

Configuring MPLS LDP IGP Synchronization

This chapter describes how to configure Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) synchronization on Cisco NX-OS devices.

This chapter includes the following sections:

- [Finding Feature Information, page 6-1](#)
- [Information About MPLS LDP IGP Synchronization, page 6-1](#)
- [Licensing Requirements for MPLS LDP IGP Synchronization, page 6-3](#)
- [Prerequisites for MPLS LDP IGP Synchronization, page 6-3](#)
- [Guidelines and Limitations for MPLS LDP IGP Synchronization, page 6-3](#)
- [Default Settings for MPLS LDP IGP Synchronization, page 6-5](#)
- [Configuring MPLS LDP IGP Synchronization, page 6-5](#)
- [Verifying the MPLS LDP IGP Synchronization, page 6-9](#)
- [Configuration Examples for MPLS LDP IGP Synchronization, page 6-10](#)
- [Additional References for MPLS LDP IGP Synchronization, page 6-10](#)
- [Feature History for MPLS LDP IGP Synchronization, page 6-11](#)

Finding Feature Information

Your software release might not support all the features documented in this module. For the latest caveats and feature information, see the Bug Search Tool at <https://tools.cisco.com/bugsearch/> and the release notes for your software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “New and Changed Information” chapter or the Feature History table below.

Information About MPLS LDP IGP Synchronization

The MPLS LDP IGP synchronization feature ensures that LDP is fully established before the IGP path is used for switching.

If IGP adjacency starts before LDP adjacency when an interface comes up, traffic flows over the interface, but LDP labels are not available. The VPN overlay traffic is dropped until LDP labels are available. To reduce VPN traffic drops when an interface comes up, you can synchronize IGP with LDP.

■ Information About MPLS LDP IGP Synchronization

This section includes the following topics:

- [MPLS LDP IGP Synchronization Process, page 6-2](#)
- [MPLS LDP IGP Synchronization Delay Timer, page 6-2](#)
- [MPLS LDP IGP Synchronization and IGP Nonstop Forwarding, page 6-3](#)
- [MPLS LDP IGP Synchronization Compatibility with LDP Graceful Restart, page 6-3](#)

MPLS LDP IGP Synchronization Process

Packet loss can occur because the IGP and LDP actions are not synchronized. Packet loss can occur in the following situations:

- When an IGP adjacency is established, the router begins forwarding packets using the new adjacency before the LDP label exchange completes between the peers on that link.
- If an LDP session closes, the router continues to forward traffic using the link that is associated with the LDP peer rather than an alternate pathway with a fully synchronized LDP session.

The MPLS LDP IGP synchronization feature does the following:

- Enables you to synchronize LDP and IGP to minimize MPLS packet loss.
- Allows you to globally enable LDP IGP synchronization on each interface that is associated with an IGP Open Shortest Path First (OSPF) or Intermediate System-to-System (IS-IS) process.
- Prevents MPLS packet loss due to synchronization conflicts.

After you enable LDP IGP synchronization for all interfaces that belong to an OSPF or IS-IS process, you can disable it for specific interfaces on which you do not want it to be enabled.

When an IGP adjacency is established on an interface but LDP IGP synchronization is not yet achieved or is lost, IGP advertises the maximum metric on that interface. When at least one LDP session over the interface is converged, IGP advertises the normal metric for the interface.

MPLS LDP IGP Synchronization Delay Timer

MPLS LDP IGP synchronization enables you to configure a delay time for MPLS LDP and IGP synchronization on an interface-by-interface basis. Typically, when LDP IGP synchronization is configured, LDP notifies IGP as soon as LDP is converged. When you configure the delay time, this notification is delayed.

When LDP is fully established and synchronized, LDP checks the delay timer as follows:

- If you configured a delay time, LDP starts the timer. When the timer expires, LDP checks that synchronization is still valid and notifies the OSPF or IS-IS process.
- If you did not configure a delay time, if synchronization is disabled or down, or if an interface was removed from an IGP process, LDP stops the timer and immediately notifies the OSPF or IS-IS process.

If you configure a new delay time while a timer is running, LDP saves the new delay time but does not reconfigure the running timer.

MPLS LDP IGP Synchronization and IGP Nonstop Forwarding

MPLS LDP IGP synchronization does not take effect while IGP is undergoing a graceful restart. IGP completes the graceful restart regardless of whether LDP is up. After the NSF startup is complete, MPLS LDP IGP synchronization is in effect, and future network events that cause an LDP or IGP session flap will trigger normal LDP IGP synchronization behavior.

MPLS LDP IGP Synchronization Compatibility with LDP Graceful Restart

LDP graceful restart protects traffic when an LDP session is lost. If an interface that supports a graceful-restart-enabled LDP session fails, MPLS LDP IGP synchronization is still achieved on the interface while it is protected by a graceful restart. MPLS LDP IGP synchronization is eventually lost under the following circumstances:

- If LDP fails to restart before the LDP graceful restart reconnect timer expires
- If an LDP session restarts through other interfaces but the LDP session on the protected interface fails to recover when the LDP graceful restart recovery timer expires

Licensing Requirements for MPLS LDP IGP Synchronization

Product	License Requirement
Cisco NX-OS	MPLS LDP IGP synchronization requires an MPLS license. For a complete explanation of the Cisco NX-OS licensing scheme and how to obtain and apply licenses, see the <i>Cisco NX-OS Licensing Guide</i> .

