## CHAPTER 1

# Cisco NCS 1004 Overview

This chapter provides an overview of the Cisco Network Convergence Series (NCS) 1004.

- [Cisco NCS 1004 Features, on page 1](#)
- [Interoperability with Cisco NCS 1001, on page 1](#)
- [Supported Line Cards, on page 2](#)

## Cisco NCS 1004 Features

Cisco NCS 1004 is a two RU unit that supports up to 4.8 Tbps traffic. The NCS 1004 has two redundant, field replaceable AC and DC power supply units and three redundant, field replaceable fans. It also provides a field replaceable controller card. The NCS 1004 has SSD disks both on board the chassis and on the controller card for resiliency. Each NCS 1004 chassis provides four line cardslots. Each NCS 1004 slot can host a line card. See [Supported Line Cards, on page 2](#) for more information.

The NCS 1004 delivers the following benefits:

- Transport of any trunk rate from to 600 Gbps wavelengths on the same platform through software provisioning.
- Support of granular control of baud-rate and modulation format to maximize spectral efficiency.
- One universal transponder that is optimized for performance for metro, long-haul, and submarine applications.
- Support for up to 350,000 ps/nm of residual chromatic dispersion compensation.
- Transport of 100GE and OTU4 client rates on the same platform through software provisioning.
- 600G DWDM, which provides unparalleled scale and density. 64 channels of 600G at 75 GHz providing 38.4 Tbps in 16 RU.
- State-of-the-art AES-256 encryption at scale – 4.8 Tbps of encrypted trunk capacity per 2 RU.

## Interoperability with Cisco NCS 1001

When the Cisco NCS 1001 with Protection Switching Module (PSM) configured as non-revertive, interoperates with Cisco NCS 1004, traffic loss may occur. After the traffic has switched from the working to the protect

path, do not perform a manual switch for 120 seconds. If you perform a manual switch, and the protect path fails, traffic loss of up to 13 seconds can occur.

# Supported Line Cards

The following line cards are supported on Cisco NCS 1004.

## NCS1K4-1.2T-K9 C-Band Line Card

The NCS1K4-1.2T-K9 ( or 1.2 Tbps) C-band line card has 12 QSFP-28 based clients and two DWDM trunk ports. The trunk ports are capable of several line rates with fine control of modulation format, baud-rate, and forward error correction. The trunk ports are software configurable. The line card supports module and slice configurations.

---

**Note** "1.2TC" refers to the NCS1K4-1.2T-K9 C-band line card.

---

The features of the 1.2T line card are:

- The card provides up to 12 100G or OTU4 client ports.
- The baud rate can be controlled between 28 Gbd/s and 72 Gbd/s.
- The frequency range is 191.25 to 196.1 THz with a default value of 193.1 THz.
- The modulation format can be QPSK, 8 QAM, 16 QAM, 32 QAM, or 64 QAM.
- Hybrid modulations formats can be configured through 1/128 bits/symbol granularity.
- Forward Error Correction (FEC) of 27% and 15% overhead across line rates (only 15% for 600G).

## CHAPTER 2

# Configuring the Card Mode

This chapter lists the supported configurations and the procedures to configure the card mode on the line cards.

- [1.2T and 1.2TL Line Cards, on page 3](#)

## 1.2T and 1.2TL Line Cards

The following section describes the supported configurations and procedures to configure the card modes on the line cards.

### Card Modes

The line cards support module and slice configurations.

The line cards have two trunk ports (0 and 1) and 12 client ports (2 through 13) each. You can configure the line card in two modes:

- Muxponder—In this mode, both trunk ports are configured with the same trunk rate. The client-to-trunk mapping is in a sequence.
- Muxponder slice—In this mode, each trunk port is configured independent of the other with different trunk rates. The client-to-trunk mapping is fixed. For Trunk 0, the client ports are 2 through 7. For Trunk 1, the client ports are 8 through 13.

## Supported Data Rates

The following data rates are supported on the line card.

. LLDP drop, L1 encryption, and AINS are not supported on the OTU4 configuration.

The following table displays the client and trunk ports that are enabled for the muxponder configuration.

Trunk Data Rate	Card Support	Client Data Rate (100GE, OTU4)	Trunk Ports	Client Ports
200	1.2T	100GE, OTU4	0, 1	2, 3, 4, 5
300	1.2T	100GE, OTU4	0, 1	2, 3, 4, 5, 6, 7

**Supported Data Rates**

<b>Trunk Data Rate</b>	<b>Card Support</b>	<b>Client Data Rate (100GE, OTU4)</b>	<b>Trunk Ports</b>	<b>Client Ports</b>
400	1.2T	100GE	0, 1	2, 3, 4, 5, 6, 7, 8, 9
500	1.2T	100GE	0, 1	2, 3, 4, 5, 6, 7, 8, 9, 10, 11
600	1.2T	100GE	0, 1	2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13

The following table displays the client and trunk ports that are enabled for the muxponder slice 0 configuration.

<b>Trunk Data Rate</b>	<b>Card Support</b>	<b>Client Data Rate</b>	<b>Trunk Ports</b>	<b>Client Ports</b>
100	1.2T, 1.2TL		0	2
200	1.2T		0	2, 3
300	1.2T		0	2, 3, 4
400	1.2T		0	2, 3, 4, 5
500	1.2T		0	2, 3, 4, 5, 6
600	1.2T		0	2, 3, 4, 5, 6, 7

The following table displays the client and trunk ports that are enabled for the muxponder slice 1 configuration.

<b>Trunk Data Rate</b>	<b>Card Support</b>	<b>Client Data Rate</b>	<b>Trunk Ports</b>	<b>Client Ports</b>
100	1.2T, 1.2TL		1	8
200	1.2T		1	8, 9
300	1.2T		1	8, 9, 10
400	1.2T		1	8, 9, 10, 11
500	1.2T		1	8, 9, 10, 11, 12
600	1.2T		1	8, 9, 10, 11, 12, 13

All configurations can be accomplished by using appropriate values for client bitrate and trunk bitrate parameters of the **hw-module** command.

The following table displays the trunk parameter ranges for the 1.2T card.

<b>Trunk Payload</b>	<b>FEC</b>	<b>Min BPS</b>	<b>Max BPS</b>	<b>Min GBd</b>	<b>Max GBd</b>
200G	27%	2	4.40625	31.51	69.43
300G	27%	2.8984375	6	34.7175497	71.8681352
400G	27%	3.8671875	6	46.2900663	71.8197392

Trunk Payload	FEC	Min BPS	Max BPS	Min GBd	Max GBd
500G	27%	4.8281250	6	57.8625828	71.9068991
600G	15%	5.2578125	-	-	71.9552971

To configure the BPS, see [Configuring the BPS, on page 8](#).

## Configuring the Card Mode

You can configure the line card in the module (muxponder) or slice configuration (muxponder slice).

To configure the card in the muxponder mode, use the following commands.

**configure**

**hw-module location *location* mxponder client-rate {100GE | OTU4}**

**hw-module location *location* mxponder trunk-rate {100G|200G | 300G | 400G | 500G | 600G }**

**commit**

To configure the card in the muxponder slice mode, use the following commands.

**configure**

**hw-module location *location* mxponder-slice *mxponder-slice-number* client-rate 100GE**

**hw-module location *location* mxponder-slice trunk-rate { 200G | 300G | 400G | 500G | 600G }**

**commit**

### Examples

The following is a sample in which the card is configured in the muxponder mode with a 500G trunk payload.

```
RP/0/RP0/CPU0:ios#config
Sun Feb 24 14:09:33.989 UTC
RP/0/RP0/CPU0:ios(config)#hw-module location 0/2 mxponder client-rate OTU4
RP/0/RP0/CPU0:ios(config)#hw-module location 0/2 mxponder trunk-rate 500G
RP/0/RP0/CPU0:ios(config)#commit
```

The following is a sample in which the card is configured in the muxponder slice 0 mode with a 500G trunk payload.

```
RP/0/RP0/CPU0:ios#config
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder-slice 0 client-rate 100GE
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder-slice 0 trunk-rate 500G
RP/0/RP0/CPU0:ios(config)#commit
```

The following is a sample in which the card is configured in the muxponder slice 1 mode with a 400G trunk payload.

```
RP/0/RP0/CPU0:ios#config
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder-slice 1 client-rate 100GE
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder-slice 1 trunk-rate 400G
RP/0/RP0/CPU0:ios(config)#commit
```

### Verifying the Card Configuration

## Configuring the Card Mode

```
RP/0/RP0/CPU0:ios#show hw-module location 0/2 mxponder
Fri Mar 15 11:48:48.344 IST

Location:          0/2
Client Bitrate:    100GE
Trunk Bitrate:     500G
Status:            Provisioned
LLDP Drop Enabled: FALSE
Client Port        Mapper/Trunk Port   CoherentDSP0/2/0/0  CoherentDSP0/2/0/1
                           Traffic Split Percentage

HundredGigECtrlr0/2/0/2  ODU40/2/0/0/1      100          0
HundredGigECtrlr0/2/0/3  ODU40/2/0/0/2      100          0
HundredGigECtrlr0/2/0/4  ODU40/2/0/0/3      100          0
HundredGigECtrlr0/2/0/5  ODU40/2/0/0/4      100          0
HundredGigECtrlr0/2/0/6  ODU40/2/0/0/5      100          0
HundredGigECtrlr0/2/0/7  ODU40/2/0/1/1      0           100
HundredGigECtrlr0/2/0/8  ODU40/2/0/1/2      0           100
HundredGigECtrlr0/2/0/9  ODU40/2/0/1/3      0           100
HundredGigECtrlr0/2/0/10 ODU40/2/0/1/4      0           100
HundredGigECtrlr0/2/0/11 ODU40/2/0/1/5      0           100
```

The following is a sample output of all the muxponder slice 0 configurations.

```
RP/0/RP0/CPU0:ios#show hw-module location 0/1 mxponder-slice 0
Fri Mar 15 06:04:18.348 UTC

Location:          0/1
Slice ID:          0
Client Bitrate:    100GE
Trunk Bitrate:     500G
Status:            Provisioned
LLDP Drop Enabled: FALSE
Client Port        Mapper/Trunk Port   CoherentDSP0/1/0/0
                           Traffic Split Percentage

HundredGigECtrlr0/1/0/2  ODU40/1/0/0/1      100
HundredGigECtrlr0/1/0/3  ODU40/1/0/0/2      100
HundredGigECtrlr0/1/0/4  ODU40/1/0/0/3      100
HundredGigECtrlr0/1/0/5  ODU40/1/0/0/4      100
HundredGigECtrlr0/1/0/6  ODU40/1/0/0/5      100
```

The following is a sample output of all the muxponder slice 1 configurations.

```
RP/0/RP0/CPU0:ios#show hw-module location 0/1 mxponder-slice 1
Fri Mar 15 06:11:50.020 UTC

Location:          0/1
Slice ID:          1
Client Bitrate:    100GE
Trunk Bitrate:     400G
Status:            Provisioned
LLDP Drop Enabled: TRUE
Client Port        Mapper/Trunk Port   CoherentDSP0/1/0/1
                           Traffic Split Percentage

HundredGigECtrlr0/1/0/8  ODU40/1/0/1/1      100
HundredGigECtrlr0/1/0/9  ODU40/1/0/1/2      100

```

## Configuring the BPS

You can configure the Bits per Symbol (BPS) to 3.4375 to support 300G trunk configurations on 75 GHz networks using the following commands:

**configure**

**controller optics R/S/I/P bits-per-symbol 3.4375**

**commit**

The following is a sample in which the BPS is configured to 3.4375.

```

RP/0/RP0/CPU0:ios#configure
Wed Mar 27 14:12:49.932 UTC
RP/0/RP0/CPU0:ios(config)#controller optics 0/3/0/0 bits-per-symbol 3.4375
RP/0/RP0/CPU0:ios(config)#commit

```

### Viewing BPS and Baud Rate Ranges

To view the the BPS for a specific range use the following command:

**show controller optics R/S/I/P bps-range bps-range | include data-rate | include fec-type**

```

RP/0/RP0/CPU0:ios#show controllers optics 0/3/0/0 bps-range 3 3.05 | include 300G | include
SD27
Thu Mar 28 03:01:39.751 UTC

## CHAPTER 3

# Configuring Controllers

There are three types of controllers for the line card. The controllers are the optics controller, the ethernet controller, and the coherent DSP controller. This chapter describes the procedures used to configure these controllers.

- [AINS, on page 11](#)
- [FEC, on page 17](#)
- [Laser Squelching, on page 20](#)
- [Idle Insertion, on page 21](#)
- [LLDP Drop, on page 22](#)
- [Link Layer Discovery Protocol \(LLDP\) Support on Management Interface, on page 25](#)
- [Loopback, on page 29](#)
- [Restore Factory Settings, on page 31](#)
- [Headless Mode, on page 33](#)
- [Trail Trace Identifier, on page 33](#)
- [Chromatic Dispersion, on page 35](#)
- [Frequency, on page 36](#)

## AINS

The Automatic-In-Service (AINS) feature allows the controller to automatically move to the automatic-in-service state after the maintenance window is completed. A soak time period is associated with the AINS state. The controller automatically moves to the In-Service state after the soak time period is completed. During the AINS maintenance window, alarms are not propagated to the EMS/NMS monitoring system.

You can configure AINS on the client ports of the card.

## AINS States

The following table lists the AINS states.

State	Description
None	AINS is not enabled on the controller or the soak time period is complete.

**Soak Time Period**

<b>State</b>	<b>Description</b>
Pending	AINS is configured on the controller. However, the soak time period has not started because either the primary state of controller is in Shutdown, Admin down, or Not ready state or the secondary state is in Maintenance state. AINS can also move to Pending state if alarms are raised during the soak time period.
Running	AINS is enabled on the controller. The primary state of the controller is Up and the secondary state is AINS.

If there are any service-affecting alarms when AINS is running on ethernet or optics controllers, the AINS state moves to Pending state. When the alarms are cleared, the AINS state moves to Running state.

The AINS soak time period restarts when there are line card reloads, XR reloads, line card warm reloads, power cycles, or alarm conditioning.

## Soak Time Period

You can configure the soak time period to be between 1 minute to 48 hours.

All alarms are suppressed during the AINS state. When the optical and ethernet alarms are raised on the port during the soak time period, the AINS state moves to Pending. These alarms are not displayed in the output of the **show alarms brief card location 0/RP0/CPU0 active** command but in the output of the **show alarms brief card location 0/RP0/CPU0 conditions** command. When all the alarms clear, the soak time period starts, and the AINS state moves to Running. When the soak time period expires, the port moves to IS state.

## Configuring AINS

To configure AINS on a muxponder, use the following command:

**configure**

**hw-module location *location* muxponder client-port-ains-soak hours *hours* minutes *minutes***

**commit**

The following is a sample in which all client ports are configured with AINS with soak time period specified to be 15 minutes.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3 muxponder client-port-ains-soak hours 0
minutes 15
RP/0/RP0/CPU0:ios(config)#commit
```

To configure AINS on a muxponder slice, use the following command:

**configure**

**hw-module location *location* muxponder-slice *slice-number* client-port-ains-soak hours *hours* minutes *minutes***

**commit**

The following is a sample in which slice 0 client ports are configured with AINS with soak time period specified to be 40 minutes.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3 mxponder-slice 0 client-port-ains-soak
hours 0 minutes 40
RP/0/RP0/CPU0:ios(config)#commit
```

## Disabling AINS

To disable AINS on all muxponder client ports, set the hours and minutes to 0. Use the following commands:

**configure**

**hw-module location *location* mxponder client-port-ains-soak hours *hours* minutes *minutes***

**commit**

The following is a sample in which AINS is disabled on all client ports.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3 mxponder client-port-ains-soak hours 0
minutes 0
RP/0/RP0/CPU0:ios(config)#commit
```

To disable AINS on a muxponder slice, set the hours and minutes to 0. Use the following command:

**configure**

**hw-module location *location* mxponder-slice *slice-number* client-port-ains-soak hours *hours* minutes *minutes***

**commit**

The following is a sample in which AINS is disabled on all client ports of slice 0.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3 mxponder-slice 0 client-port-ains-soak
hours 0 minutes 0
RP/0/RP0/CPU0:ios(config)#commit
```

## Displaying the AINS Configuration

The AINS Soak field in the output indicates the current state of AINS. The current state can be None, Pending, or Running. The Total Duration field indicates the total soak time period that is configured. The Remaining Duration field indicates the soak time that remains, after which, the AINS state moves to None.

This example displays the ethernet controller statistics with AINS Soak in running state.

