF download for Cisco ASR 9000 Series Aggregation Services Router, use the **no** form of this command.

	Note This feature is not supported.
	svd platform enable no svd platform enable
Syntax Description	This command has no keywords or arguments.
lsage Guidelines	After upgrading to Cisco IOS XR Release 4.3.1 or later, the default setting for SVD is disabled and routes or labels are not selectively downloaded to the line cards. All routes are be available on all line cards. This may lead to out of resource conditions, if the line card hardware scale limits are exceeded because routes were conserved by downloading selectively earlier. To resolve the out of resource condition, turn on SVD using the svd platform enable command.
	Ensure that the total number of routes (sum of all unique routes on core facing line cards and edge facing line cards) fits on the line card hardware, before upgrading to Cisco IOS XR Release 4.3.1 or later.
	To enable selective VRF download on NCS 5001 Series Routers, reload the chassis using the reload location all command after configuring the svd platform enable command.
	Note After enabling SVD using svd platform enable, do not use the selective-vrf-download disable command turn off SVD. Selective VRF download is disabled by default. Once SVD is enabled, use the no svd platform enable
Command Default	command followed by a reload of the router using the reload location all command to disable SVD.

This example shows how to enable selective VRF download for Cisco ASR 9000 Series Aggregation Services Router:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#svd platform enable

table-policy

To apply a routing policy to routes being installed into the routing table, use the **table-policy** command in an appropriate configuration mode. To disable applying a routing policy when installing routes into the routing table, use the **no** form of this command.

	Note This feature is not supported.		
	table-policy policy-name no table-policy [policy-name]		
Syntax Description	n <i>policy-name</i> Name of the routing policy to apply.		
Command Default	No policy is applied when routes are installed into the routing table.		
Command Modes	IPv4 address family configuration		
	IPv6 address family configuration		
	VRF IPv4 address family configuration		
	VRF IPv6 address family configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines			
	Note Table policy provides users with the ability to drop routes from the RIB based on match criteria. This feature can be useful in certain applications and should be used with caution as it can easily create a routing 'black hole' where BGP advertises routes to neighbors that BGP does not install in its global routing table and forwarding table.		
	Use the table-policy command to modify route attributes as the routes are installed into the routing table by Border Gateway Protocol (BGP). Commonly, it is used to set the traffic index attribute.		
Task ID	Task Operations ID		
	bgp read, write		

Examples

The following example shows how to apply the set-traffic-index policy to IPv4 unicast routes being installed into the routing table:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# table-policy set-traffic-index

timers (BGP)

To set the timers for a specific Border Gateway Protocol (BGP) neighbor, use the **timers** command in an appropriate configuration mode. To set the timers to the default values, use the **no** form of this command.

timers keepalive hold-time no timers [keepalive hold-time]

Syntax Description	<i>keepalive</i> Frequency (in seconds) with which the software sends keepalive messages to a neighbor. Range is 0 to 65535.					
	<i>hold-time</i> Interval (in seconds) after not receiving a keepalive message from the neighbor that the software terminates the BGP session for the neighbor. Values are 0 or a number in the range from 3 to 65535.					
Command Default	<i>keepalive</i> : 60 seconds					
	hold-time : 180 seconds					
	Use the timers bgp command to override the default values.					
Command Modes	Neighbor configuration					
	Neighbor group configuration					
	Session group configuration					
Command History	Release Modification					
	Release 6.0 This command was introduced.					
Usage Guidelines	The timers actually used in connection with the neighbor may not be the same as those configured with this command. The actual timers are negotiated with the neighbor when establishing the session. The negotiated hold time is the minimum of the configured time and the hold time received from the neighbor. If the negotiated hold time is 0, keepalives are disabled.					
	The configured value for the keepalive must not exceed one-third of the negotiated hold time. If it does, a value of one-third of the negotiated hold time is used.					
	If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.					
	In cases where mechanisms such as Bi-directional Forwarding Detection (BFD), BGP fast-external-failover or Next-hop Tracking cannot be employed to detect and react to changes in the network in a faster manner, BGP Keepalive and Hold-timer values can be configured to use smaller values than the default (60 and 180 seconds respectively). When using aggressive values, consider the router's profile and scale, particularly in respect to the number of BGP neighbours that will be using sessions with the non-default timers.					
	Sessions using very aggressive values will be more susceptible to flap during events that cause the Route-Processor's CPU utilization levels to increase. Such events include component OIR, Route-Processor Failover, network instability, excessive churn in routing protocols etc. It is therefore recommended that the					

desired scale and profile of the router be tested with the non-default timer values, subjecting the router to CPU-intensive events in order to determine the timer threshold values that are appropriate for the router before configuring the values in an operational network.

