

MAC Access Control Lists

This chapter describes how to configure MAC access control lists (ACLs) on a Cisco router. It contains the following sections:

- Finding Feature Information, on page 1
- Prerequisites for MAC Access Control Lists, on page 1
- Restrictions for MAC Access Control Lists, on page 1
- Information About MAC Access Control Lists, on page 2
- How to Configure MAC Access Control Lists, on page 2
- Configuration Examples for MAC Access Control Lists, on page 6
- Additional References for MAC Access Control Lists, on page 6

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MAC Access Control Lists

• You must be familiar with MAC addressing and non-IP protocols to configure MAC ACLs.

Restrictions for MAC Access Control Lists

- MAC ACL is not supported on:
 - Trunk EFP or trunk port
 - Egress
 - Interface

- MAC ACL is not supported for IP packets.
- MAC ACL counters are not supported.
- MAC ACLs are not supported on port, routed interface, and BDI.
- ACL and QoS cannot be applied on the same interface, EFP and bridge domain interface (BDI).
- Outbound MAC ACL is not supported on the Cisco RSP3 Module.
- MAC ACL does not deny broadcast packets on the EFP on the RSP3 module. To deny broadcast packets do any of the following:
 - Use storm control feature to restrict the broadcast packets.
 - Create a policy with the ACL (permit broadacst), and apply it to the interface with the 64K policer, to rate limit and allow only minimal amount of broadcast packets.

Information About MAC Access Control Lists

MAC Access Control Lists

MAC ACLs are ACLs that filter traffic using information in the Layer 2 header of each packet. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at the router interfaces. MAC ACL is supported on EFP and Cross-Connect.

How to Configure MAC Access Control Lists

Configuring ACL

To configure ACL, perform the steps below.

Step 1 enable

Example:

Router> enable

Enables privileged EXEC mode.

• Enter your password if prompted.

Step 2 configure terminal

Example:

Router# configure terminal

Enters global configuration mode.

Step 3 mac access-list extended name

Example:

Router(config) # mac access-list ext macext2

Creates an extended MAC access control list (ACL) and define its access control entries (ACEs).

• name—Name of the ACL to which the entry belongs.

Step 4 {permit | deny} {any | host src-MAC-addr} {any | host dst-MAC-addr}

Example:

Router(config-ext-macl) # deny any any

Permits or denies Layer 2 traffic to be forwarded if the conditions are matched.

- **permit**—Permits Layer 2 traffic to be forwarded if the conditions are matched.
- deny—Denies Layer 2 traffic to be forwarded if the conditions are matched.
- any—Keyword to deny any source or destination MAC address.
- host src-MAC-addr—Defines a host MAC address. MAC address-based subnets are not allowed.
- host dst-MAC-addr—Defines a destination MAC address. MAC address-based subnets are not allowed.

Step 5 end

Example:

Router(config-ext-macl) # end

Returns to privileged EXEC mode.

Applying ACL on Cross-Connect

To apply ACL on Cross-Connect, perform the steps below.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. interface gigabitethernet slot/subslot/port
- 4. service instance id ethernet
- 5. description string
- **6.** encapsulation dot1q sp-vlan-id second-dot1q { ce-vlan-id | any}
- 7. rewrite ingress tag $\{pop \{1 | 2\}\}\ [symmetric]$
- 8. mac access-group access-list-name in
- **9. xconnect** *peer-router-id vcid* **encapsulation mpls**
- 10. mtu mtu-value
- **11**. exit
- **12.** service instance *id* ethernet
- **13**. **encapsulation dot1q** *vlan-id*
- 14. mac access-group access-list-name in
- 15. bridge-domain bridge-id
- 16. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	interface gigabitethernet slot/subslot/port	Specifies an interface and enters interface configuration
	Example:	mode.
	Router(config) # interface gigabitEthernet 0/2/1	• slot/subslot/port—The location of the interface.
Step 4	service instance id ethernet	Configures an Ethernet service instance on an interface
	Example:	and enters service instance configuration mode.
	Router(config-if)# service instance 1120 ethernet	• <i>id</i> —Specifies the EFP identifier, an integer from 1 to 4000.
Step 5	description string	Adds a description about an interface to help you remember
	Example:	its function.
	Router(config-if-srv)# description sBROBA 41CHE Shared VLAN highest priority	• <i>string</i> —Adds a description (up to 240 characters) for an interface.
Step 6	encapsulation dot1q sp-vlan-id second-dot1q { ce-vlan-id any}	Enables stacked VLAN (802.1Q-in-Q) processing of customer VLAN traffic on an Ethernet subinterface.
	Example: Router(config-if-srv) # encapsulation dot1q 141 second-dot1q 120	 sp-vlan-id—Virtual LAN identifier of the unique service-provider VLAN used in 802.1Q-in-Q encapsulation of Ethernet traffic from the VLANs of a customer. The valid values are from 1 to 4095. ce-vlan-id—Virtual LAN identifier of a customer VLAN encapsulated with the service-provider VLAN ID specified by sp-vlan-id in stacked VLAN (802.1Q-in-Q) processing. The valid values are from 1 to 4095. This argument is the inner VLAN tag in 802.1Q-in-Q headers. any—Configures stacked VLAN processing for all customer VLAN IDs encapsulated with the specified service-provider VLAN ID that are not specified in a separate encapsulation dot1q second-dot1q command on another subinterface.
Step 7	rewrite ingress tag {pop {1 2}} [symmetric] Example:	Specifies the encapsulation adjustment that is to be performed on the frame ingress to the service instance.
	Router(config-if-srv) # rewrite ingress tag pop 2 symmetric	• pop {1 2}—One or two tags are removed from the packet. This command can be combined with a push (pop N and subsequent push vlan-id).

