CONTENTS

Preface

This guide describes how you can configure and maintain the using the command-line interface (CLI). Each topic provides a high-level summary of the tasks required for using the CLI for the in the Unified Network Solution that runs on supported appliances for small, medium, and large deployments.

Who Should Read This Guide

The majority of the instructions in this guide are straightforward; however, a few are complex. Therefore, only experienced users should use these instructions.

Note Use this guide in conjunction with the documentation listed in Related Documentation, on page xi.

How to Use This Guide

We recommend that you use the information in this guide as follows:

- Read the document in its entirety. Subsequent sections build on information and recommendations discussed in previous sections.
- Use this document for all-inclusive information about the appliance.
- Do not vary the command-line conventions.

How This Guide Is Organized

The following table lists the major sections of this guide.

Chapter	Title	Description
Overview of the Command-Line Interface	Overview of the Cisco Prime Infrastructure Command-Line Interface	Provides an overview of the CLI environment and command modes.
Using the Command-Line Interface	Using the Cisco Prime Infrastructure Command-Line Interface	Describes how you can access and administer using the CLI.
Command Reference	Cisco Prime Infrastructure Command Reference	Provides a complete description of all CLI commands.

Document Conventions

This guide uses the following conventions to convey instructions and information.

Convention	Description
bold font	Commands and keywords.
italic font	Variables for which you supply values.
[.....]	Keywords or arguments that appear within square brackets are optional.
{x | y | z}	A choice of required keywords appears in braces separated by vertical bars. You must select one.
`courier` font	Examples of information displayed on the screen.
`bold courier` font	Examples of information you must enter.
<.....>	Nonprinting characters (for example, passwords) appear in angle brackets.
[....]	Default responses to system prompts appear in square brackets.

Note Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

Tip Means the following information will help you solve a problem.

Caution Means reader be careful. In this situation, you might perform an action that could result in equipment damage or loss of data.

Related Documentation

The tables lists the Cisco Prime Infrastructure documents.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

Overview of the Command-Line Interface

This chapter provides an overview of how to access the command-line interface (CLI), the different command modes, and the commands that are available in each mode.

You can configure and monitor the through the web interface. You can also use the CLI to perform the configuration and monitoring tasks described in this guide.

Accessing the Command Environment

You can access the CLI through a secure shell (SSH) client or the console port using one of the following machines:

- Windows PC running Windows 7, 8, and 10.
- Apple Computer running Mac OS X 10.4 or later
- PC running Linux

User Accounts and Modes in CLI

Two different types of accounts are available on the CLI:

- Admin (administrator)
- Network Admin
- Security Admin
- Operator (user)

When you power on the appliance for the first time, you are prompted to run the setup utility to configure the appliances. During this setup process, an administrator user account, also known as an Admin account, is created. After you enter the initial configuration information, the appliance automatically reboots and prompts you to enter the username and the password that you specified for the Admin account. You must use this Admin account to log in to the CLI for the first time.

An Admin can create and manage Operator (user) accounts (which have limited privileges and access to the server). An Admin account also provides the functionality that is needed to use the CLI.

To create more users (with admin, security-admin, network-admin, and operator privileges) with SSH access to the CLI, you must enter the **username** command in configuration mode (see Command Modes in the CLI).

Table 2: Command Privileges lists the command privileges for each type of user account: Admin and Operator (user).

Logging in to the server places you in operator (user) mode or admin (EXEC) mode, which always requires a username and password for authentication.

You can tell which mode you are in by looking at the prompt. A right angle bracket (>) appears at the end of operator (user) mode prompt; a pound sign (#) appears at the end of admin mode prompt, regardless of the submode.

Command Modes in the CLI

This section describes the command modes supported in .

EXEC Commands

EXEC commands primarily include system-level commands such as **show** and **reload** (for example, application installation, application start and stop, copy files and installations, restore backups, and display information).

- Table 3: Summary of EXEC Commands describes the EXEC commands
- Table 4: Summary of show Commands describes the show commands in EXEC mode

For detailed information on EXEC commands, see Understanding Command Modes.

EXEC or System-Level Commands

Table 3: Summary of EXEC Commands describes EXEC mode commands.

Table 3: Summary of EXEC Commands

	Description
application install	Installs a specific application bundle.
application start	Starts or enables a specific application.
application stop	Stops or disables a specific application.
application upgrade	Upgrades a specific application bundle.
backup	Performs a backup and places the backup in a repository.
backup-logs	Performs a backup of all of the logs on the to a remote location.
banner	Sets messages while logging in to CLI (pre-login).
clock	Sets the system clock on the server.
configure	Enters configuration mode.
copy	Copies any file from a source to a destination.
debug	Displays any errors or events for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.
delete	Deletes a file in the server.
dir	Lists the files in the server.

	Description
exit	Disconnects the encrypted session with a remote system. Exits from the current command mode to the previous command mode.
forceout	Forces the logout of all of the sessions of a specific server system user.
halt	Disables or shuts down the server.
lms	Migrates data from LMS server to PI server.
mkdir	Creates a new directory.
ncs	NCS-related commands used to start, stop and back up the server.
nslookup	Queries the IPv4 address or hostname of a remote system.
ocsp	Enables certificate-based authentication for web clients using OCSP responders.
patch	Installs System or Application patch.
ping	Determines the IPv4 network connectivity to a remote system.
ping6	Determines the IPv6 network connectivity to a remote system.
reload	Reboots the server.
restore	Restores a previous backup.
rmdir	Removes an existing directory.
rsakey	Displays a configured RSA key or sets a new RSA public key for user authentication.
show	Provides information about the server.
ssh	Starts an encrypted session with a remote system.
tech	Provides Cisco Technical Assistance Center (TAC) commands.
telnet	Establishes a Telnet connection to a remote system.
terminal length	Sets terminal line parameters.
terminal session-timeout	Sets the inactivity timeout for all terminal sessions.

	Description
terminal session-welcome	Sets the welcome message on the system for all terminal sessions.
terminal terminal-type	Specifies the type of terminal connected to the current line of the current session.
traceroute	Traces the route of a remote IP address.
undebug	Disables the output (display of errors or events) of the **debug** command for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.
write	Erases the startup configuration that forces to run the setup utility and prompt the network configuration, copies the running configuration to the startup configuration, and displays the running configuration on the console.

show Commands

The **show** commands are used to display the settings and are among the most useful commands. See Table 4: Summary of show Commands for a summary of the **show** commands. The **show** commands must be followed by a keyword; for example, **show application status**. Some **show** commands require an argument or variable after the keyword to function; for example, **show application version**.

Table 4: Summary of show Commands

	Description
application (requires keyword)	Displays information about the installed application; for example, status information or version information.
backup (requires keyword)	Displays information about the backup.
banner (requires keyword)	Sets up messages when logging in to CLI.
cdp (requires keyword)	Displays information about the enabled Cisco Discovery Protocol interfaces.
clock	Displays the day, date, time, time zone, and year of the system clock.
cpu	Displays CPU information.
disks	Displays file-system information of the disks.
icmp-status	Displays the Internet Control Message Protocol (ICMP) echo response configuration information.
interface	Displays statistics for all of the interfaces configured on the .

	Description
inventory	Displays information about the hardware inventory, including the appliance model and serial number.
ip route	Displays s ip route details of the application.
logging (requires keyword)	Displays the server logging information.
logins (requires keyword)	Displays the login history of the server.
memory	Displays memory usage by all running processes.
ntp	Displays the status of the Network Time Protocol (NTP) servers.
ports	Displays all of the processes listening on the active ports.
process	Displays information about the active processes of the server.
repository (requires keyword)	Displays the file contents of a specific repository.
restore (requires keyword)	Displays the restore history in the .
running-config	Displays the contents of the configuration file that currently runs in the .
startup-config	Displays the contents of the startup configuration in the .
tech-support	Displays system and configuration information that you can provide to the TAC when you report a problem.
terminal	Displays information about the terminal configuration parameter settings for the current terminal line.
timezone	Displays the current time zone in the .
timezones	Displays all of the time zones available for use in the .
udi	Displays information about the unique device identifier (UDI) of the .
uptime	Displays how long the system you are logged in to has been up and running.
users	Displays information about the system users.
version	Displays information about the currently loaded software version, along with hardware and device information.

Configuration Commands

Configuration commands include **interface** and **repository**. To access configuration mode, run the **configure** command in EXEC mode.

Some of the configuration commands require that you enter the configuration submode to complete the configuration.

Table 5: Summary of Configuration Commands describes the configuration commands.

Table 5: Summary of Configuration Commands

	Description
aaa authentication	Logs in to Prime Infrastructure server remotely.
backup-staging-url	Specifies a Network File System (NFS) temporary space or staging area for the remote directory for backup and restore operations.
cdp holdtime	Specifies the amount of time the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it.
cdp run	Enables Cisco Discovery Protocol.
cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.
clock timezone	Sets the time zone for display purposes.
do	Executes an EXEC-level command from configuration mode or any configuration submode. **Note** To initiate, the **do** command precedes the EXEC command.
end	Returns to EXEC mode.
exit	Exits configuration mode.
hostname	Sets the hostname of the system.
icmp echo	Configures the ICMP echo requests.
interface	Configures an interface type and enters interface configuration mode.
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration in interface configuration mode.
ipv6 address dhcp	Enables IPv6 address DHCP in interface configuration mode.

	Description
ip address	Sets the IP address and netmask for the Ethernet interface. **Note** This is an interface configuration command.
ip default-gateway	Defines or sets a default gateway with an IP address.
ip domain-name	Defines a default domain name that a server uses to complete hostnames.
ip name-server	Sets the Domain Name System (DNS) servers for use during a DNS query.
kron occurrence	Schedule one or more Command Scheduler commands to run at a specific date and time or a recurring level.
kron policy-list	Specifies a name for a Command Scheduler policy.
logging	Enables the system to forward logs to a remote system.
logging loglevel	Configures the log level for the **logging** command.
no	Disables or removes the function associated with the command.
ntp	Synchronizes the software clock through the NTP server for the system.
password-policy	Enables and configures the password policy.
repository	Enters repository submode.
service	Specifies the type of service to manage.
snmp-server community	Sets up the community access string to permit access to the Simple Network Management Protocol (SNMP).
snmp-server contact	Configures the SNMP contact the Management Information Base (MIB) value on the system.
snmp-server host	Sends SNMP traps to a remote system.
snmp-server location	Configures the SNMP location MIB value on the system.
username	Adds a user to the system with a password and a privilege level.

For detailed information on configuration mode and submode commands, see Understanding Command Modes.

CLI Audit

You must have administrator access to execute the configuration commands. Whenever an administrator logs in to configuration mode and executes a command that causes configurational changes in the server, the information related to those changes is logged in the operational logs.

Table 6: Configuration Mode Commands for the Operation Log describes configuration mode commands that generate operational logs.

Table 6: Configuration Mode Commands for the Operation Log

	Description
clock	Sets the system clock on the server.
ip name-server	Sets the DNS servers for use during a DNS query.
hostname	Sets the hostname of the system.
ip address	Sets the IP address and netmask for the Ethernet interface.
ntp server	Allows synchronization of the software clock by the NTP server for the system.

In addition to configuration mode commands, some commands in EXEC mode generate operational logs.

Table 7: EXEC Mode Commands for the Operation Log describes EXEC mode commands that generate operational logs.

Table 7: EXEC Mode Commands for the Operation Log

	Description
backup	Performs a backup and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
backup-logs	Backs up system logs.

Using the Command-Line Interface

This chapter provides helpful tips for understanding and configuring the from the command-line interface (CLI). The can be deployed for small, medium, and large deployments and is available on different platforms and also as a software that can run on VMware.

Before Accessing the CLI

Before logging in to the CLI, ensure that you have completed the installation tasks as specified in the *Cisco Prime Infrastructure 3.6 Quick Start Guide at :* http://www.cisco.com/c/en/us/support/cloud-systems-management/prime-infrastructure/products-installation-guides-list.html.

Running the Setup Utility to Configure the Appliance

When you power on the appliances for the first time, you are prompted to run the setup utility to configure the appliances. Before you run the utility using the **setup** command, ensure that you have values for the following network configuration prompts:

- Hostname
- IP address
- Netmask
- Gateway
- Domain
- Nameserver
- Network Time Protocol (NTP) server (optional)
- User ID
- Password

The following is a sample output from the **setup** command:

```
********************************************
Please type 'setup' to configure the appliance
********************************************
localhost login: setup
Press 'Ctrl-C' to abort setup
Enter hostname[]: pi-33-aws-100
Enter IP address[10.126.168.100]:
Enter IP default netmask[]: 255.255.255.0
Enter IP default gateway[]: 10.126.168.1
Enter default DNS domain[]: cisco.com
Enter primary nameserver[]: 72.163.128.140
Add/Edit another nameserver? Y/N : n
Enter primary NTP server[time.nist.gov]: 10.81.254.202
Add/Edit secondary NTP server? Y/N : n
Enter system timezone[UTC]: Asia/Calcutta
Current system clock time : 2018-11-27 07:59:14 IST
Change system clock time? Y/N : n
Enter username[admin]:
Enter password:
Enter password again:
*********************************************
* High Availability (HA) Role Selection *
*********************************************
HA refers to a system that is continuously operating during failure.
To configure HA, go to the primary server's user interface.
Choose Administration > High Availability > HA Configuration.
For more information, click the context-sensitive online help.
Will this server be used as a Secondary for HA? (yes/no) : no
*******************************************
* Web Interface Root Password Selection *
*******************************************
Expected :

*  Cisco Prime Infrastructure Setup    *
*********************************************
```

```
Enter "^" to return to previous question.

************************************************
*  High Availability (HA) Role Selection        *
************************************************
HA refers to a system that is continuously operating during failure.
To configure HA, go to the primary server's user interface.
Choose Administration > High Availability > HA Configuration.
For more information, click the context-sensitive online help.

Will this server be used as a Secondary for HA? (yes/no):no

*****************************************
*  Advanced Security Selection   *
*****************************************
Do you want to allow access to root shell? (yes/no) :yes

*****************************************
*  Web Interface Root Password Selection   *
*****************************************
Enter Web Interface - root password:
Enter Web Interface - root password again:

************************************************
*  Summary                                     *
************************************************
Server will not be a Secondary
Root shell will be enabled.
Web Interface - root password is set.
Apply these settings? (y/n)y
Settings Applied.
```

After you enter the required information, the appliance automatically reboots and the following login prompt appears:

```
machine_name login:
```

where *machine_name* identifies the hostname that you specified when you ran the **setup** command.

In this example, this prompt appears:

```
NCS login:
```

To log in, use the administrator user account (and the corresponding password) that you created during the setup process. You must also use this Admin account to log in to the CLI for the first time. After accessing the CLI as an administrator, you can create more users (with admin and operator privileges) with SSH access to the CLI by running the **username** command in configuration mode.

Note The administrator user account and the corresponding password (a CLI user account) that you created during the initial setup wizard can be used to manage the application using the CLI. The CLI user has privileges to start and stop the application software, backup and restore the application data, apply software patches and upgrades to the application software, view all of the system and the application logs, and reload or shut down the appliance. To protect the CLI user credentials, explicitly create users with access to the CLI.

Note Any users that you create from the web interface cannot automatically log in to the CLI. You must explicitly create users with access to the CLI. To create these users, you must log in to the CLI using the Admin account that you created during setup; then, enter configuration mode, and run the **username** command.

Accessing the CLI

Before logging in to the CLI, ensure that you have completed the hardware installation and configuration process outlined in the Before Accessing the CLI, on page 16

To log in to the server and access the CLI, use an SSH secure shell client or the console port. You can log in from:

- A PC running Windows 7, 8, and 10.
- A PC running Linux.
- An Apple computer running Mac OS X 10.4 or later.
- Any terminal device compatible with VT100 or ANSI characteristics. On the VT100-type and ANSI devices, you can use cursor-control and cursor-movement key. Keys include left arrow, up arrow, down arrow, right arrow, Delete, and Backspace. The CLI senses the use of the cursor-control keys and automatically uses the optimal device characteristics.

To exit the CLI, use the **exit** command from EXEC mode. If you are currently in one of the configuration modes and you want to exit the CLI, enter the **end**, **exit**, or press **Ctrl z** command to return to EXEC mode, and then enter the **exit** command.

Supported Hardware and Software Platforms

The following valid terminal types can access the :

- 1178
- 2621
- 5051
- 6053
- 8510
- altos5
- amiga
- ansi
- apollo
- Apple_Terminal
- att5425
- ibm327x
- kaypro
- vt100

You can also access the through an SSH client or the console port.

Opening the CLI with Secure Shell

Note To access the CLI environment, use any SSH client that supports SSH v2.

The following example shows you how to log in with a Secure Shell (SSH) client (connection to a wired WAN) via a PC by using Windows XP. Assuming that is preconfigured through the setup utility to accept an Admin (administrator) user, log in as Admin.

Step 1 Use any SSH client and start an SSH session.

The SSH window appears.

Step 2 Press **Enter** or **Spacebar** to connect.

The Connection to Remote Host window appears.

Step 3 Enter a hostname, username, port number, and authentication method.

In this example, you enter **ncs** for the hostname, **admin** for the username, and **22** for the port number; and, for the authentication method, choose **Password** from the drop-down list.

Step 4 Click **Connect**, or press **Enter**.

The Enter Password window appears.

Step 5 Enter your assigned password for the administrator.

The SSH with the Add Profile window appears.

Step 6 (Optional) Enter a profile name in the text box and click **Add to Profile**.

Step 7 Click **Close** in the Add Profile window.

The command prompt appears. You can now enter CLI commands.

Opening the CLI Using a Local PC

If you need to configure locally (without connecting to a wired LAN), you can connect a PC to the console port on the appliance by using a null-modem cable.

The serial console connector (port) provides access to the CLI locally by connecting a terminal to the console port. The terminal is a PC running terminal-emulation software or an ASCII terminal. The console port (EIA/TIA-232 asynchronous) requires only a null-modem cable.

To connect a PC running terminal-emulation software to the console port, use a DB-9 female to DB-9 female null-modem cable.

To connect an ASCII terminal to the console port, use a DB-9 female to DB-25 male straight-through cable with a DB-25 female to DB-25 female gender changer.

The default parameters for the console port are 9600 baud, 8 data bits, no parity, 1 stop bit, and no hardware flow control.

Note If you are using a Cisco switch on the other side of the connection, set the switchport to duplex auto, speed auto (the default).

Step 1 Connect a null-modem cable to the console port on the Cisco ISE-3315 and to the COM port on your PC.

Step 2 Set up a terminal emulator to communicate with the . Use the following settings for the terminal emulator connection: 9600 baud, 8 data bits, no parity, 1 stop bit, and no flow control.

Step 3 When the terminal emulator activates, press **Enter**.

Step 4 At the console, enter your username, then press **Enter**.

Step 5 Enter the password, then press **Enter**.

When the CLI activates, you can enter CLI commands to configure the .

Understanding Command Modes

This section describes the command modes in detail.