The BGP Non-Stop Routing (NSR) is able to sustain sessions with more aggressive timer values than BGP Graceful Restart (GR) since in the event of a Route-Processor Failover, Graceful Restart (GR) requires the re-establishment of the TCP session over which the BGP session takes place. When using Non-Stop Routing (NSR), both the underlying TCP session and BGP session are maintained during Route-Processor failover.

k ID	Task ID	Operations
	bgp	read,
		write

Examples

The following example shows how to change the keepalive timer to 70 seconds and the hold-time timer to 210 seconds for the BGP peer 192.168.40.24:

RP/0/RP0/CPU0:router(config) # router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# timers 70 210

timers bgp

Command History

To change the default timer values for Border Gateway Protocol (BGP) neighbors, use the **timers bgp** command in an appropriate configuration mode. To set the default timers to the default values, use the **no** form of this command.

timers bgp keepalive hold-time no timers bgp [keepalive hold-time]

Syntax Description *keepalive* Frequency (in seconds) with which the software sends keepalive messages to a neighbor. Range is 0 to 65535.

hold-time Interval (in seconds) after not receiving a keepalive message from the neighbor that the software terminates the BGP session for the neighbor. Values are 0 or a number in the range from 3 to 65535.

Command Default *keepalive* : 60 seconds

Command Modes Router configuration

Release

Release 6.0 This command was introduced.

Modification

hold-time: 180 seconds

Usage Guidelines Use the **timers bgp** command to adjust the default timer times used by all BGP neighbors. The values can be overridden on particular neighbors using the **timers** command in the neighbor configuration mode.

The timers actually used in connection with the neighbor may not be the same as those configured with this command. The actual timers are negotiated with the neighbor when establishing the session. The negotiated hold time is the minimum of the configured time and the hold time received from the neighbor. If the negotiated hold time is 0, keepalives are disabled.

The configured value for the keepalive must not exceed one-third of the negotiated hold time. If it does, a value of one-third of the negotiated hold time is used.

In cases where mechanisms such as Bi-directional Forwarding Detection (BFD), BGP fast-external-failover or Next-hop Tracking cannot be employed to detect and react to changes in the network in a faster manner, BGP Keepalive and Hold-timer values can be configured to use smaller values than the default (60 and 180 seconds respectively). When using aggressive values, consider the router's profile and scale, particularly in respect to the number of BGP neighbors that will be using sessions with the non-default timers.

Sessions using very aggressive values will be more susceptible to flap during events that cause the Route-Processor's CPU utilization levels to increase. Such events include component OIR, Route-Processor Failover, network instability, excessive churn in routing protocols etc. It is therefore recommended that the desired scale and profile of the router be tested with the non-default timer values, subjecting the router to CPU-intensive events in order to determine the timer threshold values that are appropriate for the router before configuring the values in an operational network.

The BGP Non-Stop Routing (NSR) is able to sustain sessions with more aggressive timer values than BGP Graceful Restart (GR) since in the event of a Route-Processor Failover, Graceful Restart (GR) requires the re-establishment of the TCP session over which the BGP session takes place. When using Non-Stop Routing (NSR), both the underlying TCP session and BGP session are maintained during Route-Processor failover.

Task ID	Operations
bgp	read,
	write

Examples

The following example shows how to configure a default keepalive time of 30 seconds and a default hold time of 90 seconds:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# timers bgp 30 90

L

transport (rpki-server)

To choose a transport mechanism for the RPKI cache-server configuration, establish and manage transport connections, and send or receive byte streams from the network, use the **transport** command in rpki-server configuration mode. To disable the transport connection, use the **no** form of this command.

transport {ssh | tcp} port port-number no transport {ssh | tcp} port port-number

Syntax Description	port	port Specifies to choose a port number for the RPKI cache transport.				
	<i>port-number</i> Specifies the port number for the RPKI cache transport over TCP and SSH protocols. The port number ranges from 1 to 65535.					
		Note	SSH supports custom ports in addition to the default port number 22.			
Command Default	Transport mec	hanism is disa	bled.			
Command Modes	RPKI server c	onfiguration

RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
```

ttl-security

To configure a router to check the time-to-live (TTL) field in incoming IP packets for the specified external Border Gateway Protocol (eBGP) peer, use the **ttl-security** command in an appropriate configuration mode. To disable TTL verification, use the **no** form of this command.

ttl-security [inheritance-disable] no ttl-security [inheritance-disable]

 Syntax Description
 inheritance-disable (Optional) Prevents the ttl-security command from being inherited from a session group or neighbor group.

 Command Default
 TTL verification is not enabled for eBGP peers.

 Command Modes
 Neighbor configuration

 Neighbor group configuration
 Session group configuration

 Session group configuration
 Release

 Modification
 Release 6.0 This command was introduced.

 Usage Guidelines
 Use the ttl-security command to enable a lightweight security mechanism to protect eBGP peering session:

Isage Guidelines Use the **ttl-security** command to enable a lightweight security mechanism to protect eBGP peering sessions from CPU utilization-based and other resource exhaustion-based attacks. These types of attacks are typically brute-force Denial of Service (DoS) attacks that attempt to disable the network by flooding devices in the network with IP packets that contain forged source and destination IP addresses in the packet headers.

This command leverages existing behavior in IP packets. For a given IP packet, the TTL count of the packet always is equal to or less than the TTL count when the packet originated, a behavior that is considered impossible to circumvent. Therefore, a packet received with a TTL count equal to the maximum TTL value of 255 can be sent only by a directly adjacent peer. When the **ttl-security** command is configured for an eBGP neighbor that is directly adjacent, the router accepts only IP packets with a TTL count that is equal to the maximum TTL value.

The **ttl-security** command secures the eBGP session in the incoming direction only. In the outbound direction, it causes packets to be sent only with the maximum TTL value so that the BGP neighbor can also verify the TTL value of incoming packets. When this command is enabled, BGP establishes or maintains a session only if the TTL value in the IP packet header is equal to the maximum TTL value. If the value is less than the maximum TTL value, the packet is discarded and an Internet Control Message Protocol (ICMP) message is not generated. This behavior is designed because a response to a forged packet is not necessary.

Note The **ttl-security** command must be configured on each participating router. Failure to configure this command on both ends of the BGP session results in the session progressing as far as the OpenSent or OpenConfirm state, remaining there until the hold time expires.

The following restrictions apply to the configuration of this command:

- The **ttl-security** command should not be configured for a peer that is already configured with the **neighbor ebgp-multihop** command. The simultaneous configuration of these commands is permitted; however, the **ttl-security** command overrides the **ebgp-multihop** command.
- This command is not supported for internal BGP (iBGP) peers.

RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.223.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65501

RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.223.2
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65502

RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.223.3 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65503

RP/0/RP0/CPU0:router(config-bgp-nbr)# exit

RP/0/RP0/CPU0:router(config-bgp-nbr)# exit

RP/0/RP0/CPU0:router(config-bgp-nbr)# exit

RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group ebgp-nbrs

RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group ebgp-nbrs

RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group ebgp-nbrs

• This command is not effective against attacks from a directly adjacent peer that has been compromised.

If you configure this command for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Note If the **ttl-security** command is configured on a neighbor to which the router has an established connection or the router is in the process of establishing a connection, the session must be cleared using the clear bgp command. Task ID Task **Operations** ID bgp read, write Examples The following example shows how to enable TTL security for eBGP neighbor 192.168.223.7: RP/0/RP0/CPU0:router(config)# router bgp 65534 RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.223.7 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65507 RP/0/RP0/CPU0:router(config-bgp-nbr)# ttl-security The following example shows how to enable TTL security for multiple eBGP neighbors using a session group: RP/0/RP0/CPU0:router(config) # router bgp 65534 RP/0/RP0/CPU0:router(config-bgp)# session-group ebgp-nbrs RP/0/RP0/CPU0:router(config-bgp-sngrp)# ttl-security RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit

update limit

To set upper bound on transient memory usage for update generation, use the **update limit** command in XR Config mode. To return the bounds to the default value, use the **no** form of this command.

update limit update-limit-MB no update limit

Syntax Description	<i>update-limit-MB</i> Sets the update limit in megabytes (MB). Range is 16 to 2048 MB.
Command Default	Default update limit is 512 MB.
Command Modes	XR Config mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	Use the update limit command to configure a global limit on the size of messages the software queues when updating peers. Increasing the limit can result in faster Border Gateway Protocol (BGP) convergence, but also may result in higher memory usage during convergence.
Task ID	Task Operation ID

bgp read, write

This example shows how to set the update limit as 1024 MB:

RP/0/RP0/CPU0:router(config)# router bgp 65000
RP/0/RP0/CPU0:router(config-bgp)#update limit 1024

I

update limit address-family

To set upper bound on transient memory usage for update generation for an address family, use the **update limit address-family** command in an appropriate address-family configuration mode. To return the bounds to the default value, use the **no** form of this command.

update limit address-family update-limit-MB no update limit address-family

Syntax Description	<i>update-limit-MB</i> Sets the update limit in megabytes (MB). Range is 4 MB to 2048 MB.				
Command Default	Default update limit is 256 MB.				
Command Modes	- IPv4 address family configuration				
	IPv6 address family configuration				
Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	Use the update limit address-family command to configure a global limit on the size of messages the software queues when updating peers. Increasing the limit can result in faster Border Gateway Protocol (BGP) convergence, but also may result in higher memory usage during convergence.				
Task ID	Task Operation ID				
	bgp read, write				

This example shows how to set the update limit as 512 MB for address family IPv4 unicast:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#update limit address-family 512
```

