### **Preface**

This preface contains these sections:

- Changes to This Document, on page xiii
- Communications, Services, and Additional Information, on page xiv

### **Changes to This Document**

This table lists the technical changes made to this document since it was first released.

Table 1: Changes to This Document

Date	Summary
August 2024	Republished for Release 24.3.1
March 2024	Republished for Release 24.1.1
August 2023	Republished for Release 7.10.1
November 2022	Republished for Release 7.8.1
July 2022	Republished for Release 7.7.1
November 2021	Republished for Release 7.5.1
October 2021	Republished for Release 7.3.2
July 2021	Republished for Release 7.4.1
February 2021	Republished for Release 7.3.1
August 2020	Republished for Release 7.1.2
August 2020	Republished for Release 7.2.1
August 2019	Republished for Release 7.0.1
May 2019	Republished for Release 6.6.25
March 2019	Republished for Release 6.5.3.

Date	Summary
January 2019	Republished for Release 6.5.2
December 2018	Republished for Release 6.6.1
August 2018	Republished for Release 6.5.1.
July 2018	Republished for Release 6.4.2
March 2018	Republished for Release 6.4.1
March 2018	Republished for Release 6.3.2
September 2017	Republished for Release 6.3.1
July 2017	Republished for Release 6.2.2
March 2017	Republished for Release 6.2.1
February 2017	Republished for Release 6.1.3
August 2016	Republished for Release 6.1.2
July 2016	Republished for Release 6.0.2.
December 2015	Initial release of this document.

### **Communications, Services, and Additional Information**

- To receive timely, relevant information from Cisco, sign up at Cisco Profile Manager.
- To get the business impact you're looking for with the technologies that matter, visit Cisco Services.
- To submit a service request, visit Cisco Support.
- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit Cisco DevNet.
- To obtain general networking, training, and certification titles, visit Cisco Press.
- To find warranty information for a specific product or product family, access Cisco Warranty Finder.

#### **Cisco Bug Search Tool**

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.

### **Trustworthy Systems Commands**

This module describes the commands related to trustworthy systems on Cisco IOS XR7 software.

For detailed information about the key components that form the trustworthy security systems, see the *Implementing Trustworthy Systems* chapter in the *System Security Configuration Guide for Cisco NCS 5500* Series Routers.

- show platform security integrity log, on page 2
- show platform security attest, on page 3

### show platform security integrity log

To display the security integrity logs for the router, use the **show platform security integrity log** command in XR EXEC mode.

show platform security integrity log { boot location location-name | runtime file-location
| secure-boot status location location-name }

Syntax Description	boot	Displays boot integrity logs	
,			
	runtime	Displays integrity measurement architecture (IMA) logs	
	secure-boot	Displays information related to secure boot	
Command Default	None		
command Modes	XR EXEC		
Command History	Release		Modification
	Release 7.1	0.1	The command was modified to include the secure boot status.
	Release 7.0	0.12	This command was introduced.
Jsage Guidelines		does not support this secure boot verification functionality	
Usage Guidelines Task ID	If the router <i>Supported</i> .		
	If the router <i>Supported</i> . Task Opt	does not support this secure boot verification functionality erations d,	
Fask ID	If the router Supported. Task Ope ID system rea wri	does not support this secure boot verification functionality erations d,	y, then the status is displayed as <i>No</i>
Fask ID	If the router Supported. Task Opt ID system rea wri This examp? Router#sho	does not support this secure boot verification functionality erations d, ite	y, then the status is displayed as <i>No</i>
Fask ID	If the router Supported. Task Ope ID system rea wri This examp Router#sho Wed Aug 10	does not support this secure boot verification functionality erations d, ite le shows how to verify the secure boot status of the router: w platform security integrity log secure-boot status 15:39:17.871 UTC	y, then the status is displayed as <i>No</i>
	If the router Supported. Task Ope ID system rea wri This examp Router#sho Wed Aug 10	does not support this secure boot verification functionality erations d, ite le shows how to verify the secure boot status of the router: w platform security integrity log secure-boot status 15:39:17.871 UTC	y, then the status is displayed as <i>No</i>

### show platform security attest

To allow the operator to cryptographically verify the Platform Configuration Registers (PCRs) and attest with the device Attestation Identity Key (AIK), use the **show platform security attest** command in XR EXEC mode.

**show platform security attest** { pcr 0/1 { location all | | trustpoint ciscoaik nonce nonce value } | certificate { ciscoaik | | ciscosudi } }

Syntax Description	attest	The attest keyword is used with either pcr or certificate keywords.
	pcr	The pcr keyword takes the index number 0 or 1 as an argument. PCRs return the pcr-index and pcr-value of the specified node.
	certificate	The certificate keyword takes ciscoaik or ciscosudi as an argument.
	ciscoaik	The ciscoaik keyword returns the Cisco AIK Root, Cisco AIK CA, and Cisco AIK certificates. The AIK is a Certificate Enrollment Specification used to certify the trustworthiness of a router.
	ciscosudi	The ciscosudi keyword returns the Cisco SUDI Root, Cisco SUDI CA, and Cisco SUDI certificates. The Secure Unique Device Identifier (SUDI) is a secure device identity in an X.509v3 certificate that maintains the product identifier and serial number.
	trustpoint	Cisco AIK certificate to be used for the PCR quote.
	Optional keywords for ciscoaik and ciscosudi	<ul> <li>json</li> <li>location all</li> <li>nonce nonce value</li> </ul>
Command Default	None	
Command Modes	XR EXEC	
Command History	Release	Modification
	Release 7.4.1	This command was introduced.
Usage Guidelines	If the router does not supported.	ort this secure attest verification functionality, then the status is displayed as Not
Task ID	Task Operations ID	
	system read, write	

#### Examples

This example shows the truncated output of the certificates used to attest the trustworthiness of a router:

RP/0/RP0/CPU0:NCS-540-C-LNT#show platform security attest certificate ciscoaik Thu Apr 11 06:09:57.026 UTC

+----+
Node location: node0\_RP0\_CPU0
+-----+
Certificate name: Cisco AIK Root
-----BEGIN CERTIFICATE----MIIDITCCAgmgAwIBAgIJAZozWHjOFSHBMA0GCSqGSIb3DQEBCwUAMC0xDjAMBgNV
-----END CERTIFICATE----Certificate name: Cisco AIK CA
-----BEGIN CERTIFICATE----MIIEXzCCA0egAwIBAgIJCsCKAlbCuHJDMA0GCSqGSIb3DQEBCwUAMC0xDjAMBgNV

----END CERTIFICATE-----

Certificate name: Cisco AIK ----BEGIN CERTIFICATE----MIIEFjCCAv6gAwIBAgIDGGJ9MA0GCSqGSIb3DQEBCwUAMCkxFzAVBgNVBAMTDkF0

```

# Authentication, Authorization, and Accounting Commands

This module describes the commands used to configure authentication, authorization, and accounting (AAA) services.

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

For detailed information about AAA concepts, configuration tasks, and examples, see the Configuring AAA Services chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

Note

Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

I

### aaa accounting

To create a method list for accounting, use the **aaa accounting** command in the XR EXEC mode. To remove a list name from the system, use the **no** form of this command.

aaa accounting {commands | exec | mobile | network | subscriber | system } {default | list-name}
{start-stop | stop-only} {non e | method}
no aaa accounting {commands | exec | mobile | network} {default | list-name}

Syntax Description	commands	Enables accounting for XR EXEC shell commands.
	exec	Enables accounting of a XR EXEC session.
	mobile	Enables Mobile IP related accounting events.
	network	Enables accounting for all network-related service requests, such as Internet Key Exchange (IKE) and Point-to-Point Protocol (PPP).
	subscriber	Sets accounting lists for subscribers.
	system	Enables accounting for all system-related events.
	event manager	Sets the authorization list for XR EXEC.
	default	Uses the listed accounting methods that follow this keyword as the default list of methods for accounting services.
	list-name	Character string used to name the accounting method list.
	start-stop	Sends a "start accounting" notice at the beginning of a process and a "stop accounting" notice at the end of a process. The requested user process begins regardless of whether the "start accounting" notice was received by the accounting server.
	stop-only	Sends a "stop accounting" notice at the end of the requested user process.
		Note: This is not supported with system accounting.
	none	Uses no accounting.
	method	Method used to enable AAA system accounting. The value is one of the following options:
		<ul> <li>group tacacs+—Uses the list of all TACACS+ servers for accounting.</li> <li>group radius—Uses the list of all RADIUS servers for accounting.</li> </ul>
	_	• group <i>named-group</i> —Uses a named subset of TACACS+ or RADIUS servers for accounting, as defined by the aaa group server tacacs+ or aaa group server radius command.
Command Default	AAA account	ing is disabled.
Command Modes	XR EXEC mo	de

Relea	ase		Modification		
Relea	ase 6.0		This command was introduced.		
Use the <b>aaa accounting</b> command to create default or named method lists defining specific accounting methods and that can be used on a per-line or per-interface basis. You can specify up to four methods in the method list. The list name can be applied to a line (console, aux, or vty template) to enable accounting on that particular line					
report	ts user activity to		S+ and RADIUS methods for accounting. The router m of accounting records, which are stored on the security		
Method lists for accounting define the way accounting is performed, enabling you to designate a particular security protocol that is used on specific lines or interfaces for particular types of accounting services.					
user p sends	process. For more a "start accounti	e accounting, you can include ing" notice at the beginning of	vord to send a "stop accounting" notice after the requested the <b>start-stop</b> keyword, so that TACACS+ or RADIUS f the requested process and a "stop accounting" notice nly on the TACACS+ or RADIUS server.		
		ocess begins regardless of who	ether the "start accounting" notice was received by the

The list name can be applied to a line (console, a line.         The Cisco IOS XR software supports both TACACC reports user activity to the security server in the form server.         Method lists for accounting define the way account security protocol that is used on specific lines or inthe For minimal accounting, include the stop-only keyw user process. For more accounting, you can include sends a "start accounting" notice at the beginning of after the process. The accounting record is stored of The requested user process begins regardless of whaccounting server.         Note       This command cannot be used with TACACS         Task       Operations		

Examples

The following example shows how to define a default commands accounting method list, where accounting services are provided by a TACACS+ security server, with a stop-only restriction:

RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# aaa accounting commands default stop-only group tacacs+

#### aaa accounting system default

To enable authentication, authorization, and accounting (AAA) system accounting, use the **aaa accounting system default** command in the XR Config mode. To disable system accounting, use the **no** form of this command.

aaa accounting system default {start-stop | stop-only} {none | method} no aaa accounting system default

**Syntax Description** start-stop Sends a "start accounting" notice during system bootup and a "stop accounting" notice during system shutdown or reload.

stop-only Sends a "stop accounting" notice during system shutdown or reload.

**none** Uses no accounting.

*method* Method used to enable AAA system accounting. The value is one of the following options:

• group tacacs+—Uses the list of all TACACS+ servers for accounting.

- group radius—Uses the list of all RADIUS servers for accounting.
- group *named-group*—Uses a named subset of TACACS+ or RADIUS servers for accounting, as defined by the aaa group server tacacs+ or aaa group server radius command.
- **Command Default** AAA accounting is disabled.

Command Modes XR Config mode

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines System accounting does not use named accounting lists; you can define only the default list for system accounting.

The default method list is automatically applied to all interfaces or lines. If no default method list is defined, then no accounting takes place.

You can specify up to four methods in the method list.

		t method list is applied for all interfaces for authentication, except when a diffe icitly specified—in which case the explicitly specified method list overrides th			

Ś Note • The group tacacs+, group radius, and group group-name forms of this command refer to a set of previously defined TACACS+ or RADIUS servers. • Use the **tacacs-server host** or **radius-server host** command to configure the host servers. • Use the aaa group server tacacs+ or aaa group server radius command to create a named subset of servers. • The login keyword, local option, and group option are available only in Admin Configuration modeSystem Admin Config mode. Task ID Task **Operations** ID aaa read, write **Examples** The following example shows how to specify the default method list for authentication, and also enable authentication for console in XR Config mode:

For console and vty access, if no authentication is configured, a default of local method is applied.

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# aaa authentication login default group tacacs+

### aaa authorization (XR-VM)

To create a method list for authorization, use the **aaa authorization** command in the XR Config mode. To disable authorization for a function, use the **no** form of this command.

aaa authorization { commands | eventmanager | exec | network | subscriber | nacm } { default
list-name } { none | local | prefer-external | only-external | group { tacacs + | radius group-name
} }
no aaa authorization { commands | eventmanager | exec | network | subscriber | nacm } {
default list-name }

Syntax Description	commands	Configures authorization for all XR EXEC mode shell commands.
	eventmanager	Applies an authorization method for authorizing an event manager (fault manager).
	exec	Configures authorization for an interactive (XR EXEC mode) session.
	network	Configures authorization for network services, such as PPP or Internet Key Exchange (IKE).
	subscriber	Sets the authorization lists for the subscriber.
	default	Uses the listed authorization methods that follow this keyword as the default list of methods for authorization.
	list-name	Character string used to name the list of authorization methods.
	none	Uses no authorization. If you specify <b>none</b> , no subsequent authorization methods is attempted. However, the task ID authorization is always required and cannot be disabled.
	local	Uses local authorization.
		While this method of authorization is already supported, it is available for command authorization only from Cisco IOS XR Software Release 7.5.1 and later.
	prefer-external	Adds the external group names to the list of local group names to determine the access control rules.
	only-external	Uses the external group names to determine the access control rules.
	group tacacs+	Uses the list of all configured TACACS+ servers for authorization.
	group radius	Uses the list of all configured RADIUS servers for authorization. This method of authorization is not available for command authorization.
	group group-name	Uses a named subset of TACACS+ or RADIUS servers for authorization as defined by the <b>aaa group server tacacs</b> + or <b>aaa group server radius</b> command.
Command Default	Authorization is dis	sabled for all actions (equivalent to the method <b>none</b> keyword).
Command Modes	XR Config mode	

Command History	Release	Modification
	Release 7.5.1	The command was modified to make the <b>local</b> option available for command authorization as well.
	Release 7.4.1	NACM <b>prefer-external</b> and <b>only-external</b> keywords are introduced.
	Release 6.0	This command was introduced.

**Usage Guidelines** 

Use the **aaa authorization** command to create method lists defining specific authorization methods that can be used on a per-line or per-interface basis. You can specify up to four methods in the method list.

Ś Note

The command authorization mentioned here applies to the one performed by an external AAA server and *not* for task-based authorization.

Method lists for authorization define the ways authorization will be performed and the sequence in which these methods will be performed. A method list is a named list describing the authorization methods (such as TACACS+), in sequence. Method lists enable you to designate one or more security protocols for authorization, thus ensuring a backup system in case the initial method fails. Cisco IOS XR software uses the first method listed to authorize users for specific network services; if that method fails to respond, Cisco IOS XR software selects the next method listed in the method list. This process continues until there is successful communication with a listed authorization method or until all methods defined have been exhausted.

Note

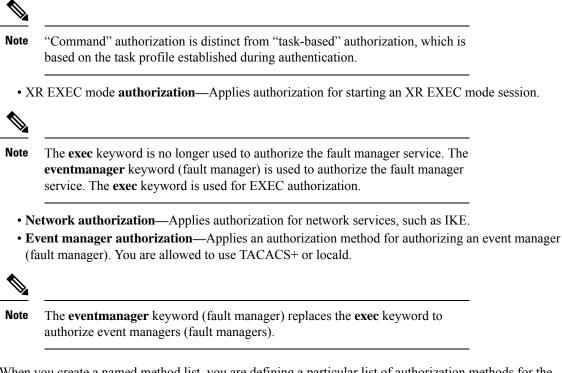

Cisco IOS XR software attempts authorization with the next listed method only when there is no response (not a failure) from the previous method. If authorization fails at any point in this cycle—meaning that the security server or local username database responds by denying the user services—the authorization process stops and no other authorization methods are attempted.

The Cisco IOS XR software supports the following methods for authorization:

- **none**—The router does not request authorization information; authorization is not performed over this line or interface.
- local—Use the local database for authorization.
- group tacacs+—Use the list of all configured TACACS+ servers for authorization.
- group radius—Use the list of all configured RADIUS servers for authorization.
- group group-name—Uses a named subset of TACACS+ or RADIUS servers for authorization.

Method lists are specific to the type of authorization being requested. Cisco IOS XR software supports four types of AAA authorization:

 Commands authorization—Applies to the XR EXEC mode commands a user issues. Command authorization attempts authorization for all XR EXEC mode commands.

When you create a named method list, you are defining a particular list of authorization methods for the indicated authorization type. When defined, method lists must be applied to specific lines or interfaces before any of the defined methods are performed.

To know more about command authorization using local user account feature which was introduced in Cisco IOS XR Software Release 7.5.1, see the *Configuring AAA Services* chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

Task ID	Task Operations ID
	aaa read, write
Examples	The following example shows how to define the network authorization method list named listname1, which specifies that TACACS+ authorization is used:
	Router# configure Router(config)# aaa authorization commands listname1 group tacacs+
	The following examples show how to configure command authorization using local user account:
	Router# <b>configure</b> Router(config)# <b>aaa authorization commands default group tacacs+ local</b> Router(config)# <b>commit</b>
	or
	Router(config) #aaa authorization commands default local
	Router(config)#commit

### aaa authorization (System Admin-VM)

To create command rules and data rules on System Admin VM for user authorization, use the **aaa authorization** command in Admin Configuration modeSystem Admin Config mode. To delete the command rules and data rules, use the **no** form of this command.

aaa authorization { cmdrules cmdrule { *integer* | range *integer* } [ action *action-type* | command *cmd-name* | context *context-name* | group *group-name* | ops *ops-type* ] | commands group { none | tacacs } | datarules datarule { *integer* | range *integer* } [ action *action-type* | context *context-name* | group *group-name* | keypath *keypath-name* | namespace *namespace-string* | ops *ops-type* ] }

Syntax Description	cmdrules	Configures command rules.	
	cmdrule integer	Specifies the command rule number.	
	range integer	Specifies the range of the command rules or data rules to be configured.	
	action	Specifies whether users are permitted or not allowed to perform the operation specified for the <b>ops</b> keyword.	
	action-type	Specifies the action type for the command rule or data rule.	
		Available options are: accept, accept_log and reject.	
	command cmd-name	Specifies the command to which the command rule applies. The command must be entered within double-quotes.	
		Example, <b>get</b> .	
	context context-name	Specifies to which type of connection the command rule or data rule applies. The connection type can be netconf, cli, or xml.	
	group group-name	Specifies the group to which the command rule or data rule applies.	
		Example, <b>admin-r</b> .	
	ops ops-type	Specifies whether the user has read, execute, or read and execute permissions for the command.	
		Available options for command rules are: $\mathbf{r}$ , rx, and $\mathbf{x}$ .	
		To know the available options for data rules, use a ? after the <b>ops</b> keyword.	
	commands group	Sets the command authorization lists for server groups.	
		Available options are <b>none</b> that specifies no authorization and <b>tacacs</b> that specifies use of the list of all tacacs+ hosts.	
	datarules	Configures data rules.	
	datarule integer	Specifies the data rule number.	
	keypath	Specifies the keypath of the data element. If you enter an asterisk '*' for keypath, it indicates that the command rule is applicable to all configuration data.	

	<b>namespace</b> Enter asterisk "*" to indicate that the data rule is applicable for all namespace values.			
Command Default	None			
Command Modes	Admin Configuration modeSystem Admin Config mode			
Command History	Release Modification			
	Release This command was introduced. 6.0			
Usage Guidelines	From Cisco IOS XR Software Release 7.4.1 and later, the system internally maps the users configured on the XR VM to System Admin VM of the router, based on the task table of the user on the XR VM. With this feature, NETCONF and gRPC users can access the admin-related information on the router even if their user profiles do not exist on System Admin VM. For a sample configuration, see the example section.			
	For more details, see the <i>Configuring AAA Services</i> chapter in the <i>System Security Configuration Guide for Cisco NCS 5500 Series Routers</i> .			
	This example shows how to create a command rule:			
	sysadmin-vm:0_RP0#config sysadmin-vm:0_RP0(config)#aaa authorization cmdrules cmdrule 10 action accept command "show platform" context cli group group1 ops rx			
	This example shows how to create a data rule:			
	<pre>sysadmin-vm:0_RP0#config sysadmin-vm:0_RP0(config)#aaa authorization datarules datarule 20 action accept context cli group group10 keypath * namespace * ops rwx</pre>			
	This example shows how to configure a command rule for a NETCONF or gRPC session to allow read access for <b>admin-r</b> group users:			
	sysadmin-vm:0_RP0(config) #aaa authorization cmdrules cmdrule 6 context netconf command get			

group admin-r ops rx action accept

### aaa default-taskgroup

To specify a task group for both remote TACACS+ authentication and RADIUS authentication, use the aaa default-taskgroup command in the XR Config mode. To remove this default task group, enter the no form of this command.

aaa default-taskgroup taskgroup-name no aaa default-taskgroup

Syntax Description	taskg	<i>roup-name</i> Na	of an existing task group.
Command Default	No de	fault task grou	assigned for remote authentication.
Command Modes	XR Co	onfig mode

**Examples** 

The following example shows how to configure certificate-based authentication for users configured in the TACACS+ Server or Server Groups:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# aaa enable-cert-authentication
RP/0/RP0/CPU0:router(config)# aaa authorization exec default group tacacs+ local
RP/0/RP0/CPU0:router(config)# commit

#### aaa group server radius

To group different RADIUS server hosts into distinct lists, use the **aaa group server radius** command in the XR Config mode. To remove a group server from the configuration list, enter the **no** form of this command.

aaa group server radius group-name no aaa group server radius group-name

**Syntax Description** group-name Character string used to name the group of servers.

**Command Default** This command is not enabled.

Command Modes XR Config mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

Usage Guidelines

Use the **aaa group server radius** command to group existing server hosts, which allows you to select a subset of the configured server hosts and use them for a particular service. A server group is used in conjunction with a global server-host list. The server group lists the IP addresses or hostnames of the selected server hosts.

Server groups can also include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and User Datagram Protocol (UDP) port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific authentication, authorization, and accounting (AAA) service. In other words, this unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service, for example, accounting, the second host entry acts as an automatic switchover backup to the first host entry. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry on the same device for accounting services. The RADIUS host entries are tried in the order in which they are configured in the server group.

All members of a server group must be the same type, that is, RADIUS.

The server group cannot be named radius or tacacs.

This command enters server group configuration mode. You can use the server command to associate a particular RADIUS server with the defined server group.

Task IDTask<br/>IDOperations<br/>operationsaaaread,<br/>write

Examples

The following example shows the configuration of an AAA group server named radgroup1, which comprises three member servers:

L

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# aaa group server radius radgroup1
RP/0/RP0/CPU0:router(config-sg-radius)# server 10.0.0.5 auth-port 1700 acct-port 1701
RP/0/RP0/CPU0:router(config-sg-radius)# server 10.0.0.10 auth-port 1702 acct-port 1703
RP/0/RP0/CPU0:router(config-sg-radius)# server 10.0.0.20 auth-port 1705 acct-port 1706
```

```
Note
```

If the **auth-port** *port-number* and **acct-port** *port-number* keywords and arguments are not specified, the default value of the *port-number* argument for the **auth-port** keyword is 1645 and the default value of the *port-number* argument for the **acct-port** keyword is 1646.

### aaa group server tacacs+

To group different TACACS+ server hosts into distinct lists, use the **aaa group server tacacs**+ command in the XR Config mode. To remove a server group from the configuration list, enter the **no** form of this command.

aaa group server tacacs+ group-name no aaa group server tacacs+ group-name

**Syntax Description** group-name Character string used to name a group of servers.

**Command Default** This command is not enabled.

**Command Modes** XR Config mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

**Usage Guidelines** The AAA server-group feature introduces a way to group existing server hosts. The feature enables you to select a subset of the configured server hosts and use them for a particular service.

The **aaa group server tacacs**+ command enters server group configuration mode. The **server** command associates a particular TACACS+ server with the defined server group.

A *server group* is a list of server hosts of a particular type. The supported server host type is TACACS+ server hosts. A server group is used with a global server host list. The server group lists the IP addresses or hostnames of the selected server hosts.

The server group cannot be named radius or tacacs.

**Note** Group name methods refer to a set of previously defined TACACS+ servers. Use the **tacacs-server host** command to configure the host servers.

From Cisco IOS XR Software Release 7.4.1 and later, you can configure a hold-down timer for TACACS+ server. For details, see the **holddown-time** command.

Task ID	Task ID	Operations
	aaa	read, write

**Examples** 

The following example shows the configuration of an AAA group server named tacgroup1, which comprises three member servers:

RP/0/RP0/CPU0:router# configure

### aaa password-policy

To define a AAA password security policy, use the **aaa password-policy** command in XR Config mode. To remove the AAA password security policy, use the **no** form of this command.

aaa password-policy policy-name { authen-max-attempts authen-max-attempts | lifetime { years | months | days | hours | minutes | seconds } lifetime | lockout-time { days | hours | minutes | seconds } lockout-time | lower-case lower-case | max-length max-length | min-char-change min-char-change | min-length min-length | numeric numeric | restrict-consecutive-characters { english-alphabet | qwerty-keyboard } num-of-chars [cyclic-wrap] | special-char special-char | upper-case }

Syntax Description	policy-name	Specifies the name of the password, in characters.
	authen-max-attempts	Specifies, in integer, the maximum number of authentication failure attempts allowed for a user, in order to restrict users who authenticate with invalid login credentials.
	lifetime	Specifies the maximum lifetime for the password, the value of which is specified in integer, as years, months, days, hours, minutes or seconds.
	lockout-time	Specifies, in integer, the duration (in days, hours, minutes or seconds) for which the user is locked out when he exceeds the maximum limit of authentication failure attempts allowed.
	lower-case	Specifies the number of lower case alphabets allowed in the password policy, in integer.
	max-length	Specifies the maximum length of the password, in integer.
	min-char-change	Specifies the number of character change required between subsequent passwords, in integer.
	min-length	Specifies the maximum length of the password, in integer.
	numeric	Specifies the number of numerals allowed in the password policy, in integer.
	restrict-consecutive-characters	Restricts consecutive characters (that includes regular English alphabets, and English alphabets from QWERTY keyboard layout and numbers), for user passwords and secrets.
	special-char	Specifies the number of special characters allowed in the password policy, in integer.
	upper-case	Specifies the number of upper case alphabets allowed in the password policy, in integer.
Command Default	None

### deadtime (server-group configuration)

To configure the deadtime value at the RADIUS server group level, use the **deadtime** command in server-group configuration mode. To set deadtime to 0, use the **no** form of this command.

deadtime minutes no deadtime

Syntax Description *minutes* Length of time, in minutes, for which a RADIUS server is skipped over by transaction requests, up to a maximum of 1440 (24 hours). The range is from 1 to 1440.

Command Default	Deadtime is set to 0.
-----------------	-----------------------

Command Modes	Server-group configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.

The value of the deadtime set in the server groups overrides the deadtime that is configured globally. If the **Usage Guidelines** deadtime is omitted from the server group configuration, the value is inherited from the primary list. If the server group is not configured, the default value of 0 applies to all servers in the group. If the deadtime is set to 0, no servers are marked dead.

ID	Task ID	Operations	
	aaa	read, write	

Examples

The following example specifies a one-minute deadtime for RADIUS server group group1 when it has failed to respond to authentication requests for the **deadtime** command:

RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # aaa group server radius group1 RP/0/RP0/CPU0:router(config-sg-radius)# server 10.1.1.1 auth-port 1645 acct-port 1646 RP/0/RP0/CPU0:router(config-sg-radius) # server 10.2.2.2 auth-port 2000 acct-port 2001 RP/0/RP0/CPU0:router(config-sg-radius)# deadtime 1

### description (AAA)

To create a description of a task group or user group during configuration, use the **description** command in task group configuration or user group configuration mode. To delete a task group description or user group description, use the **no** form of this command.

description *string* no description

Syntax Description	string Character string describing the task group or user group.	
Command Default	None	
Command Modes	Task group configuration	
	User group configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	Use the <b>description</b> command inside the task or user group configure for the task or user group, respectively.	aration submode to define a description
Task ID	Task Operations	

aaa read, write

Examples

The following example shows the creation of a task group description:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# taskgroup alpha
RP/0/RP0/CPU0:router(config-tg)# description this is a sample taskgroup

The following example shows the creation of a user group description:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# usergroup alpha
RP/0/RP0/CPU0:router(config-ug)# description this is a sample user group

# group (AAA)

		o a group, use the <b>group</b> command in username configuration mode. To remove the user from e <b>no</b> form of this command.
	sysadmingro no group {c	support   maintenance   netadmin   operator   provisioning   retrieve   root-lr   serviceadmin up-name} isco-support   maintenance   netadmin   operator   provisioning   retrieve   root-lr     sysadmingroup-name}
Syntax Description	cisco-support	Adds the user to the predefined Cisco support personnel group.
		<b>Note</b> Starting from IOS XR 6.0 release, the cisco-support group is combined with the root-system group. This means a user who is part of the root-system group can also access commands that are included in the cisco-support group.
	maintenance	Adds the user to the predefined maintenance group.
	netadmin	Adds the user to the predefined network administrators group.
	operator	Adds the user to the predefined operator group.
	provisioning	Adds the user to the predefined provisioning group.
	retrieve	Adds the user to the predefined retrieve group.
	root-lr	Adds the user to the predefined root-lr group. Only users with root-lr authority may use this option.
	serviceadmin	Adds the user to the predefined service administrators group.
	sysadmin	Adds the user to the predefined system administrators group.
	group-name	Adds the user to a named user group that has already been defined with the <b>usergroup</b> command.
Command Default	None	
Command Modes	Username con	figuration
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	U .	command in username configuration mode. To access username configuration mode, use the bage 118 command in XR Config mode.
	If the <b>group</b> concerning the second	mmand is used in Admin Configuration modeSystem Admin Config mode, only cisco-support be specified.

The privileges associated with the cisco-support group are now included in the root-system group. The cisco-support group is no longer required to be used for configuration.

)	Task ID	Operations
	aaa	read, write

**Examples** 

The following example shows how to assign the user group operator to the user named user1:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# username user1
RP/0/RP0/CPU0:router(config-un)# group operator

### holddown-time (TACACS+)

To specify a duration for which an unresponsive TACACS+ server is to be marked as down, and not be used for sending further client requests for that duration, use the **holddown-time** command in various configuration modes. To disable this feature, use the **no** form of this command or configure the hold down timer value as zero.

holddown-time time

time         Specifies the hold-down timer value, in seconds.           The range is from 0 to 1200. Zero indicates that the hold-down timer feature is disable.					
Command Default	By default, the TACACS+ hold-down timer is disabled.				
Command Modes	TACACS server				
	TACACS+ server group				
	TACACS+ private server				
Command History	Release	Modification			
	Release 7.4.1	This command was introduced			
Usage Guidelines	_				

#### Usage Guidelines

**Note** To set the hold-down timer at global level, use the **tacacs-server holddown-time** command in XR Config mode.

While selecting the timer at various configuration levels, the system gives preference to the one which is more specific to the server. That is, the server-level timer has the highest precedence, followed by server group-level and finally, the global-level.

Also, see the *Guidelines for Configuring Hold-Down Timer for TACACS+* section in the *Configuring AAA* Services chapter in the System Security Configuration Guide for Cisco NCS 5500 Series Routers.

Task ID

ID	Task ID	Operations
	aaa	read, write

#### **Examples**

This example shows how to mark an unresponsive TACACS+ server as being down, and not to use it for sending further client requests for a duration of 35 seconds:

L

Router(config)#tacacs-server host 10.105.236.102 port 2020 Router(config-tacacs-host) #holddown-time 35

This example shows how to set a hold-down timer at global level:

```
Router#configure
Router(config) #tacacs-server holddown-time 30
```

This example shows how to set a hold-down timer at server-group level:

```
Router#configure
Router(config) #aaa group server tacacs+ test-group
Router(config-sg-tacacs) #holddown-time 40
```

This example shows how to set a hold-down timer at private server level:

```
Router(config) #aaa group server tacacs+ test-group
Router(config-sg-tacacs)#server-private 10.105.236.109 port 2020
Router(config-sg-tacacs-private) #holddown-time 55
Router(config-sg-tacacs-private) #commit
```

### **Related Commands**

### radius-server dead-criteria time

To specify the minimum amount of time, in seconds, that must elapse from the time that the router last received a valid packet from the RADIUS server to the time the server is marked as dead, use the **radius-server dead-criteria time** command in XR Config mode. To disable the criteria that were set, use the **no** form of this command.

radius-server dead-criteria time seconds no radius-server dead-criteria time seconds

Syntax Description seconds Length of time, in seconds. The range is from 1 to 120 seconds. If the seconds argument is not configured, the number of seconds ranges from 10 to 60, depending on the transaction rate of the server. Note The time criterion must be met for the server to be marked as dead. If this command is not used, the number of seconds ranges from 10 to 60 seconds, depending on the transaction **Command Default** rate of the server. XR Config mode **Command Modes Command History** Modification Release Release 6.0 This command was introduced. **Usage Guidelines** 

**Note** If you configure the **radius-server dead-criteria time** command before the **radius-server deadtime** command, the **radius-server dead-criteria time** command may not be enforced.

If a packet has not been received since the router booted and there is a timeout, the time criterion is treated as though it were met.

 Task ID
 Task Operations

 ID
 aaa
 read, write

**Examples** 

The following example shows how to establish the time for the dead-criteria conditions for a RADIUS server to be marked as dead for the **radius-server dead-criteria time** command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# radius-server dead-criteria time 5

### radius-server dead-criteria tries

To specify the number of consecutive timeouts that must occur on the router before the RADIUS server is marked as dead, use the **radius-server dead-criteria tries** command in the XR Config mode. To disable the criteria that were set, use the **no** form of this command.

radius-server dead-criteria tries no radius-server dead-criteria tries

**Syntax Description** *tries* Number of timeouts from 1 to 100. If the *tries* argument is not configured, the number of consecutive timeouts ranges from 10 to 100, depending on the transaction rate of the server and the number of configured retransmissions.

Note The tries criterion must be met for the server to be marked as dead.

**Command Default** If this command is not used, the number of consecutive timeouts ranges from 10 to 100, depending on the transaction rate of the server and the number of configured retransmissions.

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

 Usage Guidelines
 If the server performs both authentication and accounting, both types of packet are included in the number.

Improperly constructed packets are counted as though they were timeouts. All transmissions, including the initial transmit and all retransmits, are counted.

Note If you configure

XR Config mode

If you configure the **radius-server dead-criteria tries** command before the **radius-server deadtime** command, the **radius-server dead-criteria tries** command may not be enforced.

 Task ID
 Task ID
 Operations

 ID
 aaa
 read, write

**Examples** 

**Command Modes** 

The following example shows how to establish the number of tries for the dead-criteria conditions for a RADIUS server to be marked as dead for the **radius-server dead-criteria tries** command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# radius-server dead-criteria tries 4

# radius-server deadtime (BNG)

Dead time is set to 0.

To improve RADIUS response times when some servers are unavailable and cause the unavailable servers to be skipped immediately, use the **radius-server deadtime** command in the XR Config mode. To set deadtime to 0, use the **no** form of this command.

radius-server deadtime value no radius-server deadtime value

Syntax DescriptionvalueLength of time, in minutes, for which a RADIUS server is skipped over by transaction requests, up<br/>to a maximum of 1440 (24 hours). The range is from 1 to 1440. The default value is 0.

**Command Modes** XR Config mode

**Command Default** 

Command HistoryReleaseModificationRelease 6.0This command was introduced.

**Usage Guidelines** A RADIUS server marked as dead is skipped by additional requests for the duration of minutes unless all other servers are marked dead and there is no rollover method.

sk ID	Task ID	Operations
	aaa	read,
		write

**Examples** This example specifies five minutes of deadtime for RADIUS servers that fail to respond to authentication requests for the **radius-server deadtime** command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# radius-server deadtime 5

### radius-server host

To specify a RADIUS server host, use the **radius-server host** command in the Global Configuration mode. To delete the specified RADIUS host, use the **no** form of this command.

**radius-server host** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*] [**dtls-server trustpoint** *string*] [**radsec-server trustpoint** *string*]

Syntax Description	ip-address	IP address of the RADIUS server host.
		IPv6 address is not supported.
	auth-port port-number	(Optional) Specifies the RADIUS authentication port for authentication requests; the host is not used for authentication if set to 0.
	acct-port port-number	(Optional) Specifies the RADIUS accounting port for accounting requests; the host is not used for accounting if set to 0.
	timeout seconds	(Optional) The time interval (in seconds) that the router waits for the RADIUS server to reply before retransmitting. This setting overrides the global value of the <b>radius-server timeout</b> command. If no timeout value is specified, the global value is used. Enter a value in the range from 1 to 1000. The default is 5.
	retransmit retries	(Optional) The number of times a RADIUS request is resent to a server, if that server is not responding or is responding slowly. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used. Enter a value in the range from 1 to 100. The default is 3.
	key string	(Optional) Specifies the authentication and encryption key used between the router and the RADIUS server. This key overrides the global setting of the <b>radius-server</b> <b>key</b> command. If no key string is specified, the global value is used.
		The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <b>radius-server host</b> command syntax. This is because the leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks themselves are part of the key.
	dtls-server trustpoint	(Optional) Specifies the details for RADIUS over DTLS support.
	string	The trustpoint is a text string that matches the Trustpoint to be used for RADIUS over DTLS configuration.
		The default destination port for RADIUS over DTLS is UDP 2083 for authentication and accounting.
	radsec-server	(Optional) Specifies the details for RADIUS over TLS support.
	trustpoint string	The trustpoint is a text string that matches the Trustpoint to be used for RADIUS over TLS configuration.
		The default destination port for RADIUS over TLS is TCP 2083 for authentication and accounting.
		and accounting.

