

CHAPTER 3

Configuring the Domain

This chapter describes how to configure the Cisco Nexus 1000V domain, including creating the domain and assigning VLANs.

This chapter includes the following topics:

- [Information About the Domain, page 3-1](#)
- [Creating the Domain, page 3-1](#)
- [Creating the Control VLAN for the Domain, page 3-3](#)
- [Creating the Packet VLAN for the Domain, page 3-5](#)
- [Feature History for Domains, page 3-7](#)

Information About the Domain

You must create a domain name for Cisco Nexus 1000V and then add control and packet VLANs for communication and management. This process is part of the initial setup of the a Cisco Nexus 1000V when installing the software. If you need to create a domain later, you can do so using the **setup** command or the procedures described in this chapter.

Creating the Domain

Use this procedure to create a domain name for the Cisco Nexus 1000V that identifies the VSM and VEMs; and then add control and packet VLANs for communication and management. This process is part of the initial setup of the Cisco Nexus 1000V when installing the software. If you need to create a domain after initial setup, you can do so using this procedure.

BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- If two or more VSMs share the same control and/or packet VLAN, the domain helps identify the VEMs managed by each VSM.
- You are logged in to the CLI in EXEC mode.
- You must have a unique domain ID for this Cisco Nexus 1000V instance.
- You must identify the VLANs to be used for control and packet traffic.

Send document comments to nexus1k-docfeedback@cisco.com.

- Cisco recommends using distinct VLANs for control and packet traffic.
- Cisco recommends using distinct VLANs for different instances of Nexus 1000V (different domains).
- The **svs mode** command in the SVS Domain Configuration mode is not used and has no effect on a configuration.
- For information about changing a domain ID after adding a second VSM see the *Cisco Nexus 1000V High Availability and Redundancy Reference, Release 4.0(4)SV1(1)*.

SUMMARY STEPS

1. **config t**
2. **svs-domain**
3. **domain id *domain-id***
4. **control vlan *vlan-id***
5. **packet vlan *vlan-id***
6. **exit**
7. **show svs-domain**
8. **copy running-config startup-config**

DETAILED STEPS

	Command	Purpose
Step 1	config t	Places you into CLI Global Configuration mode.
	Example: n1000v# config t n1000v(config)#	
Step 2	svs-domain	Places you into the SVS Domain Configuration mode.
	Example: n1000v(config)# svs-domain n1000v(config-svs-domain)#	
Step 3	domain id <i>number</i>	Creates the domain ID for this Cisco Nexus 1000V instance.
	Example: n1000v(config-svs-domain)# domain id 100 n1000v(config-svs-domain)#	
Step 4	control vlan <i>number</i>	Assigns the control VLAN for this domain.
	Example: n1000v(config-svs-domain)# control vlan 190 n1000v(config-vlan)#	
Step 5	packet vlan <i>number</i>	Assigns the packet VLAN for this domain.
	Example: n1000v(config-vlan)# packet vlan 191 n1000v(config-vlan)#	

Send document comments to nexus1k-docfeedback@cisco.com.

	Command	Purpose
Step 6	show svs-domain	Displays the domain configuration.
	Example: n1000v(config-vlan)# show svs-domain	
Step 7	exit	Returns you to CLI Global Configuration mode.
	Example: n1000v(config-vlan)# exit n1000v(config)#	
Step 8	copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.
	Example: n1000v(config)# copy running-config startup-config	

```

Example:
n1000v# config t
n1000v(config)# svs-domain
n1000v(config-svs-domain)# domain id 100
n1000v(config-svs-domain)# control vlan 190
n1000v(config-svs-domain)# packet vlan 191
n1000v(config-vlan)# exit

n1000v (config)# show svs domain
SVS domain config:
  Domain id: 100
  Control vlan: 190
  Packet vlan: 191
  L2/L3 Aipc mode: L2
  L2/L3 Aipc interface: mgmt0
  Status: Config push to VC successful.

n1000v(config)#
n1000v(config)# copy run start
[#####] 100%
n1000v(config)#

```

Creating the Control VLAN for the Domain

Use this procedure to add a control VLAN to the domain.

BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You are logged in to the CLI in EXEC mode.
- You have already configured and enabled the required switched virtual interface (SVI) using the document, *Cisco Nexus 1000V Interface Configuration Guide, Release 4.0(4)SVI(1)*. The SVI is also called the VLAN interface and provides communication between VLANs.
- You are familiar with how VLANs are numbered. For more information, see the document, *Cisco Nexus 1000V Layer 2 Switching Configuration Guide, Release 4.0(4)SVI(1)*.
- Newly-created VLANs remain unused until Layer 2 ports are assigned to them.

■ Creating the Control VLAN for the Domain

Send document comments to nexus1k-docfeedback@cisco.com.