update limit sub-group

To set upper bound on transient memory usage for update generation for eBGP or iBGP sub-groups, use the **update limit sub-group** command in an appropriate address-family configuration mode. To return the bounds to the default value, use the **no** form of this command.

update limit sub-group {ebgp | ibgp} update-limit-MB
no update limit sub-group {ebgp | ibgp}

	ebgp		Specifies the update limit for eBGP sub-groups.			
	ibgp		Specifies the update limit for iBGP sub-groups.			
	update-	limit-MB	Sets the update limit in megabytes (MB). Range is 1 MB to 512 MB.			
Command Default	Default	update limi	t is 32 MB.			
Command Modes	IPv4 add	lress family	configuration

Command History	Release Modification				
	Release 6.0 This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	Task Operation ID				
	bgp read, write				
	This example shows how to disable inbound update message basic error handling for eBGP neighbors:				

RP/0/RP0/CPU0:router#configure RP/0/RP0/CPU0:router(config)#router bgp 100 RP/0/RP0/CPU0:router(config-bgp)#update in error-handling basic ebgp disable

This example shows how to disable inbound update message basic error handling for iBGP neighbors:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#update in error-handling basic ibgp disable

update in error-handling extended

To enable inbound update message extended error handling for eBGP or iBGP neighbors, use the update in error-handling extended command in XR Config mode. To disable inbound update message error handling, use the **no** form of this command. update in error-handling extended {ebgp | ibgp} no update in error-handling extended {ebgp | ibgp} **Syntax Description** ebgp Specifies to enable inbound update message extended error handling for eBGP neighbors. ibgp specifies to enable inbound update message extended error handling for iBGP neighbors. Inbound update message extended error handling is disabled. **Command Default** XR Config mode **Command Modes Command History** Modification Release Release 6.0 This command was introduced. No specific guidelines impact the use of this command. **Usage Guidelines** Task ID Task Operation ID bgp read, write This example shows how to enable inbound update message extended error handling for eBGP neighbors:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#update in error-handling extended ebgp
```

This example shows how to enable inbound update message extended error handling for iBGP neighbors:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#update in error-handling extended ibgp
```

L

update in labeled-unicast equivalent

To treat SAFIs unicast and labelled unicast for a given neighbor as same, use the **update in labeled-unicast equivalent** command in neighbor configuration mode. This command was introduced for interoperability between Cisco IOS XR and IOS XE systems. For example, If the XE router advertises ipv4 unicast and then withdraw with the ipv4 label-unicast of the same route, with knob enabled, then the BGP in the receiving XR router treats both of them same. Hence BGP removes the prefix information from its database.