EXEC Mode

When you start a session on the , you begin in admin or EXEC mode. From EXEC mode, you can enter configuration mode. Most of the EXEC commands (one-time commands), such as **show** commands, display the current configuration status. The admin or EXEC mode prompt consists of the device name or hostname before a pound sign (#), as shown:

```
ncs/admin# (Admin or EXEC mode)
```

Note Throughout this guide, the server uses the name *ncs* in place of the hostname and *admin* of the server for the user account.

You can always tell when you are in EXEC mode or configuration mode by looking at the prompt.

- In EXEC mode, a pound sign (#) appears after the NCS server hostname and your username.

  For example:

  ```
  ncs/admin#
  ```

- In configuration mode, the 'config' keyword and a pound sign (#) appear after the hostname of the server and your username.

  For example:

  ```
  ncs/admin# configure
  Enter configuration commands, one per line.  End with CNTL/Z.
  ncs/admin(config)# (configuration mode)
  ```

If you are familiar with UNIX, you can equate EXEC mode to *root* access. You could also equate it to the administrator level in Windows NT or the supervisor in NetWare. In this mode, you have permission to access everything in the server, including the configuration commands. However, you cannot enter configuration commands directly. Before you can change the actual configuration of the server, you must enter configuration mode by entering the **configure** or **configure terminal (conf t)** command. Enter this command only when in EXEC mode.

For example:

```
ncs/admin# conf t
Enter configuration commands, one per line. End with CNTL-Z.
ncs(config)# (configuration mode)
```

The configuration mode has several submodes; each has its own prompt. To enter these submodes, you must first enter configuration mode by entering the **configure terminal** command.

To exit configuration mode, enter the **end**, **exit**, or **Ctrl-z** command. To exit EXEC mode, enter the **exit** command. To exit both configuration and EXEC modes, enter this sequence of commands:

```
ncs/admin(config)# exit
ncs/admin# exit
```

To obtain a listing of commands in EXEC mode, enter a question mark (**?**):

```
ncs/admin# ?
```

Configuration Mode

Use configuration mode to make changes to the existing configuration. When you save the configuration, these commands remain across server reboots, but only if you run either of these commands:

- **copy running-config startup-config**
- **write memory**

To enter configuration mode, run the **configure** or **configure terminal (conf t)** command in EXEC mode. When in configuration mode, the expects configuration commands.

For example:

```
ncs/admin# configure
Enter configuration commands, one per line. End with CNTL-Z.
ncs/admin(config)# (configuration mode)
```

From this level, you can enter commands directly into the configuration. To obtain a listing of commands in this mode, enter a question mark (**?**):

```
ncs/admin(config)# ?
```

The configuration mode has several configuration submodes. Each of these submodes places you deeper in the prompt hierarchy. When you enter the **exit**, command the backs you out one level and returns you to the previous level. When you enter the **exit** command again, the backs you out to the EXEC level.

Note In configuration mode, you can alternatively press the **Ctrl-z** instead of entering the **end** or **exit** command.

Configuration Submodes

In the configuration submodes, you can enter commands for specific configurations. For example:

```
ncs/admin# config t
ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config-GigabitEthernet)#
```

To obtain a list of commands in this mode, enter a question mark (**?**):

```
ncs/admin(config-GigabitEthernet)# ?
```

Use the **exit** or **end** command to exit this prompt and return to the configuration prompt.

The following table lists the commands in the interface GigabitEthernet 0 configuration submode. Other configuration submodes exist including those specific to the **kron**, **repository**, and **password policy** commands.

Table 8: Command Options in the Interface GigabitEthernet 0 Configuration Submode

	Comment

`ncs/admin(config)# interface GigabitEthernet 0`
`ncs/admin(config-GigabitEthernet)# ?`
`Configure ethernet interface:`
`  do  EXEC command`
`  end  Exit from configure mode`
`  exit  Exit from this submode`
`  ip  Configure IP features`
`  ipv6  Configure IPv6 features`
`  no  Negate a command or set its defaults`
`  shutdown  Shutdown the interface`
`ncs/admin(config-GigabitEthernet)#`
	Enter the command that you want to configure for the interface. This example uses the **interface GigabitEthernet** command.
	Enter **?** to display what you must enter next on the command line. This example shows the available **interface GigabitEthernet** configuration submode commands.

`ncs/admin(config-GigabitEthernet)# ip ?`
`  address  Configure IP address`
`ncs/admin(config-GigabitEthernet)# ip`
	Enter the command that you want to configure for the interface. This example uses the **ip** command.
	Enter **?** to display what you must enter next on the command line. This example shows the available **ip** configuration submode commands.

`ncs/admin(config-GigabitEthernet)# ip address ?`
`  <A.B.C.D>  IPv4 address`
`ncs/admin(config-GigabitEthernet) ip address`
	Enter the command that you want to configure for the interface. This example uses the **ip addresss** command.
	Enter **?** to display what you must enter next on the command line. In this example, you must enter an IPv4 address.
	A carriage return <cr> does not appear; therefore, you must enter additional arguments to complete the command.

`ncs/admin(config-GigabitEthernet)# ip address 172.16.0.1 ?`
`  <A.B.C.D>  Network mask`
`ncs/admin(config-GigabitEthernet)# ip address 172.16.0.1`
	Enter the keyword or argument that you want to use. This example uses the 172.16.0.1 IP address.
	Enter **?** to display what you must enter next on the command line. In this example, you must enter a network mask.
	A carriage return <cr> does not display; therefore, you must enter additional arguments to complete the command.

`ncs/admin(config-GigabitEthernet)# ip address 172.16.0.1 255.255.255.224 ?`
`  <cr>  Carriage Return`
`ncs/admin(config-GigabitEthernet)# ip address 172.16.0.1 255.255.255.224 ?`
	Enter the network mask. This example uses the 255.255.255.224 IP address.
	Enter **?** to display what you must enter next on the command line. In this example, you can press **Enter**.
	A carriage return <cr> displays; you can press **Enter** to complete the command.

Navigating the CLI Commands

This section describes how to navigate the commands and modes on the

Getting Help

Use the question mark (**?**) and the arrow keys to help you enter commands:

- For a list of available commands, enter a question mark (**?**):

  ```
  ncs/admin# ?
  ```

- To complete a command, enter a few known characters before **?** (with no space):

  ```
  ncs/admin# s?
  ```

- To display keywords and arguments for a command, enter **?** at the prompt or after entering part of a command followed by a space:

  ```
  ncs/admin# show ?
  ```

  The displays a list and brief description of available keywords and arguments.

  Note The <cr> symbol in command help stands for “carriage return”, which means to press the **Return** or the **Enter** key). The <cr> at the end of command help output indicates that you have the option to press **Enter** to complete the command and that the arguments and keywords in the list preceding the <cr> symbol are optional. The <cr> symbol by itself indicates that no more arguments or keywords are available, and that you must press **Enter** to complete the command.

- To redisplay a command that you previously entered, press the **Up Arrow** key. Continue to press the **Up Arrow** key to see more commands.

Using the No and Default Forms of Commands

Some EXEC or configuration commands have a **no** form. In general, use the **no** form to disable a function. Use the command without the **no** keyword to re-enable a disabled function or to enable a function disabled by default; for example, an IP address enabled by default. To disable the IP address, use the **no ip address** command; to re-enable the IP address, use the **ip address** command.

Configuration commands can also have a **default** form, which returns the command settings to the default values. Most commands disable by default, so in such cases using the **default** form has the same result as using the **no** form of the command. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** form of the command enables the command and sets the variables to their default values.

See Command Reference, on page 31 for a description of the complete syntax of the configuration commands, and the **no** and **default** forms of a command.

Command-Line Conventions

This section contains some basic command-line convention and operation information that is essential to the use of this guide.

Command-Line Editing Key Conventions

The provides a number of keyboard shortcuts that you can use to edit an entered line.

Tab

Press **Tab** to try to finish the current command.

If you press the **Tab** key:

- At the beginning of a line, the system lists all of the short-form options.
- When you enter a partial command, the system lists all of the short form options beginning with those characters.
- When only one possible option is available, the system fills in the option automatically.

Ctrl-c

Press **Ctrl-c** to abort the sequence. Pressing this key sequence breaks out of any executing command and returns to the previous mode.

Ctrl-z

Press **Ctrl-z** to exit configuration mode and return to previous configuration mode.

?

Enter a question mark (?) at the prompt to list the available commands.

Command Line Completion

Command-line completion makes the CLI more user-friendly. It saves you extra key strokes and helps out when you cannot remember the syntax of a command.

For example, for the **show running-config** command:

```
ncs/admin# show running-config
```

You can:

```
ncs/admin# sh run
```

The expands the command **sh run** to **show running-config**.

Another shortcut is to press the **Tab** key after you type **sh**; the Cisco NCS CLI fills in the rest of the command, in this case **show**.

If the Cisco NCS CLI does not understand a command, it repeats the entire command line and places a caret symbol (^) under the point at which it is unable to parse the command.

For example:

```
ncs/admin# show unning-configuration
       ^
% Invalid input detected at '^' marker.
```

The caret symbol (^) points to the first letter in the command line that the does not understand. Usually, this means that you need to provide additional arguments to complete the command or you mispelled the command. In this case, you omitted the “r” in the “unning” command. To fix the error, retype the command.

In another form of command-line completion, you can start a command by entering the first few characters, then pressing the **Tab** key. As long as you can match one command, the CLI will complete the command. For example, if you type **sh** and press **Tab**, the completes the **sh** with **show**. If does not complete the command, you can enter a few more letters and press **Tab** again.

Continuing Output at the --More-- Prompt

When working with the CLI, output often extends beyond the visible screen length. For cases where output continues beyond the bottom of the screen, such as with the output of many **?** or **show** commands, the output pauses and a --More-- prompt appears at the bottom of the screen. To resume output, press **Return** to scroll down one line, or press the **spacebar** to display the next full screen of output.

Tip If the output pauses on your screen but you do not see the **--More--** prompt, try entering a smaller value for the screen length by using the **terminal length** EXEC command. Command output will not pause if you set the length value to zero (0).

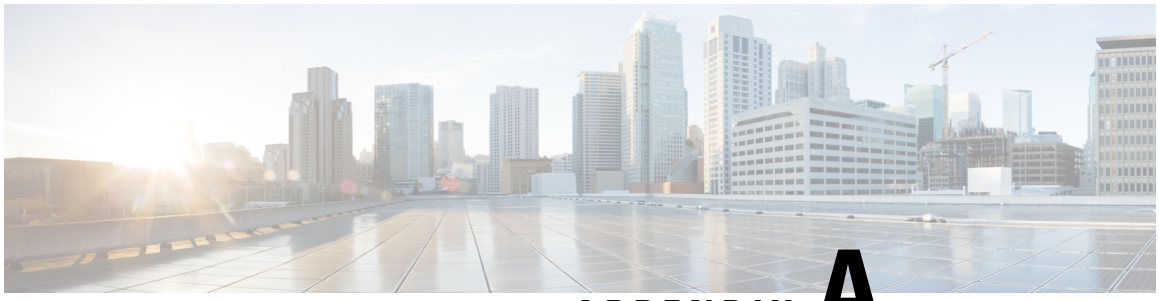
Where to Go Next

Now that you are familiar with some of the CLI basics, you can begin to configure the by using the CLI.

Remember that:

- You can use the question mark (**?**) and arrow keys to help you enter commands.
- Each command mode restricts you to a set of commands. If you have difficulty entering a command, check the prompt and then enter the question mark (**?**) to see a list of available commands.
- To disable a feature, enter the keyword **no** before the command; for example, **no ip address**.
- You must save your configuration changes so that you preserve them during a system reload or power outage.

Proceed to Command Reference, on page 31 for command listings, descriptions, syntax, usage guidelines, and sample output.



APPENDIX A

Command Reference

This appendix contains necessary information on disk space management for all types of deployments and an alphabetical listing of the commands specific to the . The comprise the following modes:

- EXEC
  - System-level
  - Show
- Configuration
  - configuration submode

    Use EXEC mode system-level **config** or **configure** command to access configuration mode.

Each of the commands in this appendix is followed by a brief description of its use, command syntax, any command defaults, command modes, usage guidelines, and one or more examples. Throughout this appendix, the server uses the name *ncs* in place of the server's hostname.

Note If an error occurs in any command usage, use the **debug** command to determine the cause of the error.

EXEC Commands

This section lists each EXEC command and each command page includes a brief description of its use, command syntax, any command defaults, command modes, usage guidelines, and an example of the command and any related commands.

application start

To start the application process, use the **application start** command in EXEC mode. There is **no** form of this command.

Note This command does not work in FIPS release.

application start *application-name*

Syntax Description		
	application-name	Name of the predefined application that you want to enable. Up to 255 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines Enables an application.

You cannot use this command to start the application. If you use this command to start the application, you can see that the is already running.

```
pi-system-168/admin# application start NCS
Starting Prime Infrastructure...
This may take a while (10 minutes or more) ...
Prime Infrastructure started successfully.
Redirecting to /bin/systemctl restart rsyslog.service
Completed in 1029 seconds
```

Related Commands

Command	Description
application stop	Stops or disables an application.
application upgrade	Upgrades an application bundle.
show application	Shows application information for the installed application packages on the system.

application stop

To stop the PI process, use the **application stop** command in EXEC mode. There is no **No** form of this command.

application stop *application-name*

Syntax Description		
	application-name	Name of the predefined application that you want to disable. Up to 255 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines

Disables an application.

```
pi-system-117/admin# application stop NCS
pi-system/admin# application stop NCS
Stopping Prime Infrastructure...
This may take a few minutes...
Prime Infrastructure successfully shutdown.
Stopping SAM daemon...
Checking for SAM daemon again ...
SAM Daemon not found...
Stopping DA daemon ...
Checking for DA daemon again ...
DA Daemon not found...
Completed shutdown of all services
```

Related Commands

	Description
application start	Starts or enables an application.
application upgrade	Upgrades an application bundle.
show application	Shows application information for the installed application packages on the system.

application upgrade

To upgrade lower version to higher version (supported version), use the **application upgrade** command in EXEC mode.

application upgrade *application-bundle repository-name*

Syntax Description

application-bundle	Enter the upgrade bundle name.
remote-repository-name	Remote repository name (up to 80 alphanumeric characters).

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Upgrades an application bundle, and preserves any application configuration data.

If you enter the **application upgrade** command when another application upgrade operation is in progress, you will see the following warning message:

```
An existing application install, remove, or upgrade is in progress. Try again shortly.
```

Caution

Do not enter the **backup** or **restore** commands when the upgrade is in progress. This action might cause the database to be corrupted.

```
pi-system/admin# application upgrade PI-Upgrade-3.X_to_3.6.0.0.172.tar.gz defaultRepo
```

Related Commands

Command	Description
application start	Starts or enables an application.
application stop	Stops or disables an application.
show application	Shows application information for the installed application packages on the system.

backup

Appliance Backup: To perform a backup (including the and Cisco ADE OS data) and place the backup in a repository, use the **backup** command in EXEC mode.

Application Backup: To perform a backup of only the application data without the Cisco ADE OS data, use the **application** keyword command.

Command for Appliance Backup:

backup *backup-name* **repository** *repository-name*

Command for Application Backup

backup *backup-name* **repository** *repository-name* **application** *application-name*

Syntax Description

backup-name	Name of the backup file. Up to 26 alphanumeric characters is recommended.
repository-name	Name of the location where the files should be backed up to. Up to 80 alphanumeric characters.
application-name	Application name. Up to 255 alphanumeric characters. **Note** Enter the application name as 'NCS' in uppercase.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Performs a backup of the and Cisco ADE OS data and places the backup in a repository.

To perform a backup of only the application data without the Cisco ADE OS data, use the **application** command.

Example for Appliance Backup

```
pi-system/admin# backup Appliancebkp repository test
```

```
DO NOT press ^C while the backup is in progress
Aborting backup with a ^C may terminate the backup operation or the backup file may be
corrupted

To restore this backup you will have to enter this password

pi-system/admin#
```

****

Related Commands

Command	Description
delete	Deletes a file from the server.
repository	Enters the repository submode for configuration of backups.
restore	Restores from backup the file contents of a specific repository.
show backup history	Displays the backup history of the system.
show repository	Displays the available backup files located on a specific repository.

backup-logs

To back up system logs, use the **backup-logs** command in EXEC mode. There is no **no** form of this command.

backup-logs *backup-name* **repository** *repository-name*

Syntax Description

backup-name	Name of one or more files to back up. Up to 100 alphanumeric characters.
repository-name	Location where files should be backed up to. Up to 80 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Backs up system logs.

```
pi-admin/admin# backup-logs log-backup repository defaultRepo
% Creating log backup with timestamped filename: log-backup-150621-1618.tar.gz
  Transferring file ...
  -- complete.
pi-system/admin#
```

Related Commands

Command	Description
repository	Enters the repository submode for configuration of backups.

Command	Description
show repository	Shows the available backup files located on a specific repository.

banner

To set up messages while logging (pre-login) in to CLI, use the **banner install pre-login** command.

banner install pre-login *banner-text-filename* **repository** *Repository-name*

Syntax Description

banner-text-filename	Banner text file name.
repository-name	Repository name.

Command Default

No default behavior or values.

Command Modes

EXEC

```
admin#  banner install pre-login test.txt repository defaultRepo
```

Related Commands

Command	Description
show banner pre-login, on page 99	Enables you to display a pre-login banner.

change-password

To change the password you use to log in to CLI interface, use the **change-password** command.

change-password *password*

Syntax Description

password	New password

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-system/admin# change-password
Changing password for user admin.
Changing password for admin.
(current) UNIX password:
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

clock

To set the system clock, use the **clock** command in EXEC mode. You cannot remove this function but reset the clock.

clock set *[mmm dd hh:mm:ss yyyy]*

Syntax Description

mmm	Current month of the year by name. Up to three alphabetic characters. For example, Jan for January.
dd	Current day (by date) of the month. Value = 0 to 31. Up to two numbers.
hh:mm:ss	Current time in hours (24-hour format), minutes, and seconds.
yyyy	Current year (no abbreviation).

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Sets the system clock. You must restart the server after you reset the clock for the change to take effect.

```
pi-system/admin# clock set nov 27 07:43:00 2018
pi-system-160/admin# show clock
Tue Nov 27 07:43:03 IST 2018
pi-system/admin#
```

Related Commands

Command	Description
show clock	Displays the time and date set on the system software clock.

configure

To enter configuration mode, use the **configure** command in EXEC mode. If the **replace** option is used with this command, copies a remote configuration to the system which overwrites the existing configuration.

configure terminal

Syntax Description

terminal	Executes configuration commands from the terminal.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Use this command to enter configuration mode. Note that commands in this mode write to the running configuration file as soon as you enter them (press **Enter**).

To exit configuration mode and return to EXEC mode, enter **end**, **exit**, or press**Ctrl-z**.

To view the changes that you have made to the configuration, use the **show running-config** command in EXEC mode.

