#### D Commands UCR-211

default-information originate (EIGRP) UCR-212 default-metric (EIGRP) UCR-213 distance (EIGRP) UCR-215

#### E Commands UCR-217

eigrp log-neighbor-changes UCR-218 eigrp log-neighbor-warnings UCR-219 eigrp router-id UCR-220

eigrp stub UCR-221 **F** Commands UCR-223 feature eigrp UCR-224 flush-routes (EIGRP) UCR-225 I Commands UCR-227 ip authentication key-chain eigrp UCR-228 ip authentication mode eigrp UCR-229 ip bandwidth eigrp UCR-230 ip bandwidth-percent eigrp UCR-231 ip delay eigrp UCR-232 ip distribute-list eigrp UCR-233 ip eigrp shutdown UCR-235 ip hello-interval eigrp UCR-236 ip hold-time eigrp UCR-237 ip next-hop-self eigrp UCR-239 ip offset-list eigrp UCR-240 ip passive-interface eigrp UCR-242 ip route UCR-243 ip router eigrp UCR-245 ip split-horizon eigrp UCR-246 ip summary-address eigrp UCR-247

#### L Commands UCR-249

log-adjacency-changes (EIGRP) UCR-250 log-neighbor-warnings UCR-251

#### M Commands UCR-253

maximum-paths (EIGRP) UCR-254 metric maximum-hops UCR-255 metric weights UCR-256

#### R Commands UCR-259

redistribute (EIGRP) UCR-260 redistribute maximum-prefix (EIGRP) UCR-262 restart eigrp (EIGRP) UCR-264 router eigrp UCR-265 router-id (EIGRP) UCR-266

#### S Commands UCR-267

shutdown (EIGRP) UCR-268

stub UCR-269

#### Show Commands UCR-271

show ip eigrp UCR-272 show ip eigrp accounting UCR-274 show ip eigrp interfaces UCR-276 show ip eigrp neighbors UCR-278 show ip eigrp route UCR-280 show ip eigrp route-map statistics UCR-282 show ip eigrp topology UCR-284 show ip eigrp traffic UCR-288 show running-config eigrp UCR-290

#### T Commands UCR-293

timers active-time UCR-294 timers nsf converge UCR-295 timers nsf route-hold UCR-296 timers nsf signal UCR-298

#### **HSRP Commands**

A Commands UCR-301 authentication (HSRP) UCR-302

#### D Commands UCR-305

delay minimum UCR-306

#### F Commands UCR-307

feature hsrp UCR-308

#### H Commands UCR-311

hsrp UCR-312

hsrp delay UCR-314

#### I Commands UCR-315

ip (HSRP) UCR-316

#### ipv6 (HSRP) UCR-318

#### P Commands UCR-321

preempt (HSRP) UCR-322 priority (HSRP) UCR-324

#### Show Commands UCR-327

show hsrp UCR-328 show hsrp delay UCR-330 show hsrp summary UCR-332

#### **Layer 3 Interfaces Commands**

#### C Commands UCR-337

clear ip arp UCR-338 clear ip interface statistics UCR-340 clear ipv6 icmp interface statistics UCR-341 clear ipv6 nd interface statistics UCR-342 clear ipv6 neighbor UCR-343

#### I Commands UCR-345

ip address UCR-346 ip arp UCR-348 ip arp gratuitous UCR-349 ip arp timeout UCR-350 ip directed-broadcast UCR-351 interface ethernet (Layer 3) UCR-353 ip local-proxy-arp UCR-355 interface loopback UCR-356 interface port-channel UCR-357 ip port-unreachable UCR-359 ip proxy-arp UCR-360 ip tcp path-mtu-discovery UCR-361 ip tcp synwait-time UCR-362 ip unreachables UCR-363 ipv6 nd UCR-364

#### N Commands UCR-367

no switchport UCR-368

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

#### R Commands UCR-369

routing-context vrf UCR-370

#### Show Commands UCR-371

show interface brief UCR-372 show interface ethernet UCR-376 show interface loopback UCR-379 show interface port-channel UCR-382 show ip arp UCR-384 show ip arp summary UCR-386 show ip client UCR-387 show ip interface UCR-388 show running-config arp UCR-390 show startup-config arp UCR-392

#### **Object Tracking Commands**

D Commands UCR-395 delay UCR-396

O Commands UCR-397 object UCR-398

#### Show Commands UCR-401

show track UCR-402

#### T Commands UCR-403

threshold percentage UCR-404

- threshold weight UCR-405
- track interface UCR-406

track ip route UCR-407

track list UCR-408

#### V Commands UCR-411

vrf member UCR-412

#### **OSPF Commands**

#### A Commands UCR-417

area authentication (OSPF) UCR-418

area default-cost (OSPF) UCR-420 area filter-list (OSPF) UCR-421 area nssa (OSPF) UCR-423 area range (OSPF) UCR-425 area stub (OSPF) UCR-425 area virtual-link (OSPF) UCR-428 authentication (OSPF virtual link) UCR-430 authentication-key (OSPF virtual link) UCR-432 auto-cost (OSPF) UCR-433

#### C Commands UCR-435

clear ip ospf neighbor UCR-436 clear ip ospf policy statistics UCR-438 clear ip ospf redistribution UCR-440 clear ip ospf statistics UCR-441 clear ip ospf traffic UCR-442 clear ip traffic UCR-443

#### D Commands UCR-445

dead-interval (OSPF virtual link) UCR-446 default-information originate (OSPF) UCR-448 default-metric (OSPF) UCR-450 distance (OSPF) UCR-452

#### F Commands UCR-453

feature ospf UCR-454 flush-routes (OSPF) UCR-455

#### H Commands UCR-457

hello-interval (OSPF virtual link) UCR-458

#### I Commands UCR-459

ip ospf authentication UCR-460 ip ospf authentication-key UCR-462 ip ospf cost UCR-464 ip ospf dead-interval UCR-465 ip ospf hello-interval UCR-466 ip ospf message-digest-key UCR-467 ip ospf mtu-ignore UCR-469 ip ospf network UCR-470 ip ospf passive-interface UCR-471 ip ospf priority UCR-472 ip ospf retransmit-interval UCR-473 ip ospf shutdown UCR-474 ip ospf transmit-delay UCR-475 ip router ospf area UCR-476 ip router ospf multi-area UCR-477

#### L Commands UCR-479

log-adjacency-changes (OSPF) UCR-480

#### M Commands UCR-481

max-metric router-Isa (OSPF) UCR-482 maximum-paths (OSPF) UCR-484 message-digest-key (OSPF virtual link) UCR-485

#### P Commands UCR-487

protocol shutdown (OSPF) UCR-488

#### R Commands UCR-489

redistribute (OSPF) UCR-490 redistribute maximum-prefix (OSPF) UCR-492 restart (OSPF) UCR-494 retransmit-interval (OSPF virtual link) UCR-495 rfc1583compatibility UCR-496 router ospf UCR-497 router-id (OSPF) UCR-498

#### S Commands UCR-499

set forwarding-address UCR-500 shutdown (OSPF) UCR-502 summary-address (OSPF) UCR-503

#### Show Commands UCR-505

show ip ospf UCR-506 show ip ospf border-routers UCR-509 show ip ospf database UCR-510 show ip ospf interface UCR-513 show ip ospf lsa-content-changed-list UCR-516 show ip ospf neighbors UCR-517 show ip ospf policy statistics area UCR-519 show ip ospf policy statistics redistribute UCR-521 show ip ospf request-list UCR-523 show ip ospf retransmission-list UCR-524 show ip ospf route UCR-525 show ip ospf statistics UCR-526 show ip ospf summary-address UCR-528 show ip ospf traffic UCR-529 show ip ospf virtual-links UCR-531 show ip traffic UCR-533 show running-config ospf UCR-535 show vrf UCR-537 show vrf detail UCR-538 show vrf interface UCR-539

Contents

## **New and Changed Information**

This chapter provides release-specific information for each new and changed feature in the *Cisco Nexus* 5500 Series NX-OS Unicast Routing Command Reference. The latest version of this document is available at the following Cisco website:

http://www.cisco.com/en/US/products/ps9670/prod\_command\_reference\_list.html

To check for additional information about this Cisco NX-OS Release, see the *Cisco Nexus 5500 Series* NX-OS Release Notes, Release 6.0 available at the following Cisco website:

http://www.cisco.com/en/US/products/ps9670/prod\_release\_notes\_list.html

## **New and Changed Information for Cisco NX-OS Releases**

This section includes the following topics:

• New and Changed Information for Cisco NX-OS Release 6.0(2)N1(2), page xx

### New and Changed Information for Cisco NX-OS Release 6.0(2)N1(2)

Table 1 summarizes the new and changed features for Cisco NX-OS Release 6.0(2)N1(2) and tells you where they are documented

Table 1	New and Changed Information for Release 6.0(2)N1(2)

## **Preface**

This preface describes the audience, organization, and conventions of the *Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference*. It also provides information on how to obtain related documentation.

This preface includes the following sections:

- Audience, page xxi
- Document Conventions, page xxi
- Related Documentation, page xxii
- Obtaining Documentation and Submitting a Service Request, page xxiv

## **Audience**

This publication is for experienced users who configure and maintain Cisco NX-OS devices.

## **Document Conventions**

Command descriptions use these conventions:

Convention	Description	
boldface font	Commands and keywords are in boldface.	
italic font	Arguments for which you supply values are in italics.	
[ ]	Elements in square brackets are optional.	
$\{x \mid y \mid z\}$	Alternative keywords are grouped in braces and separated by vertical bars.	
[ x   y   z ]	Optional alternative keywords are grouped in brackets and separated by vertica bars.	
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.	

screen font	Terminal sessions and information that the switch displays are in screen font.	
boldface screen font	Information you must enter is in boldface screen font.	
italic screen font	Arguments for which you supply values are in italic screen font.	
< >	Nonprinting characters, such as passwords, are in angle brackets.	
[]	Default responses to system prompts are in square brackets.	
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.	

Screen examples use these conventions:

This document uses the following conventions:

Means reader *take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

### **Related Documentation**

Documentation for Cisco Nexus 5500 Series Switches and Cisco Nexus 2000 Series Fabric Extender is available at the following URL:

http://www.cisco.com/en/US/products/ps9670/tsd\_products\_support\_series\_home.html

## **Obtaining Documentation and Submitting a Service Request**

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation:

http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html

Subscribe to the *What's New in Cisco Product Documentation* as an RSS feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service. Cisco currently supports RSS Version 2.0.

PART 1

### **BGP Commands**

## **A Commands**

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with A.

## address-family ipv6 unicast

To enter IPv6 unicast address family mode, use the address-family ipv6 unicast command.

address-family ipv6 unicast

Syntax Description	This command has no arguments or keywords.	
Defaults	None	
Command Modes	Router configuration mo	de
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command does not a	require a license.
Examples	This example shows how enter IPv6 unicast address family mode: switch# configure terminal switch(config)# router ospfv 1234 switch(config-router)# neighbor 2001:DB8:0:1::55 remote-as 64496 switch(config-router-neighbor)# address-family ipv6 unicast switch(config-router-af)# next-hop-self	
Related Commands	Command	Description
	area filter-list (OSPFv3)	Filters prefixes advertised in type 3 link-state advertisements (LSAs) between Open Shortest Path First (OSPF) areas of an Area Border Router (ABR).

## address-family (BGP neighbor)

To enter the neighbor address family mode address-family mode and configure submode commands for the Border Gateway Protocol (BGP), use the **address-family** command. To disable the address family submode for configuring routing protocols, use the **no** form of this command.

address-family ipv4{multicast | unicast}

no address-family ipv4 {multicast | unicast}

<u>Contan Da carintian</u>	· .	
Syntax Description	ipv4	Specifies the IPv4 address family.
	multicast	Specifies multicast address support.
	unicast	Specifies unicast address support.
Command Default	This command has no default settings.	
Command Modes	Neighbor configura	ation mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

suppress-inactive	Advertises only active routes to peer.	

## address-family (BGP router)

To enter the address family mode or a virtual routing and forwarding (VRF) address-family mode and configure submode commands for the Border Gateway Protocol (BGP), use the **address-family** command. To disable the address family submode for configuring routing protocols, use the **no** form of this command.

address-family ipv4 {multicast | unicast}

no address-family ipv4 {multicast | unicast}

Syntax Description	ipv4	Specifies the IPv4 address family.	
	multicast	Specifies multicast address support.	
	unicast	Specifies unicast address support.	
Command Default	This command has	no default settings.	
Command Modes	Router configuration	on mode	
	VRF configuration	mode	
Command History	Release	Modification

IPv4 neighbor sessions support IPv4 unicast and multicast	
	address families. From the address family configuration mode, the following parameters are available:		
	From the address fa	anny configuration mode, the following parameters are available.	
<u> </u>	This applies to IPv	4 multicast or unicast.	
	• <b>aggregate-add</b> additional info	<b>Iress</b> —Configures BGP aggregate prefixes. See the <b>aggregate-address</b> command for rmation.	
	<ul> <li>client-to-client reflection—Enables client-to-client route reflection. Route reflection allows a B speaker (route reflector) to advertise IBGP learned routes to certain IBGP peers. Use the no form this command to disable client-to-client route reflection. Default: Enabled.</li> </ul>		

- **dampening** [*half-life* | **route-map** *name*]—Configures the route flap dampening. Optionally, you can set the time (in minutes) after which a penalty is decreased. Once the route has been assigned a penalty, the penalty is decreased by half after the half-life period (which is 15 minutes by default). The process of reducing the penalty happens every 5 seconds. The default half-life is 15 minutes. Range: 1 to 45. Default: Disabled.
- **default-metric** *metric*—Sets the default flap metric of redistributed routes. The **default-metric** command is used to set the metric value for routes redistributed into BGP with the **redistribute** command. A default metric can be configured to solve the problem of redistributing routes with incompatible metrics. Assigning the default metric will allow redistribution to occur. This value is the Multi Exit Discriminator (MED) that is evaluated by BGP during the best path selection process. The MED is a non-transitive value that is processed only within the local autonomous system and adjacent autonomous systems. The default metric is not set if the received route has a MED value. Range: 0 to 4294967295.

Note

When enabled, the **default-metric** command applies a metric value of 0 to redistributed connected routes. The **default-metric** command does not override metric values that are applied with the **redistribute** command.

• **distance** *ebgp-route ibgp-route local-route*—Configures a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. BGP does not use discard routes for next-hop resolution. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. Use this command if another protocol is known to be able to provide a better route to a node than was actually learned via external BGP (eBGP), or if some internal routes should be preferred by BGP. Range: 1 to 255. Default: EBGP—20, IBGP—200.

Changing the administrative distance of internal BGP routes is considered dangerous and is not recommended. Improper configuration can introduce routing table inconsistencies and break routing.

- exit—Exits from the current command mode.
- **maximum-paths** [**ibgp**] *parallel-paths*—Configures the number of parallel paths to forward packets. The **maximum-paths ibgp** command is used to configure equal-cost or unequal-cost multipath load sharing for iBGP peering sessions. In order for a route to be installed as a multipath in the BGP routing table, the route cannot have a next hop that is the same as another route that is already installed. The BGP routing process will still advertise a best path to iBGP peers when iBGP multipath load sharing is configured. For equal-cost routes, the path from the neighbor with the lowest router ID is advertised as the best path. To configure equal-cost multipath load sharing, all path attributes must be the same. The path attributes include weight, local preference, autonomous system path (entire attribute and not just the length), origin code, Multi Exit Discriminator (MED), and Interior Gateway Protocol (IGP) distance. The optional **ibgp** keyword allows you to configure multipath for the IBGP paths. To return to the default, use the **no** form of this command. The range is from 1 to 16.
- **network**—Configures an IP prefix to advertise. See the **network** command for additional information.
- nexthop—Configures next-hop address tracking events for BGP processes.
- **no**—Negates a command or sets its defaults.

• **redistribute**—Enables the redistribution of routes learned by other protocols into BGP. Redistribution is supported for both IPv4 routes. To disable the redistribution of routes learned by other protocols into BGP, use the **no** form of this command.

- direct route-map *name*—Specifies directly connected routes.
- eigrp AS-num route-map name—Specifies Enhanced Interior Gateway Protocol routes. Range: 1 to 65535.
- ospf src-protocol route-map name—Specifies Open Shortest Path First (OSPF) routes.
- rip src-protocol route-map name—Specifies Routing Information Protocol (RIP) routes.
- static route-map name—Specifies static routes.
- **suppress-inactive**—Advertises only active routes to peer. See the **suppress-inactive** command for additional information.

This command requires the LAN Enterprise Services license.

**Examples** 

This example shows how to place the router in global address family configuration mode for the IPv4 unicast address family:

```
switch(config)# feature bgp
switch(config)# router bgp 64496
switch(config-router)# address-family ipv4 unicast
switch(config-router-af)#
```

#### Related Commands (

Command	Description	
aggregate-address	Configures BGP summary addresses.	
client-to-client reflection	Configures route reflection.	
dampening	Configures route flap dampening.	
default-metric (BGP)	Configures the default metric for routes redistributed into BGP.	
distance (BGP)	Configures the administrative distance.	
feature bgp	Enables BGP configuration.	
maximum-paths (BGP)	Configures the maximum number of equal-cost paths.	
network	Configures an IP prefix to advertise.	
nexthop route-map	Configures route policy filtering for next hops.	
nexthop trigger-delay	Configures the BGP delay for triggering next-hop calculations.	
redistribute (BGP)	Configures route redistribution for BGP.	
suppress-inactive	Advertises active routes to a BGP peer.	
timers (BGP)	Configures the BGP timers.	

## advertise-map (BGP)

To configure Border Gateway Protocol (BGP) conditional advertisement, use the **advertise-map** command. To remove BGP conditional advertisement, use the **no** form of this command.

**advertise-map** *adv-map* {**exist-map** *i* **non-exist-map** *i* **non-exist-map** }

**no advertise-map** *adv-map* {**exist-map** *i* **non-exist-map** *nonexist-rmap*}

Syntax Description	adv-map	Route map with match statements that the route must pass before BGP passes the route to the next route map. The adv-map is a case-sensitive, alphanumeric string up to 63 characters.
	<b>exist-map</b> exist-rmap	Specifies a route map with match statements for a prefix list. A prefix in the BGP table must match a prefix in the prefix list before BGP will advertise the route. The exist-rmap is a case-sensitive, alphanumeric string up to 63 characters.
	<b>non-exist-map</b> nonexist-rmap	Specifies a route map with match statements for a prefix list. A prefix in the BGP table must not match a prefix in the prefix list before BGP will advertise the route. The nonexist-rmap is a case-sensitive, alphanumeric string up to 63 characters.
Command Default	None	
Command Modes	BGP neighbor add	lress family configuration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>advertise-map</b> command to conditionally advertise selected routes. The routes or prefixes that BGP conditionally advertises are defined in two route maps, the <i>adv-map</i> and an <i>exist-map</i> or <i>nonexist-map</i> . The <i>exist-map</i> or <i>nonexist-map</i> specifies the prefix that the BGP tracks. The <i>adv-map</i> specifies the prefix that BGP advertises to the specified neighbor when the condition is met.	
	nonexist-map. The	e exist-map or nonexist-map specifies the prefix that the BGP tracks. The adv-map

neighbor	Configures a BGP peer.	
show ip bgp	Displays BGP configuration information.	

### aggregate-address (BGP)

To create a summary address in a Border Gateway Protocol (BGP) routing table, use the **aggregate-address** command. To remove the summary address, use the **no** form of this command.

aggregate-address address/length [advertise-map map-name] [as-set] [attribute-map map-name] [summary-only] [suppress-map map-name]

**no aggregate-address** *address/mask-length* [**advertise-map** *map-name*] [**as-set**] [**attribute-map** *map-name*] [**summary-only**] [**suppress-map** *map-name*]

address/length	Aggregate IPv4 address and mask length. Valid value for <i>length</i> is 1 to 32.
advertise-map map-name	(Optional) Specifies the name of the route map used to select attribute information from specific routes.
as-set	(Optional) Generates the autonomous system set path information and community information from the contributing paths.
attribute-map map-name	(Optional) Specifies the name of the route map used to set the attribute information for specific routes. The <i>map-name</i> is an alphanumeric string up to 63 characters.
summary-only	(Optional) Filters all more-specific routes from updates.
suppress-map map-name	(Optional) Specifies the name of the route map used to conditionally filter more specific routes. The <i>map-name</i> is an alphanumeric string up to 63 characters.
	advertise-map map-name as-set attribute-map map-name summary-only

## **Command Default** The atomic aggregate attribute is set automatically when an aggregate route is created with this command unless the **as-set** keyword is specified.

#### **Command Modes**

Release	Modification
5.2(1)N1(1)	This command was introduced.

#### **Usage Guidelines**

You can implement aggregate routing in BGP either by redistributing an aggregate route into BGP, or by using the conditional aggregate routing feature.

The **aggregate-address** command without keywords creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available that fall within the specified range. (A longer prefix which matches the aggregate must exist in the RIB.) The aggregate route will be advertised as coming from your autonomous system and will have the atomic aggregate attribute set to show that information might be missing. (By default, the atomic aggregate attribute is set unless you specify the **as-set** keyword.) The **as-set** keyword creates an aggregate entry using the same rules that the command follows without this keyword, but the path advertised for this route will be an AS\_SET consisting of all elements contained in all paths that are being summarized. Do not use this form of the **aggregate-address** command when aggregating many paths, because this route must be continually withdrawn and updated as autonomous system path reachability information for the summarized routes changes.

The **summary-only** keyword not only creates the aggregate route (for example, 192.\*.\*.\*) but also suppresses advertisements of more-specific routes to all neighbors. If you want to suppress only advertisements to certain neighbors, you may use the **neighbor distribute-list** command, with caution. If a more-specific route leaks out, all BGP routers will prefer that route over the less-specific aggregate you are generating (using longest-match routing).

The **suppress-map** keyword creates the aggregate route but suppresses advertisement of specified routes. You can use the match clauses of route maps to selectively suppress some more-specific routes of the aggregate and leave others unsuppressed. IP access lists and autonomous system path access lists match clauses are supported.

The **advertise-map** keyword selects specific routes that will be used to build different components of the aggregate route, such as AS\_SET or community. This form of the **aggregate-address** command is useful when the components of an aggregate are in separate autonomous systems and you want to create an aggregate with AS\_SET, and advertise it back to some of the same autonomous systems. You must remember to omit the specific autonomous system numbers from the AS\_SET to prevent the aggregate from being dropped by the BGP loop detection mechanism at the receiving router. IP access lists and autonomous system path access lists match clauses are supported.

The **attribute-map** keyword allows attributes of the aggregate route to be changed. This form of the **aggregate-address** command is useful when one of the routes forming the AS\_SET is configured with an attribute such as the community no-export attribute, which would prevent the aggregate route from being exported. An attribute map route map can be created to change the aggregate attributes.

This command requires the LAN Enterprise Services license.

#### Examples

#### **AS-Set Example**

This example shows how to create an aggregate BGP address in router configuration mode. The path advertised for this route will be an AS\_SET consisting of all elements contained in all paths that are being summarized.

```
switch(config)# router bgp 64496
switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 as-set
```

#### Summary-Only Example

This example shows how to create an aggregate BGP address in address family configuration mode and apply it to the multicast database (SAFI) under the IP Version 4 address family. Because the **summary-only** keyword is configured, more-specific routes are filtered from updates.

```
switch(config)# router bgp 64496
switch(config-router)# address-family ipv4 multicast
switch(config-router-af)# aggregate-address 10.0.0.0 255.0.0.0 summary-only
```

#### **Conditional Aggregation Example**

This example shows how to create a route map called MAP-ONE to match on an as-path access list. The path advertised for this route will be an AS\_SET consisting of elements contained in paths that are matched in the route map.

```
switch(config)# ip as-path access-list 1 deny ^1234_
switch(config)# ip as-path access-list 1 permit .*
switch(config)# !
```

```
switch(config)# route-map MAP-ONE
switch(config-route-map)# match ip as-path 1
switch(config-route-map)# exit
switch(config)# router bgp 64496
switch(config-router)# address-family ipv4
switch(config-router-af)# aggregate-address 10.0.0.0 255.0.0.0 as-set advertise-map
MAP-ONE
switch(config-router-af)# end
```

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **B** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with B.

### bestpath (BGP)

To change the default best-path selection algorithm, use the **bestpath** command. To return the Border Gateway Protocol (BGP) routing process to the default operation, use the **no** form of this command.

bestpath {always-compare-med | compare-routerid | {med {missing-as-worst | non-deterministic}}

no bestpath {always-compare-med | compare-routerid | {med {missing-as-worst | non-deterministic}}

Syntax Description	always-compare-med	Compares the Multi-Exit Discriminator (MED) on paths from a different autonomous system (AS).
	compare-routerid	Configures a Border Gateway Protocol (BGP) routing process to compare identical routes received from different external peers during the best path selection process and to select the route with the lowest router ID as the best path.
	med missing-as-worst	Assigns the value of infinity to received routes that do not carry the MED attribute, making these routes the least desirable.
	med non-deterministic	Specifies that the best-MED path among paths is not picked from the same AS.
Command Default	The default settings are as follows: med missing-as-worst: A value of 0 is assigned to the missing MED med non-deterministic: Disabled	
Command Modes	Router configuration mod	de
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Before you use this command, ensure that BGP is enabled on the switch by using the <b>feature bgp</b> command.	
	To enable the comparison of the MED for paths from neighbors in different autonomous systems, use the <b>bgp always-compare-med</b> command.	
	This command requires the LAN Enterprise Services license.	
Examples	This example shows how paths from different auto	to change the default best-path selection algorithm to compare the MED on nomous systems:
	switch(config)# <b>router</b> switch(config-router)#	bgp 64496 bestpath always-compare-med

switch(config-router)#

# **C** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with C.

# clear bgp

To clear Border Gateway Protocol (BGP) routes from the BGP table, use the **clear bgp** command.

clear bgp {ipv4 {multicast | unicast} | all} {neighbor | \* | as-number | peer-template name |
 prefix} [vrf vrf-name]

Syntax Description	ipv4	Clears the BGP information for the IPv4 address family.	
	multicast	Clears BGP information for the multicast address family.	
	unicast	Clears BGP information for the unicast address family.	
	all	Clears the BGP information for all address families.	
	neighbor	Network address. The format is A.B.C.D for IPv4.	
	*	Clears all neighbors.	
	as-number	Autonomous system number. The range is from 1 to 65535.	
	peer-template nam	<i>ne</i> Specifies a BGP peer template. The name can be any case-sensitive, alphanumeric string up to 63 characters.	
	prefix	Prefix from the selected address family. The format is A.B.C.D/length for IPv4.	
	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) context name or all VRF instances. The VRF name can be any case-sensitive, alphanumeric string up to 32 characters.	
Command Default	None		
Command Modes	Any command mod	le	
Command History	Release	Modification

# clear ip bgp

To clear Border Gateway Protocol (BGP) routes from the BGP table, use the clear ip bgp command.

clear ip bgp {ipv4 {unicast | multicast} | all} {neighbor | \* | as-number | peer-template name |
 prefix} [vrf vrf-name | all | default | management]

Syntax Description	ipv4	(Optional) Clears BGP information for the IPv4 address family.	
	unicast	Clears BGP information for the unicast address family.	
	multicast	Clears BGP information for the multicast address family.	
	all	Clears the BGP information for all address families.	
	neighbor	Network address. The format is A.B.C.D for IPv4.	
	*	Clears all BGP routes.	
	as-number	Autonomous system (AS) number. The range is from 1 to 65535.	
	peer-template name	Specifies a BGP peer template. The name can be any case-sensitive, alphanumeric string up to 63 characters.	
	prefix	Prefix from the selected address family. The format is A.B.C.D/length for IPv4.	
	vrf vrf-name	(Optional) Specifies a particular VPN routing and forwarding (VRF) instance. The VRF name can be any case-sensitive, alphanumeric string up to 32 characters.	
	all	(Optional) Clears the BGP information from all VRF entries.	
	default	(Optional) Clears the BGP information from the default VRF.	
	management	(Optional) Clears the BGP information from the management VRF.	
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines Examples	·	the LAN Enterprise Services license. w to clear all BGP entries for the IPv4 address family:	
·	switch# <b>clear ip bgp *</b>		

# clear ip bgp dampening

To clear Border Gateway Protocol (BGP) route flap dampening information, use the **clear ip bgp dampening** command.

clear ip bgp [ipv4 {unicast | multicast} | all] dampening [neighbor | prefix]
 [vrf vrf-name | all | default | management]

Syntax Description	ipv4	(Optional) Clears BGP information for the IPv4 address family.
, ,	unicast	(Optional) Clears BGP information for the unicast address family.
	multicast	(Optional) Clears BGP information for the multicast address family.
	all	(Optional) Clears the BGP information for all address families.
	neighbor	(Optional) Neighbor from the selected address family. The format is A.B.C.D for IPv4.
	prefix	(Optional) Prefix from the selected address family. The format is A.B.C.D/length for IPv4.
	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) instance. The VRF name can be any case-sensitive, alphanumeric string up to 32 characters.
	all	(Optional) Clears the BGP information from all VRF entries.
	default	(Optional) Clears the BGP information from the default VRF. (Optional) Clears the BGP information from the management VRF.
	management	
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modification
-	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requires	the LAN Enterprise Services license.
Examples	This example shows ho switch# <b>clear ip bgp</b>	w to clear BGP route flap dampening information: dampening

# clear ip bgp flap-statistics

To clear Border Gateway Protocol (BGP) route flap statistics, use the **clear ip bgp flap-statistics** command.

clear ip bgp flap-statistics [neighbor | prefix] [vrf vrf-name | all | default | management]

Syntax Description	neighbor	(Optional) Neighbor from the selected address family. The format is A.B.C.D for IPv4.
	prefix	(Optional) Prefix from the selected address family. The format is A.B.C.D/length for IPv4.
	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) instance. The VRF name can be any case-sensitive, alphanumeric string up to 32 characters.
	all	(Optional) Clears the BGP information from all VRF entries.
	default	(Optional) Clears the BGP information from the default VRF.
	management	(Optional) Clears the BGP information from the management VRF.
Command Default Command Modes Command History	None Any command mode Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requir	res the LAN Enterprise Services license.
Examples	This example shows h	how to clear BGP route flap statistics:
•	switch# <b>clear ip bg</b>	-

### client-to-client reflection

To enable or restore route reflection from a Border Gateway Protocol (BGP) route reflector to clients, use the client-to-client reflection command. To disable client-to-client route reflection, use the no form of this command.

client-to-client reflection

no client-to-client reflection

**Syntax Description** This command has no arguments or keywords.

**Command Default** Client-to-client route reflection is enabled by default; when a route reflector is configured, the route reflector reflects routes from a client to other clients.

**Command Modes** Router address-family configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

# **Usage Guidelines** By default, the clients of a route reflector are not required to be fully meshed and the routes from a client are reflected to other clients. However, if the clients are fully meshed, route reflection is not required. In this case, use the no client-to-client reflection command to disable client-to-client reflection.

ExamplesThis example shows how to configure a router as a route reflector:switch(config)# router bgp 50000switch(config-router)# address-family ipv4 multicastswitch(config-router-af)# client-to-client reflectionswitch(config-router-af)#

<b>Related Commands</b>	Command	Description
	address-family (BGP router)	Places the router in address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.
	show ip bgp	Displays entries in the BGP routing table.

# confederation

To configure the confederation parameters for the Border Gateway Protocol (BGP), use the **confederation** command.

confederation {identifier | peers} as-number

Syntax Description	identifier	Sets the routing domain confederation autonomous system (AS) number.
	peers	Sets the peer AS numbers for a BGP confederation.
	as-number	Autonomous system number. The AS number can be a 16-bit integer or a 32-bit integer in the form of <higher 16-bit="" decimal="" number="">.<lower 16-bit="" decimal="" number="">.</lower></higher>
Command Default	None	
Command Modes	Router configura	ation mode
	VRF configuration	on mode
Command History	Release	Modification
,	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command re	equires the LAN Enterprise Services license.
Examples	This example shows how to configure the confederation identifier:	
		ure terminal # router bgp 65536.33 router)# confederation identifier 65536.33
D. L. d. d. O		Description

<b>Related Commands</b>	Command	Description
	show bgp	Displays information about BGP.

# **E** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with E.

# ebgp-multihop

To configure the exterior Border Gateway Protocol (eBGP) time-to-live (TTL) value to support eBGP multihop, use the **ebgp-multihop** command. To return to the default setting, use the **no** form of this command.

ebgp-multihop ttl-value

no ebgp-multihop *ttl-value* 

Syntax Description	ttl-value	TTL value for eBGP multihop. The range is from 2 to 255. You must manually reset the BGP sessions after using this command.	
Command Default	None		
Command Modes	BGP neighbor conf	figuration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>ebgp-multihop</b> command to configure the eBGP time-to-live (TTL) value to support eBGP multihop. In some situations, an eBGP peer is not directly connected to another eBGP peer and requires multiple hops to reach the remote eBGP peer. You can configure the eBGP TTL value for a neighbor session to allow these multihop sessions. This command requires the LAN Enterprise Services license.		
Examples	switch(config)# 1 switch(config-rou	rs how to configure the eBGP multihop value: router bgp 1.1 uter)# neighbor 192.0.2.1 remote-as 1.2 ute-neighbor) ebgp-multihop 2	
Related Commands	Command	Description	
	feature bgp	Enables the BGP feature.	

# **F** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with F.

### feature bgp

To enable the Border Gateway Protocol (BGP), use the **feature bgp** command. To disable BGP, use the **no** form of this command.

feature bgp

no feature bgp

- Syntax Description This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Global configuration mode

Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.

Usage GuidelinesYou must enable the BGP feature before you can configure BGP.This command requires the LAN Enterprise Services license.

**Examples** This example shows how to enable a BGP configuration:

switch# configure terminal
switch(config)# feature bgp
switch(config)#

This example shows how to disable the BGP feature:

switch# configure terminal
switch(config)# no feature bgp
switch(config)#

<b>Related Commands</b>	Command	Description
	router bgp	Creates a BGP instance.
	show bgp	Displays BGP configuration information.
	show feature	Displays the status of features on a switch.

# I Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with I.

# ip as-path access-list

To configure an access-list filter for Border Gateway Protocol (BGP) autonomous system (AS) numbers, use the **ip as-path access-list** command. To remove the filter, use the **no** form of this command.

ip as-path access-list name {deny | permit} regexp

**no ip as-path access-list** *name* {**deny** | **permit**} *regexp* 

Syntax Description	name	AS path access list name. The name can be any alphanumeric string up to 63 characters.
	deny	Rejects packets with AS numbers that match the <i>regexp</i> argument.
	permit	Allows packets with AS numbers that match the <i>regexp</i> argument.
	regexp	Regular expression to match BGP AS paths. See the <i>Cisco Nexus 5500 Series</i> <i>NX-OS Fundamentals Configuration Guide, Release 6.0</i> at the following URL for details on regular expressions:
		http://www.cisco.com/en/US/docs/switches/datacenter/nexus5500/sw/fundamen tals/621_n1_1/Cisco_Nexus_5500_Series_NX-OS_Fundamentals_Configuratio n_Guide_Release_6_2_1_N1_1_chapter4.html#con_1237003
Command Default	None	
Command Modes	Global configura	ation mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>ip as-path access-list</b> command to configure an autonomous system path filter. You can appl autonomous system path filters to both inbound and outbound BGP paths. Each filter is defined by th regular expression. If the regular expression matches the representation of the autonomous system par of the route as an ASCII string, then the permit or deny condition applies. The autonomous system par should not contain the local autonomous system number.	
Examples	This example shows how to configure an AS path filter for BGP to permit AS numbers 55:33 and 20:0 and apply it to a BGP peer for inbound filtering: switch# configure terminal switch(config)# ip as-path access-list filter1 permit 55:33,20:01 switch(config) router bgp 65536:20 switch(config-router)# neighbor 192.0.2.1/16 remote-as 65536:20 switch(config-router-neighbor)# address-family ipv4 unicast switch(config-router-neighbor-af)# filter-list filter1 in	

Related Commands	Command	Description
	filter-list	Assigns an AS path filter to a BGP peer.
	show ip as-path access-list	Displays information about IP AS path access lists.

# ip community-list

To create a community list entry, use the **ip community-list** command. To remove the entry, use the **no** form of this command.

**ip community-list standard** *list-name* {**deny** | **permit**} {*aa:nn* | **internet** | **local-AS** | **no-advertise** | **no-export**}

no ip community-list standard list-name

**ip community-list expanded** *list-name* {**deny** | **permit**} *regexp* 

no ip community-list expanded list-name

Syntax Description	standard list-name	Configures a named standard community list.
	permit	Permits access for a matching condition.
	deny	Denies access for a matching condition.
	aa:nn	Autonomous system number and network number entered in the 4-byte new community format. This value is configured with two 2-byte numbers separated by a colon. A number from 1 to 65535 can be entered each 2-byte number. A single community can be entered or multiple communities can be entered, each separated by a space.
		You can pick more than one of these optional community keywords.
	internet	Specifies the Internet community. Routes with this community are advertised to all peers (internal and external).
		You can pick more than one of these optional community keywords.
	no-export	Specifies the no-export community. Routes with this community are advertised to only peers in the same autonomous system or to only other subautonomous systems within a confederation. These routes are not advertised to external peers.
		You can pick more than one of these optional community keywords.
	local-AS	Specifies the local-as community. Routes with community are advertised to only peers that are part of the local autonomous system or to only peers within a subautonomous system of a confederation. These routes are not advertised external peers or to other subautonomous systems within a confederation.
		You can pick more than one of these optional community keywords.
	no-advertise	Specifies the no-advertise community. Routes with this community are not advertised to any peer (internal or external).
		You can pick more than one of these optional community keywords.
		Tou can pick more than one of these optional community keywords.

	expanded list-name	Configures a named expanded community list.	
	regexp	Regular expression that is used to specify a pattern to match against an input string. See the <i>Cisco Nexus 5500 Series NX-OS Fundamentals</i> <i>Configuration Guide, Release 6.0</i> at the following URL for details on regular expressions:	
		http://www.cisco.com/en/US/docs/switches/datacenter/nexus5000/sw/fund amentals/421_n1_1/Cisco_Nexus_5000_Series_NX-OS_Fundamentals_C onfiguration_Guide_Release_4_2_1_N1_1_chapter4.html#con_1237003	
		<b>Note</b> Regular expressions can be used with expanded community lists only.	
Command Default	Community exchange	is not enabled by default.	
Command Modes	Global configuration n	node	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	are configured as a 4-b last two bytes represen BGP peers is enabled w	t command is used to configure BGP community filtering. BGP community values yte number. The first two bytes represent the autonomous system number, and the it a user-defined network number. BGP community attribute exchange between when the <b>send-community</b> command is configured for the specified neighbor. The ute is defined in RFC 1997 and RFC 1998.	
	BGP community exchange is not enabled by default. Use the <b>send-community</b> command in BGP neighbor fix-family configuration mode to enable a BGP community attribute exchange between BGP peers.		
	The Internet community is applied to all routes or prefixes by default until any other community value is configured with this command or the <b>set community</b> command.		
	Once you configure a permit value to match a given set of communities, the community list defaults to an implicit deny for all other community values. Use the <b>internet</b> community to apply an implicit permit to the community list.		
	Standard Community Lists		
	numbers. You can pick communities can be co	ists are used to configure well-known communities and specific community a more than one of the optional community keywords. A maximum of 16 onfigured in a standard community list. If you attempt to configure more than 16 munities that exceed the limit are not processed or saved to the running	
	e		

#### **Expanded Community Lists**

Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to configure patterns to match community attributes. The order for matching using the \* or + character is the longest construct is first. Nested constructs are matched from the outside in. Concatenated constructs are matched beginning at the left side. If a regular expression can match two different parts of an input string, it matches the earliest part first.

#### **Community List Processing**

When multiple values are configured in the same community list statement, a logical AND condition is created. All community values must match to satisfy an AND condition. When multiple values are configured in separate community list statements, a logical OR condition is created. The first list that matches a condition is processed.

#### Examples

This example shows how to configure a standard community list where the routes with this community are advertised to all peers (internal and external):

switch(config)# ip community-list standard test1 permit internet switch(config)#

This example shows how to configure a logical AND condition; all community values must match in order for the list to be processed:

switch(config)# ip community-list standard test1 permit 65534:40 65412:60 no-export
switch(config)#

In the above example, a standard community list is configured that permits routes from the following:

- Network 40 in autonomous system 65534 and from network 60 in autonomous system 65412.
- Peers in the same autonomous system or from subautonomous system peers in the same confederation.

This example shows how to configure a standard community list that denies routes that carry communities from network 40 in autonomous system 65534 and from network 60 in autonomous system 65412. This example shows a logical AND condition; all community values must match in order for the list to be processed.

switch(config)# ip community-list standard test2 deny 65534:40 65412:60

This example shows how to configure a named standard community list that permits all routes within the local autonomous system or permits routes from network 20 in autonomous system 40000. This example shows a logical OR condition; the first match is processed.

```
switch(config)# ip community-list standard RED permit local-AS
```

switch(config)# ip community-list standard RED permit 40000:20
switch(config)#

This example shows how to configure an expanded community list that denies routes that carry communities from any private autonomous system:

```
switch(config)# ip community-list expanded 500 deny
_64[6-9][0-9][0-9]_|_65[0-9][0-9]_
switch(config)#
```

This example shows how to configure a named expanded community list that denies routes from network 1 through 99 in autonomous system 50000:

```
switch(config)# ip community-list list expanded BLUE deny 50000:[0-9][0-9]_
```

switch(config)#

**Related Commands** 

s	Command	Description
	feature bgp	Enables BGP.
	match community	Matches a community in a route map.
	send-community	Configures BGP to propagate community attributes to BGP peers.
	set community	Sets a community in a route map.

# ip extcommunity-list

To create an extended community list entry, use the **ip extcommunity-list** command. To remove the entry, use the **no** form of this command.

- **ip extcommunity-list standard** *list-name* {**deny** | **permit**} **generic** {**transitive** | **nontransitive**} *aa4:nn*
- no ip extcommunity-list standard generic {transitive | nontransitive} list-name
- **ip extcommunity-list expanded** *list-name* {**deny** | **permit**} **generic** {**transitive** | **nontransitive**} *regexp*

no ip extcommunity-list expanded generic {transitive | nontransitive} list-name

Syntax Description	standard list-name	Configures a named standard extended community list.
	deny	Denies access for a matching condition.
	permit	Permits access for a matching condition.
	generic	Specifies the generic specific extended community type.
	transitive	Configures BGP to propagate the extended community attributes to other autonomous systems.
	nontransitive	Configures BGP to propagate the extended community attributes to other autonomous systems.
	aa4:nn	Autonomous system number and network number. This value is configured with a 4-byte AS number and a 2-byte network number separated by a colon. The 4-byte AS number range is from 1 to 4294967295 in plaintext notation, or from 1.0 to 56636.65535 in AS.dot notation. You can enter a single community or multiple communities, each separated by a space.
	expanded list-name	Configures a named expanded extended community list.
	regexp	Regular expression that is used to specify a pattern to match against an input string. See the <i>Cisco Nexus 5500 Series NX-OS Fundamentals Configuration Guide, Release 6.0</i> at the following URL for details on regular expressions:
		http://www.cisco.com/en/US/docs/switches/datacenter/nexus5500/sw/fund amentals/621_n1_1/Cisco_Nexus_5500_Series_NX-OS_Fundamentals_C onfiguration_Guide_Release_6_2_1_N1_1_chapter4.html#con_1237003
		<b>Note</b> Regular expressions can be used with expanded extended community lists only.

### **Command Default** Community exchange is not enabled by default.

**Command Modes** Global configuration mode

Command History	Release	Modification	
,	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>ip extcommunity-list</b> command to configure extended community filtering for BGP. Extended community values are configured as a 6-byte number. The first four bytes represent the autonomous system number, and the last two bytes represent a user-defined network number. The BGP generic specific community attribute is defined in draft-ietf-idr-as4octet-extcomm-generic-subtype-00.txt.		
	<ul><li>BGP extended community exchange is not enabled by default. Use the send-extcommunity command in BGP neighbor fix-family configuration mode to enable extended community attribute exchange between BGP peers.</li><li>Once you configure a permit value to match a given set of extended communities, the extended community list defaults to an implicit deny for all other extended community values.</li></ul>		
	Standard Extended Comr	nunity Lists	
	Use standard extended community lists to configure specific extended community numbers. You can configure a maximum of 16 extended communities in a standard extended community list.		
	Expanded Extended Community Lists		
	Use expanded extended community lists to filter communities using a regular expression. Use regular expressions to configure patterns to match community attributes. The order for matching using the * or + character is the longest construct is first. Nested constructs are matched from the outside in. Concatenated constructs are matched beginning at the left side. If a regular expression can match two different parts of an input string, it matches the earliest part first.		
	Community List Processing		
	When you configure multiple values in the same extended community list statement, a logical AND condition is created. All extended community values must match to satisfy the AND condition. Whe you configure multiple values in separate community list statements, a logical OR condition is created. The first list that matches a condition is processed.		
Examples	This example shows how to configure a standard generic specific extended community list that permits routes from network 40 in autonomous system 1.65534 and from network 60 in autonomous system 1.65412:		
	<pre>switch(config)# ip extcommunity-list standard test1 permit generic transitive 1.65534:40 1.65412:60 switch(config)#</pre>		
	All community values must match in order for the list to be processed.		
Related Commands	Command	Description	
	feature bgp	Enables BGP.	
	feature bgp match extcommunity send-community		

# ip prefix-list

To create a prefix list to match IP packets or routes against, use the **ip prefix-list** command. To remove the prefix-list, use the **no** form of this command.

**ip prefix-list** *name* [**seq** *number*] {**permit** | **deny**} *prefix* [**eq** *length* | [**ge** *length*] [**le** *length*]]

**no ip prefix-list** *name* [**seq** *number*] {**permit** | **deny**} *prefix* [**eq** *length* | [**ge** *length*] [**le** *length*]]

Syntax Description	name	IP prefix list name. The name can be any alphanumeric string up to 63 characters.
	seq number	(Optional) Specifies the number to order entries in the prefix list. The range is
		from 1 to 4294967294.
	permit	Allows routes or IP packets that match the prefix list.
	deny	Rejects routes or IP packets that match the prefix list.
	prefix	IP prefix in A.B.C.D/length format.
	eq length	(Optional) Specifies the prefix length to match. The range is from 1 to 32.
	ge length	(Optional) Specifies the prefix length to match. The range is from 1 to 32.
	le length	(Optional) Specifies the prefix length to match. The range is from 1 to 32.
Command Default	None	
Command Modes	Global configura	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>ip prefix-list</b> command to configure IP prefix filtering. Configure prefix lists with <b>permit</b> or <b>deny</b> keywords to either permit or deny the prefix based on the matching condition. A prefix list consists of an IP address and a bit mask. The bit mask is entered as a number from 1 to 32. An implicit deny is applied to traffic that does not match any prefix-list entry.	
	You can configure prefix lists to match an exact prefix length or a prefix range. Use the <b>ge</b> and <b>le</b> keywords to specify a range of the prefix lengths to match, which provides a more flexible configuration. If you do not configure a sequence number, Cisco NX-OS applies a default sequence number of 5 to the prefix list and subsequent prefix list entries are incremented by 5 (for example, 5, 10, 15, and so on). If you configure a sequence number for the first prefix list entry but not subsequent entries, then Cisco NX-OS increments the subsequent entries by 5 (for example, if the first configured sequence number is 3, then subsequent entries will be 8, 13, 18, and so on). You can suppress default sequence numbers by entering the <b>no</b> form of this command with the <b>seq</b> keyword.	
	list until a match	aluates prefix lists that start with the lowest sequence number and continue down the is made. Once a match is made, the <b>permit</b> or <b>deny</b> statement is applied to that network e list is not evaluated.

### <u>P</u> Tip

For the best performance of your network, you should configure the most frequently processed prefix list statements with the lowest sequence numbers. The **seq** *number* keyword and argument can be used for resequencing.

The prefix list is applied to inbound or outbound updates for specific peer by entering the **prefix-list** command in neighbor address-family mode. Prefix list information and counters are displayed in the output of the **show ip prefix-list** command. Prefix-list counters can be reset by entering the **clear ip prefix-list** command.

### Examples

This example shows how to configure a prefix list and apply it to a Border Gateway Protocol (BGP) peer:

```
switch# configure terminal
switch(config)# ip prefix-list allowprefix 10 permit 192.0.2.0 eq 24
switch(config)# ip prefix-list allowprefix 20 permit 209.165.201.0 eq 27
switch(config) router bgp 65536:20
switch(config-router)# neighbor 192.0.2.1/16 remote-as 65536:20
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# prefix-list allowprefix in
switch(config-router-neighbor-af)#
```

### Related Commands C

;	Command	Description
	clear ip prefix-list	Clears counters for IP prefix lists.
	prefix-list	Applies a prefix list to BGP peer.
	show ip prefix-list	Displays information about IP prefix lists.

# ip prefix-list description

To configure a description string for an IP prefix list, use the **ip prefix-list description** command. To revert to default, use the **no** form of this command.

ip prefix-list name description string

no ip prefix-list name description

Syntax Description	name	Name of the prefix list. The name can be any alphanumeric string up to 63 characters.
	string	Descriptive string for the prefix list. The string can be any alphanumeric string up to 90 characters.
Command Default	None	
Command Modes	Global configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows how to configure a description for an IP prefix list: switch# configure terminal switch(config)# ip prefix-list test1 description "this is a test" switch(config)#	
Related Commands	Command	Description
	show ip prefix-list	Displays information about IPv4 prefix lists.

# **L** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with L.

# local-as

To configure the Border Gateway Protocol (BGP) local autonomous system (AS) number, use the **local-as** command.

local-as as-number

Syntax Description	as-number	(Optional) Autonomous system number. The AS number can be a 16-bit integer or a 32-bit integer in the form of <higher 16-bit="" decimal="" number="">.<lower 16-bit="" decimal="" number="">.</lower></higher>
Command Default	None	
Command Modes	Router VRF m	node
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command	l requires the LAN Enterprise Services license.
Examples	This example	shows how to configure the local AS number for BGP:
	switch(config switch(config	igure terminal g)# router bgp 65536.33 g-router)# vrf red g-router-vrf)# local-as 65536.33
Related Commands	Command	Description
	show bgp	Displays information about BGP.

### low-memory exempt

To exempt a Border Gateway Protocol (BGP) neighbor from a low-memory shutdown, use the **low-memory exempt** command. To make a BGP neighbor eligible for a low-memory shutdown, use the **no** form of this command.

low-memory exempt

no low-memory exempt

Syntax Description	This command ha	s no arguments or keywords.
Command Default	Some eBGP peers	shut down for severe memory alerts.
Command Modes	Neighbor configu	ration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command red	quires the LAN Enterprise Services license.
Examples	This example sho	ws how to exempt a neighbor from low-memory shutdown:
		router bgp 1.0 puter)# neighbor 192.0.2.0/24 remote-as 1.5 puter-af)# low-memory exempt

# **M** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with M.

## mac-list

To filter based on a MAC address, use the **mac-list** command. To remove the MAC list entry, use the **no** form of this command.

**mac-list** *name* [**seq** *number*] {**permit** | **deny**} *mac-address* [*mac-mask*]

**no mac-list** *name* [**seq** *number*] {**permit** | **deny**} *mac-address* [*mac-mask*]

Syntax Description	name	MAC list name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
	seq number	(Optional) Creates an entry in the MAC list. The <i>seq</i> range is from 1 to 4294967294.
	permit	Allows the packet or route that matches a MAC address in the MAC list.
	deny	Blocks the packet or route that matches a MAC address in the MAC list.
	mac-address	MAC address to filter against.
	mac-mask	(Optional) Portion of the MAC address to match against, in MAC address format.
Command Default	No match values are	e defined
	Tto match values are	
	~	
Command Modes	Global configuratio	n mode
Command Modes	Global configuratio	n mode Modification
	<b>Release</b> 5.2(1)N1(1)	Modification
Command History	Release 5.2(1)N1(1) You can match agai	Modification This command was introduced.

Command History Usage Guidelines Examples	Release         5.2(1)N1(1)         You can match agai         This example shows         switch(config)# m	Modification         This command was introduced.         nst the MAC list in a route map.         s how to create the Red MAC list:         ac-list Red seq 1 permit 0022.5579.a4c1 ffff.ffff.0000

### match as-number

To match to a Border Gateway Protocol (BGP) autonomous system (AS) number, use the **match as-number** command. To remove an AS number list entry, use the **no** form of this command.

match as-number {number [,number...] | as-path-access-list name [...name]}

**no match as-number** {*number* [*,number...*] | **as-path-access-list** *name* [*...name*]}]

Syntax Description	number	AS number. The range is from 1 to 65535.
	number	(Optional) AS number. The range is from 1 to 65535.
	as-path-access-list	Specifies an AS-path access list to match AS numbers against. The name can
	name	be any alphanumeric string up to 63 characters.
	name	(Optional) AS-path access list. The name can be any alphanumeric string up to 63 characters.
Command Default	None	
Command Modes	Route-map configura	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		<b>mber</b> command to provide a list of AS numbers or an AS-path access list using a GP uses this match criteria to determine which BGP peers to create a BGP session
	-	specify a range of AS numbers whose peers can establish a session with the local eering. Cisco NX-OS ignores any other <b>match</b> commands if the <b>match as-number</b> n the route map.
Examples	This example shows h	now to configure a list of AS numbers:
	<pre>switch(config) # rou switch(config-route</pre>	nte-map IGP2BGP n-map)# match as-number 64496, 64498-64510

#### **Related Commands**

nds Command	Description
ip as-path access-list	Creates an AS-path list.
neighbor	Configures BGP peers.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.

### match as-path

To match a Border Gateway Protocol (BGP) autonomous system (AS) path access list, use the **match as-path** command. To remove a path list entry, use the **no** form of this command.

match as-path name [...name]

no match as-path name [...name]

Syntax Description	name	Autonomous system path access list. The name can be any alphanumeric string up to 63 characters.
	name	(Optional) Autonomous system path access list. You can configure up to 32 access list names.
Command Default	No path lists are de	fined.
Command Modes	Route-map configur	ration mode
Command History	Release	Modification
-	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	A route map can ha a <b>route-map</b> comm	The <b>match as-path</b> command overrides global values. We several parts. Any route that does not match at least one <b>match</b> clause relating to and is ignored; that is, the route is not advertised for outbound route maps and is not d route maps. Examples	A route map can har a <b>route-map</b> comm accepted for inboun second route-map second This example sets the switch(config)# <b>r</b> switch(config-rou switch(config-rou switch(config-rou	we several parts. Any route that does not match at least one <b>match</b> clause relating to and is ignored; that is, the route is not advertised for outbound route maps and is not d route maps. If you want to modify some particular data, you must configure a ection with an explicit match specified. he autonomous system path to match BGP autonomous system path access list 20: <b>oute-map IGP2BGP</b> te-map) # <b>match as-path 20</b> te-map) # <b>Description</b> Matches a BGP community. Distributes any routes that have a destination network number address that is permitted by a standard or expanded access list.

Command	Description
match tag	Redistributes routes in the routing table that match the specified tags.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set comm-list	Automatically computes the tag value in a route map configuration.
set community	Sets BGP community list (for deletion).
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric (BGP, OSPF, RIP)	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set origin (BGP)	Sets the BGP origin code.
set tag	Sets the value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

### match community

To match a Border Gateway Protocol (BGP) community, use the **match community** command. To remove the **match community** command from the configuration file and restore the system to its default condition where the software removes the BGP community list entry, use the **no** form of this command.

match community name [...name] [exact-match]

no match community name [...name] [exact-match]

Syntax Description	name	One or more community list names. The name can be any alphanumeric string up to 63 characters. You can configure a maximum of 32 community lists.
	exact-match	(Optional) Indicates that an exact match is required. All of the communities and only those communities specified must be present.
Command Default	No community list	is matched by the route map.
Command Modes	Route-map configu	iration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	related to a <b>route-n</b> and is not accepted configure a second	ave several parts. Any route that does not match at least one <b>match</b> command that is <b>nap</b> command is ignored; that is, the route is not advertised for outbound route map I for inbound route maps. If you want to modify some particular data, you must route-map section with an explicit match specified.
	to BGP.	sed on the community list number is one of the types of <b>match</b> commands applicable
Examples	This example show	vs how to match two BGP communities:
	switch(config)# <b>1</b> switch(config-rou	route-map test2 ute-map)# match community bgpLow bgpHigh
	-	ys that the routes that match community list 1 have the weight set to 200. Any route rd community 109 only has the weight set to 200.
	<pre>switch(config)# r switch(config-rou</pre>	ip community-list standard bgpLow permit 109 route-map set_weight ute-map)# match community bgpLow exact-match ute-map)# set weight 200
	This example show	vs the routes that match the community list 500. Any route that has expanded

community 1 have the weight set to 150.

switch(config)# ip community-list expanded 500 permit [0-9]\*
switch(config)# route-map MAP\_NAME permit 10
switch(config-route-map)# match community 500
switch(config-route-map)# set weight 150

#### **Related Commands**

Command	Description
ip community-list	Creates a community list for BGP and controls access to it.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set weight	Specifies the BGP weight for the routing table.

### match extcommunity

To match a Border Gateway Protocol (BGP) extended community in a route map, use the **match extcommunity** command. To remove the match from the route map, use the **no** form of this command.

match extcommunity name [...name] [exact-match]

**no match extommunity** *name* [...*name*] [**exact-match**]

Syntax Description]	name	One or more extended community list names. The name can be any alphanumeric string up to 63 characters. You can configure a maximum of 32 community lists.
	exact-match	(Optional) Indicates that an exact match is required. All of the communities and only those extended communities specified must be present.
Command Default	No community list i	s matched by the route map.
Command Modes	Route-map configur	ration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	route map is ignored inbound route maps. section with an expl	we several parts. Any route that does not match at least one <b>match</b> command in the l; that is, the route is not advertised for outbound route maps and is not accepted for If you want to modify some particular data, you must configure a second route-map icit match specified. ed on the extended community list number is one of the types of <b>match</b> commands
Examples	<pre>switch(config)# rc switch(config-rout</pre>	te-map)# match extcommunity bgpLocal bgpRemote
	switch(config)# ro switch(config-rout	p extcommunity-list standard bgpLocal permit generic nontransitive 1.9 pute-map deletCommunity te-map)# match extcommunity bgpLocal exact-match te-map)# set extcommunity generic transitive 1.9

#### Related Commands

Commands	Command	Description
	ip extcommunity-list	Creates a community list for BGP and controls access to it.
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.
	send-community	Configures BGP to propagate community attributes to BGP peers.
	set extcommunity	Sets an extended community in a route map.

### match interface

To match an interface in a route map, use the **match interface** command. To remove the match, use the **no** form of this command.

match interface { interface-type number [, interface-type number...]}

**no match interface** {*interface-type number* [, *interface-type number*...]}

Syntax Description	interface-type	Interface type. Use ? to see a list of supported interfaces.
	number	(Optional) Interface number. Use ? to see the range.
Command Default	None	
Command Modes	Route-map configu	uration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	A route map can ha to a <b>route-map</b> co not accepted for in	dresses that are reached by one of the interfaces result in a match for the route map. ave several parts. Any route that does not match at least one <b>match</b> clause that relates mmand is ignored; that is, the route is not advertised for outbound route maps and is bound route maps. If you want to modify some particular data, you must configure a section with an explicit match specified.
Examples	switch(config)#	vs how to configure a list of interfaces: route-map test1 ute-map)# match interface ethernet 2/1, ethernet 4/3
Related Commands	Command	Description
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.

### match ip address

To distribute any routes that have a destination IP network number address that is permitted by a standard access list, an expanded access list, or a prefix list, use the **match ip address** command. To remove the **match ip address** entry, use the **no** form of this command.

match ip address {prefix-list prefix-list-name [prefix-list-name...]}

**no match ip address** {**prefix-list** *prefix-list-name* [*prefix-list-name*...]}

Syntax Description	prefix-list prefix-list	t name	Distributes routes based on a prefix list. The prefix list name can be
Symax Description	prenx-nst prejtx-tis	si-name	any alphanumeric string up to 63 characters. The ellipsis indicates that multiple values can be entered, up to 32 prefix lists.
Command Default	No prefix lists are sp	pecified.	
Command Modes	Doute mor configur	ution mode	
Command Modes	Route-map configur	ation mode	
Command History	Release	Modi	fication
	5.2(1)N1(1)	This	command was introduced.
Usage Guidelines	<ul><li>An ellipsis () in the command syntax indicates that your command input can include multiple values for the <i>prefix-list-name</i> argument.</li><li>Like matches in the same route map subblock are filtered with "or" semantics. If any one match clause is matched in the entire route map subblock, this match is treated as a successful match. Dissimilar match clauses are filtered with "and" semantics, so dissimilar matches are filtered logically. If the first set of conditions is not met, the second match clause is filtered. This process continues until a match occurs or there are no more match clauses.</li></ul>		
	Use route maps to redistribute routes.		
	Use the <b>route-map</b> global configuration command and the <b>match</b> and <b>set</b> route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.		
	in any order, and all	match con	ation command has multiple formats. The <b>match</b> commands can be given nmands must pass to cause the route to be redistributed according to the commands. The <b>no</b> forms of the <b>match</b> commands remove the specified

match criteria.