```
RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/1/0/2

AINS remaining time : 0 seconds

```

**FEC**

Forward error correction (FEC) is a feature that is used for controlling errors during data transmission. This feature works by adding data redundancy to the transmitted message using an algorithm. This redundancy allows the receiver to detect and correct a limited number of errors occurring anywhere in the message, instead of having to ask the transmitter to resend the message.

**FEC States for Ethernet Controller**

The following table lists the FEC states for the Ethernet controller.

State	Description
None	FEC is not enabled on the Ethernet controller.
Standard	Standard (Reed-Solomon) FEC is enabled on the Ethernet controller.

FEC configuration is automatically enabled for only the pluggables that support Auto-FEC. If you manually configure FEC, the manual configuration overrides the Auto-FEC.

The supported pluggables for Auto-FEC are:

- QSFP-100G-SR4-S
- QSFP-100G-CWDM4-S
- QSFP-100G-SM-SR

- QSFP-100G-AOC-1M
- QSFP-100G-AOC-3M
- QSFP-100G-AOC-10M
- QDD-400-AOC15M
- QDD-400G-FR4-S
- QSFP-100G-ER4L
- QDD-400G-DR4-S
- QDD-400G-LR8-S

The LR4 pluggable is a 1310nm long range band pluggable that does not require you to enable FEC.

The software automatically enables FEC mode on the pluggables installed in the Cisco NCS 1004. When you upgrade the software of an NCS 1004 with pluggables in the FEC disabled mode, traffic is affected.

The following sample shows the running FEC configuration on the LR4 pluggable:

```
RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/0/0/4
Thu Aug  8 15:41:20.857 IST

        Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)
    Laser Squelch: Enabled

Phy:
    Media type: Not known

Autonegotiation disabled.

Operational values:
    Speed: 100Gbps
    Duplex: Full Duplex
    Flowcontrol: None
    Loopback: None (or external)
    BER monitoring:
        Not supported
    Holdoff Time: 0ms
```

The following sample shows the running FEC configuration on the non LR4 pluggable:

```
RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/0/0/2
Thu Aug  8 15:41:56.457 IST
Operational data for interface HundredGigECtrlr0/0/0/2:

State:
    Administrative state: enabled
    Operational state: Up
    LED state: Green On
```

```

Maintenance: Disabled
AINS Soak: None
    Total Duration: 0 hour(s) 0 minute(s)
    Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)
Laser Squelch: Disabled

Phy:
    Media type: Not known
    Statistics:
        FEC:
            Corrected Codeword Count: 0
            Uncorrected Codeword Count: 66

Autonegotiation disabled.

Operational values:
    Speed: 100Gbps
    Duplex: Full Duplex
    Flowcontrol: None
    Loopback: None (or external)
    BER monitoring:
        Not supported
    Forward error correction: Standard (Reed-Solomon)
    Holdoff Time: 0ms

```

## Configuring FEC on the Ethernet Controller

**Note** The FEC configuration is not required for the supported pluggables. The configuration is required only in the case of non-Cisco qualified non-LR4 pluggables.

To configure FEC on the Ethernet controller, use the following command:

```

configure
controller HundredGigECtrlr R/S/I/P fec { none | standard }
commit

```

The following sample shows how to configure FEC on the Ethernet controller:

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/1/0/10 fec standard
RP/0/RP0/CPU0:ios(config)#commit

```

The following sample shows the running FEC configuration on the Ethernet controller:

```

RP/0/RP0/CPU0:BH-SIT2#show controller HundredGigECtrlr 0/1/0/10
Tue Jul 16 15:30:30.165 IST
Operational data for interface HundredGigECtrlr0/1/0/10:

State:
    Administrative state: enabled
    Operational state: Down (Reason: State undefined)
    LED state: Red On
    Maintenance: Disabled
    AINS Soak: None
        Total Duration: 0 hour(s) 0 minute(s)
        Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)

```

**Laser Squelching**

```

Laser Squelch: Disabled

Phy:
  Media type: Not known
  Alarms:
    Current:
      Loss of Frequency Sync Data
  Statistics:
    FEC:
      Corrected Codeword Count: 0
      Uncorrected Codeword Count: 0

Autonegotiation disabled.

Operational values:
  Speed: 100Gbps
  Duplex: Full Duplex
  Flowcontrol: None
  Loopback: None (or external)
  BER monitoring:
    Not supported
  Forward error correction: Standard (Reed-Solomon)
  Holdoff Time: 0ms

```

## Laser Squelching

You can enable laser squelching on Ethernet controllers. When laser squelching is enabled, the laser is shut down in the event of trunk faults (LOS, LOF), and a SQUELCHED alarm is raised on the mapped client port.

To configure laser squelching on the Ethernet controllers, use the following commands:

**configure**

**controller HundredGigECtrlr Rack/Slot/Instance/Port**

**laser-squelch**

**commit**

The following is a sample where laser squelching is enabled on the Ethernet controller.

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/1/0/10
RP/0/RP0/CPU0:ios(config-eth-cctrlr)#laser-squelch
RP/0/RP0/CPU0:ios(config-eth-cctrlr)#commit

```

The following is a sample to view the laser squelch status on the controller.

```

RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/1/0/10
Fri Feb 22 15:18:47.011 UTC
Operational data for interface HundredGigECtrlr0/1/0/10:

State:
  Administrative state: enabled
  Operational state: Up
  LED state: Green On
  Maintenance: Disabled
  AINS Soak: None
    Total Duration: 0 hour(s) 0 minute(s)
    Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)
Laser Squelch: Enabled

```

```

Phy:
  Media type: Not known
  Statistics:
    FEC:
      Corrected Codeword Count: 0
      Uncorrected Codeword Count: 0

  Autonegotiation disabled.

Operational values:
  Speed: 100Gbps
  Duplex: Full Duplex
  Flowcontrol: None
  Loopback: None (or external)
  BER monitoring:
    Not supported
  Forward error correction: Standard (Reed-Solomon)
  Holdoff Time: 0ms

```

## Idle Insertion

When a fault occurs on the trunk port, you can hold the propagation of local faults using the idle insertion feature. This feature is enabled on the ethernet controller by configuring the hold-off timer.

When the fault occurs on the trunk, idles are inserted in the traffic stream from the trunk port to the client port for the duration of the configured holdoff-time. If the trunk port remains faulty beyond the configured holdoff-time, a local fault is transmitted towards the client device. If the trunk recovers from the fault before the holdoff-time expires, traffic resumes.

This feature can be used on customer deployments to prevent reset of client ports during a PSM switchover.

You can enable the idle insertion feature by using the following commands:

### **configure**

**controller HundredGigECtrlr Rack/Slot/Instance/Port**

**holdoff-time trunk-fault time-value**

The range of *timevalue* is from 0 ms to 3000 ms.

The following is a sample for enabling the hold off -timer in 100GE controllers:

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/1/0/10
RP/0/RP0/CPU0:ios (config-eth-cctrlr)#holdoff-time trunk-fault 3000
RP/0/RP0/CPU0:ios(config-eth-cctrlr)#commit

```

To view the hold-off time that is configured on 100GE controller, use the following command:

**show controllers hundredGigECtrlr Rack/Slot/Instance/Port**

### **Example**

```

RP/0/RP0/CPU0:ios#show controllers HundredGigECtrlr 0/1/0/10
Fri Feb 22 18:58:06.888 UTC
Operational data for interface HundredGigECtrlr0/1/0/10:

State:
  Administrative state: enabled
  Operational state: Up
  LED state: Green On

```

```

Maintenance: Disabled
AINS Soak: None
    Total Duration: 0 hour(s) 0 minute(s)
    Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)
Laser Squelch: Disabled

Phy:
    Media type: Not known
    Statistics:
        FEC:
            Corrected Codeword Count: 0
            Uncorrected Codeword Count: 0

Autonegotiation disabled.

Operational values:
    Speed: 100Gbps
    Duplex: Full Duplex
    Flowcontrol: None
    Loopback: None (or external)
    BER monitoring:
        Not supported
    Forward error correction: Standard (Reed-Solomon)
Holdoff Time: 3000ms

```

## LLDP Drop

Link Layer Discovery Protocol (LLDP) Snooping is enabled by default on all ethernet controllers.

To verify the LLDP neighbors, use the following commands:

```

RP/0/RP0/CPU0:ios#show lldp neighbors detail
Tue Mar 12 11:49:20.819 IST
Capability codes:
    (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
    (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
-----
Local Interface: HundredGigECtrlr0/1/0/7
Chassis id: 008a.96cd.34e1
Port id: Hu0/0/0/4
Port Description - not advertised
System Name: ncs5500_node

System Description:
    6.1.4, NCS-5500

Time remaining: 116 seconds
Hold Time: 120 seconds
System Capabilities: R
Enabled Capabilities: R
Management Addresses - not advertised
Peer MAC Address: 00:8a:96:cd:34:10
-----
Local Interface: HundredGigECtrlr0/1/0/13
Chassis id: 008a.96cd.34e1
Port id: Hu0/0/0/5
Port Description - not advertised
System Name: ncs5500_node

```

```
System Description:
  6.1.4, NCS-5500

Time remaining: 90 seconds
Hold Time: 120 seconds
System Capabilities: R
Enabled Capabilities: R
Management Addresses - not advertised
Peer MAC Address: 00:8a:96:cd:34:14
```

Total entries displayed: 2

```
RP/0/RP0/CPU0:ios#show lldp neighbors
Tue Mar 12 16:17:56.713 IST
Capability codes:
  (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
  (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
```

Device ID	Local Intf	Hold-time	Capability	Port ID
ncs5500_node	HundredGigEController0/1/0/7	120	R	Hu0/0/0/4
ncs5500_node	HundredGigEController0/1/0/13	120	R	Hu0/0/0/5

Total entries displayed: 2

When you enable LLDP drop on the client controller ports of the muxponder or muxponder slice, the LLDP frames drop on the ports without forwarding.

## Configuring LLDP Drop

You can configure the LLDP drop for a muxponder or muxponder slice. By default, the LLDP drop status is set to False. On enabling the LLDP Drop, the status is set to True.

To configure LLDP drop on a muxponder use the following command:

**configure**

**hw-module location *location* mxponder drop-lldp**

**Note** Use the **no** form of the command to disable LLDP drop.

**commit**

**Limitation**

- When you disable LLDP globally, the LLDP gets disabled on all the interfaces.

**Note** By default, LLDP is enabled for NCS 1004. But when you enable and disable LLDP in the global configuration mode, LLDP gets disabled on all the interfaces.

**Workaround:** You must enable LLDP globally or reload the Router.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios#hw-module location 0/1 mxponder drop-lldp
RP/0/RP0/CPU0:ios#commit
```

## Verifying the Status of LLDP Drop

### configure

**hw-module location *location* mxponder-slice *slice-number* drop-lldp**

**Note** Use the **no** form of the command to disable LLDP drop.

To configure LLDP drop on a muxponder slice, use the following command:

### commit

The following is a sample in which slice 0 client ports are enabled with LLDP drop.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder-slice 0 drop-lldp
RP/0/RP0/CPU0:ios(config)#commit
```

## Verifying the Status of LLDP Drop

To verify the LLDP drop enabled status, use the following command.

```
RP/0/RP0/CPU0:ios#show hw-module location all mxponder
Fri Feb 22 13:22:19.281 UTC

## Link Layer Discovery Protocol (LLDP) Support on Management Interface

The LLDP support on management interface feature requires a system to form LLDP neighborship over the system management interface, through which it advertises and learns LLDP neighbor information. This information about neighbors used to learn about the neighbors and in turn the topology of the devices for Operations, Administration, and Maintenance (OAM) purposes.

### Advantages of LLDP

- Provides support on non-Cisco devices.

- Enables neighbor discovery between non-Cisco devices.

### Limitation

- When you disable LLDP globally, the LLDP gets disabled on all the interfaces.

**Note** By default, LLDP is enabled for NCS 1004. But when you enable and disable LLDP in the global configuration mode, LLDP gets disabled on all the interfaces.

**Workaround:** You must enable LLDP globally or reload the Router.

### Cisco Discovery Protocol (CDP) vs LLDP

The CDP is a device discovery protocol that runs over Layer 2. Layer 2 is also known as the data link layer that runs on all Cisco devices, such as routers, bridges, access servers, and switches. This protocol allows the network management applications to automatically discover and learn about other Cisco devices that connect to the network.

The LLDP is also a device discovery protocol that runs over Layer 2. This protocol allows the network management applications to automatically discover and learn about other non-Cisco devices that connect to the network.

### Interoperability between non-Cisco devices using LLDP

LLDP is also a neighbor discovery protocol that is used by network devices to advertise information about themselves to other devices on the network. This protocol runs over the data link layer, which allows two systems running different network layer protocols to learn about each other.

With LLDP, the user can also access the information about a particular physical network connection. If the user uses a non-Cisco monitoring tool (through SNMP), LLDP helps you identify the Object Identifiers (OIDs) that the system supports. The following OIDs are supported:

- 1.0.8802.1.1.2.1.4.1.1.4
- 1.0.8802.1.1.2.1.4.1.1.5
- 1.0.8802.1.1.2.1.4.1.1.6
- 1.0.8802.1.1.2.1.4.1.1.7
- 1.0.8802.1.1.2.1.4.1.1.8
- 1.0.8802.1.1.2.1.4.1.1.9
- 1.0.8802.1.1.2.1.4.1.1.10
- 1.0.8802.1.1.2.1.4.1.1.11
- 1.0.8802.1.1.2.1.4.1.1.12

### Neighbor Discovery

System advertises the LLDP TLV (Type Length Value) details over the management network using which other devices in the management network can learn about this device.

### Configuring LLDP

- LLDP full stack functionality is supported on all three management interfaces supported in NCS 1004.
- You can selectively enable or disable LLDP on any of the management interfaces on demand.
- You can selectively enable or disable LLDP transmit or receive functionality at the management interface level.
- Information gathered using LLDP can be stored in the device Management Information Database (MIB) and queried with the Simple Network Management protocol (SNMP).
- LLDP operational data are available in both Command Line Interface and netconf-yang interface.

### Enabling LLDP Globally

When you enable LLDP globally, all interfaces that support LLDP are automatically enabled for both transmit and receive operations.

**Note** You can override this default operation at the interface to disable receive or transmit operations.

The following table describes the global LLDP attributes that the user can configure:

**Table 1:**

Attribute	Default	Range	Description
Holdtime	120	0–65535	Specifies the hold time (in sec). Hold time refers to the time or duration that an LLDP device maintains the neighbor information before discarding.
Reinit	2	2–5	Delay (in sec) for LLDP initialization on any interface
Timer	30	5–65534	Specifies the rate at which LLDP packets are sent (in sec)

The following example shows the commands to configure LLDP globally. The global LLDP configuration enables LLDP on all the three management interfaces.

