Cisco Security Cloud Control overview

Security Cloud Control is a web application that provides centralized management of Cisco Secure product instances, user identity, and user access management across Cisco Security Cloud. Security Cloud Control administrators can create new Security Cloud enterprises, manage users in an enterprise, claim domains, and integrate their organization's SSO identity provider, among other tasks.

Overview tab

The **Overview** tab lists your currently activated Cisco product instances and those that are pending activation. You also can claim a subscription or attach an external product to Security Cloud from here. For details, see [Managing products and subscriptions](#).

Users tab

The **Userstab** lists all users who are connected to the enterprise. The enterprise administrator can invite and add users to an enterprise. Administrator can also reset user passwords and MFA settings (for users in a [claimed and verified domain](#)) and deactivate user accounts. See [Managing users](#) for more information.

Domains tab

The **Domains** tab lists email domains that have been claimed and verified for the enterprise. Verifying a domain is required to integrate an identity provider with Security Cloud Sign On. It also allows administrators to reset passwords or MFA settings of users in the claimed domain. See [Managing domains](#) for more information.

The screenshot shows the 'Add New Domain' dialog in the Security Cloud Control interface. On the left, there is a navigation menu with options: Enterprise (Default Enterprise), Overview, Users, Groups, Roles, Domains (highlighted), and Identity Providers. The main content area is titled 'Add New Domain' and contains a progress indicator with two steps: '1 Domain' (selected) and '2 Verification'. The 'Domain' step includes a text input field for the domain name, with 'cloud@control.com' entered. A 'Next' button is visible at the bottom right.

Identity Providers tab

The **Identity Providers** tab lists any identity providers integrated with Security Cloud Sign On using SAML (Secure Assertion Markup Language) for the current enterprise. This allows enterprise users to access their Cisco Secure products with their identity provider's SSO credentials. See [Identity provider integration guide](#) for details.

Signing in to Security Cloud Control

To sign in to Security Cloud Control you need a [Cisco Security Cloud Sign On](#) account. If you don't have an account, [create one](#) and configure multi-factor authentication with either Duo MFA or Google Authenticator. The first time you sign in to Security Cloud Control with your Security Cloud Sign On account, a new enterprise is created with your Security Cloud Sign On account as the sole [user](#) in the enterprise.

If you only have one enterprise associated with your account, it will always be the default account when you log in. If you have multiple enterprises associated with your account, the latest one you used will be selected after you sign in.

Step 1 Open [Security Cloud Control](#).

Step 2 Sign in with your Security Cloud Sign On credentials and MFA options you established when creating your account.

If this is the first time signing in to Security Cloud Control, account, a new enterprise is created for you with a default name. You can [rename](#) the enterprise by clicking the pencil icon.