When you are passing routes through a route map, a route map can have several sections that contain specific **match** clauses. Any route that does not match at least one **match** clause that relates to a **route-map** command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify some particular data, you must configure a second route map section with an explicit match specified.

#### **Examples**

This example shows how to match routes that have addresses specified by an access list test:

switch(config)# interface ethernet 2/10
switch(config-if)# no switchport
switch(config-if)# exit
switch(config)# route-map chicago
switch(config-route-map)# match ip address test

Related Commands         Command         Description           match as-path         Matches a BGP autonomous system path access list.           match community         Matches a BGP community.           match interface         Distributes any routes that have their next hop out one of the interfaces specified.           match ip next-hop         Redistributes any routes that have a next-hop router address passed by one of the access lists specified.           match ip route-source         Redistributes routes with the metric specified.           match metric         Redistributes routes of the specified type.           match tag         Redistributes routes in the routing table that match the specified tags.           route-map         Defines the conditions for redistributing routes from one routing protocol into another.           set as-path         Modifies an autonomous system path for BGP routes.           set community         Sets the BGP communities attribute.           set community         Sets the BGP communities attribute.           set level         Indicates where to import routes.           set metric (BGP, OSPF, RIP)         Sets the metric value for a nouting protocol.           set metric-type         Sets the metric type for the destination routing protocol.           set next-hop         Specifies the address of the next hop.

set next-hopSpecifies the address of the next hop.set tagSets a tag value of the destination routing protocol.		set metric (BGP, OSPF, RIP)	Sets the metric value for a routing protocol.
<b>set tag</b> Sets a tag value of the destination routing protocol.		set metric-type	Sets the metric type for the destination routing protocol.
		set next-hop	Specifies the address of the next hop.
set weight Specifies the BGP weight for the routing table.		set tag	Sets a tag value of the destination routing protocol.
		set weight	Specifies the BGP weight for the routing table.

# match ip multicast

To configure the IPv4 multicast features for the route-map matching, use the **match ip multicast** command. To remove the match, use the **no** form of this command.

no match ip multicast

Syntax Description	group address/length	Specifies the group address and the length of the network mask in bits in this format: <i>A.B.C.D/length</i> . The network number can be any valid IP address or prefix. The bit mask can be a number from 0 to 32.		
		You can configure group, source, and rp options.		
	source address/length	Specifies the source address and the length of the network mask in bits in this format: <i>A.B.C.D/length</i> . The network number can be any valid IP address or prefix. The bit mask can be a number from 0 to 32.		
		You can configure group, source, and rp options.		
	<b>rp</b> address/length	Specifies the IPv4 rendezvous prefix (RP) and the length of the IPv4 prefix mask in bits in this format: <i>A.B.C.D/length</i> . The network number can be any valid IPv4 address or prefix. The bit mask can be a number from 0 to 32.		
		You can configure group, source, and rp options.		
	rp-type	(Optional) Specifies the multicast rendezvous point type.		
	asm	(Optional) Specifies the any-source multicast (ASM) rendezvous point type.		
Command Default	None Route-map configuratio	n mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines		t command is the only <b>match</b> command that is evaluated in the route map. You refix, group range, and source prefix to filter messages with the <b>match ip</b>		
	_	Use the <b>route-map</b> command to enter route-map configuration mode. Once you enter the <b>route-map</b> command, the prompt changes to the following:		
	switch(config-route-m	<pre>switch(config-route-map)#</pre>		
	Once you enter route man configuration made, you can enter the <b>match in multicost</b> command			

Once you enter route-map configuration mode, you can enter the match ip multicast command.

You can configure both group and rp options.

Examples

This example shows how to specify the group IPv4 prefix and the length of the IPv4 prefix for the neighbors to match:

```
switch(config)# route-map blueberry
switch(config-route-map)# match ip multicast group 192.0.0.0/19
switch(config-route-map)#
```

This example shows how to specify both the group IPv4 prefix and the rendezvous point of the IPv4 prefix for the neighbors to match:

```
switch(config)# route-map raspberry
switch(config-route-map)# match ip multicast group 192.0.0.0/19 rp 209.165.201.0/27
switch(config-route-map)#
```

#### **Related Commands**

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match interface	Distributes any routes that have their next hop out one of the interfaces specified.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match route-type	Redistributes routes of the specified type.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set automatic-tag	Automatically computes the tag value.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric (BGP, OSPF, RIP)	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

### match ip next-hop prefix-list

To redistribute any IPv4 routes that have a next-hop router address passed by one of the access lists specified, use the **match ip next-hop prefix-list** command. To remove the next hop entry, use the **no** form of this command.

match ip next-hop prefix-list prefix-list-name [ ...prefix-list-name]

**no match ip next-hop prefix-list** *prefix-list-name* [ ...*prefix-list-name*]

Syntax Description	prefix-list-name	Number or name of a prefix list. It can be any alphanumeric string up to 63 characters. The ellipsis indicates that multiple values can be entered, up to 32 prefix lists.
Command Default	Routes are distributed	I freely, without being required to match a next hop address.
Command Modes	Route-map configurat	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

#### Related Commands

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip address	Distributes any routes that have a destination network number address that is permitted by a standard or expanded access list.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match route-type	Redistributes routes of the specified type.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set automatic-tag	Automatically computes the tag value.
set communit	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric (BGP, OSPF, RIP)	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

### match ip route-source prefix-list

To redistribute IPv4 routes that have been advertised by routers and access servers at the address specified by the access lists, use the **match ip route-source prefix-list** command. To remove the route-source entry, use the **no** form of this command.

match ip route-source prefix-list prefix-list-name [ ...prefix-list-name]

**no match ip route-source prefix-list** *prefix-list-name* [ ...*prefix-list-name*]

Syntax Description	prefix-list-name	Number or name of a prefix list. It can be any alphanumeric string up to 63 characters. The ellipsis indicates that multiple values can be entered, up to 32 prefix lists.	
Command Default	No filtering on rout	e source.	
Command Modes	Route-map configu	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	for the <i>prefix-list-na</i> Use the <b>route-map</b> commands to define <b>route-map</b> comman specify the match c <b>route-map</b> comman to perform if the crit the route map.	global configuration command, and the <b>match</b> and <b>set</b> route-map configuration e the conditions for redistributing routes from one routing protocol into another. Each nd has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands riteria—the conditions under which redistribution is allowed for the current nd. The <b>set</b> commands specify the set actions—the particular redistribution actions teria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes	
	The <b>match</b> route-map configuration command has multiple formats. The <b>match</b> commands can be given in any order, and all <b>match</b> commands must pass to cause the route to be redistributed according to the set actions given with the <b>set</b> commands. The <b>no</b> forms of the <b>match</b> commands remove the specified match criteria.		
	A route map can have several parts. Any route that does not match at least one <b>match</b> clause that relates to a <b>route-map</b> command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify only some data, you must configure second route map section with an explicit match specified.		
	There are situations in which the next hop and source router address of the route are not the same.		

#### Examples

This example shows how to distribute routes that have been advertised by routers and access servers at the addresses specified by access lists 5 and 80:

switch(config)# route-map blue
switch(config-route-map)# match ip route-source prefix-list 5 80

#### **Related Commands**

Command	Description	
match as-path	Matches a BGP autonomous system path access list.	
match community	Matches a BGP community.	
match ip address	Distributes any routes that have a destination network number address that is permitted by a standard or expanded access list.	
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.	
match route-type	Redistributes routes of the specified type.	
route-map	Defines the conditions for redistributing routes from one routing protocol into another.	
set as-path	Modifies an autonomous system path for BGP routes.	
set automatic-tag	Automatically computes the tag value.	
set community	Sets the BGP communities attribute.	
set level	Indicates where to import routes.	
set local-preference	Specifies a preference value for the autonomous system path.	
set metric (BGP, OSPF, RIP)	Sets the metric value for a routing protocol.	
set metric-type	Sets the metric type for the destination routing protocol.	
set next-hop	Specifies the address of the next hop.	
set tag	Sets a tag value of the destination routing protocol.	
set weight	Specifies the BGP weight for the routing table.	

### match metric

To redistribute routes in the routing table that match the routing metric value, use the **match metric** command. To remove the tag entry, use the **no** form of this command.

**match metric** *metric-value* [+- *deviation-number*] [...*metric-value* [+- *deviation-number*]]

**no match metric** *metric-value* [+- *deviation-number*] [...*metric-value* [+- *deviation-number*]]

Syntax Description	metric-value	Internal route metric. The range is from 1 to 4,294,967,295.	
	+-	Specifies a standard deviation range of the metric. The router matches any metric that falls inclusively in that range.	
	deviation-number	(Optional) Standard deviation number that offsets the number configured for the <i>metric-value</i> argument. The <i>deviation-number</i> argument can be any number. There is no default.	
Command Default	No match values are	defined.	
Command Modes	Route-map configura	ation mode	
Command History	Release	Modification	
•	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines		s with the specified metric, use the <b>match metric</b> command in route-map To remove the entry for the redistributed route from the routing table, use the no nd.	
	You can specify one or more metrics (or) range of metrics using the <i>deviation-number</i> argument. At least one of the specified metrics must match for the command to pass.		
	An ellipsis () in the command syntax indicates that your command input can include multiple values for the arguments.		
	Use the <b>route-map</b> global configuration command, and the <b>match</b> and <b>set</b> route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.		
	in any order and all	p configuration command has multiple formats. The <b>match</b> commands can be given <b>match</b> commands must pass to cause the route to be redistributed according to the h the <b>set</b> commands. The <b>no</b> forms of the <b>match</b> commands remove the specified	

A route map can have several parts. Any route that does not match at least one **match** clause that relates to a **route-map** command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify some particular data, you must configure second route map section with an explicit match specified.

#### Examples

This example shows how to redistribute routes stored in the routing table with a metric of 5:

switch(config)# route-map blueberry
switch(config-route-map)# match metric 5

<b>Related Commands</b>	Command	Description
	match as-path	Matches a BGP autonomous system path access list.
	match community	Matches a BGP community.
	match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
	match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
	match metric	Redistributes routes with the metric specified.
	match tag	Redistributes routes in the routing table that match the specified tags.
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.
	set as-path	Modifies an autonomous system path for BGP routes.
	set community	Sets the BGP communities attribute.
	set level	Indicates where to import routes.
	set local-preference	Specifies a preference value for the autonomous system path.
	set metric	Sets the metric value for a routing protocol.
	set metric-type	Sets the metric type for the destination routing protocol.
	set next-hop	Specifies the address of the next hop.
	set tag	Sets a tag value of the destination routing protocol.
	set weight	Specifies the BGP weight for the routing table.

### match mac-list

To redistribute routes in the routing table that match a MAC address in the MAC list, use the **match mac-list** command. To remove the tag entry, use the **no** form of this command.

match mac-list *listname* 

no match mac-list listname

Syntax Description	listname	MAC list name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	No match values ar	e defined.
Command Modes	Route-map configu	ration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	commands to define route-map comma specify the match c route-map comma	global configuration command, and the <b>match</b> and <b>set</b> route-map configuration e the conditions for redistributing routes from one routing protocol into another. Each nd has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands criteria—the conditions under which redistribution is allowed for the current nd. The <b>set</b> commands specify the set actions—the particular redistribution actions teria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes
	The <b>match</b> route-map configuration command has multiple formats. The <b>match</b> commands can be given in any order and all <b>match</b> commands must pass to cause the route to be redistributed according to the set actions given with the <b>set</b> commands. 	A route map can have several parts. Any route that does not match at least one <b>match</b> clause that relates to a <b>route-map</b> command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify some particular data, you must configure a second route map section with an explicit match specified.	
Examples	MAC list: switch# configure switch(config)# r	coute-map blueberry
	switch(config-rou switch(config-rou	ute-map)# <b>match mac-list Red</b> ute-map)#

#### Related Commands

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

### match route-type

To redistribute routes of the specified type, use the **match route-type** command. To remove the route type entry, use the **no** form of this command.

match route-type {external | internal | local | nssa-external | type-1 | type-2}

no match route-type {external | internal | local | nssa-external | type-1 | type-2}

Syntax Description	external	Specifies the external route (Border Gateway Protocol [BGP], Enhanced Interior Gateway Routing Protocol [EIGRP], and Open Shortest Path First [OSPF] type 1/2). You can specify more than one keyword.	
	internal	Specifies the internal route (including the OSPF intra/inter area). You can specify more than one keyword.	
	local	Specifies the locally generated route. You can specify more than one keyword.	
	nssa-external	Specifies the nssa-external route (OSPF type 1/2). You can specify more than one keyword.	
	type-1	Specifies the OSPF external type 1 route. You can specify more than one keyword.	
	type-2	Specifies the OSPF external type 2 route. You can specify more than one keyword.	
Command Default	Disabled		
Command Modes	Route-map configu	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>route-map</b> global configuration command, and the <b>match</b> and <b>set</b> route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.		
	The <b>match</b> route-map configuration command has multiple formats. The <b>match</b> commands can be given in any order and all <b>match</b> commands must pass to cause the route to be redistributed according to the set actions given with the <b>set</b> commands. The <b>no</b> forms of the <b>match</b> commands remove the specified match criteria.		

A route map can have several parts. Any route that does not match at least one **match** clause that relates to a **route-map** command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify some particular data, you must configure a second route map section with an explicit match specified.

You can specify more than one keyword.

**Examples** This example shows how to redistribute internal routes: switch(config)# route-map blueberry switch(config-route-map)# match route-type internal

This example shows how to redistribute internal routes and type-1 OSPF routes:

switch(config) # route-map blueberry switch(config-route-map)# match route-type internal type-1

<b>Related Commands</b>	Command	Description

#### **Balatad** Commands

### match tag

To redistribute routes in the routing table that match the specified tags, use the **match tag** command. To remove the tag entry, use the **no** form of this command.

**match tag** *tag-value* [...*tag-value*]

**no match tag** *tag-value* [...*tag-value*]

Syntax Description	tag-value	List of one or more route tag values. Each can be an integer from	
		0 to 4,294,967,295. You can configure up to 32 tags.	
Command Default	No match tag values	are defined.	
	-		
Command Modes	Route-map configura	ation mode	
Command Modes	Koute-map configura		
<b>Command History</b>	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	An ellipsis () in the command syntax indicates that your command input can include multiple values for the <i>tag-value</i> argument.		
	Use the <b>route-map</b> global configuration command, and the <b>match</b> and <b>set</b> route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.		
	The <b>match</b> route-map configuration command has multiple formats. The <b>match</b> commands can be given in any order and all <b>match</b> commands must pass to cause the route to be redistributed according to the set actions given with the <b>set</b> commands. The <b>no</b> forms of the <b>match</b> commands remove the specified match criteria.		
	to a <b>route-map</b> com not accepted for inbo	e several parts. Any route that does not match at least one <b>match</b> clause that relates mand is ignored; that is, the route is not advertised for outbound route maps and is ound route maps. If you want to modify some particular data, you must configure a ction with an explicit match specified.	
Examples	switch(config)# rc	how to redistribute routes stored in the routing table with tag 5: <b>bute-map blueberry</b> <b>ie-map) # match tag 5</b>	

#### Related Commands

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.

set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

### match vlan

To filter routes with the specified VLAN, use the **match vlan** command. To remove the entry for the redistributed route from the routing table, use the **no** form of this command.

match vlan vlan-range

no match vlan vlan-range

Syntax Description	vlan-range	Range of VLAN that this command matches against. The range is from 1 to 4094.	
Command Default	No match VLAN values	s are defined.	
Command Modes	Route-map configuratio	n mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	To filter routes with the specified VLAN, use the <b>match vlan</b> command You can specify one or more VLANs (or) range of VLANs. At least one of the specified VLANs must match for the command to pass. The command matches any VLAN that falls inclusive in the range.		
	Use the <b>route-map</b> global configuration command, and the <b>match</b> and <b>set</b> route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.		
	The <b>match</b> route-map configuration command has multiple formats. The <b>match</b> commands can be given in any order and all <b>match</b> commands must pass to cause the route to be redistributed according to the set actions given with the <b>set</b> commands. The <b>no</b> forms of the <b>match</b> commands remove the specified match criteria.		
	to a <b>route-map</b> comman not accepted for inbound	everal parts. Any route that does not match at least one <b>match</b> clause that relates and is ignored; that is, the route is not advertised for outbound route maps and is d route maps. If you want to modify some particular data, you must configure a on with an explicit match specified	
Examples	This example shows how switch(config)# route switch(config-route-m		

#### Related Commands

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

# maxas-limit

To configure the external Border Gateway Protocol (eBGP) to discard routes that have a high number of autonomous system (AS) numbers in the AS-path attribute, use the **maxas-limit** command. To revert to the default, use the **no** form of this command.

maxas-limit [number]

no maxas-limit

Syntax Description	number	(Optional) Maximum number of AS numbers allowed in the AS-path attribute. The range is from 1 to 2000.	
Command Default	No limit		
Command Modes	Router configur VRF configurat		
Command History	Release	Modification	
· · · · · · · · · · · · · · · · · · ·	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	This command	requires the LAN Enterprise Services license.	
Examples	This example sl	nows how to set the maximum number of AS numbers to 50:	
	<pre>switch(config)# router bgp 64496 switch(config-router)# maxas-limit 50 switch(config-router)#</pre>		
Related Commands	Command	Description	
	feature bgp	Enables the BGP feature.	
	router bgp	Creates a BGP instance.	

### maximum-paths (BGP)

To control the maximum number of parallel routes that the Border Gateway Protocol (BGP) can support, use the **maximum-paths** command. To restore the default number of parallel routes, use the **no** form of this command.

maximum-paths [ibgp] number-paths

no maximum-paths [ibgp] number-paths

Syntax Description	ibgp	(Optional) Configures the maximum interior BGP (iBGP) paths.
	number-paths	Maximum number of parallel routes that an IP routing protocol installs in a routing table. The range is from 1 to 16.
Command Default	8 paths	
Command Modes	Router address fami	ily configuration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	switch# <b>configure</b> switch(config)# <b>r</b> e	outer bgp 64496 ter)# maximum-paths 16
Related Commands	Command	Description
	feature bgp	Enables the BGP feature on the router.
	router bgp	Enables BGP.

# maximum-prefix

To control how many prefixes can be received from a neighbor, use the **maximum-prefix** command. To disable this function, use the **no** form of this command.

maximum-prefix maximum [threshold] [restart restart-interval] [warning-only]

no maximum-prefix

Syntax Description	maximum	Maximum number of prefixes allowed from the specified neighbor. The number of prefixes that can be configured is limited only by the available system resources on a router. Range: 1 to 300000.	
	threshold	(Optional) Specifies the percentage of the maximum-prefix limit at which the router starts to generate a warning message. Range: 1 to 100. Default: 75.	
	restart interval	(Optional) Specifies the time interval (in minutes) that a peering session is reestablished. Range: 1 to 65535.	
	warning-only	(Optional) Allows the router to generate a syslog message when the maximum-prefix limit is exceeded, instead of terminating the peering session.	
Command Default		sabled by default. Peering sessions are disabled when the maximum number of . If you do not configure the restart interval, a disabled session stays down after the nit is exceeded.	
Command Modes	Router address fami	ly configuration mode	
	VRF configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	The number of prefixes that can be configured is limited only by the available system resources on a router.		
	The <b>maximum-prefix</b> command allows you to configure a maximum number of prefixes that a Border Gateway Protocol (BGP) routing process accepts from the specified peer. This feature provides a mechanism (in addition to distribute lists, filter lists, and route maps) to control prefixes received from a peer.		
	When the number of received prefixes exceeds the maximum number configured, BGP disables the peering session (by default). If you configure the restart interval, BGP automatically reestablishes the peering session at the configured time interval. If you do not configure the restart interval and a peering		

session is terminated because the maximum prefix limit has been exceed, the peering session is not reestablished until you enter the **clear ip bgp** command. If the **warning-only** keyword is configured, BGP sends only a log message and continues to peer with the sender.

There is no default limit on the number of prefixes that can be configured with this command. Limitations on the number of prefixes that can be configured are determined by the amount of available system resources.

#### **Examples**

This example shows how to set the maximum prefixes that are accepted from the 192.168.1.1 neighbor to 1000:

```
switch(config)# router bgp 64496
switch(config-router)# network 192.168.0.0
switch(config-router)# maximum-prefix 1000
switch(config-router)#
```

This example shows how to set the maximum number of prefixes that are accepted from the 192.168.2.2 neighbor to 5000. The router is also configured to display warning messages when 50 percent of the maximum-prefix limit (2500 prefixes) has been reached.

```
switch(config)# router bgp 64496
switch(config-router)# network 192.168.0.0
switch(config-router)# maximum-prefix 5000 50
switch(config-router)#
```

This example shows how to set the maximum number of prefixes that are accepted from the 192.168.3.3 neighbor to 2000. The router is also configured to reestablish a disabled peering session after 30 minutes.

```
switch(config)# router bgp 64496
switch(config-router)# network 192.168.0.0
switch(config-router)# maximum-prefix 2000 restart 30
switch(config-router)#
```

This example shows how to set the warning messages that are displayed when the maximum-prefix limit (500) for the 192.168.4.4 neighbor is exceeded:

```
switch(config)# router bgp 64496
switch(config-router)# network 192.168.0.0
switch(config-router)# maximum-prefix 500 warning-only
switch(config-router)#
```

This example shows how to set the maximum number of prefixes that are accepted from the 192.168.1.3 neighbor to 1500.

```
switch(config)# router bgp 64496
switch(config-router)# neighbor 192.168.1.3 remote-as 64497
switch(config-router-neighbor)# address-family ipv4 multicast
switch(config-router-neighbor-af)# maximum-prefix 1500
switch(config-router-neighbor-af)#
```

<b>Related Commands</b>	Command	Description
	address-family (BGP	Enters BGP neighbor address-family configuration mode.
	neighbor)	
	neighbor	Configures a BGP neighbor.

Command	Description
network	Configures an IP prefix to advertise.

# **N** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with N.

# neighbor

To configure a Border Gateway Protocol (BGP) neighbor (router or VRF) and enter the neighbor configuration mode, use the **neighbor** command. To remove an entry, use the **no** form of this command.

**neighbor** {*ip-addr* | *ip-prefix/length*} [**remote-as** {*as-num*[.*as-num*] | **route-map** *name*}

**no neighbor** {*ip-addr* | *ip-prefix/length*} [**remote-as** {*as-num*] | **route-map** *name*}]

Syntax Description	ip-addr	IP address of the neighbor in this format: A.B.C.D.
	ip-prefix/length	IP prefix and the length of the IP prefix. The format is x.x.x.x/ <i>length</i> . The <i>length</i> range is from 1 to 32.
	remote-as	(Optional) Specifies the autonomous system (AS) number of the neighbor.
	as-num	Number of an AS that identifies the router to other BGP routers and tags the routing information passed along. The range is from 1 to 65535.
	.as-num	(Optional) Number of an AS that identifies the router to other BGP routers and tags the routing information passed along. The range is from 1 to 65535.
	route-map name	(Optional) Specifies a route map that matches the BGP peer AS number against a list of AS numbers or a regular expression. The name can be any case-sensitive, alphanumeric string up to 63 characters.
Command Default	None	
Command Modes	Neighbor address fa Router bgp configu	amily configuration mode ration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	From the BGP neig	hbor configuration mode, you can perform the following actions:
		y—Configures an address-family (router, neighbor, VRF). See the <b>address-family</b> nd for information.
	• description des spaces.	scription—Describes the neighbor. You can enter up to 80 characters including
	Use the disable	cted-check—Disables the connection verification for the directly connected peer. e-connected-check command to disable a check for an exterior Border Gateway P) peer that is directly connected to the local router. BGP triggers a connection check

automatically for all eBGP peers that are known to be a single hop away, unless you disable this check with the **disable-connected-check** command. BGP does not bring up sessions if the check fails. BGP considers an EBGP peer as a single hop away if the eBGP peer does does not have the **ebgp-multihop** command configured (that is, the time-to-live (TTL) value is one).

This command is ignored if the **route-map** keyword is used in the **neighbor** command.

- dont-capability-negotiate—Turns off the negotiate capability with this neighbor.
- **dynamic-capability**—Enables the dynamic capability.
- ebgp-multihop—Accepts and attempts BGP connections to external peers that reside on networks that are not directly connected. This command is ignored if the route-map keyword is used in the neighbor command.

Note

You should enter this command under the guidance of Cisco technical support staff only.

- **exit**—Exits from the current command mode.
- inherit peer-session *session-name*—Configures a peer to inherit the configuration from another peer-session template. To remove an inherit statement from a peer-session template, use the **no** form of this command.
- no—Negates a command or sets its defaults.
- transport connection-mode passive—Allows a passive connection setup only. To remove the
  restriction, use the no form of this command.
- **remove-private-as**—Removes the private AS number from the outbound updates.
- shutdown—Administratively shuts down this neighbor.
- **timers** *keepalive-time*—Configures keepalive and hold timers in seconds. The range is from 0 to 3600. The default is 60.
- update-source {ethernet mod/port | loopback virtual-interface | port-channel number[.sub-interface]}—Specifies the source of the BGP session and updates. The range for virtual-interface is from 0 to 1023. The range for number is from 0 to 4096. The range for sub-interface is from 1 to 4093.

The Cisco NX-OS software allows BGP sessions to use any operational interface for TCP connections when you enter the **update-source** command in neighbor configuration mode. To restore the interface assignment to the closest interface, which is called the best local address, use the **no** form of this command.

This command requires the LAN Enterprise Services license.

**Examples** 

This example shows how to configure a single-hop eBGP peering session between two BGP peers that are reachable on the same network segment through a local loopback interfaces on each router:

#### **BGP Peer 1**

```
switch(config)# interface loopback 1
switch(config-if)# ip address 10.0.0.100 255.255.255
switch(config-if)# exit
switch(config)# router bgp 64497
switch(config-router)# neighbor 192.168.0.200 remote-as 64496
switch(config-router-neighbor)# update-source loopback 2
switch(config-router-neighbor)# disable-connected-check
switch(config-router-neighbor)#
```

#### **BGP Peer 2**

```
switch(config)# interface loopback 2
switch(config-if)# ip address 192.168.0.200 255.255.255
switch(config-if)# exit
switch(config)# router bgp 64496
switch(config-router)# neighbor 10.0.0.100 remote-as 64497
switch(config-router-neighbor)# update-source loopback 1
switch(config-router-neighbor)# disable-connected-check
switch(config-router-neighbor)#
```

This example shows how to source BGP TCP connections for the specified neighbor with the IP address of the loopback interface rather than the best local address:

```
switch(config)# router bgp 64496
switch(config-router)# neighbor 172.16.0.0 remote-as 64496
switch(config-router-neighbor)# update-source Loopback0
switch(config-router-neighbor)#
```

<b>Related Commands</b>	Command	Description
	feature bgp	Enables BGP on the router.
	route-map	Creates a route map.

### network

To configure an IP prefix to advertise, use the **network** command. To remove the IP prefix to advertise, use the **no** form of this command.

**network** *ip-addr* | *ip-prefix/length* **mask** *mask-num* [**route-map** *name*]

**no network** *ip-network ip-prefix/length* **mask** *mask-num* [**route-map** *name*]

Syntax Description	ip-addr	IP network address to advertise; use the following format: A.B.C.D.
	ip-prefix/length	IP prefix and the length of the IP prefix. Use the following format: A.B.C.D/length.
	mask mask-num	Configures the mask of the IP prefix to advertise in dotted 4-octet format.
	route-map name	(Optional) Specifies the name of the route map to modify attributes.
Command Default	None	
Command Modes	Neighbor address fami	ly configuration mode
	Router bgp configurati	on mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

### nexthop route-map

To specify that Border Gateway Protocol (BGP) routes are resolved using only the next hops that have routes that match specific characteristics, use the **nexthop route-map** command. To remove the route map, use the **no** form of this command.

nexthop route-map name

no nexthop route-map name

Syntax Description	name	Route map name. The name can be any alphanumeric string up to 63 characters.
Command Default	None	
Command Modes	Address family cor	figuration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	BGP next-hop filter Information Base (l	<b>Dute-map</b> command to configure route policy filtering for next hops. ring allows you to specify that when a next-hop address is checked with the Routing RIB), the underlying route for that next-hop address is passed through the route map.
	If the route map rejects the route, the next-hop address is treated as unreachable. BGP marks all next hops that are rejected by the route policy as invalid and does not calculate the best path for the routes that use the invalid next-hop address.	
	-	uires an LAN Enterprise Services license.
Examples	This example show	s how to configure a route map to filter the next-hop address:
	<pre>switch(config-rou switch(config-rou switch(config)#ig switch(config)# g switch(config)# g switch(config-rou</pre>	<pre>bute-map CHECK-BGP25 deny 10 hte-map)# match ip address prefix-list FILTER25 hte-map)# match source-protocol ospf-o1 hte-map)# exit b prefix-list FILTER25 seq 5 permit 0.0.0.0/0 le 25 couter bgp 1.0 hter)# address-family ipv4 unicast hter-af)# nexthop route-map CHECK-BGP25</pre>

#### Related Commands

	route-map	Defines the conditions for redistributing routes from one routing protocol into another.

### next-hop-self

To set the IP address of the router as the next hop address, use the **next-hop-self** command. To revert to the default configuration, use the **no** form of this command.

next-hop-self

no next-hop-self

Syntax Description	This command has	no arguments o	or keywords.
--------------------	------------------	----------------	--------------

Command Default None

**Command Modes** BGP neighbor address-family configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** This command requires a LAN Enterprise Services license.

**Examples** This example shows how to configure the IP address of a router as the next-hop address:

switch# configure terminal switch(config)# router bgp 102 switch(config-router)# neighbor 192.168.1.3 remote-as 64497 switch(config-router-neighbor)# address-family ipv4 unicast switch(config-router-neighbor-af)# next-hop-self switch(config-router-neighbor-af)#

<b>Related Commands</b>	Command	Description
	address-family (BGP neighbor)	Enters the BGP neighbor address-family configuration mode.
	feature bgp	Enables BGP.
	show ip bgp	Displays BGP configuration information.

### nexthop trigger-delay

To specify a Border Gateway Protocol (BGP) delay for triggering next-hop calculations, use the **nexthop trigger-delay** command. To set the trigger delay to the default value, use the **no** form of this command.

**nexthop trigger-delay** {**critical** *delay* | **non-critical** *delay*}

**no nexthop trigger-delay** {**critical** *delay* | **non-critical** *delay*}

Syntax Description	critical delay	Specifies the critical next-hop trigger delay, in milliseconds. The range is from 0 to 4294967295. The default is 3000.
	non-critical delay	Specifies the noncritical next-hop trigger delay, in milliseconds. The range is from 0 to 4294967295. The default is 10000.
Command Default	Critical delay: 3000 n Noncritical delay: 10	
Command Modes	Address family config	guration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	events. The <b>non-critical</b> dela delay value. The delay should be si	<b>ger-delay</b> command to modify when BGP processes next-hop address tracking by value must always be set to a value that is at least equal or greater to the <b>critical</b> lightly higher than the time it takes for the Interior Gateway Protocol (IGP) to settle
	•	er some event (IGP convergence time). es a LAN Enterprise Services license.

# **P** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with P.

## password (BGP)

To configure Border Gateway Protocol (BGP) to use MD5 authentication, use the **password** command. To disable this function, use the **no** from of this command.

password [auth-key string | string]

**no password** [auth-key string | string]

Syntax Description		
	auth-key	(Optional) MD5 authentication key. You can enter an unencrypted (cleartext) key, or one of these values followed by a space and the MD5 authentication key:
		• 0—Specifies an unencrypted (cleartext) key
		• 3—Specifies a 3-DES encrypted key
		• 7—Specifies a Cisco Type 7 encrypted key
		The key can be from 1 to 16 characters.
	string	(Optional) Neighbor password.

Related Commands	Command	Description
	show ip bgp	Displays information about BGP routes.

# **R** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with R.

### redistribute (BGP)

To inject routes from one routing domain into the Border Gateway Protocol (BGP), use the **redistribute** command. To remove the **redistribute** command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the **no** form of this command.

**redistribute** {direct | eigrp instance-tag | ospf instance-tag | rip instance-tag | static } [route-map map-name]

**no redistribute** {{**direct** | **eigrp** *instance-tag* | **ospf** *instance-tag* | **rip** *instance-tag* | **static**} [**route-map** *map-name*]

Syntax Description	direct	Distributes routes that are directly connected on an interface.	
oyntax bescription		Specifies the name of an EIGRP instance. The <i>instance-tag</i> can be	
	eigrp instance-tag	any case-sensitive, alphanumeric string up to 20 characters.	
	ospf instance-tag	Distributes routes from the OSPF protocol. This protocol is supported in the IPv4 address family. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.	
	rip instance-tag	Distributes routes from the RIP protocol. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.	
	static	Redistributes IP static routes.	
	route-map map-name	(Optional) Specifies the identifier of a configured route map. Use a route map to filter which routes are redistributed into EIGRP.	
Command Default	Disabled		
Command Modes	Address family configuration mode		
	Router configuration mode		
	VRF configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>redistribute</b> command to import routes from other routing protocols into BGP. You should always use a route map to filter these routes to ensure that BGP redistributes only the routes that you intend to redistribute.		
	You must configure a default metric to redistribute routes from another protocol into BGP. You can configure the default metric with the <b>default-metric</b> command or with the route map configured with the <b>redistribute</b> command.		
	This command requires the LAN Enterprise Services license.		

Examples	This example shows how to redistribute BGP routes into an EIGRP autonomous system:
	<pre>switch(config)# router bgp 64496 switch(config-router) address-family ipv4 unicast switch(config-router-af)# redistribute eigrp 100</pre>

<b>Related Commands</b>	Command	Description
	default-metric (BGP)	Sets the default metrics for routes redistributed into BGP.

### remote-as

To specify the autonomous system (AS) number for a neighbor, use the **remote-as** command. To remove an AS number, use the **no** form of this command.

remote-as number

no remote-as number

Syntax Description	number	AS number. The format is x for a two-byte value or x.x for a four-byte value. The range is from 1 to 65535.
Command Default	None	
Command Modes	Neighbor configur	ation mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command req	uires the LAN Enterprise Services license.
Examples	switch(config)# switch(config-ro	vs how to configure the neighbor AS number: router bgp 64496 uter)# neighbor 10.0.0.100 uter-neighbor)# remote-as 64497
Related Commands	Command	Description
	feature bgp	Enables BGP on the router.
	neighbor	Configures BGP peers.

# restart (BGP)

To restart a Border Gateway Protocol (BGP) autonomous system and remove all associated neighbors, use the **restart** command.

restart bgp as-num[.as-num]

along; valid values are from 0 to 65535.         Command Default         None         EXEC configuration mode         Command Modes         EXEC configuration mode         Command History         Release       Modification         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       This command requires the LAN Enterprise Services license. ### route-map

To create a route map, enter the route-map configuration mode, or define the conditions for redistributing routes from one routing protocol into another, use the **route-map** command. To delete an entry, use the **no** form of this command.

route-map map-tag [deny | permit] [sequence-number]

**no route-map** *map-tag* [**permit** | **deny**] [*sequence-number*]

Syntax Description	map-tag	Route map name.	
-	deny	(Optional) Specifies that the route or packet is not distributed if the match	
		criteria are met for the route map.	
	permit	(Optional) Specifies that the route or packet is distributed if the match criteria for this route are met.	
	sequence-number	(Optional) Number that indicates the position a new route map has in the list of route maps already configured with the same name. The <b>no</b> form of this command deletes the position of the route map. Range: 0 to 65535.	
Command Default	The <b>permit</b> keyword	l is the default.	
Command Modes	Global configuration	mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	If you make changes to a route map that is used by a client, you must exit the route-map configuration submode before the changes take effect in the client. The route-map changes are not propagated to its clients until you exit from the route-map configuration submode or 60 seconds expire since entering the submode.		
	Once you enter the route-map configuration mode, the following keywords are available:		
	• <b>continue</b> <i>sequence-number</i> —Continues on a different entry within the route-map. Range: 0 to 65535		
	• <b>description</b> <i>description</i> —Provides a description of the route map. The description can be any alphanumeric string up to 90 characters.		
	• <b>exit</b> —Exits from the current command mode.		
	• <b>match</b> —Matches the values from the specified routing table. The following keywords and arguments are available:		
		<i>ne</i> [ <i>name</i> ]—Specifies the autonomous system (AS) path access list to match. The any alphanumeric string up to 63 characters. See the <b>match as-path</b> command for information.	

- community name [name | exact-match]—Specifies the BGP community list name to match.
   See the match community command for additional information.
- ip—Configures the IPv4 features. The follow keywords and arguments are available:

address {access-list-name [access-list-name] | prefix-list ipv4-list-name [ipv4-list-name]}—Specifies the address of the route or packet to match. See the match ip address command for additional information.

**multicast** {group *address/length* | **rp** *address/length*}—Specifies the multicast attributes to match. See the **match ip multicast** command for additional information.

**next-hop**—Matches the next-hop address of the route. See the **match ip next-hop** command for additional information.

**route-source**—Matches the advertising source address of the route. See the **match ip route-source** command for additional information.

- **no**—Negates a command or set its defaults.
- **set**—Sets the values in the destination routing protocol. The **set** commands specify the routing actions to perform if the criteria enforced by the **match** commands are met. You might want to policy route packets some way other than the obvious shortest path. The following keywords and arguments are available:
  - **as-path**—Prepends a string for a BGP AS-path attribute. See the **set as-path** command for additional information.
  - comm-list—Sets the BGP community list (for deletion). See the set comm-list command for additional information.
  - **community**—Sets the BGP community attribute. See the **set community** command for additional information.
  - **dampening**—Sets the BGP route flap dampening parameters. See the **set dampening** command for additional information.
  - **forwarding-address**—Sets the forwarding address. See the **set forwarding-address** command for additional information.
  - **level**—Specifies where to import the route. See the **set level** command for additional information.
  - local-preference—Specifies the BGP local preference path attribute. See the set local-preference command for additional information.
  - **metric**—Sets the metric for the destination routing protocol. See the **set metric** command for additional information.
  - metric-type—Sets the type of metric for the destination routing protocol. See the set metric-type command for additional information.
  - origin—Specifies the BGP origin code. See the set origin command for additional information.
  - tag—Specifies the tag value for the destination routing protocol. See the set tag command for additional information.
  - weight—Sets the BGP weight for the routing table. See the set weight command for additional information.

Use route maps to redistribute routes.

L

#### Redistribution

The **redistribute** router configuration command uses the *map-tag* name to reference the route map. Multiple route maps may share the same map tag name.

Use the **route-map** global configuration command and the **match** and **set** route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the match criteria—the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **match** route-map configuration command has multiple formats. The **match** commands can be given in any order, and all **match** commands must pass to cause the route to be redistributed according to the set actions given with the **set** commands. The **no** forms of the **match** commands remove the specified match criteria.

Use route maps when you want detailed control over how routes are redistributed between routing processes. The destination routing protocol is the one you specify with the **router** global configuration command. The source routing protocol is the one you specify with the **redistribute** router configuration command. See the "Examples" section for an illustration of how route maps are configured.

When you are passing routes through a route map, a route map can have several parts. Any route that does not match at least one **match** clause that relates to a **route-map** command is ignored; that is, the route is not advertised for outbound route maps and is not accepted for inbound route maps. If you want to modify some particular data, you must configure a second route map section with an explicit match specified.

#### **Examples**

This example shows how to redistribute Routing Information Protocol (RIP) routes with a hop count equal to 1 into Open Shortest Path First (OSPF). These routes are redistributed into OSPF as external link-state advertisements (LSAs) with a metric type of Type 1, and a tag equal to 1.

```
switch(config)# router ospf 109
switch(config-route-map)# redistribute rip route-map rip-to-ospf
switch(config-route-map)# route-map rip-to-ospf permit
switch(config-route-map)# set metric 5
switch(config-route-map)# set metric-type type1
switch(config-route-map)# set tag 1
```

This example shows how to set the autonomous system path to match BGP autonomous system path access list 20:

```
switch(config)# route-map IGP2BGP
switch(config-route-map)# match as-path 20
```

This example shows how to configure that the routes matching community list 1 have the weight set to 100. Any route that has community 109 has the weight set to 100.

```
switch(config)# ip community-list 1 permit 109
switch(config)# route-map set_weight
switch(config-route-map)# match community 1
switch(config-route-map)# set weight 100
```

This example shows how to configure that the routes matching community list 1 have the weight set to 200. Any route that has community 109 alone has the weight set to 200.

```
switch(config)# ip community-list 1 permit 109
switch(config)# route-map set_weight
switch(config-route-map)# match community 1 exact
```

switch(config-route-map)# set weight 200

This example shows how to configure that the routes match community list LIST\_NAME have the weight set to 100. Any route that has community 101 alone has the weight set to 100.

```
switch(config)# ip community-list 1 permit 101
switch(config)# route-map set_weight
switch(config-route-map)# match community LIST_NAME
switch(config-route-map)# set weight 100
```

#### **Related Commands**

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map (IP)	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

### route-reflector-client (BGP)

To configure the router as a BGP route reflector and configure the specified neighbor as its client, use the **route-reflector-client** command. To indicate that the neighbor is not a client, use the **no** form of this command.

route-reflector-client

no route-reflector-client

Syntax Description	This command has no arguments or	keywords.
--------------------	----------------------------------	-----------

**Command Default** There is no route reflector in the autonomous system.

**Command Modes** BGP Neighbor address-family configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

# **Usage Guidelines** Use the **route-reflector-client** command to configure the local router as the route reflector and the specified neighbor as one of its clients. All the neighbors configured with this command will be members of the client group and the remaining BGP peers will be members of the nonclient group for the local route reflector.

**Examples** This example shows how to configure the local router as a route reflector to the neighbor at 192.168.0.1:

switch(config)# router bgp 102
switch(config-router)# neighbor 192.168.0.1 remote-as 201
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# route-reflector-client
switch(config-router-neighbor-af)#

<b>Related Commands</b>	Command	Description
	address-family (BGP)	Enters the router in address family configuration mode for configuring BGP
		routing sessions.
	neighbor	Configures a BGP neighbor.
	show ip bgp	Displays entries in the BGP routing table.

## router bgp

To assign an autonomous system (AS) number to a router and enter the router BGP configuration mode, use the **router bgp** command. To remove an AS number assignment, use the **no** form of this command.

router bgp as-num[.as-num]

**no router bgp** *as-num*[.*as-num*]

Syntax Description	as-num	Number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along; valid values are from 1 to 65535.	
	.as-num	(Optional) Number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along; valid values are from 0 to 65535.	
Command Default	No BGP routing pro	cess is enabled by default.	
Command Modes	<ul> <li>Address-family configuration mode</li> <li>Neighbor address-family configuration mode</li> <li>Router BGP configuration mode</li> </ul>		
Usage Guidelines	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
	The <i>as-num</i> is the number for the local BGP speaker and allows you to create a unique identifier for the BGP process on the router.		
	Once you enter the router BGP configuration mode, the following parameters are available:		
	• <b>address-family</b> —Configures an address-family (router, neighbor, VRF). See the <b>address-family</b> ( <b>BGP</b> ) command for information.		
	• <b>bestpath</b> —Changes the default best path selection algorithm. See the <b>bestpath</b> command for information.		
	• <b>cluster-id</b> { <i>cluster-ip-addr</i> }—Configures the Route Reflector Cluster-ID (router, VRF) Range: 1 to 4294967295. You can enter the cluster identification as a 32-bit quantity or as an IP address. To remove the cluster ID, use the <b>no</b> form of this command.		
	confederation p	{ <b>identifier</b> <i>as-num</i> [ <i>.as-num</i> ]   <b>peer</b> <i>as-num</i> [ <i>.as-num</i> ]}—Configures the AS arameters as the routing domain confederation AS or the peer AS in the BGP To remove the confederation identifier, use the <b>no</b> form of this command.	
	The confederat	ion command is used to configure a single autonomous system number to identify a	

The **confederation** command is used to configure a single autonomous system number to identify a group of smaller autonomous systems as a single confederation. You can use a confederation to divide a large single autonomous system into multiple subautonomous systems and then group them into a single confederation. The subautonomous systems within the confederation exchange routing information. External peers interact with the confederation as if it were a single autonomous system.

Each subautonomous system is fully meshed within itself and has a few connections to other autonomous systems within the confederation. Next hop, Multi Exit Discriminator (MED), and local preference information is preserved throughout the confederation, allowing you to retain a single Interior Gateway Protocol (IGP) for all the autonomous systems.

- **enforce-first-as**—Forces BGP to compare an external peer's configured AS number with the first AS in the AS-PATH of the routes received from the peer. In case of a mismatch of AS numbers, the peer is sent an error code update notification message. To disable this feature, use the **no** form of this command.
- exit—Exits from the current command mode.
- **fast-external-fallover**—Configures a Border Gateway Protocol (BGP) routing process to immediately reset external BGP peering sessions if the link used to reach these peers goes down. To disable BGP fast external fallover, use the **no** form of this command.

The **fast-external-fallover** command is used to disable or enable fast external fallover for BGP peering sessions with directly connected external peers. The session is immediately reset if the link goes down. Only directly connected peering sessions are supported.

If BGP fast external fallover is disabled, the BGP routing process waits until the default hold timer expires (three keepalives) to reset the peering session.

• **log-neighbor-changes**—Enables logging of the BGP neighbor resets. To disable the logging of changes in BGP neighbor adjacencies, use the **no** form of this command. The **log-neighbor-changes** command enables logging of BGP neighbor status changes (up or down) and resets for troubleshooting network connectivity problems and measuring network stability. Unexpected neighbor resets might indicate high error rates or high packet loss in the network and should be investigated.

Using the **log-neighbor-changes** command to enable status change message logging does not cause a substantial performance impact, unlike, for example, enabling per BGP update debugging. If the UNIX syslog facility is enabled, messages are sent to the UNIX host that is running the syslog daemon so that the messages can be stored and archived. If the UNIX syslog facility is not enabled, the status change messages are retained in the internal buffer of the router and are not stored to the disk. You can set the size of this buffer, which is dependent upon the available RAM, using the **logging buffered** command.

The neighbor status change messages are not tracked if the **bgp log-neighbor-changes** command is not enabled, except for the reset reason, which is always available as output of the **show ip bgp neighbors** command.

The **eigrp log-neighbor-changes** command enables logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, but messages for BGP neighbors are logged only if they are specifically enabled with the **bgp log-neighbor-changes** command.

Use the **show logging command** to display the log for the BGP neighbor changes.

- **neighbor**—Configures a BGP neighbor (router, VRF). See the **neighbor** command for additional information.
- **no**—Negates a command or sets its defaults.
- router-id—Specifies the IP address to use as router-id (router, VRF).
- **template**—Enters the template command mode. See the **neighbor** command for additional information.
- timers—Configures the BGP-related timers (router, VRF).
  - **bestpath-limit** *interval*—Configures the timeout for the first best path after a restart, in seconds. Range: 1 to 3600. Default: 300.

- **bgp** *interval*—Configures the different BGP keepalive and holdtimes in seconds. Range: 0 to 3600. Default: 60.
- **prefix-peer-timeout** *interval*—Configures how long a prefix peer is maintained in seconds. Range: 0 to 1200. Default: 300:
- **vrf**—Configures the virtual router context:
  - *vrf-name*—Specifies the VRF name.
  - management—Specifies the configurable VRF name.

This command requires the LAN Enterprise Services license.

Examples	This example shows how to configure a BGP process for autonomous system 120: switch(config)# router bgp 120 switch(config-router)#
	This example shows how to log neighbor changes for BGP in router configuration mode: switch(config# bgp router 40000 switch(config-router)# log-neighbor-changes
	This example shows how to disable the BGP fast external fallover feature. If the link through which this session is carried flaps, the connection is not reset.
	switch(config# <b>bgp router 64496</b> switch(config-router)# <b>no fast-external-fallover</b>
	This example shows how all incoming updates from eBGP peers are examined to ensure that the first autonomous system number in the AS_PATH is the local AS number of the transmitting peer. The updates from the 10.100.0.1 peer are discarded if the first AS number is not 65001.
	<pre>switch(config# router bgp 64496 switch(config-router)# bgp enforce-first-as switch(config-router)# address-family ipv4 switch(config-router-af)# neighbor 10.100.0.1 remote-as 64496 switch(config-router-af)#</pre>

Related Commands	Command	Description
	show ip bgp	Displays entries in the BGP table.

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **S** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with S.

# send-community

To send the Border Gateway Protocol (BGP) community attribute to a peer, use the **send-community** command. To revert to the defaults, use the **no** form of this command.

send-community [extended]

no send-community [extended]

Syntax Description	extended	(Optional) Specifies the BGP extended community.		
Command Default	No community attributes are sent to the peer.			
Command Modes	BGP neighbor address-family configuration mode			
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Before you use this command, you must configure BGP communities using the <b>set community</b> command. This command requires the LAN Enterprise Services license.			
Examples	This example shows 192.168.1.3:	how to configure the router to send the community attribute to the neighbor		
	<pre>switch# configure terminal switch(config)# router bgp 102 switch(config-router)# neighbor 192.168.1.3 remote-as 64497 switch(config-router-neighbor)# address-family ipv4 multicast switch(config-router-neighbor-af)# send-community switch(config-router-neighbor-af)#</pre>			
Related Commands	Command	Description		
	set community	Defines the BGP community attributes.		
	show ip bgp	Displays the BGP configuration information.		

# set as-path

To modify an autonomous system path (as-path) for BGP routes, use the **set as-path** command. To not modify the autonomous system (AS) path, use the **no** form of this command.

set as-path {tag | {prepend as-num[...as-num] | last-as num}}

**no as-path** {**tag** | {**prepend** *as-num*[...*as-num*] | **last-as** *num*}}

Syntax Description	tag	Converts the tag of a route into an autonomous system path. Applies only when redistributing routes into Border Gateway Protocol (BGP).	
	prepend as-num	Appends the specified AS number to the autonomous system path of the route that is matched by the route map. Applies to both inbound and outbound BGP route maps. Range: 1 to 65535. You can configure more than on AS number.	
	last-as num	Prepends the last AS numbers to the as-path. Range: 1 to 10.	
Command Default	Autonomous system p	bath is not modified.	
Command Modes	Route-map configurat	ion mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Once you enter route-map configuration mode, you can enter the <b>set</b> command. The only global BGP metric available to influence the best path selection is the autonomous system path length. By varying the length of the autonomous system path, a BGP speaker can influence the best-path selection by a peer further away.		
	By allowing you to convert the tag into an autonomous system path, the <b>set as-path tag</b> variation of this command modifies the autonomous system length. The <b>set as-path prepend</b> variation allows you to prepend an arbitrary autonomous system path string to BGP routes. Usually, the local autonomous system number is prepended multiple times, increasing the autonomous system path length.		
Examples	This example shows how to convert the tag of a redistributed route into an autonomous system path: switch(config)# route-map test1 switch(config-route-map)# set as-path tag		
	This example shows how to prepend 100 to all the routes advertised to 10.108.1.1:		
	switch(config)# <b>rou</b> switch(config-route		

switch(config)# router bgp 64496

switch(config-router)# neighbor 10.108.1.1 remote-as 64497
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# route-map set-as-path test1 out

#### **Related Commands**

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map (IP)	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

# set comm-list delete

To remove communities from the community attribute of an inbound or outbound update, use the **set comm-list delete** command. To remove a previous **set comm-list delete** command, use the **no** form of this command.

set comm-list community-list-name delete

no set comm-list

Syntax Description	community-list-name	Standard or expanded community list name. The name is any alphanumeric string up to 63 characters.		
Command Default	No communities are removed.			
Command Modes	Route-map configuratio	n mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	This <b>set</b> route-map configuration command removes communities from the community attribute of an inbound or outbound update using a route map to filter and determine the communities to be deleted. Depending upon whether the route map is applied to the inbound or outbound update for a neighbor, each community that passes the route map <b>permit</b> clause and matches the given community list is removed from the community attribute being received from or sent to the Border Gateway Protocol (BGP) neighbor.			
	Each entry of a standard community list should list only one community when used with the <b>set comm-list delete</b> command. For example, in order to be able to delete communities 10:10 and 10:20, you must use the following format to create the entries:			
	<pre>switch(config)# ip community-list 500 permit 10:10 switch(config)# ip community-list 500 permit 10:20</pre>			
	The following format for a community list entry, while acceptable otherwise, does not work with the <b>set comm-list delete</b> command:			
	<pre>switch(config)# ip community-list 500 permit 10:10 10:20</pre>			
	When both the <b>set community</b> <i>community-number</i> and <b>set comm-list delete</b> commands are configured in the same sequence of a route map attribute, the deletion operation ( <b>set comm-list delete</b> ) is performed before the set operation ( <b>set community</b> <i>community-number</i> ).			
Examples	This example shows how to remove communities from the community attribute of an inbound or outbound update:			

switch(config)# route-map test1
switch(config-route-map)# match as-path 1
switch(config-route-map)# set comm-list list1 delete

Related Commands	Command	Description
	match as-path	Matches a BGP autonomous system path access list.
	match community	Matches a BGP community.
	match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
	match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
	match metric	Redistributes routes with the metric specified.
	match tag	Redistributes routes in the routing table that match the specified tags.
	route-map (IP)	Defines the conditions for redistributing routes from one routing protocol into another.
	set as-path	Modifies an autonomous system path for BGP routes.
	set community	Sets the BGP communities attribute.
	set level	Indicates where to import routes.
	set local-preference	Specifies a preference value for the autonomous system path.
	set metric	Sets the metric value for a routing protocol.
	set metric-type	Sets the metric type for the destination routing protocol.
	set next-hop	Specifies the address of the next hop.
	set tag	Sets a tag value of the destination routing protocol.
	set weight	Specifies the BGP weight for the routing table.

#### set community

To set the Border Gateway Protocol (BGP) communities attribute, use the **set community** command. To delete the entry, use the **no** form of this command.

set community {none | {aa:nn [...aa:nn] | additive | local-as | no-advertise | no-export}}

**no set community** {**none** | {*aa:nn* | **additive** | **local-as** | **no-advertise** | **no-export**}}

nono	Specifies the no community attribute
none	Specifies the no community attribute.
	You cannot configure any other keyword if you configure the <b>none</b> keyword.
aa:nn	Autonomous system (AS) number and network number entered in the 4-byte new community format. This value is configured with two 2-byte numbers separated by a colon. A number from 1 to 65535 can be entered as each 2-byte number. A single community can be entered or multiple communities can be entered, each separated by a space.
	You can configure one or more AS numbers.
	You can configure one or more keywords.
additive	Adds to existing community.
	You can configure one or more keywords.
local-as	Specifies the local-as community (well-known community). Routes with community are advertised to only peers that are part of the local autonomous system or to only peers within a subautonomous system of a confederation. These routes are not advertised to external peers or to other subautonomous systems within a confederation.
	You can configure one or more keywords.
no-advertise	Specifies the no-advertise community (well-known community). Routes with this community are not advertised to any peer (internal or external).
	You can configure one or more keywords.
no-export	Specifies the no-export community (well-known community). Routes with this community are advertised to only peers in the same autonomous system or to only other subautonomous systems within a confederation. These routes are not advertised to external peers.
	You can configure one or more keywords.
	additive local-as no-advertise

**Command Default** No BGP communities attributes exist.

**Command Modes** Route-map configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

#### **Usage Guidelines** You must have a match clause (even if it points to a "permit everything" list) if you want to set tags. Use the **route-map** global configuration command and the **match** and **set** route map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each route-map command has a list of match and set commands associated with it. The match commands specify the match criteria—the conditions under which redistribution is allowed for the current route-map command. The set commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the **match** commands are met. The **no route-map** command deletes the route map. The set route map configuration commands specify the redistribution set actions to be performed when all of the match criteria of a route map are met. When all match criteria are met, all set actions are performed. **Examples** This example shows how to configure the routes that pass the autonomous system path access list 1 to have the community set to 109:02 and 33:40. Routes that pass the autonomous system path access list 2 have the community set to no-export (these routes are not advertised to any external BGP [eBGP] peers). switch(config) # route-map test1 10 permit switch(config-route-map)# match as-path 1 switch(config-route-map)# set community 109:02 33:40 switch(config-route-map)# exit switch(config)# route-map test1 20 permit switch(config-route-map)# match as-path 2 switch(config-route-map)# set community no-export This example shows how to configure the routes that pass the autonomous system path access list 1 to have the community set to 109:30. Routes that pass the autonomous system path access list 2 have the community set to local-as (the router does not advertise this route to peers outside the local autonomous system. switch(config)# route-map test1 10 permit switch(config-route-map)# match as-path 1 switch(config-route-map)# set community 109:30 additive switch(config-route-map)# exit switch(config)# route-map test1 20 permit switch(config-route-map)# match as-path 2 switch(config-route-map)# set community local-as

<b>Related Commands</b>	Command	Description
	ip community-list	Creates a community list for BGP and control access to it.
	match community	Matches a BGP community.
	route-map (IP)	Defines the conditions for redistributing routes from one routing protocol into another.
	set comm-list delete	Removes communities from the community attribute of an inbound or outbound update.
	show ip bgp community	Displays routes that belong to specified BGP communities.

### set dampening

To set the Border Gateway Protocol (BGP) route dampening factors, use the **set dampening** command. To disable this function, use the **no** form of this command.

set dampening half-life reuse suppress max-suppress-time

no set dampening

Syntax Description		
	half-life	Time (in minutes) after which a penalty is decreased. Once the route has been assigned a penalty, the penalty is decreased by half after the half life period (which is 15 minutes by default). The process of reducing the penalty occurs every 5 seconds. The range is from 1 to 45, and the default is 15.
	reuse	Route that is unsuppressed if the penalty for a flapping route decreases enough to fall below this value. The process of unsuppressing routes occurs at 10-second increments. Range: 1 to 20000. Default: 750.
	suppress	Route that is suppressed when its penalty exceeds this limit. The range is from 1 to 20000, and the default is 2000.
	max-suppress-time	Maximum time (in minutes) that a route can be suppressed. The range is from 1 to 255, and the default is four times the <i>half-life</i> value. If the default <i>half-life</i> value is used, the maximum suppress time defaults to 60 minutes.
Command Default	Disabled	
Command Modes	Route-map configurati	on mode

Related (	Commands
-----------	----------

Command	Description
match as-path	Matches a BGP autonomous system path access list.
match community	Matches a BGP community.
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.
match metric	Redistributes routes with the metric specified.
match tag	Redistributes routes in the routing table that match the specified tags.
route-map (IP)	Defines the conditions for redistributing routes from one routing protocol into another.
set as-path	Modifies an autonomous system path for BGP routes.
set community	Sets the BGP communities attribute.
set level	Indicates where to import routes.
set local-preference	Specifies a preference value for the autonomous system path.
set metric	Sets the metric value for a routing protocol.
set metric-type	Sets the metric type for the destination routing protocol.
set next-hop	Specifies the address of the next hop.
set tag	Sets a tag value of the destination routing protocol.
set weight	Specifies the BGP weight for the routing table.

#### set etxcommunity

To set the Border Gateway Protocol (BGP) extended communities attribute, use the **set extcommunity** command. To delete the entry, use the **no** form of this command.

set extcommunity {none | {generic {transitive | nontransitive} aa4:nn [...aa4:nn] } | additive}

**no set extcommunity** {**none** | {**generic** {**transitive** | **nontransitive**} *aa4:nn* [...*aa4:nn*] } | **additive**}

Syntax Description	none	Specifies the no community attribute.
	generic	Specifies the generic specific extended community type.
	transitive	Configures BGP to propagate the extended community attributes to other autonomous systems.
	nontransitive	Configures BGP to propagate the extended community attributes to other autonomous systems.
	aa4 <b>:</b> nn	Autonomous system number and network number. This value is configured with a 4-byte AS number and a 2-byte network number separated by a colon. The 4-byte AS number range is from 1 to 4294967295 in plaintext notation, or from 1.0 to 56636.65535 in AS.dot notation. You can enter a single community or multiple communities, each separated by a space.
	additive	Adds to existing community.
Command Default	No BGP communiti	es attributes exist.
Command Modes	Route-map configur	ation mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>set extcom</b> route.	nunity command in a route map to set the extended community attribute in a BGP
	You must have a ma to use <b>set</b> command	tch clause in a route map (even if it points to a "permit everything" list) if you want s.
		specify the set actions to be performed when all of the match criteria of a route map natch criteria are met, all set actions are performed.
Examples	This example shows	s how to configure a route map that sets the extended community to 1.5:
	switch(config-rout	oute-map test1 10 permit te-map)# match as-path 1 te-map)# set extcommunity generic transitive 1.5

switch(config-route-map)# exit

#### **Related Commands**

Command	Description	
<b>ip extcommunity-list</b> Creates a community list for BGP and controls access to it.		
match extcommunity Matches an extended community in a route map.		
<b>route-map</b> Defines the conditions for redistributing routes from one routing pro- into another.		
send-community	Configures BGP to propagate community attributes to BGP peers.	