	update	in labelee	l-unicast	equivalent	[inheritance-disable]
Syntax Description	equiva	llent	IPv4/IPv6 (paths)	labeled-unio	cast inbound updates (paths) treated equivalent to unicast updates
	inherit	ance-disable	Does not in	nherit this u	nicast configuration from parent group
Command Default	None				
Command Modes	Neighb	or configura	tion mode		
	Neighb	or group cor	figuration m	node	
Command History	Releas	e Mod	fication		_
	Releas 7.0.1	e This	command wa	as introduce	d
Usage Guidelines		the user grou			group associated with a task group that includes appropriate task ing you from using a command, contact your AAA administrator
Task ID	Task ID	Operation			
	bgp	read, write			
	Exampl	e			

Example

The following example shows how to treat IPv4 labeled-unicast inbound updates equivalent to unicast updates (paths):

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)#update in labeled-unicast equivalentexit
```

update out logging

To enable logging of update generation events, use the **update out logging** command in XR Config mode. To disable the logging of update generation events, use the **no** form of this command.

update out logging no update out logging

Syntax Description This command has no keywords or arguments.

Command Default Update generation event logging is disabled.

Command Modes XR Config mode

Command History Release Modification

Release 6.0 This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task IDTask
IDOperation
operation
writebgpread,
write

This example shows how to enable logging of update generation events:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#update out logging
```

update-source

To allow internal Border Gateway Protocol (iBGP) sessions to use the primary IP address from a particular interface as the local address when forming an iBGP session with a neighbor, use the **update-source** command in an appropriate configuration mode. To set the chosen local IP address to the nearest interface to the neighbor, use the **no** form of this command.

update-source *type interface-path-id* **no update-source** [*type interface-path-id*]

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface.
		Note Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.
Command Default	Best local address	3
Command Modes	Neighbor configu	iration
	Neighbor group c	configuration
	Session group con	nfiguration
Command History	Release Moo	dification
	Release 6.0 This	s command was introduced.
Usage Guidelines	loopback interfac update-source co	rce command is commonly used with the loopback interface feature for iBGP sessions. The e is defined, and the interface address is used as the endpoint for a BGP session through the ommand. This mechanism allows a BGP session to remain up even if the outbound interface ded there is another route to the neighbor.
		is configured for a neighbor group or session group, all neighbors using the group inherit . Values of commands configured specifically for a neighbor override inherited values.
Task ID	Task Operation ID	 1S
	bgp read, write	
Examples		ample shows how to configure this router to use the IP address from the Loopback0 ying to open a session with neighbor 172.20.16.6:

I

RP/0/RP0/CPU0:router(config)# router bgp 110
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.16.6
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 110
RP/0/RP0/CPU0:router(config-bgp-nbr)# update-source Loopback0

Command History

update wait-install

To configure BGP to wait for feedback from RIB indicating that the routes that BGP installed in RIB have been installed in FIB, before BGP send out updates to neighbors, use the **update wait-install** command in an appropriate configuration mode.

update wait-install no update wait-install

This command has no keywords or arguments.

Command Default The update wait-install configuration is disabled.

Command Modes Router IPv4 address family

Router IPv6 address family

Release

Release 6.0 This command was introduced.

Modification

Usage Guidelines Starting from Release 6.6.2, when you configure the wait-install command, the BGP status message "LC/FIB for the neighbor in reloading" is displayed only when a connection is established with a directly connected EBGP neighbour.

ask ID	Task ID	Operation
	bgp	read, write

This example shows how to enable the **update wait-install** configuration under VPNv4 unicast address family:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 65500
RP/0/RP0/CPU0:router(config-bgp)#address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#update wait-install

use

To inherit configuration from a neighbor group, session group, or address family group, use the **use** command in an appropriate configuration mode. To discontinue inheritance from a group, use the **no** form of this command.

use {**af-group** *group-name* | **neighbor-group** *group-name* | **session-group** *group-nam* **e**} **no use** {**af-group** [*group-name*] | **neighbor-group** [*group-name*] | **session-group** [*group-name*]}

Syntax Description	af-group	Specifies an address family group.					
	group-name	Name of the neighbor group, session group, or address family group from which you want to inherit configuration.					
	neighbor-group Specifies a neighbor group.						
	session-group	Specifies a session group.					
Command Default	Inheritance of group characteristics does not occur.						
Command Modes	For use af-group	version:					
	Address family group configuration						
	Neighbor address	s family configuration					
	Neighbor group address family configuration						
	For use neighbor-group version:						
	For use session-group version:						
	Neighbor group configuration						
	Neighbor configuration						
	Session-group configuration						
Command History	Release Mo	dification					
	Release 6.0 Thi	s command was introduced.					
Usage Guidelines	The use command configures inheritance of configuration from an address family group, neighbor group, or session group, which means that any configuration for the group also takes effect for the user of the group.						
	The configuration inherited depends on the type of group that is specified. The group types are described in the following sections:						
	Address Family Group						
	specified when the	y group can specify a configuration for only a single address family. The address family ne address family group was defined (through the af-group command) must match the om which the group is used.					

