

## Loop-Free Alternate Fast Reroute

Loop-Free Alternate (LFA) Fast Reroute (FRR) is a mechanism that provides local protection for unicast traffic in order to rapidly converge traffic flows around link and/or node failures.

- [Prerequisites for Loop-Free Alternate Fast Reroute, on page 1](#)
- [Restrictions for Loop-Free Alternate Fast Reroute, on page 1](#)
- [Information About Loop-Free Alternate Fast Reroute, on page 2](#)
- [Remote LFA for MLDP, on page 5](#)
- [How to Configure Loop-Free Alternate Fast Reroute, on page 6](#)
- [Configuring Remote LFA FRR for MLDP, on page 10](#)
- [Verifying Loop-Free Alternate Fast Reroute, on page 17](#)
- [Verifying Remote Loop-Free Alternate Fast Reroute with VPLS, on page 21](#)
- [Verifying Tunnel Interfaces Created by OSPF IPv4 Remote LFA IPFRR, on page 23](#)
- [Additional References, on page 24](#)

## Prerequisites for Loop-Free Alternate Fast Reroute

- Any of the following protocols must be supported for Loop-Free Alternate Fast Reroute:
  - Intermediate System-to-Intermediate System (IS-IS)
  - Open Shortest Path First (OSPF)
- While configuring ISIS protocol, **isis network point-to-point** must be configured.

## Restrictions for Loop-Free Alternate Fast Reroute

- Logical interfaces namely Port-channel (PoCH) support LFA FRR and remote LFA-FRR, with a single member link. Port-channel can be used as a backup path.
- Micro loops may form due to traffic congestion.
- A Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel cannot be used as a protected interface. However, an MPLS-TE tunnel can be a protecting (repair) interface as long as the TE tunnel is used as a primary path.

- For TDM pseudowires, the interfaces supported are CEM (CESoP, SAToP) and IMA (PVC,PVP); supported both on OC-3 and T1/E1 controllers. A maximum of 500 VCs can be configured per OC-3 controller.
- Each bridge domain interface (BDI) protected by FRR can have only one EFP.
- Remote LFA FRR provides better convergence with SFP ports rather than copper ports. As a workaround for copper ports, BFD triggered FRR can be used.
- FRR is *not* supported with POS and serial interfaces.
- Scale limit for FRR-protected global prefixes is 1500 and for layer 3 VPNs, scale limit is 4000.

## Information About Loop-Free Alternate Fast Reroute

The Loop-Free Alternate (LFA) Fast Reroute (FRR) feature offers an alternative to the MPLS Traffic Engineering Fast Reroute feature to minimize packet loss due to link or node failure.

LFA FRR enables a backup route to avoid traffic loss if a network fails. The backup routes (repair paths) are precomputed and installed in the router as the backup for the primary paths. After the router detects a link or adjacent node failure, it switches to the backup path to avoid traffic loss.

LFA is a node other than the primary neighbor. Traffic is redirected to an LFA after a network failure. An LFA makes the forwarding decision without any knowledge of the failure. An LFA must neither use a failed element nor use a protecting node to forward traffic. An LFA must not cause loops. By default, LFA is enabled on all supported interfaces as long as the interface can be used as a primary path.

Advantages of using per-prefix LFAs are as follows:

- The repair path forwards traffic during transition when the primary path link is down.
- All destinations having a per-prefix LFA are protected. This leaves only a subset (a node at the far side of the failure) unprotected.

## Supported Information

- LFA FRR is supported with equal cost multipath (ECMP).
- Fast Reroute triggered by Bidirectional Forwarding (BFD) is supported.
- Remote LFA tunnels are High Availability aware; hence, Stateful Switchover (SSO) compliant.

## Benefits of Loop-Free Alternate Fast Reroute

- Same level of protection from traffic loss
- Simplified configuration
- Link and node protection
- Link and path protection
- LFA (loop-free alternate) paths

- Support for both IP and Label Distribution Protocol (LDP) core
- LFA FRR is supported with equal cost multipath (ECMP).
- Fast Reroute triggered by Bidirectional Forwarding (BFD).
- Remote LFA tunnels are High Availability aware; hence, Stateful Switchover (SSO) compliant.