Example 1

```
ncs/admin# configure
Enter configuration commands, one per line.  End with CNTL/Z.
ncs/admin(config)#
```

Example 2

```
ncs/admin# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ncs/admin(config)#
```

Related Commands

Command	Description
show running-config	Displays the contents of the currently running configuration file or the configuration.
show startup-config	Displays the contents of the startup configuration file or the configuration.

copy

To copy any file from a source to a destination, use the **copy** command in EXEC mode.

Syntax Description

running-config	Represents the current running configuration file.
startup-config	Represents the configuration file used during initialization (startup).
protocol	See Table 9: Protocol Prefix Keywords for protocol keyword options.
hostname	Hostname of destination.
location	Location of disk:/<dirpath>.
logs	The system log files.
all	Copies all log files from the system to another location. All logs are packaged as ncslogs.tar.gz and transferred to the specified directory on the remote host.
filename	Allows you to copy a single log file and transfer it to the specified directory on the remote host, with its original name.

log_filename	Name of the log file, as displayed by the **show logs** command (up to 255 characters).
mgmt	Copies the management debug logs and Tomcat logs from the system, bundles them as mgmtlogs.tar.gz, and transfers them to the specified directory on the remote host.
runtime	Copies the runtime debug logs from the system, bundles them as runtimelogs.tar.gz, and transfers them to the specified directory on the remote host.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

The fundamental function of the **copy** command allows you to copy a file (such as a system image or configuration file) from one location to another location. The source and destination for the file specified uses the file system, through which you can specify any supported local or remote file location. The file system being used (a local memory source or a remote system) dictates the syntax used in the command.

You can enter on the command line all of the necessary source and destination information and the username and password to use; or, you can enter the **copy** command and have the server prompt you for any missing information. You can enter up to a maximum of 2048 characters of source and destination URL information on the command line.

The **copy** command in the copies a configuration (running or startup).

The active configuration stores itself in the RAM. Every configuration command you enter resides in the running configuration. If you reboot your server, you lose the running configuration. If you make changes that you want to save, you must copy the running configuration to a safe location, such as a network server, or save it as the server startup configuration.

You cannot edit a startup configuration directly. All commands that you enter store themselves in the running configuration, which you can copy into the startup configuration.

In other words, when you boot a server, the startup configuration becomes the initial running configuration. As you modify the configuration, the two diverge: the startup configuration remains the same; the running configuration reflects the changes that you have made. If you want to make your changes permanent, you must save the running configuration to the startup configuration using the **write memory** command. The **write memory** command makes the current running configuration permanent.

Note If you do not save the running configuration, you will lose all your configuration changes during the next reboot of the server. You can also save a copy of the running and startup configurations using the following commands, to recover in case of loss of configuration:

copy startup-config *location*

copy running-config *location*

Note The **copy** command is supported only for the local disk and not for a repository.

Tip Aliases reduce the amount of typing that you need to do. For example, type **copy run start** (the abbreviated form of the **copy running-config startup-config** command).

The entire copying process might take several minutes and differs from protocol to protocol and from network to network.

Use the filename relative to the directory for file transfers.

Possible error is the standard FTP error message.

Table 9: Protocol Prefix Keywords

Keyword	Destination
ftp	URL for FTP network server. The syntax for this alias: **ftp:**//*location*/*directory*
sftp	URL for an SFTP network server. The syntax for this alias: sftp://location/directory SFTP Repositories may require the // between the IP address/FQDN and the physical path on the SFTP store. If you find that you cannot access the SFTP repository with single slashes, add the additional slash and try the operation again. For example: url sftp://server//path **Note** The remote sftp servers need to be enabled for 'password authentication' (keyboard-interactive mode does not work for sftp transfers). See the documentation on sshd server used at the remote end, to enable password authentication. Depending on the SFTP software used with the remote server, you may need to enable "password authentication" instead of "keyboard-interactive mode". Enabling "password authentication" is required; copy to remote SFTP servers will not work unless it is enabled. For example: With OpenSSH 6.6x, "keyboard-interactive mode" is the default. To enable "password authentication", edit the OpenSSH sshd_config file to set the PasswordAuthentication parameter to "yes", as follows: PasswordAuthentication yes.

Keyword	Destination
tftp	URL for a TFTP network server. The syntax for this alias: **tftp:**//*location*/*directory*

Example 1

```
ncs/admin# copy run start
Generating configuration...
ncs/admin#
```

Example 2

```
ncs/admin# copy running-config startup-config
Generating configuration...
ncs/admin#
```

Example 3

```
ncs/admin# copy start run
ncs/admin#
```

Example 4

```
ncs/admin# copy startup-config running-config
ncs/admin#
```

Example 5

```
ncs/admin# copy logs disk:/
 Collecting logs...
ncs/admin#
```

Example 6

This command is used to copy the certificate from tftp to pnp.

```
copy tftp://<PI Server IP Address>/server.key disk:/
copy tftp://<PI Server IP Address>/server.crt disk:/
 copy tftp://<PI Server IP Address>/ncs_server_certificate.crt disk:/
```

Related Commands

Command	Description
delete	Deletes a file from the server.
dir	Lists a file from the server.

debug

To display errors or events for command situations, use the **debug** command in EXEC mode.

debug{all | application | backup-restore | cdp | config | icmp | copy | locks | logging | snmp | system | transfer | user | utils}

Syntax Description

all	Enables all debugging.
application	Application files. • *all*—Enables all application debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *install*—Enables application install debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *operation*—Enables application operation debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *uninstall*—Enables application uninstall debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
backup-restore	Backs up and restores files. • *all*—Enables all debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all. • *backup*—Enables backup debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all. • *backup-logs*—Enables backup-logs debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all. • *history*—Enables history debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all. • *restore*—Enables restore debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all.

cdp	Cisco Discovery Protocol configuration files. • *all*—Enables all Cisco Discovery Protocol configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *config*—Enables configuration debug output for Cisco Discovery Protocol. Set level between 0 and 7, with 0 being severe and 7 being all. • *infra*—Enables infrastructure debug output for Cisco Discovery Protocol. Set level between 0 and 7, with 0 being severe and 7 being all.
config	Configuration files. • *all*—Enables all configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *backup*—Enables backup configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *clock*—Enables clock configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *infra*—Enables configuration infrastructure debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *kron*—Enables command scheduler configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *network*—Enables network configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *repository*—Enables repository configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *service*—Enables service configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
icmp	Internet Control Message Protocol (ICMP) echo response configuration. *all*—Enable all debug output for ICMP echo response configuration. Set level between 0 and 7, with 0 being severe and 7 being all.

copy	Copy commands. Set level between 0 and 7, with 0 being severe and 7 being all.
locks	Resource locking. • *all*—Enables all resource locking debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *file*—Enables file locking debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
logging	Logging configuration files. *all*—Enables all logging configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
snmp	SNMP configuration files. *all*—Enables all SNMP configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
system	System files. • *all*—Enables all system files debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *id*—Enables system ID debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *info*—Enables system info debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *init*—Enables system init debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
transfer	File transfer. Set level between 0 and 7, with 0 being severe and 7 being all.
user	User management. • *all*—Enables all user management debug output. Set level between 0 and 7, with 0 being severe and 7 being all. • *password-policy*—Enables user management debug output for password-policy. Set level between 0 and 7, with 0 being severe and 7 being all.

utils	Utilities configuration files. *all*—Enables all utilities configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines Use the **debug** command to identify various failures within the server; for example, setup failures or configuration failures.

```
ncs/admin# debug all
ncs/admin# mkdir disk:/1
ncs/admin# 6 [15347]: utils: vsh_root_stubs.c[2742] [admin]: mkdir operation success

ncs/admin# rmdir disk:/1
6 [15351]: utils: vsh_root_stubs.c[2601] [admin]: Invoked Remove Directory disk:/1 command
6 [15351]: utils: vsh_root_stubs.c[2663] [admin]: Remove Directory operation success
ncs/admin#

ncs/admin# undebug all
ncs/admin#
```

Related Commands

Command	Description
undebug	Disables the output (display of errors or events) of the **debug** command for various command situations.

delete

To delete a file from the server, use the **delete** command in EXEC mode. There is no **no** form of this command.

delete *filename [disk:/path]*

Syntax Description

filename	Filename.
disk:/path	Location.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines If you attempt to delete the configuration file or image, the system prompts you to confirm the deletion. Also, if you attempt to delete the last valid system image, the system prompts you to confirm the deletion.

```
ncs/admin# delete disk:/hs_err_pid19962.log
ncs/admin#
```

Related Commands

Command	Description
dir	Lists all of the files on the server.

dir

To list a file from the server, use the **dir** command in EXEC mode. To remove this function, use the **no** form of this command.

dir *[word]***[recursive]**

Syntax Description

word	Directory name. Up to 80 alphanumeric characters. Requires **disk:/** preceding the directory name.
recursive	Lists a local directory or filename recursively.

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-system/admin# dir
Directory of disk:/

Related Commands

Command	Description
delete	Deletes a file from the server.

exit

To close an active terminal session by logging out of the server or to move up one mode level from configuration mode, use the **exit** command in EXEC mode.

exit

Syntax Description

This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines Use the **exit** command in EXEC mode to exit an active session (log out of the server) or to move up from configuration mode.

```
pi-system/admin# exit
Connection closing...Socket close.
Connection closed by foreign host.
Disconnected from remote host(10.197.71.160:22) at 10:51:43.
```

Related Commands

Command	Description
end	Exits configuration mode.
exit	Exits configuration mode or EXEC mode.
Ctrl-z	Exits configuration mode.

forceout

To force users out of an active terminal session by logging them out of the server, use the **forceout** command in EXEC mode.

forceout *username*

Syntax Description

username	The name of the user. Up to 31 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

```
ncs/admin# forceout user1
ncs/admin#
```

halt

To shut down and power off the system, use the **halt** command in EXEC mode.

halt

This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines

Before you enter the **halt** command, ensure that the is not performing any backup, restore, installation, upgrade, or remove operation. If you enter the **halt** command while the is performing any of these operations, you will get one of the following warning messages:

```
WARNING: A backup or restore is currently in progress! Continue with halt?

WARNING: An install/upgrade/remove is currently in progress! Continue with halt?
```

If you get any of these warnings, enter **YEs** to halt the operation, or enter **NO** to cancel the halt.

If no processes are running when you use the **halt** command or if you enter **Yes** in response to the warning message displayed, the asks you to respond to the following option:

```
Do you want to save the current configuration ?
```

Enter **YES** to save the existing configuration. The displays the following message:

```
Saved the running configuration to startup successfully
```

```
pi-system/admin# halt
Save the current ADE-OS running configuration? (yes/no) [yes] ? yes
Generating configuration...
Saved the ADE-OS running configuration to startup successfully
Continue with shutdown? [y/n] y
Broadcast message from root (pts/0) (Wed May  5 18:37:02 2010):
The system is going down for system halt NOW!
Server is shutting down...
```

Related Commands

Command	Description
reload	Reboots the system.

lms

To migrate data from lms server to PI server, use **lms** command in EXEC mode.

lms migrate repository *repository-name*

Syntax Description

repository-name	Name of the PI repository.

Command Default

No default values or behaviour.

Command Modes

EXEC

```
pi-cluster-160/admin# lms migrate repository test
Repository name : test
Initiating LMS data restore .  Please wait...

```

mkdir

To create a new directory on the server, use the **mkdir** command in EXEC mode.

mkdir *directory-name [disk:/path]*

Syntax Description

directory-name	The name of the directory to create. Up to 80 alphanumeric characters.
disk:/path	Use *disk:/path* with the directory name.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Use *disk***:/***path* with the directory name; otherwise, an error appears that indicates that the *disk***:/***path* must be included.

```
ncs/admin# mkdir disk:/test
ncs/admin# dir

Directory of disk:/

       4096 May 06 2010 13:34:49  activemq-data/

ncs/admin#
```

Related Commands

Command	Description
dir	Displays a list of files on the server.
rmdir	Removes an existing directory.

ncs run client-auth

You can enable client certificate authentication on your Prime Infrastructure application using **ncs run client-auth** command.

ncs run client-auth enable

ncs run client-auth disable

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-system-117/admin# ncs run client-auth enable

WARNING :

This feature requires the CA certificate to be installed on the system.
Please use the command 'ncs key importcacert ..." to
import the certificate of the CA used to sign the client certificates.
Ignore this warning if the CA certificate is already installed.

Use the 'disable' option of this command, to disable client authentication,
if not required.

client_auth status : enabled
pi-system-117/admin#

pi-system-117/admin# ncs run client-auth disable
client_auth status : disabled
pi-system-117/admin#
```

ncs run list

To display the list of commands associated with NCS, use **ncs run list** command in EXEC mode.

ncs run list

Command Default

No default behavior or arguments

Command Modes

EXEC

```
pi-system/admin# ncs run list
commands :
  list - prints this list

  test iops - tests the disk write performance
  reset [db|keys] - reset database and keys to default factory settings

  csrf [disable|enable] - enable or disable CSRF protection
```

```
  client-auth [disable|enable] - enable or disable client certificate based authentication
  jms [disable|enable] - enable or disable message bus connectivity (port 61617)

  sshclient-nonfips-ciphers [disable|enable] - enable or disable non fips compliant ciphers
 for outgoing ssh client connections to devices
  ssh-server-legacy-algorithms [disable|enable] - enable or disable legacy algorithms for
SSH service.
  tls-server-versions <tls_versions> - set the TLS versions to be enabled for TLS service
 - TLSv1.2 TLSv1.1 TLSv1
  tls-server-ciphers <tls_cipher_groups> - set the TLS cipher group to be enabled  for TLS
 service - tls-ecdhe-sha2 tls-ecdhe-sha1 tls-dhe-sha2 tls-dhe-sha1 tls-static-sha2
tls-static-sha1
  livelogs [all|secure|ade|messages] - view live audit logs
  loghistory [all|secure|ade|messages] - view audit logs
  firewall [-block|-unblock|-list] - block and unblock source ip address
```

ncs run test iops

To test and view details of the input output operations on your Prime Infrastructure, use **ncs run test iops** command in EXEC mode.

ncs run test iops

Command Default No default behavior or values.

Command Modes EXEC

```
pi-242/admin# ncs run test iops
Testing disk write speed ...
8388608+0 records in
8388608+0 records out
8589934592 bytes (8.6 GB) copied, 33.4561 s, 257 MB/s
```

ncs run reset

You can use **ncs run reset** command to delete all private keys from your Prime Infrastructure server and to clean a corrupted Database. Resetting the DB clears all existing data and replaces it with empty data.

ncs run reset { db | keys }

Syntax Description

db	Resets DB wth empty data.
keys	Deletes all private keys from Prime Infrastructure server.

Command Default No default behavior or values.

Command Modes EXEC

```
pi-system-160/admin# ncs run reset db
 ******************** Warning ********************
This script will delete the existing data in database (network data) and reset
```

```

```

This example shows how to delete all private keys in server:

```
pi-system-61/admin# ncs run reset keys
This will delete all the private keys and may impact webserver, SSH service etc.
Do you want to proceed [yes/no] [no]? yes
```

ncs run csrf

The cross-site request forgery check can be disabled (not recommended). The CLI provided only for backward compatibility with API clients which are not programmed for CSRF protection. For CSRF protection, this option should be enabled using the following command.

ncs run csrf enable

To disable, use the following command:

ncs run csrf disable

Command Default No default behavior or values.

Command Modes EXEC

```
pi-cluster-93/admin# ncs run csrf enable
```

```
pi-cluster-93/admin# ncs run csrf disable
```

ncs run jms

Prime Infrastructure can send notifications to a Java Message Server (JMS) whenever there are changes in inventory or configuration parameters that are part of an audit you have defined.You can enable or disable this feature using **ncs run jms** command.

ncs run jms enable

ncs run jms disable

Command Default No default behavior or values.

Command Modes EXEC

```
pi-cluster-93/admin# ncs run jms enable
```

```
pi-cluster-93/admin# ncs run jms disable
Connectivity to the JMS (message bus) from external servers disabled.
Connectivity is required for external  PnP Gateway servers to interact
with the Prime Infrastructure server.
```

```
Use the 'enable' option of this command, to enable connectivity again.
```

ncs run livelogs

You can run **ncs run livelogs** command to view live audit logs.

ncs run livelogs { *all* **|** *secure* **|** *ade* **|** *messages* **}**

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-system-120/admin# ncs run livelogs
***Available filter options to limit logs - all  secure ade messages***

ncs run ssh-server-legacy-algorithms

You can enable or disable ssh server legacy algorithms using **ncs run ssh-server-legacy-algorithms** command in EXEC mode.

ncs run ssh-server-legacy-algorithms { *enable* | *disable* }

Syntax Description		
	enable	Enables ssh server legacy algorithms.
	disable	Disables ssh server legacy algorithms.

Command Default Default mode is `enable`.

EXEC

```
pi-system-127/admin# ncs run ssh-server-legacy-algorithms enable

Enabling legacy algorithms for SSH service...
KexAlgorithms  :
diffie-hellman-group16-sha512,diffie-hellman-group14-sha256,ecdh-sha2-nistp521,ecdh-sha2-nistp384,ecdh-sha2-nistp256,diffie-hellman-group18-sha512,diffie-hellman-group14-sha1,diffie-hellman-group-exchange-sha256,diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1
MACs           : hmac-sha2-512,hmac-sha2-256,hmac-sha1
Ciphers        :
aes128-gcm@openssh.com,aes128-ctr,chacha20-poly1305@openssh.com,aes256-ctr,aes256-gcm@openssh.com,aes192-ctr,3des-cbc,aes128-cbc,aes256-cbc

Restarting sshd (via systemctl):                           [  OK  ]
```

ncs run tls-server-versions

To set the TLS (Transport Layer Security) version, use **ncs run tls-server-versions** command in EXEC mode.

ncs run tls-server-version <TLS version>

Command Default No default behavior or values.

Command Modes EXEC

The following example illustrates the use of the ncs run set-tls-versionscommand:

```
pi-system-168/admin# ncs run tls-server-versions TLSv1 TLSv1.1 TLSv1.2
Enabled TLS version are - TLSv1,TLSv1.1,TLSv1.2
Restart is required for the changes to take effect
pi-system-168/admin#
```

Warning Running this command requires an immediate software restart. It is suggested you perform a failover and failback so that changes are reflected in both primary and secondary servers.

ncs start

To start the server, use the **ncs start** command.

ncs start [verbose]

Syntax Description		
	verbose	Displays the detailed messages during the start process.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines To see the messages in the console, use the **ncs start verbose** command.

This example shows how to start the server:

Related Commands

Command	Description
ncs start	Starts the server.
ncs status	Displays the current status of he server.

ncs run tls-server-ciphers

You can enable a TLS cipher group using **ncs run tls-server-ciphers** command in EXEC mode.

ncs run tls-server-ciphers { *tls-ecdhe-sha2* | *tls-ecdhe-sha1* | *tls-dhe-sha2* | *tls-dhe-sha1* | *tls-static-sha2* | *tls-static-sha1* }

Syntax Description

tls-ecdhe-sha2	Refers to tls cipher group, ecdhe sha2
tls-ecdhe-sha1	Refers to tls cipher group, ecdhe sha1

tls-dhe-sha2	Refers to tls cipher group, dhe sha2
tls-dhe-sha1	Refers to tls cipher group, dhe sha1
tls-static-sha2	Refers to tls cipher group, static sha2
tls-static-sha1	Refers to tls cipher group, static sha1

Command Default The default cipher group is **tls-ecdhe-sha2**

EXEC