```
RP/0/RP0/CPU0:regen#configure terminal
RP/0/RP0/CPU0:regen(config)#lldp management enable
RP/0/RP0/CPU0:regen(config)#lldp holdtime 30
RP/0/RP0/CPU0:regen(config)#lldp reinit 2
RP/0/RP0/CPU0:regen(config)#commit
```

### Verification

You can verify the LLDP configuration using the **show running-config lldp** command.

The output of **show running-config lldp** command is as follows:

## Link Layer Discovery Protocol (LLDP) Support on Management Interface

```
RP/0/RP0/CPU0:regen#show running-config lldp
Tue Dec 10 10:36:11.567 UTC
lldp
  timer 30
  reinit 2
  holdtime 120
  management enable
!
```

You can verify the LLDP data using the **show lldp interface** and **show lldp neighbors** commands.

The output of **show lldp interface** command is as follows:

```
RP/0/RP0/CPU0:regen#show lldp interface
Thu Nov 7 08:45:22.934 UTC
```

```
MgmtEth0/RP0/CPU0/0:
  Tx: enabled
  Rx: enabled
  Tx state: IDLE
  Rx state: WAIT FOR FRAME
```

```
MgmtEth0/RP0/CPU0/1:
  Tx: enabled
  Rx: enabled
  Tx state: IDLE
  Rx state: WAIT FOR FRAME
```

The output of **show lldp neighbors** command is as follows:

```
RP/0/RP0/CPU0:M-131#show lldp neighbors
Mon Dec 2 11:01:20.143 CET
Capability codes:
  (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
  (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other

Device ID      Local Intf          Hold-time  Capability      Port ID
[DISABLED]     MgmtEth0/RP0/CPU0/0   120         B              gi19
MYS-130        MgmtEth0/RP0/CPU0/1   120         R              MgmtEth0/RP0/CPU0/1
```

where [ DISABLED] shows that the LLDP is disabled on the interface MgmtEth0/RP0/CPU0/0.

### Enabling LLDP per Management Interface

The following example shows the commands to configure LLDP at the management interface level.

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/X
RP/0/RP0/CPU0:ios(config-if)#lldp enable
RP/0/RP0/CPU0:ios(config-if)#commit
```

### Disabling LLDP Transmit and Receive Operations

The following example shows the commands to disable the LLDP transmit operations at the specified management interface.

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/X
RP/0/RP0/CPU0:ios(config-if)#lldp transmit disable
RP/0/RP0/CPU0:ios(config-if)#commit
```

The following example shows the commands to disable the LLDP receive operations at the specified management interface.

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/X
RP/0/RP0/CPU0:ios(config-if)#lldp receive disable
RP/0/RP0/CPU0:ios(config-if)#commit
```

## Debugging LLDP Issues

The following commands are used for debugging issues in the LLDP functionality.

- **show lldp traffic**
- **debug lldp all**
- **debug lldp errors**
- **debug lldp events**
- **debug lldp packets**
- **debug lldp tlvs**
- **debug lldp trace**
- **debug lldp verbose**

# Loopback

You can configure the loopback on the CoherentDSP, FC, OTU, and Ethernet controllers to identify connection problems. The loopback can be configured only in the maintenance mode. Use the **controller controller-type** and the **secondary-admin-state maintenance** commands to place the controllers in the maintenance mode.

**Note** Internal and line loopbacks are supported on the FC, OTU, and Ethernet controllers whereas only internal loopbacks are supported on the CoherentDSP controllers.

### Configuring Loopback on the 1.2T Card

To configure the loopback, use the following commands:

```
configure
controller controller-type Rack/Slot/Instance/Port
sec-admin-state maintenance
loopback [ line | internal ]
commit
```

### Example 1

The following example shows how a line loopback is configured on the Ethernet controller.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config) #controller HundredGigECtrlr 1/0/1/10 secondary-admin-state
maintenance
RP/0/RP0/CPU0:ios(config) #commit
Fri Feb 22 19:49:46.504 UTC
RP/0/RP0/CPU0:ios(config) #exit
```

The following example shows how to verify a line loopback configured on the Ethernet controller.

```

RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/1/0/10
Fri Feb 22 19:50:08.328 UTC
Operational data for interface HundredGigECtrlr0/1/0/10:

State:

Q-Margin : 0.99dB

TTI :
    Remote hostname : ios
    Remote interface : CoherentDSP 0/0/0/0
    Remote IP addr : 0.0.0.0

FEC mode : Soft-Decision 27

AINS Soak : None
AINS Timer : 0h, 0m
AINS remaining time : 0 seconds

```

## Restore Factory Settings

**Note** Perform this operation only on the console port.

You can restore the factory settings on the NCS 1004. The entire system configuration, including usernames, passwords, and IP addresses, is removed. You can perform this operation only through the console port and not on the management interface. To restore NCS 1004 to factory settings, use the **commit replace** command. After the **commit replace** operation completes, you must perform the IOS XR reload operation.

**Restore Factory Settings**

The **commit best-effort** command merges the target configuration with the running configuration and commits only valid changes (best effort). Some configuration changes might fail due to semantic errors.

**Example**

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#commit replace
Tue Sep 24 09:36:59.430 UTC

This commit will replace or remove the entire running configuration. This
operation can be service affecting.

```

## Headless Mode

During process restarts, CPU reload, or removal of CPU, the NCS 1004 operates in headless mode for up to 72 hours. During this time, traffic is not impacted, although the control plane is not up and running. Fault propagation continues to operate for failures on client and trunk ports. However, you cannot provision anything nor view operational data with a non-functional CPU. Performance monitoring data based on 15 minutes and 24 hour intervals is not supported with a non-functional CPU.

## Trail Trace Identifier

The Trail trace identifier (TTI) feature helps you to identify the signal from the source to the destination within the network. You can configure the TTI sent or expected string only in ASCII string format. When the expected TTI string does not match the received TTI trace string, the controller goes down and the OTUK-TIM alarm is raised. To configure TTI on the coherent DSP controllers, use the following commands:

**configure**

**controller coherentDSP R/S/I/P tti {sent | expected} ascii *tti-string***

**commit**

**Note** The *tti-string* can have a maximum of 64 characters.

The following sample displays how to configure TTI on a coherent DSP controller with the sent and expected strings set to the same ASCII string. The state of the controller is up.

```

RP/0/RP0/CPU0:ios#config
Fri Mar 15 08:03:02.094 UTC
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/1/0/1 tti sent ascii 1234
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/1/0/1 tti expected ascii 1234
RP/0/RP0/CPU0:ios(config)#commit
Fri Mar 15 08:03:49.725 UTC
RP/0/RP0/CPU0:ios(config)#exit

```

The following example shows how to configure TTI on a coherent DSP controller with the sent and expected strings set to different ASCII strings. The state of the controller goes down and the TIM alarm is raised.

```
RP/0/RP0/CPU0:ios#config
Fri Mar 15 08:54:29.780 UTC
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/1/0/1 tti sent ascii 1234

# Chromatic Dispersion

You can configure chromatic dispersion on optics controllers. When you configure the maximum and minimum values for chromatic dispersion for any data rate, ensure the minimum difference between the configured values is equal to or greater than 1500 ps/nm.

The following table lists the default CD search range.

Data Rate	BPS	Card Support	Default CD Search Range
200G to 500G	BPS <= 3	1.2T	-10,000 to 100,000 ps/nm
	3 < BPS <= 4	1.2T	-10,000 to 80,000 ps/nm
	4 < BPS <= 5	1.2T	-5,000 to 20,000 ps/nm
600G	BPS=5.2578125	1.2T	-2000 to 2,000 ps/nm

**Note** The cd-min and cd-max values must be set for BPS values that are greater than 4 in the 1.2T card.

**Note** When the user provisions the cd-min and cd-max values that are outside the range through CLI, the provisioned values are accepted; however, only the actual values supported by the hardware are applied.

The following is a sample where chromatic dispersion is configured on the optics controller.

```
RP/0/RP0/CPU0:ios#configure
Mon Aug 19 19:31:42.115 UTC

## Frequency

You can configure the frequency on trunk ports of the line card.

The following table lists the frequency range with grid spacing supported on the line card:

Line Card	Frequency Range (THz)	Default Frequency (THz)	Grid Spacing
1.2T	191.25 to 196.1	193.1	50GHz and 100MHz

To configure the wavelength, use the following commands:

**configure**

**controller optics Rack/Slot/Instance/Port**

```
dwdm-carrier {100MHz-grid frequency frequency} | {50GHz-grid [frequency frequency}  
commit
```

## CHAPTER 4

# Performance Monitoring

Performance monitoring (PM) parameters are used by service providers to gather, store, set thresholds for, and report performance data for early detection of network issues. You can configure and retrieve PM counters for the various controllers in 30-second, 15-minute, or 24-hour intervals. These parameters simplify troubleshooting operations and enhance data that can be collected directly from the equipment.

- [Configuring PM Parameters, on page 39](#)

## Configuring PM Parameters

You can configure and view the performance monitoring parameters for the Optics, Ethernet, and coherent DSP controllers.

To configure PM parameters, use the following commands.

**configure**

```
controller controllertype R/S/I/P { pm { 15-min | 30-sec | 24-hour } { optics | ether | pcs | fec | otn } { report | threshold } value }
```

**commit**

### Examples

The following is a sample in which the performance monitoring parameters of the Optics controller are configured at 24-hour intervals.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller optics 0/0/1/5 pm 24-hour optics threshold osnr max
345
RP/0/RP0/CPU0:ios(config)#commit
```

The following is a sample in which the performance monitoring parameters of the Ethernet controller are configured at 15-minute intervals.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/3/0/0 pm 15-min pcs report bip
enable
RP/0/RP0/CPU0:ios(config)#commit
```

The following is a sample in which performance monitoring parameters of a Coherent DSP controller are configured 30-second intervals.

## Configuring PM Parameters

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/1/1 pm 30-sec fec threshold post-fec-ber
max OE-15
RP/0/RP0/CPU0:ios(config)#commit
```

## Viewing PM Parameters

To view the performance monitoring parameters for Optics, Ethernet, and Coherent DSP controllers, use this command:

```
show controllers controller-type R/S/I/P { pm { current | history } { 30 sec | 15-min | 24-hour } { optics | ether | fec | otn | prbs } linenum }
```

**Example 1:** Displays the current performance monitoring parameters of the Optics controller at 15-minute intervals. Client optics have four lanes.

```
RP/0/RP0/CPU0:ios#show controller optics 0/1/0/3 pm current 15-min optics 3
```

```
Sat Feb 9 19:33:42.480 UTC
```

```

### Clearing PM Parameters

To clear the performance monitoring parameters for Ethernet and Coherent DSP controllers, use this command:

**clear controller controller-type R/S/I/P pm**

**Example 1:** Clears the PM parameters on the Coherent DSP controller.

```

RP/0/RP0/CPU0:ios#show controller CD 0/0/0/0 pm current 15-min fec
Mon Jun 10 11:43:39.981 UTC

## CHAPTER 5

# IP Access Lists

---

This chapter describes how to configure IPv4 and IPv6 Access Control Lists (ACL).

- [IP Access List, on page 49](#)

## IP Access List

### How an IP Access List Works

An access list is a sequential list consisting of permit and deny statements that apply to IP addresses and possibly the upper-layer IP protocols. ACLs are used to permit or deny the flow of packets based on matching criteria of access list parameters and information contained in packets. For it to be in effect, an access list must be created and applied to an interface.

An access list can control traffic arriving or leaving the system, but not traffic originating at the system.

### IP Access List Process and Rules

There are two paths for interface packet filtering for ACL configuration:

- Hardware programming path: Hardware programming path is the fast path ACL configuration. The fast path ACL configuration requires Ternary Content Addressable Memory (TCAM) through packet filter Execution Agent.
- Software programming path: Software programming path is the slow path ACL configuration. The slow path ACL configuration requires adding caps to Interface Manager and NetIO.

Use the following process and rules when configuring an IP access list:

- The software tests the source or destination address or the protocol of each packet being filtered against the conditions in the access list, one condition (permit or deny statement) at a time.
- If a packet does not match a statement in the access list, it is tested against the next statement in the list.
- If a packet matches an access list statement, the remaining statements in the list are skipped, and the packet is permitted or denied as specified in the matched statement.
- If the access list denies the address or the protocol, the software discards the packet and returns an Internet Control Message Protocol (ICMP) Host Unreachable message. ICMP is configurable in the Cisco IOS XR software.
- If no conditions match, the software drops the packet because each access list ends with an unwritten or implicit deny statement.

## Configuring an IP Access List

- The access list should contain at least one permit statement; otherwise, all packets are denied.
- The software stops testing the conditions after the first match; so, the order of the conditions is critical. The same permit or deny statements specified in a different order could result in a packet being passed under one circumstance and denied in another circumstance.
- Only one access list per interface, per protocol, per direction is allowed.
- Inbound access lists process packets arriving at the system. Incoming packets are processed before being routed to an outbound interface. An inbound access list is efficient as it saves the overhead of routing lookups if the packet is to be discarded because it is denied by the filtering tests. If the packet is permitted by the tests, it is then processed for routing. For inbound lists, "permit" means continue to process the packet after receiving it on an inbound interface; "deny" means discard the packet.
- Outbound access lists process packets before they leave the system. Incoming packets are routed to the outbound interface and then processed through the outbound access list. For outbound lists, "permit" means send it to the output buffer; "deny" means discard the packet.
- An access list cannot be removed if that access list is being applied by an access group in use. To remove an access list, remove the access group that is referencing the access list and then remove the access list.
- An access-list must be created first before it can actually be applied on the management interface using access-group command.
- ACLs apply only on management interfaces and not on any other type of interfaces or controllers.

Statistics collections are also divided into fast path packets and slow path packets. ACLs information is stored as a global data on the route processor.

### Support of IP Access list in NCS 1004:

NCS 1004 supports the following:

- Ingress ACL for both IPv4 and IPv6.
- Slow packet path for Management Interface.
- Egress ACL: Self-Originated Packet is not supported by ACL, because this is already controlled by the user. Only forwarded packets or traffic classify under ACL. This rule is applicable for both IPv4 and IPv6 ACL.

## Configuring an IP Access List

To configure the ACL, use the following commands at the IPv4 or IPv6 interface:

**configure**

**interface interface-type Rack/Slot/Instance/Port**

**ipv4 | ipv6 access-group access-list-name {ingress | egress}**

**commit**

### Example