## LFA FRR and Remote LFA FRR over Bridge Domains Interfaces

The router supports bridge domain interfaces (BDI). For information on configuring bridge domains, see [Configuring Ethernet Virtual Connections on the Cisco ASR 903 Router](#).

LFA FRR and remote LFA FRR is supported on bridge domain interfaces on the router. For information on configuring Remote LFA FRR on BDI, see [How to Configure Loop-Free Alternate Fast Reroute, on page 6](#).

## IS-IS and IP FRR

When a local link fails in a network, IS-IS recomputes new primary next-hop routes for all affected prefixes. These prefixes are updated in the RIB and the Forwarding Information Base (FIB). Until the primary prefixes are updated in the forwarding plane, traffic directed towards the affected prefixes are discarded. This process can take hundreds of milliseconds.

In IP FRR, IS-IS computes LFA next-hop routes for the forwarding plane to use in case of primary path failures. LFA is computed per prefix.

When there are multiple LFAs for a given primary path, IS-IS uses a tiebreaking rule to pick a single LFA for a primary path. In case of a primary path with multiple LFA paths, prefixes are distributed equally among LFA paths.

## Repair Paths

Repair paths forward traffic during a routing transition. When a link or a router fails, due to the loss of a physical layer signal, initially, only the neighboring routers are aware of the failure. All other routers in the network are unaware of the nature and location of this failure until information about this failure is propagated through a routing protocol, which may take several hundred milliseconds. It is, therefore, necessary to arrange for packets affected by the network failure to be steered to their destinations.

A router adjacent to the failed link employs a set of repair paths for packets that would have used the failed link. These repair paths are used from the time the router detects the failure until the routing transition is complete. By the time the routing transition is complete, all routers in the network revise their forwarding data and the failed link is eliminated from the routing computation.

Repair paths are precomputed in anticipation of failures so that they can be activated the moment a failure is detected.

The IPv4 LFA FRR feature uses the following repair paths:

- Equal Cost Multipath (ECMP) uses a link as a member of an equal cost path-split set for a destination. The other members of the set can provide an alternative path when the link fails.
- LFA is a next-hop route that delivers a packet to its destination without looping back. Downstream paths are a subset of LFAs.

## Remote LFA FRR

Some topologies (for example the commonly used ring-based topology) require protection that is not afforded by LFA FRR alone. Consider the topology shown in the figure below:

**Figure 1: Remote LFA FRR with Ring Topology**

The red looping arrow represents traffic that is looping immediately after a failure between node A and C (before network reconvergence). Device A tries to send traffic destined to F to next-hop B. Device B cannot be used as an LFA for prefixes advertised by nodes C and F. The actual LFA is node D. However, node D is not directly connected to the protecting node A. To protect prefixes advertised by C, node A must tunnel the packet around the failed link A-C to node D, provided that the tunnel does not traverse the failing link.

Remote LFA FRR enables you to tunnel a packet around a failed link to a remote loop-free alternate that is more than one hop away. In the figure above, the green arrow between A and D shows the tunnel that is automatically created by the remote LFA feature to bypass looping.

### Remote LFA FRR for TDM and ATM Pseudowires

The Router supports two pseudewire types that utilize CEM transport: Structure-Agnostic TDM over Packet (SAToP) and Circuit Emulation Service over Packet-Switched Network (CESoPSN).

### Border Gateway Protocol (BGP) Prefix-Independent Convergence (PIC) and LFA FRR Integration

Both the Labeled Border Gateway Protocol (BGP) Prefix-Independent Convergence (PIC) feature and the Loop-Free Alternate (LFA) Fast Reroute (FRR) feature can be configured together on the router.

BGP PIC is supported for bridge domain interfaces (BDI) with FRR.