Prerequisites for MPLS LDP IGP Synchronization

MPLS LDP IGP synchronization has the following prerequisites:

- You must enable MPLS LDP on the interfaces.
- You must enable OSPF and IS-IS on the device using the **feature ospf** and **feature isis** commands.

Guidelines and Limitations for MPLS LDP IGP Synchronization

MPLS LDP IGP synchronization has the following configuration guidelines and limitations:

- This feature is supported only on interfaces that are running OSPF or IS-IS processes. Other IGPs are not supported.
- This feature is not supported on MPLS traffic-engineering tunnel interfaces.

■ Guidelines and Limitations for MPLS LDP IGP Synchronization

- When MPLS LDP IGP synchronization is configured for an interface, LDP assumes that peers are reachable over the interface unless proven otherwise (for example, if LDP discovers a neighbor over the interface by receiving a hello message and finds out that the neighbor is not reachable).

Default Settings for MPLS LDP IGP Synchronization

Table 6-1 lists the default settings for MPLS LDP IGP synchronization parameters.

Table 6-1 Default MPLS LDP IGP Synchronization Parameters

Parameters	Default
MPLS LDP IGP synchronization	Disabled
MPLS LDP IGP synchronization delay timer	0 seconds

Configuring MPLS LDP IGP Synchronization

This section includes the following topics:

- [Configuring MPLS LDP IGP Synchronization for OSPF Interfaces, page 6-5](#)
- [Configuring MPLS LDP IGP Synchronization for IS-IS Interfaces, page 6-6](#)
- [Configuring the MPLS LDP IGP Synchronization Delay Timer, page 6-7](#)
- [Disabling MPLS LDP IGP Synchronization for Selected OSPF or IS-IS Interfaces, page 6-8](#)

Configuring MPLS LDP IGP Synchronization for OSPF Interfaces

You can configure MPLS LDP IGP synchronization for all interfaces that run OSPF processes.

Prerequisites

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

Ensure that MPLS LDP is enabled on the OSPF interfaces.

SUMMARY STEPS

1. **configure terminal**
2. **router ospf *process-name***
3. **mpls ldp sync**
4. (Optional) **show mpls ldp igp sync**
5. (Optional) **copy running-config startup-config**

DETAILED STEPS

	Command	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	router ospf process-name Example: switch(config)# router ospf p1 switch(config-router)#	Enables an OSPF routing process and enters router configuration mode. You can enter up to 20 alphanumeric characters for the <i>process-name</i> argument.
Step 3	mpls ldp sync Example: switch(config-router)# mpls ldp sync	Enables MPLS LDP IGP synchronization for all OSPF interfaces.
Step 4	show mpls ldp igrp sync Example: switch(config-router)# show mpls ldp igrp sync	(Optional) Displays the status of MPLS LDP IGP synchronization on all interfaces.
Step 5	copy running-config startup-config Example: switch(config-router)# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Configuring MPLS LDP IGP Synchronization for IS-IS Interfaces

You can configure MPLS LDP IGP synchronization for all interfaces that run IS-IS processes.

Prerequisites

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

Ensure that MPLS LDP is enabled on the IS-IS interfaces.

SUMMARY STEPS

1. **configure terminal**
2. **router isis process-name**
3. **mpls ldp sync**
4. (Optional) **show mpls ldp igrp sync**
5. (Optional) **copy running-config startup-config**

DETAILED STEPS

	Command	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	router isis process-name Example: switch(config)# router isis p1 switch(config-router)#	Enables an IS-IS routing process and enters router configuration mode. You can enter up to 20 alphanumeric characters for the <i>process-name</i> argument.
Step 3	mpls ldp sync Example: switch(config-router)# mpls ldp sync	Enables MPLS LDP IGP synchronization for all IS-IS interfaces.
Step 4	show mpls ldp igr sync Example: switch(config-router)# show mpls ldp igr sync	(Optional) Displays the status of MPLS LDP IGP synchronization on all interfaces.
Step 5	copy running-config startup-config Example: switch(config-router)# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Configuring the MPLS LDP IGP Synchronization Delay Timer

You can configure a delay time for MPLS LDP IGP synchronization on an interface-by-interface basis. Typically, when LDP IGP synchronization is configured, LDP notifies IGP as soon as LDP is converged. When the delay timer is configured, this notification is delayed.

Prerequisites

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

Ensure that MPLS LDP is enabled on the interfaces.