```
pi/admin# ncs run tls-server-ciphers tls-ecdhe-sha1

Enabled TLS cipher groups are - tls-ecdhe-sha1

Restart is required for the changes to take effect
```

ncs password ftpuser

To change the FTP username and password, use the **ncs password ftpuser** command in EXEC mode.

Note The value for ftpuser in the above command should always be set to ftp-user.

After you enable the ftp-user, you can FTP files to and from the /localdisk/ftp folder on standalone or, if configured, High Availability primary servers only. You cannot use change directory (cd) or list directory (ls) functionality with ftp-user.

ncs passwod ftpuser *ftp-user* **password** *password*

Syntax Description

ftp-user	The FTP user name

Command Default No default behavior or values.

Command Modes EXEC

This example shows how to change the FTP username and password:

```
pi-system-65/admin# ncs password ftpuser ftp-user password Password123
Updating FTP password
Saving FTP account password in credential store
Synching FTP account passwd to database store - location-ftp-user
Synching FTP account password to system store
Completed FTP password update
pi-system-65/admin#
```

ncs password root password

To change the root password, use the **ncs password root password** command in EXEC mode.

ncs password root password *userpassword*

Syntax Description

userpassword	Password for the root user.

Command Default

No default behavior or values.

Command Modes

EXEC

This example shows how to migrate archived files to server:

```
pi-systems/admin# ncs password root password Userpassword
Password updated for web root user
pi-systems/admin#
```

ncs ha authkey

To enter the authentication key for high availability (HA), use the **ncs ha authkey** command in EXEC mode.

ncs ha authkey *authorization key*

Syntax Description

authorization key	The authorization key for high availability. Up to 81 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

The **ncs ha authkey** command changes the authorization for the health monitor.

This example shows how to set up the authorization key for high availability:

```
pi-system/admin#ncs ha authkey cisco123
Going to update primary authentication key
Successfully updated primary authentication key
Successfully intimated  Primary updated  authentication key to Secondary Server
pi-system/admin#
```

Related Commands

Command	Description
ncs ha remove	Removes the high availability configuration settings from .
ncs ha status	Provides the current status of high availability.

ncs ha remove

To remove the high availability configuration settings from , use the **ncs ha remove** command in EXEC mode.

ncs ha remove

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines The **ncs ha remove** command removes the high availability configuration settings from . If you enter this command, you will see the following confirmation message:

```
High availability configuration will be removed.
Do you wish to continue? (Y/N)
```

Example

```
pi-system/admin# ncs ha remove
High availability configuration will be removed
Do you wish to continue? (y/N)  y

Removing primary configuration will remove all database information
Primary is attempting to remove high availability configuration from both primary    \
and secondary
Successfully removed high availability configuration
pi-system/admin#
```

Related Commands

Command	Description
ncs ha authkey	Allows you to enter the authentication key for high availability in . This command also changes the authorization for the health monitor.
ncs ha status	Provides the current status of high availability.

ncs ha status

To display the current status of high availability (HA), use the **ncs ha status** command in EXEC mode.

ncs ha status

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines

Displays the current status of HA.

If you enter the **ncs ha status** command when HA is not configured, you will see the following response:

```
[State] Stand Alone
```

Example 1: When HA is not configured

```
pi-system/admin# ncs ha status
[Role] Primary [State] HA not Configured
pi-systems/admin#
```

Example 2: When HA is configured

In Primary server:

```
pi-system/admin# ncs ha status
[Role] Primary [Secondary Server] 10.197.71.162(10.197.71.162) [State] Primary
Active [Failover Type] Automatic
pi-system/admin#
```

In Secondary server:

```
pi-system/admin# ncs ha status
[Role] Secondary [Primary Server] pi-system-161(10.197.71.161) [State] Secondary
Syncing [Failover Type] Automatic
pi-system/admin#
```

Related Commands

Command	Description
ncs ha authkey	Allows you to enter the authentication key for high availability in . This command also changes the authorization for the health monitor.
ncs ha remove	Removes the high availability configuration.

ncs key genkey

To generate a new RSA key and self-signed certificate, use the **ncs key genkey** command. You can use this command in the following ways:

ncs key genkey -newdn -csr csrfilename repository repositoryname

Syntax Description

genkey	Generates a new RSA key and self-signed certificate. You can use the following options with this command: **-csr**: Generate Certificate Signing Request(CSR) file **-newdn**: Generate new RSA key and self-signed certificate with domain information **<cr>**: Carriage return.
-newdn	Generates a new RSA key and self-signed cert with domain information. You can use the following options with this command: **-csr**: Generate Certificate Signing Request(CSR) file **<cr>**: Carriage return.
-csr	Generates new CSR certificate file. You can use the following option with this command: **<WORD>**: Type in certificate file name (Max Size - 80)
csrfilename	CSR filename.
repository	Repository command. This option is available when you use the -csr option.
repositoryname	Location where the files should be backed up to. Up to 80 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

This example shows how to generate new rsa key and certificate files in the Prime Infrastructure server:

```
pi-cluster-88/admin# ncs key genkey -newdn -csr test.csr repository defaultRepo

Changes will take affect on the next server restart
  Enter the fully qualified domain name of the server !!!!: pi-cluster-88.cisco.com
  Enter the name of your organization unit !!!!!!!!!!!!!!!: cisco
  Enter the name of your organization !!!!!!!!!!!!!!!!!!!!: hcl
  Enter the name of your city or locality !!!!!!!!!!!!!!!!: chennai
  Enter the name of your state or province !!!!!!!!!!!!!!!: tn
  Enter the two letter code for your country !!!!!!!!!!!!!: US
    Specify subject alternate names.
    If none specified, CN will be used.
  Use comma seperated list - DNS:<name>,IP:<address> !!!!!:                          \
DNS:pi-cluster-88.cisco.com,IP:10.126.168.88

  Specify the public key algorithm [rsa/ec] !!!!!!!!!!!!!!: rsa
  Specify the RSA key size [2048/4096/8192] !!!!!!!!!!!!!!: 4096
  Specify the signature algorithm [sha256/sha512] !!!!!!!!!: sha256

Key and CSR/Certificate will be generated with following details
  Subject               :                                                            \
```

```
/C=US/ST=tn/L=chennai/O=hcl/OU=cisco/CN=pi-cluster-88.cisco.com
  Subject Alternate Name : DNS:pi-cluster-88.cisco.com,IP:10.126.168.88
  Public Key Alg         : rsa, 4096
  Signature Alg          : sha256

Continue [yes] : yes
Generating...
Completed generating new key...Changes will take affect on the next server restart
Note: You can provide comma separated list of FQDN and IP of PI servers where you want to
import the same certificate received from CA.
To import same CA in other server, you need to import the key from the server where you
generate CSR and them import the CA certiifcates.
```

Note You will get csr file generated in location where repository is pointing. Use that csr file get CA certificate or signed certificate from any CA agent.

Related Commands

Command	Description
ncs key importsignedcert	Applies an RSA key and signed certificate to Prime Infrastructure.
ncs key importkey	Applies an RSA key and certificate to Prime Infrastructure.

Note After entering this command, enter the **ncs stop** and **ncs start** command to restart the Prime Infrastructure server to make changes take effect.

ncs key importkey

To apply an RSA key and signed certificate to the Prime Infrastructure, use the **ncs key importkey** command in EXEC mode.

To export key:

ncs key exportkey *key-filename cert-filename* **repository** *repositoryname*

To import key:

ncs key importkey *key-filename cert-filename* **repository** *repositoryname*

Syntax Description

key-filename	RSA private key file name.
cert-filename	Certificate file name.
repository	Repository command
repositoryname	The repository name configured in the Prime Infrastructure where the key-file and cert-file is hosted.

Command Default No default behavior or values.

Command Modes EXEC

This example shows how to apply the new RSA key and certificate files to the server.

```
ncs key exportkey private.key server.cer repository defaultRepo

ncs key importkey keyfile certfile repository ncs-sftp-repo
```

Note After applying this command, enter the **ncs stop** and **ncs start** command to restart the server to make the changes take effect.

Related Commands

Command	Description
ncs key genkey	Generates a new RSA key and self-signed certificate.
ncs key importsignedcert	Applies an RSA key and signed certificate to Prime Infratsructure.

ncs key importsignedcert

To apply an RSA key and signed certificate, use the **ncs key importsignedcert** command EXEC mode.

ncs key importsignedcert *signed-cert-filename* **repository** *repositoryname*

Syntax Description

signed-cert-filename	Signed certificate filename.
repository	Repository command
repositoryname	The repository name configured in where the key-file and cert-file is hosted.

Command Default No default behavior or values.

Command Modes EXEC

This example shows how to apply signed certificate files to the server:

```
> ncs key importsingedcert signed-certfile repository ncs-sftp-repo
```

Note After applying this command, enter the **ncs stop** and the **ncs start** command to restart the server to make changes take effect.

Related Commands

Command	Description
ncs key genkey	Generates a new RSA key and self-signed certificate.
ncs key importkey	Applies an RSA key and signed certificate to .

ncs certvalidation certificate-check

To enable or disable certificate validation, use **ncs certvalidation certificate-check** command in EXEC mode.

ncs certvalidation certificate-check {*disable* | *enable* | *trust-on-first-use* } **trustzone** *trustzone_name*

Syntax Description

disable	Disable certificate validation
enable	Enable certificate validation
trust-on-first-use	Trust and pin the host certificate on first use
trustzone_name	Name of the trustzone

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-system/admin# ncs certvalidation certificate-check trust-on-first-use trustzone system

ncs certvalidation certificate-check enable trustzone system
```

ncs certvalidation custom-ocsp-responder

To configure a custom OCSP responder, use **ncs certvalidation custom-ocsp-responder** command in EXEC mode.

ncs certvalidation custom-ocsp-responder { **clear** *url* | **disable** | **enable** | **set** *url* }

Syntax Description

clear	Clear OCSP responder URL
disable	Disable custom OCSP responder
enable	Enable custom OCSP responder
set	Set OCSP responder URL

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-system/admin# ncs certvalidation custom-ocsp-responder enable
pi-system/admin# ncs certvalidation custom-ocsp-responder set url1 http://10.104.119.201
pi-system/admin# ncs certvalidation custom-ocsp-responder clear url1
pi-system/admin# ncs certvalidation custom-ocsp-responder disable
```

ncs certvalidation revocation-check

To enable or disable revocation check using OCSP or CRL, use **ncs certvalidation revocation-check** command in EXEC mode.

ncs certvalidation revocation-check {*disable* | *enable* } **trustzone** { **devicemgmt | pubnet | system | user** }

Syntax Description

disable	Disable certificate revocation
enable	Enable certificate revocation

Command Default No default behavior or values.

Command Modes EXEC

```
pi-system/admin# ncs certvalidation revocation-check enable trustzone system
pi-system/admin#
```

ncs certvalidation tofu-certs

To view and delete certificates trusted on first use, use **ncs certvalidation tofu-certs** command in EXEC mode.

ncs certvalidation tofu-certs {**listcerts** | **deletecert host** *host_name* }

Syntax Description

deletecert	Delete a trust-on-first-use cert for a host
listcerts	List certificates trusted on first use
trust-on-first-use	Trust and pin the host certificate on first use
trustzone_name	Name of the trustzone

Command Default No default behavior or values.

Command Modes EXEC

Example 1: listcert

```
pi-system/admin# ncs certvalidation tofu-certs listcerts
Host certificate are automatically added to this list on first connection, if
trust-on-first-use is configured - ncs certvalidation certificate-check ...
host=10.197.71.121_8082; subject= /C=US/ST=CA/L=SJ/O=Cisco Systems/OU=Prime
```

```
Infra/CN=pi-system-121
pi-system/admin#
```

Example 2: deletecerts

```
pi-system/admin# ncs certvalidation tofu-certs deletecert host 10.197.71.121_8082
Deleted entry for 10.197.71.121_8082
pi-system/admin#
```

ncs certvalidation trusted-ca-store

To configure a trusted CA certificate store, use **ncs certvalidation trusted-ca-store** command in EXEC mode.

ncs certvalidation trusted-ca-store { **auto-ca-update** { **enable** | **disable truststore** *truststore_name* } | **deletecacert alias** { *alias_name* **truststore** *truststore_name* { **devicemgmt | pubnet | system | user** } } | **importcacert alias** *alias_name* **repository** *repository_name* **truststore** *truststore_name* | **listcacerts truststore** *trustsore_name* }

Syntax Description

auto-ca-update	Auto update list of trusted CA certs during software update
deletecacert	Enable certificate validation
importcacert	Import a certificate to the trust store
listcacerts	List all trusted CA certificates
truststore_name	Name of the truststore
devicemgmt	Trust store used for validating cert from managed devices
pubnet	Trust store used for validating cert from public internet
system	Trust store used for validating cert from other peer systems
user	Trust store used for validating cert for user login

Command Default

No default behavior or values.

Command Modes

Configuration

Example 1: auto-ca-upadate

```
pi-system/admin# ncs certvalidation trusted-ca-store auto-ca-update enable truststore system

pi-system/admin# ncs certvalidation trusted-ca-store auto-ca-update disable truststore
system
pi-system/admin#
```

Example 2: deletecacert

```
pi-system/admin# ncs certvalidation trusted-ca-store deletecacert alias quovadisroot
truststore system
```

```
Deleted CA certificate from trust store. Changes will take affect on the next server restart
pi-system/admin#
```

Example 3: importcacert

```
pi-system/admin# ncs certvalidation trusted-ca-store importcacert alias ALIAS repository
defaultRepo prime.cer truststore system
Imported CA certificate to trust store. Changes will take affect on the next server restart
pi-system/admin#
```

Example 3: listcacert

```
pi-system/admin# ncs certvalidation trusted-ca-store listcacerts truststore pubnet

ncs cleanup

To clean up the following data,below datafree up and reclaim the disk space, use the **ncs cleanup** command in EXEC mode.

- Files under /opt/backup
- *.m-n.logs, *.n.logs, *.log.n log files under /opt/CSCOlumos/logs
- Regular files under /localdisk
- .hprof file under opt/CSCOlumos/crash
- Matlab*.log under /opt/tmp/
- .trm and .trc files under /opt/oracle/base/diag/rdbms/*/*/trace
- Older expired Archive logs and backup set under /opt/oracle/base/fast_recovery_area/WCS

ncs cleanup

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes

EXEC

Usage Guidelines

When does not have enough disk space, an alarm is raised to free up and reclaim the disk space. If you enter the **ncs cleanup** command, you will see the following confirmation message:

```
Do you want to delete all the files in the local disk partition? (Y/N)
```

```
pi-system-117/admin# ncs cleanup

```

nslookup

To look up the hostname of a remote system on the server, use the **nslookup** command in EXEC mode.

nslookup *word*

Syntax Description

word	IPv4 address or hostname of a remote system. Up to 63 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

Example 1

```
ncs/admin# nslookup 209.165.200.225
Trying "209.165.200.225.in-addr.arpa"
Received 127 bytes from 172.16.168.183#53 in 1 ms
Trying "209.165.200.225.in-addr.arpa"
Host 209.165.200.225.in-addr.arpa. not found: 3(NXDOMAIN)
Received 127 bytes from 172.16.168.183#53 in 1 ms

ncs/admin#
```

Example 2

```
ncs/admin# nslookup 209.165.200.225

ncs/admin#
```

ocsp

Online Certificate Status Protocol (OCSP) enables certificate-based authentication for web clients using OCSP responders. Typically, the OCSP responder's URL is read from the certificate's Authority Information Access (AIA). As a failover mechanism, you can configure the same URL on the Prime Infrastructure server as well. You can enable or disable a custom OCSP responder, and set or remove OCSP responder URLs, using **ocsp responder** command in EXEC mode.

ocsp responder { *remove* | *set* | *show* }

Syntax Description

clear	Clear OCSP responder URL
custom	Enable or disable custom OCSP responder
set	Set OCSP responder URL.

Command Default No default behaviour.

Command Modes EXEC

```
ncs/admin# ocsp responder
ncs/admin# ocsp responder custom enable

ncs/admin# ocsp responder set url1 <WORD>
<WORD>  Enter ocsp url (Max Size - 1024)

ncs/admin# ocsp responder clear url1
```

ping

To diagnose the basic IPv4 network connectivity to a remote system, use the **ping** command in EXEC mode.

ping *{ip-address | hostname} [***Df***df][***packetsize***packetsize][***pingcount***pingcount]*

Syntax Description

ip-address	IP address of the system to ping. Up to 32 alphanumeric characters.
hostname	Hostname of the system to ping. Up to 32 alphanumeric characters.
df	Specification for packet fragmentation.
df	Specifies the value as **1** to prohibit packet fragmentation, or **2** to fragment the packets locally, or **3** to not set df.
packetsize	Size of the ping packet.
packetsize	Specifies the size of the ping packet; the value can be between 0 and 65507.
pingcount	Number of ping echo requests.
pingcount	Specifies the number of ping echo requests; the value can be between 1 and 10.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines

The **ping** command sends an echo request packet to an address, then awaits a reply. The ping output can help you evaluate path-to-host reliability, delays over the path, and whether you can reach a host.

```
ncs/admin# ping 172.16.0.1 df 2 packetsize 10 pingcount 2
PING 172.16.0.1 (172.16.0.1) 10(38) bytes of data.
18 bytes from 172.16.0.1: icmp_seq=0 ttl=40 time=306 ms
18 bytes from 172.16.0.1: icmp_seq=1 ttl=40 time=300 ms

--- 172.16.0.1 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1001ms
rtt min/avg/max/mdev = 300.302/303.557/306.812/3.255 ms, pipe 2
ncs/admin#
```

Related Commands

Command	Description
ping6	Pings a remote IPv6 address.

ping6

To diagnose the basic IPv6 network connectivity to a remote system, use the **ping6** command in EXEC mode.

ping6 *{ip-address | hostname}* *[***GigabitEthernetpacketsize***packetsize]][***pingcount***pingcount]*

Syntax Description

ip-address	IP address of the system to ping. Up to 64 alphanumeric characters.
hostname	Hostname of the system to ping. Up to 64 alphanumeric characters.
GigabitEthernet	Selects the ethernet interface.
packetsize	Size of the ping packet.
packetsize	Specifies the size of the ping packet; the value can be between 0 and 65507.
pingcount	Number of ping echo requests.
pingcount	Specifies the number of ping echo requests; the value can be between 1 and 10.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

The IPv6 **ping6** command sends an echo request packet to an address, then awaits a reply. The ping output can help you evaluate path-to-host reliability, delays over the path, and whether you can reach a host.