### set extcomm-list delete

To remove extended communities from the extended community attribute of an inbound or outbound Border Gateway Protocol (BGP) update, use the **set extcomm-list delete** command. To remove a previous **set extcomm-list delete** command, use the **no** form of this command.

set extcomm-list community-list-name delete

no set extcomm-list

community-list-name	Standard or expanded extended community list name. The name is any alphanumeric string up to 63 characters.
No communities are ren	noved.
Route-map configuratio	n mode
Release	Modification
5.2(1)N1(1)	This command was introduced.

#### Related Commands

ommands	Command	Description	
	match as-path	Matches a BGP autonomous system path access list.	•
	match extcommunity	Matches a BGP extended community.	
	set extcommunity	Sets the BGP extended communities attribute.	-
	show route-map	Displays information about a route map.	

### set local-preference

To specify a preference value for the autonomous system path, use the **set local-preference** command. To delete an entry, use the **no** form of this command.

**set local-preference** *number-value* 

no set local-preference number-value

Syntax Description	number-value	Preference value. Range: 0 to 4294967295. Default: 100.
Command Default	Preference value of	100 by default.
Command Modes	Route-map configu	ration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	The preference is se	ent only to all routers in the local autonomous system.
	You must have a ma	atch clause (even if it points to a "permit everything" list) if you want to set tags.
	commands to define route-map comman specify the match c route-map comman	global configuration command and the <b>match</b> and <b>set</b> route-map configuration the conditions for redistributing routes from one routing protocol into another. Each ad has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands riteria—the conditions under which redistribution is allowed for the current ad. The <b>set</b> commands specify the set actions—the particular redistribution actions teria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes
		configuration commands specify the redistribution set actions to be performed when a of a route map are met. When all match criteria are met, all set actions are
	You can change the	default preference value with the <b>bgp default local-preference</b> command.
Examples	<pre>switch# configure switch(config)# r switch(config-rou switch(config-rou</pre>	oute-map test1 ter)# route-map map-preference te-map)# match as-path 1 te-map)# set local-preference 100

#### Related Commands

ıds	Command	Description	
	match as-path	Matches a BGP autonomous system path access list.	
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.	
	show route-map	Displays information about a route map.	

#### set metric

To set the metric value for a routing protocol, use the **set metric** command. To return to the default metric value, use the **no** form of this command.

set metric [+ | -] bandwidth-metric

set metric bandwidth-metric [delay-metric reliability-metric load-metric mtu]

no set metric

Syntax Description	+	(Optional) Adds to the existing delay metric value.		
	-	(Optional) Subtracts from the existing delay metric value.		
	bandwidth-metric	<i>metric</i> Interior Gateway Routing Protocol (IGRP) bandwith metric, in Kb/s. The range is from 0 to 4294967295.		
	delay-metric	(Optional) Interior Gateway Routing Protocol (IGRP) delay metric, in 10 microsecond units. The range is from 1 to 4294967295.		
	reliability-metric	<i>ty-metric</i> (Optional) IGRP reliability metric. The range is from 0 to 255.		
	load-metric	(Optional) IGRP load metric. The range is from 1 to 255.		
	mtu	(Optional) IGRP maximum transmission unit (MTU) of the path. The range is from 1 to 4294967295.		
Command Default	None			
Command Modes	Route-map configur	ration mode Modification		
Command History	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Use the set metric of	command to modify the IGRP metric values.		
Note	We recommend that you consult your Cisco technical support representative before changing the default value.			
	When you confiture the <i>reliability-metric</i> and the <i>load-metric</i> arguments, 255 means 100 percent reliability.			
	Use the + or - keywords to modify the existing delay metric value. You can modify only the delay metric with these keywords.			
	Use the <b>route-map</b> global configuration command and the <b>match</b> and <b>set</b> route-map configuration command to define the conditions for redistributing routes from one routing protocol into another. Each			

route-map command has a list of match and set commands associated with it. The match commands

specify the match criteria—the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **set** route-map configuration commands specify the redistribution set actions to be performed when all the match criteria of a route map are met. When all match criteria are met, all set actions are performed.

#### **Examples**

This example shows how to set the bandwith metric value for the routing protocol to 100:

```
switch# configure terminal
switch(config)# route-map set-metric
switch(config-route-map)# set metric 100
switch(config-route-map)#
```

This example shows how to increase the bandwith metric value for the routing protocol by 100:

```
switch# configure terminal
switch(config)# route-map set-metric
switch(config-route-map)# set metric +100
switch(config-route-map)#
```

<b>Related Commands</b>	Command	Description
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.
	show route-map	Displays information about a route map.

### set metric-type

To set the metric type for the destination routing protocol, use the **set metric-type** command. To return to the default, use the **no** form of this command.

set metric-type {internal | type-1 | type-2}

no set metric-type {internal | type-1 | type-2}

Syntax Description	internal	Specifies the Interior Gateway Protocol (IGP) metric as the multi-exit discriminator (MED) for BGP.	
	type-1	Specifies the Open Shortest Path First (OSPF) external Type 1 metric.	
	type-2	Specifies the OSPF external Type 2 metric.	
Command Default	This command is d	isabled by default.	
Command Modes	Route-map configu	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
	<ul> <li>route-map command has a list of match and set commands associated with it.  Note	This command is n	ot supported for redistributing routes into Border Gateway Protocol (BGP).	

#### **Related Commands**

Commands	Command	Description
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.
	show ip community-list	Displays information about a community list.
	show ip extcommunity-list	Displays information about an extended community list.
	show ip prefix-list	Displays information about IPv4 prefix lists.
	show route-map	Displays information about a route map.

### set origin

To set the Border Gateway Protocol (BGP) origin code, use the **set origin** command. To delete the entry, use the **no** form of this command.

set origin {egp as-num [:as-num] | igp | incomplete}

no set origin

Syntax Description	egp as-num	Specifies the autonomous system (AS) number for a remote exterior gateway protocol (EGP) system. You can specify the AS number as a 2-byte integer or a 4-byte integer in aa:nn format. Range is from 1 to 65535.		
	igp Specifies a local interior gateway protocol (IGP) system.			
	incomplete	Specifies an unknown heritage.		
Command Default	Default origin, base	ed on route in main IP routing table.		
Command Modes	Route-map configu	ration mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	You must have a match clause (even if it points to a "permit everything" list) if you want to set tags. Use the <b>route-map</b> global configuration command, and the <b>match</b> and <b>set</b> route-map configuration commands, to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.			
	-	configuration commands specify the redistribution set actions to be performed when teria of a route map are met. When all match criteria are met, all set actions are		
Examples	<pre>switch# configure switch(config)#  switch(config-rou </pre>	<pre>coute-map set_origin ate-map)# match as-path 10 ate-map)# set origin igp</pre>		

#### Related Commands

Command	Description
match as-path	Matches a BGP autonomous system path access list.
route-map	Defines the conditions for redistributing routes from one routing protocol into another.
show ip community-list	Displays information about a community list.
show ip extcommunity-list	Displays information about an extended community list.
show ip prefix-list	Displays information about IPv4 prefix lists.
show route-map	Displays information about a route map.

#### set tag

To set a tag value of the destination routing protocol, use the **set tag** command. To delete the entry, use the **no** form of this command.

set tag tag-value

no set tag tag-value

Syntax Description	tag-value	Name for the tag. The value is an integer from 0 to 4294967295.		
Command Default	If not specified, the default action is to <i>forward</i> the tag in the source routing protocol onto the new destination protocol.			
Command Modes	Route-map config	uration mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Use the <b>route-map</b> global configuration command and the <b>match</b> and <b>set</b> route-map configuration commands to define the conditions for redistributing routes from one routing protocol into another. Each <b>route-map</b> command has a list of <b>match</b> and <b>set</b> commands associated with it. The <b>match</b> commands specify the match criteria—the conditions under which redistribution is allowed for the current <b>route-map</b> command. The <b>set</b> commands specify the set actions—the particular redistribution actions to perform if the criteria enforced by the <b>match</b> commands are met. The <b>no route-map</b> command deletes the route map.			
	The <b>set</b> route-map configuration commands specify the redistribution set actions to be performed when all the match criteria of a route map are met. When all match criteria are met, all set actions are performed.			
Examples	This example shows how to set the tag value of the destination routing protocol to 5: <pre>switch(config)# route-map test switch(config-route-map)# set tag 5</pre>			
Related Commands	Command	Description		
	match tag	Redistributes routes in the routing table that match the specified tags.		
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.		

### set weight

To specify the Border Gateway Protocol (BGP) weight for the routing table, use the **set weight** command. To delete an entry, use the **no** form of this command.

set weight number

no set weight [number]

Syntax Description	number Weight value. Range: 0 to 65535.			
Command Default	The weight is not chan	nged by the specified route map.		
Command Modes	Route-map configuration mode			
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines		th is based on the first matched autonomous system path. Weights indicated when a path is matched override the weights assigned by global <b>neighbor</b> commands.		
Examples	This example shows how to set the BGP weight for the routes that match the autonomous system path access list to 200: <pre>switch# configure terminal switch(config)# route-map set-weight switch(config-route-map)# match as-path 10 switch(config-route-map)# set weight 200 switch(config-route-map)#</pre>			
Related Commands	Command	Description		
	match as-path	Matches a BGP autonomous system path access list.		
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.		
	show ip community-list	Displays information about a community list.		
	show ip extcommunity-list	Displays information about an extended community list.		
	show ip prefix-list	Displays information about IPv4 prefix lists.		
	show route-map	Displays information about a route map.		

### shutdown (BGP)

To shut down an instance of the Border Gateway Protocol (BGP), use the **shutdown** command. To disable this function, use the **no** form of this command.

shutdown

no shutdown

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

**Command Default** Enabled

**Command Modes** Router configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

Usage GuidelinesUse the shutdown command to disable an instance of BGP without removing the configuration.This command requires the LAN Enterprise Services license.

Examples This example shows how to disable BGP 64496: switch# configure terminal switch(config)# router bgp 64496 switch(config-router)# shutdown switch(config-router)#

<b>Related Commands</b>	Command	Description
	show bgp	Displays BGP routes.

#### soft-reconfiguration inbound (BGP)

To configure the switch software to start storing Border Gateway Protocol (BGP) peer updates, use the **soft-reconfiguration** command. To not store received updates, use the no form of this command.

soft-reconfiguration inbound

no soft-reconfiguration inbound

Syntax Description	This command ha	as no arguments	or keywords.
--------------------	-----------------	-----------------	--------------

- Command Default Disabled
- **Command Modes** Neighbor address-family configuration mode

route refresh capability.

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

# Usage GuidelinesEntering this command starts the storage of updates, which is required to do inbound soft<br/>reconfiguration.To use soft reconfiguration, or soft reset, without preconfiguration, both BGP peers must support the soft

**Examples** This example shows how to configure the soft reconfiguration on the neighbor at 192.168.0.1:

```
switch# configure terminal
switch(config)# router bgp 102
switch(config-router)# neighbor 192.168.0.1 remote-as 201
switch(config-router-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# soft-reconfiguration inbound
switch(config-router-neighbor-af)#
```

<b>Related Commands</b>	Command	Description
	address-family (BGP)	Enters the router in address family configuration mode for configuring BGP routing sessions.
	neighbor	Configures a BGP neighbor.
	show ip bgp neighbors	Displays BGP peer information.

#### suppress-inactive

To advertise the active routes to a Border Gateway Protocol (BGP) peer only, use the **suppress-inactive** command. To remove the restriction, use the **no** form of this command. To return to the default setting, use the **default** form of this command.

#### suppress-inactive

#### no default suppress-inactive

**Command Default** BGP advertises routes to a peer as soon as they are installed in the local routing table, even if the routes are not the active routes in the table.

**Command Modes** Neighbor address family configuration mode

<b>Command History</b>	Release	Modification
	5.2(1)N1(1)	This command was introduced.

#### **Usage Guidelines** Use the **suppress-inactive** command to advertise only active routes to a BGP peer.

This command requires the LAN Enterprise Services license.

**Examples** This example shows how to create a summary address. The path advertised for this route is an autonomous system set consisting of all elements contained in all paths that are being summarized.

switch# configure terminal
<pre>switch(config) # router bgp 64496</pre>
<pre>switch(config-router)# neighbor 192.0.2.1/8 remote-as 64497</pre>
<pre>switch(config-router-neighbor)# address-family ipv4 unicast</pre>
<pre>switch(config-router-neighbor af)# suppress-inactive</pre>
<pre>switch(config-router-neighbor af)#</pre>

# Related Commands Command Description route-map Creates a route map.

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

## **Show Commands**

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) show commands.

### show bgp

To display Border Gateway Protocol (BGP) routes, use the show bgp command.

show bgp {all | ipv4 {unicast | multicast} [addr | prefix [longer-prefixes]] [vrf vrf-name | all]}

Syntax Description	all	Displays BGP information for all address families.	
	ipv4	Displays BGP information for the IPv4 address family.	
	unicast	Displays BGP information for the unicast address family.	
	multicast Displays BGP information for the multicast address family.		
	addr	(Optional) Network from the selected address family. The format is A.B.C.D for IPv4.	
	prefix	(Optional) Prefix from the selected address family. The format is A.B.C.D/length for IPv4.	
	longer-prefixes	(Optional) Displays the prefix and any more specific routes.	
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.	
	all	(Optional) Specifies all VRF.	
Command Default	None		
Command Modes	Any command m	lode	
Command History	Release	Modification	
	5.0(3)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>show bg</b>	<b>p</b> command to display information about BGP.	
U	This command requires the LAN Enterprise Services license.		
Examples	This example sho	ows how to display an entry in the BGP table:	
	BGP routing tak BGP table versi Status: s-suppr Path type: i-ir	<b>pp ipv4 multicast</b> ole information for VRF default, address family IPv4 Multicast on is 5, local router ID is 2.2.2.3 ressed, x-deleted, S-stale, d-dampened, h-history, *-valid, >-best aternal, e-external, c-confed, l-local, a-aggregate, r-redist IGP, e - EGP, ? - incomplete,   - multipath	
	Network 192.168.1.3 switch#	Next HopMetricLocPrfWeight Path0.0.0.010032768 i	

Related Commands	Command	Description
	clear bgp	Clears entries in the BGP table.

#### show bgp community

To display Border Gateway Protocol (BGP) routes that match a community, use the **show bgp community** command.

show bgp {{ip | ipv4} {unicast | multicast}} community [as-number] [no-advertise] [no-export]
 [no-export-subconfed] [exact-match]} [vrf vrf-name]

Syntax Description	ip	Displays BGP information for the IPv4 address family.
-	ipv4	Displays BGP information for the IPv4 address family.
	unicast	Displays BGP information for the unicast address family.
	multicast	Displays BGP information for the multicast address family.
	as-number	(Optional) AS number. The AS number can be a 16-bit integer or a 32-bit integer in the form of <higher 16-bit="" decimal="" number="">.<lower 16-bit="" decimal="" number="">.</lower></higher>
	no-advertise	(Optional) Displays the no-advertise community.
	no-export	(Optional) Displays the no-export community.
	no-export-subconfed	(Optional) Displays the no-export-subconfed community.
	exact-match	(Optional) Displays an exact match of the community.
	vrf vrf-name	(Optional) Specifies the virtual routing and forwarding (VRF) instance. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modification
	5.0(3)N1(1)	This command was introduced.
Usage Guidelines	This command requires	the LAN Enterprise Services license.
Examples	-	w to display the routes that match a community:
<b>-</b>		multicast community no-advertise
Related Commands	Command	Description
	ip community-list	Creates a community list.

### show bgp community-list

To display Border Gateway Protocol (BGP) routes that match a community list, use the **show bgp community-list** command.

show bgp {{ip | ipv4} {unicast | multicast}} community-list commlist-name [exact-match] [vrf
vrf-name]

Syntax Description	ip	Displays BGP information for the IPv4 address family.
Syntax Description	ipv4	Displays BGP information for the IPv4 address family.
	unicast	Displays BGP information for the unicast address family.
	multicast	
		Displays BGP information for the multicast address family.
	commlist-name	Name of a community-list. The commlist-name can be any case-sensitive, alphanumeric string up to 63 characters.
	exact-match	(Optional) Displays an exact match of the communities.
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	None	
Command Modes	Any command m	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command re	equires the LAN Enterprise Services license.
Examples	This example sho	ows how to display the routes that match a community list:
	switch(config)#	show bgp ip unicast community-list test1
Related Commands	Command	Description
	ip community-l	ist Creates a community list.

#### show bgp extcommunity

To display Border Gateway Protocol (BGP) routes that match an extended community, use the **show bgp** extcommunity command.

show bgp {{ip | ipv4} {unicast | multicast}} extcommunity 4byteas-generic {non-transitive |
 transitive} [as4-number] [exact-match] [vrf vrf-name]

Syntax Description	in	Displays DCD information for the IDvA address family
Syntax Description	ip in4	Displays BGP information for the IPv4 address family.
	ipv4	Displays BGP information for the IPv4 address family.
	unicast	Displays BGP information for the unicast address family.
	multicast	Displays BGP information for the multicast address family.
	4byteas-generic	Displays the routes that match the generic specifice extended communities.
	non-transitive	Displays the routes that match the nontransitive extended communities.
	transitive	Displays the routes that match the transitive extended communities.
	as4-number	AS number. The <i>as4-number</i> is a 32-bit integer in the form of a plaintext integer or <higher 16-bit="" decimal="" number="">.<lower 16-bit="" decimal="" number="">.</lower></higher>
	exact-match	(Optional) Displays an exact match of the extended community.
	vrf vrf-name	(Optional) Specifies the virtual routing and forwarding (VRF) context name. The name can be any case-sensitive, alphanumeric string up to 32 characters.

Examples	This example sho	ows how to display the routes that match a community list:
	switch(config)#	show bgp ipv4 unicast extcommunity-list test1
Related Commands	Command	Description
	ip extcommunit	ty-list Creates an extended community list.

### show bgp neighbors

To display Border Gateway Protocol (BGP) neighbors, use the show bgp neighbors command.

show bgp {ip | ipv4} {unicast | multicast} neighbors [addr [advertised-routes | flap-statistics |
 paths | received-routes | routes [advertised | dampened | received]]] [vrf {all | vrf-name}]

Syntax Description	ip	Displays the IPv4 neighbor information.
	ipv4	Displays the IPv4 neighbor information.
	unicast	Displays the unicast neighbor information.
	multicast	Displays the multicast neighbor information.
	addr	IPv4 address. The format is x.x.x.x
	advertised-rou tes	(Optional) Displays all the routes advertised to this neighbor.
	flap-statistics	(Optional) Displays flap statistics for the routes received from this neighbor.
	paths	(Optional) Displays AS paths learned from this neighbor.
	received-routes	(Optional) Displays all the routes received from this neighbor.
	routes	(Optional) Displays the routes received or advertised to or from this neighbor.
	advertised	(Optional) Displays all the routes advertised for this neighbor.
	dampened	(Optional) Displays all dampened routes received from this neighbor.
	received	(Optional) Displays all the routes received from this neighbor.
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
	all	Specifies all VRF.
Command Default	None	
Command Modes	Any command m	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command re	quires the LAN Enterprise Services license.

#### show ip bgp all

To display the Border Gateway Protocol (BGP) entries for all address families, use the **show ip bgp all** command.

- show ip bgp all [ip-addr | ip-prefix [longer-prefixes]] [filter-list list-name] [community-list
   commlist-name [exact-match]] [flap-statistics] [nexthop-database] [received-paths]
   [regexp expression][route-map map-name] [summary] [vrf {vrf-name | all}]
- show ip bgp all community [comm-name] [{{internet | no-advertise | no-export |
   no-export-subconfed} | exact-match}] [vrf {vrf-name | all}]
- show ip bgp all extcommunity 4byteas-generic {non-transitive | transitive} [as4-number]
  [exact-match] [vrf {vrf-name | all}]
- show ip bgp all dampening {dampened-paths [regexp expression] | flap-statistics |
  history-paths [regexp expression] | parameters} [vrf {vrf-name | all}]
- show ip bgp all neighbors [ip-addr [advertised-routes | flap-statistics | paths | received-routes |
  routes [advertised | dampened | received]]] [vrf {vrf-name | all}]

Syntax Description	ip-addr	(Optional) Network from the BGP route table. The format is x.x.x.x.
	ip-prefix	(Optional) Prefix from the BGP route table. The format is x.x.x.x/length.
	longer-prefixes	(Optional) Displays the prefix and any more specific routes.
	filter-list	(Optional) Displays BGP routes that match a filter list.
	list-name	Name of a filter list. The name can be any case-sensitive, alphanumeric string up to 63 characters.
	<b>community-list</b> commlist-name	(Optional) Display routes matching the community-list. The <i>commlist-name</i> can be any case-sensitive, alphanumeric string up to 63 characters.
	exact-match	(Optional) Displays an exact match of the communities.
	flap-statistics	Displays flap statistics for routes.
	nexthop-database	(Optional) Displays the BGP next-hop database.
	received-paths	(Optional) Displays paths stored for soft reconfiguration.
	regexp expression	(Optional) Displays information that matches the regular expression.
	route-map map-name	(Optional) Displays routes that match the route map. The map name can be any case-sensitive, alphanumeric string up to 63 characters.
	summary	(Optional) Displays the summary of the routes.
	community	Displays BGP routes that match a community list.
	community-number	(Optional) Community number. Valid value is a community number in the range from 1 to 4294967200, or <b>AA:NN</b> (autonomous system-community number/2-byte number).
	no-export	(Optional) Displays routes with this community that are advertised to only peers in the same autonomous system or to only other subautonomous systems within a confederation.
	no-advertise	(Optional) Displays routes that are not advertise to any peer (internal or external).

no-export-subconfed	(Optional) Displays routes that are part of the well-known community no-export-subconfed.	
internet	(Optional) Displays routes that are part of the well-known community internet community.	
extcommunity	Displays routes that match an extended community.	
4byteas-generic	(Optional) Displays the routes that match the generic specifice extended communities.	
non-transitive	(Optional) Displays the routes that match the non-transitive extended communities.	
transitive	(Optional) Displays the routes that match the transitive extended communities.	
as4-number	(Optional) AS number. The <i>as4-number</i> is a 32-bit integer in the form of a plaintext integer or <higher 16-bit="" decimal="" number="">.<lower 16-bit="" decimal="" number="">.</lower></higher>	
exact-match	(Optional) Displays an exact match of the extended community.	
dampening	Displays all dampening information.	
dampened-paths	(Optional) Displays all dampened paths.	
regexp expression	(Optional) Display information that matches the regular expression.	
history-paths	(Optional) Displays all history paths.	
parameters	(Optional) Displays all dampening parameters.	
neighbors	Displays all BGP neigbors.	
advertised-routes	(Optional) Displays all the routes advertised to this neighbor.	
flap-statistics	(Optional) Displays flap statistics for the routes received from this neighbor.	
paths	(Optional) Displays AS paths learned from this neighbor.	
received-routes	(Optional) Displays all the routes received from this neighbor.	
routes	(Optional) Displays the routes received or advertised to or from this neighbor.	
advertised	(Optional) Displays all the routes advertised for this neighbor.	
dampened	(Optional) Displays all dampened routes received from this neighbor.	
received	(Optional) Displays all the routes received from this neighbor.	
vrf vrf-name	(Optional) Specifies the virtual routing and forwarding (VRF) instance. The name can be any case-sensitive, alphanumeric string up to 32 characters.	
all	(Optional) Specifies the VFR reserved all name.

# **T** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with T.

#### template (BGP)

To create a peer template and enter a peer template configuration mode, use the **template** command. To remove a peer template, use the **no** form of this command.

**template** { **peer** *name* | **peer**-**policy** *name* | **peer**-**session** *name* }

**no template** {**peer** *name* | **peer**-**policy** *name* | **peer**-**session** *name*}

Syntax Description	peer name	Specifies the name of the neighbor template.		
	peer-policy name	Specifies the name of the peer-policy template.		
	peer-session name	Specifies the name of the peer-session template.		
Command Default	This command has no	default settings.		
Command Modes	Neighbor address-fam Router bgp configurat	ily configuration mode ion mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Note	A Border Gateway Protocol (BGP) neighbor cannot be configured to work with both peer groups and peer templates. A BGP neighbor can be configured to belong to a peer group or to inherit policies from peer templates only.			
	Peer templates only. Peer templates support only general policy commands. BGP policy configuration commands that are configured only for specific address families or NLRI configuration modes are configured with peer			
	templates.			
	When you enter the peer-policy template configuration mode, the following commands are available:			
	• <b>suppress-inactive</b> —Advertises the active routes to the peer only. See the <b>suppress-inactive</b> command for additional information.			
	• <b>exit</b> —Exits current configuration mode.			
	• <b>filter-list</b> <i>name</i> { <b>in</b>   <b>out</b> }—Creates the AS-PATH filter-list on the inbound and the outbound BGP routes. To remove the entry, use the <b>no</b> form of this command.			
	- in—Applies the access list to incoming routes.			
	<ul> <li>out—Applies the access list to outgoing routes.</li> </ul>			

• inherit peer-policy *policy-name seq-num*—Configures a peer-policy template to inherit the configuration from another peer-policy template. To remove an inherited statement from a peer-policy template, use the **no** form of this command. Range: 1 to 65535. Default: No inherit statements are configured.

The sequence number specifies the order in which the peer policy template is evaluated. Like a route-map sequence number, the lowest sequence number is evaluated first. Peer policy templates support inheritance and a peer can directly and indirectly inherit up to seven peer policy templates. Inherited peer policy templates are configured with sequence numbers like route maps. An inherited peer policy template, like a route map, is evaluated starting with the inherit statement with the lowest sequence number. However, peer policy templates do not fall through. Every sequence is evaluated. If a BGP policy command is reapplied with a different value, it overwrites any previous value from a lower sequence number.

A Border Gateway Protocol (BGP) routing process cannot be configured to be a member of a peer group and to use peer templates for group configurations. You must use one method or the other. We recommend peer templates because they provide improved performance and scalability.

- **maximum-prefix** *max*—Specifies the maximum number of prefixes from this neighbor. Range: 1 to 300000. Default: This command is disabled by default. Peering sessions are disabled when the maximum number of prefixes is exceeded. See the **maximum-prefix** command for additional information.
- **next-hop-self**—Configures the router as the next hop for a Border Gateway Protocol (BGP) neighbor or peer group. To disable this feature, use the **no** form of this command. Default: Disabled.
- next-hop-third-party—Computes a third-party next hop if possible.
- **no**—Negates a command or sets its defaults.
- **prefix-list** *name* {**in** | **out**}—Specifies the route type to apply the prefix list. To remove the entry, use the **no** form of this command.
  - in—Applies the prefix list to incoming routes.
  - out—Applies the prefix list to outgoing routes.
- route-map *name* {in | out}—Specifies the route map name to apply the route type to apply to the neighbor.
  - in—Applies the route map to incoming routes.
  - out—Applies the route map to outgoing routes.
- **route-reflector-client**—Configures the router as a BGP route reflector and configures the specified neighbor as its client. To indicate that the neighbor is not a client, use the **no** form of this command. Default: There is no route reflector in the autonomous system.

By default, all internal BGP (iBGP) speakers in an autonomous system must be fully meshed, and neighbors do not readvertise iBGP learned routes to neighbors, which prevents a routing information loop. When all the clients are disabled, the local router is no longer a route reflector.

If you use route reflectors, all iBGP speakers need not be fully meshed. In the route reflector model, an Interior BGP peer is configured to be a route reflector responsible for passing iBGP learned routes to iBGP neighbors. This scheme eliminates the need for each router to talk to every other router.

All the neighbors configured with this command are members of the client group and the remaining iBGP peers are members of the nonclient group for the local route reflector.

- **send-community**—Specifies that a community attribute be sent to a BGP neighbor. To remove the entry, use the **no** form of this command.
- soft-reconfiguration—Configures the Cisco NX-OS software to start storing updates. To not store
  received updates, use the no form of this command. Default: Disabled. Entering this command starts
  the storage of updates, which is required to do inbound soft reconfiguration. Outbound BGP soft
  reconfiguration does not require inbound soft reconfiguration to be enabled.

To use soft reconfiguration, or a soft reset, without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the open message sent when the peers establish a TCP session. Clearing the BGP session using the **soft-reconfiguration** command has a negative effect on network operations and should only be used as a last resort.

To determine whether a BGP router supports this capability, use the **show ip bgp neighbors** command. If a router supports the route refresh capability, the following message appears:

"Received route refresh capability from peer."

If you specify a BGP peer group by using the peer-group-name argument, all the members of the peer group inherit the characteristic configured with this command.

When you enter the peer-session template configuration mode, the following commands are available:

- **description** *description*—Configures a description to be displayed by the local or a peer router. You can enter up to 80 characters including spaces.
- **disable-connected-check**—Disables connection verification for eBGP peers no more than one hop away when the eBGP peer is configured with a loopback interface.
- **ebgp-multihop**—Accepts and attempts BGP connections to external peers that reside on networks that are not directly connected.

You should enter this command under the guidance of Cisco technical support staff only.

- **exit**—Exits current configuration mode.
- inherit peer-session *session-name*—Configures a peer-session template. To inherit the configuration from another peer-session template, use the **peer-session** keywords. To remove an inherit statement from a peer-session template, use the **no** form of this command.
- **local-as**—Allows you to customize the autonomous system number for eBGP peer groupings.
- **neighbor inherit peer-session**—Configures a router to send a peer session template to a neighbor so that the neighbor can inherit the configuration.
- **neighbor translate-update**—Upgrades a router running BGP in the NLRI format to support multiprotocol BGP.
- **password**—Enables MD5 authentication on a TCP connection between two BGP peers. The following configuration tools are available:
  - 0 password—Specifies an unencrypted neighbor password.
  - 3 password—Specifies an 3DES encrypted neighbor password
  - password—Specifies an unencrypted (cleartext) neighbor password
- remote-private-as—Removes the private AS number from outbound updates.
- show ip bgp template peer-policy—Displays the locally configured peer policy templates.
- show ip bgp template peer-session—Displays the locally configured peer session templates.
- **shutdown**—Disables a neighbor or peer group.

- **timers** *keepalive-time*—Configures keepalive and hold timers in seconds. Range: 0 to 3600. Default: 60.
- update-source {ethernet mod/port | loopback virtual-interface | port-channel number[.sub-interface]}—Specifies the source of the BGP session and updates. Range: virtual-interface is 0 to 1023; number is 0 to 4096; (optional) .sub-interface is 1 to 4093.

General session commands can be configured once in a peer-session template and then applied to many neighbors through the direct application of a peer-session template or through indirect inheritance from a peer-session template. The configuration of peer-session templates simplify the configuration of general session commands that are commonly applied to all neighbors within an autonomous system.

This command requires the LAN Enterprise Services license.

Examples

This example shows how to create a peer-session template named CORE1. This example inherits the configuration of the peer-session template named INTERNAL-BGP.

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# template peer-session CORE1
switch(config-router-stmp)#
```

This example shows how to create and configure a peer-policy template named CUSTOMER-A:

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# template peer-policy CUSTOMER-A
switch(config-router)# exit
switch(config-router)# route-map SET-COMMUNITY in
switch(config-router)# filter-list 20 in
switch(config-router)# inherit peer-policy PRIMARY-IN 20
switch(config-router)# inherit peer-policy GLOBAL 10
switch(config-router)# exit-peer-policy
switch(config-router)# exit-peer-policy
```

This example shows that the maximum prefixes that are accepted from the 192.168.1.1 neighbor is set to 1000:

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router) network 192.168.0.0
switch(config-router)# maximum-prefix 1000
switch(config-router)#
```

This example shows that the maximum number of prefixes that are accepted from the 192.168.2.2 neighbor is set to 5000. The router is also configured to display warning messages when 50 percent of the maximum-prefix limit (2500 prefixes) has been reached.

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router) network 192.168.0.0
switch(config-router)# maximum-prefix 5000 50
switch(config-router)#
```

This example shows that the maximum number of prefixes that are accepted from the 192.168.3.3 neighbor is set to 2000. The router is also configured to reestablish a disabled peering session after 30 minutes.

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router) network 192.168.0.0
```

```
switch(config-router)# neighbor 192.168.3.3 maximum-prefix 2000 restart 30
switch(config-router)#
```

This example shows that the warning messages are displayed when the maximum-prefix limit (500) for the 192.168.4.4 neighbor is exceeded:

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# network 192.168.0.0
switch(config-router)# maximum-prefix 500 warning-only
switch(config-router)#
```

This example forces all updates destined for 10.108.1.1 to advertise this router as the next hop:

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# next-hop-self
switch(config-router)#
```

This example shows that the router belongs to autonomous system 109 and is configured to send the communities attribute to its neighbor at IP address 172.16.70.23:

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# send-community
switch(config-router)#
```

This example shows that the router belongs to autonomous system 109 and is configured to send the communities attribute to its neighbor at IP address 172.16.70.23:

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# address-family ipv4 multicast
switch(config-router-af)# send-community
switch(config-router-af)#
```

This example enables inbound soft reconfiguration for the neighbor 10.108.1.1. All the updates received from this neighbor are stored unmodified, regardless of the inbound policy. When inbound soft reconfiguration is done later, the stored information is used to generate a new set of inbound updates.

```
switch# configure terminal
switch(config)# router bgp 64496
switch(config-router)# soft-reconfiguration inbound
switch(config-router)#
```

<b>Related Commands</b>	Command Description	
	address-family	Enters the address family mode for the Border Gateway Protocol (BGP).
	password (BGP)	Configures a MD5 password for two BGP peers.
	router bgp	Enters the assign an autonomous system (AS) number to a router and enters the router BGP configuration mode.

# **V** Commands

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) commands that begin with V.

### vrf

To enter a virtual routing and forwarding (VRF) configuration mode and configure submode commands, use the **vrf** command. To remove a VRF instance or disable the VRF configuration mode, use the **no** form of this command.

vrf name | management

no vrf name | management

Syntax Description	name	Name of the VRF. The <i>name</i> can be any case-sensitive, alphanumeric string up to 32 characters.
	management	Specifies the management VRF.
Command Default	None	
Command Modes	Address-family conf Router configuratior VRF configuration n	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	<ul><li>mode.</li><li>When you enter the</li><li>area—(OSPF) C</li></ul>	ecome active until you create an identically named VRF in global configuration VRF configuration mode, the following commands are available: Configures area properties. —(BGP) Configures an address-family. See the <b>address-family (BGP)</b> command
	for additional in	formation.
	• auto-cost—(OS	PF) Calculates OSPF cost according to bandwidth.
	vrf). Range: 1 to IP address. To re and its clients for	<i>ter-id</i>   <i>cluster-ip-addr</i> }—(BGP) Configures the Route Reflector Cluster-ID (router, 0 4294967295. You can enter the cluster identification as a 32-bit quantity or as an emove the cluster ID, use the <b>no</b> form of this command. Together, a route reflector orm a cluster. When a single route reflector is deployed in a cluster, the cluster is a router ID of the route reflector.
	or more route re and avoid a sing same cluster ID	ommand is used to assign a cluster ID to a route reflector when the cluster has one flectors. Multiple route reflectors are deployed in a cluster to increase redundancy le point of failure. When multiple route reflectors are configured in a cluster, the is assigned to all route reflectors, which allows all route reflectors in the cluster to es from peers in the same cluster and reduces the number of updates that need to be buting tables.

**Note** All route reflectors must maintain stable sessions between all peers in the cluster. If stable sessions cannot be maintained, you should use overlay route reflector clusters instead (route reflectors with different cluster IDs).

- **default-information**—(OSPF) Controls the distribution of the default route. See the **default-information originate** (**OSPF**) command for additional information.
- **default-metric**—(OSPF) Specifies the default metric for redistributed routes. See the **default-metric** (OSPF) command for additional information.
- **distance**—(OSPF) Defines the OSPF administrative distance. See the **distance** (**OSPF**) command for additional information.
- **exit**—(BGP) Exits from the current command mode.
- log-adjacency-changes—(OSPF) Logs changes in adjacency state.
- **log-neighbor-changes**—Enables logging of the BGP neighbor resets. To disable the logging of changes in BGP neighbor adjacencies, use the **no** form of this command. The **log-neighbor-changes** command enables logging of BGP neighbor status changes (up or down) and resets for troubleshooting network connectivity problems and measuring network stability. Unexpected neighbor resets might indicate high error rates or high packet loss in the network and should be investigated.

Using the **log-neighbor-changes** command to enable status change message logging does not cause a substantial performance impact, unlike, for example, enabling per BGP update debugging. If the UNIX syslog facility is enabled, messages are sent to the UNIX host running the syslog daemon so that the messages can be stored and archived. If the UNIX syslog facility is not enabled, the status change messages are retained in the internal buffer of the router, and are not stored to the disk. You can set the size of this buffer, which is dependent upon the available RAM, using the **logging buffered** command.

The neighbor status change messages are not tracked if the bgp **log-neighbor-changes** command is disabled, except for the reset reason, which is always available as output of the **show ip bgp neighbors** command.

The **eigrp log-neighbor-changes** command enables logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, but messages for BGP neighbors are logged only if they are specifically enabled with the bgp **log-neighbor-changes** command.

Use the show logging command to display the log for the BGP neighbor changes.

- **max-metric**—(OSPF) Maximizes the cost metric. See the **max-metric** (OSPF) command for additional information.
- maximum-paths—(OSPF) Sets the maximum number of parallel routes that OSPF can support. See the maximum-paths (OSPF) command for additional information.
- neighbor—Configures a BGP neighbor. See the neighbor command for additional information.
- **no**—Negates a command or set its defaults.
- **redistribute**—(OSPF) Redistributes information from another routing protocol. See the **redistribute** (OSPF) command for additional information.
- **rfc1583compatibility**—(OSPF) Configures RFSC 1583 compatibility for external path preferences. See the **rfc1583compatibility** command for additional information.
- router-id ip-addr—Specifies the IP address to use as the router-id.

L

- **shutdown**—(OSPF) Shuts down the OSPF protocol instance. See the **shutdown** (**OSPF**) command for additional information.
- **summary-address**—(OSPF) Configures route summarization for redistribution. See the **summary-address** (**OSPF**) command for additional information.
- **timers** *bestpath-timeout*—Configures the best-path timeout in seconds. Range: 1 to 3600. Default: 300.

**Examples** This example shows how to enter VRF configuration mode in a BGP environment:

switch(config)# router bgp 100
switch(config-router)# vrf management
switch(config-router-vrf)#

This example shows how to enter VRF configuration mode in an OSPF environment:

```
switch(config)# vrf context RemoteOfficeVRF
switch(config-vrf)# router ospf 201
switch(config-router)# vrf RemoteOfficeVRF
switch(config-router-vrf)#
```

Related Commands C

Command	Description
vrf context	Creates a VRF.
show vrf	Displays the VRF configuration information.

#### vrf context

To create a virtual routing and forwarding instance (VRF) and enter VRF configuration mode, use the **vrf context** command. To remove a VRF entry, use the **no** form of this command.

vrf context {name | management}

**no vrf context** {*name* | **management**}

Syntax Description	name	Name of the VRF. The <i>name</i> can be any case-sensitive, alphanumeric string up to 32 characters.
	management	Specifies the management VRF.
Command Default	None	
Command Modes	Global configuratio	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows	s how to create a VRF context:
	switch(config)# <b>v</b> . switch(config-vrf	rf context RemoteOfficeVRF )#
Related Commands	Command	Description
	vrf	Creates or configures a VRF instance.
	show vrf	Displays the VRF configuration information.

#### vrf member

To add an interface to a virtual routing and forwarding (VRF) instance or to configure object tracking on a VRF instance, use the **vrf member** command. To remove the object tracking for this route, use the **no** form of this command.

vrf member vrf-name

**no vrf member** *vrf-name* 

Syntax Description	vrf-name	VRF name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	None	
Command Modes	Interface configura Object tracking con	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>vrf memb</b> VRF.	er command in object tracking configuration mode to track objects in a nondefault
Examples	This example show	vs how to track an IP route in VRF Red:
		track 1 ip route 10.10.10.0/8 reachability ack)# vrf member Red ack)#
	This example show	vs how to add the Ethernet interface 1/5 to VRF RemoteOfficeVRF:
	switch(config-if)	) # vrf member RemoteOfficeVRF
Related Commands	Command show vrf	<b>Description</b> Displays the VRF configuration information.
	SHOW VII	Displays the VII configuration mornation.

#### <l\_ltalic>

PART UCR-

#### **EIGRP Commands**

#### <l\_ltalic>

# A Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with A.

#### address-family (EIGRP)

To configure an address family for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **address-family** command. To remove an address family, use the **no** form of this command.

address-family ipv4 unicast

no address-family ipv4 unicast

Syntax Description	ipv4	Specifies the IPv4 address family.		
	unicast	Specifies unicast address support.		
Command Default	None			
Command Modes	Router configuration r	node		
	Address family config	uration mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	This command require	es the LAN Base Services license.		
Examples	This example shows h	ow to set the IPv4 unicast address family for an EIGRP instance:		
	switch(config)# <b>rout</b> switch(config-route switch(config-route	r)# address-family ipv4 unicast		
Related Commands	Command	Description		
	default-information	Controls the distribution of a default route.		

Configures the default metric for routes redistributed into EIGRP.

Configures the maximum number of equal-cost paths.

Configures the administrative distance.

Configures the router ID. Displays EIGRP information.

Configures the EIGRP timers.

Configures route redistribution for EIGRP.

distance

#### authentication key-chain (EIGRP)

To enable authentication for the Enhanced Interior Gateway Routing Protocol (EIGRP) packets and to specify the set of keys that can be used on an interface, use the **authentication key-chain** command. To prevent authentication, use the **no** form of this command.

authentication key-chain name-of-chain

no authentication key-chain name-of-chain

Syntax Description	name-of-chain Grou	p of keys that are valid.	
oynax besonption			
Command Default	No authentication is provided	for EIGRP packets.	
Command Modes	Router configuration mode

#### authentication mode (EIGRP)

To specify the type of authentication used in the Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **authentication mode** command. To remove authentication, use the **no** form of this command.

#### authentication mode md5

no authentication mode md5

Syntax Description	md5 Specifies M	Aessage Digest 5 (MD5) authentication.		
Command Default	None			
Command Modes	Router configuration mode			
	Address family configuration mode			
	VRF configuration mode			
Command History	Release Modifica	tion		
-	5.2(1)N1(1) This com	nmand was introduced.		
Examples		ure the interface to use MD5 authentication:		
Examples	This example shows how to config switch(config) # router eigrp 20 switch(config-router)# vrf red switch(config-router-vrf)# auth switch(config-router-vrf)#	99		
Related Commands	Command	Description		
	authentication key-chain eigrp	Enables authentication for EIGRP and specifies the set of		
	aanononon noj onan orge p	keys that can be used on an interface.		
	ip authentication mode eigrp	Configures the authentication mode for EIGRP on an interface.		
	key chain	Creates a set of keys that can be used by an authentication method.		
	show ip eigrp	Displays EIGRP information.		

#### autonomous-system

To configure the autonomous system (AS) number for an Enhanced Interior Gateway Routing Protocol (EIGRP) address family, use the **autonomous-system** command. To revert to default, use the **no** form of this command.

autonomous-system as-number

no autonomous-system [as-number]

Syntax Description	as-number	Autonomous system number. The range is from 1 to 65535.
Command Default	None	
Command Modes	Address family conf	iguration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	address family.	s-system command to set a common AS number for all EIGRP instances in an areas the LAN Base Services license.
Examples	switch(config)# <b>ro</b> switch(config-rout	er-af)# address-family ipv4 unicast er-af)# autonomous-system 64496
Related Commands	Command address-family (EIGRP)	<b>Description</b> Enters the address family configuration mode for EIGRP.

# **C** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with C.

#### clear ip eigrp accounting

To clear the prefix accounting information for the Enhanced Interior Gateway Routing Protocol (EIGRP) processes, use the **clear ip eigrp accounting** command.

clear ip eigrp accounting [vrf {vrf-name | all | default | management}]

Syntax Description	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are
	all	reserved VRF names. (Optional) Clears the EIGRP accounting information from all VRF instances.
	default	(Optional) Clears the EIGRP accounting information from the default VRF.
	management	(Optional) Clears the EIGRP accounting information from the management VRF.
Command Default	None	
Command Modes	Any command mod	e
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requ	ires the LAN Base Services license.
Examples	This example show:	s how to clear the EIGRP accounting information:
	switch# <b>clear ip</b>	eigrp accounting

#### clear ip eigrp neighbors

To remove and reestablish the Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor entries from the appropriate table, use the **clear ip eigrp neighbors** command.

clear ip eigrp neighbors [\* | *ip-address* | ethernet *slot*/[*QSFP-module*/]*port* | loopback *if\_number* | port-channel *number*] [soft] [vrf {*vrf-name* | all | default | management}]

Syntax Description	*	(Optional) Clears all neighbors.	
	ip-address	(Optional) Address of the neighbor.	
	<b>ethernet</b> slot/[QSFP-module/]p	(Optional) Clears the Ethernet interface from the neighbor table. The slot number is from 1 to 255. The QSFP-module number is from 1 to 4. The port number is from 1 to 128.	
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).	
	loopback if_number	(Optional) Clears the loopback interface from the neighbor table. The loopback interface number is from 0 to 1023.	
	port-channel number	(Optional) Clears the EtherChannel interface and EtherChannel number from the neighbor table. The range is from 1 to 4096.	
	soft	(Optional) Specifies soft reset for the neighbors.	
	vrf vrf-name	(Optional) Specifies a virtual routing and forwarding (VRF) instance. The VRF name is an alphanumeric string of up to 32 characters.	
	all	(Optional) Clears the EIGRP neighbor information from all VRF instances.	
	default	(Optional) Clears the EIGRP neighbor information from the default VRF.	
	management	(Optional) Clears the EIGRP neighbor information from the management VRF.	
Command Default	When no autonomous system number, interface, or VRF instance is specified, all EIGRP neighbor entries are cleared from the table.		
Command Modes	Any command mode		
Command History	Release	Modification	
	6.0(2)N1(2)	Support for the QSFP+ GEM was added.	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	This command require	s the LAN Base Services license.	

#### Examples

This example shows how to clear all EIGRP entries for neighbors on Ethernet interface 2/1: switch# clear ip eigrp vrf \* neighbors ethernet 2/1

<b>Related Commands</b>	Command	Description
	show ip eigrp interfaces	Displays information about interfaces configured for EIGRP.
	show ip eigrp neighbors	Displays the neighbors discovered by EIGRP.

#### clear ip eigrp redistribution

To clear redistribution information for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **clear ip eigrp redistribution** command.

clear ip eigrp redistribution [vrf {vrf-name | all | default | management}]

Syntax Description	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) instance. The VRF name is a case-sensitive, alphanumeric string of up to 32 characters.
	all	(Optional) Clears the redistribution information from all VRF instances.
	default	(Optional) Clears the redistribution information from the default VRF.
	management	(Optional) Clears the redistribution information from the management VRF.
Command Default	None	
Command Modes	Any command mode	2
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requi	ires the LAN Base Services license.
Examples		how to clear redistribution information:
Related Commands	Command	Description
		•

#### clear ip eigrp traffic

To clear the Enhanced Interior Gateway Routing Protocol (EIGRP) traffic statistics, use the **clear ip eigrp traffic** command.

clear ip eigrp traffic [vrf {vrf-name | all | default | management}]

Syntax Description	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding
		(VRF) instance. The <i>vrf-name</i> argument can be specified as any
		case-sensitive, alphanumeric string up to 32 characters.
	all	(Optional) Clears the traffic statistics from all VRF instances.
	default	(Optional) Clears the traffic statistics from the default VRF.
	management	(Optional) Clears the traffic statistics from the management VRF.
Command Default	This command clea	ars information for the default VRF if no VRF is specified.
ommand Modes	Any command mod	de
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requ	uires the LAN Base Services license.
Examples	This example show	s how to clear the EIGRP traffic statistics:
	switch# <b>clear ip</b>	eigrp traffic

## **D** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with D.

#### default-information originate (EIGRP)

To generate a default route into the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **default-information originate** command. To disable this feature, use the **no** form of this command.

default-information originate [always] [route-map map-name]

no default-information originate

Syntax Description	always	(Optional) Generates the default route if the route is not in the EIGRP routing information base.
	route-map map-name	(Optional) Generates the default route only if the route is permitted by the route map. The map name is an alphanumeric string of up to 63 characters.
Command Default	Disabled	
Command Modes	Address-family configu Router configuration mo Router VRF configurati	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines Examples	This example shows how	the LAN Base Services license. v to originate a default route (0.0.0.0/0) to all routes that pass the Condition route
	This example shows how map: switch(config)# route switch(config-router)	v to originate a default route (0.0.0/0) to all routes that pass the Condition route
	This example shows how map: switch(config)# route switch(config-router)	v to originate a default route (0.0.0.0/0) to all routes that pass the Condition route or eigrp 201 # address-family ipv4 unicast
Examples	This example shows how map: switch(config)# route switch(config-router) switch(config-router-	v to originate a default route (0.0.0/0) to all routes that pass the Condition route er eigrp 201 # address-family ipv4 unicast -af)# default-information originate route-map Condition
Examples	This example shows how map: switch(config)# route switch(config-router) switch(config-router-	w to originate a default route (0.0.0/0) to all routes that pass the Condition route er eigrp 201 # address-family ipv4 unicast af)# default-information originate route-map Condition Description
Examples	This example shows how map: switch(config)# route switch(config-router) switch(config-router-	v to originate a default route (0.0.0/0) to all routes that pass the Condition route er eigrp 201 # address-family ipv4 unicast caf)# default-information originate route-map Condition Description Enters address-family configuration mode.
Examples	This example shows how map: switch(config) # route switch(config-router) switch(config-router- Command address-family copy running-config startup-config	v to originate a default route (0.0.0.0/0) to all routes that pass the Condition route er eigrp 201 # address-family ipv4 unicast af)# default-information originate route-map Condition Description Enters address-family configuration mode. Saves the configuration changes to the startup configuration file.

#### default-metric (EIGRP)

To set metrics for an Enhanced Interior Gateway Routing Protocol (EIGRP), use the **default-metric** command. To remove the metric value and restore the default state, use the **no** form of this command.

default-metric bandwidth delay reliability loading mtu

no default-metric

Syntax Description	bandwidth	Minimum bandwidth of the route in kilobits per second. The range is from 1 to 16777215. The default value is 100000.
	delay	Route delay in tens of microseconds. The range is from 1 to 16777215. The default value is 100 (tens of microseconds).
	reliability	Likelihood of successful packet transmission expressed as a number between 0 and 255. The value 255 means 100-percent reliability; 0 means no reliability. The default value is 255.
	loading	Effective bandwidth of the route expressed as a number from 1 to 255 (255 is 100-percent loading). The default value is 1.
	mtu	Minimum maximum transmission unit (MTU) size of the route in bytes. The range is from 128 to 4352.
Command Default	bandwidth: 10	2000
	-	s of microseconds)
	reliability: 255	
	loading: 1	
Command Modes		y configuration mode
	Router configu	
	Router VRF co	onfiguration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	redistributed re incompatible n	<b>t-metric</b> command with the <b>redistribute</b> command to use the same metric value for all putes. A default metric helps to solve the problem of redistributing routes with metrics. Whenever external metrics do not convert to EIGRP metrics, you can use a default de a reasonable substitute to the external metric and enable the redistribution to proceed.
	This command	requires the LAN Base Services license.

Examples	This example shows how to take redistributed Routing Information Protocol (RIP) metrics and translate
	them into EIGRP metrics with the following values: bandwidth = 1000, delay = 100, reliability = 250,
	loading = $100$ , and MTU = $1500$ .