	Command or Action	Purpose
		• symmetric —(Optional) A rewrite operation is applied on both ingress and egress. The operation on egress is the inverse operation as ingress.
Step 8	mac access-group access-list-name in	To use a MAC access control list (ACL) to control inbound traffic on an Ethernet service instance.
	<pre>Example: Router(config-if-srv)# mac access-group macext2 in</pre>	 access-list-name—Name of a MAC ACL to apply to an interface or subinterface (as specified by the mac access-list extended command). in—Filters on inbound packets.
Step 9	xconnect peer-router-id vcid encapsulation mpls Example:	Binds the attachment circuit to a pseudowire VC. The syntax for this command is the same as for all other Layer 2 transports. Enters cross-connect configuration mode.
	Router(config-if-srv)# xconnect 77.77.77.77 1120 encapsulation mpls	 peer-router-id—IP address of the remote provider edge (PE) peer router. vcid—32-bit identifier to assign to the pseudowire.
Step 10	mtu mtu-value	Specifies the MTU for the VC.
	Example: Router(config-if-xconn)# mtu 1500	• mtu-value—Specifies the value of the MTU.
Step 11	exit	Exits cross-connect configuration mode.
	<pre>Example: Router(config-if-xconn)# exit</pre>	
Step 12	service instance id ethernet	Configures an Ethernet service instance on an interface
	<pre>Example: Router(config-if)# service instance 1000 ethernet</pre>	 and enters service instance configuration mode. id—Specifies the EFP identifier, an integer from 1 to 4000.
Step 13	encapsulation dot1q vlan-id Example:	To define the matching criteria to map 802.1Q frames ingress on an interface to the appropriate service instance.
	Router(config-if-srv)# encapsulation dot1q 141 second-dot1q 120	• <i>vlan-id</i> —VLAN ID, integer in the range 1 to 4094.
Step 14	mac access-group access-list-name in Example:	To use a MAC access control list (ACL) to control inbound traffic on an Ethernet service instance.
	Router(config-if-srv) # mac access-group macext2 in	 access-list-name—Name of a MAC ACL to apply to an interface or subinterface (as specified by the mac access-list extended command). in—Filters on inbound packets.
Step 15	bridge-domain bridge-id	Binds a service instance or a MAC tunnel to a bridge domain instance.
	Example: Router(config-if-srv) # bridge-domain 1000	• <i>bridge-id</i> —Numerical identifier for the bridge domain instance. The range is an integer from 1 to 4000.

	Command or Action	Purpose
Step 16	end	Exits service instance mode and returns to privileged
	Example:	EXEC mode.
	Router(config-if-srv)# end	

Verifying MAC Access Control Lists

To verify the MAC ACL configuration, use the following **show** command.

• show access-lists name—Displays information about the named access list.

Router# show access-list macext4

```
Extended MAC access list macext4

permit any host 0000.0000.0009

permit any host 0000.0000.0010

permit any host 0000.0000.0011

permit any host 0000.0000.0012
```

Configuration Examples for MAC Access Control Lists

MAC ACL Configuration

Example: Allowing Specified Source or Destination MAC Addresses

```
(config) #mac access-list extended macext5
(config-ext-macl) #permit any host 0000.0000.0009
(config-ext-macl) #permit any host 0000.0000.0010
(config-ext-macl) #permit any host 0000.0000.0011
(config-ext-macl) #permit any host 0000.0000.0012
```

Example: Allowing any Source or Destination MAC Address

(config) #mac access-list extended macext9
(config-ext-macl) #permit any any