**Note** Each bridge domain interface (BDI) protected by FRR can have only one EFP.

For information on configuring BGP PIC, see [BGP PIC Edge for IP and MPLS-VPN](#).

## Remote LFA FRR with VPLS

VPLS (Virtual Private LAN Service) enables enterprises to link together their Ethernet-based LANs from multiple sites via the infrastructure provided by their service provider. For information on configuring VPLS, see [Configuring Virtual Private LAN Services](#). Starting With Cisco IOS XE Release 3.10S, Remote LFA FRR is supported with VPLS.

For information on configuring remote LFA FRR with VPLS, see [How to Configure Loop-Free Alternate Fast Reroute, on page 6](#).

## Remote LFA for MLDP

*Table 1: Feature History Table*

Feature Name	Release Information	Description
Remote LFA for MLDP	Cisco IOS XE Bengaluru 17.6.1	Remote Loop-Free Alternate (RLFA) based Fast Reroute (FRR) improves LFA coverage. When used with Multicast Label Distribution Protocol (MLDP) for IPv4, there's no need for an extra protocol in the control plane.

Loop-Free Alternate (LFA) FRR mechanism enables a backup route to avoid traffic loss if a network fails. The backup routes are precomputed and installed in the router as backup for primary paths. After the Cisco router detects a link or adjacent node failure, it switches to the backup path to avoid traffic loss. As the backup paths are pre-calculated and installed, switching to back up path is fast, in case of failure.

Effective Cisco IOS XE Bengaluru 17.6.1, you can enable this feature to effectively use backup routes to help with load balancing. This feature improves the LFA coverage when used with MPLS LDP (MLDP), there's no need of an extra protocol in the control plane.

## Restrictions for Remote LFA for MLDP

- MLDP Node protection is not supported.
- Only Link Level protection for MLDP LFA FRR is supported.
- The detection of local/ remote link failure and switch over to the repair path is performed within 100 msec irrespective of the FRR scale.
- RLFA FRR in MLDP for IPv6 is not supported.
- RLFA FRR for Port-channel is not supported.
- Maximum supported Data Multicast Distribution Trees (MDT) for RLFA FRR is 750.
- Make Before Break (MBB) timer should be configured based on the scale of prefixes and P2MP trees configured.
- Label Distribution Protocol (LDP), Graceful Restart (GR) and MBB are mandatory to manage new and old Label Switch Path (LSP).
- Duplicate traffic is observed during cutover until GR timer expires. Duplicate traffic is dropped in the merge node and is not received by the receiver.

- RLFA over ECMP paths for mLDP is not supported.
- You must configure microloop avoidance under the IGP instance to achieve the desired convergence parameters.

**Note** Microloop avoidance may not work when Interior Gateway Protocol (IGP) is not receiving the interface down event to trigger the microloop avoidance timer. In such cases to avoid traffic drop due to IGP convergence, you have to configure BFD over the RLFA enabled links with 3.3-msec link down timers. This enables BFD to send link down notification within 9.9 msec.

## How to Configure Loop-Free Alternate Fast Reroute

To enable loop-free alternate fast reroute support for L2VPNs, VPLS, TDM pseudowires and VPWS, you must configure LFA FRR for the routing protocol. You can enable LFA FRR using ISIS or OSPF configurations.

- For information on configuring LFA FRR using OSPF, see [OSPFv2 Loop-Free Alternate Fast Reroute](#) in the *IP Routing: OSPF Configuration Guide*.
- For information on configuring Remote LFA FRR using OSPF, see [OSPF IPv4 Remote Loop-Free Alternate IP Fast Reroute](#) in the *IP Routing: OSPF Configuration Guide*.
- For information on configuring Remote LFA FRR using ISIS on the Cisco ASR 903, see [Configuring IS-IS Remote Loop-Free Alternate Fast Reroute](#), on page 6.