SUMMARY STEPS

1. **config t**
2. **vlan *vlan-id***
3. **name *vlan-name***
4. **state *vlan-state***
5. **exit**
6. **show vlan id *vlan-id***
7. **copy running-config startup-config**

DETAILED STEPS

	Command	Purpose
Step 1	config t	Places you into CLI Global Configuration mode.
	Example: n1000v# config t n1000v(config)#	
Step 2	vlan 30	Creates VLAN ID 30 for control traffic and places you into CLI VLAN Configuration mode.
	Example: n1000v(config)# vlan 30 n1000v(config-vlan)#	Note If you enter a VLAN ID that is assigned to an internally allocated VLAN, the CLI returns an error message.
Step 3	name cp_control	Adds the descriptive name, cp_control, to this VLAN.
	Example: n1000v(config-vlan)# name cp_control n1000v(config-vlan)#	
Step 4	state active	Changes the operational state of the VLAN to active.
	Example: n1000v(config-vlan)# state active n1000v(config-vlan)#	
Step 5	show vlan id 30	Displays the configuration for VLAN ID 30.
	Example: n1000v(config-vlan)# show vlan id 30	
Step 6	exit	Returns you to CLI Global Configuration mode.
	Example: n1000v(config-vlan)# exit n1000v(config)#	
Step 7	copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.
	Example: n1000v(config)# copy running-config startup-config	
	Example: n1000v# config t n1000v(config)# vlan 30	

Send document comments to nexus1k-docfeedback@cisco.com.

```

n1000v(config-vlan)# name cp_control
n1000v(config-vlan)# state active
n1000v(config-vlan)# exit
n1000v(config)# show vlan id 30

VLAN Name Status Ports
---- -----
30 cp_control active

VLAN Type MTU
---- -----
5 enet 1500

Remote SPAN VLAN
-----
Disabled

Primary Secondary Type Ports
---- ----- ---- -
n1000v(config)# copy run start
[#####] 100%
n1000v(config)#

```

Creating the Packet VLAN for the Domain

Use this procedure to add the packet VLAN to the domain.

BEFORE YOU BEGIN

Before beginning this procedure, you must know or do the following:

- You are logged in to the CLI in EXEC mode.
- You have already configured and enabled the required switched virtual interface (SVI) using the document, *Cisco Nexus 1000V Interface Configuration Guide, Release 4.0(4)SVI(1)*. The SVI is also called the VLAN interface and provides communication between VLANs.
- You are familiar with how VLANs are numbered. For more information, see the document, *Cisco Nexus 1000V Layer 2 Switching Configuration Guide, Release 4.0(4)SVI(1)*.
- Newly-created VLANs remain unused until Layer 2 ports are assigned to them.

SUMMARY STEPS

1. **config t**
2. **vlan *vlan-id***
3. **name *vlan-name***
4. **state *vlan-state***
5. **exit**
6. **show vlan id *vlan-id***
7. **copy running-config startup-config**

■ Creating the Packet VLAN for the Domain

Send document comments to nexus1k-docfeedback@cisco.com.

DETAILED STEPS

Command	Purpose
Step 1 <code>config t</code> Example: n1000v# config t n1000v(config)#	Places you into CLI Global Configuration mode.
Step 2 <code>vlan 31</code> Example: n1000v(config)# vlan 31 n1000v(config-vlan)#	Creates VLAN ID 31 for packet traffic and places you into CLI VLAN Configuration mode. Note If you enter a VLAN ID that is assigned to an internally allocated VLAN, the CLI returns an error message.
Step 3 <code>name cp_packet</code> Example: n1000v(config-vlan)# name cp_packet n1000v(config-vlan)#	Adds the descriptive name, cp_packet, to this VLAN.
Step 4 <code>state active</code> Example: n1000v(config-vlan)# state active n1000v(config-vlan)#	Changes the operational state of the VLAN to active.
Step 5 <code>show vlan id 31</code> Example: n1000v(config-vlan)# show vlan id 30	Displays the configuration for VLAN ID 31.
Step 6 <code>exit</code> Example: n1000v(config-vlan)# exit n1000v(config)#	Returns you to CLI Global Configuration mode.
Step 7 <code>copy running-config startup-config</code> Example: n1000v(config)# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Example:
n1000v# **config t**
n1000v(config)# **vlan 31**
n1000v(config-vlan)# **name cp_packet**
n1000v(config-vlan)# **state active**
n1000v(config-vlan)# **exit**
n1000v(config)# **show vlan id 31**

VLAN Name	Status	Ports
31 cp_packet	active	
VLAN Type MTU		
5 enet 1500		
Remote SPAN VLAN		

Send document comments to nexus1k-docfeedback@cisco.com.

Disabled

Primary	Secondary	Type	Ports
-----	-----	-----	-----

```
n1000v(config)# copy run start
[########################################] 100%
n1000v(config) #
```

Feature History for Domains

This section provides the domain feature release history.

Feature Name	Releases	Feature Information
Domains	4.0(4)SV1(1)	This feature was introduced.
