

Catalyst 3750 Switch Command Reference

Cisco IOS Release 12.2(46)SE August 2008

Americas Headquarters

Cisco Systems, Inc. 170 West Tasman Drive San Jose, CA 95134-1706 USA http://www.cisco.com Tel: 408 526-4000 800 553-NETS (6387) Fax: 408 527-0883

Text Part Number: OL-8552-06

THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

CCDE, CCENT, Cisco Eos, Cisco Lumin, Cisco Nexus, Cisco StadiumVision, Cisco TelePresence, the Cisco logo, DCE, and Welcome to the Human Network are trademarks; Changing the Way We Work, Live, Play, and Learn and Cisco Store are service marks; and Access Registrar, Aironet, AsyncOS, Bringing the Meeting To You, Catalyst, CCDA, CCDP, CCIE, CCIP, CCNA, CCNP, CCSP, CCVP, Cisco, the Cisco Certified Internetwork Expert logo, Cisco IOS, Cisco Press, Cisco Systems, Cisco Systems Capital, the Cisco Systems logo, Cisco Unity, Collaboration Without Limitation, EtherFast, EtherSwitch, Event Center, Fast Step, Follow Me Browsing, FormShare, GigaDrive, HomeLink, Internet Quotient, IOS, iPhone, iQ Expertise, the iQ logo, iQ Net Readiness Scorecard, iQuick Study, IronPort, the IronPort logo, LightStream, Linksys, MediaTone, MeetingPlace Chime Sound, MGX, Networkers, Networking Academy, Network Registrar, PCNow, PIX, PowerPanels, ProConnect, ScriptShare, SenderBase, SMARTnet, Spectrum Expert, StackWise, The Fastest Way to Increase Your Internet Quotient, TransPath, WebEx, and the WebEx logo are registered trademarks of Cisco Systems, Inc. and/or its affiliates in the United States and certain other countries.

All other trademarks mentioned in this document or Website are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company. (0807R)

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

INDEX

Preface

Audience

This guide is for the networking professional using the Cisco IOS command-line interface (CLI) to manage the Catalyst 3750 switch, hereafter referred to as *the switch*. Before using this guide, you should have experience working with the Cisco IOS commands and the switch software features. Before using this guide, you should have experience working with the concepts and terminology of Ethernet and local area networking.

Purpose

The Catalyst 3750 switch is supported by either the IP base image, formerly known as the standard multilayer image (SMI), or the IP services image, formerly known as the enhanced multilayer image (EMI). The IP base image provides Layer 2+ features including access control lists (ACLs), quality of service (QoS), static routing, and the Routing Information Protocol (RIP). The IP services image provides a richer set of enterprise-class features. It includes Layer 2+ features and full Layer 3 routing (IP unicast routing, IP multicast routing, and fallback bridging). To distinguish it from the Layer 2+ static routing and RIP, the IP services image includes protocols such as the Enhanced Interior Gateway Routing Protocol (EIGRP) and Open Shortest Path First (OSPF) Protocol.

This guide provides the information that you need about the Layer 2 and Layer 3 commands that have been created or changed for use with the Catalyst 3750 switches. For information about the standard Cisco IOS Release 12.2 commands, see the Cisco IOS documentation set available from the Cisco.com home page by selecting **Technical Support & Documentation > Cisco IOS Software**.

This guide does not provide procedures for configuring your switch. For detailed configuration procedures, see the software configuration guide for this release.

This guide does not describe system messages you might encounter. For more information, see the system message guide for this release.

For documentation updates, see the release notes for this release.

Γ

Conventions

This publication uses these conventions to convey instructions and information:

Command descriptions use these conventions:

- Commands and keywords are in **boldface** text.
- Arguments for which you supply values are in *italic*.
- Square brackets ([]) means optional elements.
- Braces ({}) group required choices, and vertical bars (|) separate the alternative elements.
- Braces and vertical bars within square brackets ([{ | }]) mean a required choice within an optional element.

Interactive examples use these conventions:

- Terminal sessions and system displays are in screen font.
- Information you enter is in **boldface screen** font.
- Nonprinting characters, such as passwords or tabs, are in angle brackets (<>).

Notes, cautions, and warnings use these conventions and symbols:

Note

Means *reader take note*. Notes contain helpful suggestions or references to materials not contained in this manual.

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Related Publications

These documents provide complete information about the switch and are available from this Cisco.com site:

http://www.cisco.com/en/US/products/hw/switches/ps5023/tsd_products_support_series_home.html

Before installing, configuring, or upgrading the switch, see these documents:

- For initial configuration information, see the "Using Express Setup" section in the getting started guide or the "Configuring the Switch with the CLI-Based Setup Program" appendix in the hardware installation guide.
- For device manager requirements, see the "System Requirements" section in the release notes (not orderable but available on Cisco.com).
- For Network Assistant requirements, see the *Getting Started with Cisco Network Assistant* (not orderable but available on Cisco.com).

- For cluster requirements, see the *Release Notes for Cisco Network Assistant* (not orderable but available on Cisco.com).
- For upgrade information, see the "Downloading Software" section in the release notes.

See these documents for other information about the switches:

CHAPTER

Using the Command-Line Interface

The Catalyst 3750 switch is supported by Cisco IOS software. This chapter describes how to use the switch command-line interface (CLI) to configure software features.

- For a complete description of the commands that support these features, see Chapter 2, "Catalyst 3750 Switch Cisco IOS Commands."
- For information on the bootloader commands, see Appendix A, "Catalyst 3750 Switch Bootloader Commands."
- For information on the **debug** commands, see Appendix B, "Catalyst 3750 Switch Debug Commands."
- For information on the **show platform** commands, see Appendix C, "Catalyst 3750 Switch Show Platform Commands."
- For more information on Cisco IOS Release 12.2, see the *Cisco IOS Release 12.2 Command Summary*.
- For task-oriented configuration steps, see the software configuration guide for this release.

In this document, IP refers to IP version 4 (IPv4) unless there is a specific reference to IP version 6 (IPv6).

Accessing the Switch

You manage the switch stack and the stack member interfaces through the stack master. You cannot manage stack members on an individual switch basis. You can connect to the stack master through the console port of one or more stack members. Be careful with using multiple CLI sessions to the stack master. Commands you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation. For more information about interface notations, see the "Configuring Interfaces" chapter in the software configuration guide for this release.

L

To debug a specific stack member, you can access it from the stack master by using the **session** *stack-member-number* privileged EXEC command. The stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the stack master is Switch. Only the **show** and **debug** commands are available in a CLI session to a specific stack member.

CLI Command Modes

This section describes the CLI command mode structure. Command modes support specific Cisco IOS commands. For example, the **interface** *interface-id* command only works when entered in global configuration mode.

These are the main command modes for the switch:

- User EXEC
- Privileged EXEC
- Global configuration
- Interface configuration
- Config-vlan
- VLAN configuration
- Line configuration

Table 1-1 lists the main command modes, how to access each mode, the prompt you see in that mode, and how to exit that mode. The prompts listed use the default name *Switch*.

Command Mode	Access Method	Prompt	Exit or Access Next Mode
User EXEC	This is the first level of access.	Switch>	Enter the logout command.
	(For the switch) Change terminal settings, perform basic tasks, and list system information.		To enter privileged EXEC mode, enter the enable command.
Privileged EXEC	From user EXEC mode, enter the enable command.	Switch#	To exit to user EXEC mode, enter the disable command.
			To enter global configuration mode, enter the configure command.
Global configuration	From privileged EXEC mode, enter the configure command.	Switch(config)#	To exit to privileged EXEC mode, enter the exit or end command, or press Ctrl-Z .
			To enter interface configuration mode, enter the interface configuration command.
Interface configuration	From global configuration mode, specify an interface by entering the interface command followed	Switch(config-if)#	To exit to privileged EXEC mode, enter the end command, or press Ctrl-Z .
	by an interface identification.		To exit to global configuration mode, enter the exit command.

Table 1-1Command Modes Summary

Command Mode	Access Method	Prompt	Exit or Access Next Mode	
Config-vlan	In global configuration mode, enter the vlan <i>vlan-id</i> command.	Switch(config-vlan)#	To exit to global configuration mode, enter the exit command.	
			To return to privileged EXEC mode, enter the end command, or press Ctrl-Z .	
VLAN configuration	From privileged EXEC mode, enter the vlan database command.	Switch(vlan)#	To exit to privileged EXEC mode, enter the exit command.	
Line configuration	From global configuration mode, specify a line by entering the line	Switch(config-line)#	To exit to global configuration mode, enter the exit command.	
	command.		To return to privileged EXEC mode, enter the end command, or press Ctrl-Z .	

Table 1-1 Command Modes Summary (continued)

User EXEC Mode

After you access the device, you are automatically in user EXEC command mode. The EXEC commands available at the user level are a subset of those available at the privileged level. In general, use the user EXEC commands to temporarily change terminal settings, perform basic tests, and list system information.

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

Switch> ?

Privileged EXEC Mode

Because many of the privileged commands configure operating parameters, privileged access should be password-protected to prevent unauthorized use. The privileged command set includes those commands contained in user EXEC mode, as well as the **configure** privileged EXEC command through which you access the remaining command modes.

If your system administrator has set a password, you are prompted to enter it before being granted access to privileged EXEC mode. The password does not appear on the screen and is case sensitive.

The privileged EXEC mode prompt is the device name followed by the pound sign (#).

Switch#

Enter the enable command to access privileged EXEC mode:

Switch> **enable** Switch#

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

Switch# ?

To return to user EXEC mode, enter the disable privileged EXEC command.

Γ

Global Configuration Mode

Global configuration commands apply to features that affect the device as a whole. Use the **configure** privileged EXEC command to enter global configuration mode. The default is to enter commands from the management console.

When you enter the **configure** command, a message prompts you for the source of the configuration commands:

Switch# configure Configuring from terminal, memory, or network [terminal]?

You can specify either the terminal or NVRAM as the source of configuration commands.

This example shows you how to access global configuration mode:

Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z.

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

Switch(config)# ?

To exit global configuration command mode and to return to privileged EXEC mode, enter the **end** or **exit** command, or press **Ctrl-Z**.

Interface Configuration Mode

Interface configuration commands modify the operation of the interface. Interface configuration commands always follow a global configuration command, which defines the interface type.

Use the **interface** *interface-id* command to access interface configuration mode. The new prompt means interface configuration mode.

Switch(config-if)#

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

Switch(config-if)# ?

To exit interface configuration mode and to return to global configuration mode, enter the **exit** command. To exit interface configuration mode and to return to privileged EXEC mode, enter the **end** command, or press **Ctrl-Z**.

config-vlan Mode

Use this mode to configure normal-range VLANs (VLAN IDs 1 to 1005) or, when VTP mode is transparent, to configure extended-range VLANs (VLAN IDs 1006 to 4094). When VTP mode is transparent, the VLAN and VTP configuration is saved in the running configuration file, and you can save it to the switch startup configuration file by using the **copy running-config startup-config** privileged EXEC command. The configurations of VLAN IDs 1 to 1005 are saved in the VLAN database if VTP is in transparent or server mode. The extended-range VLAN configurations are not saved in the VLAN database.

Enter the vlan vlan-id global configuration command to access config-vlan mode:

```
Switch(config)# vlan 2000
Switch(config-vlan)#
```

The supported keywords can vary but are similar to the commands available in VLAN configuration mode. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```
Switch(config-vlan)# ?
```

For extended-range VLANs, all characteristics except the MTU size must remain at the default setting.

To return to global configuration mode, enter **exit**; to return to privileged EXEC mode, enter **end**. All the commands except **shutdown** take effect when you exit config-vlan mode.

VLAN Configuration Mode

You can use the VLAN configuration commands to create or modify VLAN parameters for VLAN IDs 1 to 1005.

Enter the vlan database privileged EXEC command to access VLAN configuration mode:

```
Switch# vlan database
Switch(vlan)#
```

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```
Switch(vlan)# ?
```

To return to privileged EXEC mode, enter the **abort** VLAN configuration command to abandon the proposed database. Otherwise, enter **exit** to implement the proposed new VLAN database and to return to privileged EXEC mode. When you enter exit or apply, the configuration is saved in the VLAN database; configuration from VLAN configuration mode cannot be saved in the switch configuration file.

Line Configuration Mode

Line configuration commands modify the operation of a terminal line. Line configuration commands always follow a line command, which defines a line number. Use these commands to change terminal parameter settings line-by-line or for a range of lines.

Use the **line vty** *line_number* [*ending_line_number*] command to enter line configuration mode. The new prompt means line configuration mode. The following example shows how to enter line configuration mode for virtual terminal line 7:

```
Switch(config)# line vty 0 7
```

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```
Switch(config-line)# ?
```

To exit line configuration mode and to return to global configuration mode, use the **exit** command. To exit line configuration mode and to return to privileged EXEC mode, enter the **end** command, or press **Ctrl-Z**.

Commands Changed in Cisco IOS 12.2(18)SE

Table 1-2 lists describes the commands that have the same function but different syntax than they did in software releases before Cisco IOS Release 12.2(18)SE.

Releases earlier than Cisco IOS Release 12.2(18)SE	Cisco IOS Release 12.2(18)SE or later	Description
show ip igmp snooping multicast	show ip igmp snooping groups	Displays the IGMP ¹ snooping multicast table for the switch or multicast information.
debug autoqos	debug auto qos	Enables debugging of the auto-QoS ² feature.

1. IGMP = Internet Group Management Protocol

2. auto-QoS = automatic quality of service

CHAPTER 2

Catalyst 3750 Switch Cisco IOS Commands

aaa accounting dot1x

Use the **aaa accounting dot1x** global configuration command to enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions. Use the **no** form of this command to disable IEEE 802.1x accounting.

aaa accounting dot1x {name | default} start-stop {broadcast group {name | radius | tacacs+} [group {name | radius | tacacs+} ...] | group {name | radius | tacacs+} [group {name | radius | tacacs+} ...]}

no aaa accounting dot1x {*name* | **default**}

Syntax Description	name	Name of a server group. This is optional when you enter it after the broadcast group and group keywords.
	default	Use the accounting methods that follow as the default list for accounting services.
	start-stop	Send a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server.
	broadcast	Enable accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.
	group	Specify the server group to be used for accounting services. These are valid server group names:
		• <i>name</i> —Name of a server group.
		• radius—List of all RADIUS hosts.
		• tacacs +—List of all TACACS+ hosts.
		The group keyword is optional when you enter it after the broadcast group and group keywords. You can enter more than optional group keyword.
	radius	(Optional) Enable RADIUS authorization.
	tacacs+	(Optional) Enable TACACS+ accounting.

Defaults AAA accounting is disabled.

Command Modes Global configuration

 Release
 Modification

 12.2(20)SE
 This command was introduced.

Usage Guidelines This command requires access to a RADIUS server.

We recommend that you enter the **dot1x reauthentication** interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

Examples

This example shows how to configure IEEE 802.1x accounting: Switch(config)# aaa new-model Switch(config)# aaa accounting dot1x default start-stop group radius

The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

Related Commands	Command	Description
	aaa authentication dot1x	Specifies one or more AAA methods for use on interfaces running IEEE 802.1x.
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	dot1x reauthentication	Enables or disables periodic reauthentication.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.

aaa authentication dot1x

Use the **aaa authentication dot1x** global configuration command on the switch stack or on a standalone switch to specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication. Use the **no** form of this command to disable authentication.

aaa authentication dot1x {default} method1

no aaa authentication dot1x {default}

Syntax Description	default	Use the listed authentication method that follows this argument as the default method when a user logs in.	
	method1	Enter the group radius keywords to use the list of all RADIUS servers for authentication.	
Note	Though other keywords are visible in the command-line help strings, only the default and group radius keywords are supported.		
Defaults	No authenticatio	n is performed.	
Command Modes	Global configura	ation	
Command History	Release	Modification	
· · · · · · · ·	12.1(11)AX	This command was introduced.	
Usage Guidelines	to validate the pa	ment identifies the method that the authentication algorithm tries in the given sequence assword provided by the client. The only method that is truly IEEE $802.1x$ -compliant is s method, in which the client data is validated against a RADIUS authentication server.	
	If you specify gr global configura	oup radius , you must configure the RADIUS server by entering the radius-server host tion command.	
	Use the show ru authentication m	nning-config privileged EXEC command to display the configured lists of aethods.	
Examples	list. This authent	ows how to enable AAA and how to create an IEEE 802.1x-compliant authentication tication first tries to contact a RADIUS server. If this action returns an error, the user is ess to the network.	
		# aaa new-model # aaa authentication dot1x default group radius	

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

Catalyst 3750 Switch Command Reference

ø

OL-8552-06

Use the **aaa authorization network** global configuration command on the switch stack or on a standalone switch to the configure the switch to use user-RADIUS authorization for all network-related service requests, such as IEEE 802.1x per-user access control lists (ACLs) or VLAN assignment. Use the **no** form of this command to disable RADIUS user authorization.

aaa authorization network default group radius

no aaa authorization network default

Syntax Description	default group radius	Use the list of all RADIUS hosts in the server group as the default authorization list.	
Defaults	Authorization is disabl	led.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	Use the aaa authorization network default group radius global configuration command to allow the switch to download IEEE 802.1x authorization parameters from the RADIUS servers in the default authorization list. The authorization parameters are used by features such as per-user ACLs or VLAN assignment to get parameters from the RADIUS servers. Use the show running-config privileged EXEC command to display the configured lists of authorization methods.		
Examples	This example shows how to configure the switch for user RADIUS authorization for all network-related service requests:		
	Switch(config)# aaa authorization network default group radius		
	You can verify your se	ttings by entering the show running-config privileged EXEC command.	
Related Commands	Command	Description	

action

Use the **action** access-map configuration command on the switch stack or on a standalone switch to set the action for the VLAN access map entry. Use the **no** form of this command to return to the default setting.

action {drop | forward}

no action

Syntax Description	drop	Drop the packet when the specified conditions are matched.		
	forward	Forward the packet when the specified conditions are matched.		
Defaults	The default action is to forward packets.			
Command Modes	Access-map configuration			
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	You enter access-map configuration mode by using the vlan access-map global configuration command.			
	If the action is drop , you should define the access map, including configuring any access control list (ACL) names in match clauses, before applying the map to a VLAN, or all packets could be dropped.			
	In access-map configuration mode, use the match access-map configuration command to define the match conditions for a VLAN map. Use the action command to set the action that occurs when a packet matches the conditions.			
	The drop and for	ward parameters are not used in the no form of the command.		
Examples	This example shows how to identify and apply a VLAN access map <i>vmap4</i> to VLANs 5 and 6 that causes the VLAN to forward an IP packet if the packet matches the conditions defined in access list <i>al2</i> :			
	Switch(config)# vlan access-map vmap4 Switch(config-access-map)# match ip address al2 Switch(config-access-map)# action forward Switch(config-access-map)# exit Switch(config)# vlan filter vmap4 vlan-list 5-6			
	You can verify your settings by entering the show vlan access-map privileged EXEC command.			

Related Commands	Command	Description
	access-list {deny permit}	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	ip access-list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	mac access-list extended	Creates a named MAC address access list.
	match (class-map configuration)	Defines the match conditions for a VLAN map.
	show vlan access-map	Displays the VLAN access maps created on the switch.
	vlan access-map	Creates a VLAN access map.

archive copy-sw

Use the **archive copy-sw** privileged EXEC command on the stack master to copy the running image from the flash memory on one stack member to the flash memory on one or more other stack members.

archive copy-sw [/destination-system destination-stack-member-number] [/force-reload] [leave-old-sw] [/no-set-boot] [/verwrite] [/reload] [/safe] source-stack-member-number

Syntax Description	/destination-system <i>destination-stack-</i> <i>member-number</i>	(Optional) The number of the stack member to which to copy the running image. The range is 1 to 9.	
	/force-reload	(Optional) Unconditionally force a system reload after successfully downloading the software image.	
	/leave-old-sw	(Optional) Keep the old software version after a successful download.	
	/no-set-boot	(Optional) Do not alter the setting of the BOOT environment variable to point to the new software image after it is successfully downloaded.	
	/overwrite	(Optional) Overwrite the software image in flash memory with the downloaded one.	
	/reload	(Optional) Reload the system after downloading the image unless the configuration has been changed and not been saved.	
	/safe	(Optional) Keep the current software image; do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.	
	source-stack-member- number	The number of the stack member from which to copy the running image. The range is 1 to 9.	
Command Modes	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	The current software im	age is not overwritten with the copied image.	
	Both the software image and HTML files are copied.		
	The new image is copied to the flash: file system.		
	The BOOT environment	variable is changed to point to the new software image on the flash: file system.	
•		variable is changed to point to the new software image on the flash: file system. ensitive; the image file is provided in tar format.	

At least one stack member must be running the image that is to be copied to the switch that has incompatible software.

You can copy the image to more than one specific stack member by repeating the /destination-system *destination-stack-member-number* option in the command for each stack member to be upgraded. If you do not specify the *destination-stack-member-number*, the default is to copy the running image file to all stack members.

Using the **/safe** or **/leave-old-sw** option can cause the new copied image to fail if there is insufficient flash memory. If leaving the software in place would prevent the new image from fitting in flash memory due to space constraints, an error results.

If you used the **/leave-old-sw** option and did not overwrite the old image when you copied the new one, you can remove the old image by using the **delete** privileged EXEC command. For more information, see the "delete" section on page 2-83.

Use the **/overwrite** option to overwrite the image on the flash device with the copied one.

If you specify the command *without* the **/overwrite** option, the algorithm verifies that the new image is not the same as the one on the switch flash device or is not running on any stack members. If the images are the same, the copy does not occur. If the images are different, the old image is deleted, and the new one is copied.

After copying a new image, enter the **reload** privileged EXEC command to begin using the new image, or specify the **/reload** or **/force-reload** option in the **archive copy-sw** command.

You can enter one or more of these options with the source-stack-member-number option:

- /destination-system destination-stack-member-number
- /force-reload
- /leave-old-sw
- /no-set-boot
- /overwrite
- /reload
- /safe

If you enter the *source-stack-member-number* option before one of the previous options, you can enter only the **archive copy-sw** *source-stack-member-number* command.

These are examples of how you can enter the **archive copy-sw** command:

- To copy the running image from a stack member to another stack member and to overwrite the software image in the second stack member's flash memory (if it already exists) with the copied one, enter the **archive copy-sw** /destination destination-stack-member-number /overwrite source-stack-member-number command.
- To copy the running image from a stack member to another stack member, keep the current software image, and reload the system after the image copies, enter the **archive copy-sw** /destination destination-stack-member-number /safe /reload source-stack-member-number command.

Examples This example shows how to copy the running image from stack member 6 to stack member 8: Switch# archive copy-sw /destination-system 8 6

This example shows how to copy the running image from stack member 6 to all the other stack members: Switch# archive copy-sw 6

This example shows how to copy the running image from stack member 5 to stack member 7. If the image being copied already exists on the second stack member's flash memory, it can be overwritten with the copied one. The system reloads after the image is copied:

 ${\tt Switch} \#$ archive copy-sw /destination-system 7 /overwrite /force-reload 5

Related Commands	Command	Description
	archive download-sw	Downloads a new image from a TFTP server to the switch.
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.
	archive upload-sw	Uploads an existing image on the switch to a server.
	delete	Deletes a file or directory on the flash memory device.

2-11

archive download-sw

Use the **archive download-sw** privileged EXEC command on the switch stack or on a standalone switch to download a new image from a TFTP server to the switch or switch stack and to overwrite or keep the existing image.

archive download-sw {/allow-feature-upgrade | /directory | /force-reload | /imageonly | /leave-old-sw | /no-set-boot | /no-version-check | /destination-system stack-member-number | /only-system-type system-type | /overwrite | /reload | /safe } source-url

Syntax Description		
	/allow-feature-upgrade	Allow installation of an image with a different feature set (for example, upgrade from the IP base image to the IP services image).
	/directory	Specify a directory for the images.
	/force-reload	Unconditionally force a system reload after successfully downloading the software image.
	/imageonly	Download only the software image but not the HTML files associated with the embedded device manager. The HTML files for the existing version are deleted only if the existing version is being overwritten or removed.
	/leave-old-sw	Keep the old software version after a successful download.
	/no-set-boot	Do not alter the setting of the BOOT environment variable to point to the new software image after it is successfully downloaded.
	/no-version-check	Download the software image without checking the compatibility of the stack protocol version on the image and on the switch stack.
	/destination-system stack-member-number	Specify the specific stack member to be upgraded. The range is 1 to 9.
	/only-system-type system-type	Specify the specific system type to be upgraded. The range is 0 to FFFFFFFF.
	/overwrite	Overwrite the software image in flash memory with the downloaded image.
	/reload	Reload the system after successfully downloading the image unless the configuration has been changed and not saved.
	/safe	Keep the current software image. Do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.

source-url	The source URL alias for a local or network file system. These options are supported:
	 The syntax for the secondary boot loader (BS1): bs1:
	• The syntax for the local flash file system on the standalone switch or the stack master: flash:
	The syntax for the local flash file system on a stack member: flash member number:
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar
	 The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar
	The <i>image-name</i> .tar is the software image to download and install on the switch.

The new image is downloaded to the flash: file system.

The BOOT environment variable is changed to point to the new software image on the flash: file system.

Image names are case sensitive; the image file is provided in tar format.

Compatibility of the stack protocol version on the image to be downloaded is checked with the version on the switch stack.

Command Modes Privileged EXEC

Comm

Defaults

Release	Modification
12.1(11)AX	This command was introduced.
12.2(20)SE	The http and https keywords were added.
12.2(35)SE	The allow-feature-upgrade and directory keywords were added.
	12.1(11)AX 12.2(20)SE

Usage Guidelines

Use the **/allow-feature-upgrade** option to allow installation of an image with a different feature set, for example, upgrading from the IP base image to the IP services image.

Beginning with Cisco IOS release 12.2(35)SE, you can use the **archive download-sw** /directory command to specify a directory one time followed by a tar file or list of tar files to be downloaded instead of specifying complete paths with each tar file. For example, you can enter **archive download-sw** /directory tftp://10.1.1.10/ c3750-ipservices-tar.122-35.SE.tar c3750-ipbase-tar.122-35.SE.tar.

The **/imageonly** option removes the HTML files for the existing image if the existing image is being removed or replaced. Only the Cisco IOS image (without the HTML files) is downloaded.

Using the **/safe** or **/leave-old-sw** option can cause the new image download to fail if there is insufficient flash memory. If leaving the software in place prevents the new image from fitting in flash memory due to space constraints, an error results.

If you used the **/leave-old-sw** option and did not overwrite the old image when you downloaded the new one, you can remove the old image by using the **delete** privileged EXEC command. For more information, see the "delete" section on page 2-83.

Use the **/no-version-check** option if you want to download an image that has a different stack protocol version than the one existing on the switch stack. You must use this option with the **/destination-system** option to specify the specific stack member to be upgraded with the image.

Note

Use the **/no-version-check** option with care. All stack members, including the stack master, must have the same stack protocol version to be in the same switch stack. This option allows an image to be downloaded without first confirming the compatibility of its stack protocol version with the version of the switch stack.

You can upgrade more than one specific stack member by repeating the **/destination-system** option in the command for each stack member to be upgraded.

Use the /overwrite option to overwrite the image on the flash device with the downloaded one.

If you specify the command *without* the **/overwrite** option, the download algorithm verifies that the new image is not the same as the one on the switch flash device or is not running on any stack members. If the images are the same, the download does not occur. If the images are different, the old image is deleted, and the new one is downloaded.

After downloading a new image, enter the **reload** privileged EXEC command to begin using the new image, or specify the **/reload** or **/force-reload** option in the **archive download-sw** command.

Use the /directory option to specify a directory for images.

Examples

This example shows how to download a new image from a TFTP server at 172.20.129.10 and to overwrite the image on the switch:

Switch# archive download-sw /overwrite tftp://172.20.129.10/test-image.tar

This example shows how to download only the software image from a TFTP server at 172.20.129.10 to the switch:

Switch# archive download-sw /imageonly tftp://172.20.129.10/test-image.tar

This example shows how to keep the old software version after a successful download:

Switch# archive download-sw /leave-old-sw tftp://172.20.129.10/test-image.tar

This example specifies the location of two tar images without having to specify the path each time:

Switch# archive download-sw /directory tftp://10.1.1.10/ c3750-ipservices-tar.122-35.SE.tar c3750-ipbase-tar.122-35.SE.tar.

This example shows how to upgrade stack members 6 and 8:

Switch# archive download-sw /imageonly /destination-system 6 /destination-system 8 tftp://172.20.129.10/test-image.tar

Related Commands	Command	Description
	archive copy-sw	Copies the running image from the flash memory on one stack member to the flash memory on one or more other stack members.
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.
	archive upload-sw	Uploads an existing image on the switch to a server.
	delete	Deletes a file or directory on the flash memory device.

archive tar

Use the **archive tar** privileged EXEC command on the switch stack or on a standalone switch to create a tar file, list files in a tar file, or extract the files from a tar file.

archive tar {/create destination-url flash:/file-url} | {/table source-url} | {/xtract source-url flash:/file-url [dir/file...]}

Syntax Description	/create destination-url flash:/file-url	Create a new tar file on the local or network file system.
		For <i>destination-url, specify the</i> destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:
		• The syntax for the local flash filesystem: flash:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for the Remote Copy Protocol (RCP) is: rcp:[[//username@location]/directory]/tar-filename.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar
		The <i>tar-filename</i> .tar is the tar file to be created.
		For flash: / <i>file-url</i> , <i>specify the</i> location on the local flash file system from which the new tar file is created.
		An optional list of files or directories within the source directory can be specified to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.

/table source-url	Display the contents of an existing tar file to the screen.		
	For <i>source-url</i> , specify the source URL alias for the local or network file system. These options are supported:		
	• The syntax for the local flash file system: flash:		
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tar 		
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar 		
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar		
	The <i>tar-filename</i> .tar is the tar file to display.		
/xtract source-url	Extract files from a tar file to the local file system.		
flash:/file-url [dir/file]	For <i>source-url</i> , specify <i>t</i> he source URL alias for the local file system. These options are supported:		
	• The syntax for the local flash file system: flash:		
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tag 		
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar 		
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar		
	The <i>tar-filename</i> .tar is the tar file from which to extract.		
	For flash :/ <i>file-url</i> [<i>dir/file</i>], specify the location on the local flash file system into which the tar file is extracted. Use the <i>dir/file</i> option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.		

Defaults

There is no default setting.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Filenames and dire	ectory names are case sensitive.
	Image names are ca	ase sensitive.
Examples	-	vs how to create a tar file. The command writes the contents of the <i>new-configs</i> cal flash device to a file named <i>saved.tar</i> on the TFTP server at 172.20.10.30:
	Switch# archive t	tar /create tftp:172.20.10.30/saved.tar flash:/new_configs
	-	s how to display the contents of the <i>c3750-ipservices-tar</i> .12-25.SEB file that is in flash ents of the tar file appear on the screen:
	Switch# archive t info (219 bytes)	tar /table flash:c3750-ipservices-12-25.SEB.tar
	c3750-ipservices	- <i>mz.12-25.SEB/</i> (directory) - <i>mz.12-25.SEB</i> (610856 bytes) - <i>mz.12-25.SEB</i> /info (219 bytes) tes)
	This example show contents:	vs how to display only the c3750-ipservices-12-25.SEB/html directory and its
	c3750-ipservices - c3750-ipservices c3750-ipservices c3750-ipservices	- <i>mz.12-25.SEB</i> /html/ (directory) - <i>mz.12-25.SEB</i> /html/const.htm (556 bytes) - <i>mz.12-25.SEB</i> /html/xhome.htm (9373 bytes) - <i>mz.12-25.SEB</i> /html/menu.css (1654 bytes)
	command extracts	as how to extract the contents of a tar file on the TFTP server at 172.20.10.30. This just the <i>new-configs</i> directory into the root directory on the local flash file system. s in the <i>saved.tar</i> file are ignored.

Switch# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/new-configs

Related Commands	Command	Description
	archive copy-sw	Copies the running image from the flash memory on one stack member to the flash memory on one or more other stack members.
	archive download-sw	Downloads a new image from a TFTP server to the switch.
	archive upload-sw	Uploads an existing image on the switch to a server.

archive upload-sw

Use the **archive upload-sw** privileged EXEC command on the switch stack or on a standalone switch to upload an existing switch image to a server.

archive upload-sw [/source-system-num stack member number | /version version_string] destination-url

Syntax Description	/source-system-num stack member number	Specify the specific stack member containing the image that is to be uploaded.
	/version version_string	(Optional) Specify the specific version string of the image to be uploaded.
	destination-url	The destination URL alias for a local or network file system. These options are supported:
		• The syntax for the local flash file system on the standalone switch or the stack master: flash:
		The syntax for the local flash file system on a stack member: flash member number:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		• The syntax for the Secure Copy Protocol (SCP): scp:[[//username@location]/directory]/image-name.tar
		• The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar
		The <i>image-name</i> .tar is the name of software image to be stored on the server.
Defaults	Uploads the currently rur	nning image from the flash file system.
Command Modes	Privileged EXEC	

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines	 You must specify the /source-system-num option to use the /version option. Using these options together uploads the specified image, not the running image, of a specific stack member. Use the upload feature only if the HTML files associated with the embedded device manager have been installed with the existing image. The files are uploaded in this sequence: the Cisco IOS image, the HTML files, and info. After these files are uploaded, the software creates the tar file. 		
	Image names are case sensitive.		
Examples	This example shows how to upload the currently running image on stack member 6 to a TFTP server at 172.20.140.2:		
	Switch# archive upload-sw /source-system-num 6 tftp://172.20.140.2/test-image.tar		
Related Commands	Command	Description	
	archive copy-sw	Copies the running image from the flash memory on one stack member to the flash memory on one or more other stack members.	
	archive download-sw	Downloads a new image to the switch.	
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.	

arp access-list

Use the **arp access-list** global configuration command on the switch stack or on a standalone switch to define an Address Resolution Protocol (ARP) access control list (ACL) or to add clauses to the end of a previously defined list. Use the **no** form of this command to delete the specified ARP access list.

arp access-list acl-name

no arp access-list acl-name

Syntax Description	acl-name	Name of the ACL.			
Defaults	No ARP access list	ts are defined.			
Command Modes	Global configuration	on			
Command History	Release	Modification			
-	12.2(20)SE	This command was introduced.			
Usage Guidelines	After entering the arp access-list command, you enter ARP access-list configuration mode, and these configuration commands are available:				
	• default : returns a command to its default setting.				
		s packets to reject. For more information, see the "deny (ARP access-list" section on page 2-84.			
	• exit: exits ARI	P access-list configuration mode.			
	• no : negates a c	command or returns to default settings.			
		Ties packets to forward. For more information, see the "permit (ARP access-list" section on page 2-360.			
	Use the permit and on the specified ma	deny access-list configuration commands to forward and to drop ARP packets based atching criteria.			
	global configuratio to the ACL. All oth permits a packet, th statement, the switch the switch compare	L is defined, you can apply it to a VLAN by using the ip arp inspection filter vlan on command. ARP packets containing only IP-to-MAC address bindings are compared her types of packets are bridged in the ingress VLAN without validation. If the ACL he switch forwards it. If the ACL denies a packet because of an explicit deny ch drops the packet. If the ACL denies a packet because of an implicit deny statement, es the packet to the list of DHCP bindings (unless the ACL is <i>static</i> , which means that npared to the bindings).			

Examples

This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 00001.0000.abcd
Switch(config-arp-nacl)# end
```

You can verify your settings by entering the show arp access-list privileged EXEC command.

Related Commands	Command	Description	
	deny (ARP access-list configuration)	Denies an ARP packet based on matches compared against the DHCP bindings.	
	ip arp inspection filter vlan	Permits ARP requests and responses from a host configured with a static IP address.	
	permit (ARP access-list configuration)	Permits an ARP packet based on matches compared against the DHCP bindings.	
	show arp access-list	Displays detailed information about ARP access lists.	

auto qos voip

Use the **auto qos voip** interface configuration command on the switch stack or on a standalone switch to automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain. Use the **no** form of this command to return to the default setting.

auto qos voip {cisco-phone | cisco-softphone | trust}

no auto qos voip [cisco-phone | cisco-softphone | trust]

Syntax Description	cisco-phone	Identify this port as connected to a Cisco IP Phone, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected. This keyword is not supported on a 10-Gigabit Ethernet interface.
	cisco-softphone	Identify this port as connected to a device running the Cisco SoftPhone, and automatically configure QoS for VoIP. This keyword is not supported on a 10-Gigabit Ethernet interface.
	trust	Identify this port as connected to a trusted switch or router, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

Defaults Auto-QoS is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues as shown in Table 2-1.

Table 2-1 Traffic Types, Packet Labels, and Queues

	VoIP Data Traffic	VoIP Control Traffic	Routing Protocol Traffic	STP ¹ BPDU ² Traffic	Real-Time Video Traffic	All Other T	raffic
DSCP ³	46	24, 26	48	56	34	-	
CoS^4	5	3	6	7	3	-	
CoS-to-ingress queue map	2, 3, 4, 5, 6, 7 (queue 2)			0, 1 (queu	e 1)		
CoS-to-egress queue map	5 (queue 1)	3, 6, 7 (queue	2)		4 (queue 3)	2 (queue 3)	0, 1 (queue 4)

1. STP = Spanning Tree Protocol

2. BPDU = bridge protocol data unit

3. DSCP = Differentiated Services Code Point

4. CoS = class of service

Table 2-2 shows the generated auto-QoS configuration for the ingress queues.

Ingress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size
SRR ¹ shared	1	0, 1	81 percent	67 percent
Priority	2	2, 3, 4, 5, 6, 7	19 percent	33 percent

Table 2-2Auto-QoS Configuration for the Ingress Queues

1. SRR = shaped round robin. Ingress queues support shared mode only.

Table 2-3 shows the generated auto-QoS configuration for the egress queues.

Table 2-3 Auto-QoS Configuration for the Egress Queues

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	5	up to100 percent	16 percent	10 percent
SRR shared	2	3, 6, 7	10 percent	6 percent	10 percent
SRR shared	3	2, 4	60 percent	17 percent	26 percent
SRR shared	4	0, 1	20 percent	61 percent	54 percent

Command Modes Int

Interface configuration

Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
	12.2(20)SE	The cisco-softphone keyword was added, and the generated auto-QoS configuration changed.
	12.2(40)SE	The information in the command output changed.

Usage Guidelines

Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and edge devices that can classify incoming traffic for QoS.

In releases earlier than Cisco IOS Release 12.2(20)SE, auto-QoS configures the switch only for VoIP with Cisco IP Phones on switch ports.

In Cisco IOS Release 12.2(20)SE or later, auto-QoS configures the switch for VoIP with Cisco IP Phones on switch and routed ports and for VoIP with devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

Beginning in Cisco IOS Release 12.2(40)SE, the **show auto qos** command output shows the service policy information for the Cisco IP phone.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

L

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

- QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are added.
- When you enter the **auto qos voip cisco-phone** interface configuration command on a port at the edge of the network that is connected to a Cisco IP Phone, the switch enables the trusted boundary feature. The switch uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP Phone. When a Cisco IP Phone is detected, the ingress classification on the port is set to trust the QoS label received in the packet. The switch also uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. When a Cisco IP Phone is absent, the ingress classification is set to not trust the QoS label in the packet. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3. The policing is applied to traffic matching the policy-map classification before the switch enables the trust boundary feature.

If the switch port was configured by using the **auto qos voip cisco-phone** interface configuration command in Cisco IOS Release 12.2(37)SE or earlier, the auto-QoS generated commands new to Cisco IOS Release 12.2(40)SE are not applied to the port. To have these commands automatically applied, you must remove and then reapply the configuration to the port.

- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the switch uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the interior of the network, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices). The switch configures the ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

When a device running Cisco SoftPhone is connected to a switch or routed port, the switch supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging. For more information, see the **debug auto qos** command.

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the **no mls qos** global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

This example shows how to enable auto-QoS and to trust the QoS labels received in incoming packets when the switch or router connected to the port is a trusted device:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# auto gos voip trust

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Command	Description
debug auto qos	Enables debugging of the auto-QoS feature.
mls qos cos	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
mls qos map { cos-dscp <i>dscp1 dscp8</i> dscp-cos <i>dscp-list</i> to <i>cos</i> }	Defines the CoS-to-DSCP map or the DSCP-to-CoS map.
mls qos queue-set output buffers	Allocates buffers to a queue-set.
mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
mls qos srr-queue input cos-map	Maps CoS values to an ingress queue or maps CoS values to a queue and to a threshold ID.
mls qos srr-queue input dscp-map	Maps DSCP values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
mls qos srr-queue output cos-map	Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID.
mls qos srr-queue output dscp-map	Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID.
mls qos trust	Configures the port trust state.

Related Commands

Examples

L

Command	Description
queue-set	Maps a port to a queue-set.
show auto qos	Displays auto-QoS information.
show mls qos interface	Displays QoS information at the port level.
srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

boot auto-copy-sw

Use the **boot auto-copy-sw** global configuration command from the stack master to enable the automatic upgrade (auto-upgrade) process. It automatically upgrades a switch in version-mismatch (VM) mode by copying the running software image on any stack member or by copying a tar file image in switch stack flash memory. Use the **no** form of this command to disable the auto-upgrade process.

boot auto-copy-sw

no boot auto-copy-sw

Syntax Description	This command has n	o arguments or keywords.		
Defaults	Enabled.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	stack. A switch in VI stack has an image th copies the image from	e is a switch that has a different minor version number than the version on the switch M mode cannot join the switch stack as a fully functioning member. If the switch hat can be copied to a switch in VM mode, the auto-upgrade process automatically m a stack member to the switch in VM mode. The switch then exits VM mode, e switch stack as a fully functioning member.		
	The auto-upgrade pro	The auto-upgrade process affects only switches in VM mode. It does not affect existing stack members.		
Related Commands	Command	Description		
	show boot	Displays the settings of the boot environment variables.		
	show version	Displays version information for the hardware and firmware.		

boot auto-download-sw

Use the **boot auto-download-sw** global configuration command on the switch stack or a standalone switch to specify a URL pathname to use for automatic software upgrades. Use the **no** form of this command to return to the default setting.

boot auto-download-sw source-url

no boot auto-download-sw

Syntax Description	source-url	The source URL alias for automatic upgrades. These options are supported:
		• The syntax for the local flash file system on the standalone switch or the stack master: flash:
		The syntax for the local flash file system on a stack member: flash member number:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar
		The <i>image-name</i> .tar is the software image to download and install on the switch.
Defaults	Disabled.	
Command Modes	Global configuration	
Command History	Release	Modification
-	12.2(35)SE	This command was introduced.

Usage Guidelines This command

This command specifies a path URL to use for automatic software upgrades. You can use this command to configure the URL for the master switch to access in case of a version-mismatch.

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot config-file

Use the **boot config-file** global configuration command on a standalone switch to specify the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration. Use the **no** form of this command to return to the default setting.

boot config-file flash:/*file-url*

no boot config-file

Syntax Description	flash:/file-url	The path (directory) and name of the configuration file.
Defaults	The default configur	ration file is flash:config.text.
Command Modes	Global configuration	1
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		tory names are case sensitive.
	This command chan	ges the setting of the CONFIG_FILE environment variable. For more information, atalyst 3750 Switch Bootloader Commands."
Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

OL-8552-06

boot enable-break

Use the **boot enable-break** global configuration command on a standalone switch to enable interrupting the automatic boot process. Use the **no** form of this command to return to the default setting.

boot enable-break

no boot enable-break

Syntax Description	This command has no an	rguments or keywords.
--------------------	------------------------	-----------------------

Defaults Disabled. The automatic boot process cannot be interrupted by pressing the Break key on the console.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines This command works properly only from a standalone switch.

When you enter this command, you can interrupt the automatic boot process by pressing the Break key on the console after the flash file system is initialized.

Despite the setting of this command, you can interrupt the automatic boot process at any time by pressing the MODE button on the switch front panel.

This command changes the setting of the ENABLE_BREAK environment variable. For more information, see Appendix A, "Catalyst 3750 Switch Bootloader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

<u>Note</u>

boot helper

Use the **boot helper** global configuration command on the switch stack or on a standalone switch to dynamically load files during boot loader initialization to extend or patch the functionality of the boot loader. Use the **no** form of this command to return to the default.

boot helper *filesystem:/file-url* ...

no boot helper

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	The path (directory) and a list of loadable files to dynamically load during loader initialization. Separate each image name with a semicolon.
Defaults	No helper files are	loaded.
Command Modes	Global configuration	on
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		ed only for internal development and testing. ctory names are case sensitive.
	This command cha	nges the setting of the HELPER environment variable. For more information, see lyst 3750 Switch Bootloader Commands."
Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot helper-config-file

Catalyst 3750 Switch Cisco IOS Commands

Use the boot helper-config-file global configuration command on the switch stack or on a standalone switch to specify the name of the configuration file to be used by the Cisco IOS helper image. If this is not set, the file specified by the CONFIG_FILE environment variable is used by all versions of Cisco IOS that are loaded. Use the no form of this command to return to the default setting.

boot helper-config-file filesystem:/file-url

no boot helper-config file

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.	
	lfile-url	The path (directory) and helper configuration file to load.	
Defaults	No helper configur	ration file is specified.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	This variable is use	ed only for internal development and testing.	
	Filenames and directory names are case sensitive.		
		nges the setting of the HELPER_CONFIG_FILE environment variable. For more ppendix A, "Catalyst 3750 Switch Bootloader Commands."	
Related Commands	Command	Description	
	show boot	Displays the settings of the boot environment variables.	

boot manual

Use the **boot manual** global configuration command on a standalone switch to enable manually booting the switch during the next boot cycle. Use the **no** form of this command to return to the default setting.

boot manual

no boot manual

Syntax Description	This command has no arguments or keywords.
--------------------	--

- **Defaults** Manual booting is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines This command works properly only from a standalone switch.

The next time you reboot the system, the switch is in boot loader mode, which is shown by the *switch:* prompt. To boot up the system, use the **boot** boot loader command, and specify the name of the bootable image.

This command changes the setting of the MANUAL_BOOT environment variable. For more information, see Appendix A, "Catalyst 3750 Switch Bootloader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot private-config-file

Use the **boot private-config-file** global configuration command on a standalone switch to specify the filename that Cisco IOS uses to read and write a nonvolatile copy of the private configuration. Use the **no** form of this command to return to the default setting.

boot private-config-file *filename*

no boot private-config-file

Syntax Description	filename	The name of the private configuration file.
Defaults	The default config	uration file is <i>private-config</i> .
Command Modes	Global configuration	on
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	This command works properly only from a standalone switch. Filenames are case sensitive.	
Examples	_	as how to specify the name of the private configuration file to be <i>pconfig</i> :
Related Commands	Command	Description
nenateu commanus	show boot	Displays the settings of the boot environment variables.

boot system

Use the **boot system** global configuration command on the switch stack or on a standalone switch to specify the Cisco IOS image to load during the next boot cycle. Use the **no** form of this command to return to the default setting.

boot system {*filesystem:/file-url* ...| **switch** {*number* | **all**} }

no boot system

no boot system switch {number | all}

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	The path (directory) and name of a bootable image. Separate image names with a semicolon.
	switch	Specify the switches on which the Cisco IOS image is loaded.
	number	Specify a stack member.
	all	Specify all stack members.

Defaults

The switch attempts to automatically boot up the system by using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SEA	The switch {number all} keywords were added. The boot system command
		now works properly on switch stacks and standalone switches.

Usage Guidelines

Filenames and directory names are case sensitive.

If you enter the **boot system** *filesystem:/file-url* command on the stack master, the specified software image is loaded only on the stack master during the next boot cycle.

On the stack master, use the **boot system switch** *number* command to specify that the software image is loaded on the specified stack member during the next boot cycle. Use the **boot system switch all** command to specify that the software image is loaded on all the stack members during the next boot cycle.

When you enter the **boot system switch** *number* or the **boot system switch all** command on the stack master, the stack master checks if a software image is already on the stack member (except on the stack master). If the software image does not exist on the stack member (for example, stack member 1), an error message like this appears:

%Command to set boot system switch all xxx on switch=1 failed

If you are using the **archive download-sw** privileged EXEC command to maintain system images, you never need to use the **boot system** command. The **boot system** command is automatically manipulated to load the downloaded image.

This command changes the setting of the BOOT environment variable. For more information, see Appendix A, "Catalyst 3750 Switch Bootloader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

channel-group

Use the **channel-group** interface configuration command on the switch stack or on a standalone switch to assign an Ethernet port to an EtherChannel group, to enable an EtherChannel mode, or both. Use the **no** form of this command to remove an Ethernet port from an EtherChannel group.

channel-group channel-group-number mode {active | {auto [non-silent]} | {desirable
 [non-silent]} | on | passive}

no channel-group

PAgP modes:

channel-group channel-group-number mode {{auto [non-silent]} | {desirable [non-silent}}

LACP modes:

channel-group channel-group-number mode {active | passive}

On mode:

channel-group channel-group-number mode on

Syntax Description	channel-group-number	Specify the channel group number. The range is 1 to 48.
	mode	Specify the EtherChannel mode.
	active	Unconditionally enable Link Aggregation Control Protocol (LACP).
		Active mode places a port into a negotiating state in which the port initiates negotiations with other ports by sending LACP packets. A channel is formed with another port group in either the active or passive mode.
	auto	Enable the Port Aggregation Protocol (PAgP) only if a PAgP device is detected.
		Auto mode places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. A channel is formed only with another port group in desirable mode. When auto is enabled, silent operation is the default.
	desirable	Unconditionally enable PAgP.
		Desirable mode places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets. An EtherChannel is formed with another port group that is in the desirable or auto mode. When desirable is enabled, silent operation is the default.
	non-silent	(Optional) Use in PAgP mode with the auto or desirable keyword when traffic is expected from the other device.
	on	Enable on mode.
		In on mode, a usable EtherChannel exists only when both connected port groups are in the on mode.
	passive	Enable LACP only if a LACP device is detected.
		Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

DefaultsNo channel groups are assigned.No mode is configured.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The active and passive keywords were added.
	12.2(25)SE	The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48.
	12.2(25)SEC	LACP can now negotiate cross-stack EtherChannel.

Usage Guidelines

For Layer 2 EtherChannels, you do not have to create a port-channel interface first by using the **interface port-channel** global configuration command before assigning a physical port to a channel group. Instead, you can use the **channel-group** interface configuration command. It automatically creates the port-channel interface when the channel group gets its first physical port if the logical interface is not already created. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

You do not have to disable the IP address that is assigned to a physical port that is part of a channel group, but we strongly recommend that you do so.

You create Layer 3 port channels by using the **interface port-channel** command followed by the **no switchport** interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group.

After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk.

If you do not specify **non-silent** with the **auto** or **desirable** mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. A example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent.

In the **on** mode, an EtherChannel exists only when a port group in the **on** mode is connected to another port group in the **on** mode.

You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

A cross-stack EtherChannel supports up to two 10-Gigabit Ethernet interfaces.

L

Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack (but not in a cross-stack configuration). Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the channel-group interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Note

If IEEE 802.1x authentication is enabled on a not-yet active port of an EtherChannel in software releases earlier than Cisco IOS Release 12.2(18)SE, the port does not join the EtherChannel.

Do not configure a secure port as part of an EtherChannel or an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Caution

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

Examples

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode desirable:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range) # switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode active:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range) # switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel. It uses LACP passive mode and assigns two ports on stack member 2 and one port on stack member 3 as static-access ports in VLAN 10 to channel 5:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode passive
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# switchport access vlan 10
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# exit
```

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	channel-protocol	Restricts the protocol used on a port to manage channeling.
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show lacp	Displays LACP channel-group information.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

Catalyst 3750 Switch Command Reference

channel-protocol

Use the **channel-protocol** interface configuration command on the switch stack or on a standalone switch to restrict the protocol used on a port to manage channeling. Use the **no** form of this command to return to the default setting.

channel-protocol {lacp | pagp}

no channel-protocol

Syntax Description	lacp	Configure an EtherChannel with the Link Aggregation Control Protocol (LACP).	
	pagp	Configure an EtherChannel with the Port Aggregation Protocol (PAgP).	
Defaults	No protocol is a	assigned to the EtherChannel.	
Command Modes	Interface config	guration	
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
Usage Guidelines	Use the channel-protocol command only to restrict a channel to LACP or PAgP. If you set the protocol by using the channel-protocol command, the setting is not overridden by the channel-group interface configuration command.		
	You must use the channel-group interface configuration command to configure the EtherChannel parameters. The channel-group command also can set the mode for the EtherChannel.		
	You cannot enable both the PAgP and LACP modes on an EtherChannel group.		
	PAgP and LAC	P are not compatible; both ends of a channel must use the same protocol.	
Examples	1	nows how to specify LACP as the protocol that manages the EtherChannel:	
	Switch(config-if)# channel-protocol lacp You can verify your settings by entering the show etherchannel [<i>channel-group-number</i>] protocol privileged EXEC command.		
Related Commands	Command	Description	
	channel-group	Assigns an Ethernet port to an EtherChannel group.	
	show ethercha	nnel protocolDisplays protocol information the EtherChannel.	

class

Use the class policy-map configuration command on the switch stack or on a standalone switch to define
a traffic classification match criteria (through the police , set , and trust policy-map class configuration
commands) for the specified class-map name. Use the no form of this command to delete an existing
class map.

class class-map-name

no class class-map-name

Syntax Description	class-map-name	Name of the class map.
Defaults	No policy map class-	maps are defined.
Command Modes	Policy-map configura	tion
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Before using the class command, you must use the policy-map global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the service-policy interface configuration command. After entering the class command, you enter policy-map class configuration mode, and these	
	 configuration commands are available: exit: exits policy-map class configuration mode and returns to policy-map configuration mode. 	
• no : returns a command to its default setting.		mand to its default setting.
	• police : defines a policer or aggregate policer for the classified traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information, see the police and police aggregate policy-map class commands.	
	• set : specifies a value to be assigned to the classified traffic. For more information, see the set command.	
	• trust : defines a trust state for traffic classified with the class or the class-map command. For more information, see the trust command.	
	To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.	
	The class command performs the same function as the class-map global configuration command . Use the class command when a new classification, which is not shared with any other ports, is needed. Use the class-map command when the map is shared among many ports.	

ExamplesThis example shows how to create a policy map called *policy1*. When attached to the ingress direction,
it matches all the incoming traffic defined in *class1*, sets the IP Differentiated Services Code Point
(DSCP) to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding
the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	police	Defines a policer for classified traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for the traffic classified through the class policy-map configuration command or the class-map global configuration command.

class-map

Use the **class-map** global configuration command on the switch stack or on a standalone switch to create a class map to be used for matching packets to the class name you specify and to enter class-map configuration mode. Use the **no** form of this command to delete an existing class map and to return to global configuration mode.

class-map [match-all | match-any] class-map-name

no class-map [match-all | match-any] *class-map-name*

Syntax Description	match-all	(Optional) Perform a logical-AND of all matching statements under this class map. All criteria in the class map must be matched.	
	match-any	(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria must be matched.	
	class-map-name	Name of the class map.	
Defaults	No class maps are c	lefined.	
	If neither the matcl	h-all or match-any keyword is specified, the default is match-all.	
Command Modes	Global configuratio	'n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines		to specify the name of the class for which you want to create or modify class-map o enter class-map configuration mode.	
	The class-map command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.		
	After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:		
	• description : describes the class map (up to 200 characters). The show class-map privileged EXEC command displays the description and the name of the class-map.		
	• exit: exits from QoS class-map configuration mode.		
	• match : configures classification criteria. For more information, see the match (class-map configuration) command.		
	• no : removes a match statement from a class map.		
	• rename : renames the current class map. If you rename a class map with a name that is already used, the message A class-map with this name already exists appears.		

Examples

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-all** and **match-any** keywords are equivalent.

Only one access control list (ACL) can be configured in a class map. The ACL can have multiple access control entries (ACEs).

This example shows how to configure the class map called *class1* with one match criterion, which is an access list called *103*:

```
Switch(config)# access-list 103 permit ip any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
```

This example shows how to delete the class map *class1*:

Switch(config)# no class-map class1

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	match (class-map configuration)	Defines the match criteria to classify traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show class-map	Displays QoS class maps.

clear dot1x

Use the **clear dot1x** privileged EXEC command on the switch stack or on a standalone switch to clear IEEE 802.1x information for the switch or for the specified port.

clear dot1x {all | interface interface-id}

Syntax Description	all	Clear all IEEE 802.1x information for the switch.	
	interface interface-id	Clear IEEE 802.1x information for the specified interface.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Examples	-	ified interface by using the clear dot1x interface <i>interface-id</i> command. w to clear all IEEE 8021.x information:	
Lyampies	Switch# clear dot1x a		
	This example shows how to clear IEEE 8021.x information for the specified interface:		
	Switch# clear dot1x interface gigabithethernet1/0/1		
	You can verify that the in	nformation was deleted by entering the show dot1x privileged EXEC command.	
Related Commands	Command	Description	
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.	

clear eap sessions

Use the **clear eap sessions** privileged EXEC command on the switch stack or on a standalone switch to clear Extensible Authentication Protocol (EAP) session information for the switch or for the specified port.

clear eap sessions [**credentials** *name* [**interface** *interface-id*] | **interface** *interface-id* | **method** *name* | **transport** *name*] [**credentials** *name* | **interface** *interface-id* | **transport** *name*] ...

Syntax Description	credentials name	Clear EAP credential information for the specified profile.	
	interface interface-id	Clear EAP information for the specified interface.	
	method name	Clear EAP information for the specified method.	
	transport name	Clear EAP transport information for the specified lower level.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Usage Guidelines	information by using the	rs by using the clear eap sessions command, or you can clear only the specific e keywords.	
Examples	-	w to clear all EAP information:	
	Switch# clear eap		
	This example shows how to clear EAP-session credential information for the specified profile:		
	Switch# clear eap sessions credential type1		
	You can verify that the in	nformation was deleted by entering the show dot1x privileged EXEC command.	
Related Commands	Command	Description	
	show eap	Displays EAP registration and session information for the switch or for	
		the specified port	

clear errdisable interface

Use the **clear errdisable interface** privileged EXEC command on the switch stack or on a standalone switch to re-enable a VLAN that was error disabled.

clear errdisable interface interface-id vlan [vlan-list]

Syntax Description	vlan list	(Optional) Specify a list of VLANs to be re-enabled. If a vlan-list is not specified, then all VLANs are re-enabled.	
Command Default	No default is defined		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(37)SE	This command was introduced.	
Usage Guidelines	-	y using the shutdown and no shutdown interface configuration commands, ble for VLANs by using the clear errdisable interface command.	
Examples	This example shows how to re-enable all VLANs that were error-disabled on port Gi4/0/2.		
Related Commands	Switch# clear errdisabl	e interface GigabitEthernet4/0/2 vlan Description	
	errdisable detect cause	Enables error-disabled detection for a specific cause or all causes.	
	errdisable recovery	Configures the recovery mechanism variables.	
	show errdisable detect	Displays error-disabled detection status.	
	show errdisable recovery	y Display error-disabled recovery timer information.	
	show interfaces status er	'r-disabled Displays interface status of a list of interfaces in error-disabled state.	

clear arp inspection log

Use the **clear ip arp inspection log** privileged EXEC command on the switch stack or on a standalone switch to clear the dynamic Address Resolution Protocol (ARP) inspection log buffer.

clear ip arp inspection log

Syntax Description This command has no arguments or keywords
--

- **Defaults** No default is defined.
- **Command Modes** Privileged EXEC

 Release
 Modification

 12.2(20)SE
 This command was introduced.

Examples This example shows how to clear the contents of the log buffer:

Switch# clear ip arp inspection log

You can verify that the log was cleared by entering the show ip arp inspection log privileged command.

Related Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	ip arp inspection vlan logging	Controls the type of packets that are logged per VLAN.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

clear ip arp inspection statistics

Use the **clear ip arp inspection statistics** privileged EXEC command on the switch stack or on a standalone switch to clear the dynamic Address Resolution Protocol (ARP) inspection statistics.

clear ip arp inspection statistics [vlan vlan-range]

Syntax Description	vlan vlan-range	(Optional) Clear statistics for the specified VLAN or VLANs.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release M	odification
	12.2(20)SE Th	nis command was introduced.
Examples	1	v to clear the statistics for VLAN 1:
	You can verify that the s privileged EXEC comma	tatistics were deleted by entering the show ip arp inspection statistics vlan 1 and.
Related Commands	Command	Description
	show inventory statisti	cs Displays statistics for forwarded, dropped, MAC validation failure, and IP validation failure packets for all VLANs or the specified VLAN.

clear ip dhcp snooping

Use the **clear ip dhcp snooping** privileged EXEC command on the switch stack or on a standalone switch to clear the DHCP snooping binding database, the DHCP snooping binding database agent statistics, or the DHCP snooping statistics counters.

clear ip dhcp snooping {binding {* | *ip-address* | interface *interface-id* | vlan *vlan-id*} | database statistics | statistics}

Syntax Description	binding	Clear the DHCP snooping binding database.		
	*	Clear all automatic bindings.		
	ip-address	Clear the binding entry IP address.		
	interface interface-id	d Clear the binding input interface.		
	vlan vlan-id	Clear the binding entry VLAN.		
	database statistics	Clear the DHCP snooping binding database agent statistics.		
	statistics	Clear the DHCP snooping statistics counter.		
Defaults	No default is defined.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.2(20)SE	This command was introduced.		
	12.2(37)SE	The statistics keyword was introduced.		
		The *, <i>ip-address</i> , interface <i>interface-id</i> , and vlan <i>vlan-id</i> keywords were introduced.		
Usage Guidelines	•	lear ip dhcp snooping database statistics command, the switch does not update ling database and in the binding file before clearing the statistics.		
Examples	This example shows h	now to clear the DHCP snooping binding database agent statistics:		
	Switch# clear ip dhcp snooping database statistics			
	You can verify that the statistics were cleared by entering the show ip dhcp snooping database privileged EXEC command.			
	This example shows h	This example shows how to clear the DHCP snooping statistics counters:		
	Switch# clear ip dh	Switch# clear ip dhcp snooping statistics		
	You can verify that the statistics were cleared by entering the show ip dhcp snooping statistics user EXEC command.			

Related Commands C

Command	Description
ip dhcp snooping	Enables DHCP snooping on a VLAN.
ip dhcp snooping database	Configures the DHCP snooping binding database agent or the binding file.
show ip dhcp snooping binding	Displays the status of DHCP snooping database agent.
show ip dhcp snooping database	Displays the DHCP snooping binding database agent statistics.
show ip dhcp snooping statistics	Displays the DHCP snooping statistics.

clear ipc

Use the **clear ipc** privileged EXEC command on the switch stack or on a standalone switch to clear Interprocess Communications Protocol (IPC) statistics.

clear ipc {queue-statistics | statistics}

Syntax Description	queue-statistics	Clear the IPC queue statistics.	
	statistics	Clear the IPC statistics.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(18)SE	This command was introduced.	
Usage Guidelines	statistics by using the	istics by using the clear ipc statistics command, or you can clear only the queue clear ipc queue-statistics command.	
Examples	Switch# clear ipc s	how to clear all statistics:	
	This example shows how to clear only the queue statistics:		
	Switch# clear ipc queue-statistics		
	You can verify that th privileged EXEC con	ne statistics were deleted by entering the show ipc rpc or the show ipc session nmand.	
Related Commands	Command	Description	
	<pre>show ipc {rpc sessi</pre>	ion } Displays the IPC multicast routing statistics.	

clear ipv6 dhcp conflict

Use the **clear ipv6 dhcp conflict** privileged EXEC command on the switch stack or on a standalone switch to clear an address conflict from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server database.

clear ipv6 dhcp conflict {* | IPv6-address}