Examples	This ex	ample shows how	to set t	the cleartext key to "samplekey":	

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# radius-server key 0 samplekey

This example shows how to set the encrypted shared key to "anykey":

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# radius-server key 7 anykey

### radius-server retransmit (BNG)

To specify the number of times the Cisco IOS XR software retransmits a packet to a server before giving up, use the **radius-server retransmit** command in the XR Config mode. The **no** form of this command sets it to the default value of 3.

radius-server retransmit {retries disable}
no radius-server retransmit {retries disable}

Syntax Description	retries Maximum number of retransmission attempts. The range is from 1 to 100. Default is 3.		
	disable Disables the radius-server transmit	t command.	
Command Default	The RADIUS servers are retried three times	s, or until a response is received.	
Command Modes	XR Config mode		
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	The RADIUS client tries all servers, allowi	ng each one to time out before increasing the retransmit cour	
Task ID	Task Operations

### restrict-consecutive-characters

To restrict consecutive characters (that includes regular English alphabets, and English alphabets from QWERTY keyboard layout and numbers), for user passwords and secrets, use the **restrict-consecutive-characters** command in *aaa password-policy* configuration mode. To disable the feature, use the **no** form of the command.

restrict-consecutive-characters { english-alphabet | qwerty-keyboard } num-of-chars [cyclic-wrap]

Syntax Description	english-alphabet	Restricts consecutive English alphabets for user passwords and secrets.			
		For example, "abcd", "wxyz", and so on.			
	qwerty-keyboard	Restricts consecutive English alphabets from QWERTY keyboard layout and numbers, for user passwords and secrets.			
		For example, "qwer", "mnbv", "7890", and so on.			
	num-of-chars	Specifies the number of consecutive characters to be restricted for user passwords and secrets.			
		Range is 2 to 26, for english-alphabet.			
		Range is 2 to 10, for <b>qwerty-keyboard</b> .			
	cyclic-wrap	Restricts cyclic wrapping of the alphabet or the number for user passwords and secrets.			
		For example, "yzab", "opqw", "9012", and so on.			
Command Default	Disabled, by defaul	lt.

### secret

To configure an encrypted or clear-text password for the user, use the **secret** command in username configuration mode or line template configuration mode. To remove this configuration, use the **no** form of this command.

secret [0 [enc-type enc-type-value] | 5 | 8 | 9 | 10] secret-login no secret

Syntax Description	0 (Optional) Specifies that an unencrypted (clear-text) password follows. The password will be encrypted for storage in the configuration using an MD5 encryption algorithm. Otherwise, the password is not encrypted.						
	5 Specifies that an encrypted MD5 password (secret) follows.						
	8	8(Optional) Specifies that SHA256-encrypted password follows.9(Optional) Specifies that scrypt-encrypted password follows.					
	9						
	10						
	secret-login						
		Can b	<ul><li>Can be up to 253 characters in length.</li><li>Note The characters entered must conform to MD5 encryption standards.</li></ul>				
		Note					
	enc-type	-type (Optional) Configures the encryption type for a password entered in clear text.					
	enc-type-value	Speci	fies the encryption type to be used.				
Command Default	<ul> <li>No password is specified.</li> <li>Username configuration</li> <li>Line template configuration</li> </ul>						
Command Modes							
Command History	Release			Modification			
	Release 6.0			This command was introduced.			
	Release 7.0.1			Added the support for Type 8 (SHA256), Type 9 (scrypt) and Type 10 (SHA512) encryption for <b>secret</b> configuration.			
	Release 7.0.1			Added the support for <b>enc-type</b> option under <b>secret 0</b> to specify the type of encryption for password entered in clear-text format.			

Usage GuidelinesFrom Release 7.0.1 and later, Type 10 encryption is applied as the default encryption type for the secret on<br/>Cisco IOS XR 64-bit operating systems. Prior to this, Type 5 (MD5) was the default one.Prior to Release 7.0.1, Cisco IOS XR software allows you to configure only Message Digest 5 (MD5) encryption<br/>for username logins and passwords. MD5 encryption is a one-way hash function that makes reversal of an

encrypted password impossible, providing strong encryption protection. Using MD5 encryption, you cannot retrieve clear-text passwords. Therefore, MD5 encrypted passwords cannot be used with protocols that require the clear-text password to be retrievable, such as Challenge Handshake Authentication Protocol (CHAP).

Prior to Release 7.0.1, you can specify only one of two types of secure secret IDs: encrypted (5) or clear text (0). If you do not select either 0 or 5, the clear-text password you enter is not encrypted.

When an XR EXEC mode process is started on a line that has password protection, the process prompts for the secret. If the user enters the correct secret, the process issues the prompt. The user can try entering the secret thrice before the terminal returns to the idle state.

Secrets are one-way encrypted and should be used for login activities that do not require a decryptable secret.

To verify that MD5 password encryption has been enabled, use the **show running-config** command. The "username name secret 5" line in the command output indicates the same.

Note

te The show running-config command does not display the login password in clear text when the **0** option is used to specify an unencrypted password. See the "Examples" section.

 Task ID
 Task Operations ID

 aaa
 read, write

 Examples
 The following example shows how to establish the clear-text secret "lab" for the user user2:

 RP/0/RP0/CPU0:router# configure

 RP/0/RP0/CPU0:router (configure

 RP/0/RP0/CPU0:router (configure

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# username user2
RP/0/RP0/CPU0:router(config-un)# secret 0 lab
RP/0/RP0/CPU0:router(config-un)# commit
RP/0/RP0/CPU0:router(config-un)# show running-config
Building configuration...
username user2
secret 5 $1$DTmd$q7C6fhzje7Cc7Xzmu2Frx1
```

! end

The following examples show how to configure a Type 10 (SHA512) password for the user, *user10*. You can also see the examples and usage of the username, on page 118 command.

You can specify Type as '10' under the **secret** keyword, to explicitly configure Type 10 password.

```
Router#configure
Router(config)#username user10 secret 10
$6$9UvJidvsTEqgkAPU$3CL1Ei/F.E4v/Hi.UaqLwX8UsSEr9ApG6c5pzhMJmZtgW4jObAQ7meAwyhu5VM/aRFJqe/jxZG17h6xPrvJWf1
Router(config-un)#commit
```

You can also use the **enc-type** keyword under the **secret 0** option, to specify Type 10 as the encryption for a password entered in clear text.

Router#configure

Router(config) #username user10 secret 0 enc-type 10 testpassword Router(config-un) #commit

#### Authentication, Authorization, and Accounting Commands

### server (RADIUS)

To associate a particular RADIUS server with a defined server group, use the **server** command in RADIUS server-group configuration mode. To remove the associated server from the server group, use the **no** form of this command.

server ip-address [auth-port port-number] [acct-port port-number]
no server ip-address [auth-port port-number] [acct-port port-number]

Syntax Description	ip-address	IP address of the RADIUS server host.		
	auth-port port-number(Optional) Specifies the User Datagram Protocol (UDP) destination port for authentication requests. The port-number argument specifies the port number authentication requests. The host is not used for authentication if this value is s 0. Default is 1645.			
	acct-port port-number	(Optional) Specifies the UDP destination port for accounting requests. The <i>port-number</i> argument specifies the port number for accounting requests. The host is not used for accounting services if this value is set to 0. Default is 1646.		
Command Default	If no port attributes are	defined, the defaults are as follows:		
	<ul><li>Authentication por</li><li>Accounting port: 1</li></ul>			
Command Modes	RADIUS server-group of	configuration		
Command History	Release	Modification		
	Release 6.0	This command was introduced.		
Usage Guidelines	Use the <b>server</b> command to associate a particular RADIUS server with a defined server group.			
	There are two different ways in which you can identify a server, depending on the way you want to offer AAA services. You can identify the server simply by using its IP address, or you can identify multiple host instances or entries using the optional <b>auth-port</b> and <b>acct-port</b> keywords.			
	When you use the optional keywords, the network access server identifies RADIUS security servers and host instances associated with a group server based on their IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS host entries providing a specific AAA service. If two different host entries on the same RADIUS server are configured for the same service, for example, accounting, the second host entry configured acts as an automatic switchover backup to the first one. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order they are configured.)			

Task ID	Task Operations ID	
	aaa read, write	
Examples	The following example shows how to use two different host entries on the same RADIUS server that are configured for the same services—authentication and accounting. The second host entry configured acts as switchover backup to the first one.

I

### server (TACACS+)

To associate a particular TACACS+ server with a defined server group, use the **server** command in TACACS+ server-group configuration mode. To remove the associated server from the server group, use the **no** form of this command.

server {hostnameip-address}
no server {hostnameip-address}

Syntax Description	hostne	ame Character	string used to name the server host.	
	ip-ada	lress IP addres	s of the server host.	
Command Default	None			
Command Modes	TACACS+ server-group configuration		oup configuration	
Command History	Relea	se		Modification
	Relea	se 6.0		This command was introduced.
Task ID	Task	Operations	onfigure authentication, authorization, and a	accounting (AAA).
	ID aaa	read, write		

### server-private (RADIUS)

To configure the IP address of the private RADIUS server for the group server, use the **server-private** command in RADIUS server-group configuration mode. To remove the associated private server from the AAA group server, use the **no** form of this command.

server-private *ip-address* [auth-port *port-number*] [acct-port *port-number*] [timeout *seconds*] [retransmit *retries*] [key *string*] no server-private *ip-address* [auth-port *port-number*] [acct-port *port-number*] [timeout *seconds*] [retransmit *retries*] [key *string*]

Syntax Description	ip-address	IP address of the RADIUS server host.		
	<b>auth-port</b> port-number	(Optional) Specifies the User Datagram Protocol (UDP) destination port for authentication requests. The <i>port-number</i> argument specifies the port number for authentication requests. The host is not used for authentication if this value is set to 0. The default value is 1645.		
	<b>acct-port</b> port-number	(Optional) Specifies the UDP destination port for accounting requests. The <i>port-number</i> argument specifies the port number for accounting requests. The host is not used for accounting services if this value is set to 0. The default value is 1646.		
	timeout seconds	(Optional) Specifies the number of seconds the router waits for the RADIUS server to reply before retransmitting. The setting overrides the global value of the <b>radius-server timeout</b> command. If no timeout is specified, the global value is used. The <i>seconds</i> argument specifies the timeout value in seconds. The range is from 1 to 1000. If no timeout is specified, the global value is used.		
	<b>retransmit</b> <i>retries</i> (Optional) Specifies the number of times a RADIUS request is resent to a sthe server is not responding or is responding slowly. The setting overrides the setting of the <b>radius-server transmit</b> command.			
		The <i>retries</i> argument specifies the retransmit value. The range is from 1 to 100. If no retransmit value is specified, the global value is used.		
	key string	(Optional) Specifies the authentication and encryption key that is used between the router and the RADIUS daemon running on the RADIUS server. This key overrides the global setting of the <b>radius-server key</b> command. If no key string is specified, the global value is used.		
Command Default	If no port attributes are defined, the defaults are as follows: • Authentication port: 1645 • Accounting port: 1646			
Command Modes	RADIUS server-grou	ip configuration		
Command History	Release	Modification		
	Release 6.0	This command was introduced.		

# **Usage Guidelines** Use the **server-private** command to associate a particular private server with a defined server group. Possible overlapping of IP addresses between VRF instances are permitted. Private servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (for example, default radius server group) can still be referred to by IP addresses and port numbers. Thus, the list of servers in server groups includes references to the hosts in the configuration and the definitions of private servers.

Both the **auth-port** and **acct-port** keywords enter RADIUS server-group private configuration mode.

Task ID	Operations	
aaa	read, write	
	ID	

#### **Examples**

The following example shows how to define the group1 RADIUS group server, to associate private servers with it, and to enter RADIUS server-group private configuration mode:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# aaa group server radius group1
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 timeout 5
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 retransmit 3
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 key coke
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 auth-port 300
RP/0/RP0/CPU0:router(config-sg-radius-private)# exit
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 timeout 5
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 retransmit 3
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 key coke
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 auth-port 300
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 key coke
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 auth-port 300
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 key coke
```

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# aaa group server radius group1
RP/0/RP0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 auth-port 300
RP/0/RP0/CPU0:router(config-sg-radius-private)# exit
(config-sg-radius)# server-private 10.2.2.2 auth-port 300
RP/0/RP0/CPU0:router(config-sg-radius-private)#
```

### server-private (TACACS+)

To configure the IP address of the private TACACS+ server for the group server, use the **server-private** command in TACACS+ server-group configuration mode. To remove the associated private server from the AAA group server, use the **no** form of this command.

server-private {hostnameip-address} [holddown-time time][port port-number] [timeout seconds]
[key string]
page comparison private (hostnamein address)

**no server-private** {*hostnameip-address*}

Syntax Description	hostname	Character string used to name the server host.				
	<i>ip-address</i> IP address of the TACACS+ server host. Both IPv4 and IPv6 addresses are supported. <b>holddown-time</b> timeSpecifies a duration, in seconds, for which an unresponsive TACACS+ server is to be marked as DOWN.					
	port port-number	(Optional) Specifies a server port number. This option overrides the default, which is port 49. Valid port numbers range from 1 to 65535.				
	timeout seconds	timeout seconds(Optional) Specifies, in seconds, a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server. This option overrides the global timeout value set with the tacacs-server timeout command for only this server. The range is from 1 to 1000. The default is 5.				
	key string	(Optional) Specifies the authentication and encryption key that is used between the router and the TACACS+ daemon running on the TACACS+ server. This key overrides the global setting of the <b>tacacs-server key</b> command. If no key string is specified, the global value is used.				
	Command Default	The <i>port-name</i> argument, if not specified, defaults to the standard port 49.				
	The seconds argument, if not specified, defaults to 5 seconds.					
Command Modes	TACACS+ server-gro	oup configuration				
Command History	Release	Modification				
	Release 6.0	This command was introduced.				
	Release 7.4.1	This command was modified to include <b>holddown-time</b> option.				
Usage Guidelines	overlapping of IP add addresses) can be def	te command to associate a particular private server with a defined server group. Possible dresses between VRF instances are permitted. Private servers (servers with private ined within the server group and remain hidden from other groups, while the servers in xample, default tacacs+ server group) can still be referred by IP addresses and port				

I

numbers. Therefore, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

For details on TACACS+ hold-down timer, see the holddown-time command.

		write

**Examples** 

This example shows how to define the myserver TACACS+ group server, to associate private servers with it, and to enter TACACS+ server-group private configuration mode:

```
RP/0/RP0/CPU0:router# configure
```

```
RP/0/RP0/CPU0:router(config)# aaa group server tacacs+ myserver
RP/0/RP0/CPU0:router(config-sg-tacacs+)# server-private 10.1.1.1 timeout 5
RP/0/RP0/CPU0:router(config-sg-tacacs+)# server-private 10.1.1.1 key a_secret
RP/0/RP0/CPU0:router(config-sg-tacacs+)# server-private 10.1.1.1 port 51
RP/0/RP0/CPU0:router(config-sg-tacacs-private)# exit
RP/0/RP0/CPU0:router(config-sg-tacacs+)# server-private 10.2.2.2 timeout 5
RP/0/RP0/CPU0:router(config-sg-tacacs+)# server-private 10.2.2.2 key coke
RP/0/RP0/CPU0:router(config-sg-tacacs+)# server-private 10.2.2.2 port 300
RP/0/RP0/CPU0:router(config-sg-tacacs-private)#
```

### show aaa (XR-VM)

To display information about an Internet Key Exchange (IKE) Security Protocol group, user group, local user, login traces, or task group; to list all task IDs associated with all IKE groups, user groups, local users, or task groups in the system; or to list all task IDs for a specified IKE group, user group, local user, or task group, use the **show aaa** command in the XR EXEC mode.

show aaa {ikegroup ikegroup-name | login trace | usergroup [usergroup-name] | trace | userdb
[username] | task supported | taskgroup [root-lr | netadmin | operator | sysadmin | root-system |
service-admin | cisco-support | taskgroup-name]}

Syntax Description	ikegroup	Displays details for all IKE groups.	
	ikegroup-name	(Optional) IKE group whose details are to be displayed.	
	login trace	Displays trace data for login subsystem.	
	usergroup	Displays details for all user groups.	
	root-lr	(Optional) Usergroup name.	
	netadmin	(Optional) Usergroup name.	
	operator	(Optional) Usergroup name.	
	sysadmin	(Optional) Usergroup name.	
	root-system	(Optional) Usergroup name.	
	cisco-support	(Optional) Usergroup name.(Optional) Usergroup name.Displays trace data for AAA subsystem.Displays details for all local users and the usergroups to which each user belongs.	
	usergroup-name		
	trace		
	userdb		
	username	(Optional) User whose details are to be displayed.	
	task supported	Displays all AAA task IDs available.	
	taskgroup	Displays details for all task groups.	
		<b>Note</b> For taskgroup keywords, see optional usergroup name keyword list.	
	taskgroup-name	(Optional) Task group whose details are to be displayed.	
Command Default	Details for all us	er groups, or all local users, or all task groups are listed if no argument is entered.	
Command Modes	XR EXEC mode

      0 ms latest rtt
```

This table describes the significant fields shown in the display.

Table 6: show radius server-groups Field Descriptions

Field	Description
Server	Server IP address/UDP destination port for authentication requests/UDP destination port for accounting requests.

### show tacacs

To display information about the TACACS+ servers that are configured in the system, use the **show tacacs** command in the XR EXEC mode.

	show tacaes			
Syntax Description	This con	nmand has no keywords or arguments.		
Command Default	None			
Command Modes	- XR EXE	EC mode		
Command History	Release Modification			
	Release	: 6.0	This command was introduced.	
Usage Guidelines	Use the	show tacacs command to display statistics for each	configured TACACS+ server.	
Task ID	Task ID	Operations		
	aaa	read		
Examples	The follo	owing is sample output from the show tacacs comma	and:	
	RP/0/RP0/CPU0:router# show tacacs			
	For IPv4 IP addresses: Server:10.1.1.1/21212 opens=0 closes=0 aborts=0 errors=0 packets in=0 packets out=0 status=up single-connect=false			
	Server:	10.2.2.2/21232 opens=0 closes=0 aborts=0 err packets in=0 packets out=0 status=up single-connect=false	cors=0	
	For IPv Server:	es=0 aborts=0 errors=0		
	This tab	le describes the significant fields shown in the displa	y.	
	Table 7: show tacacs Field Descriptions			
	Field	Description		
	Server	Server IP address.		
	opens	Number of socket opens to the external server.		

Field	Description
closes	Number of socket closes to the external server.
aborts	Number of tacacs requests that have been terminated midway.
errors	Number of error replies from the external server.
packets in	Number of TCP packets that have been received from the external server.
packets out	Number of TCP packets that have been sent to the external server.

### show tacacs server-groups

To display information about the TACACS+ server groups that are configured in the system, use the **show tacacs server-groups** command in the XR EXEC mode.

show tacacs server-groups

Syntax Description	<b>n</b> This command has no keywords or arguments.		
Command Default	- None		
Command Modes	- XR EXEC mode		
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Use the show tacacs server-groups command to display information about each configured TACA group, including the group name, numbers of servers in the group, and a list of servers in the nam group. A global list of all configured TACACS+ servers is also displayed.		s of servers in the group, and a list of servers in the named server	
Task ID	Task Operations ID		
	aaa read		
Examples	The following is sample output from the s	how tacacs server-groups command:	
	RP/0/RP0/CPU0:router# show tacacs s	erver-groups	
	Global list of servers Server 192.168.25.61/23456 Server 192.168.49.12/12345 Server 192.168.49.12/9000 Server 192.168.25.61/23432 Server 10.5.5.5/23456 Server 10.1.1.1/49 Server group `tac100' has 1 servers Server 192.168.49.12		
	This table describes the significant fields	shown in the display.	
	Table 8: show tacacs server-groups Field Descriptic	Ins	

Field	Description
Server	Server IP address.

### show user

To display all user groups and task IDs associated with the currently logged-in user, use the **show user** command in the XR EXEC mode.

show user [all | authentication | group | tasks]

Syntax Description	all	(Optional) Displays all user groups and task IDs for the currently logged-in	n user.	
	authentication	<b>n</b> (Optional) Displays authentication method parameters for the currently log	gged-in user.	
	group	(Optional) Displays the user groups associated with the currently logged-in	n user.	
	tasks	(Optional) Displays task IDs associated with the currently logged-in user. Th indicates which task is reserved in the sample output.	e <b>tasks</b> keyword	
	When the <b>show user</b> command is used without any option, it displays the ID of the user who is logged in currently.			
Command Modes	XR EXEC mod	de		
Command History	Release	Modification		
	Release 6.0	This command wa	s introduced.	
Task ID	Task Operation	tions		
	The following s command:	sample output displays the authentication method parameters from the show	user	
	RP/0/RP0/CPU0	0:router# show user authentication method		
	local			
	The following s	sample output displays the groups from the <b>show user</b> command:		
	RP/0/RP0/CPU0	0:router# show user group		
	root-system			
	The following s user command:	sample output displays all the information for the groups and tasks from the l:	show	

RP/0/RP0/CPU0:router# show user all
Username: lab
Groups: root-system

## show aaa user-group

To display user group information for AAA sub-system, use the **show aaa user-group** command in the System Admin EXEC mode. You must have a group aaa-r or root-system on System Admin VM.

	show	aaa user-gi	
Syntax Description	This co	ommand has	ywords or arguments.
Command Default	None		
Command Modes	System	Admin EX	ode
Command History	Releas	se	Modification
	Releas	se 6.0	This command was introduced.
Usage Guidelines	No spe	cific guidelin	apact the use of this command.
Task ID	Task ID	Operation	
	aaa	read	
	This is	the sample of	of the show aaa user-group command:
	-	nin-vm:0_RP ov 3 13:3	<b>w aaa user-group</b> 380 UTC

User group : root-system
sysadmin-vm:0\_RP0#

## show tech-support aaa

To collect AAA debug and trace files from System Admin VM, use the **show tech-support aaa** command in the System Admin EXEC mode.

#### show tech-support aaa

Syntax Description	This command has	no keywords or arguments.	
Command Default	None		
Command Modes	System Admin EX	EC mode	
Command History	Release		Modification
	Release 6.0		This command was introduced.
Usage Guidelines	No specific guidel	nes impact the use of this comm	and.
Task ID	Task Operation		
	aaa read		
	This is the sample	output of the show tech-support	<b>t aaa</b> command:

#### single-connection

To multiplex all TACACS+ requests to this server over a single TCP connection, use the **single-connection** command in TACACS host configuration mode. To disable the single TCP connection for all new sessions that use a separate connection, use the **no** form of this command.

single-connection no single-connection

Syntax Description	This command	has no keywor	ds or arguments.
--------------------	--------------	---------------	------------------

**Command Default** By default, a separate connection is used for each session.

Command Modes TACACS host configuration

Command History	Release	Modification
	Release 6.0	This command was introduced.

**Usage Guidelines** The **single-connection** command allows the TACACS+ server to handle a greater number of TACACS operations than would be possible if multiple TCP connections were used to send requests to a server.

The TACACS+ server that is being used must support single-connection mode for this to be effective; otherwise, the connection between the network access server and the TACACS+ server locks up or you can receive unauthentic errors.

# Task IDTask<br/>IDOperations<br/>operationsaaaread,<br/>write

**Examples** 

The following example shows how to configure a single TCP connection to be made with the TACACS+ server (IP address 209.165.200.226) and all authentication, authorization, accounting requests to use this TCP connection. This works only if the TACACS+ server is also configured in single-connection mode. To configure the TACACS+ server in single connection mode, refer to the respective server manual.

RP/0/RP0/CPU0:router(config)# tacacs-server host 209.165.200.226 RP/0/RP0/CPU0:router(config-tacacs-host)# single-connection

101

## single-connection-idle-timeout

To set the idle timeout value for the single TCP connection to the TACACS+ server, use the **single-connection-idle-timeout** command in *tacacs-server host* configuration mode. To remove the configuration or to disable the idle timeout for the single connection, use the **no** form of this command.

single-connection-idle-timeout time-in-seconds

	single-	connectio	m-nuie-timeo	at une-m-seconds			
Syntax Description	time-in	n-seconds	Specifies the	single connection timeout value, in seconds.			
			The range is:				
			• 500 to 72	200 (prior to Cisco IOS XR Software Release 7.3.2/Release 7.4.1)			
		<ul> <li>5 to 7200 (from Cisco IOS XR Software Release 7.3.2/Release 7.4.1, and later)</li> </ul>					
Command Default	Single	connectio	n idle timeout	is not set, by default.			
Command Modes	tacacs-s	tacacs-server host					
Command History	Releas	se N	Aodification				
	Releas	se 7.3.2 T	This command	was modified to change the timeout range.			
	Release 7.4.1						
	Release 6.6.3 This command was introduced.						
Usage Guidelines	No spec	cific guid	elines impact	the use of this command.			
Task ID	Task ID	Operatio	ons				
	aaa	read, write					
Examples		ample sh		t an idle timeout value of 60 seconds for the single TCP connections			
	RP/0/R	.P0/CPU0:	router(conf	ig)# <b>tacacs-server host 209.165.200.226</b> ig-tacacs-host)# <b>single-connection-idle-timeout 60</b> ig-tacacs-host)# <b>commit</b>			
Related Commands	Comma	and		Description			
	single-	connectio	n, on page 100	Multiplexes all TACACS+ requests to the server over a single TCI connection.			

#### tacacs-server host

To specify a TACACS+ host server, use the **tacacs-server host** command in XR Config mode. To delete the specified name or address, use the **no** form of this command.

tacacs-server host host-name [holddown-time time][port port-number] [timeout seconds
] [key [0 | 7] auth-key] [single-connection]
[single-connection-idle-timeout time-in-seconds]
no tacacs-server host host-name [port port-number]

Syntax Description	host-name	Host or domain name or IP address of the TACACS+ server.				
	holddown-time time	Specifies a duration, in seconds, for which an unresponsive TACACS+ server is to be marked as DOWN.				
		The range is from 0 to 1200. Zero indicates that the hold-down timer feature is disabled.				
	<b>port</b> port-number	(Optional) Specifies a server port number. This option overrides the default, which is port 49. Valid port numbers range from 1 to 65535.				
	timeout seconds	(Optional) Specifies a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server. This option overrides the global timeout value set with the <b>tacacs-server timeout</b> command for this server only. The valid timeout range is from 1 to 1000 seconds. Default is 5.				
		Note: You can use this parameter only in the config-tacacs-host sub-mode.				
	<b>key</b> [ <b>0</b>   <b>7</b> ] <i>auth-key</i>	(Optional) Specifies an authentication and encryption key shared between the AAA server and the TACACS+ server. The TACACS+ packets are encrypted using this key. This key must match the key used by the TACACS+ daemon. Specifying this key overrides the key set by the <b>tacacs-server key</b> command for this server only.				
		(Optional) Entering <b>0</b> specifies that an unencrypted (clear-text) key follows.				
		(Optional) Entering 7 specifies that an encrypted key follows.				
		The <i>auth-key</i> argument specifies the unencrypted key between the AAA server and the TACACS+ server.				
		Note: You can use this parameter only in the config-tacacs-host sub-mode.				
	single-connection	(Optional) Multiplexes all TACACS+ requests to this server over a single TCP connection. By default, a separate connection is used for each session.				
		Note: You can use this parameter only in the config-tacacs-host sub-mode.				

I

	single-	-connection-idle-timeo	ut (Optional) Specifies the single connection idle timeout value, in seconds.
	time-ir	n-seconds	The range is:
			• 500 to 7200 (prior to Cisco IOS XR Software Release 7.3.2/Release 7.4.1)
			• 5 to 7200 (from Cisco IOS XR Software Release 7.3.2/Release 7.4.1, and later)
Command Default	No TA	CACS+ host is specific	ed.
	The po	<i>rt-name</i> argument, if n	ot specified, defaults to the standard port 49.
	The sec	conds argument, if not	specified, defaults to 5 seconds.
	Single	connection idle timeou	t is not set, by default.
Command Modes	- XR Co	nfig mode	
Command History	Releas	Se	Modification
	Releas	se 7.4.1	This command was modified to include <b>holddown-time</b> option.
	Releas	se 7.3.2	This command was modified to
	Releas	se 7.4.1	change the range for <b>single-connection-idle-timeout</b> .
	Releas	se 6.6.3	This command was modified to include <b>single-connection-idle-timeout</b> option.
	Releas	se 6.0	This command was introduced.
Usage Guidelines	searche	es for hosts in the order	<b>rerver host</b> commands to specify additional hosts. Cisco IOS XR software in which you specify them.
	For det	ails on TACACS+ hole	d-down timer, see the <b>holddown-time</b> command.
Task ID	Task ID	Operations	
	aaa	read, write	
Examples	The fol	lowing example shows	how to specify a TACACS+ host with the IP address 209.165.200.226:
		PO/CPU0:router(conf PO/CPU0:router(conf	ig)# <b>tacacs-server host 209.165.200.226</b> ig-tacacs-host)#

The following example shows that the default values from the tacacs-server host command are displayed from the **show run** command:

```
RP/0/RP0/CPU0:router# show run
Building configuration...
!! Last configuration change at 13:51:56 UTC Mon Nov 14 2005 by lab
tacacs-server host 209.165.200.226 port 49
timeout 5
!
```

The following example shows how to specify that the router consult the TACACS+ server host named host1 on port number 51. The timeout value for requests on this connection is 30 seconds; the encryption key is a\_secret.

```
RP/0/RP0/CPU0:router(config) # tacacs-server host host1 port 51
RP/0/RP0/CPU0:router(config-tacacs-host)# timeout 30
RP/0/RP0/CPU0:router(config-tacacs-host)# key a_secret
```

#### 6 Related Commands .

Command	Description
holddown-time (TACACS+), on page 36	Specifies a duration for which an unresponsive TACACS+ server is to be marked as down.
key (TACACS+), on page 40	
single-connection, on page 100	
single-connection-idle-timeout, on page 101	Sets the idle timeout value for the single TCP connection to the TACACS+ server.

#### tacacs-server key

To set the authentication encryption key used for all TACACS+ communications between the router and the TACACS+ daemon, use the **tacacs-server key** command in XR Config mode. To disable the key, use the **no** form of this command.

tacacs-server key {0 clear-text-key | 7 encrypted-keyauth-key} no tacacs-server key {0 clear-text-key | 7 encrypted-keyauth-key}

Syntax Description	0 clear-text-key	Specifies an unencrypted (cleartext) shared key.					
	7 encrypted-key	7 encrypted-key Specifies an encrypted shared key.					
	auth-key	Specifies the unencrypted key between the AAA server and the TACACS+ server.					
Command Default	None						
Command Modes	XR Config mode						
Command History	Release	Modification					
	Release 6.0	This command was introduced.					
Usage Guidelines	that have no indiv If you use spaces are part of the key	ered must match the key used on the TACACS+ daemon. The key name applies to all servers idual keys specified. All leading spaces are ignored; spaces within and after the key are not. in your key, do not enclose the key in quotation marks unless the quotation marks themselves <i>y</i> . valid only when the following guidelines are followed:					
		<i>xt-key</i> argument must be followed by the <b>0</b> keyword. <i>ed-key</i> argument must be followed by the <b>7</b> keyword.					
		ver key is used only if no key is configured for an individual TACACS server. Keys individual TACACS server always override this global key configuration.					
Task ID	Task Operation ID	 IS					
	aaa read, write	_					
Examples	The following ex	ample sets the authentication and encryption key to key1:					
	RP/0/RP0/CPU0:	router(config)# <b>tacacs-server key key1</b>					

#### tacacs-server timeout

To set the interval that the server waits for a server host to reply, use the **tacacs-server timeout** command in XR Config mode. To restore the default, use the **no** form of this command.

tacacs-server timeout seconds no tacacs-server timeout seconds

Syntax Description	seconds Integer that specifies the timeout interval (in seconds) from 1 to 1000.		
Command Default	5 seco	nds	
Command Modes	- XR Co	onfig mode	
Command History	Relea	se	Modification
	Releas	se 6.0	This command was introduced.
Usage Guidelines	The TACACS+ server timeout is used only if no timeout is configured for an individual TACACS+ server. Timeout intervals configured for an individual TACACS+ server always override this global timeout configuration.		
Task ID	Task ID	Operations	
	aaa	read, write	
Examples	The fo	llowing examp	le shows the interval timer being changed to 10 seconds:
	DD (0 /-		en (config) # toose comen timeent 10

RP/0/RP0/CPU0:router(config)# tacacs-server timeout 10

I

#### tacacs-server ipv4

To set the Differentiated Services Code Point (DSCP), which is represented by the first six bits in the Type of Service (ToS) byte of the IP header, use the **tacacs-server ipv4** command in XR Config mode.

tacacs-server ipv4 dscp dscp-value

Syntax Description	ipv4	Specifies the dscp bit for the IPv4 packets.
	dscp	Sets the DSCP in the IP header.
	dscp-value	Specifies the options for setting the value of DSCP. The available options are:
		<ul> <li>&lt;0-63&gt; Differentiated services codepoint value</li> </ul>
		• af11 Match packets with AF11 dscp (001010)
		• af12 Match packets with AF12 dscp (001100)
		• af13 Match packets with AF13 dscp (001110)
		• af21 Match packets with AF21 dscp (010010)
		• af22 Match packets with AF22 dscp (010100)
		• af23 Match packets with AF23 dscp (010110)
		• af31 Match packets with AF31 dscp (011010)
		• af32 Match packets with AF32 dscp (011100)
		• af33 Match packets with AF33 dscp (011110)

abc

#### task

To add a task ID to a task group, use the **task** command in task group configuration mode. To remove a task ID from a task group, use the **no** form of this command.

task{read | write | execute | debug}taskid-namenotask{read | write | execute | debug}taskid-name

Syntax Description	read Enables read-only privileges for the named task ID.						
	write	Enables write privileges for the named task	k ID. The term "write" implies read also.				
	execute Enables execute privileges for the named task ID.						
	debug	Enables debug privileges for the named ta	sk ID.				
	taskid-name	Name of the task ID.					
Command Default	No task IDs	are assigned to a newly created task group.					
Command Modes	Task group c	onfiguration					
Command History	Release Modification						
	Release 6.0		This command was introduced.				
Usage Guidelines	Use the <b>task</b> command in task group configuration mode. To access task group configuration mode, use the <b>taskgroup</b> command in global configuration mode.						
	Task IDs are the base of command authorization. Only users who have the required permissions can execute a particular command on the router. To execute a command, the user must be part of a user group that consists of task group(s) that includes required task IDs and privileges. Cisco IOS XR software supports multiple task IDs. For example, <b>aaa</b> , <b>config-services</b> , <b>crypto</b> , <b>system</b> , and so on. To see the list of task IDs available for the user, use the <b>show user tasks</b> command.						
	as <b>read</b> , <b>wri</b>	te, execute, and debug) that denote the per	e task IDs, and their corresponding operations (su missions required to execute those commands. Yo permissions that are required to execute a particu	ou			
	For example, the following output shows that the user needs <b>aaa</b> task ID with <b>read</b> and <b>write</b> permission to execute the <b>show run aaa</b> command. So, users can execute this command if they belong to a user group associated with a task group that includes this <b>aaa</b> task ID having read and write privileges.						
	Router# <b>describe show run aaa</b> The command is defined in aaa_cmds.parser						
	User needs	ALL of the following taskids:					
	aaa (RI	EAD WRITE)>					
	It will ta}	the following actions:					

```
Wed Mar 16 07:58:01.451 UTC
Spawn the process:
nvgen "-c" "-q" "gl/aaa/"
Router#
```

Root users (users in **root-Ir** or **root-system** user group) have all task IDs, and hence will be able to execute all commands. Also, certain commands might not require any task ID as such to execute it. So, all users will have permission to execute such commands. If you do not have the required permission to execute a command, the command authorization fails. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

A few other examples that describe the commands to list the task ID:

```
Router#describe show interfaces
The command is defined in show interface.parser
show interface.parser
User needs ALL of the following taskids:
   interface (READ) ---->
It will take the following actions:
Thu Mar 17 06:42:08.264 UTC
  Spawn the process:
   show interface "-a"
Router#
Router(config) #describe ssh server
The command is defined in ssh.parser
ssh.parser
User needs ALL of the following taskids:
  crypto (READ WRITE) ----->
It will take the following actions:
  Create/Set the configuration item:
       Path: gl/crypto/ssh/server/sshd/vrf/default
      Value: packed[ 0x1 <string> <string> ]
Router(config)#
```

For more details, see *Configuring AAA Services* chapter in the *System Security Configuration Guide for Cisco* NCS 5500 Series Routers.

ID	Operations
aaa	read, write

Examples

The following example shows how to enable execute privileges for the config-services task ID and associate that task ID with the task group named taskgroup1:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# taskgroup taskgroup1
RP/0/RP0/CPU0:router(config-tg)# task execute config-services

#### taskgroup

To configure a task group to be associated with a set of task IDs, and to enter task group configuration mode, use the **taskgroup** command in XR Config mode. To delete a task group, use the **no** form of this command.

**taskgroup** *taskgroup-name* [**description** *string* | **task** {**read** | **write** | **execute** | **debug**} *taskid-name* | **inherit taskgroup** *taskgroup-name*] **no taskgroup** *taskgroup-name*]

	<u> </u>					
Syntax Description	taskgroup-name	Name of a particular task group.				
	description	(Optional) Enables you to create a description for the named task group.				
	string	(Optional) Character string used for the task group description.				
	task	(Optional) Specifies that a task ID is to be associated with the named task group.				
	read	(Optional) Specifies that the named task ID permits read access only.				
	write (Optional) Specifies that the named task ID permits read and write access only					
	execute (Optional) Specifies that the named task ID permits execute access.					
	<b>debug</b> (Optional) Specifies that the named task ID permits debug access only.					
	<i>taskid-name</i> (Optional) Name of a task: the task ID.					
	inherit taskgroup (Optional) Copies permissions from the named task group.					
	<i>taskgroup-name</i> (Optional) Name of the task group from which permissions are to be inherited.					
Command Default	Five predefined us	ser groups are available by default.				
Command Modes	XR Config mode					
Command History	Release	Modification				
	Release 6.0	This command was introduced.				
Usage Guidelines	referenced in the s	onfigured with a set of task IDs for each action type. Deleting a task group that is still ystem results in a warning and rejection of the deletion. For more details on task IDs, see nes section of the <b>task</b> command.				
	You can use the <b>show user group</b> command in XR Config mode to know the group(s) that the current user is part of. Similarly, you can use the <b>show user all</b> to know the group or task information (such as username, groups, authentication method, task IDs, and so on) of the current user.					
	From global configuration mode, you can display all the configured task groups. However, you cannot display all the configured task groups in taskgroup configuration mode.					
		<b>group</b> command with no keywords or arguments enters task group configuration mode, in the <b>description</b> , <b>inherit</b> , <b>show</b> , and <b>task</b> commands.				