```
switch(config)# router eigrp 1
switch(config-router)# address-family ipv4 unicast
switch(config-router-af)# redistribute rip 100 route-map FilterRIP
switch(config-router-af)# default-metric 1000 100 250 100 1500
switch(config-router-af)#
```

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	redistribute	Redistributes routes from one routing domain into another routing domain.
	show ip eigrp route-map statistics redistribute	Displays information about EIGRP route map statistics.

#### distance (EIGRP)

To allow the use of two administrative distances (internal and external) for the Enhanced Interior Gateway Routing Protocol (EIGRP) that could provide a better route to a node, use the **distance** command. To return to the default setting, use the **no** form of this command.

distance internal-distance external-distance

no distance

Syntax Description	internal-distance	Administrative distance for EIGRP internal routes. Internal routes are routes that are learned from another entity within the same autonomous system (AS). The distance can be a value from 1 to 255. The default value is 90.
	external-distance	Administrative distance for EIGRP external routes. External routes are routes for which the best path is learned from a source external to this autonomous system. The distance can be a value from 1 to 255. The default value is 170.
Command Default	internal-distance: external-distance:	
Command Modes	Address-family co Router configurati Router VRF config	on mode
Command History	<u></u>	
Command History	Release	Modification
Command History	<b>Release</b> 5.2(1)N1(1)	Modification         This command was introduced.

Numerically, an administrative distance is an integer from 0 to higher value indicates a lower trust rating. An administrative distance of 255 means formation source cannot be trusted and should be ignored. command if another protocol is known to provide a better route to a node than was rough the external EIGRP or some internal routes should be preferred by EIGRP. quires the LAN Base Services license.

Related Commands	Command	Description
	show ip eigrp	Displays EIGRP information.

# **E** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with E.

#### eigrp log-neighbor-changes

To enable the logging of changes in Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, use the **eigrp log-neighbor-changes** command. To disable the logging of changes in EIGRP neighbor adjacencies, use the **no** form of this command.

#### eigrp log-neighbor-changes

no eigrp log-neighbor-changes

Syntax Description	This command has no arg	guments or keywords.
Command Default	Adjacency changes are lo	ogged.
Command Modes	Address-family configuration mo Router configuration mo Router VRF configuratio	de
Command History	Release Mo	odification
	5.2(1)N1(1) Th	is command was introduced.
Usage Guidelines	stability of the routing sy logging of neighbor adja	<b>bor-changes</b> command to log neighbor adjacency changes to monitor the ystem and to detect problems. Logging is enabled by default. To disable the cency changes, use the <b>no</b> form of this command. the LAN Base Services license.
Examples	<pre>switch(config)# router</pre>	to enable logging of neighbor changes for EIGRP process 209: c eigrp 209 f eigrp log-neighbor-changes
Related Commands	Command	Description
		Enables logging of EIGRP adjacency state changes.
	log-neighbor-changes	Enables logging of EIGRP neighbor changes.
	log-neighbor-warnings	Enables logging of EIGRP neighbor warnings.

#### eigrp log-neighbor-warnings

To enable the logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor warning messages, use the **eigrp log-neighbor-warnings** command. To disable the logging of EIGRP neighbor warning messages, use the **no** form of this command.

eigrp log-neighbor-warnings [seconds]

no eigrp log-neighbor-warnings

Syntax Description	seconds	(Optional) Time interval (in seconds) between repeated neighbor warning messages. The range of seconds is from 1 to 65535.
Command Default	Neighbor warning messa	ges are logged.
Command Modes	Address-family configuration mo Router configuration mo Router VRF configuratio	de
Command History	Release Mo	dification
	5.2(1)N1(1) Th	is command was introduced.
Usage Guidelines	the interval between repe	<b>cor-warnings</b> command to enable neighbor warning messages and to configure eated neighbor warning messages. he LAN Base Services license.
Examples	_	to log neighbor warning messages for EIGRP process 209 and to repeat the ninute (300 seconds) intervals:
	<pre>switch(config)# router switch(config-router)#</pre>	eigrp 209 eigrp log-neighbor-warnings 30
Related Commands	Command	Description
	log-adjacency-changes	Enables logging of EIGRP adjacency state changes.
	log-neighbor-changes	Enables logging of EIGRP neighbor changes.
	log-neighbor-warnings	Enables logging of EIGRP neighbor warnings.

### eigrp router-id

To set the router ID used by the Enhanced Interior Gateway Routing Protocol (EIGRP) when communicating with its neighbors, use the **eigrp router-id** command. To remove the configured router ID, use the **no** form of this command.

eigrp router-id *ip-address* 

no eigrp router-id ip-address

Syntax Description	ip-address	Router ID in dotted decimal notation.
, ,		
Command Default	EIGRP automatic	ally selects an IP address to use as the router ID when an EIGRP process is started.
Command Modes	Address-family concerning and the Router configurated Router VRF configurated Router VRF configurated Router VRF configurated Router VRF configurated Router Routed	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
	unless the EIGRP configured with the Use the <b>eigrp rou</b> to identify the ori ID, the route is di	ddress is selected and loopback interfaces are preferred. The router ID is not changed process is removed with the <b>no router eigrp</b> command or if the router ID is manually he <b>eigrp router-id</b> command. <b>ter-id</b> command to manually configure the router ID for EIGRP. The router ID is used ginating router for external routes. If an external route is received with the local router scarded. The router ID can be configured with any IP address with two exceptions; 55.255.255 are not legal values and cannot be entered. You should configure a unique iter.
	This command re	quires the LAN Base Services license.
Examples	This example sho	ws how to configure 172.16.1.3 as a fixed router ID:
		<pre>router eigrp 209 puter)# eigrp router-id 172.16.1.3</pre>
Related Commands	Command	Description
	show ip eigrp	Displays a summary of the EIGRP processes.

#### eigrp stub

To configure a router as a stub using the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **eigrp stub** command. To disable the EIGRP stub routing feature, use the **no** form of this command.

eigrp stub [direct | leak-map map-name | receive-only | redistributed]

**no eigrp stub** [direct | leak-map *map-name* | receive-only | redistributed]

Syntax Description	direct	(Optional) Advertises directly connected routes.
	leak-map map-name	(Optional) Allows dynamic prefixes based on the leak map.
	receive-only	(Optional) Sets the router as a receive-only neighbor.
	redistributed	(Optional) Advertises redistributed routes from other protocols and autonomous systems.
Command Default	Disabled	
Command Modes	Address-family config Router configuration r Router VRF configura	node
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	distribution router.	mmand to configure a router as a stub where the router directs all IP traffic to a ermits EIGRP stub routing to advertise connected routes. This option is enabled

Command	Description
show ip eigrp	Displays a summary of the EIGRP processes.

## **F** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with F.

#### feature eigrp

To enable the Enhanced Interior Gateway Protocol (EIGRP), use the **feature eigrp** command. To disable EIGRP, use the **no** form of this command.

feature eigrp

no feature eigrp

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Disabled
- **Command Modes** Global configuration mode

Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** You must enable the EIGRP feature before you can configure EIGRP.

Note

In Cisco NX-OS Release 5.2(1)N1(1), a software upgrade on the Cisco Nexus 5548 switch and the Cisco Nexus 5596 switch that has the Layer 3 features enabled is disruptive. You must reload the switch and the Cisco Nexus 2000 Series Fabric Extender.

This command requires the LAN Base Services license.

Examples

This example shows how to enable the EIGRP feature: switch# configure terminal

switch# configure terminal
switch(config)# feature eigrp
switch(config)#

This example shows how to disable the EIGRP feature:

switch# configure terminal
switch(config)# no feature eigrp
switch(config)#

<b>Related Commands</b>	Command	Description
	router eigrp	Creates a EIGRP instance.
	show feature	Displays the features enabled on the switch.
	show ip eigrp	Displays EIGRP configuration information.

#### flush-routes (EIGRP)

To flush all EIGRP routes in the unicast RIB when an EIGRP instance restarts, use the **flush-routes** command. To disable this feature, use the **no** form of this command.

flush-routes

no flush-routes

	show ip eigrp interfaces	Displays information about EIGRP interfaces.	
<b>Related Commands</b>	Command	Description	
	switch(config-rout		
	<pre>switch(config)# router eigrp Test1 switch(config-router)# flush-routes</pre>		
Examples	This example shows how to flush routes when an EIGRP instance restarts:		
Usage Guidelines	This command requi	res the LAN Base Services license.	
	5.2(1)N1(1)	This command was introduced.	
Command History	Release	Modification	
Command Modes	Router configuration mode		
Command Default	Disabled		
Syntax Description	This command has no arguments or keywords.		

flush-routes (EIGRP)

# I Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with I.

### ip authentication key-chain eigrp

To enable authentication for the Enhanced Interior Gateway Routing Protocol (EIGRP) packets and to specify the set of keys that can be used on an interface, use the **ip authentication key-chain eigrp** command. To prevent authentication, use the **no** form of this command.

ip authentication key-chain eigrp instance-tag name-of-chain

no ip authentication key-chain eigrp instance-tag name-of-chain

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
	name-of-chain	Group of keys that are valid.
Command Default	No authentication is	s provided for EIGRP packets.
Command Modes	Interface configurat	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	configuration mode complete the auther	thentication mode using the <b>ip authentication mode eigrp</b> command in interface . You must separately configure a key chain using the <b>key-chain</b> command to ntication configuration for an interface. hires the LAN Base Services license.
Examples	<pre>key-chain trees: switch(config)# r switch(config-rou switch(config-if)</pre>	ter)# interface ethernet 1/2 # no switchport # ip authentication key-chain eigrp 209 trees
Related Commands	Command	Description
	ip authentication	<b>mode eigrp</b> Sets the authentication mode for EIGRP on an interface.
	key-chain	Creates a set of keys that can be used by an authentication method.
	show ip eigrp inte	rfaces Displays information about EIGRP interfaces.

### ip authentication mode eigrp

To specify the type of authentication used in the Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication mode eigrp** command. To remove authentication, use the **no** form of this command.

ip authentication mode eigrp instance-tag md5

no ip authentication mode eigrp instance-tag md5

Syntax Description	-	me of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, bhanumeric string up to 20 characters.
	<b>`</b>	ecifies Message Digest 5 (MD5) authentication.
Command Default	None	
Command Modes	Interface configuration mo	de
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requires the	e LAN Base Services license.
Examples	This example shows how to	o configure the interface to use MD5 authentication:
	<pre>switch(config)# router e switch(config-router)# i switch(config-if)# no sw switch(config-if)# ip au switch(config-if)#</pre>	interface ethernet 1/2
Related Commands	Command	Description
	authentication mode (EI	•
	copy running-config star	<b>tup-config</b> Copies the configuration changes to the startup configuration file.
	ip authentication key-cha	<b>ain eigrp</b> Enables authentication for EIGRP and specifies the set of keys that can be used on an interface.
	key chain	Creates a set of keys that can be used by an authentication method.
	show ip eigrp interfaces	Displays information about EIGRP interfaces.

# ip bandwidth eigrp

To configure the bandwidth metric on an Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the **ip bandwidth eigrp** command. To restore the default, use the **no** form of this command.

ip bandwidth eigrp instance-tag bandwidth

no ip bandwidth eigrp

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
	bandwidth	Bandwidth value. The range is from 1 to 2,560,000,000 kilobits.
Command Default	None	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requires	the LAN Base Services license.
Examples	This example shows how 209:	v to configure EIGRP to use a bandwidth metric of 10000 in autonomous system
	<pre>switch(config)# router eigrp 209 switch(config-router)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# ip bandwidth eigrp 209 10000</pre>	
Related Commands	Command	Description
	ip bandwidth-percent eigrp	Sets the percent of the interface bandwidth that EIGRP can use.
	show ip eigrp	Displays EIGRP information.

## ip bandwidth-percent eigrp

To configure the percentage of bandwidth that may be used by the Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip bandwidth-percent eigrp** command. To restore the default, use the **no** form of this command.

ip bandwidth-percent eigrp instance-tag percent

no ip bandwidth-percent eigrp

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any
		case-sensitive, alphanumeric string up to 20 characters.
	percent	Percentage of bandwidth that EIGRP may use.
Command Default	percent: 50	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	
Usage Guidelines	EIGRP uses up to 50 po	This command was introduced. ercent of the bandwidth of a link, as defined by the <b>ip bandwidth</b> interface d. Use the <b>ip bandwidth-percent</b> command to change this default percent.

## ip delay eigrp

To configure the throughput delay for the Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip delay eigrp** command. To restore the default, use the **no** form of this command.

ip delay eigrp instance-tag seconds

no ip delay eigrp instance-tag

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
	seconds	Throughput delay, in tens of microseconds. The range is from 1 to 16777215.
Command Default	100 (10-microsecond un	nits)
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		ghput delay on an interface in 10-microsecond units. For example, if you set the d to 100, the throughput delay is 1000 microseconds.
	This command requires	the LAN Base Services license.
Examples	This example shows how	w to set the delay to 400 microseconds for the interface:
	<pre>switch(config)# route switch(config-router) switch(config-if)# nc switch(config-if)# ig</pre>	<pre># interface ethernet 2/1 &gt; switchport</pre>
Related Commands	Command	Description
	ip hello-interval eigrp	Configures the hello interval on an interface for the EIGRP routing process that is designated by an autonomous system number.
	show ip eigrp	Displays EIGRP information.

# ip distribute-list eigrp

To configure a distribution list for the Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip distribute-list eigrp** command. To restore the default, use the **no** form of this command.

ip distribute-list eigrp instance-tag {prefix-list list-name | route-map map-name} {in | out}

**no ip distribute-list eigrp** *instance-tag* {**prefix-list** *list-name* | **route-map** *map-name*} {**in** | **out**}

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
	prefix-list list-name	Specifies the name of an IP prefix list to filter EIGRP routes.
	route-map map-name	Specifies the name of a route map to filter EIGRP routes.
	in	Applies the route policy to incoming routes.
	out	Applies the route policy to outgoing routes.
Command Default	None	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
lleano Guidolinos	Use the <b>in distribute</b> -l	ict aigrn command to configure a route filter policy on an interface. You must
Usage Guidelines	configure the named ro	<b>ist eigrp</b> command to configure a route filter policy on an interface. You must bute map or prefix list to complete this configuration. s the LAN Base Services license.

### ip eigrp shutdown

To shut down the Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip eigrp shutdown** command. To restore the default, use the **no** form of this command.

ip eigrp instance-tag shutdown

no ip eigrp instance-tag shutdown

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any
		case-sensitive, alphanumeric string up to 20 characters.
Command Default	None	
Command Modes	Interface configuration mo	ode
Command History	Release	Modification
Command History		
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		<b>n</b> command to shut down the interface for EIGRP and prevent EIGRP
		e for maintenance purposes. The network address for the interface does not
	show up in the EIGRP top	
		ce eigrp command to prevent EIGRP adjacency but keep the network address
	in the topology table.	
	This command requires th	e LAN Base Services license.
Examples	This example shows how t	to disable EIGRP on an interface:
	<pre>switch(config)# router</pre>	
	<pre>switch(config-router)# switch(config-if)# no s</pre>	
	switch(config-if)# ip e	-
<b>Related Commands</b>	Command	Description
	ip passive-interface eigr	p Configures an instance of EIGRP.
	router eigrp	Configures an instance of EIGRP.
	- •	-

# ip hello-interval eigrp

To configure the Enhanced Interior Gateway Routing Protocol (EIGRP) hello interval for an interface, use the **ip hello-interval eigrp** command. To restore the default, use the **no** form of this command.

ip hello-interval eigrp instance-tag seconds

no ip hello-interval eigrp instance-tag

instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
seconds	Hello interval (in seconds). The range is from 1 to 65535.
5 seconds	
Interface configurat	ion mode
Release	Modification
5.2(1)N1(1)	This command was introduced.
This command requ	ires the LAN Base Services license.
This example shows	s how to set the hello interval to 10 seconds for the interface:
switch(config-if)	ter)# interface ethernet 2/1 # no switchport # ip hello-interval eigrp 1 10
	5 seconds Interface configurat <b>Release</b> 5.2(1)N1(1) This command requ This example shows switch(config)# re switch(config-rou switch(config-if) switch(config-if)

copy running-config Saves the co startup-config	onfiguration changes to the startup configuration file.
show ip eigrp Displays EI	GRP information.

## ip hold-time eigrp

To configure the hold time for an Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the **ip hold-time eigrp** command. To restore the default, use the **no** form of this command.

ip hold-time eigrp instance-tag seconds

no ip hold-time eigrp instance-tag

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any
oyntax becomption	instance tag	case-sensitive, alphanumeric string up to 20 characters.
	seconds	Hold time (in seconds). The range is from 1 to 65535.
Command Default	15 seconds	
Command Modes	Interface configurat	ion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	networks. We recommend that does not receive a h unavailable. Increasing the hold	<b>te eigrp</b> command to increase the default hold time on very congested and large e you configure the hold time to be at least three times the hello interval. If a router ello packet within the specified hold time, routes through this router are considered time delays route convergence across the network. ires the LAN Base Services license.
Examples	<pre>switch(config)# r switch(config-rou switch(config-if)</pre>	ter)# interface ethernet 2/1
Related Commands	Command	Description
	copy running-conf startup-config	<b>ig</b> Saves the configuration changes to the startup configuration file.

Command	Description
ip hello-interval eigrp	Configures the hello interval on an interface for the EIGRP routing process designated by an autonomous system number.
show ip eigrp	Displays EIGRP information.

### ip next-hop-self eigrp

To instruct the Enhanced Interior Gateway Routing Protocol (EIGRP) process to use the local IP address as the next-hop address when advertising these routes, use the **ip next-hop-self eigrp** command. To use the received next-hop value, use the **no** form of this command.

ip next-hop-self eigrp instance-tag

no ip next-hop-self eigrp instance-tag

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
Command Default	EIGRP always sets the l	IP next-hop value to be itself.
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
	•	on the same interface from which the router learned them. To change this

Examples	next-hop value when ad This example shows how next-hop value: switch(config)# route switch(config-router) switch(config-if)# no	vertising these routes. v to change the default IP next-hop value and instruct EIGRP to use the received r eigrp 209 # interface ethernet 2/1
Examples Related Commands	next-hop value when ad This example shows how next-hop value: switch(config)# route switch(config-router) switch(config-if)# no	vertising these routes. v to change the default IP next-hop value and instruct EIGRP to use the received r eigrp 209 # interface ethernet 2/1 o switchport
	next-hop value when ad This example shows how next-hop value: switch(config)# route switch(config-router) switch(config-if)# no switch(config-if)# no	vertising these routes. v to change the default IP next-hop value and instruct EIGRP to use the received r eigrp 209 # interface ethernet 2/1 o switchport o ip next-hop-self eigrp 209

### ip offset-list eigrp

To configure an offset list for the Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip offset-list eigrp** command. To restore the default, use the **no** form of this command.

ip offset-list eigrp instance-tag {prefix-list list-name | route-map map-name} {in | out} offset

no ip offset-list eigrp instance-tag {prefix-list list-name | route-map map-name} {in | out} offset

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any
	mistance nag	case-sensitive, alphanumeric string up to 20 characters.
	prefix-list list-name	Specifies the name of an IP prefix list to filter EIGRP routes.
	route-map map-name	Specifies the name of a route map to filter EIGRP routes.
	in	Applies the route policy to incoming routes.
	out	Applies the route policy to outgoing routes.
	offset	Value to add to the EIGRP metric. The range is from 0 to 2147483647.
Command Default	None	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		the configured offset value to any routes that match the configure prefix list or onfigure the named route map or prefix list to complete this configuration.
	This command requires	the LAN Base Services license.
Examples	-	w to configure an offset list filter to add 20 to the metric for EIGRP routes coming natch the route map OffsetFilter:
	<pre>into the interface that match the route map OffsetFilter: switch(config)# router eigrp 209 switch(config-router)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# ip offset-list eigrp 209 route-map OffsetFilter in 20 switch(config-if)#</pre>	

<b>Related Commands</b>	Command	Description
	prefix-list	Configures a prefix list.
	route-map	Configures a route map.
	show ip eigrp	Displays EIGRP information.

## ip passive-interface eigrp

To suppress all routing updates on an Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the **ip passive-interface eigrp** command. To reenable the sending of routing updates, use the **no** form of this command.

ip passive-interface eigrp instance-tag

no ip passive-interface eigrp instance-tag

Syntax Description	instance-tag	Name of the EIGRP instance. The name can be any case-sensitive, alphanumeric string up to 20 characters.	
Command Default	Routing updates are set	nt on the interface.	
Command Modes	Interface configuration	mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>ip passive-interface eigrp</b> command to stop all routing updates on an interface and suppress the formation of EIGRP adjacencies. The network address for the interface remains in the EIGRP topology table. This command requires the LAN Base Services license.		
Examples	<pre>switch(config)# rout switch(config-router switch(config-if)# n</pre>	)# interface ethernet 2/1	
Related Commands	Command copy running-config	<b>Description</b> Saves the configuration in the startup configuration file.	
	startup-config		
	no switchport	Configures an interface as a Layer 3 routed interface.	

interfaces

### ip route

To configure a static route, use the **ip route** command. To remove the static route, use the **no** form of this command.

ip route ip-prefix/mask {[interface] next-hop} [preference] [tag id]

**no ip route** *ip-prefix/mask* {[*interface*] *next-hop*} [*preference*] [**tag** *id*]

Syntax Description	ip-prefix/mask	IP prefix and prefix mask. The format is x.x.x.x/length. The length is 1 to 32.	
	interface	(Optional) Interface on which all packets are sent to reach this route. Use ? to	
		display a list of supported interfaces.	
	next-hop	IP address of the next hop that can be used to reach that network. You can	
		specify an IP address and an interface type and interface number. The format	
		is x.x.x./length. The length is 1 to 32.	
	preference	(Optional) Route preference that is used as the administrative distance to this	
	41	route. The range is from 1 to 255. The default is 1.	
	tag id	(Optional) Assigns a route tag that can be used to match against in a route map. The range is from 0 to 4294967295. The default is 0.	
		map. The fange is from 0 to 4294907295. The default is 0.	
Command Default	None		
oonnana Donant	Trone		
Command Modes	Interface configur	ation mode	
	C C		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Static routes have a default administrative distance of 1. If you want a dynamic routing protocol to take		
	precidence over a static route, you must configure the static route preference argument to be greater than		
	the administrative distance of the dynamic routing protocol. For example, routes derived with the		
	Enhanced Interior Gateway Routing Protocol (EIGRP) have a default administrative distance of 100. To have a static route that would be overridden by an EIGRP dynamic route, you should specify an		
	administrative distance greater than 100.		
Examples	This example shows how to create a static route for destinations with the IP address prefix		
	192.168.1.1/32, reachable through the next-hop address 10.0.0.2:		
	switch(config)#	ip route 192.168.1.1/32 10.0.0.2	
	This example show	ws how to assign a tag to the previous example so that you can configure a route map	
	that can match on		
	switch(config)#	ip route 192.168.1.1/32 10.0.0.2 tag 5	

This example shows how to choose a preference of 110. In this case, packets for prefix 10.0.0.0 are routed to a router at 172.31.3.4 if dynamic route information with an administrative distance less than 110 is not available.

```
switch# configure terminal
switch(config)# ip route 10.0.0.0/8 172.31.3.4 110
switch(config)#
```

<b>Related Commands</b>	Command	Description
	show vrf	Displays the VRF configuration information.

## ip router eigrp

To specify the Enhanced Interior Gateway Routing Protocol (EIGRP) instance for an interface, use the **ip router eigrp** command. To return to the default, use the **no** form of this command.

**ip router eigrp** *instance-tag* 

no ip router eigrp instance-tag

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any
Command Default	None	case-sensitive, alphanumeric string up to 20 characters.
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	-	the LAN Base Services license. w to set the EIGRP instance for an interface:
	<pre>switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip router eigrp Base switch(config-if)#</pre>	
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes in the startup configuration file.
	feature eigrp	Enables EIGRP on the switch.
	show ip eigrp	Displays information about EIGRP interfaces.

# ip split-horizon eigrp

To enable split horizon for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip split-horizon eigrp** command. To disable split horizon, use the **no** form of this command.

ip split-horizon eigrp instance-tag

no ip split-horizon eigrp instance-tag

instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
Enabled	
Interface configurat	ion mode
Release	Modification
5.2(1)N1(1)	This command was introduced.
	<b>horizon eigrp</b> command to disable split horizon on an interface. ires the LAN Base Services license.
This example shows	s how to disable split horizon an an Ethernet link:
switch(config-if)	ter)# interface ethernet 2/1 # no switchport # no ip split-horizon eigrp 209
	Enabled Interface configurat Release 5.2(1)N1(1) Use the no ip split- This command requ This example shows switch(config)# ro switch(config-rou switch(config-if) switch(config-if)

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip eigrp	Displays EIGRP information.

### ip summary-address eigrp

To configure a summary aggregate address for the specified Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the **ip summary-address eigrp** command. To disable a configuration, use the **no** form of this command.

**ip summary-address eigrp** *instance-tag* {*ip-address/length* | *ip-address mask*} [*admin-distance* | **leak-map** *map-name*]

**no ip summary-address eigrp** *instance-tag* {*ip-address/length* | *ip-address mask*}

Syntax Description	instance-tag	Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.	
	ip-address/length	Summary IP prefix and prefix length to apply to an interface in four-part, dotted-decimal notation. For example, /8 indicates that the first eight bits in the IP prefix are network bits. If <i>length</i> is used, the slash is required.	
	ip-address	Summary IP address to apply to an interface in four-part, dotted-decimal notation.	
	mask	IP address mask.	
	admin-distance	(Optional) Administrative distance. The range is from 1 to 255.	
	leak-map map-name	(Optional) Specifies the leak map.	
Command Default	An administrative distance of 5 is applied to EIGRP summary routes. No summary addresses are predefined.		
Command Modes	Interface configuration	n mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines		address eigrp command to configure interface-level address summarization. es are given an administrative distance of 5.	
	This command require	es the LAN Base Services license.	
Examples	This example shows he 192.168.0.0/16 summa	ow to configure an administrative distance of 95 on an EIGRP interface for the ary address:	
	switch(config-if)# r	c)# interface ethernet 2/1	

elated Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip eigrp interfaces	Displays EIGRP interface-related information.

# L Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with L.

**Syntax Description** 

#### log-adjacency-changes (EIGRP)

To enable the logging of changes in the Enhanced Interior Gateway Routing Protocol (EIGRP) adjacency state, use the **log-adjacency-changes** command. To disable the logging of changes in the EIGRP adjacency state, use the **no** form of this command.

#### log-adjacency-changes

no log-adjacency-changes

This command has no arguments or keywords.

Command Default	Adjacency chang	es are not logged.	
Command Modes	Address-family c Router configurat Router VRF conf		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	

**Usage Guidelines** This command requires the LAN Base Services license.

**Examples** This example shows how to enable logging of adjacency state changes for EIGRP 1:

switch(config)# router eigrp 1
switch(config-router)# address-family ipv4
switch(config-router-af)# log-adjacency-changes
switch(config-router-af)#

Related Commands	Command	Description
	ip eigrp log-neighbor-changes	Logs changes to neighbors for an interface.
	ip eigrp log-neighbor-warnings	Logs neighbor warnings for an interface.
	show ip eigrp interfaces	Displays information about EIGRP interfaces.

### log-neighbor-warnings

To enable the logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor warning messages, use the **log-neighbor-warnings** command. To disable the logging of EIGRP neighbor warning messages, use the **no** form of this command.

log-neighbor-warnings [seconds]

no log-neighbor-warnings [seconds]

Syntax Description	seconds	(Optional) Time interval (in seconds) between repeated neighbor warning messages. The range of seconds is from 1 to 65535.	
Command Default	Neighbor warning messa	ages are logged.	
Command Modes	Address-family configuration mode Router configuration mode Router VRF configuration mode		
Command History	Release Mo	odification	
	5.2(1)N1(1) Th	is command was introduced.	
Usage Guidelines	interval between repeate	<b>arnings</b> command to enable neighbor warning messages and to configure the d neighbor warning messages. the LAN Base Services license.	
	This command requires	the LAN Base Services license.	
Examples	This example shows how to log neighbor warning messages for EIGRP process 209 and to repeat the warning messages in 5-minute (300 seconds) intervals:		
	<pre>switch(config)# router) switch(config-router) switch(config-router)</pre>	# log-neighbor-warnings 30	
Related Commands	Command	Description	
		Enables logging of EIGRP adjacency state changes.	
	show ip eigrp interfaces	Displays information about EIGRP interfaces.	

# **M** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with M.

# maximum-paths (EIGRP)

To control the maximum number of parallel routes that the Enhanced Interior Gateway Routing Protocol (EIGRP) can support, use the **maximum-paths** command. To remove the **maximum-paths** command from the configuration file and restore the default, use the **no** form of this command.

**maximum-paths** *maximum* 

no maximum- paths

Syntax Description	maximum	Maximum number of parallel routes that EIGRP can install in a routing table. The range is from 1 to 16 routes.
Command Default	8 paths	
Command Modes	Address-family configuration mode Router configuration mode Router VRF configuration mode	
Command History	Release M	odification
	5.2(1)N1(1) Th	his command was introduced.
Usage Guidelines	Use the <b>maximum-paths</b> command to allow EIGRP to install multiple paths into the routing table for each prefix. Multiple paths are installed for both internal and external routes that are learned in the same autonomous system and that have an equal cost (according to the EIGRP best path algorithm). This command requires the LAN Base Services license.	
Examples	This example shows how to allow a maximum of 10 paths to a destination: switch(config)# router eigrp 1 switch(config-router)# maximum-paths 10 switch(config-router)#	
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip eigrp	Displays EIGRP information.

# metric maximum-hops

To advertise that those Enhanced Interior Gateway Routing Protocol (EIGRP) routes with a higher hop count than you specified are unreachable, use the **metric maximum-hops** command. To reset the value to the default, use the **no** form of this command.

metric maximum-hops hops-number

no metric maximum-hops

Syntax Description	hops-number	Maximum hop count. The range is from 1 to 255 hops.	
Command Default	hops-number: 100		
	-		
Command Modes	Address-family configuration mode Router configuration mode Router VRF configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>metric maximum-hops</b> command to provide a safety mechanism that causes EIGRP to advertise routes with a hop count greater than the value assigned to the <i>hops-number</i> argument as unreachable. This command requires the LAN Base Services license.		
Examples	This example show switch(config)#	vs how to configure a hop count to 200:	
		uter) <b>address-family ipv4 unicast</b> uter-af)# <b>metric maximum-hops 200</b> uter-af)#	
Related Commands	Command	Description	
	metric weights	Tunes the EIGRP metric calculations.	

# metric weights

To tune the Enhanced Interior Gateway Routing Protocol (EIGRP) metric calculations, use the **metric weights** command. To reset the values to their defaults, use the **no** form of this command.

metric weights tos k1 k2 k3 k4 k5

no metric weights

Syntax Description	tos	Type of service (ToS). The range is from 0 to 8.		
	k1 k2 k3 k4 k5	Constants that convert an EIGRP metric vector into a scalar quantity. The arguments are as follows:		
		• k1—The range is from 0 to 255. The default is 1.		
		• k2—The range is from 0 to 255. The default is 0.		
		• k3—The range is from 1 to 255. The default is 1.		
		• k4—The range is from 0 to 255. The default is 0.		
		• k5—The range is from 0 to 255. The default is 0.		
Command Default	tos: 0			
oommand Derdant	<i>k1:</i> 1			
	k1: 1 k2: 0			
	$k_{2}: 0$ $k_{3}: 1$			
	<i>k4:</i> 0			
	<i>k</i> 5: 0			
Command Modes	Address-family configuration mode Router configuration mode Router VRF configuration mode			
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Use the <b>metric weights</b> command to alter the default behavior of EIGRP routing and metric computation and allow the tuning of the EIGRP metric calculation for a particular type of service (ToS).			
	This command requires the LAN Base Services license.			
Examples	This example shows how to set the metric weights to change the default values: switch(config)# router eigrp 1			

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

```
switch(config-router) address-family ipv4 unicast
switch(config-router-af)# metric weights 0 2 0 2 0 0
switch(config-router-af)#
```

Related	Commands	
---------	----------	--

Command	Description
bandwidth	Sets the EIGRP bandwidth metric in interface configuration mode.
copy running-config startup-config	Saves the configuration changes to the startup configuration file.
delay	Sets the EIGRP delay metric in interface configuration mode.
show ip eigrp	Displays EIGRP information.

# **R** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with R.

#### redistribute (EIGRP)

To inject routes from one routing domain into the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **redistribute** command. To remove the **redistribute** command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the **no** form of this command.

**redistribute** {**bgp** *as-number* | **direct** | **eigrp** *id* | **ospf** *instance-tag* | **rip** *instance-tag* | **static**} [**route-map** *map-name*]

no redistribute {bgp as-number | direct | eigrp as-number | ospf instance-tag | rip instance-tag |
static}

Syntax Description	bgp as-number	Distributes routes from Border Gateway Protocol (BGP). The <i>as-number</i> is a 2-byte or 4-byte autonomous system number. The range for 2-byte numbers is from 1 to 65535. The range for 4-byte numbers is from 1.0 to 65535.65535.
	direct	Distributes routes that are directly connected on an interface.
	eigrp id	Specifies the name of an EIGRP instance. The <i>id</i> can be any case-sensitive, alphanumeric string up to 20 characters.
	ospf instance-tag	Distributes routes from the OSPF protocol. This protocol is supported in the IPv4 address family. The <i>instance-tag</i> can be a maximum of 20 alphanumeric characters.
	rip instance-tag	Distributes routes from the RIP protocol. The <i>instance-tag</i> can be a maximum of 20 alphanumeric characters.
	static	Redistributes IP static routes.
	route-map map-name	e (Optional) Specifies the identifier of a configured route map. Use a route map to filter which routes are redistributed into EIGRP.
Command Default	Disabled	
Command Modes	Address family configuration mode Router configuration mode Router VRF configuration mode	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		command to import routes from other routing protocols into EIGRP. You should p to filter these routes to ensure that EIGRP redistributes only the routes that you

You must configure a default metric to redistribute routes from another protocol into EIGRP. You can configure the default metric with the **default-metric** command or with the route map configured with the **redistribute** command.

This command requires the LAN Base Services license.

**Examples** 

This example shows how to redistribute cause BGP routes into an EIGRP autonomous system:

```
switch(config)# router eigrp 209
switch(config-router) address-family ipv4 unicast
switch(config-router-af)# redistribute bgp 64496
switch(config-router-af)
```

<b>Related Commands</b>	Command	Description
	default-metric (EIGRP)	Sets the default metrics for routes redistributed into EIGRP.
	show ip eigrp	Displays EIGRP information.

# redistribute maximum-prefix (EIGRP)

To limit the number of routes redistributed into Enhanced Interior Gateway Routing Protocol (EIGRP), use the **redistribute maximum-prefix** command. To return to the default setting, use the **no** form of this command.

redistribute maximum-prefix max [threshold] [warning-only | withdraw [num-retries timeout]]

**no redistribute maximum-prefix** max [threshold] [**warning-only** | **withdraw** [num-retries timeout]

Syntax Description	max	Maximum number of prefixes that EIGRP will distribute. The range is from
		0 to 65536.
	threshold	(Optional) Percentage of maximum prefixes that triggers a warning message. The range is from 1 to 100. The default is 75 percent.
	warning-only	(Optional) Logs a warning message when the maximum number of prefixes is exceeded.
	widthdraw	(Optional) Withdraws all redistributed routes.
	num-retries	(Optional) Number of times EIGRP tries to retrieve the redistributed routes. The range is from 1 to 12. The default is 1.
	timeout	(Optional) Time between retry attempts. The range is from 60 to 600 seconds. The default is 300.
Command Default	No limit	
Command Modes	Router configuration VRF configuration me	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>redistribute maximim-prefix</b> command to limit the number of routes redistributed into EIGRP Use the <b>clear ip eigrp redistribute</b> command if all routes are withdrawn.	
Examples	This example shows how to limit the number of redistributed routes into EIGRP: switch# configure terminal switch(config)# router eigrp 201 switch(config-router)# address-family ipv4 unicast switch(config-router-af)# redistribute bgp route-map FilterExternalBGP switch(config-router-af)# redistribute maximum-prefix 1000 75 switch(config-router-af)#	

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	feature eigrp	Enables the EIGRP feature.
	redistribute (EIGRP)	Configures route redistribution for EIGRP.
	show running-config eigrp	Displays the EIGRP running configuration.

## restart eigrp (EIGRP)

To restart an Enhanced Interior Gateway Routing Protocol (EIGRP) instance and remove all associated neighbors, use the **restart** command.

restart eigrp instance-tag

Syntax Description	instance-tag	Name for an EIGRP routing instance. The name can be a maximum of 20 alphanumeric characters.
Command Default	None	
Command Modes	Global configuration mo	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines Examples	-	the LAN Base Services license. w to restart the OSPFv2 instance and remove all neighbors:
Examples	This example shows how switch# configure ter switch(config)# resta switch(config)#	
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration in the startup configuration file.
	show ip eigrp interfaces	Displays information about EIGRP interfaces.

## router eigrp

To configure a routing process and enter router configuration mode for Enhanced Interior Gateway Routing Protocol (EIGRP), use the **router eigrp** command. To turn off the EIGRP routing process, use the **no** form of this command.

router eigrp instance-tag

no router eigrp instance-tag

Syntax Description	instance-tag	Name of an EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
Command Default	None	
Command Modes	Global configuration n	node
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows he switch(config) # rout switch(config-router	
Related Commands	Command	Description
	default-information	Controls the distribution of a default route.
	default-metric	Configures the default metric for routes redistributed into EIGRP.
	distance	Configures the administrative distance.
	maximum-paths	Configures the maximum number of equal-cost paths.
	redistribute	Configures route redistribution for EIGRP.
	router-id	Configures the router ID.
	timers	Configures the EIGRP timers.

## router-id (EIGRP)

To configure a router ID for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **router-id** command. To cause the software to use the default method of determining the router ID, use the **no** form of this command.

router-id router-id

no router-id

Syntax Description	<i>router-id</i> 32-bit router ID value specified in four-part, dotted-decimal notation.
Command Default	If this command is not configured, EIGRP chooses an IPv4 address as the router ID from one of its interfaces.
Command Modes	Address family configuration mode Router configuration mode Router VRF configuration mode
Command History	Release Modification
	5.2(1)N1(1)This command was introduced.
Usage Guidelines	Use the <b>router-id</b> command to manually specify a unique 32-bit numeric value for the router ID. Thi action ensures that EIGRP can function regardless of the interface address configuration. This command requires the LAN Base Services license.
Examples	This example shows how to assign the IP address of 192.0.2.1 to the EIGRP process 1: switch(config)# router eigrp 1 switch(config-router) address-family ipv4 switch(config-router-af)# router-id 192.0.2.1
Related Commands	Command Description
	show ip eigrp Displays a summary of the EIGRP processes.

## **S** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with S.

#### shutdown (EIGRP)

To shut down an instance of Enhanced Interior Gateway Routing Protocol (EIGRP), use the **shutdown** command. To disable this function, use the **no** form of this command.

shutdown

no shutdown

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

Command Default Enabled

**Command Modes** Address family configuration mode Router configuration mode Router VRF configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

# Usage GuidelinesUse the shutdown command to disable an instance of EIGRP without removing the configuration.This command requires the LAN Base Services license.

**Examples** This example shows how to disable eigrp 209:

switch(config)# router eigrp 209
switch(config-router)# shutdown
switch(config-router)#

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration in the startup configuration file.
	show ip eigrp interfaces	Displays information about EIGRP interfaces.

#### stub

To configure a router as a stub using the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **stub** command. To disable the EIGRP stub routing feature, use the **no** form of this command.

stub [direct | leak-map map-name| receive-only | redistributed]

no stub [direct | leak-map map-name| receive-only | redistributed]]

Syntax Description	direct	(Ontional) Advantices directly composted routes
Syntax Description		(Optional) Advertises directly connected routes.
	leak-map map-name	(Optional) Allows dynamic prefixes based on the leak map.
	receive-only	(Optional) Sets the router as a receive-only neighbor.
	redistributed	(Optional) Advertises redistributed routes from other protocols and autonomous systems.
Command Default	Disabled	
Command Modes	Address-family configu	ration mode
command modes	Router configuration me	
	Router VRF configurati	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>stub</b> command distribution router.	to configure a router as a stub where the router directs all IP traffic to a
	The <b>direct</b> keyword per by default.	mits EIGRP stub routing to advertise connected routes. This option is enabled
	EIGRP autonomous sys	ord restricts the router from sharing any of its routes with any other router in that tem, and the <b>receive-only</b> keyword does not permit any other option to be vents any type of route from being sent.
		ord permits EIGRP stub routing to send other routing protocols and autonomous nfiguration of this option, EIGRP does not advertise redistributed routes.
		four keywords ( <b>direct</b> , <b>leak-map</b> , <b>receive-only</b> , <b>redistributed</b> ) with the <b>stub</b> e types specified by the particular keyword(s) are advertised.
	This command requires	the LAN Base Services license.
Examples	This example shows how	w to configure the router as a receive-only neighbor:
-	<pre>switch(config)# route switch(config-router)</pre>	er eigrp 1

switch(config-router)#

#### **Related Commands**

Command	Description
copy running-config startup-config	Saves the configuration changes to the startup configuration file.
show ip eigrp	Displays EIGRP information.
show ip eigrp neighbors	Displays EIGRP neighbor information.

## **Show Commands**

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) **show** commands.

## show ip eigrp

To display a summary of the Enhanced Interior Gateway Routing Protocol (EIGRP) processes, use the **show ip eigrp** command.

show ip eigrp [instance-tag]

Syntax Description	instance-tag	(Optional) Name of the EIGRP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
Command Default	None	
Command Modes	Any command mod	le
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requ	uires the LAN Base Services license.
Examples	This example show	s how to display all the EIGRP instances:
	Process-tag: Te Status: running Authentication Authentication Metric weights: IP proto: 88 Mu Int distance: 9 Max paths: 8 Number of EIGRP Number of EIGRP Number of EIGRP Redistributing: direct route- Graceful-Restar Stub-Routing: D NSF converge ti NSF route-hold NSF signal time	<pre>G ID 3.1.1.1 VRF default est1 mode: none key-chain: none K1=1 K2=0 K3=1 K4=0 K5=0 elticast group: 224.0.0.10 e Ext distance: 170 e interfaces: 8 (0 loopbacks) e passive interfaces: 0 e peers: 8 map SVI-EIGRP et: Enabled</pre>

<b>Related Commands</b>	Command	Description
	router eigrp	Configures an EIGRP instance.
	show running-config eigrp	Displays EIGRP running configuration information.

#### show ip eigrp accounting

To display prefix accounting information for the Enhanced Interior Gateway Routing Protocol (EIGRP) processes, use the **show ip eigrp accounting** command.

show ip eigrp [instance-tag] accounting [vrf {vrf-name | all | default | management}]

Syntax Description	instance-tag	virtual routing	and forward	ing (VRF)	instance is r	on is available w not specified. The ric string up to 20	e

#### show ip eigrp interfaces

To display information about interfaces configured for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **show ip eigrp interfaces** command.

show ip eigrp [instance-tag] interfaces [{ethernet slot/[QSFP-module/]port | loopback if\_number | port-channel number | vlan vlan-id}] [brief] [vrf {vrf-name | all | default | management}]

Syntax Description	instance-tag	(Optional) EIGRP Instance. The instance tag can be any case-sensitive, alphanumeric string up to 20 characters.				
	<b>ethernet</b> slot/[QSFP-module/]port	(Optional) Specifies the Ethernet interface and the slot number and port number. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.				
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).				
	loopback if_number	(Optional) Specifies the loopback interface. The loopback interface number is from 0 to 1023.				
	port-channel number	(Optional) Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.				
	vlan vlan-id	(Optional) Specifies the VLAN interface. The range is from 1 to 4094.				
	brief	(Optional) Displays a brief summary of EIGRP interface information.				
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters.				
		(Optional) Specifies all VRF instances.				
	all	(Optional) Specifies all VRF instances.				
	all default	(Optional) Specifies all VRF instances.         (Optional) Specifies the default VRF.				
Command Default Command Modes	default management	(Optional) Specifies the default VRF.

#### show ip eigrp route

To display the Enhanced Interior Gateway Routing Protocol (EIGRP) routes, use the **show ip eigrp route-map statistics** command in any mode.

show ip eigrp [instance-tag] route [ip-prefix/length] [active] [all-links] [detail-links] [pending]
[summary] [zero-successors] [vrf {vrf-name | all | default | management}]

Syntax Description	instance-tag	(Optional) Name of the EIGRP instance. The instance tag can be any case-sensitive, alphanumeric string up to 20 characters.				
	ip-prefix/length	(Optional) IP address in four-part, dotted-decimal notation with a network mask indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.				
	active	(Optional) Displays only active entries in the EIGRP topology table.				
	all-links	(Optional) Displays all entries in the EIGRP topology table.				
	detail-links	(Optional) Displays detailed information for all entries in the EIGRP topology table.				
	pending	(Optional) Displays all entries in the EIGRP topology table that are waiting for an update from a neighbor or are waiting to reply to a neighbor.				
	summary	(Optional) Displays a summary of the EIGRP topology table.				
	zero-successors	(Optional) Displays available routes in the EIGRP topology table.				
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters.

#### show ip eigrp route-map statistics

To display the route redistribution statistics for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **show ip eigrp route-map statistics** command in any mode.

Syntax Description	instance-tag	(Optional) Name of the EIGRP instance. The instance tag can be any case-sensitive, alphanumeric string up to 20 characters.				
	bgp	Displays policy statistics for the Border Gateway Protocol (BGP).				
	direct	Displays policy statistics for directly connected routes only.				
	eigrp	Displays policy statistics for EIGRP.				
	ospf	Displays policy statistics for the Open Shortest Path First (OSPF) protocol.				
	rip	Displays policy statistics for the Routing Information Protocol (RIP).				
	static	Displays policy statistics for IP static routes.				
	id	For the <b>bgp</b> keyword, an autonomous system number. The range for 2-byte numbers is from 1 to 65535. The range for 4-byte numbers is from 1.0 to 65535.65535.				
		For the <b>eigrp</b> keyword, an EIGRP instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.				
		For the <b>ospf</b> keyword, an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.				
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters.				
	all	(Optional) Specifies all VRF instances.(Optional) Specifies the default VRF.				
	default					
	management	(Optional) Specifies the management VRF.

#### show ip eigrp topology

To display the Enhanced Interior Gateway Routing Protocol (EIGRP) topology table, use the **show ip eigrp topology** command.

Syntax Description	instance-tag	(Optional) Name of the EIGRP instance. The instance tag can be any
	-	case-sensitive, alphanumeric string up to 20 characters.
	ip-address/length	(Optional) IP address in four-part, dotted-decimal notation with a network mask indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.
	active	(Optional) Displays only active entries in the EIGRP topology table.
	all-links	(Optional) Displays only active entries in the EIGRP topology table.
	detail-links	(Optional) Displays an entries in the EIGRP topology table.
	pending	(Optional) Displays all entries in the EIGRP topology table that are waiting for an update from a neighbor or are waiting to reply to a neighbor.
	summary	(Optional) Displays a summary of the EIGRP topology table.
	zero-successors	(Optional) Displays available routes in the EIGRP topology table.
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters.
	all	(Optional) Specifies all VRF instances.
	default	(Optional) Specifies the default VRF.
	management	(Optional) Specifies the management VRF.
Command Default	This command display	ys information for the default VRF if no VRF is specified.
Command Modes	Any command mode	
Command Modes	Any command mode	Modification

switch#
```

This example show how to display all the entries in the EIGRP topology table:

```
switch(config) # show ip eigrp topology all-links
```

This example shows how to display the detailed information for all entries in the EIGRP topology table:

switch(config) # show ip eigrp topology detail-links

This example shows how to display a summary of the topology table:

switch(config)# show ip eigrp topology summary
IP-EIGRP Topology Table for AS(65535)/ID(3.1.1.1) VRF default

Head serial 3, next serial 15631
3536 routes, 0 pending replies, 0 dummies
IP-EIGRP(0) enabled on 8 interfaces, 8 neighbors present on 8 interfaces
Quiescent interfaces: Eth3/11 Po2000 Po2001 Eth2/7 Eth2/5 Eth2/6 Eth1/26 Eth3/12
switch#

This example shows how to display the active entries in the topology table:

switch(config-if)# show ip eigrp topology active

This example shows how to display zero-successors in the topology table:

switch(config-router)# show ip eigrp topology zero-successors

This example shows how to display pending entries:

switch(config) # show ip eigrp topology pending

<b>Related Commands</b>	Command	Description
	show running-config eigrp	Displays EIGRP running configuration information.

#### show ip eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) packets sent and received, use the **show ip eigrp traffic** command.

show ip eigrp [instance-tag] traffic [vrf {vrf-name | all | default | management}]

Syntax Description	instance-tag	(Optional) Name of the EIGRP instance. The instance tag can be any case-sensitive, alphanumeric string up to 20 characters.		
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters.		
	all	(Optional) Specifies all VRF instances.		
	default	(Optional) Specifies the default VRF.		
	management	(Optional) Specifies the management VRF.		
Command Default	. This command disp	lays information for the default VRF if no VRF is specified.

Command	Description		
router ospf	Creates an OSPF instance.		

## **T** Commands

This chapter describes the Cisco NX-OS Enhanced Interior Gateway Routing Protocol (EIGRP) commands that begin with T.

#### timers active-time

To adjust the Enhanced Interior Gateway Routing Protocol (EIGRP) time limit for the active state, use the **timers active-time** command. To disable this function, use the **no** form of the command.

timers active-time [time-limit | disabled]

no timers active-time

Syntax Description	time-limit	(Optional) Active time limit (in minutes). The range is from 1 to 65535
		minutes. The default value is 3.
	disabled	(Optional) Disables the timers and permits the routing wait time to remain active indefinitely.
Command Default	Disabled	
Command Modes	Address family configur Router configuration mo Router VRF configurat	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Jsage Guidelines	before declaring the rou	<b>ime</b> command to control the time that the router waits (after a query is sent) ite to be in the stuck in active (SIA) state. the LAN Base Services license.
zamples	This example shows how	w to configure an indefinite routing wait time on the specified EIGRP route:
		address-family ipv4 unicast af)# timers active-time disabled
Related Commands	Command	Description
		Saves the configuration changes to the startup configuration file.
	copy running-config startup-config	Saves the configuration changes to the startup configuration me.

## timers nsf converge

To adjust the time limit for nonstop forwarding (NSF) convergence for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **timers nsf converge** command. To disable this function, use the **no** form of the command.

timers nsf converge seconds

no timers nsf converge

Syntax Description	seconds	Time limit for convergence after an NSF switchover (in seconds). The range is from 60 to 180 seconds. The default value is 120.
Command Default	120 seconds	
Command Modes	Address family configu Router configuration m Router VRF configurat	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	switchover.	werge command to control the time that the router waits for convergence after a the LAN Base Services license.
Examples	<pre>switch(config)# route switch(config-router)</pre>	address-family ipv4 unicast af)# timers nsf converge 100
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip eigrp	Displays EIGRP information.

#### timers nsf route-hold

To set the timer that determines how long an NSF-aware Enhanced Interior Gateway Routing Protocol (EIGRP) router holds routes for an inactive peer, use the **timers nsf route-hold** command. To return the route hold timer to the default value, use the **no** form of this command.

timers nsf route-hold seconds

no timers nsf route-hold

Syntax Description	seconds	Time, in seconds, that EIGRP holds routes for an inactive peer. The range is from 20 to 300 seconds. The default is 240.		
Command Default	EIGRP NSF awareness is enabled. seconds: 240			
Command Modes	Address family configuration mode Router configuration mode Router VRF configuration mode			
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Use the <b>timers nsf route-hold</b> command to set the maximum period of time that the NSF-aware router holds known routes for an NSF-capable neighbor during a switchover operation or a well-known failure condition. The route hold timer is configurable so that you can tune network performance and avoid undesired effects, such as "black holing" routes (advertising invalid routes) if the switchover operation takes too much time. When this timer expires, the NSF-aware router scans the topology table and discards any stale routes, allowing EIGRP peers to find alternate routes instead of waiting during a long switchover operation. This command requires the LAN Base Services license.			
	This command req	unes the LAN base services ficense.		
Examples	This example shows how to set the route hold timer value for an NSF-aware router to 2 minutes (120 seconds):			
		<pre>router eigrp 1 uter) address-family ipv4 unicast uter-af)# timers nsf route-hold 120</pre>		

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip eigrp	Displays EIGRP information.

#### timers nsf signal

To set the time limit to signal a nonstop forwarding (NSF) restart for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **timers nsf signal** command. To return the route hold timer to the default, use the **no** form of this command.

timers nsf signal seconds

no timers nsf signal

Syntax Description	seconds	Time, in seconds, that EIGRP waits for a peer to signal an NSF restart. The range is from 10 to 360 seconds.		
Command Default	EIGRP NSF awareness is enabled			
Command Modes	Address family configuration mode Router configuration mode Router VRF configuration mode			
Command History	Release	Modification		
•	5.2(1)N1(1)	This command was introduced.		
	This command requires the LAN Base Services license.			
	This command requires	the LAN Base Services license.		
Examples	This example shows how to set the signal timer value for an NSF-aware router to the maximum (30 seconds):			
	<pre>switch(config)# router eigrp 1 switch(config-router) address-family ipv4 unicast switch(config-router-af)# timers nsf signal 30 switch(config-router-af)#</pre>			
Related Commands	Command	Description		
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.		
	show ip eigrp	Displays EIGRP information.		

#### <l\_ltalic>

PART UCR-

#### **HSRP Commands**

#### <l\_ltalic>

## A Commands

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) commands that begin with A.

## authentication (HSRP)

To configure authentication for the Hot Standby Router Protocol (HSRP), use the **authentication** command. To disable authentication, use the **no** form of this command.

**no authentication** {*string* | **md5** {**key-chain** | **key-string** {**0** | **7**} *text* [**timeout** *seconds*]} | **text** *string*}

Syntax Description	md5	Specifies the Message Digest 5 (MD5) authentication.
, ,	key-chain key-chain	Identifies a group of authentication keys.
	key-string	Specifies the secret key for MD5 authentication.
	0	Specifies a clear text string.
	7	Specifies an encrypted string.
	text	Secret key for MD5 authentication. The range is from 1 to 255 characters. We recommend that you use at least 16 characters.
	timeout seconds	(Optional) Specifies the authentication timeout value. The range is from 0 to 32767.
	text string	Specifies an authentication string. The range is from 1 to 255 characters. The default string is "cisco".
Command Default	Disabled	
Command Modes	HSRP configuration or	HSRP template mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	groups that they are not HSRP messages. The sa	<b>text</b> command to prevent misconfigured routers from participating in HSRP t intended to participate in. The authentication string is sent unencrypted in all ame authentication string must be configured on all routers in the same group to HSRP protocol packets that do not authenticate are ignored.
<u> </u>	If you configure two router is av	uters with identical HSRP IP addresses but with different authentication strings, ware of the duplication.
Examples	This example shows ho switch# <b>configure te</b>	w to configure an authentication string for HSRP group 2:

authentication {*string* | md5 {key-chain key-chain | key-string {0 | 7} *text* [timeout *seconds*]} | text *string*}

```
switch(config)# interface ethernet 0/1
switch(config-if)# no switchport
switch(config-if)# ip address 10.0.0.1 255.255.255.0
switch(config-if)# hsrp 2
switch(config-if-hsrp)# priority 110
switch(config-if-hsrp)# preempt
switch(config-if-hsrp)# authentication text sanjose
switch(config-if-hsrp)# ip 10.0.0.3
switch(config-if-hsrp)# end
switch(config-if-hsrp)#
```

#### Related Commands

Command	Description
feature hsrp	Enables HSRP and enters HSRP configuration mode.
hsrp group	Creates an HSRP group.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

## **D** Commands

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) commands that begin with D.

## delay minimum

To delay the Hot Standby Router Protocol (HSRP) initialization after a reload or after an interface comes up, use the **delay minimum** command. To disable this function, use the **no** form of this command.

**delay minimum** [min-delay] **reload** [reload-delay]

**no delay minimum** [min-delay] **reload** [reload-delay]

Syntax Description	min-delay	(Optional) Minimum time (in seconds) to delay HSRP group initialization after an interface comes up. This period applies to all subsequent interface events. The default is 0 seconds.
	reload reload-delay	Specifies the time period to delay HSRP group initialization after the router has reloaded. This period applies only to the first interface-up event after the router has reloaded. The default is 0 seconds.
Command Default	The HSRP delay defau	It is 0 seconds.
Command Modes	Interface configuration	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		mmand to delay HSRP initialization either after a reload or after an interface tration allows the interface and router to stabilize after the interface comes up and state flapping.
Examples	This example shows ho 10 seconds:	ow to configure a minimum delay of 3 seconds and a group initialization delay of
	<pre>switch(config-if)# h</pre>	erface ethernet 1/5 no switchport np address 172.16.6.5 255.255.0 nsrp 1 rp)# delay minimum 3 reload 10

# **F** Commands

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) commands that begin with F.

#### feature hsrp

To enter Hot Standby Router Protocol (HSRP) configuration mode and enable HSRP, use the **feature hsrp** command. To disable HSRP, use the **no** form of this command.

feature hsrp

no feature hsrp

- Syntax Description The command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Global configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** You must enable the HSRP feature before you can configure HSRP.

Note

In Cisco NX-OS Release 5.2(1)N1(1), a software upgrade on the Cisco Nexus 5548 switch and the Cisco Nexus 5596 switch that has the Layer 3 features enabled is disruptive. You must reload the switch and the Cisco Nexus 2000 Series Fabric Extender.

This command does not require a license.

**Examples** This example shows how to enable HSRP on the switch:

switch# configure terminal switch(config)# feature hsrp switch(config)#

This example shows how to disable HSRP:

switch# configure terminal
switch(config)# no feature hsrp
switch(config)#

<b>Related Commands</b>	Command	Description
	hsrp group	Creates and activates an HSRP group.
	show feature	Displays the status of features on a switch.
	show hsrp	Displays HSRP information.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

## **H** Commands

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) commands that begin with H.

### hsrp

	hsrp group-n	umber ipv4
	no hsrp grou	up-number ipv4
Syntax Description	group-number	Number of HSRP groups that can be configured on a Gigabit Ethernet port, including the main interfaces and subinterfaces. The range is from 1 to 255. The default value is 0.
	ipv4	(Optional) Sets the HSRP group for IPv4.
Command Default	Disabled	
Command Modes	Interface configu	ration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

To enter Hot Standby Router Protocol (HSRP) configuration mode and create an HSRP group, use the

hsrp command. To disable HSRP, use the no form of this command.

**Usage Guidelines** You must globally enable HSRP before you can configure any HSRP options or create an HSRP group.

Examples

This example shows how to create and activate an HSRP group:

```
switch# configure terminal
switch(config)# interface ethernet 0
switch(config-if)# no switchport
switch(config-if)# ip address 172.16.6.5 255.255.255.0
switch(config-if)# hsrp 1
switch(config-if-hsrp)#
```

This example shows how to create and activate an HSRP group for IPv6:

```
switch# configure terminal
switch(config)# interface ethernet 1
switch(config-if)# no switchport
switch(config-if)# ipv6 address 172.16.6.5 255.255.255.0
switch(config-if)# hsrp 1
switch(config-if-hsrp)#
```

Related Commands	Command	Description
	feature hsrp	Enables HSRP configuration.
	ip address	Creates a virtual IP address for the HSRP group. The IP address must be in the same subnet as the interface IP address.
	show hsrp	Displays HSRP information.

### hsrp delay

To delay Hot Standbu Router Protocol (HSRP) initialization after a reload or after an interface comes up, use the **hsrp delay** command. To disable this function, use the **no** form of this command.

hsrp delay {minimum min-delay | reload reload-delay}

**no delay** {**minimum** *min-delay* | **reload** *reload-delay*}

Syntax Description	minimum min-delay	Specifies the minimum time (in seconds) to delay HSRP group initialization after an interface comes up. This period applies to all subsequent interface events. The range is from 1 to 10,000. The default is 0 seconds.
	reload reload-delay	Specifies the time period to delay HSRP group initialization after the router has reloaded. This period applies only to the first interface-up event after the router has reloaded. The range is from 1 to 10,000. The default is 0 seconds.

<b>Command Default</b> The HSRP delay default is 0 seconds.
---

#### **Command Modes**

Release	Modification
5.2(1)N1(1)	This command was introduced.

# **Usage Guidelines** Use the **hsrp delay** command to delay HSRP initialization either after a reload or after an interface comes up. This configuration allows the interface and router to stabilize after the interface comes up and helps prevent HSRP state flapping.

Examples

This example shows how to configure a minimum delay of 3 seconds and a group initialization delay of 10 seconds:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# ip address 172.16.6.5 255.255.255.0
switch(config-if)# hsrp 1
switch(config-if-hsrp)# hsrp delay minimum 3 reload 10
switch(config-if-hsrp)#
```

<b>Related Commands</b>	Command	Description
	feature hsrp	Enables the HSRP configuration.
	hsrp	Creates HSRP groups.
	show hsrp delay	Displays the HSRP delay information.

## **I** Commands

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) commands that begin with I.

# ip (HSRP)

To assign a virtual address to an HSRP group, use the **ip** command. To disable HSRP in the group, use the **no** form of this command.

ip [autoconfig | ip-address [secondary]]

no ip [autoconfig | *ip-address* [secondary]]

autoconfig	(Optional) Generates a link-local address from the link-local prefix and a modified EUI-64 format Interface Identifier, where the EUI-64 Interface Identifier is created from the relevant HSRP virtual MAC address.
ip-address	(Optional) Virtual IP address for the virtual router (HSRP group). The IP address must be in the same subnet as the interface IP address. You must configure the virtual IP address for at least one of the routers in the HSRP group. Other routers in the group will pick up this address. The IP address can be an IPv4 address.
secondary	(Optional) Indicates that the IPv4 address is a secondary HSRP virtual address.
Disabled	
HSRP configura	tion mode
Release	Modification
5.2(1)N1(1)	This command was introduced.
that address is the not configure a v same HSRP grou	and to activate HSRP on the configured interface. If you configure a virtual IP address, the designated virtual IP address for the entire HSRP group. For IPv4 groups, if you do virtual IP address, the gateway learns the virtual IP address from another gateway in the up. To allow HSRP to elect an active virtual gateway (AVG), you must configure at least the LAN with a virtual IP address.
that address is the not configure a v same HSRP grou one gateway on t	the designated virtual IP address for the entire HSRP group. For IPv4 groups, if you do virtual IP address, the gateway learns the virtual IP address from another gateway in the up. To allow HSRP to elect an active virtual gateway (AVG), you must configure at least
	<i>ip-address</i> secondary Disabled HSRP configura Release

You must configure all HSRP options before you use the **ip** command to assign a virtual IP address and activate the HSRP group so that you can avoid authentication error messages and unexpected state changes that can occur in other routers when a group is enabled first and then there is a delay before the configuration is created. We recommend that you always specify an IP address.

#### **Examples**

This example shows how to activate HSRP for group 10 on Ethernet interface 1/1. The virtual IP address used by the HSRP group is set to 192.0.2.10.

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# no switchport
switch(config-if)# ip address 192.0.2.32 255.255.255.0
switch(config-if)# hsrp 10
switch(config-if-hsrp)# ip 192.0.2.10
```

This example shows how to activate HSRP for group 10 on Ethernet interface 2/1. The virtual IP address used by the HSRP group will be learned from another gateway configured to be in the same HSRP group.

```
switch(config)# interface ethernet 2/1
switch(config-if)# no switchport
switch(config-if)# hsrp 10
switch(config-if-hsrp)#
```

This example shows how to activate HSRP for group 2 on Ethernet interface 1/1 and creates a secondary IP address on the interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# no switchport
switch(config-if)# ip address 20.20.20.1 255.255.255.0 secondary
switch(config-if)# ip address 10.10.10.1 255.255.255.0
switch(config-if)# hsrp 2
switch(config-if)# hsrp 2
switch(config-if-hsrp)# ip 10.10.10.2
switch(config-if-hsrp)# ip 20.20.20.2 secondary
```

	show hsrp	Displays HSRP information.

Г

## ipv6 (HSRP)

To assign a virtual address to an HSRP group, use the **ip** command. To disable HSRP in the group, use the **no** form of this command.

ipv6 [autoconfig | ip-address [secondary]]

no ipv6 [autoconfig | *ip-address* [secondary]]

Syntax Description	autoconfig	(Optional) Generates a link-local address from the link-local prefix and a modified EUI-64 format Interface Identifier, where the EUI-64 Interface Identifier is created from the relevant HSRP virtual MAC address.
	ipv6-address	(Optional) Virtual IPv6 address for the virtual router (HSRP group). The IPv6 address must be in the same subnet as the interface IPv6 address. You must configure the virtual IPv6 address for at least one of the routers in the HSRP group. Other routers in the group will pick up this address.
	secondary	(Optional) Indicates that the IPv6 address is a secondary HSRP virtual address.
Command Default	Disabled	
Command Modes	HSRP configurat	ion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	address, that addr if you do not con gateway in the sa	mmand to activate HSRP on the configured interface. If you configure a virtual IPv6 ress is the designated virtual IPv6 address for the entire HSRP group. For IPv6 groups, figure a virtual IPv6 address, the gateway learns the virtual IPv6 address from another me HSRP group. To allow HSRP to elect an active virtual gateway (AVG), you must one gateway on the LAN with a virtual IPv6 address.
	Configuring the v	virtual IPv6 address on the AVG always overrides a virtual IPv6 address that is in use.
	Address Resolution requests to map a replies to the ARI proxy ARP reque	ure the <b>ipv6</b> command for an IPv6 HSRP group on an interface, the handling of proxy on Protocol (ARP) requests changes (unless proxy ARP was disabled). Hosts send ARP n IPv6 address to a MAC address. The HSRP gateway intercepts the ARP requests and P requests on behalf of the connected nodes. If a forwarder in the HSRP group is active, ests are answered using the MAC address of the first active forwarder in the group. If ctive, proxy ARP responses are suppressed.
Note	and activate the H changes that can	Ire all HSRP options before you use the <b>ipv6</b> command to assign a virtual IPv6 address ISRP group so that you can avoid authentication error messages and unexpected state occur in other routers when a group is enabled first and then there is a delay before the created. We recommend that you always specify an IPv6 address.

#### Examples

This example shows how to activate HSRP for group 10 on Ethernet interface 1/1. The virtual IPv6 address used by the HSRP group is set to 192.0.2.10.

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# no switchport
switch(config-if)# ipv6 address 192.0.2.32 255.255.255.0
switch(config-if)# hsrp 10
switch(config-if-hsrp)# ipv6 192.0.2.10
```

This example shows how to activate HSRP for group 10 on Ethernet interface 2/1. The virtual IPv6 address used by the HSRP group will be learned from another gateway configured to be in the same HSRP group.

```
switch(config)# interface ethernet 2/1
switch(config-if)# no switchport
switch(config-if)# hsrp 10
switch(config-if-hsrp)#
```

This example shows how to activate HSRP for group 2 on Ethernet interface 1/1 and creates a secondary IPv6 address on the interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# no switchport
switch(config-if)# ipv6 address 20.20.20.1 255.255.255.0 secondary
switch(config-if)# ipv6 address 10.10.10.1 255.255.255.0
switch(config-if)# hsrp 2
switch(config-if)# hsrp 10.10.10.2
switch(config-if-hsrp)# ipv6 10.10.10.2
```

# **P** Commands

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) commands that begin with P.

## preempt (HSRP)

To configure a preemption delay, use the **preempt** command. To disable this feature, use the **no** form of this command.

preempt [delay {minimum min-delay | reload rel-delay | sync sync-delay}]

**no preempt** [**delay** {**minimum** *min-delay* | **reload** *rel-delay* | **sync** *sync-delay*}]

Syntax Description	<b>delay minimum</b> <i>min-delay</i>	(Optional) Specifies the minimum number of seconds that preemption is delayed to allow routing tables to be updated before a router becomes active. The default value is 0.
	reload rel-delay	(Optional) Specifies the time delay after the router has reloaded. This period applies only to the first interface-up event after the router has reloaded. The default value is 0.
	sync sync-delay	(Optional) Specifies the maximum number of seconds to allow IP redundancy clients to prevent preemption. When this period expires, preemption occurs regardless of the state of the IP redundancy clients. The default value is 0.
Command Default	The default delay tin	ne for all options is 0 seconds.
Command Modes	Interface configurati	on or HSRP template mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	a router first comes u preemption if it first does not receive a he	Im delay allows routing tables to be updated before a router becomes active. When up, it does not have a complete routing table. A high-priority router will only delay receives a hello packet from a low-priority active router. If the high-priority router llo packet from the low-priority active router when it is starting up, it assumes there or the group and becomes active as soon as possible.
Examples	This example shows	how to configure a delay when a router becomes active when its priority is 110:
	<pre>switch(config-if)# switch(config-if)# switch(config-if)#</pre>	terface ethernet 0/1 no switchport ip address 10.0.0.1 255.255.0 hsrp 4 srp)# priority 110

Related Commands	Command	Description
	feature hsrp	Enables the HSRP configuration.
	show hsrp	Displays HSRP information.

## priority (HSRP)

To set the priority level within a Hot Standby Router Protocol (HSRP) group, use the **priority** command. To remove the priority level, use the **no** form of this command.

priority level [forwarding-threshold lower lower-value upper-value]

**no priority** *level* [forwarding-threshold lower *lower-value* upper-value]

Syntax Description	level	Interface priority for a virtual router. The range of values is from 1 to 255. If this router is the owner of the IP addresses, then the value is automatically set to 255. The default is 100.
	forwarding-threshold	(Optional) Sets the threshold used by a virtual port channel (vPC) to determine when to fail over to the vPC trunk.
	lower lower-value	(Optional) Sets the low threshold value. The range is from 1 to 255. The default is 1.
	<b>upper</b> upper-value	(Optional) Sets the upper threshold value. The range is from 1 to 255. The default is 255.
Command Default	level: 100 lower-value: 1 upper-value: 255	
Command Modes	HSRP configuration or I	HSRP template mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	the priorities of all virtua	and to control which virtual router becomes the active router. HSRP compares al routers in the HSRP group and selects the router with the numerically highest outers have equal priority, HSRP selects the router with the highest IP address.
Examples	<pre>switch# configure term switch(config)# inter switch(config-if)# no</pre>	face ethernet 0/1 switchport address 10.0.0.1 255.255.255.0

Related Commands	Command	Description
	feature hsrp	Enables the HSRP configuration.
	show hsrp	Displays HSRP information.

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

## **Show Commands**

This chapter describes the Cisco NX-OS Hot Standby Router Protocol (HSRP) show commands.

## show hsrp

To display Hot Standby Router Protocol (HSRP) information for each HSRP group, use the **show hsrp** command.

show hsrp [interface {ethernet slot/[QSFP-module/]port | port-channel number | vlan vlan-id}]
[group group-number] [active | init | listen | standby] [all] [brief] [detail] [ipv4]

Syntax Description	interface	(Optional) Specifies the interface for which to display HSRP information.	
	ethernet slot/[QSFP-module/]por	Specifies the Ethernet interface and the slot number and port number. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.	
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).	
	port-channel number	Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.	
	vlan vlan-id	Specifies the VLAN interface. The range is from 1 to 4094.	
	group group-number	(Optional) Specifies the HSRP group number of the interface to display information about. The range is from 0 to 4095.	
	active	(Optional) Displays HSRP groups that are in an active state.	
	init	(Optional) Displays HSRP groups that are in an initialization state.	
	listen	(Optional) Displays HSRP groups that are in an listen state.	
	standby	(Optional) Displays HSRP groups that are in an standby state.	
	all	(Optional) Displays all HSRP groups.	
	brief	(Optional) Summarizes each virtual gateway or virtual forwarder with a single line of output.	
	detail	(Optional) Displays detailed information about HSRP groups.	
	ipv4	(Optional) Displays HSRP IPv4 groups.	
Command Default	None		
Command Modes	Any command mode		
Command History	Release Mo	dification	
	6.0(2)N1(2) Su	pport for the QSFP+ GEM was added.	
	5.2(1)N1(1) Th	is command was introduced.	
Usage Guidelines		nand to display information about HSRP groups. The <b>brief</b> keyword displays a	

If you have not configured authentication, the show hsrp command will display the following string:

Authentication text "cisco"

This is the default behavior of HSRP as defined in RFC 2281:

If no authentication data is configured, the RECOMMENDED default value is 0x63 0x69 0x73 0x63 0x6F 0x00 0x00 0x00.

This command does not require a license.

Note

Make sure the LAN Base Services license is installed on the switch to enable Layer 3 interfaces.

Examples

This example shows how to display the default information about HSRP:

```
switch# show hsrp
Vlan1 - Group 1 (HSRP-V1) (IPv4)
Local state is Active, priority 150 (Cfged 150), may preempt
Forwarding threshold(for vPC), lower: 1 upper: 150
Preemption Delay (Seconds) Reload:300
Hellotime 3 sec, holdtime 10 sec
Next hello sent in 0.793000 sec(s)
Virtual IP address is 10.1.1.3 (Cfged)
Active router is local
Standby router is unknown
Authentication text "cisco"
Virtual mac address is 0000.0c07.ac01 (Default MAC)
17 state changes, last state change 1w0d
IP redundancy name is hsrp-Vlan1-1 (default)
...
```

Note

The authentication text string in the preceding example indicates that authentication has not been configured on the interface.

This example shows how to display a brief summary of HSRP information:

```
switch# show hsrp brief
                     P indicates configured to preempt.
Interface
           Grp Prio P State
                                Active addr
                                                 Standby addr
                                                                  Group addr
Vlan1
           1
               150 P Active
                                local
                                                 unknown
                                                                  10.1.1.3
                                                                                  (conf)
              150 P Active

# **C** Commands

This chapter describes the Cisco NX-OS Layer 3 interfaces commands that begin with C.