```
<u>Note</u>
```

This command is available only if the switch stack is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	*	Clear all address conflicts.
	IPv6-address	Clear the host IPv6 address that contains the conflicting address.
Defaults	No default is defined	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(46)SE	This command was introduced.
Usage Guidelines	vlan} global configure When you configure discovery to detect cl	IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default ration command, and reload the switch. the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor ients and reports to the server through a DECLINE message. If an address conflict ss is removed from the pool, and the address is not assigned until the administrator from the conflict list.
	If you use the asterisl	k (*) character as the address parameter, DHCP clears all conflicts.
Examples	This example shows how to clear all address conflicts from the DHCPv6 server database: Switch# clear ipv6 dhcp conflict *	
Related Commands	Command	Description
	show ipv6 dhcp conflict	Displays address conflicts found by a DHCPv6 server, or reported through a DECLINE message from a client.

clear l2protocol-tunnel counters

Use the **clear l2protocol-tunnel counters** privileged EXEC command on the switch stack or on a standalone switch to clear the protocol counters in protocol tunnel ports.

clear l2protocol-tunnel counters [interface-id]

Syntax Description	interface-id	(Optional) Specify interface (physical interface or port channel) for which protocol counters are to be cleared.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	Use this command to c	lear protocol tunnel counters on the switch or on the specified interface.
Examples	This example shows ho	w to clear Layer 2 protocol tunnel counters on an interface:
	Switch# clear l2prot	ocol-tunnel counters gigabitethernet0/3
Related Commands	Command	Description
	show l2protocol-tunn	el Displays information about ports configured for Layer 2 protocol tunneling.

clear lacp

Use the **clear lacp** privileged EXEC command on the switch stack or on a standalone switch to clear Link Aggregation Control Protocol (LACP) channel-group counters.

clear lacp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 48.
	counters	Clear traffic counters.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
Usage Guidelines		The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48. s by using the clear lacp counters command, or you can clear only the counters group by using the clear lacp <i>channel-group-number</i> counters command.
	You can clear all counter for the specified channel	s by using the clear lacp counters command, or you can clear only the counters group by using the clear lacp <i>channel-group-number</i> counters command.
Usage Guidelines Examples	You can clear all counter for the specified channel	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command.
	You can clear all counter for the specified channel This example shows how Switch# clear lacp cou	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command.
	You can clear all counter for the specified channel This example shows how Switch# clear lacp cou	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command. v to clear all channel-group information: unters v to clear LACP traffic counters for group 4:
	You can clear all counters for the specified channel This example shows how Switch# clear lacp cou This example shows how Switch# clear lacp 4 of	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command. w to clear all channel-group information: unters w to clear LACP traffic counters for group 4: counters nformation was deleted by entering the show lacp counters or the show lacp 4
	You can clear all counters for the specified channel This example shows how Switch# clear lacp cou This example shows how Switch# clear lacp 4 of You can verify that the in	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command. w to clear all channel-group information: unters w to clear LACP traffic counters for group 4: counters nformation was deleted by entering the show lacp counters or the show lacp 4

clear mac address-table

Use the **clear mac address-table** privileged EXEC command on the switch stack or on a standalone switch to delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members, or all dynamic addresses on a particular VLAN. This command also clears the MAC address notification global counters.

clear mac address-table {dynamic [address mac-addr | interface interface-id | vlan vlan-id] |
 notification}

Syntax Description	dynamic	Delete all dynamic MAC addresses.
	dynamic address <i>mac-addr</i>	(Optional) Delete the specified dynamic MAC address.
	dynamic interface <i>interface-id</i>	(Optional) Delete all dynamic MAC addresses on the specified physical port or port channel.
	dynamic vlan vlan-id	(Optional) Delete all dynamic MAC addresses for the specified VLAN. The range is 1 to 4094.
	notification	Clear the notifications in the history table and reset the counters.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(19)EA1	The clear mac-address-table command (with the hyphen) was replaced by the clear mac address-table command (without the hyphen).
Fxamnles		the clear mac address-table command (without the hyphen).
Examples	This example shows how	the clear mac address-table command (without the hyphen).
Examples	This example shows how Switch# clear mac add	the clear mac address-table command (without the hyphen).
Examples Related Commands	This example shows how Switch# clear mac add You can verify that the i	the clear mac address-table command (without the hyphen).
·	This example shows how Switch# clear mac add You can verify that the i EXEC command.	the clear mac address-table command (without the hyphen). w to remove a specific MAC address from the dynamic address table: ress-table dynamic address 0008.0070.0007 anformation was deleted by entering the show mac address-table privileged Description

Command	Description
show mac address-table notification	Displays the MAC address notification settings for all interfaces or the specified interface.
snmp trap mac-notification	Enables the Simple Network Management Protocol (SNMP) MAC address notification trap on a specific interface.

clear mac address-table move update

Use the **clear mac address-table move update** privileged EXEC command on the switch stack or on a standalone switch to clear the mac address-table-move update-related counters.

clear mac address-table move update

- **Defaults** No default is defined.
- **Command Modes** Privileged EXEC

 Release
 Modification

 12.2(25)SED
 This command was introduced.

Examples This example shows how to clear the mac address-table move update related counters.

Switch# clear mac address-table move update

You can verify that the information was cleared by entering the **show mac address-table move update** privileged EXEC command.

Related Commands	Command	Description
	mac address-table move update {receive transmit}	Configures MAC address-table move update on the switch.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

clear pagp

Use the **clear pagp** privileged EXEC command on the switch stack or on a standalone switch to clear Port Aggregation Protocol (PAgP) channel-group information.

clear pagp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 48.	
	counters	Clear traffic counters.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.2(25)SE	The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48.	
Usage Guidelines		s by using the clear pagp counters command, or you can clear only the counters group by using the clear pagp <i>channel-group-number</i> counters command.	
Examples	This example shows how Switch# clear pagp con	v to clear all channel-group information:	
	This example shows how to clear PAgP traffic counters for group 10:		
	Switch# clear pagp 10 counters		
	You can verify that infor	mation was deleted by entering the show pagp privileged EXEC command.	
Related Commands	Command	Description	
	show pagp	Displays PAgP channel-group information.	

clear port-security

Use the **clear port-security** privileged EXEC command on the switch stack or on a standalone switch to delete from the MAC address table all secure addresses or all secure addresses of a specific type (configured, dynamic, or sticky) on the switch or on an interface.

clear port-security {all | configured | dynamic | sticky} [[address mac-addr | interface interface-id] [vlan {vlan-id | {access | voice}}]]

Syntax Description	all	Delete all secure MAC addresses.	
	configured	Delete configured secure MAC addresses.	
	dynamic	Delete secure MAC addresses auto-learned by hardware.	
	sticky	Delete secure MAC addresses, either auto-learned or configured.	
	address mac-addr	(Optional) Delete the specified dynamic secure MAC address.	
	interface interface-id	(Optional) Delete all the dynamic secure MAC addresses on the specified physical port or VLAN.	
	vlan	 (Optional) Delete the specified secure MAC address from the specified VLAN. Enter one of these options after you enter the vlan keyword: vlan-id—On a trunk port, specify the VLAN ID of the VLAN on which this address should be cleared. 	
		 access—On an access port, clear the specified secure MAC address on the access VLAN. voice—On an access port, clear the specified secure MAC address on the voice VLAN. 	
	Defaults	No default is defined.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEA	This command was introduced.	
	12.2(25)SEB	The access and voice keywords were added.	
Examples	This example shows how to clear all secure addresses from the MAC address table:		
	Switch# clear port-security all		
	This example shows how	w to remove a specific configured secure address from the MAC address table:	

This example shows how to remove all the dynamic secure addresses learned on a specific interface: Switch# clear port-security dynamic interface gigabitethernet1/0/1

This example shows how to remove all the dynamic secure addresses from the address table:

Switch# clear port-security dynamic

You can verify that the information was deleted by entering the **show port-security** privileged EXEC command.

Related Commands Command

Command	Description
switchport port-security	Enables port security on an interface.
switchport port-security mac-address mac-address	Configures secure MAC addresses.
switchport port-security maximum <i>value</i>	Configures a maximum number of secure MAC addresses on a secure interface.
show port-security	Displays the port security settings defined for an interface or for the switch.

clear spanning-tree counters

Use the **clear spanning-tree counters** privileged EXEC command on the switch stack or on a standalone switch to clear the spanning-tree counters.

clear spanning-tree counters [interface interface-id]

Syntax Description	interface interface-id	(Optional) Clear all spanning-tree counters on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
Usage Guidelines	If the <i>interface-id</i> is not	specified, spanning-tree counters are cleared for all interfaces.
Examples	This example shows how	w to clear spanning-tree counters for all interfaces:
	Switch# clear spannin	ng-tree counters
Related Commands	Command	Description
	show spanning-tree	Displays spanning-tree state information.

clear spanning-tree detected-protocols

clear spanning-tree detected-protocols

Use the **clear spanning-tree detected-protocols** privileged EXEC command on the switch stack or on a standalone switch to restart the protocol migration process (force the renegotiation with neighboring switches) on all interfaces or on the specified interface.

clear spanning-tree detected-protocols [**interface** *interface-id*]

Syntax Description	interface interface-id	(Optional) Restart the protocol migration process on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
	it sends only IEEE 802.1 that a port is at the bound associated with a different However, the switch does receives IEEE 802.1D BI	figuration bridge protocol data unit (BPDU) with the protocol version set to 0, D BPDUs on that port. A multiple spanning-tree (MST) switch can also detect dary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. Use the clear spanning-tree mand in this situation.
Examples	This example shows how to restart the protocol migration process on a port: Switch# clear spanning-tree detected-protocols interface gigabitethernet2,	
Related Commands	Command	Description
	show spanning-tree	Displays spanning-tree state information.
	spanning-tree link-type	e Overrides the default link-type setting and enables rapid spanning-tree changes to the forwarding state.

clear vmps statistics

Use the **clear vmps statistics** privileged EXEC command on the switch stack or on a standalone switch to clear the statistics maintained by the VLAN Query Protocol (VQP) client.

clear vmps statistics

Defaults No default is defined.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Examples This example shows how to clear VLAN Membership Policy Server (VMPS) statistics:

Switch# clear vmps statistics

You can verify that information was deleted by entering the **show vmps statistics** privileged EXEC command.

Related Commands	Command	Description	
	show vmps	Displays the VQP version, reconfirmation interval, retry count, VMPS IP addresses, and the current and primary servers.	
		addresses, and the current and primary servers.	

clear vtp counters

Use the **clear vtp counters** privileged EXEC command on the switch stack or on a standalone switch to clear the VLAN Trunking Protocol (VTP) and pruning counters.

clear vtp counters

Syntax Description This command has no arguments or keywords. Defaults No default is defined. **Command Modes** Privileged EXEC **Command History** Release Modification 12.1(11)AX This command was introduced. Examples This example shows how to clear the VTP counters: Switch# clear vtp counters You can verify that information was deleted by entering the show vtp counters privileged EXEC command. **Related Commands** Command Description show vtp Displays general information about the VTP management domain, status, and counters.

cluster commander-address

You do not need to enter this command from the switch stack or from a standalone cluster member switch. The cluster command switch automatically provides its MAC address to cluster member switches when these switches join the cluster. The cluster member switch adds this information and other cluster information to its running configuration file. Use the **no** form of this global configuration command from the cluster member switch console port to remove the switch from a cluster only during debugging or recovery procedures.

cluster commander-address mac-address [member number name name]

no cluster commander-address

Syntax Description	mac-address	MAC address of the cluster command switch.	
	member number	(Optional) Number of a configured cluster member switch. The range is 0 to 15.	
	name name	(Optional) Name of the configured cluster up to 31 characters.	
Defaults	The switch is not a mo	ember of any cluster.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	This command is avai	lable only on the cluster command switch stack or the cluster command switch.	
	A cluster member can have only one cluster command switch.		
	The cluster member switch retains the identity of the cluster command switch during a system reload by using the <i>mac-address</i> parameter.		
	You can enter the no f	orm on a cluster member switch to remove it from the cluster during debugging or	
	recovery procedures. port only when the me switch configuration,	You would normally use this command from the cluster member switch console ember has lost communication with the cluster command switch. With normal we recommend that you remove cluster member switches only by entering the no obal configuration command on the cluster command switch.	

debug cluster

Examples This is partial sample output from the running configuration of a cluster member. Switch(config)# show running-configuration <output truncated> cluster commander-address 00e0.9bc0.a500 member 4 name my_cluster <output truncated> <output truncated> This example shows how to remove a member from the cluster by using the cluster member console. Switch # configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# no cluster commander-address You can verify your settings by entering the show cluster privileged EXEC command. Related Commands Command Description

belongs.

Displays the cluster status and a summary of the cluster to which the switch

cluster discovery hop-count

Use the **cluster discovery hop-count** global configuration command on the switch stack or on the a cluster command switch on the cluster command switch to set the hop-count limit for extended discovery of candidate switches. Use the **no** form of this command to return to the default setting.

cluster discovery hop-count number

no cluster discovery hop-count

Syntax Description	number	Number of hops from the cluster edge that the cluster command switch limits the discovery of candidates. The range is 1 to 7.	
Defaults	The hop count is set to 3.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	command does not operat If the hop count is set to 1 candidates that are one ho	e only on the cluster command switch stack or cluster command switch. This e on cluster member switches. I, it disables extended discovery. The cluster command switch discovers only p from the edge of the cluster. The edge of the cluster is the point between the ember switch and the first discovered candidate switch.	
Examples	This example shows how switch.	to set hop count limit to 4. This command is executed on the cluster command	
	Switch(config)# cluster discovery hop-count 4		
	You can verify your settin	g by entering the show cluster privileged EXEC command.	
Related Commands	Command	Description	
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.	
	show cluster candidates	Displays a list of candidate switches.	

cluster enable

Use the **cluster enable** global configuration command on a command-capable switch or switch stack to enable it as the cluster command switch, assign a cluster name, and to optionally assign a member number to it. Use the **no** form of the command to remove all members and to make the cluster command switch a candidate switch.

cluster enable *name* [command-switch-member-number]

no cluster enable

Syntax Description	name		Name of the cluster up to 31 characters. Valid characters include only alphanumerics, dashes, and underscores.
	command-swite	ch-member-number	(Optional) Assign a member number to the cluster command switch of the cluster. The range is 0 to 15.
Defaults	The switch is not a cluster command switch.		
	No cluster name	e is defined.	
	The member nu	mber is 0 when the s	switch is the cluster command switch.
Command Modes	Global configu	ration	
Command History	Release	Modificat	tion
	12.1(11)AX	This com	mand was introduced.
Usage Guidelines		-	nd-capable switch that is not part of any cluster. This command fails a member of the cluster.
		ne cluster command s	u enable the cluster command switch. If the switch is already switch, this command changes the cluster name if it is different from
Examples	This example shows how to enable the cluster command switch, name the cluster, and set the cluster command switch member number to 4.		
	Switch(config)# cluster enable Engineering-IDF4 4		
	You can verify command swite		ring the show cluster privileged EXEC command on the cluster
Related Commands	Command	Description	
	show cluster		ter status and a summary of the cluster to which the switch belongs.
		=r, 5 and 5145	

cluster holdtime

Use the **cluster holdtime** global configuration command on the switch stack or on the a cluster command switch to set the duration in seconds before a switch (either the command or cluster member switch) declares the other switch down after not receiving heartbeat messages. Use the **no** form of this command to set the duration to the default value.

cluster holdtime holdtime-in-secs

no cluster holdtime

Syntax Description	holdtime-in-secs	Duration in seconds before a switch (either a command or cluster member switch) declares the other switch down. The range is 1 to 300 seconds.
Defaults	The default holdtime	e is 80 seconds.
Command Modes	Global configuration	1
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	switch. The cluster c	with the cluster timer global configuration command only on the cluster command command switch propagates the values to all its cluster members so that the setting all switches in the cluster.
		cally set as a multiple of the interval timer (cluster timer). For example, it takes vided by the interval-in-secs) number of heartbeat messages to be missed in a row lown.
Examples	This example shows	how to change the interval timer and the duration on the cluster command switch.
	Switch(config)# cl Switch(config)# cl	
	You can verify your	settings by entering the show cluster privileged EXEC command.
Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.

cluster member

Use the **cluster member** global configuration command on the cluster command switch to add candidates to a cluster. Use the **no** form of the command to remove members from the cluster.

cluster member [n] **mac-address** H.H.H [**password** enable-password] [**vlan** vlan-id]

no cluster member *n*

Syntax Description	n	The number that identifies a cluster member. The range is 0 to 15.
	mac-address H.H.H	MAC address of the cluster member switch in hexadecimal format.
	password enable-password	Enable password of the candidate switch. The password is not required if there is no password on the candidate switch.
	vlan vlan-id	(Optional) VLAN ID through which the candidate is added to the cluster by the cluster command switch. The range is 1 to 4094.
Defaults	A newly enabled cluster comm	and switch has no associated cluster members.
Command Modes	Global configuration	
Command History	Release Mod	ification
	12.1(11)AX This	command was introduced.
Usage Guidelines	Enter this command only on th	e cluster command switch to add a candidate to or remove a member from
	the cluster. If you enter this co rejects the command and displ	mmand on a switch other than the cluster command switch, the switch ays an error message.
	rejects the command and displ You must enter a member numb a member number to add a swi	
	rejects the command and displ You must enter a member numb a member number to add a swi member number and assigns it You must enter the enable pass The password is not saved in t	ays an error message. per to remove a switch from the cluster. Sword of the candidate switch for authentication when it joins the cluster he running or startup configuration. After a candidate switch becomes a

Examples This example shows how to add a switch as member 2 with MAC address 00E0.1E00.2222 and the password *key* to a cluster. The cluster command switch adds the candidate to the cluster through VLAN 3.

Switch(config)# cluster member 2 mac-address 00E0.1E00.2222 password key vlan 3

This example shows how to add a switch with MAC address 00E0.1E00.3333 to the cluster. This switch does not have a password. The cluster command switch selects the next available member number and assigns it to the switch that is joining the cluster.

Switch(config) # cluster member mac-address 00E0.1E00.3333

You can verify your settings by entering the **show cluster members** privileged EXEC command on the cluster command switch.

Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.
	show cluster candidates	Displays a list of candidate switches.
	show cluster members	Displays information about the cluster members.

cluster outside-interface

Use the **cluster outside-interface** global configuration command on the switch stack or on the a cluster command switch to configure the outside interface for cluster Network Address Translation (NAT) so that a member without an IP address can communicate with devices outside the cluster. Use the **no** form of this command to return to the default setting.

cluster outside-interface interface-id

no cluster outside-interface

Syntax Description	interface-id	Interface to serve as the outside interface. Valid interfaces include physical interfaces, port-channels, or VLANs. The port-channel range is 1 to 48. The VLAN range is 1 to 4094.	
Defaults	The default outside interface is automatically selected by the cluster command switch.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	Enter this command only on the cluster command switch. If you enter this command on a cluster member switch, an error message appears.		
Examples	This example shows how to set the outside interface to VLAN 1: Switch(config)# cluster outside-interface vlan 1		
	You can verify your setting by entering the show running-config privileged EXEC command.		
Related Commands	Command	Description	
	show running-config	Displays the current operating configuration. For syntax information, select the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.	

cluster run

Use the **cluster run** global configuration command to enable clustering on a switch. Use the **no** form of this command to disable clustering on a switch.

cluster run

no cluster run

- Syntax Description This command has no arguments or keywords.
- **Defaults** Clustering is enabled on all switches.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines When you enter the **no cluster run** command on a cluster command switch or cluster command switch stack, the cluster command switch is disabled. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the **no cluster run** command on a cluster member switch, it is removed from the cluster. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the **no cluster run** command on a switch that is not part of a cluster, clustering is disabled on this switch. This switch cannot then become a candidate switch.

Examples This example shows how to disable clustering on the cluster command switch:

Switch(config)# no cluster run

You can verify your setting by entering the show cluster privileged EXEC command.

Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.

cluster standby-group

Use the **cluster standby-group** global configuration command to enable cluster command-switch redundancy by binding the cluster to an existing Hot Standby Router Protocol (HSRP). Entering the routing-redundancy keyword enables the same HSRP group to be used for cluster command-switch redundancy and routing redundancy. Use the **no** form of this command to return to the default setting.

cluster standby-group HSRP-group-name [routing-redundancy]

no cluster standby-group

Syntax Description	HSRP-group-name	Name of the HSRP group that is bound to the cluster. The group name is limited to 32 characters.	
	routing-redundancy	(Optional) Enable the same HSRP standby group to be used for cluster command-switch redundancy and routing redundancy.	
Defaults	The cluster is not bound	l to any HSRP group.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	Enter this command only on the cluster command switch. If you enter it on a cluster member switch, an error message appears.		
	The cluster command switch propagates the cluster-HSRP binding information to all cluster-HSRP capable members. Each cluster member switch stores the binding information in its NVRAM. The HSRP group name must be a valid standby group; otherwise, the command exits with an error.		
	the cluster. The same HS the HSRP group that is to	hould be used on all members of the HSRP standby group that is to be bound to SRP group name should also be used on all cluster-HSRP capable members for o be bound. (When not binding a cluster to an HSRP group, you can use different mmander and the members.)	
Examples	This example shows how to bind the HSRP group named <i>my_hsrp</i> to the cluster. This command is executed on the cluster command switch.		
	Switch(config)# cluster standby-group my_hsrp		
	This example shows how cluster redundancy.	w to use the same HSRP group named my_hsrp for routing redundancy and	
	Switch(config)# clust	er standby-group my_hsrp routing-redundancy	

This example shows the error message when this command is executed on a cluster command switch and the specified HSRP standby group does not exist:

Switch(config)# cluster standby-group my_hsrp %ERROR: Standby (my_hsrp) group does not exist

This example shows the error message when this command is executed on a cluster member switch:

Switch(config)# cluster standby-group my_hsrp routing-redundancy %ERROR: This command runs on a cluster command switch

You can verify your settings by entering the **show cluster** privileged EXEC command. The output shows whether redundancy is enabled in the cluster.

Related Commands	Command	Description
	standby ip	Enables HSRP on the interface. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.
	show standby	Displays standby group information. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .

cluster timer

Use the **cluster timer** global configuration command on the switch stack or on the a cluster command switch to set the interval in seconds between heartbeat messages. Use the **no** form of this command to set the interval to the default value.

cluster timer interval-in-secs

no cluster timer

Syntax Description	interval-in-secs	Interval in seconds between heartbeat messages. The range is 1 to 300 seconds.		
Defaults	The interval is 8 seconds.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	Enter this command with the cluster holdtime global configuration command only on the cluster command switch. The cluster command switch propagates the values to all its cluster members so that the setting is consistent among all switches in the cluster.			
	The holdtime is typically set as a multiple of the heartbeat interval timer (cluster timer). For example, it takes (holdtime-in-secs divided by the interval-in-secs) number of heartbeat messages to be missed in a row to declare a switch down.			
Examples	This example shows how to change the heartbeat interval timer and the duration on the cluster command switch:			
	Switch(config)# cluster timer 3 Switch(config)# cluster holdtime 30			
	You can verify your s	settings by entering the show cluster privileged EXEC command.		

Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.

define interface-range

no define interface-range macro-name interface-range

define interface-range macro-name interface-range

Use the **define interface-range** global configuration command on the switch stack or on a standalone switch to create an interface-range macro. Use the **no** form of this command to delete the defined macro.

	no define into	errace-range macro-name interface-range	
Syntax Description	macro-name	Name of the interface-range macro; up to 32 characters.	
	interface-range	Interface range; for valid values for interface ranges, see "Usage Guidelines."	
Defaults	This command ha	s no default setting.	
Command Modes	Global configurat	ion	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	The macro name i	is a 32-character maximum character string.	
	A macro can contain up to five ranges.		
	All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs, but you can combine multiple interface types in a macro.		
	When entering the <i>interface-range</i> , use this format:		
	• type {first-interface} - {last-interface}		
	• You must add a space between the first interface number and the hyphen when entering an <i>interface-range</i> . For example, gigabitethernet 1/0/1 - 2 is a valid range; gigabitethernet 1/0/1-2 is not a valid range.		
	Valid values for <i>type</i> and <i>interface</i> :		
	• vlan vlan-id- vlan-ID, where the VLAN ID is 1 to 4094		
	VLAN interfaces must have been configured with the interface vlan command (the show running-config privileged EXEC command displays the configured VLAN interfaces). VLAN interfaces not displayed by the show running-config command cannot be used in <i>interface-ranges</i> .		
	• port-channel <i>port-channel-number</i> , where <i>port-channel-number</i> is from 1 to 48		
	• fastethernet	stack member/module/{first port} - {last port}	
	• gigabitetherr	net stack member/module/{first port} - {last port}	

For physical interfaces:

- stack member is the number used to identify the switch within the stack. The number ranges from 1 to 9 and is assigned to the switch the first time the stack member initializes.
- module is always 0.
- the range is type stack member/0/number number (for example, gigabitethernet 1/0/1 2).

When you define a range, you must enter a space before the hyphen (-), for example:

gigabitethernet1/0/1 - 2

You can also enter multiple ranges. When you define multiple ranges, you must enter a space after the first entry before the comma (,). The space after the comma is optional, for example:

```
fastethernet1/0/3, gigabitethernet1/0/1 - 2
```

fastethernet1/0/3 -4, gigabitethernet1/0/1 - 2

Examples

This example shows how to create a multiple-interface macro:

Switch(config)# define interface-range macrol fastethernet1/0/1 - 2, gigabitethernet1/0/1 - 2

Related Commands	Command	Description
	interface range	Executes a command on multiple ports at the same time.
	show running-config	Displays the current operating configuration, including defined macros. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

Use the **delete** privileged EXEC command on the switch stack or on a standalone switch to delete a file or directory on the flash memory device.

delete [/force] [/recursive] filesystem:/file-url

Syntax Description	/force	(Optional) Suppress the prompt that confirms the deletion.		
	/recursive	(Optional) Delete the named directory and all subdirectories and the files contained in		
	filesystem:	it. Alias for a flash file system.		
	jiiesystem.			
		The syntax for the local flash file system on the stack member or the stack master: flash:		
		From the stack master, the syntax for the local flash file system on a stack member: flash <i>member number</i> :		
	lfile-url	The path (directory) and filename to delete.		
Command Modes	Privileged EXE	2		
Command History	Release	Modification		
-	12.1(11)AX	This command was introduced.		
	of every file. The prompting b default, the swit	ecursive keyword without the /force keyword, you are prompted to confirm the deletion behavior depends on the setting of the file prompt global configuration command. By ch prompts for confirmation on destructive file operations. For more information about ee the <i>Cisco IOS Command Reference for Release 12.1</i> .		
Examples	This example sh download of a n	ows how to remove the directory that contains the old software image after a successful		
	Switch# delete	w mage: /force /recursive flash:/old-image hat the directory was removed by entering the dir filesystem: privileged EXEC		

deny (ARP access-list configuration)

Use the **deny** Address Resolution Protocol (ARP) access-list configuration command on the switch stack or on a standalone switch to deny an ARP packet based on matches against the DHCP bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access list.

- deny {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac mac}]} [log]
- no deny {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]

Syntax Description	request	(Optional) Define a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specify the sender IP address.
	any	Deny any IP or MAC address.
	host sender-ip	Deny the specified sender IP address.
	sender-ip sender-ip-mask	Deny the specified range of sender IP addresses.
	mac	Deny the sender MAC address.
	host sender-mac	Deny a specific sender MAC address.
	sender-mac sender-mac-mask	Deny the specified range of sender MAC addresses.
	response ip	Define the IP address values for the ARP responses.
	host target-ip	Deny the specified target IP address.
	target-ip target-ip-mask	Deny the specified range of target IP addresses.
	mac	Deny the MAC address values for the ARP responses.
	host target-mac	Deny the specified target MAC address.
	target-mac target-mac-mask	Deny the specified range of target MAC addresses.
	log	(Optional) Log a packet when it matches the ACE.

Defaults

There are no default settings. However, at the end of the ARP access list, there is an implicit **deny ip any mac any** command.

Command Modes ARP access-list configuration

Command History	Release	Modification
	12.2(20)SE	This command was introduced.

show arp access-list

Usage Guidelines	You can add deny clauses to drop ARP packets based on matching criteria.			
Examples	-	ine an ARP access list and to deny both ARP requests and ARP responses of 1.1.1.1 and a MAC address of 0000.0000.abcd:		
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end			
	You can verify your settings by entering the show arp access-list privileged EXEC command.			
Related Commands	Command	Description		
	arp access-list	Defines an ARP access control list (ACL).		
	ip arp inspection filter vlan	Permits ARP requests and responses from a host configured with a static IP address.		
	permit (ARP access-list configuration)	Permits an ARP packet based on matches against the DHCP bindings.		

Displays detailed information about ARP access lists.

deny (IPv6 access-list configuration)

Use the **deny** command in IPv6 access list configuration mode on the switch stack or on a standalone switch to set deny conditions for an IPv6 access list. Use the **no** form of this command to remove the deny conditions.

- deny {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value]
 [time-range name]
- **no deny** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**sequence** *value*] [**time-range** *name*]

Internet Control Message Protocol

deny icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [sequence value] [time-range name]

Transmission Control Protocol

deny tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name]
 [urg]

User Datagram Protocol

deny udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [sequence value] [time-range name]

This command is available only if the switch stack is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp ,			
		esp , icmp , ipv6 , pcp , sctp , tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.			
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks about which to set deny conditions.			
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.			
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.			
	any	An abbreviation for the IPv6 prefix ::/0.			
	host source-ipv6-address	The source IPv6 host address for which to set deny conditions.			
		This <i>source-ipv6-address</i> argument must be in the form documented RFC 2373 where the address is specified in hexadecimal using 16-bi values between colons.			
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).			
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.			
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.			
		The range operator requires two port numbers. All other operators require one port number.			
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.			
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set deny conditions.			
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.			
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.			
	host	The destination IPv6 host address for which to set deny conditions.			
	destination-ipv6-address	This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.			
	dscp value	(Optional) Match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.			

fragments	(Optional) Match non-initial fragmented packets where the fragment	
	extension header contains a non-zero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.	
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages sent to the console is controlled by the logging console command.)	
	The message includes the access list name and sequence number, whether the packet was denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets denied in the prior 5-minute interval.	
	Note Logging is not supported for port ACLs.	
log-input	(Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.	
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.	
time-range name	(Optional) Specify the time range that applies to the deny statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.	
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by an ICMP message type. The type is a number from 0 to 255.	
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.	
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or an ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.	
ack	(Optional) Only for the TCP protocol: Acknowledgment (ACK) bit set.	
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.	
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.	
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.	
psh	(Optional) Only for the TCP protocol: Push function bit set.	
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.	
rst	(Optional) Only for the TCP protocol: Reset bit set.	
syn	(Optional) Only for the TCP protocol: Synchronize bit set.	
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.	

<u>Note</u>

Although visible in the command-line help strings, the **flow-label**, **routing**, and **undetermined-transport** keywords are not supported.

Defaults	No IPv6 access list is defined.			
Command Modes	IPv6 access list configuration			
Command History	Release 12.2(25)SED	Modification This command was introduced.		
Usage Guidelines	• ·	cess-list configuration mode) command is similar to the deny (IPv4 access-list e) command, except that it is IPv6-specific.		
	• ·	5) command after the ipv6 access-list command to enter IPv6 access list configuration e the conditions under which a packet passes the access list.		
	Specifying IPv6 fo	or the <i>protocol</i> argument matches against the IPv6 header of the packet.		
	By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.			
•	list. To add a new s	it, deny, or remark statements to an existing access list without re-entering the entire statement anywhere other than at the end of the list, create a new statement with an number that falls between two existing entry numbers to show where it belongs.		
<u>Note</u>	any any statement discovery. To disal nd-ns, there must	as implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 s as its last match conditions. The two permit conditions allow ICMPv6 neighbor low ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any be an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement Pv6 ACL must contain at least one entry.		
	The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.			
	for traffic filtering.	<i>v6-prefix/prefix-length</i> and <i>destination-ipv6-prefix/prefix-length</i> arguments are used . (The source prefix filters traffic based upon the traffic source; the destination prefix l upon the traffic destination.)		
		ts only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global cal host addresses.		
	The fragments key arguments are not	yword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] specified.		

This is a list of ICMP message names:

beyond-scope	destination-unreachable
echo-reply	echo-request
header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures the IPv6 access list named CISCO and applies the access list to outbound traffic on a Layer 3 interface. The first deny entry in the list prevents all packets that have a destination TCP port number greater than 5000 from leaving the interface. The second deny entry in the list prevents all packets that have a source UDP port number less than 5000 from leaving the interface. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets to leave the interface. The second permit entry in the list permits all other traffic to leave the interface. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

deny (MAC access-list configuration)

Use the **deny** MAC access-list configuration command on the switch stack or on a standalone switch to prevent non-IP traffic from being forwarded if the conditions are matched. Use the **no** form of this command to remove a deny condition from the named MAC access list.

- {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask |mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src MAC-addr	Define a host MAC address and optional subnet mask. If the source
	src-MAC-addr mask	address for a packet matches the defined address, non-IP traffic from that address is denied.
	host dst-MAC-addr	Define a destination MAC address and optional subnet mask. If the
	dst-MAC-addr mask	destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		The type is 0 to 65535, specified in hexadecimal.
		The <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
	lavc-sca	(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.	
	<i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.	
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.	
mop-dump	(Optional) Select EtherType DEC-MOP Dump.	
msdos	(Optional) Select EtherType DEC-MSDOS.	
mumps	(Optional) Select EtherType DEC-MUMPS.	
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).	
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.	
vines-ip	(Optional) Select EtherType VINES IP.	
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary Ethertype in decimal, hexadecimal, or octal.	

۵, Note

Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-4.

Table 2-4 IPX Filtering Criteria

IPX Encapsulation Type		
Cisco IOS Name	Novel Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However; the default action for a MAC-named ACL is to deny.

	This example shows how to rea	move the deny condition from the named MAC extended access list:	
	Switch(config-ext-macl)# nc	deny any 00c0.00a0.03fa 0000.0000.0000 netbios.	
	This example denies all packet	s with Ethertype 0x4321:	
	Switch(config-ext-macl)# deny any 0x4321 0		
	You can verify your settings by	v entering the show access-lists privileged EXEC command.	
Related Commands	Command	Description	
	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.	
	permit (MAC access-list	Permits non-IP traffic to be forwarded if conditions are matched.	

Displays access control lists configured on a switch.

diagnostic monitor

Use the **diagnostic monitor** global configuration command to configure the health-monitoring diagnostic testing. Use the **no** form of this command to disable testing and return to the default settings.

diagnostic monitor switch {*num*} **test** {*test-id* | *test-id-range* | **all**}

diagnostic monitor interval switch {num} **test** {test-id | test-id-range | **all**} hh:mm:ss milliseconds day

diagnostic monitor syslog

diagnostic monitor threshold switch {num} test {test-id | test-id-range | all} count failure count

no diagnostic monitor switch {*num*} **test** {*test-id* | *test-id-range* | **all**}

no diagnostic monitor interval switch {*num*} **test** {*test-id* | *test-id-range* | **all**}

no diagnostic monitor syslog

no diagnostic monitor threshold switch {num} test {test-id | test-id-range | all} failure count

Syntax Description	switch num	Specify the module number. The range is from 1 to 9.
	test	Specify a test to run.
	test-id	Identification number for the test to be run; see the "Usage Guidelines" section for additional information.
	test-id-range	Range of identification numbers for tests to be run; see the "Usage Guidelines" section for additional information.
	all	Run all the diagnostic tests.
	interval	Specify an interval between tests to be run.
	hh:mm:ss	Specify the number of time between tests; see the "Usage Guidelines" section for formatting guidelines.
	milliseconds	Specify the time in milliseconds; valid values are 0 to 999.
	day	Specify the number of days between tests; see the "Usage Guidelines" section for formatting guidelines.
	syslog	Enable the generation of a syslog message when a health-monitoring test fails.
	threshold	Specify the failure threshold.
	failure count <i>count</i>	Specify the failure threshold count.

Defaults

The defaults are as follows:

- Monitoring is disabled.
- syslog is enabled.

Command Modes Global configuration

Command History	Release Modification				
	12.2(25)SEE	This command was introduced.			
Jsage Guidelines	Use these guide	lines when scheduling testing:			
	• <i>test-id</i> —Enter the show diagnostic content privileged EXEC command to display the test ID list.				
	•	<i>e</i> —Enter the show diagnostic content command to display the test ID list. Enter the egers separated by a comma and a hyphen (for example, 1,3-6 specifies test IDs 1, 3, 4			
	• <i>hh</i> —Enter the hours from 0 to 23.				
	• <i>mm</i> —Enter	the minutes from 0 to 60.			
	• <i>ss</i> —Enter th	ne seconds from 0 to 60.			
	• millisecond	s—Enter the milliseconds from 0 to 999.			
	• <i>day</i> —Enter the day as a number from 0 to 20.				
	When entering the diagnostic monitor switch { <i>num</i> } test { <i>test-id</i> <i>test-id-range</i> all } command, follow these required guidelines				
	• Isolate network traffic by disabling all connected ports, and do not pump test packets during the test.				
	• Reset the sy	stem or the test module before putting the system back into the normal operating mode			
Note	potentially parti	ng a diagnostic test that has the reload attribute on a switch in a stack, you could tion the stack depending on your cabling configuration. To avoid partitioning your stack r the show switch detail privileged EXEC command to verify the stack configuration.			
Examples	This example sh	nows how to configure the specified test to run every 2 minutes:			
	Switch(config)	# diagnostic monitor interval switch 1 test 1 00:02:00 0 1			
	This example shows how to run the test on the specified switch if health monitoring has not previously been enabled:				
	Switch(config)# diagnostic monitor switch 1 test 1				
	This example shows how to set the failure threshold for test monitoring on a switch:				
	Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50				
	This example shows how to enable the generation of a syslog message when any health monitoring test fails:				
	Switch(config)	# diagnostic monitor syslog			

Related Commands	Command	Description
	show diagnostic	Displays online diagnostic test results.

diagnostic schedule

Use the **diagnostic schedule** privileged EXEC command to configure the scheduling of diagnostic testing for a standalone switch or the switch stack. Use the **no** form of this command to remove the scheduling and return to the default setting.

diagnostic schedule switch *num* **test** {*test-id* | *test-id-range* | **all** | **basic** | **non-disruptive**} {**daily** *hh:mm* | **on** *mm dd yyyy hh:mm* | **weekly** *day-of-week hh:mm*}

no diagnostic schedule switch *num* **test** {*test-id* | *test-id-range* | **all** | **basic** | **non-disruptive**} {**daily** *h:mm* | **on** *mm dd yyyy h:mm* | **weekly** *day-of-week hh:mm*}

Syntax Description	switch num	Specify the switch number. The range is from 1 to 9.
	test	Specify the test to be scheduled.
	test-id	Identification number for the test to be run; see the "Usage Guidelines" section for additional information.
	test-id-range	Range of identification numbers for tests to be run; see the "Usage Guidelines" section for additional information.
	all	Run all diagnostic tests.
	basic	Run basic on-demand diagnostic tests.
	non-disruptive	Run the nondisruptive health-monitoring tests.
	daily hh:mm	Specify the daily scheduling of a test-based diagnostic task; see the "Usage Guidelines" section for formatting guidelines.
	on mm dd yyyy hh:mm	Specify the scheduling of a test-based diagnostic task; see the "Usage Guidelines" section for formatting guidelines.
	weekly <i>day-of-week hh:mm</i>	Specify the weekly scheduling of a test-based diagnostic task; see the "Usage Guidelines" section for formatting guidelines.
Defaults Command Modes	This command has no Global configuration	o default settings.
Command History	Release Mo	odification
	12.2(25)SEE Th	is command was introduced.
Usage Guidelines	 <i>test-id</i>—Enter the <i>test-id-range</i>—Enter 	when scheduling testing: e show diagnostic content command to display the test ID list. nter the show diagnostic content command to display the test ID list. Enter the
	5, and 6).	separated by a comma and a hyphen (for example, 1,3-6 specifies test IDs 1, 3, 4

- *hh:mm*—Enter the time as a 2-digit number (for a 24-hour clock) for hours:minutes; the colon (:) is required.
- *mm*—Spell out the month, such as January, February... December (either upper case or lower case characters).
- *dd*—Enter the day as a 2-digit number.
- *yyyy*—Enter the year as a 4-digit number.
- *day-of-week*—Spell out the day of the week, such as Monday, Tuesday... Sunday (either upper case or lower case characters).

ExamplesThis example shows how to schedule diagnostic testing on a specific date and time for a specific switch:
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 on january 3 2006 23:32
This example shows how to schedule diagnostic testing to occur weekly at a certain time for a specific switch:
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly friday 09:23

Related Commands	Command	Description
	show diagnostic	Displays online diagnostic test results.

diagnostic start

Use the **diagnostic start** user command to run the specified diagnostic test.

diagnostic start switch *num* **test** {*test-id* | *test-id-range* | **all** | **basic** | **non-disruptive**}

Syntax Description	switch num	Specify the switch number. The range is from 1 to 9.	
	test	Specify a test to run.	
	test-id	Identification number for the test to be run; see the "Usage Guidelines" section for additional information.	
	test-id-range	Range of identification numbers for tests to be run; see the "Usage Guidelines" section for additional information.	
	all	Run all diagnostic tests.	
	basic	Run basic on-demand diagnostic tests.	
	non-disruptive	Run the nondisruptive health-monitoring tests.	
Defaults	This command ha	as no default settings.	
Command Modes	User EXEC		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Usage Guidelines	Enter the show diagnostic content command to display the test ID list.		
	Enter the <i>test-id-r</i> IDs 1, 3, 4, 5, and	<i>range</i> as integers separated by a comma and a hyphen (for example, 1,3-6 specifies test 1 6).	
Examples	This example sho	ows how to start a diagnostic test on a specific switch:	
	Switch> diagnostic start switch 1 test 1		
	Switch> 06:27:50: %DIAG-6-TEST_RUNNING: Switch 1: Running TestPortAsicStackPortLoopback{ID=1} (switch-1) 06:27:51: %DIAG-6-TEST_OK: Switch 1: TestPortAsicStackPortLoopback{ID=1} has completed successfully (switch-1)		
	This example shows how to start diagnostics test 2 on a switch that will disrupt normal system operation:		
	<pre>Switch> diagnostic start switch 1 test 2 Switch 1: Running test(s) 2 will cause the switch under test to reload after completion of the test list. Switch 1: Running test(s) 2 may disrupt normal system operation Do you want to continue? [no]: y Switch></pre>		

16:43:29: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state DOWN 16:43:30: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 9 has changed to state DOWN 16:43:30: %STACKMGR-4-SWITCH_REMOVED: Switch 1 has been REMOVED from the stack Switch# 16:44:35: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 2 has changed to state UP 16:44:37: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state UP 16:44:45: %STACKMGR-4-SWITCH_ADDED: Switch 1 has been ADDED to the stack 16:45:00: %STACKMGR-5-SWITCH_READY: Switch 1 is READY 16:45:00: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 1 has changed to state UP 16:45:00: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 1 has changed to state UP 00:00:20: %STACKMGR-4-SWITCH_ADDED: Switch 1 has been ADDED to the stack (Switch-1) 00:00:20: %STACKMGR-4-SWITCH_ADDED: Switch 2 has been ADDED to the stack (Switch-1) 00:00:25: %SPANTREE-5-EXTENDED_SYSID: Extended SysId enabled for type vlan (Switch-1) 00:00:29: %SYS-5-CONFIG_I: Configured from memory by console (Switch-1) 00:00:29: %STACKMGR-5-SWITCH_READY: Switch 2 is READY (Switch-1) 00:00:29: %STACKMGR-5-MASTER_READY: Master Switch 2 is READY (Switch-1) 00:00:30: %STACKMGR-5-SWITCH_READY: Switch 1 is READY (Switch-1) 00:00:30: %DIAG-6-TEST_RUNNING: Switch 1: Running TestPortAsicLoopback{ID=2} ... (Switch-1) 00:00:30: %DIAG-6-TEST_OK: Switch 1: TestPortAsicLoopback{ID=2} has completed successfully (Switch-1)

This message appears if the test can cause the switch to lose stack connectivity:

Switch 3: Running test(s) 2 will cause the switch under test to reload after completion of the test list. Switch 3: Running test(s) 2 may disrupt normal system operation Do you want to continue? [no]:

This message appears if the test will cause a stack partition:

Switch 6: Running test(s) 2 will cause the switch under test to reload after completion of the test list. Switch 6: Running test(s) 2 will partition stack Switch 6: Running test(s) 2 may disrupt normal system operation Do you want to continue? [no]:

Related Commands	Command	Description
	show diagnostic	Displays online diagnostic test results.

dot1x

Use the **dot1x** global configuration command on the switch stack or on a standalone switch to globally enable IEEE 802.1x authentication. Use the **no** form of this command to return to the default setting.

dot1x {critical {eapol | recovery delay milliseconds} | {guest-vlan supplicant} | system-auth-control}

no dot1x {critical {eapol | recovery delay} | {guest-vlan supplicant} | system-auth-control}

Though visible in the command-line help strings, the **credentials** name keywords are not supported.

Syntax Description	critical {eapol recovery delay milliseconds}	Configure the inaccessible authentication bypass parameters. For more information, see the dot1x critical (global configuration) command.
	guest-vlan supplicant	Enable optional guest VLAN behavior globally on the switch.
	system-auth-control	Enable IEEE 802.1x authentication globally on the switch.

Defaults

IEEE 802.1x authentication is disabled, and the optional guest VLAN behavior is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
	12.2(25)SE	The guest-vlan supplicant keywords were added.
	12.2(25)SEE	The critical {eapol recovery delay milliseconds} keywords were added.

Usage Guidelines

s You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list before globally enabling IEEE 802.1x authentication. A method list describes the sequence and authentication methods to be used to authenticate a user.

Before globally enabling IEEE 802.1x authentication on a switch, remove the EtherChannel configuration from the interfaces on which IEEE 802.1x authentication and EtherChannel are configured.

If you are using a device running the Cisco Access Control Server (ACS) application for IEEE 802.1x authentication with EAP-Transparent LAN Services (TLS) and with EAP-MD5 and your switch is running Cisco IOS Release 12.1(14)EA1, make sure that the device is running ACS Version 3.2.1 or later.

You can use the **guest-vlan supplicant** keywords to enable the optional IEEE 802.1x guest VLAN behavior globally on the switch. For more information, see the **dot1x guest-vlan** command.

 Examples
 This example shows how to globally enable IEEE 802.1x authentication on a switch:

 Switch(config)# dot1x system-auth-control

This example shows how to globally enable the optional guest VLAN behavior on a switch: Switch(config)# dot1x guest-vlan supplicant

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
	dot1x guest-vlan	Enables and specifies an active VLAN as an IEEE 802.1x guest VLAN.
	dot1x port-control	Enables manual control of the authorization state of the port.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

Use the **dot1x auth-fail max-attempts** interface configuration command on the switch stack or on a standalone switch to configure the maximum allowable authentication attempts before a port is moved to the restricted VLAN. To return to the default setting, use the **no** form of this command.

dot1x auth-fail max-attempts max-attempts

no dot1x auth-fail max-attempts

Syntax Description	max-attempts	Specify a maximum number of authentication attempts allowed before a port is moved to the restricted VLAN. The range is 1 to 3, the default value is 3.	
Defaults	The default value	is 3 attempts.	
Command Modes	Interface configur	ation	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	If you reconfigure the maximum number of authentication attempts allowed by the VLAN, the change takes effect after the re-authentication timer expires.		
Examples	-	ws how to set 2 as the maximum number of authentication attempts allowed before the he restricted VLAN on port 3:	
	<pre>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet1/0/3 Switch(config-if)# dot1x auth-fail max-attempts 2 Switch(config-if)# end Switch(config)# end Switch#</pre>		
	You can verify yo command.	ur settings by entering the show dot1x [interface interface-id] privileged EXEC	

Related Commands	Command	Description
	dot1x auth-fail vlan [vlan id]	Enables the optional restricted VLAN feature.
	<pre>dot1x max-reauth-req [count]</pre>	Sets the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

2-105

dot1x auth-fail vlan

Use the dot1x auth-fail vlan interface configuration command on the switch stack or on a standalone switch to enable the restricted VLAN on a port. To return to the default setting, use the no form of this command.

dot1x auth-fail vlan vlan-id

no dot1x auth-fail vlan

Syntax Description	vlan-id	Specify a VLAN in the range of 1 to 4094.	
Defaults	No restricted VL.	AN is configured.	
Command Modes	Interface configu	ration	
Command History	Release	Modification	
-	12.2(25)SED	This command was introduced.	
Usage Guidelines	You can configure	e a restricted VLAN on ports configured as follows:	
	• single-host (default) mode		
	• auto mode for authorization		
	You should enable re-authentication. The ports in restricted VLANs do not receive re-authentication requests if it is disabled. To start the re-authentication process, the restricted VLAN must receive a link-down event or an Extensible Authentication Protocol (EAP) logoff event from the port. If a host is connected through a hub, the port might never receive a link-down event when that host is disconnected, and, as a result, might not detect any new hosts until the next re-authentication attempt occurs.		
	If the supplicant fails authentication, the port is moved to a restricted VLAN, and an EAP <i>success</i> message is sent to the supplicant. Because the supplicant is not notified of the actual authentication failure, there might be confusion about this restricted network access. An EAP success message is sent for these reasons:		
		access message is not sent, the supplicant tries to authenticate every 60 seconds (the ending an EAP-start message.	
	• Some hosts (an EAP succ	for example, devices running Windows XP) cannot implement DHCP until they receive ess message.	
	success message	ht cache an incorrect username and password combination after receiving an EAP from the authenticator and re-use that information in every re-authentication. Until the the correct username and password combination, the port remains in the restricted	
	Internal VLANs	used for Layer 3 ports cannot be configured as restricted VLANs.	

You cannot configure a VLAN to be both a restricted VLAN and a voice VLAN. If you do this, a syslog message is generated.

When a restricted VLAN port is moved to an unauthorized state, the authentication process restarts. If the supplicant fails the authentication process again, the authenticator waits in the held state. After the supplicant has correctly re-authenticated, all IEEE 802.1x ports are reinitialized and treated as normal IEEE 802.1x ports.

When you reconfigure a restricted VLAN as a different VLAN, any ports in the restricted VLAN are also moved, and the ports stay in their currently authorized state.

When you shut down or remove a restricted VLAN from the VLAN database, any ports in the restricted VLAN are immediately moved to an unauthorized state, and the authentication process restarts. The authenticator does not wait in a held state because the restricted VLAN configuration still exists. While the restricted VLAN is inactive, all authentication attempts are counted so that when the restricted VLAN becomes active, the port is immediately placed in the restricted VLAN.

The restricted VLAN is supported only in single host mode (the default port mode). For this reason, when a port is placed in a restricted VLAN, the supplicant's MAC address is added to the MAC address table, and any other MAC address that appears on the port is treated as a security violation.

Examples This example shows how to configure a restricted VLAN on port 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# dot1x auth-fail vlan 40
Switch(config-if)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x auth-fail max-attempts [max-attempts]	Configures the number of authentication attempts allowed before assigning a supplicant to the restricted VLAN.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x control-direction

Use the dot1x control-direction interface configuration command to enable the IEEE 802.1x authentication with the wake-on-LAN (WoL) feature and to configure the port control as unidirectional or bidirectional. Use the no form of this command to return to the default setting.

dot1x control-direction {both | in}

no dot1x control-direction

Syntax Description	both	Enable bidirectional control on port. The port cannot receive packets from or send packets to the host.	
	in	Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.	
Defaults	The port is in bidire	ectional mode.	
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
	12.2(25)SEC	This command was introduced.	
		on about WoL, see the "Using IEEE 802.1x Authentication with Wake-on-LAN" figuring IEEE 802.1x Port-Based Authentication" chapter in the software e.	
Examples	This example show	a how to another unidirectional control.	
Examples	This example shows how to enable unidirectional control: Switch(config-if)# dot1x control-direction in		
	This example show	s how to enable bidirectional control:	
	-	# dot1x control-direction both	
	You can verify your	r settings by entering the show dot1x all privileged EXEC command.	
	The show dot1x all privileged EXEC command output is the same for all switches except for the port names and the state of the port. If a host is attached to the port but is not yet authenticated, a display similar to this appears:		
	Supplicant MAC 00 AuthSM State = CO BendSM State = ID PortStatus = UNAU	NNECTING DLE	

If you enter the **dot1x control-direction in** interface configuration command to enable unidirectional control, this appears in the **show dot1x all** command output:

ControlDirection = In

If you enter the **dot1x control-direction in** interface configuration command and the port cannot support this mode due to a configuration conflict, this appears in the **show dot1x all** command output:

ControlDirection = In (Disabled due to port settings)

Related Commands	Command	Description
	<pre>show dot1x [all interface interface-id]</pre>	Displays control-direction port setting status for the specified interface.

dot1x critical (global configuration)

Use the **dot1x critical** global configuration command on the switch stack or on a standalone switch to configure the parameters for the inaccessible authentication bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. To return to default settings, use the **no** form of this command.

dot1x critical {eapol | recovery delay milliseconds}

no dot1x critical {eapol | recovery delay}

Syntax Description	eapol	Specify that the switch sends an EAPOL-Success message when the switch puts the critical port in the critical-authentication state.	
	recovery delay milliseconds	Set the recovery delay period in milliseconds. The range is from 1 to 10000 milliseconds.	
Defaults		POL-Success message to the host when the switch successfully putting the critical port in the critical-authentication state.	
	The recovery delay period is 10	00 milliseconds (1 second).	
Command Modes	Global configuration		
Command History	Release Modification		
	12.2(25)SEE This comm	and was introduced.	
Usage Guidelines	Use the eapol keyword to specify that the switch sends an EAPOL-Success message when the switch puts the critical port in the critical-authentication state.		
Ū		•

Related Commands	Command	Description
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature, and configures the access VLAN for the feature.
	show dot1x	Displays IEEE 802.1x status for the specified port.

dot1x critical (interface configuration)

Use the **dot1x critical** interface configuration command on the switch stack or on a standalone switch to enable the inaccessible-authentication-bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. You can also configure the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state. To disable the feature or return to default, use the **no** form of this command.

dot1x critical [recovery action reinitialize | vlan vlan-id]

no dot1x critical [recovery | vlan]

	recovery action	reinitialize	Enable the inaccessible-authentication-bypass recovery feature, and specify that the recovery action is to authenticate the port when an authentication server is available.	
	vlan vlan-id		Specify the access VLAN to which the switch can assign a critical port. The range is from 1 to 4094.	
Defaults	The inaccessible-	authentication-	bypass feature is disabled.	
	The recovery act			
	The access VLA		-	
Command Modes	Interface configu	ration		
Command History	Release	Modificatio)n	
	12.2(25)SED	This comm	and was introduced.

The specified type of VLAN must match the sess port, the VLAN must be an access VLAN.	
Usage Guidelines	To specify the ac critical-authentic type of port, as fo • If the critical • If the critical • If the critical • If the critical If the client is run	cess VLAN to ation state, use ollows: port is an acce port is a privat port is a routed nning Windows	which the switch assigns a critical port when the port is in the the vlan <i>vlan-id</i> keywords. The specified type of VLAN must match the ess port, the VLAN must be an access VLAN. The VLAN host port, the VLAN must be a secondary private VLAN.	

You can configure the inaccessible authentication bypass feature and the restricted VLAN on an IEEE 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, the switch changes the port state to the critical authentication state, and it remains in the restricted VLAN.

You can configure the inaccessible bypass feature and port security on the same switch port.

Examples

This example shows how to enable the inaccessible authentication bypass feature on port 21:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/21
Switch(config-if)# dot1x critical
Switch(config-if)# end
Switch(config)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

dot1x fallback

Use the **dot1xfallback** interface configuration command on the switch stack or on a standalone switch to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the **no** form of this command.

dot1x fallback profile

no dot1x fallback

Syntax Description	profile	Specify a fall authentication	back profile for clients that do not support IEEE 802.1x n.			
Defaults	No fallback is en	abled.				
Command Modes	Interface configuration					
Command History	Release	Modification				
	12.2(35)SE	This command wa	as introduced.			
Usage Guidelines	You must enter the dot1x port-control auto interface configuration command on a switch port before entering this command.					
Examples	This example shows how to specify a fallback profile to a switch port that has been configured for IEEE 802.1x authentication:					
	<pre>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet1/0/3 Switch(config-if)# dot1x fallback profile1 Switch(config-fallback-profile)# exit Switch(config)# end</pre>					
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.

2-115

dot1x guest-vlan

Use the **dot1x guest-vlan** interface configuration command on the switch stack or on a standalone switch to specify an active VLAN as an IEEE 802.1x guest VLAN. Use the **no** form of this command to return to the default setting.

dot1x guest-vlan vlan-id

no dot1x guest-vlan

Syntax Description	vlan-id	Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094.			
Defaults	No guest VLAN is	s configured.			
Command Modes	Interface configuration				
Command History	Release	Modification			
	12.1(14)EA1	This command was introduced.			
	12.2(25)SE	This command was modified to change the default guest VLAN behavior.			
	 A static-access port that belongs to a nonprivate VLAN. A private-VLAN port that belongs to a secondary private VLAN. All the hosts connected to the switch port are assigned to private VLANs, whether or not the posture validation was successful. The switch determines the primary private VLAN by using the primary- and secondary-private-VLAN associations on the switch. 				
	secondary-private-VLAN associations on the switch.For each IEEE 802.1x port on the switch, you can configure a guest VLAN to provide limited services to clients (a device or workstation connected to the switch) not running IEEE 802.1x authentication.				
	These users might be upgrading their systems for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.				
	When you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.				
	With Cisco IOS Release 12.2(25)SE and later, the switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is reset upon loss of link.				
	Before Cisco IOS Release 12.2(25)SE, the switch did not maintain the EAPOL packet history and allowed clients that failed authentication access to the guest VLAN, regardless of whether EAPOL packets had been detected on the interface. In Cisco IOS Release 12.2(25)SE, you can use the dot1x guest-ylan supplicant global configuration command to enable this behavior.				

However, in Cisco IOS Release 12.2(25)SEE, the **dot1x guest-vlan supplicant** global configuration command is no longer supported. You can use a restricted VLAN to allow clients that failed authentication access to the network by entering the **dot1x auth-fail vlan** *vlan-id* interface configuration command.

Any number of non-IEEE 802.1x-capable clients are allowed access when the switch port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on IEEE 802.1x ports in single-host or multiple-hosts mode.

You can configure any active VLAN except an Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (**dot1x timeout quiet-period** and **dot1x timeout tx-period** interface configuration commands). The amount to decrease the settings depends on the connected IEEE 802.1x client type.

The switch supports *MAC authentication bypass* in Cisco IOS Release 12.2(25)SEE and later. When it is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified. For more information, see the "Using IEEE 802.1x Authentication with MAC Authentication Bypass" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.

```
This example shows how to specify VLAN 5 as an IEEE 802.1x guest VLAN:
```

Switch(config-if) # dot1x guest-vlan 5

This example shows how to set 3 as the quiet time on the switch, to set 15 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request, and to enable VLAN 2 as an IEEE 802.1x guest VLAN when an IEEE 802.1x port is connected to a DHCP client:

```
Switch(config-if)# dot1x timeout quiet-period 3
Switch(config-if)# dot1x timeout tx-period 15
Switch(config-if)# dot1x guest-vlan 2
```

This example shows how to enable the optional guest VLAN behavior and to specify VLAN 5 as an IEEE 802.1x guest VLAN:

```
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# dot1x guest-vlan 5
```

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Examples

Related Commands	Command	Description	
	dot1x	Enables the optional guest VLAN supplicant feature.	
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.	

dot1x host-mode

Use the **dot1x host-mode** interface configuration command on the switch stack or on a standalone switch to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port. Use the **multi-domain** keyword to enable multidomain authentication (MDA) on an IEEE 802.1x-authorized port. Use the **no** form of this command to return to the default setting.

dot1x host-mode {multi-host | single-host | multi-domain }

no dot1x host-mode [multi-host | single-host | multi-domain]

Syntax Description	multi-host	Enable multiple-hosts mode on the switch.
	single-host	Enable single-host mode on the switch.
	multi-domain	Enable MDA on a switch port.
Defaults	The default is sing	le-host mode.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.1(14)EA1	This command was introduced. It replaces the dot1x multiple-hosts interface configuration command.
	12.2(35)SE	The multi-domain keyword was added.
Usage Guidelines	an IEEE 802.1x-en successfully author (re-authentication f	to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to abled port. In multiple-hosts mode, only one of the attached hosts needs to be rized for all hosts to be granted network access. If the port becomes unauthorized fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is ned clients are denied access to the network.
	Use the multi-domain keyword to enable MDA on a port. MDA divides the port into both a data do and a voice domain. MDA allows both a data device and a voice device, such as an IP phone (Cisc non-Cisco), on the same IEEE 802.1x-enabled port.	
	Before entering this is set to auto for the	s command, make sure that the dot1x port-control interface configuration command he specified port.
Examples	-	s how to enable IEEE 802.1x authentication globally, to enable IEEE 802.1x port, and to enable multiple-hosts mode:
	Switch(config)# : Switch(config-if)	dot1x system-auth-control interface gigabitethernet2/0/1 # dot1x port-control auto # dot1x host-mode multi-host

This example shows how to globally enable IEEE 802.1x authentication, to enable IEEE 802.1x authentication, and to enable MDA on the specified port:

Switch(config)# dot1x system-auth-control Switch(config)# interface gigabitethernet3/0/1 Switch(config-if)# dot1x port-control auto Switch(config-if)# dot1x host-mode multi-domain

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x initialize

Use the **dot1x initialize** privileged EXEC command on the switch stack or on a standalone switch to manually return the specified IEEE 802.1x-enabled port to an unauthorized state before initiating a new authentication session on the port.

dot1x initialize [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be initialized.	
Defaults	There is no default setting.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
Usage Guidelines		lize the IEEE 802.1x state machines and to set up a fresh environment for nter this command, the port status becomes unauthorized. his command.	
Examples	This example shows how to manually initialize a port:		
	Switch# dot1x initialize interface gigabitethernet2/0/22		
	You can verify the unautho privileged EXEC command	rized port status by entering the show dot1x [interface <i>interface-id</i>] 1.	
Related Commands	Command	Description	
	show dot1x [interface interface inte	<i>erface-id</i>] Displays IEEE 802.1x status for the specified port.	

dot1x mac-auth-bypass

Use the **dot1x mac-auth-bypass** interface configuration command on the switch stack or on a standalone switch to enable the MAC authentication bypass feature. Use the **no** form of this command to disable MAC authentication bypass feature.

dot1x mac-auth-bypass [eap | timeout inactivity value]

no dot1x mac-auth-bypass

Syntax Description	eap	(Optional) Configure the switch to use Extensible Authentication Protocol (EAP) for authentication.	
	timeout inactivity <i>value</i>	(Optional) Configure the number of seconds that a connected host can be inactive before it is placed in an unauthorized state. The range is 1 to 65535.	
Defaults	MAC authentication	bypass is disabled.	
Command Modes	Interface configuration	on	
Command History	Release	Modification	
-	12.2(25)SEE	This command was introduced.	
	12.2(35)SE	The timeout inactivity <i>value</i> keywords were added.	
Usage Guidelines	Unless otherwise stated, the MAC authentication bypass usage guidelines are the same as the IEEE 802.1x authentication guidelines.If you disable MAC authentication bypass from a port after the port has been authenticated with its MAC address, the port state is not affected.		
	If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.		
	If the port is in the authorized state, the port remains in this state until re-authorization occurs.		
	If the port is in the at	ithorized state, the port remains in this state until re-authorization occurs.	
	If an EAPOL packet that the device conne	is detected on the interface during the lifetime of the link, the switch determines cted to that interface is an IEEE 802.1x-capable supplicant and uses IEEE 802.1x IAC authentication bypass) to authorize the interface.	
	If an EAPOL packet that the device conne authentication (not M	is detected on the interface during the lifetime of the link, the switch determines cted to that interface is an IEEE 802.1x-capable supplicant and uses IEEE 802.1x	

Examples	This example shows how to enable MAC authentication bypass and to configure the switch to use EAP for authentication:					
	<pre>Switch(config-if)# dot1x mac-auth-bypass eap This example shows how to enable MAC authentication bypass and to configure the timeout if the connected host is inactive for 30 seconds: Switch(config-if)# dot1x mac-auth-bypass timeout inactivity 30 You can verify your settings by entering the show dot1x [interface interface-id] privileged EXEC command.</pre>					
				Related Commands	Command	Description
					<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x max-reauth-req

Use the **dot1x max-reauth-req** interface configuration command on the switch stack or on a standalone switch to set the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state. Use the **no** form of this command to return to the default setting.

dot1x max-reauth-req count

no dot1x max-reauth-req

	N	
Syntax Description		umber of times that the switch restarts the authentication process before the
	po	rt changes to the unauthorized state. The range is 0 to 10.
Defaults	The default is 2 times.	
Donano	The default is 2 times.

Command History	Release	Modification
Commanu mistory		
	12.2(18)SE	This command was introduced.
	12.2(25)SEC	The <i>count</i> range was changed.
<u> </u>	••••••	
Usage Guidelines		fault value of this command only to adjust for unusual circumstances such as
	unreliable links or specifi	c behavioral problems with certain clients and authentication servers.
Examples	This example shows how	to set 4 as the number of times that the switch restarts the authentication
Exampleo	-	anges to the unauthorized state:
	Switch(config-if)# dot :	1x max-reauth-reg 4
	Vou con vonify your estim	as he entering the chare dot 1 interface interface in minilaged EVEC
	command.	gs by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC
	commune.	
Related Commands	Command	Description
	dot1x max-req	Sets the maximum number of times that the switch forwards an EAP
		frame (assuming that no response is received) to the authentication server
		before restarting the authentication process.
	dot1x timeout tx-period	-
		EAP-request/identity frame from the client before resending the
		request.
	show dot1x [interface	Displays IEEE 802.1x status for the specified port.
	interface-id]	

dot1x max-req

Use the **dot1x max-req** interface configuration command on the switch stack or on a standalone switch to set the maximum number of times that the switch sends an Extensible Authentication Protocol (EAP) frame from the authentication server (assuming that no response is received) to the client before restarting the authentication process. Use the **no** form of this command to return to the default setting.

dot1x max-req count

no dot1x max-req

Syntax Description		Sumber of times that the switch resends an EAP frame from the authentication erver before restarting the authentication process. The range is 1 to 10.	
Defaults	The default is 2 times.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	This command was changed to the interface configuration mode.	
Examples	This example shows how	The client before restarting the authentication process:	
	Switch(config-if)# dot1x max-reg 5		
	You can verify your setti command.	ngs by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC	
Related Commands	Command	Description	
	dot1x timeout tx-period	d Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.	
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.	

dot1x multiple-hosts

This is an obsolete command.

In past releases, the **dot1x multiple-hosts** interface configuration command was used on the switch stack or on a standalone switch to allow multiple hosts (clients) on an IEEE 802.1x-authorized port.

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The dot1x multiple-hosts interface configuration command was replaced by the dot1x host-mode interface configuration command.

Related Commands	Command	Description
	dot1x host-mode	Sets the IEEE 802.1x host mode on a port.
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.

dot1x pae

Use the **dot1x pae** interface configuration command on the switch stack or on a standalone switch to configure the port as an IEEE 802.1x port access entity (PAE) authenticator. Use the **no** form of this command to disable IEEE 802.1x authentication on the port.

dot1x pae authenticator

no dot1x pae

Syntax Description	This command has no arguments or keywords.		
Defaults	The port is not an II port.	EEE 802.1x PAE authenticator, and IEEE 802.1x authentication is disabled on the	
Command Modes	Interface configurat	on	
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Usage Guidelines	Use the no dot1x pae interface configuration command to disable IEEE 802.1x authentication on the port. When you configure IEEE 802.1x authentication on a port, such as by entering the dot1x port-control		
	interface configurat	on command, the switch automatically configures the port as an EEE 802.1x the no dot1x pae interface configuration command is entered, the Authenticator	
Examples	This example shows how to disable IEEE 802.1x authentication on the port: Switch(config-if)# no dot1x pae		
	You can verify your settings by entering the show dot1x or show eap privileged EXEC command.		
Related Commands	Command	Description	
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.	
	show eap	Displays EAP registration and session information for the switch or for the specified port.	

dot1x port-control

Use the **dot1x port-control** interface configuration command on the switch stack or on a standalone switch to enable manual control of the authorization state of the port. Use the **no** form of this command to return to the default setting.

dot1x port-control {auto | force-authorized | force-unauthorized}

no dot1x port-control

Syntax Description	auto	Enable IEEE 802.1x authentication on the port and cause the port to change to	
		the authorized or unauthorized state based on the IEEE 802.1x authentication exchange between the switch and the client.	
	force-authorized	Disable IEEE 802.1x authentication on the port and cause the port to transition to the authorized state without an authentication exchange. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client.	
	force-unauthorized	Deny all access through this port by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.	
Defaults	The default is force-a	uthorized.	
Command Modes	Interface configuratio	n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	You must globally enable IEEE 802.1x authentication on the switch by using the dot1x system-auth-control global configuration command before enabling IEEE 802.1x authentication on a specific port.		
	The IEEE 802.1x standard is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports.		
	You can use the auto keyword only if the port is not configured as one of these:		
	• Trunk port—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.		
	• Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.		

	• Dynamic-access ports—If you try to enable IEEE 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
	• EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.
	Note In software releases earlier than Cisco IOS Release 12.2(18)SE, if IEEE 802.1x authentication is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.
	• Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.
	To globally disable IEEE 802.1x authentication on the switch, use the no dot1x system-auth-control global configuration command. To disable IEEE 802.1x authentication on a specific port or to return to the default setting, use the no dot1x port-control interface configuration command.
Examples	This example shows how to enable IEEE 802.1x authentication on a port:
	Switch(config)# interface gigabitethernet2/0/21 Switch(config-if)# dot1x port-control auto
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.
Rolatod Commande	Command Description

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

2-129

dot1x re-authenticate

Use the **dot1x re-authenticate** privileged EXEC command on the switch stack or on a standalone switch to manually initiate a re-authentication of the specified IEEE 802.1x-enabled port.

dot1x re-authenticate [interface interface-id]

Syntax Description	interface interface-id	(Optional) Stack switch number, module, and port number of the interface to re-authenticate.
Defaults	There is no default settin	g.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		nd to re-authenticate a client without waiting for the configured number of entication attempts (re-authperiod) and automatic re-authentication.
Examples	-	to manually re-authenticate the device connected to a port: enticate interface gigabitethernet2/0/21
Related Commands	Command	Description
	dot1x reauthentication	Enables periodic re-authentication of the client.
	dot1x timeout reauth-p	Sets the number of seconds between re-authentication attempts.

dot1x re-authentication

This is an obsolete command.

In past releases, the **dot1x re-authentication** global configuration command was used on the switch stack or on a standalone switch to set the amount of time between periodic re-authentication attempts.

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The dot1x reauthentication interface configuration command replaced the dot1x re-authentication global configuration command.

Related Commands

Command	Description
dot1x reauthentication	Sets the number of seconds between re-authentication attempts.
show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.

dot1x reauthentication

Use the **dot1x reauthentication** interface configuration command on the switch stack or on a standalone switch to enable periodic re-authentication of the client. Use the **no** form of this command to return to the default setting.

dot1x reauthentication

no dot1x reauthenti	cation
---------------------	--------

Syntax Description	This command has n	no arguments or keywords.
--------------------	--------------------	---------------------------

- **Defaults** Periodic re-authentication is disabled.
- **Command Modes** Interface configuration

Command History	Kelease	Modification
	12.1(14)EA1	This command was introduced. It replaces the dot1x re-authentication global configuration command (with the hyphen).
Usage Guidelines	You configure the	e amount of time between periodic re-authentication attempts by using the dot1x

Auidelines You configure the amount of time between periodic re-authentication attempts by using the dot1x timeout reauth-period interface configuration command.

Examples This example shows how to disable periodic re-authentication of the client:

Switch(config-if) # no dot1x reauthentication

This example shows how to enable periodic re-authentication and to set the number of seconds between re-authentication attempts to 4000 seconds:

Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x re-authenticate	Manually initiates a re-authentication of all IEEE 802.1x-enabled ports.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x test eapol-capable

Use the **dot1x test eapol-capable** privileged EXEC command on the switch stack or on a standalone switch to monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x.

dot1x test eapol-capable [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be queried.	
Defaults	There is no default setting	g.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(44)SE	This command was introduced.	
Usage Guidelines	Use this command to test ports on a switch.	the IEEE 802.1x capability of the devices connected to all ports or to specific	
	There is not a no form of	this command.	
Examples	-	to enable the IEEE 802.1x readiness check on a switch to query a port. It also ved from the queried port verifying that the device connected to it is	
	switch# dot1x test eapol-capable interface gigabitethernet1/0/13 DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable		
Related Commands	Command	Description	
	dot1x test timeout timeo	out Configures the timeout used to wait for EAPOL response to an IEEE 802.1x readiness query.	

dot1x test timeout

Use the **dot1x test timeout** global configuration command on the switch stack or on a standalone switch to configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness.

dot1x test timeout timeout

Syntax Description	timeout	Time in sec 1 to 65535	conds to wait for an EAPOL response. The range is from seconds.
Defaults	The default setting is	10 seconds.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(44)SE	This comman	d was introduced.
Usage Guidelines	Use this command to There is not a no forr	-	out used to wait for EAPOL response.
Examples	This example shows l Switch# dot1x test	-	e switch to wait 27 seconds for an EAPOL response:
	You can verify the tir	neout configuration	n status by entering the show run privileged EXEC command.
Related Commands	Command		Description
	<pre>dot1x test eapol-cap interface-id]</pre>	bable [interface	Checks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports.

dot1x timeout

Use the **dot1x timeout** interface configuration command on the switch stack or on a standalone switch to set IEEE 802.1x timers. Use the **no** form of this command to return to the default setting.

dot1x timeout {quiet-period seconds | ratelimit-period seconds | reauth-period {seconds |
 server} | server-timeout seconds | supp-timeout seconds | tx-period seconds}

no dot1x timeout {quiet-period | reauth-period | server-timeout | supp-timeout | tx-period}

quiet-period seconds	Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535.	
ratelimit-period seconds	Number of seconds that the switch ignores Extensible Authentication Protocol over LAN (EAPOL) packets from clients that have been successfully authenticated during this duration. The range is 1 to 65535.	
reauth-period {seconds	Set the number of seconds between re-authentication attempts.	
server}	The keywords have these meanings:	
	• <i>seconds</i> —Sets the number of seconds from 1 to 65535; the default is 3600 seconds.	
	• server —Sets the number of seconds as the value of the Session-Timeout RADIUS attribute (Attribute[27]).	
server-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the authentication server. The range is 30 to 65535.	
supp-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the IEEE 802.1x client. The range is 30 to 65535.	
tx-period seconds	Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65535.	
	ratelimit-period seconds reauth-period {seconds server} server-timeout seconds supp-timeout seconds	

Defaults

These are the default settings:

reauth-period is 3600 seconds.

quiet-period is 60 seconds.

tx-period is 5 seconds.

supp-timeout is 30 seconds.

server-timeout is 30 seconds.

rate-limit is 1 second.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The supp-timeout and server-timeout keywords were added, and the command was changed to the interface configuration mode.
	12.2(18)SE	The ranges for the server-timeout , supp-timeout , and tx-period keywords were changed.
	12.2(25)SEC	The range for tx-period keyword was changed, and the reauth-period server keywords were added.
	12.2(25)SEE	The ratelimit-period keyword was introduced.
	12.2(40)SE	The range for tx-period <i>seconds</i> is incorrect. The correct range is from 1 to 65535.
Usage Guidelines	unreliable links or s	the default value of this command only to adjust for unusual circumstances such as specific behavioral problems with certain clients and authentication servers.
		reauth-period interface configuration command affects the behavior of the switch abled periodic re-authentication by using the dot1x reauthentication interface nand.
		riod, the switch does not accept or initiate any authentication requests. If you want response time to the user, enter a number smaller than the default.
		-period is set to 0 (the default), the switch does not ignore EAPOL packets from en successfully authenticated and forwards them to the RADIUS server.
Examples	This example shows between re-authenti	s how to enable periodic re-authentication and to set 4000 as the number of seconds ication attempts:
		<pre># dot1x reauthentication # dot1x timeout reauth-period 4000</pre>
	_	s how to enable periodic re-authentication and to specify the value of the ADIUS attribute as the number of seconds between re-authentication attempts:
		<pre># dot1x reauthentication # dot1x timeout reauth-period server</pre>
	This example show	s how to set 30 seconds as the quiet time on the switch:
	Switch(config-if)	# dot1x timeout quiet-period 30
	This example show	s how to set 45 seconds as the switch-to-authentication server retransmission time:
		ot1x timeout server-timeout 45
	This example shows request frame:	s how to set 45 seconds as the switch-to-client retransmission time for the EAP
	-	# dot1x timeout supp-timeout 45
	-	s how to set 60 as the number of seconds to wait for a response to an ty frame from the client before re-transmitting the request:
	-	# dotly timeout ty-period 60