Neighbor Group

A neighbor group (like a neighbor) can have address family-independent configuration and address family-specific configuration. All of these configurations could be inherited.

Session Group

A session group can have only address family-independent configuration and thus only address family-independent configuration is inherited from it.

The following rules govern inheritance to resolve possible conflicting configuration:

- 1. If a command is configured directly on the neighbor that is using group configuration, the command overrides the value that would be normally inherited from the group.
- 2. If the neighbor is configured to use a session group (for address family-independent configuration) or an address family group (for address family-specific configuration) and the command is configured for the session group or address family group, that configuration is used.
- **3.** The neighbor group configuration is used:
 - If the command is not configured directly on the neighbor and the neighbor is not using a session group (for address family-independent configuration) or an af-group (for address family-specific configuration).
 - The neighbor is using a neighbor group and the command is configured on the neighbor group.

Typically, all configuration for a neighbor group is inherited, but some characteristics may be masked by a session group or address family group. For an example of this configuration, see the "Examples" section.

If the neighbor is using both a session group and a neighbor group and a specific command is configured for the neighbor group but not for the session group, then the configuration for the neighbor group does not take effect. The session group "hides" all address family-independent configuration on the neighbor group and prevents it from being inherited. Similarly, the use of an address family group hides any address family-specific configuration that may otherwise be inherited from a neighbor group for that address family.

In addition to neighbors using groups, it is possible to build a hierarchy by having groups use other groups. The following hierarchical groups are permitted:

- Session groups may use other session groups.
- Address family groups may use other address family groups.
- Neighbor groups may use other neighbor groups.
- Neighbor groups may use session groups and address family groups.

Note

te Within the Cisco IOS XR system configuration architecture, do not combine the **remote-as** command and the **no use neighbor-group** command in the same commit, or the **remote-as** command and the **no use session-group** command in the same commit.

ID	Task ID	Operations
	bgp	read, write

Task

Examples

The following example shows how to define a session group session1 and configure neighbor 172.168.40.24 to use session1. As a result, the session1 configuration takes effect on the neighbor also.

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # session-group session1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # advertisement-interval 40
RP/0/RP0/CPU0:router(config-bgp-sngrp) # timers 30 90
RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.168.40.24
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session1
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session1
```

The following example is similar to the previous example, but in this case the **timers** command on the session group does not take effect on the neighbor because it is overridden by a **timers** command directly configured for the neighbor.

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# session-group session1
RP/0/RP0/CPU0:router(config-bgp-sngrp)# advertisement-interval 40
RP/0/RP0/CPU0:router(config-bgp-sngrp)# timers 30 90
RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.168.40.24
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group session1
RP/0/RP0/CPU0:router(config-bgp-nbr)# timers 60 180
RP/0/RP0/CPU0:router(config-bgp-nbr)# timers 60 180
```

The following example shows an address family group, family1, for IPv4 multicast and a neighbor group, neighbor1, that have IPv4 unicast and IPv4 multicast enabled. In this case, the neighbor inherits IPv4 unicast (and address family-independent) configuration from the neighbor group, but inherits IPv4 multicast configuration from the address family group. In this example, the neighbor group also has a remote autonomous system configured, so there is no need to configure a remote autonomous system for the neighbor because it inherits the remote autonomous system from the neighbor group:

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# af-group family1 address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # route-policy mcast-in in
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor-group neighbor1
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 in
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 out
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bqp-nbrqrp)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 in
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 out
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bqp)# neighbor 172.168.40.24
RP/0/RP0/CPU0:router(config-bgp-nbr)# use neighbor-group neighbor1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# use af-group family1
```

RP/0/RP0/CPU0:router(config-bgp-nbr-af)# exit

In the previous example, the neighbor uses the policy1 route policy for inbound and outbound IPv4 unicast routes, but uses the meast-in route policy for inbound IPv4 multicast routes and no policy for outbound IPv4 multicast routes.

The following example shows a neighbor inheriting configuration from a session group that likewise inherits configuration from another session group. The configuration from both session groups take effect on the neighbor:

RP/0/RP0/CPU0:router(config) # router bgp 1 RP/0/RP0/CPU0:router(config-bgp) # session-group session1 RP/0/RP0/CPU0:router(config-bgp-sngrp) # advertisement-interval 40 RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RP0/CPU0:router(config-bgp-sngrp) # use session-group session1 RP/0/RP0/CPU0:router(config-bgp-sngrp) # update-source Loopback0 RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session2 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session2 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session2 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session2

username (rpki-server)

To specify a SSH **username** for the RPKI cache-server, use the **username** command in rpki-server configuration mode. To remove the username, use the **no** form of this command.

username user-name no username user-name

Syntax Description	<i>user-name</i> Enters a username to be used for the SSH transport mechanism.
Command Default	Username is not configured.
Command Modes	RPKI server configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	The username configuration applies only if the SSH transport mechanism is ac
Task ID	Task Operation ID
	bgp read, write

This example shows how to configure a username (*rpki-user*) for the RPKI cache-server SSH transport mechanism:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 22
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#username rpki-user
```

vrf (BGP)

To configure a VPN routing and forwarding (VRF) instance and enter VRF configuration mode, use the **vrf** command in XR Config mode. To remove the VRF instance from the configuration file and restore the system to its default condition, use the **no** form of this command.

-	Note This feature is not supported.		
	vrf vrf-name no vrf vrf-name		
Syntax Description	<i>vrf-name</i> Name of the VRF instance. The following names cannot be used: all, default, and global.		
Command Default	No default behavior or values		
Command Modes	XR Config mode		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the vrf command to configure a VRF instance. A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.		
Task ID	Task Operations ID		
	bgp read, write		
Examples	The following example shows how to configure a VRF instance and enter VRF configuration mode:		
	RP/0/RP0/CPU0:router(config)# router bgp 1 RP/0/RP0/CPU0:router(config-bgp)# vrf vrf-1 RP/0/RP0/CPU0:router(config-bgp-vrf)#		

weight

To assign a weight to routes received from a neighbor, use the **weight** command in an appropriate configuration mode. To remove the **weight** command from the configuration file and restore the system to its default condition in which the software assigns the default weight to routes, use the **no** form of this command.

weight weight-value
no weight [weight-value]

Syntax Description	weight-value Weight to assign. Range is 0 to 65535.
Command Default	Routes learned through another Border Gateway Protocol (BGP) peer have a default weight of 0 and routes sourced by the local router have a default weight of 32768.
Command Modes	- IPv4 address family group configuration
	IPv6 address family group configuration
	IPv4 neighbor address family configuration
	IPv4 neighbor group address family configuration
	IPv6 neighbor group address family configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	The weight of a route is a Cisco-specific attribute. It is used in the best-path selection process (as the strongest tie-breaker). See the <i>Implementing BGP on</i> module of the <i>BGP Configuration Guide for Cisco NCS 5000 Series Routers</i> for information on best path. If there are two BGP routes with the same network layer reachability information (NLRI), the route with the higher weight is always chosen no matter what the value of other BGP attributes. Weight only has significance on the local router. Weight is assigned locally to the router, is a value that only makes sense to the specific router, is not propagated or carried through any route updates, and never is sent between BGP peers (even within the same AS).

Note If an address family group, neighbor group, or session group is configured, the configuration inside these configuration groups will not be effective unless it is applied directly or indirectly to one or more neighbors.

The weight assigned to individual routes can be further manipulated in the inbound route policy of a neighbor using the **set weight** command. The **set weight** command sets the weight directly. If you have particular neighbors that you want to prefer for most of your outbound traffic, you can assign a higher weight to all routes learned from that neighbor.

The weight assigned to individual routes may be modified by using an inbound routing policy.

Note For weight changes to take effect, you may need to use the clear bgp soft, on page 105 command. If this command configures a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values. Task ID Task **Operations** ID bgp read, write Examples The following example shows how to assign a weight of 50 to all IP Version 4 (IPv4) unicast routes learned through 172.20.16.6: RP/0/RP0/CPU0:router(config) # router bgp 1 RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.16.6 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af) # weight 50 RP/0/RP0/CPU0:router(config-bgp-nbr-af)# exit