#### clear ip arp

To clear the Address Resolution Protocol (ARP) information, use the clear ip arp command.

clear ip arp [ip-addr | {[event-history | all | cli | client-errors | client event | control | errors |
 event | ha | lcache | lcache-errors | packet | snmp | sync-event]} | [force-delete | statistics] |
 [mgmt mgmt-inteface-number] | [statistics] | [tunnel-statistics] | [vlan vlan-interface-number] |
 [vpc-statistics] | [vrf vrf-name | all | default | management]

Syntax Description	ip-addr	(Optional) IPv4 source address. The format is x.x.x.x.
	event-history	(Optional) Clears the event history buffers.
	all	(Optional) Clears all event history buffers.
	cli	(Optional) Clears CLI logs.
	client-errors	(Optional) Clears client_error logs.
	client-event	(Optional) Clears client_event logs.
	control	(Optional) Clears ARP control event logs.
	errors	(Optional) Clears inst error logs.
	event	(Optional) Clears internal event logs.
	ha	(Optional) Clears HA and GR logs.
	lcache	(Optional) Clears lcache logs.
	lcache-errors	(Optional) Clears lcache_error logs.
	packet	(Optional) Inst packet logs.
	snmp	(Optional) SNMP logs.
	sync-event	(Optional) CFS and MCECM related event logs.
	force-delete	(Optional) Clears the entries from the ARP table without a refresh.
	mgmt	(Optional) Management interface
	mgmt-inteface-number	
	statistics	(Optional) Clears ARP statistics.
	ethernet	(Optional) Ethernet IEEE 802.3z
	loopback	(Optional) Loopback interface
	mgmt	(Optional) Management Interface
	port-channel	(Optional) Port channel interface
	vlan	(Optional) VLAN interface
	vrf	(Optional) Displays per-VRF information
	tunnel-statistics	(Optional) Clears ARP statistics for tunneled packets
	<b>vlan</b> vlan-interface-number	(Optional) VLAN interface
	vpc-statistics	(Optional) Clears ARP vPC statistics
	vrf vrf-name	(Optional) Specifies the virtual routing and forwarding (VRF) context name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
	all	(Optional) Clears the ARP information from all VRF entries.

	default	(Optional) Clears the ARP information from the default VRF.
	management	(Optional) Clears the ARP information from the management VRF.
Command Default	None	
Command Modes	Any command mode	e
		-
Command History	Release	Modification
	6.0(2)N1(2)	Support for the QSFP+ GEM was added.
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows	s how to clear the ARP table:
	switch# <b>clear ip a</b>	arp
Related Commands	Command	Description
	show ip arp	Displays information about ARP.
	suow ih ai h	Displays mormation about AKI.

# clear ip interface statistics

To clear IP interface statistics, use the clear ip interface statistics command.

clear ip interface statistics

Syntax Description	This command has n	no arguments or keywords.
Command Default	None	
Command Modes	Any command mode	
Command History	<b>Release</b> 5.2(1)N1(1)	Modification This command was introduced.
Examples	-	how to clear the IP interface statistics: .nterface statistics

Related Commands	Command	Description
	show ip interface	Displays IP interface information.

## clear ipv6 icmp interface statistics

To clear statistics about ICMPv6, use the clear ipv6 icmp interface statistics command.

clear ipv6 icmp interface statistics [type number]

Syntax Description	type	(Optional) Interface type. Use ? to see the list of supported interfaces.
	number	(Optional) Interface number. Use ? to see the range.
Defaults	None	
Command Modes	Any command	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command	does not require a license.
Examples	This example s	hows how to clear the ICMPv6 statistics:
	switch(config	-if)# clear ipv6 icmp interface statistics
Related Commands	Command	Description
	ipv6 icmp	Configures ICMPv6 on an interface.

# clear ipv6 nd interface statistics

To clear information about Neighbor Discovery (ND), use the **clear ipv6 nd interface statistics** command.

clear ipv6 nd interface statistics [type number]

Syntax Description	type	(Optional) Interface type. Use ? to see the list of supported interfaces.
	number	(Optional) Interface number. Use ? to see the range.
Defaults	None	
Command Modes	Any command	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command	does not require a license.
Examples	This example s	shows how to clear the ND information:
	switch(config	-if)# clear <b>ipv6 nd interface statistics</b>
Related Commands	Command	Description
	ipv6 nd	Configures ICMPv6 ND on an interface.

# clear ipv6 neighbor

To clear IPv6 neighbors, use the clear ipv6 neighbor command.

clear ipv6 neighbor [type number] [force-clear] [vrf vrf-name]

Syntax Description		
eynax beeenpaen	type	(Optional) Interface type. Use ? to see the list of supported interfaces.
	number	(Optional) Interface number. Use ? to see the range.
	force-clear	(Optional) Clears the IPv6 neighbor cache withouth a refresh.
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 63 characters.
Defaults	None	
command Modes	Any command	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Jsage Guidelines		This command was introduced.
Jsage Guidelines	Use the clear ij	
	Use the <b>clear ij</b> This command	<b>pv6 neighbor</b> command to clear the IPv6 adjacency table.
Usage Guidelines Examples	Use the <b>clear ij</b> This command This example s	<b>pv6 neighbor</b> command to clear the IPv6 adjacency table. does not require a license.
	Use the <b>clear ij</b> This command This example s	<b>by6 neighbor</b> command to clear the IPv6 adjacency table. does not require a license. hows how to clear the IPv6 neighbors:

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# I Commands

This chapter describes the Cisco NX-OS Layer 3 interfaces commands that begin with I.

#### ip address

To set a primary or secondary IP address for an interface, use the **ip address** command. To remove an IP address or disable IP processing, use the **no** form of this command.

ip address ip-address mask [secondary]

no ip address ip-address mask [secondary]

Contact Description	· 11	
Syntax Description	ip-address	IPv4 address in the format A.B.C.D or A.B.C.D/length.
	mask	Mask for the associated IP subnet.
	secondary	(Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
Command Default	No IP address is de	fined for the interface.
Command Modes	Interface configura Subinterface config	
Command History	Release	Modification
-	5.2(1)N1(1)	This command was introduced.
 Note	Before you use this command, make sure that you use the <b>no switchport</b> command on the interface to use the Layer 3 features. An interface can have one primary IP address and one secondary IP address.	
	You can disable IP processing on a particular interface by removing its IP address with the <b>no ip address</b> command.	
treated like primary addresses, except the system never generates datage		<b>dary</b> keyword allows you to specify a secondary IP address. Secondary addresses are addresses, except the system never generates datagrams other than routing updates rce addresses. IP broadcasts and Address Resolution Protocol (ARP) requests are erface routes in the IP routing table.
Note	•	ing using the Open Shortest Path First (OSPF) algorithm, ensure that the secondary face fall into the same OSPF area as the primary addresses.
Examples		s how to configure the IP address 192.168.0.27 as the primary address and secondary address for Ethernet interface 1/5:

```
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# ip address 192.168.0.27 255.255.255.0
switch(config-if)# ip address 192.168.0.5 255.255.255.0 secondary
switch(config-if)#
```

#### Related Commands

nds	Command	Description
	copy running-config startup-config	Saves the configuration change to the startup configuration file.
	no switchport	Enables an interface for Layer 3 configuration.
	show ip interface	Displays interfaces configured for IPv4.

# ip arp

To configure a static Address Resolution Protocol (ARP) entry, use the **ip arp** command. To remove a static ARP entry, use the **no** form of this command.

ip arp *ip-address mac-address* 

no ip arp *ip-address* 

Cuntary Description	• 11	ID 4 allows 's A D C D former	
Syntax Description	ip-address mac-address	IPv4 address, in <i>A.B.C.D</i> format.	
	mac-adaress	MAC address in one of the following formats:	
		• E.E.E	
		• EE-EE-EE-EE-EE	
		• EE:EE:EE:EE:EE	
		• EEEE.EEEE	
Command Default	None		
Command Modes	Release	Modification

# ip arp gratuitous

To enable gratuitous Address Resolution Protocol (ARP), use the **ip arp gratuitous** command. To disable gratuitous ARP, use the **no** form of this command.

ip arp gratuitous {request | update}

no ip arp gratuitous {request | update}

Syntax Description	request	Enables sending gratuitous ARP requests when a duplicate address is detected.
	update	Enables ARP cache updates for gratuitous ARP.
command Default	Enabled	
ommand Modes	Interface configu	iration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example sho	ows how to disable gratuitous ARP request on interface Ethernet 2/1:
	switch(config)#	<pre>interface ethernet 1/2 if)# no gwitghowt</pre>
	switch(config-i switch(config-i switch(config-i	f)# ip arp gratuitous
Related Commands	switch(config-i	if)# <b>ip arp gratuitous</b> if)#
Related Commands	switch(config-i switch(config-i	f)# ip arp gratuitous

## ip arp timeout

To configure an Address Resolution Protocol (ARP) timeout, use the **ip arp timeout** command. To revert to the default value, use the **no** form of this command.

**ip arp timeout** *timeout-value* 

no ip arp timeout

Syntax Description	timeout-value	Time (in seconds) that an entry remains in the ARP cache. Valid values are from 60 to 28800, and the default is 1500.	
Command Default	1500 seconds		
Command Modes	Global configuration mo	ode	
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
Examples	This example shows how to configure the ARP timeout value to 120 seconds: switch(config)# <b>ip arp timeout 120</b>		
	<pre>switch(config)#</pre>		
	This example shows how to revert to the default ARP timeout value of 1500 seconds:		
	<pre>switch(config)# no ip switch(config)#</pre>	arp timeout	
Related Commands	Commond	Description	
Kelated Commands	Command show running-config arp all	<b>Description</b> Displays the ARP configuration, including the default configurations.	

## ip directed-broadcast

To enable the translation of a directed broadcast to physical broadcasts, use the **ip directed-broadcast** command. To disable this function, use the **no** form of this command.

ip directed-broadcast

no ip directed-broadcast

Syntax Description	This command has no arguments or keywords.		
Command Default	Disabled; all IP d	Disabled; all IP directed broadcasts are dropped.	
Command Modes	Interface configuration mode Subinterface configuration mode		
Command History	<b>Release</b> 5.2(1)N1(1)	Modification           This command was introduced.	
Usage Guidelines	<ul> <li>An IP directed broadcast is an IP packet whose destination address is a valid broadcast address for some IP subnet but which originates from a node that is not itself part of that destination subnet.</li> <li>A device that is not directly connected to its destination subnet forwards an IP directed broadcast in the same way it would forward unicast IP packets destined to a host on that subnet. When a directed broadcast packet reaches a device that is directly connected to its destination subnet, that packet is broadcast on the destination subnet. The destination address in the IP header of the packet is rewritten to the configured IP broadcast address for the subnet, and the packet is sent as a link-layer broadcast.</li> <li>If directed broadcast is enabled for an interface, incoming IP packets whose addresses identify them as directed broadcasts intended for the subnet to which that interface is attached are broadcast on that subnet.</li> <li>If the no ip directed-broadcast command has been configured for an interface, directed broadcasts destined for the subnet to which that interface are dropped, rather than being broadcast.</li> </ul>		
Note	broadcasts, have broadcasts, have broadcasts, have broadcasts	broadcasts, and particularly Internet Control Message Protocol (ICMP) directed been abused by malicious persons, we recommend that you disable the <b>ip</b> <b>ast</b> command on any interface where directed broadcasts are not needed. We also you use access lists to limit the number of broadcast packets.	
Examples	switch(config)#	ws how to enable forwarding of IP directed broadcasts on Ethernet interface 2/1: interface ethernet 2/1 f) # no switchport	

switch(config-if)# ip directed-broadcast
switch(config-if)#

Related Commands	Command	Description
	show ip interface	Displays IP information for an interface.

# interface ethernet (Layer 3)

To configure a Layer 3 Ethernet IEEE 802.3 routed interface, use the interface ethernet command.

interface ethernet [chassis\_ID/] slot/[QSFP-module/]port[.subintf-port-no]

Syntax Description	chassis_ID	(Optional) Specifies the Fabric Extender chassis ID. The chassis ID is from 100 to 199.	
		<b>Note</b> This argument is not optional when addressing the host interfaces of a Cisco Nexus 2000 Series Fabric Extender.	
	slot	Slot from 1 to 4. The following list defines the slots available:	
		• Slot 1 includes all the fixed ports. A Fabric Extender only has one slot.	
		• Slots 2 to 4 include the ports on the Generic Expansion Module (if populated).	
	QSFP-module	The <i>QSFP-module</i> number is from 1 to 4.	
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).	
	port	Port number within a particular slot. The port number is from 1 to 128.	
	•	(Optional) Specifies the subinterface separator.	
	subintf-port-no	(Optional) Port number for the subinterface. The range is from 1 to 48.	
Command Modes	Global configuration Interface configuration	on mode	
Command History	Release	Modification	
	$\frac{6.0(2)N1(2)}{5.2(1)N1(1)}$	Support for the QSFP+ GEM was added.	
Usage Guidelines	5.2(1)N1(1) You must use the <b>no</b> s	This command was introduced. switchport command in the interface configuration mode to configure the interface	
	as a Layer 3 routed interface. When you configure the interface as a Layer 3 interface, all Layer 2 specific configurations on this interface are deleted.		
		ommand to convert a Layer 3 interface into a Layer 2 interface. When you configure yer 2 interface, all Layer 3 specific configurations on this interface are deleted.	
Examples	-	how to enter configuration mode for a Layer 3 Ethernet interface 1/5: terface ethernet 1/5 no switchport	

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

switch(config-if)# ip address 10.1.1.1/24
switch(config-if)#

This example shows how to enter configuration mode for a host interface on a Fabric Extender:

```
switch(config)# interface ethernet 101/1/1
switch(config-if)# no switchport
switch(config-if)# ip address 10.1.1.1/24
switch(config-if)#
```

This example shows how to configure a Layer 3 subinterface for Ethernet interface 1/5 in the global configuration mode:

```
switch(config)# interface ethernet 1/5.2
switch(config-if)# no switchport
switch(config-subif)# ip address 10.1.1.1/24
switch(config-subif)#
```

This example shows how to configure a Layer 3 subinterface in interface configuration mode:

```
switch(config)# interface ethernet 1/5
switch(config-if)# interface ethernet 1/5.1
switch(config-if)# no switchport
switch(config-subif)# ip address 10.1.1.1/24
switch(config-subif)#
```

This example shows how to convert a Layer 3 interface to a Layer 2 interface:

```
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# ip address 10.1.1.1/24
switch(config-if)# switchport
switch(config-if)#
```

Related Commands	Command	Description
	bandwidth	Sets the bandwidth parameters for an interface.
	delay	Configures the interface throughput delay value.
	encapsulation	Sets the encapsulation type for an interface.
	ip address	Sets a primary or secondary IP address for an interface.
	inherit	Assigns a port profile to an interface.
	interface vethernet	Configures a virtual Ethernet interface.
	no switchport	Configures an interface as a Layer 3 interface.
	service-policy	Configures a service policy for an interface.
	show fex	Displays all configured Fabric Extender chassis connected to the switch.
	show interface ethernet	Displays various parameters of an Ethernet IEEE 802.3 interface.

#### ip local-proxy-arp

To enable the local proxy Address Resolution Protocol (ARP) feature, use the **ip local-proxy-arp** command. To disable this feature, use the **no** form of this command.

ip local-proxy-arp

no ip local-proxy-arp

Syntax Description	This command has no arguments or keywords.
--------------------	--

Command Default Disabled

**Command Modes** Interface configuration mode Subinterface configuration mode

 Release
 Modification

 5.2(1)N1(1)
 This command was introduced.

**Usage Guidelines** Before the local proxy ARP feature can be used, you must enable the IP proxy ARP feature by using the **ip proxy-arp** command. The IP proxy ARP feature is disabled by default.

Note

This command is not applicable to Layer 3 loopback interfaces.

**Examples** This example shows how to enable the local proxy ARP:

switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# ip arp local-proxy-arp
switch(config-if)#

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	ip proxy-arp	Enables proxy ARP on an interface.
	show ip arp	Displays ARP configuration information.

## interface loopback

To create a loopback interface and enter interface configuration mode, use the **interface loopback** command. To remove a loopback interface, use the **no** form of this command.

interface loopback number

no interface loopback number

Syntax Description	number	Interface number; valid values are from 0 to 1023.	
Command Default	None		
Command Modes	Global configuration	on mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>interface l</b>	oopback command to create or modify loopback interfaces.	
	From the loopback interface configuration mode, the following parameters are available:		
	• <b>description</b> —Provides a description of the purpose of the interface.		
		s IP features, such as the IP address for the interface, Address Resolution Protocol es, load balancing, Unicast Reverse Path Forwarding (RPF) or IP Source Guard.	
	• logging—Con	figure logging of events.	
	• shutdown—Sl	nut down traffic on the interface.	
	This command doe	s not require a license.	
Examples	This example show	rs how to create a loopback interface:	
		interface loopback 50 # ip address 10.1.1.1/24 #	
Related Commands	Command	Description	
	show interface loopback	Displays information about the traffic on the specified loopback interface.	

#### interface port-channel

To create an EtherChannel interface and enter interface configuration mode, use the **interface port-channel** command. To remove an EtherChannel interface, use the **no** form of this command.

interface port-channel channel-number[.subintf-channel-no]

**no interface port-channel** *channel-number*[.*subintf-channel-no*]

Suntax Description			
Syntax Description	channel-number	Channel number that is assigned to this EtherChannel logical interface. The range is from 1 to 4096.	
	•	(Optional) Specifies the subinterface separator.	
		Note Applies to Layer 3 interfaces.	
	subintf-channel-no	(Optional) Port number of the EtherChannel subinterface. The range is from 1 to 4093.	
		Note Applies to Layer 3 interfaces.	
Command Default	None		
Command Modes	Global configuration n Interface configuratior		
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
	5.2(1)N1(1)	Support for Layer 3 interfaces and subinterfaces was added.	
Usage Guidelines		nly one channel group.	
	When you use the inte	rface port-channel command for Layer 2 interfaces, follow these guidelines:	
	• If you are using CDP, you must configure it only on the physical interface and not on the EtherChannel interface.		
	• If you do not assign a static MAC address on the EtherChannel interface, a MAC address is automatically assigned. If you assign a static MAC address and then later remove it, the MAC address is automatically assigned.		
	• The MAC address of the EtherChannel is the address of the first operational port added to the channel group. If this first-added port is removed from the channel, the MAC address comes from the next operational port added, if there is one.		

**Examples** 

Use the **switchport** command to convert a Layer 3 EtherChannel interface into a Layer 2 interface. When you configure the interface as a Layer 2 interface, all Layer 3 specific configurations on this interface are deleted.

You can configure one or more subinterfaces on a port channel made from routed interfaces.

This example shows how to create an EtherChannel group interface with channel-group number 50:

switch(config)# interface port-channel 50
switch(config-if)#

This example shows how to create a Layer 3 EtherChannel group interface with channel-group number 10:

```
switch(config)# interface port-channel 10
switch(config-if)# no switchport
switch(config-if)# ip address 192.0.2.1/24
switch(config-if)#
```

This example shows how to configure a Layer 3 EtherChannel subinterface with channel-group number 1 in interface configuration mode:

```
switch(config)# interface port-channel 10
switch(config-if)# no switchport
switch(config-if)# interface port-channel 10.1
switch(config-subif)# ip address 192.0.2.2/24
switch(config-subif)#
```

This example shows how to configure a Layer 3 EtherChannel subinterface with channel-group number 20.1 in global configuration mode:

```
switch(config)# interface port-channel 20.1
switch(config-subif)# ip address 192.0.2.3/24
switch(config-subif)#
```

<b>Related Commands</b>	Command	Description
	encapsulation	(Layer 3 interfaces) Sets the encapsulation type for an interface.
	ip address	(Layer 3 interfaces) Sets a primary or secondary IP address for an interface.
	no switchport	(Layer 3 interfaces) Configures an interface as a Layer 3 interface.
	show interface	Displays configuration information about interfaces.
	show lacp	Displays LACP information.
	show port-channel	Displays information on the EtherChannels.
	summary	
	vtp (interface)	Enables VLAN Trunking Protocol (VTP) on an interface.

#### ip port-unreachable

To enable the generation of Internet Control Message Protocol (ICMP) port unreachable messages, use the **ip port-unreachable** command. To disable this function, use the **no** form of this command.

ip port-unreachable

no ip port-unreachable

Syntax Description	This command has	no arguments or keywords.
Command Default	Enabled	
Command Modes	Interface configurat Subinterface config	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows on an interface:	s how to enable the generation of ICMP port unreachable messages, as appropriate,
	switch(config-if)	nterface ethernet 2/1
Related Commands	Command	Description
	ip unreachables	Sends ICMP unreachable messages.

#### ip proxy-arp

To enable proxy Address Resolution Protocol (ARP) on an interface, use the **ip proxy-arp** command. To disable proxy ARP on the interface, use the **no** form of this command.

ip proxy-arp

no ip proxy-arp

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

**Command Default** Disabled

Command ModesInterface configuration modeSubinterface configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

Examples	This example shows how to enable proxy ARP:
----------	---

switch(config)# interface ethernet 2/1
switch(config-if)# no switchport
switch(config-if)# ip proxy-arp
switch(config-if)#

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	show ip arp	Displays ARP configuration information.

#### ip tcp path-mtu-discovery

To enable path maximum transmission unit (MTU) discovery on an IPv4 interface, use the **ip tcp path-mtu discovery** command. To disable this feature, use the **no** form of this command.

ip tcp path-mtu discovery

no ip tcp path-mtu discovery

Syntax Description	This command has no arguments or keywords.
--------------------	--

**Command Default** Disabled

**Command Modes** Interface configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

**Examples** This example shows how to enable path MTU discovery for IPv4:

switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# ip tcp path-mtu-discovery switch(config-if)#

Related Commands	Command	Description
	show ip arp	Displays ARP configuration information.

# ip tcp synwait-time

To set a period of time the Cisco NX-OS software waits while attempting to establish a TCP connection before it times out, use the **ip tcp synwait-time** command. To restore the default time, use the **no** form of this command.

ip tcp synwait-time seconds

no ip tcp synwait-time

Syntax Description	seconds	Time, in seconds, the software waits while attempting to establish a TCP connection. It can be an integer from 5 to 300 seconds.
Command Default	5 seconds	
Command Modes	Global configurati	on mode
Command History	Release	Modification
	5.1(3)N1(1)	This command was introduced.
Examples	This example show connection for 10	ws how to configure the switch software to continue attempting to establish a TCP seconds:
Examples		seconds:
	switch(config)# Setting syn time switch(config)#	<pre>ip tcp synwait-time 10 e to 10 seconds</pre>
	This example show	ws how to disable TCP synchronization on interfaces:
	<pre>switch# configur switch(config)# switch(config)#</pre>	e terminal no ip tcp synwait-time
Related Commands	Command	Description
	show running-co	<b>nfig</b> Displays the running system configuration information.

#### ip unreachables

To enable the generation of Internet Control Message Protocol (ICMP) unreachable messages, use the **ip unreachables** command. To disable this function, use the **no** form of this command.

ip unreachables

no ip unreachables

Syntax Description	This command has no arguments or ke	ywords.
--------------------	-------------------------------------	---------

**Command Default** Enabled

Command ModesInterface configuration modeSubinterface configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

**Examples** This example shows how to enable the generation of ICMP unreachable messages on an interface:

switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# ip unreachables

<b>Related Commands</b>	Command	Description
	ip port-unreachable	Sends ICMP port unreachable messages.

#### ipv6 nd

To configure IPv6 neighbor discovery (ND), use the **ipv6 nd** command. To remove the IPv6 ND configuration, use the **no** form of this command.

- ipv6 nd {hop-limit hop-limit | managed-config-flag | mtu | ns-interval ns-interval |
  other-config-flag | prefix {A:B::C:D/LEN | default {0-4294967295 | infinite {infinite
  [no-autoconfig | no-onlink | off-link]}| no-advertise}} | ra-interval ra-interval | ra-lifetime
  ra-lifetime | reachable-time reachable-time | redirects | retrans-timer retrans-timer |
  suppress-ra [mtu]}
- no ipv6 nd {hop-limit hop-limit | managed-config-flag | mtu mtu-size | ns-interval ns-interval |
  other-config-flag | prefix {A:B::C:D/LEN | default {0-4294967295 | infinite { infinite
   [no-autoconfig | no-onlink | off-link]} | no-advertise}} | ra-interval ra-interval | ra-lifetime
   ra-lifetime | reachable-time reachable-time | redirects | retrans-timer retrans-timer |
   suppress-ra [mtu]}

yntax Description	hop-limit	Specifies the hop limit in the IPv6 header.
	hop-limit	Hop limit. The range is from 0 to 255.
	managed-config-flag	Informs hosts to use stateful address autoconfiguration to obtain address information.
	mtu	Specifies the MTU size.
	mtu-size	MTU size. The range is from 1280 to 65535.
	ns-interval	Specifies the retransmission interval between sending the neighbor-solicitation messages.
	ns-interval	Interval in milliseconds. The range is from 1000 to 3600000.
	other-config-flag	Informs hosts to use stateful autoconfiguration to obtain non-address related information.
	prefix	Specifies the IPv6 prefix to advertise in the router-advertisement message.
	A:B::C:D/LEN	Specifies the IPv6 address prefix.
	default	Specifies the prefix default parameters.
	0-4294967295	Valid value for the life time.
	infinite	Specifies the indefinite lifetime.
	no-autoconfig	(Optional) Specifies no to use the prefix for autoconfiguration.
	no-onlink	(Optional) Specifies not use the prefix for the onlink determination.
	off-link	Indicates the prefix is offlink.
	no-advertise	Specifies not to advertise the prefix.
	ra-interval	Specifies the interval between sending the router-advertisement message.
	ra-interval	Router-advertisement message interval. The range is from 4 to 1800.
	ra-lifetime	Specifies the router lifetime of a default router.
	ra-lifetime	Router-advertisement message lifetime. The range is from 4 to 1800. The value for the default router cannot be 0.
	reachable-time	Specifies the advertised time when a node considers a neighbor is up after receiving a reachability confirmation.
	reachable-time	Reachable time. The range is from 0 to 3600000.

	redirects	Enables sending ICMPv6 Redirect messages.
	retrans-timer	Specifies the advertised time between NS messages.
	retrans-timer	Time between messages. The range is from 0 to 4294967295.
	suppress-ra	Disables sending router-advertisement messages.
Defaults	hop-limit–64 mtu–1500	
	ns-interval–1000 ra-interval–600	
	reachable-time–0 retrans-timer–0	
Command Modes	Interface configura	tion mode
Command History	Release	Modification
	5.2(1)U3(1)	This command was introduced.
Usage Guidelines	This command doe	s not require a license.
Examples	This example show	s how to configure IPv6 neighbor discovery:
	switch(config-if)	nterface ethernet 1/5
	This example show	s how to remove IPv6 neighbor discovery:
	<pre>switch(config-if) switch(config-if)</pre>	# no ipv6 nd reachable time 30 #
Related Commands	Command	Description

show ipv6 nd interface Displays neighbor discovery interface information.

# **N** Commands

This chapter describes the Cisco NX-OS Layer 3 interfaces commands that begin with N.

#### no switchport

To configure the interface as a Layer 3 Ethernet interface, use the **no switchport** command.

no switchport **Syntax Description** This command has no arguments or keywords. **Command Default** None **Command Modes** Interface configuration mode Release Modification **Command History** 5.2(1)N1(1) This command was introduced. **Usage Guidelines** You can configure any Ethernet port as a routed interface. When you configure an interface as a Layer 3 interface, any configuration specific to Layer 2 on this interface is deleted. If you want to configure a Layer 3 interface for Layer 2, enter the switchport command. Then, if you change a Layer 2 interface to a routed interface, enter the **no switchport** command. **Examples** This example shows how to enable an interface as a Layer 3 routed interface: switch(config)# interface ethernet 1/5 switch(config-if) # no switchport switch(config-if)# This example shows how to configure a Layer 3 interface as a Layer 2 interface: switch(config)# interface ethernet 1/5 switch(config-if)# switchport switch(config-if)# **Related Commands** Command Description

copy running-config startup-config	Saves the running configuration to the startup configuration file.
ip address	Sets a primary or secondary IP address for an interface.
show interfaces	Displays interface information.

# **R** Commands

This chapter describes the Cisco NX-OS Layer 3 interfaces commands that begin with R.

## routing-context vrf

To set the virtual routing and forwarding (VRF) scope for all EXEC commands, use the **routing-context vrf** command. To return to the default setting, use the **no** form of this command.

routing-context vrf vrf-name

no routing-context vrf vrf-name

Syntax Description	vrf-name	Name of the VRF instance. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	default VRF	
Command Modes	EXEC mode	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>routing-context vrf</b> command to set the VRF scope for all EXEC commands (for example, <b>show</b> commands). This feature automatically restricts the scope of the output of EXEC commands to the configured VRF. You can override this scope by using the VRF keywords available for some EXEC commands.	
Examples	This example shows how to limit EXEC commands to the management VRF: switch# routing-context vrf management switch%management#	
Related Commands	Command	Description
	show routing-context	Displays the current routing context.

# **Show Commands**

This chapter describes the Cisco NX-OS Layer 3 interfaces **show** commands.

## show interface brief

To display a brief summary of the interface configuration information, use the **show interface brief** command.

#### show interface brief

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** None
- **Command Modes** EXEC mode

 Release
 Modification

 5.2(1)N1(1)
 This command was introduced.

#### **Examples**

This example shows how to display the summary configuration information of the specified interface: switch# show interface brief

Ethernet Interface	VLAN	Туре	Mode	Status	Reason	Speed	Port Ch #

Note the following in the above display:

- Ethernet 1/5 is a Layer 3-ready interface. The following fields in the display help identify an interface as a configured Layer 3 interface:
  - Mode—routed
  - Status—up
  - Reason-none
- Ethernet 1/5.2 is a Layer 3 subinterface; however, the interface is not ready for Layer 3 configuration (Status—down).
- Interface Lo10 is a Layer 3 loopback interface.

This example shows how to display a brief summary of interfaces configured as FabricPath interfaces on a switch that runs Cisco Nexus 5500 Release 5.1(3)N1(1):

switch# show interface brief

Ethernet Interface	VLAN	Туре	Mode	Status	Reason	Speed	Port Ch#
Eth1/1	1	eth	access	down	SFP not inserted	1000(D)	
Eth1/2		eth	routed	down	SFP not inserted	1000(D)	
Eth1/3	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/4	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/5	1	eth	f-path	down	SFP not inserted	10G(D)	
Eth1/6	1	eth	access	down	Link not connected	10G(D)	
Eth1/7	1	eth	fabric	down	Link not connected	10G(D)	
Eth1/8	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/9	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/10	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/11	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/12	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/13	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/14	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/15	1	eth	pvlan	up	none	1000(D)	
Eth1/16	1	eth	access	down	SFP not inserted	10G(D)	
Eth1/17	1	eth	access	down	SFP not inserted	10G(D)	
switch#							

In the above display, Ethernet 1/5 has the mode shown as "f-path" indicating that it has been configured as a FabricPath port.

Related Commands	Command	Description
	interface ethernet	Configures an Ethernet IEEE 802.3 interface.

## show interface ethernet

To display information about the interface configuration, use the **show interface ethernet** command.

Syntax Description					
	slot/[QSFP-module/]port	Ethernet interface slot number and port number. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.			
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).			
	•	(Optional) Specifies the subinterface separator.			
		<b>Note</b> This keyword applies to Layer 3 interfaces.			
	subintf-port-no	(Optional) Port number for the subinterface. The range is from 1 to 48			
		<b>Note</b> This argument applies to Layer 3 interfaces.			
	brief	(Optional) Displays brief information about the interfaces.			
	counters	(Optional) Displays information about the counters configured on an interface.			
	description	(Optional) Displays the description of an interface configuration.			
	status	(Optional) Displays the operational state of the interface.			
	switchport	(Optional) Displays the switchport information of an interface.			
Command Modes	EXEC mode	or the interface.			
Command Modes	EXEC mode

```

switch#

Related Commands	Command	Description
	interface ethernet	Configures an Ethernet IEEE 802.3 interface.
	interface ethernet (Layer 3)	Configures a Layer 3 Ethernet IEEE 802.3 interface.
	switchport mode vntag	Configures an Ethernet interface as a VNTag port.
	switchport monitor rate-limit	Configures the rate limit for traffic on an interface.

# show interface loopback

To display information about the loopback interface, use the show interface loopback command.

show interface loopback lo-number [brief | description]

Syntax Description	lo-number	Loopback interface number. The range is from 0 to 1023.
	brief	(Optional) Displays a brief summary of the loopback interface information
	description	(Optional) Displays the description provided for the loopback interface.
Command Default	None	
ommand Modes	EXEC mode	
command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	<pre>switch# show inte loopback10 is up Hardware: Loopk MTU 1500 bytes, reliability Encapsulation I 0 packets ing 0 multicast f 0 input error 0 packets out 0 output error switch# Table 1 describes the Comparison of the statement Table 1 describes the Comparison of the statement of the statement</pre>	, BW 8000000 Kbit, DLY 5000 usec, 255/255, txload 1/255, rxload 1/255 LOOPBACK
	Field	Description
	Loopback is	Indicates whether the interface hardware is currently active (whether carrier detect is present), is currently inactive (down), or has been taken down by an administrator (administratively down).
	Hardware	Hardware is Loopback.
	MTU	Maximum transmission unit (MTU) of the interface.
	BW	Bandwidth (BW) of the interface in kilobits per second.

Delay (DLY) of the interface in microseconds.

DLY

Field	Description
reliability	Reliability of the interface as a fraction of 255 (255/255 is 100 percent reliability), calculated as an exponential average over 5 minutes.
txload	Load on the interface for transmitting packets as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over 5 minutes.
rxload	Load on the interface for receiving packets as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over 5 minutes.
Encapsulation	Encapsulation method assigned to interface.
LOOPBACK	Indicates whether loopback is set.
packets input	Total number of error-free packets received by the system.
bytes	Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.
multicast frames	Total number of multicast frames enabled on the interface.
compressed	Total number of multicast frames compressed on the interface.
input errors	Sum of all errors that prevented the receipt of datagrams on the interface being examined. This may not balance with the sum of the enumerated output errors, because some datagrams may have more than one error and others may have errors that do not fall into any of the specifically tabulated categories.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets. On a serial line, this is usually the result of noise or other transmission problems.
overrun	Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
fifo	Number of First In, First Out (FIFO) errors in the receive direction
packets output	Total number of messages transmitted by the system.
bytes	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the far-end transmitter has been running faster than the near-end router's receiver can handle. This may never happen (be reported) on some interfaces.
Dutput errors         Sum of all errors that prevented the final transmission of dat out of the interface being examined. Note that this may not with the sum of the enumerated output errors, as some data may have more than one error, and others may have errors to not fall into any of the specifically tabulated categories.	
collisions	Loopback interface does not have collisions.
fifo	Number of First In, First Out (FIFO) errors in the transmit direction

Command

**interface port-channel** Configures an EtherChannel interface.

Description

## show ip arp

To display the Address Resolution Protocol (ARP) information, use the show ip arp command.

show ip arp [ip-addr | {ethernet slot/[QSFP-module/]port | loopback if\_number | mgmt
mif\_number | port-channel number}] [client] [static] [statistics] [vrf vrf-name]

Syntax Description	<i>ip-addr</i> (Optional) IPv4 source address. The format is x.x.x.x.					
	<b>ethernet</b> slot/[QSFP-module/]port	(Optional) Specifies the Ethernet interface. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.				
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).				
	loopback if_number	(Optional) Specifies the loopback interface. The loopback interface number is from 0 to 1023.				
	mgmt mif_number	(Optional) Specifies the management interface. The management interface number is from 0 to 1023.				
	<b>port-channel</b> <i>number</i> (Optional) Specifies the EtherChannel interface and EtherCh number. The range is from 1 to 4096.					
	client (Optional) Displays the ARP client table					
	static	(Optional) Displays static ARP entries.				
	statistics	(Optional) Displays ARP statistics.				
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.				
Command Default	None					
	None Any command mode					
command Modes	Any command mode	Modification				
command Modes	Any command mode Release	<b>Modification</b> Support for the QSFP+ GEM was added.

### show running-config arp

To display the Address Resolution Protocol (ARP) configuration in the running configuration, use the **show running-config arp** command.

show running-config arp [all]

```
Syntax Description
                    all
                                            (Optional) Displays configured and default information.
Command Default
                    None
Command Modes
                    Any command mode
Command History
                                            Modification
                    Release
                    5.0(2)N1(1)
                                            This command was introduced.
Examples
                    This example shows how to display the ARP configuration:
                    switch# show running-config arp
                    !Command: show running-config arp
                    !Time: Mon Aug 23 07:33:15 2010
                    version 5.0(2)N1(1)
                    ip arp timeout 2100
                    ip arp event-history errors size medium
                    interface Vlan10
                      ip arp 192.0.11.37 00C0.4F00.0000
                    switch#
                    This example shows how to display the ARP configuration with the default information:
                    switch# show running-config arp all
                    !Command: show running-config arp all
                    !Time: Mon Aug 23 07:33:52 2010
                    version 5.0(2)N1(1)
                    ip arp timeout 1500
                    ip arp event-history cli size small
                    ip arp event-history snmp size small
                    ip arp event-history client-errors size small
                    ip arp event-history client-event size small
                    ip arp event-history lcache-errors size small
                    ip arp event-history lcache size small
                    ip arp event-history errors size small
                    ip arp event-history ha size small
                    ip arp event-history event size small
                    ip arp event-history packet size small
```

```
interface Vlan10
  ip arp 192.0.11.37 00C0.4F00.0000
  ip arp gratuitous update
  ip arp gratuitous request
switch#
```

Related Commands	Command	Description
	copy running-config startup-config	Copies the running configuration to the startup configuration file.
	ip arp timeout	Configures an ARP timeout.
	show startup-config arp	Displays the ARP startup configuration.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# show startup-config arp

To display the Address Resolution Protocol (ARP) configuration in the startup configuration, use the **show startup-config arp** command.

show startup-config arp [all]

Syntax Description	all	(Optional) Displays configured and default information.		
Command Default	None			
Command Modes	Any command mod	e		
Command History	Release	Modification		
	5.0(2)N1(1)	This command was introduced.		
Examples	This example show	s how to display the ARP startup configuration:		
	switch# show startup-config arp			
	!Command: show running-config arp !Time: Mon Aug 23 07:33:15 2010			
	version 5.0(2)N1( ip arp timeout 21 ip arp event-hist			
	interface Vlan10 ip arp 192.0.1.37 00C0.4F00.0000			
	switch#			

delated Commands	Command	Description
	copy running-config startup-config	Copies the running configuration to the startup configuration file.
	ip arp timeout	Configures an ARP timeout.
	show running-config arp	Displays the ARP running configuration.

### <l\_ltalic>

PART UCR-

### **Object Tracking Commands**

### <l\_ltalic>

# **D** Commands

This chapter describes the Cisco NX-OS object tracking commands that begin with D.

# delay

To delay a state change for object tracking, use the **delay** command. To disable this function, use the **no** form of this command.

**delay** {**up** *up-time* [**down** *down-time*] | **down** *down-time* [**up** *up-time*]}

no delay

Syntax Description	<b>up</b> up-time	Delays the object track state change for an up condition. The range is from 0 to 180 seconds.
	down down-time	Delays the object track state change for a down condition. The range is from 0 to 180 seconds.
Command Default	None	
Command Modes	Object track mode	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	-	and to delay when object tracking detects an up or down state change for a tracked his delay helps to prevent state flapping.
Examples	This example shows	how to configure the delay timer for a tracked object:
	· · · ·	ack 1 interface ethernet 1/2 line-protocol ()# delay up 30 down 30
Related Commands	Command	Description
	track	Configures a tracked object or track list.

# **O** Commands

This chapter describes the Cisco NX-OS object tracking commands that begin with O.

# object

To specify an object for a tracked list, use the **object** command. To remove the object from the tracked list, use the **no** form of this command.

object object-number [not] [weight weight-number]

no object object-number

Syntax Description	not	(Opti	onal) Negates the state of an object.		
		Note	You cannot use the <b>not</b> keyword in a weight or percentage threshold list. You can use this keyword only in a Boolean list.		
	weight weight-number	weight weight-number(Optional) Specifies a threshold weight for each object.			
Command Default	None				
Command Modes	Tracking configuration	mode			
Command History	Release	Modification	1		
	5.2(1)N1(1)	This comma	nd was introduced.		
	or more objects. The Boolean expression You can also configure objects must exceed the For example, if the trac of the objects must be i	n enables two ty an object track e configured tra ked list has thr n the up state (	hat contains multiple tracked objects. A tracked list contains one ypes of calculation by using either "and" or "or" operators. list that contains a percentage threshold. The percentage of up ck list up percent threshold before the track list is in an up state. ee objects, and you configure an up threshold of 60 percent, two 66 percent of all objects) for the track list to be in the up state.		
	or more objects. The co threshold before the tra default weight of 10 eac	ombined weight ck list is in an u ch, and you con	list that contains a weight threshold. A tracked list contains one of up objects must exceed the configured track list up weight up state. For example, if the tracked list has three objects with the figure an up threshold of 15, two of the objects must be in the up track list to be in the up state.		
Examples	This example shows how of 10:	w to configure a	a track list with an up weight threshold of 30 and a down threshold		
	<pre>switch(config)# trac! switch(config-track) switch(config-track) switch(config-track)</pre>	# threshold we # object 10 we	eight up 30 down 10 eight 15

# **Show Commands**

This chapter describes the Cisco NX-OS object tracking **show** commands.

## show track

To show information about object tracking, use the show track command.

show track [object-id] [interface | ip route] [brief]

Syntax Description	object-id	(Optional) Tracking ID. The range can be from 1 to 500.	
	interface	(Optional) Displays information about tracked interfaces.	
	ip route	(Optional) Displays information about tracked IP routes.	
	brief	(Optional) Displays brief information about tracked objects.	
Command Default	Display information for all tracked objects.		
Command Modes	Any command mo	de	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Examples	switch# <b>show trac</b> This example show switch# <b>show trac</b>	as how to display information about tracked IP routes: <b>ck ip route</b> as how to display brief information about tracked objects:	
Related Commands	Command track interface	<b>Description</b> Tracks the state of an interface.	
	track ip route	Tracks the state of an IP route.	

# **T** Commands

This chapter describes the Cisco NX-OS object tracking commands that begin with T.

## threshold percentage

To set a threshold percentage for a tracked object in a list of objects, use the **threshold percentage** command. To disable the threshold percentage, use the **no** form of this command.

threshold percentage {up number [down number] | down number [up number]}

no threshold percentage

Syntax Description	up	Specifies the up threshold.
	down	(Optional) Specifies the down threshold.
	number	Threshold value. The range is from 0 to 100.
Command Default	None	
Command Modes	Tracking configurati	on mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	available: <b>boolean</b> a <b>percentage</b> or <b>weig</b> l unavailable. If you s	a tracked list using the <b>track</b> <i>object-number</i> <b>list</b> command, there are two keywords nd <b>threshold</b> . If you specify the <b>threshold</b> keyword, you can specify either the <b>ht</b> keywords. If you specify the <b>percentage</b> keyword, the <b>weight</b> keyword is pecify the <b>weight</b> keyword, the <b>percentage</b> keyword is unavailable. e the up percentage first. The valid range is from 1 to 100. The down percentage
	depends on what you a range from 0 to 49	
Examples	This example shows of 50 and a down pe switch(config)# tr switch(config-trac switch(config-trac	percent for down. how to configure the tracked list 11 to measure the threshold using an up percentage rcentage of 32: rack 11 list threshold percentage ck) # object 1 ck) # object 2 ck) # threshold percentage up 50 down 32
·	This example shows of 50 and a down pe switch(config)# tr switch(config-trac switch(config-trac switch(config-trac	percent for down. how to configure the tracked list 11 to measure the threshold using an up percentage rcentage of 32: rack 11 list threshold percentage ck) # object 1 ck) # object 2 ck) # threshold percentage up 50 down 32
Examples Related Commands	a range from 0 to 49 This example shows of 50 and a down pe switch(config)# tr switch(config-trac switch(config-trac switch(config-trac	how to configure the tracked list 11 to measure the threshold using an up percentage rcentage of 32: rack 11 list threshold percentage rcentage of 32: rack 11 list threshold percentage rcentage up 50 down 32 rcentage up 50 down 32 rcentage up 50 down 32

# threshold weight

To set a threshold weight for a tracked object in a list of objects, use the **threshold weight** command. To disable the threshold weight, use the **no** form of this command.

threshold weight {up number [down number] | down number [up number]}

no threshold weight

Syntax Description	up	Specifies the up threshold.	
	down	(Optional) Specifies the down threshold.	
	number	Threshold value. The range is from 1 to 255.	
Command Default	None		
Command Modes	Tracking configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
	unavailable. If you spec You should configure th	reywords. If you specify the <b>percentage</b> keyword, the <b>weight</b> keyword is hify the <b>weight</b> keyword, the <b>percentage</b> keyword is unavailable. He up weight first. The valid range is from 1 to 255. The available down weight have configured for the up weight. For example, if you configure 25 for up, you to 24 for down.	
	will see a range from 0	to 24 for down.	
Examples	This example shows how	w to configure the tracked list 12 to measure a threshold using a specified weight:	
	<pre>switch(config-track)# switch(config-track)#</pre>	object 2 threshold weight up 35 down 22	
Related Commands	Command	Description	
		-	
	threshold percentage	Sets a threshold percentage for a tracked object in a list of objects.	

### track interface

To configure object tracking on an interface, use the **track interface** command. To remove the object tracking for this interface, use the **no** form of this command.

track object-id interface interface-type number {ip routing | line-protocol}

no track object-id [force]

Syntax Description	object-id	Tracking ID. The range can be from 1 to 500.	
	<b>interface</b> <i>interface-type number</i>	Specifies the interface to track. Use the online ? help to see a list of available interface types.	
	ip routing	Tracks the IP routing state of the interface.	
	line-protocol	Tracks the line protocol state of the interface.	
	force	(Optional) Completely removes the object tracking instance.	
Command Default	None		
Command Modes	Global configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>track interface</b> command to track the line protocol status or IPv4 routing state of an interfa This command enters the object tracking command mode. Use the <b>vrf member</b> command in object tracking configuration mode to track objects in a nondefault VRF.		
Examples	This example shows how to track the IP routing state on interface Ethernet 1/2:		
	<pre>switch(config)# track 1 interface ethernet 1/2 ip routing switch(config-track)#</pre>		
Related Commands	Command	Description	

lated Commands	Command	Description
	show track	Displays information about object tracking.
	track ip route reachability	Tracks the state of an IPv4 route reachability.
	vrf member	Tracks an object in a nondefault VRF.

### track ip route

To configure object tracking on an IP route, use the **track ip route** command. To remove the object tracking for this route, use the **no** form of this command.

track object-id ip route ip-prefix/length reachability

no track *object-id* [force]

Syntax Description	object-id	Tracking ID. The range can be from 1 to 500.
	ip-prefix/length	Prefix of route to track. The IP prefix is in dotted decimal format (X.X.X.X).
		The length can be from 1 to 32.
	reachability	Tracks the reachability state of an IP route.
	force	(Optional) Completely removes the object tracking instance.
Command Default	None	
Command Modes	Global configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	-	the vrf member command in object tracking configuration mode to track objects
Usage Guidelines Examples	command mode. Use in a nondefault VRF.	the vrf member command in object tracking configuration mode to track objects
	command mode. Use in a nondefault VRF. This example shows	the <b>vrf member</b> command in object tracking configuration mode to track objects how to track an IP route: ack 1 ip route 10.10.10.0/8 reachability
	command mode. Use in a nondefault VRF. This example shows switch(config)# tr	the <b>vrf member</b> command in object tracking configuration mode to track objects how to track an IP route: ack 1 ip route 10.10.10.0/8 reachability
Examples	command mode. Use in a nondefault VRF. This example shows switch(config)# tr	the <b>vrf member</b> command in object tracking configuration mode to track objects how to track an IP route: ack 1 ip route 10.10.10.0/8 reachability
	command mode. Use in a nondefault VRF. This example shows switch(config)# transwitch(config)track	the <b>vrf member</b> command in object tracking configuration mode to track objects how to track an IP route: <b>ack 1 ip route 10.10.10.0/8 reachability</b> k) #
Examples	command mode. Use in a nondefault VRF. This example shows switch(config)# tra switch(config-trac)	how to track an IP route: ack 1 ip route 10.10.10.0/8 reachability k) # Description

## track list

To configure object tracking on an object list, use the **track list** command. To remove the object tracking for this object list, use the **no** form of this command.

track object-id list boolean {and | or}

track object-id list threshold {percentage | weight}

no track object-id [force]

Syntax Description	object-id	Tracking ID. The range can be from 1 to 500.	
	boolean	Combines the tracked object states as a boolean combination.	
	and	Combines the tracked object states as a boolean AND.	
	or	Combines the tracked object states as a boolean OR.	
	threshold	Combines the tracked object states as a percent or weight combination.	
	percentage	Combines the tracked object states as a percent of the total number of tracked objects in the list.	
	weight	Combines the tracked object states as a combination of their configured weights.	
	force	(Optional) Completely removes the object tracking instance.	
Command Default	None		
Command Modes	Global configuration	on mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>track list</b> command to create a list of objects to combine into one tracked state. Use <b>and</b> keywords to combine the tracked objects as an AND function (that is, all objects must track list to be up). Use the <b>boolean or</b> keywords to combine the tracked objects as an OR (object is up, the tracked state is up).		
	The track list command enters the track command mode. You can configure the following commands in this mode:		
	• <b>object</b> —Configures one or more objects to track in the track list. You can optionally use the <b>not</b> keyword to negate the object track state. (That is, an up state becomes a down state if you use the <b>not</b> keyword) for boolean tracked lists. You can optionally use the <b>weight</b> keyword to assign a weight to an object for a threshold weight tracked list. The default weight is 10.		
	weight to an ot	bjeet for a threshold weight tracked list. The default weight is fo.	

#### Examples

This example shows how to create a track list of two objects and AND their state:

```
switch# configure terminal
switch(config)# track 1 boolean and
switch(config-track)# object 33
switch(config-track)# object 30
switch(config-track)#
```

This example shows how to configure a track list with an up threshold of 70 percent and a down threshold of 30 percent:

```
switch# configure terminal
switch(config)# track 1 list threshold percentage
switch(config-track)# threshold percentage up 70 down 30
switch(config-track)# object 10
switch(config-track)# object 20
switch(config-track)# object 30
switch(config-track)#
```

This example shows how to configure a track list with an up weight threshold of 30 and a down threshold of 10:

```
switch# configure terminal
switch(config)# track 1 list threshold weight
switch(config-track)# threshold weight up 30 down 10
switch(config-track)# object 10 weight 15
switch(config-track)# object 20 weight 15
switch(config-track)# object 30
switch(config-track)#
```

In this example, the track list is up if object 10 and object 20 are up, and the track list goes to the down state if all three objects are down.

Related Commands	Command	Description
	show track	Displays information about object tracking.
	track ip route	Tracks an interface.

# **V** Commands

This chapter describes the Cisco NX-OS object tracking commands that begin with V.

### vrf member

To add an interface to a virtual routing and forwarding (VRF) instance or to configure object tracking on a VRF instance, use the **vrf member** command. To remove the object tracking for this route, use the **no** form of this command.

vrf member vrf-name

no vrf member vrf-name

Syntax Description	vrf-name	VRF name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	None	
Command Modes	Interface configuration n Object tracking confiura	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	VRF.	nmand in object tracking configuration mode to track objects in a nondefault
Examples	-	v to track an IP route in VRF Red: 1 ip route 10.10.10.0/8 reachability vrf member Red
	This example shows how	to add the Ethernet interface 1/5 to VRF RemoteOfficeVRF:
	<pre>switch(config)# interf switch(config-if)# no switch(config-if)# vrf switch(config-if)#</pre>	
Related Commands	Command	Description
	show ip eigrp	Displays Enhanced Interior Gateway Routing Protocol (EIGRP) information.
	show ip ospf interface	Displays Open Shortest Path First (OSPF) interface-related information.

Displays a summary of RIP information for all RIP instances.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

show ip rip

Command	Description
show track	Displays information about object tracking.
track ip route	Tracks an interface.

OL-27886-02

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

### <l\_ltalic>

PART UCR-

### **OSPF** Commands

### <l\_ltalic>

## A Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with A.

### area authentication (OSPF)

To enable authentication for an Open Shortest Path First (OSPF) area, use the **area authentication** command. To remove authentication for an area, use the **no** form of this command.

area area-id authentication [message-digest]

no area area-id authentication [message-digest]

Syntax Description	area-id	Identifier for the OSPF area where you want to enable authentication. Specify
	message-digest	as either a positive integer value or an IP address. (Optional) Enables Message Digest 5 (MD5) authentication on the area specified by the <i>area-id</i> argument.
Command Default	No authentication	
Command Modes	Router configurati	on mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		entication command to configure the authentication mode for the entire OSPF area.
		type and authentication password must be the same for all OSPF devices in an area. <b>thentication-key</b> command in interface configuration mode to specify this password.
	•	5 authentication with the <b>message-digest</b> keyword, you must configure a password <b>message-digest-key</b> command in interface configuration mode.
	This command rec	uires the LAN Base Services license.
Examples	This example show	ws how to configure authentication for area 0 of OSPF routing process 201:
	switch(config-ro switch(config-if switch(config-if	router ospf 201 puter)# area 0 authentication message-digest puter)# interface ethernet 1/1 ()# no switchport ()# ip ospf area 0 f# ip ospf message-digest-key 10 md5 0 adcdefgh

#### **Related Commands**

Command	Description
copy running-config startup-config	Saves the configuration changes to the startup configuration file.
ip ospf authentication-key	Assigns a password for simple password authentication for OSPF.
ip ospf message-digest-key	Assigns a password for OSPF MD5 authentication.
show ip ospf interface	Displays OSPF interface-related information.

### area default-cost (OSPF)

To specify a cost for the default summary route sent into an Open Shortest Path First (OSPF) stub or not-so-stubby area (NSSA), use the **area default-cost** command. To remove the assigned default route cost, use the **no** form of this command.

area area-id default-cost cost

no area area-id default-cost cost

Syntax Description	area-id	Identifier for the OSPF area where you want to configure the default cost. The area ID can be from 0 to 4294967295 or an IP address.
	cost	Cost for the default summary route used for a stub or NSSA. The range is from 0 to 16777215.
Command Default	The summary route	cost is based on the area border router that generated the summary route.
Command Modes	Router configuration	n mode
Command History	Release	Modification
-	5.2(1)N1(1)	This command was introduced.
Evomploo		ires the LAN Base Services license.
Examples	-	how to set a default cost of 20 to stub network 192.0.2.0:
		cer)# area 192.0.2.0 stub cer)# area 192.0.2.0 default-cost 20
Related Commands	0 1	Description
	Command	Description
	command area stub	Defines an area as a stub area.
		Defines an area as a stub area.
	area stub copy running-confi	Defines an area as a stub area.

### area filter-list (OSPF)

To filter prefixes advertised in type 3 link-state advertisements (LSAs) between Open Shortest Path First (OSPF) areas of an Area Border Router (ABR), use the **area filter-list** command. To change or cancel the filter, use the **no** form of this command.

area *area-id* filter-list route-map *map-name* {in | out}

**no area** *area-id* **filter-list route-map** *map-name* {**in** | **out**}

Syntax Description		
	area-id	Identifier for the OSPF area where you want to configure filtering. Specify as either a positive integer value or an IP address.
	<b>route-map</b> map-name	Specifies the name of a route map used as the filter policy. The <i>map-name</i> argument can be any alphanumeric string of up to 63 characters.
	in	Filters networks sent to this area.
	out	Filters networks sent from this area.
	<u></u>	There hereories sent from this area.
Command Default	None	
Command Modes	Router configurat	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>area filte</b> the route map filt originated as a re If you apply the advertised by the <b>area range</b> comm	er-list command to filter Type 3 LSAs. If you apply the route map with the <b>in</b> keyword ers all Type 3 LSAs originated by the ABR to this area, including Type 3 LSAs that sult of the <b>area range</b> command in another area. route map with the <b>out</b> keyword, the route map filters all Type 3 LSAs that are ABR to all other areas including Type 3 LSAs that originate locally as a result of the nand configured in this area.
Usage Guidelines	Use the <b>area filte</b> the route map filt originated as a re If you apply the advertised by the <b>area range</b> comm	er-list command to filter Type 3 LSAs. If you apply the route map with the in keyword ers all Type 3 LSAs originated by the ABR to this area, including Type 3 LSAs that sult of the <b>area range</b> command in another area. route map with the <b>out</b> keyword, the route map filters all Type 3 LSAs that are ABR to all other areas including Type 3 LSAs that originate locally as a result of the

Usage Guidelines Examples	Use the <b>area filte</b> the route map filt originated as a re If you apply the advertised by the <b>area range</b> comm Cisco Nexus 5500 This command re	er-list command to filter Type 3 LSAs. If you apply the route map with the in keyword ers all Type 3 LSAs originated by the ABR to this area, including Type 3 LSAs that sult of the <b>area range</b> command in another area. route map with the <b>out</b> keyword, the route map filters all Type 3 LSAs that are ABR to all other areas including Type 3 LSAs that originate locally as a result of the nand configured in this area.

<b>Related Commands</b>	Command	Description
	area range	Consolidates and summarizes routes at an area boundary.
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	route-map	Defines the conditions for redistributing routes from one routing protocol into another.
	show ip ospf policy statistics area	Displays OSPF policy statistics for an area.

### area nssa (OSPF)

To configure an area as an Open Shortest Path First (OSPF) not-so-stubby (NSSA) area, use the **area nssa** command. To remove the NSSA area, use the **no** form of this command.

area *area-id* nssa [default-information-originate [route-map *map-name*]] [no-redistribution] [no-summary] [translate type7 [always | never] [suppress-fa]]

**no area** *area-id* **nssa** [**default-information-originate** [**route-map** *map-name*]] [**no-redistribution**] [**no-summary**] [**translate type7** [**always** | **never**] [**suppress-fa**]]

Syntax Description	area-id	Identifier for the OSPF NSSA area. The area ID can be from 0 to 4294967295 or an IP address.	
	default-information-	(Optional) Generates a Type 7 default into the NSSA area. This keyword takes	
	originate	effect only on NSSA area border router (ABR) or NSSA autonomous system border router (ASBR).	
	<b>route-map</b> map-name	(Optional) Filters the Type 7 default generation based on the route map. The <i>map-name</i> argument can be any alphanumeric string up to 63 characters.	
	no-redistribution	(Optional) Blocks redistributed link-state advertisements (LSAs) from entering this NSSA area. Use this keyword when the router is both an NSSA ASBR and an NSSA ABR and you want the <b>redistribute</b> command to import routes into the normal areas but not into the NSSA area.	
	no-summary	(Optional) Allows an area to be an NSSA area but not have summary routes injected into it.	
	translate type7	(Optional) Translates Type 7 LSAs to type 5 LSAs.	
	always	(Optional) Always translates LSAs.	
	never	(Optional) Never translates LSAs.	
	suppress-fa	(Optional) Suppresses the forwarding address in translated LSAs. The ABR uses 0.0.0.0 as the forwarding IPv4 address.	
Command Default	None Router configuration mode		
Command Modes			
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	that you understand the translated LSAs. Subo destination's forwardin		
	This command require	s the LAN Base Services license.	

#### **Examples** This example sh

This example shows how to configure area 1 as an NSSA area:

switch(config)# router ospf 10
switch(config-router)# area 1 nssa
switch(config-router)#

This example shows how to configure area 1 as an NSSA area and translate Type 7 LSAs from area 1 to Type 5 LSAs, but not place the Type 7 forwarding address into the Type 5 LSAs. (OSPF places 0.0.0.0 as the forwarding address in the Type 5 LSAs.)