```
Switch(config-if) # dot1x timeout tx-period 60
```

This example shows how to set 30 as the number of seconds that the switch ignores EAPOL packets from successfully authenticated clients:

Switch(config-if)# dot1x timeout ratelimit-period 30

You can verify your settings by entering the **show dot1x** privileged EXEC command.

Related Commands	Command	Description
	dot1x max-req	Sets the maximum number of times that the switch sends an EAP-request/identity frame before restarting the authentication process.
	dot1x reauthentication	Enables periodic re-authentication of the client.
	show dot1x	Displays IEEE 802.1x status for all ports.

dot1x violation-mode

Use the **dot1x violation-mode** interface configuration command on the switch stack or on a standalone switch to configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.

dot1x violation-mode { shutdown | restrict | protect }

no dot1x violation-mode

Syntax Description	shutdown	Error disables the port or the virtual port on which a new unexpected MAC address occurs.	
	restrict	Generates a syslog error when a violation error occurs.	
	protect	Silently discards packets from any new MAC addresses. This is the default setting.	
Defaults	By default dot1x v	iolation-mode protect is enabled.	
Command Modes	Interface configura	ition	
Command History	Release	Modification	
-	12.2(46)SE	This command was introduced.	
Examples	-	vs how to configure an IEEE 802.1x-enabled port as error disabled and to shut down connects to the port:	
		# dot1x violation-mode shutdown	
	This example shows how to configure an IEEE 802.1x-enabled port to generate a system error and change the port to restricted mode when a new device connects to the port:		
	Switch(config-if)	# dot1x violation-mode restrict	
	This example show when it is connected	vs how to configure an IEEE 802.1x-enabled port to ignore a new connected device ed to the port:

	You can verify you command.	r settings by entering the show dot1x [interface interface-id] privileged EXEC	

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

duplex

Use the **duplex** interface configuration command on the switch stack or on a standalone switch to specify the duplex mode of operation for a port. Use the **no** form of this command to return the port to its default value.

duplex {auto | full | half}

no duplex

Syntax Description	auto	Enable automatic duplex configuration; port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.	
	full	Enable full-duplex mode.	
	half	Enable half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.	
Defaults	The default is aut	o for Fast Ethernet and Gigabit Ethernet ports.	
	The default is full	for 100BASE-x (where -x is -BX, -FX, -FX-FE, or - LX) SFP modules.	
	Duplex options are not supported on the 1000BASE- <i>x</i> (where - <i>x</i> is -BX, -CWDM, -LX, -SX, or -ZX) SFP modules.		
	For information about which SFP modules are supported on your switch, see the product release notes.

Support for the half keyword was added for the 100BASE-FX SFP module. not available on a 10-Gigabit Ethernet interface. ports, setting the port to auto has the same effect as specifying half if the attached	

Note

Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is **auto** and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duplex mode.

Certain ports can be configured to be either full duplex or half duplex. Applicability of this command depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do use the **auto** setting on the supported side.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

Beginning with Cisco IOS Release 12.2(20)SE1, you can configure the duplex setting when the speed is set to **auto**.

∕!∖ Caution

Examples

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.

This example shows how to configure an interface for full-duplex operation:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# duplex full

You can verify your setting by entering the show interfaces privileged EXEC command.

Related Commands Command Description		Description
	show interfaces	Displays the interface settings on the switch.
	speed	Sets the speed on a 10/100 or 10/100/1000 Mb/s interface.

errdisable detect cause

Use the **errdisable detect cause** global configuration command on the switch stack or on a standalone switch to enable error-disable detection for a specific cause or all causes. Use the **no** form of this command to disable the error-disable detection feature.

- errdisable detect cause {all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power ||2ptguard | link-flap | loopback | pagp-flap | security-violation shutdown vlan | sfp-config-mismatch}
- no errdisable detect cause {all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power |l2ptguard | link-flap | loopback | pagp-flap | security-violation shutdown vlan | sfp-config-mismatch }

For the BPDU guard and port-security features, you can use this command to globally configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

When the per-VLAN error-disable feature is turned off and a BPDU guard violation occurs, the entire port is disabled. Use the **no** form of this command to disable the per-VLAN error-disable feature.

errdisable detect cause bpduguard shutdown vlan

no errdisable detect cause bpduguard shutdown vlan

Syntax Description	all	Enable error detection for all error-disabled causes.
	arp-inspection	Enable error detection for dynamic Address Resolution Protocol (ARP) inspection.
	bpduguard shutdown vlan	Enable per-VLAN error-disable for BPDU guard.
	dhcp-rate-limit	Enable error detection for DHCP snooping.
	dtp-flap	Enable error detection for the Dynamic Trunking Protocol (DTP) flapping.
	gbic-invalid	Enable error detection for an invalid Gigabit Interface Converter (GBIC) module.
		Note On the Catalyst 3750switch, this error refers to an invalid small form-factor pluggable (SFP) module.
	inline-power	Enable error detection for inline power.
	l2ptguard	Enable error detection for a Layer 2 protocol tunnel error-disabled cause.
	link-flap	Enable error detection for link-state flapping.
	loopback	Enable error detection for detected loopbacks.
	pagp-flap	Enable error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.
	security-violation shutdown vlan	Enable voice aware 802.1x security.
	sfp-config-mismatch	Enable error detection on an SFP configuration mismatch.

Command Default Detection is enabled for all causes. All causes, except for per-VLAN error disabling, are configured to shut down the entire port.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The loopback keyword was added.
	12.1(19)EA1	The dhcp-rate-limit keyword was added.
	12.2(20)SE	The arp-inspection keyword was added.
	12.2(25)SE	The l2ptguard keyword was added.
	12.2(37)SE	The Per-VLAN error-detection feature was added. The inline-power and
		sfp-config-mismatch keywords were added.
	12.2(46)SE	The security-violation shutdown vlan keywords were added.

Usage Guidelines A cause (**link-flap**, **dhcp-rate-limit**, and so forth) is the reason why the error-disabled state occurred. When a cause is detected on a port, the port is placed in an error-disabled state, an operational state that

is similar to a link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU, voice aware 802.1x security, guard and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the **errdisable recovery** global configuration command for the cause, the port is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the **shutdown** and then the **no shutdown** commands to manually change the port from the error-disabled state.

Examples

This example shows how to enable error-disable detection for the link-flap error-disabled cause:

Switch(config) # errdisable detect cause link-flap

This command shows how to globally configure BPDU guard for per-VLAN error disable:

Switch(config) # errdisable detect cause bpduguard shutdown vlan

This command shows how to globally configure voice aware 802.1x security for per-VLAN error disable:

Switch(config) # errdisable detect cause security-violation shutdown vlan

You can verify your settings by entering the show errdisable detect privileged EXEC command.

Г

Re

elated Commands	Command	Description
	show errdisable detect	Displays error-disabled detection information.
	show interfaces status err-disabled	Displays interface status or a list of interfaces in the error-disabled state.
	clear errdisable interface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.

errdisable detect cause small-frame

Use the **errdisable detect cause small-frame** global configuration command on the switch stack or on a standalone switch to allow any switch port to be error disabled if incoming VLAN-tagged packets are small frames (67 bytes or less) and arrive at the minimum configured rate (the threshold). Use the **no** form of this command to return to the default setting.

errdisable detect cause small-frame

no errdisable detect cause small-frame

Syntax Description	This command has	no arguments or keywords.
Defaults	This feature is disal	bled.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.2(44)SE	This command was introduced.
Usage Guidelines	configuration comm You can configure t	pally enables the small-frame arrival feature. Use the small violation-rate interface hand to set the threshold for each port. he port to be automatically re-enabled by using the errdisable recovery cause configuration command. You configure the recovery time by using the errdisable
	recovery interval <i>i</i>	nterval global configuration command.
Examples	-	s how to enable the switch ports to be put into the error-disabled mode if incoming at the configured threshold:
	Switch(config)# e	rrdisable detect cause small-frame
	** :0	

You can verify your setting by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	errdisable recovery cause small-frame	Enables the recovery timer.
	errdisable recovery interval interval	Specifies the time to recover from the specified error-disabled state.
	show interfaces	Displays the interface settings on the switch, including input and output flow control.
	small violation-rate	Configures the rate (threshold) for incoming small frames to cause a port to be put into the error-disabled state.

errdisable recovery cause small-frame

Use the **errdisable recovery cause small-frame** global configuration command on the switch stack or on a standalone switch to enable the recovery timer for ports to be automatically re-enabled after they are error disabled by the arrival of small frames. Use the **no** form of this command to return to the default setting.

errdisable recovery cause small-frame

no errdisable recovery cause small-frame

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** This feature is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.

Usage Guidelines This command enables the recovery timer for error-disabled ports. You configure the recovery time by using the errdisable **recovery interval** *interval* interface configuration command.

Examples This example shows how to set the recovery timer:

Switch(config)# errdisable recovery cause small-frame

You can verify your setting by entering the show interfaces user EXEC command.

Related Commands	Command	Description	
	errdisable detect cause small-frame	Allows any switch port to be put into the error-disabled state if an incoming frame is smaller than the configured minimum size and arrives at the specified rate (threshold).	
	show interfaces	Displays the interface settings on the switch, including input and output flow control.	
	small violation-rate	Configures the size for an incoming (small) frame to cause a port to be put into the error-disabled state.	

errdisable recovery

Use the **errdisable recovery** global configuration command on the switch stack or on a standalone switch to configure the recover mechanism variables. Use the **no** form of this command to return to the default setting.

- errdisable recovery {cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power |l2ptguard | link-flap | loopback | pagp-flap | psecure-violation | security-violation | sfp-mismatch | udld | vmps} | {interval interval}
- no errdisable recovery {cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | psecure-violation | security-violation | sfp-mismatch | udld | vmps} | {interval interval}

Syntax Description	cause	Enable the error-disabled mechanism to recover from a specific cause.
	all	Enable the timer to recover from all error-disabled causes.
	bpduguard	Enable the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.
	arp-inspection	Enable the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.
	channel-misconfig	Enable the timer to recover from the EtherChannel misconfiguration error-disabled state.
	dhcp-rate-limit	Enable the timer to recover from the DHCP snooping error-disabled state.
	dtp-flap	Enable the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.
	gbic-invalid	Enable the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.
		Note On the Catalyst 3750switch, this error refers to an invalid small form-factor pluggable (SFP) error-disabled state.
	inline-power	Enable error detection for inline-power.
	l2ptguard	Enable the timer to recover from a Layer 2 protocol tunnel error-disabled state.
	link-flap	Enable the timer to recover from the link-flap error-disabled state.
	loopback	Enable the timer to recover from a loopback error-disabled state.
	pagp-flap	Enable the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.
	psecure-violation	Enable the timer to recover from a port security violation disable state.
	security-violation	Enable the timer to recover from an IEEE 802.1x-violation disabled state.
	sfp-mismatch	Enable error detection on an SFP configuration mismatch.
	udld	Enable the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.

	vmps	Enable the timer to recover from the VLAN Membership Policy Server (VMPS) error-disabled state.	
	interval interval	Specify the time to recover from the specified error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds.	
		Note The error-disabled recovery timer is initialized at a random differential from the configured interval value. The difference between the actual timeout value and the configured value can be up to 15 percent of the configured interval.	
Defaults	Recovery is disabled	for all causes.	
	The default recovery	interval is 300 seconds.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	The security-violation keyword was added. The gbic-invalid keyword is supported for SFP module ports.	
	12.1(19)EA1	The dhcp-rate-limit keyword was added.	
	12.2(18)SE	The channel-misconfig keyword was added.	
	12.2(20)SE	The arp-inspection keyword was added.	
	12.2(25)SE	The l2ptguard keyword was added.	
	12.2(37)SE	The per-VLAN error-detection feature was added. The inline-power and sfp-mismatch keywords were added.	
Usage Guidelines	· •	pduguard, and so forth) is defined as the reason that the error-disabled state	
	state similar to the lin	use is detected on a port, the port is placed in the error-disabled state, an operational nk-down state.	
	BPDU guard and por	isabled, it is effectively shut down, and no traffic is sent or received on the port. For the t-security features, you can configure the switch to shut down just the offending hen a violation occurs, instead of shutting down the entire port.	
	the shutdown and the	the recovery for the cause, the port stays in the error-disabled state until you enter e no shutdown interface configuration commands. If you enable the recovery for a ught out of the error-disabled state and allowed to retry the operation again when med out.	
	Otherwise, you must port from the error-d	enter the shutdown and then the no shutdown commands to manually recover a isabled state.	

Examples This example shows how to enable the recovery timer for the BPDU guard error-disabled cause: Switch(config)# errdisable recovery cause bpduguard This example shows how to set the timer to 500 seconds: Switch(config)# errdisable recovery interval 500

You can verify your settings by entering the show errdisable recovery privileged EXEC command.

Related Commands	Command	Description
	show errdisable recovery	Displays error-disabled recovery timer information.
	show interfaces status err-disabled	Displays interface status or a list of interfaces in error-disabled state.
	clear errdisable interface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.

exception crashinfo

Use the **exception crashinfo** global configuration command on the switch stack or on a standalone switch to configure the switch to create the extended crashinfo file when the Cisco IOS image fails. Use the **no** form of this command to disable this feature.

exception crashinfo

no exception crashinfo

Syntax Description	This command has n	no arguments or	keywords.
--------------------	--------------------	-----------------	-----------

- **Defaults** The switch creates the extended crashinfo file.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(25)SEC	This command was introduced.

Usage Guidelines The basic crashinfo file includes the Cisco IOS image name and version that failed, a list of the processor registers, and a stack trace. The extended crashinfo file includes additional information that can help determine the cause of the switch failure.

If you enter the **exception crashinfo** global configuration command on a stack master, it configures all the stack members to create the extended crashinfo file if the Cisco IOS image on the stack members fail.

Use the **no exception crashinfo** global configuration command to configure the switch to not create the extended crashinfo file.

 Examples
 This example shows how to configure the switch to not create the extended crashinfo file:

 Switch(config)# no exception crashinfo

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the operating configuration, including defined macros.
		For syntax information, select Cisco IOS Configuration
		Fundamentals Command Reference, Release 12.2 > File
		Management Commands > Configuration File Management
		Commands.

fallback profile

Use the **fallback profile** global configuration command on the switch stack or on a standalone switch to create a fallback profile for web authentication. To return to the default setting, use the **no** form of this command.

fallback profile profile

no fallback profile

Syntax Description	profile	Specify the fallback profile for clients that do not support IEEE 802.1x authentication.	
Defaults	No fallback pro	file is configured.	
Command Modes	Global configur	ation	
Command History	Release	Modification	
	12.2(35)SE	This command was introduced.	
Usage Guidelines	The fallback profile is used to define the IEEE 802.1x fallback behavior for IEEE 802.1x ports that do not have supplicants. The only supported behavior is to fall back to web authentication.		
	After entering the fallback profile command, you enter profile configuration mode, and these configuration commands are available:		
	• ip: Create an IP configuration.		
	• access-group: Specify access control for packets sent by hosts that have not yet been authenticated.		
	• admission: Apply an IP admission rule.		
Examples	This example sh	nows how to create a fallback profile to be used with web authentication:	
	<pre>Switch# configure terminal Switch(config)# ip admission name rule1 proxy http Switch(config)# fallback profile profile1 Switch(config-fallback-profile)# ip access-group default-policy in Switch(config-fallback-profile)# ip admission rule1 Switch(config-fallback-profile)# exit Switch(config)# interface gigabitethernet 1/0/1 Switch(config-if)# dot1x fallback profile1 Switch(config-if)# end</pre>		
	You can verify y	your settings by entering the show running-configuration [interface <i>interface-id</i>] C command.	

Related Commands Command Description dot1x fallback Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. ip admission Enable web authentication on a switch port ip admission name proxy http Enable web authentication globally on a switch show dot1x [interface interface-id] Displays IEEE 802.1x status for the specified port. show fallback profile Display the configured profiles on a switch.

flowcontrol

Use the **flowcontrol** interface configuration command on the switch stack or on a standalone switch to set the receive flow-control state for an interface. When flow control **send** is operable and on for a device and it detects any congestion at its end, it notifies the link partner or the remote device of the congestion by sending a pause frame. When flow control **receive** is on for a device and it receives a pause frame, it stops sending any data packets. This prevents any loss of data packets during the congestion period.

Use the receive off keywords to disable flow control.

flowcontrol receive {desired | off | on}

The switch can receive, but not send, pause frames.

Syntax Description	receive	Set whether the interface can receive flow-control packets from a remote device.	
		Allow an interface to operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.	
	off	Turn off the ability of an attached device to send flow-control packets to an interface.	
		Allow an interface to operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.	
efaults	The default is f	flowcontrol receive off.	
command Modes	Interface confi	guration	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Jsage Guidelines	The switch doe	es not support sending flow-control pause frames.	
	Note that the on and desired keywords have the same result.		
	When you use the flowcontrol command to set a port to control traffic rates during congestion, you are setting flow control on a port to one of these conditions:		
		or desired : The port cannot send pause frames, but can operate with an attached device nired to or is able to send pause frames. The port can receive pause frames.	
		The second secon	

Table 2-5 shows the flow control results on local and remote ports for a combination of settings. The table assumes that **receive desired** has the same results as using the **receive on** keywords.

Flow Control Settings		Flow Control Resolution	
Local Device	Remote Device	Local Device	Remote Device
send off/receive on	send on/receive on	Receives only	Sends and receives
	send on/receive off	Receives only	Sends only
	send desired/receive on	Receives only	Sends and receives
	send desired/receive off	Receives only	Sends only
	send off/receive on	Receives only	Receives only
	send off/receive off	Does not send or receive	Does not send or receive
send off/receive off	send on/receive on	Does not send or receive	Does not send or receive
	send on/receive off	Does not send or receive	Does not send or receive
	send desired/receive on	Does not send or receive	Does not send or receive
	send desired/receive off	Does not send or receive	Does not send or receive
	send off/receive on	Does not send or receive	Does not send or receive
	send off/receive off	Does not send or receive	Does not send or receive

Table 2-5 Flow Control Settings and Local and Remote Port Flow Control Resolution

Examples This example shows how to configure the local port to not support flow control by the remote port:

Switch(config)# interface gigabitethernet1/0/21
Switch(config-if)# flowcontrol receive off

You can verify your settings by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	show interfaces	Displays the interface settings on the switch, including input and output flow control.

interface port-channel

Use the **interface port-channel** global configuration command on the switch stack or on a standalone switch to access or create the port-channel logical interface. Use the **no** form of this command to remove the port-channel.

interface port-channel port-channel-number

no interface port-channel port-channel-number

Syntax Description	port-channel-number	Port-channel number. The range is 1 to 48.
Defaults	No port-channel logica	l interfaces are defined.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SE	The <i>port-channel-number</i> range was changed from 1 to 12 to 1 to 48.
Usage Guidelines	physical port to a chan command. It automatic	nels, you do not have to create a port-channel interface first before assigning a nel group. <u>^</u>	physical port to a cham command. It automatic physical port. If you cr as the <i>port-channel-nun</i> command dynamically You create Layer 3 por switchport interface co interface before putting Only one port channel When using a port-cham ports that are assigned	nel group. Instead, you can use the channel-group interface configuration cally creates the port-channel interface when the channel group gets its first reate the port-channel interface first, the <i>channel-group-number</i> can be the same <i>mber</i> , or you can use a new number. If you use a new number, the channel-group creates a new port channel. It channels by using the interface port-channel command followed by the no onfiguration command. You should manually configure the port-channel logical g the interface into the channel group. in a channel group is allowed.

Follow these guidelines when you use the interface port-channel command:

- If you want to use the Cisco Discovery Protocol (CDP), you must configure it only on the physical port and not on the port-channel interface.
- Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE 802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Examples This example shows how to create a port-channel interface with a port channel number of 5: Switch(config)# interface port-channel 5

You can verify your setting by entering the **show running-config** privileged EXEC or **show etherchannel** *channel-group-number* **detail** privileged EXEC command.

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

interface range

Use the **interface range** global configuration command on the switch stack or on a standalone switch to enter interface range configuration mode and to execute a command on multiple ports at the same time. Use the **no** form of this command to remove an interface range.

interface range {port-range | macro name}

no interface range {*port-range* | **macro** *name*}

Syntax Description	port-range	Port range. For a list of valid values for <i>port-range</i> , see the "Usage Guidelines" section.		
	macro name	Specify the name of a macro.		
Defaults	This command h	nas no default setting.		
Command Modes	Global configur:	ation		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	When you enter interface range configuration mode, all interface parameters you enter are attributed to all interfaces within the range.			
	(SVIs). To displa displayed canno	a can use the interface range command only on existing VLAN switch virtual interfaces ay VLAN SVIs, enter the show running-config privileged EXEC command. VLANs not t be used in the interface range command. The commands entered under interface I are applied to all existing VLAN SVIs in the range.		
	All configuration changes made to an interface range are saved to NVRAM, but the interface range itself is not saved to NVRAM.			
	You can enter the interface range in two ways:			
	• Specifying up to five interface ranges			
	• Specifying a previously defined interface-range macro			
	All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs. However, you can define up to five interface ranges with a single command, with each range separated by a comma.			
	Valid values for	port-range type and interface:		
	• vlan vlan-II	D - vlan-ID, where VLAN ID is from 1 to 4094		
	• fastetherne	t stack member/module/{ <i>first port</i> } - { <i>last port</i> }, where module is always 0		

• **gigabitethernet** stack member/module/{*first port*} - {*last port*}, where module is always **0** For physical interfaces:

- stack member is the number used to identify the switch within the stack. The number ranges from 1 to 9 and is assigned to the switch the first time the stack member initializes.

- module is always 0
- the range is type stack member/0/number number (for example, gigabitethernet1/0/1 2)
- **port-channel** *port-channel-number port-channel-number*, where *port-channel-number* is from 1 to 48

When you use the **interface range** command with port channels, the first and last port channel number in the range must be active port channels.

When you define a range, you must enter a space between the first entry and the hyphen (-):

```
interface range gigabitethernet1/0/1 -2
```

When you define multiple ranges, you must still enter a space after the first entry and before the comma (,):

```
interface range fastethernet1/0/1 - 2, gigabitethernet1/0/1 - 2
```

You cannot specify both a macro and an interface range in the same command.

You can also specify a single interface in *port-range*. The command is then similar to the **interface** *interface-id* global configuration command.

For more information about configuring interface ranges, see the software configuration guide for this release.

Examples

This example shows how to use the **interface range** command to enter interface-range configuration mode to apply commands to two ports:

```
Switch(config)# interface range gigabitethernet1/0/1 - 2
Switch(config-if-range)#
```

This example shows how to use a port-range macro *macro1* for the same function. The advantage is that you can reuse *macro1* until you delete it.

```
Switch(config)# define interface-range macrol gigabitethernet1/0/1 - 2
Switch(config)# interface range macro macrol
Switch(config-if-range)#
```

L

Related Commands	Command	Description
	define interface-range	Creates an interface range macro.
	show running-config	Displays the configuration information currently running on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

interface vlan

Use the **interface vlan** global configuration command on the switch stack or on a standalone switch to create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode. Use the **no** form of this command to delete an SVI.

interface vlan vlan-id

no interface vlan vlan-id

Syntax Description	vlan-id	VLAN number. The range is 1 to 4094.	
Defaults	The default VLAN	interface is VLAN 1.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Note	encapsulated trunk	or the VLAN-tag associated with data frames on an ISL or IEEE 802.1Q or the VLAN ID configured for an access port.	
•	If you delete an SV	If by entering the no interface vlan <i>vlan-id</i> command, the deleted interface is no e output from the show interfaces privileged EXEC command.	
<u> </u>	You cannot delete t	the VLAN 1 interface.	
	You can re-instate a deleted SVI by entering the interface vlan <i>vlan-id</i> command for the deleted interface. The interface comes back up, but the previous configuration is gone.		
	features being conf	ip between the number of SVIs configured on a switch stack and the number of other igured might have an impact on CPU utilization due to hardware limitations. You can global configuration command to reallocate system hardware resources based on	

templates and feature tables. For more information, see the sdm prefer command.

Examples This example shows how to create a new SVI with VLAN ID 23 and to enter interface configuration mode:

Switch(config)# interface vlan 23
Switch(config-if)#

You can verify your setting by entering the **show interfaces** and **show interfaces vlan** *vlan-id* privileged EXEC commands.

Related Commands	Command	Description	
	show interfaces vlan vlan-id	Displays the administrative and operational status of all interfaces or the specified VLAN.	

ip access-group

Use the **ip access-group** interface configuration command on the switch stack or on a standalone switch to control access to a Layer 2 or Layer 3 interface. Use the **no** form of this command to remove all access groups or the specified access group from the interface.

ip access-group {access-list-number | name} {in | out}

no ip access-group [access-list-number | name] {**in** | **out**}

	1		
Syntax Description	access-list-number	The number of the IP access control list (ACL). The range is 1 to 199 or 1300 to 2699.	
	name	The name of an IP ACL, specified in the ip access-list global configuration command.	
	in	Specify filtering on inbound packets.	
	out	Specify filtering on outbound packets. This keyword is valid only on Layer 3 interfaces.	
Defaults	No access list is applie	d to the interface.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	This command support was extended to Layer 2 interfaces.	
Usage Guidelines	access list by name, use access list, use the acce	or numbered standard or extended IP access lists to an interface. To define an e the ip access-list global configuration command. To define a numbered ess list global configuration command. You can used numbered standard access 99 and 1300 to 1999 or extended access lists ranging from 100 to 199 and	
	You can use this command to apply an access list to a Layer 2 or Layer 3 interface. However, note these limitations for Layer 2 interfaces (port ACLs):		
	• You can only apply ACLs in the inbound direction; the out keyword is not supported for Layer 2 interfaces.		
	• You can only apply one IP ACL and one MAC ACL per interface.		
	• Layer 2 interfaces of	do not support logging; if the log keyword is specified in the IP ACL, it is ignored.	
	• An IP ACL applied to a Layer 2 interface only filters IP packets. To filter non-IP packets, use the mac access-group interface configuration command with MAC extended ACLs.		

You can use router ACLs, input port ACLs, and VLAN maps on the same switch. However, a port ACL takes precedence over a router ACL or VLAN map:

- When an input port ACL is applied to an interface and a VLAN map is applied to a VLAN that the interface is a member of, incoming packets received on ports with the ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACLs exist in an switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
- When a VLAN map, output router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

You can apply IP ACLs to both outbound or inbound Layer 3 interfaces.

A Layer 3 interface can have one IP ACL applied in each direction.

You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

For standard inbound access lists, after the switch receives a packet, it checks the source address of the packet against the access list. IP extended access lists can optionally check other fields in the packet, such as the destination IP address, protocol type, or port numbers. If the access list permits the packet, the switch continues to process the packet. If the access list denies the packet, the switch discards the packet. If the access list has been applied to a Layer 3 interface, discarding a packet (by default) causes the generation of an Internet Control Message Protocol (ICMP) Host Unreachable message. ICMP Host Unreachable messages are not generated for packets discarded on a Layer 2 interface.

For standard outbound access lists, after receiving a packet and sending it to a controlled interface, the switch checks the packet against the access list. If the access list permits the packet, the switch sends the packet. If the access list denies the packet, the switch discards the packet and, by default, generates an ICMP Host Unreachable message.

If the specified access list does not exist, all packets are passed.

Examples

This example shows how to apply IP access list 101 to inbound packets on a port:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 101 in

You can verify your settings by entering the **show ip interface**, **show access-lists**, or **show ip access-lists** privileged EXEC command.

Related Commands	Command	Description
	access list	Configures a numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands
	ip access-list	Configures a named ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	show access-lists	Displays ACLs configured on the switch.
	show ip access-lists	Displays IP ACLs configured on the switch. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	show ip interface	Displays information about interface status and configuration. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.

ip address

Use the **ip address** interface configuration command on the switch stack or on a standalone switch to set an IP address for the Layer 2 switch or an IP address for each switch virtual interface (SVI) or routed port on the Layer 3 switch. Use the **no** form of this command to remove an IP address or to disable IP processing.

ip address ip-address subnet-mask [secondary]

no ip address [ip-address subnet-mask] [secondary]

Syntax Description	ip-address	IP address.
	subnet-mask	Mask for the associated IP subnet.
	secondary	(Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
Defaults	No IP address is def	fined.
Command Modes	Interface configurat	ion
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Hosts can find subn	witch IP address through a Telnet session, your connection to the switch will be lost. et masks using the Internet Control Message Protocol (ICMP) Mask Request espond to this request with an ICMP Mask Reply message.
Usage Guidelines	Hosts can find subn	
	command. If the sw to the console.	processing on a particular interface by removing its IP address with the no ip address itch detects another host using one of its IP addresses, it will send an error message
	Secondary addresse other than routing up	ional keyword secondary to specify an unlimited number of secondary addresses. s are treated like primary addresses, except the system never generates datagrams pdates with secondary source addresses. IP broadcasts and ARP requests are handled arface routes in the IP routing table.
<u>Note</u>	must also use a seco	etwork segment uses a secondary address, all other devices on that same segment ondary address from the same network or subnet. Inconsistent use of secondary ork segment can very quickly cause routing loops.
		ng Open Shortest Path First (OSPF), ensure that all secondary addresses of an le same OSPF area as the primary addresses.

If your switch receives its IP address from a Bootstrap Protocol (BOOTP) or a DHCP server and you remove the switch IP address by using the **no ip address** command, IP processing is disabled, and the BOOTP or the DHCP server cannot reassign the address.

A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is not limited by software; however, the interrelationship between this number and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.

ExamplesThis example shows how to configure the IP address for the Layer 2 switch on a subnetted network:
Switch(config)# interface vlan 1
Switch(config-if)# ip address 172.20.128.2 255.255.255.0This example shows how to configure the IP address for a port on the Layer 3 switch:
Switch(config)# ip multicast-routing
Switch(config)# interface gigabitethernet6/0/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 172.20.128.2 255.255.255.0You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

L

ip admission

Use the **ip admission** interface configuration command to enable web authentication. You can also use this command in fallback-profile mode. Use the **no** form of this command to disable web authentication.

ip admission *rule*

no ip admission

Syntax Description	<i>rule</i> Apply an IP admission rule to the interface.				
Command Modes	Global configuration				
Command History	Release	Modification			
	12.2(35)SE	This command was introduced.			
Usage Guidelines	The ip admissio	n command applies a web authentication rule to a switch port.			
Examples	This example shows how to apply a web authentication rule to a switchport:				
	Switch# configure terminal Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)# ip admission rule1				
	This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.				
	Switch# configure terminal Switch(config)# fallback profile profile1 Switch(config)# ip admission name rule1 Switch(config)# end				

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	fallback profile	Enable web authentication on a port
	ip admission name proxy http	Enable web authentication globally on a switch
	show ip admission	Displays information about NAC cached entries or the NAC configuration.
		For more information, see the <i>Network Admission Control Software</i> <i>Configuration Guide</i> on Cisco.com.

ip admission name proxy http

Use the **ip admission name proxy http** global configuration command to enable web authentication. Use the **no** form of this command to disable web authentication.

ip admission name proxy http

no ip admission name proxy http

Syntax Description	This command h	as no arguments or keywords.
Defaults	Web authenticat	ion is disabled.
Command Modes	Global configura	ation
Command History	Release	Modification
	12.2(35)SE	This command was introduced.
Usage Guidelines	After you enable	on name proxy http command globally enables web authentication on a switch. web authentication on a switch, use the ip access-group in and ip admission <i>web-rule</i> aration commands to enable web authentication on a specific interface.
Examples	Switch# config Switch(config) Switch(config) Switch(config-	ows how to configure only web authentication on a switchport: ure terminal ip admission name http-rule proxy http # interface gigabitethernet1/0/1 if)# ip access-group 101 in if)# ip admission rule
	mechanism on a Switch# config Switch(config)	ows how to configure IEEE 802.1x authentication with web authentication as a fallback switchport.

Switch(config)# ip access group 101 in
Switch(config)# ip admission name rule2
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x fallback profile1
Switch(config-if)# end

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	fallback profile	Create a web authentication fallback profile.
	ip admission	Enable web authentication on a port
	show ip admission	Displays information about NAC cached entries or the NAC configuration. For more information, see the <i>Network Admission Control Software</i> <i>Configuration Guide</i> on Cisco.com.

2-171

ip arp inspection filter vlan

Use the **ip arp inspection filter vlan** global configuration command on the switch stack or on a standalone switch to permit or deny Address Resolution Protocol (ARP) requests and responses from a host configured with a static IP address when dynamic ARP inspection is enabled. Use the **no** form of this command to return to the default settings.

ip arp inspection filter arp-acl-name vlan vlan-range [static]

no ip arp inspection filter *arp-acl-name* **vlan** *vlan-range* [**static**]

Syntax Description	arp-acl-name	ARP access control list (ACL) name.
	vlan-range	VLAN number or range.
	Ū.	You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	static	(Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.
		If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.
Defaults Command Modes	No defined ARP A Global configurati	ACLs are applied to any VLAN.
Command History	Release	Modification
Command History	Release 12.2(20)SE	Modification This command was introduced.
	12.2(20)SE When an ARP AC IP-to-MAC addres	
Command History Usage Guidelines	12.2(20)SE When an ARP AC IP-to-MAC address forwards it. All ot If the switch denies the switch denies	This command was introduced. It is applied to a VLAN for dynamic ARP inspection, only the ARP packets with so bindings are compared against the ACL. If the ACL permits a packet, the switch

ExamplesThis example shows how to apply the ARP ACL static-hosts to VLAN 1 for dynamic ARP inspection:
Switch(config)# ip arp inspection filter static-hosts vlan 1

You can verify your settings by entering the show ip arp inspection vlan 1 privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP ACL.
	deny (ARP access-list configuration)	Denies an ARP packet based on matches against the DHCP bindings.
	permit (ARP access-list configuration)	Permits an ARP packet based on matches against the DHCP bindings.
	show arp access-list	Displays detailed information about ARP access lists.
	show inventory vlan vlan-range	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip arp inspection limit

Use the **ip arp inspection limit** interface configuration command on the switch stack or on a standalone switch to limit the rate of incoming Address Resolution Protocol (ARP) requests and responses on an interface. It prevents dynamic ARP inspection from using all of the switch resources if a denial-of-service attack occurs. Use the **no** form of this command to return to the default settings.

ip arp inspection limit {**rate** *pps* [**burst interval** *seconds*] | **none**}

no ip arp inspection limit

Syntax Description	rate ppsSpecify an upper limit for the number of incoming packets processed second. The range is 0 to 2048 packets per second (pps).			
	burst interval seconds (Optional) Specify the consecutive interval in seconds, over interface is monitored for a high rate of ARP packets. The ra- seconds.			
	none	Specify no upper limit for the rate of incoming ARP packets that can be processed.		
Defaults		The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second.		
	The rate is unlimited on	all trusted interfaces.		
	The burst interval is 1 so	econd.		
Command Modes	Interface configuration			
Command History	Release Modification			
	12.2(20)SE TI	nis command was introduced.		
Usage Guidelines	The rate applies to both trusted and untrusted interfaces. Configure appropriate rates on trunks to process packets across multiple dynamic ARP inspection-enabled VLANs, or use the none keyword to make the rate unlimited.			
	After a switch receives more than the configured rate of packets every second consecutively over a number of burst seconds, the interface is placed into an error-disabled state.			
	Unless you explicitly configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the no ip arp inspection limit interface configuration command, the interface reverts to its default rate limit.			
	incoming packets exceed	unk ports with higher rates to reflect their aggregation. When the rate of ds the user-configured rate, the switch places the interface into an error-disabled l recovery feature automatically removes the port from the error-disabled state		

The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

The rate of incoming ARP packets on EtherChannel ports equals the sum of the incoming rate of ARP packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on all the channel members.

Examples This example shows how to limit the rate of incoming ARP requests on a port to 25 pps and to set the interface monitoring interval to 5 consecutive seconds:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip arp inspection limit rate 25 burst interval 5
```

You can verify your settings by entering the **show ip arp inspection interfaces** *interface-id* privileged EXEC command.

Related Commands	ls Command Description	
	show inventory	Displays the trust state and the rate limit of ARP packets for the specified
	interfaces	interface or all interfaces.

ī

logging rate.

ip arp inspection log-buffer

Use the ip arp inspection log-buffer global configuration command on the switch stack or on a standalone switch to configure the dynamic Address Resolution Protocol (ARP) inspection logging buffer. Use the no form of this command to return to the default settings.

ip arp inspection log-buffer {**entries** *number* | **logs** *number* **interval** *seconds*}

	no ip arp insp	ection log-buffer {entries logs}		
Syntax Description	entries number	Number of entries to be logged in the buffer. The range is 0 to 1024.		
-	logs number	Number of entries needed in the specified interval to generate system messages.		
	interval seconds	For logs <i>number</i> , the range is 0 to 1024. A 0 value means that the entry is placed in the log buffer, but a system message is not generated.		
		For interval <i>seconds</i> , the range is 0 to 86400 seconds (1 day). A 0 value means that a system message is immediately generated (and the log buffer is always empty).		
Defaults	When dynamic AR The number of log	P inspection is enabled, denied or dropped ARP packets are logged. entries is 32.		
	The number of system messages is limited to 5 per second.			
	The logging-rate interval is 1 second.			
Command Modes	Global configuratio	Modification		
	12.2(20)SE	This command was introduced.		
Usage Guidelines		allowed for both the logs and the interval keywords. val settings interact. If the logs <i>number</i> X is greater than interval <i>seconds</i> Y, X		
	divided by Y (X/Y) system messages are sent every second. Otherwise, one system message is sent every Y divided by X (Y/X) seconds. For example, if the logs number is 20 and the interval seconds is 4, the switch generates system messages for five entries every second while there are entries in the log buffer.			
	packets on the same	can represent more than one packet. For example, if an interface receives many e VLAN with the same ARP parameters, the switch combines the packets as one entry nd generates a system message as a single entry.		
	for the show ip arg appears in place of	erflows, it means that a log event does not fit into the log buffer, and the output display p inspection log privileged EXEC command is affected. A in the output display all data except the packet count and the time. No other statistics are provided for the is entry in the display, increase the number of entries in the log buffer, or increase the		

The log buffer configuration applies to each stack member in a switch stack. Each stack member has the specified **logs** *number* entries and generates system messages at the configured rate. For example, if the interval (rate) is one entry per second, up to five system messages are generated per second in a five-member switch stack.

Examples This example shows how to configure the logging buffer to hold up to 45 entries:

Switch(config) # ip arp inspection log-buffer entries 45

This example shows how to configure the logging rate to 20 log entries per 4 seconds. With this configuration, the switch generates system messages for five entries every second while there are entries in the log buffer.

Switch(config)# ip arp inspection log-buffer logs 20 interval 4

You can verify your settings by entering the **show ip arp inspection log** privileged EXEC command.

Related Commands	Command	Description	
	arp access-list	Defines an ARP access control list (ACL).	
	clear ip arp inspection log	Clears the dynamic ARP inspection log buffer.	
	ip arp inspection vlan logging	Controls the type of packets that are logged per VLAN.	
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.	

ip arp inspection trust

Use the **ip arp inspection trust** interface configuration command on the switch stack or on a standalone switch to configure an interface trust state that determines which incoming Address Resolution Protocol (ARP) packets are inspected. Use the **no** form of this command to return to the default setting.

ip arp inspection trust

no ip arp inspection trust

Syntax Description	This command has	no arguments or	keywords.
--------------------	------------------	-----------------	-----------

Defaults The interface is untrusted.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(20)SE	This command was introduced.

Usage Guidelines The switch does not check ARP packets that it receives on the trusted interface; it simply forwards the packets.

For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the **ip arp inspection vlan logging** global configuration command.

Examples This example shows how to configure a port to be trusted:

Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)# ip arp inspection trust

You can verify your setting by entering the **show ip arp inspection interfaces** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	show inventory interfaces	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

2-179

ip arp inspection validate

Use the **ip arp inspection validate** global configuration command on the switch stack or on a standalone switch to perform specific checks for dynamic Address Resolution Protocol (ARP) inspection. Use the **no** form of this command to return to the default settings.

ip arp inspection validate {[src-mac] [dst-mac] [ip [allow zeros]]}

no ip arp inspection validate [src-mac] [dst-mac] [ip [allow zeros]]

Syntax Description	src-mac	Compare the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses.		
		When enabled, packets with different MAC addresses are classified as invalid and are dropped.		
	dst-mac	Compare the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses.		
		When enabled, packets with different MAC addresses are classified as invalid and are dropped.		
	ip	Compare the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses.		
		Sender IP addresses are compared in all ARP requests and responses. Target IP addresses are checked only in ARP responses.		
	allow-zeros	Modifies the IP validation test so that ARPs with a sender address of 0.0.0.0 (ARP probes) are not denied.		
Defaults	No checks are performed.			
Command Modes	Global configu	iration		
Command History	Release	Modification		
	12.2(20)SE	This command was introduced.		
	12.2(37)SE	The allow-zero keyword was added.		
Usage Guidelines	-	ify at least one of the keywords. Each command overrides the configuration of the		

Founderines Fourmust specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables **src-mac** and **dst-mac** validations, and a second command enables IP validation only, the **src-mac** and **dst-mac** validations are disabled as a result of the second command.

The allow-zeros keyword interacts with ARP access control lists (ACLs) in this way:

- If you configure an ARP ACL to deny ARP probes, they are dropped even if the **allow-zero** keyword is specified.
- If you configure an ARP ACL that specifically permits ARP probes and configure the **ip arp inspection validate ip** command, ARP probes are dropped unless you enter the **allow-zeros** keyword.

The **no** form of the command disables only the specified checks. If none of the options are enabled, all checks are disabled.

ExamplesThis example show how to enable source MAC validation:
Switch(config)# ip arp inspection validate src-macYou can verify your setting by entering the show in arp inc

You can verify your setting by entering the **show ip arp inspection vlan** *vlan-range* privileged EXEC command.

Related Commands	Command	Description
	show inventory vlan vlan-range	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip arp inspection vlan

Use the **ip arp inspection vlan** global configuration command on the switch stack or on a standalone switch to enable dynamic Address Resolution Protocol (ARP) inspection on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip arp inspection vlan vlan-range

no ip arp inspection vlan vlan-range

Syntax Description	vlan-range	VLAN number or range.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
Defaults	ARP inspection is disa	bled on all VLANs.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Usage Guidelines		VLANs on which to enable dynamic ARP inspection. on is supported on access ports, trunk ports, EtherChannel ports, or private VLAN
Examples	This example shows he	ow to enable dynamic ARP inspection on VLAN 1:
•	-	arp inspection vlan 1
	You can verify your se command.	tting by entering the show ip arp inspection vlan <i>vlan-range</i> privileged EXEC
Related Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	show inventory vlan <i>vlan-range</i>	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip arp inspection vlan logging

Use the **ip arp inspection vlan logging** global configuration command on the switch stack or on a standalone switch to control the type of packets that are logged per VLAN. Use the **no** form of this command to disable this logging control.

no ip arp inspection vlan *vlan-range* logging {acl-match | dhcp-bindings | arp-probe}

Syntax Description	vlan-range	Specify the VLANs configured for logging.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	acl-match {matchlog none}	Specify that the logging of packets is based on access control list (ACL) matches.
		The keywords have these meanings:
		• matchlog —Log packets based on the logging configuration specified in the access control entries (ACE). If you specify the matchlog keyword in this command and the log keyword in the permit or deny ARP access-list configuration command, Address Resolution Protocol (ARP) packets permitted or denied by the ACL are logged.
		• none —Do not log packets that match ACLs.
	dhcp-bindings {permit all none}	Specify the logging of packets is based on Dynamic Host Configuration Protocol (DHCP) binding matches.
		The keywords have these meanings:
		• all —Log all packets that match DHCP bindings.
		• none —Do not log packets that match DHCP bindings.
		• permit —Log DHCP-binding permitted packets.
	arp-probe	Specify logging of packets permitted specifically because they are ARP probes.
Defaults	All denied or all droppe	ed packets are logged. ARP probe packets are not logged.
Command Modes	Global configuration	
Command History	Delesso M	Indification

Command History	Release	Modification
	12.2(20)SE	This command was introduced.
	12.2(37)SE	The arp-probe keyword was added.

clear ip arp inspection log ip arp inspection log-buffer

show inventory log

show inventory vlan

vlan-range

	arp access-list Defines an ARP ACL.
Related Commands	Command Description
	<pre>Switch(config)# arp access-list test1 Switch(config-arp-nacl)# permit request ip any mac any log Switch(config-arp-nacl)# permit response ip any any mac any any log Switch(config-arp-nacl)# exit Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog You can verify your settings by entering the show ip arp inspection vlan vlan-range privileged EXEC command.</pre>
Examples	This example shows how to configure ARP inspection on VLAN 1 to log packets that match the permit commands in the ACL:
	The implicit deny at the end of an ACL does not include the log keyword. This means that when you use the static keyword in the ip arp inspection filter vlan global configuration command, the ACL overrides the DHCP bindings. Some denied packets might not be logged unless you explicitly specify the deny ip any mac any log ACE at the end of the ARP ACL.
	If neither the acl-match or the dhcp-bindings keywords are specified, all denied packets are logged.
	• dhcp-bindings —Logging on DHCP binding matches is reset to log on deny.
	• acl-match—Logging on ACL matches is reset to log on deny.
	The acl-match and dhcp-bindings keywords merge with each other; that is, when you configure an ACL match, the DHCP bindings configuration is not disabled. Use the no form of the command to reset the logging criteria to their defaults. If neither option is specified, all types of logging are reset to log when ARP packets are denied. These are the options:
Usage Guidelines	The term <i>logged</i> means that the entry is placed into the log buffer and that a system message is generated.

Clears the dynamic ARP inspection log buffer.

inspection log buffer.

inspection for the specified VLAN.

Configures the dynamic ARP inspection logging buffer.

ip dhcp snooping

Use the **ip dhcp snooping** global configuration command on the switch stack or on a standalone switch to globally enable DHCP snooping. Use the **no** form of this command to return to the default setting.

ip dhcp snooping

no ip dhcp snooping

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

- **Defaults** DHCP snooping is disabled.
- Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage GuidelinesFor any DHCP snooping configuration to take effect, you must globally enable DHCP snooping.DHCP snooping is not active until you enable snooping on a VLAN by using the ip dhcp snooping vlan
vlan-id global configuration command.

ExamplesThis example shows how to enable DHCP snooping:
Switch(config)# ip dhcp snooping
You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	ip dhcp snooping vlan	Enables DHCP snooping on a VLAN.
	show ip igmp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping binding

ip dhcp snooping binding

Use the **ip dhcp snooping binding** privileged EXEC command on the switch stack or on a standalone switch to configure the DHCP snooping binding database and to add binding entries to the database. Use the **no** form of this command to delete entries from the binding database.

ip dhcp snooping binding mac-address **vlan** vlan-id ip-address **interface** interface-id **expiry** seconds

no ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id

Syntax Description	mac-address	Specify a MAC address.
	vlan vlan-id	Specify a VLAN number. The range is 1 to 4094.
	ip-address	Specify an IP address.
	interface interface-	<i>id</i> Specify an interface on which to add or delete a binding entry.
	expiry seconds	Specify the interval (in seconds) after which the binding entry is no longer valid. The range is 1 to 4294967295.
Defaults	No default database	is defined.
Command Modes	Privileged EXEC	
Command History	Release N	Nodification
	12.2(20)SE T	This command was introduced.
Usage Guidelines	Use this command v	vhen you are testing or debugging the switch.
	In the DHCP snooping binding database, each database entry, also referred to a binding, has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database can have up to 8192 bindings.	
	-	cp snooping binding privileged EXEC command to display only the configured now ip source binding privileged EXEC command to display the dynamically and

ExamplesThis example shows how to generate a DHCP binding configuration with an expiration time of
1000 seconds on a port in VLAN 1:
Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface
gigabitethernet1/0/1 expiry 1000You can verify your settings by entering the show ip dhcp snooping binding or the show ip dhcp source
binding privileged EXEC command.

Related Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	show ip dhcp snooping binding	Displays the dynamically configured bindings in the DHCP snooping binding database and the configuration information.
	show ip source binding	Displays the dynamically and statically configured bindings in the DHCP snooping binding database.

ip dhcp snooping database

Use the **ip dhcp snooping database** global configuration command on the switch stack or on a standalone switch to configure the DHCP snooping binding database agent. Use the **no** form of this command to disable the agent, to reset the timeout value, or to reset the write-delay value.

ip dhcp snooping database {{flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password]@]{hostname | host-ip][/directory]/image-name.tar | rcp://user@host/filename | tftp://host/filename} | timeout seconds | write-delay seconds}

no ip dhcp snooping database [timeout | write-delay]

Syntax Description	flash[number]	:Ifilename	Specify that the database agent or the binding file is in the flash	
			memory. (Optional) Use the <i>number</i> parameter to specify the stack member number of the stack master. The range for <i>number</i> is 1 to 9.	
	ftp://user:pas	sword@hostlfilename	Specify that the database agent or the binding file is on an FTP server.	
	-	ame:password]@] ost-ip}[/directory] t ar	Specify that the database agent or the binding file is on an FTP server.	
	rcp://user@ha	ostlfilename	Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.	
	tftp://host/file	name	Specify that the database agent or the binding file is on a TFTP server.	
	timeout secon	ads	Specify (in seconds) how long to wait for the database transfer process to finish before stopping.	
			The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.	
	write-delay so	econds	Specify (in seconds) the duration for which the transfer should be delayed after the binding database changes. The default is 300 seconds. The range is 15 to 86400.	
Defaults	The URL for the database agent or binding file is not defined.			
	The timeout value is 300 seconds (5 minutes).			
	The write-delay value is 300 seconds (5 minutes).			
Command Modes	Global configu	iration		
Command History	Release	Modification		
	12.2(20)SEThis command was introduced.			

Usage Guidelines

s The DHCP snooping binding database can have up to 8192 bindings.

To ensure that the lease time in the database is accurate, we recommend that Network Time Protocol (NTP) is enabled and configured for these features:

- NTP authentication
- NTP peer and server associations
- NTP broadcast service
- NTP access restrictions
- NTP packet source IP address

If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

Because both NVRAM and the flash memory have limited storage capacities, we recommend that you store a binding file on a TFTP server. You must create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can first write bindings to the binding file at that URL.

Use the **ip dhcp snooping database flash**[*number*]:*lfilename* command to save the DHCP snooping binding database in the stack master NVRAM. The database is not saved in a stack member NVRAM.

If you set the **ip dhcp snooping database timeout** command to 0 seconds and the database is being written to a TFTP file, if the TFTP server goes down, the database agent continues to try the transfer indefinitely. No other transfer can be initiated while this one is in progress. This might be inconsequential because if the server is down, no file can be written to it.

Use the no ip dhcp snooping database command to disable the agent.

Use the **no ip dhcp snooping database timeout** command to reset the timeout value.

Use the no ip dhcp snooping database write-delay command to reset the write-delay value.

Examples	This example shows how to store a binding file at an IP address of 10.1.1.1 that is in a directory called <i>directory</i> . A file named <i>file</i> must be present on the TFTP server.				
	Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file				
Related Commands	This example shows how to store a binding file called <i>file01.txt</i> in the stack master NVRAM: Switch(config)# ip dhcp snooping database flash:file01.txt				
	You can verify your settings by entering the show ip dhcp snooping database privileged EXEC command.				
	Command	Description			
	ip dhcp snooping	Enables DHCP snooping on a VLAN.

Γ

ip dhcp snooping information option

Use the **ip dhcp snooping information option** global configuration command on the switch stack or on a standalone switch to enable DHCP option-82 data insertion. Use the **no** form of this command to disable DHCP option-82 data insertion.

ip dhcp snooping information option

no ip dhcp snooping information option

Syntax Description	This command has	no arguments	or keywords.
--------------------	------------------	--------------	--------------

Defaults DHCP option-82 data is inserted.

Command Modes Global configuration

Command History	Release	Modification
12.1(19)EA1		This command was introduced.

Usage Guidelines You must globally enable DHCP snooping by using the **ip dhcp snooping** global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled and a switch receives a DHCP request from a host, it adds the option-82 information in the packet. The option-82 information contains the switch MAC address (the remote ID suboption) and the port identifier, **vlan-mod-port**, from which the packet is received (circuit ID suboption). The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

When the DHCP server receives the packet, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or a circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. When the client and server are on the same subnet, the server broadcasts the reply. The switch inspects the remote ID and possibly the circuit ID fields to verify that it originally inserted the option-82 data. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP host that sent the DHCP request.

Examples

Switch(config)# ip dhcp snooping information option

This example shows how to enable DHCP option-82 data insertion:

You can verify your settings by entering the **show ip dhcp snooping** user EXEC command.

Related Commands	Command	Description	
show ip dhcp snooping		Displays the DHCP snooping configuration.

2-191

spoof the option-82 information.

ip dhcp snooping information option allow-untrusted

Use the ip dhcp snooping information option allow-untrusted global configuration command on an aggregation switch to configure it to accept DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. Use the **no** form of this command to return to the default setting. ip dhcp snooping information option allow-untrusted no ip dhcp snooping information option allow-untrusted Syntax Description This command has no arguments or keywords. Defaults The switch drops DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. **Command Modes** Global configuration **Command History** Release Modification 12.2(25)SEA This command was introduced. **Usage Guidelines** You might want an edge switch to which a host is connected to insert DHCP option-82 information at the edge of your network. You might also want to enable DHCP security features, such as DHCP snooping, IP source guard, or dynamic Address Resolution Protocol (ARP) inspection, on an aggregation switch. However, if DHCP snooping is enabled on the aggregation switch, the switch drops packets with option-82 information that are received on an untrusted port and does not learn DHCP snooping bindings for connected devices on a trusted interface. If the edge switch to which a host is connected inserts option-82 information and you want to use DHCP snooping on an aggregation switch, enter the **ip dhcp snooping information option allow-untrusted** command on the aggregation switch. The aggregation switch can learn the bindings for a host even though the aggregation switch receives DHCP snooping packets on an untrusted port. You can also enable DHCP security features on the aggregation switch. The port on the edge switch to which the aggregation switch is connected must be configured as a trusted port. Note Do not enter the **ip dhcp snooping information option allow-untrusted** command on an aggregation

switch to which an untrusted device is connected. If you enter this command, an untrusted device might

Examples This example shows how to configure an access switch to not check the option-82 information in untrusted packets from an edge switch and to accept the packets:

Switch(config)# ip dhcp snooping information option allow-untrusted

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description	
	show ip dhcp snooping	Displays the DHCP snooping configuration.	
show ip dhcp snooping binding		Displays the DHCP snooping binding information.	

ip dhcp snooping information option format remote-id

Use the **ip dhcp snooping information option format remote-id** global configuration command on the switch stack or on a standalone switch to configure the option-82 remote-ID suboption. Use the **no** form of this command to configure the default remote-ID suboption.

ip dhcp snooping information option format remote-id [string ASCII-string | hostname]

no ip dhcp snooping information option format remote-id

Syntax Description	string ASCII-strin	g Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).	
	hostname	Specify the switch hostname as the remote ID.	
Defaults	The switch MAC a	ddress is the remote ID.	
Command Modes	Global configurati	n	
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Usage Guidelines	.	enable DHCP snooping by using the ip dhcp snooping global configuration DHCP snooping configuration to take effect.	
	When the option-82 feature is enabled, the default remote-ID suboption is the switch MAC address. Thi command allows you to configure either the switch hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.		
<u> </u>	If the hostname ex configuration.	eeds 63 characters, it will be truncated to 63 characters in the remote-ID	
Examples	I.	s how to configure the option- 82 remote-ID suboption:	
		p dhcp snooping information option format remote-id hostname r settings by entering the show ip dhcp snooping user EXEC command.	

Related Commands	Command	Description
	ip dhcp snooping vlan information option format-type circuit-id string	Configures the option-82 circuit-ID suboption.
	show ip dhcp snooping	Displays the DHCP snooping configuration.

ip dhcp snooping limit rate

Use the **ip dhcp snooping limit rate** interface configuration command on the switch stack or on a standalone switch to configure the number of DHCP messages an interface can receive per second. Use the **no** form of this command to return to the default setting.

ip dhcp snooping limit rate rate

no ip dhcp snooping limit rate

Syntax Description	rate	Number of DHC 2048.	CP messages an interface can receive per second. The range is 1 to
Defaults	DHCP snooping r	ate limiting is disa	ibled.
Command Modes	Interface configur	ation	
Command History	Release	Modification	
	12.1(19)EA1	This commar	nd was introduced.
	12.2(18)SE	The range wa	as changed to 1 to 2048.
Usage Guidelines	 Normally, the rate limit applies to untrusted interfaces. If you want to configure rate limiting for trusted interfaces, keep in mind that trusted interfaces might aggregate DHCP traffic on multiple VLANs (some of which might not be snooped) in the switch, and you will need to adjust the interface rate limits to a higher value. If the rate limit is exceeded, the interface is error-disabled. If you enabled error recovery by entering the errdisable recovery dhcp-rate-limit global configuration command, the interface retries the operation again when all the causes have timed out. If the error-recovery mechanism is not enabled, the interface stays in the error-disabled state until you enter the shutdown and no shutdown interface configuration commands. 		
Examples	Switch(config-if)# ip dhcp snoo	essage rate limit of 150 messages per second on an interface: ping limit rate 150 pring the show ip dhcp snooping user EXEC command.
Related Commands	Command		Description
	errdisable recov	ery	Configures the recover mechanism.
	show ip dhcp sno	-	Displays the DHCP snooping configuration.
	show ip dhcp sno	ooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping trust

Use the **ip dhcp snooping trust** interface configuration command on the switch stack or on a standalone switch to configure a port as trusted for DHCP snooping purposes. Use the **no** form of this command to return to the default setting.

ip dhcp snooping trust

no ip dhcp snooping trust

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

Defaults DHCP snooping trust is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines Configure as trusted ports those that are connected to a DHCP server or to other switches or routers. Configure as untrusted ports those that are connected to DHCP clients.

Examples	This example shows how to enable DHCP snooping trust on a port:
	Switch(config-if)# ip dhcp snooping trust
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description	
	show ip dhcp snooping	Displays the DHCP snooping configuration.	
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.	

L

ip dhcp snooping verify

Use the **ip dhcp snooping verify** global configuration command on the switch stack or on a standalone switch to configure the switch to verify on an untrusted port that the source MAC address in a DHCP packet matches the client hardware address. Use the **no** form of this command to configure the switch to not verify the MAC addresses.

ip dhcp snooping verify mac-address

no ip dhcp snooping verify mac-address

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

Defaults The switch verifies the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet.

Command Modes Global configuration

Command History	Release	Modification
	12.2(18)SE	This command was introduced.

Usage Guidelines In a service-provider network, when a switch receives a packet from a DHCP client on an untrusted port, it automatically verifies that the source MAC address and the DHCP client hardware address match. If the addresses match, the switch forwards the packet. If the addresses do not match, the switch drops the packet.

Examples This example shows how to disable the MAC address verification:

Switch(config) # no ip dhcp snooping verify mac-address

You can verify your settings by entering the **show ip dhcp snooping** user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.

ip dhcp snooping vlan

Use the **ip dhcp snooping vlan** global configuration command on the switch stack or on a standalone switch to enable DHCP snooping on a VLAN. Use the **no** form of this command to return to the default setting.

ip dhcp snooping vlan vlan-range

no ip dhcp snooping vlan vlan-range

vlan-range	Specify a VLAN range is 1 to 409	ID or a range of VLANs on which to enable DHCP snooping. The 4.
	IDs separated by	ingle VLAN ID identified by VLAN ID number, a series of VLAN commas, a range of VLAN IDs separated by hyphens, or a range parated by entering the starting and ending VLAN IDs separated

ip dhcp snooping vlan information option format-type circuit-id string

Use the **ip dhcp snooping vlan information option format-type circuit-id string** interface configuration command on the switch stack or on a standalone switch to configure the option-82 circuit-ID suboption. Use the **no** form of this command to configure the default circuit-ID suboption.

ip dhcp snooping vlan vlan information option format-type circuit-id string ASCII-string

no ip dhcp snooping vlan vlan information option format-type circuit-id string

Syntax Description	vlan vlan	Specify the VLAN ID. The range is 1 to 4094.
	string ASCII-stri	g Specify a circuit ID, using from 3 to 63 ASCII characters (no spaces).
Defaults	The switch VLAN	and the port identifier, in the format vlan-mod-port , is the default circuit ID.
Command Modes	Interface configur	tion
Command History	Release	Modification
	12.2(25)SEE	This command was introduced.
Usage Guidelines		enable DHCP snooping by using the ip dhcp snooping global configuration DHCP snooping configuration to take effect.
	When the option-82 feature is enabled, the default circuit-ID suboption is the switch VLAN and the port identifier, in the format vlan-mod-port . This command allows you to configure a string of ASCII characters to be the circuit ID.	
Note	strings on the NV	a large number of circuit IDs on a switch, consider the impact of lengthy character AM or flash memory. If the circuit-ID configurations, combined with other data, y of the NVRAM or the flash memory, an error message appears.

Examples	This example shows how to configure the option-82 circuit-ID suboption: Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id string customerABC-250-0-0			
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.			
Note	The show ip dhcp snooping user EXEC command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.			
Related Commands	Command	Description		
	ip dhcp snooping information option format remote-id	Configures the option-82 remote-ID suboption.		
	show ip dhcp snooping	Displays the DHCP snooping configuration.		

ip igmp filter

Use the **ip igmp filter** interface configuration command on the switch stack or on a standalone switch to control whether or not all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an Internet Group Management Protocol (IGMP) profile to the interface. Use the **no** form of this command to remove the specified profile from the interface.

ip igmp filter profile number

no ip igmp filter

Syntax Description	profile number	The IGMP profile number to be applied. The range is 1 to 4294967295.	
Defaults	No IGMP filters a	re applied.	
Command Modes	Interface configura	ation	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines		AP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed al interfaces (SVIs), or ports that belong to an EtherChannel group.	
	An IGMP profile can be applied to one or more switch port interfaces, but one port can have only one profile applied to it.		
Examples	This example show	ws how to apply IGMP profile 22 to a port:	
	Switch(config)# interface gigabitethernet1/0/2 Switch(config-if)# ip igmp filter 22		
	You can verify you specifying an inter	ur setting by using the show running-config privileged EXEC command and by rface.	

Related Commands	Command	Description
	ip igmp profile	Configures the specified IGMP profile number.
	show ip dhcp snooping statistics	Displays the characteristics of the specified IGMP profile.
	show running-config interface <i>interface-id</i>	Displays the running configuration on the switch interface, including the IGMP profile (if any) that is applied to an interface. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

ip igmp max-groups

Use the **ip igmp max-groups** interface configuration command on the switch stack or on a standalone switch to set the maximum number of Internet Group Management Protocol (IGMP) groups that a Layer 2 interface can join or to configure the IGMP throttling action when the maximum number of entries is in the forwarding table. Use the **no** form of this command to set the maximum back to the default, which is to have no maximum limit, or to return to the default throttling action, which is to drop the report.

ip igmp max-groups {number | action {deny | replace}}

no ip igmp max-groups {*number* | **action**}

Syntax Description	number	The maximum number of IGMP groups that an interface can join. The range is 0 to 4294967294. The default is no limit.	
	action deny When the maximum number of entries is in the IGMP snooping forwarding table the next IGMP join report. This is the default action.		
	action replace	When the maximum number of entries is in the IGMP snooping forwarding table, replace the existing group with the new group for which the IGMP report was received.	
Defaults	The default m	aximum number of groups is no limit.	
	After the switch learns the maximum number of IGMP group entries on an interface, the default throttling action is to drop the next IGMP report that the interface receives and to not add an entry for the IGMP group to the interface.		
Command Modes	Interface conf	iguration	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(19)EA1	The action {deny replace} keywords were added.	

Usage Guidelines You can use this command only on Layer 2 physical interfaces and on logical EtherChannel interfaces. You cannot set IGMP maximum groups for routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

Follow these guidelines when configuring the IGMP throttling action:

- If you configure the throttling action as **deny** and set the maximum group limitation, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out, when the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.
- If you configure the throttling action as **replace** and set the maximum group limitation, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected multicast entry with the received IGMP report.
- When the maximum group limitation is set to the default (no maximum), entering the **ip igmp max-groups** {**deny** | **replace**} command has no effect.

Examples This example shows how to limit to 25 the number of IGMP groups that a port can join:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip igmp max-groups 25

This example shows how to configure the switch to replace the existing group with the new group for which the IGMP report was received when the maximum number of entries is in the forwarding table:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip igmp max-groups action replace

You can verify your setting by using the **show running-config** privileged EXEC command and by specifying an interface.

Command	Description
show running-config interface	Displays the running configuration on the switch interface, including
interface-id	the maximum number of IGMP groups that an interface can join and
	the throttling action. For syntax information, select Cisco IOS
	Configuration Fundamentals Command Reference, Release 12.2 >
	File Management Commands > Configuration File Management
	Commands.
	show running-config interface

ip igmp profile

Use the **ip igmp profile** global configuration command on the switch stack or on a standalone switch to create an Internet Group Management Protocol (IGMP) profile and enter IGMP profile configuration mode. From this mode, you can specify the configuration of the IGMP profile to be used for filtering IGMP membership reports from a switchport. Use the **no** form of this command to delete the IGMP profile.

ip igmp profile profile number

no ip igmp profile profile number

Syntax Description	profile number	The IGMP profile number being configured. The range is 1 to 4294967295.	
Defaults	No IGMP profiles are defined. When configured, the default action for matching an IGMP profile is to deny matching addresses.		
Command Modes			
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	 When you are in IGMP profile configuration mode, you can create the profile by using these commands: deny: specifies that matching addresses are denied; this is the default condition. 		
	 exit: exits from igmp-profile configuration mode. no: negates a command or resets to its defaults. 		
	 permit: specifies that matching addresses are permitted. 		
		es a range of IP addresses for the profile. This can be a single IP address or a range and an end address.	
	When entering a range, enter the low IP multicast address, a space, and the high IP mu		
	You can apply an l profile applied to i	IGMP profile to one or more Layer 2 interfaces, but each interface can have only one it.	
Examples	This example show addresses:	ws how to configure IGMP profile 40 that permits the specified range of IP multicast	
	Switch(config-ig	<pre>ip igmp profile 40 mp-profile)# permit mp-profile)# range 233.1.1.1 233.255.255.255</pre>	

You can verify your settings by using the show ip igmp profile privileged EXEC command.

Related Commands	Command	Description
	ip igmp filter	Applies the IGMP profile to the specified interface.
	show ip dhcp snooping statistics	Displays the characteristics of all IGMP profiles or the specified IGMP profile number.

2-207

ip igmp snooping

Use the **ip igmp snooping** global configuration command on the switch stack or on a standalone switch to globally enable Internet Group Management Protocol (IGMP) snooping on the switch or to enable it on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping [vlan vlan-id]

no ip igmp snooping [**vlan** *vlan-id*]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.	
Defaults	1 0 0	globally enabled on the switch. enabled on VLAN interfaces.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	-	ng is enabled globally, it is enabled in all the existing VLAN interfaces. When IGMP y disabled, it is disabled on all the existing VLAN interfaces.	
	VLAN IDs 1002 to snooping.	1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
Examples	This example shows how to globally enable IGMP snooping: Switch(config)# ip igmp snooping		
	This example shows how to enable IGMP snooping on VLAN 1:		
	Switch(config)# i	p igmp snooping vlan 1	
	You can verify your	settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping querier

Use the **ip igmp snooping querier** global configuration command on the switch stack or on a standalone switch to globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. Use the **no** form of this command to return to the default settings.

- **ip igmp snooping querier** [**vlan** *vlan-id*] [**address** *ip-address* | **max-response-time** *response-time* | **query-interval** *interval-count* | **tcn query** [**count** *count* | **interval** *interval*] | **timer expiry** | **version** *version*]
- **no ip igmp snooping querier [vlan** *vlan-id*] [address | max-response-time | query-interval | tcn query { count count | interval interval} | timer expiry | version]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping and the IGMP querier function on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.
	address ip-address	(Optional) Specify a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.
	max-response-time response-time	(Optional) Set the maximum time to wait for an IGMP querier report. The range is 1 to 25 seconds.
	query-interval <i>interval-count</i>	(Optional) Set the interval between IGMP queriers. The range is 1 to 18000 seconds.
	tcn query[count <i>count</i> interval <i>interval</i>]	(Optional) Set parameters related to Topology Change Notifications (TCNs). The keywords have these meanings:
		• count —Set the number of TCN queries to be executed during the TCN interval time. The range is 1 to 10.
		• interval <i>interval</i> —Set the TCN query interval time. The range is 1 to 255.
	timer expiry	(Optional) Set the length of time until the IGMP querier expires. The range is 60 to 300 seconds.
	version version	(Optional) Select the IGMP version number that the querier feature uses. Select 1 or 2.
Defaults	The IGMP snooping que	rier feature is globally disabled on the switch.
	When enabled, the IGMI multicast-enabled device	P snooping querier disables itself if it detects IGMP traffic from a
Command Modes		
Command Modes	multicast-enabled device	

Usage Guidelines	Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a <i>querier</i> .
	By default, the IGMP snooping querier is configured to detect devices that use IGMP Version 2 (IGMPv2) but does not detect clients that are using IGMP Version 1 (IGMPv1). You can manually configure the max-response-time value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured and is set to zero).
	Non-RFC compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the max-response-time value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1.
	VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.
Examples	This example shows how to globally enable the IGMP snooping querier feature:
	Switch(config)# ip igmp snooping querier
	This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:
	Switch(config)# ip igmp snooping querier max-response-time 25
	This example shows how to set the IGMP snooping querier interval time to 60 seconds:
	Switch(config)# ip igmp snooping querier query-interval 60
	This example shows how to set the IGMP snooping querier TCN query count to 25:
	Switch(config)# ip igmp snooping querier tcn count 25
	This example shows how to set the IGMP snooping querier timeout to 60 seconds:
	Switch(config)# ip igmp snooping querier timeout expiry 60
	This example shows how to set the IGMP snooping querier feature to version 2:
	Switch(config)# ip igmp snooping querier version 2
	You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

	show ip igmp snooping mrouter	Displays the IGMP snooping router ports.

Г

ip igmp snooping report-suppression

ip igmp snooping report-suppression no ip igmp snooping report-suppression Syntax Description This command has no arguments or keywords. Defaults IGMP report suppression is enabled. **Command Modes** Global configuration Release **Command History** Modification 12.1(19)EA1 This command was introduced. **Usage Guidelines** IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports. The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices. If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices. If you disable IGMP report suppression by entering the **no ip igmp snooping report-suppression** command, all IGMP reports are forwarded to all the multicast routers. **Examples** This example shows how to disable report suppression: Switch(config) # no ip igmp snooping report-suppression You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

Use the **ip igmp snooping report-suppression** global configuration command on the switch stack or on a standalone switch to enable Internet Group Management Protocol (IGMP) report suppression. Use the **no** form of this command to disable IGMP report suppression and to forward all IGMP reports to multicast routers.

If you set the TCN flood query count to 1 by using the ip query count command, the flooding stops after receiving 1 general query. If flooding of multicast traffic due to the TCN event lasts until 7 general queries elearned based on the general queries received during the TCN event. tcn query solicit global configuration command to enable the switch to send whether or not it is the spanning-tree root. This command also speeds the in the flood mode caused during a TCN event.

ip igmp snooping tcn

Use the ip igmp snooping tcn global configuration command on the switch stack or on a standalone switch to configure the Internet Group Management Protocol (IGMP) Topology Change Notification (TCN) behavior. Use the no form of this command to return to the default settings.

ip igmp snooping tcn {flood query count count | query solicit}

no in iomn anooning ton (flood approx 41 1: .: .: .:

l Commands	Command	Description
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
	ip igmp snooping tcn flood	Specifies flooding on an interface as the IGMP snooping spanning-tree TCN behavior.
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping tcn flood

Use the **ip igmp snooping tcn flood** interface configuration command on the switch stack or on a standalone switch to specify multicast flooding as the Internet Group Management Protocol (IGMP) snooping spanning-tree Topology Change Notification (TCN) behavior. Use the **no** form of this command to disable the multicast flooding.

ip igmp snooping tcn flood

no ip igmp snooping tcn flood

Syntax Description	This command has no arguments or keywords.		
Defaults	Multicast flooding is enabl	led on an interface during a spanning-tree TCN event.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(25)SEB	This command was introduced.	
Usage Guidelines	received. If the switch has	TCN, multicast traffic is flooded to all the ports until two general queries are many ports with attached hosts that are subscribed to different multicast exceed the capacity of the link and cause packet loss.	
	You can change the floodin global configuration comm	ng query count by using the ip igmp snooping tcn flood query count count nand.	
Examples	Switch(config)# interfa	o disable the multicast flooding on an interface: ce gigabitethernet1/0/2 p igmp snooping tcn flood	
	You can verify your setting	gs by entering the show ip igmp snooping privileged EXEC command.	
Related Commands	Command	Description	
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.	
	ip igmp snooping tcn	Configures the IGMP TCN behavior on the switch.	
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.	

ip igmp snooping vlan immediate-leave

Use the **ip igmp snooping immediate-leave** global configuration command on the switch stack or on a standalone switch to enable Internet Group Management Protocol (IGMP) snooping immediate-leave processing on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping vlan vlan-id immediate-leave

no ip igmp snooping vlan vlan-id immediate-leave

Syntax Description	vlan-id	Enable IGMP snooping and the Immediate-Leave feature on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.	
Defaults	IGMP immediate-l	eave processing is disabled.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.		
You should configure the Immediate- Leave feature only when there is a every port in the VLAN. The configuration is saved in NVRAM.		ure the Immediate- Leave feature only when there is a maximum of one receiver on LAN. The configuration is saved in NVRAM.	
	The Immediate-Le	ave feature is supported only with IGMP Version 2 hosts.	
Examples	1	vs how to enable IGMP immediate-leave processing on VLAN 1:	
	You can verify you	r settings by entering the show ip igmp snooping privileged EXEC command.

Command	Description
ip igmp snooping report-suppression	Enables IGMP report suppression.
show ip igmp snooping	Displays the snooping configuration.
show ip igmp snooping groups	Displays IGMP snooping multicast information.
show ip igmp snooping mrouter	Displays the IGMP snooping router ports.
show ip igmp snooping querier	Displays the configuration and operation information for the IGMP querier configured on a switch.

ip igmp snooping vlan mrouter

Use the **ip igmp snooping mrouter** global configuration command on the switch stack or on a standalone switch to add a multicast router port or to configure the multicast learning method. Use the **no** form of this command to return to the default settings.

ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

no ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

Syntax Description	vlan-id	Enable IGMP snooping, and add the port in the specified VLAN as the multicast router port. The range is 1 to 1001 and 1006 to 4094.	
	interface interface-id	 Specify the next-hop interface to the multicast router. The keywords have these meanings: fastethernet <i>interface number</i>—a Fast Ethernet IEEE 802.3 interface. gigabitethernet <i>interface number</i>—a Gigabit Ethernet IEEE 802.3z interface. port-channel <i>interface number</i>—a channel interface. The range is 0 to 48. 	
	learn {cgmp pim-dvmrp}	Specify the multicast router learning method. The keywords have these meanings:	
		• cgmp —Set the switch to learn multicast router ports by snooping on Cisco Group Management Protocol (CGMP) packets.	
		• pim-dvmrp —Set the switch to learn multicast router ports by snooping on IGMP queries and Protocol-Independent Multicast-Distance Vector Multicast Routing Protocol (PIM-DVMRP) packets.	
Defaults	By default, there are no multicast router ports. The default learning method is pim-dvmrp —to snoop IGMP queries and PIM-DVMRP packets.		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	VLAN IDs 1002 to 100. snooping.	5 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
	The CGMP learn method is useful for reducing control traffic.		
	The configuration is sav	red in NVRAM.	

ExamplesThis example shows how to configure a port as a multicast router port:
Switch(config)# ip igmp snooping vlan 1 mrouter interface gigabitethernet1/0/22
This example shows how to specify the multicast router learning method as CGMP:
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

Related Commands	Command	Description

ip snap forwarding

Use the **ip snap forwarding** global configuration command on the switch stack or on a standalone switch to enable forwarding of IP Version 4 (IPv4) and IP Version 6 (IPv6) frames with Subnetwork Access Protocol (SNAP) encapsulation. Use **no** form of this command to disable forwarding of these frames.

ip snap forwarding

no ip snap forwarding

Syntax Description This command has no arguments or keyword	ds.
---	-----

Defaults The switch does not forward IPv4 and IPv6 frames with SNAP encapsulation.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SEC	This command was introduced.

Usage Guidelines Use the **ip snap forwarding** global configuration command to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation.

If a switch that is joining the stack does not support forwarding of IPv4 and IPv6 frames with SNAP encapsulation, all the switches in the stack do not forward the IPv4 and IPv6 frames, and this forwarding feature is disabled.

 Examples
 This example shows how to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation:

 Switch(config)# ip snap forwarding

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax
		information, select Cisco IOS Configuration Fundamentals Command
		Reference, Release 12.2 > File Management Commands >
		Configuration File Management Commands.

Syntax Description	mac-address	Specify a MAC address.
	vlan vlan-id	Specify a VLAN number. The range is from 1 to 4094.
	ip-address	Specify an IP address.
	interface <i>interface-id</i>	Specify an interface on which to add or delete an IP source binding.
Defaults	No IP source bindings a	re configured.
Command Modes	Global configuration	
Command History	Release Modi	ification
	12.2(20)SE This	command was introduced.
Usage Guidelines	number. The entry is bas	ng entry has an IP address, its associated MAC address, and its associated VLAN sed on the MAC address and the VLAN number. If you modify an entry by dress, the switch updates the entry instead creating a new one.
Examples	This example shows how	w to add a static IP source binding:
	Switch(config)# ip so gigabitethernet1/0/1	wurce binding 0001.1234.1234 vlan 1 172.20.50.5 interface
	This example shows how	w to add a static binding and then modify the IP address for it:
	gigabitethernet1/0/1	wurce binding 0001.1357.0007 vlan 1 172.20.50.25 interface wurce binding 0001.1357.0007 vlan 1 172.20.50.30 interface
	You can verify your sett	ings by entering the show ip source binding privileged EXEC command.

ip source binding

Use the **ip source binding** global configuration command on the switch stack or on a standalone switch to configure static IP source bindings on the switch. Use the **no** form of this command to delete static bindings.

ip source binding mac-address vlan vlan-id ip-address interface interface-id

no source binding mac-address vlan vlan-id ip-address interface interface-id

elated Commands	Command	Description
	ip verify source	Enables IP source guard on an interface.
	show ip source binding	Displays the IP source bindings on the switch.
	show ip verify source	Displays the IP source guard configuration on the switch or on a specific interface.

ip ssh

Use the **ip** ssh global configuration command on the switch stack or on a standalone switch to configure the switch to run Secure Shell (SSH) Version 1 or SSH Version 2. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the **no** form of this command to return to the default setting. ip ssh version [1 | 2] no ip ssh version [1 | 2] Syntax Description 1 (Optional) Configure the switch to run SSH Version 1 (SSHv1). 2 (Optional) Configure the switch to run SSH Version 2 (SSHv1). Defaults The default version is the latest SSH version supported by the SSH client. **Command Modes** Global configuration **Command History** Release Modification 12.1(19)EA1 This command was introduced. **Usage Guidelines** If you do not enter this command or if you do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2. The switch supports an SSHv1 or an SSHv2 server. It also supports an SSHv1 client. For more information about the SSH server and the SSH client, see the software configuration guide for this release. A Rivest, Shamir, and Adelman (RSA) key pair generated by an SSHv1 server can be used by an SSHv2 server and the reverse. **Examples** This example shows how to configure the switch to run SSH Version 2: Switch(config) # ip ssh version 2 You can verify your settings by entering the show ip ssh or show ssh privileged EXEC command.

Γ

Related Commands	Command	Description

	ip source bindi	ng Configures static bindings on the switch.
	show ip verify s	Displays the IP source guard configuration on the switch or on a specific interface.

ipv6 access-list

Use the **ipv6 access-list** global configuration command on the switch stack or on a standalone switch to define an IPv6 access list and to place the switch in IPv6 access list configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list access-list-name

no ipv6 access-list access-list-name

	no ipv6 access-l	list access-list-name
Note		ailable only if the switch stack is running the advanced IP services image and you al IPv4 and IPv6 Switch Database Management (SDM) template on the switch.
Syntax Description	access-list-name	Name of the IPv6 access list. Names cannot contain a space or quotation mark or begin with a numeric.
Defaults	No IPv6 access list i	s defined.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines	-	IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) command and reload the switch.
	The ipv6 access-list	command is similar to the ip access-list command, except that it is IPv6-specific.
Note		ed by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and share the same name.
	See the inv6 access-	list and permit (IPv6 access-list configuration) commands for more information

See the **ipv6 access-list** and **permit (IPv6 access-list configuration)** commands for more information on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer protocol-type information. See the "Examples" section for an example of a translated IPv6 ACL configuration.

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. The two **permit** conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny **icmp any any nd-na** or **icmp any any nd-ns**, there must be an explicit **deny** entry in the ACL. For the implicit **deny ipv6 any any** statement to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. You can apply inbound and outbound IPv6 ACLs to Layer 3 physical interfaces or switch virtual interfaces for routed ACLs, but only inbound IPv6 ACLs to Layer 2 interfaces for port ACLs.

Note

An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded by the switch and does not filter traffic generated by the switch.

Examples

This example puts the switch in IPv6 access list configuration mode and configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on an interface. The first ACL entry prevents all packets from the network FE80:0:0:2::/64 (packets that have the link-local prefix FE80:0:0:2 as the first 64 bits of their source IPv6 address) from leaving the interface. The second entry in the ACL permits all other traffic to leave the interface. The second entry is necessary because an implicit deny-all condition is at the end of each IPv6 ACL.

```
Switch(config)# ipv6 access-list list2
Switch(config-ipv6-acl)# deny FE80:0:0:2::/64 any
Switch(config-ipv6-acl)# permit any any
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter list2 out
```

IPv6 ACLs that rely on the implicit deny condition or specify a **deny any any** statement to filter traffic should contain **permit** statements for link-local addresses to avoid the filtering of protocol packets. Additionally IPv6 ACLs that use **deny** statements to filter traffic should also use a **permit any any** statement as the last statement in the list.

Related Commands	Command	Description
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

2-233

interface

ipv6 address dhcp

Use the **ipv6 address dhcp** interface configuration command on the switch stack or on a standalone switch to acquire an IPv6 address on an interface from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server. To remove the address from the interface, use the **no** form of this command.

ipv6 address dhcp [rapid-commit]

no ipv6 address dhcp [rapid-commit]

Note		ble only if the switch stack is running the advanced IP services image and you Pv4 and IPv6 Switch Database Management (SDM) template on the switch.
Syntax Description	rapid-commit	(Optional) Allow two-message exchange method for address assignment.
Defaults	No default is defined.	
Command Modes	Interface configuration	
Command History	Release	Modification
	12.2(46)SE	This command was introduced.
Usage Guidelines	vlan} global configurati	v4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default on command, and reload the switch. interface configuration command allows any interface to dynamically learn its e DHCP protocol
	The rapid-commit keyw	yord enables the use of the two-message exchange for address allocation and is enabled, the client includes the rapid-commit option in a solicit message.
Examples	Switch(config)# inter : Switch(config-if)# ip	v to acquire an IPv6 address and enable the rapid-commit option: face gigabitethernet2/0/1 v6 address dhcp rapid-commit
	You can verify your setti	ings by using the show ipv6 dhcp interface privileged EXEC command.
Related Commands	Command	Description
	show ipv6 dhcp	Displays DHCPv6 interface information.

ipv6 dhcp client request vendor

Use the **ipv6 dhcp client request** interface configuration command on the switch stack or on a standalone switch to configure an IPv6 client to request an option from a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server. To remove the request, use the **no** form of this command.

ipv6 dhcp client request vendor

no ipv6 dhcp client request vendor

Note		vailable only if the switch stack is running the advanced IP services image and you dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.
Syntax Description	This command has	no arguments or keywords.
Defaults	No default is define	ed.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.2(46)SE	This command was introduced.
Usage Guidelines	•	al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default guration command, and reload the switch.
	When enabled, the the command after	client request vendor interface configuration to request a vendor-specific option. command is checked only when an IPv6 address is acquired from DHCP. If you enter the interface has acquired an IPv6 address, it does not take effect until the next time an IPv6 address from DHCP.
Examples	This example show	s how to enable the request vendor-specific option.
		interface gigabitethernet2/0/1 # ipv6 dhcp client request vendor-specific
Related Commands	Command	Description
	ipv6 address dhcp	Acquires an IPv6 address on an interface from DHCP.

ipv6 dhcp ping packets

Use the ipv6 dhcp ping packets global configuration command on the switch stack or on a standalone switch to specify the number of packets a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server sends to a pool address as part of a ping operation. To prevent the server from pinging pool addresses, use the no form of this command.

ipv6 dhcp ping packets number

no ipv6 dhcp ping packets

Note		ilable only if the switch stack is running the advanced IP services image and you al IPv4 and IPv6 Switch Database Management (SDM) template on the switch.	
Syntax Description	number	The number of ping packets sent before the address is assigned to a requesting client. The range is 0 to 10.	
Defaults	The default is 0.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(46)SE	This command was introduced.	
Usage Guidelines	•	l IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default ration command, and reload the switch.	
		pings a pool address before assigning the address to a requesting client. If the ping erver assumes, with a high probability, that the address is not in use and assigns the ting client.	
	Setting the <i>number</i> as	rgument to 0 turns off the DHCPv6 server ping operation.	
Examples		es two ping attempts by the DHCPv6 server before further ping attempts stop:	
	Switch(config)# ipv6 dhcp ping packets 2		

Related Commands	Command	Description
	clear ipv6 dhcp conflict	Clears an address conflict from the DHCPv6 server database.
	show ipv6 dhcp conflict	Displays address conflicts found by a DHCPv6 server, or reported through a DECLINE message from a client.

ipv6 dhcp pool

Use the **ipv6 dhcp pool** global configuration command on the switch stack or on a standalone switch to enter Dynamic Host Configuration Protocol for IPv6 (DHCPv6) pool configuration mode. Use the **no** form of this command to return to the default settings.

ipv6 dhcp pool poolname

no ipv6 dhcp pool poolname

	no ipv6 dhcp po	oi pooiname
Note		ilable only if the switch stack is running the advanced IP services image and you al IPv4 and IPv6 Switch Database Management (SDM) template on the switch.
Syntax Description	poolname	User-defined name for the DHCPv6 pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).
Defaults	No default is defined	
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(46)SE	The address prefix , lifetime , link-address , and vendor-specific keywords were added to the command sub-modes.
Usage Guidelines		IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default ration command, and reload the switch.
	The ipv6 dhcp pool of commands are available	command enables the DHCPv6 pool configuration mode. These configuration ble:
	commands are availableaddress prefix <i>I</i>.	
	 commands are available address prefix <i>I</i> hexadecimal, usi lifetime <i>t1 t2</i>: set is 5 to 42949672¹ 	ble: <i>Pv6-prefix</i> : sets an address prefix for address assignment. This address must be in

- **vendor-specific**: enables the DHCPv6 vendor-specific configuration mode. These configuration commands are available:
 - vendor-id: enter a vendor-specific identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295.
 - **suboption** *number*: sets vendor-specific suboption number. The range is 1 to 65535. Enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.

After you create the DHCPv6 configuration information pool, use the **ipv6 dhcp server** interface configuration command to associate the pool with a server on an interface. However, if you do not configure an information pool, you still need to use the **ipv6 dhcp server** interface configuration command to enable the DHCPv6 server function on an interface.

When you associate a DHCPv6 pool with an interface, only that pool services requests on the associated interface. The pool also services other interfaces. If you do not associate a DHCPv6 pool with an interface, it can service requests on any interface.

Not using any IPv6 address prefix means that the pool only returns configured options.

The **link-address** keyword allows matching a link-address without necessarily allocating an address. You can match the pool from multiple relays by using multiple link-address configuration commands inside a pool.

Because a longest match is performed on either the address pool information or the link information, you can configure one pool to allocate addresses and another pool on a subprefix that only returns configured options.

Examples

This example shows how to configure a pool called engineering with an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool engineering
Switch(config-dhcpv6)# address prefix 2001:1000::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called testgroup with three link-address prefixes and an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool testgroup
Switch(config-dhcpv6)# link-address 2001:1001::0/64
Switch(config-dhcpv6)# link-address 2001:1002::0/64
Switch(config-dhcpv6)# link-address 2001:2000::0/48
Switch(config-dhcpv6)# address prefix 2001:1003::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called 350 with vendor-specific options:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool 350
Switch(config-dhcpv6)# vendor-specific 9
Switch(config-dhcpv6-vs)# suboption 1 address 1000:235D::1
Switch(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone"
Switch(config-dhcpv6-vs)# end
```

Related Commands	Command	Description
	ipv6 dhcp server	Enables DHCPv6 service on an interface.
	show ipv6 dhcp pool	Displays DHCPv6 configuration pool information.

ipv6 dhcp server

Use the **ipv6 dhcp server** interface configuration command on the switch stack or on a standalone switch to enable Dynamic Host Configuration Protocol for IPv6 (DHCPv6) service on an interface. To disable DHCPv6 service on an interface, use the **no** form of this command.

ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]

no ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]

This command is available only if the switch stack is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	poolname	(Optional) User-defined name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).
	automatic	(Optional) Enable the server to automatically determine which pool to use when allocating addresses for a client.
	rapid-commit	(Optional) Allow two-message exchange method.
	preference value	(Optional) The preference value carried in the preference option in the advertise message sent by the server. The range is from 0 to 255. The preference value default is 0.
	allow-hint	(Optional) Specify whether the server should consider client suggestions in the SOLICIT message. By default, the server ignores client hints.
Command Modes	Interface configuration	6 packets are serviced on the interface.
Command history	12.2(46)SE	The automatic keyword was added to the command.
Usage Guidelines	The ipv6 dhcp server interface configuration command enables DHCPv6 service on a specified interface. The automatic keyword enables the system to automatically determine which pool to use when allocating addresses for a client. When an IPv6 DHCP packet is received by the server, the server determines if it was received from a DHCP relay or if it was directly received from the client. If the packet was received from a relay, the server verifies the link-address field inside the packet associa with the first relay that is closest to the client. The server matches this link-address against all address prefix and link-address configurations in IPv6 DHCP pools to find the longest prefix match. The server	
	with the first relay that	t is closest to the client. The server matches this link-address against all address

If the packet was directly received from the client, the server performs this same matching, but it uses all the IPv6 addresses configured on the incoming interface when performing the match. Once again, the server selects the longest prefix match.

The **rapid-commit** keyword enables the use of the two-message exchange.

If the **preference** keyword is configured with a value other than 0, the server adds a preference option to carry the preference value for the advertise messages. This action affects the selection of a server by the client. Any advertise message that does not include a preference option is considered to have a preference value of 0. If the client receives an advertise message with a preference value of 255, the client immediately sends a request message to the server from which the message was received.

If the **allow-hint** keyword is specified, the server allocates a valid client-suggested address in the solicit and request messages. The prefix address is valid if it is in the associated local prefix address pool and it is not assigned to a device. If the **allow-hint** keyword is not specified, the server ignores the client hint, and an address is allocated from the free list in the pool.

The DHCPv6 client, server, and relay functions are mutually exclusive on an interface. When one of these functions is already enabled and you try to configure a different function on the same interface, the switch returns one of these messages:

Interface is in DHCP client mode Interface is in DHCP server mode Interface is in DHCP relay mode

Examples This example enables DHCPv6 for the pool named testgroup:

Switch(config-if) # ipv6 dhcp server testgroup

Related Commands	Command	Description
	ipv6 dhcp pool	Configures a DHCPv6 pool and enters DHCPv6 pool configuration mode.
	show ipv6 dhcp interface	Displays DHCPv6 interface information.

ipv6 mld snooping

Use the **ipv6 mld snooping** global configuration command on the switch stack or on a standalone switch without keywords to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN. Use the **no** form of this command to disable MLD snooping on the switch or switch stack or the VLAN.

ipv6 mld snooping [vlan vlan-id]

no ipv6 mld snooping [vlan vlan-id]

Note	This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	vlan vlan-id	(Optional) Enable or disable IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
Defaults		obally disabled on the switch.	
	MLD snooping is en VLAN snooping wil	nabled on all VLANs. However, MLD snooping must be globally enabled before Il take place.	
Command Modes	Global configuration	n	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines		al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default uration command and reload the switch.	
	globally enable MLI	g is globally disabled, it is disabled on all the existing VLAN interfaces. When you D snooping, it is enabled on all VLAN interfaces that are in the default state onfiguration will override global configuration on interfaces on which MLD lisabled.	
		globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally sable it on individual VLANs.	
	range 1006 to 4094), switch in order for the	icast router is a Catalyst 6500 switch and you are using extended VLANs (in the , IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 he Catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For Is (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the h.	
	VLAN numbers 100 in MLD snooping.	2 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

Examples	This example shows how to globally enable MLD snooping:			
	Switch(config)# ipv6 mld snooping			
	This example shows how to disable MLD snooping on a VLAN: Switch(config) # no ipv6 mld snooping vlan 11			
	You can verify your settings by entering the show ipv6 mld snooping user EXEC command.

ipv6 mld snooping last-listener-query-interval

Use the **ipv6 mld snooping last-listener-query-interval** global configuration command on the switch stack or on a standalone switch to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping last-listener query interval on the switch or on a VLAN. This time interval is the maximum time that a multicast router waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group. Use the **no** form of this command to reset the query time to the default settings.

ipv6 mld snooping [vlan vlan-id] last-listener-query-interval integer_value

no ipv6 mld snooping [vlan vlan-id] last-listener-query-interval

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	(Optional) Configure last-listener query interval on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
	integer_value	Set the time period (in thousands of a second) that a multicast router to wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second),	
Command Default	-	query interval (maximum response time) is 1000 (1 second). query interval (maximum response time) is 0 (the global count is used).	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	Ų	al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default uration command and reload the switch.	
	In MLD snooping, when the IPv6 multicast router receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the router deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the router waits before deleting a nonresponsive port from the multicast group.		
	When a VLAN query interval is set, this overrides the global query interval. When the VLAN interval is set at 0, the global value is used.		
	VLAN numbers 100 in MLD snooping.	02 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

ExamplesThis example shows how to globally set the last-listener query interval to 2 seconds:
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC
command.

Related Commands	Command	Description
	ipv6 mld snooping last-listener-query-count	Sets IPv6 MLD snooping last-listener query count.
	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
	show ipv6 mld snooping querier	Sets IPv6 MLD snooping last-listener query interval.

ipv6 mld snooping listener-message-suppression

Use the **ipv6 mld snooping listener-message-suppression** global configuration command on the switch stack or on a standalone switch to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression. Use the **no** form of this command to disable MLD snooping listener message suppression.

ipv6 mld snooping listener-message-suppression

no ipv6 mld snooping listener-message-suppression

Note	This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Command Default	The default is for MLD snooping listener message suppression to be disabled.		
Command Modes	Global configuration		
Command History	Release Modification		
	12.2(25)SEDThis command was introduced.		
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan } global configuration command and reload the switch.		
	MLD snooping listener message suppression is equivalent to IGMP snooping report suppression. When enabled, received MLDv1 reports to a group are forwarded to IPv6 multicast routers only once in every report-forward time. This prevents the forwarding of duplicate reports.		
Examples	This example shows how to enable MLD snooping listener-message-suppression:		
	Switch(config)# ipv6 mld snooping listener-message-suppression		
	This example shows how to disable MLD snooping listener-message-suppression:		
	Switch(config)# no ipv6 mld snooping listener-message-suppression		
	You can verify your settings by entering the show ipv6 mld snooping [vlan <i>vlan-id</i>] user EXEC command.

ipv6 mld snooping vlan

Use the **ipv6 mld snooping vlan** global configuration command on the switch stack or on a standalone switch to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface. Use the **no** form of this command to reset the parameters to the default settings.

- **ipv6 mld snooping vlan** *vlan-id* [**immediate-leave** | **mrouter interface** *interface-id* | **static** *ipv6-multicast-address* **interface** *interface-id*]
- **no ipv6 mld snooping vlan** *vlan-id* [**immediate-leave** | **mrouter interface** *interface-id* | **static** *ip-address* **interface** *interface-id*]

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	Specify a VLAN number. The range is 1 to 1001 and 1006 to 4094.	
	immediate-leave	(Optional) Enable MLD Immediate-Leave processing on a VLAN interface. Use the no form of the command to disable the Immediate Leave feature on the interface.	
	mrouter interface	 (Optional) Configure a multicast router port. The no form of the command removes the configuration. (Optional) Configure a multicast group with the specified IPv6 multicast address. Add a Layer 2 port to the group. The mrouter or static interface can be a physical port or a port-channel interface in the range of 1 to 48. 	
	static ipv6-multicast-address		
	interface interface-id		
Command Default	MID mensione Immediate I.		
Command Default	MLD snooping Immediate-Leave processing is disabled.		
	By default, there are no static IPv6 multicast groups.		
	By default, there are no multicast router ports.		
Command Modes	Global configuration		
Command History	Release Mo	dification	
	12.2(25)SED Thi	s command was introduced.	
Usage Guidelines	-	Id IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default	
	vlan } global configuration command and reload the switch.You should only configure the Immediate-Leave feature when there is only one receiver on every port in the VLAN. The configuration is saved in NVRAM.		
	The static keyword is used fo	or configuring the MLD member ports statically.	

The configuration and the static ports and groups are saved in NVRAM.

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

Examples This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

Switch(config) # ipv6 mld snooping vlan 1 immediate-leave

This example shows how to disable MLD Immediate-Leave processing on VLAN 1: Switch(config) # no ipv6 mld snooping vlan 1 immediate-leave

This example shows how to configure a port as a multicast router port:

Switch(config) # ipv6 mld snooping vlan 1 mrouter interface gigabitethernet1/0/2

This example shows how to configure a static multicast group:

Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface gigabitethernet1/0/2

You can verify your settings by entering the **show ipv6 mld snooping vlan** *vlan-id* user EXEC command.

Related Commands Co

Command	Description

ipv6 traffic-filter

Use the **ipv6 traffic-filter** interface configuration command on the switch stack or on a standalone switch to filter IPv6 traffic on an interface. The type and direction of traffic that you can filter depends on the image running on the switch stack. Use the **no** form of this command to disable the filtering of IPv6 traffic on an interface.

ipv6 traffic-filter access-list-name {in | out}

no ipv6 traffic-filter access-list-name {in | out}

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	access-list-name	Specify an IPv6 access name.	
	in Specify incoming IPv6 traffic.		
	out	Specify outgoing IPv6 traffic.	
		Note The out keyword is not supported for Layer 2 interfaces (port ACLs). If the switch stack is running the IP services or IP base image, the out keyword is not supported for Layer 3 interfaces.	
Defaults	Filtering of IPv6 traffi	ic on an interface is not configured.	
Command Modes	Interface configuration	a	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
	12.2(35)SE	Support was added for inbound Layer 3 management traffic (router ACLs) in the IP services and IP base images.	
Usage Guidelines	e	IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default ation command and reload the switch.	
	You can use the ipv6 traffic-filter command on physical interfaces (Layer 2 or Layer 3 ports), Layer 3 port channels, or switch virtual interfaces (SVIs).		
	If the switch stack is running the advanced IP services image, you can apply an ACL to outbound or inbound traffic on Layer 3 interfaces (port ACLs), or to inbound traffic on Layer 2 interfaces (router ACLs). If the switch stack is running the IP services or IP base image, you can apply ACLs only to inbound management traffic on Layer 3 interfaces. Switches running the IP services or IP base image do not support port ACLs.		

If *any* port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

Examples This example filters inbound IPv6 traffic on an IPv6-configured interface as defined by the access list named cisco: Switch (config)# interface gigabitethernet1/0/1 Switch(config-if)# no switchport Switch(config-if)# ipv6 address 2001::/64 eui-64 Switch(config-if)# ipv6 traffic-filter cisco in

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and sets deny or permit conditions for the defined access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.
	show ipv6 interface	Displays the usability status of interfaces configured for IPv6.

l2protocol-tunnel

Use the **l2protocol-tunnel** interface configuration command on the switch stack or on a standalone switch to enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel. You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets. Use the **no** form of this command to disable tunneling on the interface.

12protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] value] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] value]

no l2protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]]

Syntax Description	l2protocol-tunnel	Enable point-to-multipoint tunneling of CDP, STP, and VTP packets.
	cdp	(Optional) Enable tunneling of CDP, specify a shutdown threshold for CDP, or specify a drop threshold for CDP.
	stp	(Optional) Enable tunneling of STP, specify a shutdown threshold for STP, or specify a drop threshold for STP.
	vtp	(Optional) Enable tunneling or VTP, specify a shutdown threshold for VTP, or specify a drop threshold for VTP.
	point-to-point	(Optional) Enable point-to point tunneling of PAgP, LACP, and UDLD packets.
	pagp	(Optional) Enable point-to-point tunneling of PAgP, specify a shutdown threshold for PAgP, or specify a drop threshold for PAgP.
	lacp	(Optional) Enable point-to-point tunneling of LACP, specify a shutdown threshold for LACP, or specify a drop threshold for LACP.
	udld	(Optional) Enable point-to-point tunneling of UDLD, specify a shutdown threshold for UDLD, or specify a drop threshold for UDLD.
	shutdown-threshold	(Optional) Set a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.
	drop-threshold	(Optional) Set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.
	value	Specify a threshold in packets per second to be received for encapsulation before the interface shuts down, or specify the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

Defaults

The default is that no Layer 2 protocol packets are tunneled.

The default is no shutdown threshold for the number of Layer 2 protocol packets.

The default is no drop threshold for the number of Layer 2 protocol packets.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	You must enter this	s command, with or without protocol types, to tunnel Layer 2 packets.
	If you enter this co	mmand for a port channel, all ports in the channel must have the same configuration.
	propagated across packets are encaps	inneling across a service-provider network ensures that Layer 2 information is the network to all customer locations. When protocol tunneling is enabled, protocol ulated with a well-known Cisco multicast address for transmission across the packets reach their destination, the well-known MAC address is replaced by the IAC address.
	You can enable Lag protocols.	yer 2 protocol tunneling for CDP, STP, and VTP individually or for all three
	EtherChannels by a the service-provide	ler network, you can use Layer 2 protocol tunneling to enhance the creation of emulating a point-to-point network topology. When protocol tunneling is enabled on er switch for PAgP or LACP, remote customer switches receive the protocol data units gotiate automatic creation of EtherChannels.
	topology. To decrea	g of PAgP, LACP, and UDLD packets, you must have a point-to-point network ase the link-down detection time, you should also enable UDLD on the interface when ng of PAgP or LACP packets.
	You can enable poi three protocols.	int-to-point protocol tunneling for PAgP, LACP, and UDLD individually or for all
\triangle		
Caution	-	JDLD tunneling is only intended to emulate a point-to-point topology. An erroneous sends tunneled packets to many ports could lead to a network failure.
	received on an inte the threshold is ap	n-threshold keyword to control the number of protocol packets per second that are erface before it shuts down. When no protocol option is specified with the keyword, plied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold e shutdown-threshold value must be greater than or equal to the drop-threshold value.
	entering the errdis brought out of the o timed out. If the er	In threshold is reached, the interface is error-disabled. If you enable error recovery by sable recovery cause l2ptguard global configuration command, the interface is error-disabled state and allowed to retry the operation again when all the causes have ror recovery mechanism is not enabled for l2ptguard , the interface stays in the e until you enter the shutdown and no shutdown interface configuration commands.

Enter the **drop-threshold** keyword to control the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.

Examples This example shows how to enable protocol tunneling for CDP packets and to configure the shutdown threshold as 50 packets per second:

```
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)# l2protocol-tunnel shutdown-threshold cdp 50
```

This example shows how to enable protocol tunneling for STP packets and to configure the drop threshold as 400 packets per second:

```
Switch(config-if)# l2protocol-tunnel stp
Switch(config-if)# l2protocol-tunnel drop-threshold stp 400
```

This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and to configure the PAgP drop threshold as 1000 packets per second:

```
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
```

Related Commands	Command	Description
	12protocol-tunnel cos	Configures a class of service (CoS) value for all tunneled Layer 2 protocol packets.
	show errdisable recovery	Displays error-disabled recovery timer information.
	show l2protocol-tunnel	Displays information about ports configured for Layer 2 protocol tunneling, including port, protocol, class of service (CoS), and threshold.

l2protocol-tunnel cos

Use the **l2protocol-tunnel cos** global configuration command on the switch stack or on a standalone switch to configure class of service (CoS) value for all tunneled Layer 2 protocol packets. Use the **no** form of this command to return to the default setting.

l2protocol-tunnel cos value

no l2protocol-tunnel cos

	<u> </u>	B	
	Switch(config)# 12	protocol-tunnel cos 7	
rvamhies	This example shows how to configure a Layer-2 protocol-tunnel CoS value of 7: Switch(config) # 12protocol-tunnel cos 7		
Examples	This example shows	now to configure a Laver-2 protocol-tunnel CoS value of 7.	
	The value is saved in	NVRAM.	
Usage Guidelines	When enabled, the tunneled Layer 2 protocol packets use this CoS value.		
	12.2(25)SE	This command was introduced.	
Command History	Release	Modification	
Command Modes	Global configuration		
	the default is 5 for all	tunneled Layer 2 protocol packets.	
Defaults		the CoS value configured for data on the interface. If no CoS value is configured	
		5. The range is 0 to 7, with 7 being the highest priority.	
Syntax Description	value	Specify CoS priority value for tunneled Layer 2 protocol packets. If a CoS value is configured for data packets for the interface, the default is to use this CoS value. If no CoS value is configured for the interface, the default is	

lacp port-priority

Use the **lacp port-priority** interface configuration command on the switch stack or on a standalone switch to configure the port priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp port-priority priority

no lacp port-priority

Syntax Description	priority	Port priority for LACP. The range is 1 to 65535.	
Defaults	The default is 3276	8.	
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
Usage Guidelines	The lacp port-prio	rity interface configuration command determines which ports are bundled and which	
0	ports are put in hot-standby mode when there are more than eight ports in an LACP channel group.		
	An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.		
	In port-priority comparisons, a numerically <i>lower</i> value has a <i>higher</i> priority: When there are more than eight ports in an LACP channel-group, the eight ports with the numerically lowest values (highest priority values) for LACP port priority are bundled into the channel group, and the lower-priority ports are put in hot-standby mode. If two or more ports have the same LACP port priority (for example, they are configured with the default setting of 65535) an internal value for the port number determines the priority.		
<u> </u>	The LACP port price	prities are only effective if the ports are on the switch that controls the LACP link.	
	See the lacp system-priority global configuration command for determining which switch controls the link.		
	Use the show lacn i	nternal privileged EXEC command to display LACP port priorities and internal port	

number values.

For information about configuring LACP on physical ports, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Examples This example shows how to configure the LACP port priority on a port:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# lacp port-priority 1000

You can verify your settings by entering the **show lacp** [*channel-group-number*] **internal** privileged EXEC command.

Related Commands Command

Command	Description
channel-group	Assigns an Ethernet port to an EtherChannel group.
lacp system-priority	Configures the LACP system priority.
<pre>show lacp [channel-group-number] internal</pre>	Displays internal information for all channel groups or for the specified channel group.

lacp system-priority

Use the **lacp system-priority** global configuration command on the switch stack or on a standalone switch to configure the system priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp system-priority priority

no lacp system-priority

Syntax Description	priority	System priority for LACP. The range is 1 to 65535.	
Defaults	The default is 32768	8.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
Usage Guidelines	The lacp system-pr	iority command determines which switch in an LACP link controls port priorities.	
	An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel-group, the switch on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other switch (the noncontrolling end of the link) are ignored.		
	In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both switches have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the switch MAC address) determines which switch is in control.		
	The lacp system-priority command applies to all LACP EtherChannels on the switch.		
	Use the show etherchannel summary privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).		
	For more information about configuring LACP on physical ports, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.		
Examples	-	s how to set the LACP system priority: acp system-priority 20000	
	You can verify your settings by entering the show lacp sys-id privileged EXEC command.		

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	lacp port-priority	Configures the LACP port priority.
	show lacp sys-id	Displays the system identifier that is being used by LACP.

location (global configuration)

Use the **location** global configuration command to configure location information for an endpoint. Use the **no** form of this command to remove the location information.

location {admin-tag *string* | civic-location identifier *id* | elin-location *string* identifier *id*}

no location {admin-tag *string* | civic-location identifier *id* | elin-location *string* identifier *id*}

Syntax Description	admin-tag	Configure administrative tag or site information.
	civic-location	Configure civic location information.
	elin-location	Configure emergency location information (ELIN).
	identifier id	Specify the ID for the civic location or the elin location. The ID range is 1 to 4095.
	string	Specify the site or location information in alphanumeric format.
Defaults	This command has	no default setting.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.2(40)SE	This command was introduced.
Usage Guidelines	 After entering the location civic-location identifier <i>id</i> global configuration command, you enter civic location configuration mode. In this mode, you can enter the civic location and the postal location information. Use the no lldp med-tlv-select location information interface configuration command to disable the location TLV. The location TLV is enabled by default. For more information, see the "Configuring LLDP and LLDP-MED" chapter of the software configuration guide for this release. 	
Examples	This example shows	s how to configure civic location information on the switch:
	Switch(config-civ Switch(config-civ Switch(config-civ Switch(config-civ Switch(config-civ Switch(config-civ	<pre>ic)# primary-road-name "Cisco Way" ic)# city "San Jose" ic)# state CA ic)# building 19 ic)# room C6 ic)# county "Santa Clara" ic)# country US</pre>
	You can verify your	r settings by entering the show location civic-location privileged EXEC command.

This example shows how to configure the emergency location information on the switch: Switch (config)# location elin-location 14085553881 identifier 1

You can verify your settings by entering the show location elin privileged EXEC command.

Related Commands	Command	Description
	location (interface configuration)	Configures the location information for an interface.
	show location	Displays the location information for an endpoint.

location (interface configuration)

Use the **location** interface command to enter location information for an interface. Use the **no** form of this command to remove the interface location information.

location {additional-location-information *word* | civic-location-id *id* | elin-location-id *id*}

no location {additional-location-information word | civic-location-id id | elin-location-id id}

Syntax Description	additional-location-information	Configure additional information for a location or place.	
	civic-location-id	Configure global civic location information for an interface.	
	elin-location-id	Configure emergency location information for an interface.	
	id	Specify the ID for the civic location or the elin location. The ID range is 1 to 4095.	
	word	Specify a word or phrase that provides additional location information.	
Defaults	This command has no default settin	ng.	
Command Modes	Interface configuration		
Command History	Release Modifica	ation	
	12.2(40)SE This con	nmand was introduced.	
Usage Guidelines		Ocation-id <i>id</i> interface configuration command, you enter civic is mode, you can enter the additional location information.	
Examples	These examples show how to enter	civic location information for an interface:	
	Switch(config-if)# interface gigabitethernet1/0/1 Switch(config-if)# location civic-location-id 1 Switch(config-if) # end		
	Switch(config-if)# interface g : Switch(config-if)# location civ Switch(config-if) # end		
	You can verify your settings by entering the show location civic interface privileged EXEC command.		

This example shows how to enter emergency location information for an interface:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# location elin-location-id 1
Switch(config-if)# end
```

You can verify your settings by entering the show location elin interface privileged EXEC command.

Related Commands	Command	Description
	link state group	Configures the location information for an endpoint.
	show location	Displays the location information for an endpoint.

link state group

Use the **link state group** interface configuration command to configure a port as a member of a link-state group. Use the **no** form of this command to remove the port from the link-state group.

link state group [number] {upstream | downstream}

no link state group [*number*] {**upstream** | **downstream**}

	number	(Optional) Specify the link-state group number. The group number can be 1 to 10. The default is 1.	
	upstream	Configure a port as an upstream port for a specific link-state group.	
	downstream	Configure a port as a downstream port for a specific link-state group.	
Defaults	The default group is	s group 1.	
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
	number is 1. To enable link-state tracking, create a <i>link-state group</i> , and specify the interfaces that are assigned to the		
Usage Guidelines			
	in access or trunk mode, or a routed port. In a link-state group, these interfaces are bundled together. The <i>downstream interfaces</i> are bound to the <i>upstream interfaces</i> . Interfaces connected to servers are referred to as downstream interfaces, and interfaces connected to distribution switches and network devices are referred to as upstream interfaces.		
	For more information about the interactions between the downstream and upstream interfaces, see the "Configuring EtherChannels and Link-State Tracking" chapter of the software configuration guide for this release.		
	Follow these guidelines to avoid configuration problems:		
	• An interface that is defined as an upstream interface cannot also be defined as a downstream interface in the same or a different link-state group. The reverse is also true.		
	• An interface cannot be a member of more than one link-state group.		
	• An interface ca	nnot be a member of more than one link-state group.	

Examples This example shows how to configure the interfaces as upstream in group 2: Switch# configure terminal Switch(config)# interface range gigabitethernet1/0/11 - 14 Switch(config-if-range)# link state group 2 downstream Switch(config-if-range)# end Switch(config-if)# end Switch(config-if)# end You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	link state track	Enables a link-state group.
	show link state group	Displays the link-state group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference for Release 12.2 > Cisco IOS File Management Commands > Configuration File Commands.

link state track

Use the **link state track** user EXEC command to enable a link-state group. Use the **no** form of this command to disable a link-state group.

link state track [number]

no link state track [number]

Syntax Description	number	(Optional) Specify the link-state group number. The group number can be 1 to 10. The default is 1.	
Defaults	Link-state tracking is dis	sabled for all groups.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Examples	This example shows how enable link-state group 2: Switch(config)# link state track 2		
Examples	This example shows how	v enable link-state group 2:	
	You can verify your settings by entering the show running-config privileged EXEC command.		
Related Commands	Command	Description	
	link state track	Configures an interface as a member of a link-state group.	
	show link state group	Displays the link-state group information.	
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference for Release 12.2 > Cisco IOS File Management Commands > Configuration File Commands .	

logging event

Use the **logging event** interface configuration command to enable notification of interface link status changes. Use the **no** form of this command to disable notification.

logging event {bundle-status | link-status | spanning-tree | status | trunk status}

no logging event {bundle-status | link-status | spanning-tree | status | trunk status}

Syntax Description	bundle-status	Enable notification of BUNDLE and UNBUNDLE messages.
	link-status	Enable notification of interface data link status changes.
	spanning-tree	Enable notification of spanning-tree events.
	status	Enable notification of spanning-tree state change messages.
	trunk-status	Enable notification of trunk-status messages.
Defaults	Event logging is	disabled.
Command Modes	Interface configu	iration
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Examples	-	ows how to enable spanning-tree logging: if)# logging event spanning-tree

logging event power-inline-status

Use the **logging event power-inline-status** interface configuration command to enable the logging of Power over Ethernet (PoE) events. Use the **no** form of this command to disable the logging of PoE status events; however, the **no** form of this command does not disable PoE error events.

logging event power-inline-status

no logging event power-inline-status

Syntax Description	power-inline-status	Enable the logging of PoE messages.
Defaults	Logging of PoE events	s is enabled.
Command Modes	Interface configuratior	1
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	The power-inline-stat	us keyword is available only on PoE interfaces.
	-	
Usage Guidelines Examples	This example shows he	ow to enable logging of PoE events on a port:
	This example shows he Switch(config-if)# i	
	This example shows he Switch(config-if)# i Switch(config-if)# 1	ow to enable logging of PoE events on a port: Interface fastethernet1/0/1
Examples	This example shows he Switch(config-if)# i Switch(config-if)# i Switch(config-if)#	ow to enable logging of PoE events on a port: .nterface fastethernet1/0/1 .ogging event power-inline-status

logging file

Use the **logging file** global configuration command on the switch stack or on a standalone switch to set logging file parameters. Use the **no** form of this command to return to the default setting.

logging file *filesystem:filename* [*max-file-size* | **nomax** [*min-file-size*]] [*severity-level-number* | *type*]

no logging file *filesystem:filename* [*severity-level-number* | *type*]

Syntax Description	filesystem:filename	Alias for a flash file system. Contains the path and name of the file that contains the log messages.
		The syntax for the local flash file system on the stack member or the stack master: flash:
		From the stack master, the syntax for the local flash file system on a stack member: flash member number
	max-file-size	(Optional) Specify the maximum logging file size. The range is 4096 to 2147483647.
	nomax	(Optional) Specify the maximum file size of 2147483647.
	min-file-size	(Optional) Specify the minimum logging file size. The range is 1024 to 2147483647.
	severity-level-number	(Optional) Specify the logging severity level. The range is 0 to 7. See the <i>type</i> option for the meaning of each level.
	type	(Optional) Specify the logging type. These keywords are valid:
		• emergencies —System is unusable (severity 0).
		• alerts —Immediate action needed (severity 1).
		• critical —Critical conditions (severity 2).
		• errors —Error conditions (severity 3).
		• warnings—Warning conditions (severity 4).
		• notifications —Normal but significant messages (severity 5).
		• informational —Information messages (severity 6).
		• debugging —Debugging messages (severity 7).

Defaults

The minimum file size is 2048 bytes; the maximum file size is 4096 bytes. The default severity level is 7 (**debugging** messages and numerically lower levels).

Command Modes Global configuration

Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	The log file is stored in ASCII text format in an internal buffer on a standalone switch, and in the case of a switch stack, on the stack master. If a standalone switch or the stack master fails, the log is lost unless you had previously saved it to flash memory by using the logging file flash : <i>filename</i> global configuration command.		
	After saving the log to flash memory by using the logging file flash : <i>filename</i> global configuration command, you can use the more flash : <i>filename</i> privileged EXEC command to display its contents.		
	The command rejects the minimum file size if it is greater than the maximum file size minus 1024; the minimum file size then becomes the maximum file size minus 1024.		
	Specifying a <i>level</i> cause	es messages at that level and numerically lower levels to be displayed.	
Examples	This example shows ho	w to save informational log messages to a file in flash memory:	
	Switch(config)# logging file flash:logfile informational		
	You can verify your setting by entering the show running-config privileged EXEC command.		
Related Commands	Command	Description	
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .	

mac access-group

Use the **mac access-group** interface configuration command on the switch stack or on a standalone switch to apply a MAC access control list (ACL) to a Layer 2 interface. Use the **no** form of this command to remove all MAC ACLs or the specified MAC ACL from the interface. You create the MAC ACL by using the **mac access-list extended** global configuration command.

mac access-group {*name*} **in**

no mac access-group {*name* }

Syntax Description	name	Specify a named MAC access list.	
	in	Specify that the ACL is applied in the ingress direction. Outbound ACLs are not supported on Layer 2 interfaces.	
Defaults	No MAC ACL	is applied to the interface.	
Command Modes	Interface config	guration (Layer 2 interfaces only)	
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
	On Layer 2 interfaces, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC access lists. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP ACL and a MAC ACL to the interface. You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface.		
	If a MAC ACL is already configured on a Layer 2 interface and you apply a new MAC ACL to the interface, the new ACL replaces the previously configured one.		
	If you apply an ACL to a Layer 2 interface on a switch, and the switch has an input Layer 3 ACL or a VLAN map applied to a VLAN that the interface is a member of, the ACL applied to the Layer 2 interface takes precedence.		
	When an inbound packet is received on an interface with a MAC ACL applied, the switch checks the match conditions in the ACL. If the conditions are matched, the switch forwards or drops the packet, according to the ACL.		
	If the specified	ACL does not exist, the switch forwards all packets.	
		mation about configuring MAC extended ACLs, see the "Configuring Network Security apter in the software configuration guide for this release.	

ExamplesThis example shows how to apply a MAC extended ACL named macacl2 to an interface:
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mac access-group macacl2 in

You can verify your settings by entering the **show mac access-group** privileged EXEC command. You can see configured ACLs on the switch by entering the **show access-lists** privileged EXEC command.

Related Commands	Command	Description
	show access-lists	Displays the ACLs configured on the switch.
	show link state group	Displays the MAC ACLs configured on the switch.
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

mac access-list extended

Use the **mac access-list extended** global configuration command on the switch stack or on a standalone switch to create an access list based on MAC addresses for non-IP traffic. Using this command puts you in the extended MAC access-list configuration mode. Use the **no** form of this command to return to the default setting.

mac access-list extended name

no mac access-list extended name

Syntax Description	name	Assign a name to the MAC extended access list.	
Defaults	By default, there are no MAC access lists created.		
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	You can apply name	led lists are used with VLAN maps and class maps. ed MAC extended ACLs to VLAN maps or to Layer 2 interfaces; you cannot apply led ACLs to Layer 3 interfaces.	
	Entering the mac access-list extended command enables the MAC access-list configuration mode. These configuration commands are available:		
	• default : sets a command to its default.		
	• deny : specifies packets to reject. For more information, see the deny (MAC access-list configuration) MAC access-list configuration command.		
	• exit: exits from MAC access-list configuration mode.		
	• no : negates a command or sets its defaults.		
	• permit : specifies packets to forward. For more information, see the permit (MAC access-list configuration) command.		
	For more information release.	on about MAC extended access lists, see the software configuration guide for this	

Examples This example shows how to create a MAC named extended access list named *mac1* and to enter extended MAC access-list configuration mode:

Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)#

This example shows how to delete MAC named extended access list *mac1*:

Switch(config) # no mac access-list extended mac1

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Configures the MAC ACL (in extended MAC-access list configuration mode).
	permit (MAC access-list configuration)	
	show access-lists	Displays the access lists configured on the switch.
	vlan access-map	Defines a VLAN map and enters access-map configuration mode where you can specify a MAC ACL to match and the action to be taken.

mac address-table aging-time

Use the **mac address-table aging-time** global configuration command on the switch stack or on a standalone switch to set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated. Use the **no** form of this command to return to the default setting. The aging time applies to all VLANs or a specified VLAN.

mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]

no mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]

Syntax Description	0	This value disables aging. Static address entries are never aged or removed from the table.		
	10-1000000	Aging time in seconds. The range is 10 to 1000000 seconds.		
	vlan vlan-id	(Optional) Specify the VLAN ID to which to apply the aging time. The range is 1 to 4094.		
Defaults	The default is 300	0 seconds.		
Command Modes	Clabel configurat	tion		
Command Modes	Global configurat	non		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
	12.1(19)EA1	The mac-address-table aging-time command (with the hyphen) was replaced by the mac address-table aging-time command (without the hyphen).		
Usage Guidelines	Increasing the tin	nd continuously, increase the aging time to record the dynamic entries for a longer time. ne can reduce the possibility of flooding when the hosts send again.		
	If you do not spec	cify a specific VLAN, this command sets the aging time for all VLANs.		
Examples	This example shows how to set the aging time to 200 seconds for all VLANs:			
	Switch(config)# mac address-table aging-time 200			
	You can verify yo command.	our setting by entering the show mac address-table aging-time privileged EXEC		
Related Commands	Command	Description		
	show mac addre	Example aging-time Displays the MAC address table aging time for all VLANs or the specified VLAN.		

Catalyst 3750 Switch Command Reference

mac address-table learning vlan

Use the **mac address-table learning** global configuration command to enable MAC address learning on a VLAN. This is the default state. Use the **no** form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

mac address-table learning vlan vlan-id

no mac address-table notification vlan vlan-id

Syntax Description	vlan-id	The VLAN ID range is 1 to 4094. It cannot be an internal VLAN.	
Syntax Description	vian-ia	The VLAN ID range is 1 to 4094. It cannot be an internal VLAN.	
Defaults	By default, MAC add	ress learning is enabled on all VLANs.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(46)SE	This command was introduced.	
Usage Guidelines	When you control MAC address learning on a VLAN, you can manage the available MAC address table space by controlling which VLANs, and therefore which ports, can learn MAC addresses.		
	 Before you disable MAC address learning, be sure that you are familiar with the network topology the switch system configuration. Disabling MAC address learning on a VLAN could cause flooding the network. For example, if you disable MAC address learning on a VLAN with a configured switt virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch is flooded in that VLAN domain. We recommend that you disable MAC address learning on a VLAN we an SVI. You cannot disable MAC address learning on a VLAN that the switch uses internally. If the VLAN that you enter in the no mac address-table learning vlan vlan-id command is an internal VLAN, the switch generates an error message and rejects the command. To view used internal VLANs, enter the show vlan internal usage privileged EXEC command. If you disable MAC address learning on a VLAN configured as a private VLAN primary or a second VLAN, the MAC address learning on a VLAN configured as a private VLAN. You cannot disable MAC address learning on a NLAN configured as a private VLAN primary or a second VLAN. You cannot disable MAC address learning on a NLAN configured as a private VLAN primary or a second VLAN. 		
	•	ddress learning on a VLAN that includes a secure port, MAC address learning is cure port. If you later disable port security on the interface, the disabled MAC is enabled.	
		ess learning status of all VLANs or a specified VLAN, enter the show carning [vlan <i>vlan-id</i> command].	

ExamplesThis example shows how to disable MAC address learning on VLAN 2003:
Switch(config)# no mac address-table learning vlan 2003

To display MAC address learning status of all VLANs or a specified VLAN, enter the **show mac** address-table learning [vlan *vlan-id*] command.

Related Commands	Command	Description
	show mac address-table learning	Displays the MAC address learning status on all VLANs or
		on the specified VLAN.

mac address-table move update

Use the **mac address-table move update** global configuration command on the switch stack or on a standalone switch to enable the MAC address-table move update feature. Use the **no** form of this command to return to the default setting.

mac address-table move update {receive | transmit}

no mac address-table move update {receive | transmit}

Syntax Description	receive	Specify that the switch processes MAC address-table move update messages.
	transmit	Specify that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up.
Command Modes	Global configuratio	n.
Defaults	By default, the MA	C address-table move update feature is disabled.
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines		able move update feature allows the switch to provide rapid bidirectional mary (forwarding) link goes down and the standby link begins forwarding traffic.
	You can configure t primary link goes do	he access switch to send the MAC address-table move update messages if the own and the standby link comes up. You can configure the uplink switches to receive C address-table move update messages.
Examples	This example shows messages:	s how to configure an access switch to send MAC address-table move update
	Switch# configure Switch(conf)# mac Switch(conf)# end	terminal address-table move update transmit
	This example shows update messages:	s how to configure an uplink switch to get and process MAC address-table move
	Switch# configure Switch(conf)# mac Switch(conf)# end	terminal address-table move update receive
	You can verify your command.	settings by entering the show mac address-table move update privileged EXEC

Related Commands	Command	Description
	clear mac address-table move update	Clears the MAC address-table move update global counters.
	debug matm move update	Debugs the MAC address-table move update message processing.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

mac address-table notification

Use the **mac address-table notification** global configuration command on the switch stack or on a standalone switch to enable the MAC address notification feature on the switch stack. Use the **no** form of this command to return to the default setting.

mac address-table notification [history-size value] | [interval value]

no mac address-table notification [history-size | interval]

Syntax Description	history-size value	(Optional) Configure the maximum number of entries in the MAC notification history table. The range is 0 to 500 entries.
	interval value	(Optional) Set the notification trap interval. The switch stack sends the notification traps when this amount of time has elapsed. The range is 0 to 2147483647 seconds.
Defaults	By default, the MAC a The default trap interv	address notification feature is disabled. /al value is 1 second.
	The default number of	f entries in the history table is 1.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(19)EA1	The mac-address-table notification command (with the hyphen) was replaced by the mac address-table notification command (without the hyphen).
Usage Guidelines	network management a from the forwarding ta	ification feature sends Simple Network Management Protocol (SNMP) traps to the system (NMS) whenever a new MAC address is added or an old address is deleted ables. MAC notifications are generated only for dynamic and secure MAC not generated for self addresses, multicast addresses, or other static addresses.
	When you configure the new table is created.	he history-size option, the existing MAC address history table is deleted, and a
	command. You must a mac-notification inter	address notification feature by using the mac address-table notification lso enable MAC address notification traps on an interface by using the snmp trap rface configuration command and configure the switch to send MAC address traps the snmp-server enable traps mac-notification global configuration command.

Examples This example shows how to enable the MAC address-table notification feature, set the interval time to 60 seconds, and set the history-size to 100 entries:

```
Switch(config)# mac address-table notification
Switch(config)# mac address-table notification interval 60
Switch(config)# mac address-table notification history-size 100
```

You can verify your settings by entering the **show mac address-table notification** privileged EXEC command.

Related Commands	Command	Description
	clear mac address-table notification	Clears the MAC address notification global counters.
	show mac address-table notification	Displays the MAC address notification settings on all interfaces or on the specified interface.
	snmp-server enable traps	Sends the SNMP MAC notification traps when the mac-notification keyword is appended.
	snmp trap mac-notification	Enables the SNMP MAC notification trap on a specific interface.

mac address-table static

Use the **mac address-table static** global configuration command on the switch stack or on a standalone switch to add static addresses to the MAC address table. Use the **no** form of this command to remove static entries from the table.

mac address-table static mac-addr vlan vlan-id interface interface-id

no mac address-table static *mac-addr* **vlan** *vlan-id* [**interface** *interface-id*]

Syntax Description	mac-addr	Destination MAC address (unicast or multicast) to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. The range is 1 to 4094.
	interface interface-id	Interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels.
Defaults	No static addresses are c	configured.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(19)EA1	The mac-address-table static command (with the hyphen) was replaced by
		the mac address-table static command (without the hyphen).
Examples	This example shows how	
Examples	This example shows how packet is received in VL specified interface:	the mac address-table static command (without the hyphen). v to add the static address c2f3.220a.12f4 to the MAC address table. When a

Examples Related Commands	This example shows how packet is received in VL specified interface: Switch(config)# mac au gigabitethernet6/0/1	the mac address-table static command (without the hyphen). v to add the static address c2f3.220a.12f4 to the MAC address table. When a AN 4 with this MAC address as its destination, the packet is forwarded to the ddress-table static c2f3.220a.12f4 vlan 4 interface

OL-8552-06

mac address-table static drop

Use the mac address-table static drop global configuration command on the switch stack or on a standalone switch to enable unicast MAC address filtering and to configure the switch to drop traffic with a specific source or destination MAC address. Use the **no** form of this command to return to the default setting.

mac address-table static mac-addr vlan vlan-id drop

no mac address-table static mac-addr vlan vlan-id

Syntax Description	mac-addr	Unicast source or destination MAC address. Packets with this MAC address are dropped.
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
Defaults	Unicast MAC ac destination MAC	ddress filtering is disabled. The switch does not drop traffic for specific source or C addresses.
Command Modes	Global configur	ation
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	Follow these gu	idelines when using this feature:
		IAC addresses, broadcast MAC addresses, and router MAC addresses are not supported. t are forwarded to the CPU are also not supported.
	the switch e	a unicast MAC address as a static address and configure unicast MAC address filtering, ither adds the MAC address as a static address or drops packets with that MAC address, on which command was entered last. The second command that you entered overrides nmand.
	interface-id	e, if you enter the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface global configuration command followed by the mac address-table static <i>mac-addr</i> <i>d</i> drop command, the switch drops packets with the specified MAC address as a source on.
	command for	the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop global configuration ollowed by the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface <i>interface-id</i> he switch adds the MAC address as a static address.

ExamplesThis example shows how to enable unicast MAC address filtering and to configure the switch to drop
packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in
VLAN 4 with this MAC address as its source or destination, the packet is dropped:
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 dropThis example shows how to disable unicast MAC address filtering:
Switch(config)# no mac address-table static c2f3.220a.12f4 vlan 4You can verify your setting by entering the show mac address-table static privileged EXEC command.

Related Commands	Command	Description
	show mac address-table static	Displays only static MAC address table entries.

macro apply

Use the **macro apply** interface configuration command on the switch stack or on a standalone switch to apply a macro to an interface or to apply and trace a macro configuration on an interface.

macro {apply | trace} macro-name [parameter {value}] [parameter {value}]
[parameter {value}]

Syntax Description	apply	Apply a macro to the specified interface.	
	trace	Use the trace keyword to apply a macro to an interface and to debug the macro.	
	macro-name	Specify the name of the macro.	
	parameter value		
Defaults	This command has	s no default setting.	
Command Modes	Interface configura	ation	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(18)SE	The parameter value keywords were added.	
Usage Guidelines		acro trace <i>macro-name</i> interface configuration command to apply and show the an interface or to debug the macro to find any syntax or configuration errors.	
	If a command fails	because of a syntax error or a configuration error when you apply a macro, the macro the remaining commands to the interface.	
	-	acro that requires the assignment of unique values, use the parameter <i>value</i> keywords s specific to the interface.	
	corresponding valu	g is case sensitive. All matching occurrences of the keyword are replaced with the ue. Any full match of a keyword, even if it is part of a larger string, is considered a ced by the corresponding value.	
	macro-name ? con	It contain keywords that require a parameter value. You can use the macro apply mand to display a list of any required values in the macro. If you apply a macro ne keyword values, the commands are invalid and are not applied.	
		efault Smartports macros embedded in the switch software. You can display these mmands they contain by using the show parser macro user EXEC command.	

	Follow these guidelines when you apply a Cisco-default Smartports macro on an interface:
	• Display all macros on the switch by using the show parser macro user EXEC command. Display the contents of a specific macro by using the show parser macro name <i>macro-name</i> user EXEC command.
	• Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the parameter <i>value</i> keywords.
	The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.
	When you apply a macro to an interface, the macro name is automatically added to the interface. You can display the applied commands and macro names by using the show running-configuration interface <i>interface-id</i> user EXEC command.
	A macro applied to an interface range behaves the same way as a macro applied to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.
	You can delete a macro-applied configuration on an interface by entering the default interface <i>interface-id</i> interface configuration command.
Examples	After you have created a macro by using the macro name global configuration command, you can apply it to an interface. This example shows how to apply a user-created macro called duplex to an interface:
	Switch(config-if)# macro apply duplex
	To debug a macro, use the macro trace interface configuration command to find any syntax or configuration errors in the macro as it is applied to an interface. This example shows how troubleshoot the user-created macro called duplex on an interface:
	Switch(config-if)# macro trace duplex Applying command`duplex auto' %Error Unknown error. Applying command`speed nonegotiate'
	This example shows how to display the Cisco-default cisco-desktop macro and how to apply the macro and set the access VLAN ID to 25 on an interface:
	Switch# show parser macro cisco-desktop
	Macro name : cisco-desktop Macro type : default
	# Basic interface - Enable data VLAN only # Recommended value for access vlan (AVID) should not be 1 switchport access vlan \$AVID switchport mode access
	<pre># Enable port security limiting port to a single # MAC address that of desktop switchport port-security</pre>
	<pre>switchport port-security maximum 1 # Ensure port-security age is greater than one minute # and use inactivity timer switchport port-security violation restrict switchport port-security aging time 2 switchport port-security aging type inactivity</pre>

macro global

macro global

Use the **macro global** global configuration command on the switch stack or on a standalone switch to apply a macro to a switch or to apply and trace a macro configuration on a switch.

macro global {apply | trace} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]

Syntax Description	apply	Apply a macro to the switch.
	trace	Apply a macro to a switch and to debug the macro.
	macro-name	Specify the name of the macro.
	parameter value	(Optional) Specify unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.
Defaults	This command has	s no default setting.
Command Modes	Global configurati	on
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Usage Guidelines		acro trace <i>macro-name</i> global configuration command to apply and to show the a switch or to debug the macro to find any syntax or configuration errors.
		because of a syntax error or a configuration error when you apply a macro, the macro the remaining commands to the switch.
	When creating a m	acro that requires the assignment of unique values, use the parameter value keywords
	-	s specific to the switch.
	to designate values Keyword matching corresponding valu	s specific to the switch. g is case sensitive. All matching occurrences of the keyword are replaced with the ue. Any full match of a keyword, even if it is part of a larger string, is considered a ced by the corresponding value.
	to designate values Keyword matching corresponding valu match and is replac Some macros migh apply <i>macro-name</i>	g is case sensitive. All matching occurrences of the keyword are replaced with the ue. Any full match of a keyword, even if it is part of a larger string, is considered a

Follow these guidelines when you apply a Cisco-default Smartports macro on a switch:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro** name *macro-name* user EXEC command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter** *value* keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to a switch, the macro name is automatically added to the switch. You can display the applied commands and macro names by using the **show running-configuration** user EXEC command.

You can delete a global macro-applied configuration on a switch only by entering the **no** version of each command contained in the macro.

Examples

After you have created a new macro by using the **macro name** global configuration command, you can apply it to a switch. This example shows how see the **snmp** macro and how to apply the macro and set the hostname to test-server and set the IP precedence value to 7:

```
Switch# show parser macro name snmp
Macro name : snmp
Macro type : customizable
#enable port security, linkup, and linkdown traps
snmp-server enable traps port-security
snmp-server enable traps linkup
snmp-server enable traps linkdown
#set snmp-server host
snmp-server host ADDRESS
#set SNMP trap notifications precedence
snmp-server ip precedence VALUE
```

```
Switch(config)# macro global apply snmp ADDRESS test-server VALUE 7
```

To debug a macro, use the **macro global trace** global configuration command to find any syntax or configuration errors in the macro when it is applied to a switch. In this example, the **ADDRESS** parameter value was not entered, causing the snmp-server host command to fail while the remainder of the macro is applied to the switch:

```
Switch(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

macro name

Use the **macro name** global configuration command on the switch stack or on a standalone switch to create a configuration macro. Use the **no** form of this command to delete the macro definition.

macro name macro-name

no macro name macro-name

Syntax Description	<i>macro-name</i> Name of the macro.		
Defaults	This command has no default setting.		
Command Modes	Global configuratio	on	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(20)SE	The help string # macro keywords was added.	
Usage Guidelines	A macro can contain up to 3000 characters. Enter one macro command per line. Use the @ character to end the macro. Use the # character at the beginning of a line to enter comment text within the macro. You can define mandatory keywords within a macro by using a help string to specify the keywords. Enter # macro keywords word to define the keywords that are available for use with the macro. You can enter up to three help string keywords separated by a space. If you enter more than three macro keywords, only the first three are shown.		
	Macro names are case sensitive. For example, the commands macro name Sample-Macro and macro name sample-macro will result in two separate macros.		
	When creating a macro, do not use the exit or end commands or change the command mode by interface <i>interface-id</i> . This could cause commands that follow exit , end , or interface <i>interface interface interface</i> .		
	The no form of this command only deletes the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied. You can delete a macro-applied configuration on an interface by entering the default interface <i>interface-id</i> interface configuration command. Alternatively, you can create an <i>anti-macro</i> for an existing macro that contains the no form of all the corresponding commands in the original macro. Then apply the anti-macro to the interface.		
	You can modify a macro by creating a new macro with the same name as the existing macro. The newly created macro overwrites the existing macro but does not affect the configuration of those interfaces on which the original macro was applied.		

Examples This example shows how to create a macro that defines the duplex mode and speed:

```
Switch(config)# macro name duplex
Enter macro commands one per line. End with the character `@'.
duplex full
speed auto
@
```

This example shows how create a macro with **# macro keywords**:

```
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
@
```

This example shows how to display the mandatory keyword values before you apply the macro to an interface:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# macro apply test ?
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID ?
WORD Value of first keyword to replace
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace
```

2-301

match (access-map configuration)

match (access-map configuration)

Use the **match** access-map configuration command on the switch stack or on a standalone switch to set the VLAN map to match packets against one or more access lists. Use the **no** form of this command to remove the match parameters.

- match {ip address {name | number} [name | number] [name | number]...} | {mac address {name}
 [name] [name]...}
- **no match** {**ip address** {*name* | *number*} [*name* | *number*] [*name* | *number*]...} | {**mac address** {*name*} [*name*] [*name*]...}

Syntax Description	ip address	Set the access map to match packets against an IP address access list.		
	mac address	Set the access map to match packets against a MAC address access list.		
	name	name Name of the access list to match packets against.		
	number	Number of the access list to match packets against. This option is not valid for MAC access lists.		
Defaults	The default act	ion is to have no match parameters applied to a VLAN map.		
Command Modes	Access-map co	nfiguration		
Command History	Release	Modification

Usage Guidelines	You must enter or more access In access-map of map applied to the conditions. Packets are mai IP access lists,	one access list name or number; others are optional. You can match packets against one lists. Matching any of the lists counts as a match of the entry. configuration mode, use the match command to define the match conditions for a VLAN a VLAN. Use the action command to set the action that occurs when the packet matches tched only against access lists of the same protocol type; IP packets are matched against		

Examples

This example shows how to define and apply a VLAN access map *vmap4* to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list *al2*.

```
Switch(config)# vlan access-map vmap4
Switch(config-access-map)# match ip address al2
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan filter vmap4 vlan-list 5-6
```

You can verify your settings by entering the show vlan access-map privileged EXEC command.

Command	Description
access-list	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
action	Specifies the action to be taken if the packet matches an entry in an access control list (ACL).
ip access list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
mac access-list extended	Creates a named MAC address access list.
show vlan access-map	Displays the VLAN access maps created on the switch.
vlan access-map	Creates a VLAN access map.
	access-list action ip access list mac access-list extended show vlan access-map

match (class-map configuration)

Use the match class-map configuration command on the switch stack or on a standalone switch to define the match criteria to classify traffic. Use the **no** form of this command to remove the match criteria.

match {access-group acl-index-or-name | input-interface interface-id-list | ip dscp dscp-list | ip precedence ip-precedence-list}

no match {access-group acl-index-or-name | input-interface interface-id-list | ip dscp dscp-list | ip precedence ip-precedence-list}

Syntax Description	access-group acl-index-or-name	Number or name of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.
	input-interface <i>interface-id-list</i>	Specify the physical ports to which the interface-level class map in a hierarchical policy map applies. This command can only be used in the child-level policy map and must be the only match condition in the child-level policy map. You can specify up to six entries in the list by specifying a port (counts as one entry), a list of ports separated by a space (each port counts as an entry), or a range of ports separated by a hyphen (counts as two entries).
	ip dscp dscp-list	List of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly-used value.
	ip precedence <i>ip-precedence-list</i>	List of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly-used value
Defaults Command Modes	No match criteria are o Class-map configuratio	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SE	The input-interface <i>interface-id-list</i> keyword was added.
Usage Guidelines	the packets. Only the I supported.	is used to specify which fields in the incoming packets are examined to classify P access group or the MAC access-group matching to the Ether Type/Len are ification on a physical-port basis, only one match command per class map is
		ation, the match-all and match-any keywords are equivalent.

Catalyst 3750 Switch Command Reference

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries.

Examples

This example shows how to create a class map called *class2*, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
```

This example shows how to create a class map called *class3*, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using *acl1*:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet2/0/1 gigabitethernet2/0/2
Switch(config-cmap)# exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet2/0/1 - gigabitethernet2/0/5
Switch(config-cmap)# exit
```

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	show class-map	Displays quality of service (QoS) class maps.

mdix auto

Use the **mdix auto** interface configuration command on the switch stack or on a standalone switch to enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the **no** form of this command to disable auto-MDIX.

mdix auto

no mdix auto

Syntax Description	This command has	This command has no arguments or keywords.	
Defaults	Auto-MDIX is enab	bled.	
Command Modes	Interface configurat	ion	
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
	12.2(18)SE	The default setting changed from <i>disabled</i> to <i>enabled</i> .	
	interfaces, link up o Auto-MDIX is supp	and autonegotiation of speed and duplex) is enabled on one or both of connected occurs, even if the cable type (straight-through or crossover) is incorrect. Forted on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX luggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP	
Examples	Switch# configure	nterface gigabitethernet1/0/1 # speed auto # duplex auto	
		# end opperational state of auto-MDIX on the interface by entering the show controllers <i>interface-id</i> phy privileged EXEC command.	

Related Commands	Command	Description
	show controllers ethernet-controller interface-id phy	Displays general information about internal registers of an interface, including the operational state of auto-MDIX.

mls qos

Use the **mls qos** global configuration command on the switch stack or on a standalone switch to enable quality of service (QoS) for the entire switch. When the **mls qos** command is entered, QoS is enabled with the default parameters on all ports in the system. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

mls qos

no mls qos

Syntax Description	This command has no arguments or keywords.		
Defaults	QoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).		
	to their defaults, tra policing. No policy	ed with the mls qos global configuration command and all other QoS settings are set ffic is classified as best effort (the DSCP and CoS value is set to 0) without any maps are configured. The default port trust state on all ports is untrusted. The default queue settings are in effect.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	QoS must be globally enabled to use QoS classification, policing, mark down or drop, queueing, and traffic shaping features. You can create a policy-map and attach it to a port before entering the mls qos command. However, until you enter the mls qos command, QoS processing is disabled. Policy-maps and class-maps used to configure QoS are not deleted from the configuration by the no mls qos command, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To re-enable QoS with the previous configurations, use the mls qos command. Toggling the QoS status of the switch with this command modifies (reallocates) the sizes of the queues. During the queue size modification, the queue is temporarily shut down during the hardware reconfiguration, and the switch drops newly arrived packets for this queue.		
Examples	Switch(config)# m	s how to enable QoS on the switch: 1s qos • settings by entering the show mls qos privileged EXEC command.	

Related Commands	Command	Description
	show mls qos	Displays QoS information.

mls qos aggregate-policer

Use the **mls qos aggregate-policer** global configuration command on the switch stack or on a standalone switch to define policer parameters, which can be shared by multiple classes within the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to delete an aggregate policer.

mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action {drop |
 policed-dscp-transmit}

no mls qos aggregate-policer aggregate-policer-name

Syntax Description	aggregate-policer-name	Name of the aggregate policer referenced by the police aggregate policy-map class configuration command.
	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	When the specified rate is exceeded, specify that the switch change the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then send the packet.
Defaults	No aggregate policers are	e defined.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Define an aggregate polic	cer if the policer is shared with multiple classes.
	Policers for a port cannot cannot be aggregated for	be shared with other policers for another port; traffic from two different ports policing purposes.
	user-configurable policer user-configurable policer and are constrained by th	hich controls more than one physical port, supports 256 policers (255 rs plus 1 policer reserved for internal use). The maximum number of rs supported per port is 63. Policers are allocated on demand by the software hardware and ASIC boundaries. You cannot reserve policers per port (there rt will be assigned to any policer).
	You apply an aggregate p policer across different p	olicer to multiple classes in the same policy map; you cannot use an aggregate olicy maps.