Task ID	Task Operations ID
	aaa read, write
Examples	The following example assigns read bgp permission to the task group named alpha
	RP/0/RP0/CPU0:router# <b>configure</b> RP/0/RP0/CPU0:router(config)# <b>taskgroup alpha</b> RP/0/RP0/CPU0:router(config-tg)# <b>task read bgp</b>

I

### timeout (TACACS+)

To specify a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server, use the **timeout** (TACACS+) command in TACACS host configuration mode. To disable this command and return to the default timeout value of 5 seconds, use the **no** form of this command.

timeout seconds no timeout seconds

Syntax Description	seconds Timeout value (in seconds). The range is from 1 to 1000. If no timeout is specified, the global value is used.		
Command Default	second	<i>ls</i> : 5	
Command Modes	TACA	CS host configu	uration
Command History	Releas	se	Modification
	Releas	se 6.0	This command was introduced.
Usage Guidelines Task ID		meout (TACAC and for this serv  Operations	CS+) command overrides the global timeout value set with the <b>tacacs-server timeout</b> yer only.
	aaa	read, write	
Examples	aaa	write	le shows how to set the number of seconds for the timeout value:

## timeout login response

To set the interval that the server waits for a reply to a login, use the **timeout login response** command in line template configuration mode. To restore the default, use the **no** form of this command.

timeout login response seconds no timeout login response seconds

Syntax Description	seconds Integer that specifies the timeout interval (in seconds) from 0 to 300.		
Command Default	second	<i>ls</i> : 30	
Command Modes	Line to	emplate config	uration
Command History	Relea	se	Modification
	Relea	se 6.0	This command was introduced.
Usage Guidelines	timeou cannot	it value applie	<b>n response</b> command in line template configuration mode to set the timeout value. This is to all terminal lines to which the entered line template is applied. This timeout value line console. After the timeout value has expired, the user is prompted again. The retry s.
Task ID	Task ID	Operations	
	aaa	read, write	
Examples	The fo	llowing exam	ble shows how to change the interval timer to 20 seconds:
	RP/0/1	RP0/CPU0:rou	ter# <b>configure</b> ter(config)# <b>line template alpha</b> ter(config-line)# <b>timeout login response 20</b>

I

#### usergroup

To configure a user group and associate it with a set of task groups, and to enter user group configuration mode, use the **usergroup** command in XR Config mode. To delete a user group, or to delete a task-group association with the specified user group, use the **no** form of this command.

usergroup usergroup-name no usergroup usergroup-name

**Syntax Description** *usergroup-name* Name of the user group. The *usergroup-name* argument can be only one word. Spaces and quotation marks are not allowed.

**Command Default** Five predefined user groups are available by default.

Command Modes XR Config mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

## Usage Guidelines User groups are configured with the command parameters for a set of users, such as task groups. You can remove specific user groups by using the **no** form of the **usergroup** command. You can remove the user group itself by using the **no** form of the command without giving any parameters. Deleting a user group that is still referenced in the system results in a warning and a rejection of the deletion.

Use the inherit usergroup, on page 39 command to copy permissions from other user groups. The user group is inherited by the parent group and forms a union of all task IDs specified in those groups. Circular inclusions are detected and rejected. User groups cannot inherit properties from predefined groups, such as root-system and owner-sdr.

From global configuration mode, you can display all the configured user groups. However, you cannot display all the configured user groups in usergroup configuration mode.

Task ID	Operations
aaa	read, write
	ID

**Examples** 

The following example shows how to add permissions from the user group beta to the user group alpha:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# usergroup alpha
RP/0/RP0/CPU0:router(config-ug)# inherit usergroup beta

#### username

To configure a new user with a username, establish a password, associate a password policy with the user, grant permissions for the user, and to enter username configuration mode, use the **username** command in XR Config mode or Admin Configuration modeSystem Admin Config mode. To delete a user from the database, use the **no** form of this command.

username name [ group name | policy name | [ password-policy name ] { password | masked-password } [ type ] password | { secret | masked-secret } [ type | 0 [ enc-type type ] secret ] ]

**no username** *name* [ **group** *name* | **policy** | **password** | **masked-password** | **secret** | **masked-secret** | **password-policy** *name* [ **masked-password** [ *type* ] *password* ] ]

Syntax Description	name	Name of the user. The <i>name</i> argument can be only one word. Spaces and quotation marks are not allowed.
		The allowed range for a user-defined username is 2-253 characters.
	group name	Enables a user to be associated with a user group, as defined with the <b>usergroup</b> command.
	policy name	Configures a password policy that is common to user password and secret.
	password-policy name	(Optional) Specifies the password policy for cleartext and Type 7 password authentication.
	password	Enables a password to be created for the specified user.
	masked-password	Enables a password to be created for the specified user. When you key in the password, it is not visible on the screen.

type password	Specifies the password type and the password to be keyed in.
	Enter 0 or 7 for the <i>type</i> argument. 0 specifies a cleartext password, and 7 specifies a Type 7 encrypted password.
	If Type 7 encryption is enabled with the <b>password</b> keyword, the password is not visible to the user. The password can be up to 253 characters in length.
	(Optional) type argument
secret	Enables a secret to be created for the specified user.
masked-secret	Enables a secret to be created for the specified user. When you key in the secret, it is not visible on the screen.
type secret	Specifies the secret type and the secret to be keyed in.
	Enter 0, or enter 5, 8, 9, or 10, for the <i>type</i> argument. Details:
	<ul> <li>0 specifies a cleartext secret that will be encrypted for use.</li> </ul>
	<ul> <li>5 specifies a Type 5 password that uses MD5 hashing algorithm.</li> </ul>
	<ul> <li>8 specifies a Type 8 password that uses SHA256 hashing algorithm.</li> </ul>
	<ul> <li>9 specifies a Type 9 password that uses scrypthashing algorithm.</li> </ul>
	• 10 specifies a Type 10 password that uses SHA512 hashing algorithm.
	(Optional) <i>type</i> argument.

	0 enc-type type secret	Specifies that you enter a cleartext secret to be encrypted by a specified encryption method.		
		• 0 specifies that you should enter a cleartext secret.		
		• <b>enc-type</b> specifies that you enter 5, 8, 9, or 10, for the <i>type</i> argument.		
		• Enter the cleartext secret for the <i>secret</i> argument.		
		(Optional) <b>enc-type</b> <i>type</i> keyword-argument combination.		
Command Default	No usernames are defined in the system.			
Command Modes	XR Config mode			
Command Modes	XR Config mode Admin Configuration modeSystem Admin Config mode			
		Modification		
Command Modes Command History	Admin Configuration modeSystem Admin Config mode	Modification This command was introduced.		
	Admin Configuration modeSystem Admin Config mode Release			
	Admin Configuration modeSystem Admin Config mode          Release         Release 6.0	This command was introduced. Added the support for Type 8 (SHA256), Type 9 (scrypt) and Type 10 (SHA512) for <b>secret</b>		

#### **Usage Guidelines**

Note

- A user is never allowed to have cisco-support privileges as the only group.
- From Release 7.0.1 and later, Type 10 (SHA512) is applied as the default type for the **secret** configuration. Prior to this, Type 5 (MD5) was the default one.

Use the **username** command to identify the user and enter username configuration mode. Password and user group assignments can be made from either XR Config mode or username configuration submode. Permissions (task IDs) are assigned by associating the user with one or more defined user groups.

From XR Config mode, you can display all the configured usernames. You can display configured usernames in configuration mode by router(config): **do show run username**.

Each user is identified by a username that is unique across the administrative domain. Each user should be made a member of at least one user group. Deleting a user group may orphan the users associated with that group. The AAA server authenticates orphaned users, but most commands are not authorized.

The **username** command is associated with a particular user for local login authentication by default. Alternatively, a user and password can be configured in the database of the TACACS+ server for TACACS+ login authentication. For more information, see the description of the aaa authentication (XR-VM), on page 13 command.

The predefined group root-system may be specified only by root-system users while administration is configured.

Note

To enable the local networking device to respond to remote Challenge Handshake Authentication Protocol (CHAP) challenges, one **username** command entry must be the same as the hostname entry that has already been assigned to the other networking device.

The following are password masking guidelines for various command forms:

• username name password type password

username name masked-password type password

Enter 0 or 7 for the *type* argument. 0 specifies a cleartext password, and 7 specifies a Type 7 encrypted password.

• secret type secret

masked-secret type secret

Enter 0, or enter 5, 8, 9, or 10, for the *type* argument. 0 specifies a cleartext secret, and 5, 8, 9, and 10 specify a Type 5, Type 8, Type 9, and Type 10 secret, respectively.

• secret 0 enc-type type secret

masked-secret 0 enc-type type secret

Enter 5, 8, 9, or 10, for the type argument.

- masked-password type password
- masked-secret type secret

After specifying the password encryption type, press **Enter** or **return** on your keyboard. The password/secret option appears in the next line. Example:

Router(config) # masked-secret 10

```
Enter secret:
Re-enter secret:
```

## Task ID Task Operations ID aaa read,

write

#### **Examples**

The following example shows the commands available after executing the username command:

RP/0/RP0/CPU0:router# config RP/0/RP0/CPU0:router(config)# username user1 RP/0/RP0/CPU0:router(config-un)# ?

clear	Clear the uncommitted configuration	
commit	Commit the configuration changes to running	
describe	Describe a command without taking real actions	
do	Run an exec command	
exit	Exit from this submode	
group	User group in which this user will be a member of	
no	Negate a command or set its defaults	
password	Specify the password for the user	
policy	Specify the policy common to password and secret for the user	
pwd	Commands used to reach current submode	
root	Exit to the XR Config mode	
secret	Specify the secure password for the user	
show	Show contents of configuration	

RP/0/RP0/CPU0:router(config-un) #

The following example shows how to establish the clear-text password *password1* for the user name *user1*:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# username user1
RP/0/RP0/CPU0:router(config-un)# password 0 password1
```

This example shows how to apply a password policy for the user secret:

```
Router#configure
Router(config)#username user1
Router(config-un)#policy test-policy1
Router(config-un)#secret 10
$6$dmwuW0Ajicf98W0.$y/vzynWF1/OcGxwBwHs79VAy5ZZ1hoHd7TicR4mOo8IIVriYCGAKW0A.w1JvTPO7IbZry.DxHrE3SN2BBzBJe0
Router(config-un)#commit
```

The following example shows how to configure a Type 8 (SHA256) password for the user, *user8*. You can also see the examples and usage of the secret, on page 62 command.

You can specify Type as '8' under the secret keyword, to explicitly configure Type 8 password.

```
Router#configure
Router(config)#username user8 secret 8
$8$ZYKG11dZIw73D1$IUWJOqTLoMyExhsNKoL5vMtvCOYguM5ajXf4uGeQj6I
Router(config-un)#commit
```

This example shows how to configure Type 9 password:

```
Router#configure
Router(config)#username user9 secret 9
$9$/rIQL1B3rp1RBL$oS2fLWKFYH6B/kApxkkXmIqbPAHpRZkPEoh3WqGbvwQ
Router(config-un)#commit
```

Similarly, this example shows how to configure Type 10 password :

```
Router#configure
Router(config)#username user10 secret 10
$6$9UvJidvsTEqgkAPU$3CL1Ei/F.E4v/Hi.UaqIwX8UsSEr9ApG6c5pzhMJmZtgW4jObAQ7meAwyhu5VM/aRFJqe/jxZG17h6xPrvJWf1
Router(config-un)#commit
```

This example shows how to specify the Type 10 password in System Admin VM:

```
Router#admin
sysadmin-vm:0_RP0# configure
sysadmin-vm:0_RP0(config)# aaa authentication users user user10 password testpassword
sysadmin-vm:0_RP0(config)# commit
```

#### **Password Masking Examples**

The following example shows how to enable password masking for a cleartext password entry:

In this example, for user us3, a cleartext password is entered.

Router(config) # username us3 masked-password 0

Enter password: Re-enter password:

Router(config)#commit

In the **show** command output, you can see the encrypted password:

```
Router# show run aaa ..
username us3
password 7 105A1D0D
```

The encrypted password 105A1D0D is entered in the **Enter password:** and **Re-enter password:** fields, for Type 7 password encryption:

Router(config) # username us3 masked-password 7

Enter password: Re-enter password: Router(config)#commit

If there is a password mismatch between the two entries, an error message is displayed.

The following example shows how to enable password masking for a AAA password policy:

In this example, for user us6, a cleartext password is entered.

```
Router(config)# aaa password-policy security
Router(config)# username us6 password-policy security masked-password 0
```

Enter password: Re-enter password:

Router(config)#commit

In the show command output, you can see the encrypted password.

Router# show run aaa .. aaa password-policy security .. username us6 password-policy security password 7 0835585A

The encrypted password 0835585A is entered in the Enter password: and Re-enter password:

fields for Type 7 password encryption.

Router(config)# username us6 password-policy test-policy masked-password 7

Enter password: Re-enter password:

Router (config) #commit

#### users group

To associate a user group and its privileges with a line, use the **users group** command in line template configuration mode. To delete a user group association with a line, use the **no** form of this command.

users group {*usergroup-name* | cisco-support | maintenance | netadmin | operator | provisioning | retrieve | root-lr | serviceadmin | sysadmin}

no users group {*usergroup-name* | cisco-support | maintenance | netadmin | operator | provisioning | retrieve | root-lr | serviceadmin | sysadmin}

Syntax Description	usergroup-name	Name of the user group. The <i>usergroup-name</i> argument can be only one word. Spaces and quotation marks are not allowed.
	cisco-support	Specifies that users logging in through the line are given Cisco support personnel privileges.
	maintenance	Specifies that users logging in through the line are given SCAPA maintenance privileges.
	netadmin	Specifies that users logging in through the line are given network administrator privileges.
	operator	Specifies that users logging in through the line are given operator privileges.
	provisioning	Specifies that users logging in through the line are given SCAPA provisioning privileges.
	retrieve	Specifies that users logging in through the line are given SCAPA retrieve privileges.
	root-lr	Specifies that users logging in through the line are given root logical router (LR) privileges.
	serviceadmin	Specifies that users logging in through the line are given service administrator group privileges.
	sysadmin	Specifies that users logging in through the line are given system administrator privileges.

Command Default	None		
Command Modes	Line template configuration		
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	Use the <b>users group</b> command to enable a user group and its privileges to be associated with a line, meaning that users logging in through the line are given the privileges of the particular user group.		
Task ID	Task Operations ID		
	aaa read, write		
Examples	In the following example, if a vty-pool is created with line template <i>vty</i> , users logging in through vty are given operator privileges:		
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# aaa authen le RP/0/RP0/CPU0:router(config)# commit RP/0/RP0/CPU0:router(config)# line template RP/0/RP0/CPU0:router(config-line)# users ge RP/0/RP0/CPU0:router(config-line)# login ad	e <i>vty</i> roup operator	

l

### vrf (RADIUS)

To configure the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA RADIUS server group, use the **vrf** command in RADIUS server-group configuration mode. To enable server groups to use the global (default) routing table, use the **no** form of this command.

vrf vrf-name
no vrf vrf-name

Syntax Description	<i>vrf-name</i> Name assigned to a VRF.		
Command Default	The de	efault VRF is u	
Command Modes	RADI	US server-gro	iration
Command History	Relea	se	Modification
	Relea	se 6.0	This command was introduced.
Usage Guidelines	Use the <b>vrf</b> command to specify a VRF for an AAA RADIUS server group and enable dial-up users to use AAA servers in different routing domains.		
Task ID	Task ID	Operations	
	aaa	read, write	
Examples	The fo	llowing exam	how to use the <b>vrf</b> command:
		RP0/CPU0:rou RP0/CPU0:rou	figure ig)# aaa group server radius group1

RP/0/RP0/CPU0:router(config-sg-radius) # vrf vrf1

## vrf (TACACS+)

To configure the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA TACACS+ server group, use the **vrf** command in TACACS+ server-group configuration mode. To enable server groups to use the global (default) routing table, use the **no** form of this command.

vrf vrf-name
no vrf vrf-name

Syntax Description	<i>vrf-name</i> Name assigned to a VRF.		
Command Default	The default VRF is used.		
Command Modes	TACACS+ server-group configuration		
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	Use the <b>vrf</b> command to specify a VRF for an AAA TACACS+ server group and enable dial-up users to use AAA servers in different routing domains.		
Task ID	Task Operations ID		
	aaa read, write		
Examples	This example shows how to use the <b>vrf</b> comm	and:	
	RP/0/RP0/CPU0:router# <b>configure</b> RP/0/RP0/CPU0:router(config)# <b>aaa grou</b> RP/0/RP0/CPU0:router(config-sg-tacacs+ RP/0/RP0/CPU0:router(config-sg-tacacs+	)# server 9.27.10.6	

## **Keychain Management Commands**

This module describes the commands used to configure keychain management.

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

For detailed information about keychain management concepts, configuration tasks, and examples, see the Implementing Keychain Management chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

- accept-lifetime, on page 131
- accept-tolerance, on page 132
- ao, on page 133
- clear type6 client, on page 134
- cryptographic-algorithm, on page 135
- key (key chain), on page 137
- key (tcp ao keychain), on page 138
- keychain, on page 139
- tcp ao, on page 140
- key chain (key chain), on page 141

- key-string (keychain), on page 143
- send-lifetime, on page 145
- show key chain, on page 146
- show type6, on page 147

## accept-lifetime

To set the time period during which the authentication key on a keychain is received as valid, use the **accept-lifetime** command in key configuration mode. To revert to the default value, use the **no** form of this command.

**accept-lifetime** *start-time* [**duration** *duration value* | **infinite***end-time*] **no accept-lifetime** *start-time* [**duration** *duration value* | **infinite***end-time*]

Syntax Description	start-time	Start time, in <i>hh:mm:ss day month year</i> format, in which the key becomes valid. The range is from 0:0:0 to 23:59:59.		
		The range for the number of days of the month is from 1 to 31.		
		The range for the years is from 1993 to 2035.		
	duration duration value	e (Optional) Determines the lifetime of the key in seconds. The range is from 1-2147483646.		
	infinite	(Optional) Specifies that the key never expires after it becomes valid.		
	<i>end-time</i> (Optional) Time, in <i>hh:mm:ss day month year</i> format, after which the key expires. The range is from 0:0:0 to 23:59:59.			
Command Default	None			
Command Modes	Key configuration			
Command History	Release Modificati	on		
	Release 6.0 This commintroduced			
Usage Guidelines	No specific guidelines in	mpact the use of this command.		
Task ID	Task Operations ID			
	system read, write			
Examples	The following example	shows how to use the <b>accept-lifetime</b> command:		
RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# key chain isi RP/0/RP0/CPU0:router(config-isis-keys)# key RP/0/RP0/CPU0:router(config-isis-keys-0x8)#		(config)# key chain isis-keys		

I

## accept-tolerance

To specify the tolerance or acceptance limit, in seconds, for an accept key that is used by a peer, use the **accept-tolerance** command in keychain configuration mode. To disable this feature, use the **no** form of this command.

accept-tolerance [value | infinite] no accept-tolerance [value | infinite]

Syntax Description	value (Optional) Tolerance range, in seconds. The range is from 1 to 8640000.		
	<b>infinite</b> (Optional) Specifies that the tolerance specification is infinite. The accept key never expires. The tolerance limit of infinite indicates that an accept key is always acceptable and validated when used by a peer.		
Command Default	The default value is 0, which is no tolerance.		
Command Modes	Keychain configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	If you do not configure the <b>accept-tolerance</b> command, the tolerance value is set to zero.		
	Even though the key is outside the active lifetime, the key is deemed acceptable as long as it is within the tolerance limit (for example, either prior to the start of the lifetime, or after the end of the lifetime).		
Task ID	Task Operations ID		
	system read, write		
Examples	The following example shows how to use the <b>accept-tolerance</b> command:		
	RP/0/RP0/CPU0:router# <b>configure</b> RP/0/RP0/CPU0:router(config)# <b>key chain isis-keys</b> RP/0/RP0/CPU0:router(config-isis-keys)# <b>accept-tolerance infinite</b>		

#### **ao**

To specify the name the key chain used in the authentication option **ao** command in BGP neighbor configuration mode.

## **ao** *key-chain-name* { **inheritance-disable** | **include-tcp-options** { **disable** | **enable** } accept-ao-mismatch-connection }

Syntax Description	inheritance-disable       Prevents the         include-tcp-options       Includes or e         disable       Excludes oth		Specifies the name of the key chain.			
			String of maximum length of 32 characters.			
			Prevents the key chain from being inherited from the parent. Includes or excludes other TCP options in the header for MAC calculation.			
					Excludes other TCP options in the header. Includes other TCP options in the header.	
			accept-ao-mismatch-connection Accepts connection even if there is a mismatch of AO options between peer			
			Command Default	The key cha	ain has no specified	name.
	Command Modes	BGP neighbor				
Command History	Release	Modification				
	Release 6.5.1	This command w	vas introduced.			
	This examp	le shows how to sp	ecify the name the key chain used in the authentication option :			

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.51.51.1
RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr)#ao tcpaol include-tcp-options disable
accept-ao-mismatch-connection
```

ao

## clear type6 client

To clear the Type 6 client state in case the primary key update process is stuck at any stage, use the **clear type6** command in XR EXEC mode.

	clear typ	e6 client { keych	ain   snmp }
Syntax Description	keychain	Clears the key chain c	lient information.
	snmp	Clears the snmp clier	nt information.
Command Default	None		
Command Modes	XR EXEC mode		
Command History	Release	Modification	
	Release 7.0.1	This command was introduced.	3
Usage Guidelines	<i>key Inprogr</i> command (	ess field in that output or, show type6 clients	date operation using the <b>show type6 server</b> command output. If the <i>Master</i> displays as <i>YES</i> , then you can use <b>show type6 masterkey update status</b> command, prior to Cisco IOS XR Software Release 7.0.2) to check which ation. Accordingly, you can clear that particular client using this <b>clear</b>
Task ID	Task Ope ID	eration	
	system rea wri		
	This example shows how to clear the Type 6 client state:		
	Router# <b>cle</b>	ear type6 client ke	ychain
Related Commands	Command		Description
	show type	6, on page 14 <b>7</b>	Displays Type 6 password encryption information.

## cryptographic-algorithm

To apply the cryptographic algorithm to the packets using the key string configured for the key ID, use the **cryptographic-algorithm** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

cryptographic-algorithm [ HMAC-MD5 | HMAC-SHA1-12 | HMAC-SHA1-20 | MD5 | SHA-1 | HMAC-SHA-256 | HMAC-SHA1-96 | AES-128-CMAC-96 ]

Syntax Description	HMAC-MD5	Configures HMAC-MD5 as a cryptographic algorithm with a digest size of 16 bytes.		
	HMAC-SHA1-12	2 Configures HMAC-SHA1-12 as a cryptographic algorithm with a digest size of 12 bytes.		
	HMAC-SHA1-20	• Configures HMAC-SHA1-20 as a cryptographic algorithm with a digest size of 20 bytes.		
	MD5	Configures MD5 as a cryptographic algorithm with a digest size of 16 bytes.		
	SHA-1	<b>SHA-1</b> Configures SHA-1-20 as a cryptographic algorithm with a digest size of 20 bytes.		
	HMAC-SHA-256	6 Configures HMAC-SHA-256 as a cryptographic algorithm with a digest size of 32 bytes.		
	HMAC-SHA1-96	Configures HMAC-SHA1-96 as a cryptographic algorithm with a digest size of 12 bytes.		
	AES-128-CMAC-	<b>96</b> Configures AES-128-CMAC as a cryptographic algorithm with a digest size of 12 bytes.		
Command Default	No default behavio	or or values		
Command Modes	Keychain-key con	figuration		
Command History	Release Mod	ification		
	Release 6.0 This	command was introduced.		
	Release Supp	port for the following algorithms are added:		
	6.5.1	HMAC-SHA-256		
	•	HMAC-SHA1-96		
		AES-128-CMAC-96		
Usage Guidelines	If you do not speci	fy the cryptographic algorithm, MAC computation and API verification would be invalid.		
	These protocols su	pport the following cryptographic algorithms:		
	Border Gatew and HMAC-S	vay Protocol (BGP) supports only HMAC-MD5, HMAC-SHA1-12, AES-128-CMAC-96 HA1-96.		

- Intermediate System-to-Intermediate System (IS-IS) supports HMAC-MD5, SHA-1, MD5, AES-128-CMAC-96, HMAC-SHA-256, HMAC-SHA1-12, HMAC-SHA1-20, and HMAC-SHA1-96.
- Open Shortest Path First (OSPF) supports MD5, HMAC-MD5, HMAC-SHA-256, HMAC-SHA1-12, HMAC-SHA1-20, and HMAC-SHA1-96.

ID	Operations
system	read, write

Examples

The following example shows how to use the **cryptographic-algorithm** command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# key chain isis-keys
RP/0/RP0/CPU0:router(config-isis-keys)# key 8
RP/0/RP0/CPU0:router(config-isis-keys-0x8)# cryptographic-algorithm HMAC-MD5

## key (key chain)

To create or modify a keychain key, use the **key** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

key key-id no key key-id

Syntax Description	<i>key-id</i> 48-bit integer key identifier of from 0 to 281474976710655.		
Command Default	No default behavior or values		
Command Modes	Keychain-key configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	For a Border Gateway Protocol (BGP) keychain configuration, the range for the <i>key-id</i> argument must be from 0 to 63. If the range is above the value of 63, the BGP keychain operation is rejected.		
Task ID	Task Operations ID		

system read, write

**Examples** 

The following example shows how to use the key command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# key chain isis-keys
RP/0/RP0/CPU0:router(config-isis-keys)# key 8
RP/0/RP0/CPU0:router(config-isis-keys-0x8)#

I

# key (tcp ao keychain)

To configure in send and receive identifiers for the key, use the **key** command in TCP authentication option keychain configuration mode.

key key-identifier sendID send-id-value ReceiveID receive-id-value

Syntax Description	key-identifier	Identifier of the key. Acceptable values are 48-bit integers. Range is 0 to 281474976710655.	
	SendID send-id-value	Specifies the send identifier value. Range is 0 to 255.	
	<b>ReceiveID</b> <i>receive-id-value</i> Specifies the receive identifier value to be used for the key. The range is 0 255.		
Command Default	The key is not enabled.		
Command Modes	TCP authentication option keychain		
Command History	Release Modification		
	Release 6.5.1 This command	was introduced.	
Task ID	Task Operations ID		
	bgp read		
Examples	This example shows how to configure the send and receive identifier for the key.		
	RP/0/RP0/CPU0:router# con RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf	ig)# tcp ao	

#### keychain

To configure the keychain to be used in TCP authentication option, use the **tcp ao** command in TCP authentication option configuration mode.

keychain keychain-name This command has no arguments or keywords. **Syntax Description** The keychain is not enabled. **Command Default** TCP authentication option **Command Modes Command History** Release Modification Release 6.5.1 This command was introduced. Task ID Task **Operations** ID bgp read **Examples** This example shows how to configure the keychain for TCP Authentication option: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # tcp ao

RP/0/RP0/CPU0:router(conf-tcp-ao)keychain tcpao1

#### tcp ao

To enable the TCP authentication option, use the tcp ao command in global configuration mode.

	tcp ao no tcp	tcp ao no tcp ao		
Syntax Description	This co	This command has no arguments or keywords.		
Command Default	The TC	The TCP authentication option is not enabled.		
Command Modes	Global	Global configuration		
Command History	Release Modification			
	Release 6.5.1 This command was introduced.			
Task ID	Task ID	Operations	-	
	bgp	read	-	
<b>Examples</b> This example shows how to configure RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# t		ample show	rs how to configure the <b>tcp ao</b> command:	
		-		

## key chain (key chain)

To create or modify a keychain, use the **key chain** command . To disable this feature, use the **no** form of this command.

**key chain** *key-chain-name* **no key chain** *key-chain-name* 

**Syntax Description** *key-chain-name* Specifies the name of the keychain. The maximum number of characters is 48.

**Command Default** No default behavior or values

Command Modes XR Config mode

Command History Release Modification

Release 6.0 This command was introduced.

**Usage Guidelines** You can configure a keychain for Border Gateway Protocol (BGP) as a neighbor, session group, or neighbor group. BGP can use the keychain to implement a hitless key rollover for authentication.

sk ID	Task ID	Operations
	system	read, write

**Examples** 

The following example shows that the name of the keychain isis-keys is for the **key chain** command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# key chain isis-keys
RP/0/RP0/CPU0:router(config-isis-keys)#

# key config-key password-encryption

To create a primary key for the Type 6 password encryption feature, use the **key config-key password-encryption** command in the EXEC mode.

key config-key password-encryption [delete]

Syntax Description	delete (Optional) Deletes the primary key for Type 6 password encryption.			
Command Default	No primary key exists.			
Command Modes	EXEC mode			
Command History	Release Modification			
	Release 7.0.1 This command was introduced.			
Examples	The following example shows how to create a primary key for Type 6 password encryption:			
	Router# key config-key password-encryption			
	New password Requirements: Min-length 6, Max-length 64 Characters restricted to [A-Z][a-z][0-9] Enter new key : Enter confirm key : Master key operation is started in background			
	The following example shows how to delete a primary key for Type 6 password encryption:			
	Router# key config-key password-encryption delete			
	WARNING: All type 6 encrypted keys will become unusable Continue with master key deletion ? [yes/no]: yes Master key operation is started in background			

Related Commands	Command	Description
	password6 encryption aes	Enables Type 6 password encryption feature.
	show type6 server	Displays Type 6 password information.

## key-string (keychain)

To specify the text string for the key, use the **key-string** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

key-string [clear | password] key-string-text no key-string [clear | password] key-string-text

Syntax Description	clear	Specifies the key string in clear-text form.			
	password	sword Specifies the key in encrypted form.			
	<i>key-string-text</i> Text string for the key, which is encrypted by the parser process before being saved to the configuration. The text string has the following character limitations:				
		• Plain-text key strings—Minimum of 1 character and a maximum of 32.			
	• Encrypted key strings—Minimum of 4 characters and no maximum.				
Command Default	The default val	ue is clear.			
Command Modes	Keychain-key	configuration			
Command History	Release N	Iodification			
		This command was ntroduced.			
Usage Guidelines	For an encrypted password to be valid, the following statements must be true:				
-	• String must contain an even number of characters, with a minimum of four.				
	• The first two characters in the password string must be decimal numbers and the rest must be hexadecimals.				
	• The first two digits must not be a number greater than 53.				
	Either of the following examples would be valid encrypted passwords:				
	1234abcd				
	or				
	50aefd				
	algorithm for a	S XR Software Release 7.1.2, Release 7.2.1 and later, if you are using any <b>HMAC-SHA</b> a session, then you must ensure that the configured <i>key-string</i> has a minimum length of 14 nerwise, the session goes down. This guideline is applicable only for FIPS mode.			

I

Task ID	Task Operations ID
	system read, write
Examples	The following example shows how to use the <b>keystring</b> command:
	<pre>RP/0/RP0/CPU0:router:# configure RP/0/RP0/CPU0:router(config)# key chain isis-keys RP/0/RP0/CPU0:router(config-isis-keys)# key 8 RP/0/RP0/CPU0:router(config-isis-keys-0x8)# key-string password 850aefd</pre>

### send-lifetime

To send the valid key and to authenticate information from the local host to the peer, use the **send-lifetime** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

**send-lifetime** *start-time* [**duration** *duration value* | **infinite***end-time*] **no send-lifetime** *start-time* [**duration** *duration value* | **infinite***end-time*]

Syntax Description	start-time	Start time, in <i>hh:mm:ss day month year</i> format, in which the key becomes valid. The range is from 0:0:0 to 23:59:59.
		The range for the number of days of the month to start is from 1 to 31.
		The range for the years is from 1993 to 2035.         (Optional) Determines the lifetime of the key in seconds.         (Optional) Specifies that the key never expires once it becomes valid.
	duration duration value	
	infinite	
	end-time	(Optional) Time, in <i>hh:mm:ss day month year</i> format, after which the key expires. The range is from 0:0:0 to 23:59:59
Command Default	No default behavior or v	values
Command Modes	Keychain-key configura	tion
Command History	Release Modificati	on
	Release 6.0 This commintroduced	
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task Operations ID	
	system read, write	
Examples	The following example s	shows how to use the <b>send-lifetime</b> command:
	RP/0/RP0/CPU0:router	<pre># configure (config) # key chain isis-keys (config-isis-keys) # key 8 (config-isis-keys-0x8) # send-lifetime 1:00:00 June 29 2006 infinite</pre>

#### show key chain

To display the keychain, use the **show key chain** command.

show key chain key-chain-name

Syntax Description key-chain-name Names of the keys in the specified keychain. The maximum number of characters is 32. If the command is used without any parameters, then it lists out all the key chains. **Command Default** XR EXEC mode **Command Modes Command History** Release Modification Release 6.0 This command was introduced. No specific guidelines impact the use of this command. **Usage Guidelines** Task ID Task Operations ID system read **Examples** When a secure key storage becomes available, it is desirable for keychain management to alternatively prompt you for a primary password and display the key label after decryption. The following example displays only the encrypted key label for the show key chain command: RP/0/RP0/CPU0:router# show key chain isis-keys Key-chain: isis-keys/ accept-tolerance -- infinite Key 8 -- text "8" cryptographic-algorithm -- MD5 Send lifetime: 01:00:00, 29 Jun 2006 - Always valid [Valid now] Accept lifetime: 01:00:00, 29 Jun 2006 - Always valid [Valid now]

## show type6

To view Type 6 password encryption information, use the **show type6** command in EXEC mode.

show type6 { clients | masterkey update status | server | trace server { all | error | info } [ trace-server-parameter ] }

Syntax Description	clients	Displays Type 6 client info	ormation.		
	masterkey update status	Displays Type 6 primary k	ey operation status.		
	server Displays Type 6 server information.				
	trace server	ace server Displays Type 6 trace server information.			
	all	Displays all Type 6 traces.			
	error	Displays Type 6 error traces.			
	info	info Displays Type 6 information trace entries.			
	trace-server-parameter		6 trace server information for the specified parameter. arameters defined in the Usage Guidelines section.		
Command Default	None.				
Command Modes	XR EXEC mode				
Command History	Release Modification				
	Release 7.0.1 This command was introduced.				
	Release 7.0.2 This command was modified to include the <b>masterkey update status</b> option.				
Usage Guidelines	In the command form <b>show type6 trace server info</b> <i>trace-server-parameter</i> , replace <i>trace-server-parameter</i> with one of the following parameters:				
	The show type6 clients of	command is deprecated with	the introduction of masterkey update status.		
	Trace Server Parameter		Displayed Trace Server Information		
	file		The specified file.		
	hexdump		Hexadecimal format.		
	last		The most recent entries.		
	location		Line card location.		
	reverse		From the most recent entry to the first entry.		

Trace Server Parameter	Displayed Trace Server Information
stats	Statistics information.
tailf	New traces as they are added.
udir	Copies trace information from remote locations to the specifed temporary directory.
unique	Unique entries with counts.
usec	User security information, with time stamp.
verbose	Internal debugging information.
wide	Removes buffer name, node name, and tid information.
wrapping	Wrapping entries.