```
interface MgmtEth0/RP0/CPU0/0
  ipv4 address 10.1.1.1 255.255.255.0
  ipv6 address 1000::1/64
  ipv4 access-group IPV4_ICMP_DENY ingress
```

```
ipv4 access-group IPV4_ROUTER_FWD_TELNET_TRAFFIC_DENY egress
ipv6 access-group IPV6_SSH_DENY ingress
ipv6 access-group IPV6_ROUTER_FWD_TELNET_TRAFFIC_DENY egress
```

### Sample Configuration for IPv4 Access Lists

```
ipv4 access-list IPV4_ICMP_DENY
10 deny icmp any any
20 permit ipv4 any any
!
ipv4 access-list IPV4_ROUTER_FWD_TELNET_TRAFFIC_DENY
10 deny tcp any any eq telnet
20 permit ipv4 any any
!
```

### Sample Configuration for IPv6 Access Lists

```
ipv6 access-list IPV6_SSH_DENY
10 deny tcp any any eq ssh
20 permit ipv6 any any
!
ipv6 access-list IPV6_ROUTER_FWD_TELNET_TRAFFIC_DENY
10 deny tcp any any eq telnet
20 permit ipv6 any any
!
```

## Verifying ACLs

The following examples verify the number of packets filtered by the respective ACLs:

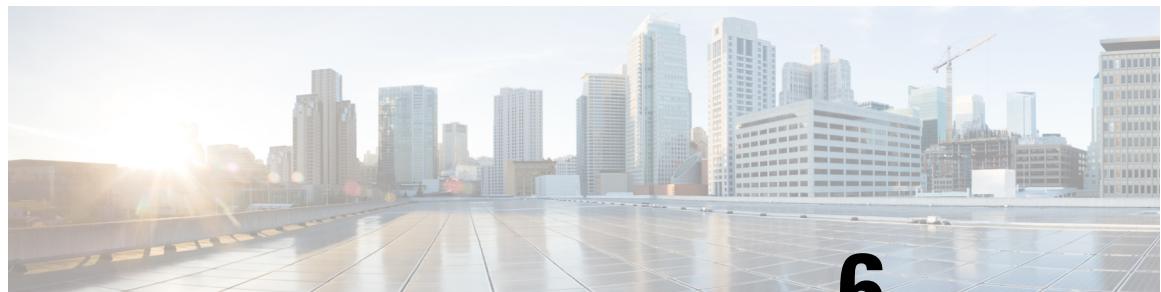

### IPv4:

```
RP/0/RP0/CPU0:ios#show access-lists ipv4
Wed Jan 17 09:52:12.448 IST
ipv4 access-list IPV4_ICMP_DENY
10 deny icmp any any (8 matches)
20 permit ipv4 any any (106 matches)
ipv4 access-list IPV4_ROUTER_FWD_TELNET_TRAFFIC_DENY
10 deny tcp any any eq telnet (3 matches)
20 permit ipv4 any any (6 matches)
```

### IPv6:

```
RP/0/RP0/CPU0:ios#show access-lists ipv6
Wed Jan 17 09:52:14.591 IST
ipv6 access-list IPV6_ROUTER_FWD_TELNET_TRAFFIC_DENY
10 deny tcp any any eq telnet (3 matches)
20 permit ipv6 any any (5 matches)
ipv6 access-list IPV6_SSH_DENY
10 deny tcp any any eq ssh (9 matches)
20 permit ipv6 any any (100 matches)
```

## Verifying ACLs

# CHAPTER 6

## Layer 1 Encryption

This chapter describes how to configure the IKEv2 protocol and layer 1 encryption for NCS 1004.

**Note** In this chapter, "layer 1 encryption" is referred to as "OTNSec".

**Table 2: Feature History**

Feature Name	Release Information	Feature Description
Encryption Support on 1.2TL Card	Cisco IOS XR Release 7.3.1	AES 256 GCM authenticated OTNSec encryption on 1.2TL line cards is supported. It uses only pre-shared keys for authentication. Optical encryption secures the communications link in and out of a facility, rendering all data undecipherable to hackers who tap into networks.

### The Need for High Speed Encryption

Most of the emphasis on protecting networks today is focused on protecting data within data center. However, the infrastructure of networks that connect these data centers are as vulnerable to calculated attacks as the data centers themselves. As more sensitive information gets transmitted across fiber-optic networks, cyber criminals are increasingly turning their attention to intercepting the data when it travels across the network.

With the increase in network or fiber optic hacks, the need for data protection is paramount. Encryption of any data that leaves the data centers is becoming an important requirement for cloud operators. Optical encryption secures everything on the communications link in and out of a facility rendering all data undecipherable to any hacker that taps into the fiber strand. *Protecting data at high speeds or lines rates is a requirement for data centers today.*

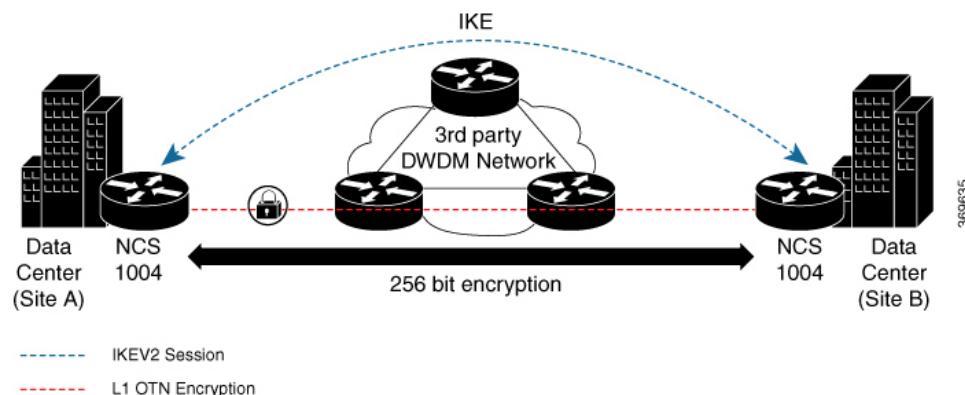

The Cisco NCS 1004 brings to you AES256 based OTNSec encryption for 100GE clients. Encryption is supported on the 1.2T cards.

OTNSec encryption uses the IKEv2 protocol to negotiate and establish the IKEv2 and OTNSec Security Associations (SA). IKEv2 is used for authentication of the devices in an encryption session, and the protocol

provides pre-shared keys (PSK) authentication. The IKEv2 datagrams are carried as payloads using the point-to-point protocol (PPP) over the GCC channel.

To implement this, an IKE session is established between the two endpoints, Site A and Site B, for overhead control plane communication between the two data centers. Data is then encrypted at Site A using OTNSec encryption and decrypted at Site B.

**Figure 1: OTNSec Site-to-Site Example and Components**

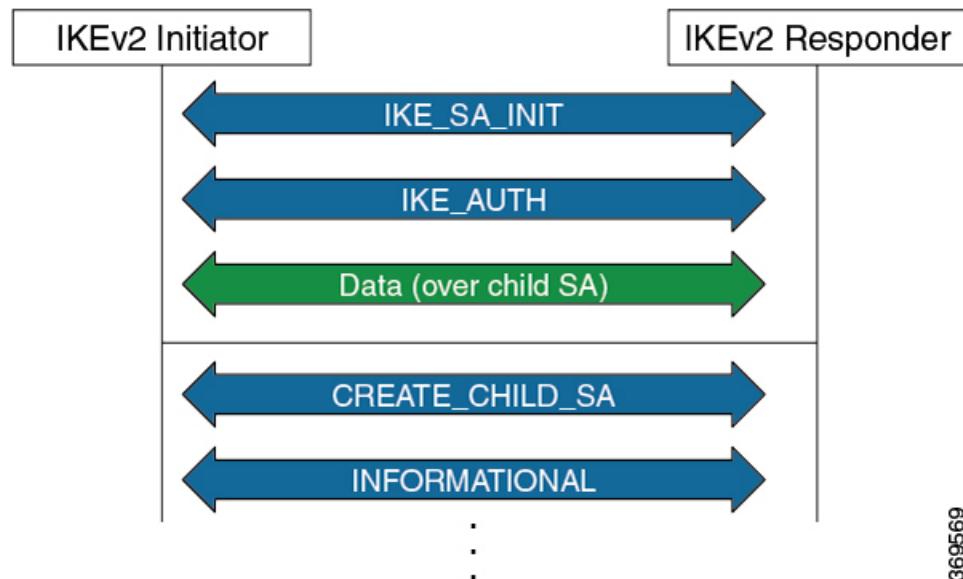

The recommended deployment is to have a single IKEv2 session running over a GCC2 channel per trunk port which creates the child SAs for each of the OTNSec controllers that are configured on the trunk port.

## IKEv2 Overview

Internet Key Exchange Version 2 (IKEv2) is a request and response encryption that establishes and handles security associations (SA) in an authentication suite, such as OTNSec, to ensure secure traffic. IKE performs mutual authentication between two endpoints and establishes an IKE Security Association (SA). All IKE communications consist of pairs of messages that include a request and a response. The pair is called an exchange or a request-response pair. The first two exchanges of messages establishing an IKE SA are called the IKE\_SA\_INIT exchange and the IKE\_AUTH exchange; subsequent IKE exchanges are called either CREATE\_CHILD\_SA exchanges or INFORMATIONAL exchanges. IKEv2 uses sequence numbers and acknowledgments to provide reliability, and mandates some error-processing logistics and shared state management (windowing). IKEv2 does not process a request until it determines the requester. This helps to mitigate DoS attacks. IKEv2 provides built-in support for Dead Peer Detection (DPD), which periodically confirms the availability of the peer node. When there is no response from the peer node, the system attempts to establish the session again.

**Figure 2: IKEv2 Exchanges**

369569

IKEv2 is defined in RFC 7296 and consists of the following constructs:

- **Keyring**

A keyring is a repository of symmetric and asymmetric pre-shared keys that is configured for a peer and identified using the IP address of the peer. The keyring is associated with an IKEv2 profile and therefore, caters to a set of peers that match the IKEv2 profile. This is a required configuration for the pre-shared keys authentication method that is used for NCS 1004.

- **IKEv2 Profile**

An IKEv2 profile is a repository of nonnegotiable parameters of the IKE SA, such as authentication method and services that are available to the authenticated peers that match the profile. The profile match lookup is done based on the IP address of the remote identity. For security purposes, the IKE SAs have a lifetime that is defined in the IKEv2 profile. The lifetime range, in seconds, is from 120 to 86400. The SAs are rekeyed proactively before the expiry of the lifetime. The default lifetime is 86400. An IKEv2 profile must be attached to an OTNSec configuration on the ODU4 controllers on both the IKEv2 initiator and responder. This is a required configuration.

- **IKEv2 Proposal**

An IKEv2 proposal is a collection of transforms that are used in the negotiation of IKE SAs as part of the IKE\_SA\_INIT exchange. The IKE2 proposal must be attached to an IKEv2 policy. This is an optional configuration. The transform types used in the negotiation are as follows:

- Encryption algorithm
- Integrity algorithm
- Pseudo-Random Function (PRF) algorithm
- Diffie-Hellman (DH) group

**Note** The IKEv2 proposal must have at least one algorithm of each type. It is possible to specify multiple algorithms for each type; the order in which the algorithms are specified determines the precedence.

- **IKEv2 Policy**

IKEv2 employs policies that are configured on each peer to negotiate handshakes between the two peers. An IKEv2 policy contains proposals that are used to negotiate the encryption, integrity, PRF algorithms, and DH group in the SA\_INIT exchange. An IKEv2 policy is selected based on the local IP address. This is an optional configuration.

**Note** The default IKEv2 proposal is used with default IKEv2 policy in the absence of any user-defined policy.

## OTNSec Encryption Overview

OTNSec encryption in NCS 1004 has the following characteristics:

- The OTN layer 1 security is supported over the OPU client payload.
- The Galois-Counter-Mode (GCM) AES 256-bit security is the default cipher used for encryption and decryption of the OPU payloads.
- Each client offers an independent encrypted channel in each direction.
- There are two banks of 256-bit programmable key registers (current key and future key) that permit key updates through the software without interrupting traffic.
- Each key is associated with an Association Number [AN(1:0)] allowing up to four different numbers.
- Interhost key exchange is supported through communication over GCC.
- The encryption is supported in headless mode.

The OTNSec control plane generates two different keys, one for the transmit (Tx) side and the other for the receive (Rx) side. These keys are used by the line card to program the encryptor and decryptor blocks. These blocks encrypt and decrypt the data packets between the trunk ports of the two nodes. For security purposes, the keys have a lifetime. A key's lifetime specifies the time the key expires.

The key lifetime for the child SAs can be configured using the sak-rekey-interval which ranges from 30 seconds to 14 days. For example, if the sak-rekey-interval is configured for five minutes, a new key is generated by the OTNSec layer every five minutes. In the absence of a lifetime configuration, the default lifetime is 14.18 days. When the key reaches the maximum lifetime, it becomes invalid and the CRYPTO-KEY-EXPIRED alarm is raised. Volume-based rekeying is supported; it prevents the key from reaching the maximum lifetime. This allows the OTNSec layer to generate a new key when 70% of the lifetime (11 days) of the current key is over.

When the lifetime of the first key expires, it automatically rolls over to the next key. To achieve a hitless rollover, the lifetimes of the keys need to be overlapped so that for a certain period of time both keys are

active. To maintain this seamless switchover, a key index table is maintained. Each key pair (Tx and Rx) is associated with an Association Number (AN). The index table allows up to four numbers (0,1,2, and 3). When the keys are installed, the Rx AN number of node A must match the Tx AN number of node B. Also, the Tx AN number of node A must match the Rx AN number of node B. If there is a mismatch of the AN numbers between the peer nodes, the CRYPTO-INDEX-MISMATCH alarm is raised.

## Prerequisites

- Ensure that the required k9sec.rpm package is installed.
- Configure the line card in the muxponder or muxponder slice mode using the following commands:
  - **1.2T Card:**
    - muxponder mode:  
**hw-module location *location* mxponder client-rate 100GE | OTU4**
    - **hw-module location *location* mxponder trunk-rate {100G | 200G | 300G | 400G | 500G | 600G}**
  - muxponder slice mode:  
**hw-module location *location* mxponder-slice *mxponder-slice-number* client-rate 100GE**  
**hw-module location *location* mxponder-slice trunk-rate { 100G | 200G | 300G | 400G | 500G | 600G }**

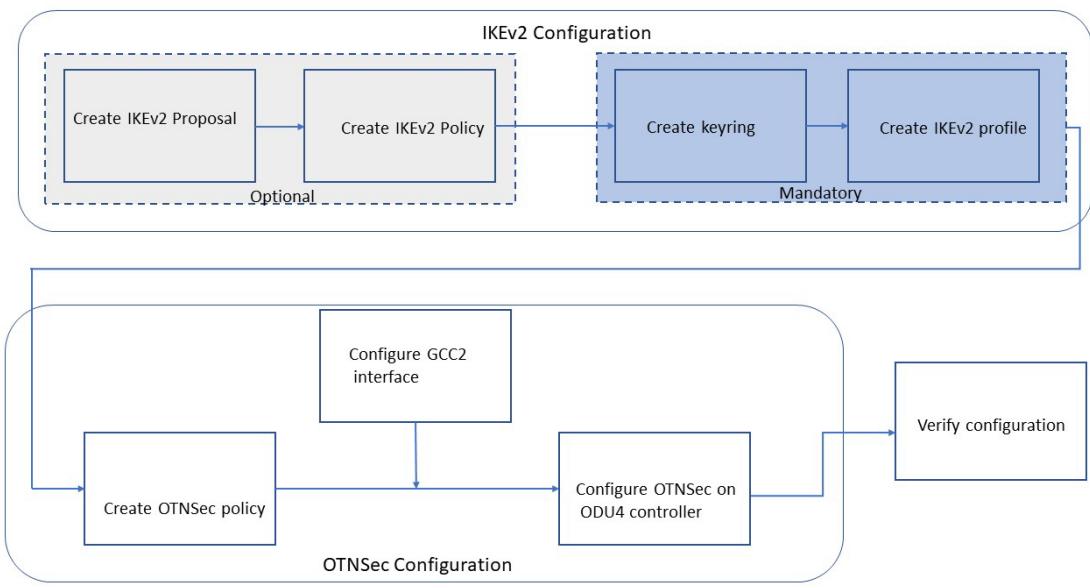

## Limitations

- Traffic is impacted for a few seconds if the RP fails or GCC2 control plane goes down, during a key rollover.
- The sak-rekey-interval must be configured on the initiator and responder node.

## Configuration Workflow

This section describes the workflow to configure IKEv2 and OTNSec encryption on NCS 1004. The authentication method used is pre-shared keys (PSKs).

Figure 3: L1 Encryption Workflow

369571

Table 3: Workflow for Configuring IKEv2 and OTNSec Encryption on NCS 1004

Workflow Sequence	Details
<b>IKE Configuration</b>	
<a href="#">Configuring an IKEv2 Proposal, on page 59</a>	(Optional) Configure an IKEv2 proposal manually; otherwise, the default IKEv2 proposal is used in the default IKEv2 policy.  The default IKEv2 proposal requires no configuration and is a collection of commonly used transforms types, which are as follows:  <code>encryption cbc-aes-256 integrity sha512, sha384 prf sha512, sha384 dh 19, 20, 21</code>
<a href="#">Configuring an IKEv2 Policy, on page 60</a>	(Optional) Configure an IKEv2 policy manually; otherwise, the default proposal associated with the default policy is used for negotiation.  <b>Note</b> An IKEv2 policy with no proposal is considered incomplete.
<a href="#">Configuring a Keyring, on page 61</a>	Configure a keyring as the local or remote authentication method is a preshared key.

Workflow Sequence	Details
<a href="#">Configuring a IKEv2 Profile, on page 62</a>	<p>Configure an IKEv2 profile.</p> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>The IKEv2 profile must be attached to the OTNSec profile on both the IKEv2 initiator and the responder.</li> <li>The DPD interval is 10 seconds. If there is no response from the peer node, it retries every two seconds with a maximum of five attempts. After five retries, the IKE session is brought down. NCS 1004 supports headless mode. Therefore, even though the control plane is down, traffic is not impacted because the encryption and decryption keys are still active on the line cards. The data path functions in a locally secure mode and the OTNSEC-LOCALLY-SECURED alarm is raised.</li> </ul>
<b>OTNSec Configuration</b>	
<a href="#">Configuring an OTNSec Policy, on page 62</a>	(Optional) Configure the OTNSec policy.
<a href="#">Configuring the GCC Interface, on page 63</a>	Configure the GCC2 interface.

<b>Verification</b>	
<a href="#">Verification, on page 68</a>	Verify the IKEv2 and OTNSec configuration.

## Configuring an IKEv2 Proposal

To configure an IKEv2 proposal, use the following commands:

```
config
ikev2 proposal proposal-name
encryption {aes-gcm-256} {aes-gcm-128} {aes-cbc-256} {aes-cbc-192} {aes-cbc-128}
integrity {sha-1} {sha-256} {sha-384} {sha-512}
prf {sha-1} {sha-256} {sha-384} {sha-512}
dh {19} {20} {21}
```

**Note** Configuring an AES-GCM encryption algorithm does not require configuring an integrity algorithm. AES-GCM and non-GCM algorithms cannot be configured in the same proposal. However, you can configure the AES-GCM and non-GCM algorithms under two different proposals and attach both the proposals to the same IKEv2 policy.

The following sample displays how to configure an IKEv2 proposal.

```
RP/0/RP0/CPU0:ios#configure
Thu Mar  7 19:19:30.259 UTC
RP/0/RP0/CPU0:ios(config)#ikev2 proposal proposal1
RP/0/RP0/CPU0:ios(config-ikev2-proposal=proposal1)#encryption aes-cbc-256
RP/0/RP0/CPU0:ios(config-ikev2-proposal=proposal1)#integrity sha-1

## Configuring an IKEv2 Policy

To configure an IKEv2 policy, use the following commands:

**config**

**ikev2 policy *policy-name***

**proposal *proposal-name1* *proposal-name2* *proposal-name3***

**match address local { *ipv4-address* }**

The following sample displays how to configure an IKEv2 policy.

```
RP/0/RP0/CPU0:ios#configure
Thu Mar  7 19:26:45.752 UTC
RP/0/RP0/CPU0:ios(config)#ikev2 policy mypolicy
RP/0/RP0/CPU0:ios(config-ikev2-policy=mypolicy)#proposal proposal1
RP/0/RP0/CPU0:ios(config-ikev2-policy=mypolicy)#match address local 10.1.1.1
RP/0/RP0/CPU0:ios(config-ikev2-policy=mypolicy)#commit
Thu Mar  7 19:29:25.043 UTC
RP/0/RP0/CPU0:ios(config-ikev2-policy=mypolicy)#exit
```

```

RP/0/RP0/CPU0:ios(config)#exit
RP/0/RP0/CPU0:ios#show ikev2 policy mypolicy
Thu Mar  7 19:30:30.343 UTC

```

## Configuring a Keyring

To configure a keyring, use the following commands:

**config**

**keyring *keyring-name***

**peer *peer-block name***

**address {*ipv4-address [mask]*}**

**Note** The IP address of the far-end node (remote node) must be used.

**pre-shared-key {{*key*} {clear *clear-text key*} {local *local key*} {password*encrypted key*}}**

**Note** The key input can either be in clear text or in type 7 encrypted password format.

The following sample displays how to configure a keyring.

```

RP/0/RP0/CPU0:ios#configure
Thu Mar  7 19:33:14.594 UTC
RP/0/RP0/CPU0:ios(config)#keyring kyr1
RP/0/RP0/CPU0:ios(config-keyring-kyr1)#peer peer1
RP/0/RP0/CPU0:ios(config-keyring-kyr1-peer-peer1)#address 10.1.1.2 255.255.255.0
RP/0/RP0/CPU0:ios(config-keyring-kyr1-peer-peer1)#pre-shared-key password 106D000A064743595F
RP/0/RP0/CPU0:ios(config-keyring-kyr1-peer-peer1)#commit
Thu Mar  7 19:54:33.314 UTC

Remote PSK             : Configured

```

## Configuring a IKEv2 Profile

To configure an IKEv2 profile, use the following commands:

```
config
ikev2 profile profile-name
match identity remote address {ipv4-address [mask]}
keyring keyring-name
lifetime seconds
```

---

**Note** The lifetime range, in seconds, is from 120 to 86400.

---

The following sample displays how to configure an IKEv2 profile.

```
RP/0/RP0/CPU0:ios#configure
Thu Mar 7 20:00:36.490 UTC
RP/0/RP0/CPU0:ios(config)#ikev2 profile profile1
RP/0/RP0/CPU0:ios(config-ikev2-profile-profile1)#match identity remote address 10.1.1.2
255.255.255.0
RP/0/RP0/CPU0:ios(config-ikev2-profile-profile1)#keyring kyrl
RP/0/RP0/CPU0:ios(config-ikev2-profile-profile1)#lifetime 120

```

## Configuring an OTNSec Policy

To configure an OTNSec policy, use the following commands:

```
config
otnsec-policy policy-name
cipher-suite AES-GCM-256
security-policy must-secure
sak-rekey-interval seconds
```

**Note** The interval range, in seconds, is from 30 to 1209600. SAK rekey timer does not start by default until it is configured.

The following sample displays how to configure an OTNSec policy.

```
RP/0/RP0/CPU0:ios#configure
Mon Mar 11 15:16:58.417 UTC
RP/0/RP0/CPU0:ios(config)#otnsec policy otnsec-policy1
RP/0/RP0/CPU0:ios(config-otnsec-policy)#cipher-suite AES-GCM-256
RP/0/RP0/CPU0:ios(config-otnsec-policy)#security-policy must-secure
RP/0/RP0/CPU0:ios(config-otnsec-policy)#sak-rekey-interval 120
RP/0/RP0/CPU0:ios(config-otnsec-policy)#commit
```

The following is a sample of an OTNSec policy.

```
RP/0/RP0/CPU0:ios#show run otnsec policy otnsec-policy1
Tue Mar 12 11:14:03.591 UTC
otnsec policy otnsec-policy1
  cipher-suite AES-GCM-256
  security-policy must-secure
  sak-rekey-interval 120
!
```

## Configuring the GCC Interface

To configure the GCC interface, use the following commands:

**config**

**interface GCC2 R/S/I/P**

**ipv4 address *ipv4-address***

The following sample displays how to configure the GCC2 interface.

```
RP/0/RP0/CPU0:ios#config
Tue Mar 12 12:06:32.547 UTC
RP/0/RP0/CPU0:ios(config)#controller odu4 0/1/0/0/1

```

## Configuring OTNSec on ODU4 Controllers

To configure the OTNSec on ODU4 controller, use the following commands:

**config**  
**controller ODU4 rack/slot-instance/port**  
**otnsec**  
**source ipv4 ipv4-address**  
**destination ipv4 ipv4-address**  
**session-id session-id**  
**policy policy-name**  
**ikev2 profile-name**

---

**Note** The session ID ranges 1–65535.

---

The following sample displays how to configure OTNSec on the ODU4 controller.

```

RP/0/RP0/CPU0:ios#configure
Mon Mar 12 12:10:21.374 UTC
RP/0/RP0/CPU0:ios(config)#controller ODU4 0/1/0/0/1
RP/0/RP0/CPU0:ios(config-oduc4)#otnsec
RP/0/RP0/CPU0:ios(config-otnsec)#source ipv4 10.1.1.1
RP/0/RP0/CPU0:ios(config-otnsec)#destination ipv4 10.1.1.2
RP/0/RP0/CPU0:ios(config-otnsec)#session-id 9000

RP/0/RP0/CPU0:ios(config-otnsec)#commit
Mon Mar 12 12:14:17.609 UTC
RP/0/RP0/CPU0:ios(config-otnsec)#exit
RP/0/RP0/CPU0:ios(config)#exit

```

# Configuration Example

In the following example, there are two nodes. The node with the lower IP address always acts as the initiator. In this case, node A (SITE-A) has the role of an initiator while Node B (SITE-B) has the role of a responder. In this example, the default IKE proposal and policy have been used on both nodes.

**Figure 4: Configuration Schema**

The configuration on Node A is displayed below.