SUMMARY STEPS

1. **configure terminal**
2. **interface ethernet slot/port**
3. **mpls ldp igr sync delay seconds**
4. (Optional) **show mpls ldp igr sync interface ethernet slot/port**
5. (Optional) **copy running-config startup-config**

DETAILED STEPS

Command	Purpose
Step 1 <code>configure terminal</code> Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2 <code>interface ethernet slot/port</code> Example: switch(config) # interface ethernet 7/1 switch(config-if)#	Specifies the interface on which you are configuring the MPLS LDP IGP synchronization delay timer and enters interface configuration mode.
Step 3 <code>mpls ldp igr sync delay seconds</code> Example: switch(config-if) # mpls ldp igr sync delay 30	Configures a delay time for MPLS LDP IGP synchronization on the specified interface. The range for the <i>seconds</i> argument is from 5 to 60 seconds. Note The no mpls ldp igr sync delay command sets the delay time to 0 seconds but leaves MPLS LDP IGP synchronization enabled.
Step 4 <code>show mpls ldp igr sync interface ethernet slot/port</code> Example: switch(config-if) # show mpls ldp igr sync interface ethernet 7/1	(Optional) Displays the delay time configuration and running status for MPLS LDP IGP synchronization on the specified interface.
Step 5 <code>copy running-config startup-config</code> Example: switch(config-if) # copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Disabling MPLS LDP IGP Synchronization for Selected OSPF or IS-IS Interfaces

You can disable LDP IGP synchronization for specific OSPF or IS-IS interfaces after they were configured with the MPLS LDP IGP synchronization feature.

Prerequisites

Ensure that you are in the correct VDC (or use the **switchto vdc** command).

Ensure that MPLS LDP is enabled on the interfaces.

SUMMARY STEPS

1. `configure terminal`
2. `interface ethernet slot/port`
3. `no mpls ldp igr sync [delay]`
4. (Optional) `show mpls ldp igr sync interface ethernet slot/port`
5. (Optional) `copy running-config startup-config`

DETAILED STEPS

Command	Purpose
Step 1 <code>configure terminal</code> Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2 <code>interface ethernet slot/port</code> Example: switch(config)# interface ethernet 7/1 switch(config-if)#	Specifies the interface on which you are disabling MPLS LDP IGP synchronization and enters interface configuration mode.
Step 3 <code>no mpls ldp igr sync [delay]</code> Example: switch(config-if)# no mpls ldp igr sync	Disables MPLS LDP IGP synchronization for the specified interface. Note The <code>no mpls ldp igr sync delay</code> command sets the delay time to 0 seconds but leaves MPLS LDP IGP synchronization enabled.
Step 4 <code>show mpls ldp igr sync interface ethernet slot/port</code> Example: switch(config-if)# show mpls ldp igr sync interface ethernet 7/1	(Optional) Displays the status of MPLS LDP IGP synchronization on the specified interface.
Step 5 <code>copy running-config startup-config</code> Example: switch(config-if)# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Verifying the MPLS LDP IGP Synchronization

To display the MPLS LDP IGP synchronization, perform one of the following tasks:

Command	Purpose
<code>show ip ospf mpls ldp interface [ethernet slot/port]</code>	Displays the status of MPLS LDP IGP synchronization on the OSPF interfaces.
<code>show mpls ldp igr sync [interface ethernet slot/port]</code>	Displays the status of MPLS LDP IGP synchronization.

For detailed information about the fields in the output from these commands, see the *Cisco Nexus 7000 Series NX-OS MPLS Command Reference*.

Configuration Examples for MPLS LDP IGP Synchronization

The following example shows how to configure MPLS LDP IGP synchronization for OSPF interfaces and verify the results:

```
switch# configure terminal
switch(config)# router ospf 1
switch(config-router)# mpls ldp sync
switch(config-router)# show mpls ldp igrp sync
Ethernet2/1:
    LDP configured; LDP-IGP Synchronization enabled.
    Sync status: sync not achieved; peer not reachable.
    Sync delay time: 0 seconds (0 seconds left)
    IGP enabled: isis-p1[gen:1]
Ethernet2/6:
    LDP configured; LDP-IGP Synchronization enabled.
    Sync status: sync not achieved; peer reachable.
    Sync delay time: 0 seconds (0 seconds left)
    IGP enabled: isis-p1[gen:1]
```

The following example shows how to configure a delay time for MPLS LDP IGP synchronization on a specific interface:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# mpls ldp igrp sync delay 10
switch(config-if)# show mpls ldp igrp sync interface ethernet 2/1
Ethernet2/1:
    LDP configured; LDP-IGP Synchronization enabled.
    Sync status: sync achieved; peer reachable.
    Sync delay time: 10 seconds (0 seconds left)
    IGP enabled: isis-p1[gen:1]
```

The following example shows how to disable MPLS LDP IGP synchronization on a specific interface after it was enabled using the MPLS LDP IGP synchronization feature:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# no mpls ldp igrp sync
switch(config-if)# show mpls ldp igrp sync interface ethernet 2/1
Ethernet2/1:
    LDP configured; LDP-IGP Synchronization not enabled.
```