The IPv6 **ping6** command is similar to the existing IPv4 ping command that does not support the IPv4 ping fragmentation (df in IPv4) options, but allows an optional specification of an interface. The interface option

is primarily useful for pinning with link-local addresses that are interface-specific. The packetsize and pingcount options work identically the same as they do with the IPv4 command.

Example 1

```
ncs/admin# ping6 3ffe:302:11:2:20c:29ff:feaf:da05
PING 3ffe:302:11:2:20c:29ff:feaf:da05(3ffe:302:11:2:20c:29ff:feaf:da05) from
3ffe:302:11:2:20c:29ff:feaf:da05 eth0: 56 data bytes
64 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=0 ttl=64 time=0.599 ms
64 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=1 ttl=64 time=0.150 ms
64 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=2 ttl=64 time=0.070 ms
64 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=3 ttl=64 time=0.065 ms

--- 3ffe:302:11:2:20c:29ff:feaf:da05 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3118ms
rtt min/avg/max/mdev = 0.065/0.221/0.599/0.220 ms, pipe 2

ncs/admin#
```

Example 2

```
ncs/admin# ping6 3ffe:302:11:2:20c:29ff:feaf:da05 GigabitEthernet 0 packetsize 10 pingcount
 2
PING 3ffe:302:11:2:20c:29ff:feaf:da05(3ffe:302:11:2:20c:29ff:feaf:da05) from
3ffe:302:11:2:20c:29ff:feaf:da05 eth0: 10 data bytes
18 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=0 ttl=64 time=0.073 ms
18 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=1 ttl=64 time=0.073 ms

--- 3ffe:302:11:2:20c:29ff:feaf:da05 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1040ms
rtt min/avg/max/mdev = 0.073/0.073/0.073/0.000 ms, pipe 2

ncs/admin#
```

Related Commands

	Description
ping	Pings a remote IP address.

reload

To reload the operating system, use the **reload** command in EXEC mode.

reload

Syntax Description

This command has no arguments or keywords.

Command Default

The command has no default behavior or values.

Command Modes

EXEC

Usage Guidelines

The **reload** command reboots the system. Use the **reload** command after you enter configuration information into a file and save the running-configuration to the persistent startup-configuration on the CLI and save any settings in the web Administration user interface session.

Before you enter the **reload** command, ensure that the is not performing any backup, restore, installation, upgrade, or remove operation. If the performs any of these operations and you enter the **reload** command, you will notice any of the following warning messages:

```
WARNING: A backup or restore is currently in progress! Continue with reload?

WARNING: An install/upgrade/remove is currently in progress! Continue with reload?
```

If you get any of these warnings, enter YES to halt the operation, or enter NO to cancel the halt.

If no processes are running when you use the **reload** command or you enter YES in response to the warning message displayed, the asks you to respond to the following option:

```
Do you want to save the current configuration ?
```

Enter YES to save the existing configuration. The displays the following message:

```
Saved the running configuration to startup successfully
```

```
ncs/admin# reload
Do you want to save the current configuration ? (yes/no) [yes] ? yes
Generating configuration...
Saved the running configuration to startup successfully
Continue with reboot? [y/n] y

Broadcast message from root (pts/0) (Fri Aug  7 13:26:46 2010):

The system is going down for reboot NOW!

ncs/admin#
```

Related Commands

Command	Description
halt	Disables the system.

restore

To perform a restore of a previous backup, use the **restore** command in EXEC mode.

Application Backup Restore:

Use the following command to restore data related only to application:

restore *filename* **repository** *repository-name* **application** *application-name*

Application Backup Restore

Use the following command to restore data related to the application and Cisco ADE OS:

restore *filename* **repository** *repository-name*

Syntax Description

filename	Name of the backed-up file that resides in the repository. Up to 120 alphanumeric characters. **Note** You must add the .tar.gpg extension after the filename (for example, myfile.tar.gpg).
repository	The repository keyword.
repository-name	Name of the repository you want to restore from backup.
application	The application keyword.
application-name	The name of the application data to be restored. Up to 255 alphanumeric characters. **Note** Enter the application name as 'PI' in upper case.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

A restore operation restores data related to the as well as the Cisco ADE OS. To perform a restore of a previous backup of the application data of the only, add the **application** command to the **restore** command in EXEC mode.

When you use these two commands in the , the server restarts automatically.

```
pi-system-153/admin# restore                                                    \
veeraiah-180306-1952__VER3.4.0.0.120_BKSZ10G_CPU4_MEM3G_RAM11G_SWAP15G_APP_CK1753058
834.tar.gpg repository defaultRepo application NCS

* NOTE *
If the system console is disconnected or got cleared on session timeout
run 'show restore log' to see the output of the last restore session.

Restore will restart the application services. Continue? (yes/no) [yes] ? yes

DO NOT press ^C while the restoration is in progress
Aborting restore with a ^C may leave the system in a unrecoverable state

Enter the backup password, if your backup is password protected. Otherwise, press
Enter to continue the data restoration.

Related Commands

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
show restore, on page 117	Displays the restore history.
repository	Enters the repository submode for configuration of backups.
show repository	Displays the available backup files located on a specific repository.
show backup history	Displays the backup history of the system.

rmdir

To remove an existing directory, use the **rmdir** command in EXEC mode.

rmdir *word*

Syntax Description

word	Directory name. Up to 80 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

```
ncs/admin# mkdir disk:/test
ncs/admin# dir

Directory of disk:/

       4096 May 06 2010 13:34:49  activemq-data/

ncs/admin#
```

Related Commands

Command	Description
dir	Displays a list of files on the server.
mkdir	Creates a new directory.

rsakey

To display a configured RSA key or to set a new RSA public key for user authentication, use **rsakey** command in EXEC mode. You can also use it to remove a configured RSA key.

rsakey { remove | set | show }

Syntax Description		
	remove	Remove RSA public key for user authentication.
	set	Set RSA public key for user authentication.
	show	Show RSA public key for user authentication.

Command Default No default behaviour.

Command Modes EXEC

```
ncs/admin# rsakey
ncs/admin# rsakey show
No RSA key configured for user 'admin'
```

```
ncs/admin# rsakey remove
No RSA key configured for user 'admin
```

```
ncs/admin# rsakey set <WORD>
<WORD>  Filename of RSA public key (Max Size - 256)
```

show

To show the running system information, use the **show** command in EXEC mode. The **show** commands are used to display the settings and are among the most useful commands.

The commands in Table A-6 require the **show** command to be followed by a keyword; for example, **show application status**. Some **show** commands require an argument or variable after the keyword to function; for example, **show application version**.

For detailed information on all of the **show** commands, see show Commands.

show keyword

Syntax Description

Table 10: Summary of show Commands

Command(1)	Description
application (requires keyword)(2)	Displays information about the installed application; for example, status or version.
backup (requires keyword)	Displays information about the backup.
cdp (requires keyword)	Displays information about the enabled Cisco Discovery Protocol interfaces.
clock	Displays the day, date, time, time zone, and year of the system clock.
cpu	Displays CPU information.

Command(1)	Description
disks	Displays file-system information of the disks.
interface	Displays statistics for all of the interfaces configured on the Cisco ADE OS.
logging (requires keyword)	Displays system logging information.
logins (requires keyword)	Displays login history.
memory	Displays memory usage by all running processes.
ntp	Displays the status of the Network Time Protocol (NTP).
ports	Displays all of the processes listening on the active ports.
process	Displays information about the active processes of the server.
repository (requires keyword)	Displays the file contents of a specific repository.
restore (requires keyword)	Displays restore history on the server.
running-config	Displays the contents of the currently running configuration file on the server.
startup-config	Displays the contents of the startup configuration on the server.
tech-support	Displays system and configuration information that you can provide to the TAC when you report a problem.
terminal	Displays information about the terminal configuration parameter settings for the current terminal line.
timezone	Displays the time zone of the server.
timezones	Displays all of the time zones available for use on the server.
udi	Displays information about the unique device identifier (UDI) of the .
uptime	Displays how long the system you are logged in to has been up and running.

Command(1)	Description
users	Displays information for currently logged in users.
version	Displays information about the installed application version.

12

1 (1) The commands in this table require that the show command precedes a keyword; for example, show application.
2 (2) Some show commands require an argument or variable after the keyword to function; for example, show application version. This show command displays the version of the application installed on the system (see show application).

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines All **show** commands require at least one keyword to function.

```
pi-system-117/admin# show application
name         Description
NCS             Cisco Prime Infrastructure
pi-system-117/admin#

pi-system-96/admin# show version

```

ssh

To start an encrypted session with a remote system, use the **ssh** command in EXEC mode.

Note An Admin or Operator (user) can use this command (see Table 2: Command Privileges).

ssh *[ip-address | hostname] username***port***[number]****version[1|2] delete hostkey***word*

Syntax Description

ip-address	IP address of the remote system. Up to 64 alphanumeric characters.
hostname	Hostname of the remote system. Up to 64 alphanumeric characters.
username	Username of the user logging in through SSH.
port [*number*]	(Optional) Indicates the port number of the remote host. From 0 to 65,535. Default 22.
version [1 | 2]	(Optional) Indicates the version number. Default 2.
delete hostkey	Deletes the SSH fingerprint of a specific host.
word	IPv4 address or hostname of a remote system. Up to 64 alphanumeric characters.

Command Default

Disabled.

Command Modes

EXEC (Admin or Operator).

Usage Guidelines

The **ssh** command enables a system to make a secure, encrypted connection to another remote system or server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an insecure network.

Example 1

```
ncs/admin# ssh ncs1 admin
admin@ncs1's password:
Last login: Wed Jul 11 05:53:20 2008 from ncs.cisco.com

ncs1/admin#
```

Example 2

```
ncs/admin# ssh delete host ncs
ncs/admin#
```

tech dumptcp

To dump a Transmission Control Protocol (TCP) package to the console, use the **tech dumptcp** command in EXEC mode.

tech dumptcp *gigabit-ethernet*

Syntax Description

gigabit-ethernet	Gigabit Ethernet interface number 0 to 1.

Command Default Disabled.

Command Modes EXEC

```
ncs/admin# tech dumptcp 0
140816:141088(272) ack 1921 win 14144

ncs/admin#
```

telnet

To log in to a host that supports Telnet, use the **telnet** command in operator (user) or EXEC mode.

telnet *[ip-address | hostname] port number*

Syntax Description

ip-address	IP address of the remote system. Up to 64 alphanumeric characters.
hostname	Hostname of the remote system. Up to 64 alphanumeric characters.
port number	(Optional) Indicates the port number of the remote host. From 0 to 65,535.

Command Default No default behavior or values.

Command Modes EXEC

```
ncs/admin# telnet 172.16.0.11 port 23
ncs.cisco.com login: admin
password:
Last login: Mon Jul  2 08:45:24 on ttyS0
ncs/admin#
```

terminal length

To set the number of lines on the current terminal screen for the current session, use the **terminal length** command in EXEC mode.

terminal length *integer*

Syntax Description

integer	Number of lines on the screen. Contains between 0 to 511 lines, inclusive. A value of zero (0) disables pausing between screens of output.

Command Default

24 lines.

Command Modes

EXEC

Usage Guidelines

The system uses the length value to determine when to pause during multiple-screen output.

```
ncs/admin# terminal length 0
ncs/admin#
```

terminal session-timeout

To set the inactivity timeout for all sessions, use the **terminal session-timeout** command in EXEC mode.

terminal session-timeout *minutes*

Syntax Description

minutes	Sets the number of minutes for the inactivity timeout. From 0 to 525,600. Zero (0) disables the timeout.

Command Default

30 minutes.

Command Modes

EXEC

Usage Guidelines

Setting the **terminal session-timeout** command to zero (0) results in no timeout being set.

```
ncs/admin# terminal session-timeout 40
ncs/admin#
```

Related Commands

Command	Description
terminal session-welcome	Sets a welcome message on the system for all users who log in to the system.

terminal session-welcome

To set a welcome message on the system for all users who log in to the system, use the **terminal session-welcome** command in EXEC mode.

terminal session-welcome *string*

Syntax Description

string	Welcome message. Up to 2,023 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Specify a message using up to 2048 characters.

```
ncs/admin# terminal session-welcome Welcome
ncs/admin#
```

Related Commands

Command	Description
terminal session-timeout	Sets the inactivity timeout for all sessions.

terminal terminal-type

To specify the type of terminal connected to the current line for the current session, use the **terminal terminal-type** command in EXEC mode.

terminal terminal-type *type*

Syntax Description

type	Defines the terminal name and type, and permits terminal negotiation by hosts that provide that type of service. Up to 80 alphanumeric characters.

Command Default

VT100.

Command Modes

EXEC

Usage Guidelines

Indicate the terminal type if it is different from the default of VT100.

```
ncs/admin# terminal terminal-type vt220
ncs/admin#
```

traceroute

To discover the routes that packets take when traveling to their destination address, use the **traceroute** command in EXEC mode.

traceroute *[ip-address | hostname]*

Syntax Description

ip-address	IP address of the remote system. Up to 32 alphanumeric characters.
hostname	Hostname of the remote system. Up to 32 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

```
ncs/admin# traceroute 172.16.0.11
traceroute to 172.16.0.11 (172.16.0.11), 30 hops max, 38 byte packets
 1  172.16.0.11 0.067 ms  0.036 ms  0.032 ms

ncs/admin#
```

undebug

To disable debugging functions, use the **undebug** command in EXEC mode.

undebug *{all | application | backup-restore | cdp | config | copy | icmp | locks | logging | snmp | system | transfer | user | utils}*

Syntax Description

all	Disables all debugging.
application	Application files. • *all*—Disables all application debug output. • *install*—Disables application install debug output. • *operation*—Disables application operation debug output. • *uninstall*—Disables application uninstall debug output.

backup-restore	Backs up and restores files. • *all*—Disables all debug output for backup-restore. • *backup*—Disables backup debug output for backup-restore. • *backup-logs*—Disables backup-logs debug output for backup-restore. • *history*—Disables history debug output for backup-restore. • *restore*—Disables restore debug output for backup-restore.
cdp	Cisco Discovery Protocol configuration files. • *all*—Disables all Cisco Discovery Protocol configuration debug output. • *config*—Disables configuration debug output for Cisco Discovery Protocol. • *infra*—Disables infrastructure debug output for Cisco Discovery Protocol.
config	Configuration files. • *all*—Disables all configuration debug output. • *backup*—Disables backup configuration debug output. • *clock*—Disables clock configuration debug output. • *infra*—Disables configuration infrastructure debug output. • *kron*—Disables command scheduler configuration debug output. • *network*—Disables network configuration debug output. • *repository*—Disables repository configuration debug output. • *service*—Disables service configuration debug output.
copy	Copy commands.

icmp	ICMP echo response configuration. *all*—Disable all debug output for ICMP echo response configuration. Set level between 0 and 7, with 0 being severe and 7 being all.
locks	Resource locking. • *all*—Disables all resource locking debug output. • *file*—Disables file locking debug output.
logging	Logging configuration files. *all*—Disables all debug output for logging configuration.
snmp	SNMP configuration files. *all*—Disables all debug output for SNMP configuration.
system	System files. • *all*—Disables all system files debug output. • *id*—Disables system ID debug output. • *info*—Disables system info debug output. • *init*—Disables system init debug output.
transfer	File transfer.
user	User management. • *all*—Disables all user management debug output. • *password-policy*—Disables user management debug output for password-policy.
utils	Utilities configuration files. *all*—Disables all utilities configuration debug output.

Command Default

No default behavior or values.

Command Modes

EXEC

```
ncs/admin# undebug all
ncs/admin#
```

Related Commands

Command	Description
debug	Displays errors or events for command situations.

write

To copy, display, or erase server configurations, use the **write** command with the appropriate argument in EXEC mode.

write *{erase | memory | terminal}*

Syntax Description

erase	Erases the startup configuration. This command is disabled by default.
memory	Copies the running configuration to the startup configuration.
terminal	Copies the running configuration to console.

Command Default No default behavior or values.

Command Modes EXEC

The following is an example of the write command with the erase keyword:

Note write erase command functionality is disabled from Cisco Prime Infrastructure Release 2.0 and later. If you try to write erase, then the following warning message is displayed.