<b>Node A (Initiator)</b>

```

## Verification

- Verify that there are no alarms on the ports of the NCS 1004.
- Use the **show** commands listed in the table below to verify the IKEv2 and OTNSec configuration. For details of these commands, see the *Command Reference for Cisco NCS 1004*.

**Table 4: Show Commands**

Show Commands	Purpose
show run ikev2	Displays the running configuration of IKEv2
show ikev2 session	Displays the child SAs created for the session
show ip interface brief	Displays the status of the GCC interfaces
show run controller ODU4 0/1/0/0/1	Displays the running configuration of the ODU4 controller
show controllers ODU4 0/1/0/0/1 otnsec	Displays the OTNSec configuration on the ODU4 controller
show controllers ODU4 0/1/0/0/1 pm current 15-min otnsec	Displays the PM statistics that help verify the encrypted and decrypted blocks.

## Troubleshooting

**Problem:** The IKE session is not established between the two nodes.

**Solution:** Check the status of the GCC interface using the **show ip interface brief** command.

To gather logs and traces, use the **show tech-support ncs1004 detail**, **show tech-support ikev2**, and **show tech-support otnsec** commands.

## CHAPTER 7

# GMPLS UNI for Packet and Optical Integration

With the cloud becoming increasingly central to business operations, packet and optical network services must evolve to become more efficient and dynamic. Closer integration of packet and optical networks becomes critical especially in the control plane.

- [Understanding GMPLS UNI, on page 71](#)
- [Use Case Overview, on page 72](#)
- [Prerequisites, on page 72](#)
- [Limitations, on page 73](#)
- [Configuration Workflow, on page 73](#)
- [Verification, on page 82](#)
- [General Troubleshooting, on page 89](#)
- [You May Be Also Interested In, on page 89](#)

## Understanding GMPLS UNI

Generalized Multiprotocol Label Switching (GMPLS) User Network Interface (UNI) or GMPLS UNI is a key technology that enables this integration. GMPLS UNI enables packet networks to directly tap into the optical transport control plane to coordinate its resource requirements with the optical transport network. Leveraging open standards, GMPLS UNI optimizes network resources and improves network utilization across packet and optical networks.

### Channel Spacing

DWDM grid in the optical spectrum can be divided into multiple channels so that each channel can carry traffic independently. The number of channels that we receive from the DWDM grid depends on the channel spacing. For example, the lower the channel spacing, the higher the number of channels, and also conversely.

GMPLS has two types of channel spacing:

- Fixed Grid channel spacing - The channel spacing is fixed to 50 GHz and supports 100 and 200-Gbps traffic.
- Flexible Grid channel spacing - The channel spacing is 6.25 GHz and supports all data rates.

The **neighbor flexi-grid-capable** command enables GMPLS UNI flexible grid channel spacing. This command is executed during the [Configure LMP on Cisco NCS 1004 Node](#) configuration.

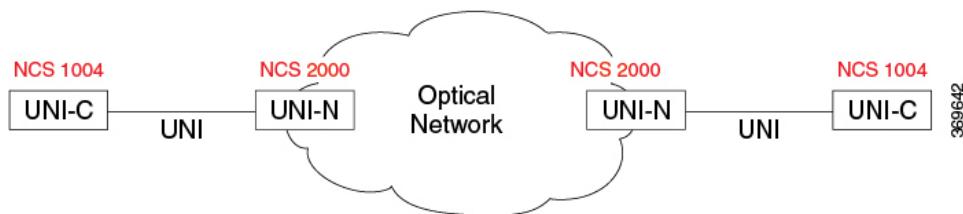

# Use Case Overview

GMPLS UNI technology addresses the following customer needs in packet and optical networks:

- Effective usage of the DWDM grid with minimal wastage of spectral bandwidth
- Transmission of mixed bit-rate or mixed modulation data in a grid with different channel widths

To address these needs, you create a tunnel between two NCS 1004 nodes to carry traffic using the GMPLS UNI technology as shown in the following figure.

**Figure 5: GMPLS UNI Reference Model**

UNI-C is the client or packet or router node; for example, NCS 1004 nodes. UNI-N is the network or optical node; for example, NCS 2000 nodes.

The Link Management Protocol (LMP) link is created to establish connectivity between a NCS 2000 node and a NCS 1004 node. The tunnel is then created between the trunk interfaces of the source and destination NCS 1004 nodes to carry traffic. When the tunnel is created between NCS 1004 nodes, a circuit is internally created between the NCS 2000 nodes. The circuit is created to perform path computation, restoration, and reversion functions.

The tunnel can be created between the source and destination NCS 1004 nodes without involving NCS 2000 nodes in the middle. However, the restoration and reversion capabilities are provided only by the NCS 2000 nodes using GMPLS UNI.

## Prerequisites

Before you create a tunnel using GMPLS UNI, fulfill these prerequisites:

- NCS 1004 node must have both the MPLS and MPLS-TE packages. The package names are ncs1004-mpls and ncs1004-mpls-te-rsvp.
- NCS 2000 node must have a valid license for ROADM and WSON support.
- The management IP addresses of NCS 1004 and NCS 2000 nodes must be accessible.
- The administrative state of the trunk port of the optics controller on the NCS 1004 node must not be in the shutdown state.

# Limitations

## Configuration Workflow

Perform the following tasks in sequence to create a tunnel using GMPLS UNI:

**Configurations on the NCS 2000 node:**

1. GMPLS signaled LMP circuit creation.
  - [Configure LMP and Alien Wavelength on NCS 2000 Node Using CTC , on page 73](#)
2. [Retrieve Ifindex from NCS 2000 Node, on page 78](#)

**Configurations on the node:**

1. Configure LMP on Cisco NCS 1002 Node.
  - [Configure LMP on Cisco NCS 1004 Node , on page 79](#)
2. [Configure RSVP on NCS 1004 Node, on page 80](#)
3. Configure MPLS Tunnel on a NCS 1002 Node.
  - [Configure MPLS Tunnel on a NCS 1004 Node for Numbered Circuit, on page 81](#)

## Configure LMP and Alien Wavelength on NCS 2000 Node Using CTC

This procedure creates a static LMP link to establish connectivity between a NCS 2000 node and a NCS 1004 node. The LMP creation wizard in CTC provides the capability to select source and destination endpoints of the LMP link, optical parameters, and alien wavelength settings.

---

**Step 1** From the **View** menu, choose **Go to Network View**.

**Step 2** Click the **Provisioning > LMP** tabs.

**Step 3** Click **Create**.

The LMP Creation window appears.

**Step 4** Click **Signaled** in the **Router Not Managed by CTC** area.

A wizard appears with the following options:

**LMP Origination, LMP Termination, Optical Parameters, and Alien Wavelength**

**Step 5** In the LMP Origination screen of the wizard, provision these parameters:

- From the **Originating Node** drop-down list, choose the source node of the LMP.  
If the source node is Cisco NCS 1004, the destination node must be MSTP, and the other way round.
- From the **Local Interfaces** drop-down list, choose an available interface.

## Configure LMP and Alien Wavelength on NCS 2000 Node Using CTC

- Choose the Type, Shelf, Slot, and Port for Ingress Port Selection and Egress Port Selection.
- Choose **Numbered** interface.
- Enter the IP address of the source node in the **Interface IP** field.
- Set the mode of revertive restoration to either UNI-C or UNI-N. If the mode is set to UNI-C, the reversion of the circuit from the restored path to the original path is initiated by the UNI client that is connected to NCS 1004. If the mode is set to UNI-N, the reversion of the circuit is initiated by the DWDM network and can either be a manual revert or an auto revert.
- Enter the RSVP signaling interval and RSVP signaling missed values in the respective fields.
- Click **Next**.

**Step 6** In the LMP Termination screen of the wizard, provision these parameters:

- From the **Terminating Node** drop-down list, choose the destination node of the LMP; for example, MSTP node.
- From the **Rx Port Selection** area, perform the following.
  - Choose the card type from the **Type** drop-down list.
  - Choose a shelf from the **Shelf** drop-down list.
  - Choose a source slot from the **Slot** drop-down list
  - Choose a port from the **Port** drop-down list.
- From the **Tx Port Selection** area, perform the following.
  - Choose the card type from the **Type** drop-down list.
  - Choose a shelf from the **Shelf** drop-down list.
  - Choose a destination slot from the **Slot** drop-down list.
  - Choose a port from the **Port** drop-down list
- Enter the IP address of the destination node in the **Interface IP** field.
- Set the mode of revertive restoration to either UNI-C or UNI-N. If the mode is set to UNI-C, the reversion of the circuit from the restored path to the original path is initiated by the UNI client that is connected. If the mode is set to UNI-N, the reversion of the circuit is initiated by the DWDM network and can be either a manual revert or an auto revert.
- Enter the remote Ifindex of NCS 1004 node (in decimals) in the **Remote If Index** field.
- Click **Next**.

**Step 7** In the Optical Parameters screen of the wizard, provision these parameters:

- **Allow Regeneration**—When checked, the computed path traverses through the regeneration site only if the optical validation is not satisfied. You can regenerate a circuit that is created from the UNI interface. If a transparent path is feasible, the regenerator is not used.
- **UNI State**—Choose **Enable** or **Disable** from the UNI State drop-down list.

The Enable state is used to configure the UNI interface for the circuits to pass through, between the router and the DWDM node. In the Disable state, the interface is configured but not active, and so the circuit activation is rejected. When the status is changed from Enable to Disable, all active circuits on the interface are deleted.

- **Description**—Enter the description of the UNI interface. The description can be up to 256 characters.
- **Label**—Enter an alphanumeric string. This label is a unique circuit identifier.
- **Validation**—Sets the optical validation mode.
  - **Full**—The circuit is created when the circuit validation result is greater than or equal to the acceptance threshold value.
  - **None**—The circuit is created without considering the acceptance threshold value. The Opt Valid column in the Circuits tab displays the value as **Not Valid**.
  - **Inherited**—The restoration circuit inherits the validation and acceptance threshold values from the primary circuit.
- **Acceptance threshold**—Sets the acceptance threshold value for the GMPLS circuit. The circuit is created if the actual acceptance threshold value is greater than, or equal to, the value set in this field.
  - Green—Indicates that the channel failure risk is 0%.
  - Yellow—Indicates that the channel failure risk is between 0% and 16%.
  - Orange—Indicates that the channel failure risk is between 16% and 50%.
  - Red—Indicates that the channel failure risk is greater than 50%.
- **Restoration**—Check this check box to enable the restoration of the GMPLS circuits on the UNI interface.
- **Revert**—Check this check box to enable the revert of the GMPLS circuits on the UNI interface.
- **Auto Revert**—Click this radio button to automatically revert the circuit from the restored path to the original path after the failure is fixed, WSON alarms are acknowledged, and the soak time expires.
- **Manual Revert**—Click this radio button to manually revert the circuit from the restored path to the original path after the failure is fixed, the WSON alarms are acknowledged, and the soak time expires.
- **Soak Time**—Enter the time (in hours, minutes, and seconds) in the Soak Time field that the circuit on the restored path waits before moving to the original path after the failure is fixed. The circuit reverts to the original path after the soak time expires. The soak time must be set only if both the **Restoration** and **Revert** check boxes are checked.

**Step 8** Click Next.**Step 9** In the Alien wavelength screen of the wizard, provision these parameters.

- From the **Alien Wavelength** drop-down list, choose the alien wavelength class.
- From the **Trunk Selection** drop-down list, choose 100G, 200G, or 250G.
- From the **FEC** drop-down list, choose a valid value for forward error correction (FEC) mode. If an invalid FEC value is chosen, LMP link is created; however, the circuit creation fails.
- Click **Finish** to create an LMP link.

The newly created LMP link appears in the LMP table in CTC.

## Configure LMP and Alien Wavelength on NCS 2000 Node Using CTC for Signaled Unnumbered Circuit

This procedure creates a static LMP unnumbered link to establish connectivity between a NCS 2000 node and a NCS 1004 node. The LMP creation wizard in CTC provides the capability to select source and destination endpoints of the LMP link, optical parameters, and alien wavelength settings.

### SUMMARY STEPS

1. From the **View** menu, choose **Go to Network View**.
2. Click the **Provisioning > LMP** tabs.
3. Click **Create**.
4. Click **Signaled** in the **Router Not Managed by CTC** area.
5. In the LMP Origination screen of the wizard, provision these parameters:
6. In the LMP Termination screen of the wizard, provision these parameters:
7. In the Optical Parameters screen of the wizard, provision these parameters:
8. Click **Next**.
9. In the Alien wavelength screen of the wizard, provision these parameters.

### DETAILED STEPS

**Step 1** From the **View** menu, choose **Go to Network View**.

**Step 2** Click the **Provisioning > LMP** tabs.

**Step 3** Click **Create**.

The LMP Creation window appears.

**Step 4** Click **Signaled** in the **Router Not Managed by CTC** area.

A wizard appears with the following options:

**LMP Origination, LMP Termination, Optical Parameters, and Alien Wavelength**

**Step 5** In the LMP Origination screen of the wizard, provision these parameters:

- From the **Originating Node** drop-down list, choose the source node of the LMP.
- From the **Local Interfaces** drop-down list, choose an available interface.
- Choose the Type, Unit, and Port for Ingress Port Selection and Egress Port Selection.
- Choose **Unnumbered** interface.
- The IP address of the source node selected appears in the **IP** field.
- Set the mode of revertive restoration to UNI-N. If the mode is set to UNI-N, the reversion of the circuit is initiated by the DWDM network and can either be a manual revert or an auto revert.

- Click **Next**.

**Step 6** In the LMP Termination screen of the wizard, provision these parameters:

- From **Interfaces Configuration**:

Enter the NCS 1004 system IP address in the **System IP** field.

- Enter the IP address of the source node in the **Communication Channel** field.

- Enter the SNMP Ifindex value of optic trunk in the **Remote If Index** field.

- Click **Next**.

**Step 7** In the Optical Parameters screen of the wizard, provision these parameters:

- **Allow Regeneration**—When checked, the computed path traverses through the regeneration site only if the optical validation is not satisfied. You can regenerate a circuit that is created from the UNI interface. If a transparent path is feasible, the regenerator is not used.

- **UNI State**—Choose **Enable** or **Disable** from the UNI State drop-down list.

The Enable state is used to configure the UNI interface for the circuits to pass through, between the router and the DWDM node. In the Disable state, the interface is configured but not active, and so the circuit activation is rejected. When the status is changed from Enable to Disable, all active circuits on the interface are deleted.

- **Description**—Enter the description of the UNI interface like **Signal Unnumb LMP**. The description can be up to 256 characters.

- **Label**—Enter an alphanumeric string. This label is a unique circuit identifier.

- **Validation**—Sets the optical validation mode.

- **Full**—The circuit is created when the circuit validation result is greater than or equal to the acceptance threshold value.

- **None**—The circuit is created without considering the acceptance threshold value. The Opt Valid column in the Circuits tab displays the value as **Not Valid**.

- **Inherited**—The restoration circuit inherits the validation and acceptance threshold values from the primary circuit.

- **Acceptance Threshold**—Sets the acceptance threshold value for the GMPLS circuit. The circuit is created if the actual acceptance threshold value is greater than, or equal to, the value set in this field.

- Green—Indicates that the channel failure risk is 0%.

- Yellow—Indicates that the channel failure risk is between 0% and 16%.

- Orange—Indicates that the channel failure risk is between 16% and 50%.

- Red—Indicates that the channel failure risk is greater than 50%.

- **Restoration**—Check this check box to enable the restoration of the GMPLS circuits on the UNI interface.

- **Revert**—Check this check box to enable the revert of the GMPLS circuits on the UNI interface.

- **Auto Revert**—Click this radio button to automatically revert the circuit from the restored path to the original path after the failure is fixed, WSON alarms are acknowledged, and the soak time expires.

## Retrieve Ifindex from NCS 2000 Node

- **Manual Revert**—Click this radio button to manually revert the circuit from the restored path to the original path after the failure is fixed, the WSON alarms are acknowledged, and the soak time expires.
- **Soak Time**—Enter the time (in hours, minutes, and seconds) in the Soak Time field that the circuit on the restored path waits before moving to the original path after the failure is fixed. The circuit reverts to the original path after the soak time expires. The soak time must be set only if both the **Restoration** and **Revert** check boxes are checked.

**Step 8** Click Next.

**Step 9** In the Alien wavelength screen of the wizard, provision these parameters.

- From the **Alien Wavelength** drop-down list, choose the alien wavelength class such as NCS 1004.
- From the **Trunk Selection** drop-down list, choose 100G, 200G, or 250G.
- From the **FEC** drop-down list, choose a valid value for forward error correction (FEC) mode. If an invalid FEC value is chosen, LMP link is created; however, the circuit creation fails.
- Click **Finish** to create an LMP link.

The newly created signaled LMP unnumbered circuit link appears in the LMP table in CTC.

## Retrieve Ifindex from NCS 2000 Node

The Ifindex value of all the LMP ports of NCS 2000 node can be retrieved using CTC or TL1.

### Using CTC:

From the **Provisioning > LMP** tab, retrieve the Ifindex value in decimal format under the **Originating Interface Index** column.

This Ifindex value is used in the **neighbor interface-id unnumbered** command during the [Configure LMP on Cisco NCS 1004 Node](#) configuration.

### Using TL1:

1. Log in to the TL1 interface and issue the following command.
2. **rtrv-unicfg ::all:1;**

This command retrieves the Ifindex of all the LMP ports of NCS 2000 node in hexadecimal format. This must be converted to decimal format and used in remote Ifindex of NCS 1004 node during the [Configure LMP on Cisco NCS 1004 Node](#).

### TL1 Output