```
switch(config)# router ospf 2
switch(config-router)# area 1 nssa translate type7 suppress-fa
switch(config-router)#
```

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	redistribute	Redistributes routes learned from one routing protocol to another routing protocol domain.
	show ip ospf	Displays OSPF information.

### area range (OSPF)

To consolidate and summarize routes at an Open Shortest Path First (OSPF) area boundary, use the **area range** command. To disable this function, use the **no** form of this command.

area area-id range ip-prefix [not-advertise]

no area area-id range ip-prefix [not-advertise]

area-id	Identifier for the OSPF area where you want to summarize routes. The area ID can be from 0 to 4294967295 or an IP address.
ip-prefix	IP prefix specified as IP address/subnet mask length (A.B.C.D/LEN).
not-advertise	(Optional) Sets the address range status to DoNotAdvertise. The Type 3 summary LSA is suppressed, and the component networks remain hidden from other networks.

### area virtual-link (OSPF)

To define an Open Shortest Path First (OSPF) virtual link, use the **area virtual-link** command. To remove a virtual link, use the **no** form of this command.

area area-id virtual-link router-id

no area area-id virtual-link router-id

Syntax Description	area-id	Identifier for the OSPF area assigned to the transit area for the virtual link. The area ID can be from 0 to 4294967295 or an IP address.
	router-id	Router ID associated with the virtual link neighbor. Specify as an IP address. The router ID appears in the <b>show ip ospf neighbors</b> display.
Command Default	None	
Command Modes	Router configura	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Command History		
Usage Guidelines	In OSPF, all areas	<b>ual-link</b> command to establish a virtual link from a remote area to the backbone area s must be connected to a backbone area. If the connection to the backbone is lost, it can tablishing a virtual link.
	Use the <b>area virt</b> following comma	<b>cual-link</b> command to enter the virtual link configuration mode where you can use the ands:
	• authenticati	on [key-chain   message-digest   null]
	• authenticati	on-key [0   3] <i>key</i>
	• dead-interva	al seconds
	• hello-interva	al seconds
	• message-dig	est-key key-id md5 key
	• retransmit-i	nterval seconds
	• transmit-del	ay seconds
		d fan sumter and use an detaile
	See each comman	nd for syntax and usage details.

Note

You cannot configure a virtual link on a not-so-stubby (NSSA) area.

This command requires the LAN Base Services license.

Examples

This example shows how to establish a virtual link between two devices, A, and B, with default values for all optional parameters:

```
Device A:
switch(config)# router ospf 1
switch(config-router)# router-id 192.0.2.2
switch(config-router)# area 1 virtual-link 192.0.2.1
switch(config-router-vlink)#
Device B:
```

```
switch(config# router ospf 209
switch(config-router)# router-id 192.0.2.1
switch(config-router)# area 1 virtual-link 192.0.2.2
switch(config-router-vlink)#
```

<b>Related Commands</b>	Command	Description
	authentication (OSPF virtual link)	Enables authentication for an OSPF virtual link.
	authentication-key (OSPF virtual link)	Assigns a password to be used by neighboring routers that are using the simple password authentication of OSPF.
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	dead-interval (OSPF virtual link)	Configures the dead interval for an OSPF virtual link.
	hello-interval (OSPF virtual link)	Configures the hello interval for an OSPF virtual link.
	message-digest-key (virtual link)	Enables OSPF MD5 authentication in an OSPF virtual link.
	retransmit-interval (OSPF virtual link)	Configures the retransmit interval for an OSPF virtual link.
	show ip ospf neighbors	Displays OSPF neighbor information.
	show ip ospf virtual-link	Displays OSPF virtual link information.
	transmit-delay (OSPF virtual link)	Configures the transmit delay for an OSPF virtual link.

### authentication (OSPF virtual link)

To specify the authentication type for an Open Shortest Path First (OSPF) virtual link, use the **authentication** command. To remove the authentication type for a virtual link, use the **no** form of this command.

authentication [key-chain key-name | message-digest | null]

no authentication

Syntax Description		
-,	key-chain key-name	(Optional) Specifies the key-chain to use. The <i>key-name</i> argument can be any alphanumeric string up to 63 characters.
	message-digest	(Optional) Specifies to use message-digest authentication.
	null	(Optional) Specifies no authentication is used. Disables authentication if configured for an area.
Command Default	Defaults to password at	thentication if you configure authentication with none of the optional keywords
Command Modes	Router configuration m	ode
Command History	Release	Nodification
	5.2(1)N1(1) T	his command was introduced.
Usage Guidelines	<b>Je Guidelines</b> Use the <b>authentication</b> command in virtual link configuration mode to configure the method used on the virtual link. ### auto-cost (OSPF)

To control how Open Shortest Path First (OSPF) calculates default metrics for an interface, use the **auto-cost** command. To assign the default reference bandwidth of 40 Gb/s, use the **no** form of this command.

#### auto-cost reference-bandwidth bandwidth [Gbps | Mbps]

no auto-cost reference-bandwidth

Syntax Description	reference-bandv	<b>vidth</b> Sets the reference bandwidth used to calculate the default metrics for
-,	bandwidth	an interface. The range depends on whether you use the Gbps or
		MBps keywords.
	Gbps	(Optional) Specifies the rate in Gbps (bandwidth). The range is from 1 to 4000; the default is 40.
	Mbps	(Optional) Specifies the rate in Mbps (bandwidth). The range is from 1 to 4000000; the default is 40000.
Command Default	40 Gb/s. The band	width defaults to Gb/s if you do not specify the <b>Gpbs</b> or <b>Mbps</b> keyword.
Command Modes	Router configurat	ion mode
Command History	Release	Modification
oonnana mistory	5.2(1)N1(1)	This command was introduced.
	5.2(1)1(1(1)	
Command History		
Usage Guidelines	Use the auto-cost	command to set the reference bandwidth used by the OSPF cost-metric calculation.
	The value set by t	he <b>ip ospf cost</b> command overrides the cost that results from the <b>auto-cost</b> command.
	This command re-	quires the LAN Base Services license.
Examples	This example sho	ws how to set the reference handwidth for all local interfaces in an OSPE instance.
Examples		
	This example shows how to set the reference bandwidth for all local interfaces in an OSPF instance: switch(config)# router ospf 201 switch(config-router)# auto-cost reference-bandwidth 10

### clear ip ospf neighbor

To clear neighbor statistics and reset adjacencies for Open Shortest Path First (OSPF), use the **clear ip ospf neighbor** command.

clear ip ospf [instance-tag] neighbor {\* | neighbor-id | interface-type number | loopback number | port-channel number } [vrf vrf-name]

Syntax Description	instance-tag	(Optional) Instance tag. Specify as an alphanumeric string of up to 20 characters.
	*	Clears all neighbors.
	neighbor-id	Neighbor ID (as an IP address) of the neighbor to clear.
	interface-type number	Interface from which to clear all neighbors.
	loopback number	Clears all neighbors on a loopback interface.
	port-channel number	Clears all neighbors on a port-channel interface.
	vrf vrf-name	(Optional) Specifies the name of the OSPF virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be any alphanumeric string of up to 32 characters, except "default" and "all".
Command Default	None	
Command Modes	Any command mode

### clear ip ospf policy statistics

To clear policy statistics for Open Shortest Path First (OSPF), use the **clear ip ospf policy statistics** command.

**clear ip ospf** [*instance-tag*] **policy statistics** {**area** *area-id* **filter-list** {**in** | **out**} | **redistribute** {**bgp** *autonomous-system* | **direct** | **eigrp** *id* | **ospf** *id* | **rip** *id* | **static**} } [**vrf** *vrf-name*]

Syntax Description	instance-tag	(Optional) Instance tag. Specify as an alphanumeric string of up to 20 characters.
	area	Clears policy statistics for an area.
	area-id	Area ID as an integer or IP address.
	filter-list	Specifies the policy statistics for filtered prefixes between OSPF areas.
	in	Filters prefixes sent into this OSPF area.
	out	Filters prefixes sent from this OSPF area.
	redistribution	Clears OSPF route redistribution statistics.
	<b>bgp</b> autonomous-system	Specifies the autonomous system number for the Border Gateway Protocol. Specify the autonomous system number as x.y, where the range is from 1 to 65535 for both x and y, or as a single integer, where the range is from 1 to 65535.
	direct	Specifies directly connected routes.
	eigrp id	Specifies the autonomous system number for the Enhanced Interior Gateway Protocol. Specify the <i>id</i> argument as any case-sensitive, alphanumeric string.
	ospf id	Specifies the Open Shortest Path First version 2 instance. Specify the <i>id</i> argument as any case-sensitive, alphanumeric string.
	rip id	Specifies the Routing Information Protocol instance. Specify the <i>id</i> argument as any case-sensitive, alphanumeric string.
	static	Specifies static routes.
	vrf vrf-name	(Optional) Specifies the name of the OSPF virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be any alphanumeric string of up to 32 characters, except "default" and "all".
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modification
-	5.2(1)N1(1)	This command was introduced.

Usage Guidelines	statistics command. Use the <i>instance</i> If you do not specify the instance tag	nand to learn the policy statistics shown in the <b>show ip ospf policy</b> <i>e-tag</i> argument to clear the policy statistics from one OSPF instance. g, Cisco Nexus 5500 clears the policy statistics from all OSPF <b>cy statistics</b> command to to view the statistics that you are clearing. se Services license.			
Examples	This example shows how to clear all OSPF policy statistics for area 99 inbound filtered routes for OSPF 201:

	show ip ospf policy statistics	Displays details for OSPF policies.			

### clear ip ospf redistribution

To clear redistribution information for Open Shortest Path First (OSPF) , use the **clear ip ospf redistribution** command.

clear ip ospf redistribution [vrf {vrf-name | all | default | management}]

	all default management	<ul> <li>instance. The VRF name is a case-sensitive, alphanumeric string of up to 32 characters.</li> <li>(Optional) Specifies the "all" VRF instance.</li> <li>(Optional) Specifies the default VRF.</li> <li>(Optional) Specifies the management VRF.</li> </ul>	
	default	(Optional) Specifies the default VRF.	
	management	(Optional) Specifies the management VRF.	
Command Default	None		
Command Modes	Any command mo	de	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	This command requires the LAN Base Services license.		
Examples	This example shows how to clear redistribution information:		
	switch# <b>clear ip</b>	o spf redistribution	
Related Commands	Command	Description	

 feature ospf
 Enables the OSPF feature.

## clear ip ospf statistics

To clear Open Shortest Path First (OSPF) event statistics, use the clear ip ospf statistics command.

clear ip ospf [instance-tag] statistics [vrf vrf-name]

Syntax Description	instance-tag	(Optional) Instance tag. Specify as an alphanumeric string of up to 20 characters.		
	vrf vrf-name	(Optional) Specifies the name of the OSPF virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be any alphanumeric string of up to 32 characters, except "default" and "all".		
Command Default	None			
Command Modes	Any command m	ode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Use the <b>clear ip ospf statistics</b> command to clear the event statistics from one or more OSPF instances. If you do not specify the <i>instance-tag</i> argument, Cisco Nexus 5500 clears statistics from all OSPF instances. Use the <b>show ip ospf statistics</b> command to to view the statistics that you are clearing.			
Usage Guidelines	If you do not spe	cify the <i>instance-tag</i> argument, Cisco Nexus 5500 clears statistics from all OSPF		
Usage Guidelines	If you do not spe- instances. Use the	cify the <i>instance-tag</i> argument, Cisco Nexus 5500 clears statistics from all OSPF		
Usage Guidelines Examples	If you do not specification of the second se	cify the <i>instance-tag</i> argument, Cisco Nexus 5500 clears statistics from all OSPF e <b>show ip ospf statistics</b> command to to view the statistics that you are clearing.		
	If you do not specinstances. Use the This command re	cify the <i>instance-tag</i> argument, Cisco Nexus 5500 clears statistics from all OSPF e <b>show ip ospf statistics</b> command to to view the statistics that you are clearing.

## clear ip ospf traffic

To clear Open Shortest Path First (OSPF) traffic statistics, use the clear ip ospf traffic command.

clear ip ospf [instance-tag] traffic [interface] [vrf vrf-name]

Syntax Description	instance-tag	(Optional) Instance tag. Specify as an alphanumeric string of up to 20 characters.	
	interface	(Optional) Interface to clear traffic statistics for. Use the ? option to see the interface options.	
	vrf vrf-name	(Optional) Specifies the name of the OSPF virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be any alphanumeric string of up to 32 characters, except "default" and "all".	
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>clear ip ospf traffic</b> command to clear the traffic statistics from one or more OSPF instances. If you do not specify the <i>instance-tag</i> argument, Cisco Nexus 5500 clears traffic statistics from all OSPF instances. Use the <b>show ip ospf traffic statistics</b> command to view the statistics that you are clearing. This command requires the LAN Base Services license.		
	This command requi	res the LAN base Services ficense.	
Examples	This example shows how to clear OSPF traffic statistics for OSPF 100:		
	switch# <b>clear ip o</b>	spf 100 traffic	
Related Commands	Command	Description	
	show ip ospf traffic statistics	Displays OSPF traffic statistics.	

## clear ip traffic

To clear IP traffic information, use the clear ip traffic command.

clear ip traffic

Syntax Description	This command ha	s no arguments or keywords.
Command Default	None	
Command Modes	Any command me	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

Related Commands	Command	Description
	show ip traffic	Displays IP traffic information.

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **D** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with D.

#### dead-interval (OSPF virtual link)

To set the interval during which at least one hello packet must be received from a neighbor on an Open Shortest Path First (OSPF) virtual link before the router declares that neighbor as down, use the **dead interva**l command. To restore the default, use the **no** form of this command.

dead-interval seconds

no dead-interval

Syntax Description	seconds	Interval (in seconds) during which the router must receive at least one hello packet from a neighbor or that neighbor is removed from the peer list and does not participate in routing. The range is from 1 to 65535. The value must be the same for all nodes on the virtual link.	
Command Default	40 seconds		
Command Modes	Virtual link confi	guration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	advertised in OSI link. The default You can configur convergence. A s neighbor as dowr		
	Use the <b>show ip ospf virtual-links</b> command to verify the dead interval.		
Examples		equires the LAN Base Services license. ows how to configure the OSPF dead interval to 20 seconds:	
	switch(config-r	<pre>couter)# area 99 virtual-link 192.0.2.4 couter-vlink)# dead-interval 20</pre>	

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	hello-interval (OSPF virtual link)	Specifies the interval between hello packets that Cisco NX-OS sends on the virtual link.
	show ip ospf virtual-link	Displays OSPF virtual link information.

### default-information originate (OSPF)

To generate a default external route into an Open Shortest Path First (OSPF) routing domain, use the **default-information originate** command. To disable this feature, use the **no** form of this command.

default-information originate [always] [route-map map-name]

**no default-information originate** [always] [route-map map-name]

Syntax Description	always		(Optional) Specifies to always advertise the default route regardless of whether the route table has a default route.
	route-map map-	name	(Optional) Specifies to advertise the default route if the route map is satisfied. The <i>map-name</i> argument can be any alphanumeric string up to 63 characters.
Command Default	Advertises the det	fault route if	the route is in the route table.
Command Modes	Router configurat	ion mode	
Command History	Release	Modifica	tion
	5.2(1)N1(1)	This com	mand was introduced.
Command History			
Usage Guidelines	Whenever you use NX-OS automatic	e the <b>redistril</b> cally becomes	<b>riginate</b> command to assign a default route for redistributed routes. <b>pute</b> command to redistribute routes into an OSPF routing domain, Cisco an Autonomous System Boundary Router (ASBR). However, an ASBR default route into the OSPF routing domain.
	route only for rou	tes that pass	o filter redistributed routes so that Cisco Nexus 5500 generates a default the route map. Use the <b>always</b> keyword to generate the default route all route is in the route table.
Note	The default-information originate command ignores match statements in the optional ro		nate command ignores match statements in the optional route map.
	This command real	quires the LA	N Base Services license.
Examples	-		nfigure the default route redistributed into the OSPF routing domain for Protocol (EIGRP):
		outer)# <b>redi</b> outer)# <b>defa</b>	109 stribute eigrp 108 route-map EigrpPolicy ult-information originate always

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	redistribute (OSPF)	Redistributes routes from one routing domain into OSPF.
	route-map	Defines a filter policy for routes.
	show ip ospf	Displays OSPF information.

## default-metric (OSPF)

To set default metric values for the Open Shortest Path First (OSPF) routing protocol, use the **default-metric** command. To return to the default state, use the **no** form of this command.

**default-metric** *metric-value* 

**no default-metric** *metric-value* 

Syntax Description	metric-value	Default metric value appropriate for the specified routing protocol. The range is from 1 to 1677214.
Command Default	The metric for re	distributed, connected, and static routes is set to 25.
Command Modes	Router configura	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	for all redistribut redistribute route	<b>netric</b> command with the <b>redistribute</b> command to configure the same metric value ed routes except static and directly connected routes. A default metric helps to s with incompatible metrics. Whenever external route metrics do not convert to an e a default metric to enable the redistribution to proceed.
Note		<b>ric</b> command does not apply to the redistribution of directly connected routes into e map to change the default metric for directly connected routes.
	This command re	quires the LAN Base Services license.
Examples	switch(config)# switch(config-r switch(config-r	ws how to configure OSPF to redistribute RIP and BGP and set the default metric to 10: router ospf 201 outer)# default-metric 10 outer)# redistribute rip 109 route-map FilterRip outer)# redistribute bgp 4 route-map FilterBgp outer)#

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	redistribute (OSPF)	Redistributes routes from another routing domain into OSPF.
	show ip ospf	Displays OSPF information.

#### distance (OSPF)

To define the Open Shortest Path First (OSPF) route administrative distance, use the **distance** command. To restore the default, use the **no** form of this command.

distance distance

no distance

Syntax Description	distance	Administrative distance for all routes local to this OSPF process. The range is from 1 to 255.	
Command Default	110		
Command Modes	Router configuration	on mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	when you configur	ommand to set a distance for an entire group of routes. Use the <b>distance</b> command e multiple routing protocols, and you want to choose one set of routes over the other uires the LAN Base Services license.	
Examples	This example shows how to set the distance to 200, making the route less reliable: switch(config) # router ospf 1 switch(config-router) # distance 200 switch(config-router) #		
Related Commands	Command	Description	
	copy running-cor startup-config	<b>fig</b> Saves this configuration change to the startup configuration file.	
	show ip ospf	Displays OSPF information.	

# **F** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with F.

#### feature ospf

To enable the Open Shortest Path First Protocol (OSPF), use the **feature ospf** command. To disable OSPF, use the **no** form of this command.

feature ospf

no feature ospf

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Global configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** 

You must enable the OSPF feature before you can configure OSPF.

Note

In Cisco NX-OS Release 5.2(1)N1(1), a software upgrade on the Cisco Nexus 5548 switch and the Cisco Nexus 5596 switch that has the Layer 3 features enabled is disruptive. You must reload the switch and the Cisco Nexus 2000 Series Fabric Extender.

This command requires the LAN Base Services license.

Examples

This example shows how to enable the OSPF feature: switch# configure terminal

switch(config)# feature ospf
switch(config)#

This example shows how to disable the OSPF feature:

switch# configure terminal
switch(config)# no feature ospf
switch(config)#

<b>Related Commands</b>	Command	Description
	router ospf	Creates an OSPF instance.
	show feature	Displays the status of features on a switch.
	show ospf	Displays OSPF configuration information.

### flush-routes (OSPF)

To flush routes on a restart for the Open Shortest Path First (OSPF) protocol, use the **flush-routes** command. To disable this feature, use the **no** form of this command.

flush-routes

no flush-routes

Syntax Description	This command has no arguments or keywords.		
Command Default	Disabled		
Command Modes	Router configurat	ion mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	This command causes OSPF to unregister from the unicast RIB when OSPF shuts down. The unicast RIE removes all the routes associated with this OSPF instance. If you do not configure the <b>flush-routes</b> command, OSPF does not unregister and the OSPF routes will be stale. The OSPF routes are eventually removed from the unicast RIB after a timeout period. This command requires the LAN Base Services license.		
Examples	This example shows how to flush routes for an OSPF restart: <pre>switch# configure terminal switch(config)# router ospf 202 switch(config-router)# flush-routes switch(config-router)#</pre>		
Related Commands	Command	Description	
	show ip ospf	Displays OSPF information.	

flush-routes (OSPF)

# **H** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with H.

#### hello-interval (OSPF virtual link)

To specify the interval between hello packets that Cisco NX-OS sends on an Open Shortest Path First (OSPF) virtual link, use the **hello-interval** command. To return to the default setting, use the **no** form of this command.

hello-interval seconds

no hello-interval

Syntax Description	seconds	Hello interval (in seconds). The value must be the same for all nodes on a specific virtual link. The range is from 1 to 65535.	
Command Default	10 seconds		
Command Modes	Virtual link configuratio	n mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	across a virtual link. A s traffic. The hello interva	ommand in virtual link configuration mode to set the hello interval for OSPF horter hello interval detects topological changes faster but causes more routing I must be the same for all devices on a virtual link. the LAN Base Services license.	
	-		
Examples	<pre>switch(config)# route switch(config-router)</pre>	# area 99 virtual-link 192.0.2.4 vlink)# hello-interval 15	
Related Commands	Command	Description	
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.	
	dead-interval (virtual link)	Sets the time period to declare a neighbor as down if the local device receives no hello packets.	
	show ip ospf virtual-link	Displays OSPF virtual link information.	

# I Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with I.

### ip ospf authentication

To specify the authentication type for an Open Shortest Path First (OSPF) interface, use the **ip ospf authentication** command. To remove the authentication type for an interface, use the **no** form of this command.

ip ospf authentication [key-chain key-name | message-digest | null]

no ip ospf authentication

Syntax Description	key-chain key-name	(Optional) Specifies a key chain to use for authentication. The <i>key-name</i> argument can be a maximum of 63 alphanumeric characters.
	message-digest	(Optional) Specifies that message-digest authentication is used.
	null	(Optional) Specifies that no authentication is used. Use this keyword to override any other authentication configured for an area.
Command Default	No authentication	
Command Modes	Interface configuration	on mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	If you use this comm the password. If you	entication command to configure the authentication mode for an OSPF interface. and with no keywords, use the <b>ip ospf authentication-key</b> command to configure use the <b>message-digest</b> keyword, use the <b>ip ospf message-digest-key</b> command to re-digest key for the interface.
	The authentication th the area.	at you configure on an interface overrides the authentication that you configure for
	This command require	res the LAN Base Services license.
Examples	This example shows	how to configure message-digest authentication:
	<pre>switch(config-if)# switch(config-if)#</pre>	terface ethernet 2/1 no switchport ip ospf authentication message-digest ip ospf message-digest-key 33 md5 0 mypassword

Related Commands	Command	Description
	area authentication	Enables authentication for an OSPF area.
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	ip ospf authentication-key	Assigns a password to be used by neighboring routers that are using the password authentication of OSPF.
	ip ospf message-digest-key	Configures the OSPF MD5 message-digest key.
	show ip ospf	Displays OSPF information.

## ip ospf authentication-key

To assign a password for simple password authentication to be used by neighboring Open Shortest Path First (OSPF) routers, use the **ip ospf authentication-key** command. To remove a previously assigned OSPF password, use the **no** form of this command.

ip ospf authentication-key [0 | 3 | 7] password

no ip ospf authentication-key

Syntax Description	2		
	0	(Optional) Configures an unencrypted password.	
	3	(Optional) Configures a 3DES encrypted password string.	
	7	(Optional) Configures a Cisco type 7 encrypted password string.	
	<i>password</i> Any continuous string of characters that can be entered f keyboard up to 8 bytes.		
Command Default	Unencrypted pass	word	
Command Modes	Interface configur	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Ilsage Guidelines			
Usage Guidelines	Use the <b>ip ospf a</b> t authentication. Th OSPF header whe password to each	<b>uthentication-key</b> command to configure a password for simple password ne password created by this command is used as a key that is inserted directly into the en Cisco NX-OS originates routing protocol packets. You can assign a separate network on a per-interface basis. All neighboring routers on the same network must assword to be able to exchange OSPF information.	
Usage Guidelines <u>Note</u>	Use the <b>ip ospf a</b> authentication. Th OSPF header whe password to each have the same pas Cisco NX-OS use <b>authentication</b> in	<b>uthentication-key</b> command to configure a password for simple password ne password created by this command is used as a key that is inserted directly into the en Cisco NX-OS originates routing protocol packets. You can assign a separate network on a per-interface basis. All neighboring routers on the same network must assword to be able to exchange OSPF information.	
	Use the <b>ip ospf a</b> t authentication. Th OSPF header whe password to each have the same pas Cisco NX-OS use <b>authentication</b> in <b>area authenticati</b>	<b>uthentication-key</b> command to configure a password for simple password ne password created by this command is used as a key that is inserted directly into the en Cisco NX-OS originates routing protocol packets. You can assign a separate network on a per-interface basis. All neighboring routers on the same network must sword to be able to exchange OSPF information.	

<b>Related Commands</b>	Command	Description
	area authentication	Specifies the authentication type for an OSPF area.
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	ip ospf authentication	Specifies the authentication type for an interface.
	show ip ospf interface	Displays OSPF information.

#### ip ospf cost

To specify the cost of sending a packet on an interface, use the **ip ospf cost** command. To reset the path cost to the default, use the **no** form of this command.

**ip ospf cost** *interface-cost* 

no ip ospf cost interface-cost

Syntax Description	interface-cost Unsigned integer value expressed as the link-state m is from 1 to 65535.	
Command Default		based on the reference bandwidth divided by the configured interface bandwidth. You ofference bandwidth or it defaults to 40 Gb/s.
Command Modes	Interface configurat	ion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	overrides any settin	t command to configure the cost metric manually for each interface. This command gs for the reference bandwidth that you set using the <b>reference-bandwidth</b> configuration mode.
	If this command is	not used, the link cost is calculated using the following formula:
	link cost = refe	rence bandwidth / interface bandwidth
	This command requ	ires the LAN Base Services license.
Examples	This example show	s how to configure the interface cost value to 65:
	switch(config-if)	# ip ospf cost 65
Related Commands	Command	Description
	reference-bandwie	•

#### ip ospf dead-interval

To set the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down, use the **ip ospf dead-interval** command. To restore the default, use the **no** form of this command.

ip ospf dead-interval seconds

no ip ospf dead-interval

Syntax Description	seconds	Interval (in seconds) during which the router must receive at least one hello packet from a neighbor or that neighbor adjacency is removed from the local router and does not participate in routing. The range is from 1 to 65535, and the default is 40. The value must be the same for all nodes on the network.
Command Default	The default for second	nds is four times the interval set by the <b>ip ospf hello-interval</b> command.
Command Modes	Interface configurati	ion mode
Command History	Release	Modification
•	5.2(1)N1(1)	This command was introduced.
Command History		
Usage Guidelines		<b>d-interval</b> command to set the dead interval that Open Shortest Path First (OSPF) ackets. This value must be the same for all networking devices on a specific network.
	-	dead interval to detect down neighbors faster and improve convergence. Very short cause routing instability.
	Use the <b>show ip osp</b>	f interface command to verify the dead interval and hello interval.
	This command requi	ires the LAN Base Services license.
Examples	This example shows	how to set the OSPF dead interval to 20 seconds:
	switch(config-if)#	ip ospf dead-interval 20
Related Commands	Command	Description
	ip ospf hello-interv	<b>val</b> Specifies the interval between hello packets that OSPF sends on the interface.
	show ip ospf interf	ace Displays OSPF interface-related information.

## ip ospf hello-interval

To specify the interval between hello packets that Open Shortest Path First (OSPF) sends on the interface, use the **ip ospf hello-interval** command. To return to the default, use the **no** form of this command.

ip ospf hello-interval seconds

no ip ospf hello-interval

Syntax Description         seconds         Interval (in seconds). The value must be the same for specific network. The range is from 1 to 65535.			
Command Default	10 seconds		
Command Modes	Interface configu	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	hello intervals all	<b>ello-interva</b> l command to set the rate at which OSPF advertises hello packets. Shorter low OSPF to detect topological changes faster. This value must be the same for all as servers on a specific network.	
	This command re	equires the LAN Base Services license.	
Examples	switch(config)# switch(config-i	bws how to set the interval between hello packets to 15 seconds: interface ethernet 1/2 f) # no switchport f) # ip ospf hello-interval 15 f) #	
Related Commands	Command	Description	
	copy running-co startup-config	•	
	ip ospf dead-int	<b>erval</b> Sets the time period for which hello packets must not have been seen before neighbors declare the router as down.	
	show ip ospf	Displays OSPF information.	

#### ip ospf message-digest-key

To enable Open Shortest Path First (OSPF) Message Digest 5 (MD5) authentication, use the **ip ospf message-digest-key** command. To remove an old MD5 key, use the **no** form of this command.

ip ospf message-digest-key key-id md5 [0 | 3 | 7] key

no ip ospf message-digest-key key-id

Syntax Description	key-id	Identifier in the range from 1 to 255.	
	0	(Optional) Specifies an unencrypted password to generate the MD5 key.	
	3	(Optional) Specifies an encrypted 3DES password to generate the md5 key.	
	7	(Optional) Specifies a Cisco type 7 encrypted password to generate the MD5 key.	
	key	Alphanumeric password of up to 16 bytes.	
Command Default	Unencrypted		
Command Modes	Interface configu	aration mode	
Command History	Release Modification		
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines		<b>nessage-digest-key</b> command when you configure the MD5 digest authentication mode. Iters must have the same <i>key</i> value on the network.	
	This command requires the LAN Base Services license.		
Examples	This example shows how to set key 19 with the password 8ry4222:		
	<pre>switch# configure terminal switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip ospf message-digest-key 19 md5 8ry4222 switch(config-if)#</pre>		

Commands	Command	Description	
	area authentication	Enables authentication for an OSPF area.	
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.	
	ip ospf authentication	Specifies the authentication type for an interface.	
	show ip ospf	Displays OSPF information.	

#### ip ospf mtu-ignore

To disable Open Shortest Path First (OSPF) maximum transmission unit (MTU) mismatch detection on received Database Descriptor (DBD) packets, use the **ip ospf mtu-ignore** command. To return to the default, use the **no** form of this command.

#### ip ospf mtu-ignore

no ip ospf mtu-ignore

Syntax Description	This command h	nas no arguments	or keywords.
--------------------	----------------	------------------	--------------

**Command Default** OSPF MTU mismatch detection is enabled.

**Command Modes** Interface configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

Use the **ip ospf mtu-ignore** command to disable MTU mismatch detection on an interface. By default, OSPF checks whether neighbors are using the same MTU on a common interface. If the receiving MTU is higher than the IP MTU configured on the incoming interface, OSPF does not establish adjacencies. Use the **ip ospf mtu-ignore** command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

This command requires the LAN Base Services license.

**Examples** This example shows how to disable MTU mismatch detection on received DBD packets:

switch(config)# interface ethernet 1/2
switch(config-if)# no switchport
switch(config-if)# ip ospf mtu-ignore
switch(config-if)#

Related Commands Command Description		Description
	show ip ospf	Displays general information about OSPF routing instances.
	show ip ospf interface	Displays OSPF-related interface information.

#### ip ospf network

To configure the Open Shortest Path First (OSPF) network type to a type other than the default for an interface, use the **ip ospf network** command. To return to the default, use the **no** form of this command.

ip ospf network {broadcast | point-to-point}

no ip ospf network

Syntax Description	broadcast	Sets the network type as broadcast.	
	point-to-point	Sets the network type as point-to-point.	
Command Default	Depends on the ne	etwork type.	
Command Modes	Interface configur	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	broadcast, which backup designated	influences the behavior of the OSPF interface. An OSPF network type is usually uses OSPF multicasting capabilities. Under this network type, a designated router and d router are elected. For point-to-point networks, there are only two neighbors and quired. For routers on an interface to become neighbors, the network type for all should	
	This command overrides the <b>medium</b> { <b>broadcast</b>   <b>p2p</b> } command in interface configuration mode.		
	This command ree	quires the LAN Base Services license.	
Examples	This example sho	ws how to set an OSPF network as a broadcast network:	
	<pre>switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip address 192.0.2.33 255.255.255.0 switch(config-if)# ip ospf network broadcast switch(config-if)#</pre>		
Related Commands	Command	Description	
	show ip ospf	Displays general information about OSPF routing instances.	
	show ip ospf into	erface Displays OSPF-related interface information.	

#### ip ospf passive-interface

show ip ospf

show ip ospf interface

To suppress Open Shortest Path First (OSPF) routing updates on an interface, use the **ip ospf passive-interface** command. To return to the default, use the **no** form of this command.

ip ospf passive-interface

no ip ospf passive-interface

Syntax Description	This command has no arguments or keywords.		
Command Default	Disabled		
Command Modes	Interface configur	ration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	adjacencies or ser	configured as a passive interface, it does not participate in OSPF and does not establish nd routing updates. However, the interface is announced as part of the routing network. quires the LAN Base Services license.	
Examples	switch(config)# switch(config-i:	ws how to set an interface as passive: interface ethernet 1/2 f) # no switchport f) # ip ospf passive-interface f) #	
Related Commands	Command	Description	

Displays general information about OSPF routing instances.

Displays OSPF-related interface information.

## ip ospf priority

To set the router priority for an Open Shortest Path First (OSPF) interface, use the **ip ospf priority** command. To return to the default, use the **no** form of this command.

**ip ospf priority** *number-value* 

no ip ospf priority number-value

Syntax Description	number-value	Number that specifies the priority of the router. The range is from 0 to 255.	
Command Default	Priority of 1		
Command Modes	Interface configur	ation mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>ip ospf priority</b> command to set the router priority, which determines the designated router for this network. When two routers are attached to a network, both attempt to become the designated router. The router with the higher router priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. A router with a router priority set to zero cannot become the designated router router or backup designated router.		
	Cisco Nexus 5500 uses this priority value when you configure OSPF for broadcast networks using the <b>neighbor</b> command in router configuration mode.		
	This command requires the LAN Base Services license.		
Examples	This example show	ws how to set the router priority value to 4:	
	<pre>switch# configure terminal switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip ospf priority 4 switch(config-if)#</pre>		
Related Commands	Command	Description	
	ip ospf network	Configures the OSPF network type to a type other than the default for a given medium.	

### ip ospf retransmit-interval

To specify the time between Open Shortest Path First (OSPF) link-state advertisement (LSA) retransmissions for adjacencies that belongs to the interface, use the **ip ospf retransmit-interval** command. To return to the default, use the **no** form of this command.

ip ospf retransmit-interval seconds

no ip ospf retransmit-interval

Syntax Description	seconds	Time (in seconds) between retransmissions. The time must be greater than the expected round-trip delay between any two routers on the attached network. The range is from 1 to 65535 seconds. The default is 5 seconds.
Command Default	5 seconds	
Command Modes	Interface configuration	n mode
Command History	Release	Nodification
	5.2(1)N1(1)	This command was introduced.
	the neighbor. If the rour resends the LSA.	its neighbor, it keeps the LSA until it receives an acknowledgment message from iter receives no acknowledgment within the retransmit interval, the local router s the LAN Base Services license.
Examples	This example shows how to set the retransmit interval value to 8 seconds: switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip ospf retransmit-interval 8 switch(config-if)#	
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	ip ospf transmit-dela	y Sets the estimated time to transmit an LSA to a neighbor.
	show ip ospf	Displays OSPF information.

#### ip ospf shutdown

To shut down an Open Shortest Path First (OSPF) interface, use the **ip ospf shutdown** command. To return to the default, use the **no** form of this command.

ip ospf shutdown

no ip ospf shutdown

Syntax Description	This command has no argume	nts or keywords.
--------------------	----------------------------	------------------

Command Default None

**Command Modes** Interface configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

Use the **ip ospf shutdown** command to shut down OSPF on this interface. This command requires the LAN Base Services license.

**Examples** This example shows how to shut down OSPF on an interface:

switch(config)# interface ethernet 1/2
switch(config-if)# no switchport
switch(config-if)# ip ospf shutdown
switch(config-if)#

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays OSPF information.

#### ip ospf transmit-delay

To set the estimated time required to send an Open Shortest Path First (OSPF) link-state update packet on the interface, use the **ip ospf transmit-delay** command. To return to the default, use the **no** form of this command.

ip ospf transmit-delay seconds

no ip ospf transmit-delay

Syntax Description	seconds	Time (in seconds) required to send a link-state update. The range is from 1 to 450 seconds, and the default is 1.	
Command Default	1 second		
Command Modes	Interface configura	ation mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>ip ospf transmit-delay</b> command to set the estimated time needed to send an LSA update packet. OSPF increments the LSA age time by the transmit delay amount before transmitting the LSA update. You should take into account the transmission and propagation delays for the interface when you set this value.		
	This command req	uires the LAN Base Services license.	
Examples	This example shows how to set the transmit delay value to 8 seconds: <pre>switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip ospf transmit-delay 8 switch(config-if)#</pre>		
Related Commands	Command	Description	
	copy running-con startup-config	<b>afig</b> Saves the configuration changes to the startup configuration file.	
	ip ospf retransmit-interv	Sets the estimated time between LSAs transmitted from this interface.	

Displays OSPF information.

show ip ospf

#### ip router ospf area

To specify the Open Shortest Path First (OSPF) instance and area for an interface, use the **ip router ospf area** command. To return to the default, use the **no** form of this command.

ip router ospf instance-tag area area-id [secondaries none]

no ip router ospf instance-tag area area-id [secondaries none]

instance-tag	Instance tag. The <i>instance-tag</i> can be an alphanumeric string of 20 characters.	
area-id	Identifier for the OSPF area where you want to enable authentication. The area ID can be either a positive integer value from 0 to 4294967295 or an IP address.	
secondaries none	(Optional) Excludes secondary IP addresses.	
10 seconds		
Interface configuration	mode	
Release M	lodification	
5.2(1)N1(1) T	his command was introduced.	
	<b>area</b> command to specify the area and OSPF instance for the interface. the LAN Base Services license.	
This example shows ho	w to configure an interface for OSPF:	
<pre>switch# configure terminal switch(config)# interface ethernet 1/2 switch(config-if)# no switchport switch(config-if)# ip router ospf Base area 33 switch(config-if)#</pre>		
Command	Description	
copy running-config startup-config	Saves the configuration changes to the startup configuration file.	
	area-id         secondaries none         10 seconds         Interface configuration         Release       N         5.2(1)N1(1)       T         Use the ip router ospf         This command requires         This example shows ho         switch(config)# integration         switch(config-if)# no         switch(config-if)# if         switch(config-if)# if	

### ip router ospf multi-area

To configure a multi-area adjacency on an Open Shortest Path First (OSPF) interface, use the **ip router ospf multi-area** command. To return to the default, use the **no** form of this command.

ip router ospf instance-tag multi-area area-id

no ip router ospf instance-tag multi-area area-id

Syntax Description	instance-tag	Instance tag. Specify as an case-sensative alphanumeric string up to 20 characters.	
	area-id	Identifier for the OSPF area where you want to add as another area to the primary interface. The area ID can be either a positive integer value from 0 to 4294967295 or an IP address.	
Command Default	None		
Command Modes	Interface configuration	n mode	
Command History	Release	Modification	
-	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	•	ommand, make sure that you enable OSPF on the switch. es the LAN Base Services license.	
Examples	This example shows how to configure a multi-area adjacency:		
	switch# configure terminal		
	<pre>switch(config)# interface ethernet 1/2 switch(config-if)# no switchport</pre>		
	<pre>switch(config-if)# ip router ospf Base area 33 switch(config-if)# ip router ospf Base multi-area 99 switch(config-if)#</pre>		
Related Commands	Command	Description	
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.	
	feature ospf	Enables OSPF on the switch.	
	show ip ospf interfac	ce Displays OSPF interface-related information.	

# **L** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with L.

# log-adjacency-changes (OSPF)

To configure the router to send a syslog message when the state of an Open Shortest Path First (OSPF) neighbor changes, use the **log-adjacency-changes** command. To turn off this function, use the **no** form of this command.

log adjacency changes [detail]

Syntax Description		Optional) Provides all (DOWN, INIT, 2WAY, EXSTART, EXCHANGE, LOADING, FULL) adjacency state changes.
Command Default	The router sends a syst	tem message when the state of an OSPF neighbor changes.
Command Modes	Router configuration n	node
	VRF configuration mo	de
Command History	Release	Nodification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	<ul> <li>Use the log-adjacency-changes command to display high-level changes to the state of the C neighbor relationship. This command is on by default but only reports the up/down (full/dow you do not use the detail keyword.</li> <li>This command requires the LAN Base Services license.</li> </ul>

# **M** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with M.

### max-metric router-Isa (OSPF)

To configure the Open Shortest Path First (OSPF) protocol to advertise a maximum metric so that other routers do not prefer the router as an intermediate hop in their shortest path first (SPF) calculations, use the **max-metric router-lsa** command. To disable the advertisement of a maximum metric, use the **no** form of this command.

max-metric router-lsa [on-startup [seconds | wait-for bgp tag]]

no max-metric router-lsa [on-startup [seconds | wait-for bgp tag]]

Syntax Description	on-startup	(Optional) Configures the router to advertise a maximum metric at startup.		
	seconds	(Optional) Maximum metric (in seconds) that is advertised for the specified		
		time interval. The configurable range is from 5 to 86400 seconds. The		
		default is 600 seconds.		
	wait-for bgp <i>tag</i>	(Optional) Advertises a maximum metric until Border Gateway Protocol (BGP) routing tables have converged or the default timer has expired. The default timer is 600 seconds. The <i>tag</i> name can be a maximum of 20 characters.		
Command Default	Originates router link-state advertisements (LSAs) with normal link metrics.			
Command Modes	Router configurat	ion mode		
	VRF configuratio	n mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	Use the <b>max-metric router-lsa</b> command to originate LSAs with a maximum metric (LSInfinity: 0xFFFF) through all nonstub links. This command allows Border Gateway Protocol (BGP) routing tables to converge without attracting transit traffic (if there are not alternate lower cost paths to the router). The router advertises accurate (normal) metrics after the configured or default timers expire or after BGP sends a notification that routing tables have converged.			
Note		d links in a stub network are not affected by the configuration of a maximum or infinite e cost of a stub link is always set to the output interface cost.		
	You can use the <b>max-metric router-lsa</b> command in the following situations:			
		router. After a router is reloaded, Interior Gateway Protocols (IGPs) converge very other routers may try to forward traffic through the newly reloaded router. If the router		
	is still buildir	ng BGP routing tables, the packets that are destined for other networks that the router ed through BGP may be dropped.		

• Introducing a router into a network without routing traffic through it. You might want to connect a router to an OSPF network but not want real traffic to flow through the router if there are better alternate paths. If no alternate paths exist, then this router would still accept transit traffic.

This command requires the LAN Base Services license.

**Examples** This example shows how to configure a router that is running OSPF to advertise a maximum metric for 100 seconds:

```
switch(config)# router ospf 100
switch(config-router)# max-metric router-lsa on-startup 100
switch(config-router)#
```

This example shows how to configure a router to advertise a maximum metric until BGP routing tables converge or until the default timer expires (600 seconds):

```
switch(config)# router ospf 100
switch(config-router)# max-metric router-lsa on-startup wait-for bgp bgpTag
switch(config-router)#
```

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays OSPF information.

# maximum-paths (OSPF)

To control the maximum number of parallel routes that Open Shortest Path First (OSPF) can support, use the **maximum-paths** command. To remove the **maximum-paths** command from the configuration file and restore the system to the default, use the **no** form of this command.

**maximum-paths** *maximum* 

no maximum- paths

Syntax Description	maximum	Maximum number of parallel routes that OSPF can install in a routing table. The range is from 1 to 16 routes.
Command Default	8 paths	
Command Modes	Router configuration VRF configuration n	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	each prefix. Multiple autonomous system	<b>paths</b> command to allow OSPF to install multiple paths into the routing table for e paths are installed for both internal and external routes that are learned in the same and that have an equal cost (according to the OSPF shortest path first algorithm). ares the LAN Base Services license.
Examples	This example shows how to allow a maximum of 10 paths to a destination: <pre>switch# configure terminal switch(config)# router ospf 1 switch(config-router)# maximum-paths 10 switch(config-router)#</pre>	
Related Commands	Command	Description
	copy running-confi startup-config	<b>ig</b> Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays OSPF information.

# message-digest-key (OSPF virtual link)

To enable Open Shortest Path First (OSPF) Message Digest 5 (MD5) authentication on a virtual link, use the **message-digest-key** command. To remove an old MD5 key, use the **no** form of this command.

message-digest-key key-id md5 [0 | 3] key

no message-digest-key key-id

Syntax Description	key-id	Identifier in the range from 1 to 255.	
	0	(Optional) Specifies to use an unencrypted password to generate the md5 key.	
	3	(Optional) Specifies to use an encrypted 3DES password to generate the md5 key.	
	key	Alphanumeric password of up to 16 bytes.	
Command Default	Unencrypted		
Command Modes	Virtual link conf	iguration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	When you config link have the san	gure the MD5 digest authentication mode, make sure that both interfaces on the virtual ne <i>key</i> value.	
	This command re	equires the LAN Base Services license.	
Examples	This example shows how to set key 19 with the password 8ry4222:		
		router)# <b>area 22 virtual-link 192.0.2.2</b> router-vlink)# <b>message-digest-key 19 md5 8ry4222</b> router-vlink)#	
Related Commands	Command	Description	
	authentication	(virtual-link) Configures the authentication mode on a virtual link.	

# **P** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with P.

# protocol shutdown (OSPF)

To shut down an Open Shortest Path First (OSPF) instance, use the **protocol shutdown** command. To disable this function, use the **no** form of this command.

#### protocol shutdown

no protocol shutdown

Syntax Description	This command has no arguments or keywords.		
Command Default	The OSPF instan	ce is enabled by default when configured.	
Command Modes	Router configura	tion mode	
	VRF configuration	on mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>protocol</b> configuration.	shutdown command to disable an instance of OSPF without removing the	
	This command re	equires the LAN Base Services license.	
Examples	This example sho	ows how to disable OSPF 209:	
	switch(config) switch(config-r	router ospf 209 router)# protocol shutdown	
Related Commands	Command	Description	

oommanu	Description
show ip ospf	Displays general information about OSPF routing instances.

# **R** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with R.

# redistribute (OSPF)

To inject routes from one routing domain into Open Shortest Path First (OSPF), use the **redistribute** command. To remove the **redistribute** command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the **no** form of this command.

**redistribute** {**bgp** *as-number* | **direct** | **eigrp** *id* | **ospf** *instance-tag* | **rip** *instance-tag* | **static**} [**route-map** *map-name*]

no redistribute {bgp as-number | direct | eigrp as-number | ospf instance-tag | rip instance-tag |
static}

Syntax Description	bgp as-number	Distributes routes from Border Gateway Protocol (BGP). The <i>as-number</i> is a 2-byte or 4-byte autonomous system number. The range for 2-byte numbers is from 1 to 65535. The range for 4-byte numbers is from 1 to 4294967295.	
	direct	Distributes routes that are directly connected on an interface.	
	eigrp id	Distributes routes from EIGRP. The <i>id</i> argument can be any case-sensitive, alphanumeric string.	
	ospf instance-tag	Distributes routes from the OSPF protocol. This protocol is supported in the IPv4 address family. The <i>instance-tag</i> argument can be any case-sensitive, alphanumeric string of up to 20 characters.	
	rip instance-tag	Distributes routes from the RIP protocol. The <i>instance-tag</i> can be a maximum of 20 alphanumeric characters.	
	static	Redistributes IP static routes, including the default static route.	
	route-map map-	<i>name</i> (Optional) Specifies the identifier of a configured route map. Use a route map to filter which routes are redistributed into EIGRP. The <i>map-name</i> argument can be a maximum of 63 alphanumeric characters.	
Command Default	Route redistribution is disabled. Router configuration mode		
Command Modes			
	VRF configuration		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines		<b>ute</b> command to import routes from other routing protocols into OSPF. You should e map to filter these routes to ensure that OSPF redistributes only the routes that you	

You must configure a default metric to redistribute routes from another protocol into OSPF. You can configure the default metric with the **default-metric** command or with the route map configured with the **redistribute** command.

Note

If you redistribute static routes, Cisco NX-OS also redistributes the default static route.

This command requires the LAN Base Services license.

Examples

This example shows how to redistribute BGP routes into an OSPF autonomous system:

```
switch(config)# router ospf 209
switch(config-router)# redistribute bgp 64496
witch(config-router)#
```

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	default-metric (OSPF)	Sets the default metrics for routes redistributed into OSPF.
	show ip ospf	Displays OSPF information.

# redistribute maximum-prefix (OSPF)

To limit the number of routes redistributed into Open Shortest Path First (OSPF), use the **redistribute maximum-prefix** command. To return to the default setting, use the **no** form of this command.

redistribute maximum-prefix max [threshold] [warning-only | withdraw [num-retries timeout]]

**no redistribute maximum-prefix** max [threshold] [**warning-only** | **withdraw** [num-retries timeout]

Syntax Description	max	Maximum number of prefixes that OSPF will distribute. The range is from 0 to 65535.	
	threshold	(Optional) Percentage of maximum prefixes that triggers a warning message. The range is from 1 to 100. The default is 75 percent.	
	warning-only	(Optional) Logs a warning message when the maximum number of prefixes is exceeded.	
	widthdraw	(Optional) Withdraws all redistributed routes.	
	num-retries	(Optional) Number of times OSPF tries to retrieve the redistributed routes. The range is from 1 to 12. The default is 1.	
	timeout	(Optional) Time between retry attempts. The range is from 60 to 600 seconds. The default is 300.	
Command Default	No limit		
Command Modes	Router configurat	tion mode	
	VRF configuration	n mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the clear ip ospf redistribute command if all routes are withdrawn.		
	This command requires the LAN Base Services license.		
Examples	This example sho	ws how to limit the number of redistributed routes into OSPF:	
	<pre>switch# configure terminal switch(config)# router ospf 201 switch(config-router)# redistribute bgp route-map FilterExternalBGP switch(config-router)# redistribute maximum-prefix 1000 75</pre>		

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays OSPF information.
	show running-config ospf	Displays the OSPF running configuration.

# restart (OSPF)

To restart an Open Shortest Path First version 2 (OSPFv2) instance and remove all associated neighbors, use the **restart** command.

restart ospf instance-tag

Syntax Description	instance-tag	Internally used identification parameter for an OSPF routing instance. It is locally assigned and can be any word or positive integer. The <i>instance-tag</i> argument can be a maximum of 20 alphanumeric characters.
Command Default	None	
Command Modes	Global configuration	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command requ	ires the LAN Base Services license.
Examples	This example shows	s how to restart the OSPFv2 instance and remove all neighbors:
	switch(config)# re switch(config)#	estart ospf 12
Related Commands	Command	Description
	show ip ospf	Displays OSPF information.

# retransmit-interval (OSPF virtual link)

To specify the time between link-state advertisement (LSA) retransmissions for adjacencies that belong to the virtual link, use the **retransmit-interval** command. To return to the default, use the **no** form of this command.

retransmit-interval seconds

#### retransmit-interval

Syntax Description	seconds	Time (in seconds) between retransmissions. The time must be greater than the expected round-trip delay between any two routers on the attached network. The range is from 1 to 65535 seconds. The default is 5 seconds.	
Command Default	5 seconds		
Command Modes	Virtual-link confi	guration mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use this command to set the LSA retransmission time. If a router receives no acknowledgment that an LSA was received, the router resends the LSA at the retransmission interval. You should set this value larger for virtual links.		
		quires the LAN Base Services license.	
Examples	-	ws how to set the retransmit interval value to 8 seconds:	
		<pre>router ospf 109 puter)# area 33 virtual-link 192.0.2.2 puter-vrf)# retransmit-interval 8</pre>	
Related Commands	Command	Description	
	area virtual-link	Creates a virtual link in an OSPF area.	

### rfc1583compatibility

To configure RFC 1583 compatibility as the method used to calculate summary route costs, use the **rfc1583compatibility** command. To disable RFC 1583 compatibility, use the **no** form of this command.

rfc1583compatibility

no rfc1583compatibility

Syntax Description	This command has	s no arguments or	keywords.
--------------------	------------------	-------------------	-----------

- **Command Default** RFC 1583 compatibility is disabled.
- **Command Modes** Router configuration mode

Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	

 Usage Guidelines
 To minimize the chance of routing loops, all Open Shortest Path First (OSPF) routers in an OSPF routing domain should have RFC compatibility set identically.

 Description
 Shortest Path First (OSPF) routers in an OSPF routing domain should have RFC compatibility set identically.

Because of the introduction of RFC 2328, OSPF Version 2, the method used to calculate summary route costs has changed. Use the **no rfc1583compatibility** command to enable the calculation method used per RFC 2328.

**Examples** This example specifies that the router process is compatible with RFC 1583: switch# configure terminal

Enter configuration commands, one per line. End with CNTL/Z. switch(config)# router ospf 2 switch(config-router)# rfc1583compatibility

<b>Related Commands</b>	Command	Description	
show ip ospf		Displays general information about OSPF routing instances.	

# router ospf

To configure an Open Shortest Path First (OSPF) routing instance, use the **router ospf** command. To terminate an OSPF routing process, use the **no** form of this command.

**router ospf** *instance-tag* 

no router ospf instance-tag

Syntax Description	instance-tag	Internally used identification parameter for an OSPF routing instance. It is locally assigned and can be any word or positive integer. The <i>instance-tag</i> argument can be a maximum of 20 alphanumeric characters.
Command Default	No OSPF routing inst	ance is defined.
Command Modes	Global configuration	mode
Command History	Release	Modification
-	5.2(1)N1(1)	This command was introduced.
Examples	This example shows h	low to configure a basic OSPF instance:
Examples	switch(config)# rou switch(config-route	ter ospf 12
	This example shows h	low to delete an OSPF instance:
	<pre>switch(config)# no : switch(config)#</pre>	router ospf 12

Related Commands	copy running-config startup-config	-

# router-id (OSPF)

To use a fixed router ID for an Open Shortest Path First (OSPF) instance, use the **router-id** command. To revert to the previous OSPF router ID behavior, use the **no** form of this command.

router-id *ip-address* 

no router-id *ip-address* 

Syntax Description	ip-address	Router ID in IP address format.
Command Default	If this command interfaces.	is not configured, OSPF chooses an IPv4 address as the router ID from one of its
Command Modes	Global configura	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		<b>d</b> command to manually specify a unique 32-bit numeric value for the router ID. This
	If this command	at EIGRP can function regardless of the interface address configuration. is used on an OSPF instance that has neighbors, OSPF uses the new router ID at the a restart of OSPF.
	This command re	equires the LAN Base Services license.
Examples	This example sho	ows how to configure the router ID:
		<pre># router ospf 12 router)# router-id 192.0.2.1</pre>
Related Commands	Command	Description
	router ospf	Configures the OSPF routing process.

# **S** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with S.

### set forwarding-address

To set the Open Shortest Path First (OSPF) forwarding address for redistributed type-5 Link State Advertisements (LSAs), use the **set forwarding-address** command. To remove the address, use the **no** form of this command.

#### set forwarding-address

no forwarding-address

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

- **Command Default** No forwarding address is set as a default.
- **Command Modes** Route-map configuration mode

Command History	Release	Modification	
	5.0(3)N1(1)	This command was introduced.	

# **Usage Guidelines** This command is used by the OSPF to set the forwarding address for the redistributed type-5 LSAs. The value of the forwarding address specified by the autonomous system boundary router (ASBR) can be either 0.0.0.0 or nonzero. The 0.0.0.0 address indicates that the originating router (the ASBR) is the next hop.

If the ASBR redistributes routes and OSPF is not enabled on the next hop interface for those routes, the forwarding address is set to 0.0.0.0.

All of the following conditions must be met to set the forwarding address field to a nonzero address:

- OSPF is enabled on the ASBR's next hop interface.
- ASBR's next hop interface is non-passive under OSPF.
- ASBR's next hop interface is not point-to-point.
- ASBR's next hop interface is not point-to-multipoint.

For all other conditions, set the forwarding address to 0.0.0.0.

Examples

This example shows how to set the forwarding address:

switch(config)# route-map test1 10 permit
switch(config-route-map)# set forwarding-address

Command Description		
match as-path	Matches a BGP autonomous system path access list.	
match community	Matches a BGP community.	
match ip next-hop	Redistributes any routes that have a next-hop router address passed by one of the access lists specified.	
match ip route-source	Redistributes routes that have been advertised by routers and access servers at the address specified by the access lists.	
match metric	Redistributes routes with the metric specified.	
match tag	Redistributes routes in the routing table that match the specified tags.	
route-map (IP)	Defines the conditions for redistributing routes from one routing protocol into another.	
set as-path	Modifies an autonomous system path for BGP routes.	
set community	Sets the BGP communities attribute.	
set level	Indicates where to import routes.	
set local-preference	Specifies a preference value for the autonomous system path.	
set metric	Sets the metric value for a routing protocol.	
set metric-type	Sets the metric type for the destination routing protocol.	
set next-hop	Specifies the address of the next hop.	
set tag	Sets a tag value of the destination routing protocol.	
set weight	Specifies the BGP weight for the routing table.	

### shutdown (OSPF)

To stop an Open Shortest Path First (OSPF) instance without removing the configuration, use the **shutdown** command. To start a stopped OSPF instance, use the **no** form of this command.

shutdown

no shutdown

Syntax Description	This command has no	o arguments or keywords.
--------------------	---------------------	--------------------------

**Command Default** No process is stopped.

Command ModesRouter configuration modeVRF configuration mode

Command History Release		Modification	
	5.2(1)N1(1)	This command was introduced.	

# **Usage Guidelines** Entering the **shutdown** command stops a router process but does not remove any configuration parameters. The **shutdown** command is displayed in the running configuration file when enabled.

This command requires the LAN Base Services license.

**Examples** This example shows how to stop an active OSPF instance: switch(config)# router ospf firstcompany

switch(config-router)# shutdown

<b>Related Commands</b>	Command	Description
	feature ospf	Enables OSPF on the router.
	router ospf	Configures an OSPF instance.

# summary-address (OSPF)

To create aggregate addresses for the Open Shortest Path First (OSPF) protocol, use the **summary-address** command. To return to the default, use the **no** form of this command.

summary-address ip-prefix/length [not-advertise] [tag tag]

**no summary-address** *ip-prefix/length* [**not-advertise**] [**tag** *tag*]

Syntax Description	ip-prefix/length	IP prefix designated for a range of addresses, including the prefix length. Specify <i>ip-prefix</i> as an IP address. Specify <i>length</i> as a number from 1 to 31.	
	not-advertise	(Optional) Suppresses routes that match the specified prefix/length pair.	
	tag tag	(Optional) Specifies the tag value that can be used as a match value for controlling redistribution using route maps. The range is from 1 to 65535.	
Command Default	None		
Command Modes	Router configura	tion mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>summary-address</b> command to create an aggregate address to replace a series of more-specific addresses. The metric used to advertise the summary is the smallest metric of all the more specific routes.		
	Use this command to help reduce the size of the routing table and allow an OSPF Autonomous System Boundary Router (ASBR) to advertise one external route as an aggregate for all redistributed routes that are covered by the address.		
	This command re	equires the LAN Base Services license.	
Examples	-	ows how to configure the summary address 192.0.0.0 to include address 192.0.1.0, 3.0, and so on. Only the address 192.0.0.0 is advertised in an external link-state	
		router ospf 201 router)# summary-address 192.0.0.0/16	

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	redistribute (OSPF)	Redistributes external routing protocol routes into OSPF.
	show ip ospf summary-address	Displays OSPF summary-address redistribution information.

# **Show Commands**

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) show commands.

# show ip ospf

To display general information about Open Shortest Path First (OSPF) routing instances, use the **show ip ospf** command.

show ip ospf [instance-tag] [vrf vrf-name]

Syntax Description	instance-tag	(Optional) Name of the OSPF instance. Use this tag to display OSPF information about a specific OSPF instance. The <i>instance-tag</i> argument can be any alphanumeric string of 20 characters.			
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.			
Command Default	None				
Command Modes	Any command m	node			
Command History	Release	Modification			
· · · · · ·	5.2(1)N1(1)	This command was introduced.			
Examples	This example shows how to display information all about OSPF instances:				
	switch# <b>show ip ospf</b> Routing Process 201 with ID 192.0.2.1 VRF default				
	Stateful High Availability enabled Graceful-restart is configured				
	Grace period: 60 state: Inactive Last graceful restart exit status: None				
	Supports only single TOS(TOS0) routes				
	Supports opaque LSA This router is an autonomous system boundary				
	Redistributing External Routes from bgp-1				
	Maximum limit: 1000 (warning-only) Threshold: message 750				
	Current count: 0 Administrative distance 110				
	Reference Bandwidth is 40000 Mbps Initial SPF schedule delay 3000.000 msecs,				
	minimum inter SPF delay of 2000.000 msecs, maximum inter SPF delay of 4000.000 msecs

switch#
```

Table 1 describes the significant fields shown in the display.