## Configuring IS-IS Remote Loop-Free Alternate Fast Reroute

The following additional configurations are mandatory:

- **mpls ldp discovery targeted-hello accept**

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>router isis [area-tag]</b> <b>Example:</b>	Enables the IS-IS routing protocol and specifies an IS-IS process. <ul style="list-style-type: none"> <li>• Enters router configuration mode.</li> </ul>

	Command or Action	Purpose
	<code>Device(config)# router isis ipfrr</code>	
<b>Step 4</b>	<b>fast-reroute per-prefix {level-1   level-2} {all   route-map route-map-name}</b> <b>Example:</b> <code>Device (config-router)# fast-reroute per-prefix level-1 all</code>	Enables per-prefix FRR. <ul style="list-style-type: none"> <li>• Configure the <b>all</b> keyword to protect all prefixes.</li> </ul>
<b>Step 5</b>	<b>fast-reroute remote-lfa {level-1   level-2} mpls-ldp [maximum-metric metric-value]</b> <b>Example:</b> <code>Device(config-router)# fast-reroute remote-lfa level-1 mpls-ldp</code>	Configures an FRR path that redirects traffic to a remote LFA tunnel for either level 1 or level 2 packets. <ul style="list-style-type: none"> <li>• Use the <b>maximum-metric metric-value</b> keyword-argument pair to specify the maximum metric value required to reach the release node.</li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> <code>Device(config-router)# end</code>	Exits router configuration mode and enters privileged EXEC mode.

## Recommended Configurations ISIS

For optimal results with remote LFA FRR, it is recommended that you use the following SFP timers:

- ISIS
  - `spf-interval 5 50 200`
  - `prc-interval 5 50 200`
  - `sp-gen-interval 5 50 200`
  - `fast-flood 10`
- Globally configure the MPLS IGP hold-down timer to avoid an indefinite wait by IGP for synchronization using the `mpls ldp igp sync holdown 2000` command.

## Example: Configuring IS-IS Remote Loop-Free Alternate Fast Reroute

The following example shows how to enable remote LFA FRR:

```
Router(config)# router isis
Router(config)# fast-reroute per-prefix level-1 all
Router(config)# fast-reroute per-prefix level-2 all
Router(router-config)# fast-reroute remote-lfa level-1 mpls-ldp
Router(router-config)# fast-reroute remote-lfa level-2 mpls-ldp
```

## Example: Configuring Remote LFA FRR with VPLS

Example: Configuration of Remote LFA FRR with Interior Gateway Protocol (IGP)

```
router isis hp
 net 49.0101.0000.0000.0802.00
 is-type level-2-only
 ispf level-2
 metric-style wide
 fast-flood
 set-overload-bit on-startup 180
 max-lsp-lifetime 65535
 lsp-refresh-interval 65000
 spf-interval 5 50 200
 prc-interval 5 50 200
 lsp-gen-interval 5 5 200
 no hello padding
 log-adjacency-changes
 nsf cisco
 fast-reroute per-prefix level-1 all
 fast-reroute per-prefix level-2 all
 fast-reroute remote-lfa level-1 mpls-ldp
 fast-reroute remote-lfa level-2 mpls-ldp
 passive-interface Loopback0
 mpls ldp sync
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng level-2
```

Example: Configuration of Remote LFA FRR with VPLS at the interface level.

```
!
interface GigabitEthernet0/3/3
 ip address 198.51.100.1 255.255.255.0
 ip router isis hp
 logging event link-status
 load-interval 30
 negotiation auto
 mpls ip
 mpls traffic-eng tunnels
 isis network point-to-point
end
!
```

Example: Configuration of remote LFA FRR with VPLS at the global level.

```
!
12 vfi Test-2000 manual
 vpn id 2010
 bridge-domain 2010
 neighbor 192.0.2.1 encapsulation mpls
!
```

Example: Configuration of remote LFA FRR with VPLS at Access side.

```
!
interface TenGigabitEthernet0/2/0
 no ip address
 service instance trunk 1 ethernet
 encapsulation dot1q 12-2012
 rewrite ingress tag pop 1 symmetric
```

```
bridge-domain from-encapsulation
!
```