```
PSLINE-81-1-9-RX:PSLINE-81-1-9-TX,10.77.142.92,3.3.3.4,3.3.3.3,0.0.0.0,VALMODE=None,ADMINSTATE=UP,
RESTTYPE=REVERT,USPWROFS=0.0,
DSPWROFS=0.0,ALLOWREGEN=NO,UNICTRLMODE=CLIENT,REVERTMODE=MANUAL,SOAK=00-01-00,
RESTVALMODE=None,TERMINTFDX=0,ORIGINTFIDX=7f000d12,NUMBERED=True,UNIMODE=GMPLS

PSLINE-81-1-10-RX:PSLINE-81-1-10-TX,10.77.142.92,4.4.4.4,4.4.4.3,0.0.0.0,VALMODE=None,ADMINSTATE=UP,
RESTTYPE=REVERT,USPWROFS=0.0,DSPWROFS=0.0,ALLOWREGEN=NO,UNICTRLMODE=CLIENT,
REVERTMODE=MANUAL,SOAK=00-01-00,RESTVALMODE=None,TERMINTFDX=0,
ORIGINTFIDX=7f000d14,NUMBERED=True,UNIMODE=GMPLS
```

The Ifindex of port 81-1-9 is 7f000d12 (in hexadecimal) and 2130709778 (in decimal). The Ifindex of port 81-1-10 is 7f000d14 (in hexadecimal) and 2130709780 (in decimal).

## Configure LMP on Cisco NCS 1004 Node

LMP is a logical link that is created on the trunk optics controller of the source and destination NCS 1004 nodes of the tunnel.

**configure**

**lmp**

**mpls optical-uni**

**controller optics** *Rack/Slot/Instance/Port*

**neighbor** *name*

**neighbor link-id ipv4 unicast** *ipv4-address*

**neighbor flexi-grid-capable**

**neighbor interface-id unnumbered** *interface-id*

**link-id ipv4 unicast** *ipv4-address*

**router-id ipv4 unicast** *ipv4-address*

**commit**

### Important Notes

- **neighbor link-id ipv4 unicast** *ipv4-address* is the IP address of the MSTP interface on the NCS 2000 node.
- **neighbor flexi-grid-capable** enables GMPLS UNI flexible grid channel spacing.
- **neighbor interface-id unnumbered** *interface-id* is the optical interface ID of the neighbor. This value is the Ifindex value of all the LMP ports of NCS 2000 node in decimal format that is manually retrieved from CTC or TL1. See [Retrieve Ifindex from NCS 2000 Node, on page 78](#) to retrieve the Ifindex.
- **link-id ipv4 unicast** *ipv4-address* is the IP address of the optics controller on the current NCS 1004 node.
- **router-id ipv4 unicast** *ipv4-address* is the neighbor router IP address for GMPLS UNI.

### Running Configuration

The following is a sample of configuring LMP on the source NCS 1004 node.

**show running-config lmp**

```
Mon Jul  1 14:42:46.856 IST
lmp
  mpls optical-uni
    controller Optics0/0/0/0
      neighbor ncs1k
        neighbor link-id ipv4 unicast 10.1.1.1
        neighbor flexi-grid-capable
```

## Configure RSVP on NCS 1004 Node

```

neighbor interface-id unnumbered 2130706976
link-id ipv4 unicast 10.0.1.1
!
controller Optics0/0/0/1
neighbor ncs1k
neighbor link-id ipv4 unicast 10.1.3.3
neighbor flexi-grid-capable
neighbor interface-id unnumbered 2130707232
link-id ipv4 unicast 10.0.3.3
!
controller Optics0/1/0/0
neighbor ncs1k
neighbor link-id ipv4 unicast 10.1.4.4
neighbor flexi-grid-capable
neighbor interface-id unnumbered 2130706964
link-id ipv4 unicast 10.0.4.4
!
controller Optics0/1/0/1
neighbor ncs1k
neighbor link-id ipv4 unicast 10.1.5.5
neighbor flexi-grid-capable
neighbor interface-id unnumbered 2130706966
link-id ipv4 unicast 10.0.5.5
!
neighbor ncs1k
ipcc routed
router-id ipv4 unicast 10.127.60.48
!
router-id ipv4 unicast 10.105.57.101
!
!
```

The following sample shows the brief summary of the tunnel status and configuration.

**show mpls traffic-eng tunnels optical-uni brief**

Wed Sep 22 17:08:13.132 IST

TUNNEL NAME	DESTINATION	STATUS	STATE
GMPLS-UNI-Optics0/3/0/1	10.24.1.1	up	up
GMPLS-UNI-Optics0/0/0/1	10.34.1.1	up	up

Displayed 2 (of 2) heads, 0 (of 0) midpoints, 0 (of 0) tails  
 Displayed 2 up, 0 down, 0 recovering, 0 recovered heads

## Configure RSVP on NCS 1004 Node

Resource Reservation Protocol (RSVP) with an appropriate timeout must be configured on the source and destination NCS 1004 nodes of the tunnel.

**configure**

**rsvp**

**controller optics Rack/Slot/Instance/Port**

**signalling refresh out-of-band interval interval**

**signalling refresh out-of-band missed mis-count**

**commit**

The following is a sample of configuring RSVP on the source NCS 1004 node.

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#rsvp
RP/0/RP0/CPU0:ios(config-rsvp)#controller optics 0/0/0/6
RP/0/RP0/CPU0:ios(config-rsvp-cntl)#signalling refresh out-of-band interval 3600
RP/0/RP0/CPU0:ios(config-rsvp-cntl)#signalling refresh out-of-band missed 24
RP/0/RP0/CPU0:ios(config-rsvp-cntl)#commit

```

## Configure MPLS Tunnel on a NCS 1004 Node for Numbered Circuit

Ensure that the administrative state of the trunk port of the optics controller on the NCS 1004 node is not in shutdown state.

```

configure
mpls traffic-eng
gmppls optical-uni
controller optics Rack/Slot/Instance/Port
tunnel-properties
tunnel-id id
destination ipv4 unicast ipv4-address
path-option 10 no-ero lockdown
commit

```

### Important Notes

- **destination ipv4 unicast** *ipv4-address* is the IP address of the optics controller on the destination NCS 1004 node.
- Explicit Route Object (ERO) - Includes one or more routes to use from a list of specified nodes for a tunnel.
- Exclude Route Object (XRO) - Excludes one or more routes to use from a list of specified nodes for a tunnel.

### Running Configuration

The following is a sample of configuring the MPLS tunnel on the source NCS 1004 node.

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#mpls traffic-eng
RP/0/RP0/CPU0:ios(config-mpls-te)#gmppls optical-uni
RP/0/RP0/CPU0:ios(config-te-gmppls-uni)#controller optics 0/0/0/6
RP/0/RP0/CPU0:ios(config-te-gmppls-cntl)#tunnel-properties
RP/0/RP0/CPU0:ios(config-te-gmppls-tun)#tunnel-id 100
RP/0/RP0/CPU0:ios(config-te-gmppls-tun)#destination ipv4 unicast 10.20.20.20
RP/0/RP0/CPU0:ios(config-te-gmppls-tun)#path-option 10 no-ero lockdown
RP/0/RP0/CPU0:ios(config-te-gmppls-tun)#commit

```

The following is a sample of configuring the MPLS tunnel on the destination NCS 1004 node.

```
RP/0/RP0/CPU0:ios#configure
```

```

RP/0/RP0/CPU0:ios(config)#mpls traffic-eng
RP/0/RP0/CPU0:ios(config-mpls-te)#gmpls optical-uni
RP/0/RP0/CPU0:ios(config-te-gmpls-uni)#controller optics 0/0/0/6
RP/0/RP0/CPU0:ios(config-te-gmpls-uni)#commit

```

# Verification

Use the show commands in the following table to verify the GMPLS UNI tunnel, RSVP, and LMP configuration.

**Table 5: Show Commands**

Show Commands	Description
<b>show mpls traffic-eng link-management optical-uni controller optics</b>	Displays detailed GMPLS information of a specific optics controller.
<b>show mpls traffic-eng link-management optical-uni</b>	Displays detailed GMPLS information of all the optics controllers.
<b>show mpls traffic-eng tunnels</b>	Displays information about tunnels.
<b>show mpls traffic-eng link-management optical-uni tabular</b>	Displays detailed GMPLS information of all the optics controllers in tabular format.
<b>show mpls traffic-eng tunnels tabular</b>	Displays information about all the tunnels in tabular format.
<b>show lmp gmpls optical-uni</b>	Verifies LMP configuration and state.
<b>show rsvp neighbors</b>	Displays information about RSVP neighbors.

## Sample Outputs

**show mpls traffic-eng link-management optical-uni controller optics 0/0/0/13**

Displays detailed GMPLS information of a specific optics controller.

```

### show mpls traffic-eng link-management optical-unı

Displays detailed GMPLS information of all the optics controllers. MPLS tunnels are not created when the optics controller is in the shutdown state. The state is displayed as **Admin down**. Enter the **no shutdown** command under the optics controller to initiate the tunnel creation.

```

Optics0/0/0/0	10	10.11.1.1	Up

## General Troubleshooting

Collect and analyze the output of the following commands for any software issues.

- **show tech-support mpls traffic-eng file *filename***
- **show tech-support mpls rsvp file *filename***
- **show lmp clients**
- **show rsvp neighbors**
- **show mpls traffic-eng link-management optical-uni controller optics *Rack/Slot/Instance/Port***
- **show mpls traffic-eng tunnels *tunnel-id***

Problem	Solution
When NCS 2000 node cannot route the DWDM wavelength to the destination, it displays a generic error message as <b>No Route to destination</b> .	As a superuser, collect and analyze the diagnostic information by entering the following address at the browser.  <a href="http://ip-address-of-head-node/diagnostics/wson">http://ip-address-of-head-node/diagnostics/wson</a>

## CHAPTER 8

# Smart Licensing

This chapter describes the smart licensing configuration on Cisco NCS 1004.

- [Understanding Smart Licensing, on page 91](#)
- [Configure Smart Licensing, on page 95](#)

## Understanding Smart Licensing

Smart Licensing is a cloud-based approach to licensing. Smart Licensing simplifies the licensing experience across the enterprise making it easier to purchase, deploy, track, and renew Cisco Software. It provides visibility into license ownership and consumption through a single, simple user interface. The solution allows you to easily track the status of your license and software usage trends.

Smart Licensing helps you simplify three core functions:

- **Purchasing:** The software that you have installed in your network can be registered, without Product Activation Keys (PAKs).
- **Management:** You can automatically track activations against your license entitlements. Also, there is no need to install the license file on every node. You can create license pools (logical grouping of licenses) to reflect your organization structure. Smart Licensing offers you Cisco Smart Software Manager, a centralized portal that enables you to manage all your Cisco software licenses from one centralized website.
- **Reporting:** Through the portal, Smart Licensing offers an integrated view of the licenses you have purchased and what has been deployed in your network. You can use this data to make better purchasing decisions, based on your consumption.

### Smart Licensing Features

- Your device initiates a call home and requests the licenses it needs.
- Pooled licences - Licences are company account-specific, and can be used with any compatible device in your company. You can activate or deactivate different types of licenses on the device without actually installing a license file on the device.
- Licenses are stored securely on Cisco servers.
- Licenses can be moved between product instances without license transfer. This greatly simplifies the reassignment of a software license as part of the Return Material Authorization (RMA) process.

- It provides a complete view of all the Smart Software Licenses used in the network using a consolidated usage report of software licenses and devices in one easy-to-use portal.

### Cisco Smart Account

Cisco Smart Account is an account where all products enabled for Smart Licensing are deposited. Cisco Smart Account allows you to manage and activate your licenses to devices, monitor license use, and track Cisco license purchases. Through transparent access, you have a real-time view into your Smart Licensing products. IT administrators can manage licenses and account users within your organization's Smart Account through the Smart Software Manager.

When creating a Smart Account, you must have the authority to represent the requesting organization. After you submit the request, it goes through a brief approval process. Access <http://software.cisco.com> to learn about, set up, or manage Smart Accounts.

### Cisco Smart Software Manager Overview

Cisco Smart Software Manager enables you to manage all your Cisco Smart software licenses from one centralized website. With Cisco Smart Software Manager, you organize and view your licenses in groups called virtual accounts (collections of licenses and product instances). Use the Cisco Smart Software Manager to do the following tasks:

- Create, manage, or view virtual accounts.
- Create and manage Product Instance Registration Tokens.
- Transfer licenses between virtual accounts or view licenses.
- Transfer, remove, or view product instances.
- Run reports against your virtual accounts.
- Modify your email notification settings.
- View overall account information.

### Virtual Accounts

A Virtual Account exists as a sub-account within the Smart Account. Virtual Accounts are a customer-defined structure based on organizational layout, business function, geography, or any defined hierarchy. They are created and maintained by the Smart Account administrator. Smart Licensing allows you to create multiple license pools or virtual accounts within the Smart Software Manager portal. Using the Virtual Accounts option that you can aggregate licenses into discrete bundles that are associated with a cost center so that one section of an organization cannot use the licenses of another section of the organization. For example, if you segregate your company into different geographic regions, you can create a virtual account for each region to hold the licenses and product instances for that region.

All new licenses and product instances are placed in the default virtual account in the Smart Software Manager, unless you specify a different one during the order process. After you access the default account, you may choose to transfer them to any other account, provided you have the required access permissions.

Use the Smart Software Manager portal to create license pools or transfer licenses.

### Product Instance Registration Tokens

A product requires a registration token until you have registered the product. On successful registration, the device receives an identity certificate. This certificate is saved and automatically used for all future communications with Cisco. Registration tokens are stored in the Product Instance Registration Token Table that is associated with your enterprise account. Registration tokens can be valid 1–365 days.

## Product Instances

A product instance is an individual device with a unique device identifier (UDI) that is registered using a product instance registration token (or registration token). You can register any number of instances of a product with a single registration token. Each product instance can have one or more licenses residing in the same virtual account. Product instances must periodically connect to the Cisco Smart Software Manager servers during a specific renewal period. If you remove the product instance, its licenses are released and made available within the virtual account.

## Smart Licensing Work Flow

The following figure depicts a working model of smart licensing that involves a three-step procedure.

**Figure 6: Smart Licensing Work Flow**

- Setting up Smart Licensing:** You can place the order for Smart Licensing, to manage licenses on the Cisco.com portal. You agree to the terms and conditions governing the use and access of Smart Licensing in the Smart Software Manager portal.
- Enabling and Use Smart Licensing:** Smart Licensing is enabled by default. You can use either of the following options to communicate:
  - Smart Call Home:** The Smart Call Home feature is automatically configured when Smart Licensing is enabled. Smart Call Home is used by Smart Licensing as a medium for communication with the Cisco license service. Call Home feature allows Cisco products to periodically call-home and perform an audit and reconciliation of your software usage information. This information helps Cisco efficiently track your install base, keep them up and running, and effectively pursue service and support contract renewals. For more information on Smart Call Home feature, see [http://www.cisco.com/c/dam/en/us/td/docs/switches/lan/smart\\_call\\_home/SCH\\_Deployment\\_Guide.pdf](http://www.cisco.com/c/dam/en/us/td/docs/switches/lan/smart_call_home/SCH_Deployment_Guide.pdf).
  - Smart Software Manager Satellite :** is a component of Cisco Smart Licensing and works with Cisco Smart Software Manager (SSM). It helps customers intelligently manage product licenses, providing near real-time visibility and reporting of the Cisco licenses they purchase and consume. For customers who do not want to manage their installed base using a direct Internet connection, the Smart Software Manager satellite is installed on the customer premises and provides a subset of Cisco SSM functionality. After you download the satellite application, deploy it, and register it to Cisco SSM, you can perform the following functions locally:
    - Activate or register a license

- Get visibility to your company's licenses
- Transfer licenses between company entities

Periodically, the satellite must synchronize with Cisco SSM to reflect the latest license entitlements.

For more information about the Smart Software Manager satellite, see <http://www.cisco.com/c/en/us/buy/smart-accounts/software-manager-satellite.html>.

3. **Manage and Report Licenses:** You can manage and view reports about your overall software usage in the Smart Software Manager portal. Compliance reporting describes the types of Smart Licensing reports.

## Benefits of Smart Licensing

- Licenses are not locked to perform configurations even if the license limit exceeds the paid license limit. You are notified with out-of-compliance notification to buy additional licenses when the license limit exceeds the paid license limit. This saves time with the ability to transfer licenses across the organization.
- Licenses can be pooled across the entire organization, enabling them to be reused across organizational boundaries.
- Provides software asset management information so that you can plan and track the licenses.

## Licensing in NCS 1004

Cisco NCS 1004 has the following line card PIDs :

- **NCS1K4-1.2T-K9**—High-cost PID. You can use this line card without any explicit licensing.
- **NCS1K4-1.2T-L-K9**—Licensed PID for 1.2T line card and the licenses are charged per port.
- 
- **NCS1K4-QXP-L-K9**—Licensed PID for QXP line card.
- **NCS1K4-QXP-K9** —Non-licensed PID for QXP line card.

You can use either one or a combination of both types of the 1.2T line card in the NCS 1004.

## Software Entitlements of Cisco NCS 1004

Software entitlement is a system that consists of a license manager on Cisco NCS 1004. The license manager manages licenses for various software and hardware features. The license manager parses and authenticates the license before accepting it.

The following table lists the features and its corresponding entitlements that can be enabled on Cisco NCS 1004 using licenses:

*Table 6: Software Entitlements of Cisco NCS 1004*

Feature	Software Entitlement
NCS1K4 Smart License-one QSFP28 client	S-NCS1K4-LIC-100G=

Feature	Software Entitlement
NCS1K4 Smart License - one QSFP28 client with encryption	S-NCS1K4-LIC-100X=

The licenses are charged per port basis and dependent on the number of trunk ports and client ports that you configure. The license count for the configuration of 4 x 100GE client ports or lesser is zero. For configurations greater than 4 x 100GE client ports, the license count is incremented by one for every 100GE client port configured at the slice level. The license count for the trunk port is incremented based on the BPS & optics configuration.

## Configure Smart Licensing

To configure smart licensing in Cisco NCS 1004, perform the following tasks:

- Step 1** Configure the domain name server for the smart license server.

**Example:**