#### Examples

The following command displays Type 6 password encryption feature information:

```
Router# show type6 server
```

Router# show type6 trace server all

```
Client file lib/type6/type6 server wr
25 wrapping entries (18496 possible, 64 allocated, 0 filtered, 25 total)
Jul 19 09:59:27.168 lib/type6/type6_server_wr 0/RP0/CPU0 t7145 ***** Type6 server process
started Respawn count (1) ****
...
Jul 19 12:22:59.908 lib/type6/type6 server wr 0/RP0/CPU0 t7145 User has started Master key
operation (CREATE)
Jul 19 12:22:59.908 lib/type6/type6_server_wr 0/RP0/CPU0 t7145 Created Master key in TAM
successfully
Jul 19 12:23:00.265 lib/type6/type6 server wr 0/RP0/CPU0 t7145 Master key Available set to

I

# **Management Plane Protection Commands**

This module describes the commands used to configure management plane protection (MPP).

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

For detailed information about keychain management concepts, configuration tasks, and examples, see the Implementing Management Plane Protection chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

**Note** Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

- address ipv4 (MPP), on page 153
- address ipv6 (MPP), on page 154
- allow (MPP), on page 155
- allow local-port, on page 157
- enable-inband-behaviour, on page 159
- inband, on page 160
- interface (MPP), on page 161
- out-of-band, on page 163
- show mgmt-plane, on page 164
- tpa (MPP), on page 166
- vrf (MPP), on page 167

# address ipv4 (MPP)

To configure the peer IPv4 or IPv6 address in which management traffic is allowed on the interface, use the **address ipv4**command in interface peer configuration mode. To remove the IP address that was previously configured on this interface, use the **no** form of this command.

address {ipv4 | ipv6} peer-ip-address |peer-ip-address / length no address {ipv4 | ipv6} peer-ip-address | peer-ip-address / length

Syntax Description	<i>peer-ip-address</i> (Required) Peer IPv4 or IPv6 address in which management traffic is allowed on the interface. This address can effectively be the source address of the management traffic that is coming in on the configured interface.		
	peer ip-address/length (Required) Prefix of the peer IP address and IPv4 address or IPv6 format:		
	• IPv4—A.B.C.D/length		
		• IPv6— <i>X.X:X.X</i>	
Command Default	If no specific peer i	is configured, all peers are allowed.	
Command Modes	Interface peer confi	iguration	
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	No specific guidelin	nes impact the use of this command.	
Task ID	Task Operations ID	-	
	system read, write	-	
Examples	The following exan	nple shows how to configure the peer address for management traffic:	
	RP/0/RP0/CPU0:rot RP/0/RP0/CPU0:rot RP/0/RP0/CPU0:rot RP/0/RP0/CPU0:rot	<pre>uter# configure uter(config)# control-plane uter(config-ctrl)# management-plane uter(config-mpp)# inband uter(config-mpp-inband)# interface all uter(config-mpp-inbandoutband-all)# allow all peer uter(config-telnettftp-peer)# address ipv4 10.1.0.0/16</pre>	

## address ipv6 (MPP)

To configure the peer IPv6 address in which management traffic is allowed on the interface, use the **address ipv6** command in interface peer configuration mode. To remove the IP address that was previously configured on this interface, use the **no** form of this command.

address ipv6 {peer-ip-address | peer-ip-address / length}

Syntax Description	<i>peer-ip-address</i> Peer IPv6 address in which management traffic is allowed on the interface. This address can effectively be the source address of the management traffic that is coming in on the configured interface.
	speer ip-address/length Prefix of the peer IPv6 address.
Command Default	If no specific peer is configured, all peers are allowed.
Command Modes	Interface peer configuration
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operations ID
	system read, write
Examples	The following example shows how to configure the peer IPv6 address 33::33 for management traffic:
	<pre>RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# control-plane RP/0/RP0/CPU0:router(config-ctrl)# management-plane RP/0/RP0/CPU0:router(config-mpp)# inband RP/0/RP0/CPU0:router(config-mpp-outband)# interface GigabitEthernet 0/1/1/2 RP/0/RP0/CPU0:router(config-mpp-outband-GigabitEthernet0_1_1_2)# allow TFTP peer RP/0/RP0/CPU0:router(config-tftp-peer)# address ipv6 33::33</pre>

### allow (MPP)

To configure an interface as an inband or out-of-band interface to allow all peer addresses for a specified protocol or all protocols, use the **allow** command in management plane protection inband interface configuration mode or management plane protection out-of-band interface configuration.

To disallow a protocol on an interface, use the **no** form of this command.

allow {protocol | all} [peer] no allow {protocol | all} [peer]

Cuntou Decemintion			
Syntax Description	protocol	Interface configured to allow peer-filtering for the following specified protocol's traffic:	
		• HTTP(S)	
		• NETCONF (version 1.1 protocol)	
		• SNMP (also versions)	
		• Secure Shell (v1 and v2)	
		• TFTP	
		• Telnet	
		• XML	
	<b>all</b> Configures the interface to allow peer-filtering for all the management traffic that is specified in the list of protocols.		
	peer	(Optional) Configures the peer address on the interface. Peer refers to the neighboring router interface in which traffic might arrive to the main router.	
Command Default	By defau	lt, no management protocol is allowed on any interface except the management interfaces.	
	Management plane protection inband interface configuration		
Command Modes	Managen	nent plane protection inband interface configuration	
Command Modes Command History	Managen Release		
	Release		
Command History	Release Release	Modification       6.0 This command was introduced.

XR XML API provides a programmatic interface to the router for use by external management ons. This interface provides a mechanism for router configuration and monitoring utilizing XML d request and response streams. As one of the management services, XML should be capable of MPP. To secure XML MPP data, XML keyword has been added to the command.         Operations	

#### **Examples**

The following example shows how to configure all management protocols for all inband interfaces:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# control-plane
RP/0/RP0/CPU0:router(config-ctrl)# management-plane
RP/0/RP0/CPU0:router(config-mpp)# inband
RP/0/RP0/CPU0:router(config-mpp-inband)# interface all
RP/0/RP0/CPU0:router(config-mpp-inband-all)# allow all
```

The following example shows how to configure MPP support on an XML peer in-band interface:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# control-plane
RP/0/RP0/CPU0:router(config-ctrl)# management-plane
RP/0/RP0/CPU0:router(config-ctrl-mpp)# inband interface all allow xml peer address ipv4
172.10.10.1
```

## allow local-port

To configure a local port and third-party application protocols for management plane protection (MPP) on an interface, use the **allow local-port** command in management plane protection TPA mode. To disallow a protocol on an interface, use the **no** form of this command.

**allow local-port** port-number **protocol** protocol-number **interface** interface-name **local-address** IP local address **remote-address** IP remote address

Syntax Description	local-port	Specifies local L4 port of an interface.
	protocol	Specifies the L4 protocol to be configured on MPP.
	Protocol number	Enter the protocol number corresponding to different protocols. You can choose a value from range 1 to 255. Following are some of the protocol numbers dedicated to different protocols:
		• gre - Generic Routing Encapsulation. (47)
		• udp - User Datagram Protocol, RFC 768. (17)
		• tcp - Transmission Control Protocol, RFC 793. (6)
		• pptp - Point-to-Point Tunneling Protocol. Entering the pptp protocol literal is equivalent to entering the gre protocol literal. (47)
		• pim - Protocol Independent Multicast. (103)
		• ospf - Open Shortest Path First routing protocol, RFC 1247. (89)
		• ipsec - IP Security. Entering the ipsec protocol literal is equivalent to entering the esp protocol literal. (50)
		• ipinip - IP-in-IP encapsulation. (4)
		• icmp6 - Internet Control Message Protocol for IPv6, RFC 2463. (58)
		• igmp - Internet Group Management Protocol, RFC 1112. (2)
		• igrp - Interior Gateway Routing Protocol. (9)
		<b>Note</b> In IOS XR release 6.5.2, protocol number is replaced by protocol names. The supported protocols are <i>tcp</i> and <i>udp</i> .
	interface	Specify the MPP interface on which the protocol has to be configured.
	<b>local-address</b> Specify the local IP address of the host or client.	
	remote-address	Specify the remote IP address of the host or client.
Command Default	Not Applicable	
Command Modes	Management plan	ne protection TPA

Command History	Release
-----------------	---------

Release 6.3.2 This command was introduced.

Modification

#### Example

```
Router(config)# control-plane
Router(config-ctrl)# management-plane
Router(config-mpp)# tpa vrf default address-family [ipv4 | ipv6]
Router(config-mpp-tpa-vrf-afi)# allow local-port 57600 protocol tcp interface mgmtEth
0/RP0/CPU0/0 local-address 10.1.1.1/32 remote-address 10.2.2.2/32
```

## enable-inband-behaviour

To enable inband management plane protection (MPP) behavior for management Ethernet interface, use the **enable-inband-behaviour** command in out-of-band configuration mode (under control-plane->management-plane configuration mode). To disable the feature, use the **no** form of this command.

#### enable-inband-behaviour

Syntax Description	This command has no keywords or arguments.	
Command Default	Disabled, by default.	
Command Modes	Out-of-band configuration	
Command History	Release	Modification
	Release 7.5.1	This command was introduced.
Usage Guidelines	This feature takes effect only with MPP c	onfiguration in place.
	behavior for management Ethernet interfa	he router rejects the configuration to enable or disable inband MPP ce. Hence, we recommend enabling this feature before configuring fter removing the existing MPP configuration.
Task ID	Task Operations ID	
	system read, write	
Examples	This example shows how to enable inban	d MPP behavior for management Ethernet interface:
	Router# <b>configure</b> Router(config)# <b>control-plane</b> Router(config-ctrl)# <b>management-pla</b> Router(config-mpp)# <b>out-of-band</b> Router(config-mpp-outband)# <b>enable</b> = Router(config-mpp-outband)# <b>commit</b>	

I

## inband

	To configure an inband interface and to enter management plane protection inband configuration mode, use the <b>inband</b> command in management plane protection configuration mode. To disable all configurations under inband configuration mode, use the <b>no</b> form of this command.		
	inband no inband		
Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Management plane protection inband configuration		
Command History	Release Modification		
	Release 6.0 This command was introduced.		
Usage Guidelines	Use the <b>inband</b> command to enter management plane protection inband configuration mode.		
Task ID	Task Operations ID		
	system read, write		
Examples	The following example shows how to enter management plane protection inband configuration mode using the <b>inband</b> command:		
	<pre>RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# control-plane RP/0/RP0/CPU0:router(config-ctrl)# management-plane RP/0/RP0/CPU0:router(config-mpp)# inband RP/0/RP0/CPU0:router(config-mpp-inband)#</pre>		

## interface (MPP)

To configure a specific interface or all interfaces as an inband or out-of-band interface, use the **interface** command in management plane protection inband configuration mode or management plane protection out-of-band configuration mode.

To disable all the configurations under an interface mode, use the **no** form of this command.

interface {type interface-path-id | all}
no interface {type interface-path-id | all}

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.			
	interface-path-id Virtual interface instance. Number range varies depending on interface type.				
		<b>Note</b> Use the <b>show interfaces</b> command in EXEC mode to see a list of all interfaces currently configured on the router.			
		For more information about the syntax for the router, use the question mark (?) online help function.			
	all	Configures all interfaces to allow for management traffic.			
Command Default	None				
Command Modes	Management plane protection out-of-band configuration				
	Management plane protection inband configuration				
Command History	Release Moo	lification			
	Release 6.0 This intro	oduced.			
Usage Guidelines	Use the <b>interface</b> command to enter management plane protection inband interface configuration mode or management plane protection out-of-band interface configuration mode.				
	For the <i>instance</i> a	rgument, you cannot configure Management Ethernet interfaces as inband interfaces.			
Task ID	Task Operation ID	ls			
	system read, write				
Examples	The following exa	ample shows how to configure all inband interfaces for MPP:			
	RP/0/RP0/CPU0:	<pre>couter# configure couter(config)# control-plane couter(config-ctrl)# management-plane</pre>			

RP/0/RP0/CPU0:router(config-mpp)# inband RP/0/RP0/CPU0:router(config-mpp-inband)# interface all RP/0/RP0/CPU0:router(config-mpp-inband-all)#

The following example shows how to configure all out-of-band interfaces for MPP:

RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# control-plane RP/0/RP0/CPU0:router(config-ctrl)# management-plane RP/0/RP0/CPU0:router(config-mpp)# out-of-band RP/0/RP0/CPU0:router(config-mpp-outband)# interface all RP/0/RP0/CPU0:router(config-mpp-outband-all)#

### out-of-band

To configure out-of-band interfaces or protocols and to enter management plane protection out-of-band configuration mode, use the **out-of-band** command in management plane protection configuration mode. To disable all configurations under management plane protection out-of-band configuration mode, use the **no** form of this command.

	out-of-band no out-of-band - This command has no keywords or arguments.				
Syntax Description					
Command Default	None Management plane protection out-of-band configuration				
Command Modes					
Command History	Release		Modification		
	Release 6	5.0		This command was introduced.	
Usage Guidelines	Use the <b>out-of-band</b> command to enter management plane protection out-of-band configuration mode.				
	<i>Out-of-band</i> refers to an interface that allows only management protocol traffic to be forwarded or processed. An <i>out-of-band management interface</i> is defined by the network operator to specifically receive network management traffic. The advantage is that forwarding (or customer) traffic cannot interfere with the management of the router.				
Task ID	Task O ID	perations			
	system re	ead, vrite			
Examples	The following example shows how to enter management plane protection out-of-band configuration mode using the <b>out-of-band</b> command:				
	<pre>RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# control-plane RP/0/RP0/CPU0:router(config-ctrl)# management-plane RP/0/RP0/CPU0:router(config-mpp)# out-of-band RP/0/RP0/CPU0:router(config-mpp-outband)#</pre>				

I

## show mgmt-plane

To display information about the management plane such as type of interface and protocols enabled on the interface, use the **show mgmt-plane** command.

show mgmt-plane [inband | out-of-band] [interface type interface-path-id | vrf]

Syntax Description	inband	(Optional) Displays the inband management interface configurations that are the interfaces that process management packets as well as data-forwarding packets. An inband management interface is also called a <i>shared management interface</i> .				
	out-of-band	out-of-band (Optional) Displays the out-of-band interface configurations. Out-of-band interfaces are defined by the network operator to specifically receive network management traffic.				
	interface	(Optional) Displays all the protocols that are allowed in the specified interface.				
	type	Interface type. For more information, use the question mark (?) online help function.				
	interface-path-id	<i>rface-path-id</i> Interface instance. Number range varies depending on interface type.				
		<b>Note</b> Use the <b>show interfaces</b> command to see a list of all interfaces currently configured on the router.				
	For more information about the syntax for the router, use the question mark (?) online function.					
	vrf (Optional) Displays the Virtual Private Network (VPN) routing and forwarding reference of an out-of-band interface.					
Command Default	None					
Command Modes	XR EXEC mode					
Command History	Release Mod	dification				
	Release 6.0 This intro	s command was oduced.				
Usage Guidelines	The <b>vrf</b> keyword is valid only for out-of-band VRF configurations.					
Task ID	Task Operation ID	ns				
	system read					
Examples	The following sar interfaces under N	mple output displays all the interfaces that are configured as inband or out-of-band MPP:				
	RP/0/RP0/CPU0:	router# <b>show mgmt-plane</b>				

L

```
Management Plane Protection
inband interfaces
_____
interface - HundredGigabitEthernet0 1 1 0
      ssh configured -
             All peers allowed
       telnet configured -
             peer v4 allowed - 10.1.0.0/16
       all configured -
              All peers allowed
interface - HundredGigabitEthernet0_1_1_0
       telnet configured -
             peer v4 allowed - 10.1.0.0/16
interface - all
      all configured -
              All peers allowed
outband interfaces
_____
interface - HundredGigabitEthernet0_1_1_0
      tftp configured -
              peer v6 allowed - 33::33
```

The following sample output displays the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an out-of-band interface:

```
RP/0/RP0/CPU0:router# show mgmt-plane out-of-band vrf
```

```
Management Plane Protection -
out-of-band VRF - my out of band
```

I

# tpa (MPP)

To configure a third-party application protocol for Management Plane Protection (MPP), use the **tpa** command in management plane protection configuration mode. To disable all configurations related to the third-party application, use the **no** form of this command.

Syntax Description	vrf	Configures a Virtual Private Network (VPN) routing and forwarding (VRF) reference.			
	address-family	Enables support for various address family configuration modes while configuring TPA.			
	ipv4	Specifies IP Version 4 address prefixes.			
	ipv6	Specifies IP Version 6 address prefixes.			
Command Default	Not Applicable				
Command Modes	Management plane protection configuration				
Command History	Release	Modification			
	Release 6.3.2 This command was introduced.				
Usage Guidelines	Only default vrf	is supported for TPA configuration.			

tpa vrf default address-family [ipv4 |ipv6]

#### Example

```
Router(config)# control-plane
Router(config-ctrl)# management-plane
Router(config-mpp)# tpa vrf default address-family [ipv4 | ipv6]
```

## vrf (MPP)

To configure a Virtual Private Network (VPN) routing and forwarding (VRF) reference of an out-of-band interface, use the **vrf** command in management plane protection out-of-band configuration mode. To remove the VRF definition before the VRF name is used, use the **no** form of this command.

vrf vrf-name no vrf vrf-name

Syntax Description	<i>vrf-name</i> Name assigned to a VRF.					
Command Default	The VRF concept must be used to configure interfaces as out-of-band. If no VRF is configured during a out-of-band configuration, the interface goes into a default VRF.					
Command Modes	Management plane protection out-of-band cont	figuration				
Command History	Release	Modification				
	Release 6.0	This command was introduced.				
Usage Guidelines	If the VRF reference is not configured, the defa	ault name MPP_OUTBAND_VRF is used.				
	If there is an out-of-band configuration that is reare removed.	eferring to a VRF and the VRF is deleted, all the MPP bindings				
Task ID	Task Operations ID					
	system read					
Examples	The following example shows how to configur	e the VRF:				
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# vrf my_ou RP/0/RP0/CPU0:router(config-vrf)# addre RP/0/RP0/CPU0:router(config-vrf-af)# ex RP/0/RP0/CPU0:router(config-vrf-af)# co RP/0/RP0/CPU0:router(config-vrf-af)# en RP/0/RP0/CPU0:router(config-vrf-af)# en	s-family ipv4 unicast it ss-family ipv6 unicast mmit				
	The following example shows how to configur	e the VRF definition for MPP:				
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# control-p RP/0/RP0/CPU0:router(config-ctrl)# mana RP/0/RP0/CPU0:router(config-mpp)# out-o RP/0/RP0/CPU0:router(config-mpp-outband	gement-plane f-band				

l

## **Traffic Protection Commands**

This module describes the commands used to configure traffic protection.

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

For detailed information about traffic protection concepts, configuration tasks, and examples, see the *Traffic Protection for Third-Party Applications* chapter in the *System Security Configuration Guide for Cisco NCS* 5500 Series Routers.

- allow, on page 171
- tpa, on page 173

To configure a local port and third-party application protocols for traffic protection, use the **allow** command in protection mode. To disallow a protocol on an interface, use the **no**form of this command.

**allow protocol** {**tcp** | **udp**}**local-port** *port-number* [**interface** *interface-name* | **local-address** *local IP address* | **remote-address***remote IP address* 

**no allow protocol** {**tcp** | **udp**}**local-port** *port-number* [**interface** *interface-name* | **local-address** *local IP address* | **remote-address***remote IP address* 

Syntax Description	protocolSpecifies the L4 protocol to be configured for traffic protection. The supported protocols are TCP and UDP.
	local-port Specifies local L4 port.
	<i>Port-number</i> Specifies a port number in the range of 1 to 65535.
	<b>interface</b> Specifies the interface on which the protocol has to be configured.
	local-address Specifies the local IP address of the host or client.
	remote-address Specifies the remote IP address of the host or client.
Command Default	Not Applicable
Command Modes	Protection
Command History	Release Modification
	ReleaseThis command was6.5.2introduced.
Usage Guidelines	If no allow command is used for a given local port and protocol, then by default, any ingress traffic is delivered to Third Party Applications. If one or more allow entries are added, only the ingress traffic matching an allow entry is delivered for that protocol and port. It is possible to configure multiple allow entries for the same protocol and port, for example, to allow traffic from multiple remote addresses.
	<b>Note</b> If multiple allow entries are configured for the same protocol and port, the entries are expected to be non-overlapping. If overlapping entries are present, for example, multiple remote addresses in overlapping subnets, then the behaviour is platform-dependent.
Task ID	Task Operation ID

#### Example

The following example shows how to configure a local port and third-party application protocols for traffic protection:

```
Router# configure
Router(config)# tpa
Router(config-tpa)# vrf default
Router(config-tpa-vrf)# address-family ipv4
Router(config-tpa-vrf-afi)# protection
Router(config-tpa-vrf-afi-prot)# allow protocol tcp local-port 6 remote-address 192.0.2.3
interface MgmtEth0 local-address 192.0.2.125
```

## tpa

To configure a third-party application protocol for traffic protection, use the **tpa**command in global configuration mode. To disable all configurations related to the third-party application, use the **no**form of this command.

tpa vrf vrf-name address-family [ ipv4 | ipv6 ] protection

Router(config-tpa-vrf-afi) # protection

no tpa vrf vrf-name address-family [ ipv4 | ipv6] protection

Syntax Description	vrf	Configures a VPN routing and forwarding (VRF) reference.			
	address-family	Enables support for various address family configuration modes while configuring TPA			
	ipv4	Specifies IP Version 4 address prefixes.			
	ipv6	6 Specifies IP Version 6 address prefixes.			
	protection	Enters the Traffic Protection submode.			
Command Default	Not Applicable				
Command Modes	Global configurat	ion			
Command History	Release Mod	ification			
	Release This 6.0	command was introduced.			
Usage Guidelines	Some platforms d	lo not support non-management traffic in any VRFs apart from default VRF.			
	Example				
	The following example shows how to configure a third-party application protocol for traffic protection.				

l

## **802.1X and Port Control Commands**

This module describes the commands used for 802.1X Authentication.

**Note** All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module provides command line interface (CLI) commands for 802.1X Authentication Commands.

For detailed information about 802.1X authentication commands, configuration tasks, and examples, see the 802.1X Port-Based Authentication chapter in the System Security Configuration Guide for Cisco NCS 5500 Series Routers.

- authenticator, on page 177
- clear mab, on page 179
- dot1x host-mode, on page 180
- dot1x profile, on page 181
- show dot1x, on page 183
- show mab, on page 185

### authenticator

To configure authenticator parameters and to enter the authenticator configuration sub mode, use the **authenticator** command in dot1x profile configuration sub mode. To remove this configuration, use the **no** form of this command.

authenticator{ eapprofileprofile-name| host-mode{ multi-auth| multi-host| single-host| serverdeadaction{ auth-fail| auth-retry} | timer{ mab-retry-timeretry-timer-valuereauth-time{ reauth-timer-value| server} } }

Syntax Description	eap	eapEnables local Extensible Authentication Protocol (EAP) server for MACSec.		
	profile-name Specifies the EAP profile name, in WORD.			
	host-mode	Sets the host mode for authentication.		
		Note Only single-host mode is supported.		
	server dead action	Sets the action to be taken when the remote AAA server is unreachable. You can set it as either to retry the authentication or to consider it as authentication failure.		
	timer	Sets various timers for authentication.		
	mab-retry-tin	<b>ne</b> Sets the interval, in seconds, after which the router re-initiates an authentication attempt for the MAC authentication bypass (MAB) clients, in scenarios where previous authentication failed or if the RADIUS server was unreachable.		
		Range is 60 to 300, default being 60.		
	reauth-time	Sets the interval, in seconds, after which the router automatically initiates re-authentication process with the RADIUS server.		
		Range is 60 to 5184000 (2 months).		
	server	Sets the re-authentication interval on the router as per the value specified by the RADIUS server.		
		Minimum expected value is 60 seconds, default being 1 hour.		
Command Default	None			
Command Modes	Dot1x profile o	e configuration mode		
Command History	Release	Modification		
	Release 24.3.1	This command was modified to include the <b>mab-retry-time</b> timer option as part of the MAB feature.		
	Release 6.4.1	This command was introduced.		
Usage Guidelines	No specific gu	idelines impact the use of this command.		

l

Task ID Examples Related Commands	Task ID	Operations				
	config-services	read, write				
	This example shows how to set the authenticator mode as <b>single-host</b> :					
	Router# configure Router(config)# dot1x profile test_profile Router(config-dot1x-test_profile)# authenticator host-mode single-host Router(config-dot1x-test_profile)# commit This example shows how to set the authenticator retry timer for MAB clients:					
	Command		Description			
		dot1x profile, o	on page 181	Configures IEEE 802.1X profile parameters and enters dot1x profile configuration sub mode.		

### clear mab

To clear the MAC authentication bypass (MAB) session or statistics, use the **clear mab** command in the XR EXEC mode.

**clear mab** { **session** *intf-type if-name* [ **client** *mac-address* ] | **statistics** { **interface** *intf-type if-name* | **location** *node* } }

Syntax Description	session Clears MAB session related to a specific interface.				
	statistics Cl	lears MAB statistics			
Command Default	None				
Command Modes	XR EXEC mode				
Command History	Release	Modification			
	Release 24.3.1	This command was introduced.			
Usage Guidelines	No specific	guidelines impact the use of this command.			
Task ID	Task Op ID	eration			

The following example shows how to clear MAB statistics on an interface:

Router#clear mab statistics interface gigabitEthernet 0/0/0/0

## dot1x host-mode

To allow multiple hosts or MAC addresses on a single port, use the host-mode command under authenticator mode in dot1x profile.

	host-mode	{ multi-auth   multi-host	single-host }
Syntax Description	multi-auth	Multiple authentication mode	_
	multi-host	Multiple host mode	_
	single-host	Single host mode	_
Command Default	The default is	smulti-auth mode.	
Command Modes	XR Config m	node	
Command History	Release	Modification	
	Release 7.2.1	This command was introduced.	
		wing stong to configure 802 1	V haat madaa

Use the following steps to configure 802.1X host-modes:

```
Router# configure terminal
Router(config)# dot1x profile {name}
Router(config-dot1x-auth)# pae {authenticator}
Router(config-dot1x-auth-auth)# host-mode
multi-auth multiple authentication mode
multi-host multiple host mode
single-host single host mode
```

## dot1x profile

	To configure IEEE 802.1X profile parameters and to enter dot1x profile configuration sub mo dot1x profile command in XR Config mode. To remove this configuration, use the <b>no</b> form of				
	-	ile <i>profile-name</i> { authenticator   mab   pae { authenticator   both   supplicant }			
Syntax Description	profile-name	Specifies the dot1x profile name, in WORD, with a maximum of 63 characters.			
	authenticator	• Enters the sub mode for authenticator.			
	mab	Enables MAC authentication bypass (MAB) feature.			
	pae	Sets 802.1X PAE type			
	supplicant	Enters the sub mode for supplicant.			
	eap	Configures EAP supplicant parameters.			
Command Default	None				
Command Modes	Global Config	gurationXR Config			
Command History	Release	Modification			
	ReleaseThis command was modified to include the <b>mab</b> option as part of MAC authentication bypass24.3.1(MAB) feature.				
	Release 6.3.2	2 This command was introduced.			
Usage Guidelines		troduction of MAB feature, the dot1x configuration in these routers was only a key-provider functionality, and not a mechanism for port control on the router.			
		Sec Using EAP-TLS Authentication chapter and the Implementing MAC Authentication Bypass System Security Configuration Guide for Cisco NCS 5500 Series Routers, for more details.			
Task ID	Task ID	Operations			
	config-service	s read, write			
Examples	This example	shows how to configure 802.1X profile on the router:			
	Router(conf:	figure ig)# dot1x profile test_profile ig-dot1x-test_profile)# pae both ig-dot1x-test_profile)# authenticator timer reauth-time 3600			

Router(config-dot1x-test\_profile) # supplicant eap profile test-eap-profile
Router(config-dot1x-test\_profile) # commit

This example shows how to enable MAB feature to implement port controlling:

```
Router#configure
Router(config)#dot1x profile test_mab
Router(dot1xx-test_mab)#mab
Router(dot1xx-test_mab)#commit
```

Related Commands	Command	Description	
	authenticator, on page 177	Configures authenticator parameters and enters the authenticator configuration sub mode.	

### show dot1x

To display whether 802.1X authentication has been configured on the device, use the **show dot1x** command in privileged EXEC mode.

**show dot1x** [**interface** *interface-type interface-id* | **detail**]

Syntax Description	interface	<i>interface-type interface-id</i> Displays the information for the specified interface ID.
Command Default	None	
Command Modes	EXEC	
Command History	Release	Modification
	Release 6.6.1	This command was introduced.
Usage Guidelines	No specific	e guidelines impact the use of this command.
Task ID	Task Ope ID	eration
	dot1x rea	ıd

#### Example

The **show dot1x interface** command verifies whether the 802.1X port-based authentication is successful or not for the supplicant to proceed with the traffic flow on the configured interface.

Router# show dot1x interface HundredGigE 0/0/1/0 detail

Dot1x info for HundredGigE 0/0/1/0

## **MACsec Commands**

This module describes the commands used to configure MACsec.

**Note** All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

For detailed information about keychain management concepts, configuration tasks, and examples, see the Implementing MACsec encryption chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

## allow (MACsec)

To specify MACsec policy exception to allow packets in clear text, use **allow** command under MACsec policy configuration mode. To remove this configuration, use the **no** form of this command.

	allow lacp-in-clear		
Syntax Description	lacp-in-clear Allows Link Aggregation Control Plane protocol (LACP) packets in clear text.		
Command Default	None		
Command Modes	MACsec policy configuration mode		
Command History	Release Modification	_	
	ReleaseThis command was7.3.1introduced.	_	
Usage Guidelines		nd under MACsec policy configuration mode is deprecated. Hence, -clear command instead, to allow LACP packets in clear-text	
Task ID	Task Operations ID		
	system read, write		
Examples	This example shows how to create a MACs	ec policy exception to allow LACP packets in clear text:	
	Router# <b>configure</b> Router(config)# <b>macsec-policy test-m</b> a Router(config-macsec-policy)# <b>allow</b>		

Router(config-macsec-policy) #commit

### cipher-suite

Configures the cipher suite for encrypting traffic with MACsec in the MAcsec policy configuration mode.

The first portion of the cipher name indicates the encryption method, the second portion indicates the hash or integrity algorithm, and the third portion indicates the length of the cipher (128/256).

To disable this feature, use the **no** form of this command.

cipher-suite encryption\_suite

 Syntax Description
 encryption\_suite
 The GCM encryption method that uses the AES encryption algorithm. The available encryption suites are:

 • GCM-AES-128

- GCM-AES-256
- GCM-AES-XPN-128
- GCM-AES-XPN-256

**Command Default** The default cipher suite chosen for encryption is GCM-AES-XPN-256.

**Command Modes** MACsec policy configuration.

 Release
 Modification

 Release
 This command was introduced.

 5.3.2
 This command was introduced.

 Task ID
 Task Operations

 ID
 system read, write

#### **Examples**

The following example shows how to use the **cipher-suite** command:

RP/0/RP0/CPU0:router# configure t
RP/0/RP0/CPU0:router(config)# macsec-policy mac\_policy
RP/0/RP0/CPU0:router(config-mac\_policy)# cipher-suite GCM-AES-XPN-256
RP/0/RP0/CPU0:router(config-mac\_policy)#

### conf-offset

Configures the confidentiality offset for MACsec encryption in the MACsec policy configuration mode. To disable this feature, use the **no** form of this command.

conf-offset offset\_value

offset_value	Configures the offset value. The options are:						
<ul> <li>CONF-OFFSET-0 : Does not offset the encryption</li> <li>CONF-OFFSET-30: Offsets the encryption by 30 characters</li> <li>CONF-OFFSET-50: Offsets the encryption by 50 characters.</li> </ul>							
				Default value is 0.			
				MACsec policy configuration.			
Release	Modification						
Release 5.3.2	This command was introduced.						
Task Ope ID	erations						
system read writ							
The followir	ng example shows how to use the <b>conf-offset</b> command:						
RP/0/RP0/CI RP/0/RP0/CI	PU0:router# configure t PU0:router(config)# macsec-policy mac_policy PU0:router(config-mac_policy)# conf-offset CONF-OFFSET PU0:router(config-mac policy)#						
	<ul> <li>Default valu</li> <li>MACsec pol</li> <li>Release</li> <li>Release</li> <li>5.3.2</li> <li>Task Ope</li> <li>ID</li> <li>system readwriti</li> <li>The followin</li> <li>RP/0/RP0/CC</li> <li>RP/0/RP0/CC</li> </ul>						

## crypto-sks-kme

To display details of the Quantum Key Distribution (QKD) server, use the **crypto-sks-kme** command in EXEC mode.

	crypto-sks-kme profile-name { entropy   capability }		
Syntax Description	profile-name Specifies the key string in clear-text form.		
	<b>entropy</b> Specifies the key in encrypted form.		
	<b>capability</b> Specifies the key in Type 6 encrypted form.		
Command Default	None		
Command Modes	EXEC mode		
Command History	Release Modification		
	Release 7.9.1 This command was introduced.		
Usage Guidelines	No specific guidelines impact the use of this command.		
Task ID	Task Operations ID		
	system read, write		
Examples	The following examples shows how to use the <b>crypto-sks-kme</b> command:		
	Router# crypto sks kme remote_qkd_prof1 entropy Entropy Details: Key details Dump: 0000 - 406b004c9c7f00000000000000000000000000000000000		
	Router# crypto sks kme QkdIP capability Capability Details: Entropy supported : False Key supported : False Algorithm : QKD Local identifier : Alicel Remote identifier : Alice1, Bob1,		

Task ID

## cryptographic-algorithm (MACsec)

Configures the cryptographic algorithm used for authenticating a peer for MACsec encryption in the Keychain-key configuration mode.

To disable this feature, use the **no** form of this command.

cryptographic-algorithm authentication algorithm

 Syntax Description
 authentication algorithm Configures the 128-bit or 256-bit AES encryption algorithm.

 Command Default
 No default behavior or values.

 Command Modes
 Keychain-key configuration.

 Usage Guidelines
 If you do not specify the cryptographic algorithm, MAC computation and API verification would be invalid.

Task Operations ID

system read, write

# **Examples** The following example shows how to use the **cryptographic-algorithm** command for MACsec Encryption:

Examples	The following example shows how to use the AES-128-CMAC authentication algorithm command:

RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router# key chain mac\_chain macsec RP/0/RP0/CPU0:router(config-mac\_chain-MacSec)# key 1234abcd5678 RP/0/RP0/CPU0:router(config-mac\_chain-MacSec-1234abcd5678)# key-string 12345678123456781234567812345678 cryptographic-algorithm aes-128-cmac

#### **Examples** The following example shows how to use the **AES-256-CMAC authentication algorithm** command:

RP/0/RP0/CPU0:router#configure

```
RP/0/RP0/CPU0:router# key chain mac_chain macsec
RP/0/RP0/CPU0:router(config-mac_chain-MacSec) # key 1234abcd5678
RP/0/RP0/CPU0:router(config-mac_chain-MacSec-1234abcd5678)# key-string
123456781234567812345678123456781234567812345678123456781234567812345678 cryptographic-algorithm
aes-256-cmac
```

## enable-legacy-fallback

To enable interoperability with peer devices that do not support MACsec active fallback feature, use the **enable-legacy-fallback** command in MACsec policy configuration mode. To remove the configuration, use the **no** form of this command.

#### enable-legacy-fallback

Syntax Description	This command has no keywords or arguments.
--------------------	--

**Command Default** Disabled, by default.

Command Modes MACsec policy configuration mode

Command History	Release	Modification	
	Release	This command was	_
	7.1.2	introduced.	

write

**Usage Guidelines** For more details on MACsec active fallback feature, see the *Fallback PSK* section in the *Configuring MACsec Encryption* chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers.* 

```
Task IDTask OperationIDsystem read,
```

This example shows how to enable interoperability with peer devices that do not support MACsec active fallback feature:

```
Router#configure
Router(config)#macsec-policy P1
Router(config-macsec-policy)#enable-legacy-fallback
Router(config-macsec-policy)#commit
```

### fallback-psk-keychain

To create or modify a fallback psk keychain key, use the **fallback-psk-keychain** command in keychain-key configuration mode.

To disable this feature, use the **no** form of this command.

fallback-psk-keychain key-id

Syntax Description	key-id	64-character hexadecimal string
eynax Decemption	kty iu	04 endracter nexadeennar string

**Command Default** No default behavior or values.

**Command Modes** Key chain configuration

**Usage Guidelines** The key must be of even number of characters. Entering an odd number of characters will exit the MACsec configuration mode.

 Task ID
 Task ID
 Operations

 ID
 system
 read, write

#### **Examples**

The following example shows how to use the **key** command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router# fallback-psk-keychain fallback\_mac\_chain
RP/0/RP0/CPU0:router(config-mac\_chain-MacSec)# key 1234abcd5678

## impose-overhead-on-bundle

To impose the MACsec overhead on the bundle interface, use **impose-overhead-on-bundle** command under MACsec policy configuration mode.

impose-overhead-on-bundle

Syntax Description	<b>impose-overhead-on-bundle</b> Applies macsec overhead on the bundle interface.			
Command Default	None			
Command Modes	MACsec policy configuration mode			
Command History	Release Modification			
	ReleaseThis command was24.1.1introduced.			
Usage Guidelines	No specific guidelines impact the use of this command.			
Task ID	Task Operations ID			
	system read, write			
Examples	This example shows how to configure MACsec policy exception to apply macsec overhead on the bundle interface:			
	Router# <b>configure</b> Router(config)# <b>macsec-policy test-macsec-policy</b> Router(config-macsec-policy)# <b>impose-overhead-on-bundle</b> Router(config-macsec-policy)# <b>commit</b>			

## key

To create or modify a keychain key, use the **key** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

key key-id

Syntax Description	key-id 64-character hexadecimal string.
Command Default	No default behavior or values.
Command Modes	Key chain configuration
Usage Guidelines	The key must be of even number of characters. Entering an odd number of characters will exit the MACsec configuration mode.
Task ID	Task Operations ID
	system read, write
Examples	The following example shows how to use the <b>key</b> command:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router# key chain mac\_chain macsec
RP/0/RP0/CPU0:router(config-mac\_chain-MacSec)# key 1234abcd5678

## key chain

	To creat	e or modify a	keychain, use the key chain command in the key chain configuration mode.		
	To disable this feature, use the <b>no</b> form of this command.				
	key chain key-chain-name				
Syntax Description	<i>key-chain-name</i> Specifies the name of the keychain. The maximum length is 32 (128-bit encryption)/64 (256-bit encryption) character hexadecimal string.				
		Note	If you are configuring MACsec to interoperate with a MACsec server that is running software prior to IOS XR 6.1.3, then ensure that the MACsec key length is of 64 characters. If the key length is lesser than 64 characters, authentication will fail.		
Command Modes	Key cha	in configuration	ion		
Command Default	No defa	ult behavior c	or values		
Task ID	Task ID	Operations			
	system	read, write			
Examples	The foll	owing examp	le shows how you can configure a key chain for MACsec encryption:		
	RP/0/RE	0/CPU0:rout	er# configure er(config)# key chain mac_chain macsec er(config-mac_chain-MacSec)#		

## key-string

To specify the text string for the key, use the **key-string** command in keychain-key configuration mode.

To disable this feature, use the **no** form of this command.

key-string [clear | password] key-string-text

Syntax Description	clear	Specifies the key string in clear-text form.			
	<b>password</b> password	Specifies the key in encrypted form.			
	key-string-text	Text string for the key, which is encrypted by the parser process before being saved to the configuration. The text string has the following character limitations:			
		• Plain-text key strings—Minimum of 1 character and a maximum of 32 (128-bit encryption)/64 (256-bit encryption) characters (hexadecimal string).			
		• Encrypted key strings—Minimum of 4 characters and no maximum.			
Command Default	The default value is	clear.			
Command Modes	Key chain configura	ition			
Usage Guidelines	For an encrypted pa	ssword to be valid, the following statements must be true:			
	• String must contain an even number of characters, with a minimum of four.				
	• The first two characters in the password string must be decimal numbers and the rest must be hexadecimals.				
	• The first two digits must not be a number greater than 53.				
	Either of the following examples would be valid encrypted passwords:				
	1234abcd				
	or				
	50aefd				
Task ID	Task Operations ID				
	system read, write				
Examples	The following exam	ple shows how to use the <b>keystring</b> command:			
	! For AES 128-bit encryption				
		ater# configure ater(config)# key chain mac_chain macsec ater(config-mac_chain-MacSec)# key 1234abcd5678

123456788

## key-server-priority

Configures the preference for a device to serve as the key server for MACsec encryption in the MACsec policy configuration mode. To disable this feature, use the **no** form of this command.

key-server-priority value

**Syntax Description** *value* Indicates the priority for a device to become the key server. Lower the value, higher the preference. The range is 0-255.

**Command Default** Default value is 16.

**Command Modes** MACsec policy configuration.

Commond Illiotoms		
Command History	Release	Modification
	Release 5.3.2	This command was introduced.

write

 Task ID

 ID
 system read,

**Examples** 

The following example shows how to use the **key-server-priority** command:

RP/0/RP0/CPU0:router# configure t
RP/0/RP0/CPU0:router(config)# macsec-policy mac\_policy
RP/0/RP0/CPU0:router(config-mac\_policy)# key-server-priority 16
RP/0/RP0/CPU0:router(config-mac\_policy)#

### lifetime

Configures the validity period for the MACsec key or CKN in the Keychain-key configuration mode. To disable this feature, use the **no** form of this command.

The lifetime period can be configured with a duration in seconds, as a validity period between two dates (for example, Jan 01 2014 to Dec 31 2014), or with an infinite validity.

The key is valid from the time you configure in HH:MM:SS format. Duration is configured in seconds.

When a key has expired, the MACsec session is torn down and running the **show macsec mka session** command does not display any information. If you run the **show macsec mka interface** and **show macsec mka interface** detail commands, you can see that the session is unsecured.

lifetime start\_time start\_date
{
 end\_time end\_date |
 duration validity | infinite
}

Syntax Description	start-time	Start time in hh:mm:ss from which the key becomes valid. The range is from 0:0:0 to 23:59:59.		
	end-time	End time in hh:mm:ss at which point the key becomes invalid. The range is from 0:0:0 to 23:59:59.		
	start_date	The date in DD month YYYY format that the key becomes valid.		
	end_date	The date in DD month YYYY format that the key becomes invalid.		
	duration validity	The key chain is valid for the duration you configure. You can configure duration in seconds.		
	infinite	The key chain is valid indefinitely.		
Command Default	No default behavio	or or values		
Command Modes	Keychain-key conf	iguration		
Command History	Release Mo	dification		
	Release 5.3.2 Thi	s command was introduced.		
Task ID	Task Operations			
	system read, write	-		

#### **Examples**

The following example shows how to use the **lifetime** command:

#### ! For AES 128-bit encryption

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# key chain mac_chain macsec
RP/0/RP0/CPU0:router(config-mac_chain-MacSec)# key 1234abcd5678
RP/0/RP0/CPU0:router(config-mac_chain-MacSec-1234abcd5678)# key-string
12345678123456781234567812345678 cryptographic-algorithm AES-128-CMAC

#### macsec

Enables MACsec on the router in the keychain configuration mode. To disable this feature, use the **no** form of this command. macsec [key key-id ] **Syntax Description** key-id The key can be up to 64 bytes in length. The configured key is the CKN that is exchanged between the peers. No default behavior or values. **Command Default** Keychain configuration **Command Modes Command History** Release Modification Release 5.3.2 This command was introduced. Release 7.1.2 The key-id values are made case insensitive, and are stored as uppercase letters. Release 7.2.1 From Cisco IOS XR Software Release 7.1.2, Release 7.2.1 and later, the MACsec key IDs are considered to **Usage Guidelines** be case insensitive. These key IDs are stored as uppercase letters. For example, a key ID of value 'FF' and of value 'ff' are considered to be the same, and both these key IDs are now stored in uppercase as 'FF'. Whereas, prior to Release 7.1.2 and Release 7.2.1, both these values were treated as case sensitive, and hence considered as two separate key IDs. However, the support for this case insensitive IDs is applicable only for the configurations done through CLI, and not for configurations done through Netconf protocol. Hence, it is recommended to have unique strings as key IDs for a MACsec key chain to avoid flapping of MACsec sessions. For example, the key IDs ('FF' and 'ff') in this example are not unique (although one is in uppercase and other is in lowercase), and hence this might cause a MACsec session flap. key chain 1 macsec key FF lifetime 02:01:01 may 18 2020 infinite kev ff lifetime 01:01:01 may 18 2020 infinite Task ID Task Operations ID system read, write **Examples** The following example shows how to use the **macsec** command:

RP/0/RP0/CPU0:router# configure t
RP/0/RP0/CPU0:router(config)# key chain mac\_chain macsec
RP/0/RP0/CPU0:router(config-mac\_chain-MacSec)# key 1234abcd5678
RP/0/RP0/CPU0:router(config-mac\_chain-MacSec-1234abcd5678)#

# macsec-policy

Creates a MACsec policy for MACsec encryption in XR Config mode. To disable this feature, use the **no** form of this command.

macsec-policy policy\_name

Syntax Description	<i>policy_name</i> Name of the MACsec policy for encryption.		
Command Default	No default behavior or values.		
Command Modes	XR Config mode		
Command History	Release Modification		
	Release 5.3.2 This command was introduced.		
Task ID	Task Operations ID		
	system read, write		
Examples	The following example shows how to use the <b>macsec-policy</b> command:		
	RP/0/RP0/CPU0:router# configure t RP/0/RP0/CPU0:router(config)# macsec-policy mac_policy RP/0/RP0/CPU0:router(config-mac_policy)#		

### macsec shutdown

To enable MACsec shutdown, use the macsec shutdown command in XR Config mode. To disable MACsec shutdown, use the no form of the command.

#### macsec shutdown

#### Syntax Description

This command has no keywords or arguments.

The macsec shutdown command is disabled by default. **Command Default** 

XR Config mode **Command Modes** 

#### **Command History** Release Modification Release This command was 6.3.3 introduced.

#### Enabling the macsec shutdown command, brings down all macsec sessions on the MACsec-enabled interfaces **Usage Guidelines** and resets ports to non-macsec mode. The already existing MACsec configurations remain unaffected by enabling this feature.

Disabling the macsec shutdown command, brings up MACsec sessions for the configured interfaces and enforces MACsec policy on the port.

A

Warning

Configuring macsec shutdown command disables MACsec on all data ports, system wide. Execute clear command to erase cached configuration or **commit** command to continue.

Task ID

#### Task Operation

system read, write

#### Example

ID

The following example shows how to enable MACsec shutdown:

RP/0/RSP0/CPU0:router# configure terminal RP/0/RSP0/CPU0:router(config) # macsec shutdown

### show macsec mka summary

To display the Summary of MACsec Sessions, use the **show macsec mka summary** command in EXEC mode.

show macsec mka summary

#### Syntax Description

This command has no keywords or arguments.

**Command Default** No default behavior or values.

### show macsec ea

To display MACsec programming details for each interface, use the **show macsec ea** command in EXEC mode.

show macsec ea [ idb { interface interface name | |location location name } | trace {all | errors | events| base}

Syntax Description	interface	Specifies the interface name to view MACsec details.						
	interface I name	Enables MACsec mode for a specified interface.						
	location	ocation Specifies the node location to enable the MACsec details.						
	location ] name	Enables MACsec mode for a specific node.						
		<b>all</b> (Optional) Show <b>all</b> MACsec EA traces for the specified node, or the current node if none is specified.						
	<b>base</b> (Optional) Show MACsec EA <b>base</b> traces for the specified node, or the current node if none is specified.							
	errors (Optional) Show MACsec EA error traces for the specified node, or the current node if none is specified.							
		(Optional) Show MACsec EA <b>event</b> traces for the specified node, or the current node if none s specified.						
Command Default	No default beha	vior or values.						
Command Modes	EXEC mode							
Command History	Release M	odification						
	Release TI 7.0.1	nis command was introduced.						
Usage Guidelines	The show macs	ec ea command is available only with the installation of the k9sec rpm.						
Task ID	Task ID Operati	ion						
	interface read							
	This example sh 0/RP0/CPU0.	ows how to view MACsec information for a specific interface located on location						
	Router# <b>show</b> Mon Dec 4 03:	macsec ea idb location 0/RP0/CPU0 59:07.481 UTC

#### show macsec open-config

To display Open-config MACSEC traces, use the **show macsec open-config** command in EXEC mode.

#### show macsec opwn-config trace

#### Syntax Description

This command has no keywords or arguments.

**Command Default** No default behavior or values.

**Command Modes** EXEC mode

Command History	Release	Modification
	Release 7.0.1	This command was introduced.

**Usage Guidelines** The **show macsec open-config** command is available only with the installation of the k9sec rpm.

## sak-rekey-interval

To set a timer value to rekey the MACsec secure association key (SAK) at a specified interval, use the **sak-rekey-interval** command in the macsec-policy configuration mode. To disable this feature, use the **no** form of this command.

	sak-rek	key-inte	rval timer-value	
Syntax Description	timer-ve	alue Sp	pecifies the timer value, in second	ds.
		Ra	ange is 60 to 2592000.	
Command Default	The tim	er is set	t to OFF, by default	
Command Modes	MACse	ec policy	configuration.	
Command History	Releas	e I	Modification	
	Release 6.3.3	e ]	This command was introduced.	
Task ID	Task ID	Operati	ions	
	system	read, write		
Examples	This exa	ample sl	hows how to set a timer value to	o rekey the MACsec SAK:
		(config	<pre>gure g)#macsec-policy test-polic g-macsec-policy)#sak-rekey- g-macsec-policy)#sak-rekey-</pre>	-

Router(config-macsec-policy)#commit

# security-policy

Configures the type of data that is allowed to transit out of the interface configured with MACsec in the MACsec policy configuration mode. To disable this feature, use the **no** form of this command.

	security-policy {should-secure   must-secure}							
Syntax Description	should-secure Configures the interface on which the MACsec policy is applied, to permit all data.							
	<b>must-secure</b> Configures the interface on which the MACsec policy is applied, to permit only MACsec encrypted data.							
Command Default	Default value is <b>must-secure</b> .							
Command Modes	MACsec policy configuration.							
Command History	Release Modification							
	Release 5.3.2 This command was introduced.							
Task ID	Task Operations ID							
	system read, write							
Examples	The following example shows how to use the <b>security-policy</b> command:							
	RP/0/RP0/CPU0:router# configure t RP/0/RP0/CPU0:router(config)# macsec-policy mac_policy RP/0/RP0/CPU0:router(config-mac_policy)# security-policy must-secure RP/0/RP0/CPU0:router(config-mac_policy)#							

# show crypto sks profile

To display the details or statistics of the Session Key Service (SKS) profiles in the router, use the **show crypto sks profile** command in the XR EXEC mode.

	show cry	pto sks j	profile	profile-n	ame	all }	[ stats ]					
Syntax Description	profile name	Specifie	es the name	e of the SK	KS prof	ile.						
	all											
	stats	ts Displays the statistics of the SKS profiles.										
Command Default	None											
Command Modes	XR EXEC mode											
Command History	Release	Modific	cation									
	Release 7.9.1	mmand wa	is introduc	ed.								
Usage Guidelines	No specific	guidelines	s impact th	e use of th	is com	mand.						
Task ID	Task Ope ID	eration										
	system rea	d										
	The following example shows how to view the SKS profile details in a router:											
	Router (cor				file a	11						
	Profile Na			eR1toR2								
	Myidentifi	ler	:Router1	Remote								
	Type Reg Client	Count	:1

System Security Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers

L

#### window-size

Configures the replay protection window size in MACsec policy configuration mode. To disable this feature, use the **no** form of this command.

The replay protection window size indicates the number of out-of-sequence frames that can be accepted at the interface configured with MACsec, without being dropped.

window-size value

write

Syntax Description	value       Number of out-of-sequence frames that can be accepted at the interface without being dropped. The range is 0-1024.         Default value is 64.		
Command Default			
Command Modes	MACsec policy configuration.		
Command History	Release Modification		
	Release 5.3.2 This command was introduced.		
Task ID	Task Operations ID		
	system read,		

**Examples** 

The following example shows how to use the **window-size** command:

RP/0/RP0/CPU0:router# configure t
RP/0/RP0/CPU0:router(config)# macsec-policy mac\_policy
RP/0/RP0/CPU0:router(config-mac\_policy)# window-size 64

I

# **IPSec Commands**

This module describes the commands used to configure IPSec.

The IPSec and IKEv2 commands apply to the below listed Cisco NCS 540 series routers only:

- N540X-12Z16G-SYS-D
- N540X-12Z16G-SYS-A
- ikev2 policy, on page 242
- ikev2 profile, on page 243
- ikev2 proposal, on page 245
- ipsec profile, on page 247
- ipsec transform-set, on page 249
- keyring, on page 250
- show ikev2 session detail, on page 252
- show ikev2 session, on page 253
- show ikev2 summary, on page 254
- show ipsec sa, on page 255

## ikev2 policy

To configure any parameters for the Internet Key Exchange Version 2 (IKEv2) policy, use the **ikev2 policy** command in XR Config mode.

	<pre>ikev2 policy name name }</pre>	{ match { address local address   vrf { name   any } }   proposal
Syntax Description	name	Specifies the name for the IKEv2 policy
	match	Specifies that a match type follows
	address local address	Specifies the ip address of the local interface to be associated with this IKEv2 profile
	vrf	Configures VRF profile for the IKEv2 policy.
	name	Specifies the name of the dedicated VRF profile
	any	Specifies that the IKEv2 policy can use any matching VRF profile in the router.
	proposal name	Specifies the IKEv2 proposal for the IKEv2 policy
Command Default	None	
Command Modes	XR Config mode	
Command History	Release Modificati	ion
	ReleaseThis comm7.8.1introduced	
Usage Guidelines	Before configuring IKE	v2 policy, an IKEv2 proposal must be available in your router.
Examples	This example shows how	w to create a IKEv2 policy:
	Router (config)# ike	v2 policy ikev2_policy_P2 match address local 5.22.16.52 v2 policy ikev2_policy_P2 match fvrf any v2 policy ikev2_policy_P2 proposal ikev2_proposal_P1 mit

## ikev2 profile

To configure the parameters of an Internet Key Exchange Version 2 (IKEv2) profile, use the **ikev2 profile** command in XR Config mode.

Syntax Description	name	Specifies the name of the IKEv2 profile		
	keyring <i>name</i>	Configures the trustpoints used for user certificate validation		
	keyring ppk	(Optional) When configured, PPK related IKEv2 packet exchange is enabled.		
	lifetime seconds	Specifies the name of the trustpoint		
	match	Specifies that a match type follows		
	fvrf	Configures the FVRF profile for the IKEv2 profile.		
	name	Specifies the name of the dedicated FVRF profile.		
	any	Specifies that the IPSec profile can use any matching FVRF profile in the router.Specifies that the IPSec Peer authentication method followsSpecifies that the authentication occurs on the source router.Specifies that the authentication occurs on the peer router.Specifies that the authentication uses the pre-shared key available in the router		
	authentication			
	local			
	remote			
	pre-shared			
	rsa-signature	Specifies that the authentication is X.509v3 certificate based on rsa signature		
	identity remote	Specifies that the identity match for the IKEv2 profile is via the remote identity		
	pki trustpoint name	Specifies the public key infrastructure trustpoint name in the IPSec profile		
Command Default	None			
Command Modes	XR Config mode			
Command History	Release Modification			
	Release 7.8.1 This command	was introduced.		
	ReleaseThe keyring pp24.1.1	<b>k</b> keyword is introduced in the <b>ikev2 profile</b> command.		

#### Usage Guidelines Before creating an IKEv2 profile, A keyring profile must be available in your router.

This example shows how to configure an IKEv2 profile:

```
Router#configure
Router(config)# ikev2 profile ikev2_prof_mgmt_P1 keyring key_mgmt_P1
Router(config)# ikev2 profile ikev2_prof_mgmt_P1 lifetime 600
Router(config)# ikev2 profile ikev2_prof_mgmt_P1 match identity remote address 5.22.16.25
255.255.0.0
Router(config)#commit
```

This example shows how to configure dynamic PPK for one or more peers or groups of peers, in the IKEv2 keyring.

```
Router#configure terminal
Router(config)#keyring dynamic
Router(config-ikev2-keyring)#peer peer1
Router(config-ikev2-keyring-peer)#ppk dynamic qkd required
Router(config-ikev2-keyring)#pre-shared-key cisco123!cisco123
Router(config-ikev2-keyring-peer)#address 10.0.0.1 255.0.0.0
Router(config)#ikev2 profile test
Router(config-ikev2-profile-test)#keyring dynamic
Router(config-ikev2-profile-test)#keyring ppk dynamic
Router(config-ikev2-profile-test)#keyring ppk dynamic
Router(config-ikev2-profile-name)#match address 10.0.0.1 255.255.255.0
Router(config)#sks profile qkd type remote
Router(config-sks-profile)#kme server ipv4 192.0.2.34 port 10001
Router(config-ikev2-keyring-peer)#exit
Router(config)#exit
```

## ikev2 proposal

To configure the parameters for an Internet Key Exchange Version 2 (IKEv2) proposal, use the **ikev2 proposal** command in XR Config mode.

Syntax Description	name	Specifies the name for the IKEv2 proposal
	dh-group	Specifies that the transform of the DH group follows.
		<b>Note</b> You can configure one or more DH groups by separating them by a comma.
	19	Specifies the ECP group type DH Group-19 (256-bit)
	20	Specifies the ECP group type DH Group-20 (384-bit)
	21	Specifies the ECP group type DH Group-21 (512-bit)
	encryption	Specifies that the type of encryption algorithm follows.
		<b>Note</b> You can configure one or more encryption algorithms by separating them by a comma.
	aes-gcm-128	Specifies 128 bits encryption using the Advanced Encryption Standard (AES) with Galois/Counter Mode (AES-GCM).
	aes-gcm-256	Specifies 256 bits encryption using the Advanced Encryption Standard (AES) with Galois/Counter Mode (AES-GCM).
	aes-cbc-128	Specifies 128 bits encryption using the Advanced Encryption Standard (AES) with cipher-block chaining (CBC).
	aes-cbc-192	Specifies 192 bits encryption using the Advanced Encryption Standard (AES) with cipher-block chaining (CBC).
	aes-cbc-256	Specifies 256 bits encryption using the Advanced Encryption Standard (AES) with cipher-block chaining (CBC).
	integrity	Specifies that the type of algorithm used to authenticate packets in IPSec follows.
		<b>Note</b> You can configure one or more integrity algorithms by separating them by a comma.
	sha-1	Specifies that SHA-1 algorithm is used to authenticate in IPSec packets.
	sha-256	Specifies that SHA-256 algorithm is used to authenticate in IPSec packets.
	sha-384	Specifies that SHA-384 algorithm is used to authenticate in IPSec packets.
	sha-512	Specifies that SHA-512 algorithm is used to authenticate in IPSec packets.

I

	prf	Specifies the type of algorithm used to provide randomness for keying information in IPSec follows.	
		<b>Note</b> You can configure one or more PRF algorithms by separating them by a comma.	
	sha-1	Specifies that SHA-1 algorithm is used to provide randomness for keying information.	
	sha-256	Specifies that SHA-256 algorithm is used to provide randomness for keying information.	
	sha-384	Specifies that SHA-384 algorithm is used to provide randomness for keying information.	
	sha-512	Specifies that SHA-512 algorithm is used to provide randomness for keying information.	
Command Default	None		
Command Modes	XR Config	; mode	
Command History	Release	Modification	
	Release 7.8.1	This command was introduced	
Usage Guidelines	No specific guidelines impact the use of this command.		
Examples	This examp	ple shows how to configure a IKEv2 profile:	
	Router(co: Router(co:	nfig)# ikev2 proposal ikev2_proposal_P1 prf sha-256 nfig)# ikev2 proposal ikev2_proposal_P1 dh-group 20 nfig)# ikev2 proposal ikev2_proposal_P1 integrity sha-256 nfig)# ikev2 proposal ikev2_proposal_P1 encryption aes-cbc-256	

## ipsec profile

To create an IPSec profile, use the ipsec profile command in XR Config mode.

	ipsec profile <i>name</i> set security-association lifetime	<pre>{ ikev2-profile name   pfs { group19   group20   group21 }   seconds   transform-set name   responder-only }</pre>	
Syntax Description	пате	Specifies the name for the IPSec profile	
	ikev2-profile name	Associates the specified IKEv2 profile with the IPSec profile.	
	pfs	Specifies that a DH group follows.	
	group19	Specifies the MODP group type DH Group1 (768-bit).	
	group20	Specifies the MODP group type DH Group2 (1024-bit).	
	group21	Specifies the MODP group type DH Group5 (1536-bit).	
	security-association lifetime seconds	Configures the duration of the security associations validity in seconds. The range of security assosiation lietime is 120-2592000 seconds. By default, the fixed lifetime value associated with SAis 14400 seconds.	
	transform-set name	Associates the specified transform set with the IPSec profile.	
	responder-only	Allows a router configured with this command to respond to an initiation request from an IPSec peer router. The router cannot initiate an IPSec session.	
Command Default	None		
Command Modes	XR Config mode		
Command History	Release Modification		
	Release 7.8.1 This command was introduced.		
	ReleaseThe responder-only keyword was introduced.7.11.1		
Usage Guidelines	Before creating an IPSec profile	e, an IKEv2 profile and transform set must be available in your router.	
Examples	The following example iterates l	how to create an IPSec profile:	
	Router# config Router(config)# ipsec profile set ikev2 profile ikev2_prof_mgmt_P2 Router(config)# ipsec profile set pfs group19 Router(config)# ipsec profile set security-association lifetime seconds 600 Router(config)# ipsec profile set transform-set ts_mgmt_P2 Router (config)# ipsec profile set responder-only Router(config)# commit		

I

## ipsec transform-set

To configure the transform set parameters of an IPSec profile, use the **ipsec transform-set** command in XR Config mode.

ipsec transform-set *name* { mode tunnel | tansform { esp-192-aes | esp-256-aes | esp-hmac-sha-256 | esp-hmac-sha-384 | esp-hmac-sha-512 | esp-hmac-sha1 } }

Syntax Description	name		Specifies the name for the transform set.		
	mode	mode         Species that the IPSec channel type follows.			
	tunnel		Specifies the IPSec channel between the interfaces is a tunnel.		
	transform		Specifies that the algorithm used in the transform set follows.		
	esp-192-aes	5	Specifies that the transform set uses the ESP-192-AES algorithm for encryption.		
	esp-256-aes	5	Specifies that the transform set uses the ESP-256-AES algorithm for encryption.		
	esp-hmac-sha-256		Specifies that the transform set uses the ESP-HMAC-SHA-256 algorithm for encryption.		
	esp-hmac-s	ha-384	Specifies that the transform set uses the ESP-HMAC-SHA-384 algorithm for encryption.		
	esp-hmac-sha-512 Specifies that the transform set uses the ESP-HMAC-SHA-512 algorithm for encryption.				
	esp-hmac-s	sha1	Specifies that the transform set uses the ESP-HMAC-SHA1 algorithm for encryption.		
Command Default	No specific g	guidelin	es impact the use of this command.		
Command Modes	XR Config r	node			
Command History	Release	Modi	fication		
	Release 7.8.1	This c introd	command was luced.		
Usage Guidelines	None				
	This example shows how to configure an IPSec transform set:				
		fig)# <b>i</b> fig)# <b>i</b>	psec transform-set ts_mgmt_P2 mode tunnel psec transform-set ts_mgmt_P2 transform esp-hmac-sha-256 mmit		

### keyring

To configure the keying details of an IPSec profile, use the keyring command in XR Config mode.

keyring *name* peer { manual | dynamic } name { address *ip* | pre-shared-key ł ppk clear | local | password } key } **Syntax Description** keyring name Specifies the name for the keyring profile Specifies the name of the peer interface peer name Provision the same PPK on both IKEv2 and IPsec initiator and responder manually ppk manual/dynamic or dynamically from an external key source. Specifies the ip address of the peer interface along with the prefix. address ip Specifies that the preshared key for IPSec communication is in cleartext format. clear local Specifies that the preshared key for IPSec communication is a local passphrase. Specifies that the preshared key for IPSec communication is an encrypted string in password hexadecimal format. Specifies the preshared key for IPSec communication. key No specific guidelines impact the use of this command. **Command Default** XR Config mode **Command Modes Command History** Release Modification Release 7.8.1 This command was introduced. Release The **ppk manual/dynamic** keyword was introduced in the **keyring** command. 24.1.1 None **Usage Guidelines Examples** This example shows how to configure the keyring parameters for IPSec: Router# config Router(config)# keyring key\_mgmt\_P1 peer ACADIA-2 address 5.22.16.25 255.255.0.0 Router (config) # keyring key\_mgmt\_P1 peer ACADIA-2 pre-shared-key cisco123 Router(config) # commit This example shows how to configure the manual PPK for one or more peers or groups of peers, in the IKEv2 keyring.

```
Router#configure terminal
Router(config)#keyring manual
```

```
Router(config-ikev2-keyring)#peer peer1
Router(config-ikev2-keyring-peer)#ppk manual id cisco123 key password 060506324F41584B56
required
Router(config-ikev2-keyring)#pre-shared-key cisco123!cisco123
Router(config-ikev2-keyring-peer)#address 10.0.0.1 255.0.0.0
Router(config)#ikev2 profile test
Router(config-ikev2-profile-test)#keyring manual
Router(config-ikev2-profile-test)#keyring ppk manual
Router(config-ikev2-profile-test)#keyring ppk manual
Router(config-ikev2-profile-name)#match address 10.0.0.1 255.255.255.0
Router(config-ikev2-keyring-peer)#exit
Router(config)#exit
```

#### **Examples**

This example shows how to configure the dynamic PPK for one or more peers or groups of peers, in the IKEv2 keyring.

```
Router#configure terminal

Router(config)#keyring dynamic

Router(config-ikev2-keyring)#peer peer1

Router(config-ikev2-keyring-peer)#ppk dynamic qkd required

Router(config-ikev2-keyring)#pre-shared-key ciscol23!ciscol23

Router(config-ikev2-keyring-peer)#address 10.0.0.1 255.0.0.0

Router(config)#ikev2 profile test

Router(config-ikev2-profile-test)#keyring dynamic

Router(config-ikev2-profile-test)#keyring ppk dynamic

Router(config-ikev2-profile-test)#keyring ppk dynamic

Router(config-ikev2-profile-name)#match address 10.0.0.1 255.255.255.0

Router(config)#sks profile qkd type remote

Router(config-sks-profile)#kme server ipv4 192.0.2.34 port 10001

Router(config-ikev2-keyring-peer)#exit

Router(config)#exit
```

## show ikev2 session detail

To view details of IKEv2 sessions in your router, use the **show ikev2 session detail** command in XR EXEC mode.

	show ikev2 session detail		
Command Default	None		
Command Modes	XR EXEC m	ode	
Command History	Release	Modification	
	Release 7.8.1	This command was introduce	d.
Usage Guidelines	No specific g	guidelines impact the use of thi	s command.
Examples	This example	e shows the usage of <b>show ike</b>	v2 session detail command:
		/RP0/CPU0:R1#show platfor VU0:ios# show ikev2 sessio	m security integrity statistics ima-cache block stats n detail : 1
	Status		: UP-ACTIVE
	IKE Count		: 1
	Child Coun IKE SA ID		: 1 : 1
	Local		: 1.1.1.1/500
	Remote		: 1.1.1.2/500
	Status (De	scription)	: READY (Negotiation done)
	Role		: Initiator
	Encryptio	on/Keysize	: AES-CBC/128
	PRF/Hash/		: SHA1/SHA256/20
	Authentic	ation(Sign/Verify)	: PSK/PSK
	Authentic	ation(Sign/Verify)	: RSA/RSA (for certificate based)
	Life/Acti	ve Time(sec)	: 86400/2043
	Session I	D	: 1
	Local SPI		: 3B95C7FCC6A69D0A
	Remote SP	I.	: F44C4DBCFEE67F07
	Local ID		: 1.1.1.1
	Remote ID		: 1.1.1.2
	Child SA		
	Local Se	lector	: 1.1.1.1/1000 - 1.1.1.1/1000
	Remote S	elector	: 1.1.1.2/1000 - 1.1.1.2/1000
	ESP SPI		: 0x6c7b15b7 / 0xbf55acd7
		IN/OUT	: 0x6c7b15b7 / 0xbf55acd7 : AES-GCM
	ESP SPI	IN/OUT	

## show ikev2 session

To display the statistics of an IKEv2 session in thr router, use the **show ikev2 session** command in XR EXEC mode.

	show ikev2 session			
Syntax Description	This command has	s no keywords or argument	IS.	
Command Default	None			
Command Modes	XR EXEC mode			
Command History	Release Modification			
	ReleaseThis command was introduced.7.8.1			
Usage Guidelines	No specific guidelines impact the use of this command.			
Examples	This example show	ws the sample output of the	e show ikev2 session command:	
	Router# <b>show ik</b> Session ID	: 1		
	Status IKE Count Child Count IKE SA ID	: 1		
	Role Child SA	: 1.1.1.1/50 : 1.1.1.2/50 ion) : READY (Nego : Initiator	) otiation done)	
		: 1.1.1.1/ : 1.1.1.2/		

# show ikev2 summary

To display the IKEv2 session summary of your router, use the **show ikev2 summary** command in XR EXEC mode.

	show ike	w2 summary		
Syntax Description	This command has no keywords or arguments.			
Command Default	None			
Command Modes	- XR EXEC	XR EXEC mode		
Command History	Release	Modification	-	
	Release 7.8.1	This command was introduced.	-	
Usage Guidelines	No specific guidelines impact the use of this command.			
Examples	This examp	ble shows the sample output of the	e show ikev2 summary command:	
	Router# <b>show ikev2 summary</b> IKEv2 Session Summary			
	Total Out	(Active/Negotiation) going Sa (Active/Negotiation) oming Sa (Active/Negotiation)		

## show ipsec sa

To display the Security Association (SA) details of the interfaces used for IPSec in the router, use the **show ipsec sa** command in the XR EXEC mode.

	show ipsec sa	[ interface name ]		
Syntax Description	interface Specifies th	nat an interface name follo	WS	
	name Specifies th	ne name of the interface for	which the displays th	e IPSec Security-Association (SA)
Command Default	None			
Command Modes	XR EXEC mode			
Command History	Release			Modification
	Release 7.8.1			This command was introduced.
Usage Guidelines	No specific guideline	s impact the use of this con	nmand.	
Examples	The following sample output is from the <b>show ipsec sa</b> command:			
		SA-Id Inbound SPI		
		804 0x2c378849		
	Router# show ipsec sa interface tunnel-ip1			
	Interface Name Interface handle SA id Mode	: tunnel-ip1 : 0x800090 : 713 : Tunnel		
	Inbound SA SPI Protocol Encrypt Algorithm Auth Algorithm Rekey (After Secor			
	Outbound SA SPI Protocol Encrypt Algorithm Auth Algorithm Rekey (After Secor	: HMAC_SHA_256		

l

## **Public Key Infrastructure Commands**

This module describes the commands used to configure Public Key Infrastructure (PKI).

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

For detailed information about PKI concepts, configuration tasks, and examples, see the Implementing Certification Authority Interoperability chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

I

#### auto-enroll

To specify the duration after which the router request for automatic renewal of a PKI certificate from the CA, , use the **auto-enroll** command in trustpoint configuration mode. To disable the automatic renewal of the certificate after the said period, use the **no** form of this command.

auto-enroll percentage

Syntax Description	percentag	<i>percentage</i> Percentage of the certificate validity after which the router will request for a new certificate from the CA. The range is from 1 to 99.		
Command Default	None			
Command Modes	Trustpoint	configuration		
Command History	Release	Modification		
	Release 7.5.3	This command was introduced.		
Usage Guidelines	This comm	nand is applicable only for Cisco IO	S XR 64-bit Software.	
Task ID	Task O ID	perations		
	crypto re w	ead, vrite		
Examples	The follow	ving example shows how to configu	re auto renewal of PKI certificate in the router:	
		onfigure onfig)#crypto ca trustpoint sy onfig-trustp)#auto-enroll 30	stem-trustpoint	

Router(config-trustp)#commit

## ca-keypair

To create the key pair for the root certificate on the router, use the **ca-keypair** command in trustpoint configuration mode. To remove this configuration, use the **no** form of this command.

	ca-keypair	{ dsa   ecdsanistp256   ecdsanistp384   ecdsanistp521   ed25519   rsa } key-pair-label
Syntax Description	key-pair-label	Specifies the key pair label for the respective key signature algorithm (DSA, ECDSA, Ed25519 or RSA).
Command Default	None	
Command Modes	Trustpoint con	ifiguration
Command History	Release	Modification
	Release 7.0.1	This command was introduced.
	Release 7.3.1	The command was modified to include the <b>ed25519</b> option.
Usage Guidelines	No specific gu	aidelines impact the use of this command.
Task ID	Task Opera ID	itions
	crypto read, write	
Examples	This example	shows how to create the key pair for the root certificate on the router:
		.g)# <b>crypto ca trustpoint system-trustpoint</b> .g-trustp)# <b>ca-keypair rsa system-root-key</b>
Related Commands	Command	Description
	keypair, on p	age 306 Creates the key pair for the leaf certificate on the router.

I

# clear crypto ca certificates

To clear certificates associated with trustpoints that no longer exist in the configuration file, use the **clear crypto ca certificates** command in XR EXEC mode.

clear crypto ca certificates trustpoint

Syntax Description	trustpoint Trustpoint name.	
Command Default	None	
Command Modes	XR EXEC mode	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	If the router is loaded with a new configuration file and certificates in the new configuration file do not have their corresponding trustpoint configuration, use the <b>clear crypto ca certificates</b> command to clear the certificates associated with trustpoints that no longer exist in the configuration file. The <b>clear crypto ca certificates</b> command deletes both certification authority (CA) and router certificates from the system.	
Task ID	Task Operations ID	
	crypto execute	
Examples	The following example shows how to clear the exist in the configuration file:	e certificates associated with trustpoints that no longer
	RP/0/RP0/CPU0:router# clear crypto ca	certificates tp_1

## clear crypto ca crl

To clear all the Certificate Revocation Lists (CRLs) stored on the router, use the **clear crypto ca crl** command in XR EXEC mode.

clear crypto ca crl

Syntax Description	This command has no keywords or arguments.		
Command Default	No default behavior or values		
Command Modes	XR EXEC mode		
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	Use the <b>clear crypto ca crl</b> command to clear all CRLs stored on the router. As a result, the router goes through the certification authorities (CAs) to download new CRLs for incoming certificate validation requests.		
Task ID	Task Operations ID		
	crypto execute		
Examples	The following example shows how to clear all CRLs stored on the router:		
	RP/0/RP0/CPU0:router# show crypto ca crls		
	CRL Entry		
	Issuer : cn=Certificate Manager,ou=HF Last Update : [UTC] Wed Jun 5 02:40: Next Update : [UTC] Wed Jun 5 03:00: CRL Distribution Point : ldap://manager.cisco.com/CN=Certificate	R,o=Cisco Systems,l=San Jose,st=CA,c=US 04 2002 04 2002	
	RP/0/RP0/CPU0:router# clear crypto ca c RP/0/RP0/CPU0:router# show crypto ca cr RP/0/RP0/CPU0:router#		

#### crl optional (trustpoint)

To allow the certificates of other peers to be accepted without trying to obtain the appropriate CRL, use the **crl optional** command in trustpoint configuration mode. To return to the default behavior in which CRL checking is mandatory before your router can accept a certificate, use the **no** form of this command.

crl optional no crl optional

Syntax Description This command has no keywords or arguments.

**Command Default** The router must have and check the appropriate CRL before accepting the certificate of another IP security peer.

Command Modes Trustpoint configuration

Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines When your router receives a certificate from a peer, it searches its memory for the appropriate CRL. If the router finds the appropriate CRL, that CRL is used. Otherwise, the router downloads the CRL from either the certificate authority (CA) or from a CRL distribution point (CDP) as designated in the certificate of the peer. Your router will then check the CRL to ensure that the certificate that the peer sent has not been revoked. If the certificate appears on the CRL, your router cannot accept the certificate and will not authenticate the peer. To instruct the router not to download the CRL and treat the certificate as not revoked, use the **crl optional** command.

#### Task ID

crypto read, write

**Operations** 

Task

ID

#### **Examples**

The following example declares a CA and permits your router to accept certificates without trying to obtain a CRL. This example also specifies a nonstandard retry period and retry count.

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/RP0/CPU0:router(config-trustp)# enrollment url http://ca\_server
RP/0/RP0/CPU0:router(config-trustp)# enrollment retry period 20
RP/0/RP0/CPU0:router(config-trustp)# enrollment retry count 100
RP/0/RP0/CPU0:router(config-trustp)# crl optional

## crypto ca authenticate

To authenticate the certification authority (CA) by getting the certificate for the CA, use the **crypto ca authenticate** command in XR EXEC mode.

crypto ca authenticate {ca-name | system-trustpoint}

Syntax Description	ca-name	Name of the CA Server.	_
	system-trust	point Generates self-signed root certificat	e
Command Default	None		
Command Modes	XR EXEC me	ode	
Command History	Release		Modification
	Release 6.0		This command was introduced.
	system-trust	point	Generates self-signed root certificate.
Usage Guidelines	The crypto ca	a authenticate command is required whe	en you initially configure CA support at your router.
-	This command authenticates the CA to your router by obtaining the CA certificate, which contains the public key for the CA. For self-signed root CA, because the CA signs its own certificate, you should manually authenticate the CA public key by contacting the CA administrator when you use this command. The certificate fingerprint matching is done out-of-band (for example, phone call, and so forth).		
	Authenticating a second-level CA requires prior authentication of the root CA.		
		<b>pto ca authenticate</b> command is issued a nust obtain terminal control again to re-en	and the CA does not respond by the specified timeout ter the command.
Task ID	Task Oper ID	ations	
	crypto exec	ute	
Examples	The CA sends the certificate, and the router prompts the administrator to verify the certificate by checking the certificate fingerprint (a unique identifier). The CA administrator can also display the CA certificate fingerprint, so you should compare what the CA administrator sees to what the router displays on the screen. If the fingerprint on the display matches the fingerprint displayed by the CA administrator, you should accept the certificate as valid.		
	The following	g example shows that the router requests	the CA certificate:
	Retrieve Cer	<b>pto ca authenticate msiox</b> rtificate from SFTP server? [yes/no tes as CA certificate	o]: <b>yes</b>