You cannot delete an aggregate policer if it is being used in a policy map. You must first use the **no police aggregate** *aggregate-policer-name* policy-map class configuration command to delete the aggregate policer from all policy maps before using the **no mls qos aggregate-policer** *aggregate-policer-name* command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Examples

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

Switch(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop Switch(config)# policy-map policy2 Switch(config-pmap)# class class1 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap)# class class2 Switch(config-pmap-c)# set dscp 10 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap-c)# exit Switch(config-pmap-c)# exit Switch(config-pmap-c)# trust dscp Switch(config-pmap-c)# police aggregate agg_policer2 Switch(config-pmap-c)# exit

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	police aggregate	Creates a policer that is shared by different classes.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

mls qos cos

Use the **mls qos cos** interface configuration command on the switch stack or on a standalone switch to define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port. Use the **no** form of this command to return to the default setting.

mls qos cos {*default-cos* | **override**}

no mls qos cos {*default-cos* | **override**}

Syntax Description	default-cos	Assign a default CoS value to a port. If packets are untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7.
	override	Override the CoS of the incoming packets, and apply the default CoS value on the port to all incoming packets.
Defaults	The default Co	S value for a port is 0.
	CoS override is	s disabled.
Command Modes	Interface confi	guration

2-315

mls qos map

Use the **mls qos map** global configuration command on the switch stack or on a standalone switch to define the class of service (CoS)-to-Differentiated Services Code Point (DSCP) map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map. Use the **no** form of this command to return to the default map.

no mls qos map {cos-dscp | dscp-cos | dscp-mutation *dscp-mutation-name* | **ip-prec-dscp | policed-dscp}**

Syntax Description	cos-dscp dscp1dscp8	Define the CoS-to-DSCP map.
		For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to CoS values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.
	dscp-cos dscp-list to	Define the DSCP-to-CoS map.
	COS	For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. The range is 0 to 63. Then enter the to keyword.
		For <i>cos</i> , enter a single CoS value to which the DSCP values correspond. The range is 0 to 7.
	dscp-mutation	Define the DSCP-to-DSCP-mutation map.
	dscp-mutation-name in-dscp to out-dscp	For dscp-mutation-name, enter the mutation map name.
		For <i>in-dscp</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
		For <i>out-dscp</i> , enter a single DSCP value.
		The range is 0 to 63.
	ip-prec-dscp	Define the IP-precedence-to-DSCP map.
	dscp1dscp8	For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.
	policed-dscp dscp-list	Define the policed-DSCP map.
	to mark-down-dscp	For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
	For <i>mark-down-dscp</i> , enter the corresponding policed (marked down) DSCP value.	
		The range is 0 to 63.

Defaults

Table 2-6 shows the default CoS-to-DSCP map:

Table 2-6 Default CoS-to-DSCP Map

CoS Value	DSCP Value
0	0
1	8
2	16
3	24
4	32
5	40
6	48
7	56

Table 2-7 shows the default DSCP-to-CoS map:

DSCP Value	CoS Value	
0–7	0	
8–15	1	
16–23	2	
24–31	3	
32–39	4	
40–47	5	
48–55	6	
56–63	7	

Table 2-7Default DSCP-to-CoS Map

Table 2-8 shows the default IP-precedence-to-DSCP map:

Table 2-8 Default IP-Precedence-to-DSCP Map

IP Precedence Value	DSCP Value
0	0
1	8
2	16
3	24
4	32
5	40
6	48
7	56

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

Command Modes Global configuration

Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	

Usage Guidelines All the maps are globally defined. All the maps, except the DSCP-to-DSCP-mutation map, are applied to all ports. The DSCP-to-DSCP-mutation map is applied to a specific port.

Examples This example shows how to define the IP-precedence-to-DSCP map and to map IP-precedence values 0 to 7 to DSCP values of 0, 10, 20, 30, 40, 50, 55, and 60:

Switch# configure terminal Switch(config)# mls qos map ip-prec-dscp 0 10 20 30 40 50 55 60

This example shows how to define the policed-DSCP map. DSCP values 1, 2, 3, 4, 5, and 6 are marked down to DSCP value 0. Marked DSCP values that not explicitly configured are not modified:

Switch# configure terminal Switch(config)# mls gos map policed-dscp 1 2 3 4 5 6 to 0

This example shows how to define the DSCP-to-CoS map. DSCP values 20, 21, 22, 23, and 24 are mapped to CoS 1. DSCP values 10, 11, 12, 13, 14, 15, 16, and 17 are mapped to CoS 0:

Switch# configure terminal Switch(config)# mls qos map dscp-cos 20 21 22 23 24 to 1 Switch(config)# mls qos map dscp-cos 10 11 12 13 14 15 16 17 to 0

This example shows how to define the CoS-to-DSCP map. CoS values 0 to 7 are mapped to DSCP values 0, 5, 10, 15, 20, 25, 30, and 35:

```
Switch# configure terminal
Switch(config)# mls gos map cos-dscp 0 5 10 15 20 25 30 35
```

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remain as specified in the null map):

```
Switch# configure terminal
Switch(config)# mls gos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 10
Switch(config)# mls gos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls gos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls gos map dscp-mutation mutation1 0 31 32 33 34 to 30
```

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description	
	mls qos dscp-mutation	Applies a DSCP-to-DSCP-mutation map to a DSCP-trusted port.	
	show mls qos maps	Displays quality of service (QoS) mapping information.	

mls qos queue-set output buffers

Use the **mls qos queue-set output buffers** global configuration command on the switch stack or on a standalone switch to allocate buffers to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output qset-id buffers allocation1 ... allocation4

no mls qos queue-set output qset-id buffers

Syntax Description	qset-id	ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.		
	allocation1Buffer space allocation (percentage) for each queue (four values for queues 1 to 4).allocation4For allocation1, allocation3, and allocation4, the range is 0 to 99. For allocation2, the range is 1 to 100 (including the CPU buffer). Separate each value with a space.			
Defaults	All allocation va the buffer space.	lues are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 or

	buffer to the que To configure dif			
	buffer to the que To configure dif	eue with the highest-priority traffic. ferent classes of traffic with different characteristics, use this command with the mls		

Examples This example shows how to map a port to queue-set 2. It allocates 40 percent of the buffer space to egress queue 1 and 20 percent to egress queues 2, 3, and 4:

```
Switch(config)# mls qos queue-set output 2 buffers 40 20 20 20
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# queue-set 2
```

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays quality of service (QoS) information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos queue-set output threshold

Use the **mls qos queue-set output threshold** global configuration command on the switch stack or on a standalone switch to configure the weighted tail-drop (WTD) thresholds, to guarantee the availability of buffers, and to configure the maximum memory allocation to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output *qset-id* **threshold** *queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold*

no mls qos queue-set output qset-id threshold [queue-id]

Syntax Description	qset-id	ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.
	queue-id	Specific queue in the queue-set on which the command is performed. The range is 1 to 4.
	drop-threshold1 drop-threshold2	Two WTD thresholds expressed as a percentage of the allocated memory of the queue. The range is 1 to 3200 percent.
	reserved-threshold	Amount of memory to be guaranteed (reserved) for the queue and expressed as a percentage of the allocated memory. The range is 1 to 100 percent.
	maximum-threshold	Enable a queue in the full condition to get more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped. The range is 1 to 3200 percent.

Defaults

When quality of service (QoS) is enabled, WTD is enabled.

Table 2-9 shows the default WTD threshold settings.

Table 2-9 Default Egress Queue WTD Threshold Settings

Feature	Queue 1	Queue 2	Queue 3	Queue 4
WTD drop threshold 1	100 percent	200 percent	100 percent	100 percent
WTD drop threshold 2	100 percent	200 percent	100 percent	100 percent
Reserved threshold	50 percent	100 percent	50 percent	50 percent
Maximum threshold	400 percent	400 percent	400 percent	400 percent

Command Modes Global configuration

Command History	Release	Modification
12.1(11)AX		This command was introduced.

Usage Guidelines

Use the **mls qos queue-set output** *qset-id* **buffers** global configuration command to allocate a fixed number of buffers to the four queues in a queue-set.

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue-set to use more of the common pool when available, the maximum number of packets for each queue is still internally limited to 400 percent, or 4 times the allocated number of buffers. One packet can use one 1 or more buffers.

The range increased in Cisco IOS Release 12.2(25)SEE1 or later for the *drop-threshold*, *drop-threshold*2, and *maximum-threshold* parameters.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Examples

This example shows how to map a port to queue-set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers	Allocates buffers to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays QoS information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos rewrite ip dscp

Use the **mls qos rewrite ip dscp** global configuration command on the switch stack or on a standalone switch to configure the switch to change (rewrite) the Differentiated Services Code Point (DSCP) field of an incoming IP packet. Use the **no** form of this command to configure the switch to not modify (rewrite) the DSCP field of the packet and to enable DSCP transparency.

mls qos rewrite ip dscp

no mls qos rewrite ip dscp

Syntax Description	This command has no arguments or keywords.		
Defaults	DSCP transparence	y is disabled. The switch changes the DSCP field of the incoming IP packet.	
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.2(25)SE	This command was introduced.	
Usage Guidelines	enabled by using the	y affects only the DSCP field of a packet at the egress. If DSCP transparency is the no mls qos rewrite ip dscp command, the switch does not modify the DSCP field acket, and the DSCP field in the outgoing packet is the same as that in the incoming	
Note	Enabling DSCP tra	ansparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.	
	and the DSCP field	transparency is disabled. The switch modifies the DSCP field in an incoming packet, d in the outgoing packet is based on the quality of service (QoS) configuration, trust setting, policing and marking, and the DSCP-to-DSCP mutation map.	
	packet that the swi	DSCP transparency configuration, the switch modifies the internal DSCP value of the atch uses to generate a class of service (CoS) value representing the priority of the also uses the internal DSCP value to select an egress queue and threshold.	
	the internal DSCP to 16. If DSCP tran	S is enabled and an incoming packet has a DSCP value of 32, the switch might modify value based on the policy-map configuration and change the internal DSCP value asparency is enabled, the outgoing DSCP value is 32 (same as the incoming value). If y is disabled, the outgoing DSCP value is 16 because it is based on the internal DSCP	

Examples

This example shows how to enable DSCP transparency and configure the switch to not change the DSCP value of the incoming IP packet:

Switch(config)# mls qos Switch(config)# no mls qos rewrite ip dscp

This example shows how to disable DSCP transparency and configure the switch to change the DSCP value of the incoming IP packet:

Switch(config)# mls qos Switch(config)# mls qos rewrite ip dscp

You can verify your settings by entering the **show running config** | **include rewrite** privileged EXEC command.

mls qos srr-queue input bandwidth

Use the **mls qos srr-queue input bandwidth** global configuration command on the switch stack or on a standalone switch to assign shaped round robin (SRR) weights to an ingress queue. The ratio of the weights is the ratio of the frequency in which the SRR scheduler dequeues packets from each queue. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input bandwidth weight1 weight2

no mls qos srr-queue input bandwidth

Syntax Description	weight1 weight2	Ratio of <i>weight1</i> and <i>weight2</i> determines the ratio of the frequency in which the SRR scheduler dequeues packets from ingress queues 1 and 2. The range is 1 to 100. Separate each value with a space.	
Defaults	Weight1 and weight	2 are 4 (1/2 of the bandwidth is equally shared between the two queues).	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	mls qos srr-queue input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global configuration command. Then SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the mls qos srr-queue input bandwidth <i>weight1 weight2</i> global configuration command.		
	- ·	ingress queue is the priority queue by using the mls qos srr-queue input bal configuration command.	
Examples	-	s how to assign the ingress bandwidth for the queues in the stack. Priority queueing shared bandwidth ratio allocated to queue 1 is $25/(25+75)$ and to queue 2 is	
		lls qos srr-queue input priority-queue 2 bandwidth 0 lls qos srr-queue input bandwidth 25 75	
	In this example, que often as queue 1.	eue 2 has three times the bandwidth of queue 1; queue 2 is serviced three times as	

This example shows how to assign the ingress bandwidths for the queues in the stack. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Related Commands	Command	Description

OL-8552-06

Command	Description
mls qos srr-queue input threshold	Assigns weighted tail-drop (WTD) threshold percentages to an ingress queue.
show mls qos input-queue	Displays ingress queue settings.
show mls qos interface buffers	Displays quality of service (QoS) information.

mls qos srr-queue input cos-map

Use the **mls qos srr-queue input cos-map** global configuration command on the switch stack or on a standalone switch to map class of service (CoS) values to an ingress queue or to map CoS values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input cos-map queue *queue-id* {*cos1...cos8* | **threshold** *threshold-id cos1...cos8*}

no mls qos srr-queue input cos-map

Syntax Description	queue queue-id	Specify a queue number.
		For <i>queue-id</i> , the range is 1 to 2.
	cos1cos8	Map CoS values to an ingress queue.
		For <i>cos1cos8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 7.
	threshold threshold-id	Map CoS values to a queue threshold ID.
	cos1cos8	For <i>threshold-id</i> , the range is 1 to 3.
		For <i>cos1cos8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 7.

Defaults

Table 2-10 shows the default CoS input queue threshold map:

 Table 2-10
 Default CoS Input Queue Threshold Map

CoS Value	Queue ID - Threshold ID
0–4	1–1
5	2–1
6, 7	1–1

Command Modes Global configuration

Command History	Release	Modification	
12.1(11)AX This comma		This command was introduced.	

Usage Guidelines The CoS assigned at the ingress port selects an ingress or egress queue and threshold.

The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. You can assign two weighted tail-drop (WTD) threshold percentages to an ingress queue by using the **mls qos srr-queue input threshold** global configuration command.

You can map each CoS value to a different queue and threshold combination, allowing the frame to follow different behavior.

Examples This example shows how to map CoS values 0 to 3 to ingress queue 1 and to threshold ID 1 with a drop threshold of 50 percent. It maps CoS values 4 and 5 to ingress queue 1 and to threshold ID 2 with a drop threshold of 70 percent:

```
Switch(config)# mls qos srr-queue input cos-map queue 1 threshold 1 0 1 2 3
Switch(config)# mls qos srr-queue input cos-map queue 1 threshold 2 4 5
Switch(config)# mls qos srr-queue input threshold 1 50 70
```

You can verify your settings by entering the show mls qos maps privileged EXEC command.

0-39	1–1
40–47	2-1
48-63	1–1

Command Modes Gl

Global configuration

Command History	Release	Modification	
12.1(11)AX This command was introduced.		This command was introduced.	

Usage Guidelines The DSCP assigned at the ingress port selects an ingress or egress queue and threshold.

The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. You can assign two weighted tail-drop (WTD) threshold percentages to an ingress queue by using the **mls qos srr-queue input threshold** global configuration command.

You can map each DSCP value to a different queue and threshold combination, allowing the frame to follow different behavior.

You can map up to eight DSCP values per command.

Examples This example shows how to map DSCP values 0 to 6 to ingress queue 1 and to threshold 1 with a drop threshold of 50 percent. It maps DSCP values 20 to 26 to ingress queue 1 and to threshold 2 with a drop threshold of 70 percent:

Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 1 0 1 2 3 4 5 6 Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 2 20 21 22 23 24 25 26 Switch(config)# mls qos srr-queue input threshold 1 50 70

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps class of service (CoS) values to an ingress queue or maps CoS values to a queue and to threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns WTD threshold percentages to an ingress queue.
	show mls qos maps	Displays QoS mapping information.

mls qos srr-queue input priority-queue

Use the **mls qos srr-queue input priority-queue** global configuration command on the switch stack or on a standalone switch to configure the ingress priority queue and to guarantee bandwidth on the stack ring if the ring is congested. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input priority-queue queue-id bandwidth weight

no mls qos srr-queue input priority-queue queue-id

Syntax Description	queue-id	Ingress queue ID. The range is 1 to 2.	
	bandwidth weight	Bandwidth percentage of the stack ring. The range is 0 to 40.	
Defaults	The priority queue is q	ueue 2, and 10 percent of the bandwidth is allocated to it.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	You should use the pric which needs minimum	prity queue only for traffic that needs to be expedited (for example, voice traffic, delay and jitter).	
	The priority queue is guaranteed part of the bandwidth on the stack ring, which reduces the delay and jitter under heavy network traffic on an oversubscribed stack (when there is more traffic than the backplane can carry, and the queues are full and dropping frames).		
	The amount of bandwidth that can be guaranteed is restricted because a large value affects the entire stack and can degrade the stack performance.		
	Shaped round robin (SRR) services the priority queue for its configured weight as specified by the bandwidth keyword in the mls qos srr-queue input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global configuration command. Then SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the mls qos srr-queue input bandwidth <i>weight1 weight2</i> global configuration command.		
To disable priority queueing, set the bandwidth weight to 0, for example, mls qos srr -o priority-queue <i>queue-id</i> bandwidth 0 .			

Examples

This example shows how to assign the ingress bandwidths for the queues in the stack. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Related Commands	Command	Description

2-341

mls qos trust

Use the **mls qos trust** interface configuration command on the switch stack or on a standalone switch to configure the port trust state. Ingress traffic can be trusted, and classification is performed by examining the packet Differentiated Services Code Point (DSCP), class of service (CoS), or IP-precedence field. Use the **no** form of this command to return a port to its untrusted state.

mls qos trust [cos | device cisco-phone | dscp | ip-precedence]

no mls qos trust [cos | device | dscp | ip-precedence]

Syntax Description	cos	(Optional) Classify an ingress packet by using the packet CoS value. For an
		untagged packet, use the port default CoS value.
	device cisco-phone	(Optional) Classify an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.
	dscp	(Optional) Classify an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.
	ip-precedence	(Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.
		I. If no keyword is specified when the command is entered, the default is dscp .

The device cisco-phone keywords were added. The usage guidelines were revised to describe how the switch sets the trust state when a Cisco IP Phone is connected to a switch or routed port. Ality of service (QoS) domain are classified at the edge of the domain. When the at the edge, the switch port within the QoS domain can be configured to one of the there is no need to classify the packets at every switch within the domain. Use thi
Command Modes Command History Usage Guidelines	Interface configuration Release 12.1(11)AX 12.1(14)EA1 12.2(20)SE Packets entering a quapackets are classified a trusted states because command to specify weights	n Modification This command was introduced. The device cisco-phone keywords were added. The usage guidelines were revised to describe how the switch sets the trust

If the DSCP is trusted, the DSCP field of the IP packet is not modified. However, it is still possible that the CoS value of the packet is modified (according to DSCP-to-CoS map).

If the CoS is trusted, the CoS field of the packet is not modified, but the DSCP can be modified (according to CoS-to-DSCP map) if the packet is an IP packet.

The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cisco IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You must globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP phone. If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port and prevents misuse of a high-priority queue.

If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the **mls qos cos override** interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.

For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.

Classification using a port trust state (for example, **mls qos trust** [**cos** | **dscp** | **ip-precedence**] and a policy map (for example, **service-policy input** *policy-map-name*) are mutually exclusive. The last one configured overwrites the previous configuration.

Examples

This example shows how to configure a port to trust the IP precedence field in the incoming packet:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos trust ip-precedence

This example shows how to specify that the Cisco IP Phone connected on a port is a trusted device:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls gos trust device cisco-phone

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	mls qos cos	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
	mls qos dscp-mutation	Applies a DSCP-to DSCP-mutation map to a DSCP-trusted port.
	mls qos map	Defines the CoS-to-DSCP map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map.
	show mls qos interface	Displays QoS information.

mls qos vlan-based

L

Use the **mls qos vlan-based** interface configuration command on the switch stack or on a standalone switch to enable VLAN-based quality of service (QoS) on the physical port. Use the **no** form of this command to disable this feature.

mls qos vlan-based

no mls qos vlan-based

Syntax Description	There are no arguments or keywords.
--------------------	-------------------------------------

Defaults VLAN-based QoS is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SE	This command was introduced.

Usage Guidelines Before attaching a hierarchical policy map to a switch virtual interface (SVI), use the **mls qos vlan-based** interface configuration command on a physical port if the port is to be specified in the secondary interface level of the hierarchical policy map.

When you configure hierarchical policing, the hierarchical policy map is attached to the SVI and affects all traffic belonging to the VLAN. The individual policer in the interface-level traffic classification only affects the physical ports specified for that classification.

For detailed instructions about configuring hierarchical policy maps, see the "Classifying, Policing, and Marking Traffic by Using Hierarchical Policy Maps" section in the software configuration guide for this release.

Examples This example shows how to enable VLAN-based policing on a physical port:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos vlan-based

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface	Displays QoS information.

monitor session

Use the **monitor session** global configuration command on the switch stack or on a standalone switch to start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source or destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, and to limit (filter) SPAN source traffic to specific VLANs. Use the **no** form of this command to remove the SPAN or RSPAN session or to remove source or destination interfaces or filters from the SPAN or RSPAN session. For destination interfaces, the encapsulation options are ignored with the **no** form of the command.

- monitor session session_number destination {interface interface-id [, | -] [encapsulation
 replicate] [ingress { dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id }] } | {remote
 vlan vlan-id }
- monitor session session_number filter vlan vlan-id [, | -]
- **monitor session** *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}

no monitor session {*session_number* | **all** | **local** | **remote**}

no monitor session_number destination {interface interface-id [, | -] [encapsulation
replicate] [ingress {dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id}]} | {remote
vlan vlan-id}

no monitor session session_number filter vlan vlan-id [, | -]

no monitor session *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}

Syntax Description	session_number	Specify the session number identified with the SPAN or RSPAN session. The range is 1 to 66.
	destination	Specify the SPAN or RSPAN destination. A destination must be a physical port.
	interface <i>interface-id</i>	Specify the destination or source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For source interface , port channel is also a valid interface type, and the valid range is 1 to 48.
	encapsulation replicate	(Optional) Specify that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
		These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged.
	ingress	(Optional) Enable ingress traffic forwarding.
	dot1q vlan vlan-id	Accept incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
	isl	Specify ingress forwarding using ISL encapsulation.

untagged vlan vlan-id	Accept incoming packets with untagged encapsulation with the specified VLAN as the default VLAN.
vlan vlan-id	When used with only the ingress keyword, set default VLAN for ingress traffic.
remote vlan vlan-id	Specify the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.
	The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs).
,	(Optional) Specify a series of interfaces or VLANs, or separate a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.
-	(Optional) Specify a range of interfaces or VLANs. Enter a space before and after the hyphen.
filter vlan vlan-id	Specify a list of VLANs as filters on trunk source ports to limit SPAN source traffic to specific VLANs. The <i>vlan-id</i> range is 1 to 4094.
source	Specify the SPAN or RSPAN source. A source can be a physical port, a port channel, or a VLAN.
both, rx, tx	(Optional) Specify the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic.
source vlan vlan-id	Specify the SPAN source interface as a VLAN ID. The range is 1 to 4094.
all, local, remote	Specify all , local , or remote with the no monitor session command to clear all SPAN and RSPAN, all local SPAN, or all RSPAN sessions.

Defaults

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The ingress { dot1q vlan <i>vlan-id</i> isl untagged vlan <i>vlan-id</i> vlan <i>vlan-id</i> } keywords were added.

Usage Guidelines

Traffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN. Traffic routed to source ports or source VLANs cannot be monitored. You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch or switch stack.

You can have a maximum of 64 destination ports on a switch stack.

If a 10-Gigabit Ethernet port is configured as a SPAN or RSPAN destination port, the line rate of the link decreases.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports cannot be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A private-VLAN port cannot be configured as a SPAN destination port.

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the **port-channel** number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the **monitor session** *session_number* **filter vlan** *vlan-id* command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to act in these ways:

- When you enter **monitor session** *session_number* **destination interface** *interface-id* with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—dot1q, isl, or **untagged**.

	• When you enter monitor session <i>session_number</i> destination interface <i>interface-id</i> encapsulation replicate with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)				
	• When you enter monitor session <i>session_number</i> destination interface <i>interface-id</i> encapsulation replicate ingress , egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow— dot1q , isl , or untagged . (This applies to local SPAN only; RSPAN does not support encapsulation replication.)				
Examples	This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:				
	<pre>Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 both Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2</pre>				
	This example shows how to delete a destination port from an existing local SPAN session:				
	Switch(config) # no monitor session 2 destination gigabitethernet1/0/2				
	This example shows how to limit SPAN traffic in an existing session only to specific VLANs:				
	Switch(config)# monitor session 1 filter vlan 100 - 110				
	This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.				
	<pre>Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 Switch(config)# monitor session 1 source interface port-channel 2 tx Switch(config)# monitor session 1 destination remote vlan 900 Switch(config)# end</pre>				
	This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic.				
	Switch(config)# monitor session 10 source remote vlan 900 Switch(config)# monitor session 10 destination interface gigabitethernet1/0/2				
	This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.				
	Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation replicate ingress dot1q vlan 5				
	This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a				

 ${\rm Switch}\,({\rm config})\,\#$ monitor session 2 destination interface gigabitethernet1/0/2 ingress untagged vlan 5

security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN and RSPAN configurations on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Command	Description
remote-span	Configures an RSPAN VLAN in vlan configuration mode.
show monitor	Displays SPAN and RSPAN session information.
show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

mvr (global configuration)

Use the **mvr** global configuration command without keywords on the switch stack or on a standalone switch to enable the multicast VLAN registration (MVR) feature on the switch. Use the command with keywords to set the MVR mode for a switch, configure the MVR IP multicast address, set the maximum time to wait for a query reply before removing a port from group membership, and to specify the MVR multicast VLAN. Use the **no** form of this command to return to the default settings.

mvr [group *ip-address* [count] | mode [compatible | dynamic] | querytime value | vlan vlan-id]

no mvr [group *ip-address* | mode [compatible | dynamic] | querytime value | vlan vlan-id]

Syntax Description	group ip-address	Statically configure an MVR group IP multicast address on the switch.
		Use the no form of this command to remove a statically configured IP multicast address or contiguous addresses or, when no IP address is entered, to remove all statically configured MVR IP multicast addresses.
	count	(Optional) Configure multiple contiguous MVR group addresses. The range is 1 to 256; the default is 1.
	mode	(Optional) Specify the MVR mode of operation.
		The default is compatible mode.
	compatible	Set MVR mode to provide compatibility with Catalyst 2900 XL and Catalyst 3500 XL switches. This mode does not allow dynamic membership joins on source ports.
	dynamic	Set MVR mode to allow dynamic MVR membership on source ports.
	querytime value	(Optional) Set the maximum time to wait for IGMP report memberships on a receiver port. This time applies only to receiver-port leave processing.When an IGMP query is sent from a receiver port, the switch waits for the default or configured MVR querytime for an IGMP group membership report before removing the port from multicast group membership.
		The value is the response time in units of tenths of a second. The range is 1 to 100; the default is 5 tenths or one-half second.
		Use the no form of the command to return to the default setting.
	vlan vlan-id	(Optional) Specify the VLAN on which MVR multicast data is expected to be received. This is also the VLAN to which all the source ports belong. The range is 1 to 4094; the default is VLAN 1.

Defaults

MVR is disabled by default.

The default MVR mode is compatible mode.

No IP multicast addresses are configured on the switch by default.

The default group ip address count is 0.

The default query response time is 5 tenths of or one-half second.

The default multicast VLAN for MVR is VLAN 1.

Command Modes Global configuration

Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
	_			
Usage Guidelines	A maximum of 256	MVR multicast groups can be configured on a switch.		
	MVR. Any multica	Use the mvr group command to statically set up all the IP multicast addresses that will take part in MVR. Any multicast data sent to a configured multicast address is sent to all the source ports on the switch and to all receiver ports that have registered to receive data on that IP multicast address.		
	MVR supports aliased IP multicast addresses on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).			
	The mvr querytime command applies only to receiver ports.			
	If the switch MVR is interoperating with Catalyst 2900 XL or Catalyst 3500 XL switches, set the multicast mode to compatible.			
	When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.			
	MVR can coexist with IGMP snooping on a switch.			
	Multicast routing and MVR cannot coexist on a switch. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled and a warning message appears. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled with an Error message.			
Examples	This example show	s how to enable MVR:		
	Switch(config)# m	IVT		
	Use the show mvr groups.	privileged EXEC command to display the current setting for maximum multicast		
	This example show	s how to configure 228.1.23.4 as an IP multicast address:		
	Switch(config)# m	wr group 228.1.23.4		
	This example show 228.1.23.1 to 228.1	s how to configure ten contiguous IP multicast groups with multicast addresses from .23.10:		
	Switch(config)# m	wr group 228.1.23.1 10		
	Use the show mvr configured on the s	members privileged EXEC command to display the IP multicast group addresses witch.		
	This example show	s how to set the maximum query response time as one second (10 tenths):		
	Switch(config)# m	vr querytime 10		
	This example show	s how to set VLAN 2 as the multicast VLAN:		
	Switch(config)# m	wr vlan 2		
	You can verify you	r settings by entering the show mvr privileged EXEC command.		

Related Commands	Command	Description
	mvr (interface configuration)	Configures MVR ports.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces with their type, status, and Immediate Leave configuration. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all ports that are members of an MVR multicast group; if the group has no members, its status is shown as Inactive.

mvr (interface configuration)

Use the **mvr** interface configuration command on the switch stack or on a standalone switch to configure a Layer 2 port as a multicast VLAN registration (MVR) receiver or source port, to set the Immediate Leave feature, and to statically assign a port to an IP multicast VLAN and IP address. Use the **no** form of this command to return to the default settings.

mvr [immediate | type {receiver | source} | vlan vlan-id group [ip-address]]

no mvr [immediate | type {source | receiver}] vlan vlan-id group [ip-address]]

Syntax Description	immediate	(Optional) Enable the Immediate Leave feature of MVR on a port. Use	
	type	the no mvr immediate command to disable the feature. (Optional) Configure the port as an MVR receiver port or a source port.	
	, pe	The default port type is neither an MVR source nor a receiver port. The no mvr type command resets the port as neither a source or a receiver port.	
	receiver	Configure the port as a subscriber port that can only receive multicast data. Receiver ports cannot belong to the multicast VLAN.	
	source	Configure the port as an uplink port that can send and receive multicast data for the configured multicast groups. All source ports on a switch belong to a single multicast VLAN.	
	vlan vlan-id group	(Optional) Add the port as a static member of the multicast group with the specified VLAN ID.	
Defaults		The no mvr vlan <i>vlan-id</i> group command removes a port on a VLAN from membership in an IP multicast address group.	
	ip-address	(Optional) Statically configure the specified MVR IP multicast group address for the specified multicast VLAN ID. This is the IP address of the multicast group that the port is joining.	
	A port is configured as neither a receiver nor a source.		
	The Immediate Leave feature is disabled on all ports.		
	No receiver port is a member of any configured multicast group.		
Command Modes	Interface configuration	n	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	

Usage Guidelines

Configure a port as a source port if that port should be able to both send and receive multicast data bound for the configured multicast groups. Multicast data is received on all ports configured as source ports.

Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.

A port that is not taking part in MVR should not be configured as an MVR receiver port or a source port. A non-MVR port is a normal switch port, able to send and receive multicast data with normal switch behavior.

When Immediate Leave is enabled, a receiver port leaves a multicast group more quickly. Without Immediate Leave, when the switch receives an IGMP leave message from a group on a receiver port, it sends out an IGMP MAC-based query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP MAC-based query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency.

The Immediate Leave feature should be enabled only on receiver ports to which a single receiver device is connected.

The **mvr vlan group** command statically configures ports to receive multicast traffic sent to the IP multicast address. A port statically configured as a member of group remains a member of the group until statically removed. In compatible mode, this command applies only to receiver ports; in dynamic mode, it can also apply to source ports. Receiver ports can also dynamically join multicast groups by using IGMP join messages.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.

An MVR port cannot be a private-VLAN port.

This example shows how to configure a port as an MVR receiver port:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mvr type receiver

Use the **show mvr interface** privileged EXEC command to display configured receiver ports and source ports.

This example shows how to enable Immediate Leave on a port:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mvr immediate

This example shows how to add a port on VLAN 1 as a static member of IP multicast group 228.1.23.4:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# mvr vlan1 group 230.1.23.4

You can verify your settings by entering the show mvr members privileged EXEC command.

Examples

Related Commands	Command	Description
	mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces or displays the multicast groups to which a receiver port belongs. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all receiver ports that are members of an MVR multicast group.

Use the **nsf** router configuration command on the switch stack or on a standalone switch to enable and configure Cisco nonstop forwarding (NSF) for Open Shortest Path First (OSPF) or Enhanced Interior Gateway Routing Protocol (EIGRP) routing. Use the **no** form of this command to disable NSF.

nsf [enforce global]

no nsf

Syntax Description	enforce global	(Optional) Cancel OSPF NSF restart when non-NSF-aware neighbors are detected. These keywords are visible only in OSPF router configuration mode.	
Defaults	NSF is disabled. The enforce global	option is enabled (OSPF only)	
Command Modes	Router configuration	on (OSPF or EIGRP)	
Command History	Release	Modification	
	12.2(35)SE	This command was introduced.	
Usage Guidelines	designated routing When NSF is enable	s a router configuration command and affects all interfaces that are covered by the process. The switch supports Cisco NSF for OSPF and EIGRP protocols. ed and a stack master switchover is detected, the NSF-capable routers rebuild routing ISF-aware or NSF-capable neighbors and do not wait for a restart.	
Examples	This example show Switch(config)# r Switch(config-rou		
	Use the show ip ospf privileged EXEC command to verify that OSPF NSF is enabled.		
	This example shows how to enable EIGRP NSF:

pagp learn-method

Use the **pagp learn-method** interface configuration command on the switch stack or on a standalone switch to learn the source address of incoming packets received from an EtherChannel port. Use the **no** form of this command to return to the default setting.

pagp learn-method {aggregation-port | physical-port}

no pagp learn-method

Syntax Description	aggregation-port	Specify address learning on the logical port-channel. The switch sends packets to the source using any of the ports in the EtherChannel. This setting is the default. With aggregate-port learning, it is not important on which physical port the packet arrives.
	physical-port	Specify address learning on the physical port within the EtherChannel. The switch sends packets to the source using the same port in the EtherChannel from which it learned the source address. The other end of the channel uses the same port in the channel for a particular destination MAC or IP address.
Defaults	The default is aggrega	ation-port (logical port channel).
Command Modes	Interface configuratio	n
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The learn method mu	st be configured the same at both ends of the link.
Note	is provided in the con interface configuratio	address learning only on aggregate ports even though the physical-port keyword nmand-line interface (CLI). The pagp learn-method and the pagp port-priority n commands have no effect on the switch hardware, but they are required for PAgP devices that only support address learning by physical ports, such as the
	as a physical-port lease command and to set t port-channel load-ba	r to the switch is a physical learner, we recommend that you configure the switch rner by using the pagp learn-method physical-port interface configuration he load-distribution method based on the source MAC address by using the alance src-mac global configuration command. Use the pagp learn-method on command only in this situation.

Examples This example shows how to set the learning method to learn the address on the physical port within the EtherChannel:

Switch(config-if) # pagp learn-method physical-port

This example shows how to set the learning method to learn the address on the port-channel within the EtherChannel:

Switch(config-if)# pagp learn-method aggregation-port

You can verify your settings by entering the **show running-config** privileged EXEC command or the **show pagp** *channel-group-number* **internal** privileged EXEC command.

Related Commands	Command	Description
	pagp port-priority	Selects a port over which all traffic through the EtherChannel is sent.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

pagp port-priority

Use the **pagp port-priority** interface configuration command on the switch stack or on a standalone switch to select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. Use the **no** form of this command to return to the default setting.

pagp port-priority priority

no pagp port-priority

Syntax Description	priority	A priority number ranging from 0 to 255.
Defaults	The default is 128.	
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		with the highest priority that is operational and has membership in the same e one selected for PAgP transmission.
<u>Note</u>	The switch supports address learning only on aggregate ports even though the physical-port keyword is provided in the command-line interface (CLI). The pagp learn-method and the pagp port-priority interface configuration commands have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.	
	When the link partner to the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the pagp learn-method physical-port interface configuration command and to set the load-distribution method based on the source MAC address by using the port-channel load-balance src-mac global configuration command. Use the pagp learn-method interface configuration command only in this situation.	
Examples	This example show	rs how to set the port priority to 200:
	Switch(config-if)	# pagp port-priority 200
	You can verify your setting by entering the show running-config privileged EXEC command or the show pagp <i>channel-group-number</i> internal privileged EXEC command.	

Related Commands	Command	Description
	pagp learn-method	Provides the ability to learn the source address of incoming packets.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

permit (ARP access-list configuration)

Use the **permit** Address Resolution Protocol (ARP) access-list configuration command to permit an ARP packet based on matches against the Dynamic Host Configuration Protocol (DHCP) bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access control list.

- permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]
- no permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]

Syntax Description	request	(Optional) Requests a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specify the sender IP address.
	any	Accept any IP or MAC address.
	host sender-ip	Accept the specified sender IP address.
	sender-ip sender-ip-mask	Accept the specified range of sender IP addresses.
	mac	Specify the sender MAC address.
	host sender-mac	Accept the specified sender MAC address.
	sender-mac sender-mac-mask	Accept the specified range of sender MAC addresses.
	response ip	Define the IP address values for the ARP responses.
	host target-ip	(Optional) Accept the specified target IP address.
	target-ip target-ip-mask	(Optional) Accept the specified range of target IP addresses.
	mac	Specify the MAC address values for the ARP responses.
	host target-mac	(Optional) Accept the specified target MAC address.
	target-mac target-mac-mask	(Optional) Accept the specified range of target MAC addresses.
	log	(Optional) Log a packet when it matches the ACE. Matches are logged if you also configure the matchlog keyword in the ip arp inspection vlan logging global configuration command.

Defaults

There are no default settings.

Command Modes ARP access-list configuration

Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
Usage Guidelines	You can add permit c	clauses to forward ARP packets based on some matching criteria.	
Examples	This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:		
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end		
	You can verify your	settings by entering the show arp access-list privileged EXEC command.	
Related Commands	Command	Description	
	arp access-list	Defines an ARP access control list (ACL).	
	deny (ARP access-l configuration)	ist Denies an ARP packet based on matches against the DHCP bindings.	
	ip arp inspection fi	Iter vlan Permits ARP requests and responses from a host configured with a static IP address.	
	show arp access-list	t Displays detailed information about ARP access lists.	

permit (IPv6 access-list configuration)

Use the **permit** IPv6 access list configuration command on the switch stack or on a standalone switch to set permit conditions for an IPv6 access list. Use the **no** form of this command to remove the permit conditions.

- permit {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value]
 [time-range name]
- **no permit** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**sequence** *value*] [**time-range** *name*]

Although visible in the command-line help strings, the **flow-label**, **reflect**, and **routing** keywords are not supported.

Internet Control Message Protocol

permit icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [sequence value] [time-range name]

Transmission Control Protocol

permit tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name]
 [urg]

User Datagram Protocol

permit udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [sequence value] [time-range name]

Although visible in the command-line help strings, the **flow-label**, **reflect**, and **routing** keywords are not supported.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp , esp , icmp , ipv6 , pcp , sctp , tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	any	An abbreviation for the IPv6 prefix ::/0.
	host source-ipv6-address	The source IPv6 host address for which to set permit conditions.
		This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
		The range operator requires two port numbers. All other operators require one port number.
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	host destination-ipv6-address	The destination IPv6 host address for which to set permit conditions.
		This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	dscp value	(Optional) Match a differentiated services codepoint value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

fragments	(Optional) Match noninitial fragmented packets where the fragment
C	extension header contains a nonzero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages logged to the console is controlled by the logging console command.)
	The message includes the access list name and sequence number; whether the packet was permitted; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets permitted in the prior 5-minute interval.
log-input	(Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.
timeout value	(Optional) Interval of idle time (in seconds) after which a reflexive IPv6 access list times out. The acceptable range is from 1 to 4294967295. The default is 180 seconds.
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.
time-range name	(Optional) Specify the time range that applies to the permit statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by the ICMP message type. The type is a number from 0 to 255.
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by the ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.
ack	(Optional) Only for the TCP protocol: acknowledgment (ACK) bit set.
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.
psh	(Optional) Only for the TCP protocol: Push function bit set.
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.
rst	(Optional) Only for the TCP protocol: Reset bit set.
syn	(Optional) Only for the TCP protocol: Synchronize bit set.
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.

Defaults	No IPv6 access list is defined.		
Command Modes	IPv6 access-list configuration		
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines		ccess-list configuration mode) command is similar to the permit (IPv4 access-list) command, except that it is IPv6-specific.	
	Use the permit (IPv6) command after the ipv6 access-list command to enter IPv6 access-list configuration mode and to define the conditions under which a packet passes the access list.		
	Specifying IPv6 for the <i>protocol</i> argument matches against the IPv6 header of the packet.		
	By default, the first statement in an access list is number 10, and the subsequent statements are incremented by 10.		
	You can add permit , deny , or remark statements to an existing access list without re-entering the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to show where it belongs.		
	See the ipv6 access-list command for more information on defining IPv6 ACLs.		
Note	Every IPv6 ACL has implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 any any statements as its last match conditions. The two permit conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any nd-ns , there must be an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement to take effect, an IPv6 ACL must contain at least one entry.		
	The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.		
	-	6-prefix/prefix-length and destination-ipv6-prefix/prefix-length arguments are used	

for traffic filtering (the source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic based upon the traffic based upon the traffic destination).

The switch supports only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.

The fragments keyword is an option only if the operator [port-number] arguments are not specified.

This is a list of ICMP message names:

beyond-scope	destination-unreachable
echo-reply	echo-request
header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures two IPv6 access lists named OUTBOUND and INBOUND and applies both access lists to outbound and inbound traffic on a Layer 3 interface. The first and second permit entries in the OUTBOUND list permit all TCP and UDP packets from network 2001:ODB8:0300:0201::/64 to leave the interface. The deny entry in the OUTBOUND list prevents all packets from the network FE80:0:0:0201::/64 (packets that have the link-local prefix FE80:0:0:0201 as the first 64 bits of their source IPv6 address) from leaving the interface. The third permit entry in the OUTBOUND list permits all ICMP packets to exit the interface.

The permit entry in the INBOUND list permits all ICMP packets to enter the interface.

```
Switch(config)#ipv6 access-list OUTBOUND
Switch(config-ipv6-acl)# permit tcp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# permit udp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# deny FE80:0:0:0201::/64 any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter OUTBOUND out
Switch(config-if)# ipv6 traffic-filter INBOUND in
```

Given that a **permit any any** statement is not included as the last entry in the OUTBOUND or INBOUND access list, only TCP, UDP, and ICMP packets are permitted out of and into the interface (the implicit deny-all condition at the end of the access list denies all other packet types on the interface).

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

permit (MAC access-list configuration)

Use the **permit** MAC access-list configuration command on the switch stack or on a standalone switch to allow non-IP traffic to be forwarded if the conditions are matched. Use the **no** form of this command to remove a permit condition from the extended MAC access list.

- {permit | deny} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
 dst-MAC-addr mask} [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv |
 diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console |

		etype-8042	(Optional) Select EtherType 0x8042.
		lat	(Optional) Select EtherType DEC-LAT.
lavc-sca (Optional) Select EtherType DEC-LAVC-SCA.		lavc-sca	(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.		
	The <i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.		
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.		
mop-dump (Optional) Select EtherType DEC-MOP Dump.			
msdos (Optional) Select EtherType DEC-MSDOS.			
mumps(Optional) Select EtherType DEC-MUMPS.			
netbios (Optional) Select EtherType DEC- Network Basic Input/Output (NETBIOS).			
vines-echo (Optional) Select EtherType Virtual Integrated Network Serv Echo from Banyan Systems.			
vines-ip (Optional) Select EtherType VINES IP.			
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite.		

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-14.

IPX Encapsulation Typ		
Cisco IOS Name	Novell Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes MAC access-list configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

For more information about MAC-named extended access lists, see the software configuration guide for this release.

Examples This example shows how to define the MAC-named extended access list to allow NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

Switch(config-ext-macl)# permit any host 00c0.00a0.03fa netbios

This example shows how to remove the permit condition from the MAC-named extended access list: Switch(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000 netbios

This example permits all packets with Ethertype 0x4321:

Switch(config-ext-macl)# permit any any 0x4321 0

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Denies non-IP traffic to be forwarded if conditions are matched.
	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.
	show access-lists	Displays access control lists configured on a switch.

police

Use the **police** policy-map class configuration command on the switch stack or on a standalone switch to define a policer for classified traffic. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove an existing policer.

police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]

no police *rate-bps burst-byte* [**exceed-action** {**drop** | **policed-dscp-transmit**}]

Syntax Description	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 1000000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	(Optional) When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	(Optional) When the specified rate is exceeded, specify that the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.
Defaults	No policers are defined.	
Command Modes	Policy-map class configu	iration
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	When configuring hierar secondary interface-leve	chical policy maps, you can only use the police policy-map command in a l policy map.
	-	which controls more than one physical port, supports 256 policers (255
	user-configurable policer and are constrained by th	rs plus 1 policer reserved for internal use). The maximum number of rs supported per port is 63. Policers are allocated on demand by the software ne hardware and ASIC boundaries. You cannot reserve policers per port. There rt will be assigned to any policer.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how quickly (the average rate) the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Policy maps that have the **police aggregate** command fail when applied to a 10-Gigabit Ethernet interface.

Examples

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action drop
Switch(config-pmap-c)# exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Switch(config)# policy-map policy2
Switch(config-pmap)# class class2
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	mls qos map policed-dscp	Applies a policed-DSCP map to a DSCP-trusted port.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for traffic classified through the class policy-map configuration or the class-map global configuration command.

police aggregate

Use the **police aggregate** policy-map class configuration command on the switch stack or on a standalone switch to apply an aggregate policer to multiple classes in the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove the specified policer.

police aggregate aggregate-policer-name

no police aggregate *aggregate-policer-name*

Syntax Description	aggregate-policer-	<i>name</i> Name of the aggregate policer.	
Defaults	No aggregate policers are defined.		
Command Modes	Policy-map class c	onfiguration	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	user-configurable p user-configurable p and are constrained		
	and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port. There is no guarantee that a port will be assigned to any policer.You set aggregate policer parameters by using the mls qos aggregate-policer global configuration		
	command. You apply an aggregate policer to multiple classes in the same policy map; you can aggregate policer across different policy maps.		
	To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Policy maps that use the police aggregate command fail when applied to a 10-Gigabit Ethernet interface.		
	You cannot configu	are aggregate policers in hierarchical policy maps.	

Examples	This example shows how to define the aggregate policer parameters and to apply the policer to multiple classes in a policy map:
	Switch(config)# mls qos aggregate-policer agg_policer1 10000 1000000 exceed-action drop Switch(config)# policy-map policy2 Switch(config-pmap)# class class1
	Switch(config-pmap-c)# police aggregate agg_policer1
	Switch(config-pmap-c)# exit
	Switch(config-pmap)# class class2
	Switch(config-pmap-c)# set dscp 10
	Switch(config-pmap-c)# police aggregate agg_policer1
	Switch(config-pmap-c)# exit
	Switch(config-pmap)# class class3
	Switch(config-pmap-c)# trust dscp
	Switch(config-pmap-c)# police aggregate agg_policer2
	Switch(config-pmap-c)# exit

You can verify your settings by entering the show mls qos aggregate-policer privileged EXEC command.

Related Commands	Command	Description
	mls qos aggregate-policer	Defines policer parameters, which can be shared by multiple classes within a policy map.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

Catalyst 3750 Switch Command Reference

policy-map

Use the **policy-map** global configuration command on the switch stack or on a standalone switch to create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name

no policy-map policy-map-name

Syntax Description	policy-map-name	Name of the policy map.	
Defaults	No policy maps are defined. The default behavior is to set the Differentiated Services Code Point (DSCP) to 0 if the packet is an IP packet and to set the class of service (CoS) to 0 if the packet is tagged. No policing is performed.		
Command Modes	Global configuration		
Command History	Release	Modification	
-	12.1(11)AX	This command was introduced.	
	12.2(25)SE	Support for policy maps on SVIs was added.	
Usage Guidelines	 After entering the policy-map command, you enter policy-map configuration mode, and these configuration commands are available: class: defines the classification match criteria for the specified class map. For more information, see the "class" section on page 2-43. 		
	• description : describes the policy map (up to 200 characters).		
	• exit: exits policy-map configuration mode and returns you to global configuration mode.		
	• no : removes a previously defined policy map.		
	• rename : renames the current policy map.		
	To return to global configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Before configuring policies for classes whose match criteria are defined in a class map, use the policy-map command to specify the name of the policy map to be created, added to, or modified. Entering the policy-map command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.		
	To configure the matcl	ss policies in a policy map only if the classes have match criteria defined for them. h criteria for a class, use the class-map global configuration and match class-map nds. You define packet classification on a physical-port basis.	

Only one policy map per ingress port or SVI is supported. You can apply the same policy map to multiple physical ports or SVIs.

In software releases earlier than Cisco IOS Release 12.2(25)SE, you can apply a policy map and configure policing only on physical ports. You can configure the trust state, set a new DSCP or IP precedence value in the packet, or define an individual or aggregate policer. For more information, see the "Policing on Physical Ports" section in the "Configuring QoS" chapter of the software configuration guide for this release.

In Cisco IOS Release 12.2(25)SE or later, you can apply a nonhierarchical policy maps to physical ports or to SVIs. A nonhierarchical policy map is the same as a port-based policy maps in software releases earlier than Cisco IOS Release 12.2(25)SE. However, you can only apply a hierarchical policy map to SVIs.

A hierarchical policy map has two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on an SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI and are specified in the interface-level policy map.

In a primary VLAN-level policy map, you can only configure the trust state or set a new DSCP or IP precedence value in the packet. In a secondary interface-level policy map, you can only configure individual policers on physical ports that belong to the SVI.

After the hierarchical policy map is attached to an SVI, an interface-level policy map cannot be modified or removed from the hierarchical policy map. A new interface-level policy map also cannot be added to the hierarchical policy map. If you want these changes to occur, the hierarchical policy map must first be removed from the SVI.

For more information about hierarchical policy maps, see the "Policing on SVIs" section in the "Configuring QoS" chapter of the software configuration guide for this release.

Examples

This example shows how to create a policy map called *policy1*. When attached to the ingress port, it matches all the incoming traffic defined in *class1*, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

This example shows how to configure multiple classes in a policy map called *policymap2*:

```
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 100000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# set dscp 0 (no policer)
Switch(config-pmap-c)# exit
```

This example shows how to create a hierarchical policy map and attach it to an SVI:

```
Switch(config) # class-map cm-non-int
Switch(config-cmap) # match access-group 101
Switch(config-cmap)# exit
Switch(config) # class-map cm-non-int-2
Switch(config-cmap)# match access-group 102
Switch(config-cmap)# exit
Switch(config) # class-map cm-test-int
Switch(config-cmap)# match input-interface gigabitethernet2/0/2 - gigabitethernet2/0/3
Switch(config-cmap)# exit
Switch(config) # policy-map pm-test-int
Switch(config-pmap) # class cm-test-int
Switch(config-pmap-c)# police 18000000 8000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap) # exit
Switch(config)# policy-map pm-test-pm-2
Switch(config-pmap) # class cm-non-int
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap)# class cm-non-int-2
Switch(config-pmap-c)# set dscp 15
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# end
Switch(config-cmap) # exit
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input pm-test-pm-2
```

This example shows how to delete *policymap2*:

Switch(config) # no policy-map policymap2

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration command) for the specified class-map name.
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	service-policy	Applies a policy map to a port.
	show mls qos vlan	Displays the quality of service (QoS) policy maps attached to an SVI.
	show policy-map	Displays QoS policy maps.

port-channel load-balance

Use the **port-channel load-balance** global configuration command on the switch stack or on a standalone switch to set the load-distribution method among the ports in the EtherChannel. Use the **no** form of this command to return to the default setting.

port-channel load-balance {dst-ip | dst-mac | src-dst-ip | src-dst-mac | src-ip | src-mac}

no port-channel load-balance

Related Commands	Command	Description
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

power inline

Use the **power inline** interface configuration command on the switch stack or on a standalone switch to configure the power management mode on the Power over Ethernet (PoE) ports. Use the **no** form of this command to return to the default settings.

power inline {auto [max max-wattage] | never | static [max max-wattage]}

no power inline {auto | never | static}

Syntax Description	auto	Enable powered-device detection. If enough power is available, automatically allocate power to the PoE port after device detection.	
	max max-wattage	(Optional) Limit the power allowed on the port. The range is 4000 to 15400 milliwatts. If no value is specified, the maximum is allowed.	
	never	Disable device detection, and disable power to the port.	
	static	Enable powered-device detection. Pre-allocate (reserve) power for a port before the switch discovers the powered device.	
Defaults	The default is auto (en	abled).	
	The maximum wattage	is 15400 milliwatts.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(25)SE	The static and max max-wattage options were added.	
Usage Guidelines	This command is support PoE, this e	orted only on PoE-capable ports. If you enter this command on a port that does rror message appears:	
	Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)# power inline auto		
	% Invalid input detected at '^' marker.		
	In a switch stack, this command is supported on all ports in the stack that support PoE.		
	when the powered devi the maximum wattage,	<i>age</i> option to disallow higher-power powered devices. With this configuration, ce sends Cisco Discovery Protocol (CDP) messages requesting more power that the switch removes power from the port. If the powered-device IEEE class an the maximum wattage, the switch does not power the device. The power is pal power budget.	

The switch never powers any Class 0 or Class 3 device if the **power inline max** *max-wattage* command is configured for less than 15.4 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** user EXEC command output shows *power-deny*.

Use the **power inline static max** *max-wattage* command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur on the port, placing it into an error-disabled state.

In releases earlier than Cisco IOS Release 12.2(20)SE1, power was sometimes still applied to a PoE port even after a powered device was removed. This could cause damage to a nonpowered device when it was later connected to that port. Make sure that your switch is running Cisco IOS Release 12.2(20)SE1 or later.

Examples

This example shows how to enable detection of a powered device and to automatically power a PoE port:

Switch(config)# interface fastethernet1/0/2
Switch(config-if)# power inline auto

This example shows how to configure a PoE port to allow a Class 1 or a Class 2 powered device:

Switch(config)# interface fastethernet1/0/2
Switch(config-if)# power inline auto max 7000

This example shows how to disable powered-device detection and to not power a PoE port:

Switch(config)# interface fastethernet1/0/2
Switch(config-if)# power inline never

You can verify your settings by entering the show power inline user EXEC command.

Related Commands	Command	Description
	logging event power-inline-status	Enables the logging of PoE events.
	show controllers power inline	Displays the values in the registers of the specified PoE controller.
	show power inline	Displays the PoE status for the specified PoE port or for all PoE ports.

power inline consumption

Use the **power inline consumption** global or interface configuration command on the switch stack or on a standalone switch to override the amount of power specified by the IEEE classification for the device by specifying the wattage used by each powered device. Use the **no** form of this command to return to the default power setting.

power inline consumption default wattage

no power inline consumption default

Note	The default keyword	appears only in the global configuration command.
Syntax Description	wattage	Specify the power that the switch budgets for the port. The range is 4000 to 15400 milliwatts.
Defaults	The default power on	each Power over Ethernet (PoE) port is 15400 milliwatts.
Command Modes	Global configuration	
	Interface configuratio	n
Command History	Release 12.2(25)SEC	Modification This command was introduced.
Usage Guidelines	(CDP) to determine the budget accordingly. T the switch grants a po IEEE classification. It budgets 15400 milliwa device reports a higher	devices are connected to PoE ports, the switch uses Cisco Discovery Protocol ne <i>actual</i> power consumption of the devices, and the switch adjusts the power his does not apply to IEEE third-party powered devices. For these devices, when wer request, the switch adjusts the power budget according to the powered-device f the powered device is a Class 0 (class status unknown) or a Class 3, the switch atts for the device, regardless of the actual amount of power needed. If the powered er class than its actual consumption or does not support power classification the switch can power fewer devices because it uses the IEEE class information to r budget.
	power requirement sp the IEEE classificatio budget for use by add effectively.	aline consumption <i>wattage</i> configuration command, you can override the default ecified by the IEEE classification. The difference between what is mandated by n and what is actually needed by the device is reclaimed into the global power itional devices. You can then extend the switch power budget and use it more
	powered devices. If ye consumption wattage	vitch budgets 15400 milliwatts on each PoE port, you can connect only 24 Class 0 our Class 0 device power requirement is actually 5000 milliwatts, you can set the to 5000 milliwatts and connect up to 48 devices. The total PoE output power tor 48-port switch is 370,000 milliwatts.

Catalyst 3750 Switch Command Reference

Caution You should carefully plan your switch power budget and make certain not to oversubscribe the power supply. When you enter the **power inline consumption default** wattage or the **no power inline consumption** default global configuration command, or the power inline consumption wattage or the no power inline consumption interface configuration command, this caution message appears. %CAUTION: Interface interface-id: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation. Note When you manually configure the power budget, you must also consider the power loss over the cable between the switch and the powered device. For more information about the IEEE power classifications, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release. This command is supported only on PoE-capable ports. If you enter this command on a switch or port that does not support PoE, an error message appears. In a switch stack, this command is supported on all switches or ports in the stack that support PoE. **Examples** By using the global configuration command, this example shows how to configure the switch to budget 5000 milliwatts to each PoE port: Switch(config)# power inline consumption default 5000 %CAUTION: Interface Gi1/0/1: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation. By using the interface configuration command, this example shows how to configure the switch to budget 12000 milliwatts to the powered device connected to a specific PoE port: Switch(config)# interface gigabitethernet1/0/2 Switch(config-if)# power inline consumption 12000 %CAUTION: Interface Gi1/0/2: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation. You can verify your settings by entering the **show power inline consumption** privileged EXEC command.

Related Commands	Command	Description	
	power inline	Configures the power management mode on PoE ports.	
	show power inline	Displays the PoE status for the specified PoE port or for all PoE ports.	

priority-queue

Use the **priority-queue** interface configuration command to enable the egress expedite queue on a port. Use the **no** form of this command to return to the default setting.

priority-queue out

no priority-queue out

Syntax Description	out	Enable the egress expedite queue.	
Defaults	The egress expedite	queue is disabled.	
Command Modes	Interface configurat	ion	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	When you configure the priority-queue out command, the shaped round robin (SRR) weight ratios are affected because there is one fewer queue participating in SRR. This means that <i>weight1</i> in the srr-queue bandwidth shape or the srr-queue bandwidth shape interface configuration command is ignored (not used in the ratio calculation). The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced.		
	Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:		
	• If the egress exp	bedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.	
	• If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.		
	• If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRI services the queue in shared mode.		
Examples	This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.		
	Switch(config-if) Switch(config-if)	nterface gigabitethernet1/0/2 # srr-queue bandwidth shape 25 0 0 0 # srr-queue bandwidth share 30 20 25 25 # priority-queue out	

This example shows how to disable the egress expedite queue after the SRR shaped and shared weights are configured. The shaped mode overrides the shared mode.