```
RP/0/RP0/CPU0:ios#configure
Sat Dec 15 15:25:14.385 IST
RP/0/RP0/CPU0:NCS1004(config)#domain name-server 198.51.100.247
```

- Step 2** Setup the CiscoTAC-1 profile and destination address for Smart Call Home, using the following commands:

**call-home**

**service active**

**contact smart-licensing**

**profile CiscoTAC-1**

**active**

**destination address http {http|https}://{FQDN}/its/service/oddce/services/DDCEService**

**destination transport-method http**

**Note** FQDN must be either Cisco Smart Software Manager FQDN (tools.cisco.com) or Smart Licensing satellite server FQDN. You must configure the DNS server before setting-up the call-home destination address as FQDN. Use the **domain name-server {DNS server IP}** command to configure the DNS server on the device.

**Example:**

```
domain name-server 198.51.100.247
call-home
service active
contact smart-licensing
profile CiscoTAC-1
active
destination address http https://tools.cisco.com/its/service/oddce/services/DDCEService
destination transport-method http
```

**Note** CiscoTAC-1 profile is the default profile for smart licensing and it must not be deleted.

- Step 3** Configure the crypto ca Trust point profile, if CRL distribution point is not defined in the Satellite server certificate or if the device is not able to reach the host mentioned in the CRL distribution point.

**Example:**

```
RP/0/RP0/CPU0:ios(config)#crypto ca trustpoint Trustpool crt optional
```

- Step 4** Create and copy the registration token ID using Cisco Smart Software Manager.

For more details about creating a token, see [Creating a Token, on page 96](#).

- Step 5** In the privileged EXEC mode, register the token ID in Cisco NCS 1004, using the following commands:

```
license smart register idtoken token-ID
```

The registration may fail if the token is invalid or there is communication failure between the device and the portal or satellite. If there is a communication failure, there is a wait time of 24 hours before the device attempts to register again. To force the registration, use the **license smart register idtoken token-ID force** command.

When your device is taken off the inventory, shipped elsewhere for redeployment, or returned to Cisco for replacement using the return merchandise authorization (RMA) process, you can use the **license smart deregister** command to cancel the registration on your device. All smart licensing entitlements and certificates on the platform are removed.

ID certificates are renewed automatically after six months. In case, the renewal fails, the product instance goes into unidentified state. You can manually renew the ID certificate using the **license smart renew id** command.

Authorization periods are renewed by the Smart Licensing system every 30 days. As long as the license is in an 'Authorized' or 'Out-of-Compliance' (OOC), the authorization period is renewed. Use the **license smart renew auth** command to make an on-demand manual update of your registration. Thus, instead of waiting 30 days for the next registration renewal cycle, you can issue this command to instantly find out the status of your license.

After 90 days, the authorization period expires and the status of the associated licenses display "AUTH EXPIRED". Use the **license smart renew auth** command to retry the authorization period renewal. If the retry is successful, a new authorization period begins.

## Creating a Token

To create a new token using Cisco Smart Software Manager, perform the following tasks:

- Step 1** Log in to the Cisco Smart Software Manager.

URL: <https://software.cisco.com/#SmartLicensing-Inventory>

- Step 2** Select the appropriate Virtual Account.

From the **General** tab, choose **New Token**. Create Registration Token dialog box appears.

- Step 4** Follow the dialog to provide a name, duration, and export compliance applicability before accepting the terms and responsibilities.

- Step 5** Click **Create Token**.

# Verifying Smart Licensing Configuration

After enabling Smart Licensing, you can use the **show** commands to verify the default Smart Licensing configuration. If any issue is detected, take corrective action before making further configurations.

- **show license all**
- **show license trace all**
- **show license status**
- **show license summary**
- **show license tech**
- **Show license udi**
- **show license usage**
- **show license platform detail**
- **show license platform summary**
- **show license platform trace**
- **Show license platform trace all**
- **show tech-support smartlic**
- **show call-home detail**
- **show call-home trace all**
- **show tech-support call-home**

The following table defines the available license authorization status in Cisco NCS 1004:

*Table 7: License Authorization Status*

License Authorization Status	Description
Unconfigured	Smart Software Licensing is not configured.
Unidentified	Smart Software Licensing is enabled but is not registered.
Registered	Device registration is completed and an ID certificate is received that is used for future communication with the Cisco licensing authority.
Authorized	Registration is completed with a valid Smart Account and license consumption has begun. This indicates compliance.
Out of Compliance	Consumption exceeds available licenses in the Smart Account.
Authorization Expired	The device is unable to communicate with the Cisco Smart Software Manager for an extended period. This state occurs after 90 days of expiry. The device attempts to contact the CSSM every hour to renew the authorization until the registration period expires.

## Verifying Smart Licensing Configuration

### Example 1:

The following example shows the sample output of the **show license all** command.

```
RP/0/RP0/CPU0:ios#show license all
Mon Feb 11 15:58:44.047 IST

Smart Licensing Status

```
RP/0/RP0/CPU0:ios#show license udiMon Feb 11 16:02:46.733 IST
Product Information
=====
UDI: SN:CAT2231B18Y,UUID:default-sdr
```

## License Registration

You can use the following procedure to register license:

**Step 1** Register the license using the following command:

```
RP/0/RP0/CPU0:ios#license smart register idtoken <idtoken>
```

**Step 2** Browse to the URL : <https://software.cisco.com/software/csks/ws/platform/home#module/SmartLicensing>.

**Step 3** Click **Inventory**.

**Step 4** Click **Product Instances**.

**Step 5** Select the node instance.

**Step 6** Click **Actions**.

**Step 7** Click **Remove**.

**Step 8** Renew the authorization period using the following command:

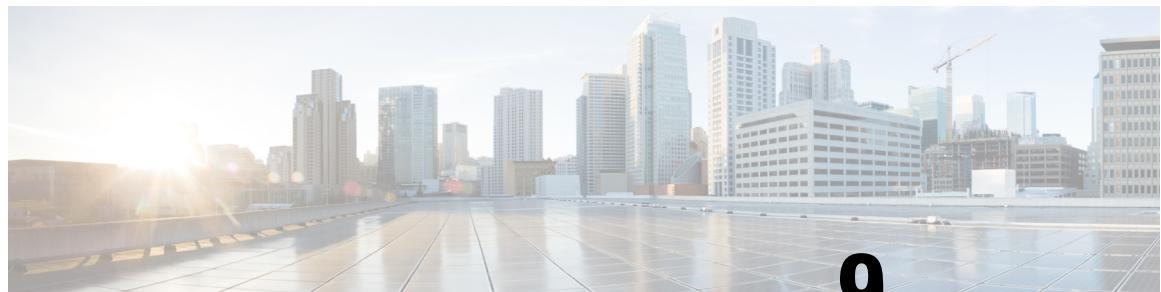

```
RP/0/RP0/CPU0:ios#license smart renew auth
RP/0/RP0/CPU0:ios#show logging | i "Data and signature"
Thu May 27 09:57:02.237 UTC
RP/0/RP0/CPU0:May 27 09:54:57.783 UTC: smartlicserver[311]:
LICENSE-SMART_LIC-3-AUTH_RENEW_FAILED : Authorization renewal with the Cisco Smart Software Manager
(CSSM) :
Error received from Smart Software Manager: Data and signature do not match for udi
PID:8812, SN:FOX2202WIVM
```

**Note** The error message in the output of the **show logging** command is expected and is due to loss of synchronization between the CSSM server and the device after removing the product instance directly from the CSSM server.

**Step 9** Perform deregister using the following command:

```
RP/0/RP0/CPU0:ios#license smart deregister
RP/0/RP0/CPU0:ios#show logging | i DREG
Thu May 27 14:48:58.170 UTC
RP/0/RP0/CPU0:May 27 09:58:58.464 UTC: smartlicserver[311]:
%LICENSE-SMART_LIC-3-AGENT_DREG_FAILED : Smart Agent for Licensing DeRegistration with Cisco Smart
Software Manager (CSSM) failed:
Agent received a failure status in a response message. Please check the Agent log file for the detailed
message.
```

**Note** The error message in the output of the **show logging** command is expected.

## CHAPTER 9

# USB Device Automount

---

This chapter describes the USB automount configuration on NCS 1004.

- [USB Automount, on page 101](#)
- [Mount USB Device, on page 101](#)
- [Unmount USB Device, on page 102](#)

## USB Automount

When you insert a USB device in NCS 1004, it is automatically mounted in sysadmin-vm with Read and Write permissions and unmounted in XR by default. The USB device is automatically mounted in sysadmin-vm only when the file system of the USB device is FAT or FAT32. This feature allows you to read from or write files and folders onto the USB device without explicitly mounting it. You can access the mounted USB device as disk2: file system.

Unmount the USB device from sysadmin-vm before you remove it from NCS 1004. Use the **mount** command, if you want to mount the USB device again after you unmount the device but before physically removing it.

You can simultaneously mount the USB device in XR-vm and sysadmin-vm. Unmount the USB device from both sysadmin-vm and XR-vm before you remove it from NCS 1004.

## Mount USB Device

To mount the USB device in sysadmin-vm, use the following command:

**usb device operation mount**

To mount the USB device in XR-vm, use the following command:

**unmount disk2: undo**

### Example

The following is an example of USB mount in sysadmin-vm.

```
sysadmin-vm:0_RP0#usb device operation mount  
Fri Jul 13 09:26:00.821 UTC success usb mounted
```

The following is an example of USB mount in XR-vm.

**Unmount USB Device**

```
RP/0/RP0/CPU0:ios#unmount disk2: undo
Fri Jul 13 14:56:34.326 IST
disk2: mounted successfully.
```

The following is an example of copying the file to the USB device.

```
[sysadmin-vm:0_RP0:~/showtech]$scp showtech-envmon-admin-2018-Jul-04.171400.IST.tgz /disk2\:
[sysadmin-vm:0_RP0:~/showtech]$cd /disk2\:
[sysadmin-vm:0_RP0:/disk2:]$ls -lrt
total 122424
drwxr-xr-x 2 root root      8192 Jul 12  2017 System Volume Information
drwxr-xr-x 2 root root      8192 Jun 11 16:16 boot
drwxr-xr-x 3 root root      8192 Jun 11 16:17 EFI
-rw-r--r--x 1 root root 125306880 Jul 10 13:50 calvVarLog.tar
-rw-r--r--x 1 root root   23023 Jul 13 05:23 showtech-envmon-admin-2018-Jul-04.171400.IST.tgz
```

## Unmount USB Device

To unmount the USB device in sysadmin-vm, use the following command:

**usb device operation unmount**

To unmount the USB device in XR-vm, use the following command:

**unmount disk2:**

### Example

The following is an example of USB unmount in sysadmin-vm.

```
sysadmin-vm:0_RP0#usb device operation unmount
Fri Jul 13 09:25:24.531 UTC success usb unmounted
```

The following is an example of USB unmount in XR-vm.

```
RP/0/RP0/CPU0:ios#unmount disk2:
Fri Jul 13 14:56:46.393 IST
disk2: unmounted successfully.
```

## APPENDIX A

# SNMP

---

NCS 1004 supports the following MIBs.

- CISCO-CONFIG-MAN-MIB
- CISCO-FLASH-MIB
- CISCO-ENTITY-REDUNDANCY-MIB
- CISCO-SYSTEM-MIB
- CISCO-ENTITY-ASSET-MIB
- EVENT-MIB
- DISMAN-EXPRESSION-MIB
- CISCO-FTP-CLIENT-MIB
- NOTIFICATION-LOG-MIB

The following table provides more information about SNMP MIBs and related documentation links.

Task	Link
Determine the MIB definitions	<a href="#">SNMP Object Navigator</a>
Configure SNMP	<a href="#">Configure SNMP</a>
Understand SNMP best practices about the recommended order of SNMP query, maximum cache hit, and SNMP retry and timeout recommendation	<a href="#">SNMP Best Practices</a>

Make sure that you configure snmp-server community as the SystemOwner to have the admin-plane parameters to appear to entity MIB. The parameters of fans and power supply units are examples of admin-plane parameters.