```
Serial Number : 06:A5:1B:E6:4F:5D:F7:83:41:11:D5:F9:22:7F:95:23
  Subject:
   Name: CA2
   CN= CA2
  Issued By
                 :
       cn=CA2
  Validity Start : 07:51:51 UTC Wed Jul 06 2005
  Validity End : 08:00:43 UTC Tue Jul 06 2010
 CRL Distribution Point
       http://10.56.8.236/CertEnroll/CA2.crl
Certificate has the following attributes:
  Fingerprint: D0 44 36 48 CE 08 9D 29 04 C4 2D 69 80 55 53 A3
Do you accept this certificate? [yes/no]: yes
Router#:Apr 10 00:28:52.324 : cepki[335]: %SECURITY-CEPKI-6-INFO : certificate database
updated
Do you accept this certificate? [yes/no] yes
```

This example shows how to generate a self-signed root certificate:

Router#crypto ca authenticate system-trustpoint

#### crypto ca cancel-enroll

To cancel a current enrollment request, use the crypto ca cancel-enroll command in XR EXEC mode.

crypto ca cancel-enroll ca-name Syntax Description Name of the certification authority (CA). ca-name None **Command Default** XR EXEC mode **Command Modes Command History** Modification Release Release 6.0 This command was introduced. Use the crypto ca enroll command to request certificates from the CA for the Rivest, Shamir, and Adelman **Usage Guidelines** (RSA) key pairs for the router defined by the rsakeypair, on page 313 command in trustpoint configuration mode. If no rsakeypair, on page 313 command is configured for the current trustpoint, the default RSA key pair is used for enrollment. This task is also known as enrolling with the CA. Use the crypto ca cancel-enroll command to cancel a current enrollment request. Task ID Task **Operations** ID crypto execute **Examples** The following example shows how to cancel a current enrollment request from a CA named myca: RP/0/RP0/CPU0:router# crypto ca cancel-enroll myca

#### crypto ca enroll

To obtain a router certificate from the certification authority (CA), use the **crypto ca enroll** command in XR EXEC mode.

crypto ca enroll {ca-name | system-trustpoint} **Syntax Description** ca-name Name of the CA Server. system-trustpoint Generates the leaf certificate. None **Command Default** XR EXEC mode **Command Modes Command History** Modification Release Release 6.0 This command was introduced. Release 7.0.1 The command was modified to include the system-trustpoint option. Use the crypto ca enroll command to request certificates from the CA for the Rivest, Shamir, and Adelman **Usage Guidelines** (RSA) key pairs for the router defined by the rsakeypair, on page 313 command in trustpoint configuration mode. If no rsakeypair, on page 313 command is configured for the current trustpoint, the default RSA key pair is used for enrollment. This task is also known as enrolling with the CA. (Enrolling and obtaining certificates are two separate events, but they both occur when the **crypto ca enroll** command is issued.) When using manual enrollment, these two operations occur separately. The router needs a signed certificate from the CA for each of the RSA key pairs on the router; if you previously generated general-purpose keys, this command obtains the one certificate corresponding to the one general-purpose RSA key pair. If you previously generated special-usage keys, this command obtains two certificates corresponding to each of the special-usage RSA key pairs. If you already have a certificate for your keys, you are unable to configure this command; instead, you are prompted to remove the existing certificate first. (You can remove existing certificates by removing the trustpoint configuration with the no crypto ca trustpoint command.) The **crypto ca enroll** command is not saved in the router configuration. Note The root certificate signs the leaf certificate. Task ID Task Operations ID crypto execute

#### **Examples** The following sample output is from the **crypto ca enroll** command:

```
Router# crypto ca enroll msiox
% Start certificate enrollment...
% Create a challenge password. You will need to verbally provide this password to the
   CA Administrator in order to revoke your certificate.
% For security reasons you password will not be saved in the configuration.
% Please make a note of it.
%Password
re-enter Password:
   Fingerprint: 4F35ADC9 2791997A CE211437 AFC66CF7
RP/0/RP0/CPU0:May 29 18:49:15.572 : pki_cmd: %PKI-6-LOG_INFO : certificate request pending
RP/0/RP0/CPU0:May 29 18:52:17.705 : pki_get_cert: %PKI-6-LOG_INFO : certificate is granted
```

This example shows how to generate a leaf certificate:

Router#crypto ca enroll system-trustpoint

#### crypto ca fqdn-check ip-address allow

To avoid server certificate (leaf certificate) failure in the router, resulting from the IP addresses in the Subject Alternate Name (SAN) field of the certificates instead of Fully Qualified Domain Names (FQDNs) when the certificate extension type doesn't specifies the IP address, use the **crypto ca fqdn-check ip-address allow** command in XR Config mode.

crypto ca fqdn-check ip-address allow This command has no keywords or arguments. Syntax Description When the certificate extension type doesn't specifies the IP address, the certificates with IP addresses in the **Command Default** SAN field don't function properly. XR Config mode **Command Modes Command History** Modification Release Release 7.4.2 This command was introduced. In Cisco IOS XR Routers, to use an IP address in the SAN field in server certificates, the certificate extension **Usage Guidelines** type is IP addresses. The router rejects certificates that don't meet this criterion. To prevent such failures when an IP address is present in the SAN field, configure the crypto ca fqdn-check ip-address allow command. This command enables the router to validate and accept server certificates with IP addresses in the SAN field without the IP addresses certificate extension type. Task ID Task Operations ID crypto execute **Examples** This example shows how to run the command for the router to accept server certificates with ip-address in the SAN field: Router# config Router(config) # crypto ca fqdn-check ip-address allow

## crypto ca import

To import a certification authority (CA) certificate manually through TFTP, SFTP, or cut and paste it at the terminal, use the **crypto ca import** command in XR EXEC mode.

crypto ca import name certificate

Syntax Description	<i>name</i> Name of the certification authority (CA). This name is the same name used when the CA was declared with the crypto ca trustpoint, on page 274 command.		
Command Default	None		
Command Modes	XR EXEC mo	de	
Command History	Release		Modification
	Release 6.0		This command was introduced.
Usage Guidelines	No specific gu	idelines impact the use of this command.	
Task ID	Task Opera ID	tions	
	crypto execu	te	
Examples	The following the certificate		icate through cut-and-paste. In this example,
	RP/0/RP0/CPU	0:router# crypto ca import myca ce	rtificate

#### crypto ca http-proxy

To fetch the Certificate Revocation List (CRL) through the http proxy server, use the **crypto ca http-proxy** command in the XR Config mode. Use the **no** form of this command to disable the proxy server.

crypto ca http-proxy proxy-server-IP-address port port-number no crypto ca http-proxy proxy-server-IP-address port port-number

Syntax Description	http-prox	<b>y</b> proxy-server-IP-address	Specifies the proxy server IP address.
	port port-	number	Specifies the proxy server port number. The range is from 1-65535
Command Default	None		
Command Modes	XR Config	mode	
Command History	Release	Modification	
	Release 7.1.1	This command was intro	duced.
Usage Guidelines	No specific	c guidelines impact the use	of this command.
Task ID	– Task Op ID	perations	
	15		

#### Example

This example shows how to configure the proxy server to enable communication with the certification authority to retrieve the Certificate Revocation List (CRL).

Router#configure Router(config)#crypto ca http-proxy 10.10.10.1 port 1 L

#### crypto ca crl request

To fetch the latest CRL from a specific CDP (CRL Distribution point), use the **crypto ca crl request** command in the XR EXEC mode.

	crypto ca crl request cdp-url [ http-proxy ip-address port port-number ]
Syntax Description	<i>cdp-url</i> Specifies the CDP URL.
	http-proxy proxy-server-IP-address Specifies the proxy server IP address.
	<b>port</b> <i>port-number</i> Specifies the proxy server port number. The range is from 1-65535.
Command Default	None
Command Modes	XR EXEC mode
Command History	Release Modification
	ReleaseThis command was modified.7.1.1
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operations ID
	crypto execute

#### Example

This example shows how to fetch the latest CRL from a specific CDP.

```
Router#crypto ca crl request http://zxy-w2k.cisco.com/CertEnroll/zxy-w2k-root.crl
Certificate Revocation List (CRL):
        Version 2 (0x1)
    Signature Algorithm: sha256WithRSAEncryption
       Issuer: /C=US/ST=NC/L=RTP/O=Cisco/OU=GCT/CN=ca-root
        Last Update: Jan 29 11:43:50 2019 GMT
        Next Update: Jan 26 11:43:50 2029 GMT
        CRL extensions:
           xyz321v3 CRL Number:
                2.92
Revoked Certificates:
   Serial Number: 0138
       Revocation Date: Feb 17 01:01:55 2017 GMT
    Serial Number: 0139
        Revocation Date: Feb 17 01:22:28 2017 GMT
    Serial Number: 013A
       Revocation Date: Feb 17 03:04:32 2017 GMT
    Serial Number: 013B
```

### crypto ca trustpoint

To configure a trusted point with a selected name, use the **crypto ca trustpoint** command. To unconfigure a trusted point, use the **no** form of this command in XR Config mode.

crypto ca trustpoint {ca-name | system-trustpoint} **Syntax Description** ca-name Name of the CA. system-trustpoint Specifies the default system trustpoint. None **Command Default** XR Config mode **Command Modes Command History** Release Modification Release 6.0 This command was introduced. Release 7.0.1 The command was modified to include the system-trustpoint option to specify the default system trustpoint. Use the **crypto ca trustpoint** command to declare a CA. **Usage Guidelines** This command allows you to configure a trusted point with a selected name so that your router can verify certificates issued to peers. Your router need not enroll with the CA that issued the certificates to the peers. The **crypto ca trustpoint** command enters trustpoint configuration mode, in which you can specify characteristics for the CA with a set of commands. See the Related Commands section for details. Task ID Task Operations ID crypto execute **Examples** The following example shows how to use the **crypto ca trustpoint** command to create a trustpoint: Router# configure Router(config) # crypto ca trustpoint msiox Router(config-trustp) # sftp-password xxxxxx Router(config-trustp) # sftp-username tmordeko Router (config-trustp) # enrollment url sftp://192.168..254.254/tftpboot/tmordeko/CAcert Router(config-trustp) # rsakeypair label-2 This example shows how to create a default system trustpoint: Router#configure

Router(config)#crypto ca trustpoint system-trustpoint
Router(config-trustp)#commit

Related	Commai	nds

Command	Description
ca-keypair, on page 261	Creates the key pair for the root certificate on the router.
crl optional (trustpoint), on page 264	Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL.
enrollment retry count, on page 298	Specifies how many times a router resends a certificate request.
enrollment retry period, on page 299	Specifies the wait period between certificate request retries.
enrollment terminal, on page 300	Specifies manual cut-and-paste certificate enrollment.
enrollment url, on page 301	Specifies the URL of the CA.
ip-address (trustpoint), on page 303	Specifies a dotted IP address that is included as an unstructured address in the certificate request.
key-usage, on page 304	Specifies the key usage field for the self-enrollment certificate.
keypair, on page 306	Creates the key pair for the leaf certificate on the router.
lifetime (trustpoint), on page 309	Configures the lifetime for self-enrollment of certificates.
message-digest, on page 310	Configures the message digest hashing algorithm for the certificates.
query url, on page 311	Specifies the LDAP URL of the CRL distribution point.
	Required only if your CA supports Lightweight Directory Access Protocol (LDAP).
rsakeypair, on page 313	Specifies a named RSA key pair for this trustpoint.
serial-number (trustpoint), on page 314	Specifies a router serial number in the certificate request.
sftp-password (trustpoint), on page 315	Secures the FTP password.
sftp-username (trustpoint), on page 316	Secures the FTP username.
subject-name (trustpoint), on page 317	Specifies a subject name in the certificate request.

### crypto ca trustpool import url

To manually update certificates in the trust pool if they are not current, are corrupt, or if certain certificates need to be updated, use the **crypto ca trustpool import url**command in XR EXEC mode.

crypto ca trustpool import url {cleanURL}

**Syntax Description** clean (Optional) Manually remove all downloaded certificate authority (CA) certificates. URL Specify the URL from which the CA trust pool certificate bundle must be downloaded. This manually imports (downloads) the CA certificate bundle into the CA trust pool to update or replace the existing CA certificate bundle. This parameter can either be the URL of an external server or the local folder path (/tmp) in the router where the certificate is available. The CA trust pool feature is enabled. The router uses the built-in CA certificate bundle in the CA trust pool **Command Default** which is updated automatically from Cisco. XR EXEC mode **Command Modes Command History** Release Modification Release 6.0 This command was introduced. This command was modified to also allow a local folder path Release 7.1.2 (/tmp) in the router as the URL parameter. The CA trust pool feature is enabled by default and uses the built-in CA certificate bundle in the trust pool, **Usage Guidelines** which receives automatic updates from Cisco. Use the **crypto ca trustpool import url**to manually update certificates in the trust pool if they are not current, are corrupt, or if certain certificates need to be updated. From Cisco IOS XR Software Release 7.1.2 and later, you can also specify a local folder path (/tmp) in the router as the URL parameter for crypto ca trustpool import url command. This is useful in scenarios where the router does not have connectivity to an external server to download the certificate. In such cases, you can download the certificate from an external server to elsewhere, and then copy it to the /tmp folder in the router. Note The local folder path in the router has to be /tmp itself; no other folder paths are allowed. The format of the certificate can .pem, .der, or .p7b(bundle). For example, crypto ca trustpool import url /tmp/certificate.pem crypto ca trustpool import url /tmp/certificate.der crypto ca trustpool import url /tmp/pki bundle tmp.p7b

# Task ID Task Operation ID

crypto execute

This example shows how to run the command to manually update certificates in the trust pool if they are not current, are corrupt, or if certain certificates need to be updated.

RP/0/RP0/CPU0:router#crypto ca trustpool import url http://www.cisco.com/security/pki/trs/ios.p7b

This example shows how to import a certificate that resides in the local /tmp folder in the router:

Router#crypto ca trustpool import url /tmp/certificate.der

#### crypto ca trustpool policy

To configure certificate authority (CA) trust pool policy, use the **crypto ca trustpool policy** command in XR Config mode.

crypto ca trustpool policy {cabundle url *url* | crl optional | description *line*} **Syntax Description** cabundle url URL Configures the URL from which the CA trust pool bundle is downloaded. crl optional To specify the certificate revocation list (CRL) query for the CA trust pool, use the crl command in ca-trustpool configuration mode. By default, the router enforces a check of the revocation status of the certificate by querying the certificate revocation list (CRL). Setting this to optional disables revocation checking when the trust pool policy is in use. description line Indicates the description for the trust pool policy. The default CA trust pool policy is used. **Command Default** XR Config mode **Command Modes Command History** Release Modification Release 6.0 This command was introduced. The crypto ca trustpool policy command enters ca-trustpool configuration mode, where commands can be **Usage Guidelines** accessed to configure certificate authority (CA) trustpool policy parameters. Task ID Task Operation ID crypto READ, WRITE Example

This example shows you how to disable certificate revocation checks when the trust pool policy is in use.

RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)#crypto ca trustpool policy RP/0/RP0/CPU0:router(config-trustpool)#crl optional

# crypto ca source interface

To configure an interface in the router to act as the source interface for all certificate requests to a certificate authority (CA) in the EXEC mode.

	crypto ca source interface { interface_name   default }			
Syntax Description	interface_nam	interface_name Specify the name of the source interface in an appropriate format.		
	default	Clears the current configuration for the source interface and reverts to using default interfaces as the source.		
Command Default	The router use	The router uses the default interfaces as the source interface for the certificate requests to CA.		
Command Modes	EXEC			
Command History	Release	Modification		
	Release 7.0.0	This command was introduced		
Usage Guidelines	<ul> <li>To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.</li> <li>Ensure the source interface has proper IP for CA communication and necessary ports are open for smooth connectivity.</li> </ul>

I

# crypto key generate authentication-ssh

To generate the cryptographic key pair for public key-based authentication of logged-in users on Cisco IOS XR routers that are configured as SSH clients, use the **crypto key generate authentication-ssh** command in XR EXEC mode.

	crypto key generate authentication-ssh rsa		
Syntax Description	Ra Generates RSA key pairs for signing and encryption of packets for SSH public key-based authentication.		
Command Default	None		
Command Modes	XR EXEC		
Command History	Release	Modification	
	Release 7.10.1	This command was introduced.	
Usage Guidelines	<ul> <li>Remote AAA servers such as RADIUS and TACACS+ servers do not support public key-based authenticate Hence this functionality is available only for users who are configured locally on the router and not for use who are configured remotely.</li> <li>To delete the RSA key of a user, use the crypto key zeroize authentication-ssh rsa username command XR EXEC mode.</li> <li>A user with root privileges has permission to create and delete keys for other users.</li> </ul>		
Task ID	Task Operations ID		
	crypto execute		
Examples	This example shows how to ge clients on Cisco IOS XR route	enerate an RSA key pair for public key-based authentication of SSH rs:	
	Router#crypto key generate authentication-ssh rsa Wed Dec 21 10:02:57.684 UTC The name for the keys will be: cisco Choose the size of the key modulus in the range of 512 to 4096. Choosing a greater than 512 may take a few minutes.		
	How many bits in the modul Generating RSA keys Done w/ crypto generate ke [OK]		
	Router#		

# crypto key generate dsa

To generate Digital Signature Algorithm (DSA) key pairs, use the **crypto key generate dsa** command in XR EXEC mode and XR Config mode.

crypto key generate dsa

		_	
Syntax Description	system-enroll-key Specifies key pair generation for the leaf certificate.		
	system-root-key Specifies key pair generation for the root certificate.	-	
Command Default	None		
Command Modes	XR EXEC mode and XR Config mode		
Command History	Release	Modification	
	Release 7.3.2	This command was introduced in XR Config mode	
	Release 7.0.1	The command was modified to include <b>system-enroll-key</b> and <b>system-root-key</b> options for the key pair generation of leaf and root certificates.	
	Release 6.0	This command was introduced.	
Usage Guidelines	Use the crypto key generate dsa command to generate DSA key pairs for your router.		
	DSA keys are generated in pairs—one public DSA key and one private DSA key.		
	If your router already has DSA keys when you issue this command, yo the existing keys with new keys.	u are warned and prompted to replace	
	To remove the DSA key generated in XR Config mode, use <b>no</b> form of	f this command in XR Config mode.	
	To remove the DSA key generated in XR EXEC mode, use the crypto	key zeroize dsa command.	
Task ID	Task Operations ID		
	crypto execute		
Examples	The following example shows how to generate a 512-bit DSA key:		
	RP/0/RP0/CPU0:router# crypto key generate dsa The name for the keys will be: the_default Choose the size of your DSA key modulus. Modulus size c Choosing a key modulus	an be 512, 768, or 1024 bits.	

```
How many bits in the modulus [1024]: 512
Generating DSA keys...
Done w/ crypto generate keypair
[OK]
```

This example shows how to generate a DSA key pair for the root certificate:

Router#crypto key generate dsa system-root-key

This example shows how to generate a DSA key pair for the leaf certificate:

Router#crypto key generate dsa system-enroll-key

The following example shows how to generate a 512-bit DSA key-pair in XR Config mode:

```
Router#conf t
Router(config)#crypto key generate dsa 512
Router(config)#commit
```

This example shows how to delete a DSA key-pair in XR Config mode:

Router# conf t Router(config)#no crypto key generate dsa 512 Router(config)#commit

#### crypto key generate ecdsa

To generate an Elliptic Curve Digital Signature Algorithm (ECDSA) key pair, use the **crypto key generate** ecdsa command in XR EXEC mode and XR Config mode.

crypto key generate ecdsa [nistp256|nistp384|nistp521] [system-enroll-key | system-root-key]

<b>nistp256</b> Generates an ECDSA key of curve type nistp256, with key size 256 bits.		
<b>nistp384</b> Generates an ECDSA key of curve type nistp384, with key size 384 bits.		
<b>nistp521</b> Generates an ECDSA key of curve type nistp521, with key size 521 bits.		
system-enroll-key Specifies key pair generation for the leaf certificate.		
system-root-key Specifies key pair generation for the root certificate.		
None		
XR EXEC mode and XR Config mode		
Release Modification		
ReleaseThis command was introduced in XR Config mode7.3.2		
ReleaseThe command was modified to include system-enroll-key and system-root-key options for7.0.1the key pair generation of leaf and root certificates.		
Release 6.0 This command was introduced.		
To remove the ECDSA key generated in XR Config mode, use <b>no</b> form of this command in XR Config r		
To remove an ECDSA key generated in XR EXEC mode, use the crypto key zeroize ecdsa command.		
Task Operation ID		
crypto execute		
Example		

The following example shows how to generate a ECDSA key pair:

```
Router# crypto key generate ecdsa nistp384
Wed Mar 28 12:53:57.355 UTC
% You already have keys defined for the_default
Do you really want to replace them? [yes/no]: yes
Generating ECDSA keys ...
Done w/ crypto generate ECDSA keypair
```

[OK]

This example shows how to generate a ECDSA key pair for the root certificate:

Router#crypto key generate ecdsa system-root-key

This example shows how to generate a ECDSA key pair for the leaf certificate:

Router#crypto key generate dsa system-enroll-key

The following example shows how to generate an ECDSA key-pair in XR Config mode:

```
Router#conf t
Router(config)#crypto key generate ecdsa nistp256
Router(config)#commit
```

This example shows how to delete en ECDSA key-pair in XR Config mode:

```
Router# conf t
Router(config)#no crypto key generate ecdsa nistp256
Router(config)#commit
```

# crypto key generate ed25519

To generate Ed25519 crypto key pairs as part of supporting the Ed25519 public-key signature system, use the **crypto key generate ed25519** command in XR EXEC mode and XR Config mode.

	crypto key generate ed25519 [ system-enroll-key   system-root-key ]
Syntax Description	system-enroll-key Specifies key pair generation for the leaf certificate.
	system-root-key Specifies key pair generation for the root certificate.
Command Default	None
Command Modes	XR EXEC mode and XR Config mode
Usage Guidelines	This command is applicable only for Cisco IOS XR 64-bit platforms.
Ū	To remove the Ed25519 key generated in XR Config mode, use <b>no</b> form of this command in XR Config mode.
	To remove the Ed25519 key generated in XR EXEC mode, use the crypto key zeroize ed25519 command.
	You can generate the crypto keys either with an empty label or with two predefined labels ( <b>system-root-key</b> and <b>system-enroll-key</b> ). In case of empty label, the system generates the key pair against the default label. The key pairs with the predefined labels are used to integrate Cisco IOS XR with Cisco Crosswork Trust Insights.
Task ID	Task Operations ID
	crypto execute
Examples	This example shows how to generate a Ed25519 crypto key pair:
	<pre>Router# crypto key generate ed25519 The name for the keys will be: the_default     Choose the size of your Ed25519 key modulus. Modulus size can be 512, 768, or 1024 bits. Choosing a key modulus How many bits in the modulus [1024]: 512 Generating Ed25519 keys Done w/ crypto generate keypair [OK]</pre>
	This example shows how to generate a Ed25519 crypto key pair for the root certificate:
	Router#crypto key generate ed25519 system-root-key
	This example shows how to generate a Ed25519 crypto key pair for the leaf certificate:
	Router#crypto key generate ed25519 system-enroll-key

The following example shows how to generate an Ed25519 key-pair in XR Config mode:

Router#conf t Router(config)#crypto key generate ed25519 Router(config)#commit

This example shows how to delete en Ed25519 key-pair in XR Config mode:

Router# conf t Router(config)#no crypto key generate ed25519 Router(config)#commit

## crypto key generate rsa

To generate a Rivest, Shamir, and Adelman (RSA) key pair, use the **crypto key generate rsa** command in XR EXEC mode and XR Config mode.

crypto key generate rsa [usage-keys | general-keys | system-enroll-key | system-root-key] [keypair-label]

Syntax Description	usage-keys	(Optional) Generates separate RSA key pairs for signing and encryption.	
	general-keys	(Optional) Generates a general-purp	ose RSA key pair for signing and encryption.
	keypair-label	(Optional) RSA key pair label that n	names the RSA key pairs.
	system-enroll-key	Specifies key pair generation for the	e leaf certificate.
	system-root-key	Specifies key pair generation for the	e root certificate.
Command Default		o not exist. If the <b>usage-keys</b> keyword is not used, general-purpose keys are generated. If no ceified, the key is generated as the default RSA key.	
Command Modes	XR EXEC mode a	and XR Config mode	
Command History	Release		Modification
	Release 7.3.2		This command was introduced in XR Config mode
	Release 7.0.1		The command was modified to include <b>system-enroll-key</b> and <b>system-root-key</b> options for the key pair generation of leaf and root certificates.
	Release 6.0		This command was introduced.
Usage Guidelines	Use the crypto key generate rsa command to generate RSA key pairs for your router.		
	RSA keys are generated in pairs—one public RSA key and one private RSA key.		
	If your router already has RSA keys when you issue this command, you are warned and prompted to replace the existing keys with new keys. The keys generated by this command are saved in the secure NVRAM (which is not displayed to the user or backed up to another device).		
	is not displayed to	the user of suched up to unother user	
	1 2	1	use <b>no</b> form of this command in XR Config mode.

Task ID **Operations** Task ID crypto execute **Examples** The following example shows how to generate an RSA key pair: Router# crypto key generate rsa The name for the keys will be: the\_default Choose the size of the key modulus in the range of 360 to 2048 for your General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes. How many bits in the modulus[1024]: <return> Router# This example shows how to generate an RSA key pair for the root certificate: Router#crypto key generate rsa system-root-key This example shows how to generate an RSA key pair for the leaf certificate: Router#crypto key generate rsa system-enroll-key The following example shows how to generate an RSA key-pair in XR Config mode: Router#conf t Router(config)#crypto key generate rsa user1 general-keys 2048 Router (config) #commit This example shows how to delete en RSA key-pair in XR Config mode:

```
Router# conf t
Router(config)#no crypto key generate rsa user1 general-keys 2048
Router(config)#commit
```

# crypto key import authentication rsa

To import a public key using the Rivest, Shamir, and Adelman (RSA) method, use the crypto key import authentication rsa command in XR EXEC mode.

	rypto key import authentication rsa [username name] [WORD   second   third   ourth ]
Syntax Description	rsa Imports the RSA public key on the router.
-	sername (Optional) Imports the RSA public key for the user <i>name</i> .
-	name Specifies the name of the user for which the RSA public key is imported.
	If you do not specify a <i>name</i> , the RSA public key for the currently logged-in user is imported.
-	WORD (Optional) Specifies the path (harddisk: / or disk0: / or tftp) to the RSA public key file.
-	econd (Optional) Imports the second RSA public key for a user.
-	hird (Optional) Imports the third RSA public key for a user.
-	<b>Courth</b> (Optional) Imports the fourth RSA public key for a user.
Command Modes 2	<ul> <li>The crypto key import authentication rsa username <i>name</i> command imports the first RSA public key for the user <i>name</i> if you do not specify the second, third, or fourth option.</li> <li>CR EXEC mode</li> </ul>
Command History	Release Modification
-	Release 3.9.0 This command was introduced.
-	Release 7.11.1 This command was modified to include the <b>second</b> , <b>third</b> , and <b>fourth</b> options.
Usage Guidelines 1	• Use shh-keygen generation mechanism to generate keys using either a LINUX or UNIX client. This creates two keys: one public and one private.
2	Remove the comment and other header tag from the keys, except the base64encoded text.
3	Decode the base64encoded text, and use the for authentication.
	Fask Operations D
_	crypto execute
-	

#### **Examples**

This example shows how to import the second RSA public key for the currently logged-in user.

```
RP/0/RP0/CPU0:0C_router1#crypto key import authentication rsa harddisk:/id_rsa_key2.pub
Thu Nov 9 20:43:19.568 IST
RP/0/RP0/CPU0:Nov 9 20:43:19.740 IST: cepki[129]: %SECURITY-CEPKI-6-KEY_INFO : crypto key
RSA(public key authentication) generated, label:cafyauto, modBits:4096

%SECURITY-CEPKI-6-INFO : key database updated successfully
RP/0/RP0/CPU0:OC router1#
```

This example shows how to import the third RSA public key for the currently logged-in user by manually copy-pasting the key.

```
RP/0/RP0/CPU0:OC_router1#crypto key import authentication rsa third
Thu Nov 9 20:51:52.599 IST
Enter the public key
ssh-rsa
```

RP/0/RP0/CPU0:Nov 9 20:52:38.122 IST: cepki[129]: %SECURITY-CEPKI-6-KEY\_INFO : crypto key RSA(public key authentication) generated, label:cafyauto, modBits:4096 RP/0/RP0/CPU0:OC router1#

This example shows how to import the fourth RSA public key for user *test*.

```
RP/0/RP0/CPU0:OC_router1#crypto key import authentication rsa username test fourth
harddisk:/id_rsa_key4.pub
Thu Nov 9 20:55:02.586 IST
RP/0/RP0/CPU0:Nov 9 20:55:02.757 IST: cepki[129]: %SECURITY-CEPKI-6-KEY_INFO : crypto key
RSA(public key authentication) generated, label:test, modBits:4096
RP/0/RP0/CPU0:OC router1
```

# crypto key zeroize authentication-ssh

To delete the cryptographic key pair on the router that was generated for public key-based authentication of SSH clients, use the **crypto key zeroize authentication-ssh** command in XR EXEC mode.

	crypto key zeroize authentication-ssh	rsa [username name]
Syntax Description	rsa Deletes the RSA key pair on t	he router.
	username Specifies the name of the user name	whose RSA key pairs are to be deleted from the router.
Command Default	None	
Command Modes	XR EXEC mode	
Command History	Release	Modification
	Release 7.10.1	This command was introduced.
Usage Guidelines	If the <b>username</b> is not specified, then the command deletes the key for the user who is currently logged A user with root privileges has permission to create and delete keys for other users.	
Task ID	Task Operations ID	
Examples	This example shows how to delete the RSA ke authentication of SSH clients.	y pair that was generated for public key-based
	Router#crypto key zeroize authenticatio	n-ssh rsa username userl

I

# crypto key zeroize authentication rsa

To delete a public key imported on the router using the Rivest, Shamir, and Adelman (RSA) method, use the **crypto key zeroize authentication rsa** command in XR EXEC mode.

Syntax Description         rsa         Deletes the RSA public key on the router.           username         Deletes the RSA public key for the user specified in the name.           name         (Optional) Specifies the name of the user for which the RSA public key is deleted. If you do not specify a name, the RSA public key.           all         Deletes all imported RSA public keys.           second         Deletes fourth imported RSA public key.           fourth         Deletes fourth imported RSA public key.           fourth         Deletes fourth imported RSA public key.           fourth         Deletes fourth imported RSA public key.           it on to specify the all, second, third, or fourth option.         • The crypto key zeroize authentication rsa command deletes the first imported RSA public key if you do not specify the all, second, third, or fourth option.           Command Default         • The crypto key zeroize authentication rsa username name command deletes the first imported RSA public key for the user name if you do not specify the second, third, or fourth option.           Command Modes         XR EXEC mode           Command History         Release           Release         This command was introduced.           Usage Guidelines         If the username is not specified, then the command deletes the first imported RSA public key for the currently logged-in user. #### **Examples**

This example shows how to delete the first imported RSA public key for the currently logged-in user *test1*.

RP/0/RP0/CPU0:OC\_router1#crypto key zeroize authentication rsa

```
Wed Oct 25 18:32:30.421 IST
% Keys to be removed are named test1
Do you really want to remove these keys ?? [yes/no]: yes
```

```
RP/0/RP0/CPU0:OC router1#
```

This example shows how to delete the fourth imported RSA public key for the currently logged-in user *test1*.

RP/0/RP0/CPU0:OC router1#crypto key zeroize authentication rsa fourth

Wed Oct 25 21:18:04.336 IST % Keys to be removed are named test1 Do you really want to remove these keys ?? [yes/no]: yes

RP/0/RP0/CPU0:OC router1#

This example shows how to delete the first imported RSA public key for user *test2*.

RP/0/RP0/CPU0:0C router1#crypto key zeroize authentication rsa username test2

```
Wed Oct 25 18:54:34.153 IST
% Keys to be removed are named test2
Do you really want to remove these keys ?? [yes/no]: yes
```

RP/0/RP0/CPU0:OC router1#

This example shows how to delete the second imported RSA public key for user *test3*.

RP/0/RP0/CPU0:0C router1#crypto key zeroize authentication rsa username test3 second

```
Wed Oct 25 18:54:34.153 IST
% Keys to be removed are named test3
Do you really want to remove these keys ?? [yes/no]: yes
```

```
RP/0/RP0/CPU0:OC router1#
```

This example shows how to delete all imported RSA public keys on the router in EXEC mode.

RP/0/RP0/CPU0:OC router1#crypto key zeroize authentication rsa all

Wed Oct 25 18:32:58.007 IST Do you really want to remove all these keys ?? [yes/no]: yes

I

# crypto key zeroize dsa

To delete the Digital Signature Algorithm (DSA) key pair from your router, use the **crypto key zeroize dsa** command in XR EXEC mode.

crypto key zeroize dsa

Syntax Description	This command has no keywords or arguments.	
Command Default	None	
Command Modes	XR EXEC mode	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines Task ID	Use the <b>crypto key zeroize dsa</b> command to delete the DSA key pair that was previously generated by your router.           Task         Operations	
	ID crypto execute	
Examples	The following example shows how to delet	e DSA keys from your router:
	RP/0/RP0/CPU0:router# <b>crypto key zer</b> % Keys to be removed are named the_d Do you really want to remove these k	efault

# crypto key zeroize ed25519

To delete the Ed25519 crypto key pair from the router, use the **crypto key zeroize ed25519** command in XR EXEC mode.

	crypto key zeroize ed25519	
Syntax Description	This command has no keywords or argum	ents.
Command Default	None	
Command Modes	XR EXEC mode	
Usage Guidelines	No specific guidelines impact the use of the	his command.
Task ID	Task Operations ID	
	crypto execute	
Examples	This example shows how to delete Ed255	19 crypto key pairs from your router:
	Router# <b>crypto key zeroize ed25519</b> % Keys to be removed are named the_ Do you really want to remove these	
Related Commands	Command	Description
	crypto key generate ed25519, on page 285	Generates Ed25519 crypto key pairs.
	#unique_204	Displays the Ed25519 public keys of your router.

#### crypto key zeroize rsa

To delete all Rivest, Shamir, and Adelman (RSA) keys from the router, use the **crypto key zeroize rsa** command in XR EXEC mode.

crypto key zeroize rsa [keypair-label]

 Syntax Description
 keypair-label (Optional) Names the RSA key pair to be removed.

 Command Default
 If the key pair label is not specified, the default RSA key pair is removed.

Command Modes XR EXEC mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

# Usage Guidelines Use the crypto key zeroize rsa command to delete all RSA keys that were previously generated by the router. After issuing this command, you must perform two additional tasks:

- Ask the certification authority (CA) administrator to revoke the certificates for the router at the CA; you
  must supply the challenge password you created when you originally obtained the router certificates with
  the crypto ca enroll, on page 268 command CA.
- Manually remove the certificates from the configuration using the clear crypto ca certificates command.

 Task ID
 Task ID
 Operations

 ID
 crypto
 execute

**Examples** The following example shows how to delete the general-purpose RSA key pair that was previously generated:

RP/0/RP0/CPU0:router# crypto key zeroize rsa key1
% Keys to be removed are named key1
Do you really want to remove these keys? [yes/no]: yes

# description (trustpoint)

To create a description of a trustpoint, use the **description** command in trustpoint configuration mode. To delete a trustpoint description, use the **no** form of this command.

description *string* no description

Syntax Description	string Character string describing the trustpo	pint.
Command Default	The default description is blank.	
Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	Use the <b>description</b> command in the trustpo	bint configuration mode to create a description for a trustpoint.
Task ID	Task Operations ID	
	crypto read, write	
Examples	The following example shows how to create	a trustpoint description:
	RP/0/RP0/CPU0:router# <b>configure</b> RP/0/RP0/CPU0:router(config)# <b>crypto</b> RP/0/RP0/CPU0:router(config-trustp)#	ca trustpoint myca description this is the primary trustpoint

#### enrollment retry count

To specify the number of times a router resends a certificate request to a certification authority (CA), use the **enrollment retry count** command in trustpoint configuration mode. To reset the retry count to the default, use the **no** form of this command.

enrollment retry count number no enrollment retry count number

**Syntax Description** *number* Number of times the router resends a certificate request when the router does not receive a certificate from the previous request. The range is from 1 to 100.

**Command Default** If no retry count is specified, the default value is 10.

Command Modes Trustpoint configuration

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

# Usage Guidelines After requesting a certificate, the router waits to receive a certificate from the CA. If the router does not receive a certificate within a specified time (the retry period), the router sends another certificate request. The router continues to send requests until it receives a valid certificate, the CA returns an enrollment error, or the configured number of retries (the retry count) is exceeded.

To reset the retry count to the default of 10, use the **no** form of this command. Setting the retry count to 0 indicates an infinite number of retries. The router sends the CA certificate requests until a valid certificate is received (there is no limit to the number of retries).

 Task ID
 Task ID
 Operations ID

 crypto
 read, write

**Examples** 

The following example shows how to declare a CA, change the retry period to 10 minutes, and change the retry count to 60 retries. The router resends the certificate request every 10 minutes until receipt of the certificate or approximately 10 hours pass since the original request was sent, whichever occurs first (10 minutes x 60 tries = 600 minutes = 10 hours).

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/RP0/CPU0:router(config-trustp)# enrollment url http://ca_server
RP/0/RP0/CPU0:router(config-trustp)# enrollment retry period 10
RP/0/RP0/CPU0:router(config-trustp)# enrollment retry count 60
```

#### enrollment retry period

To specify the wait period between certificate request retries, use the **enrollment retry period** command in trustpoint configuration mode. To reset the retry period to the default of 1 minute, use the **no** form of this command.

enrollment retry period minutes no enrollment retry period minutes

**Syntax Description** *minutes* Period (in minutes) between certificate requests issued to a certification authority (CA) from the router. The range is from 1 to 60 minutes.

Command Default	minutes: 1	
Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	a certificate within a specified time (the r	aits to receive a certificate from the CA. If the router does not receive etry period), the router sends another certificate request. The router as a valid certificate, the CA returns an enrollment error, or the

The router sends the CA another certificate request every minute until a valid certificate is received. (By default, the router sends ten requests, but you can change the number of permitted retries with the **enrollment retry count** command.)

 
 Task ID
 Task ID
 Operations

 crypto
 read, write

#### **Examples**

The following example shows how to declare a CA and change the retry period to 5 minutes:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/RP0/CPU0:router(config-trustp)# enrollment retry period 5

configured number of retries (the retry count) is exceeded.