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# no priority-queue out
```

You can verify your settings by entering the **show mls qos interface** *interface-id* **queueing** or the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface queueing	Displays the queueing strategy (SRR, priority queueing), the weights corresponding to the queues, and the CoS-to-egress-queue map.
	srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
	srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

2-387

private-vlan

Use the **private-vlan** VLAN configuration command on the switch stack or on a standalone switch to configure private VLANs and to configure the association between private-VLAN primary and secondary VLANs. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

private-vlan {association [add | remove] secondary-vlan-list | community | isolated | primary}

no private-vlan {association | community | isolated | primary}

Syntax Description	association	Create an association between the primary VLAN and a secondary VLAN.
	secondary-vlan-listSpecify one or more secondary VLANs to be associated with a pr VLAN in a private VLAN.addAssociate a secondary VLAN to a primary VLAN.	
	remove	Clear the association between a secondary VLAN and a primary VLAN.
	community	Designate the VLAN as a community VLAN.
	isolated	Designate the VLAN as a community VLAN.
	primary	Designate the VLAN as a community VLAN.
Command Modes	VLAN configuration	
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Jsage Guidelines	6 61	vate VLANs, you must disable VTP (VTP mode transparent). After you configure hould not change the VTP mode to client or server.
		e private-VLAN configuration. You must manually configure private VLANs on er 2 network to merge their Layer 2 databases and to prevent flooding of

You can **associate** a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.

- A secondary VLAN cannot be configured as a primary VLAN.
- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.
- If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A **community** VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An **isolated** VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary vlan domain.

A **primary** VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The private-vlan commands do not take effect until you exit from VLAN configuration mode.

Do not configure private-VLAN ports as EtherChannels. While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For information about configuring host ports and promiscuous ports, see the **switchport mode private-vlan** command.

For more information about private-VLAN interaction with other features, see the software configuration guide for this release.

Examples

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
Switch# configure terminal
Switch(config) # vlan 20
Switch(config-vlan) # private-vlan primary
Switch(config-vlan)# exit
Switch(config) # vlan 501
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan) # exit
Switch(config) # vlan 502
Switch(config-vlan) # private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 503
Switch(config-vlan) # private-vlan community
Switch(config-vlan) # exit
Switch(config) # vlan 20
Switch(config-vlan) # private-vlan association 501-503
Switch(config-vlan) # end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status** privileged EXEC command.

Related Commands	Command	Description
	show interfaces status	Displays the status of interfaces, including the VLANs to which they belong.
	show vlan private-vlan	Displays the private VLANs and VLAN associations configured on the switch stack.
	switchport mode private-vlan	Configures a private-VLAN port as a host port or promiscuous port.

private-vlan mapping

Use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI) on the switch stack or on a standalone switch to create a mapping between a private-VLAN primary and secondary VLANs so that both VLANs share the same primary VLAN SVI. Use the **no** form of this command to remove private-VLAN mappings from the SVI.

private-vlan mapping {[add | remove] secondary-vlan-list}

no private-vlan mapping

Syntax Description	secondary-vlan-list	Specify one or more secondary VLANs to be mapped to the primary VLAN SVI.	
	add	(Optional) Map the secondary VLAN to the primary VLAN SVI.	
	remove	(Optional) Remove the mapping between the secondary VLAN and the primary VLAN SVI.	
Defaults	The default is to have no private VLAN SVI mapping configured.		
Command Modes	Interface configuration		
Command History	Release	Modification	
-	12.2(20)SE	This command was introduced.	
Usage Guidelines	The switch must be in	VTP transparent mode when you configure private VLANs.	
	The SVI of the primary	VLAN is created at Layer 3.	
	Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Lay VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLA configured as a secondary VLAN.		
	items. Each item can be	st parameter cannot contain spaces. It can contain multiple comma-separated a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list d VLAN and multiple community VLANs.	
	Traffic that is received	on the secondary VLAN is routed by the SVI of the primary VLAN.	
	•	n be mapped to only one primary SVI. IF you configure the primary VLAN as a SVIs specified in this command are brought down.	
		ping between two VLANs that do not have a valid Layer 2 private-VLAN ag configuration does not take effect.	

Examples

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

Switch# configure terminal Switch# interface vlan 18 Switch(config-if)# private-vlan mapping 20 Switch(config-vlan)# end

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

Switch# configure terminal Switch# interface vlan 20 Switch(config-if)# private-vlan mapping 303-305, 307 Switch(config-vlan)# end

You can verify your setting by entering the **show interfaces private-vlan mapping** privileged EXEC command.

Related Commands	Command	Description
	show interfaces private-vlan	Display private-VLAN mapping information for the VLAN SVIs.
	mapping	

queue-set

Use the **queue-set** interface configuration command on the switch stack or on a standalone switch to map a port to a queue-set. Use the **no** form of this command to return to the default setting.

queue-set qset-id

no queue-set qset-id

Syntax Description	qset-idID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.The queue-set ID is 1.		
Defaults			
Command Modes	Interface configurat	ion	
Command History	Release	Modification	1
	12.1(11)AX	This comma	nd was introduced.
Examples	This example shows	s how to map a port	t to queue-set 2:
	Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# queue-set 2		
	You can verify your EXEC command.	settings by enterin	g the show mls qos interface [interface-id] buffers privileged
Related Commands	Command		Description
	mls qos queue-set	output buffers	Allocates buffers to a queue-set.
	mls qos queue-set	output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	show mls qos inter	face buffers	Displays quality of service (QoS) information.

radius-server dead-criteria

Use the **radius-server dead-criteria** global configuration command on the switch stack or on a standalone switch to configure the conditions that determine when a RADIUS server is considered unavailable or *dead*. Use the **no** form of this command to return to the default settings.

radius-server dead-criteria [time seconds [tries number] | tries number]

no radius-server dead-criteria [time seconds [tries number] | tries number]

Syntax Description	time seconds (Optional) Set the time in seconds during which the switch does not need to get a valid response from the RADIUS server. The range is from 1 to 120 seconds.		
		optional) Set the number of times that the switch does not get a valid response from e RADIUS server before the server is considered unavailable. The range is from 1 to 00.	
Defaults	-	ically determines the <i>seconds</i> value that is from 10 to 60 seconds. ically determines the <i>tries</i> value that is from 10 to 100.	
Command Modes	Global configurati		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Usage Guidelines	We recommend the	at you configure the <i>seconds</i> and <i>number</i> parameters as follows:	
	seconds during	s-server timeout <i>seconds</i> global configuration command to specify the time in g which the switch waits for a RADIUS server to respond before the IEEE 802.1x times out. The switch dynamically determines the default <i>seconds</i> value that is from ads.	
	times the swite	s-server retransmit <i>retries</i> global configuration command to specify the number of ch tries to reach the radius servers before considering the servers to be unavailable. namically determines the default <i>tries</i> value that is from 10 to 100.	
	-	arameter is less than or equal to the number of retransmission attempts times the time fore the IEEE 802.1x authentication times out.	
	• The <i>tries</i> para	meter should be the same as the number of retransmission attempts.	
Examples	-	vs how to configure 60 as the time and 10 as the number of tries , the conditions that RADIUS server is considered unavailable	
	Switch(config)#	radius-server dead-criteria time 60 tries 10	
	You can verify you	ar settings by entering the show running-config privileged EXEC command.	

Catalyst 3750 Switch Command Reference

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	radius-server retransmit retries	Specifies the number of times that the switch tries to reach the RADIUS servers before considering the servers to be unavailable. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	radius-server timeout seconds	Specifies the time in seconds during which the switch waits for a RADIUS server to respond before the IEEE 802.1x authentication times out. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

radius-server host

Use the **radius-server host** global configuration command on the switch stack or on a standalone switch to configure the RADIUS server parameters, including the RADIUS accounting and authentication. Use the **no** form of this command to return to the default settings.

radius-server host *ip-address* **[acct-port** *udp-port*] **[auth-port** *udp-port*] **[test username** *name* [**idle-time** *time*] **[ignore-acct-port**] **[ignore-auth-port**]] **[key** *string*]

no radius-server host ip-address

Syntax Description	ip-address	Specify the IP address of the RADIUS server.	
	acct-port udp-port	(Optional) Specify the UDP port for the RADIUS accounting server. The range is from 0 to 65536.	
	auth-port udp-port	(Optional) Specify the UDP port for the RADIUS authentication server. The range is from 0 to 65536.	
	test username name	(Optional) Enable automatic server testing of the RADIUS server status, and specify the username to be used.	
	idle-time time	(Optional) Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes.	
	ignore-acct-port	(Optional) Disables testing on the RADIUS-server accounting port.	
	ignore-auth-port	(Optional) Disables testing on the RADIUS-server authentication port.	
	key string	(Optional) Specify the authentication and encryption key for all RADIUS communication between the switch and the RADIUS daemon. The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.	
Defaults	-	e RADIUS accounting server is 1646.	
	The UDP port for the RADIUS authentication server is 1645.		
	Automatic server testing is disabled.		
	The idle time is 60 minutes (1 hour).		
	When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.		
	The authentication and encryption key (<i>string</i>) is not configured.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	

Usage Guidelines We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.

Use the **test username** *name* keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

You can configure the authentication and encryption key by using the **radius-server host** *ip-address* **key** *string* or the **radius-server key** {0 *string* | 7 *string* | *string*} global configuration command. Always configure the key as the last item in this command.

Examples

This example shows how to configure 1500 as the UDP port for the accounting server and 1510 as the UDP port for the authentication server:

Switch(config)# radius-server host 1.1.1.1 acct-port 1500 auth-port 1510

This example shows how to configure the UDP port for the accounting server and the authentication server, enable automated testing of the RADIUS server status, specify the username to be used, and configure a key string:

Switch(config)# radius-server host 1.1.1.2 acct-port 800 auth-port 900 test username
aaafail idle-time 75 key abc123

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description	
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.	
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.	
	<pre>radius-server key {0 string 7 string string }</pre>	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .	
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .	

rcommand

Use the **rcommand** user EXEC command on the switch stack or on the cluster command switch to start a Telnet session and to execute commands on a cluster member switch from the cluster command switch or the switch stack. To end the session, enter the **exit** command.

rcommand {*n* | **commander** | **mac-address** *hw-addr*}

Syntax Description	n	Provide the number that identifies a cluster member. The range is 0 to 15.	
	commander	Provide access to the cluster command switch from a cluster member switch.	
	mac-address hw-addr	MAC address of the cluster member switch.	
Command Modes	User EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	This command is availab	ble only on the cluster command switch stack or cluster command switch.	
		er command switch but the cluster member switch <i>n</i> does not exist, an error the switch number, enter the show cluster members privileged EXEC command switch.	
	You can use this command to access a cluster member switch from the cluster command-switch prompt or to access a cluster command switch from the member-switch prompt.		
	accesses the member-sw command switch. For ex switch, the cluster memb command switch at privi	500 XL, 2950, 2960, 2970, 3550, 3560, and 3750 switches, the Telnet session vitch command-line interface (CLI) at the same privilege level as on the cluster cample, if you execute this command at user level on the cluster command ber switch is accessed at user level. If you use this command on the cluster ileged level, the command accesses the remote device at privileged level. If you be-level lower than <i>privileged</i> , access to the cluster member switch is at user	
	For Catalyst 1900 and 2820 switches running standard edition software, the Telnet session accesses the menu console (the menu-driven interface) if the cluster command switch is at privilege level 15. If the cluster command switch is at privilege level 1, you are prompted for the password before being able to access the menu console. Cluster command switch privilege levels map to the cluster member switches running standard edition software as follows:		
	• If the cluster command switch privilege level is from 1 to 14, the cluster member switch is accessed at privilege level 1.		
	• If the cluster command switch privilege level is 15, the cluster member switch is accessed at privilege level 15.		
	The Catalyst 1900 and 2	2820 CLI is available only on switches running Enterprise Edition Software.	

This command will not work if the vty lines of the cluster command switch have access-class configurations.

You are not prompted for a password because the cluster member switches inherited the password of the cluster command switch when they joined the cluster.

Examples

This example shows how to start a session with member 3. All subsequent commands are directed to member 3 until you enter the **exit** command or close the session.

Switch# rcommand 3
Switch-3# show version
Cisco Internet Operating System Software ...
...
Switch-3# exit
Switch#

Related Commands	Command	Description
	show cluster members	Displays information about the cluster members.

reload

Use the **reload** privileged EXEC command to reload the stack member and to put a configuration change into effect.

reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu]

Syntax Description	LINE	Specify the reason for the reload.	
	at	Specify the time in hh:mm for the reload to occur.	
	cancel	Cancel the pending reload.	
	in	Specify a time interval in mmm or hhh:mm for reloads to occur.Save the changes on the specified stack member and restart it.	
	slot stack-member-number		
	standby-cpu	Reload the standby route processor (RP).	
Defaults	Immediately reloads the stack	k member and puts a configuration change into effect.	
Command Modes	Privilege EXEC		
Command History	Release Mo	dification	
	12.1(11)AX Th	is command was introduced.	
Usage Guidelines	If there is more than one swite command, you are not promp	ch in the switch stack, and you enter the reload slot <i>stack-member-number</i> ted to save the configuration.	
Examples	This example shows how to r	eload the switch stack:	
Examples	Switch(config)# reload	peen modified. Save? [yes/no]: y	
Examples	Switch(config)# reload System configuration has h Proceed to reload the whol	peen modified. Save? [yes/no]: y	
Examples	Switch(config)# reload System configuration has h Proceed to reload the whol	peen modified. Save? [yes/no]: y le Stack? [confirm] y eload a specific stack member: ot 6	
Examples	Switch(config)# reload System configuration has h Proceed to reload the whol This example shows how to r Switch(config)# reload slo Proceed with reload? [conf	peen modified. Save? [yes/no]: y le Stack? [confirm] y eload a specific stack member: ot 6	

ommands	Command	Description
	rcommand	Accesses a specific stack member.
	switch priority	Changes the stack member priority value.
	switch renumber	Changes the stack member number.
	show switch	Displays information about the switch stack and its stack members.

remote command

Use the remote command privileged EXEC command to monitor all or specified stack members.

remote command {**all** | *stack-member-number*} *LINE*

Syntax Description	all	Apply to all stack members.	
	stack-member-number	Specify the stack member. The range is 1 to 9.	
	LINE	Specify the command to execute.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines		debug , show , or clear) you use in the LINE command-to-execute string apply per or to the switch stack.	
Examples	This example shows how	v to execute the undebug command on the switch stack:	
	Switch(config)# remot Switch :1 :	e command all undebug all	
	All possible debuggin Switch :5 :	g has been turned off	
	All possible debugging has been turned off Switch :9 :		
	All possible debugging has been turned off		
	This example shows how to execute the debug udld event command on stack member 5:		
	Switch(config)# remote command 5 undebug all Switch :5 :		

UDLD events debugging is on

Related	Commands
---------	----------

ands	Command	Description
	reload	Accesses a specific stack member.
	switch priority	Changes the stack member priority value.
	switch renumber	Changes the stack member number.
	show switch	Displays information about the switch stack and its stack members.

remote-span

Use the **remote-span** VLAN configuration command on the switch stack or on a standalone switch to configure a VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN. Use the **no** form of this command to remove the RSPAN designation from the VLAN.

remote-span

no remote-span

Syntax Description	This command	has no a	arguments	or keywords.
--------------------	--------------	----------	-----------	--------------

Defaults No RSPAN VLANs are defined.

Command Modes VLAN configuration (config-VLAN)

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You can configure RSPAN VLANs only in config-VLAN mode (entered by using the **vlan** global configuration command), not the VLAN configuration mode entered by using the **vlan database** privileged EXEC command.

If VLAN Trunking Protocol (VTP) is enabled, the RSPAN feature is propagated by VTP for VLAN-IDs that are lower than 1005. If the RSPAN VLAN ID is in the extended range, you must manually configure intermediate switches (those in the RSPAN VLAN between the source switch and the destination switch).

Before you configure the RSPAN **remote-span** command, use the **vlan** (global configuration) command to create the VLAN.

The RSPAN VLAN has these characteristics:

- No MAC address learning occurs on it.
- RSPAN VLAN traffic flows only on trunk ports.
- Spanning Tree Protocol (STP) can run in the RSPAN VLAN, but it does not run on RSPAN destination ports.

When an existing VLAN is configured as an RSPAN VLAN, the VLAN is first deleted and then recreated as an RSPAN VLAN. Any access ports are made inactive until the RSPAN feature is disabled.

Examples

This example shows how to configure a VLAN as an RSPAN VLAN.

Switch(config)# vlan 901 Switch(config-vlan)# remote-span

This example shows how to remove the RSPAN feature from a VLAN.

Switch(config)# vlan 901 Switch(config-vlan)# no remote-span

You can verify your settings by entering the show vlan remote-span user EXEC command.

Commands Command Description monitor session Enables Switched Port Analyzer (SPAN) and RSPAN monitoring on a port and configures a port as a source or destination port. vlan (global configuration) Changes to config-vlan mode where you can configure VLANs 1 to 4094.

2-405

renew ip dhcp snooping database

Use the **renew ip dhcp snooping database** privileged EXEC command on the switch stack or on a standalone switch to renew the DHCP snooping binding database.

renew ip dhcp snooping database [{flash[number]:/filename |

ftp://user:password@host/filename | **nvram:**/filename | **rcp:**//user@host/filename | **tftp:**//host/filename}] [**validation none**]

Syntax Description							
	flash[number]:/filen(Optional) Specify that the database agent or the binding file is in the flash memory. Use the number parameter to specify the stack member number of the stack master. The range for number is 1 to 9.						
	ftp://user:password(Optional) Specify that the database agent or the binding file is on an FT@hostlfilenameserver.						
	nvram: <i>/filename</i> (Optional) Specify that the database agent or the binding file is in the NVRA						
	rcp: //user@host/file name	(Optional) Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.					
	tftp://host/filename	(Optional) Specify that the database agent or the binding file is on a TFTP server.					
	validation none	(Optional) Specify that the switch does not verify the cyclic redundancy check (CRC) for the entries in the binding file specified by the URL.					
Defaults	No default is defined.

sdm prefer

Use the **sdm prefer** global configuration command on the switch stack or on a standalone switch to configure the template used in Switch Database Management (SDM) resource allocation. You can use a template to allocate system resources to best support the features being used in your application. Use a template to provide maximum system usage for unicast routing or for VLAN configuration, to change an aggregator template (Catalyst 3750-12S only) to a desktop template, or to select the dual IPv4 and IPv6 template to support IPv6 forwarding (supported only when the switch stack is running the advanced IP services image). Use the **no** form of this command to return to the default template.

sdm prefer {access | default | dual-ipv4-and-ipv6 {default | routing | vlan} | routing | vlan} [desktop]

no sdm prefer

Syntax Description	access	Provide maximum system usage for access control lists (ACLs). Use this template if you have a large number of ACLs.
	default	Sets the switch to use the default template. On Catalyst 3750-12S switches, use with the desktop keyword to set the switch to the default desktop template. (Use the no sdm prefer command to set a desktop switch to the default desktop template or to set an aggregator switch to the default aggregator template.)
	dual-ipv4-and-ipv6	Select a template that supports both IPv4 and IPv6 routing.
	{default routing vlan}	• default —Provide balance to IPv4 and IPv6 Layer 2 and Layer 3 functionality.
		• routing —Provide maximum system usage for IPv4 and IPv6 routing, including IPv4 policy-based routing.
		• vlan—Provide maximum system usage for IPv4 and IPv6 VLANs.
	routing	Provide maximum system usage for unicast routing. You would typically use this template for a router or aggregator in the middle of a network.
	vlan	Provide maximum system usage for VLANs. This template maximizes system resources for use as a Layer 2 switch with no routing.
	desktop	Use only on a Catalyst 3750-12S switch (where aggregator templates are the default) to select the desktop default , routing , or vlan template.

Defaults The default template provides a balance to all features.

Command Modes Global configuration

Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	The aggregator templates were added.	
	12.2(25)SEA	The dual-ipv4-and-ipv6 templates were added.	
	12.2(25)SED	The access templates were added.	
	12.2(25)SEE	The dual-ipv4-and-ipv6 routing template was added.	

Usage Guidelines

You must reload the switch for the configuration to take effect. If you enter the **show sdm prefer** command before you enter the **reload** privileged EXEC command, the **show sdm prefer** command shows the template currently in use and the template that will become active after a reload.

Desktop switches support only desktop templates; an aggregator switch (Catalyst 3750-12S) supports both desktop and aggregator templates. On an aggregator switch, if you do not enter the desktop keyword, the aggregator templates are selected.

All stack members use the same SDM desktop or aggregator template, stored on the stack master. When a new switch member is added to a stack, as with the switch configuration file and VLAN database file, the SDM configuration that is stored on the stack master overrides the template configured on an individual switch.

To route IPv6 packets in a stack of switches, all switches in the stack should be running the advanced IP services image. The IPv6 packets are routed in hardware across the stack, as long as the packet does not have exceptions (IPv6Options) and the switches have not run out of hardware resources.

If a stack member cannot support the template that is running on the master switch, the switch goes into SDM mismatch mode, the master switch does not attempt to change the SDM template, and the switch cannot be a functioning member of the stack.

- If the master switch is a Catalyst 3750-12S, and you change the template from an aggregator template to a desktop template and reload the switch, the entire stack operates with the selected desktop template. This could cause configuration losses if the number of ternary content addressable memory (TCAM) entries exceeds the desktop template sizes.
- If you change the template on a Catalyst 3750-12S master from a desktop template to an aggregator template and reload the switch, any desktop switches that were part of the stack go into SDM mismatch mode.
- If you add a Catalyst 3750-12S switch that is running the aggregator template to a stack that has a desktop switch as the stack master, the stack operates with the desktop template selected on the stack master. This could cause configuration losses on the Catalyst 3750-12S stack member if the number of TCAM entries on it exceeds desktop template sizes.

For more information about stacking, see the "Managing Switch Stacks" chapter in the software configuration guide.

The access template maximizes system resources for access control lists (ACLs) as required to accommodate a large number of ACLs.

The default templates balance the use of system resources.

Use the **sdm prefer vlan** [**desktop**] global configuration command only on switches intended for Layer 2 switching with no routing. When you use the VLAN template, no system resources are reserved for routing entries, and any routing is done through software. This overloads the CPU and severely degrades routing performance. Do not use the routing template if you do not have routing enabled on your switch. Entering the **sdm prefer routing** [**desktop**] global configuration command prevents other features from using the memory allocated to unicast routing in the routing template.

Do not use the ipv4-and-ipv6 templates if you do not plan to enable IPv6 routing on the switch. Entering the sdm prefer ipv4-and-ipv6 {default | routing | vlan} [desktop] global configuration command divides resources between IPv4 and IPv6, limiting those allocated to IPv4 forwarding.

Table 2-15 lists the approximate number of each resource supported in each of the IPv4-only templates for a desktop or aggregator switch. The values in the template are based on eight routed interfaces and approximately one thousand VLANs and represent the approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

	Desktop Templates				Aggregator Templates			
Resource	Access	Default	Routing	VLAN	Access	Default	Routing	VLAN
Unicast MAC addresses	4 K	6 K	3 K	12 K	6 K	6 K	6 K	12 K
Internet Group Management Protocol (IGMP) groups and multicast routes	1 K	1 K	1 K	1 K	1 K	1 K	1 K	1 K
Unicast routes	6 K	8 K	11 K	0	12 K	12 K	20 K	0
Directly connected hosts	4 K	6 K	3 K	0	6 K	6 K	6 K	0
• Indirect routes	2 K	2 K	8 K	0	6 K	6 K	14 K	0
Policy-based routing access control entries (ACEs)	512	0	512	0	512	0	512	0
Quality of service (QoS) classification ACEs	512	512	512	512	896	896	512	896
Security ACEs	2 K	1 K	1 K	1 K	4 K	1 K	1 K	1 K
Layer 2 VLANs	1 K	1 K	1 K	1 K	1 K	1 K	1 K	1 K

Table 2-15 Approximate Number of Feature Resources Allowed by IPv4Templates

Table 2-16 lists the approximate number of each resource supported in each of the dual IPv4-and IPv6 templates for a desktop or aggregator switch.

Table 2-16 Approximate Feature Resources Allowed by Dual IPv4-IPv6 Tem	plates
--	--------

	Desktop II	Pv4-and-IPv6	Templates	Aggregator IPv4-and-IPv6 Templates		
Resource	Default	Routing	VLAN	Default	Routing	VLAN
Unicast MAC addresses	2 K	1536	8 K	2 K	2K	8 K
IPv4 IGMP groups and multicast routes	1 K	1K	1 K	1 K	1 K	0
Total IPv4 unicast routes:	3 K	2816	0	3 K	8K	0
• Directly connected IPv4 hosts	2 K	1536	0	2 K	2K	0
• Indirect IPv4 routes	1 K	1280	0	1 K	6K	1 K
IPv6 multicast groups	1 K	1152	1 K	1 K	2176	1 K
Total IPv6 unicast routes:	3 K	2816	0	3 K	8K	0
• Directly connected IPv6 addresses	2 K	1536	0	2 K	2K	0
• Indirect IPv6 unicast routes	1 K	1280	0	1 K	6K	0

	Desktop I	Pv4-and-IPv6	Templates	Aggregator IPv4-and-IPv6 Templates

IPv4 or MAC security ACEs (total)	1 K	512	1 K	512	1K	1 K
IPv6 policy-based routing ACEs ¹	0	255	0	0	510	0
IPv6 QoS ACEs	510	510	510	876	510	876
IPv6 security ACEs	510	510	510	876	510	876

Table 2-16 Approximate Feature Resources Allowed by Dual IPv4-IPv6 Templates (continued)

1. IPv6 policy-based routing is not supported in this release.

Examples

This example shows how to configure the access template on a desktop switch:

Switch(config)# sdm prefer access
Switch(config)# exit
Switch# reload

This example shows how to configure the routing template on a desktop switch:

Switch(config)# sdm prefer routing
Switch(config)# exit
Switch# reload

This example shows how to configure the desktop routing template on an aggregator switch:

Switch(config)# sdm prefer routing desktop Switch(config)# exit Switch# reload

This example shows how to configure the dual IPv4-and-IPv6 default template on a desktop switch:

Switch(config)# sdm prefer dual-ipv4-and-ipv6 default
Switch(config)# exit
Switch# reload

This example shows how to change a switch template to the default template. On an aggregator switch, this is the default aggregator template; on a desktop switch, this is the default desktop template.

Switch(config)# no sdm prefer
Switch(config)# exit
Switch# reload

This example shows how to configure the desktop default template on an aggregator switch:

```
Switch(config)# sdm prefer default desktop
Switch(config)# exit
Switch# reload
```

You can verify your settings by entering the **show sdm prefer** privileged EXEC command.

Related Commands	s Command Description	
	show sdm prefer	Displays the current SDM template in use or displays the templates that can
		be used, with approximate resource allocation per feature.

service password-recovery

Use the **service password-recovery** global configuration command on the switch stack or on a standalone switch to enable the password-recovery mechanism (the default). This mechanism allows an end user with physical access to the switch to hold down the **Mode** button and interrupt the bootup process while the switch is powering up and to assign a new password. Use the **no** form of this command to disable part of the password-recovery functionality. When the password-recovery mechanism is disabled, interrupting the bootup process is allowed only if the user agrees to set the system back to the default configuration.

service password-recovery

no service password-recovery

Syntax Description This command has no arguments or keywords.

The password-recovery mechanism is enabled.

Command Modes Global configuration

Defaults

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines As a system administrator, you can use the **no service password-recovery** command to disable some of the functionality of the password recovery feature by allowing an end user to reset a password only by agreeing to return to the default configuration.

To use the password-recovery procedure, a user with physical access to the switch holds down the **Mode** button while the unit powers up and for a second or two after the LED above port 1X turns off. When the button is released, the system continues with initialization.

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

If the user chooses not to reset the system to the default configuration, the normal bootup process continues, as if the **Mode button** had not been pressed. If you choose to reset the system to the default configuration, the configuration file in flash memory is deleted, and the VLAN database file, *flash:vlan.dat* (if present), is deleted. If you use the **no service password-recovery** command to control

end user access to passwords, we recommend that you save a copy of the config file in a location away from the switch in case the end user uses the password recovery procedure and sets the system back to default values. Do not keep a backup copy of the config file on the switch.

If the switch is operating in VTP transparent mode, we recommend that you also save a copy of the vlan.dat file in a location away from the switch.

When you enter the **service password-recovery** or **no service password-recovery** command on the stack master, it is propagated throughout the stack and applied to all switches in the stack.

You can verify if password recovery is enabled or disabled by entering the **show version** privileged EXEC command.

Examples

This example shows how to disable password recovery on a switch or switch stack so that a user can only reset a password by agreeing to return to the default configuration.

Switch(config)# no service-password recovery
Switch(config)# exit

Related Commands	Command	Description
	show version	Displays version information for the hardware and firmware.

service-policy

Use the **service-policy** interface configuration command on the switch stack or on a standalone switch to apply a policy map defined by the **policy-map** command to the input of a physical port or a switch virtual interface (SVI). Use the **no** form of this command to remove the policy map and port association.

service-policy input *policy-map-name*

no service-policy input policy-map-name

Syntax Description	input policy-map-name	Apply the specified policy map to the input of a physical port or an SVI.
Note		mand-line help strings, the history keyword is not supported, and you should gathers. The output keyword is also not supported.
Defaults	No policy maps are attach	
Delduits	No poncy maps are attach	led to the port.
Command Modes	Interface configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SE	A policy map can now be applied to a physical port or an SVI.
	12.2(25)SED	Hierarchical policy-maps can now be applied to an SVI.
Usage Guidelines	Release 12.2(25)SE, polic In Cisco IOS Release 12.2 When VLAN-based qualic configuration command o VLAN-based QoS is enab physical port, the switch r policy map is configured interface.	ingress port is supported. In software releases earlier than Cisco IOS ey maps can be configured only on physical ports. 2(25)SE or later, policy maps can be configured on physical ports or on SVIs. ty of service (QoS) is disabled by using the no mls qos vlan-based interface n a physical port, you can configure a port-based policy map on the port. If oled by using the mls qos vlan-based interface configuration command on a emoves the previously configured port-based policy map. After a hierarchical and applied on an SVI, the interface-level policy map takes effect on the
	incoming traffic on a phys map to incoming traffic or can configure different int	er than Cisco IOS Release 12.2(25)SE, you can apply a policy map only to the sical port. In Cisco IOS Release 12.2(25)SE or later, you can apply a policy in a physical port or on an SVI. In Cisco IOS Release 12.2(25)SED or later, you erface-level policy maps for each class defined in the VLAN-level policy map. ut hierarchical policy maps, see the "Configuring QoS" chapter in the software is release.

Examples

Classification using a port trust state (for example, **mls qos trust** [**cos** | **dscp** | **ip-precedence**] and a policy map (for example, **service-policy input** *policy-map-name*) are mutually exclusive. The last one configured overwrites the previous configuration.

Policy maps that use the **police aggregate** command fail when applied to a 10-Gigabit Ethernet interface.

This example shows how to apply *plcmap1* to an physical ingress port:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# service-policy input plcmap1
```

This example shows how to remove *plcmap2* from a physical port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# no service-policy input plcmap2
```

This example shows how to apply *plcmap1* to an ingress SVI when VLAN-based QoS is enabled:

```
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input plcmap1
```

This example shows how to create a hierarchical policy map and attach it to an SVI:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) # access-list 101 permit ip any any
Switch(config) # class-map cm-1
Switch(config-cmap) # match access 101
Switch(config-cmap)# exit
Switch(config) # exit
Switch#
Switch#
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) # class-map cm-interface-1
Switch(config-cmap)# match input gigabitethernet3/0/1 - gigabitethernet3/0/2
Switch(config-cmap)# exit
Switch(config) # policy-map port-plcmap
Switch(config-pmap)# class-map cm-interface-1

Switch(config-pmap-c) # match ip dscp 3
Switch(config-pmap-c)# service-policy port-plcmap-2
Switch(config-pmap) # exit
Switch(config-pmap) # class-map cm-4
Switch(config-pmap-c)# trust dscp
Switch(config-pmap)# exit
Switch(config) # interface vlan 10
Switch(config-if)#
```

L

Switch(config-if)# ser input vlan-plcmap Switch(config-if)# exit Switch(config)# exit

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show policy-map	Displays QoS policy maps.
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference , Release 12.2 > File Management Commands > Configuration File Management Commands .

session

Use the **session** privileged EXEC command on the stack master to access a specific stack member or to access the controller on a Catalyst 3750G Integrated Wireless LAN Controller Switch.

session stack-member-number [processor 1]

Syntax Description	stack-member-number	Specify the stack member number. The range is 1 to 9.	
	processor 1	(Optional) Specify the destination processor for the session, that is, the embedded controller in the Catalyst 3750G Integrated Wireless LAN Controller Switch. Entering this keyword puts you in the controller CLI.	
		Note This keyword applies only to a wireless LAN controller switch.	
Defaults	No default is defined.		
Command Modes	Global configuration		
Command History	Release	Modification	
-	12.1(11)AX	This command was introduced.	
	12.2(25)FZ	The processor keyword was added for Catalyst 3750G Integrated Wireless LAN Controller Switch.	
Usage Guidelines	•	the member, its stack member number is appended to the system prompt.	
	Use the session command from the stack master to access a stack member switch. Use the session command with processor 1 from the stack master or a standalone switch to access the internal controller. A standalone switch is always stack member 1.		
		word to change to the controller command-line interface. See the <i>Cisco Wireless tration Guide Release 4.0</i> for controller configuration information.	
Examples	This example shows how	w to access stack member 6:	
	Switch(config)# session 6 Switch-6#		
	-	v to access the controller on stack member 2, which is a Catalyst 3750G wireless standalone or stack master):	
	Switch# session 2 pro	cessor 1

Related Commands Co

ommands	Command	Description
	reload	Reloads the stack member and puts a configuration change into effect.
	switch priority	Changes the stack member priority value.
	switch renumber	Changes the stack member number.
	show switch	Displays information about the switch stack and its stack members.

set

Use the **set** policy-map class configuration command on the switch stack or on a standalone switch to classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet. Use the **no** form of this command to remove traffic classification.

set {dscp new-dscp | [ip] precedence new-precedence}

no set {**dscp** *new-dscp* | [**ip**] **precedence** *new-precedence*}

Syntax Description	dscp new-dscp	New DSCP value assigned to the classified traffic. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.	
	[ip] precedence new-preced	<i>dence</i> New IP-precedence value assigned to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.	
Defaults	No traffic classification is de	efined.	
Command Modes	Policy-map class configurati	ion	
Command History	Release M	odification	
	12.1(11)AX Th	his command was introduced.	
	12.2(25)SE Th	he ip dscp <i>new-dscp</i> keyword was changed to dscp <i>new-dscp</i> .

Usage Guidelines	configuration command, the enter the set ip dscp policy- switch configuration.	25)SE or later, if you have used the set ip dscp policy-map class switch changes this command to set dscp in the switch configuration. If you map class configuration command, this setting appears as set dscp in the	
	In Cisco IOS Release 12.2(25)SEC or later, you can use the set ip precedence policy-map class configuration command or the set precedence policy-map class configuration command. This setting appears as set ip precedence in the switch configuration.		
	configuration command or th	he set precedence policy-map class configuration command. This setting	
	configuration command or the appears as set ip precedence	he set precedence policy-map class configuration command. This setting	

command, which is the same as entering the **set ip precedence 5** command. For a list of supported mnemonics, enter the **set dscp ?** or the **set ip precedence ?** command to see the command-line help strings.

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Examples

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```
Switch(config)# policy-map policy_ftp
Switch(config-pmap)# class ftp_class
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	police	Defines a policer for classified traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show policy-map	Displays QoS policy maps.
	trust	Defines a trust state for traffic classified through the class policy-map configuration command or the class-map global configuration command.

setup

Use the **setup** privileged EXEC command to configure the switch with its initial configuration. setup Syntax Description This command has no arguments or keywords. **Command Modes** Privileged EXEC **Command History** Release Modification 12.1(11)AX This command was introduced. **Usage Guidelines** When you use the setup command, make sure that you have this information: IP address and network mask Password strategy for your environment Whether the switch will be used as the cluster command switch and the cluster name When you enter the setup command, an interactive dialog, called the System Configuration Dialog, appears. It guides you through the configuration process and prompts you for information. The values shown in brackets next to each prompt are the default values last set by using either the setup command facility or the configure privileged EXEC command. Help text is provided for each prompt. To access help text, press the question mark (?) key at a prompt. To return to the privileged EXEC prompt without making changes and without running through the entire System Configuration Dialog, press Ctrl-C. When you complete your changes, the setup program shows you the configuration command script that was created during the setup session. You can save the configuration in NVRAM or return to the setup program or the command-line prompt without saving it. **Examples** This is an example of output from the **setup** command: Switch# setup --- System Configuration Dialog ---Continue with configuration dialog? [yes/no]: yes At any point you may enter a question mark '?' for help. Use ctrl-c to abort configuration dialog at any prompt. Default settings are in square brackets '[]'. Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.

Would you like to enter basic management setup? setup express

Use the **setup express** global configuration command to enable Express Setup mode on the switch stack or on a standalone switch. Use the **no** form of this command to disable Express Setup mode.

setup express

no setup express

Syntax Description	This command has no	o arguments or keywords.
--------------------	---------------------	--------------------------

- **Defaults** Express Setup is enabled.
- Command Modes Global configuration

Command History	Release	Modification
	12.1(14)EA1	This command was introduced.

Usage Guidelines

When Express Setup is enabled on a new (unconfigured) switch, pressing the Mode button for 2 seconds activates Express Setup. You can access the switch through an Ethernet port by using the IP address 10.0.0.1 and then can configure the switch with the web-based Express Setup program or the command-line interface (CLI)-based setup program.

When you press the Mode button for 2 seconds on a configured switch, the LEDs above the Mode button start blinking. If you press the Mode button for a total of 10 seconds, the switch configuration is deleted, and the switch reboots. The switch can then be configured like a new switch, either through the web-based Express Setup program or the CLI-based setup program.

As soon as you make any change to the switch configuration (including entering *no* at the beginning of the CLI-based setup program), configuration by Express Setup is no longer available. You can only run Express Setup again by pressing the Mode button for 10 seconds. This deletes the switch configuration and reboots the switch.

If Express Setup is active on the switch, entering the **write memory** or **copy running-configuration** startup-configuration privileged EXEC commands deactivates Express Setup. The IP address 10.0.0.1 is no longer valid on the switch, and your connection using this IP address ends.

The primary purpose of the **no setup express** command is to prevent someone from deleting the switch configuration by pressing the Mode button for 10 seconds.

Examples

This example shows how to enable Express Setup mode:

Switch(config) # setup express

You can verify that Express Setup mode is enabled by pressing the Mode button:

- On an unconfigured switch, the LEDs above the Mode button turn solid green after 3 seconds.
- On a configured switch, the mode LEDs begin blinking after 2 seconds and turn solid green after 10 seconds.

If you *hold* the Mode button down for a total of 10 seconds, the configuration is deleted, and the switch reboots.

This example shows how to disable Express Setup mode:

Switch(config) # no setup express

You can verify that Express Setup mode is disabled by pressing the Mode button. The mode LEDs do not turn solid green *or* begin blinking green if Express Setup mode is not enabled on the switch.

Related Commands	Command	Description
	show setup express	Displays if Express Setup mode is active.

show access-lists

Use the **show access-lists** privileged EXEC command to display access control lists (ACLs) configured on the switch.

show access-lists [name | number | hardware counters | ipc] [| {begin | exclude | include}
expression]

name	(Optional) Name of the ACL.	
number	(Optional) ACL number. The range is 1 to 2699.	
hardware counters	(Optional) Display global hardware ACL statistics for switched and routed packets.	
ірс	(Optional) Display Interprocess Communication (IPC) protocol access-list configuration download information.	
begin	(Optional) Display begins with the line that matches the <i>expression</i> .	
exclude	(Optional) Display excludes lines that match the <i>expression</i> .	
include	(Optional) Display includes lines that match the specified <i>expression</i> .	
expression	Expression in the output to use as a reference point.	

Though visible in the command-line help strings, the rate-limit keywords are not supported.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The ipc keyword was added.

Usage Guidelines

es The switch supports only IP standard and extended access lists. Therefore, the allowed numbers are only 1 to 199 and 1300 to 2699.

This command also displays the MAC ACLs that are configured.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Examples

This is an example of output from the **show access-lists** command:

```
Switch# show access-lists
Standard IP access list 1
    10 permit 1.1.1.1
    20 permit 2.2.2.2
    30 permit any
    40 permit 0.255.255.255, wildcard bits 12.0.0.0
Standard IP access list videowizard_1-1-1-1
    10 permit 1.1.1.1
Standard IP access list videowizard_10-10-10-10
    10 permit 10.10.10.10
Extended IP access list 121
    10 permit ahp host 10.10.10.10 host 20.20.10.10 precedence routine
Extended IP access list CMP-NAT-ACL
    Dynamic Cluster-HSRP deny ip any any
    10 deny ip any host 19.19.11.11
    20 deny ip any host 10.11.12.13
    Dynamic Cluster-NAT permit ip any any
    10 permit ip host 10.99.100.128 any
    20 permit ip host 10.46.22.128 any
    30 permit ip host 10.45.101.64 any
    40 permit ip host 10.45.20.64 any
    50 permit ip host 10.213.43.128 any
    60 permit ip host 10.91.28.64 any
    70 permit ip host 10.99.75.128 any
    80 permit ip host 10.38.49.0 any
```

This is an example of output from the show access-lists hardware counters command:

```
Switch# show access-lists hardware counters

Related Commands	Command	Description	
	access-list	Configures a standard or extended numbered access list on the switch. For syntax information, select Cisco IOS IP Command Reference , Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.	
	ip access list	Configures a named IP access list on the switch. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.	
	mac access-list extended	Configures a named or numbered MAC access list on the switch.	
	mac access-list extended	Configures a named or numbered MAC access list on the switch.	

show archive status

Use the **show archive status** privileged EXEC command to display the status of a new image being downloaded to a switch with the HTTP or the TFTP protocol.

show archive status [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .				
,	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Display includes lines that match the specified <i>expression</i> .				
	expression	Expression in the output to use as a reference point.				
Command Modes	Privileged EX	ΧEC				
Command History	Release	Modification				
	12.2(20)SE	This command was introduced.				
Usage Guidelines	•	archive download-sw privileged EXEC command to download an image to a TFTP tput of the archive download-sw command shows the status of the download.				
	If you do not have a TFTP server, you can use Network Assistant or the embedded device manager to download the image by using HTTP. The show archive status command shows the progress of the download.					
	-	re case sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> yed, but the lines that contain <i>Output</i> are displayed.				
Examples	These are exa	mples of output from the show archive status command:				
	Switch# show archive status IDLE: No upgrade in progress					
	Switch# show archive status LOADING: Upgrade in progress					
	Switch# show archive status EXTRACT: Extracting the image					
		r archive status fying software				
		archive status rade completed. Reload pending				
Related Commands	Command	Description				
	Juinnand	Description				

Downloads a new image from a TFTP server to the switch.

archive download-sw

show arp access-list

Use the **show arp access-list** user EXEC command to display detailed information about Address Resolution Protocol (ARP) access control (lists).

show arp access-list [acl-name] [| {begin | exclude | include} expression]

Syntax Description	acl-name	(Optional) Nam	ne of the ACL.			
	begin	(Optional) Disp	play begins with the line that matches the <i>expression</i> .			
	exclude	exclude (Optional) Display excludes lines that match the <i>expression</i> .

show auto qos

Use the **show auto qos** user EXEC command to display the quality of service (QoS) commands entered on the interfaces on which automatic QoS (auto-QoS) is enabled.

show auto qos [interface [interface-id]]

Syntax Description	interface [interface-id]	(Optional) Display auto-QoS information for the specified port or for all ports. Valid interfaces include physical ports.				
Command Modes	User EXEC					
Command History	Release	Modification				
	12.1(14)EA1	This command was introduced.				
	12.2(20)SE	The information in the command output changed, and the user guidelines were updated.				
	12.2(40)SE	The information in the command output changed.				
	command entered on ea the auto-QoS command	2.2(20)SE or later, the show auto qos command output shows only the auto-QoS ch interface. The show auto qos interface <i>interface-id</i> command output shows entered on a specific interface. config privileged EXEC command to display the auto-QoS configuration and the				
	Beginning in Cisco IOS Release 12.2(40)SE, the show auto qos command output also shows the service policy information for the Cisco IP phone.					
	To display information about the QoS configuration that might be affected by auto-QoS, use one of these commands:					
	• show mls qos					
	• show mls qos maps cos-dscp					
	• show mls qos interface [interface-id] [buffers queueing]					
	 show mls qos maps [cos-dscp cos-input-q cos-output-q dscp-cos dscp-input-q dscp-output-q] 					
	• show mls qos input-queue					
	• show running-conf	ňo				

Examples

This is an example of output from the **show auto qos** command after the **auto qos voip cisco-phone** and the **auto qos voip cisco-softphone** interface configuration commands are entered:

Switch> **show auto qos** GigabitEthernet2/0/4 auto qos voip cisco-softphone

GigabitEthernet2/0/5 auto qos voip cisco-phone

GigabitEthernet2/0/6 auto qos voip cisco-phone

This is an example of output from the **show auto qos interface** *interface-id* command when the **auto qos voip cisco-phone** interface configuration command is entered:

```
Switch> show auto qos interface gigabitethernet 2/0/5
GigabitEthernet2/0/5
auto qos voip cisco-phone
```

This is an example of output from the **show running-config** privileged EXEC command when the **auto qos voip cisco-phone** and the **auto qos voip cisco-softphone** interface configuration commands are entered:

```
Switch# show running-config

	Auto upgrade	:no					
	<output truncated=""></output>						
	-						

Field	Description				
BOOT path-list	Displays a semicolon separated list of executable files to try to load and execute when automatically booting up.				
	If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory.				
	If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot up with the first bootable file that it can find in the flash file system.				
Config file	Displays the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.				
Private Config file	Displays the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.				
Enable Break	Displays whether a break during booting up is enabled or disabled. If it is set to yes, on, or 1, you can interrupt the automatic bootup process by pressing the Break key on the console after the flash file system is initialized.				
Manual Boot	Displays whether the switch automatically or manually boots up. If it is set to no or 0, the bootloader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the bootloader mode.				
Helper path-list	Displays a semicolon separated list of loadable files to dynamically load during the bootloader initialization. Helper files extend or patch the functionality of the bootloader.				
Auto upgrade	Displays whether the switch stack is set to automatically copy its software version to an incompatible switch so that it can join the stack.				
	A switch in version-mismatch (VM) mode is a switch that has a different stack protocol version than the version on the switch stack. Switches in VM mode cannot join the switch stack. If the switch stack has an image that can be copied to a switch in VM mode, and if the boot auto-copy-sw feature is enabled, the switch stack automatically copies the image from another stack member to the switch in VM mode. The switch then exits VM mode, reboots, and joins the switch stack.				

Related Commands	Command	Description
	boot auto-copy-sw	Enables the automatic upgrade (auto-upgrade) process to automatically upgrade a switch in version-mismatch (VM) mode.
	boot config-file	Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.
	boot enable-break	Enables interrupting the automatic boot process.
	boot manual	Enables manually booting up the switch during the next bootup cycle.
	boot private-config-file	Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the private configuration.
	boot system	Specifies the Cisco IOS image to load during the next bootup cycle.

show cable-diagnostics tdr

Use the **show cable-diagnostics tdr** privileged EXEC command to display the Time Domain Reflector (TDR) results.

show cable-diagnostics tdr interface interface-id [| {begin | exclude | include} expression]

Syntax Description	interface-id	Specify the interface on which TDR was run.						
	begin	(Optional) Display begins with the line that matches the expression.						
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .						
	include	(Optional) Display includes lines that match the specified expression.						
	expression	<i>xpression</i> Expression in the output to use as a reference point.						
Command Modes	Privileged EXI	EC						
Command History	Release	Modification						
	12.1(19)EA1	This command was introduced.						
lsage Guidelines	10-Gigabit mo	rted only on 10/100/100 copper Ethernet ports. It is not supported on 10/100 ports, odule ports, or on SFP module ports. For more information about TDR, see the softw guide for this release.						
Usage Guidelines	10-Gigabit mo configuration g Expressions ar	odule ports, or on SFP module ports. For more information about TDR, see the softw

							-	
		Pair	в	0	+/- 4 meters	N/A	Open	
			-		,		-	
		Pair	С	0	+/- 4 meters	N/A	Open	
		Pair	D	0	+/- 4 meters	N/A	Open	

Table 2-18 lists the descriptions of the fields in the **show cable-diagnostics tdr** command output.

 Table 2-18
 Fields Descriptions for the show cable-diagnostics tdr Command Output

Field	Description
Interface	Interface on which TDR was run.
Speed	Speed of connection.
Local pair	Name of the pair of wires that TDR is testing on the local interface.
Pair length	Location on the cable where the problem is, with respect to your switch. TDR can only find the location in one of these cases:
	• The cable is properly connected, the link is up, and the interface speed is 1000 Mb/s.
	• The cable is open.
	• The cable has a short.
Remote pair	Name of the pair of wires to which the local pair is connected. TDR can learn about the remote pair only when the cable is properly connected and the link is up.
Pair status	The status of the pair of wires on which TDR is running:
	• Normal—The pair of wires is properly connected.
	• Not completed—The test is running and is not completed.
	• Not supported—The interface does not support TDR.
	• Open—The pair of wires is open.
	• Shorted—The pair of wires is shorted.
	• ImpedanceMis—The impedance is mismatched.
	• Short/Impedance Mismatched—The impedance mismatched or the cable is short.
	• InProgress—The diagnostic test is in progress

This is an example of output from the **show interfaces** *interface-id* command when TDR is running:

Switch# show interfaces gigabitethernet1/0/2 gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)

This is an example of output from the **show cable-diagnostics tdr interface** *interface-id* command when TDR is not running:

Switch# show cable-diagnostics tdr interface gigabitethernet1/0/2 % TDR test was never issued on Gi1/0/2

If an interface does not support TDR, this message appears:

% TDR test is not supported on switch 1

Related Commands	Command	Description
	test cable-diagnostics tdr	Enables and runs TDR on an interface.

show class-map

Use the **show class-map** user EXEC command to display quality of service (QoS) class maps, which define the match criteria to classify traffic.

show class-map [class-map-name] [| {begin | exclude | include} expression]

Syntax Description	class-map-name	(Optional) Display the contents of the specified class map.	
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .	
	exclude	(Optional) Display excludes lines that match the expression.	
	include	(Optional) Display includes lines that match the specified expression.	
	expression	Expression in the output to use as a reference point.	
Command Modes	User EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Examples	This is an example	of output from the show class-man command:	
Examples	This is an example of output from the show class-map command:		
	Switch> show class-map Class Map match-all videowizard_10-10-10 (id 2)		
	Match access-group name videowizard_10-10-10-10		
	Class Map match-any class-default (id 0) Match any		
	Class Map match-all dscp5 (id 3) Match ip dscp 5		
Related Commands	Command	Description	
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.	

Defines the match criteria to classify traffic.

match (class-map configuration)

show cluster

Use the **show cluster** user EXEC command to display the cluster status and a summary of the cluster to which the switch belongs. This command can be entered on the cluster command switch and cluster member switches.

show cluster [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display	begins with the line that matches the <i>expression</i> .
	l exclude (Optional) Display excludes lines that match the <i>expression</i> .		v excludes lines that match the <i>expression</i> .
	include	(Optional) Display	v includes lines that match the specified <i>expression</i> .
	expression		
Command Modes	User EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command wa	s introduced.
Usage Guidelines	If you enter this con cluster member app		not a cluster member, the error message Not a management
	On a cluster member switch, this command displays the identity of the cluster command switch, the switch member number, and the state of its connectivity with the cluster command switch.		
	On a cluster command switch stack or cluster command switch, this command displays the cluster name and the total number of members. It also shows the cluster status and time since the status changed. If redundancy is enabled, it displays the primary and secondary command-switch information.		
	-	e sensitive. For example, ut the lines that contain <i>C</i>	if you enter I exclude output , the lines that contain <i>output Dutput</i> are displayed.
Examples	This is an example of switch:	of output when the show of	cluster command is entered on the active cluster command
	Status: Time sinc Redundanc S S Heartbeat Heartbeat	r cluster "Ajang" ber of members: e last status change:	7 1 members are unreachable 0 days, 0 hours, 2 minutes Enabled Member 1 Ajang_standby 110 8 80 3

This is an example of output when the **show cluster** command is entered on a cluster member switch:

Switch1> show cluster Member switch for cluster "hapuna"	
Member number:	3
Management IP address:	192.192.192.192
Command switch mac address:	0000.0c07.ac14
Heartbeat interval:	8
Heartbeat hold-time:	80

This is an example of output when the show cluster command is entered on a cluster member switch that is configured as the standby cluster command switch:

Switch> show cluster Member switch for cluster "hapuna"	
Member number:	3 (Standby command switch)
Management IP address:	192.192.192.192
Command switch mac address:	0000.0c07.ac14
Heartbeat interval:	8
Heartbeat hold-time:	80

This is an example of output when the **show cluster** command is entered on the cluster command switch that has lost connectivity with member 1:

Switch>	show cluster	
Command	switch for cluster "Ajang"	
	Total number of members:	7
	Status:	1 members are unreachable
	Time since last status change:	0 days, 0 hours, 5 minutes
	Redundancy:	Disabled
	Heartbeat interval:	8
	Heartbeat hold-time:	80
	Extended discovery hop count:	3

This is an example of output when the show cluster command is entered on a cluster member switch that has lost connectivity with the cluster command switch:

Switch> show cluster	
Member switch for cluster "hapuna"	
Member number:	<unknown></unknown>
Management IP address:	192.192.192.192
Command switch mac address:	0000.0c07.ac14
Heartbeat interval:	8
Heartbeat hold-time:	80

Related Commands	Command	Description
	cluster enable	Enables a command-capable switch as the cluster command switch, assigns a cluster name, and optionally assigns a member number to it.
	show cluster candidates	Displays a list of candidate switches.
	show cluster members	Displays information about the cluster members.

2-445

show cluster candidates

Use the **show cluster candidates** privileged EXEC command on a switch stack or on a cluster command switch to display a list of candidate switches.

show cluster candidates [detail | mac-address H.H.H.] [| {begin | exclude | include} expression]

Syntax Description	detail	(Optional) Display detailed information for all candidates.	
	mac-address H.H.H.	(Optional) MAC address of the cluster candidate.	
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .	
	I exclude(Optional) Display excludes lines that match the <i>expression</i> .I include(Optional) Display includes lines that match the specified <i>expression</i> .		
Command Modes	User EXEC		
Command History	Release	Modification	
-	12.1(11)AX	This command was introduced.	
	The SN in the display means <i>switch member number</i> . If E appears in the SN column, it means that the switch is discovered through extended discovery. If E does not appear in the SN column, it means that the <i>switch member number</i> is the upstream neighbor of the candidate switch. The hop count is the number of devices the candidate is from the cluster command switch.		
	Expressions are case sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i> are not displayed, but the lines that contain <i>Output</i> are displayed.		
xamples	This is an example of ou	utput from the show cluster candidates command:	
Examples	This is an example of our switch> show cluster	-	

This is an example of output from the **show cluster candidates** command that uses the MAC address of a cluster member switch directly connected to the cluster command switch:

```
Switch> show cluster candidates mac-address 00d0.7961.c4c0
Device 'Tahiti-12' with mac address number 00d0.7961.c4c0
Device type: cisco WS-C3750-12T
Upstream MAC address: 00d0.796d.2f00 (Cluster Member 0)
Local port: Gi6/0/1 FEC number:
Upstream port: GI6/0/11 FEC Number:
Hops from cluster edge: 1
Hops from command device: 1
```

This is an example of output from the **show cluster candidates** command that uses the MAC address of a cluster member switch three hops from the cluster edge:

```
Switch> show cluster candidates mac-address 0010.7bb6.1cc0
Device 'Ventura' with mac address number 0010.7bb6.1cc0
Device type: cisco WS-C2912MF-XL
Upstream MAC address: 0010.7bb6.1cd4
Local port: Fa2/1 FEC number:
Upstream port: Fa0/24 FEC Number:
Hops from cluster edge: 3
Hops from command device: -
```

This is an example of output from the **show cluster candidates detail** command:

```
Switch> show cluster candidates detail
Device 'Tahiti-12' with mac address number 00d0.7961.c4c0
                              cisco WS-C3512-XL
       Device type:
       Upstream MAC address: 00d0.796d.2f00 (Cluster Member 1)
                     Fa0/3 FEC number:
Fa0/13 FEC Number:
       Local port:
       Upstream port:
       Hops from cluster edge: 1
       Hops from command device: 2
Device '1900_Switch' with mac address number 00e0.1e7e.be80
                      cisco 1900
       Device type:
       Upstream MAC address: 00d0.796d.2f00 (Cluster Member 2)
                      3 FEC number: 0
Fa0/11 FEC Number:
       Local port:
       Upstream port:
       Hops from cluster edge: 1
       Hops from command device: 2
Device 'Surfers-24' with mac address number 00e0.1e9f.7a00
       Device type:
                            cisco WS-C2924-XL
       Upstream MAC address: 00d0.796d.2f00 (Cluster Member 3)
       Local port: Fa0/5 FEC number:
       Upstream port:
                             Fa0/3 FEC Number:
       Hops from cluster edge: 1
       Hops from command device: 2
```

Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.
	show cluster members	Displays information about the cluster members.

show cluster members

Use the **show cluster members** privileged EXEC command on a switch stack or on a cluster command switch to display information about the cluster members.

show cluster members [*n* | **detail**] [| {**begin** | **exclude** | **include**} *expression*]

Syntax Description	n	(Optional) Number that identifies a cluster member. The range is 0 to 15.	
	detail	detail (Optional) Display detailed information for all cluster members.	
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .	
	exclude	clude (Optional) Display excludes lines that match the <i>expression</i> .	
	include

Description

<output truncated>

Related Commands

Command	Description
show controllers ethernet-controller	Displays per-interface send and receive statistics read from the hardware or the interface internal registers.
show interfaces	Displays the administrative and operational status of all interfaces or a specified interface.

show controllers ethernet-controller

show controllers ethernet-controller

Use the **show controllers ethernet-controller** privileged EXEC command without keywords to display per-interface send and receive statistics read from the hardware. Use with the **phy** keyword to display the interface internal registers or the **port-asic** keyword to display information about the port ASIC.

show controllers ethernet-controller [interface-id] [phy [detail]] [port-asic {configuration |
 statistics}] [fastethernet 0][| {begin | exclude | include} expression]

Syntax Description	interface-id	The physical interface (including type, stack member, module, and port number).
	phy	(Optional) Display the status of the internal registers on the switch physical layer device (PHY) for the device or the interface. This display includes the operational state of the automatic medium-dependent interface crossover (auto-MDIX) feature on an interface.
	detail	(Optional) Display details about the PHY internal registers.
	port-asic	(Optional) Display information about the port ASIC internal registers.
	configuration	Display port ASIC internal register configuration.
	statistics	Display port ASIC statistics, including the Rx/Sup Queue and miscellaneous statistics.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC (only supported with the *interface-id* keywords in user EXEC mode)

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(20)SE	The display was enhanced to show the XENPAK module serial EEPROM contents.

Usage Guidelines

This display without keywords provides traffic statistics, basically the RMON statistics for all interfaces or for the specified interface.

When you enter the **phy** or **port-asic** keywords, the displayed information is useful primarily for Cisco technical support representatives troubleshooting the switch.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Tran

Examples

This is an example of output from the **show controllers ethernet-controller** command for an interface. Table 2-19 describes the *Transmit* fields, and Table 2-20 describes the *Receive* fields.

Table 2-19Transmit Field Descriptions

Field	Description
Bytes	The total number of bytes sent on an interface.
Unicast Frames	The total number of frames sent to unicast addresses.
Multicast frames	The total number of frames sent to multicast addresses.
Broadcast frames	The total number of frames sent to broadcast addresses.
Too old frames	The number of frames dropped on the egress port because the packet aged out.
Deferred frames	The number of frames that are not sent after the time exceeds 2*maximum-packet time.
MTU exceeded frames	The number of frames that are larger than the maximum allowed frame size.
1 collision frames	The number of frames that are successfully sent on an interface after one collision occurs.
2 collision frames	The number of frames that are successfully sent on an interface after two collisions occur.
3 collision frames	The number of frames that are successfully sent on an interface after three collisions occur.
4 collision frames	The number of frames that are successfully sent on an interface after four collisions occur.

Field	Description
5 collision frames	The number of frames that are successfully sent on an interface after five collisions occur.
6 collision frames	The number of frames that are successfully sent on an interface after six collisions occur.
7 collision frames	The number of frames that are successfully sent on an interface after seven collisions occur.
8 collision frames	The number of frames that are successfully sent on an interface after eight collisions occur.
9 collision frames	The number of frames that are successfully sent on an interface after nine collisions occur.
10 collision frames	The number of frames that are successfully sent on an interface after ten collisions occur.
11 collision frames	The number of frames that are successfully sent on an interface after 11 collisions occur.
12 collision frames	The number of frames that are successfully sent on an interface after 12 collisions occur.
13 collision frames	The number of frames that are successfully sent on an interface after 13 collisions occur.
14 collision frames	The number of frames that are successfully sent on an interface after 14 collisions occur.
15 collision frames	The number of frames that are successfully sent on an interface after 15 collisions occur.
Excessive collisions	The number of frames that could not be sent on an interface after 16 collisions occur.
Late collisions	After a frame is sent, the number of frames dropped because late collisions were detected while the frame was sent.
VLAN discard frames	The number of frames dropped on an interface because the CFI ¹ bit is set.
Excess defer frames	The number of frames that are not sent after the time exceeds the maximum-packet time.
64 byte frames	The total number of frames sent on an interface that are 64 bytes.
127 byte frames	The total number of frames sent on an interface that are from 65 to 127 bytes.
255 byte frames	The total number of frames sent on an interface that are from 128 to 255 bytes.
511 byte frames	The total number of frames sent on an interface that are from 256 to 511 bytes.
1023 byte frames	The total number of frames sent on an interface that are from 512 to 1023 bytes.
1518 byte frames	The total number of frames sent on an interface that are from 1024 to 1518 bytes.
Too large frames	The number of frames sent on an interface that are larger than the maximum allowed frame size.
Good (1 coll) frames	The number of frames that are successfully sent on an interface after one collision occurs. This value does not include the number of frames that are not successfully sent after one collision occurs.

Table 2-19	Transmit Field Descriptions	(continued)
------------	-----------------------------	-------------

1. CFI = Canonical Format Indicator

Table 2-20Receive Field Descriptions

Field	Description
Bytes	The total amount of memory (in bytes) used by frames received on an interface, including the FCS^1 value and the incorrectly formed frames. This value excludes the frame header bits.
Unicast frames	The total number of frames successfully received on the interface that are directed to unicast addresses.
Multicast frames	The total number of frames successfully received on the interface that are directed to multicast addresses.
Broadcast frames	The total number of frames successfully received on an interface that are directed to broadcast addresses.

I

Field	Description
Unicast bytes	The total amount of memory (in bytes) used by unicast frames received on an interface, including the FCS value and the incorrectly formed frames. This value excludes the frame header bits.
Multicast bytes	The total amount of memory (in bytes) used by multicast frames received on an interface, including the FCS value and the incorrectly formed frames. This value excludes the frame header bits.
Broadcast bytes	The total amount of memory (in bytes) used by broadcast frames received on an interface, including the FCS value and the incorrectly formed frames. This value excludes the frame header bits.
Alignment errors	The total number of frames received on an interface that have alignment errors.
FCS errors	The total number of frames received on an interface that have a valid length (in bytes) but do not have the correct FCS values.
Oversize frames	The number of frames received on an interface that are larger than the maximum allowed frame size.
Undersize frames	The number of frames received on an interface that are smaller than 64 bytes.
Collision fragments	The number of collision fragments received on an interface.
Minimum size frames	The total number of frames that are the minimum frame size.
65 to 127 byte frames	The total number of frames that are from 65 to 127 bytes.
128 to 255 byte frames	The total number of frames that are from 128 to 255 bytes.
256 to 511 byte frames	The total number of frames that are from 256 to 511 bytes.
512 to 1023 byte frames	The total number of frames that are from 512 to 1023 bytes.
1024 to 1518 byte frames	The total number of frames that are from 1024 to 1518 bytes.
Overrun frames	The total number of overrun frames received on an interface.
Pause frames	The number of pause frames received on an interface.
Symbol error frames	The number of frames received on an interface that have symbol errors.
Invalid frames, too large	The number of frames received that were larger than maximum allowed MTU ² size (including the FCS bits and excluding the frame header) and that have either an FCS error or an alignment error.
Valid frames, too large	The number of frames received on an interface that are larger than the maximum allowed frame size.
Invalid frames, too small	The number of frames received that are smaller than 64 bytes (including the FCS bits and excluding the frame header) and that have either an FCS error or an alignment error.
Valid frames, too small	The number of frames received on an interface that are smaller than 64 bytes (or 68 bytes for VLAN-tagged frames) and that have valid FCS values. The frame size includes the FCS bits but excludes the frame header bits.
Too old frames	The number of frames dropped on the ingress port because the packet aged out.
Valid oversize frames	The number of frames received on an interface that are larger than the maximum allowed frame size and have valid FCS values. The frame size includes the FCS value but does not include the VLAN tag.

Table 2-20 Receive Field Descriptions (continued)

Field	Description
2	The total number of frames received on an interface that have a valid length (in bytes) but that do not have the correct FCS values.
RxPortFifoFull drop frames	The total number of frames received on an interface that are dropped because the ingress queue is full.

Table 2-20 **Receive Field Descriptions (continued)**

1. FCS = frame check sequence

2. MTU = maximum transmission unit

This is an example of output from the show controllers ethernet-controller tengigabitethernet1/0/1 phy command for the 10-Gigabit Ethernet interface. It shows the XENPAK module serial EEPROM contents.

For information about the EEPROM map and the field descriptions for the display, see the XENPAK multisource agreement (MSA) at these sites:

http://www.xenpak.org/MSA/XENPAK_MSA_R2.1.pdf

http://www.xenpak.org/MSA/XENPAK_MSA_R3.0.pdf

To determine which version of the XENPAK documentation to read, check the *XENPAK MSA Version supported* field in the display. Version 2.1 is 15 hexadecimal, and Version 3.0 is 1e hexadecimal.

Related Commands	Command	Description
	show controllers cpu-interface	Displays the state of the CPU network ASIC and send and receive statistics for packets reaching the CPU.
	show controllers tcam	Displays the state of registers for all ternary content addressable memory (TCAM) in the system and for TCAM interface ASICs that are CAM controllers.
	show idprom	Displays the IDPROM information for the specified interface.

show controllers power inline

Use the **show controllers power inline** user EXEC command to display the values in the registers of the specified Power over Ethernet (PoE) controller.

show controllers power inline [instance] [module switch-number] [| {begin | exclude | include}
expression]

Syntax Description	instance	(Optional) Power controller instance, where each instance corresponds to four ports. See the "Usage Guidelines" section for more information. If no instance is specified, information for all instances appear.
	module switch number	(Optional) Limit the display to ports on the specified stack member. The switch number is 1 to 9.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	For the Catalyst 3	750-48PS switches, the <i>instance</i> range is 0 to 11.
	For the Catalyst 3	750-24PS switches, the <i>instance</i> range is 0 to 5.
	For the Catalyst 3 switches provides	750G-48PS switches, the <i>instance</i> range is 0 to 2. For instances other than 0 to 2, the no output.
	For the Catalyst 3 switches provides	750G-24PS switches, the <i>instance</i> range is 0 to 1. For instances other than 0 to 1, the no output.
	-	all switches, this command is valid only for PoE switches. It provides no information do not support PoE.
	The output provid troubleshooting th	es information that might be useful for Cisco technical support representatives ne switch.
	-	ase sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> , the lines that contain <i>Output</i> appear.

Examples

This is an example of output from the **show controllers power inline** command on a switch other than a Catalyst 3750G-48PS or 3750G-24PS switch:

Related Commands	Command	Description
	logging event power-inline-status	Enables the logging of PoE events.
	power inline	Configures the power management mode for the specified PoE port or for all PoE ports.
	show power inline	Displays the PoE status for the specified PoE port or for all PoE ports.

show controllers tcam

Use the **show controllers tcam** privileged EXEC command to display the state of the registers for all ternary content addressable memory (TCAM) in the system and for all TCAM interface ASICs that are CAM controllers.

	show	controllers tcam [asic [number]] [detail] [{begin exclude include} expression]
Syntax Description	asic	(Optional) Display port ASIC TCAM information.
	number	(Optional) Display information for the specified port ASIC number. The range is from 0 to 15.
	detail	(Optional) Display detailed TCAM register information.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	<i>n</i> Expression in the output to use as a reference point.

This is an example of output from the show controllers utilization command on a specific port:

```
Switch> show controllers gigabitethernet1/0/1 utilization
Receive Bandwidth Percentage Utilization : 0
Transmit Bandwidth Percentage Utilization : 0
```

Table 2-21show controllers utilization Field Descriptions

Field	Description
Receive Bandwidth Percentage Utilization	Displays the received bandwidth usage of the switch, which is the sum of the received traffic on all the ports divided by the switch receive capacity.
Transmit Bandwidth Percentage Utilization	Displays the transmitted bandwidth usage of the switch, which is the sum of the transmitted traffic on all the ports divided it by the switch transmit capacity.
Fabric Percentage Utilization	Displays the average of the transmitted and received bandwidth usage of the switch.

Related Commands

Command	Description
show controllers ethernet-controller	Displays the interface internal registers.

show diagnostic

Use the **show diagnostic** user EXEC command to view the test results of the online diagnostics and to list the supported test suites.

show diagnostic content switch [num | all] [| { begin | exclude | include } expression]

show diagnostic post [{begin | exclude | include} expression]

show diagnostic result switch [num | all] [detail | test {test-id | test-id-range | all} [detail]]
 [| {begin | exclude | include} expression]

show diagnostic schedule switch [num | **all**] [| {**begin** | **exclude** | **include**} expression]

show diagnostic status [| {begin | exclude | include} expression]

show diagnostic switch [num | all] [detail] [| {begin | exclude | include} expression]

Syntax Description	content	Display test information including test ID, test attributes, and supported
-,	content	coverage test levels for each test and for all modules.
	switch num	Specify the switch number. The range is from 1 to 9.
	switch all	Specify all of the switches in the switch stack.
	post	Display the power-on self-test (POST) results; the command output is the same as the show post command.
	result	Displays the test results.
	detail	(Optional) Displays the all test statistics.
	test	Specify a test.
	test-id	Identification number for the test; see the "Usage Guidelines" section for additional information.
	test-id-range	Range of identification numbers for tests; see the "Usage Guidelines" section for additional information.
	all	All the tests.
	schedule	Displays the current scheduled diagnostic tasks.
	status	Displays the test status.
	lbegin	(Optional) Display begins with the line that matches the expression.
	lexclude	(Optional) Display excludes lines that match the expression.
	linclude	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

3	N/A	N/A	
4	N/A ====================================	N/A =====	
Switch#			

This example shows how to display the online diagnostic test schedule for a switch:

This example shows how to display the online diagnostic test schedule for a switch: Switch# show diagnostic schedule switch 1 Current Time = 14:39:49 PST Tue Jul 5 2005 Diagnostic for Switch 1: Schedule #1: To be run daily 12:00

Test ID(s) to be executed: 1.

Related Commands	Command Description	
	clear arp inspection log	Configures the health-monitoring diagnostic test.
	diagnostic schedule	Sets the scheduling of test-based online diagnostic testing.
	diagnostic start	Starts the online diagnostic test.

show dot1q-tunnel

Use the **show dot1q-tunnel** user EXEC command to display information about IEEE 802.1Q tunnel ports.

show dot1q-tunnel [interface interface-id] [| {begin | exclude | include} expression]

Syntax Description	interface interface-id	(Optional) Specify the interface for which to display IEEE 802.1Q tunneling information. Valid interfaces include physical ports and port channels.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History	Release	Modification
	12.2(25)EA1	This command was introduced.
Examples	These are examples of o	output from the show dot1q-tunnel command:
	Switch> show dot1q-tu dot1q-tunnel mode LAN	I Port(s)
	Gi1/0/1 Gi1/0/2 Gi1/0/3 Gi1/0/6	
	Po2 Switch> show dot1q-tu dot1q-tunnel mode LAN	
	Po2 Switch> show dot1q-tu	I Port(s)
Related Commands	Po2 Switch> show dot1q-tu dot1q-tunnel mode LAN	I Port(s)
Related Commands	Po2 Switch> show dotlq-tu dotlq-tunnel mode LAN Gi1/0/1	Description
Related Commands	Po2 Switch> show dotlq-tu dotlq-tunnel mode LAN Gil/0/1 Command	Description ative Displays IEEE 802.1Q native VLAN tagging status.

show dot1x

Use the **show dot1x** user EXEC command to display IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.

show dot1x [{all [summary] | interface interface-id} [details | statistics]] [| {begin | exclude |
include} expression]

Syntax Description	all [summary]	(Optional) Display the IEEE 802.1x status for all ports.
	interface interface-id	(Optional) Display the IEEE 802.1x status for the specified port (including type, stack member, module, and port number).
	details	(Optional) Display the IEEE 802.1x interface details.
	statistics	(Optional) Display IEEE 802.1x statistics for the specified port.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The all keyword was added.
	12.2(25)SED	The display was expanded to include auth-fail-vlan in the authorization state machine state and port status fields.
	12.2(25)SEE	The command syntax was changed, and the command output was modified.
	12.2(35)SE	The display was expanded to include the status of a port that is configured as both a host and an IP phone (a Cisco IP phone or phone from another manufacturer).

Usage Guidelines

If you do not specify a port, global parameters and a summary appear. If you specify a port, details for that port appear.

If the port control is configured as unidirectional or bidirectional control and this setting conflicts with the switch configuration, the **show dot1x** {**all** | **interface** *interface-id*} privileged EXEC command output has this information:

ControlDirection = In (Inactive)

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* appear.

Examples

This is an example of output from the **show dot1x** user EXEC command:

Switch> show dot1x

Sysauthcontrol Enabled			
ocol Version	2		
ecovery Delay	100		
APOL	Disabled		
•	ocol Version ecovery Delay		

This is an example of output from the **show dot1x all** user EXEC command:

Switch> show dot1x all	
Sysauthcontrol	Enabled
Dot1x Protocol Version	2
Critical Recovery Delay	100
Critical EAPOL	Disabled

Dot1x Info for GigabitEthernet1/0/1

```

Table 2-22show dot1x statistics Field Descriptions

Field	Description
RxStart	Number of valid EAPOL-start frames that have been received.
RxLogoff	Number of EAPOL-logoff frames that have been received.
RxResp	Number of valid EAP-response frames (other than response/identity frames) that have been received.
RxRespID	Number of EAP-response/identity frames that have been received.
RxInvalid	Number of EAPOL frames that have been received and have an unrecognized frame type.
RxLenError	Number of EAPOL frames that have been received in which the packet body length field is invalid.
RxTotal	Number of valid EAPOL frames of any type that have been received.
TxReq	Number of EAP-request frames (other than request/identity frames) that have been sent.
TxReqId	Number of Extensible Authentication Protocol (EAP)-request/identity frames that have been sent.
TxTotal	Number of Extensible Authentication Protocol over LAN (EAPOL) frames of any type that have been sent.

Field Description	
RxVersion	Number of received packets in the IEEE 802.1x Version 1 format.
LastRxSrcMac	Source MAC address carried in the most recently received EAPOL frame.

Related Commands Comm

 Command
 Description

 show interfaces trunk
 Displays interface trunking information.

show eap

Use the **show eap** privileged EXEC command to display Extensible Authentication Protocol (EAP) registration and session information for the switch or for the specified port.

show eap {{registrations [method [name] | transport [name]]} | {sessions [credentials name
[interface interface-id] | interface interface-id | method name | transport name]}}
[credentials name | interface interface-id | transport name] [| {begin | exclude | include}
expression]

Syntax Description	registrations	Display EAP registration information.		
	method name	(Optional) Display EAP method registration information.		
	transport name	(Optional) Display EAP transport registration information.		
	sessions	Display EAP session information.(Optional) Display EAP method registration information.(Optional) Display the EAP information for the specified port (including type, stack member, module, and port number).		
	credentials name			
	interface interface-id			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .		
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .		
	include	(Optional) Display includes lines that match the specified <i>expression</i> .		
	expression	Expression in the output to use as a reference point.		
	Delegan			
Command History	Release	Modification		
	12.2(25)SEE	This command was introduced.		
Usage Guidelines	When you use the show command output shows	y eap registrations privileged EXEC command with these keywords, the this information:		
	• None—All the lower levels used by EAP and the registered EAP methods.			
	 method name keyword—The specified method registrations. 			
	• transport <i>name</i> keyword—The specific lower-level registrations.			
	When you use the show eap sessions privileged EXEC command with these keywords, the command output shows this information:			
	• None—All active EAP sessions.			
	• credentials <i>name</i> keyword—The specified credentials profile.			
	• interface interface-id keyword—The parameters for the specified interface.			
	• method <i>name</i> keyv	vord—The specified EAP method.		
	• transport <i>name</i> ke	• transport <i>name</i> keyword—The specified lower layer.		

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* appear.

Examples

This is an example of output from the show eap registrations privileged EXEC command:

Switch> s	how eap registra	tions

ø

show env

Use the **show env** user EXEC command to display fan, temperature, redundant power system (RPS) availability, and power information for the switch being accessed (standalone switch or stack master or stack member). Use with the **stack** keyword to display all information for the stack or for a specified switch in the stack.

show env {all | fan | power | rps | stack [switch-number] | temperature [status] } [| {begin | exclude | include} expression]

Syntax Description	all	Display both fan and temperature environmental status.				
	fan	Display the switch fan status.				
	power	Display the switch power status.				
	rps	Display whether an RPS 300 Redundant Power System is connected to the switch				
	stack [switch-number]	Display all environmental status for each switch in the stack or for the specified switch. The range is 1 to 9, depending on the switch member numbers in the stack. Display the switch temperature status.				
	temperature					
	status	(Optional) Display the switch internal temperature (not the external temperature) and the threshold values. This keyword is available only on the Catalyst 3750G-48TS, 3750G-48PS, 3750G-24TS-1U, and 3750G-24PS switches.				
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .				
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Display includes lines that match the specified <i>expression</i> .				
	expression	<i>ression</i> Expression in the output to use as a reference point.				
Command History	Release	Modification				
Commanu history		This command was introduced.				
	12.1(11)AX 12.2(20)SE3	The temperature status keyword was added.				
	12.2(20)3E3	The temperature status keyword was added.				
Usage Guidelines	Use the session pri master.	vileged EXEC command to access information from a specific switch other than the				
	Use the show env s from any member s	stack [<i>switch-number</i>] command to display information about any switch in the stack switch.				
	-	all switches, the show env temperature status command is valid only for the TS, 3750G-48PS, 3750G-24TS-1U, and 3750G-24PS switches. If you enter this				

On a Catalyst 3750G-48PS or 3750G-24PS switch, you can also use the **show env temperature** command to display the switch temperature status. The command output shows the green and yellow states as *OK* and the red state as *FAULTY*. If you enter the **show env all** command on this switch, the command output is the same as the **show env temperature status** command output.

For more information about the threshold levels, see the software configuration guide for this release.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Examples

This is an example of output from the **show env all** command entered from the master switch or a standalone switch:

Switch> **show env all** FAN is OK TEMPERATURE is OK POWER is OK RPS is AVAILABLE

This is an example of output from the **show env fan** command:

Switch> **show env fan** FAN is OK

This is an example of output from the **show env stack** command:

Switch> show env stack SWITCH: 1 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT SWITCH: 2 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT SWITCH: 3 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT SWITCH: 4 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT SWITCH: 5 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT SWITCH: 6 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT

This example shows how to display information about stack member 3 from the master switch:

Switch> show env stack 3 SWITCH: 3 FAN is OK TEMPERATURE is OK POWER is OK RPS is NOT PRESENT

Table 2-23

This example shows how to display the temperature value, state, and the threshold values. Table 2-23 describes the temperature states in the command output.