```
pi-system/admin# write erase
% Warning: 'write erase' functionality has been disabled by application: NCS
pi-system/admin#
```

show Commands

This section lists **show** commands. Each command includes a brief description of its use, any command defaults, command modes, usage guidelines, an example of the command syntax and any related commands.

show application

To show application information of the installed application packages on the system, use the **show application** command in EXEC mode.

show application [**status** | **version** [app_name]]

Syntax Description

status	Displays the status of the installed application.
version	Displays the application version for an installed application—the .
app_name	Name of the installed application.

Table 11: Output Modifier Variables for Count or Last

|	Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the output. Add number after the word *count*. |—Output modifier variables. • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludes lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10. |—Output modifier variables (see Table A-8).

Command Default

No default behavior or values.

Command Modes

EXEC

Examples

Example 1

```
pi-system/admin# show application
<name>          <Description>
NCS             Cisco Prime Infrastructure
pi-system/admin#
```

Related Commands

	Description
application start	Starts or enables an application.
application stop	Stops or disables an application.
application upgrade	Upgrades an application bundle.

show backup history

To display the backup history of the system, use the **show backup history** command in EXEC mode.

show backup history

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Example 2

```
pi-common-133/admin# show restore log
Started at : Wed Feb 21 15:07:27 2018
Initiating restore.  Please wait...
  Restore Started at 02/21/18 15:07:27
  Stage 1 of 9: Transferring backup file ...
  -- completed at 02/21/18 15:07:57
  Stage 2 of 9: Decrypting backup file ...
  -- completed at  02/21/18 15:19:18
  Stage 3 of 9: Unpacking backup file ...
  -- completed at  02/21/18 15:19:20
  Stopping PI server ...
  Stage 4 of 9: Decompressing backup ...
  -- completed at  02/21/18 15:20:12
  Stage 5 of 9: Restoring Support Files ...
  -- completed at  02/21/18 15:20:33
  Stage 6 of 9: Restoring Database Files ...
   -- completed at  02/21/18 15:21:38
  Stage 7 of 9: Recovering Database ...
  -- completed at  02/21/18 15:39:52
  Stage 8 of 9: Updating Database Schema ...
    This could take long time based on the existing data size.
  -- completed at  02/21/18 16:20:51
  Stage 9 of 9: Re-enabling Database Settings ...
   -- completed at  02/21/18 16:38:33
   Total Restore duration is: 01h:31m:06s
INFO: Restore completed successfully.
System will reboot to enable FIPS and proceed with PI server startup
Finished at : Wed Feb 21 16:39:59 2018
pi-common-133/admin#
```

Example 3

```
pi-system/admin# sh backup history
backup history is empty
pi-system/admin#
```

Related Commands

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
repository	Enters the repository submode for configuration of backups.

Command	Description
show repository	Displays the available backup files located on a specific repository.

show banner pre-login

To display the banner that you installed, use the **show banner pre-login** command in EXEC mode.

show banner pre-login

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

EXEC

Example

```
pi-system/admin# show banner pre-login
Banner-Test
pi-system/admin#
```

Related Commands

Command	Description
banner, on page 37	Enables you to install a pre-login banner.

show cdp

To display information about the enabled Cisco Discovery Protocol interfaces, use the **show cdp** command in EXEC mode.

show cdp {**all** | **neighbors**}

Syntax Description

all	Shows all of the enabled Cisco Discovery Protocol interfaces.
neighbors	Shows the Cisco Discovery Protocol neighbors.

Command Default

No default behavior or values.

Command Modes

EXEC

Example 1

```
ncs/admin# show cdp all
CDP protocol is enabled ...
        broadcasting interval is every 60 seconds.
        time-to-live of cdp packets is 180 seconds.
```

```
        CDP is enabled on port GigabitEthernet0.
ncs/admin#
```

Example 2

```
ncs/admin# show cdp neighbors
CDP Neighbor : 000c297840e5
        Local Interface    : GigabitEthernet0
        Device Type        : L-NCS-1.0-50
        Port               : eth0
        Address            : 172.23.90.114

CDP Neighbor : isexp-esw5
        Local Interface    : GigabitEthernet0
        Device Type        : cisco WS-C3560E-24TD
        Port               : GigabitEthernet0/5
        Address            : 172.23.90.45

CDP Neighbor : 000c29e29926
        Local Interface    : GigabitEthernet0
        Device Type        : L-NCS-1.0-50
        Port               : eth0
        Address            : 172.23.90.115

CDP Neighbor : 000c290fba98
        Local Interface    : GigabitEthernet0
        Device Type        : L-NCS-1.0-50
        Port               : eth0
        Address            : 172.23.90.111

ncs/admin#
```

Related Commands

Command	Description
cdp holdtime	Specifies the length of time that the receiving device should hold a Cisco Discovery Protocol packet from your router before discarding it.
cdp run	Enables the Cisco Discovery Protocol.
cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.

show clock

To display the day, month, date, time, time zone, and year of the system software clock, use the **show clock** command in EXEC mode.

show clock

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

EXEC

```
ncs-system/admin# show clock
Tue Mar 26 17:42:17 IST 2019
ncs-system/admin#
```

Note The **show clock** output in the previous example includes Coordinated Universal Time (UTC) or Greenwich Mean Time (GMT), Great Britain, or Zulu time (see Tables A-16, Table 15: Australia Time Zones, and Table 16: Asia Time Zones on pages A-84 and A-85 for sample time zones).

Related Commands

Command	Description
clock	Sets the system clock for display purposes.

show cpu

To display CPU information, use the **show cpu** command in EXEC mode.

show cpu [statistics] [|] [|]

Syntax Description

statistics	Displays CPU statistics.
|	Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the output. Add number after the word *count*. |—Output modifier variables (see Table A-9). • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludes lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10. |—Output modifier variables (see Table A-9).

Command Default No default behavior or values.

Command Modes EXEC

Example 1

```
ncs/admin# show cpu

processor : 0
model     : Intel(R) Xeon(R) CPU           E5320  @ 1.86GHz
speed(MHz): 1861.914
cache size: 4096 KB

ncs/admin#
```

Example 2

```
ncs/admin# show cpu statistics
user time:             265175
kernel time:           166835
idle time:            5356204
i/o wait time:         162676
irq time:                4055

ncs/admin#
```

Related Commands

Command	Description
show disks	Displays the system information of all disks.
show memory	Displays the amount of system memory that each system process uses.

show disks

To display the disks file-system information, use the **show disks** command in EXEC mode.

show disks [|] [|]

Syntax Description

|	Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the output. Add number after the word *count*. |—Output modifier variables (see Table A-10). • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludes lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10. |—Output modifier variables (see Table A-10).

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

Only platforms that have a disk file system support the **show disks** command.

```
ncs/admin# show disks

temp. space 2% used (17828 of 988116)
disk: 3% used (143280 of 5944440)

Internal filesystems:
  all internal filesystems have sufficient free space

ncs/admin#
```

Related Commands

Command	Description
show cpu	Displays CPU information.
show memory	Displays the amount of system memory that each system process uses.

show icmp_status

To display the Internet Control Message Protocol echo response configuration information, use the **show icmp_status** command in EXEC mode.

show icmp_status {> file | |}

Syntax Description

>	Output direction.
file	Name of file to redirect standard output (stdout).
|	Output modifier commands: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the output. Add number after the word count. • |—Output modifier commands (see Table A-11). • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludes lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • last—Displays last few lines of output. Add number after the word last. Up to 80 lines to display. Default 10. • |—Output modifier commands (see Table A-11).

Command Default

No default behavior or values.

Command Modes

EXEC

Example 1

```
ncs/admin# show icmp_status
icmp echo response is turned on
ncs/admin#
```

Example 2

```
ncs/admin# show icmp_status
icmp echo response is turned off
ncs/admin#
```

Related Commands

Command	Description
icmp echo	Configures the Internet Control Message Protocol (ICMP) echo requests.

show ip route

To display details the ip route details of the application, use **show ip route** command in EXEC mode.

show ip route {| |}

Syntax Description

>	Output redirection
|	Output modifiers

Command Default No default behaviour.

Command Modes EXEC

```
ncs/admin# show ip route
Kernel IP routing table
Destination     Gateway         Genmask         Flags Metric Ref    Use Iface
10.126.168.0    0.0.0.0         255.255.255.0   U     0      0        0 eth0
0.0.0.0         10.126.168.1    0.0.0.0         UG    0      0        0 eth0
Kernel IPv6 routing table
Destination                                 Next Hop                                Flags
Metric Ref    Use Iface
2001::/64                                   ::                                      UA

ff00::/8
```

show interface

To display the usability status of interfaces configured for IP, use the **show interface** command in EXEC mode.

show interface [GigabitEthernet] |

Syntax Description

GigabitEthernet	Shows the Gigabit Ethernet interface. Either 0 or 1.

	Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the interface. Add number after the word *count*. • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludse lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

In the **show interface GigabitEthernet 0** output, you can find that the interface has three IPv6 addresses. The first internet address (starting with 3ffe) is the result of using stateless autoconfiguration. For this to work, you need to have IPv6 route advertisement enabled on that subnet. The next address (starting with fe80) is a link local address that does not have any scope outside the host. You always see a link local address regardless of the IPv6 autoconfiguration or DHCPv6 configuration. The last address (starting with 2001) is the result obtained from an IPv6 DHCP server.

Example 1

```
ncs/admin# show interface
eth0      Link encap:Ethernet  HWaddr 00:0C:29:6A:88:C4
          inet addr:172.23.90.113  Bcast:172.23.90.255  Mask:255.255.255.0
          inet6 addr: fe80::20c:29ff:fe6a:88c4/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:48536 errors:0 dropped:0 overruns:0 frame:0
          TX packets:14152 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:6507290 (6.2 MiB)  TX bytes:12443568 (11.8 MiB)
          Interrupt:59 Base address:0x2000

lo        Link encap:Local Loopback
          inet addr:127.0.0.1  Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
          UP LOOPBACK RUNNING  MTU:16436  Metric:1
          RX packets:1195025 errors:0 dropped:0 overruns:0 frame:0
          TX packets:1195025 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:649425800 (619.3 MiB)  TX bytes:649425800 (619.3 MiB)

sit0      Link encap:IPv6-in-IPv4
          NOARP  MTU:1480  Metric:1
          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
```

```
          TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:0 (0.0 b)  TX bytes:0 (0.0 b)

ncs/admin#
```

Example 2

```
ncs/admin# show interface GigabitEthernet 0
eth0      Link encap:Ethernet  HWaddr 00:0C:29:AF:DA:05
          inet addr:172.23.90.116  Bcast:172.23.90.255  Mask:255.255.255.0
          inet6 addr: 3ffe:302:11:2:20c:29ff:feaf:da05/64 Scope:Global
          inet6 addr: fe80::20c:29ff:feaf:da05/64 Scope:Link
          inet6 addr: 2001:558:ff10:870:8000:29ff:fe36:200/64 Scope:Global
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:77848 errors:0 dropped:0 overruns:0 frame:0
          TX packets:23131 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:10699801 (10.2 MiB)  TX bytes:3448374 (3.2 MiB)
          Interrupt:59 Base address:0x2000
```

Related Commands

Command	Description
interface	Configures an interface type and enters the interface configuration submode.
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration on an interface.
ipv6 address dhcp	Enables IPv6 address DHCP on an interface.

show inventory

To display information about the hardware inventory, including the appliance model and serial number, use the **show inventory** command in EXEC mode.

show inventory |

Syntax Description		
	|	Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the interface. Add number after the word *count*. • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludse lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10.

Command Default No default behavior or values.

Command Modes EXEC

```
pi-system/admin# show inventory

NAME: "Cisco-VM chassis", DESCR: "Cisco-VM chassis"
PID: Cisco-VM-SPID     , VID: V01 , SN: GITQA6QC26B

pi-system-61/admin#
```

show logging

To display the state of system logging (syslog) and the contents of the standard system logging buffer, use the **show logging** command in EXEC mode.

show logging {**application** [*application-name*]} {**internal**} {**system**} |

Syntax Description		
	application	Displays application logs.

application-name	Application name. Up to 255 alphanumeric characters. • *tail*—Tail system syslog messages. • *count*—Tail last count messages. From 0 to 4,294,967,295. |—Output modifier variables (see below).
internal	Displays the syslogs configuration.
system	Displays the system syslogs.
|	Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the interface. Add number after the word *count*. • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludes lines that match. Up to 80 alphanumeric characters. • *include*—Includes lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10.

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

This command displays the state of syslog error and event logging, including host addresses, and for which, logging destinations (console, monitor, buffer, or host) logging is enabled.

Example 1

```
ncs/admin# show logging system
ADEOS Platform log:
-----------------

Example 2

```
ncs/admin# show logging internal

log server:          localhost
Global loglevel:     6
Status:              Enabled
ncs/admin#
```

Example 3

```
ncs/admin# show logging internal

log server:          localhost
Global loglevel:     6
Status:              Disabled
ncs/admin#
```

show logins

To display the state of system logins, use the **show logins** command in EXEC mode.

show logins cli

Syntax Description		
	cli	Lists the **cli** login history.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines Requires the **cli** keyword; otherwise, an error occurs.

```
ncs/admin# show logins cli
admin    pts/0        10.77.137.60     Fri Aug  6 09:45   still logged in
admin    pts/0        10.77.137.60     Fri Aug  6 08:56 - 09:30  (00:33)

admin    tty1                          Thu Aug  5 18:15 - down   (00:00)
reboot   system boot  2.6.18-164.el5PA Thu Aug  5 18:09          (00:06)
setup    tty1                          Thu Aug  5 17:43 - 18:07  (00:24)
reboot   system boot  2.6.18-164.el5PA Thu Aug  5 16:05          (02:02)

wtmp begins Thu Aug  5 16:05:36 2010

ncs/admin#
```

show memory

To display the memory usage of all of the running processes, use the **show memory** command in EXEC mode.

show memory

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

```
ncs/admin# show memory
total memory:    1035164 kB
```

```
free memory:       27128 kB
cached:           358888 kB
swap-cached:      142164 kB

ncs/admin#
```

show netstat

To display statistics about your network connection, use **show netstat** command in EXEC mode.

show netstat{ > | | }

Syntax Description

>	Output redirection.
|	Output modifiers.

Command Default No default behavior.

Command Modes EXEC

```
ncs/admin# show netstat

show ntp

To show the status of the NTP associations, use the **show ntp** command in EXEC mode.

show ntp

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

EXEC ncs/admin# **show ntp** pi-system-241/admin# show ntp NTP Server 1 : 10.81.254.202 NTP Server 2 : 10.64.58.50 synchronised to NTP server (10.81.254.202) at stratum 2 time correct to within 173 ms polling server every 1024 s remote refid st t when poll reach delay offset jitter ========== ========== *10.81.254.202 .GPS. 1 u 255 1024 377 272.081 1.756 1.850 +10.64.58.50 10.67.68.33 2 u 27 1024 377 0.388 -0.936 1.904 Warning: Output results may conflict during periods of changing synchronization.

Related Commands

Command	Description
ntp server	Allows synchronization of the software clock by the NTP server for the system.

show ports

To display information about all of the processes listening on active ports, use the **show ports** command in EXEC mode.

show ports [|] [|]

Syntax Description

| Output modifier variables:

- *begin*—Matched pattern. Up to 80 alphanumeric characters.
- *count*—Counts the number of lines in the interface. Add number after the word *count*.

  |—Output modifier variables (see Table A-12).
- *end*—Ends with line that matches. Up to 80 alphanumeric characters.
- *exclude*—Excludes lines that match. Up to 80 alphanumeric characters.
- *include*—Includes lines that match. Up to 80 alphanumeric characters.
- *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10.

  |—Output modifier variables (see Table A-12).

Command Default

No default behavior or values.

Command Modes

EXEC

Usage Guidelines

When you run the **show ports** command, the port must have an associated active session.

```

Table 12: Show Process Field Descriptions

Field	Description
USER	Logged-in user.
PID	Process ID.
TIME	The time that the command was last used.
TT	Terminal that controls the process.
COMMAND	Type of process or command used.

show repository

To display the file contents of the repository, use the **show repository** command in EXEC mode.

show repository repository-name

Syntax Description

repository-name	Name of the repository whose contents you want to view. Up to 30 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

EXEC

Related Commands

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
repository	Enters the repository submode for configuration of backups.
show backup history	Displays the backup history of the system.

show restore

To display the restore history, use the **show restore** command in EXEC mode.

show restore {**history**}

Syntax Description

history	Displays the restore history.

Command Default

No default behavior or values.

Command Modes

EXEC

```
pi-common-133/admin# show restore history

Related Commands

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
repository	Enters the repository submode for configuration of backups.
show backup history	Displays the backup history of the system.

show restore log

To display the last restore operation in the case of Auto logout console, use the **show restore log** command in EXEC mode. You can run this command even while performing a restore operation and a successful restore operation.

show restore log

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

EXEC

Example 1

```
pi-system/admin# show restore log
Started at : Tue Nov 14 13:10:09 2017
Initiating restore.  Please wait...

Command	Description
restore	Restores from backup the file contents of a specific repository.

show running-config

To display the contents of the currently running configuration file or the configuration, use the **show running-config** command in EXEC mode.

showrunning-config

Syntax Description

This command has no arguments or keywords.

Command Default

The **show running-config** command displays all of the configuration information.

Command Modes

EXEC

```
ncs/admin# show running-config

```

show tech-support

To display technical support information, including email, use the **show tech-support** command in EXEC mode.

show tech-support file [word]

Syntax Description

file	Saves any technical support data as a file in the local disk.
word	Filename to save. Up to 80 alphanumeric characters.

Command Default

Passwords and other security information do not appear in the output.

Command Modes

EXEC

Usage Guidelines

The **show tech-support** command is useful for collecting a large amount of information about your server for troubleshooting purposes. You can then provide output to technical support representatives when reporting a problem.

```
ncs/admin# show tech-support

```

Related Commands

Command	Description
show interface	Displays the usability status of the interfaces.
show process	Displays information about active processes.
show running-config	Displays the contents of the current running configuration.

show terminal

To obtain information about the terminal configuration parameter settings, use the **show terminal** command in EXEC mode.

show terminal

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

EXEC

```
ncs/admin# show terminal
TTY: /dev/pts/0 Type: "vt100"
Length: 27 lines, Width: 80 columns
Session Timeout: 30 minutes
ncs/admin#
```

show terminal describes the fields of the **show terminal** output.

Table 13: Show Terminal Field Descriptions

Field	Description
TTY: /dev/pts/0	Displays standard output to type of terminal.
Type: “vt100“	Type of current terminal used.
Length: 24 lines	Length of the terminal display.
Width: 80 columns	Width of the terminal display, in character columns.
Session Timeout: 30 minutes	Length of time, in minutes, for a session, after which the connection closes.

show timezone

To display the time zone set on the system, use the **show timezone** command in EXEC mode.

show timezone

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

```
pi-system/admin# show timezone
Asia/Kolkata
pi-system/admin#
```

Related Commands

Command	Description
clock timezone	Sets the time zone on the system.
show timezones	Displays the time zones available on the system.

show timezones

To obtain a list of time zones from which you can select, use the **show timezones** command in EXEC mode.

show timezones

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines

See the clock timezone command, for examples of the time zones available for the server.

```
ncs/admin# show timezones

Related Commands

Command	Description
show timezone	Displays the time zone set on the system.
clock timezone	Sets the time zone on the system.

show udi

To display information about the UDI of the Cisco ISE 3315 appliance, use the **show udi** command in EXEC mode.

show udi

Syntax Description

This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

The following output appears when you run the **show udi** on **Hyper V**appliance server.

Example 1

```
pi-system/admin# sh udi
SPID: Cisco-HY-SPID
VPID: V02
Serial: KDGGLLPDJDC

pi-system-241/admin#
```

The following output appears when you run the **show udi** on **Gen 2** appliance server.

Example 2

```
pi-system/admin# sh udi
PID: PI-UCS-APL-K9
VPID: A0
Serial: FCH1842V1EH

pi-system-117/admin#
```

show uptime

To display the length of time that you have been logged in to the server, use the **show uptime** command in EXEC mode.

show uptime |

Syntax Description

|	(Optional) Output modifier variables: • *begin*—Matched pattern. Up to 80 alphanumeric characters. • *count*—Counts the number of lines in the output. Add number after the word *count*. • *end*—Ends with line that matches. Up to 80 alphanumeric characters. • *exclude*—Excludes lines that match. Up to 80 alphanumeric characters. • *include*—Includse lines that match. Up to 80 alphanumeric characters. • *last*—Displays last few lines of output. Add number after the word *last*. Up to 80 lines to display. Default 10.

Command Default No default behavior or values.

Command Modes EXEC

```
ncs/admin# show uptime
3 day(s), 18:55:02
ncs/admin#
```

show users

To display the list of users logged in to the server, use the **show users** command in EXEC mode.

show users

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

```
ncs/admin# show users
USERNAME         ROLE   HOST                    TTY      LOGIN DATETIME

admin            Admin  10.77.137.60            pts/0    Fri Aug  6 09:45:47 2010

ncs/admin#
```

show version

To display information about the software version of the system, use the **show version** command in EXEC mode.

show version

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines This command displays version information about the Cisco ADE-OS software running on the server, and displays the version.

```
pi-system-121/admin# show version
Cisco Application Deployment Engine OS Release: 4.1
ADE-OS Build Version: 4.1.0.001
ADE-OS System Architecture: x86_64

Copyright (c) 2009-2018 by Cisco Systems, Inc.