## How to Configure OSPF IPv4 Remote Loop-Free Alternate IP Fast Reroute

### Configuring a Remote LFA Tunnel

Perform this task to configure a per-prefix LFA FRR path that redirects traffic to a remote LFA tunnel.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>router ospf process-id</b> <b>Example:</b>  Device(config)# router ospf 10	Enables OSPF routing and enters router configuration mode.
<b>Step 4</b>	<b>fast-reroute per-prefix remote-lfa [area area-id] tunnel mpls-ldp</b> <b>Example:</b>  Device(config-router)# fast-reroute per-prefix remote-lfa area 2 tunnel mpls-ldp	Configures a per-prefix LFA FRR path that redirects traffic to a remote LFA tunnel via MPLS-LDP.  • Use the <b>area area-id</b> keyword and argument to specify an area in which to enable LFA FRR.

#### Recommended Configurations OSPF

For optimal results with remote LFA FRR, it is recommended that you use the following SFP timers:

- timers throttle spf 50 200 5000
- timers throttle lsa 50 200 5000
- timers lsa arrival 100
- timers pacing flood 33

**Note** ISPF should be disabled.

## Configuring the Maximum Distance to a Tunnel Endpoint

Perform this task to configure the maximum distance to the tunnel endpoint in a per-prefix LFA FRR path that redirects traffic to a remote LFA tunnel.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>router ospf</b> <i>process-id</i> <b>Example:</b> Device(config)# router ospf 10	Enables OSPF routing and enters router configuration mode.
<b>Step 4</b>	<b>fast-reroute per-prefix remote-lfa</b> [ <b>area</b> <i>area-id</i> ] <b>maximum-cost</b> <i>distance</i> <b>Example:</b> Device(config-router)# fast-reroute per-prefix remote-lfa area 2 maximum-cost 30	Configures the maximum distance to the tunnel endpoint in a per-prefix LFA FRR path that redirects traffic to a remote LFA tunnel. <ul style="list-style-type: none"> <li>• Use the <b>area</b> <i>area-id</i> keyword and variable to specify an area in which to enable LFA FRR.</li> </ul>

## Configuring Remote LFA FRR for MLDP

Perform this task to configure the LDP based Remote LFA FRR for MLDP.

**Note** Ensure to configure a carrier delay down of 1 second on all core interfaces.

You must configure the **mpls mldp forwarding recursive** command to enable recursive forwarding. Do not disable this command while configuring Remote LFA MLDP.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	<code>Router enable</code>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Router# configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>mpls ldp graceful-restart</b> <b>Example:</b> <code>Router(config)# mpls ldp graceful-restart</code>	Enables the router to protect the LDP bindings and MPLS forwarding state during a disruption in service.
<b>Step 4</b>	<b>mpls traffic-eng tunnels</b> <b>Example:</b> <code>Router(config)# mpls traffic-eng tunnels</code>	Enables MPLS traffic engineering tunnel signaling on a device.
<b>Step 5</b>	<b>mpls ldp discovery targeted-hello accept</b> <b>Example:</b> <code>Router(config)# mpls ldp discovery targeted-hello accept</code>	Enables MPLS LDP targeted discovery on a device.
<b>Step 6</b>	<b>mpls mldp make-before-break delay 1000</b> <b>Example:</b> <code>Router(config)# mpls mldp make-before-break delay 1000</code>	Enables MPLS MLDP MBB on a device.
<b>Step 7</b>	<b>end</b> <b>Example:</b> <code>Router(config)# end</code>	Exits router configuration mode and enters privileged EXEC mode.