```
Switch> show env temperature status
Temperature Value:28 Degree Celsius
Temperature State:GREEN
Yellow Threshold :70 Degree Celsius
Red Threshold :75 Degree Celsius
```

State	Description
Green	The switch temperature is in the <i>normal</i> operating range.

States in the show env temperature status Command Output

State	Description
-------	-------------

The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.
The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range.

show errdisable detect

Use the show errdisable detect user EXEC command to display error-disabled detection status.

show errdisable detect [| {begin | exclude | include} expression]

Syntax Description	l begin (Optional) Display b	egins with the line that matches the expression.			
	exclude ((Optional) Display excludes lines that match the <i>expression</i> .				
	include (
	expression E	Expression in the ou	tput to use as a reference point.			
		r	F			
Command Modes	User EXEC					
Command History	Release	Modificat	ion			
	12.1(11)AX	This com	mand was introduced.			
	12.2(37)SE	A mode c	olumn was added to the show errdisable detect output.			
Usage Guidelines	A displayed gbi	c-invalid error rea	son refers to an invalid small form-factor pluggable (SFP) module			
	Expressions are case sensitive. For example, if you enter exclude output, the lines that contain <i>output</i> are not displayed, but the lines that contain <i>Output</i> are displayed.					
	The error-disable reasons in the command ouput are listed in alphabetical order. The mode column shows how error disable is configured for each feature.					
	You can configure error-disabled detection in these modes:					
	• port mode—The entire physical port is error disabled if a violation occurs.					
	• vlan mode—The VLAN is error disabled if a violation occurs.					
	• port/vlan mode—The entire physical port is error disabled on some ports and per-VLAN error disabled on other ports.					
Examples	This is an examp	ole of output from th	ne show errdisable detect command:			
	ErrDisable Reas		Mode			
	arp-inspection	Enabled	port			
	bpduguard	Enabled	vlan			
	channel-miscon: community-limit		port			
	dhcp-rate-limit		port port			
	dtp-flap	Enabled	port			
	gbic-invalid	Enabled	port			
	inline-power	Enabled	port

Related Commands

Command	Description	
errdisable detect cause	Enables error-disabled detection for a specific cause or all causes.	
show errdisable flap-values	Displays error condition recognition information.	
show errdisable recovery	Displays error-disabled recovery timer information.	
show interfaces status	Displays interface status or a list of interfaces in error-disabled state.	

show errdisable flap-values

Use the **show errdisable flap-values** user EXEC command to display conditions that cause an error to be recognized for a cause.

show errdisable flap-values [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Displ	ay begins with the l	line that matches the <i>expression</i> .		
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Displ	ay includes lines th	at match the specified expression.		
	expression	Expression in the	e output to use as a	reference point.		
Command Modes	User EXEC					
Command History	Release	Modif	fication			
	12.1(11)AX	This c	command was introd	duced.		
		ik up/down) chan	on Protocol (PAgP) f ges occur during a Time (sec)	flap changes occur during a 30-second interval, or if 10-second interval.

Related Commands

Command	Description
errdisable recovery	Configures the recover mechanism variables.
show errdisable detect	Displays error-disabled detection status.
show errdisable flap-values	Displays error condition recognition information.
show interfaces status	Displays interface status or a list of interfaces in error-disabled state.

show etherchannel

Use the show etherchannel user EXEC command to display EtherChannel information for a channel.

show etherchannel [channel-group-number {detail | port | port-channel | protocol | summary}]
{detail | load-balance | port | port-channel | protocol | summary} [| {begin | exclude |
include} expression]

Syntax Description	channel-group-number	(Optional) Number of the channel group. The range is 1 to 48.
	detail	Display detailed EtherChannel information.
	load-balance	Display the load-balance or frame-distribution scheme among ports in the port channel.
	port	Display EtherChannel port information.
	port-channel	Display port-channel information.
	protocol	Display the protocol that is being used in the EtherChannel.
	summary	Display a one-line summary per channel-group.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The protocol keyword was added.
	12.2(25)SE	The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48.

Usage Guidelines

If you do not specify a *channel-group*, all channel groups are displayed.

In the output, the Passive port list field is displayed only for Layer 3 port channels. This field means that the physical port, which is still not up, is configured to be in the channel group (and indirectly is in the only port channel in the channel group).

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Examples This is an example of output from the show etherchannel 1 detail command: Switch> show etherchannel 1 detail Group state = L2Ports: 2 Maxports = 16 Port-channels: 1 Max Port-channels = 16 Protocol: LACP Ports in the group: _____ Port: Gi1/0/1 _____ Port state = Up Mstr In-Bndl Channel group = 1Mode = ActiveGcchange = -Port-channel = Po1GC = -Pseudo port-channel = Po1 Port-channel = Po1 Port index = 0 Load = 0x00Protocol = LACP Flags: S - Device is sending Slow LACPDUS F - Device is sending fast LACPDU A - Device is in active mode. P - Device is in passive mode. Related Commands

Command	Description
show controllers	Displays per-interface send and receive statistics read from the
ethernet-controller	hardware, interface internal registers, or port ASIC information.

show interfaces

Use the **show interfaces** privileged EXEC command to display the administrative and operational status of all interfaces or a specified interface.

show interfaces [interface-id | vlan vlan-id] [accounting | capabilities [module number] |
 counters | description | etherchannel | flowcontrol | private-vlan mapping | pruning | stats
 | status [err-disabled] | switchport [backup | module number] | transceiver
 {tengigabitethernet interface-id} | properties | detail [module number] | trunk] [| {begin |
 exclude | include} expression]

interface-id	(Optional) Valid interfaces include physical ports (including type, stack member, module, and port number) and port channels. The port-channel range is 1 to 48.
vlan vlan-id	(Optional) VLAN identification. The range is 1 to 4094.
accounting	(Optional) Display accounting information on the interface, including active protocols and input and output packets and octets.
	Note The display shows only packets processed in software; hardware-switched packets do not appear.
capabilities	(Optional) Display the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.
module number	(Optional) Display capabilities , switchport configuration, or transceiver characteristics (depending on preceding keyword) of all interfaces on the specified stack member. The range is 1 to 9. This option is not available if you enter a specific interface ID.
counters	(Optional) See the show interfaces counters command.
description	(Optional) Display the administrative status and description set for an interface
etherchannel	(Optional) Display interface EtherChannel information.
flowcontrol	(Optional) Display interface flowcontrol information
private-vlan mapping	(Optional) Display private-VLAN mapping information for the VLAN switch virtual interfaces (SVIs). This keyword is available only if your switch is running the IP services image, formerly known as the enhanced multilayer image (EMI).
pruning	(Optional) Display interface trunk VTP pruning information.
stats	(Optional) Display the input and output packets by switching path for the interface.
status	(Optional) Display the status of the interface. A status of <i>unsupported</i> in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot.
err-disabled	(Optional) Display interfaces in error-disabled state.
switchport	(Optional) Display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
backup	(Optional) Display Flex Link backup interface configuration and status for the
	vlan vlan-idaccountingcapabilitiesmodule numbercountersdescriptionetherchannelflowcontrolprivate-vlanmappingpruningstatsstatuserr-disabledswitchport

tengigabitethernet	Display the status of a connected ten-gigabit module.					
transceiver [detail properties]	(Optional) Display the physical properties of a CWDM ¹ or DWDM ² small form-factor (SFP) module interface. The keywords have these meanings:					
	• detail —(Optional) Display calibration properties, including high and low numbers and any alarm information.					
	• properties —(Optional) Display speed, duplex, and inline power settings on an interface.					
trunk	Display interface trunk information. If you do not specify an interface, only information for active trunking ports appears.					
begin	(Optional) Display begins with the line that matches the <i>expression</i> .					
exclude	(Optional) Display excludes lines that match the <i>expression</i> .					
include	(Optional) Display includes lines that match the specified expression.					
expression	Expression in the output to use as a reference point.					

1. Coarse wavelength-division multiplexer

2. Dense wavelength-division multiplexer

Note

Though visible in the command-line help strings, the **crb**, **fair-queue**, **irb**, **mac-accounting**, **precedence**, **random-detect**, **rate-limit**, and **shape** keywords are not supported.

	12.1(11)AX	This command was introduced.
	12.1(14)EA1	Support for the capabilities keyword was added.
	12.2(20)SE	The private-vlan mapping , backup , transceiver calibration , detail , and properties , keywords were added.
	12.2(25)SEA	The calibration keyword was removed.
	12.2(25)SEE	Added the backup, counters, detail, and trunk keywords.
	12.2(44)SE	Added the tengigabitethernet interface-id transceiver detail keywords.

Usage Guidelines

s The **show interfaces capabilities** command with different keywords has these results:

- Use the **show interfaces capabilities module** *number* command to display the capabilities of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.
- Use the **show interfaces** *interface-id* **capabilities** to display the capabilities of the specified interface.

- Use the **show interfaces capabilities** (with no module number or interface ID) to display the capabilities of all interfaces in the stack.
- Use the **show interfaces switchport module** *number* command to display the switch port characteristics of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Examples	This is an example of output from the show interfaces command for an interface on stack member 3:
----------	--

Switch# show interfaces gigabitethernet3/0/2
GigabitEthernet3/0/2 is down, line protocol is down
Hardware is Gigabit Ethernet, address is 0009.43a7.d085 (bia 0009.43a7.d085)
MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Auto-duplex, Auto-speed
input flow-control is off, output flow-control is off
ARP type: ARPA, ARP Timeout 04:00:00 Last input never, output never, output hang never
Last clearing of "show interfaces" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue :0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
2 packets input, 1040 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
0 watchdog, 0 multicast, 0 pause input
0 input packets with dribble condition detected
4 packets output, 1040 bytes, 0 underruns
0 output errors, 0 collisions, 3 interface resets
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier, 0 PAUSE output

0 output buffer failures, 0 output buffers swapped out

This is an example of output from the show interfaces accounting command.

This is an example of output from the **show interfaces** *interface* **description** command when the interface has been described as *Connects to Marketing* by using the **description** interface configuration command.

```
Switch# show interfaces gigabitethernet1/0/2 descriptionInterface StatusProtocol DescriptionGi1/0/2updownConnects to Marketing
```

This is an example of output from the **show interfaces etherchannel** command when port channels are configured on the switch:

```
Switch# show interfaces etherchannel
Port-channel1:
Age of the Port-channel = 03d:20h:17m:29s
Logical slot/port = 10/1 Number of ports = 0
                 = 0x00000000 HotStandBy port = null
GC
Port state
                 = Port-channel Ag-Not-Inuse
Port-channel2:
Age of the Port-channel = 03d:20h:17m:29s
Logical slot/port = 10/2 Number of ports = 0
GC
                  = 0 \times 00000000
                                  HotStandBy port = null
                  = Port-channel Ag-Not-Inuse
Port state
Port-channel3:
Age of the Port-channel = 03d:20h:17m:29s
Logical slot/port = 10/3 Number of ports = 0
GC
                  = 0 \times 000000000
                                 HotStandBy port = null
Port state
                 = Port-channel Ag-Not-Inuse
```

This is an example of output from the **show interfaces private-vlan mapping** command when the private-VLAN primary VLAN is VLAN 10 and the secondary VLANs are VLANs 501 and 502:

This is an example of output from the **show interfaces** *interface-id* **pruning** command when pruning is enabled in the VTP domain:

```
Switch# show interfaces gigibitethernet1/0/2 pruning
Port Vlans pruned for lack of request by neighbor
Gi1/0/2 3,4
```

Port Vlans traffic requested of neighbor Gi1/0/2 1-3

This is an example of output from the **show interfaces stats** command for a specified VLAN interface.

 Switch# show interfaces vlan 1 stats

This is an example of partial output from the **show interfaces status** command. It displays the status of all interfaces.

Switch# show interfaces status

Port	Name	Status	Vlan	Duplex	Speed	Туре
Fa1/0/1		connected	routed	a-half	a-100	10/100BaseTX
Fa1/0/2		notconnect	121,40	auto	auto	10/100BaseTX
Fa1/0/3		notconnect	1	auto	auto	10/100BaseTX
Fa1/0/4		notconnect	18	auto	auto	Not Present
Fa1/0/5		connected	121	a-full	a-1000	10/100BaseTX
Fa1/0/6		connected	122,11	a-full	a-1000	10/100BaseTX
<output t<="" td=""><td>runcated></td><td></td><td></td><td></td><td></td><td></td></output>	runcated>					
Gi1/0/1		notconnect	1	auto	auto	10/100/1000BaseTX
Gi1/0/2		notconnect	1	auto	auto	unsupported

These are examples of output from the **show interfaces status** command for a specific interface when private VLANs are configured. Port 22 is configured as a private-VLAN host port. It is associated with primary VLAN 20 and secondary VLAN 25.

Switch#	show	interfaces	fastethernet1/0/	22 status			
Port	Nan	ne	Status	Vlan	Duplex	Speed	Туре
Fa1/0/22	1		connected	20,25	a-full	a-100	10/100BaseTX

In this example, port 20 is configured as a private-VLAN promiscuous port. The display shows only the primary VLAN 20.

Switch#	show interfaces	fastethernet1/0/2	0 status		
Port	Name	Status	Vlan	Duplex	Speed Type
Fa1/0/20)	connected	20	a-full	a-100 10/100BaseTX

This is an example of output from the **show interfaces status err-disabled** command. It displays the status of interfaces in the error-disabled state.

Switch#show interfacesstatuserr-disablePortNameStatusReasonGi2/0/26err-disabledgbic-invalid

This is an example of output from the **show interfaces switchport** command for a port. Table 2-24 describes the fields in the display.

```
Note
```

Private VLAN trunks are not supported in this release, so those fields are not applicable.

```
Switch# show interfaces gigabitethernet1/0/1 switchport
Name: Gi1/0/1
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: static access
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Voice VLAN: none
Administrative private-vlan host-association:10 (VLAN0010) 502 (VLAN0502)
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
```

```
Protected: false
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
```

```
Voice VLAN: none (Inactive)
Appliance trust: none
```

Table 2-24	show interfaces switch	port Field Descriptions
------------	------------------------	-------------------------

Field	Description
Name	Displays the port name.
Switchport	Displays the administrative and operational status of the port. In this display, the port is in switchport mode.
Administrative Mode	Displays the administrative and operational modes.
Operational Mode	
Administrative Trunking Encapsulation	Displays the administrative and operational encapsulation method and whether trunking negotiation is enabled.
Operational Trunking Encapsulation	
Negotiation of Trunking	
Access Mode VLAN	Displays the VLAN ID to which the port is configured.

Field	Description
Trunking Native Mode VLAN	Lists the VLAN ID of the trunk that is in native mode. Lists the
Trunking VLANs Enabled	allowed VLANs on the trunk. Lists the active VLANs on the trunk.
Trunking VLANs Active	uunk.
Pruning VLANs Enabled	Lists the VLANs that are pruning-eligible.
Protected	Displays whether or not protected port is enabled (True) or disabled (False) on the interface.
Unknown unicast blocked	Displays whether or not unknown multicast and unknown
Unknown multicast blocked	unicast traffic is blocked on the interface.
Voice VLAN	Displays the VLAN ID on which voice VLAN is enabled.
Administrative private-vlan host-association	Displays the administrative VLAN association for private-VLAN host ports.
Administrative private-vlan mapping	Displays the administrative VLAN mapping for private-VLAN promiscuous ports.
Operational private-vlan	Displays the operational private-VLAN status.
Appliance trust	Displays the class of service (CoS) setting of the data packets of the IP phone.

Table 2-24	show interfaces	switchport Fi	ield Descriptions	(continued)
------------	-----------------	---------------	-------------------	-------------

This is an example of output from the **show interfaces switchport** command for a port configured as a private VLAN promiscuous port. The primary VLAN 20 is mapped to secondary VLANs 25, 30, and 35:

```
Switch# show interfaces gigabitethernet1/0/2 switchport
Name: Gi1/0/2
Switchport: Enabled
Administrative Mode: private-vlan promiscuous
Operational Mode: private-vlan promiscuous
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: 20 (VLAN0020) 25 (VLAN0025) 30 (VLAN0030) 35
(VLAN0035)
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan:
20 (VLAN0020) 25 (VLAN0025)
30 (VLAN0030)
35 (VLAN0035)
```

<output truncated>

This is an example of output from the show interfaces switchport backup command:

Switch# show interface	es switchport backup	
Switch Backup Interfac	ce Pairs:	
Active Interface	Backup Interface	State
Fa1/0/1	Fa1/0/2	Active Up/Backup Standby
Fa3/0/3	Fa4/0/5	Active Down/Backup Up
Pol	Po2	Active Standby/Backup Up

This is an example of output from the **show interfaces switchport backup** command. In this example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

Switch(config)#interface gigabitEthernet 2/0/6 Switch(config-if)#switchport backup interface gigabitEthernet 2/0/8 prefer vlan 60,100-120

When both interfaces are up, Gi2/0/8 forwards traffic for VLANs 60, 100 to 120, and Gi2/0/6 forwards traffic for VLANs 1 to 50.

Switch#show interfaces switchport backup Switch Backup Interface Pairs:

Active Interface Backup Interface State GigabitEthernet2/0/6 GigabitEthernet2/0/8 Active Down/Backup Up

Vlans on Interface Gi 2/0/6: 1-50 Vlans on Interface Gi 2/0/8: 60, 100-120

When a Flex Link interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface Gi2/0/6 goes down, Gi2/0/8 carries all VLANs of the Flex Link pair.

Switch#show interfaces switchport backup Switch Backup Interface Pairs:

Active Interface Backup Interface State GigabitEthernet2/0/6 GigabitEthernet2/0/8 Active Down/Backup Up Vlans on Interface Gi 2/0/6: Vlans on Interface Gi 2/0/8: 1-50, 60, 100-120

When a Flex Link interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi2/0/6 comes up, then VLANs preferred on this interface are blocked on the peer interface Gi2/0/8 and forwarded on Gi2/0/6.

```
Switch#show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet2/0/6 GigabitEthernet2/0/8 Active Down/Backup Up
Vlans on Interface Gi 2/0/6: 1-50
Vlans on Interface Gi 2/0/8: 60, 100-120
```

This is an example of output from the **show interfaces** interface-id **pruning** command:

Switch# show interfaces gigibitethernet1/0/2 pruning Port Vlans pruned for lack of request by neighbor

L

This is an example of output from the **show interfaces** *interface-id* **trunk** command. It displays trunking information for the port.

Switch# show	interfaces g	jigabitethernet1,	/0/1 trunk	
Port	Mode	Encapsulation	Status	Native vlan
Gi1/0/1	auto	negotiate	trunking	1
Port Gi1/0/1	Vlans allow 1-4094	ved on trunk		
Port Gi1/0/1	Vlans allow 1-4	wed and active in	n management	domain
Port Gi1/0/1	Vlans in sp 1-4	panning tree for	warding state	e and not pruned

Catalyst 3750 Switch Command Reference

This is an example of output from the **show interfaces** interface-id **transceiver properties** command:

Switch# show interfaces gigabitethernet1/0/1 transceiver properties

Name : Gi1/0/1 Administrative Speed: auto Operational Speed: auto Administrative Duplex: auto Administrative Power Inline: enable Operational Duplex: auto Administrative Auto-MDIX: off Operational Auto-MDIX: off

This is an example of output from the **show interfaces** interface-id **transceiver detail** command:

```
Switch# show interfaces gigabitethernet2/0/3 transceiver detail

This is an example of output from the **show interfaces tengigabitethernet** *interface-id* **transceiver properties** command:

Switch# show interfaces tengigabitethernet1/0/1 transceiver properties Transceiver monitoring is disabled for all interfaces.

ITU Channel not available (Wavelength not available), Transceiver is internally calibrated. Name : Te1/0/1 Administrative Speed: 10000 Administrative Duplex: full Administrative Auto-MDIX: on Administrative Power Inline: N/A Operational Speed: 10000 Operational Duplex: full Operational Auto-MDIX: off Media Type: 10GBase-LR

Related Commands	Command	Description
	switchport access	Configures a port as a static-access or a dynamic-access port.
	switchport block	Blocks unknown unicast or multicast traffic on an interface.
	switchport backup interface	Configures Flex Links, a pair of Layer 2 interfaces that provide mutual backup.
	switchport mode	Configures the VLAN membership mode of a port.
	<mark>switchport mode</mark> private-vlan	Configures a port as a private-VLAN host or a promiscuous port.
	switchport private-vlan	Defines private-VLAN association for a host port or private-VLAN mapping for a promiscuous port.

Command	Description
switchport protected	Isolates unicast, multicast, and broadcast traffic at Layer 2 from other protected ports on the same switch.
switchport trunk pruning	Configures the VLAN pruning-eligible list for ports in trunking mode.

show interfaces counters

Use the **show interfaces counters** privileged EXEC command to display various counters for the switch or for a specific interface.

show interfaces [*interface-id* | **vlan** *vlan-id*] **counters** [**errors** | **etherchannel** | **module** *switchnumber* | **protocol status** | **trunk**] [| {**begin** | **exclude** | **include**} *expression*]

Syntax Description	interface-id	(Optional) ID of the physical interface, including type, stack member, module, and port number.			
	errors	(Optional) Display error counters.			
etherchannel module switch- num	etherchannel	(Optional) Display EtherChannel counters, including octets, broadcast packets, multicast packets, and unicast packets received and sent.			
	module switch- number	(Optional) Display counters for the specified stack member. The range is from 1 to 9, depending upon the switch numbers in the stack.			
		Note In this command, the module keyword refers to the stack member number (1 to 9). The module number that is part of the interface ID is always zero.			
	protocol status	(Optional) Display status of protocols enabled on interfaces.			
	trunk	(Optional) Display trunk counters.			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .			
	include	(Optional) Display includes lines that match the specified <i>expression</i> .			
	expression	Expression in the output to use as a reference point.			
Note	Though visible in the cor	nmand-line help string, the vlan <i>vlan-id</i> keyword is not supported.			
Command Modes	Privileged EXEC				
	Privileged EXEC Release	Modification			
Command Modes Command History		Modification This command was introduced.			

Usage Guidelines

If you do not enter any keywords, all counters for all interfaces are included.

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Examples

This is an example of partial output from the **show interfaces counters** command. It displays all counters for the switch.

Switch# show interfaces counters				
Port	InOctets	InUcastPkts	InMcastPkts	InBcastPkts
Gi1/0/1	0	0	0	0
Gi1/0/2	0	0	0	0

<output truncated>

This is an example of partial output from the **show interfaces counters module** command for stack member 2. It displays all counters for the specified switch in the stack.

Switch# sh	now interfaces of	counters module	2	
Port	InOctets	InUcastPkts	InMcastPkts	InBcastPkts
Fa2/0/1	520	2	0	0
Fa2/0/2	520	2	0	0

show ip arp inspection

Use the **show ip arp inspection** privileged EXEC command to display the configuration and the operating state of dynamic Address Resolution Protocol (ARP) inspection or the status of this feature for all VLANs or for the specified interface or VLAN.

show ip arp inspection [interfaces [*interface-id*] | **log** | **statistics** [**vlan** *vlan-range*] | **vlan** *vlan-range*] [| {**begin** | **exclude** | **include**} *expression*]

Syntax Description	interfaces [interface-id]	(Optional) Display the trust state and the rate limit of ARP packets for the specified interface or all interfaces. Valid interfaces include physical ports and port channels.
	log	(Optional) Display the configuration and contents of the dynamic ARP inspection log buffer.
	statistics [vlan vlan-range]	(Optional) Display statistics for forwarded, dropped, MAC validation failure, IP validation failure, access control list (ACL) permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, display information only for VLANs with dynamic ARP inspection enabled (active).
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	vlan vlan-range	(Optional) Display the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, display information only for VLANs with dynamic ARP inspection enabled (active).
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(20)SE	This command was introduced.
	12.2(37)SE	The output changed to include Probe Logging information.

Usage Guidelines Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Examples

This is an example of output from the show ip arp inspection command

Switch# show ip arp inspection

Source Mac	Validation	:	Disabled
Destination	n Mac Validation	:	Disabled
IP Address	Validation	:	Enabled
171 am	Configuration	(moration

Vlan	J	-		Static ACL
1	Enabled	Active	deny-all	 No
Vlan	ACL Logging	DHCP Logg	ing Probe 1	Logging
1	Acl-Match	A11	Permit	
Vlan	Forwarded	Dropped	DHCP Drops	ACL Drops
1	0	0	0	0
Vlan	DHCP Permits A	CL Permits	Probe Permits	Source MAC Failures
1	0	0	0	0
Vlan	Dest MAC Failures	IP Valid	ation Failures	Invalid Protocol Data
	0		0	0

This is an example of output from the **show ip arp inspection interfaces** command:

Switch# show ip arp inspection interfaces

Interface	Trust State	Rate (pps)	Burst Interval
Gi1/0/1	Untrusted	15	1
Gi1/0/2	Untrusted	15	1
Gi1/0/3	Untrusted	15	1

This is an example of output from the **show ip arp inspection interfaces** interface-id command:

Switch# show ip	arp inspection	interfaces gigab	itethernet1/0/1
Interface	Trust State	Rate (pps)	Burst Interval
Gi1/0/1	Untrusted	15	1

This is an example of output from the **show ip arp inspection log** command. It shows the contents of the log buffer before the buffers are cleared:

```
Switch# show ip arp inspection log
Total Log Buffer Size : 32
Syslog rate : 10 entries per 300 seconds.
```

Interface	Vlan	Sender MAC	Sender IP	Num Pkts	Reason	Time
Gi1/0/1	5	0003.0000.d673	192.2.10.4	5	DHCP Deny	19:39:01 UTC
Mon Mar 1	1993					
Gi1/0/1	5	0001.0000.d774	128.1.9.25	6	DHCP Deny	19:39:02 UTC
Mon Mar 1	1993					
Gi1/0/1	5	0001.c940.1111	10.10.10.1	7	DHCP Deny	19:39:03 UTC
Mon Mar 1	1993					
Gi1/0/1	5	0001.c940.1112	10.10.10.2	8	DHCP Deny	19:39:04 UTC
Mon Mar 1	1993					
Gi1/0/1	5	0001.c940.1114	173.1.1.1	10	DHCP Deny	19:39:06 UTC
Mon Mar 1	1993					

Gi1/0/1	5	0001.c940.1115	173.1.1.2	11	DHCP Deny	19:39:07 UTC
Mon Mar 1	1993					
Gi1/0/1	5	0001.c940.1116	173.1.1.3	12	DHCP Deny	19:39:08 UTC
Mon Mar 1	1993					

If the log buffer overflows, it means that a log event does not fit into the log buffer, and the display for the show ip arp inspection log privileged EXEC command is affected. A -- in the display appears in place of all data except the packet count and the time. No other statistics are provided for the entry. If you see this entry in the display, increase the number of entries in the log buffer, or increase the logging rate in the ip arp inspection log-buffer global configuration command.

This is an example of output from the **show ip arp inspection statistics** command. It shows the statistics for packets that have been processed by dynamic ARP inspection for all active VLANs.

Switch#	show ip arp inspe	ection statis	tics	
Vlan	Forwarded	Dropped	DHCP Drops	ACL Drops
5	3	4618	4605	4
2000	0	0	0	0
Vlan	DHCP Permits A	ACL Permits	Source MAC Fail	ures
5	0	12		0
2000	0	0		0
Vlan	Dest MAC Failures	s IP Valida	tion Failures	
5	()	9	
2000	()	0	

For the show ip arp inspection statistics command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate failure count.

This is an example of output from the **show ip arp inspection statistics vlan 5** command. It shows statistics for packets that have been processed by dynamic ARP for VLAN 5.

Switch#	show ip arp ins	pection statis	tics vlan 5	
Vlan	Forwarded	Dropped	DHCP Drops	ACL Drops
5	3	4618	4605	4
Vlan	DHCP Permits	ACL Permits	Source MAC Fail	lures
5	0	12		0
Vlan	Dest MAC Failur	es IP Valida	tion Failures	Invalid Protocol Data
5		0	9	3

This is an example of output from the **show ip arp inspection vlan 5** command. It shows the configuration and the operating state of dynamic ARP inspection for VLAN 5.

```
Switch# show ip arp inspection vlan 5
Source Mac Validation :Enabled
Destination Mac Validation :Enabled
IP Address Validation :Enabled
       Configuration Operation ACL Match
Vlan
                                               Static ACL

Total number of bir	ndings: 2				

Table 2-25 describes the fields in the show ip dhcp snooping binding command output:

Table 2-25 show ip dhcp snooping binding Command Output

Field	Description			
MacAddress	Client hardware MAC address			
IpAddress	Client IP address assigned from the DHCP server			
Lease(sec)	Remaining lease time for the IP address			
Туре	Binding type			
VLAN	VLAN number of the client interface			
Interface	Interface that connects to the DHCP client host			
Total number of bindings	Total number of bindings configured on the switch			
	Note The command output might not show the total number of bindings. For example, if 200 bindings are configured on the switch and you stop the display before all the bindings appear, the total number does not change.

Table 2-26 shows the DHCP snooping statistics and their descriptions:

Table 2-26	DHCP Snooping Statistics
------------	--------------------------

DHCP Snooping Statistic	Description
Packets Processed by DHCP Snooping	Total number of packets handled by DHCP snooping, including forwarded and dropped packets.
Packets Dropped Because IDB not known	Number of errors when the input interface of the packet cannot be determined.
Queue full	Number of errors when an internal queue used to process the packets is full. This might happen if DHCP packets are received at an excessively high rate and rate limiting is not enabled on the ingress ports.
Interface is in errdisabled	Number of times a packet was received on a port that has been marked as error disabled. This might happen if packets are in the processing queue when a port is put into the error-disabled state and those packets are subsequently processed.
Rate limit exceeded	Number of times the rate limit configured on the port was exceeded and the interface was put into the error-disabled state.
Received on untrusted ports	Number of times a DHCP server packet (OFFER, ACK, NAK, or LEASEQUERY) was received on an untrusted port and was dropped.
Nonzero giaddr	Number of times the relay agent address field (giaddr) in the DHCP packet received on an untrusted port was not zero, or the no ip dhcp snooping information option allow-untrusted global configuration command is not configured and a packet received on an untrusted port contained option-82 data.
Source mac not equal to chaddr	Number of times the client MAC address field of the DHCP packet (chaddr) does not match the packet source MAC address and the ip dhcp snooping verify mac-address global configuration command is configured.
Binding mismatch	Number of times a RELEASE or DECLINE packet was received on a port that is different than the port in the binding for that MAC address-VLAN pair. This indicates someone might be trying to spoof the real client, or it could mean that the client has moved to another port on the switch and issued a RELEASE or DECLINE. The MAC address is taken from the chaddr field of the DHCP packet, not the source MAC address in the Ethernet header.
Insertion of opt82 fail	Number of times the option-82 insertion into a packet failed. The insertion might fail if the packet with the option-82 data exceeds the size of a single physical packet on the internet.
Interface Down	Number of times the packet is a reply to the DHCP relay agent, but the SVI interface for the relay agent is down. This is an unlikely error that occurs if the SVI goes down between sending the client request to the DHCP server and receiving the response.
Unknown output interface	Number of times the output interface for a DHCP reply packet cannot be determined by either option-82 data or a lookup in the MAC address table. The packet is dropped. This can happen if option 82 is not used and the client MAC address has aged out. If IPSG is enabled with the port-security option and option 82 is not enabled, the MAC address of the client is not learned, and the reply packets will be dropped.

Table 2-26	DHCP Snooping Statistics (continued)
------------	--------------------------------------

DHCP Snooping Statistic	Description
Reply output port equal to input port	Number of times the output port for a DHCP reply packet is the same as the input port, causing a possible loop. Indicates a possible network misconfiguration or misuse of trust settings on ports.
Packet denied by platform	Number of times the packet has been denied by a platform-specific registry.

Related Commands	Command	Description
	clear ip dhcp snooping	Clears the DHCP snooping binding database, the DHCP snooping binding database agent statistics, or the DHCP snooping statistics counters.

show ip igmp profile

Use the **show ip igmp profile** privileged EXEC command to display all configured Internet Group Management Protocol (IGMP) profiles or a specified IGMP profile.

show ip igmp profile [profile number] [| {begin | exclude | include} expression]

Syntax Description	<i>profile number</i> (Optional) The IGMP profile number to be displayed. The range is 1 to 4294967295. If no profile number is entered, all IGMP profiles are displayed.				
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .			
	include	(Optional) Display includes lines that match the specified <i>expression</i> .			
	expression	Expression in the output to use as a reference point.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(11)AX	This command was introduced.			
Examples	These are example	es of output from the show ip igmp profile privileged EXEC command, with and			
	without specifying configured on the	g a profile number. If no profile number is entered, the display includes all profiles			
	configured on the Switch# show ip IGMP Profile 40 permit	g a profile number. If no profile number is entered, the display includes all profiles switch.			
	<pre>configured on the Switch# show ip IGMP Profile 40 permit range 233.1. Switch# show ip IGMP Profile 3 range 230.9. IGMP Profile 4 permit</pre>	g a profile number. If no profile number is entered, the display includes all profiles switch. igmp profile 40 .1.1 233.255.255.255			
Related Commands	<pre>configured on the Switch# show ip IGMP Profile 40 permit range 233.1. Switch# show ip IGMP Profile 3 range 230.9. IGMP Profile 4 permit</pre>	<pre>g a profile number. If no profile number is entered, the display includes all profiles switch. igmp profile 40 .1.1 233.255.255.255 igmp profile .9.0 230.9.9.0</pre>			

show ip igmp snooping

Use the **show ip igmp snooping** user EXEC command to display the Internet Group Management Protocol (IGMP) snooping configuration of the switch or the VLAN.

show ip igmp snooping [groups | mrouter | querier] [vlan vlan-id] [| {begin | exclude | include}
expression]

Syntax Description	groups	(Optional) See the show ip igmp snooping groups command.
	mrouter	(Optional) See the show ip igmp snooping mrouter command.
	querier	(Optional) See the show ip igmp snooping querier command.
	vlan vlan-id	(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094 (available only in privileged EXEC mode).
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification				
	12.1(11)AXThis command was introduced.					
	12.1(19)EA1The querier keyword was added.					
	12.2(18)SE	The groups keyword was added. The show ip igmp snooping groups command replaced the show ip igmp snooping multicast command.				
Usage Guidelines	Use this command to dis	play snooping configuration for the switch or for a specific VLAN.				
	VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.					
	Expressions are case sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i> do not appear, but the lines that contain <i>Output</i> appear.					
Examples	This is an example of out characteristics for a speci	tput from the show ip igmp snooping vlan 1 command. It shows snooping ific VLAN.				
	Switch# show ip igmp s Global IGMP Snooping c					
	IGMP snooping IGMPv3 snooping (minim Report suppression TCN solicit query	:Enabled nal) :Enabled :Enabled :Disabled				

TCN flood query count :2 Last member query interval : 100 Vlan 1: _____ IGMP snooping :Enabled :Disabled Immediate leave :pim-dvmrp Multicast router learning mode Source only learning age timer :10 CGMP interoperability mode :IGMP_ONLY Last member query interval : 100

This is an example of output from the **show ip igmp snooping** command. It displays snooping characteristics for all VLANs on the switch.

Switch> show ip igmp snooping Global IGMP Snooping configuration: _____ IGMP snooping : Enabled IGMPv3 snooping (minimal) : Enabled Report suppression : Enabled TCN solicit query : Disabled : 2 TCN flood query count Last member query interval : 100 Vlan 1: _____ IGMP snooping :Enabled Immediate leave :Disabled Multicast router learning mode :pim-dvmrp Source only learning age timer :10 CGMP interoperability mode :IGMP_ONLY Last member query interval : 100 Vlan 2: _____ IGMP snooping :Enabled Immediate leave :Disabled Multicast router learning mode :pim-dvmrp Source only learning age timer :10 CGMP interoperability mode :IGMP_ONLY Last member query interval : 333

<output truncated>

Related Commands

Command	Description
ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
ip igmp snooping last-member-query-interval	Enables the IGMP snooping configurable-leave timer.
ip igmp snooping querier	Enables the IGMP querier function in Layer 2 networks.
ip igmp snooping report-suppression	Enables IGMP report suppression.
ip igmp snooping tcn	Configures the IGMP topology change notification behavior.
ip igmp snooping tcn flood	Specifies multicast flooding as the IGMP spanning-tree topology change notification behavior.
ip igmp snooping vlan immediate-leave	Enables IGMP snooping immediate-leave processing on a VLAN.

Command	Description
ip igmp snooping vlan mrouter	Adds a multicast router port or configures the multicast learning method.
ip igmp snooping vlan static	Statically adds a Layer 2 port as a member of a multicast group.
show ip igmp snooping groups	Displays the IGMP snooping multicast table for the switch.
show ip igmp snooping mrouter	Displays IGMP snooping multicast router ports for the switch or for the specified multicast VLAN.
show ip igmp snooping querier	Displays the configuration and operation information for the IGMP querier configured on a switch.

show ip igmp snooping groups

Use the **show ip igmp snooping groups** privileged EXEC command to display the Internet Group Management Protocol (IGMP) snooping multicast table for the switch or the multicast information. Use with the **vlan** keyword to display the multicast table for a specified multicast VLAN or specific multicast information.

show ip igmp snooping groups [count | dynamic [count] | user [count]] [| {begin | exclude |
 include} expression]

show ip igmp snooping groups vlan vlan-id [ip_address | count | dynamic [count] | user [count]]
 [| {begin | exclude | include} expression]

Syntax Description	count	(Optional) Display the total number of entries for the specified command options instead of the actual entries.				
	dynamic	(Optional) Display entries learned by IGMP snooping. Optional) Display only the user-configured multicast entries.				
	user					
	ip_address	(Optional) Display characteristics of the multicast group with the specified group IP address.				
	vlan vlan-id	(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.				
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .				
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Display includes lines that match the specified expression.				
	expression	Expression Expression in the output to use as a reference point.				
Command History	Release	Modification				
-	12.2(18)SE	This command was introduced. It replaced the show ip igmp snooping multicast command.				
Usage Guidelines	Use this comma	and to display multicast information or the multicast table.				
J.		2 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP				
	Expressions are case sensitive. For example, if you enter exclude output, the lines that contain <i>output</i> do not appear, but the lines that contain <i>Output</i> appear.					

Examples

This is an example of output from the **show ip igmp snooping groups** command without any keywords. It displays the multicast table for the switch.

Switch# show ip igmp snooping groups

Vlan	Group	Туре	Version	Port List
1	224.1.4.4	igmp	v2	Fa1/0/11
1	224.1.4.5	igmp		Fa1/0/11
2	224.0.1.40	igmp		Fa1/0/15

This is an example of output from the **show ip igmp snooping groups count** command. It displays the total number of multicast groups on the switch.

Switch# **show ip igmp snooping groups count** Total number of multicast groups: 2

This is an example of output from the **show ip igmp snooping groups dynamic** command. It shows only the entries learned by IGMP snooping.

Switch#	show ip igmp	snooping groups	vlan 1 dyna	mic
Vlan	Group	Туре	Version	Port List
104	224.1.4.2	igmp	v2	Gi2/0/1, Fa1/0/15
104	224.1.4.3	igmp	v2	Gi2/0/1, Fa1/0/15

This is an example of output from the **show ip igmp snooping groups vlan** *vlan-id ip-address* command. It shows the entries for the group with the specified IP address.

Switch#	show ip igmp	snooping groups	vlan 104	224.1.4.2
Vlan	Group	Туре	Version	Port List
104	224.1.4.2	igmp	v2	Gi2/0/1, Fa1/0/15

Command	Description
ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
ip igmp snooping vlan mrouter	Configures a multicast router port.
ip igmp snooping vlan static	Statically adds a Layer 2 port as a member of a multicast group.
show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.
show ip igmp snooping mrouter	Displays IGMP snooping multicast router ports for the switch or for the specified multicast VLAN.

2-533

show ip igmp snooping mrouter

Use the **show ip igmp snooping mrouter** privileged EXEC command to display the Internet Group Management Protocol (IGMP) snooping dynamically learned and manually configured multicast router ports for the switch or for the specified multicast VLAN.

show ip igmp snooping mrouter [vlan vlan-id] [| {begin | exclude | include} expression]

Syntax Description	vlan vlan-id	(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	VLAN IDs 1002 to snooping. When multicast VL	to display multicast router ports on the switch or for a specific VLAN. 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP AN registration (MVR) is enabled, the show ip igmp snooping mrouter command ticast router information and IGMP snooping information.
		e sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i> he lines that contain <i>Output</i> appear.
Examples	-	of output from the show ip igmp snooping mrouter command. It shows how to outer ports on the switch.
	Vlan ports	gmp snooping mrouter
	1 Gi2/0/1(d	ynamic)

Related Commands

Command	Description
ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
ip igmp snooping vlan mrouter	Adds a multicast router port.

show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN
show ip igmp snooping groups	Displays IGMP snooping multicast information for the switch or for the specified parameter.

show ip igmp snooping querier

Use the **show ip igmp snooping querier detail** user EXEC command to display the configuration and operation information for the IGMP querier configured on a switch.

show ip igmp snooping querier [detail | vlan vlan-id [detail]] [| {begin | exclude | include}
expression]

Syntax Description	detail	Optional) Display detailed IGMP querier information.
	vlan vlan-id [detail]	Optional) Display IGMP querier information for the specified VLAN. The range is 1 to 1001 and 1006 to 4094. Use the detail keyword to display detailed information.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History	Release	Modification
	12.2(25)SEA	This command was introduced.
Usage Guidelines		nooping querier command to display the IGMP version and the IP address of a

Usage Guidelines Examples	do not appear, but the This is an example of a Switch> show ip veri Interface Filter-ty gil/0/1 ip gil/0/2 ip gil/0/2 ip gil/0/3 ip gil/0/4 ip-mac gil/0/4 ip-mac gil/0/4 ip-mac gil/0/5 ip-mac	lines that contain O output from the sho Afy source ppe Filter-mode active active inactive-th inactive-th inactive-th active active active active active active	<pre>putput appear. pw ip verify source IP-address 10.0.0.1 deny-all rust-port o-snooping-vlar 10.0.0.2 11.0.0.1 deny-all 10.0.0.3 deny-all</pre>	rce command: Mac-address aaaa.bbbb.cccc aaaa.bbbb.ccccd deny-all permit-all permit-all	Vlan 10 11-20 11 12-20 10

- The Gigabit Ethernet 1/0/2 interface is configured as trusted for DHCP snooping.
- On the Gigabit Ethernet 1/0/3 interface, DHCP snooping is not enabled on the VLANs to which the interface belongs.

- On the Gigabit Ethernet 1/0/4 interface, IP source guard with source IP and MAC address filtering is enabled, and static IP source bindings are configured on VLANs 10 and 11. For VLANs 12 to 20, the default port ACL is applied on the interface for the VLANs on which IP source guard is not configured.
- On the Gigabit Ethernet 1/0/5 interface, IP source guard with source IP and MAC address filtering is enabled and configured with a static IP binding, but port security is disabled. The switch cannot filter source MAC addresses.

This is an example of output on an interface on which IP source guard is disabled:

Switch> show ip verify source gigabitethernet1/0/6 IP source guard is not configured on the interface gi1/0/6.

Related Commands	Command	Description
	ip verify source	Enables IP source guard on an interface.

show ipc

Use the **show ipc** user EXEC command to display Interprocess Communications Protocol (IPC) configuration, status, and statistics on a switch stack or a standalone switch.

show ipc {mcast {appclass | groups | status } | nodes | ports [open] | queue | rpc | session {all |
 rx | tx } [verbose] | status [cumlulative] | zones } [| {begin | exclude | include } expression]

Syntax Description	mcast {appclass groups status}	Display the IPC multicast routing information. The keywords have these meanings:
		• appclass —Display the IPC multicast application classes.
		• groups—Display the IPC multicast groups.
		• status —Display the IPC multicast routing status.
	nodes	Display participating nodes.
	ports [open]	Display local IPC ports. The keyword has this meaning:
		• open —(Optional) Display only the open ports.
	queue	Display the contents of the IPC transmission queue.
	rpc	Display the IPC remote-procedure statistics.
	session {all rx tx}	Display the IPC session statistics (available only in privileged EXEC mode). The keywords have these meanings:
		• all—Display all the session statistics.
		• rx —Display the sessions statistics for traffic that the switch receives
		• tx—Display the sessions statistics for traffic that the switch forwards.
	verbose	(Optional) Display detailed statistics (available only in privileged EXEC mode).
	status [cumlulative]	Display the status of the local IPC server. The keyword has this meaning:
		• cumlulative —(Optional) Display the status of the local IPC server since the switch was started or restarted.
	zones	Display the participating IPC zones. The switch supports a single IPC zone.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
ommand Modes	User EXEC	

Command History

ry	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(18)SE	The mcast {appclass groups status }, rpc, session {all rx tx } [verbose], and cumulative keywords were added.

Usage Guidelines Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Exam	ples
------	------

This example shows how to display the IPC routing status:

IPC Mcast Status

Related Commands	Command	Description
	clear ipc	Clears the IPC multicast routing statistics.

show ipv6 access-list

Use the **show ipv6 access-list** user EXEC command to display the contents of all current IPv6 access lists.

show ipv6 access-list [access-list-name]

Note This command is available only if the switch stack is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	access-list-name	(Optional) Name of access list.	
Command Modes	User EXEC		
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	The show ipv6 access-list command provides output similar to the show ip access-list command, except that it is IPv6-specific.		
	-	l IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default ration command and reload the switch.	
Examples	The following output and outbound:	from the show ipv6 access-list command shows IPv6 access lists named inbound	
	permit tcp any		
	Table 2-27 describes the significant fields shown in the display.		
	Table 2-27 show ipv6 access-list Field Descriptions		

Field	Description	
IPv6 access list inbound Name of the IPv6 access list, for example, inbound.		
permit Permits any packet that matches the specified protocol type.		
tcp	Transmission Control Protocol. The higher-level (Layer 4) protocol type that the packet must match.	
any	Equal to ::/0.	

Field	Description
eq	An equal operand that compares the source or destination ports of TCP or UDP packets.
bgp (matches)	Border Gateway Protocol. The protocol type that the packet is equal to and the number of matches.
sequence 10	Sequence in which an incoming packet is compared to lines in an access list. Access list lines are ordered from first priority (lowest number, for example, 10) to last priority (highest number, for example, 80).

 Table 2-27
 show ipv6 access-list Field Descriptions (continued)

Related Commands

nds	Command	Description
	clear ipv6 access-list	Resets the IPv6 access list match counters.
	ipv6 access-list	Defines an IPv6 access list and puts the switch into IPv6 access-list configuration mode.
	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.

show ipv6 dhcp conflict

Use the **show ipv6 dhcp conflict** privileged EXEC command on the switch stack or on a standalone switch to display address conflicts found by a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server when addresses are offered to the client.

show ipv6 dhcp conflict

Note	This command is available only if the switch stack is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	This command has no	o arguments or keywords.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(46)SE	This command was introduced.	
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) global configuration command, and reload the switch.		
	When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list.		
Examples	This is an example of the output from the show ipv6 dhcp conflict command:		
	Switch# show ipv6 dhcp conflict Pool 350, prefix 2001:1005::/48 2001:1005::10		
Related Commands	Command	Description	
	ipv6 dhcp pool	Configures a DHCPv6 pool and enters DHCPv6 pool configuration mode.	
	clear ipv6 dhcp conflict	Clears an address conflict from the DHCPv6 server database.	

show ipv6 mld snooping

Use the **show ipv6 mld snooping** user EXEC command to display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN.

show ipv6 mld snooping [vlan vlan-id] [| {begin | exclude | include} expression]

Note

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History Usage Guidelines	Release	Modification
	12.2(25)SED	This command was introduced.
	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan } global configuration command and reload the switch. Expressions are case sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> do not appear, but the lines that contain <i>Output</i> appear.	
Examples	This is an example of characteristics for a spectrum of the second secon	output from the show ipv6 mld snooping vlan command. It shows snooping pecific VLAN.

Related Commands	Command	Description
	ipv6 mld snooping	Enables and configures MLD snooping on the switch or on a VLAN.
	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.

show ipv6 mld snooping address

Use the **show ipv6 mld snooping address** user EXEC command to display all or specified IP version 6 (IPv6) multicast address information maintained by Multicast Listener Discovery (MLD) snooping.

Note

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description

vlan vlan-id	(Optional) Specify a VLAN about which to show MLD snooping multicast address information. The VLAN ID range is 1 to 1001 and 1006 to 4094.
ipv6-multicast-address	(Optional) Display information about the specified IPv6 multicast address. This keyword is only available when a VLAN ID is entered.
count	(Optional) Display the number of multicast groups on the switch or in the specified VLAN.
dynamic	(Optional) Display MLD snooping learned group information.
user	(Optional) Display MLD snooping user-configured group information.
begin	(Optional) Display begins with the line that matches the <i>expression</i> .
exclude	(Optional) Display excludes lines that match the <i>expression</i> .
include	(Optional) Display includes lines that match the specified expression.
expression	Expression in the output to use as a reference point.
expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.2(25)SED	This command was introduced.

Usage Guidelines

nes Use this command to display IPv6 multicast address information.

You can enter an IPv6 multicast address only after you enter a VLAN ID.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

Use the **dynamic** keyword to display information only about groups that are learned. Use the **user** keyword to display information only about groups that have been configured.

To configure the dual IPv4 and IPv6 template, enter the **sdm prefer dual-ipv4-and-ipv6** {**default** | **vlan**} global configuration command and reload the switch.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

FF12::3 user v2

Examples	This is an example of output from the show snooping address user EXEC command: Switch> show ipv6 mld snooping address			
	Vlan Group Type Version Port List			
	2 FF12::3 user Fa1/0/2, Gi2/0/2, Gi3/0/1,Gi3/0/3			
	This is an example of output from the show snooping address count user EXEC command:			
	Switch> show ipv6 mld snooping address count Total number of multicast groups: 2			
	This is an example of output from the show snooping address user user EXEC command:			
	Switch> show ipv6 mld snooping address user Vlan Group Type Version Port List			

Related Commands	Command	Description
	ipv6 mld snooping vlan	Configures IPv6 MLD snooping on a VLAN.
	sdm prefer	Configures an SDM template to optimize system resources
		based on how the switch is being used.

Fa1/0/2, Gi2/0/2, Gi3/0/1,Gi4/0/3

show ipv6 mld snooping mrouter

Use the **show ipv6 mld snooping mrouter** user EXEC command to display dynamically learned and manually configured IP version 6 (IPv6) Multicast Listener Discovery (MLD) router ports for the switch or a VLAN.

show ipv6 mld snooping mrouter [vlan vlan-id] [| {begin | exclude | include} expression]

۵, Note

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.2(25)SED	This command was introduced.

Use this command to display MLD snooping router ports for the switch or for a specific VLAN.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6

default | vlan) global configuration command and reload the switch.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of output from the **show ipv6 mld snooping mrouter** command. It displays snooping characteristics for all VLANs on the switch that are participating in MLD snooping.

Switch> show ipv6 mld snooping mrouter Vlan ports ---- -----2 Gi1/0/11(dynamic) 72 Gi1/0/11(dynamic) 200 Gi1/0/11(dynamic)

This is an example of output from the **show ipv6 mld snooping mrouter vlan** command. It shows multicast router ports for a specific VLAN.

Related Commands

Command	Description
ipv6 mld snooping	Enables and configures MLD snooping on the switch or on a VLAN.
ipv6 mld snooping vlan mrouter interface <i>interface-id</i> static <i>ipv6-multicast-address</i> interface <i>interface-id</i>]	Configures multicast router ports for a VLAN.
sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.

show ipv6 mld snooping querier

Use the **show ipv6 mld snooping querier** user EXEC command to display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping querier-related information most recently received by the switch or the VLAN.

show ipv6 mld snooping querier [vlan vlan-id] [detail] [| {begin | exclude | include} expression]

```
<u>Note</u>
```

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.	
Syntax Description	detail	(Optional) Display MLD snooping detailed querier information for the	
	detall	switch or for the VLAN.	
	begin	(Optional) Display begins with the line that matches the expression.	
	exclude	(Optional) Display excludes lines that match the expression.	
	include	(Optional) Display includes lines that match the specified expression.	
	expression	Expression in the output to use as a reference point.	
Command Modes	User EXEC		
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	detected device that	mld snooping querier command to display the MLD version and IPv6 address of a t sends MLD query messages, which is also called a <i>querier</i> . A subnet can have routers but has only one MLD querier. The querier can be a Layer 3 switch.	
	The show ipv6 mld snooping querier command output also shows the VLAN and interface on which the querier was detected. If the querier is the switch, the output shows the <i>Port</i> field as <i>Router</i> . If the querier is a router, the output shows the port number on which the querier is learned in the <i>Port</i> field.		
	response to a query VLAN values, such information is used	how ipv6 mld snoop querier vlan command displays the information received in message from an external or internal querier. It does not display user-configured as the snooping robustness variable on the particular VLAN. This querier only on the MASQ message that is sent by the switch. It does not override the bustness variable that is used for aging out a member that does not respond to query	
	VLAN numbers 100 in MLD snooping.	02 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	
	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) global configuration command and reload the switch.		

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of output from the **show ipv6 mld snooping querier** command:

```
      Switch>
      show ipv6 mld snooping querier

      Vlan
      IP Address
      MLD Version Port

      2
      FE80::201:C9FF:FE40:6000 v1
      Gi3/0/1
```

This is an example of output from the show ipv6 mld snooping querier detail command:

```
      Switch>
      show ipv6 mld snooping querier detail

      Vlan
      IP Address
      MLD Version Port

      2
      FE80::201:C9FF:FE40:6000 v1
      Gi3/0/1
```

This is an example of output from the show ipv6 mld snooping querier vlan command:

```
Switch> show ipv6 mld snooping querier vlan 2
IP address : FE80::201:C9FF:FE40:6000
MLD version : v1
Port : Gi3/0/1
Max response time : 1000s
```

Related Commands

Command	Description
ipv6 mld snooping	Enables and configures IPv6 MLD snooping on the switch or on a VLAN.
ipv6 mld snooping last-listener-query-cou nt	Configures the maximum number of queries that the switch sends before aging out an MLD client.
ipv6 mld snooping last-listener-query-int erval	Configures the maximum response time after sending out a query that the switch waits before deleting a port from the multicast group.
ipv6 mld snooping robustness-variable	Configures the maximum number of queries that the switch sends before aging out a multicast address when there is no response.
sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
ipv6 mld snooping	Enables and configures IPv6 MLD snooping on the switch or on a VLAN.

show ipv6 route updated

Use the **show ipv6 route updated** command in user EXEC command to display the current contents of the IPv6 routing table.

Syntax Description	protocol	(Optional) Displays routes for the specified routing protocol using any of these keywords:			
		• bgp			
		• isis			
		• ospf			
		• rip			
		-			
		or displays routes for the specified type of route using any of these keywords:			
		• connected			
		• local			
		• static			
		• interface interface id			
	boot-up	Display the current contents of the IPv6 routing table.			
	hh:mm	Enter the time as a 2-digit number for a 24-hour clock. Make sure to use the colons (:). For example, enter 13:32			
	day	Enter the day of the month. The range is from 1 to 31.			
	month	Enter the month in upper case or lower case letters. You can enter the full name of the month, such as January or august , or the first three letters of the month, such as jan or Aug .			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the expression.			
	include	(Optional) Display includes lines that match the specified expression.			
	expression	Expression in the output to use as a reference point.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.2(37)SE	This command was introduced.			
Usage Guidelines	Use the show ipv6 ro table.	ute privileged EXEC command to display the current contents of the IPv6 routing

show l2protocol-tunnel

Use the **show l2protocol-tunnel** user EXEC command to display information about Layer 2 protocol tunnel ports. Displays information for interfaces with protocol tunneling enabled.

show l2protocol-tunnel [interface interface-id] [summary] [| {begin | exclude | include}
expression]

nary in ude ude ssion	 (Optional) Display only Layer 2 protocol summary information. (Optional) Display begins with the line that matches the <i>expression</i>. (Optional) Display excludes lines that match the <i>expression</i>. (Optional) Display includes lines that match the specified <i>expression</i>. Expression in the output to use as a reference point. 					
ude ude	(Optional) Display excludes lines that match the <i>expression</i> .(Optional) Display includes lines that match the specified <i>expression</i> .					
ude	(Optional) Display includes lines that match the specified <i>expression</i> .					
ession	Expression in the output to use as a reference point.					
	<i>expression</i> Expression in the output to use as a reference point.					
ISE	Modification					
25)SE	This command was introduced.					

- Shutdown threshold
- Drop threshold

If you enter the **show l2protocol-tunnel** [**interface** *interface-id*] command, only information about the active ports on which all the parameters are configured appears.

If you enter the **show l2protocol-tunnel summary** command, only information about the active ports on which some or all of the parameters are configured appears.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of output from the show l2protocol-tunnel command:

Switch> show 12protocol-tunnel

COS for Encapsulated Packets: 5 Drop Threshold for Encapsulated Packets: 0

Port	Protocol		-	Encapsulation Counter	Decapsulation Counter	Drop Counter

Related Commands

Commands	Command	Description
	clear l2protocol-tunnel counters	Clears counters for protocol tunneling ports.
	l2protocol-tunnel	Enables Layer 2 protocol tunneling for CDP, STP, or VTP packets on an interface.
	12protocol-tunnel cos	Configures a class of service (CoS) value for tunneled Layer 2 protocol packets.

show lacp

Use the **show lacp** user EXEC command to display Link Aggregation Control Protocol (LACP) channel-group information.

show lacp [channel-group-number] {counters | internal | neighbor | sys-id } [| {begin | exclude | include} expression]

Syntax Description	channel-group-number	(Optional) Number of the channel group. The range is 1 to 48.		
	counters	Display traffic information.		
	internal	Display internal information.		
	neighbor	Display neighbor information.		
	sys-idDisplay the system identifier that is being used by LACP. The system identifier is made up of the LACP system priority and the switch MA address.			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .		
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .		
	include	(Optional) Display includes lines that match the specified expression.		
	<i>expression</i> Expression in the output to use as a reference point.

Examples

This is an example of output from the **show lacp counters** user EXEC command. Table 2-28 describes the fields in the display.

Switch> show lacp counters

	LACP	DUs	Mark	er	Marker F	lesponse	LACPDUs
Port	Sent	Recv	Sent	Recv	Sent	Recv	Pkts Err
Channel grou	ıp:1						
Gi2/0/1	19	10	0	0	0	0	0
Gi2/0/2	14	6	0	0	0	0	0

Table 2-28show lacp counters Field Descriptions

Field	Description
LACPDUs Sent and Recv	The number of LACP packets sent and received by a port.
Marker Sent and Recv	The number of LACP marker packets sent and received by a port.
Marker Response Sent and Recv	The number of LACP marker response packets sent and received by a port.
LACPDUs Pkts and Err	The number of unknown and illegal packets received by LACP for a port.

This is an example of output from the show lacp internal command:

```
Switch> show lacp 1 internal
Flags: S - Device is requesting Slow LACPDUs
        F - Device is requesting Fast LACPDUs
       A - Device is in Active mode

                                            0x3
                                                       0x3
                                                               0x5
                                                                        0x3D
```

 Table 2-29 describes the fields in the display:

Field	Description		
State	State of the specific port. These are the allowed values:		
	• – —Port is in an unknown state.		
	• bndl —Port is attached to an aggregator and bundled with other ports.		
	• susp —Port is in a suspended state; it is not attached to any aggregator.		
	• hot-sby —Port is in a hot-standby state.		
	• indiv —Port is incapable of bundling with any other port.		
	• indep —Port is in an independent state (not bundled but able to switch data traffic. In this case, LACP is not running on the partner port).		
	• down —Port is down.		
LACP Port Priority	Port priority setting. LACP uses the port priority to put ports s in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.		
Admin Key	Administrative key assigned to this port. LACP automatically generates an administrative key value as a hexadecimal number. The administrative key defines the ability of a port to aggregate with other ports. A port's ability to aggregate with other ports is determined by the port physical characteristics (for example, data rate and duplex capability) and configuration restrictions that you establish.		
Oper Key	Runtime operational key that is being used by this port. LACP automatically generates this value as a hexadecimal number.		
Port Number	Port number.		
Port State	State variables for the port, encoded as individual bits within a single octet with these meanings:		
	• bit0: LACP_Activity		
	• bit1: LACP_Timeout		
	• bit2: Aggregation		
	• bit3: Synchronization		
	• bit4: Collecting		
	• bit5: Distributing		
	• bit6: Defaulted		
	• bit7: Expired		
	Note In the list above, bit7 is the MSB and bit0 is the LSB.		

Table 2-29show lacp internal Field Descriptions

Flags: S	how lacp neighbor - Device is sending a - Device is in Active			-

This is an example of output from the **show lacp sys-id** command:

Switch> **show lacp sys-id** 32765,0002.4b29.3a00

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

Related Commands	Command	Description
	clear lacp	Clears the LACP channel-group information.
	lacp port-priority	Configures the LACP port priority.
	lacp system-priority	Configures the LACP system priority.

show location

Use the show location user EXEC command to display location information for an endpoint.

show location admin-tag | [| {begin | exclude | include} expression]

show location civic-location {identifier id number | interface interface-id | static } | {begin |
 exclude | include} expression]

show location elin-location {identifier id number | interface interface-id | static } | {begin |
 exclude | include} expression]

Syntax Description	1 * 4	
	admin-tag	Display administrative tag or site information.
	civic-location	Display civic location information.
	elin-location	Display emergency location information (ELIN).
	identifier id	Specify the ID for the civic location or the elin location. The id range is 1 to 4095.
	interface interface-id	(Optional) Display location information for the specified interface or all interfaces. Valid interfaces include physical ports.
	static	Display static configuration information.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

	location (global configuration)	Configures the global location information for an endpoint.
	location (interface configuration)	Configures the location information for an interface.

show link state group

Use the show link state group privileged EXEC command to display the link-state group information.

show link state group [number] [detail] [| {begin | exclude | include} expression]

Syntax Description	number	(Optional) Number of the link-state group.		
	detail	(Optional) Specify that detailed information appears.		
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .		
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .		
	include	(Optional) Display includes lines that match the specified <i>expression</i> .		
	expression	Expression in the output to use as a reference point.		
Defaults	There is no default.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.2(25)SEE	This command was introduced.		
Usage Guidelines	command without k	tate group command to display the link-state group information. Enter this eywords to display information about all link-state groups. Enter the group number on specific to the group.		
	Enter the detail keyword to display detailed information about the group. The output for the show link state group detail command displays only those link-state groups that have link-state tracking enabled or that have upstream or downstream interfaces (or both) configured. If there is no link-state group configuration for a group, it is not shown as enabled or disabled.			
	Expressions are case sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i> are not displayed, but the lines that contain <i>Output</i> are displayed.			
Examples	This is an example of	of output from the show link state group 1 command:		
	Switch> show link Link State Group:			

This is an example of output from the **show link state group detail** command:

```
Switch> show link state group detail

show mac access-group

Use the **show mac access-group** user EXEC command to display the MAC access control lists (ACLs) configured for an interface or a switch.

show mac access-group [interface interface-id] [| {begin | exclude | include} expression]

Syntax Description	interface interface-id	(Optional) Display the MAC ACLs configured on a specific interface. Valid			
		interfaces are physical ports and port channels; the port-channel range is 1 to 48 (available only in privileged EXEC mode).			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the expression.			
	include	(Optional) Display includes lines that match the specified expression.			
	expression	Expression in the output to use as a reference point.			
Command Modes	User EXEC				
Command History	Release	Modification			
	12.1(14)EA1	This command was introduced.			
Examples	This is an example of output from the show mac-access group user EXEC command. Port 2 has the MAC access list <i>macl_e1</i> applied; no MAC ACLs are applied to other interfaces.				
	<pre>Switch> show mac access-group Interface GigabitEthernet1/0/1: Inbound access-list is not set Interface GigabitEthernet1/0/2: Inbound access-list is macl_e1 Interface GigabitEthernet1/0/3: Inbound access-list is not set Interface GigabitEthernet1/0/4: Inbound access-list is not set</pre>

Related Commands	Command	Description
	clear mac address-table dynamic	Deletes from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, or all dynamic addresses on a particular VLAN.
	show mac address-table aging-time	Displays the aging time in all VLANs or the specified VLAN.
	show mac address-table count	Displays the number of addresses present in all VLANs or the specified VLAN.
	show mac address-table dynamic	Displays dynamic MAC address table entries only.
	show mac address-table interface	Displays the MAC address table information for the specified interface.
	show mac address-table notification	Displays the MAC address notification settings for all interfaces or the specified interface.
	show mac address-table static	Displays static MAC address table entries only.
	show mac address-table vlan	Displays the MAC address table information for the specified VLAN.

show mac address-table address

Use the **show mac address-table address** user EXEC command to display MAC address table information for the specified MAC address.

show mac address-table address mac-address [interface interface-id] [vlan vlan-id] [| {begin |
 exclude | include} expression]

Syntax Description		
	mac-address	Specify the 48-bit MAC address; the valid format is H.H.H.
	interface interface-id	(Optional) Display information for a specific interface. Valid interfaces include physical ports and port channels.
	vlan vlan-id	(Optional) Display entries for the specific VLAN only. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(19)EA1	The show mac-address-table address command (with the hyphen) was
		replaced by the show mac address-table address command (without the
		hyphen).

Usage Guidelines Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of output from the **show mac address-table address** command:

Switch# show mac address-table address 0002.4b28.c482 Mac Address Table

Related Commands C

Command	Description
show mac address-table aging-time	Displays the aging time in all VLANs or the specified VLAN.

	<pre>mac address-table move update {receive transmit}</pre>	Configures MAC address-table move update on the switch.

show mac address-table notification

Use the **show mac address-table notification** user EXEC command to display the MAC address notification settings for all interfaces or the specified interface.

show mac address-table notification [interface [interface-id]] [| {begin | exclude | include}
expression]

Syntax Description	interface	(Optional) Display information for all interfaces. Valid interfaces include physical ports and port channels.
	interface-id	(Optional) Display information for the specified interface. Valid interfaces include physical ports and port channels.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(19)EA1	The show mac-address-table notification command (with the hyphen) was replaced by the show mac address-table notification command (without the hyphen).

Usage Guidelines Use the **show mac address-table notification** command without any keywords to display whether the feature is enabled or disabled, the MAC notification interval, the maximum number of entries allowed in the history table, and the history table contents.

Use the **interface** keyword to display the flags for all interfaces. If the *interface-id* is included, only the flags for that interface appear.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples	This is an example of output from the show mac address-table notification command:			
	Switch> show mac address-table notification			
	MAC Notification Feature is Enabled on the switch Interval between Notification Traps : 60 secs			
	Number of MAC Addresses Added : 4			
	Number of MAC Addresses Removed : 4			
	Number of Notifications sent to NMS : 3			
	Maximum Number of entries configured in History Table : 100			
	Current History Table Length : 3			
	MAC Notification Traps are Enabled History Table contents			
	History Index 0, Entry Timestamp 1032254, Despatch Timestamp 1032254 MAC Changed Message :			
	Operation: Added Vlan: 2 MAC Addr: 0000.0000.0001 Module: 0 Port: 1			
	History Index 1, Entry Timestamp 1038254, Despatch Timestamp 1038254 MAC Changed Message :			
	Operation: Added Vlan: 2 MAC Addr: 0000.0000.0000 Module: 0 Port: 1			
	Operation: Added Vlan: 2 MAC Addr: 0000.0000.0002 Module: 0 Port: 1			
	Operation: Added Vlan: 2 MAC Addr: 0000.0000.0003 Module: 0 Port: 1			
	History Index 2, Entry Timestamp 1074254, Despatch Timestamp 1074254 MAC Changed Message :			
	Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0000 Module: 0 Port: 1			
	Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0001 Module: 0 Port: 1			
	Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0002 Module: 0 Port: 1			
	Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0003 Module: 0 Port: 1			

Related Commands	ds Command	Description
	clear mac address-table notification	Clears the MAC address notification global counters.
	show mac address-table address	Displays MAC address table information for the specified MAC address.
	show mac address-table aging-time	Displays the aging time in all VLANs or the specified VLAN.
	show mac address-table count	Displays the number of addresses present in all VLANs or the specified VLAN.
	show mac address-table dynamic	Displays dynamic MAC address table entries only.
	show mac address-table interface	Displays the MAC address table information for the specified interface.
	show mac address-table static	Displays static MAC address table entries only.
	show mac address-table vlan	Displays the MAC address table information for the specified VLAN.

show mac address-table static

Use the **show mac address-table static** user EXEC command to display only static MAC address table entries.

show mac address-table static [address mac-address] [interface interface-id] [vlan vlan-id]
 [| {begin | exclude | include} expression]

Syntax Description	address mac-address	(Optional) Specify a 48-bit MAC address; the valid format is H.H.H (available in privileged EXEC mode only).
	interface interface-id	(Optional) Specify an interface to match; valid <i>interfaces</i> include physical ports and port channels.
	vlan vlan-id	(Optional) Display addresses for a specific VLAN. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(19)EA1	The show mac-address-table static command (with the hyphen) was replaced by the show mac address-table static command (without the hyphen).

Usage Guidelines Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of output from the **show mac address-table static** command:

Switch> show mac address-table static

For example, if you enter I exclude output , the lines that contain <i>output</i> he lines that contain <i>Output</i> appear. of output from the show mls qos command when QoS is enabled and DSCP bled: gos

show mls qos aggregate-policer

Use the **show mls qos aggregate-policer** user EXEC command to display the quality of service (QoS) aggregate policer configuration. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded.

show mls qos aggregate-policer [aggregate-policer-name] [| {begin | exclude | include}
expression]

Syntax Description	aggregate-policer-name	(Optional) Display the policer configuration for the specified name.		
	begin	(Optional) Display begins with the line that matches the expression.		
	exclude	(Optional) Display excludes lines that match the expression.		
	include	(Optional) Display includes lines that match the specified expression.		
	expression	Expression in the output to use as a reference point.		
Command Modes	User EXEC			
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	-	sitive. For example, if you enter exclude output , the lines that contain <i>output</i> es that contain <i>Output</i> appear.		
Examples	This is an example of output from the show mls qos aggregate-policer command:			
		ggregate-policer policer1 cer1 1000000 2000000 exceed-action drop map		
Related Commands	Command	Description		
	mls qos aggregate-polic	Defines policer parameters that can be shared by multiple classes		

within a policy map.

show mls qos input-queue

Use the **show mls qos input-queue** user EXEC command to display quality of service (QoS) settings for the ingress queues.

show mls qos input-queue [| {begin | exclude | include} expression]

<u> </u>		
Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
command History	Release	Modification
	12.1(11)AX	This command was introduced.
Isane Guidelines	Expressions are	case sensitive. For example, if you enter lexclude output, the lines that contain <i>output</i>
-	do not appear, bi	case sensitive. For example, if you enter I exclude output , the lines that contain <i>output</i> at the lines that contain <i>Output</i> appear.
-	do not appear, bu This is an examp	at the lines that contain <i>Output</i> appear.
	do not appear, bu This is an examp	at the lines that contain <i>Output</i> appear.

	do not appear, bu This is an examp Switch> show m Queue : 	at the lines that contain <i>Output</i> appear. ble of output from the show mls qos input-queue command: Is qos input-queue 1 2 90 10 4 4
-	do not appear, bu This is an examp Switch> show m Queue : 	at the lines that contain <i>Output</i> appear. ble of output from the show mls qos input-queue command: Is qos input-queue 1 2 90 10 4 4 0 10
Usage Guidelines Examples	do not appear, bu This is an examp Switch> show m Queue : 	at the lines that contain <i>Output</i> appear. ble of output from the show mls qos input-queue command: Ls qos input-queue 1 2 90 10 4 4

Related Commands	Command	Description
	mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps assigned class of service (CoS) values to an ingress queue and assigns CoS values to a queue and to a threshold ID.
	mls qos srr-queue input dscp-map	Maps assigned Differentiated Services Code Point (DSCP) values to an ingress queue and assigns DSCP values to a queue and to a threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns weighted tail-drop (WTD) threshold percentages to an ingress queue.

show mls qos interface

Use the **show mls qos interface** user EXEC command to display quality of service (QoS) information at the port level.

show mls qos interface [interface-id] [buffers | queueing | statistics]
[| {begin | exclude | include} expression]

Syntax Description	interface-id	(Optional) Display QoS information for the specified port. Valid interfaces include physical ports.
	buffers	(Optional) Display the buffer allocation among the queues.
	queueing	(Optional) Display the queueing strategy (shared or shaped) and the weights corresponding to the queues.
	statistics	(Optional) Display statistics for sent and received Differentiated Services Code Points (DSCPs) and class of service (CoS) values, the number of packets enqueued or dropped per egress queue, and the number of in-profile and out-of-profile packets for each policer.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Note

Though visible in the command-line help string, the **policer** keyword is not supported.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples This is an example of output from the **show mls qos interface** *interface-id* command when VLAN-based QoS is enabled:

Switch> show mls qos interface gigabitethernet1/0/1 GigabitEthernet1/0/1 trust state:not trusted trust mode:not trusted trust enabled flag:ena COS override:dis default COS:0

```
DSCP Mutation Map:Default DSCP Mutation Map
Trust device:none
qos mode:vlan-based
```

This is an example of output from the **show mls qos interface** *interface-id* command when VLAN-based QoS is disabled:

```
Switch> show mls qos interface gigabitethernet1/0/2
```

```
GigabitEthernet1/0/2
trust state:not trusted
trust mode:not trusted
trust enabled flag:ena
COS override:dis
default COS:0
DSCP Mutation Map:Default DSCP Mutation Map
Trust device:none
gos mode:port-based
```

This is an example of output from the show mls qos interface interface-id buffers command:

```
Switch> show mls qos interface gigabitethernet1/0/2 buffers
GigabitEthernet1/0/2
The port is mapped to qset : 1
The allocations between the queues are : 25 25 25 25
```

This is an example of output from the **show mls qos interface** *interface-id* **queueing** command. The egress expedite queue overrides the configured shaped round robin (SRR) weights.

```
Switch> show mls qos interface gigabitethernet1/0/2 queueing
GigabitEthernet1/0/2
Egress Priority Queue :enabled
Shaped queue weights (absolute) : 25 0 0 0
Shared queue weights : 25 25 25 25
The port bandwidth limit : 100 (Operational Bandwidth:100.0)
The port is mapped to qset : 1
```

This is an example of output from the **show mls qos interface** *interface-id* **statistics** command. Table 2-30 describes the fields in this display.

```
Switch> show mls qos interface gigabitethernet1/0/2 statistics GigabitEthernet1/0/2
```

Table 2-30 show mls qos interface statistics Field Descriptions

Field		Description	
DSCP	incoming	Number of packets received for each DSCP value.	
	outgoing	Number of packets sent for each DSCP value.	
CoS	incoming	Number of packets received for each CoS value.	
	outgoing	Number of packets sent for each CoS value.	
Policer	Inprofile	Number of in profile packets for each policer.	
	Outofprofile	Number of out-of-profile packets for each policer.	

Related Commands	Command	Description
	mls qos queue-set output buffers	Allocates buffers to a queue-set.
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	mls qos srr-queue input bandwidth	Assigns SRR weights to an ingress queue.
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps CoS values to an ingress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue input dscp-map	Maps DSCP values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns WTD threshold percentages to an ingress queue.
	mls qos srr-queue output cos-map	Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID.

Command	Description
mls qos srr-queue output dscp-map	Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID.
policy-map	Creates or modifies a policy map.
priority-queue	Enables the egress expedite queue on a port.
queue-set	Maps a port to a queue-set.
srr-queue bandwidth limit	Limits the maximum output on a port.
srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

show mls qos maps

Use the **show mls qos maps** user EXEC command to display quality of service (QoS) mapping information. During classification, QoS uses the mapping tables to represent the priority of the traffic and to derive a corresponding class of service (CoS) or Differentiated Services Code Point (DSCP) value from the received CoS, DSCP, or IP precedence value.