**Command Default** 

## enrollment terminal

To specify manual cut-and-paste certificate enrollment, use the **enrollment terminal** command in trustpoint configuration mode. To delete a current enrollment request, use the **no** form of this command.

enrollment terminal no enrollment terminal

Syntax Description	This command has no	keywords or arguments.
--------------------	---------------------	------------------------

None

Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	between the router and certification auth	e requests and certificates when you do not have a network connection ority (CA). When the <b>enrollment terminal</b> command is enabled, the the console terminal, which allows you to enter the issued certificate

**Examples** 

The following example shows how to manually specify certificate enrollment through cut-and-paste. In this example, the CA trustpoint is myca.

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/RP0/CPU0:router(config-trustp)# enrollment terminal

#### enrollment url

**Syntax Description** 

To specify the certification authority (CA) location by naming the CA URL, use the **enrollment url** command in trustpoint configuration mode. To remove the CA URL from the configuration, use the **no** form of this command.

enrollment url CA-URL no enrollment url CA-URL

*CA-URL* URL of the CA server. The URL string must start with http://CA\_name, where CA\_name is the host Domain Name System (DNS) name or IP address of the CA (for example, http://ca-server).

If the CA cgi-bin script location is not /cgi-bin/pkiclient.exe at the CA (the default CA cgi-bin script location), you must also include the nonstandard script location in the URL, in the form of http://CA-name/script-location, where script-location is the full path to the CA scripts.

Command Default	None	
Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.

Usage Guidelines Use the enrollment url command to specify the CA URL. This command is required when you declare a CA with the crypto ca trustpoint command. The URL must include the CA script location if the CA scripts are not loaded into the default cgi-bin script location. The CA administrator should be able to tell you where the CA scripts are located.

This table lists the available enrollment methods.

Table 9: Certificate Enrollment Methods

Enrollment Method	Description
SFTP	Enroll through SFTP: file system
TFTP <sup>1</sup>	Enroll through TFTP: file system

<sup>1</sup> If you are using TFTP for enrollment, the URL must be in the form tftp://certserver/file\_specification. (The file specification is optional.)

TFTP enrollment sends the enrollment request and retrieves the certificate of the CA and the certificate of the router. If the file specification is included in the URL, the router appends an extension to the file specification.

To change the CA URL, repeat the enrollment url command to overwrite the previous URL

I

Task ID	Task ID	Operations	
	crypto	read, write	
Examples	The foll	lowing exam	ple shows the absolute minimum configuration required to declare a CA:
		P0/CPU0:rou	outer# <b>configure</b> uter(config)# <b>rypto ca trustpoint myca</b>
	RP/0/H		<pre>buter(config-trustp)# nrollment url http://ca.domain.com/certsrv/mscep/mscep.dll</pre>

# ip-address (trustpoint)

To specify a dotted IP address that is included as an unstructured address in the certificate request, use the **ip-address** command in trustpoint configuration mode. To restore the default behavior, use the **no** form of this command.

ip-address {ip-address | none}
no ip-address {ip-address | none}

Syntax Description	<i>ip-address</i> Dotted IP address that is included in	the certificate request.
	none Specifies that an IP address is not in	cluded in the certificate request.
Command Default	You are prompted for the IP address during cert	ificate enrollment.
Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	Use the <b>ip-address</b> command to include the IP at to specify that an IP address should not be inclu	address of the specified interface in the certificate request or ded in the certificate request.
Task ID	Task Operations ID	
	crypto read, write	
Examples	The following example shows how to include th certificate request for the trustpoint frog:	ne IP address of the Ethernet-0 interface in the
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# crypto ca RP/0/RP0/CPU0:router(config-trustp)# enr RP/0/RP0/CPU0:router(config-trustp)# sub RP/0/RP0/CPU0:router(config-trustp)# ip-	collment url http://frog.phoobin.com Ject-name OU=Spiral Dept., O=tiedye.com address 172.19.72.120

# key-usage

To specify the key usage field for the self-enrollment certificate, use the **key-usage** command in trustpoint configuration mode. To remove this configuration, use the **no** form of this command.

key-usage {ca-certificate {crlsign | digitalsignature | keycertsign | nonrepudiation} | certificate {dataencipherment | digitalsignature | keyagreement | keyencipherment | nonrepudiation}}

Syntax Description	ca-certificate	Specifies the key usage field for the CA certificate.
	certificate	Specifies the key usage field for the leaf certificate.
	crlsign	Asserts <b>cRLSign</b> (bit 6) for the key usage field to verify signatures on certificate revocation list (CRL).
	digitalsignature	Asserts <b>digitalSignature</b> (bit 0) for the key usage field.
		This is used when the subject public key is used with a digital signature mechanism to support security services other than certificate signing (bit 5), or CRL signing (bit 6).
	keycertsign	Asserts <b>keyCertSign</b> (bit 5) for the key usage field when the subject public key is used for verifying a signature on public key certificates.
	nonrepudiation	Asserts <b>nonRepudiation</b> (bit 1) for the key usage field when the subject public key is used to verify digital signatures that is used to provide a non-repudiation service.
	dataencipherment	Asserts <b>dataEncipherment</b> (bit 3) for the key usage field when the subject public key is used for enciphering user data, other than cryptographic keys.
	keyagreement	Asserts <b>keyAgreement</b> (bit 4) for the key usage field when the subject public key is used for key agreement.
	keyencipherment	Asserts <b>keyEncipherment</b> (bit 2) for the key usage field when the subject public key is used for key transport.
Command Default	None

#### message-digest

To configure the message digest hashing algorithm for the certificates, use the **message-digest** command in trustpoint configuration mode. To remove this configuration, use the **no** form of this command.

message-digest {md5 | sha1 | sha256 | sha384 | sha512} **Syntax Description** md5 Specifies MD5 as the message digest hashing algorithm for the certificate. sha1 Specifies SHA1 as the message digest hashing algorithm for the certificate. sha256 Specifies SHA256 as the message digest hashing algorithm for the certificate. sha384 Specifies SHA384 as the message digest hashing algorithm for the certificate. sha512 Specifies SHA512 as the message digest hashing algorithm for the certificate. None **Command Default** Trustpoint configuration **Command Modes Command History** Modification Release Release This command was introduced. 7.0.1No specific guidelines impact the use of this command. **Usage Guidelines** Task ID Task Operations ID crypto read, write **Examples** This example shows how to specify SHA256 as the message digest hashing algorithm for the certificate: Router#configure Router(config)#crypto ca trustpoint system-trustpoint Router (config-trustp) #message-digest sha256 Router (config-trustp) #commit

#### query url

To specify Lightweight Directory Access Protocol (LDAP) protocol support, use the **query url** command in trustpoint configuration mode. To remove the query URL from the configuration, use the **no** form of this command.

query url LDAP-URL no query url LDAP-URL

Syntax Description	LDAP-URL URL of the LDAP server (for example,	ldap://another-server).			
	This URL must be in the form of ldap://server-name where server-name is the host Domain Name System (DNS) name or IP address of the LDAP server.				
Command Default	The URL provided in the router certificate's CRLDis	tributionPoint extension is used.			
Command Modes	Trustpoint configuration				
Command History	Release	Modification			
	Release 6.0	This command was introduced.			

# Usage Guidelines LDAP is a query protocol used when the router retrieves the Certificate Revocation List (CRL). The certification authority (CA) administrator should be able to tell you whether the CA supports LDAP; if the CA supports LDAP, the CA administrator can tell you the LDAP location where certificates and certificate revocation lists should be retrieved.

To change the query URL, repeat the query url command to overwrite the previous URL.

 Task ID
 Task ID
 Operations

 ID
 crypto
 read, write

**Examples** 

The following example shows the configuration required to declare a CA when the CA supports LDAP:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/RP0/CPU0:router(config-trustp)# query url ldap://my-ldap.domain.com

# renewal-message-type

Allows you to configure the request type from the router to the CA for automatic PKI certificate renewal.

	renewal-message-type { pkcsreq   renewalreq }		
Syntax Description	<b>pkcsreq</b> The router uses Public Key Cryptography Standards (PKCS) requests for automatic PKI certificate renewal.		
	renewalreq The router uses Renew requests for automatic PKI certificate renewal.		
Command Default	By default, the PKCS request is available in the router.		
Command Modes	Trustpoint configuration		
Command History	Release Modification		
	ReleaseThis command was introduced.7.5.3		
Usage Guidelines	This command is applicable only for Cisco IOS XR 64-bit Software.		
Task ID	Task Operations ID		
	crypto read, write		
Examples	This example shows how to use this command in the router:		
	Router#configure Router(config)#crypto ca trustpoint system-trustpoint Router(config-trustp)# renewal-message-type renewalreq Router(config-trustp)# keypair rsa system-enroll-key Router(config-trustp)# commit		

#### rsakeypair

To specify a named Rivest, Shamir, and Adelman (RSA) key pair for this trustpoint, use the **rsakeypair** command in trustpoint configuration mode. To reset the RSA key pair to the default, use the **no** form of this command.

rsakeypair keypair-label no rsakeypair keypair-label

Syntax Description	keypair-label RSA key pair label that names the	RSA key pairs.
Command Default	If the RSA key pair is not specified, the default RSA key is used for this trustpoint.	
Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines	Use the <b>rsakeypair</b> command to specify a named command for this trustpoint.	RSA key pair generated using the crypto key generate rsa

Task ID	Operations
crypto	read, write

**Examples** 

The following example shows how to specify the named RSA key pair key1 for the trustpoint myca:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/RP0/CPU0:router(config-trustp)# rsakeypair key1

### serial-number (trustpoint)

To specify whether the router serial number should be included in the certificate request, use the **serial-number** command in trustpoint configuration mode. To restore the default behavior, use the **no** form of this command.

serial-number [none] no serial-number

Syntax Description	none (Optional) Specifies that a serial num	nber is not included in the certificate request.		
Command Default	You are prompted for the serial number during certificate enrollment.			
Command Modes	Trustpoint configuration			
Command History	Release	Modification		
	Release 6.0	This command was introduced.		
Usage Guidelines	5	nmand, you must enable the <b>crypto ca trustpoint</b> command, which at your router should use and enters trustpoint configuration mode.		
	Use this command to specify the router se specify that a serial number should not be	rial number in the certificate request, or use the <b>none</b> keyword to included in the certificate request.		
Task ID	Task Operations ID			
	crypto read, write			
Examples	The following example shows how to om	t a serial number from the root certificate request:		
	RP/0/RP0/CPU0:router(config-trustp) RP/0/RP0/CPU0:router(config-trustp)	<pre># enrollment url http://10.3.0.7:80 # ip-address none</pre>		

### sftp-password (trustpoint)

To secure the FTP password, use the **sftp-password** command in trustpoint configuration mode. To disable this feature, use the **no** form of this command.

**sftp-password** {*clear text* | **clear** *text* | **password** *encrypted string*} **no sftp-password** {*clear text* | **clear** *text* | **password** *encrypted string*}

Syntax Description	clear text	Clear text password and is encrypted only for display pu	rposes.		
	password <i>encrypted string</i> Enters the password in an encrypted form.				
Command Default	The clear text argu	iment is the default behavior.			
Command Modes	Trustpoint configur	iration			
Command History	Release	Release Modification			
	Release 6.0	This comma	and was introduced.		
Usage Guidelines		red in encrypted form and not as plain text. The command-line interexample, clear and encrypted) to specify the password input.	face (CLI) contains the		
	with the prefix (sftp	password are required as part of the SFTP protocol. If you specify p://), you must configure the parameters for the <b>sftp-password</b> comm tificate from the SFTP server, which is used for manual certificate	and under the trustpoint.		
Task ID	Task Operations ID	S S			
	crypto read, write	_			
Examples	The following exar	mple shows how to secure the FTP password in an encrypted form	ı:		
		outer# configure outer(config)# crypto ca trustpoint msiox outer(config-trustp)# sftp-password password xxxxxx			

# sftp-username (trustpoint)

To secure the FTP username, use the **sftp-username** command in trustpoint configuration mode. To disable this feature, use the **no** form of this command.

sftp-username username no sftp-username username

Syntax Description	<i>username</i> Name of the user.	
Command Default	None	
Command Modes	Trustpoint configuration	
Command History	Release	Modification
	Release 6.0	This command was introduced.
Usage Guidelines Task ID	The sftp-username command is used only in the prefix, the manual certificate enrollment Task Operations ID	f the URL has (sftp://) in the prefix. If (sftp://) is not specified in using SFTP fails.
	crypto read, write	
Examples	The following example shows how to secure	e the FTP username:
	RP/0/RP0/CPU0:router# <b>configure</b> RP/0/RP0/CPU0:router(config)# <b>crypto</b>	ca trustpoint msiox

RP/0/RP0/CPU0:router(config-trustp)# sftp-username tmordeko

### subject-name (trustpoint)

To specify the subject name in the certificate request, use the **subject-name** command in trustpoint configuration mode. To clear any subject name from the configuration, use the **no** form of this command.

subject-name [ca-certificate] subject-name

Syntax Description	ca-certificate (Optional) Specifies the subject name for	or the CA certificate for self-enrollment.		
	subject-name (Optional) Specifies the subject name u	ised in the certificate request.		
Command Default	If the <i>subject-name</i> argument is not specified, the fully qualified domain name (FQDN), which is the defau subject name, is used.			
Command Modes	- Trustpoint configuration			
Command History	Release	Modification		
	Release 6.0	This command was introduced.		
	Release 7.0.1	The command was modified to include the <b>ca-certificate</b> option.		
Usage Guidelines		must enable the <b>crypto ca trustpoint</b> command, which er should use and enters trustpoint configuration mode.		
	The <b>subject-name</b> command is an attribute that can be sprevents you from being prompted for a subject name	set for automatic enrollment; thus, issuing this command during enrollment.		
Task ID	Task Operations ID			
	crypto read, write			
Examples	The following example shows how to specify the subj	ect name for the frog certificate:		
	Router# configure Router(config)# crypto ca trustpoint frog Router(config-trustp)# enrollment url http:// Router(config-trustp)# subject-name OU=Spiral Router(config-trustp)# ip-address 172.19.72.1	Dept., O=tiedye.com		
	This example shows how to specify the subject name	for the CA certificate for self-enrollment.		
	Router#configure Router(config)#crypto ca trustpoint system-tr Router(config-trustp)#subject-name ca-certific systems,OU=ASR	rustpoint ate CN=labuser-ca,C=US,ST=CA,L=San Jose,O=cisco

### show crypto ca crls

To display information about the local cache Certificate Revocation List (CRL), use the **show crypto ca crls** command in XR EXEC mode.

show crypto ca crls

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	- XR EXEC mode		
Command History	Release	Modification	
	Release 6.0	This command was introduced.	
Usage Guidelines	No specific guidelines impact the use of this comma	and.	
Task ID	Task Operations ID		
	crypto read		
Examples	The following sample output is from the <b>show cryp</b>	oto ca crls command:	
	RP/0/RP0/CPU0:router:router# <b>show crypto ca</b> CRL Entry		
	Issuer : cn=xyz-w2k-root,ou=HFR,o=Cisco Sys Last Update : [UTC] Thu Jan 10 01:01:14 200 Next Update : [UTC] Thu Jan 17 13:21:14 200 CRL Distribution Point : http://xyz-w2k.cisco.com/CertEnroll/xyz-w2k	tem,l=San Jose,st=CA,c=US 2 2	

#### show crypto ca trustpool policy

To display the CA trust pool certificates of the router in a verbose format use the **show crypto ca trustpool policy**command in XR EXEC mode.

show crypto ca trustpool policy

This command has no keywords or arguments.

**Command Default** No default behavior or values

Command Modes XR EXEC mode

**Syntax Description** 

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

**Usage Guidelines** Use the command to display the CA trust pool certificates of the router in a verbose format.

Task ID Task Operation ID

crypto read

#### Example

This example shows you how to run the command to view details of your CA certificate trust pool policy.

RP/0/RP0/CPU0:router# show crypto ca trustpool policy

Trustpool Policy

Trustpool CA certificates will expire [UTC] Thu Sep 30 14:01:15 2021 CA Bundle Location: http://cisco.com/security/pki/trs/ios.p7b

#### show crypto key mypubkey authentication-ssh

To display the cryptographic keys that are used for the public key-based authentication of SSH clients on the router, use the **show crypto key mypubkey authentication-ssh** command in XR EXEC mode.

Syntax Description	Diant-	a the DCA 1	or of the second				
Syntax Description	rsa Displays the RSA key of the user.						
	<b>username</b> Specifies the name of the user whose RSA key is to be displayed.						
	name						
Command Default	None						
Command Modes	XR EXEC mode						
Command History	Release					Modificatio	on
	Release 7.10.1					This comm	and was introduced.
Jsage Guidelines	If the <b>username</b> is not sp	ecified, then	the command	d displays th	ne key for	r the currentl	y logged-in user.
Fask ID	Task Operations ID						
	crypto read						
Examples	crypto read This example shows how clients on Cisco IOS XR		e RSA key u	sed for publ	lic key-ba	ased authenti	ication of SSH
Examples	This example shows how	routers:	-	-	-	ased authenti	cation of SSH

The key value starts with *ssh-rsa* in the above output.

#### show crypto key mypubkey dsa

To display the Directory System Agent (DSA) public keys for your router, use the **show crypto key mypubkey dsa** command in XR EXEC mode.

show crypto key mypubkey dsa This command has no keywords or arguments. Syntax Description None **Command Default** XR EXEC mode **Command Modes Command History** Release Modification Release 6.0 This command was introduced. No specific guidelines impact the use of this command. **Usage Guidelines** Task ID Task Operations ID crypto read **Examples** The following sample output is from the **show crypto key mypubkey dsa** command: RP/0/RP0/CPU0:router# show crypto key mypubkey dsa Key label: mykey Type : RSA General purpose Size : 1024 Created : 17:33:23 UTC Thu Sep 18 2003 Data : 3081F230 81AA0605 2B0E0302 0C3081A0 02020200 024100C8 A36B6179 56B8D620 1F77595C 32EF3004 577A9F79 0A8ABDA4 89FB969D 35C04E7E 5491ED4E 120C657C 610576E5 841696B6 0948846C C92F56E5 B4921458 70FC4902 1500AB61 5C0D63D3 EB082BB9 F16030C5 AA0B5D1A DFE50240 73F661EA 9F579E77 B413DBC4 9047B4F2 10A1CFCB 14D98B57 3E0BBA97 9B5120AD F52BBDC7 15B63454 8CB54885 92B6C9DF 7DC27768 FD296844 42024945 5E86C81A 03430002 4071B49E F80F9E4B AF2B62E7 AA817460 87EFD503 C668AD8C D606050B 225CC277 7C0A0974 8072D7D7 2ADDDE42 329FE896 AB015ED1 3A414254 6935FDCA 0043BA4F 66

### show crypto key mypubkey ed25519

To display the Ed25519 crypto public keys of your router, use the **show crypto key mypubkey ed25519** command in XR EXEC mode.

	show crypto key mypubkey ed2	25519
Syntax Description	This command has no keywords or argum	nents.
Command Default	None	
Command Modes	XR EXEC mode	
Usage Guidelines	No specific guidelines impact the use of t	his command.
Task ID	Task Operations ID	
	crypto read	
Examples	This example shows the sample output of Router# show crypto key mypubkey	the show crypto key mypubkey ed25519 command:
	1F77595C         32EF3004         577A9F79         0A8ABDA4           610576E5         841696B6         0948846C         C92F56E           EB082BB9         F16030C5         AA0B5D1A         DFE50240           10A1CFCB         14D98B57         3E0BBA97         9B5120AB           7DC27768         FD296844         42024945         5E86C812	<ul> <li>02020200 024100C8 A36B6179 56B8D620</li> <li>89FB969D 35C04E7E 5491ED4E 120C657C</li> <li>B4921458 70FC4902 1500AB61 5C0D63D3</li> <li>73F661EA 9F579E77 B413DBC4 9047B4F2</li> <li>F52BBDC7 15B63454 8CB54885 92B6C9DF</li> <li>A 03430002 4071B49E F80F9E4B AF2B62E7</li> <li>3225CC277 7C0A0974 8072D7D7 2ADDDE42</li> </ul>
Related Commands	Command	Description

#### show platform security integrity dossier

To collect the data from various IOS XR applications, use the **show platform security integrity dossier** command in XR EXEC mode.

show platform security integrity dossier [ include { packages | reboot-history |
rollback-history | running-config | system-integrity-snapshot | system-inventory } ] [ nonce
nonce-value | display compact ]

Syntax Description	packages reboot-history		Displays active package(s) installed. Displays reboot history of the node.			
	rollback-hi	istory	Displays rollback h	Displays rollback history of the node.		
	running-co	onfig	Displays the currently committed running configuration on the node, as displayed by <b>show running configuration</b> command.			
	system-inte	grity-snapshot	Displays the system	n integrity snapsho	t.	
	system-inv	entory	Displays the system	n inventory.		
	nonce		Specifies the nonce to generate the signature.			
	nonce-value		Specifies the nonce value in hexadecimal string format.			
	display cor	npact	Displays IMA even	t logs in the protol	ouf format.	
Command Default	None					
Command Modes	XR EXEC n	node				
Command History	Release	Modificatio	n			
	Release 7.0.1	This comma	nd was introduced.			
	Release 7.4.1	Display com	pact keyword was int	roduced.		
Usage Guidelines	The output of	of this comman	d is displayed in JSC	ON format.		
Task ID	Options		Task ID	Operations		
	packages		pkg-mgmt	read		
	reboot-hist	tory	system	read		
	rollback-hi	istory	config-services	read		

Options	Task ID	Operations
running-config	NA (available to all users)	read
system-integrity-snapshot	basic-services	read
system-inventory	sysmgr	read

Examples

This example shows the usage of **show platform security integrity dossier** command with various selectors:

Router#show platform security integrity dossier include packages reboot-history rollback-history system-integrity-snapshot system-inventory nonce 1580 | utility sign nonce 1580 include-certificate

### utility sign

To sign the command output with the enrollment key to verify its data integrity and authenticity, use the **utility** sign command along with any of the Cisco IOS XR commands.

	utility sign [include-certificate   nonce nonce-value]				
Syntax Description	include-certificate Includes the certificate of the signer.				
	<b>nonce</b> Indicates the nonce to generate the signature.				
	<i>nonce-value</i> Specifies the nonce value in hexadecimal string format.				
Command Default	None				
Command Modes	Any IOS XR command configuration mode.				
Command History	Release Modification				
	ReleaseThis command was introduced.7.0.1				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	Task Operations ID				
	crypto execute				
Examples	This example shows how to add a signature to the command output data to verify its data integrity and authenticity:				

Router#show version | utility sign nonce 1234 include-certificate

# **Secure Shell Commands**

This module describes the Cisco IOS XR software commands used to configure Secure Shell (SSH).

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

For detailed information about SSH concepts, configuration tasks, and examples, see the Implementing Secure Shell chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

Note

Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

RP/0/RP0/CPU0:router# clear ssh 0

#### disable auth-methods

To selectively disable the authentication methods for the SSH server, use the **disable auth-methods** command in ssh server configuration mode. To remove the configuration, use the **no** form of this command.

disable auth-methods { keyboard-interactive | password | public-key }

Syntax Description	keyboard	interactive	Disables keyboard-interactive authentication method for the SSH server	
	password		Disables password authentication method for the SSH server	
	public-key	7	Disables publick-key authentication method for the SSH server	
Command Default	Allows all t	the authentication methods, by de	fault.	
Command Modes	ssh server			
Command History	Release	Modification		
	Release 7.8.1	This command was introduced.		
Usage Guidelines	If this configuration is not present, you can consider that the SSH server on the router allows all the authentication methods.			
	The public-	key authentication method includ	es certificate-based authentication as well.

Router(config-ssh)# disable auth-methods public-key Router(config-ssh)# commit

#### netconf-yang agent ssh

To enable netconf agent over SSH (Secure Shell), use the **netconf-yang agent ssh** command in the global configuration mode. To disable netconf, use the **no** form of the command.

netconf-yang agent ssh no netconf-yang agent ssh

Syntax Description	This command has no keywords or arguments.			
Command Default	None			
Command Modes	Global Configuration			
Command History	Release	Modification		
	Release 6.0	This command was introduced.		
Usage Guidelines	SSH is curre	ntly the supported trans	sport method for Netconf.	
Task ID	Task ID	Operation		
	config-servio	es read, write		

#### Example

This example shows how to use the netconf-yang agent ssh command:

RP/0/RP0/CPU0:router (config) # netconf-yang agent ssh

#### sftp

To start the secure FTP (SFTP) client, use the sftp command.

**sftp** [username @ host : remote-filenam e] source-filename dest-filename [ **port** port-num ] [ **source-interface** type interface-path-id ] [ **vrf** vrf-name ]

Syntax Description	username	(Optional) Name of the user performing the file transfer. The at symbol (@) following the username is required.			
	hostname:remote-filename	(Optional) Name of the Secure Shell File Transfer Protocol (SFTP) server. The colon (:) following the hostname is required.			
	source-filename	SFTP source, including the path.			
	dest-filename	SFTP destination, including the path.			
	port port-num	Specifies the non-default port number of the server to which the SFTP client of the router attempts a connection.			
		The port number ranges from 1025 - 65535.			
	source-interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.			
	type	Interface type. For more information, use the question mark (?) online help function.			
	interface-path-id	Physical interface or virtual interface.			
		<b>Note</b> Use the <b>show interfaces</b> command in XR EXEC mode to see a list of all interfaces currently configured on the router.			
		For more information about the syntax for the router, use the question mark (?) online help function.			
	vrf vrf-name	Specifies the name of the VRF associated with the source interface.			
Command Default	If no <i>username</i> argument is provided, the login name on the router is used. If no <i>hostname</i> argument is provided, the file is considered local.				
Command Modes	XR EXEC mode				
Command History	Release Modification				
	ReleaseModified the7.7.1connections.	command to include the <b>port</b> option that specifies the non-default port for outbound			
	Release 6.0 This comman	nd was introduced.			

#### sftp

#### **Usage Guidelines**

SFTP provides for the secure (and authenticated) copying of files between a router and a remote host. Like the **copy** command, the **sftp** command can be invoked only in XR EXEC mode.

If a username is not provided, the login name on the router is used as the default. If a host name is not provided, the file is considered local.

If the source interface is specified in the **sftp** command, the **sftp** interface takes precedence over the interface specified in the **ssh client source-interface** command.

When the file destination is a local path, all of the source files should be on remote hosts, and vice versa.

When multiple source files exist, the destination should be a preexisting directory. Otherwise, the destination can be either a directory name or destination filename. The file source cannot be a directory name.

If you download files from different remote hosts, that is, the source points to different remote hosts, the SFTP client spawns SSH instances for each host, which may result in multiple prompts for user authentication.

If you have configured a non-default SSH server port on the router, then the SCP and SFTP services also use that SSH port for their connections. The **port** option to specify the non-default port number is available for the **ssh** command also.

The non-default SSH port number is supported only for SSHv2 and only on Cisco IOS XR SSH; not on CiscoSSH, the Open-SSH-based implementation of SSH. For more details, see *Non-default SSH Port* section in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

From Cisco IOS XR Software Release 7.10.1 and later, you can use public-key based user authentication for Cisco IOS XR routers configured as SSH clients as well. This feature thereby allows you to use password-less authentication for secure file transfer and copy operations using SFTP and SCP protocols.

Task ID	Task ID	Operations
	crypto	execute
	basic-services	execute

#### **Examples**

In the following example, user *abc* is downloading the file *ssh.diff* from the SFTP server *ena-view1* to *disk0*:

RP/0/RP0/CPU0:router#sftp abc@ena-view1:ssh.diff disk0

In the following example, user *abc* is uploading multiple files from disk 0:/sam\_\* to /users/abc/ on a remote SFTP server called ena-view1:

#### RP/0/RP0/CPU0:router# sftp disk0:/sam\_\* abc@ena-view1:/users/abc/

In the following example, user *admin* is downloading the file *run* from *disk0a*: to *disk0:/v6copy* on a local SFTP server using an IPv6 address:

```
RP/0/RP0/CPU0:router#sftp admin@[2:2:2::2]:disk0a:/run disk0:/V6copy
Connecting to 2:2:2::2...
Password:
disk0a:/run
Transferred 308413 Bytes
308413 bytes copied in 0 sec (338172)bytes/sec
```

RP/0/RP0/CPU0:router#dir disk0:/V6copy
Directory of disk0:
70144 -rwx 308413 Sun Oct 16 23:06:52 2011 V6copy
2102657024 bytes total (1537638400 bytes free)

In the following example, user *admin* is uploading the file *v6copy* from *disk0:* to *disk0a:/v6back* on a local SFTP server using an IPv6 address:

```
RP/0/RP0/CPU0:router#sftp disk0:/V6copy admin@[2:2:2::2]:disk0a:/v6back
Connecting to 2:2:2::2...
Password:
/disk0:/V6copy
Transferred 308413 Bytes
  308413 bytes copied in 0 sec (421329)bytes/sec
```

RP/0/RP0/CPU0:router#dir disk0a:/v6back

Directory of disk0a:

66016 -rwx 308413 Sun Oct 16 23:07:28 2011 v6back

2102788096 bytes total (2098987008 bytes free)

In the following example, user *admin* is downloading the file *sampfile* from *disk0*: to *disk0a:/sampfile\_v4* on a local SFTP server using an IPv4 address:

```
RP/0/RP0/CPU0:router#sftp admin@2.2.2.2:disk0:/sampfile disk0a:/sampfile_v4
Connecting to 2.2.2.2...
Password:
disk0:/sampfile
Transferred 986 Bytes
986 bytes copied in 0 sec (493000)bytes/sec
RP/0/RP0/CPU0:router#dir disk0a:/sampfile_v4
Directory of disk0a:
131520 -rwx 986 Tue Oct 18 05:37:00 2011 sampfile_v4
502710272 bytes total (502001664 bytes free)
```

In the following example, user *admin* is uploading the file *sampfile\_v4* from *disk0a:* to *disk0:/sampfile\_back* on a local SFTP server using an IPv4 address:

```
RP/0/RP0/CPU0:router#sftp disk0a:/sampfile_v4 admin@2.2.2.2:disk0:/sampfile_back
Connecting to 2.2.2.2...
Password:
disk0a:/sampfile_v4
Transferred 986 Bytes
986 bytes copied in 0 sec (564000)bytes/sec
RP/0/RP0/CPU0:router#dir disk0:/sampfile_back
Directory of disk0:
```

121765 -rwx 986 Tue Oct 18 05:39:00 2011 sampfile\_back 524501272 bytes total (512507614 bytes free)

This example shows how to connect to the non-default port of a remote SFTP server and download a file to the local *disk0*: on the router.

RP/0/RP0/CPU0:router#sftp user1@198.51.100.1:disk0:/test-file port 5525 disk0

# sftp (Interactive Mode)

To enable users to start the secure FTP (SFTP) client, use the sftp command.

	<b>sftp</b> [ userr interface-path		ost : remote-filenam e ] [ port port-num ] [ source-interface type vrf-name ]		
Syntax Description	username		(Optional) Name of the user performing the file transfer. The at symbol (@) following the username is required.		
	hostname:ren	note-filename	(Optional) Name of the Secure Shell File Transfer Protocol (SFTP) server. The colon (:) following the hostname is required.		
	port port-nu	m	Specifies the non-default port number of the server to which the SFTP client on the router attempts a connection.		
			The port number ranges from 1025 - 65535.		
	source-inter	face	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.		
	type		Interface type. For more information, use the question mark (?) online help function.		
	interface-pa	th-id	Physical interface or virtual interface.		
			<b>Note</b> Use the <b>show interfaces</b> command in XR EXEC mode to see a list of all interfaces currently configured on the router.		
			For more information about the syntax for the router, use the question mark (?) online help function.		
	vrf vrf-name		Specifies the name of the VRF associated with the source interface.		
Command Default	If no <i>username</i> argument is provided, the login name on the router is used. If no <i>hostname</i> argument is provided, the file is considered local.				
Command Modes	XR EXEC m	ode			
Command History	Release	Modification			
	ReleaseModified the command to include the <b>port</b> option that specifies the non-default port for outbout7.7.1connections.				
	Release 6.0	This comman	nd was introduced.		
Usage Guidelines	command. W	hen a user star	ractive mode, creates a secure SSH channel where the user can enter any supported rts the SFTP client in an interactive mode, the SFTP client process creates a secure editor where user can enter any supported command.		

More than one request can be sent to the SFTP server to execute the commands. While there is no limit on the number of 'non-acknowledged' or outstanding requests to the server, the server might buffer or queue these requests for convenience. Therefore, there might be a logical sequence to the order of requests.

The following unix based commands are supported in the interactive mode:

- bye
- cd <*path*>
- chmod <mode> <path>
- exit
- get <remote-path> [local-path]
- help
- **ls** [-alt] [path]
- mkdir <path>
- put <local-path> [remote-path]
- pwd
- quit
- rename <old-path> <new-path>
- rmdir <path>
- rm <path>

The following commands are not supported:

- · lcd, lls, lpwd, lumask, lmkdir
- ln, symlink
- · chgrp, chown
- !, !command
- ?
- mget, mput

If you have configured a non-default SSH server port on the router, then the SCP and SFTP services also use that SSH port for their connections. The **port** option to specify the non-default port number is available for the **ssh** command also.

The non-default SSH port number is supported only for SSHv2 and only on Cisco IOS XR SSH; not on CiscoSSH, the Open-SSH-based implementation of SSH. For more details, see *Non-default SSH Port* section in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

From Cisco IOS XR Software Release 7.10.1 and later, you can use public-key based user authentication for Cisco IOS XR routers configured as SSH clients as well. This feature thereby allows you to use password-less authentication for secure file transfer and copy operations using SFTP and SCP protocols.

Task ID	Task ID	Operations		
	crypto	execute		
	basic-service	es execute		

sftp>

**Examples** 

In the following example, user *admin* is downloading and uploading a file from/to an external SFTP server using an IPv6 address:

```
RP/0/RP0/CPU0:router#sftp admin@[2:2:2::2]
```

```
Connecting to 2:2:2::2...
Password:
sftp> pwd
Remote working directory: /
sftp> cd /auto/tftp-server1-users5/admin
sftp> get frmRouter /disk0:/frmRouterdownoad
/auto/tftp-server1-users5/admin/frmRouter
    Transferred 1578 Bytes
    1578 bytes copied in 0 sec (27684)bytes/sec
sftp> put /disk0:/frmRouterdownoad againtoServer
/disk0:/frmRouterdownoad
    Transferred 1578 Bytes
    1578 bytes copied in 0 sec (14747)bytes/sec
sftp>
```

In the following example, user *abc* is downloading and uploading a file from/to an external SFTP server using an IPv4 address:

```
RP/0/RP0/CPU0:router#sftp abc@2.2.2.2
Connecting to 2.2.2.2...
Password:
sftp> pwd
Remote working directory: /
sftp> cd /auto/tftp-server1-users5/abc
sftp> get frmRouter /disk0:/frmRouterdownoad
/auto/tftp-server1-users5/abc/frmRouter
Transferred 1578 Bytes
1578 bytes copied in 0 sec (27684)bytes/sec
sftp> put /disk0:/frmRouterdownoad againtoServer
/disk0:/frmRouterdownoad
Transferred 1578 Bytes
1578 bytes copied in 0 sec (14747)bytes/sec
```

### show ssh

To display all incoming and outgoing connections to the router, use the show ssh command.

	show ssh						
Syntax Description	This command has no keywords or arguments.

This table describes significant fields shown in the display.

#### Table 10: show ssh Field Descriptions

Field	Description
session	Session identifier for the incoming and outgoing SSH connections.
chan	Channel identifier for incoming (v2) SSH connections. NULL for SSH v1 sessions.
pty	pty-id allocated for the incoming session. Null for outgoing SSH connection.
location	Specifies the location of the SSH server for an incoming connection. For an outgoing connection, location specifies from which route processor the SSH session is initiated.
state	The SSH state that the connection is currently in.
userid	Authentication, authorization and accounting (AAA) username used to connect to or from the router.
host	IP address of the remote peer.
ver	Specifies if the connection type is SSHv1 or SSHv2.
authentication	Specifies the type of authentication method chosen by the user.
connection type	Specifies which application is performed over this connection (Command-Line-Interface, Remote-Command, Scp, Sftp-Subsystem, or Netconf-Subsystem)

The following is a sample output of SSH port-forwarded session:

#### Router#show ssh

Outgoing sessions

Command	Description
show ssh	Displays all incoming and outgoing connections to the router.
show ssh session details	Displays the details for all the incoming and outgoing SSHv2 connections, to the router.
show ssh rekey	Displays session rekey details such as session id, session rekey count, time to rekey, data to rekey.
show ssh history	Displays the last hundred SSH connections that were terminated.
show tty trace info all all	
show tty trace error all all	

#### ssh

To start the Secure Shell (SSH) client connection and enable an outbound connection to an SSH server, use the **ssh** command.

ssh [vrf vrf-name] { ipv4-address [ port port-num ] | ipv6-address [ port port-num ] | hostname[ port port-num ] } [ username user-id ] [ cipher aes { 128-cbc | 192-cbc | 256-cbc } ] [source-interface type interface-path-id ] [ command command-name ]

Syntax Description	vrf vrf-name	Specifies the name of the VRF associated with this connection.
	ipv4-address	IPv4 address in A:B:C:D format.
	ipv6-address	IPv6 address in X:X::X format.
	hostname	Hostname of the remote node. If the hostname has both IPv4 and IPv6 addresses, the IPv6 address is used.
	port port-num	Specifies the non-default SSH port number of the remote SSH server to which the SSH client on the router attempts a connection.
		The port number ranges from 1025 - 65535.
	<b>username</b> user-id	(Optional) Specifies the username to use when logging in on the remote networking device running the SSH server. If no user ID is specified, the default is the current user ID.
	cipheraes	(Optional) Specifies Advanced Encryption Standard (AES) as the cipher for the SSH client connection.
		<b>Note</b> If there is no specification of a particular cipher by the administrator, the client proposes 3DES as the default to ensure compatibility.
	128-CBC	128-bit keys in CBC mode.
	192-CBC	192-bit keys in CBC mode.
	256-CBC	256-bit keys in CBC mode.
	source interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.
	type	Interface type. For more information, use the question mark (?)online help function.
	interface-path-id	Physical interface or virtual interface.
		<b>Note</b> Use the <b>showinterfaces</b> command in XR EXEC mode to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark(?)online help function.

l

	command	(Optional) Specifies a remote command. Adding this keyword prompts the SSHv2 server to parse and execute the <b>ssh</b> command in non-interactive mode instead of initiating the interactive session.
Command Default	3DES cipher	
Command Modes	XR EXEC m	node
Command History	Release	Modification
	Release 7.7.1	Modified the command to include the <b>port</b> option that specifies the non-default port for outbound SSH connections.
	Release 6.0	This command was introduced.
lsage Guidelines	connection to SSHv1 conn	command to make an outbound client connection. The SSH client tries to make an SSHv2 o the remote peer. If the remote peer supports only the SSHv1 server, it internally spawns an ection to the remote server. The process of the remote peer version detection and spawning the client connection is transparent to the user.
	If a VRF is s	pecified in the ssh command, the ssh interface takes precedence over the interface specified in
	the ssh client	t source-interface, on page 364 command.
	When you co key sizes you	t source-interface, on page 364 command. onfigure the <b>cipher aes</b> keyword, an SSH client makes a proposal, including one or more of the u specified, as part of its request to the SSH server. **Examples** 

The following sample output is from the **ssh** command to enable an outbound SSH client connection:

Router# ssh vrf green username userabc

Password: Remote-host>

This examples shows how to initiate an outbound SSH client connection to an SSH server which uses a port number other than the standard default port, 22. Here, the SSH server listens on port 5525 for client connections:

Router#ssh 198.51.100.1 port 5525 username user1

# ssh algorithms cipher

To configure the list of supported SSH algorithms on the client or on the server, use the **ssh client algorithms cipher** command or **ssh server algorithms cipher** command in XR Config mode. To remove the configuration, use the **no** form of this command.

ssh {client | server} algorithms cipher {aes256-cbc | aes256-ctr | aes192-ctr | aes192-cbc | aes128-ctr | aes128-cbc | aes128-gcm@openssh.com | aes256-gcm@openssh.com | 3des-cbc}

Syntax Description	client Configures the list of supported SSH	algorithms on the client.		
	server Configures the list of supported SSH	algorithms on the server.		
Command Default	None			
Command Modes	XR Config mode			
Command History	Release Modification			
	ReleaseThis command was7.0.1introduced.			
Usage Guidelines	No specific guidelines impact the use of this c	ommand.		
Task ID	Task Operation ID			
	crypto read, write			
	This example shows how to enable CTR cipher on the client and CBC cipher on the server:			
	Router1#ssh client algorithms cipher aes128-ctr aes192-ctr aes256-ctr			
	Router1# <b>ssh server algorithms cipher a</b>	es128-cbc aes192-cbc aes256-cbc 3des-cbc		
Related Commands	Command	Description		
	ssh client enable cipher , on page 361	Enables CBC mode ciphers on the SSH client.		
	ssh server enable cipher, on page 372	Enables CBC mode ciphers on the SSH server.		