Version : 3.6.0 [FIPS not Enabled]
Build : 3.6.0.0.172
```

Configuration Commands

This section lists the **configuration commands** along with a brief description of their use, command defaults, command syntax, command modes, usage guidelines, command examples, and related commands, where applicable.

Configuration commands include **interface** and **repository**.

Note Some of the configuration commands require you to enter the configuration submode to complete the command configuration.

To access configuration mode, you must use the **configure** command in EXEC mode.

aaa authentication

To configure external authentication, use the **aaa authentication** command in configuration mode.

aaa authentication tacacs+ server *TACACS server address* **key plain** *shared-key*

Syntax Description

TACACS server address	IP address or hostname of the TACACS+ server.
shared-key	Indicates the shared secret text string.

Command Default No default behavior or values.

Command Modes Configuration

```
admin# aaa authentication tacacs+ server 1.1.1.5 key plain Secret
admin# username tacacsuser password remote role admin
```

Ensure that the TACACS+ server has the same user name of the Prime Infrastructure server, and Prime Infrastructure and TACACS+ servers are integrated properly.

backup-staging-url

You can use this option to configure a Network File System (NFS) share on Cisco Prime Infrastructure when partition is low on disk space and a backup cannot be taken. You can do so by using the **backup-staging-url** command in configuration mode.

backup-staging-url *word*

Syntax Description

word	NFS URL for staging area. Up to 2048 alphanumeric characters. Use **nfs:**//*server*:*path*(1) .

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

The URL is NFS only. The format of the command is **backup-staging-url nfs:**//server:path.

Caution Ensure that you secure your NFS server in such a way that the directory can be accessed only by the IP address of the server.

```
ncs/admin(config)# backup-staging-url nfs://loc-filer02a:/vol/local1/private1/jdoe
ncs/admin(config)#
```

cdp holdtime

To specify the amount of time for which the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it, use the **cdp holdtime** command in configuration mode. To revert to the default setting, use the **no** form of this command.

[no] cdp holdtime *seconds*

Syntax Description

seconds	Specifies the hold time, in seconds. Value from 10 to 255 seconds.

Command Default

180 seconds

Command Modes

Configuration

Usage Guidelines

Cisco Discovery Protocol packets transmit with a time to live, or hold time, value. The receiving device will discard the Cisco Discovery Protocol information in the Cisco Discovery Protocol packet after the hold time has elapsed.

The **cdp holdtime** command takes only one argument; otherwise, an error occurs.

```
ncs/admin(config)# cdp holdtime 60
ncs/admin(config)#
```

Related Commands

	Description
cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.

	Description
cdp run	Enables the Cisco Discovery Protocol.

cdp run

To enable the Cisco Discovery Protocol, use the **cdp run** command in configuration mode. To disable the Cisco Discovery Protocol, use the **no** form of this command.

[no] cdp run *[GigabitEthernet]*

Syntax Description

GigabitEthernet	Specifies the Gigabit Ethernet interface on which to enable the Cisco Discovery Protocol.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

The command has one optional argument, which is an interface name. Without an optional interface name, the command enables the Cisco Discovery Protocol on all interfaces.

Note The default for this command is on interfaces that are already up and running. When you are bringing up an interface, stop the Cisco Discovery Protocol first; then, start the Cisco Discovery Protocol again.

```
ncs/admin(config)# cdp run GigabitEthernet 0
ncs/admin(config)#
```

Related Commands

	Description
cdp holdtime	Specifies the length of time that the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it.
cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.

cdp timer

To specify how often the server sends Cisco Discovery Protocol updates, use the **cdp timer** command in configuration mode. To revert to the default setting, use the **no** form of this command.

[no] cdp timer *seconds*

Syntax Description		
	seconds	Specifies how often, in seconds, the server sends Cisco Discovery Protocol updates. Value from 5 to 254 seconds.

Command Default 60 seconds

Command Modes Configuration

Usage Guidelines Cisco Discovery Protocol packets transmit with a time to live, or hold time, value. The receiving device will discard the Cisco Discovery Protocol information in the Cisco Discovery Protocol packet after the hold time has elapsed.

The **cdp timer** command takes only one argument; otherwise, an error occurs.

```
ncs/admin(config)# cdp timer 60
ncs/admin(config)#
```

Related Commands

	Description
cdp holdtime	Specifies the amount of time that the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it.
cdp run	Enables the Cisco Discovery Protocol.

clock timezone

To set the time zone, use the **clock timezone** command in configuration mode. To disable this function, use the **no** form of this command.

clock timezone *timezone*

Syntax Description		
	timezone	Name of the time zone visible when in standard time. Up to 64 alphanumeric characters.

Command Default UTC

Command Modes Configuration

Usage Guidelines The system internally keeps time in Coordinated Universal Time (UTC). If you do not know your specific time zone, you can enter the region, country, and city (see Tables Table 14: Common Time Zones, Table 15: Australia Time Zones, and Table 16: Asia Time Zones for sample time zones to enter on your system).

Table 14: Common Time Zones

Acronym or name	Time Zone Name
Europe	

Acronym or name	Time Zone Name
GMT, GMT0, GMT-0, GMT+0, UTC, Greenwich, Universal, Zulu	Greenwich Mean Time, as UTC
GB	British
GB-Eire, Eire	Irish
WET	Western Europe Time, as UTC
CET	Central Europe Time, as UTC + 1 hour
EET	Eastern Europe Time, as UTC + 2 hours
United States and Canada	
EST, EST5EDT	Eastern Standard Time, as UTC -5 hours
CST, CST6CDT	Central Standard Time, as UTC -6 hours
MST, MST7MDT	Mountain Standard Time, as UTC -7 hours
PST, PST8PDT	Pacific Standard Time, as UTC -8 hours
HST	Hawaiian Standard Time, as UTC -10 hours

Table 15: Australia Time Zones

AustraliaFootnote.			
ACTFootnote.	Adelaide	Brisbane	Broken_Hill
Canberra	Currie	Darwin	Hobart
Lord_Howe	Lindeman	LHIFootnote.	Melbourne
North	NSWFootnote.	Perth	Queensland
South	Sydney	Tasmania	Victoria
West	Yancowinna		

[3] (1) Enter the country and city together with a forward slash (/) between them; for example, Australia/Currie.
[4] (2) ACT = Australian Capital Territory
[5] (3) LHI = Lord Howe Island
[6] (4) NSW = New South Wales

Table 16: Asia Time Zones

AsiaFootnote.			
AdenFootnote.	Almaty	Amman	Anadyr

AsiaFootnote.			
Aqtau	Aqtobe	Ashgabat	Ashkhabad
Baghdad	Bahrain	Baku	Bangkok
Beirut	Bishkek	Brunei	Calcutta
Choibalsan	Chongqing	Columbo	Damascus
Dhakar	Dili	Dubai	Dushanbe
Gaza	Harbin	Hong_Kong	Hovd
Irkutsk	Istanbul	Jakarta	Jayapura
Jerusalem	Kabul	Kamchatka	Karachi
Kashgar	Katmandu	Kuala_Lumpur	Kuching
Kuwait	Krasnoyarsk		

[7] (1) The Asia time zone includes cities from East Asia, Southern Southeast Asia, West Asia, and Central Asia.

[8] (2) Enter the region and city or country together separated by a forward slash (/); for example, Asia/Aden.

Note Several more time zones are available to you. On your server, enter the **show timezones** command. A list of all of the time zones available in the server appears. Choose the most appropriate one for your time zone.

```
pi-admin/admin(config)# conf t
Enter configuration commands, one per line.  End with CNTL/Z.
pi-admin/admin(config)# clock timezone Asia/Kolkata
pi-admin/admin(config)#
```

Related Commands

	Description
show timezones, on page 125	Displays a list of available time zones on the system.
show timezone, on page 125	Displays the current time zone set on the system.

do

To execute an EXEC-level command from configuration mode or any configuration submode, use the **do** command in any configuration mode.

do

Syntax Description

This command has no arguments or keywords.

Table 17: Command Options for the Do Command

	Description
application install	Installs a specific application.
application remove	Removes a specific application.
application start	Starts or enables a specific application
application stop	Stops or disables a specific application.
application upgrade	Upgrades a specific application.
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
backup-logs	Performs a backup of all of the logs on the server to a remote location.
clock	Sets the system clock on the server.
configure	Enters configuration mode.
copy	Copies any file from a source to a destination.
debug	Displays any errors or events for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.
delete	Deletes a file on the server.
dir	Lists files on the server.
forceout	Forces the logout of all of the sessions of a specific node user.
halt	Disables or shuts down the server.
mkdir	Creates a new directory.
nslookup	Queries the IPv4 address or hostname of a remote system.
patch	Install System or Application patch.
pep	Configures the Inline PEP node.
ping	Determines the IPv4 network activity on a remote system.
ping6	Determines the IPv6 network activity on a IPv6 remote system.

	Description
reload	Reboots the server.
restore	Performs a restore and retrieves the backup out of a repository.
rmdir	Removes an existing directory.
show	Provides information about the server.
ssh	Starts an encrypted session with a remote system.
tech	Provides Technical Assistance Center (TAC) commands.
telnet	Establishes a Telnet connection to a remote system.
terminal length	Sets terminal line parameters.
terminal session-timeout	Sets the inactivity timeout for all terminal sessions.
terminal session-welcome	Sets the welcome message on the system for all terminal sessions.
terminal terminal-type	Specifies the type of terminal connected to the current line of the current session.
traceroute	Traces the route of a remote IP address.
undebug	Disables the output (display of errors or events) of the **debug** command for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.
write	Erases the startup configuration that forces the setup utility to run and prompts the network configuration, copies the running configuration to the startup configuration, and displays the running configuration on the console.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

Use this command to execute EXEC commands (such as **show**, **clear**, and **debug** commands) while configuring your server. After the EXEC command executes, the system will return to the configuration mode that you were using.

```
ncs/admin(config)# do show run
Generating configuration...
!

ncs/admin(config)#
```

end

To end the current configuration session and return to EXEC mode, use the **end** command in configuration mode.

end

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

This command brings you back to EXEC mode regardless of what configuration mode or submode you are in.

Use this command when you finish configuring the system and you want to return to EXEC mode to perform verification steps.

```
ncs/admin(config)# end
ncs/admin#
```

Related Commands

Command	Description
exit	Exits configuration mode.
exit (EXEC)	Closes the active terminal session by logging out of the server.

exit

To exit any configuration mode to the next-highest mode in the CLI mode hierarchy, use the **exit** command in configuration mode.

exit

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

The **exit** command is used in the server to exit the current command mode to the next highest command mode in the CLI mode hierarchy.

For example, use the **exit** command in configuration mode to return to EXEC mode. Use the **exit** command in the configuration submodes to return to configuration mode. At the highest level, EXEC mode, the **exit** command exits the EXEC mode and disconnects from the server (see exit, for a description of the **exit** (EXEC) command).

```
ncs/admin(config)# exit
ncs/admin#
```

Related Commands

Command	Description
end	Exits configuration mode.
exit (EXEC)	Closes the active terminal session by logging out of the server.

hostname

To set the hostname of the system, use the **hostname** command in configuration mode. To delete the hostname from the system, use the **no** form of this command, which resets the system to localhost.

[no] hostname word

Syntax Description

word	Name of the host. Contains at least 2 to 64 alphanumeric characters and an underscore (_). The hostname must begin with a character that is not a space.

Command Default No default behavior or values.

Command Modes Configuration

Usage Guidelines A single instance type of command, **hostname** only occurs once in the configuration of the system. The hostname must contain one argument; otherwise, an error occurs.

```
ncs/admin(config)# hostname ncs-1
Changing the hostname or IP may result in undesired side effects,
such as installed application(s) being restarted.
Are you sure you want to proceed? [y/n] y

ncs-1/admin#
```

icmp echo

To configure the Internet Control Message Protocol (ICMP) echo responses, use the **icmp echo** command in configuration mode.

icmp echo {off | on}

Syntax Description

off	Disables ICMP echo response.
on	Enables ICMP echo response.

Command Default The system behaves as if the ICMP echo response is on (enabled).

Command Modes Configuration

```
ncs/admin(config)# icmp echo off
ncs/admin(config)#
```

Related Commands

Command	Description
show icmp_status	Display ICMP echo response configuration information.

interface

To configure an interface type and enter interface configuration mode, use the **interface** command in configuration mode.

Note VMware virtual machine may have a number of interfaces available. This depends on how many network interfaces (NIC) are added to the virtual machine.

interface GigabitEthernet ip-address

Syntax Description

GigabitEthernet	Configures the Gigabit Ethernet interface.
0 - 3	Number of the Gigabit Ethernet port to configure.

Note After you enter the Gigabit Ethernet port number in the **interface** command, you enter config-GigabitEthernet configuration submode (see the following Syntax Description).

do	EXEC command. Allows you to perform any EXEC commands in this mode (see do).
end	Exits config-GigabitEthernet submode and returns you to EXEC mode.
exit	Exits the config-GigabitEthernet configuration submode.
ip	Sets IP address and netmask for the Ethernet interface (see ip address).
ipv6	Configures the IPv6 autoconfiguration address and IPv6 address from DHCPv6 server. (see ipv6 address autoconfig and ipv6 address dhcp).

no	Negates the command in this mode. Two keywords are available: • ip—Sets the IP address and netmask for the interface. • shutdown—Shuts down the interface.
shutdown	Shuts down the interface (see shutdown).

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

You can use the **interface** command to configure subinterfaces to support various requirements.

```
ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config-GigabitEthernet)#
```

Related Commands

Command	Description
show interface	Displays information about the system interfaces.
ip address (interface configuration mode)	Sets the IP address and netmask for the interface.
shutdown (interface configuration mode)	Shuts down the interface (see shutdown).

ipv6 address autoconfig

To enable IPv6 stateless autoconfiguration, use the **ipv6 address autoconfig** command in configuration mode. To remove the address from the interface, use the **no** form of this command.

[no] ipv6 address autoconfig [default]0

Syntax Description

default	(Optional) If a default router is selected on this interface, the default keyword causes a default route to be installed using that default router. The **default** keyword can be specified only on one interface.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

IPv6 stateless autoconfiguration has the security downfall of having predictable IP addresses. This downfall is resolved with privacy extensions. You can verify that the privacy extensions feature is enabled using the **show** command.

IPv6 address autoconfiguration is enabled by default in Linux. Cisco ADE 2.0 shows the IPv6 address autoconfiguration in the running configuration for any interface that is enabled.

Example 1

```
ncs/admin# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config)# (config-GigabitEthernet)# ipv6 address autoconfig
ncs/admin(config)# (config-GigabitEthernet)# end
ncs/admin#
```

When IPv6 autoconfiguration is enabled, the running configuration shows the interface settings similar to the following:

```
!
interface GigabitEthernet 0
  ip address 172.23.90.116 255.255.255.0
  ipv6 address autoconfig
!
```

You can use the **show interface GigabitEthernet 0** command to display the interface settings. In example 2, you can see that the interface has three IPv6 addresses. The first address (starting with 3ffe) is obtained using the stateless autoconfiguration. For the stateless autoconfiguration to work, you must have IPv6 route advertisement enabled on that subnet. The next address (starting with fe80) is a link-local address that does not have any scope outside the host. You will always see a link local address regardless of the IPv6 autoconfiguration or DHCPv6 configuration. The last address (starting with 2001) is obtained from a IPv6 DHCP server.

Example 2

```
ncs/admin# show interface GigabitEthernet 0
eth0      Link encap:Ethernet  HWaddr 00:0C:29:AF:DA:05
          inet addr:172.23.90.116  Bcast:172.23.90.255  Mask:255.255.255.0
          inet6 addr: 3ffe:302:11:2:20c:29ff:feaf:da05/64 Scope:Global
          inet6 addr: fe80::20c:29ff:feaf:da05/64 Scope:Link
          inet6 addr: 2001:558:ff10:870:8000:29ff:fe36:200/64 Scope:Global
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:77848 errors:0 dropped:0 overruns:0 frame:0
          TX packets:23131 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:10699801 (10.2 MiB)  TX bytes:3448374 (3.2 MiB)
          Interrupt:59 Base address:0x2000

ncs/admin#
```

To verify that the privacy extensions feature is enabled, you can use the **show interface GigabitEthernet 0** command. You can see two autoconfiguration addresses: one address is without the privacy extensions, and the other is with the privacy extensions.

In the example 3 below, the MAC is 3ffe:302:11:2:20c:29ff:feaf:da05/64 and the non-RFC3041 address contains the MAC, and the privacy-extension address is 302:11:2:9d65:e608:59a9:d4b9/64.

The output appears similar to the following:

Example 3

```
ncs/admin# show interface GigabitEthernet 0
eth0      Link encap:Ethernet  HWaddr 00:0C:29:AF:DA:05
```

```
inet addr:172.23.90.116  Bcast:172.23.90.255  Mask:255.255.255.0
inet6 addr: 3ffe:302:11:2:9d65:e608:59a9:d4b9/64 Scope:Global
inet6 addr: 3ffe:302:11:2:20c:29ff:feaf:da05/64 Scope:Global
inet6 addr: fe80::20c:29ff:feaf:da05/64 Scope:Link
UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
RX packets:60606 errors:0 dropped:0 overruns:0 frame:0
TX packets:2771 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:1000
RX bytes:9430102 (8.9 MiB)  TX bytes:466204 (455.2 KiB)
Interrupt:59 Base address:0x2000

ncs/admin#
```

Related Commands

Command	Description
show interface	Displays information about the system interfaces.
ip address (interface configuration mode)	Sets the IP address and netmask for the interface.
shutdown (interface configuration mode)	Shuts down the interface (see shutdown).
ipv6 address dhcp	Enables IPv6 address DHCP on an interface.
show running-config	Displays the contents of the currently running configuration file or the configuration.

ipv6 address dhcp

To enable IPv6 address DHCP, use the **ipv6 address dhcp** command in configuration mode. To remove the address from the interface, use the **no** form of this command.

[no] ipv6 address dhcp [rapid-commit] 0

Syntax Description

[rapid-commit]	(Optional) Allows the two-message exchange method for address assignment.
0	Gigabit Ethernet port number to be configured.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

None.

```
ncs/admin# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config-GigabitEthernet)# ipv6 address dhcp
ncs/admin(config-GigabitEthernet)# end
ncs/admin#
```

When IPv6 DHCPv6 is enabled, the running configuration shows the interface settings similar to the following:

```
!
interface GigabitEthernet 0
  ip address 172.23.90.116 255.255.255.0
  ipv6 address dhcp
!
```

Note The IPv6 stateless autoconfiguration and IPv6 address DHCP are not mutually exclusive. It is possible to have both IPv6 stateless autoconfiguration and IPv6 address DHCP on the same interface. You can use the **show interface** to display what IPv6 addresses are in use for a particular interface.

When both the IPv6 stateless autoconfiguration and IPv6 address DHCP are enabled, the running configuration shows the interface settings similar to the following:

```
!
interface GigabitEthernet 0
  ip address 172.23.90.116 255.255.255.0
  ipv6 address dhcp
!
```

Related Commands

Command	Description
show interface	Displays information about the system interfaces.
ip address (interface configuration mode)	Sets the IP address and netmask for the interface.
shutdown (interface configuration mode)	Shuts down the interface (see shutdown).
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration on an interface.
show running-config	Displays the contents of the currently running configuration file or the configuration.

ipv6 address static

To assign static IPv6 address, use the **ipv6 address static** command in configuration mode. To remove the address from the interface, use the **no** form of this command.

ipv6 address static [ipv6 address] 0

Command Default No default behavior or values.

Command Modes Configuration

Usage Guidelines None.