Field Description		
Routing Process	OSPF instance tag and OSPF router ID.	
Stateful High Availability	Status of stateful restart capability.	
Supports	Number of types of service supported (Type 0 only).	
Administrative distance	Administrative distance for the OSPFv2 instance.	
Reference Bandwidth	Bandwidth used for cost calculation.	
Initial SPF schedule delay	Delay time of SPF calculations.	
Initial LSA generation delay	Delay time of LSA generations.	
Minimum LSA arrival	Minimum interval between link-state advertisements.	
Maximum paths to destination	Maximum paths to the neighbor.	
Number of	Number and type of link-state advertisements that have been received.	
Number of areas is	Number and type of areas configured for the router.	
Number of active areas is	Number and type of active areas configured on the router.	

Displays the OSPF running configuration.

#### Description

show running-config ospf

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# show ip ospf border-routers

To display the Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **show ip ospf border-routers** command.

show ip ospf [instance-tag] border-routers [vrf vrf-name]

Related Commands	Command	Description		
	switch# <b>show ip osy</b>	of border-routers		
Examples	This example shows l	how to display information about border routers:		
	This command requir	es the LAN Base Services license.		
Usage Guidelines	Use the <b>show ip ospf</b>	<b>border-routers</b> command to display information on ABRs. and ASBRs.		
	5.2(1)N1(1)	This command was introduced.		
Command History	Release	Modification		
command Modes	Any command mode			
Command Default	None			
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.		
Syntax Description	instance-tag	(Optional) Name of the OSPF instance. Use this tag to display OSPF information about a specific OSPF instance. The <i>instance-tag</i> argument can be a maximum of 20 alphanumeric characters.		

# show ip ospf database

	To display the Ope database comman	en Shortest Path First (OSPF) database for a specific router, use the <b>show ip ospf</b> id.	
		[instance-tag] database [area-id] [link-state-id] [adv-router ip-address   nated] [detail] [vrf vrf-name]	
	<pre>show ip ospf [instance-tag] database asbr-summary [area-id] [link-state-id] [adv-router ip-address   self-originated] [detail] [vrf vrf-name]</pre>		
	<pre>show ip ospf [instance-tag] database database-summary [vrf vrf-name] show ip ospf [instance-tag] database external [ext_tag value] [link-state-id] [adv-router ip-address   self-originated] [detail] [vrf vrf-name]</pre>		
		[instance-tag] database network [area-id] [link-state-id] [adv-router ip-address   nated] [detail] [vrf vrf-name]	
		[instance-tag] database nssa-external [area-id] [link-state-id] [adv-router s   self-originated] [detail] [vrf vrf-name]	
	show ip ospf [instance-tag] database opaque-area [area-id] [link-state-id] [adv-router ip-address   self-originated] [detail] [vrf vrf-name] show ip ospf [instance-tag] database opaque-as [link-state-id] [adv-router ip-address   self-originated] [detail] [vrf vrf-name]		
	<pre>show ip ospf [instance-tag] database opaque-link [area-id] [link-state-id   self-originated] [detail] [vrf vrf-name]</pre>		
	<pre>show ip ospf [instance-tag] database router [area-id] [link-state-id] [adv-router ip-address       self-originated] [detail] [vrf vrf-name]</pre>		
	show ip ospf [instance-tag] database summary [area-id] [link-state-id] [adv-router ip-address   self-originated] [detail] [vrf vrf-name]		
Syntax Description	<i>instance-tag</i> (Optional) Name of the OSPF instance. The name can be a maximum of 20 alphanumeric characters.		
	area-id	(Optional) Area number used to define the particular area. Specify as either an IP address or a number from 0 to 4294967295.	
	link-state-id	(Optional) Portion of the Internet environment that is being described by the advertisement. The value entered depends on the	

	by the advertisement. The value entered depends on the advertisement's link-state type. Specify in the form of an IP address.
<b>adv-router</b> <i>ip-address</i>	(Optional) Displays all the link-state advertisements (LSAs) of the specified router.
self-originate	(Optional) Displays self-originated LSAs (from the local router).
asbr-summary	(Optional) Displays information about the autonomous system boundary router summary LSAs.
database-summary	(Optional) Displays each type of LSA for each area in the database, and the total number of LSAs.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

	4				
	external	(Optional) Displays information about the external LSAs.			
	ext_tag value	(Optional) Displays information based on an external tag. The range is from 1 to 4294967295.			
	network	(Optional) Displays information about the network LSAs.			
	nssa-external	(Optional) Displays information about the not-so-stubby area (NSSA) external LSAs.			
	opaque-area	(Optional) Displays information about the opaque area LSAs.			
	opaque-as	(Optional) Displays information about the opaque AS LSAs.			
	opaque-link	(Optional) Displays information about the opaque link-local LSAs.			
	router	(Optional) Displays information about the router LSAs.			
	summary	(Optional) Displays information about the summary LSAs.			
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.			
Command Default	None				
Command Modes	Any command mod	le			
Command History	Release	Modification			
5.2(1)N1(1) 7		This command was introduced.			
Usage Guidelines	Use the <b>ip ospf database</b> command to display information about different OSPF LSAs.				
	When the link state forms:	advertisement is describing a network, the <i>link-state-id</i> argument can take one of two			
		IP address (such as Type 3 summary link advertisements and autonomous system dvertisements).			
	• A derived address obtained from the link state ID. (Note that masking a network links advertisement's link state ID with the network's subnet mask yields the network's IP address.)				
	<ul> <li>When the link state advertisement is describing a router, the link state ID is always the described router's OSPF router ID.</li> </ul>				
	• When the link	state advertisement is describing a router, the link state ID is always the described			
	<ul><li>When the link router's OSPF</li><li>When an auton</li></ul>	state advertisement is describing a router, the link state ID is always the described router ID.			
	<ul> <li>When the link router's OSPF</li> <li>When an auton link state ID is</li> </ul>	state advertisement is describing a router, the link state ID is always the described router ID. nomous system external advertisement (LS Type = 5) is describing a default route, its a set to Default Destination $(0.0.0.0)$ .			
	<ul> <li>When the link router's OSPF</li> <li>When an auton link state ID is</li> </ul>	state advertisement is describing a router, the link state ID is always the described router ID.			
Examples	<ul> <li>When the link router's OSPF</li> <li>When an auton link state ID is This command requ</li> </ul>	state advertisement is describing a router, the link state ID is always the described router ID. nomous system external advertisement (LS Type = 5) is describing a default route, its a set to Default Destination $(0.0.0.0)$ .			
Examples	<ul> <li>When the link router's OSPF</li> <li>When an auton link state ID is This command requ</li> </ul>	state advertisement is describing a router, the link state ID is always the described router ID. nomous system external advertisement (LS Type = 5) is describing a default route, its set to Default Destination (0.0.0.0). uires the LAN Base Services license.			

switch# show ip ospf database asbr-summary

This example shows how to display information about external links:

switch# show ip ospf database external

This example shows how to display a summary of the OSPF database:

switch# show ip ospf database database-summary

#### **Related Commands**

Command	Description	
show running-config	Displays the OSPF running configuration.	
ospf		

# show ip ospf interface

To display Open Shortest Path First (OSPF)-related interface information, use the **show ip ospf interface** command.

show ip ospf interface [instance-tag] [{ethernet slot/[QSFP-module/]port | loopback if\_number |
port-channel number}] [brief] [vrf vrf-name]

Syntax Description	instance-tag		(Optional) Name of the OSPF instance. The name can be a maximum of 20 alphanumeric characetrs.	
	ethernet slot/[QSFP-modu	ıle/]port	(Optional) Specifies the Ethernet interface. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.	
			<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).	
	loopback if_num	ber	(Optional) Specifies the loopback interface. The loopback interface number is from 0 to 1023.	
	port-channel number brief vrf vrf-name		(Optional) Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.	
			(Optional) Displays brief overview information for OSPF interfaces, states, addresses, masks, and areas on the router.	
			(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.	
Command Default	None			
Command Modes	Any command me	ode		
Command History	Release Modifi		cation	
	6.0(2)N1(2)	Support	t for the QSFP+ GEM was added.	
	5.2(1)N1(1)	This co	mmand was introduced.	
Usage Guidelines	-	-	ce command to display the OSPF status for the interface. AN Base Services license.	
Examples	-	ospf inter	isplay OSPF information for Ethernet interface 1/5: <b>face ethernet 1/5</b> rotocol is down	

```
IP address 192.0.2.1, Process ID 201 VRF RemoteOfficeVRF, area 0.0.0.10
Enabled by interface configuration
State DOWN, Network type BROADCAST, cost 4
Index 1, Transmit delay 1 sec, Router Priority 1
No designated router on this network
No backup designated router on this network
0 Neighbors, flooding to 0, adjacent with 0
Timer intervals: Hello 10, Dead 40, Wait 40, Retransmit 5
No authentication
Number of opaque link LSAs: 0, checksum sum 0
switch#
```

Table 2 describes the significant fields shown in the display.

#### Table 2 show ip ospf interface Field Descriptions

Field	Description		
Ethernet	Status of physical link and operational status of protocol.		
IP Address	Interface IP address, subnet mask, and area address.		
VRF	Virtual routing and forwarding (VRF) instance.		
Transmit Delay	Transmit delay, interface state, and router priority.		
designated router	Designated router ID and interface IP address.		
backup designated router	Backup designated router ID and interface IP address.		
Timer intervals	Configuration information of timer intervals.		
Hello	Number of seconds until next hello packet is sent out this interface.		

This example shows how to display OSPF information for all VRFs:

```
switch# show ip ospf interface vrf all
VL1-0.0.0.10-10.1.2.3 is down, line protocol is down
IP address 0.0.0.0, Process ID 201 VRF default, area 0.0.0.0
State DOWN, Network type P2P, cost 65535
Index 2, Transmit delay 2 sec
0 Neighbors, flooding to 0, adjacent with 0
Timer intervals: Hello 25, Dead 50, Wait 50, Retransmit 50
Message-digest authentication, using key id 21
Number of opaque link LSAs: 0, checksum sum 0
```

switch#

This example shows how to display OSPF information in a brief format:

switch# show ip ospf interface brief								
OSPF Process ID 201 VRF default								
Total number of interface: 1								
Interface	ID	Area	Cost	State	Neighbors	Status		
VL1	2	0.0.0.0	65535	DOWN	0	down		

switch#

<b>Related Commands</b>	Command	Description
	show running-config	Displays the OSPF running configuration.
	ospf	

### show ip ospf lsa-content-changed-list

To display a list of all link-state advertisements (LSAs) with changed content, use the **show ip ospf lsa-content-changed-list** command.

show ip ospf lsa-content-changed-list neighbor-id {ethernet slot/[QSFP-module/]port | loopback
if\_number | port-channel number}

Syntax Description	<i>neighbor id</i> Router ID for the neighbor in the format <i>A.B.C.D.</i>				
	ethernet slot/[QSFP-module/	Specifies the Ethernet interface and the slot number and port number.			
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).			
	loopback if_number	Specifies the loopback interface. The loopback interface number is from 0 to 1023.			
	port-channel numbe	<i>er</i> Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.			
Command Default	None				
Command Modes	Any command mode				
Command History	Release Modification				
	6.0(2)N1(2)	Support for the QSFP+ GEM was added.			
	5.2(1)N1(1)	This command was introduced.			
Usage Guidelines	This command requir	res the LAN Base Services license.			
Examples	This example shows how to display a list of LSAs that changed for Ethernet 2/1:				
	switch# <b>show ip os</b> p	pf lsa-content-changed-list 192.0.2.2 ethernet 2/1			
Related Commands	Command	Description			
	show running-configDisplays the OSPF running configuration.ospf				

### show ip ospf neighbors

To display Open Shortest Path First (OSPF)-neighbor information on a per-interface basis, use the **show ip ospf neighbors** command.

show ip ospf [instance-tag] neighbors [{ethernet slot/[QSFP-module/]port | loopback if\_number | port-channel number}] [neighbor-id] [detail] [summary] [vrf {vrf-name | all | default | management}]

Syntax Description	instance-tag	(Optional) Name of the OSPF instance. Specify as an alphanumeric string of 20 characters.
	ethernet slot/[QSFP-module/]p	(Optional) Specifies the Ethernet interface and the slot number and port number. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).
	loopback if_number	(Optional) Specifies the loopback interface. The loopback interface number is from 0 to 1023.
	port-channel number	(Optional) Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.
	neighbor-id	(Optional) Router ID of the neighbor. Specify as an IP address.
	detail	(Optional) Displays all neighbors given in detail (lists all neighbors).
	summary	(Optional) Displays a summary of the neighbors.
	vrf	(Optional) Specifies a virtual routing and forwarding (VRF) instance.
	vrf-name	VRF name. The name can be a maximum of 32 alphanumeric characters and is case sensitive.
	all	Specifies all VRF entries.
	default	Specifies the default VRF.
	management	Specifies the management VRF.
Command Default	None	
Command Modes	Any command mode	
Command History	Release N	Adification
	6.0(2)N1(2)	Support for the QSFP+ GEM was added.
	5.2(1)N1(1) 7	This command was introduced.
Usage Guidelines	Use the <b>show ip ospf n</b> this OSPF instance.	eighbors command to display information about all or some of the neighbors for

 Examples
 This example shows how to display the summary information about the neighbor that matches the neighbor ID:

 switch# show ip ospf neighbors 10.199.199.137

 This example shows how to display the neighbors that match the neighbor ID on an interface:

 switch# show ip ospf neighbors ethernet 2/1 10.199.199.137

 This example shows how to display detailed information about OSPF neighbors:

 switch# show ip ospf neighbors detail

<b>Related Commands</b>	Command	Description	
	show running-config	Displays the OSPF running configuration.	
	ospf		

### show ip ospf policy statistics area

To display Open Shortest Path First (OSPF) policy statistics for an area, use the **show ip ospf policy statistics area** command.

**show ip ospf** [*instance-tag*] **policy statistics area** *area-id* **filter-list** {**in** | **out**} [**vrf** *vrf-name*]

Syntax Description	instance-tag	(Optional) Name of the OSPF instance. Specify as an alphanumeric string.			
	area area-idSpecifies the area number used to define the particular area. The area ID can be an IP address or a number from 0 to 4294967295.				
	filter-list	Filters prefixes between OSPF areas.			
	inDisplays policy statistics for incoming routes.outDisplays policy statistics for outgoing routes.				
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default", "management", and "all" are reserved VRF names.			
Command Default	None				
Command Modes	Any command mode				
Command History	Release Mo	odification			
	5.2(1)N1(1) Th	is command was introduced.			
Usage Guidelines	to an area.	icy statistics area command to display information about the filter lists applied the LAN Base Services license.			
Examples	This example shows how to display policy statistics for OSPF: switch# show ip ospf policy statistics area 201 filter-list in				
Related Commands	Command	Description			
	area filter-list (OSPF)	F) Filters incoming or outgoing Network Summary (type 3) link-state advertisements (LSAs) on an Area Border Router (ABR).			

Command	Description
copy running-config startup-config	Saves the configuration changes to the startup configuration file.
show running-config ospf	Displays the OSPF running configuration.

# show ip ospf policy statistics redistribute

To display Open Shortest Path First (OSPF) policy statistics, use the **show ip ospf policy statistics redistribute** command.

show ip ospf [instance-tag] policy statistics redistribute {bgp id | direct | eigrp id | ospf id | rip
id | static} [vrf vrf-name]

Syntax Description	instance-tag	(Optional) Name of the OSPF instance. Specify as an alphanumeric string.			
Cyntax Dosonption	bgp	Displays policy statistics for the Border Gateway Protocol (BGP).			
	direct	Displays policy statistics for the Enhanced Interior Gateway Routing Protocol (EIGRP).			
	eigrp				
	ospf	Displays policy statistics for OSPF.			
	rip	Displays policy statistics for the Routing Information Protocol (RIP).			
	static	Displays policy statistics for IP static routes.			
	id	For the <b>bgp</b> keyword, an autonomous system number. The range for 2-byte numbers is from 1 to 65535.			
		For the <b>eigrp</b> keyword, an autonomous system number. The range is from 1 to 65535.			
		For the <b>ospf</b> and <b>rip</b> keywords, an instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.			
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default", "management", and "all" are reserved VRF names.

### show ip ospf request-list

To display a list of all link-state advertisements (LSAs) requested by a router, use the **show ip ospf request-list** command.

show ip ospf request-list neighbor-id {ethernet slot/[QSFP-module/]port | loopback if\_number |
 port-channel number}

neighbor-id	Router ID of the neighbor. Specify as an IP address.		
<b>ethernet</b> slot/[QSFP-module/] port	(Optional) Specifies the Ethernet interface and the slot number and port number. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.		
	<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).		
loopback if_number	(Optional) Specifies the loopback interface. The loopback interface number is from 0 to 1023.		
port-channel number	(Optional) Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.		
None			
Any command mode			
Release	Nodification		
	Support for the QSFP+ GEM was added.

## show ip ospf retransmission-list

To display a list of all link-state advertisements (LSAs) waiting to be resent to neighbors, use the **show ip ospf retransmission-list** command.

show ip ospf retransmission-list neighbor-id {ethernet slot/[QSFP-module/]port | loopback
if\_number | port-channel number}

Syntax Description	<i>neighbor-id</i> Router ID of the neighbor. Specify as an IP address.				
σγπάλ μεσυτιμάση	ethernet	(Optional) Specifies the Ethernet interface and the slot number and port			
	slot/[QSFP-module/]pc				
	1 <b>2</b> 31	from 1 to 4. The <i>port</i> number is from 1 to 128. $$			
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).			
	loopback if_number	(Optional) Specifies the loopback interface. The loopback interface number is from 0 to 1023.			
	port-channel number	(Optional) Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.			
Command Default	None				
Command Modes	Any command mode				
Command History	Release Modification				
	6.0(2)N1(2) St	upport for the QSFP+ GEM was added.			
	5.2(1)N1(1) T	his command was introduced.			
Usage Guidelines	Use the <b>show ip ospf retransmission-list</b> command to troubleshoot Open Shortest Path First (OSPF) routing operations. This command requires the LAN Base Services license.				
Examples	This example shows ho	w to display all LSAs waiting to be resent to neighbors:			
	switch# <b>show ip ospf</b>	retransmission-list 192.0.2.11 ethernet 2/1			
Related Commands	Command	Description			
	show running-config ospf	Displays the OSPF running configuration.			

# show ip ospf route

To display the Open Shortest Path First (OSPF) topology table, use the **show ip ospf routes** command.

show ip ospf [instance-tag] routes [prefix/length | summary} [vrf vrf-name]

Syntax Description	instance-tag	(Optional) Name of the OSPF instance. Specify as an alphanumeric string of 20 characters.				
	prefix/length	(Optional) IP prefix, which limits output to a specific route. Indicate the length as a slash (/) and number from 1 to 31. For example, /8 indicates that the first eight bits in the IP prefix are network bits.				
	summary (Optional) Displays a summary of all routes.					
	vrf vrf-name(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The vrf-name argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default", "management", and "all" are reserved VRF names.					
Command Default	None					
Command Modes	Any command mode					
Command History	Release	Modification				
	5.2(1)N1(1)	This command was introduced.				
Usage Guidelines	routes that are calcul (RIB), then you show	<b>routes</b> command to display the OSPF private routing table (which contains only lated by OSPF). If something is wrong with a route in the routing information base ald check the OSPF copy of the route to determine if it matches the RIB contents. If synchronization problem exists between OSPF and the RIB.				
	This command requires the LAN Base Services license.					
Examples	This example shows	how to display OSPF routes:				
	switch# <b>show ip os</b>	spf route				
Related Commands	Command	Description				

## show ip ospf statistics

To display Open Shortest Path First (OSPF) shortest path first (SPF) calculation statistics, use the **show ip ospf statistics** command.

show ip ospf [instance-tag] statistics [vrf vrf-name]

Syntax Description	instance-tag	ag (Optional) Name of the OSPF instance. Specify as an alphanumeric string up to 20 characters.				
	vrf vrf-name	(Optional) Name of the VRF. The <i>vrf-name</i> argument can be specified as a case-sensitive, alphanumeric string up to 32 characters. The strings "default "management", and "all" are reserved VRF names.				
Command Default	None

Table 3 describes the significant fields shown in the display.

#### Table 3show ip ospf statistics Field Descriptions

Field	Description		
OSPF process	Unique value assigned to the OSPF instance in the configuration.		
VRF	Virtual routing and forwarding (VRF) for this OSPF instance.		
DR elections	Number of times that a new designated router was elected.		
Neighbor	Details about neighbors.		
LSA Type	Number of each type of LSA sent.		
Hello queue	Queue of hello packets to be processed:		
	• current number in queue/maximum number allowed in queue.		
	• hwm—high water mark. The maximum number of packets ever stored in the queue.		
	• drops—The number of packets dropped because the queue was full.		
Flood queue	Queue of flood packets to be processed.		
Buffers	Chunks of memory used to store packets.

# **T** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with T.

### timers Isa-arrival (OSPF)

To set the minimum interval in which the software accepts the same link-state advertisement (LSA) from Open Shortest Path First (OSPF) neighbors, use the **timers lsa-arrival** command. To return to the default, use the **no** form of this command.

timers lsa-arrival milliseconds

no timers lsa-arrival

Command Default       1000 milliseconds         Command Modes       Router configuration mode         VRF configuration mode       VRF configuration mode         Command History       Release       Modification         5.2(1)N1(1)       This command to configure the minimum interval for accepting the same LSA. The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the software drops the LSA. We recommend that you keep the milliseconds value of the timers lsa-arrival command less than or equal to the neighbors' hold-interval value of the timers throttle lsa command. This command requires the LAN Base Services license.         Examples       This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds witch(config)# router ospf 1 switch(config-router)# timers lsa-arrival 2000 switch(config-router)#         Related Commands       Command Description show ip ospf Displays OSPF information. timers throttle lsa Sets rate-limiting values for LSAs being generated.	Syntax Description	milliseconds	Minimum delay (in milliseconds) that must pass between acceptance of the same LSA arriving from neighbors. The range is from 10 to 600,000 milliseconds. The default is 1000 milliseconds.	
VRF configuration mode         Command History       Release       Modification         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the timers Isa arrival command to configure the minimum interval for accepting the same LSA. The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the software drops the LSA.         We recommend that you keep the milliseconds value of the timers Isa-arrival command less than or equal to the neighbors' hold-interval value of the timers throttle Isa command. This command requires the LAN Base Services license.         Examples       This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds switch(config)# router ospf 1 switch(config-router)# timers Isa-arrival 2000 switch(config-router)#         Related Commands       Command       Description show JOSPF information.	Command Default	1000 milliseconds		
Release       Modification         5.2(1)N1(1)       This command was introduced. Examples	This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds:		
<b>show ip ospf</b> Displays OSPF information.		switch(config-ro	uter)# timers lsa-arrival 2000	
	Related Commands	Command	Description	
timers throttle lsa Sets rate-limiting values for LSAs being generated.		show ip ospf	Displays OSPF information.	
		timers throttle ls	a Sets rate-limiting values for LSAs being generated.	

## timers Isa-group-pacing (OSPF)

To change the interval at which Open Shortest Path First (OSPF) link-state advertisements (LSAs) are collected into a group and refreshed, checksummed, or aged, use the **timers lsa-group-pacing** command. To return to the default, use the **no** form of this command.

timers lsa-group-pacing seconds

no timers lsa-group-pacing

Syntax Description	seconds	Time (in seconds) in the interval in which LSAs are grouped and refreshed, checksummed, or aged. The range is from 1 to 1800 seconds. The default value is 240 seconds.	
Command Default	The default inter	val for this command is 240 seconds. OSPF LSA group pacing is enabled by default.	
Command Modes	Router configura	tion mode	
	VRF configuration	on mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
	LSAs. The default settings for OSPF packet pacing timers are suitable for the majority of OSPF deployments. Do not change the packet pacing timers unless you have tried all other options to meet OSPF packet flooding requirements. You should try summarization, stub area usage, queue tuning, and buffer tuning before changing the default flooding timers. There are no guidelines for changing timer values; each OSPF deployment is unique and should be considered on a case-by-case basis.		
	OSPF packet flooding requirements. You should try summarization, stub area usage, queue tuning, and buffer tuning before changing the default flooding timers. There are no guidelines for changing timer		
	refreshes in large topologies. The group timer controls the interval used for group refreshment of LSAs; however, this timer does not change the frequency that individual LSAs are refreshed (the default refresh rate is every 30 minutes).		
	The duration of the LSA group pacing is inversely proportional to the number of LSAs that the router is handling. For example, if you have about 10,000 LSAs, you should decrease the pacing interval. If you have a very small database (40 to 100 LSAs), you should increase the pacing interval to 10 to 20 minutes.		
	This command re	equires the LAN Base Services license.	
Examples	_	ows how to configure OSPF group packet-pacing updates between LSA groups to occur crvals for OSPF routing process 1:	
	switch(config)#	router ospf 1	

#### switch(config-router)# timers lsa-group-pacing 60

Related Commands

ands	Command	Description	
	copy running-config	Saves the configuration changes to the startup configuration	
	startup-config	file.	
	show ip ospf	Displays general information about OSPF routing processes.	

## timers throttle Isa (OSPF)

To set rate-limiting values for Open Shortest Path First (OSPF) link-state advertisement (LSA) generation, use the **timers throttle lsa** command. To return to the default values, use the **no** form of this command.

timers throttle lsa start-time hold-interval max-time

no timers throttle lsa

Syntax Description	start-time	Start time (in milliseconds) that is used to calculate the subsequent rate limiting times for LSA generation. The range is from 0 to 5000 milliseconds. The default value is 0 milliseconds.
	hold-interval	Incremental time (in milliseconds) that is used to calculate the subsequent rate limiting times for LSA generation. The range is from 50 to 30,000 milliseconds. The default value is 5000 milliseconds.
	max-time	Maximum time (in milliseconds) that is used to calculate the subsequent rate limiting times for LSA generation. The range is from 50 to 30,000 milliseconds. The default value is 5000 milliseconds.
Command Default	<i>start-time:</i> 0 millis <i>hold-interval:</i> 500 <i>max-time:</i> 5000 m	0 milliseconds
Command Modes	Router configurati	on mode
	VRF configuration	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	Use the <b>timers throttle lsa</b> command to rate-limit LSA generation. This command requires the LAN Base Services license.	
Examples	This example show	vs how to customize OSPF LSA throttling:
	<pre>switch(config)# switch(config-ro switch(config-ro</pre>	uter)# timers throttle 1sa 50 5000 6000

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays information about OSPF routing processes.
	timers lsa arrival	Sets the minimum interval at which the software accepts the same LSA from OSPF neighbors.

### timers throttle spf (OSPF)

To set the shortest-path first (SPF) best-path schedule initial delay time and the minimum hold between SPF best-path calculation for Open Shortest Path First (OSPF), use the **timers throttle spf** command. To turn off SPF throttling, use the **no** form of this command.

timers throttle spf spf-start spf-hold spf-max-wait

no timers throttle spf spf-start spf-hold spf-max-wait

Syntax Description	spf-start	Initial SPF schedule delay in milliseconds. The range is from 1 to 600,000 milliseconds.	
	spf-hold	Minimum hold time between two consecutive SPF calculations. The range is from 1 to 600,000 milliseconds.	
	spf-max-wait	Maximum wait time between two consecutive SPF calculations. The range is from 1 to 600,000 milliseconds.	
Command Default	SPF throttling is 1	not set.	
Command Modes	Router configuration mode		
	VRF configuratio	n mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>timers th</b>	arottle spf command to set the SPF timers.	
	The first wait interval between SPF calculations is the amount of time in milliseconds specified by the <i>spf-start</i> argument. Each consecutive wait interval is two times the current hold level in milliseconds until the wait time reaches the maximum time in milliseconds as specified by the <i>spf-maximum</i> argument. Subsequent wait times remain at the maximum until the values are reset or an LSA is received between SPF calculations.		
Examples	This example shows how to configure a router configured with the start, hold, and maximum interval values for the <b>timers throttle spf</b> command set at 5, 1,000, and 90,000 milliseconds:		
	<pre>switch(config)# switch(config-ro switch(config-ro</pre>	outer)# timers throttle spf 5 1000 90000	

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays information about OSPF routing processes.
	timers lsa arrival	Sets the minimum interval at which the software accepts the same LSA from OSPF neighbors.
	timers throttle lsa	Sets the rate limit for generating LSAs.

## transmit-delay (OSPF virtual link)

To set the estimated time required to end a link-state update packet on the interface, use the **transmit-delay** command. To return to the default, use the **no** form of this command.

transmit-delay seconds

no transmit-delay

Syntax Description	seconds	Time (in seconds) required to send a link-state update. The range is from 1 to 65535 seconds. The default is 1 second.
Command Default	1 second	
Command Modes	Router configurat	ion mode
	VRF configuratio	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	propagation delay	-delay command in virtual link configuration to account for the transmission and vs for the virtual link. quires the LAN Base Services license.
Examples	This example sets the retransmit delay value to 3 seconds: switch(config)# router ospf 201 switch(config-router)# area 22 virtual-link 192.0.2.1 switch(config-router-vlink)# transmit-delay 3	
Related Commands	Command show ip ospf	<b>Description</b> Displays general information about Open Shortest Path First (OSPF)
		routing instances.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **V** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with V.

# vrf

To enter a virtual routing and forwarding (VRF) configuration mode and configure submode commands, use the **vrf** command. To remove a VRF instance or disable the VRF configuration mode, use the **no** form of this command.

vrf name | management

no vrf name | management

Syntax Description	name	Name of the VRF. The <i>name</i> can be any case-sensitive, alphanumeric string up to 32 characters.	
	management	Specifies the management VRF.	
Command Default	None		
Command Modes	Address-family conf Router configuration VRF configuration r	n mode	
Command History	Release	Modification	
· · · · · · ·	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	<ul> <li>The VRF does not become active until you create an identically named VRF in global configuration mode.</li> <li>When you enter the VRF configuration mode, the following commands are available:</li> <li>area—(OSPF) Configures area properties.</li> <li>address-family—(BGP) Configures an address-family. See the address-family (BGP) command</li> </ul>		
	<ul> <li>for additional information.</li> <li>auto-cost—(OSPF) Calculates OSPF cost according to bandwidth.</li> </ul>		
	<ul> <li>cluster-id {cluster-ip-addr}—(BGP) Configures the Route Reflector Cluster-ID (router, vrf). Range: 1 to 4294967295. You can enter the cluster identification as a 32-bit quantity or as an IP address. To remove the cluster ID, use the <b>no</b> form of this command. Together, a route reflector and its clients form a cluster. When a single route reflector is deployed in a cluster, the cluster is identified by the router ID of the route reflector.</li> <li>The cluster-id command is used to assign a cluster ID to a route reflector when the cluster has one or more route reflectors. Multiple route reflectors are deployed in a cluster to increase redundancy and avoid a single point of failure. When multiple route reflectors are configured in a cluster, the</li> </ul>		
		is assigned to all route reflectors, which allows all route reflectors in the cluster to es from peers in the same cluster and reduces the number of updates that need to be outing tables.	

**Note** All route reflectors must maintain stable sessions between all peers in the cluster. If stable sessions cannot be maintained, you should use overlay route reflector clusters instead (route reflectors with different cluster IDs).

- **default-information**—(OSPF) Controls the distribution of the default route. See the **default-information originate** (**OSPF**) command for additional information.
- **default-metric**—(OSPF) Specifies the default metric for redistributed routes. See the **default-metric** (OSPF) command for additional information.
- **distance**—(OSPF) Defines the OSPF administrative distance. See the **distance** (**OSPF**) command for additional information.
- **exit**—(BGP) Exits from the current command mode.
- log-adjacency-changes—(OSPF) Logs changes in adjacency state.
- **log-neighbor-changes**—Enables logging of the BGP neighbor resets. To disable the logging of changes in BGP neighbor adjacencies, use the **no** form of this command. The **log-neighbor-changes** command enables logging of BGP neighbor status changes (up or down) and resets for troubleshooting network connectivity problems and measuring network stability. Unexpected neighbor resets might indicate high error rates or high packet loss in the network and should be investigated.

Using the **log-neighbor-changes** command to enable status change message logging does not cause a substantial performance impact, unlike, for example, enabling per BGP update debugging. If the UNIX syslog facility is enabled, messages are sent to the UNIX host running the syslog daemon so that the messages can be stored and archived. If the UNIX syslog facility is not enabled, the status change messages are retained in the internal buffer of the router, and are not stored to the disk. You can set the size of this buffer, which is dependent upon the available RAM, using the **logging buffered** command.

The neighbor status change messages are not tracked if the bgp **log-neighbor-changes** command is disabled, except for the reset reason, which is always available as output of the **show ip bgp neighbors** command.

The **eigrp log-neighbor-changes** command enables logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, but messages for BGP neighbors are logged only if they are specifically enabled with the bgp **log-neighbor-changes** command.

Use the show logging command to display the log for the BGP neighbor changes.

- **max-metric**—(OSPF) Maximizes the cost metric. See the **max-metric** (OSPF) command for additional information.
- maximum-paths—(OSPF) Sets the maximum number of parallel routes that OSPF can support. See the maximum-paths (OSPF) command for additional information.
- neighbor—Configures a BGP neighbor. See the neighbor command for additional information.
- **no**—Negates a command or set its defaults.
- **redistribute**—(OSPF) Redistributes information from another routing protocol. See the **redistribute** (OSPF) command for additional information.
- **rfc1583compatibility**—(OSPF) Configures RFSC 1583 compatibility for external path preferences. See the **rfc1583compatibility** command for additional information.
- router-id ip-addr—Specifies the IP address to use as the router-id.

L

- **shutdown**—(OSPF) Shuts down the OSPF protocol instance. See the **shutdown** (**OSPF**) command for additional information.
- **summary-address**—(OSPF) Configures route summarization for redistribution. See the **summary-address** (**OSPF**) command for additional information.
- **timers** *bestpath-timeout*—Configures the best-path timeout in seconds. Range: 1 to 3600. Default: 300.

**Examples** This example shows how to enter VRF configuration mode in a BGP environment:

switch(config)# router bgp 100
switch(config-router)# vrf management
switch(config-router-vrf)#

This example shows how to enter VRF configuration mode in an OSPF environment:

```
switch(config)# vrf context RemoteOfficeVRF
switch(config-vrf)# router ospf 201
switch(config-router)# vrf RemoteOfficeVRF
switch(config-router-vrf)#
```

Related Commands C

Command	Description
vrf context	Creates a VRF.
show vrf	Displays the VRF configuration information.

#### vrf context

To create a virtual routing and forwarding instance (VRF) and enter VRF configuration mode, use the **vrf context** command. To remove a VRF entry, use the **no** form of this command.

vrf context {name | management }

**no vrf context** {*name* | **management**}

Syntax Description	name	Name of the VRF. The <i>name</i> can be any case-sensitive, alphanumeric string up to 32 characters.
	management	Specifies the management VRF.
Command Default	None	
Command Modes	Global configuratio	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows	s how to create a VRF context:
	<pre>switch(config)# vrf context RemoteOfficeVRF switch(config-vrf)#</pre>	
Related Commands	Command	Description
	vrf	Creates or configures a VRF instance.
	show vrf	Displays the VRF configuration information.

#### vrf member

To add an interface to a virtual routing and forwarding (VRF) instance or to configure object tracking on a VRF instance, use the **vrf member** command. To remove the object tracking for this route, use the **no** form of this command.

vrf member vrf-name

**no vrf member** *vrf-name* 

Syntax Description	vrf-name	VRF name. The name can be any case-sensitive, alphanumeric string up to 32 characters.	
Command Default	None		
Command Modes	Interface configura Object tracking con		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>vrf memb</b> VRF.	er command in object tracking configuration mode to track objects in a nondefault	
Examples	This example show	vs how to track an IP route in VRF Red:	
	<pre>switch(config)# track 1 ip route 10.10.10.0/8 reachability switch(config-track)# vrf member Red switch(config-track)#</pre>		
	This example shows how to add the Ethernet interface 1/5 to VRF RemoteOfficeVRF:		
	switch(config-if)	) # vrf member RemoteOfficeVRF	
Related Commands	Command	Description	
	show vrf	Displays the VRF configuration information.

#### <l\_ltalic>

# A Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with A.

### address-family (RIP)

To configure an address family for the Routing Information Protocol (RIP), use the **address-family** command in router configuration mode.

address-family ipv4 unicast

Syntax Description	ipv4	Specifies the IPv4 address family.
	unicast	Specifies unicast address support.
Command Default	This command ha	as no default settings.
Command Modes	Router configura	tion mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
		router rip Enterprise outer)# address-family ipv4 unicast
Related Commands	Command	Description
Related Commands	default-informa	tion Controls the distribution of a default route.
Related Commands		tion       Controls the distribution of a default route.         Configures the default metric for routes redistributed into RIP.
Related Commands	default-informa	tion Controls the distribution of a default route.
Related Commands	default-informa default-metric distance maximum-path	tion       Controls the distribution of a default route.         Configures the default metric for routes redistributed into RIP.         Configures the administrative distance.
Related Commands	default-informa default-metric distance	tion       Controls the distribution of a default route.         Configures the default metric for routes redistributed into RIP.         Configures the administrative distance.
Related Commands	default-informa default-metric distance maximum-path	tion       Controls the distribution of a default route.         Configures the default metric for routes redistributed into RIP.         Configures the administrative distance.         s       Configures the maximum number of equal-cost paths.

# **C** Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with C.

#### clear ip rip policy statistics redistribute

To clear policy statistics for routes redistributed into the Routing Information Protocol (RIP) topology table, use the **clear ip rip policy statistics redistribute** command in any mode.

clear ip rip policy statistics redistribute {bgp id | direct | eigrp id | ospf id | static} [vrf vrf-name]

Syntax Description	bgp	Clears policy statistics for the Border Gateway Protocol (BGP).
	direct	Clears policy statistics for directly connected routes only.
	eigrp	Clears policy statistics for the Enhanced Interior Gateway Routing Protocol (EIGRP).
	ospf	Clears policy statistics for the Open Shortest Path First (OSPF) protocol.
	static	Clears policy statistics for IP static routes.
	id	For the <b>bgp</b> keyword, an autonomous system number. The range for 2-byte numbers is from 1 to 65535. The range for 4-byte numbers is from 1.0 to 65535.65535.
		For the <b>eigrp</b> keyword, an EIGRP instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.
		For the <b>ospf</b> keyword, an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.
	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) instance. The VRF name can be a maximum of 32 alphanumeric characters and is case-sensitive.
Command Default	This command ha	as no default settings.
Command Modes	Any command m	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	-	ws how to clear policy statistics for EIGRP: p rip policy statistics redistribute eigrp 201
Related Commands	Command	Description
	show ip rip poli	cy statistics Displays policy statistics for RIP.

### clear ip rip statistics

To clear the Routing Information Protocol (RIP) statistics, use the **clear ip rip statistics** command in any mode.

clear ip rip statistics [interface type instance] [vrf vrf-name]

Syntax Description	<b>interface</b> type instance	e (Optional) Specifies the interface to clear topology entries.
	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) instance. The VRF name can be up to 32 alphanumeric characters.
Command Default	This command has no c	lefault settings.
Command Modes	Any command mode	
Command History	Release N	Iodification
	5.2(1)N1(1) T	his command was introduced.
Examples	This example shows how to clear all RIP statistics: switch# clear ip rip statistics	
R-1-4-10-mm-1-	Command	Description
Related Commands		

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **D** Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with D.

### default-information originate (RIP)

To generate a default route into the Routing Information Protocol (RIP), use the **default-information originate** command. To disable this feature, use the **no** form of this command.

default-information originate [always] [route-map map-name]

no default-information originate

Syntax Description	always	(Optional) Generates the default route if the route is not in the RIP routing information base.
	route-map map-name	(Optional) Generates the default route only if the route is permitted by the route map. The map name is any alphanumerical string up to 63 characters.
Command Default	Disabled	
Command Modes	Router address-family c	configuration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows how map:	w to originate a default route $(0.0.0.0/0)$ to all routes that pass the Condition route
	switch(config)# <b>route</b> switch(config-router)	<pre># address-family ipv4 unicast af)# default-information originate route-map Condition</pre>
Related Commands	Command	Description
	address-family	Enters address-family configuration mode.
	default-metric	Sets the metric for routes redistributed into RIP.
	redistribute	Redistributes routes from other routing protocols into RIP.

Displays the routes in RIP table.

show ip rip route

### default-metric (RIP)

To set default metric values for the Routing Information Protocol (RIP), use the **default-metric** command in router address-family configuration mode. To return to the default state, use the **no** form of this command.

default-metric value

no default-metric [value]

Syntax Description	value	Default metric value. The range is from 1 to 15.
Command Default	value: 1	
Command Modes	Router address-family	configuration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	redistributed routes. A incompatible metrics.	<b>c</b> command with the <b>redistribute</b> command to use the same metric value for all default metric helps to solve the problem of redistributing routes with Whenever external metrics do not convert to RIP metrics, you can use a default asonable substitute to the external metric and enable the redistribution to proceed
Examples		ow to advertise Open Shortest Path First (OSPF) routes using RIP and assign the with a RIP metric of 10:
	switch(config-route:	r)# address-family ipv4 unicast r-af)# default-metric 10 r-af)# redistribute ospf 109 route-map FilterOSPF
Related Commands	Command	Description
	address-family	Enters address-family configuration mode.
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	default-information originate	Generates a default route for routes redistributed into RIP.
	redistribute	Redistributes routes from one routing domain into another routing domain.
	show ip rip route	Displays the routes in RIP table.

#### distance (RIP)

To define the administrative distance assigned to routes discovered by the Routing Information Protocol (RIP), use the **distance** command. To remove the distance and restore the system to its default condition, use the **no** form of this command.

**distance** *admin-distance* 

no distance admin-distance

admin-distance	Administrative distance to be assigned to RIP routes. The range is from 1 to 255.
admin-distance: 120	
Router address-famil	ly configuration mode
Release	Modification
5.2(1)N1(1)	This command was introduced.
	inistrative distance is an integer from 1 to 255. In general, a higher value indicates An administrative distance of 255 means that the routing information source cannot should be ignored.
This example shows how to set the administrative distance for RIP: switch(config)# router rip Enterprise switch(config-router)# address-family ipv4 unicast switch(config-router-af)# distance 85 switch(config-router-af)#	
Command	Description
address-family	Enters address-family configuration mode.
redistribute	Redistributes routes from one routing domain into RIP.
show ip rip	Displays a summary of RIP information for all RIP instances.
	admin-distance: 120 Router address-famil Release 5.2(1)N1(1) Use the distance corr Numerically, an adm a lower trust rating. A be trusted at all and a This example shows switch(config)# ro switch(config-rout switch(config-rout switch(config-rout switch(config-rout switch(config-rout switch(config-rout switch(config-rout switch(config-rout switch(config-rout

# **F** Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with F.

#### feature rip

To enable the Routing Information Protocol (RIP), use the **feature rip** command. To disable RIP, use the **no** form of this command.

feature rip

no feature rip

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled

**Command Modes** Global configuration mode

Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** 

You must enable the RIP feature before you can configure RIP.

Note

In Cisco NX-OS Release 5.2(1)N1(1), a software upgrade on the Cisco Nexus 5548 switch and the Cisco Nexus 5596 switch that has the Layer 3 features enabled is disruptive. You must reload the switch and the Cisco Nexus 2000 Series Fabric Extender.

This command does not require a license.

\$ Note

Make sure the LAN Base Services license is installed on the switch to enable Layer 3 interfaces.

**Examples** 

This example shows how to enable the RIP feature:

switch# configure terminal
switch(config)# feature rip
switch(config)#

This example shows how to disable the RIP feature:

switch# configure terminal
switch(config)# no feature rip
switch(config)#

<b>Related Commands</b>	Command	Description
	router rip	Creates a RIP instance.
	show feature	Displays the status of features on a switch.
	show rip	Displays RIP configuration information.

# I Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with I.

#### ip rip authentication key-chain

To enable authentication for the Routing Information Protocol (RIP) Version 2 packets and to specify the set of keys that can be used on an interface, use the **ip rip authentication key-chain** command. To prevent authentication, use the **no** form of this command.

ip rip authentication key-chain name-of-chain

no ip rip authentication key-chain [name-of-chain]

Syntax Description       name-of-chain       Group of valid keys.         Command Default       No authentication is provided for RIP packets.         Command Modes       Interface configuration mode	
Command Modes         Interface configuration mode	
Command History Release Modification	
5.2(1)N1(1) This command was introduced.	
Usage Guidelines This command does not require a license.	
Note Make sure the LAN Base Services license is installed on the switch to enab	le Layer 3 interfaces.
<b>Examples</b> This example shows how to configure the interface to accept and send any k key-chain trees: switch(config)# interface ethernet 1/2	key that belongs to the
<pre>switch(config-if)# no switchport switch(config-if)# ip rip authentication key-chain trees switch(config-if)#</pre>	
Related Commands         Command         Description	
copy running-configSaves the configuration to the startup configstartup-config	guration file.
<b>key-chain</b> Creates a set of keys that can be used by an	authentication method.
	r all RIP instances.

### ip rip authentication mode

To specify the type of authentication used in the Routing Information Protocol (RIP) Version 2 packets, use the **ip rip authentication mode** command. To restore clear text authentication, use the **no** form of this command.

ip rip authentication mode {text | md5}

no ip rip authentication mode

Syntax Description	text	Specifies the c	ear text authentication.
	md5	Specifies the m	essage Digest 5 (MD5) authentication.
Command Default	Clear text authenti	cation is provided fo	r RIP packets if you configured a key chain.
ommand Modes	Interface configura	ation mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This comman	d was introduced.
Note	Make sure the LA	N Base Services lice	nse is installed on the switch to enable Layer 3 interfaces.
ixamples	switch(config)#	interface ethernet	he interface to use MD5 authentication: 1/2
Examples	<pre>switch(config)# switch(config-if</pre>	interface ethernet )# no switchport )# ip rip authenti	1/2
	<pre>switch(config)# switch(config-if switch(config-if</pre>	interface ethernet )# no switchport )# ip rip authenti	1/2
Examples Related Commands	<pre>switch(config)# switch(config-if switch(config-if switch(config-if command</pre>	interface ethernet )# no switchport )# ip rip authenti	1/2 cation mode md5
	<pre>switch(config)# switch(config-if switch(config-if switch(config-if command</pre>	<pre>interface ethernet )# no switchport )# ip rip authenti )#  fig startup-config</pre>	1/2 cation mode md5 Description
	<pre>switch(config)# switch(config-if switch(config-if switch(config-if switch(config-if command copy running-con</pre>	<pre>interface ethernet )# no switchport )# ip rip authenti )#  fig startup-config</pre>	1/2 cation mode md5 Description Saves the configuration to the startup configuration file. Enables authentication for RIP Version 2 packets and

# ip rip metric-offset

To add an additional value to the incoming IP Routing Information Protocol (RIP) route metric for an interface, use the **ip rip metric-offset** command. To return the metric to its default value, use the **no** form of this command.

**ip rip metric-offset** *value* 

no ip rip metric-offset

Syntax Description	value	Value to add to the incoming route metric for an interface. The range is from 1 to 15. The default is 1.	
Command Default	value: 1		
Command Modes	Interface configura	ation mode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>ip route metric-offset</b> command to influence which routes are used by Cisco Nexus 5500. This command allows you to add a fixed offset to the route metric of all incoming routes on an interface. For example, if you set the metric-offset to 5 on an interface and the incoming route metric is 5, then Cisco Nexus 5500 adds the route to the route table with a metric of 10. This command does not require a license.		
Note	Make sure the LAN	N Base Services license is installed on the switch to enable Layer 3 interfaces.	
Examples	This example show interface 2/1:	vs how to configure a metric offset of 10 for all incoming RIP routes on Ethernet	
	switch(config-if	)# ip rip metric-offset 10	
Related Commands	Command in rip offset-list	<b>Description</b> Adds an offset value to incoming RIP route metrics.	

#### ip rip offset-list

To add an offset to incoming and outgoing metrics to routes learned via Routing Information Protocol (RIP), use the **ip rip offset-list** command. To remove an offset list, use the **no** form of this command.

**ip rip offset-list** *value* 

no ip rip offset-list

Syntax Description	value	Value to add to the incoming route metric for an interface. The range is from 1 to 15. The default is 1.
Command Default	value: 1	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines <u>Note</u>	This command does no Make sure the LAN Ba	t require a license. se Services license is installed on the switch to enable Layer 3 interfaces.
Examples	This example shows ho 2/1: switch# configure te switch(config)# inte switch(config-if)# i switch(config-if)# i switch(config-if)#	rface ethernet 2/1 o switchport
Related Commands	Command	Description
	ip rip metric-offset	Adds an offset value to incoming RIP route metrics.

#### ip rip passive-interface

To suppress the sending of the Routing Information Protocol (RIP) updates on an interface, use the **ip rip passive-interface** command. To unsuppress updates, use the **no** form of this command.

ip rip passive-interface

no ip rip passive-interface

- **Command Default** RIP updates are sent on the interface.
- **Command Modes** Interface configuration mode

 Release
 Modification

 5.2(1)N1(1)
 This command was introduced.

**Usage Guidelines** While RIP stops sending routing updates to the multicast (or broadcast) address on a passive interface, RIP continues to receive and process routing updates from its neighbors on that interface.

This command does not require a license.

Note

Make sure the LAN Base Services license is installed on the switch to enable Layer 3 interfaces.

**Examples** This example shows how to configure Ethernet 1/2 as a passive interface:

switch(config)# interface ethernet 1/2
switch(config-if)# no switchport
switch(config-if)# ip rip passive-interface
switch(config-if)#

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	show ip rip	Displays a summary of RIP information for all RIP instances.

#### ip rip poison-reverse

To enable poison-reverse processing of the Routing Information Protocol (RIP) router updates, use the **ip rip poison-reverse** command. To disable poison-reverse processing of RIP updates, use the **no** form of this command.

ip rip poison-reverse

no ip rip poison-reverse

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

**Command Default** Split horizon is always enabled. Poison-reverse processing is disabled.

**Command Modes** Interface configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

# **Usage Guidelines** Use the **ip rip poison-reverse** command to enable poison-reverse processing of RIP router updates. By default, Cisco Nexus 5500 does not advertise RIP routes out the interface over which they were learned (split horizon). If you configure both poison reverse and split horizon, then Cisco Nexus 5500 advertises the learned routes as unreachable over the interface on which the route was learned.

This command does not require a license.

```
Note
```

Make sure the LAN Base Services license is installed on the switch to enable Layer 3 interfaces.

```
Examples This example shows how to enable poison-reverse processing for an interface running RIP:
```

switch(config)# interface ethernet 1/2
switch(config-if)# no switchport
switch(config-if)# ip rip poison-reverse

<b>Related Commands</b>	Command	Description
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	show ip rip	Displays a summary of RIP information for all RIP instances.

#### ip rip route-filter

To filter the Routing Information Protocol (RIP) routes coming in or out of an interface, use the **route-filter** command. To remove filtering from an interface, use the **no** form of this command.

**ip rip route filter** {**prefix-list** *list-name* | **route-map** *map-name*} {**in** | **out**}

**no ip rip route filter** {**prefix-list** *list-name* | **route-map** *map-name*} {**in** | **out**}

Syntax Description	prefix-list list-name	Associates a prefix list to filter RIP packets.
	route-map map-name	Associates a route map to set the redistribution policy for RIP.
	in	Filters incoming routes.
	out	Filters outgoing routes.
Command Default	Route filtering is disable	ed.
Command Modes	Interface configuration 1	node
Command History	Release	Modification
Usage Guidelines	5.2(1)N1(1) Use the <b>ip rip route-filt</b> This command does not	This command was introduced. <b>Fer</b> command to filter incoming or outgoing routes on an interface. require a license.
Usage Guidelines	Use the <b>ip rip route-filt</b>	<b>er</b> command to filter incoming or outgoing routes on an interface.
Usage Guidelines <u>Note</u>	Use the <b>ip rip route-filt</b> This command does not	<b>er</b> command to filter incoming or outgoing routes on an interface.
Note	Use the <b>ip rip route-filt</b> This command does not Make sure the LAN Bas	er command to filter incoming or outgoing routes on an interface. require a license.
Note	Use the <b>ip rip route-filt</b> This command does not Make sure the LAN Bas This example shows how switch# <b>configure ter</b>	<pre>ver command to filter incoming or outgoing routes on an interface. require a license. e Services license is installed on the switch to enable Layer 3 interfaces. w to use a route map to filter routes for a RIP interface: minal</pre>
Note	Use the <b>ip rip route-filt</b> This command does not Make sure the LAN Bas This example shows how	<pre>ver command to filter incoming or outgoing routes on an interface. require a license. e Services license is installed on the switch to enable Layer 3 interfaces. w to use a route map to filter routes for a RIP interface: minal face ethernet 1/2</pre>
	Use the <b>ip rip route-filt</b> This command does not Make sure the LAN Bas This example shows how switch# <b>configure ter</b> switch(config)# <b>inter</b> switch(config-if)# <b>no</b>	<pre>ver command to filter incoming or outgoing routes on an interface. require a license. e Services license is installed on the switch to enable Layer 3 interfaces. w to use a route map to filter routes for a RIP interface: minal face ethernet 1/2</pre>
Note	Use the <b>ip rip route-filt</b> This command does not Make sure the LAN Bas This example shows how switch# <b>configure ter</b> switch(config)# <b>inter</b> switch(config-if)# <b>no</b> switch(config-if)# <b>ip</b>	<pre>ver command to filter incoming or outgoing routes on an interface. require a license. e Services license is installed on the switch to enable Layer 3 interfaces. w to use a route map to filter routes for a RIP interface: minal face ethernet 1/2 switchport</pre>
Note Examples	Use the <b>ip rip route-filt</b> This command does not Make sure the LAN Bas This example shows how switch# <b>configure ter</b> switch(config)# <b>inter</b> switch(config-if)# <b>no</b> switch(config-if)# <b>ip</b> switch(config-if)#	<pre>er command to filter incoming or outgoing routes on an interface. require a license. e Services license is installed on the switch to enable Layer 3 interfaces. w to use a route map to filter routes for a RIP interface: minal face ethernet 1/2 switchport rip route-filter route-map InRipFilter in</pre>

#### ip rip summary-address

To configure a summary aggregate address under an interface for the Routing Information Protocol (RIP), use the **ip rip summary-address** command. To disable summarization of the specified address or subnet, use the **no** form of this command.

**ip rip summary-address** *ip-prefix/mask* 

no ip rip summary-address ip-prefix/mask

Syntax Description	ip-prefix/length	IP prefix and prefix length to be summarized.
Command Default	Disabled	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	The <b>ip rip summary-ac</b> This command does not	<b>ddress</b> command summarizes an address or subnet under a specific interface. require a license.
Note	Make sure the LAN Bas	se Services license is installed on the switch to enable Layer 3 interfaces.
Examples	interface 1/2:	w to configure the summary address 192.0.2.0 that is advertised out Ethernet
	<pre>switch(config)# inter switch(config-if)# nc switch(config-if)# ip switch(config-if)#</pre>	
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	show ip rip	Displays a summary of RIP information for all RIP instances.

#### ip router rip

To specify the Routing Information Protocol (RIP) instance for an interface, use the **ip router rip** command. To return to the default, use the **no** form of this command.

**ip router rip** *instance-tag* 

no ip router rip instance-tag

Syntax Description	instance-tag	Name of the RIP instance. The <i>instance-tag</i> can be any case-sensitive, alphanumeric string up to 20 characters.
Command Default	None	
Command Modes	Interface configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	•	nmand, make sure that you enable RIP on the switch. the LAN Base Services license.
Examples	switch(config)# <b>inter</b> switch(config-if)# <b>nc</b>	
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	feature rip	Enables RIP on the switch.

Displays a summary of RIP information for all RIP instances.

show ip rip

# **M** Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with M.

# maximum-paths (RIP)

To configure the maximum number of equal cost parallel routes that the Routing Information Protocol (RIP) can install into the routing table, use the **maximum-paths** command. To remove the **maximum-paths** command and restore the system to its default condition, use the **no** form of this command.

maximum-paths maximum

no maximum-paths

Syntax Description	maximum	Maximum number of parallel routes that RIP can install in a routing table. The range is from 1 to 16.
Command Default	8 paths	
Command Modes	Router address-family	configuration mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows how to allow a maximum of 16 equal cost paths to a destination: switch(config)# router rip Enterprise	
	switch(config-router	)# address-family ipv4 unicast -af)# maximum-paths 16
Related Commands	Command	Description
	address-family	Enters address-family configuration mode.
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	show ip rip	Displays a summary of RIP information for all RIP instances.

# **R** Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with R.

#### redistribute (RIP)

To redistribute routes from another routing domain into the Routing Information Protocol (RIP), use the **redistribute** command. To restore the system to its default condition in which the software does not redistribute routes, use the **no** form of this command.

**redistribute** {**bgp** *id* | **direct** | **eigrp** *id* | **ospf** *id* | **static**} **route-map** *map-name* 

Syntax Description	bgp id	Redistributes routes from the Border Gateway Protocol (BGP). The ID is an autonomous system number. The range for 2-byte numbers is from 1 to 65535. The range for 4-byte numbers is from 1.0 to 65535.65535.
	direct	Redistributes routes from directly connected routes only.
	eigrp id	Redistributes routes from the Enhanced Interior Gateway Routing Protocol (EIGRP). The ID is an EIGRP instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.
	ospf id	Redistributes routes from the Open Shortest Path First (OSPF) protocol. The ID is an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.
	static	Redistributes routes from IP static routes.
	route-map map-name	Associates a route map to set the redistribution policy for RIP.
Command Default	Route redistribution is d Router address-family c	
Command Modes	Router address-family c	onfiguration mode
Command Modes	Router address-family c Release 5.2(1)N1(1) Cisco Nexus 5500 filters route map to set the RIP map, Cisco Nexus 5500	onfiguration mode Modification

Related Commands	Command	Description
	address-family	Enters address-family configuration mode.
	default-information originate	Generates a default route for routes redistributed into RIP.
	default-metric	Sets default metric values for routes redistributed from other protocols into RIP.
	show ip rip	Displays a summary of RIP information for all RIP instances.

## restart (RIP)

To restart a Routing Information Protocol (RIP) instance and remove all associated neighbors, use the **restart** command.

restart eigrp instance-tag

Syntax Description	instance tac	Nome for an DID routing instance. The name can be a maximum of
Syntax Description	instance-tag	Name for an RIP routing instance. The name can be a maximum of 20 alphanumeric characters.
Command Default	None	
ommanu Deraut	None	
Command Modes	Global configuration me	ode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines Examples	-	the LAN Base Services license. w to restart the RIP instance and remove all neighbors:
	switch(config)# <b>resta</b> switch(config)#	-
Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration in the startup configuration file.
	show ip eigrp interfaces	Displays information about EIGRP interfaces.

### router rip

To configure the Routing Information Protocol (RIP) routing process, use the **router rip** command. To turn off the RIP routing process, use the **no** form of this command.

router rip *instance-tag* 

no router rip

Syntax Description	instance-tag	Name for this RIP instance.
Command Default	No RIP routing proc	ess is defined.
Command Modes	Global configuration	n mode
Command History	<b>Release</b> 5.2(1)N1(1)	Modification This command was introduced.
xamples	_	how to begin the RIP routing process: outer rip Enterprise
Related Commands	Command	<b>Description</b> Specifies a RIP instance for an interface.

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **Show Commands**

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) show commands.