## ssh client auth-method

To set the preferred order of SSH client authentication methods to be negotiated with the SSH server while establishing SSH sessions, use the **ssh client auth-method** command in the XR Config mode. To revert to the default order of SSH client authentication methods, use the **no** form of this command.

ssh client auth-method list-of-auth-method

Syntax Description	list-of-auth-method	<i>d</i> Specifies the list of SSH client authentication methods in the respective order.
		The available options are:
		keyboard-interactive
		• password
		• public-key
Command Default	None	
Command Modes	Global Configuration	onXR Config
Command History	Release	Modification
	Release 7.9.2/Rele 7.10.1	ease This command was introduced.
Usage Guidelines	The default order o	f SSH client authentication methods on Cisco IOS XR routers is as follows:
	• On routers run	nning Cisco IOS XR SSH:
	• public-ko	ey, password and keyboard-interactive (prior to Cisco IOS XR Software Release 24.1.1
	• <b>public-k</b> (and later)	ey, keyboard-interactive and password (from Cisco IOS XR Software Release 24.1.1)
	• On routers run	nning CiscoSSH (open source-based SSH):
	• public-ko	ey, keyboard-interactive and password
Task ID	Task Operation ID	
	crypto read, write	
	This example show	s how to set the order of SSH client authentication methods in such a way that

This example shows how to set the order of SSH client authentication methods in such a way that public key authentication is negotiated first, followed by keyboard-interactive, and then password-based authentication.

 $\texttt{Router} \texttt{\texttt{#configure}}$ 

Router(config)**#ssh client auth-method public-key keyboard-interactive password** Router(config-ssh)**#commit** 

# ssh client enable cipher

To enable the CBC mode ciphers 3DES-CBC and/or AES-CBC for an SSH client connection, use the **ssh** client enable cipher command in XR Config mode. To disable the ciphers, use the **no** form of this command.

ssh client enable cipher {aes-cbc | 3des-cbc}

Syntax Description	<b>3des-cbc</b> Specifies that the 3DES-CBC cipher be enabled for the SSH client connection.			
-	<b>aes-cbc</b> Specifies that the AES-CBC cipher be enabled for the SSH client connection.			
Command Default	CBC mode ciphers are disabled.			
Command Modes	Global Configuration			
Command History	Release Modification			
	Release 6.3.1 This command was introduced.			
Usage Guidelines	The support for CBC ciphers were disabled by default, from Cisco IOS XR Software Release 6.1.2. Hence, <b>ssh client enable cipher</b> and <b>ssh server enable cipher</b> commands were introduced to explicitly enable CBC ciphers in required scenarios.			
	If a client tries to reach the router which acts as a server with CBC cipher, and if the CBC cipher is not explicitly enabled on that router, then the system displays an error message:			
	ssh root@x.x.xc aes128-cbc Unable to negotiate with x.x.x.x port 22: no matching cipher found. Their offer: aes128-ctr,aes192-ctr,aes256-ctr,aes128-gcm@openssh.com,aes256-gcm@openssh.com			
	You must configure <b>ssh server enable cipher aes-cbc</b> command in this case, to connect to the router using the CBC cipher.			
Task ID	Task Operation ID			
	crypto read, write			
Examples	The following example shows how to enable the 3DES-CBC and AES-CBC ciphers for an SSH client connection:			
	Router# configure			

Router(config)# ssh client enable cipher aes-cbc 3des-cbc Router(config)# commit

## ssh client source-interface

To specify the source IP address of a selected interface for all outgoing Secure Shell (SSH) connections, use the **ssh client source-interface** command. To disable use of the specified interface IP address, use the **no** form of this command.

**ssh client source-interface** *type interface-path-id* **no ssh client source-interface** *type interface-path-id* 

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface.
		<b>Note</b> Use the <b>show interfaces</b> command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.
Command Default	No source interfa	ace is used.
Command Modes	XR Config mode	
Command History	Release Mo	dification
	Release 6.0 Thi intr	roduced.
Usage Guidelines	SSH connections connected, based server. This com	at source-interface command to set the IP address of the specified interface for all outgoing s. If this command is not configured, TCP chooses the source IP address when the socket is l on the outgoing interface used—which in turn is based on the route required to reach the mand applies to outbound shell over SSH as well as Secure Shell File Transfer Protocol which use the ssh client as a transport.
	The system datab	face configuration affects connections only to the remote host in the same address family. base (Sysdb) verifies that the interface specified in the command has a corresponding IP ame family) configured.
Task ID	Task Operatio ID	ns
	crypto read, write	
Examples	The following ex all outgoing SSH	ample shows how to set the IP address of the Management Ethernet interface for I connections:

RP/0/RP0/CPU0:router# configure

RP/0/RP0/CPU0:router(config) # ssh client source-interface MgmtEth 0/RP0/CPU0/0

## ssh client vrf

To configure a new VRF for use by the SSH client, use the ssh client vrf command. To remove the specified VRF, use the **no** form of this command.

ssh client vrf vrf-name no ssh client vrf vrf-name

Syntax Description	vrf-nan	<i>vrf-name</i> Specifies the name of the VRF to be used by the SSH client.			
Command Default	None			-	
Command Modes	XR Co	nfig mode			
Command History	Releas	se		Modification	
	Releas	se 6.0		This command was introduced.	
Usage Guidelines	If a spe	cific VRF is	nave only one VRF. not configured for the SSH client, the default VRF ands, such as ssh client knownhost, on page 363 o		
Task ID	Task ID	Operations			
	crypto	read, write			
Examples	The fol	lowing exam	ple shows the SSH client being configured to star	t with the specified VRF:	
			nter# <b>configure</b> nter(config)# <b>ssh client vrf green</b>		

RP/0/RP0/CPU0:router(config) # ssh client vrf green

#### ssh server

To bring up the Secure Shell (SSH) server, use the ssh server command. To stop the SSH server, use the no form of this command. ssh server no ssh server This command has no keywords or arguments. The default SSH server version is 2 (SSHv2), which falls back to 1 (SSHv1) if the incoming SSH client **Command Default** connection is set to SSHv1. XR Config mode **Command Modes Command History** Release Modification Release 6.0 This command was introduced. The SSH server listens for an incoming client connection on port 22. This server handles both Secure Shell **Usage Guidelines** Version 1 (SSHv1) and SSHv2 incoming client connections for both IPv4 and IPv6 address families. To accept only Secure Shell Version 2 connections, use the ssh server v2, on page 381 command. To verify that the SSH server is up and running, use the show process sshd command. Task ID Task Operations ID crypto read, write **Examples** In the following example, how to bring up the the SSH server: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# ssh server

## ssh server algorithms host-key

To configure the allowed SSH host-key pair algorithms from the list of auto-generated host-key pairs on the SSH server, use the **ssh server algorithms host-key** command in XR Config mode. To remove the configuration, use the **no** form of this command.

ssh server algorithms host-key { dsa | ecdsa-nistp256 | ecdsa-nistp384 | ecdsa-nistp521 | ed25519 | rsa | x509v3-ssh-rsa }

Syntax Description	• dsa		Selects the specified host keys to be offered to the SSH client.
	• ecdsa	n-nistp256	While configuring this, you can specify
	• ecdsa	n-nistp384	the algorithms in any order.
	• ecdsa	n-nistp521	
	• ed25	519	
	• rsa		
	• x509	v3-ssh-rsa	
Command Default	None		
Command Modes	XR Config	mode	
Command History	Release	Modification	
	Release 7.0.1	This command was introduced.	
	Release 7.3.1	The support for ed25519 and x509v3-ssh-	<b>rsa</b> algorithms was introduced.
Usage Guidelines			present, it is assumed that all the SSH host-key pairs connect to the SSH sever with any of the host-key
	You can als	so use the crypto key zeroize command to rem	nove the SSH algorithms that are not required.
	command of the output of the o	output displays key information of all the keys	host-key pairs, the <b>show crypto key mypubkey</b> that are auto-generated. Before its introduction, the those host-key pairs that were explicitly configured
Task ID	Task Op ID	eration	
	crypto rea wr		

This example shows how to select the **ecdsa** algorithm from the list of auto-generated host-key pairs on the SSH server:

Router#ssh server algorithms host-key ecdsa-nistp521 Similarly, this example shows how to select the ed25519 algorithm:

Router(config) #ssh server algorithms host-key ed25519

Similarly, this example shows how to select the x509v3-ssh-rsa algorithm:

Router(config) #ssh server algorithms host-key x509v3-ssh-rsa

#### ssh server certificate

To configure the certificate-related parameters of SSH server, use the **ssh server certificate** command in XR Config mode. To remove the configuration, use the **no** form of this command.

	ssh server certificate username { common-name   user-principle-name }
Syntax Description	<b>username</b> Specifies which field in the certificate to be used as the username.
	<b>common-name</b> Configures the user common name (CN) from the subject name field.
	user-principle-name Configures the user principle name (UPN) from subject alternate name.
Command Default	In the absence of this configuration, the SSH server considers common name (CN) as the username.
Command Modes	XR Config mode
Command History	Release Modification
	ReleaseThis command was7.3.1introduced.
Usage Guidelines	The user name must match the user name provided in the CLI.
Task ID	Task Operation ID
	crypto read, write
	This example shows how to specify which field in the certificate is to be used as the username. Here, it specifies the user common name to be picked up from the subject name field.

Router#configure

```
Router(config)#ssh server certificate username common-name
Router(config)#commit
```

Here, it specifies the user principle name to be picked up from the subject alternate name field.

```
Router#configure
Router(config)#ssh server certificate username user-principle-name
Router(config)#commit
```

## ssh server disable hmac

To disable HMAC cryptographic algorithm on the SSH server, use the **ssh server disable hmac** command, and to disable HMAC cryptographic algorithm on the SSH client, use the **ssh client disable hmac** command in XR Config mode. To disable this feature, use the **no** form of this command.

	ssh {clie	ent   ser	rver} disable hmac {hmac-sha1   hmac-sha2-512}
Syntax Description	hmac-sh	<b>a1</b> I	Disables the SHA-1 HMAC cryptographic algorithm.
	hmac-sh	a2-512 I	Disables the SHA-2 HMAC cryptographic algorithm.
		N	<b>Note</b> This option is available only for the <b>server</b> .
Command Default	None		
Command Modes	XR Confi	g mode	
Command History	Release	Mod	dification
	Release 7.0.1		is command was roduced.
Usage Guidelines	No specif	ic guideli	lines impact the use of this command.
Task ID	Task O ID	peration	-
	crypto re w	ead, vrite	-
	This exan	ple show	ws how to disable SHA1 HMAC cryptographic algorithm on the SSH client:
	Router# <b>s</b>	sh clien	nt disable hmac hmac-shal
	This exan	ple show	ws how to disable SHA-2 HMAC cryptographic algorithm on the SSH server:

Router#ssh server disable hmac hmac-sha2-512

## ssh server enable cipher

To enable CBC mode ciphers 3DES-CBC and/or AES-CBC for an SSH server connection, use the **ssh server enable cipher** command in XR Config mode. To disable the ciphers, use the **no** form of this command.

ssh server enable cipher {aes-cbc | 3des-cbc}

Syntax Description	<b>3des-cbc</b> Specifies that the 3DES-CBC cipher be enabled for the SSH server connection.			
	aes-cbc S <sub>I</sub>	<b>aes-cbc</b> Specifies that the AES-CBC cipher be enabled for the SSH server connection.		
Command Default	CBC mode ci	phers are disabled.		
Command Modes	Global Config	guration		
Command History	Release	Modification	_	
	Release 6.3.1	This command was introduced	 I.	
Usage Guidelines	The support for CBC ciphers were disabled by default, from Cisco IOS XR Software Release 6.1.2. <b>ssh client enable cipher</b> and <b>ssh server enable cipher</b> commands were introduced to explicitly enable ciphers in required scenarios.			
Task ID	Task Opera ID	tion		
	crypto read, write			
Examples	The following example shows how to enable the 3DES-CBC and AES-CBC ciphers for an server connection:		the 3DES-CBC and AES-CBC ciphers for an SSH	
	Router# <b>con</b> f Router(conf Router(conf	ig)# ssh server enable ciph	ner aes-cbc 3des-cbc	
Related Commands	Command		Description	
	ssh algorithm	ns cipher, on page 358	Configures the list of supported SSH algorithms on the client or on the server.	
	ssh client en	able cipher , on page 361	Enables CBC mode ciphers on the SSH client.	

# ssh server logging

To enable SSH server logging, use the **ssh server logging** command. To discontinue SSH server logging, use the **no** form of this command.

ssh server logging no ssh server logging

**Syntax Description** This command has no keywords or arguments.

Command Default None

Command Modes XR Config mode

Command History Release Modification Release 6.0 This command was

introduced.

**Usage Guidelines** Only SSHv2 client connections are allowed.

Once you configure the logging, the following messages are displayed:

- Warning: The requested term-type is not supported
- SSH v2 connection from %s succeeded (user:%s, cipher:%s, mac:%s, pty:%s)

The warning message appears if you try to connect using an unsupported terminal type. Routers running the Cisco IOS XR software support only the vt100 terminal type.

The second message confirms a successful login.

Task ID	Operations
crypto	read, write

**Examples** The following example shows the initiation of an SSH server logging:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server logging

# ssh server max-auth-limit

	To configure the maximum number of authentication attempts allowed for SSH connection, use the <b>ssh server max-auth-limit</b> command in XR Config mode. To remove the configuration, use the <b>no</b> form of this command.					
	ssh server max-auth-limit <i>limit</i>					
Syntax Description	<i>limit</i> Specifies the maximum authentication attempts allowed for SSH connection.					
	The limit ranges from 3 to 20; default being 20 (prior to Cisco IOS XR Software Release 7.3.2, the limit range was from 4 to 20).					
Command Default	The default authentication limit is 20.					
Command Modes	XR Config mode					
Command History	Release Modification					
	ReleaseThe command was modified to change the minimum value of limit range from 4 to7.3.23.					
	ReleaseThis command was introduced7.3.1					
Usage Guidelines	The SSH server limits the number of authentication attempts using the password authentication method to a maximum of 3 due to security reasons. You cannot change this particular limit of 3 by configuring the maximum authentication attempts limit for SSH.					
	For example, even if you configure the maximum authentication attempts limit as 5, the number of authentication attempts allowed using the password authentication method still remain as 3.					
Task ID	Task Operations ID					
	crypto read, write					
Examples	This example shows how to configure the maximum number of authentication attempts allowed for SSH connection:					
	Router# <b>configure</b> Router(config)# <b>ssh server max-auth-limit 5</b> Router(config)# <b>commit</b>					

#### ssh server port

To configure a non-default port for the SSH server, use the **ssh server port** command in XR Config mode. To remove the configuration and to change the SSH port number to the default port (22), use the **no** form of this command.

	ssh serve	e <b>r port</b> port-number			
Syntax Description	port-numbe	er Specifies the non-default S	SH port number.		
		The limit ranges from 5520	to 5529.		
Command Default	Disabled, b	y default.			
Command Modes	XR Config mode				
Command History	Release	Modification			
	Release 7.7.1	This command was introduced			
Usage Guidelines	If this comr and SFTP s		he SSH server uses the default port number, 22, for all SSH, SCP		
	Among the NCS540 router variants, this command is applicable only for the following variants:				
	• N540-	ACC-SYS			
	• N540X	K-ACC-SYS			
	• N540-	24Z8Q2C-SYS			
Task ID	Task Op ID	perations			
	crypto rea wr	ad, ite			
Examples	This examp	ble shows how to configure a r	non-default SSH port for the SSH server on your router:		
	Router# <b>co</b>	onfigure			

Router# configure Router(config)# ssh server port 5520 Router(config)# commit

# ssh server port-forwarding local

To enable SSH port forwarding feature on SSH server, use the **ssh server port-forwarding local** command in XR Config mode. To disable the feature, use the **no** form of this command.

	ssh serve	r port-forwarding local					
Syntax Description	This command has no keywords or arguments.						
Command Default	None						
Command Modes	XR Config mode						
Command History	Release	Modification	_				
	Release 7.3.2	This command was introduced.					
Usage Guidelines	The Cisco IOS XR software supports SSH port forwarding only on SSH server; not on SSH client. Hence, to utilize this feature, the SSH client running at the end host must already have the support for SSH port forwarding or tunneling.						
Task ID	Task Op ID	erations					
	crypto rea wr						
Examples	This examp	le shows how to enable SSH p	ort forwarding feature on SSH server:				
		n <b>figure</b> nfig) <b>#ssh server port-forw</b> nfig)# <b>commit</b>	arding local				
Related Commands	Command		Description				
	show ssh,	on page 344	Displays all incoming and outgoing SSH connections on the router.				

## ssh server rate-limit

To limit the number of incoming Secure Shell (SSH) connection requests allowed per minute, use the **ssh** server rate-limit command. To return to the default value, use the **no** form of this command.

ssh server rate-limit *rate-limit* no ssh server rate-limit

Syntax Description	rate-limit Number of incoming SSH connection requests allowed per minute. Range is from 1 to 120.					
	When setting it to 60 attempts per minute, it basically means that we can only allow 1 per second. If you set up 2 sessions at the same time from 2 different consoles, one of them will get rate limited. This is connection attempts to the ssh server, not bound per interface/username or anything like that. So value of 30 means 1 session per 2 seconds and so forth.					
Command Default	<i>rate-limit</i> : 60 connection requests per minute					
Command Modes	XR Config mode					
Command History	Release Modification					
	Release 6.0 This command was introduced.					
Usage Guidelines	<ul> <li>Use the ssh server rate-limit command to limit the incoming SSH connection requests to the configured rate. Any connection request beyond the rate limit is rejected by the SSH server. Changing the rate limit does not affect established SSH sessions.</li> <li>If, for example, the <i>rate-limit</i> argument is set to 30, then 30 requests are allowed per minute, or more precisely, a two-second interval between connections is enforced.</li> </ul>					
Task ID	Task Operations ID					
	crypto read, write					
Examples	The following example shows how to set the limit of incoming SSH connection requests to 20 per minute:					
	RP/0/RP0/CPU0:router# <b>configure</b> RP/0/RP0/CPU0:router(config)# <b>ssh server rate-limit 20</b>					

#### ssh server session-limit

To configure the number of allowable concurrent incoming Secure Shell (SSH) sessions, use the **ssh server session-limit** command. To return to the default value, use the **no** form of this command.

ssh server session-limit sessions

**Syntax Description** sessions Number of incoming SSH sessions allowed across the router. The range is from 1 to 100110. Note Although CLI output option has 1024, you are recommended to configure session-limit not more than 100. High session count may cause resource exhaustion . From Cisco IOS XR release 6.4.1 and later, the session-limit is increased from 100 to 110. Note sessions: 64 per router **Command Default** XR Config mode **Command Modes Command History** Modification Release Release 6.0 This command was introduced. Release The session-limit is increased from 100 to 110. 6.4.1 Use the ssh server session-limit command to configure the limit of allowable concurrent incoming SSH **Usage Guidelines** connections. Outgoing connections are not part of the limit. Task ID Task Operations ID crypto read, write Examples The following example shows how to set the limit of incoming SSH connections to 50:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server session-limit 50

# ssh server set-dscp-connection-phase

To set the DSCP marking from TCP connection phase itself for SSH packets originating from Cisco IOS XR routers that function as SSH servers, use the **ssh server set-dscp-connection-phase** command in XR Config mode. To remove the configuration and to continue marking the SSH packets from the authentication phase, use the **no** form of this command.

	ssh se	rver set-	dscp-connection-phase		
Syntax Description	This command has no keywords or arguments.				
Command Default	None				
Command Modes	XR Config mode				
Command History	Release	e Mo	odification		
	Release		is command was roduced.	-	
Usage Guidelines	<ul> <li>By default, the DSCP marking for the SSH packets originating from Cisco IOS XR routers with CiscoSSH that function as SSH servers is done from the authentication phase. Whereas, for routers with Cisco IOS XR SSH, the DSCP marking for the SSH packets is done from TCP connection phase itself.</li> <li>Although the ssh server set-dscp-connection-phase command is available on routers with CiscoSSH and routers with Cisco IOS XR SSH, this configuration is relevant only on routers with CiscoSSH due to the above mentioned reason.</li> </ul>				
Task ID	Task ID	Operations	-		
	crypto	read, write	-		
Examples		-	s how to set the DSCP mark from Cisco IOS XR routers	ing from TCP connection phase itself for SSH server s with CiscoSSH:	
	Router(	-	sh server set-dscp-conn h)#commit	ection-phase	

## ssh server trustpoint

To configure the trustpoint for SSH certificates, use the **ssh server trustpoint** command in XR Config mode. To disable this feature, use the **no** form of this command.

	ssh server	<b>trustpoint</b> { <b>host</b>   <b>user</b> } <i>trustpoint-name</i>		
Syntax Description	<b>host</b> Configures the trustpoint from where server takes its certificate.			
	user	Configures the trustpoints used for user certificate validation.		
	trustpoint-n	<i>name</i> Specifies the name of the trustpoint.		
Command Default	None			
Command Modes	XR Config r	node		
Command History	Release	Modification		
	Release 7.3.1	This command was introduced.		
Usage Guidelines	No specific	guidelines impact the use of this command.		
Task ID	Task Ope ID	ration		
	crypto read writ			

```
Router#configure
Router(config)#ssh server trustpoint host test-host-tp
Router(config)#commit
```

This example shows how to configure the trustpoint used for user certificate validation:

```
Router#configure
Router(config)#ssh server trustpoint user test-user-tp
Router(config)#commit
```

L

#### ssh server v2

To force the SSH server version to be only 2 (SSHv2), use the **ssh server v2** command. To bring down an SSH server for SSHv2, use the **no** form of this command.

ssh server v2 no ssh server v2

**Syntax Description** This command has no keywords or arguments.

Command Default None

Command Modes XR Config mode

 Command History
 Release
 Modification

 Release 6.0
 This command was introduced.

**Usage Guidelines** Only SSHv2 client connections are allowed.

sk ID	Task ID	Operations
	crypto	read,
		write

**Examples** 

The following example shows how to initiate the SSH server version to be only SSHv2:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)# ssh server v2

#### ssh server vrf

To bring up the Secure Shell (SSH) server and to configure one or more VRFs for its use, use the **ssh server vrf** command. To stop the SSH server from receiving any further connections for the specified VRF, use the **no** form of this command. Optionally ACLs for IPv4 and IPv6 can be used to restrict access to the server before the port is opened.

ssh server vrf vrf-name [ipv4 access-list access-list name] [ipv6 access-list access-list name] no ssh server vrf vrf-name [ipv4 access-list access-list name] [ipv6 access-list access-list name]

Syntax Description	vrf vrf-name		Specifies the name of the VRF to be used by the SSH server. The maximum VRF length is 32 characters.				
				<b>Note</b> If no VRF is specified, the default VRF is assumed.			
	<b>ipv4 access-list</b> access-list name				Configures an IPv4 access-list for access restrictions to the ssh server. The maximum length of the access-list name length is 32 characters.		
	<b>ipv6</b> name	access-list	access-list		gures an IPv6 access-list for access restrictions to the ssh server. The num length of the access-list name length is 32 characters.		
Command Default	The default SSH server version is 2 (SSHv2), which falls back to 1 (SSHv1) if the incoming SSH client connection is set to SSHv1.						
Command Modes	XR Con	fig mode					
Command History	Release Modification						
	Release	Release 6.0 This command was introduced.					
Usage Guidelines	the defa	ult, the SSF g other com	I server proce	ess stop	inimum for one VRF. If you delete all configured VRFs, including s. If you do not configure a specific VRF for the SSH client when <b>lient knownhost</b> or <b>ssh client source-interface</b> the default VRF is		
	To verif	y that the S	SH server is ı	ip and r	unning, use the show process sshd command.		
Task ID	Task ID	Operations	-				
	crypto	read, write	-				
Examples	In the fo	ollowing exa	ample, the SS	H serve	er is brought up to receive connections for VRF "green":		
	RP/0/RP	0/CPU0:ro	uter# <b>confi</b>	gure			

RP/0/RP0/CPU0:router(config) # ssh server vrf green

In the following example, the SSH server is brought up to receive connections for VRF "green" and a standard access list ipv4 access list named Internetfilter is configured:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server vrf green ipv4 access-list Internetfilter

### ssh server netconf

To configure a port for the netconf SSH server, use the **ssh server netconf port** in the XR Config mode. To disable netconf for the configured port, use the **no** form of the command.

ssh server netconf [ port port-number ]
no ssh server netconf [ port port-number ]

Syntax Description	<i>port-number</i> (Optional) Port number for the netconf SSH server (default port number is 830).
Command Default	Default port number is 830.
Command Modes	XR Config mode
Command History	Release Modification
	Release 6.0 This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.
Task ID	Task Operation ID
	crypto read, write

#### Example

This example shows how to use the **ssh server netconf port** command:

RP/0/RP0/CPU0:router (config) # ssh server netconf port 830

L

### ssh timeout

To configure the timeout value for authentication, authorization, and accounting (AAA) user authentication, use the ssh timeout command. To set the timeout value to the default time, use the no form of this command. ssh timeout seconds no ssh timeout seconds **Syntax Description** seconds Time period (in seconds) for user authentication. The range is from 5 to 120. seconds: 30 **Command Default** XR Config mode **Command Modes Command History** Modification Release Release 6.0 This command was introduced. Use the ssh timeout command to configure the timeout value for user authentication to AAA. If the user fails **Usage Guidelines** to authenticate itself within the configured time to AAA, the connection is terminated. If no value is configured, the default value of 30 seconds is used. Task ID Task Operations ID crypto read, write **Examples** In the following example, the timeout value for AAA user authentication is set to 60 seconds: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config) # ssh timeout 60

# **Secure Logging Commands**

This module describes the Cisco IOS XR software commands used to configure secure logging on the Cisco NCS 5500 Series Routers over Transport Layer Security (TLS). TLS, the successor of Secure Socket Layer (SSL), is an encryption protocol designed for data security over networks.

For detailed information about secure logging concepts, configuration tasks, and examples, see the *Implementing Secure Logging* module in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

Ø Note

Starting with Cisco IOS XR Release 7.0.1, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.

- address, on page 388
- logging tls-server, on page 389
- severity, on page 390
- tls-hostname, on page 392
- tlsv1-disable, on page 393
- trustpoint, on page 394
- vrf, on page 395

## address

To configure the syslog server settings with IP address, use the **address** command in logging TLS peer configuration mode. To remove the configuration, use the **no** form of this command.

	address {	IPv4 ipv4-add	ress   <b>IPv6</b> ipv	v6-address }	
Syntax Description	<i>ipv4-address</i> IPv4 address in A:B:C:D format.				
	ipv6-addre	ss IPv6 address in	n X:X::X format.		
Command Default	None				
Command Modes	Logging TI	S peer configurat	ion mode		
Command History	Release	Modification			
	Release 6.2.1	This command introduced.	was		
Usage Guidelines	You can use	e the IPv4 or IPv6	address of the ser	ver to access the remot	te syslog server.
Task ID	Task Op ID	erations			
	logging Re Wi	rad, rite			
Examples	Router (cor	nfig)# logging t	ls-server TEST	e syslog server settings	with IPv4 address:
	Router (cor	nfig-logging-tls	s-peer) <b># severit</b> s-peer) <b># trustpo</b> s-peer) <b># address</b>		3
Related Commands	Command		Description		
	logging tls 389	-server, on page	Configures sysle	og over TLS server.	

severity, on page 390

trustpoint, on page 394

Configures the severity of the router.

Configures the trustpoint for the TLS server.

## logging tls-server

To configure System Logging over Transport Layer Security (TLS) server, use the **logging tls-server** command in Global Configuration mode. To remove the configuration, use the **no** form of this command.

	logging tls-	server tls-name	
Syntax Description	tls-name	User-defined name for the TLS s	erver.
Command Default	None		
Command Modes	Global conf	figuration mode	
Command History	Release	Modification	-
	Release 6.2.1	This command was introduced.	-
Usage Guidelines		and enters the logging TLS peer emote syslog server.	configuration mode, where you can configure the settings to

	logging rea wri		
	This examp mode:	le shows how to configure a TL	S server that enters the logging TLS peer configuration
		nfigure nfig)# logging tls-server TH nfig-logging-tls-peer)#	ST

# severity

To configure the severity of the router, use the **severity** command in logging TLS peer configuration mode. To remove the configuration, use the **no** form of this command.

severity { alerts | critical | debugging | emergencies | errors | informational | notifications | warnings }

Syntax Description	alerts	Immediate action needed	
	critical	Critical conditions	
	debugging	Debugging messages	
	emergencies	System is unusable	
	errors	Error conditions	
	informational	Informational messages	
	notifications	Normal but significant conditions	
	warnings	Warning conditions	
Command Default	None		
Command Modes	Logging TLS p	eer configuration mode	
Command History	Release N	Iodification	
		his command was ntroduced.	
Usage Guidelines	The router send	s syslogs to the server, based on the	ne severity.
Task ID	Task Operat ID	ions	
	logging Read, Write		
Examples	Router(config	example shows how to configure t ) # logging tls-server TEST -logging-tls-peer) # severity	he severity with debugging option: debugging

Related Commands	Command	Description
	logging tls-server, on page 389	Configures syslog over TLS server.

## tls-hostname

To configure the syslog server settings with hostname or FQDN of the secure log server, use the **tls-hostname** command in logging TLS peer configuration mode. To remove the configuration, use the **no** form of this command.

	tls-hostname h	ostname		
Syntax Description	hostname Name host.	of the logging		
Command Default	None			
Command Modes	Logging TLS pee	r configuration mo	de	
Command History	Release Mo	lification		
		s command was oduced.		
Usage Guidelines	No specific guide	lines impact the use	e of this command.	
Task ID	Task Operatio ID	ns		
	logging Read, Write			
Examples	Router(config)# Router(config-1 Router(config-1	logging tls-ser ogging-tls-peer) ogging-tls-peer)	<pre># severity debugging</pre>	h server hostname:

	severity, on page	e 390 Confi	gures the severity of the router.	-

trustpoint , on page 394

Configures the trustpoint for the TLS server.

## tlsv1-disable

To disable Transport Layer Security (TLS) version 1.0, use the tlsv1-disable command in XR Config mode.

	tlsv1-di	sable			
Syntax Description	This cor	nmand has n	o keywords or	arguments.	
Command Default	None				
Command Modes	XR Con	ifig mode			
Command History	Release	e Modifi	cation		
	Release 7.9.1	e This co introdu	ommand was aced.		
Usage Guidelines	No spec	ific guidelin	es impact the us	e of this comr	nand.
Task ID	Task ID	Operations			
	system	Read, Write			
Examples		•	ple shows how rpc tlsv1-dis		S version 1.0:

## trustpoint

To configure syslog server settings with a trustpoint for the TLS server, use the **trustpoint** command in logging TLS peer configuration mode. To remove the configuration, use the **no** form of this command.

trustpoint trustpoint-name **Syntax Description** trustpoint-name Name of the configured trustpoint None **Command Default** Logging TLS peer configuration mode **Command Modes Command History** Release **Modification** Release This command was 6.2.1 introduced. Ensure that you have already configured the trustpoint name, using the crypto ca trustpoint command. **Usage Guidelines** Task ID Task **Operations** ID logging Read, Write Examples The following example shows how to configure syslog server settings with trustpoint: Router(config) # logging tls-server TEST Router(config-logging-tls-peer)# severity debugging Router(config-logging-tls-peer)# trustpoint tp **Related Commands** Command Description logging tls-server, on page Configures syslog over TLS server. 389

### vrf

To configure the VRF option for the TLS server, use the **vrf** command in logging TLS peer configuration mode. To remove the configuration, use the **no** form of this command.

	vrf vrf-	name			
Syntax Description	vrf-name VPN Routing/Forwarding instance name.				
Command Default	None				
Command Modes	Logging	TLS peer co	nfiguratio	on mode	
Command History	Release	e Modific	ation		
	Release 6.2.1	This co introduc	mmand v ced.	was	
Usage Guidelines	No spec	ific guidelines	simpact	the use of this command.	
Task ID	Task ID	Operations			
	logging	Read, Write			
Examples	The foll	owing examp	le shows	how to configure a VRF instance:	
		-		<b>ls-server TEST</b> -peer)# <b>vrf vrftest</b>	
Related Commands	Comma	nd		Description

	Router# <b>show platform security boot status</b> Fri Jul 7 10:25:09.344 UTC Secure Boot: Enabled by default Image type: Production /*When the image type is Production*/ Image type: Production and Developmet /*When the image type is Production and Development*/

## **Lawful Intercept Commands**

Note

- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540X-16Z8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module describes the commands used to configure Lawful intercept.

**Note** All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

• lawful-intercept disable, on page 405

• request consent-token, on page 406

# lawful-intercept disable

To disable the Lawful Intercept (LI) feature, use the **lawful-intercept disable** command. To re-enable the LI feature, use the **no** form of this command.

### lawful-intercept disable no lawful-intercept disable

Syntax Description	This command has no keywords or arguments.				
Command Default	LI feature is	LI feature is enabled by default only if the LI package is installed.			
Command Modes	Global conf	iguration			
Command History	Release	Modification			
	Release 5.2	.1 This command is introduced.			
Usage Guidelines	If you disable lawful intercept, all Mediation Devices and associated TAPs are deleted. To enable this command, you must install and activate the <b>ncs5500-li.rpm</b> .				
Task ID	Task Ope ID	erations			
	li rea	d,			

This example shows how to configure the lawful-intercept disable command:

Router(config)# lawful-intercept disable

write

## request consent-token

To request for a consent-token to activate or deactivate features on the router, use the **request consent-token** command in the XR EXEC mode

 $\label{eq:consent-token accept-response | generate-challenge | terminate-auth \} \ \{ lawful-intercept | secure-ztp \} \ \{ enable | disable \} \\$ 

Syntax Description	accept-re	esponse	Request to accept the response string from the network vendor
	generate	-challenge	Request to generate a challenge string which can be sent to the network vendor to request for consent.
	terminate	e-auth	Request to terminate the authorization to renable the feature.
	lawful-in	tercept	Specifies the Lawful Intercept feature.
	secure-zt	р	Specifies the Secure ZTP feature.
	enable disable		Request to enable the feature.
			Request to disable the feature.
Command Default	None		
Command Modes	Global cor	nfiguration	
Command History	Release Modification		
	ReleaseCommand options for lawful-intercept enable and disable was introduced.7.5.1		
	Release This command was introduced. 7.3.1		
Usage Guidelines	If you disable lawful intercept, all Mediation Devices and associated TAPs are deleted.		
	To use consent-token, you must install and activate the LI-control package <b>ncs5500-lictrl-1.0.0.0-rxyz.x86_64.rpm</b> .		
Task ID	Task O ID	perations	
		ead, vrite	

The following example shows how to generate a challenge to enable lawful-intercept with the **request consent-token** command:

```
Router# request consent-token generate-challenge lawful-intercept enable
+-----+
Node location: node0_RP0_CPU0
+-----+
Challenge string:
pAoP8QAAAQYBAAQAAAAFAgAEAAAABQMACAAAAAAAAAAAAAAAAAAAF7N2FWTaq3Du+bixEyUQUAB
AAA//8GAAxJT1MtWFItU1ctQ1QHAAxJT1MtWFItU1ctQ1QIAAdOQzU1LVJQCQALRk9DMjMxNTRNWVk=
```

The following example shows how to accept the response string provided by the network vendor's Signing Servers for enabling lawful-intercept. Execute the below command and when prompted, enter the response string from the network vendor in the router console.

```
+----+
Node location: node0_RP0_CPU0
+----+
Error_code: 0
```

An output of **Error code: 0** means the router has enabled LI functionality without any errors.