## Configuring IGP based Remote LFA for MLDP

Perform this task to configure the IGP based Remote LFA MLDP.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Router enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Router# configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>router ospf</b> <i>process-id</i> <b>Example:</b> Router(config-router)# router ospf 10	Enables OSPF routing and enters router configuration mode.
<b>Step 4</b>	<b>microloop avoidance rib-update-delay</b> <i>delay-time</i> <b>Example:</b> Router(config-router)# microloop avoidance rib-update-delay 60000	Specifies the amount of time the node uses the microloop avoidance policy before updating its forwarding table. The delay-time is in milliseconds. The range is from 1-60000.
<b>Step 5</b>	<b>fast-reroute per-prefix enable prefix-priority</b> <i>priority-level</i> <b>Example:</b> Router(config-router)# fast-reroute per-prefix enable prefix-priority low	Enables repair-path computation and selects the priority level for repair paths.  Low priority specifies that all prefixes have the same eligibility for protection. High priority specifies that only high-priority prefixes are protected.
<b>Step 6</b>	<b>fast-reroute per-prefix remote-lfa</b> [ <i>area area-id</i> ] <b>tunnel mpls-ldp</b> <b>Example:</b> Router(config-router)# fast-reroute per-prefix remote-lfa area 0 tunnel mpls-ldp	Configures a per-prefix LFA FRR path that redirects traffic to a remote LFA tunnel via MPLS-LDP.  Use the <b>area</b> area-id keyword and argument to specify an area in which to enable LFA FRR.
<b>Step 7</b>	<b>fast-reroute keep-all-paths</b> <b>Example:</b> Router(config-router)# fast-reroute keep-all-paths	Specifies creating a list of repair paths considered for LFA FRR.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Router(config)# end	Exits router configuration mode and enters privileged EXEC mode.

## Verifying Remote LFA for MLDP

**Note** The prefix 3.3.3.3 is mLDP Next Hop (NH) in the direction of receiver.

```
Router#show ip cef 3.3.3.3 internal

## Verifying Loop-Free Alternate Fast Reroute

Use one or more of the following commands to verify the LFA FRR configuration

- **show ip cef network-prefix internal**
- **show mpls infrastructure lfd pseudowire internal**
- **show platform hardware pp active feature cef database ipv4 network-prefix**

### Example: Verifying LFA FRR with L2VPN

#### show ip cef internal

The following is sample output from the **show ip cef internal** command:

```

Device# show ip cef 16.16.16.16 internal
16.16.16.16/32, epoch 2, RIB[I], refcount 7, per-destination sharing
sources: RIB, RR, LTE
feature space:
  IPRM: 0x00028000
  Broker: linked, distributed at 1st priority
  LFD: 16.16.16.16/32 1 local label

```

```

    local label info: global/17
        contains path extension list
        disposition chain 0x3A3C1DF0
        label switch chain 0x3A3C1DF0
    subblocks:
        1 RR source [no flags]

## Configuration Examples for OSPF IPv4 Remote Loop-Free Alternate IP Fast Reroute

### Example: Configuring a Remote LFA Tunnel

The following example shows how to configure a remote per-prefix LFA FRR in area 2. The remote tunnel type is specified as MPLS-LDP:

```
Router(config-router)# fast-reroute per-prefix remote-lfa area 2 tunnel mpls-ldp
```

### Example: Configuring the Maximum Distance to a Tunnel Endpoint

The following example shows how to set a maximum cost of 30 in area 2:

```
Router(config-router)# fast-reroute per-prefix remote-lfa area 2 maximum-cost 30
```

### Example: Verifying Tunnel Interfaces Created by OSPF IPv4 Remote LFA IPFRR

The following example displays information about tunnel interfaces created by OSPF IPv4 LFA IPFRR:

```
Router# show ip ospf fast-reroute remote-lfa tunnels

      OSPF Router with ID (192.168.1.1) (Process ID 1)
      Area with ID (0)
      Base Topology (MTID 0)

Interface MPLS-Remote-Lfa3
Tunnel type: MPLS-LDP
Tailend router ID: 192.168.3.3
Termination IP address: 192.168.3.3
Outgoing interface: Ethernet0/0
First hop gateway: 192.168.14.4
Tunnel metric: 20
Protects:
  192.168.12.2 Ethernet0/1, total metric 30
```

# Verifying Remote Loop-Free Alternate Fast Reroute with VPLS

## Example: Verifying Remote LFA FRR with VPLS

### show ip cef internal