## show ip rip

To display the configuration and status of the Routing Information Protocol (RIP), use the **show ip rip** command in any mode.

show ip rip [instance-tag] [vrf vrf-name]

Syntax Description	ē .	Optional) RIP instance. The instance tag can be a maximum of 20 lphanumeric characters.
	ir a	Optional) Specifies the name of the virtual routing and forwarding (VRF) isstance. The <i>vrf-name</i> argument can be specified as any case-sensitive, lphanumeric string up to 32 characters. The strings "default" and "all" are eserved VRF names.
Command Default	No default behavior or valu	es
Command Modes	Any command mode	
Command History	Release M	odification
	5.2(1)N1(1) T	his command was introduced.
Examples	This example shows how to switch(config-if)# <b>show</b>	display the RIP configuration information: ip rip
Related Commands	Command	Description
	show ip rip interface	Displays RIP information for an interface.
	show ip rip neighbor	Displays RIP neighbor information.
	show ip rip policy statistic	cs Displays RIP policy statistics.
	show ip rip route	Displays RIP route information.
	show ip rip statistics	Displays RIP statistics.

### show ip rip interface

To display interface entry information from the Routing Information Protocol (RIP) topology table, use the **show ip rip interface** command in any mode.

show ip rip interface [type slot/[QSFP-module/]port] [vrf vrf-name]

Syntax Description	<b>interface</b> type slot/[QSFP-module/]port	(Optional) Specifies the interface. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.	
Command Default		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).	
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.	
	This command has no default settings.		
Command Modes	Any command mode		
Command History	Release M	lodification	
	6.0(2)N1(2) St	upport for the QSFP+ GEM was added.	
	5.2(1)N1(1) T	his command was introduced.	
Examples	topology table:	o display the neighbor information for a specified interface from the RIP ip rip interface ethernet 1/2	
Examples Related Commands	topology table:		
	<pre>topology table: switch(config-if)# show</pre>	ip rip interface ethernet 1/2

## show ip rip neighbor

To display the neighbor information from the Routing Information Protocol (RIP) topology table, use the **show ip rip neighbor** command in any mode.

show ip rip neighbor [interface-type instance] [vrf vrf-name]

Syntax Description	· · · ·	Optional) Interface type. For more information, use the question mark (?) nline help function.
		Optional) Either a physical interface instance or a virtual interface instance.
	ir al	Optional) Specifies the name of the virtual routing and forwarding (VRF) astance. The <i>vrf-name</i> argument can be specified as any case-sensitive, lphanumeric string up to 32 characters. The strings "default" and "all" are eserved VRF names.
Command Default	No default behavior or valu	es
Command Modes	Any command mode	
Command History	Release M	odification
	5.2(1)N1(1) Th	his command was introduced.
Examples	The following is sample out switch(config-if)# <b>show</b>	put from the <b>show rip neighbor</b> command: ip rip neighbor
Related Commands	Command	Description
	show ip rip	Displays RIP information.
	show ip rip interface	Displays RIP information for an interface.
	show ip rip policy statistic	•
	show ip rip route	Displays RIP route information.
	show ip rip statistics	Displays RIP statistics.
	I I I	1 2

### show ip rip policy statistics

To display the policy statistics for the Routing Information Protocol (RIP), use the **show ip rip policy statistics** command in any mode.

**show ip rip policy statistics redistribute** {**bgp** *id* | **direct** | **eigrp** *id* | **ospf** *id* | **static**} [**vrf** *vrf*-*name*]

Syntax Description	bgp	Displays policy statistics for the Border Gateway Protocol (BGP).	
	direct	Displays policy statistics for directly connected routes only.	
	eigrp	Displays policy statistics for Enhanced Interior Gateway Routing Protocol (EIGRP).	
	ospf	Displays policy statistics for Open Shortest Path First (OSPF) protocol.	
	static	Displays policy statistics for IP static routes.	
	id	For the <b>bgp</b> keyword, an autonomous system number. The range for 2-byte numbers is from 1 to 65535. The range for 4-byte numbers is from 1.0 to 65535.65535.	
		For the <b>eigrp</b> keyword, an EIGRP instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.	
		For the <b>ospf</b> keyword, an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. You can enter a decimal number, but Cisco Nexus 5500 stores it internally as a string.	
	<b>vrf</b> vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.	
Command Default	No default behav	ior or values.	
Command Modes	Any command m	ode	
Command Modes	Any command m Release	ode Modification	
	Release	Modification	
	<b>Release</b> 5.2(1)N1(1)	Modification	

Command	Description
clear ip rip policy statistics	Clears policy statistics for RIP.
show ip rip	Displays RIP information.
show ip rip interface	Displays RIP information for an interface.
show ip rip neighbor	Displays RIP information for a neighbor.
show ip rip route	Displays RIP route information.
show ip rip statistics	Displays RIP statistics.

## show ip rip route

To display route information from the Routing Information Protocol (RIP) topology table, use the **show ip rip route** command in any mode.

show ip rip route [prefix/length] [summary] [vrf vrf-name]

Syntax Description	prefix/length (C	Optional) IP prefix about which routing information should be displayed.	
	summary (Opt	ional) Displays information about summary routes.	
	in al	Optional) Specifies the name of the virtual routing and forwarding (VRF) istance. The <i>vrf-name</i> argument can be specified as any case-sensitive, phanumeric string up to 32 characters. The strings "default" and "all" are eserved VRF names.	
Command Default	No default behavior or value	es	
Command Modes	Any command mode		
Command History	Release M	odification	
	5.2(1)N1(1) Th	his command was introduced.	
Examples	This example shows how to switch# <b>show ip rip rout</b>	display route information from the RIP topology table:	
Related Commands	Command	Description	
	show ip rip	Displays RIP information.	
	show ip rip interface	Displays RIP information for an interface.	
	show ip rip neighbor	Displays RIP information for a neighbor.	
	show ip rip policy statistic	s Displays policy statistics for RIP.	
	show ip rip statistics	Displays RIP statistics.	

### show ip rip statistics

To display statistical entry information from the Routing Information Protocol (RIP) topology table, use the **show ip rip statistics** command in any mode.

show ip rip statistics [interface-type instance] [vrf vrf-name]

Syntax Description	0 01	(Optional) Interface type. For more information, use the question mark (?) online help function.	
		(Optional) Either a physical interface instance or a virtual interface instance.	
	·	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.	
Command Default	No default behavior or val	ues.	
Command Modes	Any command mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Examples	This example shows how t switch# <b>show ip rip sta</b>	to display the RIP statistics:	
	<u> </u>	<b>•</b>	
Related Commands	Command	Description	
	show ip rip	Displays RIP information.	
	show ip rip interface	Displays RIP information for an interface.	
	show ip rip neighbor	Displays RIP information for a neighbor.	
	show ip rip policy statist	ics Displays policy statistics for RIP.	
	show ip rip route	Displays RIP route information.	

# **T** Commands

This chapter describes the Cisco NX-OS Routing Information Protocol (RIP) commands that begin with T.

## timers basic

To adjust the Routing Information Protocol (RIP) network timers, use the **timers basic** command. To restore the default timers, use the **no** form of this command.

timers basic update invalid holddown flush

no timers basic

Syntax Description	<i>update</i> Rate (in seconds) at which updates are sent. The range is from 5 to 4,294,967,2 The default is 30 seconds.			
	invalid	Interval of time (in seconds) after which a route is declared invalid; it should be at least three times the value of the <i>update</i> argument. A route becomes invalid when no updates refresh the route. The route then enters into a <i>holddown</i> state where it is marked as inaccessible and advertised as unreachable. However, the route is still used to forward packets. The range is from 1 to 4,294,967,295. The default is 180 seconds.		
	holddown	Interval (in seconds) during which routing information regarding better paths is suppressed; it should be at least three times the value of the <i>update</i> argument. A route enters into a <i>holddown</i> state when an update packet is received that indicates that the route is unreachable. The route is marked as inaccessible and advertised as unreachable. However, the route is still used to forward packets. When holddown expires, routes advertised by other sources are accepted and the route is no longer inaccessible. The range is from 0 to 4,294,967,295. The default is 180 seconds.		
	flush	Amount of time (in seconds) that must pass before the route is removed from the routing table; the interval specified should be greater than the sum of the <i>invalid</i> argument plus the <i>holddown</i> argument. If it is less than this sum, the proper <i>holddown</i> interval cannot elapse, which results in a new route being accepted before the <i>holddown</i> interval expires. The range is from 1 to 4,294,967,295. The default is 240 seconds.		
Command Default	update: 30 secon invalid: 180 secon holddown: 180 s flush: 240 secon	onds seconds		
Command Modes	Router address-	family configuration mode		
Command History	Release	Modification		
	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	You can modify servers in the ne	the basic timing parameters for RIP. These timers must be the same for all routers and etwork.		

You can view the current and default timer values by using the show ip protocols command.

#### Examples

This example shows how to set updates to broadcast every 5 seconds. If Cisco Nexus 5500 does not hear from a router in 15 seconds (the invalid time), it declares the route as unusable. Cisco Nexus 5500 suppresses further information for an additional 15 seconds (the holddown time). At the end of the suppression period, Cisco Nexus 5500 flushes the route from the routing table.

```
switch(config)# router rip Enterprise
switch(config-router)# address-family ipv4 unicast
switch(config-router-af)# timers basic 5 15 15 30
switch(config-router-af)#
```

Related Commands	Command	Description
	address-family	Enters address-family configuration mode.
	copy running-config startup-config	Saves the configuration to the startup configuration file.
	show ip rip	Displays a summary of RIP information for all RIP instances.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

PART UCR-

### **Unicast RIB and FIB Commands**

### <l\_ltalic>

# **C** Commands

This chapter describes the Cisco NX-OS unicast Routing Information Base (RIB) and the Forwarding Information Base (FIB) commands that begin with C.

## clear forwarding route

To clear forwarding information, use the clear forwarding route command.

clear forwarding {ip | ipv4} route [\* | prefix] [vrf vrf-name]

Syntax Description	ip	Clears an IPv4 route.
	ipv4	Clears an IPv4 route.
	*	(Optional) Clears all routes.
	prefix	(Optional) IPv4 prefix. The IPv4 format is x.x.x.x/length.
	vrf vrf-name	(Optional) Specifies a particular virtual routing and forwarding (VRF) instance. The VRF name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	None	
Command Modes	Any command mode	
	Release	Modified
Command History		

## clear forwarding inconsistency

To clear the Layer 3 inconsistency checker for the Forwarding Information Base (FIB), use the **clear forwarding inconsistency** command.

#### clear forwarding inconsistency

Syntax Description	This command has no	arguments or keywords.
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Examples	-	ow to clear the Layer 3 inconsistency checker for all modules:
Related Commands	Command	Description
	show forwarding inconsistency	Displays information about the FIB inconsistencies.
	test forwarding inconsistency	Triggers the forwarding inconsistency checker.

# clear ip adjacency statistics

To clear adjacency statistics, use the clear ip adjacency statistics command.

clear ip adjacency statistics

Syntax Description	This command has n	o arguments or keywords.	
Command Default	None		
Command Modes	Any command mode		
Command History	<b>Release</b> 5.2(1)N1(1)	Modified This command was introduced.	
Examples	-	how to clear the adjacency statistics: djacency statistics	

Related Commands	Command	Description
	show ip adjacency	Displays adjacency information.

## clear ip route

To clear individual routes from the unicast Routing Information Base (RIB), use the **clear ip route** command.

clear ip route [\* | addr | prefix]] [vrf vrf-name]

Command Modes       Any command mode         Command History       Release       Modified         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the clear ip route command to clear individual routes from the route table.         Mathematical Caution       The * keyword is severely disruptive to routing.	Syntax Description	*	(Optional) Clears all routes.
vrf vrf-name       (Optional) Specifies the virtual routing and forwarding (VRF) context name. The name can be any case-sensitive, alphanumeric string up to 32 characters.         Command Default       None         Command Modes       Any command mode         Command History       Release       Modified         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the clear ip route command to clear individual routes from the route table.         Caution       The * keyword is severely disruptive to routing.         Examples       This example shows how to clear the individual route: switch(config)# clear ip route 192.0.2.1         Related Commands       Command       Description	-	addr	(Optional) Clears this route. The format is x.x.x.x.
name can be any case-sensitive, alphanumeric string up to 32 characters.         Command Default       None         Command Modes       Any command mode         Command History       Release       Modified         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the clear ip route command to clear individual routes from the route table.         Image Guidelines       The * keyword is severely disruptive to routing.         Examples       This example shows how to clear the individual route: witch(config) # clear ip route 192.0.2.1         Related Commands       Command       Description		prefix	(Optional) Clears this prefix. The format is x.x.x.x/length.
Command Modes       Any command mode         Command History       Release       Modified         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the clear ip route command to clear individual routes from the route table.         Amount       The * keyword is severely disruptive to routing.         Examples       This example shows how to clear the individual route: switch(config)# clear ip route 192.0.2.1         Related Commands       Command       Description		vrf vrf-name	
Release       Modified         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the clear ip route command to clear individual routes from the route table.         Image Guidelines       Image Command is severely disruptive to routing.         Image Guidelines       Image Command is severely disruptive to routing. ### clear sockets statistics

To clear the socket statistics, use the clear sockets statistics command.

clear sockets statistics [all | raw | tcp | udp]

Syntax Description	all (Option	nal) Clears all the socket statistics.
	raw (Option	nal) Clears the socket statistic for the raw IPv4 protocols.
	tcp (Option	nal) Clears the socket statistic for the TCP IPv4 protocols.
	udp (Option	nal) Clears the socket statistic for the UDP IPv4 protocols.
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modified
Command History	<b>Release</b> 5.2(1)N1(1)	Modified This command was introduced.
Command History Examples	5.2(1)N1(1) This example shows how	This command was introduced.
	5.2(1)N1(1)	This command was introduced.
	5.2(1)N1(1) This example shows how	This command was introduced.
Examples	5.2(1)N1(1) This example shows how switch# clear sockets	This command was introduced. To clear the TCP socket statistics: statistics tcp
Examples	5.2(1)N1(1) This example shows how switch# clear sockets	This command was introduced. To clear the TCP socket statistics: statistics tcp Description Displays information about the socket client information.

# **H** Commands

This chapter describes the Cisco NX-OS unicast Routing Information Base (RIB) and the Forwarding Information Base (FIB) commands that begin with H.

### hardware profile ucast6 max-limit

To set the maximum number of unicast IPv6 entry limit for the host table, use the **hardware profile** ucast6 max-limit command.

hardware profile ucast6 max-limit max-limit

Syntax Description	max-limit	Maximum limit for the unicast IPv6 entries. The range is from 0 to 8000.
Defaults	4000	
Command Modes	Global configuration r	node
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	the host table.	<b>ofile ucast6 max-limit</b> command to limit the maximum number of host entries in for multicast and IPv6 in the host table, the remaining number of entries are t entries.
Note		hardware profile multicast max-limit command overrides the limit set by using ucast6 max-limit command.
	switch# <b>configure te</b> switch(config)# <b>hard</b>	ow to set the maximum number of unicast IPv6 entry limit in the host table: erminal dware profile ucast6 max-limit 2500 (v4 & v6) unicast route limits have been changed.
Related Commands	Command	Description
	hardware profile multicast max-limit	Sets the maximum number of entries in the multicast routing table.

Displays information about the multicast and unicast routing table limits.

show hardware profile

status

# **I** Commands

This chapter describes the Cisco NX-OS unicast Routing Information Base (RIB) and the Forwarding Information Base (FIB) commands that begin with I.

### ip load-sharing address

To configure the load-sharing algorithm used by the unicast Forwarding Information Base (FIB), use the **ip load-sharing address command**. To restore the default, use the **no** form of this command.

ip load-sharing address {destination port destination | source-destination [port source-destination]} [universal-id *seed*]

**no ip load-sharing address {destination port destination | source-destination [port source-destination]} [universal-id** *seed*]

Syntax Description	destination port destination	Sets the load-sharing algorithm based on the destination address and port.
	source-destination	Sets the load-sharing algorithm based on the source and destination address.
	port source-destination	(Optional) Sets the load-sharing algorithm based on the source and destination address and port address.
	universal-id seed	(Optional) Sets the random seed for the load sharing hash algorithm. The range is from 1 to 4294967295.
Command Default	Destination address and port a	uddress
Command Modes	Global configuration mode	
Command History	Release Moo	dified
	5.2(1)N1(1) Thi	s command was introduced.
Usage Guidelines		ress command to set the load-sharing algorithm that the unicast FIB uses l-cost paths in the Routing Information Base (RIB).
Examples	-	et the load-sharing algorithm to use the source and destination address: aring address source-destination
Rolatod Commanda	Command	Description
Related Commands	Command	Description
Related Commands	Command show ip load-sharing show routing hash	<b>Description</b> Displays the load-sharing algorithm. Displays the path the RIB and FIB select for a source/destination pair.

### ip route

To configure a static route, use the **ip route** command. To remove the static route, use the **no** form of this command.

ip route ip-prefix/mask {[interface] next-hop} [preference] [tag id]

**no ip route** *ip-prefix/mask* {[*interface*] *next-hop*} [*preference*] [**tag** *id*]

Syntax Description	ip-prefix/mask	IP prefix and prefix mask. The format is x.x.x.x/length. The length is 1 to 32.	
	interface	(Optional) Interface on which all packets are sent to reach this route. Use ? to	
		display a list of supported interfaces.	
	next-hop	IP address of the next hop that can be used to reach that network. You can	
		specify an IP address and an interface type and interface number. The format is x.x.x.x/length. The length is 1 to 32.	
	preference	(Optional) Route preference that is used as the administrative distance to this	
	prejerence	route. The range is from 1 to 255. The default is 1.	
	tag id	(Optional) Assigns a route tag that can be used to match against in a route map. The range is from 0 to 4294967295. The default is 0.	
Command Default	None		
Command Modes	Global configuration	on mode	
Command History	Release	Modified	
Commanu History			
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Static routes have a default administrative distance of 1. If you want a dynamic routing protocol to tak precidence over a static route, you must configure the static route preference argument to be greater tha the administrative distance of the dynamic routing protocol. For example, routes derived with the Enhanced Interior Gateway Routing Protocol (EIGRP) have a default administrative distance of 100. The have a static route that would be overridden by an EIGRP dynamic route, you should specify an administrative distance greater than 100.		
Examples	-	we how to create a static route for destinations with the IP address prefix achable through the next-hop address 10.0.0.2:	
	switch(config)# ip route 192.168.1.1/32 10.0.0.2		
	This example show that can match on t	vs how to assign a tag to the previous example so that you can configure a route map this static route:	
	switch(config)#	ip route 192.168.1.1/32 10.0.0.2 tag 5	

This example shows how to choose a preference of 110. In this case, packets for prefix 10.0.0.0 are routed to a router at 172.31.3.4 if dynamic route information with an administrative distance less than 110 is not available.

```
switch# configure terminal
switch(config)# ip route 10.0.0.0/8 172.31.3.4 110
switch(config)#
```

<b>Related Commands</b>	Command	Description
	match tag	Matches the tag value associated with a route.

# **Show Commands**

This chapter describes the Cisco NX-OS unicast Routing Information Base (RIB) and the Forwarding Information Base (FIB) **show** commands.

## show forwarding

To display forwarding information, use the **show forwarding** command.

show forwarding [ip | ipv4] {adjacency | interfaces | route | trace [clear] | table id | pss | route}
[ethernet | port-channel | vlan slot] [vrf vrf-name]

Syntax Description	ір	(Optional) Displays the IPv4 forwarding information.
-	ipv4	(Optional) Displays the IPv4 forwarding information.
	adjacency	Displays the adjacency information.
	interfaces	Displays the forwarding information for interfaces on a module.
	route	Displays the forwarding information for routes on a module.
	trace	Displays the forwarding trace buffer on a module.
	clear	(Optional) Clears the forwarding trace buffer on a module.
	table id	Displays the forwarding information for a route table. The <i>id</i> range is from 0 to 2147483647.
	pss	Displays route information from persistent storage.
	route	Displays route information from the IP routing table.
	ethernet slot	(Optional) Displays information for the ethernet. The slot range depends on the hardware platform.
	port-channel slot	(Optional) Displays information for the port-channel. The slot range depends on the hardware platform.
	vlan	(Optional) Displays information for the vlan. The slot range depends on the hardware platform.
	vrf vrf-name	(Optional) Specifies the name of the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.
Command Default	None	
	Any command mode	e
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		<b>Arding</b> command on the supervisor to view forwarding information on a module. use the <b>attach module</b> command to attach to a module and use the <b>show forwardin</b> odule.

# **Examples** This example shows how to display forwarding information for module 2: switch# show forwarding route ethernet 2

<b>Related Commands</b>	Command	Description
	show ip fib	Displays information about the FIB.

## show forwarding distribution

To display forwarding distribution information, use the **show forwarding distribution** command.

show forwarding distribution [clients | fib-state]

Syntax Description	clients (	(Optional) Displays the forwarding distribution information for unicast clients
		Optional) Displays the forwarding distribution state for unicast Forwarding Information Base (FIB).
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modified
oommanu mistoly		mouniou
	5.2(1)N1(1)	This command was introduced.
Examples	5.2(1)N1(1) This example shows ho	
	5.2(1)N1(1) This example shows ho	This command was introduced.

# show forwarding distribution multicast

To display information about multicast Forwarding Information Base (FIB) distribution messages, use the **show forwarding distribution multicast** command.

show forwarding distribution multicast [messages]

Syntax Description	messages	(Optional) Displays message information.	
Command Default	None		
Command Modes	Any command 1	node	
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	This command does not require a license.		
Examples	This example shows how to display information about multicast distribution messages:		
	<pre>switch(config)# show forwarding distribution multicast Number of Multicast FIB Processes Active: 1 Slot FIB State 1 ACTIVE switch#</pre>		

## show forwarding distribution multicast client

To display information about the multicast Forwarding Information Base (FIB) distribution client, use the **show forwarding distribution multicast client** command.

#### show forwarding distribution multicast client

Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	This command does not require a license.		
Examples	This example shows how to display information about the multicast FIB distribution client:		
		ing distribution multicast client id Shared Memory Name mrib-mfdm	

#### show forwarding distribution multicast outgoing-interface-list

To display information about the multicast Forwarding Information Base (FIB) outgoing interface (OIF) list, use the **show forwarding distribution multicast outgoing-interface-list** command.

show forwarding distribution multicast outgoing-interface-list {L2 | L3} [index]

Syntax Description	L2	Specifies the Layer 2 OIF list.
	L3	Specifies the Layer 3 OIF list.
	index	(Optional) OIF list index.
Command Default	None	
Command Modes	Any command a	mode
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	This command	does not require a license.

#### show forwarding distribution multicast route

To display information about the multicast Forwarding Information Base (FIB) distribution routes, use the **show forwarding distribution multicast route** command.

show forwarding distribution [ip | ipv4] multicast route [table id | vrf vrf\_name] [[group
{group-addr [mask] | group-prefix}] [source {source-addr [source-mask] | source-prefix}] |
summary]

Syntax Description	ip	(Optional) Specifies IPV4 information.		
	ipv4	(Optional) Specifies IPV4 information.		
	table id	<ul><li>(Optional) Specifies the multicast routing table ID. The range is from 0 to 2147483647.</li><li>(Optional) Specifies a virtual routing and forwarding (VRF) name. The name can be a maximum of 32 alphanumeric characters.</li></ul>		
	<pre>vrf vrf_name</pre>			
	group	(Optional) Specifies an IPv4 multicast group.		
	group-addr	IPv4 multicast group address.		
	mask	(Optional) Mask for the group address.		
	group-prefix	(Optional) IPv4 multicast group prefix.		
	source	(Optional) Specifies an IPv4 multicast source.		
	source-addr	IPv4 source address.		
	source-mask	(Optional) Mask for the group address.		
	source-prefix	(Optional) IPv4 multicast source prefix.		
	summary	(Optional) Displays the route counts.		
Command Modes	Any command	mode		
Command History	Release	Modified		
·····	5.2(1)N1(1)	This command was introduced.		
Usage Guidelines	This command does not require a license.			
Examples	This example sl	hows how to display information about all the multicast FIB distribution routes:		

D = Drop Route G = Local Group (directly connected receivers) O = Drop on RPF Fail P = Punt to supervisor d = Decap Route (\*, 224.0.0.0/4), RPF Interface: NULL, flags: D Received Packets: 0 Bytes: 0 Number of Outgoing Interfaces: 0 Null Outgoing Interface List (\*, 224.0.0.0/24), RPF Interface: NULL, flags: CP Received Packets: 0 Bytes: 0 Number of Outgoing Interfaces: 0 Null Outgoing Interface List (\*, 224.0.1.39/32), RPF Interface: NULL, flags: CP Received Packets: 0 Bytes: 0 Number of Outgoing Interfaces: 0 Null Outgoing Interface List (\*, 224.0.1.40/32), RPF Interface: NULL, flags: CP Received Packets: 0 Bytes: 0 Number of Outgoing Interfaces: 0 Null Outgoing Interface List (\*, 232.0.0.0/8), RPF Interface: NULL, flags: D Received Packets: 0 Bytes: 0 Number of Outgoing Interfaces: 0 Null Outgoing Interface List switch#

### show forwarding inconsistency

To display the results of the forwarding inconsistency checker, use the **show forwarding inconsistency** command.

show forwarding inconsistency [ip | ipv4] [unicast] module slot [vrf vrf-name]

Syntax Description	ір	(Optional) Displays the IPv4 forwarding inconsistency information.			
	ipv4	(Optional) Displays the IPv4 forwarding inconsistency information.			
	unicast (Optional) Displays the forwarding inconsistency information for un				
	module <i>slot</i>	Displays inconsistency information for the module. The slot range depends on the hardware platform.			
	vrf vrf-name	(Optional) Displays inconsistency information for the virtual routing and forwarding (VRF) instance. The <i>vrf-name</i> argument can be specified as any case-sensitive, alphanumeric string up to 32 characters. The strings "default" and "all" are reserved VRF names.			
Command Default	None Any command mode				
Command Modes					
Command History	Release	Modified			
	5.2(1)N1(1)	This command was introduced.			
Usage Guidelines	Use the <b>show forwarding inconsistency</b> command to display the results of the <b>test forwarding inconsistency</b> command.				
Examples	This example shows how to display the forwarding inconsistency information for module 2:				
	switch# <b>show forv</b>	warding inconsistency module 2			
Related Commands	Command	Description			
	clear forwarding inconsistency	Clears the forwarding inconsistency checker.			
	test forwarding inconsistency	Triggers the forwarding inconsistency checker.			

#### show forwarding multicast outgoing-interface-list

To display information about the multicast Forwarding Information Base (FIB) outgoing interface (OIF) list, use the **show forwarding multicast outgoing-interface-list** command.

show forwarding multicast outgoing-interface-list [index]

Syntax Description	<i>index</i> (Optional) OIF list index. The OIF list index is from 1 to 65535.		
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Examples	This example shows how to display information about the multicast FIB OIF list		
Examples	This example shows how to display information about the multicast FIB OIF list:		
	switch# show forwarding multicast outgoing-interface-list		
	Outgoing Interface I Reference Count: 1 Ethernet1/5 switch#	ist Index: 1	
Related Commands	Command	Description	
	clear ip igmp interface statistics	Clears the IGMP statistics for an interface.	
	ip igmp static-oif	Binds a multicast group to the outgoing interface (OIF).	

#### show forwarding multicast route

To display information about the IPv4 Forwarding Information Base (FIB) multicast routes, use the **show forwarding multicast route** command.

show forwarding [vrf {vrf-name | all}] [ip | ipv4] multicast route {[group {group-addr
 [group-mask] | group-prefix} | source {source-addr [source-mask] | source-prefix} | module
 num | vrf {vrf-name | all}] | summary [vrf {vrf-name | all}]}

Syntax Description	vrf	(Optional) Displays information for a specified virtual routing and forwarding (VRF) instance.			
	vrf-name	VRF name. The name can be a maximum of 32 alphanumeric characters and is case sensitive.			
	all	Displays information for all VRFs.			
	ір	(Optional) Specifies IPv4.			
	ipv4				
	group (Optional) Specifies an IPv4 multicast group address.				
	group-addr	IPv4 multicast group address.			
	group-mask	(Optional) IPv4 multicast group address mask.			
	group-prefix	(Optional) IPv4 multicast group prefix.			
	source	(Optional) Specifies an IPv4 multicast source address.			
	source-addr	IPv4 multicast source address.			
	source-mask	IPv4 multicast source address mask.			
	source-prefix	IPv4 multicast source prefix.			
	summary	Displays route counts.			
Command Default	None				
Command Modes	Any command n	node			
Command History	Release	Modified			
	5.2(1)N1(1)	This command was introduced.			
Usage Guidelines	This command	does not require a license.			
Examples	This example sh	nows how to display information about the IPv4 multicast FIB routes:			
	switch# show forwarding multicast route				
	IPv4 Multicast Total number c	Routing table table-id:1 f groups: 1			

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

```
Legend:

C = Control Route

D = Drop Route

G = Local Group (directly connected receivers)

O = Drop on RPF failure

P = Punt to Supervisor

W = Wildcard

d = OTV Decap route

(*, 230.0.0.0/32), RPF Interface: NULL, flags: DG

Received Packets: 0 Bytes: 0

Number of Outgoing Interfaces: 1

Outgoing Interface List Index: 1

Ethernet1/5 Outgoing Packets:0 Bytes:0

switch#
```

This example shows how to display the summary information about the IPv4 multicast FIB routes:

```
switch# show forwarding multicast route summary
```

```
IPv4 Multicast Routing Table for Context "default"
Total number of routes: 1
Total number of (*,G) routes: 1
Total number of (S,G) routes: 0
Total number of (*,G-prefix) routes: 0
Group count: 1
Prefix insert fail count: 9
switch#
```

<b>Related Commands</b>	Command	Description
	clear ip mroute	Clears the multicast routing table.

### show ip adjacency

To display adjacency information, use the **show ip adjacency** command.

show ip adjacency [ip-addr | interface] [detail] [non-best] [statistics] [summary]
 [vrf vrf-name | all | default | management]

Syntax Description						
	ip-addr	(Optional) IPv4 source address. The format is x.x.x.x.				
	interface	(Optional) Interface. Use ? to determine the supported interface types.				
	detail	(Optional) Displays detailed adjacency information.				
	non-best	(Optional) Displays both the best and nonbest adjacency information.				
	statistics	(Optional) Displays adjacency statistics.				
	summary	summary(Optional) Displays a summary of the adjacency information.				
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.				
	all	(Optional) Displays adjacency statistics for all VRF entries.				
	default	(Optional) Displays adjacency statistics for the default VRF.				
	management	(Optional) Displays adjacency statistics for the management VRF.				
Command Default	None					
Command Derault	None					
Command Modes	Any command 1	node				
<b>Command History</b>	Release	Modified				
	5.2(1)N1(1)	This command was introduced.				
	5.2(1)N1(1)	This command was introduced.

	The counter val a supervisor mo This example sh	ues in the output of <b>show ip adjacency</b> { <b>statistics</b>   <b>detail</b> } command are cleared after dule switchover.				

<b>Related Commands</b>	Command	Description
	show forwarding adjacency	Displays forwarding adjacency information.

#### show ip adjacency summary

To display the IP adjacency summary, use the show ip adjacency summary command.

show ip adjacency summary

Syntax Description	This command has r	to arguments or keywords.	
Defaults	None		
Command Modes	Any command mode		
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines		not require a license.	
Examples	This example shows how to display the IP adjacency summary: switch# show ip adjacency summary		
	I IP AM Table - Adja		
	Static : 1 Dynamic : 0		
	Others : 0		
	Total : 1		
	switch#		

<b>Related Commands</b>	Command	Description
	ip arp timeout	Configures ARP.

### show ip fib

To display forwarding information, use the show ip fib command.

show ip fib {adjacency | interfaces | route} module slot

Syntax Description		Displays the adjace	
			ding information for interfaces on a module.
			ding information for routes on a module.
	module <i>slot</i>	Displays information platform.	on for the module. The slot range depends on the hardware
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modified	
	5.2(1)N1(1)	This command	was introduced.
Usage Guidelines	-	-	visor to view forwarding information on a module. Optionally,
	you can use the <b>attac</b> l module.	<b>n module</b> command	to attach to a module and use the <b>show ip fib</b> command on the
Usage Guidelines Examples	you can use the <b>attach</b> module. This example shows h	<b>n module</b> command	
	you can use the <b>attac</b> l module.	n module command now to display the fo	to attach to a module and use the <b>show ip fib</b> command on the
	you can use the <b>attach</b> module. This example shows h switch# <b>show ip fik</b> IPv4 routes for tak Prefix	n module command now to display the for o route module 1 ole default/base Next-hop	to attach to a module and use the <b>show ip fib</b> command on the
	you can use the <b>attach</b> module. This example shows h switch# <b>show ip fik</b> IPv4 routes for tak	n module command now to display the for o route module 1 ole default/base Next-hop	to attach to a module and use the <b>show ip fib</b> command on the orwarding information for module 1:
	you can use the attack module. This example shows h switch# show ip fik IPv4 routes for tak Prefix   	n module command now to display the for o route module 1 ole default/base Next-hop	to attach to a module and use the <b>show ip fib</b> command on the prwarding information for module 1:

### show ip fib distribution

To display forwarding distribution information, use the show ip fib distribution command.

show ip fib distribution [clients | state]

Syntax Description	clients	(Optional) Displays the forwarding distribution information for unicast clients.
	state	(Optional) Displays the forwarding distribution state for unicast FIB.
Command Default	None	
ommand Modes	Any command mode	e
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
xamples	-	s how to display the forwarding information for unicast clients: ib distribution clients
Related Commands	Command	Description
	show forwarding distribution	Displays distribution information about the FIB.

### show ip load-sharing

To display IP load sharing information, use the show ip load-sharing command.

show ip load-sharing

Syntax Description	This command has no ar	guments or keywords.
Command Default	None	
Command Modes	Any command mode	
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows how switch# <b>show ip load</b> -a	v to display the IP load sharing information: sharing
Related Commands	Command	Description
	show ip load-sharing	Displays IP load sharing.

### show ip process

To display formation about the IP process, use the **show ip process** command.

show ip process [vrf vrf-name]

Syntax Description	vrf vrf-name	instance. The	becifies the name of the virtual routing and forwarding (VR e <i>vrf-name</i> argument can be specified as any case-sensitive, e string up to 32 characters. The strings "default" and "all" a F names.	
Command Default	None			
Command Modes	Any command mode			
Command History	Release	Modified		
	5.2(1)N1(1)	This command	nd was introduced.	
Examples	This example shows	details about the IP	P process:	
	Auto Punt broadc Static discard i Number of static	1 disabled not added ast is configured ast is configured s not configured default route configured	d onfigured is O	

#### show ip route

To display routes from the unicast Routing Information Base (RIB), use the show ip route command.

show ip route [all | addr | hostname | prefix | route-type | interface type number | next-hop addr]]
[vrf vrf-name]

	all	(Optional) Displays all routes.
	addr	(Optional) IPv4 address. The format is x.x.x.x.
	hostname	Hostname. The <i>name</i> can be any case-sensitive, alphanumeric string up to 80 characters.
	prefix	(Optional) IPv4 prefix. The format is x.x.x.x/length. The length range is from 1 to 32.
	route-type	(Optional) Type of route. Use ? to see the list of types.
	<b>interface</b> type number	(Optional) Displays the routes for an interface. Use ? to see the supported interfaces.
	next-hop addr	(Optional) Displays routes with this next-hop address. The format is x.x.x.x.
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Modes	Any command m	
Command Modes	Release	Modified
	Release 5.2(1)N1(1) This example sho	

### show ip static-route

To display static routes from the unicast Routing Information Base (RIB), use the **show ip static-route** command.

show ip static-route [vrf {vrf-name | all}]

Syntax Description	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
	all	(Optional) Specifies all virtual router contexts (VRF) name.
Command Default	None	
Command Modes	Any command	mode
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Examples	This example s	hows how to display the static routes:
	switch(config)	)# show ip static-route
Related Commands	Command	Description

#### show routing

To display routing information, use the show routing command.

**show routing** [**ip** | **ipv4**] [*address* | *hostname* | *prefix* | *route-type* | **clients** | **hidden-nh interface** *type number* | **next-hop** *addr* | **recursive-next-hop** [*addr*]] [**vrf** *vrf-name*]

Syntax Description	ip	(Optional) Displays the routing information for the network.
	ipv4	(Optional) Displays the routing information for the IPv4 network.
	address	(Optional) IPv4 address. IPv4 address format is x.x.x.x.
	hostname	Hostname. The <i>name</i> can be any case-sensitive, alphanumeric string up to 80 characters.
	prefix	(Optional) IPv4 prefix. IPv4 prefix format is x.x.x.x/length.
	route-type	(Optional) Type of route. Use ? to see the list of types.
	clients	(Optional) Displays the routing clients.
	hidden-nh	(Optional) Displays hidden next-hop information.
	<b>interface</b> type number	(Optional) Displays the routes for an interface. The interface can be one of the following:
		• <b>mgmt</b> —Management interface. The default management interface is 0.
		• vlan—VLAN interface. The VLAN interface number is from 1 to 4094.
	next-hop addr	(Optional) Displays routes with this next-hop address. The format is x.x.x.x.
	recursive next-hop addr	(Optional) Displays routes with this recursive next-hop address. The format is x.x.x.x.
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The VRF can be one of the following:
		• <i>vrf-name</i> —VRF name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
		• all—Specifies all VRFs.
		• <b>default</b> —Specifies the default VRF.
		• management—Specifies the management VRF.
Command Default	None	
Command Modes	Any command n	ıode
	-	
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Examples	This example sh	ows how to display the route table:

switch(config)# show ip routing

**Related Commands** 

Command

clear ip route

**Description** Clears entries in the route table.

### show routing memory estimate

To display an estimate of routing memory requirements, use the **show routing memory estimate** command.

show routing memory estimate [routes num-routes next-hops num-hop-addresses]

routes	(Optional) Specifies the unicast Routing Information Base (RIB) memory estimate for the number of routes.
num-routes	Number of routes. The range is from 1000 to 1,000,000.
next-hops	(Optional) Specifies the unicast RIB memory estimate for the number of next hops per route.
num-hop- addresses	Number of next-hop addresses per route. The range is from 1 to 16.
None	
Any command n	node
Release	Modified
5.2(1)N1(1)	This command was introduced.
	<b>Duting memory estimate</b> command to estimate the memory required for a selected as and number of next-hop addresses per route.
This example sh	nows how to display the route table:
switch# <b>show r</b> Shared memory Current max in-u:	32 MB; 27495 routes with 16 nhs
	num-routes         next-hops         num-hop-addresses         None         Any command r         Release         5.2(1)N1(1)         Use the show roon number of route

### show routing hash

To display the route selected for a particular source and destination address, use the **show routing hash** command.

**show routing hash** source-addr dest-addr [source-port dest-port]] [**vrf** vrf-name]

Syntax Description	source-addr	Source IPv4 address. IPv4 address format is x.x.x.x.
	dest-addr	Destination IPv4 address. IPv4 address format is x.x.x.x.
	source-port	(Optional) Source port. The range is from 1 to 65535.
	dest-port	(Optional) Destination port. The range is from 1 to 65535.
	vrf vrf-name	(Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.
Command Default	None	
Command Modes	Any command	mode
	Any command	mode Modified
Command History	<b>Release</b> 5.2(1)N1(1)	Modified

Command Modes Command History Examples Related Commands	Release5.2(1)N1(1)This example st	Modified This command was introduced. hows how to display the route selected to reach 30.0.0.2 from 10.0.0.5:

#### show sockets client

To display information about the sockets clients, use the show sockets client command.

show sockets client [pid id] [raw | tcp | udp ] [detail]

Syntax Description	pid id	(Optional) Displays the socket client information for a specific process. The <i>id</i> range is from 1 to 65535.
	raw	(Optional) Displays information about the raw client.
	tcp	(Optional) Displays information about the TCP client.
	udp	(Optional) Displays information about the UDP client.
	detail	(Optional) Displays information about the detailed client.
Command Default	None	
Command Modes	Any command	mode
Command History	Release	Modified
-	5.2(1)N1(1)	This command was introduced.
		sockets client udp of UDP clients: 9

#### **Related Commands**

ands	Command	Description
	clear sockets statistics	Clears socket statistics.
	show sockets client	Displays information about the socket client.
	show sockets connection	Displays information about the socket connection.

## **T** Commands

This chapter describes the Cisco NX-OS unicast Routing Information Base (RIB) and the Forwarding Information Base (FIB) commands that begin with T.

### test forwarding distribution perf

To test the forwarding distribution performance of the Forwarding Information Base (FIB), use the **test forwarding distribution perf** command.

test forwarding distribution perf

Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Examples	This example shows how to test the forwarding distribution performance: switch# test forwarding distribution perf		
Related Commands	Command	Description	
	show forwarding distribution	Displays information about the FIB.	

#### test forwarding inconsistency

inconsistency

To trigger the Layer 3 inconsistency checker for the Forwarding Information Base (FIB), use the **test forwarding inconsistency** command.

test forwarding inconsistency [ip | ipv4] [unicast] [vrf vrf-name] [module {slot | all}] [stop]

Syntax Description	ір	(Optional) Specifies the inconsistency check for IPv4 routes.	
	ipv4	(Optional) Specifies the inconsistency check for IPv4 routes.	
	unicast	(Optional) Specifies the inconsistency check for unicast routes.	
	vrf vrf-name	(Optional) Specifies the virtual routing and forwarding (VRF) context name. The name can be any case-sensitive, alphanumeric string up to 32 characters.	
	module	(Optional) Specifies the inconsistency check for one or more modules.	
	slot	Module number. The range depends on the platform.	
	all	(Optional) Specifies the inconsistency check for all modules.	
	stop	(Optional) Stops the inconsistency check.	
Command Default	None		
Command Modes	Any command mode		
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Examples	This example shows	how to trigger the Layer 3 inconsistency checker for all modules:	
	switch# test forwarding inconsistency module all This example shows how to stop the Layer 3 inconsistency checker for all modules:		
	switch# test forwarding inconsistency module all stop		
Related Commands	Command	Description	
	clear forwarding inconsistency	Clears the FIB inconsistencies.	
	show forwarding	Displays information about the FIB inconsistencies.	

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

#### <l\_ltalic>

PART UCR-

#### **VRRP Commands**

#### <l\_ltalic>

# A Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with A.

#### address (VRRP)

To add a single, primary IP address to a virtual router, use the **address** command. To remove an IP address from a virtual router, use the **no** form of this command.

address ip-address [secondary]

no address [ip-address [secondary]]

Syntax Description	ip-address	Virtual router address (IPv4). This address should be in the same subnet as the interface IP address.	
	secondary	(Optional) Specifies a secondary virtual router address.	
Command Default	None		
Command Modes	VRRP configuration	node	
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	You can configure one virtual router IP address for a virtual router. If the configured IP address is the same as the interface IP address, this switch automatically owns the IP address. You can configure an IPv4 address only. The master VRRP router drops the packets addressed to the virtual router's IP address because the virtual router is only intended as a next-hop router to forward packets. In NX-OS devices, some applications require that packets addressed to the virtual router's IP address be accepted and delivered. By using the <b>secondary</b> option to the virtual router IPv4 address, the VRRP router will accept these packets when it		
	is the master. This command does n	ot require a license.	
Examples	This example shows how to configure a virtual router IP address:		
	<pre>switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# vrrp 250 switch(config-if-vrrp)# address 10.0.0.10</pre>		
	This example shows h command:	now to remove all the IP addresses (primary and secondary) using a single	
	<pre>switch(config-if-vrrp)# show running-config interface ethernet 9/10</pre>		
	!Command: show runn !Time: Mon Apr 14 0	ing-config interface Ethernet9/10 6:04:18 2008	

```
version 5.2(1)N1(1)
interface Ethernet9/10
vrrp 1
address 10.10.10.1/24
no shutdown
switch(config-if-vrrp)# no address
switch(config-if-vrrp)# show running-config interface ethernet 9/10
!Command: show running-config interface Ethernet1/5
!Time: Mon Apr 14 06:07:54 2008
version 5.2(1)N1(1)
interface Ethernet9/10
no switchport
vrrp 1
switch(config-if-vrrp)#
```

Command	Description
clear vrrp	Clears all the software counters for the specified virtual router.
show vrrp	Displays VRRP configuration information.
vrrp	Configures a VRRP group.

#### advertisement-interval (VRRP)

To specify the time interval between the advertisement packets that are being sent to other Virtual Router Redundancy Protocol (VRRP) routers in the same group, use the **advertisement-interval** command. To return to the default interval value of 1 second, use the **no** form of this command.

advertisement-interval seconds

no advertisement-interval [seconds]

Syntax Description	seconds	Number of seconds between advertisement frames being sent. For IPv4, the range is from 1 to 255 seconds.
Command Default	1 second	
Command Modes	VRRP configuration	on mode
Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	VRRP advertisements communicate the priority and state of the virtual router master. The advertisements are encapsulated in IP packets and are sent to the IPv4 multicast address that is assigned to the VRRP group.	
	(224.0.0.18) for VI must service the mu	cated Internet Assigned Numbers Authority (IANA) standard multicast address RRP advertisements. This addressing scheme minimizes the number of routers that ulticasts and allows test equipment to accurately identify VRRP packets on a segment. d VRRP IP protocol number is 112.
Examples	This example show	vs how to specify an advertisement interval of 200 seconds for VRRP group 250:
	<pre>switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# vrrp 250 switch(config-if-vrrp)# advertisement-interval 200 switch(config-if-vrrp)#</pre>	
Related Commands	Command	Description
	clear vrrp	Clears all the software counters for the specified virtual router.
	show vrrp	Displays VRRP configuration information.
	vrrp	Configures a VRRP group.

## authentication (VRRP)

To configure an authentication for the Virtual Router Redundancy Protocol (VRRP), use the **authentication** command. To disable authentication, use the **no** form of this command.

authentication text password

no authentication [text password]

Syntax Description	text password	Selects to use simple text password of up to 8 alphanumeric characters.
Command Default	No authentication	
Command Modes	VRRP configuration	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Examples	This example shows how to configure MD5 authentication for VRRP: switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# vrrp 250 switch(config-if-vrrp)# authentication text mypwasswd switch(config-if-vrrp)#	
Related Commands	Command	Description
	clear vrrp	Clears all the software counters for the specified virtual router.
	show vrrp	Displays VRRP configuration information.
	vrrp	Configures a VRRP group.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **C** Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with C.

## clear ip interface statistics

To clear IP interface statistics, use the clear ip interface statistics command.

clear ip interface statistics

Syntax Description	This command has r	no arguments or keywords.
Command Default	None	
Command Modes	Any command mode	
Command History	<b>Release</b> 5.2(1)N1(1)	<b>Modification</b> This command was introduced.
Examples	-	how to clear the IP interface statistics:

Related Commands	Command	Description
	show ip interface	Displays IP interface information.

### clear vrrp

To clear the Virtual Router Redundancy Protocol (VRRP) statistics, use the clear vrrp command.

clear vrrp vr id interface {ethernet slot/[QSFP-module/]port| port-channel
 number[.sub\_if\_number]}

Syntax Description	vr id	Clears VRRP statistics in a VRRP group on an interface. The range is from 1 to 255.
	interface	Specifies an Ethernet or EthreChannel interface or a subinterface.
	ethernet slot/[QSFP-module/]port	Clears VRRP statistics on the Ethernet interface. The <i>slot</i> number is
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).
	port-channel number	Clears VRRP statistics on the EtherChannel interface. The EtherChannel number is from 1 to 4096.
	.sub_if_number	(Optional) Subinterface number. The range is from 1 to 4093.
Command Default	None	
Command Modes	Any command mode	
Command History		
Sommuna motory	Release	Modification
Sommana motory	Release 6.0(2)N1(2)	Modification Support for the QSFP+ GEM was added.
	6.0(2)N1(2) 5.2(1)N1(1)	Support for the QSFP+ GEM was added.
Examples	6.0(2)N1(2) 5.2(1)N1(1) This example shows how	Support for the QSFP+ GEM was added. This command was introduced.
	6.0(2)N1(2) 5.2(1)N1(1) This example shows how switch(config)# clear	Support for the QSFP+ GEM was added. This command was introduced. to clear VRRP statistics from a specific Ethernet interface:

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

## **F** Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with F.

### feature vrrp

To enable the Virtual Router Redundancy Protocol (VRRP), use the **feature vrrp** command. To disable VRRP, use the **no** form of this command.

feature vrrp

no feature vrrp

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** Global configuration mode

Command History	Release	Modified
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** 

You must enable the VRRP feature before you can configure VRRP.

<u>Note</u>

In Cisco NX-OS Release 5.2(1)N1(1), a software upgrade on the Cisco Nexus 5548 switch and the Cisco Nexus 5596 switch that has the Layer 3 features enabled is disruptive. You must reload the switch and the Cisco Nexus 2000 Series Fabric Extender.

This command does not require a license.

\$ Note

Make sure the LAN Base Services license is installed on the switch to enable Layer 3 interfaces.

**Examples** 

This example shows how to enable the VRRP feature:

switch# configure terminal
switch(config)# feature vrrp
switch(config)#

This example shows how to disable the VRRP feature:

switch# configure terminal
switch(config)# no feature vrrp
switch(config)#

<b>Related Commands</b>	Command	Description
	clear vrrp	Clears all the software counters for the specified virtual router.
	show feature	Displays the status of features on a switch.
	show vrrp	Displays VRRP configuration information.
	vrrp	Configures a VRRP group on an interface.

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

# **P** Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with P.

### preempt (VRRP)

To enable a high-priority backup virtual router to preempt the low-priority master virtual router, use the **preempt** command. To disable a high-priority backup virtual router from preempting the low-priority master virtual router, use the **no** form of this command.

preempt no preempt

Syntax Description This command has no arguments or keywords.

Command Default Enabled

**Command Modes** VRRP configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

### **Usage Guidelines**

**s** VRRP enables you to preempt a virtual router backup that has taken over for a failing virtual router master with a high-priority virtual router backup that has become available.

By default, a preemptive scheme is enabled. A backup high-priority virtual router that becomes available takes over for the backup virtual router that was elected to become the virtual router master. If you disable preemption, the backup virtual router that is elected to become the virtual router master remains the master until the original virtual router master recovers and becomes the master again.

This preemption does not apply to the primary IP address.

If the virtual IP address is also the IP address for the interface, then preemption is applied.

This command does not require a license.

Note

Make sure the LAN Base Services license is installed on the switch to enable Layer 3 interfaces.

#### **Examples**

This example shows how to enable the backup high-priority virtual router to preempt the low-priority master virtual router:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# no switchport
switch(config-if)# vrrp 250
switch(config-if-vrrp)# preempt
switch(config-if-vrrp)#
```

Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

<b>Related Commands</b>	Command	Description
	clear vrrp	Clears all the software counters for the specified virtual router.
	show vrrp	Displays VRRP configuration information.
	vrrp	Configures a VRRP group.

## priority (VRRP)

To set the priority for the Virtual Router Redundancy Protocol (VRRP), use the **priority** command. To revert to the default value, use the **no** form of this command.

priority level [forwarding-threshold lower lower-value upper-value]

**no priority** *level* [forwarding-threshold lower *lower-value* upper-value]

Syntax Description	level	Interface priority for a virtual router. The range of values is from 1 to 254. If this router is the owner of the IP addresses, then the value is automatically set to 254. The default is 100.
	forwarding-threshold	(Optional) Sets the threshold used by a virtual port channel (vPC) to determine when to fail over to the vPC trunk.
	lower lower-value	(Optional) Sets the low threshold value. The range is from 1 to 254. The default is 1.
	<b>upper</b> upper-value	(Optional) Sets the upper threshold value. The range is from 1 to 254. The default is 254.
Command Default	The default value is 100. address, the default value	. For switches whose interface IP address is the same as the primary virtual IP e is 254.
Command Modes	VRRP configuration mo	de
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	ascendancy for the VRR role that each VRRP rou	whether or not a VRRP router functions as a virtual router backup, the order of P router to become a virtual router master if the virtual router master fails, the ter plays, and what happens if the virtual router master fails.
		he IP address of the virtual router and the IP address of the physical interface, s as a virtual router master.
	By default, a preemptive scheme is enabled. A backup high-priority virtual router that becomes available takes over for the backup virtual router that was elected to become the virtual router master. If you disable preemption, then the backup virtual router that is elected to become the virtual router master remains the master until the original virtual router master recovers and becomes the master again.	
	This command does not	require a license.
Examples	This example shows how switch# configure tern switch(config)# inter:	

switch(config-if)# no switchport
switch(config-if)# vrrp 250
switch(config-if-vrrp)# priority 2
switch(config-if-vrrp)#

### **Related Commands**

#### Cisco Nexus 5500 Series NX-OS Unicast Routing Command Reference

## **S** Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with S.

### shutdown (VRRP)

To disable a Virtual Router Redundancy Protocol (VRRP) configuration, use the **shutdown** command. To enable a VRRP configuration, use the **no** form of this command.

shutdown

no shutdown

- **Syntax Description** This command has no arguments or keywords.
- Command Default Disabled
- **Command Modes** VRRP configuration mode

Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.

**Usage Guidelines** Shut down the virtual router before configuring the virtual router parameters; you can only configure the virtual router after it is in the administrative shut down state. Enter the **no shutdown** command to update the virtual router state after completing configuration.

**Examples** This example shows how to shut down a VRRP group: switch# configure terminal

switch(config)# interface ethernet 2/3
switch(config-if)# no switchport
switch(config-if)# vrrp 45
switch(config-if-vrrp)# shutdown
switch(config-if-vrrp)# address 6.6.6.45
switch(config-if-vrrp)# no shutdown
switch(config-if-vrrp)#

<b>Related Commands</b>	Command	Description
	feature vrrp	Enables VRRP.
	show vrrp	Displays VRRP configuration information.
	clear vrrp	Clears all the software counters for the specified virtual router.

## **Show Commands**

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) show commands.

### show vrrp

To show information about the Virtual Router Redundancy Protocol (VRRP), use the **show vrrp** command.

show vrrp [detail | statistics | summary] [interface if-number] [vr id] [backup | init | master]

Syntax Description	detail	(Optional) Displays detailed information about VRRP.	
	statistics	(Optional) Displays VRRP statistics.	
	summary	(Optional) Displays the VRRP summary.	
	interface	(Optional) Displays information about VRRP on an interface. Use ? to see a list	
	if-number	of supported interfaces.	
	<b>vr</b> id	(Optional) Displays information about VRRP for a group. The <i>id</i> range is from 1 to 255.	
	backup	(Optional) Displays information about VRRP groups in the backup state.	
	init	(Optional) Displays information about VRRP groups in the init state.	
	master	(Optional) Displays information about VRRP groups in the master state.	
Command Default		ion for all VRRP groups.	
Command Modes	Any command m	ode	
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Examples	This example sho	ows how to display information about VRRP:	
	switch(config)# <b>show vrrp</b> Interface VR IpVersion Pri Time Pre State VR IP addr		
	Ethernet1/5	1 IPV4 200 200 s Y Init 192.0.1.10	
	switch(config)#		
	This example shows how to display the detailed configuration information about VRRP:		
	switch(config)# show vrrp detail		
	Ethernet1/5 - Group 1 (IPV4) State is Init(Administratively down) Virtual IP address is 192.0.1.10 Priority 200, Configured 200 Forwarding threshold(for VPC), lower: 1 upper: 200 Advertisement interval 200 Preemption enabled Virtual MAC address is 0000.5e00.0101 Master router is Unknown		

#### switch(config)#

This example shows how to displayinformation about a specific virtual router:

```
switch# show vrrp vr 1
Interface VR IpVersion Pri Time Pre State VR IP addr
Ethernet1/5 1 IPV4 200 200 s Y Init 192.0.1.10
switch#
```

Table 1 describes the significant fields shown in the display.

#### Table 1show vrrp Field Descriptions

Field	Description		
Interface	Interface on which VRRP is configured.		
VR	ID of the virtual router.		
IPVersion	IP address on the interface.		
Pri	Priority range of the virtual router.		
Time	Checksum of the complete contents of the link state advertisement.		
Pre	Preemption state of the virtual router.		
State	VRRP group state. The state can be one of the following:		
	• Init		
	• Backup		
	• Master		
VR IP addr	Virtual IPv4 address for a VRRP group.		

#### **Related Commands**

Command	Description
clear vrrp	Clears VRRP statistics.
feature vrrp	Enables the VRRP feature.
vrrp	Creates a virtual router group.

## **T** Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with T.

## track (VRRP)

To modify the priority for a virtual router based on a tracked object, use the **track** command. To disable priority tracking for a virtual router, use the **no** form of this command.

track object-number [decrement value]

no track object-number [decrement value]

Syntax Description	object-number	Number for a configured tracked object. The range is from 1 to 500.
	decrement value	(Optional) Decrements the VRRP priority if the tracked object is down. The range is from 1 to 254.
Command Default	None	
Command Modes	VRRP configuration	mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
	object is down, the pr	bject. Use the track command to configure the tracked object. When the tracked iority reverts to the priority value for the virtual router. When the tracked object is virtual router is restored to the original value.
Examples	This example shows how to enable object tracking for a virtual router: switch# configure terminal switch(config)# track 33 ip route 192.0.2.0/24 reachability switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# vrrp 250 switch(config-if-vrrp)# track 33 priority 2 switch(config-if-vrrp)#	
Related Commandsl	Command	Description
	feature vrrp	Enables VRRP.
	show vrrp	Displays VRRP configuration information.

Command	Description
track interfave (VRRP)	Tracks the state of an interface and modifies the VRRP priority if that interface state goes down.
vrrp	Configures a VRRP group.

### track interface (VRRP)

To track the priority for a virtual router based on an interface, use the **track interface** command. To disable priority tracking for a virtual router, use the **no** form of this command.

track interface {ethernet slot/[QSFP-module/]port | port-channel number[.sub\_if\_number]}
priority value

**no track interface** {**ethernet** *slot/[QSFP-module/]port* | **port-channel** *number[.sub\_if\_number]*} **priority** *value* 

Syntax Description	ethernet slot/[QSFP-module/]port	Specifies the virtual router interface for which to track the priority. The <i>slot</i> number is from 1 to 255. The <i>QSFP-module</i> number is from 1 to 4. The <i>port</i> number is from 1 to 128.
		<b>Note</b> The <i>QSFP-module</i> number applies only to the QSFP+ Generic Expansion Module (GEM).
	port-channel number	Specifies the port-channel group for which to track priority. The range is from 1 to 4096
	sub_if-number	(Optional) Subinterface number. The range is from 1 to 4093.
	priority value	Specifies the interface priority for a virtual router. The range of values is from 1 to 254. If this router is the owner of the IP addresses, the value is automatically set to 254.
	Disabled VRRP configuration mode	
Command Modes	VRRP configuration mode	Nodification
Command Modes	VRRP configuration mode	Modification Support for the QSFP+ GEM was added.
Command Modes	VRRP configuration mode          Release       I         6.0(2)N1(2)       S	
Command Modes Command History	VRRP configuration mode         Release       I         6.0(2)N1(2)       S         5.2(1)N1(1)       T         Use the track command to in the switch. Command Default Command Modes Command History Usage Guidelines	Release       I         6.0(2)N1(2)       5         5.2(1)N1(1)       7         Use the track command to in the switch. When the track router. When the tracked in	Support for the QSFP+ GEM was added.

This command does not require a license.

#### Examples

This example shows how to enable interface state tracking for a virtual router:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# no switchport
switch(config-if)# vrrp 250
switch(config-if-vrrp)# track interface ethernet 2/2 priority 2
switch(config-if-vrrp)#
```

### Related Commandsl Co

Command	Description
feature vrrp	Enables VRRP.
show vrrp	Displays VRRP configuration information.
track (VRRP)	Tracks an object to modify the VRRP priority.
vrrp	Configures a VRRP group.

# **V** Commands

This chapter describes the Cisco NX-OS Virtual Router Redundancy Protocol (VRRP) commands that begin with V.

### vrrp

To create a Virtual Router Redundancy Protocol (VRRP) group on a particular Ethernet interface and assign a number to the VRRP group and enter VRRP configuration mode, use the **vrrp** command. To remove a VRRP group, use the **no** form of this command.

vrrp number

no vrrp number

Syntax Description	number	VRRP group number, which you can configure for a Gigabit Ethernet port, including the main interfaces and subinterfaces. The range is from 1 to 255.	
Command Default	None		
Command Modes	Interface configura	ation mode	
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines		VRRP only if its state is disabled. Make sure that you configure at least one IP address to enable a virtual router.	
Examples	This example show	vs how to create a VRRP group:	
	<pre>switch# configur switch(config)# : switch(config-if switch(config-if switch(config-if;</pre>	interface ethernet 2/1 )# no switchport )# vrrp 7	
	This example shows how to create a VRRP group and configure an IPv4 address for the group:		
	<pre>switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# no switchport switch(config-if)# vrrp 7 switch(config-if-vrrp)# address 10.0.0.10 switch(config-if-vrrp)# no shutdown switch(config-if-vrrp)#</pre>		
Related Commands	Command	Description	
	clear vrrp	Clears all the software counters for the specified virtual router.	
	feature vrrp	Enables VRRP.	

Command	Description
address (VRRP)	Adds a primary or secondary IP address to a virtual router.
show vrrp	Displays VRRP configuration information.