```
admin(config-GigabitEthernet)# ipv6 address static 0:0:0:0:0:ffff:a7e:a9d2
```

```
admin(config-GigabitEthernet)# ipv6 default-gateway 0:0:0:0:0:ffff:ffff:ffe0
```

Related Commands

Command	Description
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration on an interface.
ipv6 address dhcp, on page 143	Enables IPv6 address DHCP on an interface.

ip address

To set the IP address and netmask for the Ethernet interface, use the **ip address** command in interface configuration mode. To remove an IP address or disable IP processing, use the **no** form of this command.

[no] ip address ip-address netmask

Note You can configure the same IP address on multiple interfaces. You might want to do this to limit the configuration steps that are needed to switch from using one interface to another.

Syntax Description

ip-address	IPv4 version IP address.
netmask	Mask of the associated IP subnet.

Command Default

Enabled.

Command Modes

Interface configuration

Usage Guidelines

Requires exactly one address and one netmask; otherwise, an error occurs.

```
ncs/admin(config)# interface GigabitEthernet 1
ncs/admin(config-GigabitEthernet)# ip address 209.165.200.227 255.255.255.224
Changing the hostname or IP may result in undesired side effects,
such as installed application(s) being restarted.
........
To verify that NCS processes are running, use the
'show application status ncs' command.
ncs/admin(config-GigabitEthernet)#
```

Related Commands

Command	Description
shutdown (interface configuration mode)	Disables an interface (see shutdown).
ip default-gateway	Sets the IP address of the default gateway of an interface.
show interface	Displays information about the system IP interfaces.

Command	Description
interface	Configures an interface type and enters the interface mode.

ip default-gateway

To define or set a default gateway with an IP address, use the **ip default-gateway** command in configuration mode. To disable this function, use the **no** form of this command.

[no] ip default-gateway ip-address

Syntax Description

ip-address	IP address of the default gateway.

Command Default

Disabled.

Command Modes

Configuration

Usage Guidelines

If you enter more than one argument or no arguments at all, an error occurs.

```
ncs/admin(config)# ip default-gateway 209.165.202.129
ncs/admin(config)#
```

Related Commands

Command	Description
ip address (interface configuration mode)	Sets the IP address and netmask for the Ethernet interface.

ip domain-name

To define a default domain name that the server uses to complete hostnames, use the **ip domain-name** command in configuration mode. To disable this function, use the **no** form of this command.

[no] ip domain-name word

Syntax Description

word	Default domain name used to complete the hostnames. Contains at least 2 to 64 alphanumeric characters.

Command Default

Enabled.

Command Modes

Configuration

Usage Guidelines

If you enter more or fewer arguments, an error occurs.

```
ncs/admin(config)# ip domain-name cisco.com
ncs/admin(config)#
```

Related Commands

	Description
ip name-server	Sets the DNS servers for use during a DNS query.

ip name-server

To set the Domain Name Server (DNS) servers for use during a DNS query, use the **ip name-server** command in configuration mode. You can configure one to three DNS servers. To disable this function, use the **no** form of this command.

Note Using the **no** form of this command removes all of the name servers from the configuration. Using the **no** form of this command and one of the IP names removes only that IP name server.

[no] ip name-server *ip-address [ip-address*]}*

Syntax Description

ip-address	Address of a name server.
*ip-address**	(Optional) IP addresses of additional name servers. **Note** You can configure a maximum of three name servers.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

The first name server that is added with the **ip name-server** command occupies the first position and the system uses that server first to resolve the IP addresses.

You can add name servers to the system one at a time or all at once, until you reach the maximum (3). If you already configured the system with three name servers, you must remove at least one server to add additional name servers.

To place a name server in the first position so that the subsystem uses it first, you must remove all name servers with the **no** form of this command before you proceed.

```
ncs/admin(config)# ip name-server 209.165.201.1

To verify that NCS processes are running, use the
'show application status ncs' command.
ncs/admin(config)#
```

You can choose not to restart the server; nevertheless, the changes will take effect.

Related Commands

Command	Description
ip domain-name	Defines a default domain name that the server uses to complete hostnames.

ip route

To configure the static routes, use the **ip route** command in configuration mode. To remove static routes, use the **no** form of this command.

ip route prefix mask **gateway** ip-address

no ip route prefix mask

Syntax Description

prefix	IP route prefix for the destination.
mask	Prefix mask for the destination.
gateway	Route-specific gateway
ip-address	IP address of the next hop that can be used to reach that network.

Command Default

No default behavior or values.

Configuration.

Usage Guidelines

Static routes are manually configured, which makes them inflexible (they cannot dynamically adapt to network topology changes), but extremely stable. Static routes optimize bandwidth utilization, because no routing updates need to be sent to maintain them. They also make it easy to enforce routing policy.

```
ncs/admin(config)# ip route 192.168.0.0 255.255.0.0 gateway 172.23.90.2
ncs/admin(config)#
```

logging

To enable the system to forward logs to a remote system or to configure the log level, use the **logging** command in configuration mode. To disable this function, use the **no** form of this command.

[no] logging *{ip-address | hostname}* {**loglevel** *level*}

Syntax Description

ip-address	IP address of remote system to which you forward logs. Up to 32 alphanumeric characters.
hostname	Hostname of remote system to which you forward logs. Up to 32 alphanumeric characters.
loglevel	The command to configure the log level for the **logging** command.

level	Number of the desired priority level at which you set the log messages. Priority levels are (enter the number for the keyword): • 0-emerg—Emergencies: System unusable. • 1-alert—Alerts: Immediate action needed. • 2-crit—Critical: Critical conditions. • 3-err—Error: Error conditions. • 4-warn—Warning: Warning conditions. • 5-notif—Notifications: Normal but significant conditions. • 6-inform—(Default) Informational messages. • 7-debug—Debugging messages.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

This command requires an IP address or hostname or the **loglevel** keyword; an error occurs if you enter two or more of these arguments.

Example 1

```
ncs/admin(config)# logging 209.165.200.225
ncs/admin(config)#
```

Example 2

```
ncs/admin(config)# logging loglevel 0
ncs/admin(config)#
```

Related Commands

Command	Description
show logging	Displays the list of logs for the system.

ntp server

To allow for software clock synchronization by the NTP server for the system, use the **ntp server** command in configuration mode. Allows up to three servers.

ntp server *{ ntp-server}*

For the unauthenticated NTP servers, use the following command:

ntp server *{ ntp-server}*

Syntax Description

intp-server |	IP address or hostname of the server providing the clock synchronization. Arguments are limited to 255 alphanumeric characters.

Command Default

No servers are configured by default.

Command Modes

Configuration

Usage Guidelines

Use this command if you want to allow the system to synchronize with a specified server.

Note The synchronization process can take up to 20 minutes to complete.

Related Commands

Command	Description
show ntp	Displays the status information about the NTP associations.

Example - NTP Server Addition

```
ncs/admin(config)# ntp server 192.0.2.1 10 plain password
ncs/admin(config)# ntp server 192.0.2.2 20 plain pass123
```

Example - NTP Server Initialization

```
ncs/admin# sh ntp
pi-ha-test-237-75/admin# sh ntp
NTP Server 1 : 192.0.2.1 : keyid=10
NTP Server 2 : 192.0.2.2
NTP Server 3 : 192.0.2.3 : keyid=10

unsynchronised
  time server re-starting
   polling server every 64 s

     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
192.0.2.1    .INIT.          16 u    -   64    0    0.000    0.000   0.000

192.0.2.3  192.0.2.2     2 u    8   64   37  231.451    7.517   3.784

Warning: Output results may conflict during periods of changing synchronization.
```

password-policy

To enable or configure the passwords on the system, use the **password-policy** command in configuration mode. To disable this function, use the **no** form of this command.

[no] password-policy option

Note The **password-policy** command requires a policy option (see Syntax Description). You must enter the **password-expiration-enabled** command before the other password-expiration commands.

Syntax Description

option	Different command options.

Note After you enter the **password-policy** command, you can enter config-password-policy configuration submode.

digit-required	Requires a digit in the password.
disable-repeat-characters	Disables the ability of the password to contain more than four identical characters.
disable-cisco-password	Disables the ability to use the word Cisco or any combination as the password.
do	EXEC command.
end	Exits from configure mode.
exit	Exits from this submode.
lower-case-required	Requires a lowercase letter in the password.
min-password-length	Specifies a minimum number of characters for a valid password. Integer length from 1 to 40.
no	Negates a command or set its defaults.

no-previous-password	Prevents users from reusing a part of their previous password.
no-username	Prohibits users from reusing their username as a part of a password.
password-expiration-days	Number of days until a password expires. Integer length from 1 to 3600.
password-expiration-enabled	Enables password expiration. **Note** You must enter the **password-expiration-enabled** command before the other password-expiration commands.
password-expiration-warning	Number of days before expiration that warnings of impending expiration begin. Integer length from 0 to 3600.
password-lock-enabled	Locks a password after several failures.
password-lock-retry-count	Number of failed attempts before password locks. Integer length from 1 to 20.
upper-case-required	Requires an uppercase letter in the password.
special-required	Requires a special character in the password.

Command Default No default behavior or values.

Command Modes Configuration

```
ncs/admin(config)# password-policy
ncs/admin(config-password-policy)# password-expiration-days 30
ncs/admin(config-password-policy)# exit
ncs/admin(config)#
```

repository

To enter the repository submode for configuration of backups, use the **repository** command in configuration mode.

repository *repository-name*

Syntax Description

repository-name	Name of repository. Up to 80 alphanumeric characters.

Note After you enter the name of the repository in the **repository** command, you enter repository configuration submode.

do	EXEC command.
end	Exits repository config submode and returns you to EXEC mode.
exit	Exits this mode.
no	Negates the command in this mode. Two keywords are available: • url—Repository URL. • user—Repository username and password for access.
url	URL of the repository. Up to 80 alphanumeric characters (see Table A-20).
user	Configure the username and password for access. Up to 30 alphanumeric characters.

Table 18: URL Keywords

Keyword	Source of Destination
word	Enter the repository URL, including server and path info. Up to 80 alphanumeric characters.
cdrom:	Local CD-ROM drive (read only).
disk:	Local storage. You can enter the **show repository** *repository_name* command to view all of the files in the local repository. **Note** All local repositories are created on the /localdisk partition. When you specify disk:/ in the repository URL, the system creates directories in a path that is relative to /localdisk. For example, if you entered **disk:/backup,** the directory is created at /localdisk/backup.
ftp:	Source or destination URL for an FTP network server. Use url ftp://*server*/*path*(1) .
nfs:	Source or destination URL for an NFS network server. Use url nfs://*server*:*path*1.

Keyword	Source of Destination
sftp:	Source or destination URL for an SFTP network server. Use url sftp://*server*/*path*1. **Note** SFTP Repositories may require the // between the ip address/FQDN and the physical path on the SFTP store. If you find that you cannot access the SFTP repository with single slashes, add the additional slash and try the operation again. Example: Repository SFTP-Store url sftp://server//path
tftp:	Source or destination URL for a TFTP network server. Use url tftp://*server*/*path*1. **Note** You cannot use a TFTP repository for performing a upgrade.

Command Default

No default behavior or values.

Command Modes

Configuration

Example 1

```
ncs/admin#
ncs/admin(config)# repository myrepository
ncs/admin(config-Repository)# url sftp://example.com/repository/system1
ncs/admin(config-Repository)# user abcd password plain example
ncs/admin(config-Repository)# exit
ncs/admin(config)# exit
ncs/admin#
```

Example 2

```
ncs/admin# configure termainal
ncs/admin(config)# repository myrepository
ncs/admin(config-Repository)# url disk:/
ncs/admin(config-Repository)# exit
ncs/admin(config)# exit
```

Related Commands

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Performs a restore and takes the backup out of a repository.

Command	Description
show backup history	Displays the backup history of the system.
show repository	Displays the available backup files located on a specific repository.

service

To specify a service to manage, use the **service** command in configuration mode. To disable this function, use the **no** form of this command.

[no] service sshd

Syntax Description

sshd	Secure Shell Daemon. The daemon program for SSH.

Command Default

No default behavior or values.

Command Modes

Configuration

```
ncs/admin(config)# service sshd
ncs/admin(config)#
```

shutdown

To shut down an interface, use the **shutdown** command in interface configuration mode. To disable this function, use the **no** form of this command.

[no] shutdown

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Interface

Usage Guidelines

When you shut down an interface using this command, you lose connectivity to the Cisco ISE-3315 appliance through that interface (even though the appliance is still powered on). However, if you have configured the second interface on the appliance with a different IP and have not shut down that interface, you can access the appliance through that second interface.

To shut down an interface, you can also modify the ifcfg-eth[0,1] file, which is located at */etc/sysconfig/network-scripts,* using the ONBOOT parameter:

- Disable an interface: set ONBOOT="no"
- Enable an interface: set ONBOOT="yes"

You can also use the **no shutdown** command to enable an interface.

```
ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config-GigabitEthernet)# shutdown
```

Related Commands

Command	Description
interface	Configures an interface type and enters interface mode.
ip address (interface configuration mode)	Sets the IP address and netmask for the Ethernet interface.
show interface	Displays information about the system IP interfaces.
ip default-gateway	Sets the IP address of the default gateway of an interface.

snmp-server community

To set up the community access string to permit access to the Simple Network Management Protocol (SNMP), use the **snmp-server community** command in configuration mode. To disable this function, use the **no** form of this command.

[no] snmp-server community *word* **ro**

Syntax Description

word	Accessing string that functions much like a password and allows access to SNMP. No blank spaces allowed. Up to 255 alphanumeric characters.
ro	Specifies read-only access.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

The **snmp-server community** command requires a community string and the **ro** argument; otherwise, an error occurs.

```
ncs/admin(config)# snmp-server community new ro
ncs/admin(config)#
```

Related Commands

Command	Description
snmp-server host	Sends traps to a remote system.
snmp-server location	Configures the SNMP location MIB value on the system.

Command	Description
snmp-server contact	Configures the SNMP contact MIB value on the system.

snmp-server contact

To configure the SNMP contact Management Information Base (MIB) value on the system, use the **snmp-server contact** command in configuration mode. To remove the system contact information, use the **no** form of this command.

[no] snmp-server contact *word*

Syntax Description

word	String that describes the system contact information of the node. Up to 255 alphanumeric characters.

Command Default

No default behavior or values.

Command Modes

Configuration

Usage Guidelines

None.

```
ncs/admin(config)# snmp-server contact Abcd
ncs/admin(config)#
```

Related Commands

Command	Description
snmp-server host	Sends traps to a remote system.
snmp-server community	Sets up the community access string to permit access to the SNMP.
snmp-server location	Configures the SNMP location MIB value on the system.

snmp-server host

To send SNMP traps to a remote user, use the **snmp-server host** command in configuration mode. To remove trap forwarding, use the **no** form of this command.

[no] snmp-server host {*ip-address* | *hostname*} **version** {1 | 2c} *community*

Syntax Description

ip-address	IP address of the SNMP notification host. Up to 32 alphanumeric characters.
hostname	Name of the SNMP notification host. Up to 32 alphanumeric characters.

version {1 | 2c}	(Optional) Version of the SNMP used to send the traps. Default = 1. If you use the version keyword, specify one of the following keywords: • 1—SNMPv1. • 2c—SNMPv2C.
community	Password-like community string that is sent with the notification operation.

Command Default Disabled.

Command Modes Configuration

Usage Guidelines The command takes arguments as listed; otherwise, an error occurs.

```
ncs/admin(config)# snmp-server community new ro
ncs/admin(config)# snmp-server host 209.165.202.129 version 1 password
ncs/admin(config)#
```

Related Commands

Command	Description
snmp-server community	Sets up the community access string to permit access to SNMP.
snmp-server location	Configures the SNMP location MIB value on the system.
snmp-server contact	Configures the SNMP contact MIB value on the system.

snmp-server location

To configure the SNMP location MIB value on the system, use the **snmp-server location** command in configuration mode. To remove the system location information, use the **no** form of this command.

[no] snmp-server location *word*

Syntax Description

word	String that describes the physical location information of the system. Up to 255 alphanumeric characters.

Command Default No default behavior or values.

Command Modes Configuration

Usage Guidelines We recommend that you use underscores (_) or hyphens (-) between the terms within the *word* string. If you use spaces between terms within the *word* string, you must enclose the string in quotation marks (“).

Example 1

```
ncs/admin(config)# snmp-server location Building_3/Room_214
ncs/admin(config)#
```

Example 2

```
ncs/admin(config)# snmp-server location "Building 3/Room 214"
ncs/admin(config)#
```

Related Commands

Command	Description
snmp-server host	Sends traps to a remote system.
snmp-server community	Sets up the community access string to permit access to SNMP.
snmp-server contact	Configures the SNMP location MIB value on the system.

username

To add a user who can access the Cisco ISE-3315 using SSH, use the **username** command in configuration mode. If the user already exists, the password, the privilege level, or both change with this command. To delete the user from the system, use the **no** form of this command.

[no] username *username* **password** {**hash** | **plain**} *password* **role** {**admin** | **user**] [**disabled** [**email** email-address]] [**email** email-address]

For an existing user, use the following command option:

username username **password role** {admin | **user**} password

Syntax Description

username	You should enter only one word which can include hyphen (-), underscore (_) and period (.). **Note** Only alphanumeric characters are allowed at an initial setup.
password	The command to use specify password and user role.
password	Password character length up to 40 alphanumeric characters. You must specify the password for all new users.
hash | plain	Type of password. Up to 34 alphanumeric characters.
role admin | user	Sets the privilege level for the user.
disabled	Disables the user according to the user's email address.

email *email-address*	The user's email address. For example, user1@example.com.

Command Default

The initial user during setup.

Command Modes

Configuration

Usage Guidelines

The **username** command requires that the username and password keywords precede the hash | plain and the admin | user options.

Example 1

```
ncs/admin(config)# username admin password hash ###### role admin
ncs/admin(config)#
```

Example 2

```
ncs/admin(config)# username admin password plain Secr3tp@swd role admin
ncs/admin(config)#
```

Example 3

```
ncs/admin(config)# username admin password plain Secr3tp@swd role admin email
admin123@example.com
ncs/admin(config)#
```

Related Commands

	Description
password-policy	Enables and configures the password policy.
show users	Displays a list of users and their privilege level. It also displays a list of logged-in users.