Contro De conintiere					
Syntax Description	cos-dscp	(Optional) Display class of service (CoS)-to-DSCP map.			
	cos-input-q	(Optional) Display the CoS input queue threshold map.			
	cos-output-q	(Optional) Display the CoS output queue threshold map.			
	dscp-cos	(Optional) Display DSCP-to-CoS map.			
	dscp-input-q	(Optional) Display the DSCP input queue threshold map.			
	dscp-mutation dscp-mutation-name	e (Optional) Display the specified DSCP-to-DSCP-mutation map.			
	dscp-output-q	(Optional) Display the DSCP output queue threshold map.			
	ip-prec-dscp	(Optional) Display the IP-precedence-to-DSCP map.			
	policed-dscp	(Optional) Display the policed-DSCP map.			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .			
	include	(Optional) Display includes lines that match the specified <i>expression</i> .			
	expression	Expression in the output to use as a reference point.			
Command Modes	User EXEC				
Command History	Release Modificati	ion			
	12.1(11)AX This comm	nand was introduced.			
Usage Guidelines	Expressions are case sensitive. For e	xample, if you enter exclude output , the lines that contain <i>output</i>			
	do not appear, but the lines that contain Output appear.				
	column specifies the most-significan in the DSCP. The intersection of the	nd the DSCP-to-DSCP-mutation maps appear as a matrix. The d1 t digit in the DSCP. The d2 row specifies the least-significant digit d1 and d2 values provides the policed-DSCP, the CoS, or the n the DSCP-to-CoS map, a DSCP value of 43 corresponds to a CoS			

The DSCP input queue threshold and the DSCP output queue threshold maps appear as a matrix. The d1 column specifies the most-significant digit of the DSCP number. The d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID. For example, in the DSCP input queue threshold map, a DSCP value of 43 corresponds to queue 2 and threshold 1 (02-01).

The CoS input queue threshold and the CoS output queue threshold maps show the CoS value in the top row and the corresponding queue ID and threshold ID in the second row. For example, in the CoS input queue threshold map, a CoS value of 5 corresponds to queue 2 and threshold 1 (2-1).

Related Commands	Command	Description		
	mls qos queue-set output buffers	Allocates buffers to the queue-set.		
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation of the queue-set.		

show mls qos vlan

Use the **show mls qos vlan** user EXEC command to display the policy maps attached to a switch virtual interface (SVI).

show mls qos vlan vlan-id [| {begin | exclude | include} expression]

Syntax Description	vlan-id	Specify the VLAN ID of the SVI to display the policy maps. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	service (QoS) is Expressions are	the show mls qos vlan command is meaningful only when VLAN-based quality of enabled and when hierarchical policy maps are configured. case sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> ut the lines that contain <i>Output</i> appear.
Examples	This is an examp	ple of output from the show mls qos vlan command:
	Switch> show m Vlan10 Attached polic	ls qos vlan 10 y-map for Ingress:pm-test-pm-2
Related Commands	Command	Description
	policy-map	Creates or modifies a policy map that can be attached to multiple ports and enters policy-map configuration mode.

show monitor

Use the **show monitor** user EXEC command to display information about all Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) sessions on the switch. Use the command with keywords to show a specific session, all sessions, all local sessions, or all remote sessions.

show monitor [session { session_number | all | local | range list | remote } [detail]] [| {begin |
 exclude | include } expression]

Syntax Description	session	(Optional) Display information about specified SPAN sessions.
	session_number	Specify the number of the SPAN or RSPAN session. The range is 1 to 66.
	all	Display all SPAN sessions.
	local	Display only local SPAN sessions.
	range list	Display a range of SPAN sessions, where <i>list</i> is the range of valid sessions, either a single session or a range of sessions described by two numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated parameters or in hyphen-specified ranges.
		Note This keyword is available only in privileged EXEC mode.
	remote	Display only remote SPAN sessions.
	detail	(Optional) Display detailed information about the specified sessions.
	begin	Display begins with the line that matches the <i>expression</i> .
	exclude	Display excludes lines that match the <i>expression</i> .
	include	Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The range list and detail keywords were added.

Usage Guidelines

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

The output is the same for the show monitor command and the show monitor session all command.

Examples

This is an example of output for the **show monitor** user EXEC command:

```
Switch# show monitor
Session 1
-----
Type : Local Session
Source Ports :
RX Only : Fa4/0/1
Both : Fa4/0/2-3,Fa4/0/5-6
Destination Ports : Fa4/0/20
Encapsulation : Replicate
Ingress : Disabled
```

Session 2 -----Type : Remote Source Session Source VLANs : TX Only : 10 Both : 1-9 Dest RSPAN VLAN : 105

This is an example of output for the **show monitor** user EXEC command for local SPAN source session 1:

Switch# show monitor session 1 Session 1 ------Type : Local Session Source Ports : RX Only : Fa4/0/1 Both : Fa4/0/2-3,Fa4/0/5-6 Destination Ports : Fa4/0/20 Encapsulation : Replicate Ingress : Disabled

This is an example of output for the **show monitor session all** user EXEC command when ingress traffic forwarding is enabled:

Switch# show monitor session all Session 1 ------Type : Local Session Source Ports : Both : Fa4/0/2 Destination Ports : Fa4/0/3 Encapsulation : Native Ingress : Enabled, default VLAN = 5 Ingress encap : DOT1Q

```
Session 2
-----
Type : Local Session
Source Ports :
Both : Fa4/0/8
Destination Ports : Fa4/012
Encapsulation : Replicate
Ingress : Enabled, default VLAN = 4
Ingress encap : Untagged
```

Related Commands	Command	Description
	monitor session	Starts or modifies a SPAN or RSPAN session.

show mvr

Use the **show mvr** privileged EXEC command without keywords to display the current Multicast VLAN Registration (MVR) global parameter values, including whether or not MVR is enabled, the MVR multicast VLAN, the maximum query response time, the number of multicast groups, and the MVR mode (dynamic or compatible).

show mvr [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .			
	include	(Optional) Display includes lines that match the specified expression.			
	expression	Expression in the output to use as a reference point.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(11)AX	This command was introduced.			
Examples	This is an example	of output from the show mvr command:			
P	Switch# show mvr MVR Running: TRUE MVR multicast VLAN: 1 MVR Max Multicast Groups: 256 MVR Current multicast groups: 0 MVR Global query response time: 5 (tenths of sec) MVR Mode: compatible				
	MVR Max Multicast MVR Current multi MVR Global query :	N: 1 Groups: 256 cast groups: 0 response time: 5 (tenths of sec)			

Related Commands	Command	Description		
	mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.		
	mvr (interface configuration)	Configures MVR ports.		
	show mvr interface	Displays the configured MVR interfaces, status of the specified interface, or all multicast groups to which the interface belongs when the interface and members keywords are appended to the command.		
	show mvr members	Displays all ports that are members of an MVR multicast group or, if there are no members, means the group is inactive.		

show mvr interface

Use the **show mvr interface** privileged EXEC command without keywords to display the Multicast VLAN Registration (MVR) receiver and source ports. Use the command with keywords to display MVR parameters for a specific receiver port.

show mvr interface [interface-id [members [vlan vlan-id]]] [| {begin | exclude | include}
expression]

Syntax Description	interface-id	(Optional) Display MVR type, status, and Immediate Leave setting for the interface.
		Valid interfaces include physical ports (including type, stack member, module, and port number.
	members	(Optional) Display all MVR groups to which the specified interface belongs.
	vlan vlan-id	(Optional) Display all MVR group members on this VLAN. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	-	identification is a non-MVR port or a source port, the command returns an error ver ports, it displays the port type, per port status, and Immediate-Leave setting.
		mbers keyword, all MVR group members on the interface appear. If you enter a R group members in the VLAN appear.
	-	se sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> the lines that contain <i>Output</i> appear.
Examples	This is an example	of output from the show mvr interface command:
·	Switch# show mvr	interface
	Port Type	Status Immediate Leave

In the preceding display, Status is defined as follows:

- Active means the port is part of a VLAN.
- Up/Down means that the port is forwarding/nonforwarding.
- Inactive means that the port is not yet part of any VLAN.

This is an example of output from the show mvr interface command for a specified port:

```
Switch# show mvr interface gigabitethernet1/0/2
Type: RECEIVER Status: ACTIVE Immediate Leave: DISABLED
```

This is an example of output from the show mvr interface interface-id members command:

Switch# show mvr interface gigabitethernet1/0/2 members

239.255.0.0	DYNAMIC	ACTIVE
239.255.0.1	DYNAMIC	ACTIVE
239.255.0.2	DYNAMIC	ACTIVE
239.255.0.3	DYNAMIC	ACTIVE
239.255.0.4	DYNAMIC	ACTIVE
239.255.0.5	DYNAMIC	ACTIVE
239.255.0.6	DYNAMIC	ACTIVE
239.255.0.7	DYNAMIC	ACTIVE
239.255.0.8	DYNAMIC	ACTIVE
239.255.0.9	DYNAMIC	ACTIVE

Related Commands

Command	Description
mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.
mvr (interface configuration)	Configures MVR ports.
show mvr	Displays the global MVR configuration on the switch.
show mvr members	Displays all receiver ports that are members of an MVR multicast group.

show mvr members

Use the **show mvr members** privileged EXEC command to display all receiver and source ports that are currently members of an IP multicast group.

show mvr members [ip-address] [| {begin | exclude | include} expression]

Syntax Description	ip-address	sourc	ional) The IP multicast address. If the address is entered, all receiver and ce ports that are members of the multicast group appear. If no address is ed, all members of all Multicast VLAN Registration (MVR) groups are d. If a group has no members, the group is listed as Inactive.
	begin	(Opti	ional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Opti	ional) Display excludes lines that match the <i>expression</i> .
	include	(Opti	ional) Display includes lines that match the specified <i>expression</i> .
	expression	Expr	ession in the output to use as a reference point.
Command Modes	Privileged EXE	С	
Command History	Release	Modi	fication
	12.1(11)AX	This	command was introduced.
Examples			contain <i>Output</i> appear. om the show mvr members command:
_//ampioo	Switch# show m		
	MVR Group IP	Status	Members
	239.255.0.1	ACTIVE	 Gi1/0/1(d), Gi1/0/5(s)
	239.255.0.2	INACTIVE	None
	239.255.0.3	INACTIVE	None
	239.255.0.4	INACTIVE	None
	239.255.0.5	INACTIVE	None
	239.255.0.6	INACTIVE	None
	239.255.0.7	INACTIVE	None
	239.255.0.8 239.255.0.9	INACTIVE INACTIVE	None None
	239.255.0.10	INACTIVE	None
			None

This is an example of output from the **show mvr members** *ip-address* command. It displays the members of the IP multicast group with that address:

```
Switch# show mvr members 239.255.0.2
239.255.003.--22 ACTIVE Gi1/0/1(d), Gi1/0/2(d), Gi1/0/3(d),
Gi1/0/4(d), Gi1/0/5(s)
```

Related Commands

Command	Description
mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.
mvr (interface configuration)	Configures MVR ports.
show mvr	Displays the global MVR configuration on the switch.
show mvr interface	Displays the configured MVR interfaces, status of the specified interface, or all multicast groups to which the interface belongs when the members keyword is appended to the command.

show pagp

Use the **show pagp** user EXEC command to display Port Aggregation Protocol (PAgP) channel-group information.

show pagp [channel-group-number] {counters | dual-active | internal | neighbor} [| {begin |
 exclude | include} expression]]

Syntax Description	channel-group-number	(Optional) Number of the channel group. The range is 1 to 48.
	counters	Display traffic information.
	dual-active	Display the dual-active status.
	internal	Display internal information.
	neighbor	Display neighbor information.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SE	The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48.
	12.2(46)SE	The dual-active keyword was added.

Usage Guidelines You can enter any **show pagp** command to display the active channel-group information. To display the nonactive information, enter the **show pagp** command with a channel-group number.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* are appear.

Examples

This is an example of output from the **show pagp 1 counters** command:

Switch> show	pagp 1	counters		
	Inform	ation	Flu	sh
Port	Sent	Recv	Sent	Recv
Channel grou	p: 1			
Gi1/0/1	45	42	0	0
Gi1/0/2	45	41	0	0

This is an example of output from the show pagp 1 internal command:

Switch>	show pagp	1 inter	nal					
Flags:	S - Devic	e is sen	ding Slo	w hello.	C - Dev	ice is in	Consisten	t state.
	A - Devic	e is in	Auto mod	e.				
Timers:	H - Hello	timer i	s runnin	g.	Q - Qui	t timer is	running.	
	S - Switc	hing tim	er is ru	nning.	I - Inte	erface tim	er is run	ning.
Channel	group 1							
				Hello	Partner	PAgP	Learning	Group
Port	Flags	State	Timers	Interval	Count	Priority	Method	Ifindex
Gi1/0/1	SC	U6/S7	Н	30s	1	128	Any	16
Gi1/0/2	SC	U6/S7	Н	30s	1	128	Any	16

This is an example of output from the show pagp 1 neighbor command:

Switch> show pagp 1 neighbor

Flags:	S - Device is sendi	5				
	A - Device is in Au	to mode. F	- Device learns	on pny:	sicai po	rt.
Channel	group 1 neighbors					
	Partner	Partner	Partner		Partner	Group

2-621

show policy-map

Use the **show policy-map** user EXEC command to display quality of service (QoS) policy maps, which define classification criteria for incoming traffic. Policy maps can include policers that specify the bandwidth limitations and the action to take if the limits are exceeded.

show policy-map [policy-map-name [class class-map-name]] [| {begin | exclude | include}
expression]

Syntax Description	policy-map-name	(Optional) Display the specified policy-map name.				
	class class-map-name	(Optional) Display QoS policy actions for a individual class.				
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .				
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Display includes lines that match the specified expression.				
	expression	Expression in the output to use as a reference point.				
Note	•	mmand-line help string, the control-plane and interface keywords are not tics shown in the display should be ignored.				
Command Modes	User EXEC					
Command History	Release	Modification				
	12.1(11)AX	This command was introduced.				
Usage Guidelines		sitive. For example, if you enter I exclude output , the lines that contain <i>outpu</i> uses that contain <i>Output</i> appear.				
xamples	This is an example of out	tput from the show policy-map command:				
	Switch> show policy-ma	2p				
	Policy Map videowizard class videowizard_1 set dscp 34 police 100000000 20					

nd	Description
map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.

show port-security

Use the **show port-security** privileged EXEC command to display port-security settings for an interface or for the switch.

show port-security [interface interface-id] [address | vlan] [| {begin | exclude | include}
expression]

Suntax Description						
Syntax Description	interface interface-id	(Optional) Display port security settings for the specified interface. Valid interfaces include physical ports (including type, stack member, module, and port number).				
	address	(Optional) Display all secure MAC addresses on all ports or a specified port.				
	vlan	(Optional) Display port security settings for all VLANs on the specified interface. This keyword is visible only on interfaces that have the switchport mode set to trunk .				
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .				
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Display includes lines that match the specified expression.				
	expression	Expression in the output to use as a reference point.				
Command Modes	Privileged EXEC					
Command History	Release	Modification

You can also use this command to displays for an interface even if you have not enabled port security on it. yword, the command displays the configured maximum and the current number es for all VLANs on the interface. This option is visible only on interfaces that				

Examples

This is an example of the output from the **show port-security** command:

Switch# show port-security

Secure Port	MaxSecureAddr (Count)	CurrentAddr (Count)	-	n Security Action
Gi1/0/1	1	0	0	Shutdown
Total Addresses	in System (excl	uding one mac	per port) : 1	

Max Addresses limit in System (excluding one mac per port) : 6272

This is an example of output from the **show port-security interface** *interface-id* command:

Switch# show port-security interface gigabitethernet1/0/1

```
Port Security : Enabled
Port status : SecureUp
Violation mode : Shutdown
Maximum MAC Addresses : 1
Total MAC Addresses : 0
Configured MAC Addresses : 0
Aging time : 0 mins
Aging type : Absolute
SecureStatic address aging : Disabled
Security Violation count : 0
```

This is an example of output from the show port-security address command:

Switch# show port-security address

Secure Mac Address Table

Vlan	Mac Address	Туре	Ports	Remaining Age (mins)
1	0006.0700.0800	SecureConfigured	Gi1/0/2	1
	Addroggog in Sustom	(ovaluding one mag	por port	· · · 1

Total Addresses in System (excluding one mac per port) : 1 Max Addresses limit in System (excluding one mac per port) : 6272

This is an example of output from the **show port-security interface gigabitethernet**1/0/2 **address** command:

Switch# show port-security interface gigabitethernet1/0/2 address Secure Mac Address Table

Vlan	Mac Address	Туре	Ports	Remaining Age (mins)
1	0006.0700.0800	SecureConfigured	Gi1/0/2	1
Total A	Addresses: 1			

This is an example of output from the **show port-security interface** *interface-id* **vlan** command:

Switch# show port-security interface gigabitethernet1/0/2 vlan Default maximum:not set, using 5120 VLAN Maximum Current 5 default 1

J	ueraurc	1
10	default	54
11	default	101
12	default	101
13	default	201
14	default	501

Related Commands	Command	Description
	clear port-security	Deletes from the MAC address table a specific type of secure address or all the secure addresses on the switch or an interface.
	switchport port-security	Enables port security on a port, restricts the use of the port to a user-defined group of stations, and configures secure MAC addresses.

show power inline

Use the **show power inline** user EXEC command to display the Power over Ethernet (PoE) status for the specified PoE port or for all PoE ports.

show power inline [[interface-id | consumption] | module switch-number] [| {begin | exclude |
include} expression]

Syntax Description	interface-id	(Optional) Display PoE-related power management information for the specified interface.
	consumption	(Optional) Display the power allocated to devices connected to PoE ports.
	module switch-number	(Optional) Limit the display to ports on the specified stack member. The switch number is 1 to 9.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(25)SEC	The consumption keywords were added.

Usage Guidelines Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain output do not appear, but the lines that contain Output appear.

Examples

This is an example of output from the **show power inline** command. In the display, port 2 is configured as static; power has been pre-allocated to this port, but no powered device is connected. Port 6 is a static port in the power-deny state because its maximum wattage is configured for 10 W. The connected powered device has a reported class maximum wattage for a Class 0 or Class 3 device. Table 2-31 describes the output fields.

Switch> Module	show powe Availab (Watts)	le	line Used (Watts)		aining Matts)
1 2	370 370		114.9 34.3		255.1 335.

<output t<="" td=""><td>runcate</td><td>d></td><td></td><td></td><td></td><td></td><td></td></output>	runcate	d>					

Table 2-31show power inline interface Field Descriptions

Field	Description
Admin	Administration mode: auto, off, static
Oper	Operating mode:
	• on—the powered device is detected, and power is applied.
	• off—no PoE is applied.
	• faulty—device detection or a powered device is in a faulty state.
	• power-deny—a powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.
Power	The supplied PoE in watts
Device	The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, <name cdp="" from=""></name>
Class	The IEEE classification: n/a, Class <0–4>
Available	The total amount of PoE in the system

Field	Description
Used	The amount of PoE allocated to ports
Remaining	The amount of PoE not allocated to ports in the system. (Available – Used = Remaining)

Table 2-31 show power inline interface Field Descriptions (continued)

Related Commands	Command	Description
	logging event power-inline-status	Enables the logging of PoE events.
	power inline	Configures the power management mode for the specified PoE port or for all PoE ports.
	show controllers power inline	Displays the values in the registers of the specified PoE controller.

show sdm prefer

Use the **show sdm prefer** privileged EXEC command to display information about the Switch Database Management (SDM) templates that can be used to maximize used for allocating system resources for a particular feature, or use the command without a keyword to display the template in use.

show sdm prefer [access | default | dual-ipv4-and-ipv6 {default | routing | vlan } | routing | vlan
[desktop]] [| {begin | exclude | include} expression]

Syntax Description	access	(Optional) Display the template that maximizes system resources for ACLs.
	default	(Optional) Display the template that balances system resources among
		features.
	dual-ipv4-and-ipv6	(Optional) Display the dual templates that support both IPv4 and IPv6.
	{default routing vlan)	• default —Display the default dual template configuration.
	,	• routing —Display the routing dual template configuration.
		• vlan—Display the VLAN dual template configuration.
	routing	(Optional) Display the template that maximizes system resources for routing.
	vlan	(Optional) Display the template that maximizes system resources for Layer 2 VLANs.
	desktop	(Optional) For Catalyst 3750-12S aggregator switches only, display the desktop templates. For this switch, when you do not enter the desktop keyword, the aggregator templates appear.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History

Release	Modification
12.1(11)AX	This command was introduced.
12.1(14)EA1	The desktop keyword was added.
12.2(25)SE	The dual-ipv4-and-ipv6 {default vlan) keywords were added.
12.2(25)SED	The access keyword was added.
12.2(25)SEE	The routing keyword was added for the dual IPv4 and IPv6 template.

Usage Guidelines When you change the SDM template by using the **sdm prefer** global configuration command, you must reload the switch for the configuration to take effect. If you enter the **show sdm prefer** command before you enter the **reload** privileged EXEC command, the **show sdm prefer** command shows the template currently in use and the template that will become active after a reload.

The numbers displayed for each template represent an approximate maximum number for each feature resource. The actual number might vary, depending on the actual number of other features configured.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of output from the **show sdm prefer** command, displaying the template in use:

Switch# show sdm prefer

The current template is "desktop default" tem	plate.
The selected template optimizes the resource	s in
the switch to support this level of features	for
8 routed interfaces and 1024 VLANs.	
number of unicast mac addresses:	бK
number of igmp groups + multicast routes:	1K
number of unicast routes:	8K
number of directly connected hosts:	6K
number of indirect routes:	2K
number of policy based routing aces:	0
number of gos aces:	512
number of security aces:	1K

This is a sample output from the **show sdm prefer routing** command entered on an aggregator switch:

Switch# show sdm prefer routing

"aggregate routing" template: The selected template optimizes the resources in the switch to support this level of features for 8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:	6K
number of igmp groups + multicast routes:	1K
number of unicast routes:	20K
number of directly connected hosts:	6K
number of indirect routes:	14K
number of policy based routing aces:	512
number of qos aces:	512
number of security aces:	1K

This is an example of output from the **show sdm prefer routing** command entered on a desktop switch:

Switch# show sdm prefer routing

```
"desktop routing" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.
```

number of unicast mac addresses:	3 K
number of igmp groups + multicast routes:	1K
number of unicast routes:	11K
number of directly connected hosts:	3 K
number of indirect routes:	8K
number of policy based routing aces:	512
number of qos aces:	512
number of security aces:	1K

This is an example of output from the **show sdm prefer dual-ipv4-and-ipv6 default** command entered on a desktop switch:

```
Switch# show sdm prefer dual-ipv4-and-ipv6 default
"desktop IPv4 and IPv6 default" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.
 number of unicast mac addresses:
                                                    2.K
 number of IPv4 IGMP groups + multicast routes:
                                                    1K
 number of IPv4 unicast routes:
                                                    ЗK
   number of directly-connected IPv4 hosts:
                                                    2K
   number of indirect IPv4 routes:
                                                    1 K
 number of IPv6 multicast groups:
                                                    1 K
 number of directly-connected IPv6 addresses:
                                                    2K
 number of indirect IPv6 unicast routes:
                                                    1K
 number of IPv4 policy based routing aces:
                                                     0
 number of IPv4/MAC qos aces:
                                                    512
 number of IPv4/MAC security aces:
                                                    1 K
 number of IPv6 policy based routing aces:
                                                    0
 number of IPv6 qos aces:
                                                    510
 number of IPv6 security aces:
                                                    510
```

This is an example of output from the **show sdm prefer** command when you have configured a new template but have not reloaded the switch:

```
Switch# show sdm prefer
The current template is "desktop routing" template.
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.
 number of unicast mac addresses:
                                              3ĸ
 number of igmp groups + multicast routes:
                                              1K
 number of unicast routes:
                                              11K
   number of directly connected hosts:
                                              3ĸ
   number of indirect routes:
                                              8K
 number of qos aces:
                                              512
 number of security aces:
                                              1K
```

On next reload, template will be "desktop vlan" template.

Related Commands	Command	Description
	sdm prefer	Sets the SDM template to maximize resources for routing or VLANs or to the default template, to select a dual IPv4 and IPv6 template, or to select the desktop or aggregator templates.

show setup express

Use the **show setup express** privileged EXEC command to display if Express Setup mode is active on the switch.

show setup express [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Defaults	No default is defi	ned.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
Examples	This is an exampl	e of output from the show setup express co mmand:

L

show spanning-tree

Use the show spanning-tree user EXEC command to display spanning-tree state information.

- show spanning-tree [bridge-group | active [detail] | backbonefast | blockedports | bridge | detail
 [active] | inconsistentports | interface interface-id | mst | pathcost method | root | summary
 [totals] | uplinkfast | vlan vlan-id] [| {begin | exclude | include} expression]
- show spanning-tree bridge-group [active [detail] | blockedports | bridge | detail [active] |
 inconsistentports | interface interface-id | root | summary] [| {begin | exclude | include}
 expression]
- show spanning-tree vlan vlan-id [active [detail] | blockedports | bridge | detail [active] |
 inconsistentports | interface interface-id | root | summary] [| {begin | exclude | include}
 expression]
- show spanning-tree {vlan vlan-id | bridge-group} bridge [address | detail | forward-time | hello-time | id | max-age | priority [system-id] | protocol] [| {begin | exclude | include} expression]
- show spanning-tree {vlan vlan-id | bridge-group} root [address | cost | detail | forward-time |
 hello-time | id | max-age | port | priority [system-id] [| {begin | exclude | include}
 expression]
- show spanning-tree interface interface-id [active [detail] | cost | detail [active] | inconsistency |
 portfast | priority | rootcost | state] [| {begin | exclude | include} expression]

show spanning-tree mst [configuration [digest]] | [instance-id [detail | interface interface-id
 [detail]] [| {begin | exclude | include} expression]

Syntax Description	bridge-group	(Optional) Specify the bridge group number. The range is 1 to 255.
	active [detail]	(Optional) Display spanning-tree information only on active interfaces (available only in privileged EXEC mode).
	backbonefast	(Optional) Display spanning-tree BackboneFast status.
	blockedports	(Optional) Display blocked port information (available only in privileged EXEC mode).
	bridge [address detail forward-time hello-time id max-age priority [system-id] protocol]	(Optional) Display status and configuration of this switch (optional keywords available only in privileged EXEC mode).
	detail [active]	(Optional) Display a detailed summary of interface information (active keyword available only in privileged EXEC mode).
	inconsistentports	(Optional) Display inconsistent port information (available only in privileged EXEC mode).
	interface interface-id [active [detail] cost detail [active] inconsistency portfast priority rootcost state]	(Optional) Display spanning-tree information for the specified interface (all options except portfast and state available only in privileged EXEC mode). Enter each interface separated by a space. Ranges are not supported. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.

mst [configuration [digest]] [instance-id	(Optional) Display the multiple spanning-tree (MST) region configuration and status (available only in privileged EXEC mode).	
[detail interface	The keywords have these meanings:	
interface-id [detail]]	• digest —(Optional) Display the MD5 digest included in the current MST configuration identifier (MSTCI). Two separate digests, one for standard and one for prestandard switches, appear (available only in privileged EXEC mode).	
	The terminology was updated for the implementation of the IEEE standard, and the <i>txholdcount</i> field was added.	
	The new master role appears for boundary ports.	
	The word <i>pre-standard</i> or <i>Pre-STD</i> appears when an IEEE standard bridge sends prestandard BPDUs on a port.	
	The word <i>pre-standard</i> (<i>config</i>) or <i>Pre-STD-Cf</i> appears when a por has been configured to transmit prestandard BPDUs and no prestandard BPDU has been received on that port.	
	The word <i>pre-standard</i> (<i>rcvd</i>) or <i>Pre-STD-Rx</i> appears when a prestandard BPDU has been received on a port that has not been configured to transmit prestandard BPDUs.	
	A <i>dispute</i> flag appears when a designated port receives inferior designated information until the port returns to the forwarding state or ceases to be designated.	
	• <i>instance-id</i> —You can specify a single instance ID, a range of IDs separated by a hyphen, or a series of IDs separated by a comma. The range is 1 to 4094. The display shows the number of currently configured instances.	
	• interface <i>interface-id</i> —(Optional) Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.	
	• detail —(Optional) Display detailed information for the instance or interface.	
pathcost method	(Optional) Display the default path cost method (available only in privileged EXEC mode).	
root [address cost detail forward-time hello-time id max-age port priority [system-id]]	(Optional) Display root switch status and configuration (all keywords available only in privileged EXEC mode).	
summary [totals]	(Optional) Display a summary of port states or the total lines of the spanning-tree state section. The words <i>IEEE Standard</i> identify the MST version running on a switch.	
uplinkfast	(Optional) Display spanning-tree UplinkFast status.	
vlan vlan-id [active [detail] backbonefast blockedports bridge [address detail forward-time hello-time id may agg priority	 (Optional) Display spanning-tree information for the specified VLAN (some keywords available only in privileged EXEC mode). You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. 	
id max-age priority [system-id] protocol]		

	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	User EXEC	
Command History	Release	Modification
•	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The mst keyword and options were added.
	12.2(25)SEC	The digest keyword was added, and new digest and transmit hold count fields appear.

Related Commands	Command	Description
	clear spanning-tree counters	Clears the spanning-tree counters.
	clear spanning-tree detected-protocols	Restarts the protocol migration process.
	spanning-tree backbonefast	Enables the BackboneFast feature.
	spanning-tree bpdufilter	Prevents an interface from sending or receiving bridge protocol data units (BPDUs).
	spanning-tree bpduguard	Puts an interface in the error-disabled state when it receives a BPDU.
	spanning-tree cost	Sets the path cost for spanning-tree calculations.
	spanning-tree extend system-id	Enables the extended system ID feature.
	spanning-tree guard	Enables the root guard or the loop guard feature for all the VLANs associated with the selected interface.
	spanning-tree link-type	Overrides the default link-type setting for rapid spanning-tree transitions to the forwarding state.

Command	Description
spanning-tree loopguard default	Prevents alternate or root ports from becoming the designated port because of a failure that leads to a unidirectional link.
spanning-tree mst configuration	Enters multiple spanning-tree (MST) configuration mode through which the MST region configuration occurs.
spanning-tree mst cost	Sets the path cost for MST calculations.
spanning-tree mst forward-time	Sets the forward-delay time for all MST instances.
spanning-tree mst hello-time	Sets the interval between hello BPDUs sent by root switch configuration messages.
spanning-tree mst max-age	Sets the interval between messages that the spanning tree receives from the root switch.
spanning-tree mst max-hops	Sets the number of hops in an MST region before the BPDU is discarded and the information held for an interface is aged.
spanning-tree mst port-priority	Configures an interface priority.
spanning-tree mst priority	Configures the switch priority for the specified spanning-tree instance.
spanning-tree mst root	Configures the MST root switch priority and timers based on the network diameter.
spanning-tree port-priority	Configures an interface priority.
spanning-tree portfast (global configuration)	Globally enables the BPDU filtering or the BPDU guard feature on Port Fast-enabled interfaces or enables the Port Fast feature on all nontrunking interfaces.
spanning-tree portfast (interface configuration)	Enables the Port Fast feature on an interface and all its associated VLANs.
spanning-tree uplinkfast	Accelerates the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself.
spanning-tree vlan	Configures spanning tree on a per-VLAN basis.

show storm-control

Use the **show storm-control** user EXEC command to display broadcast, multicast, or unicast storm control settings on the switch or on the specified interface or to display storm-control history.

show storm-control [interface-id] [broadcast | multicast | unicast] [| {begin | exclude | include}
expression]

Syntax Description	interface-id	(Optional) Interface ID for the physical port (including type, stack member, module, and port number).
	broadcast	(Optional) Display broadcast storm threshold setting.
	multicast	(Optional) Display multicast storm threshold setting.
	unicast	(Optional) Display unicast storm threshold setting.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines Who

s When you enter an *interface-id*, the storm control thresholds appear for the specified interface.

If you do not enter an *interface-id*, settings appear for one traffic type for all ports on the switch.

If you do not enter a traffic type, settings appear for broadcast storm control.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

This is an example of a partial output from the **show storm-control** command when no keywords are entered. Because no traffic-type keyword was entered, the broadcast storm control settings appear.

Switch> show storm-control

Interface	Filter State	Upper	Lower	Current
Gi1/0/1	Forwarding	20 pps	10 pps	5 pps
Gi1/0/2	Forwarding	50.00%	40.00%	0.00%
<output td="" trun<=""><td>cated></td><td></td><td></td><td></td></output>	cated>			

This is an example of output from the **show storm-control** command for a specified interface. Because no traffic-type keyword was entered, the broadcast storm control settings appear.

Switch> show	storm-control	gigabitether	net 1/0/1	
Interface	Filter State	Upper	Lower	Current
Gi1/0/1	Forwarding	20 pps	10 pps	5 pps

Table 2-32 describes the fields in the **show storm-control** display.

Table 2-32show storm-control Field Descriptions

Field	Description	
Interface	Displays the ID of the interface.	
Filter State	Displays the status of the filter:	
	• Blocking—Storm control is enabled, and a storm has occurred.	
	• Forwarding—Storm control is enabled, and no storms have occurred.	
	• Inactive—Storm control is disabled.	
Upper	Displays the rising suppression level as a percentage of total available bandwidth in packets per second or in bits per second.	
Lower	Displays the falling suppression level as a percentage of total available bandwidth in packets per second or in bits per second.	
Current	Displays the bandwidth usage of broadcast traffic or the specified traffic type (broadcast, multicast, or unicast) as a percentage of total available bandwidth. This field is only valid when storm control is enabled.	

Related Commands

Command	Description
storm-control	Sets the broadcast, multicast, or unicast storm control levels for the switch.

show switch

Use the **show switch** user EXEC command to display information related to the stack member or the switch stack.

show switch [stack-member-number | detail | neighbors | stack-ports | stack-ring activity
 [detail]] [| {begin | exclude | include} expression]

stack-member-number detail neighbors stack-ports stack-ring activity [detail]	 (Optional) Display information for the specified stack member. The range is 1 to 9. (Optional) Display detailed information about the stack ring. (Optional) Display the neighbors for the entire switch stack. (Optional) Display port information for the entire switch stack. (Optional) Display the number of frames per stack member that are sent to the stack ring. Use the detail keyword to display the ASIC, the receive
neighbors stack-ports stack-ring activity	(Optional) Display the neighbors for the entire switch stack.(Optional) Display port information for the entire switch stack.(Optional) Display the number of frames per stack member that are sent to
stack-ports stack-ring activity	(Optional) Display port information for the entire switch stack.(Optional) Display the number of frames per stack member that are sent to
stack-ring activity	(Optional) Display the number of frames per stack member that are sent to
	queues, and the number of frames per stack member that are sent to the stack ring.
begin	(Optional) Display begins with the line that matches the expression.
exclude	(Optional) Display excludes lines that match the <i>expression</i> .
include	(Optional) Display includes lines that match the specified expression.
expression	Expression in the output to use as a reference point.
Release	Modification
12.1(11)AX	This command was introduced.
12.1(14)EA1	The display was expanded to include Switch Database Management (SDM) mismatch.
12.2(20)SE	The display was expanded to include provisioning information. The stack-ring activity [detail] keywords were added.
- Expressions are case sen	sitive. For example, if you enter exclude output , the lines that contain <i>output</i>
-	I exclude I include expression User EXEC Release 12.1(11)AX 12.1(14)EA1 12.2(20)SE

• Initializing—The state when a switch has determined whether it is the stack master or not. If the switch is not the stack master, it is receiving its system- and interface-level configuration from the stack master and loading it.

- Ready—The state when the stack member has completed loading the system- and interface-level configuration and is ready to forward traffic.
- Master Re-Init—The state immediately after a stack master re-election and a different stack member is elected stack master. The new stack master is re-initializing its configuration. This state applies only to the new stack master.
- Ver Mismatch—The state of a switch in version mismatch (VM) mode. VM mode is when a switch joining the switch stack has a different stack protocol minor version number than the stack master.
- SDM Mismatch—The state of a switch in Switch Database Management (SDM) mismatch mode. SDM mismatch is when a stack member does not support the SDM template running on the stack master.
- Provisioned—The state of a preconfigured switch before it becomes an active member of a switch stack, or the state of a stack member after it has left the switch stack. The MAC address and the priority number in the display are always 0 for the provisioned switch.

A typical state transition for a stack member (including a stack master) booting up is Waiting -> Initializing -> Ready.

A typical state transition for a stack member becoming a stack master after a stack master election is Ready -> Master Re-Init -> Ready.

A typical state transition for a stack member in version mismatch (VM) mode is Waiting -> Ver Mismatch.

You can use the **show switch** command to identify whether the provisioned switch exists in the switch stack. The **show running-config** and the **show startup-config** privileged EXEC commands do not provide this information.

Beginning with Cisco IOS Release 12.2(35)SE, the display also includes stack MAC persistency wait time if persistent MAC address is enabled.

Examples

This example shows how to display summary information about a switch stack:

Switch> show switch

Switch#	Role	Mac Address	Priority	Current State
6	Member	0003.e31a.1e00	1	Ready
*8	Master	0003.e31a.1200	1	Ready
2	Member	0000.000.0000	0	Provisioned

This example shows detailed information about a switch stack:

Switch> show switch detail

Switch#	Role	Mac Address	Priority	Current State
2	Member	0000.000.0000	0	Provisioned
6	Member	0003.e31a.1e00	1	Ready
*8	Master	0003.e31a.1200	1	Ready
Switch#	Stack Po Port A	ort Status Port B	Neight Port A	
6	Down	Ok	None	8
8	Ok	Down	6	None

This example shows how to display summary information about stack member 6:

Switch>	show swite	h 6		
Switch#	Role	Mac Address	Priority	Current State
6	Member	0003.e31a.1e00	1	Ready

This example shows how to display neighbor information for a switch stack:

Switch> show	switch nei	lghbors
Switch #	Port A	Port B
6	None	8
8	6	None

This example shows how to display stack-port information for a switch stack:

Switch> show	switch sta	ck-ports
Switch #	Port A	Port B
6	Down	Ok
8	Ok	Down

This example shows how to display detailed stack-ring activity information for a switch stack:

Switch		Rx Queue-1	-	Rx Queue-3	Rx Queue-4	Total
1 1 1	0 1	2021864 52	1228937 0	281510 72678	0 0	3532311 72730
				 Swit	ch 1 Total:	3605041
2 2 2	0 1	2020901 52	90833 0	101680 0	0 0	2213414 52
				 Swit	ch 2 Total:	2213466

Switch> show switch stack-ring activity detail

Total frames sent to stack ring : 5818507

Note: these counts do not include frames sent to the ring by certain output features, such as output SPAN and output ACLs.

Related Commands

Command	Description
reload	Reloads the stack member and puts a configuration change into effect.
remote command	Monitors all or specified stack members.
session	Accesses a specific stack member.
switch priority	Changes the stack member priority value.
switch provision	Provisions a new switch before it joins the switch stack.
switch renumber	Changes the stack member number.

show system mtu

Use the **show system mtu** privileged EXEC command to display the global maximum transmission unit (MTU) or maximum packet size set for the switch.

show system mtu [| {begin | exclude | include} expression]

Syntax Description		
-	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	ports; the system ro Expressions are cas	efers to ports operating at 10/100 Mb/s; the system jumbo MTU refers to Gigabit outing MTU refers to routed ports. se sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> the lines that contain <i>Output</i> appear.

show udld

Use the **show udld** user EXEC command to display UniDirectional Link Detection (UDLD) administrative and operational status for all ports or the specified port.

show udld [interface-id] [| {begin | exclude | include} expression]

Syntax Description	interface-id	(Optional) ID of the interface and port number. Valid interfaces include physical ports and VLANs. The VLAN range is 1 to 4094.		
	begin	(Optional) Display begins with the line that matches the expression.		
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .		
	include	(Optional) Display includes lines that match the specified <i>expression</i> .		
	expression	Expression in the output to use as a reference point.		
Command Modes	User EXEC			
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Examples	-	of output from the show udld <i>interface-id</i> command. For this display, UDLD is ds of the link, and UDLD detects that the link is bidirectional. Table 2-33 describes splay.		
		l gigabitethernet2/0/1		
	Port enable opera Current bidirecti	histrative configuration setting: Follows device default ational state: Enabled onal state: Bidirectional hal state: Advertisement - Single Neighbor detected 60		

Field	Description
Interface	The interface on the local device configured for UDLD.
Port enable administrative configuration setting	How UDLD is configured on the port. If UDLD is enabled or disabled, the port enable configuration setting is the same as the operational enable state. Otherwise, the enable operational setting depends on the global enable setting.
Port enable operational state	Operational state that shows whether UDLD is actually running on this port.
Current bidirectional state	The bidirectional state of the link. An unknown state appears if the link is down or if it is connected to an UDLD-incapable device. A bidirectional state appears if the link is a normal two-way connection to a UDLD-capable device. All other values mean miswiring.
Current operational state	The current phase of the UDLD state machine. For a normal bidirectional link, the state machine is most often in the Advertisement phase.
Message interval	How often advertisement messages are sent from the local device. Measured in seconds.
Time out interval	The time period, in seconds, that UDLD waits for echoes from a neighbor device during the detection window.
Entry 1	Information from the first cache entry, which contains a copy of echo information received from the neighbor.
Expiration time	The amount of time in seconds remaining before this cache entry is aged out.
Device ID	The neighbor device identification.
Current neighbor state	The neighbor's current state. If both the local and neighbor devices are running UDLD normally, the neighbor state and local state should be bidirectional. If the link is down or the neighbor is not UDLD-capable, no cache entries appear.
Device name	The device name or the system serial number of the neighbor. The system serial number appears if the device name is not set or is set to the default (Switch).
Port ID	The neighbor port ID enabled for UDLD.
Neighbor echo 1 device	The device name of the neighbors' neighbor from which the echo originated.
Neighbor echo 1 port	The port number ID of the neighbor from which the echo originated.
Message interval	The rate, in seconds, at which the neighbor is sending advertisement messages.
CDP device name	The CDP device name or the system serial number. The system serial number appears if the device name is not set or is set to the default (Switch).

Table 2-33	show udld Field Descriptions
------------	------------------------------

Related Commands	Command	Description
	udld	Enables aggressive or normal mode in UDLD or sets the configurable message timer time.
	udld port	Enables UDLD on an individual interface or prevents a fiber-optic interface from being enabled by the udld global configuration command.
	udld reset	Resets all interfaces shutdown by UDLD and permits traffic to begin passing through them again.

2-649

show version

Use the **show version** user EXEC command to display version information for the hardware and firmware.

show version [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the expression.			
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .			
	include	(Optional) Display includes lines that match the specified expression.			
	expression	Expression in the output to use as a reference point.			
Command Modes	User EXEC				
Command History	Release	Modification			
	12.1(11)AX	This command was introduced.			
Usage Guidelines	*	se sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> the lines that contain <i>Output</i> appear.

show vlan

Use the **show vlan** user EXEC command to display the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) on the switch.

show vlan [brief | dot1q tag native | id vlan-id | internal usage | mtu | name vlan-name |
private-vlan [type] | remote-span | summary] [| {begin | exclude | include} expression]

Syntax Description	brief	(Optional) Display one line for each VLAN with the VLAN name, status, and its ports.
	dot1q tag native	(Optional) Display the IEEE 802.1Q native VLAN tagging status.
	id vlan-id	(Optional) Display information about a single VLAN identified by VLAN ID number. For <i>vlan-id</i> , the range is 1 to 4094.
	internal usage	(Optional) Display a list of VLANs being used internally by the switch. These VLANs are always from the extended range (VLAN IDs 1006 to 4094), and you cannot create VLANs with these IDS by using the vlan global configuration command until you remove them from internal use.
	mtu	(Optional) Display a list of VLANs and the minimum and maximum transmission unit (MTU) sizes configured on ports in the VLAN.
	name vlan-name	(Optional) Display information about a single VLAN identified by VLAN name. The VLAN name is an ASCII string from 1 to 32 characters.
	private-vlan	(Optional) Display information about configured private VLANs, including primary and secondary VLAN IDs, type (community, isolated, or primary) and ports belonging to the private VLAN. This keyword is only supported if your switch is running the IP services image, formerly known as the enhanced multilayer image (EMI).
	type	(Optional) Display only private VLAN ID and type.
	remote-span	(Optional) Display information about Remote SPAN (RSPAN) VLANs.
	summary	(Optional) Display VLAN summary information.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Though visible in the command-line help string, the **ifindex** keyword is not supported.

Command Modes

User EXEC

Command History	Release	Modification					
	12.1(11)AX	This command was introduced.					
	12.2(20)SE	The mtu and private-vlan keywords were added.					
	12.2(25)SE	The dot1q tag native keywords were added.					
Usage Guidelines	VLAN have the san different MTUs, an MTU might be dro SVI_MTU column.	ntu command output, the MTU_Mismatch column shows whether all the ports in the me MTU. When <i>yes</i> appears in this column, it means that the VLAN has ports with ad packets that are switched from a port with a larger MTU to a port with a smaller pped. If the VLAN does not have an SVI, the hyphen (-) symbol appears in the . If the MTU-Mismatch column displays <i>yes</i> , the names of the port with the MinMTU he MaxMTU appear.					
	If you try to associate a private VLAN secondary VLAN with a primary VLAN before you define the secondary VLAN, the secondary VLAN is not included in the show vlan private-vlan command output.						
	In the show vlan private-vlan type command output, a type displayed as <i>normal</i> means a VLAN that has a private VLAN association but is not part of the private VLAN. For example, if you define and associate two VLANs as primary and secondary VLANs and then delete the secondary VLAN configuration without removing the association from the primary VLAN, the VLAN that was the secondary VLAN is shown as <i>normal</i> in the display. In the show vlan private-vlan output, the primary and secondary VLAN pair is shown as <i>non-operational</i> .						
	1	se sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> the lines that contain <i>Output</i> appear.					
Examples	This is an example	of output from the show vlan command. Table 2-34 describes the fields in the display.

Table 2-34show vlan Command Output Fields

Field	Description	
VLAN	VLAN number.	
Name	Name, if configured, of the VLAN.	
Status	Status of the VLAN (active or suspend).	
Ports	Ports that belong to the VLAN.	
Туре	Media type of the VLAN.	
SAID	Security association ID value for the VLAN.	
MTU	Maximum transmission unit size for the VLAN.	
Parent	Parent VLAN, if one exists.	
RingNoRing number for the VLAN, if applicable.		
BrdgNo	Bridge number for the VLAN, if applicable.	
Stp	Spanning Tree Protocol type used on the VLAN.	
BrdgMode	Bridging mode for this VLAN—possible values are source-route bridging (SRB) and source-route transparent (SRT); the default is SRB.	
Trans1 Translation bridge 1.		
Trans2 Translation bridge 2.		
Remote SPAN VLANs	LANs Identifies any RSPAN VLANs that have been configured.	
Primary/Secondary/ Type/Ports	Includes any private VLANs that have been configured, including the primary VLAN ID, the secondary VLAN ID, the type of secondary VLAN (community or isolated), and the ports that belong to it.	

This is an example of output from the **show vlan dot1q tag native** command:

Switch> **show vlan dotlq tag native** dotlq native vlan tagging is disabled

This is an example of output from the show vlan private-vlan command:

Switch>	show vlan	private-vlan	
Primary	Secondary	Туре	Ports
10	501	isolated	Gi3/0/3
10	502	community	Fa2/0/11
10	503	non-operational3	-

			Fa2/0/22, Fa3/0/13, Fa3/0/14, Fa3/0/20, Gi3/0/1
20	30	community	Fa1/0/13, Fa1/0/20, Fa1/0/21, Gi1/0/1, Fa2/0/13,
			Fa2/0/20, Fa3/0/14, Fa3/0/20, Fa3/0/21, Gi3/0/1
20	35	community	Fa1/0/13, Fa1/0/20, Fa1/0/23, Fa1/0/33. Gi1/0/1,
			Fa2/0/13, Fa3/0/14, Fa3/0/20. Fa3/0/23, Fa3/0/33,
			Gi3/0/1
20	55	non-operational	
2000	2500	isolated	Fa1/0/5, Fa1/0/10, Fa2/0/5, Fa2/0/10, Fa2/0/15

This is an example of output from the show vlan private-vlan type command:

This is an example of output from the show vlan summary command:

Switch> show vlan summary

Number of existing VLANs : 45 Number of existing VTP VLANs : 45 Number of existing extended VLANs : 0

This is an example of output from the show vlan id command.

Switch# show vlan VLAN Name	id 2	Status	Ports	
2 VLAN0200		active	Fa1/0/7, Fa1/0/8	
2 VLAN0200 VLAN Type SAID	MTU Parent		/3, Fa2/5, Fa2/6 No Stp BrdgMode	Trans1 Trans2
2 enet 100002	1500 -			0 0
Remote SPAN VLAN				

This is an example of output from the **show vlan internal usage** command. It shows that VLANs 1025 and 1026 are being used as internal VLANs for Fast Ethernet routed ports 23 and 24 on stack member 1. If you want to use one of these VLAN IDs, you must first shut down the routed port, which releases the internal VLAN, and then create the extended-range VLAN. When you start up the routed port, another internal VLAN number is assigned to it.

Switch> **show vlan internal usage** VLAN Usage ---- ------1025 FastEthernet1/0/23 1026 FastEthernet1/0/24

Related Commands	Command	Description
	private-vlan	Configures a VLAN as a community, isolated, or primary VLAN or associates a primary VLAN with secondary VLANs.
	switchport mode	Configures the VLAN membership mode of a port.
	vlan (global configuration)	Enables VLAN configuration mode where you can configure VLANs 1 to 4094.
	vlan (VLAN configuration)	Configures VLAN characteristics in the VLAN database. Only available for normal-range VLANs (VLAN IDs 1 to 1005). Do not enter leading zeros.

show vlan access-map

Use the **show vlan access-map** privileged EXEC command to display information about a particular VLAN access map or for all VLAN access maps.

show vlan access-map [mapname] [| {begin | exclude | include} expression]

Syntax Description	mapname	(Optional) Name of a specific VLAN access map.					
	begin	(Optional) Display begins with the line that matches the expression.					
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .					
	include	(Optional) Display includes lines that match the specified expression.					
	<i>expression</i> Expression in the output to use as a reference point.						
Command Modes	Privileged EXEC						
Commana Moues	Thinkged EXEC						
Command History	Release	Modification					
	12.1(11)AX	This command was introduced.					
Usage Guidelines	-	ase sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> the lines that contain <i>Output</i> appear.					
Examples	This is an exampl	e of output from the show vlan access-map command:					
	-	"SecWiz" 10					
	Action: forward						

Related Commands Command		Description	
	show vlan filter	Displays information about all VLAN filters or about a particular VLAN or VLAN access map.	
	vlan access-map	Creates a VLAN map entry for VLAN packet filtering.	
	vlan filter	Applies a VLAN map to one or more VLANs.	

show vlan filter

Use the **show vlan filter** privileged EXEC command to display information about all VLAN filters or about a particular VLAN or VLAN access map.

show vlan filter [access-map name | vlan vlan-id] [| {begin | exclude | include} expression]

Syntax Description	access-map name	(Optional) Display filtering information for the specified VLAN access map.			
	vlan-id(Optional) Display filtering information for the specified VLAN. The ran 1 to 4094.				
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the expression.			
	include	(Optional) Display includes lines that match the specified expression.			
	expression	Expression in the output to use as a reference point.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(11)AX	This command was introduced.			
Usage Guidelines	Expressions are case sensitive. For example, if you enter exclude output, the lines that contain <i>a</i> do not appear, but the lines that contain <i>Output</i> appear.				
Examples	This is an example of	output from the show vlan filter command:			
	Switch# show vlan filter VLAN Map map_1 is filtering VLANs: 20-22				
Related Commands	Command	Description			
	show vlan access-ma	 Displays information about a particular VLAN access map or for all VLAN access maps. 			
	vlan access-map	Creates a VLAN map entry for VLAN packet filtering.			
	vlan filter	Applies a VLAN map to one or more VLANs.			

show vmps

Use the **show vmps** user EXEC command without keywords to display the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, and the current and primary servers, or use the **statistics** keyword to display client-side statistics.

show vmps [statistics] [| {begin | exclude | include} expression]

Syntax Description	statistics	(Optional) Display VQP client-side statistics and counters.				
	begin	(Optional) Display begins with the line that matches the expression.				
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	clude (Optional) Display includes lines that match the specified <i>expression</i> .				
	expression	Expression in the output to use as a reference point.

This is an example of output from the **show vmps statistics** command. Table 2-35 describes each field in the display.

Switch> show vmps statistics VMPS Client Statistics _____ 0 VQP Queries: VQP Responses: 0 VMPS Changes: 0 VQP Shutdowns: 0 VQP Denied: 0 VQP Wrong Domain: 0 VQP Wrong Version: 0 VQP Insufficient Resource: 0

Table 2-35show vmps statistics Field Descriptions

Field	Description
VQP Queries	Number of queries sent by the client to the VMPS.
VQP Responses	Number of responses sent to the client from the VMPS.
VMPS Changes	Number of times that the VMPS changed from one server to another.
VQP Shutdowns	Number of times the VMPS sent a response to shut down the port. The client disables the port and removes all dynamic addresses on this port from the address table. You must administratively re-enable the port to restore connectivity.
VQP Denied	Number of times the VMPS denied the client request for security reasons. When the VMPS response denies an address, no frame is forwarded to or from the workstation with that address (broadcast or multicast frames are delivered to the workstation if the port has been assigned to a VLAN). The client keeps the denied address in the address table as a blocked address to prevent more queries from being sent to the VMPS for each new packet received from this workstation. The client ages the address if no new packets are received from this workstation on this port within the aging time period.
VQP Wrong Domain	Number of times the management domain in the request does not match the one for the VMPS. Any previous VLAN assignments of the port are not changed. This response means that the server and the client have not been configured with the same VTP management domain.
VQP Wrong Version	Number of times the version field in the query packet contains a value that is higher than the version supported by the VMPS. The VLAN assignment of the port is not changed. The switches send only VMPS Version 1 requests.
VQP Insufficient Resource	Number of times the VMPS is unable to answer the request because of a resource availability problem. If the retry limit has not yet been reached, the client repeats the request with the same server or with the next alternate server, depending on whether the per-server retry count has been reached.

Related Commands	Command	Description
	clear vmps statistics	Clears the statistics maintained by the VQP client.
	vmps reconfirm (privileged EXEC)	Sends VQP queries to reconfirm all dynamic VLAN assignments with the VMPS.
	vmps retry	Configures the per-server retry count for the VQP client.
	vmps server	Configures the primary VMPS and up to three secondary servers.

show vtp

Use the **show vtp** user EXEC command to display general information about the VLAN Trunking Protocol (VTP) management domain, status, and counters.

show vtp {counters | password | status} [| {begin | exclude | include} expression]

Syntax Description	counters	Display the VTP statistics for the switch.				
	password	Display the configured VTP password.				
	status	Display general information about the VTP management domain status.				
	begin	(Optional) Display begins with the line that matches the expression.				
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .				
	include	(Optional) Display includes lines that match the specified <i>expression</i> .				
	expression	Expression in the output to use as a reference point.				
Command Modes	User EXEC					
Command History	Release	Modification				
	12.1(11)AX	This command was introduced.				
	12.1(14)EA1	The password keyword was added.				
Usage Guidelines Examples	do not appear, but tl	e sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> he lines that contain <i>Output</i> appear.				
	Switch> show vtp	counters				
	Subset advertisem	ents received: 0ments received: 0ments transmitted: 0ents transmitted: 0ments transmitted: 0revision errors: 0				

VTP pruning statistics:

Trunk	Join Transmitted	Join Received	Summary advts received from non-pruning-capable device
Fa1/0/47	0	0	0
Fa1/0/48	0	0	0
Gi2/0/1	0	0	0
Gi3/0/2	0	0	0

Table 2-36	show vtp counters Field Descriptions

Field	Description	
Summary advertisements received	Number of summary advertisements received by this switch on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow.	
Subset advertisements received	Number of subset advertisements received by this switch on its trunk ports. Subset advertisements contain all the information for one or more VLANs.	
Request advertisements received	Number of advertisement requests received by this switch on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.	
Summary advertisements Number of summary advertisements sent by this switch on its transmitted ports. Summary advertisements contain the management doma the configuration revision number, the update timestamp and ic the authentication checksum, and the number of subset advertise follow.		
Subset advertisementsNumber of subset advertisements sent by this switch on its trtransmittedSubset advertisements contain all the information for one or toVLANs.		
Request advertisements transmittedNumber of advertisement requests sent by this switch on Advertisement requests normally request information on They can also request information on a subset of VLANs		
Number of configuration	Number of revision errors.	
revision errors	Whenever you define a new VLAN, delete an existing one, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the switch increments.	
	Revision errors increment whenever the switch receives an advertisement whose revision number matches the revision number of the switch, but the MD5 digest values do not match. This error means that the VTP password in the two switches is different or that the switches have different configurations.	
	These errors means that the switch is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.	

Field	Description		
Number of configuration	Number of MD5 digest errors.		
digest errors	Digest errors increment whenever the MD5 digest in the summary packet and the MD5 digest of the received advertisement calculated by the switch do not match. This error usually means that the VTP password in the two switches is different. To solve this problem, make sure the VTP password on all switches is the same.		
	These errors mean that the switch is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.		
Number of V1 summary	Number of Version 1 errors.		
errors	Version 1 summary errors increment whenever a switch in VTP V2 mode receives a VTP Version 1 frame. These errors mean that at least one neighboring switch is either running VTP Version 1 or VTP Version 2 with V2-mode disabled. To solve this problem, change the configuration of the switches in VTP V2-mode to disabled.		
Join Transmitted	Number of VTP pruning messages sent on the trunk.		
Join Received	Number of VTP pruning messages received on the trunk.		
Summary Advts Received from non-pruning-capable device	Number of VTP summary messages received on the trunk from devices that do not support pruning.		

 Table 2-36
 show vtp counters Field Descriptions (continued)

This is an example of output from the **show vtp status** command. Table 2-37 describes each field in the display.

```
Switch> show vtp status
```

VTP Version	:	2
Configuration Revision	:	0
Maximum VLANs supported locally	:	1005
Number of existing VLANs	:	45
VTP Operating Mode	:	Transparent
VTP Domain Name	:	shared_testbed1
VTP Pruning Mode	:	Disabled
VTP V2 Mode	:	Disabled
VTP Traps Generation	:	Enabled
MD5 digest	:	0x3A 0x29 0x86 0x39 0xB4 0x5D 0x58 0xD7

Field	Description		
VTP Version	Displays the VTP version operating on the switch. By default, the switch implements Version 1 but can be set to Version 2.		
Configuration Revision	Current configuration revision number on this switch.		
Maximum VLANs Supported Locally	Maximum number of VLANs supported locally.		
Number of Existing VLANs	Number of existing VLANs.		
VTP Operating Mode	Displays the VTP operating mode, which can be server, client, or transparent.		
	Server: a switch in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The switch guarantees that it can recover all the VLAN information in the current VTP database from NVRAM after reboot. By default, every switch is a VTP server.		
	Note The switch automatically changes from VTP server mode to VTF client mode if it detects a failure while writing the configuration to NVRAM and cannot return to server mode until the NVRAM is functioning.		
	Client: a switch in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.		
	Transparent: a switch in VTP transparent mode is disabled for VTP, does not send or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The switch receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.		
VTP Domain Name	Name that identifies the administrative domain for the switch.		
VTP Pruning Mode	Displays whether pruning is enabled or disabled. Enabling pruning on a VTP server enables pruning for the entire management domain. Pruning restricts flooded traffic to those trunk links that the traffic must use to access the appropriate network devices.		
VTP V2 Mode	Displays if VTP Version 2 mode is enabled. All VTP Version 2 switches operate in Version 1 mode by default. Each VTP switch automatically detects the capabilities of all the other VTP devices. A network of VTP devices should be configured to Version 2 only if all VTP switches in the network can operate in Version 2 mode.		
VTP Traps Generation	Displays whether VTP traps are sent to a network management station.		
MD5 Digest	A 16-byte checksum of the VTP configuration.		
Configuration Last Modified	Displays the date and time of the last configuration modification. Displays the IP address of the switch that caused the configuration change to the database.		

Related Commands	Command	D
	aloar ytp counters	C

S	Command	Description
	clear vtp counters	Clears the VTP and pruning counters.
	vtp (global configuration)	Configures the VTP filename, interface name, domain name, and mode.
	vtp (VLAN configuration)	Configures the VTP domain name, password, pruning, and mode.

shutdown

Use the **shutdown** interface configuration command on the switch stack or on a standalone switch to disable an interface. Use the **no** form of this command to restart a disabled interface.

shutdown

no shutdown

Syntax Description	This command has no arguments or keywords.
--------------------	--

- **Defaults** The port is enabled (not shut down).
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines The **shutdown** command causes a port to stop forwarding. You can enable the port with the **no shutdown** command.

The **no shutdown** command has no effect if the port is a static-access port assigned to a VLAN that has been deleted, suspended, or shut down. The port must first be a member of an active VLAN before it can be re-enabled.

The shutdown command disables all functions on the specified interface.

This command also marks the interface as unavailable. To see if an interface is disabled, use the **show interfaces** privileged EXEC command. An interface that has been shut down is shown as administratively down in the display.

Examples These examples show how to disable and re-enable a port:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# shutdown

Switch(config)# interface gigabitethernet1/0/2 Switch(config-if)# no shutdown You can verify your settings by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	show interfaces	Displays the statistical information specific to all interfaces or to a specific interface.

shutdown vlan

Use the **shutdown vlan** global configuration command on the switch stack or on a standalone switch to shut down (suspend) local traffic on the specified VLAN. Use the **no** form of this command to restart local traffic on the VLAN.

shutdown vlan vlan-id

no shutdown vlan vlan-id

Syntax Description	de ex	O of the VLAN to be locally shut down. The range is 2 to 1001. VLANs defined as sfault VLANs under the VLAN Trunking Protocol (VTP), as well as tended-range VLANs (greater than 1005) cannot be shut down. The default LANs are 1 and 1002 to 1005.
Defaults	No default is defined	
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		command does not change the VLAN information in the VTP database. The a local traffic, but the switch still advertises VTP information.
Examples	This example shows how to shut down traffic on VLAN 2:	
Exampleo	This example shows	how to shut down traffic on VLAN 2:
Exampleo	This example shows Switch(config)# shows	
LAUNPIOU	Switch(config)# sh	
Related Commands	Switch(config)# sh	utdown vlan 2
	Switch(config)# sh	atdown vlan 2 setting by entering the show vlan privileged EXEC command.

small-frame violation rate

Use the **small-frame violation rate** *pps* interface configuration command on the switch stack or on a standalone switch to configure the rate (threshold) for an interface to be error disabled when it receives VLAN-tagged packets that are small frames (67 bytes or less) at the specified rate. Use the **no** form of this command to return to the default setting.

small-frame violation rate pps

no small-frame violation rate pps

Syntax Description	pps	Specify the threshold at which an interface receiving small frames will be error disabled. The range is 1 to 10,000 packets per second (pps).
Defaults	This feature is disa	bled.
Command Modes	Interface configurat	tion
Command History	Release	Modification
	12.2(44)SE	This command was introduced.
Usage Guidelines	Small frames are co	bles the rate (threshold) for a port to be error disabled when it receives small frames. onsidered packets that are 67 frames or less. detect cause small-frame global configuration command to globally enable the nold for each port.
	You can configure the port to be automatically re-enabled by using the errdisable recovery cause small-frame global configuration command. You configure the recovery time by using the errdisable recovery interval interval global configuration command.	
Examples	-	s how to enable the small-frame arrival rate feature so that the port is error disabled rames arrived at 10,000 pps.
		nterface gigabitethernet2/0/1 # small-frame violation rate 10000
	You can verify you	r setting by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description	
	errdisable detect cause small-frame	Allows any switch port to be put into the error-disabled state if an incoming frame is smaller than the minimum size and arrives at the specified rate (threshold).	
	errdisable recovery cause small-frame	Enables the recovery timer.	
	show interfaces	Displays the interface settings on the switch, including input and output flow control.	

snmp-server enable traps

Use the **snmp-server enable traps** global configuration command on the switch stack or on a standalone switch to enable the switch to send Simple Network Management Protocol (SNMP) notifications for various traps or inform requests to the network management system (NMS). Use the **no** form of this command to return to the default setting.

- snmp-server enable traps [bgp | bridge [newroot] [topologychange] | cluster | config |
 copy-config | {dot1x [auth-fail-vlan | guest-vlan | no-auth-fail-vlan | no-guest-vlan] } |
 entity | envmon [fan | shutdown | status | supply | temperature] | errdisable
 [notification-rate value] | flash [insertion | removal] | fru-ctrl | hsrp | ipmulticast |
 mac-notification | msdp | ospf [cisco-specific | errors | lsa | rate-limit | retransmit |

 [root-inconsistency] [loop-inconsistency] | syslog | tty | vlan-membership | vlancreate |
 vlandelete | vtp]
- no snmp-server enable traps [bgp | bridge [newroot] [topologychange] | cluster | config | copy-config | {dot1x [auth-fail-vlan | guest-vlan | no-auth-fail-vlan | no-guest-vlan] } | entity | envmon [fan | shutdown | status | supply | temperature] | errdisable [notification-rate] | flash [insertion | removal] | fru-ctrl | hsrp | ipmulticast | mac-notification | msdp | ospf [cisco-specific | errors | lsa | rate-limit | retransmit | state-change] | pim [invalid-pim-message | neighbor-change | rp-mapping-change] | port-security [trap-rate] | rtr | snmp [authentication | coldstart | linkdown | linkup | warmstart] | stackwise | storm-control trap-rate | stpx [inconsistency] [root-inconsistency] [loop-inconsistency] | syslog | tty | vlan-membership | vlancreate | vlandelete | vtp]

bri [to clu cor	bgp	(Optional) Enable Border Gateway Protocol (BGP) state-change traps.
		Note This keyword is available only when the IP services image is installed on the stack master.
	bridge [newroot] [topologychange]	(Optional) Generate STP bridge MIB traps. The keywords have these meanings:
		• newroot —(Optional) Enable SNMP STP Bridge MIB new root traps.
		• topologychange —(Optional) Enable SNMP STP Bridge MIB topology change traps.
	cluster	(Optional) Enable cluster traps.
	config	(Optional) Enable SNMP configuration traps.
	copy-config	(Optional) Enable SNMP copy-configuration traps.

dot1x [auth-fail-vlan	(Optional) Enable IEEE 802.1x traps. The keywords have these meanings:		
guest-vlan no-auth-fail-vlan no-guest-vlan]	• auth-fail-vlan —(Optional) Generate a trap when the port moves to the configured restricted VLAN.		
no guest thang	• guest-vlan —(Optional) Generate a trap when the port moves to the configured guest VLAN.		
	• no-auth-fail-vlan —(Optional) Generate a trap when a port tries to enter the restricted VLAN, but cannot because the restricted VLAN is not configured.		
	• no-guest-vlan —(Optional) Generate a trap when a port tries to enter the guest VLAN, but cannot because the guest VLAN is not configured.		
	Note When the snmp-server enable traps dot1x command is entered (without any other keywords specified), all the IEEE 802.1x traps are enabled.		
entity	(Optional) Enable SNMP entity traps.		
envmon [fan shutdown status	Optional) Enable SNMP environmental traps. The keywords have these meanings:		
supply temperature]	• fan —(Optional) Enable fan traps.		
	 shutdown—(Optional) Enable environmental monitor shutdown traps. status—(Optional) Enable SNMP environmental status-change traps. 		
	• supply —(Optional) Enable environmental monitor power-supply traps.		
	• temperature —(Optional) Enable environmental monitor temperature traps.		
errdisable [notification-rate value]	(Optional) Enable errdisable traps. Use notification-rate keyword to set the maximum value of errdisable traps sent per minute. The range is 0 to 10000; the default is 0 (no limit imposed; a trap is sent at every occurrence).		
flash [insertion removal]	(Optional) Enable SNMP FLASH notifications. The keywords have these meanings:		
	insertion —(Optional) Generate a trap when a switch (flash) is inserted into a stack, either physically or because of a power cycle or reload.		
	removal —(Optional) Generate a trap when a switch (flash) is removed from a stack, either physically or because of a power cycle or reload.		
fru-ctrl	(Optional) Generate entity field-replaceable unit (FRU) control traps. In the Catalyst 3750 switch stack, this trap refers to the insertion or removal of a switch in the stack.		
hsrp	(Optional) Enable Hot Standby Router Protocol (HSRP) traps.		
ipmulticast	(Optional) Enable Hot Standby Router Protocol (HSRP) traps. (Optional) Enable IP multicast routing traps.		

ospf [cisco-specific errors lsa rate-limit	(Optional) Enable Open Shortest Path First (OSPF) traps. The keywords have these meanings:	
retransmit state-change]	• cisco-specific —(Optional) Enable Cisco-specific traps.	
	• errors—(Optional) Enable error traps.	
	• lsa —(Optional) Enable link-state advertisement (LSA) traps.	
	• rate-limit —(Optional) Enable rate-limit traps.	
	• retransmit —(Optional) Enable packet-retransmit traps.	
	• state-change —(Optional) Enable state-change traps.	
pim [invalid-pim-message	(Optional) Enable Protocol-Independent Multicast (PIM) traps. The keywords have these meanings:	
neighbor-change	• invalid-pim-message—(Optional) Enable invalid PIM message traps.	
rp-mapping-change]	 neighbor-change—(Optional) Enable PIM neighbor-change traps. 	
	 rp-mapping-change (Optional) Enable rendezvous point 	
	(RP)-mapping change traps.	
port-security	(Optional) Enable port security traps. Use the trap-rat e keyword to set the	
[trap-rate value]	maximum number of port-security traps sent per second. The range is from 0 to 1000; the default is 0 (no limit impressed a trap is cart at avery	
	0 to 1000; the default is 0 (no limit imposed; a trap is sent at every occurrence).	
rtr	(Optional) Enable SNMP Response Time Reporter traps.	
snmp [authentication	(Optional) Enable SNMP traps. The keywords have these meanings:	
coldstart linkdown	• authentication—(Optional) Enable authentication trap.	
linkup warmstart]	• coldstart —(Optional) Enable cold start trap.	
	• linkdown —(Optional) Enable linkdown trap.	
	• linkup —(Optional) Enable linkup trap.	
	• warmstart—(Optional) Enable warmstart trap.	
stackwise	(Optional) Enable SNMP stackwise traps.	
storm-control trap-rate value	(Optional) Enable storm-control traps. Use the trap-rat e keyword to set the maximum number of storm-control traps sent per minute. The range is 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence)	
stpx	(Optional) Enable SNMP STPX MIB traps. The keywords have these meanings:	
	• inconsistency —(Optional) Enable SNMP STPX MIB Inconsistency Update traps.	
	• root-inconsistency —(Optional) Enable SNMP STPX MIB Root Inconsistency Update traps.	
	• loop-inconsistency —(Optional) Enable SNMP STPX MIB Loop Inconsistency Update traps.	
syslog	(Optional) Enable SNMP syslog traps.	
tty	(Optional) Send TCP connection traps. This is enabled by default.	
	(Optional) Enable SNMP VLAN membership traps.	
vlan-membership vlancreate	(Optional) Enable SNMP VLAN membership traps. (Optional) Enable SNMP VLAN-created traps.	

•	vlandelete	(Optional) Enable SNMP VLAN-deleted traps.	
-	vtp	(Optional) Enable VLAN Trunking Protocol (VTP) traps.	

Note

Though visible in the command-line help strings, the **cpu** [**threshold**] keyword is not supported. The **snmp-server enable informs** global configuration command is not supported. To enable the sending of SNMP inform notifications, use the **snmp-server enable traps** global configuration command combined with the **snmp-server host** *host-addr* **informs** global configuration command.

Defaults

The sending of SNMP traps is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The bgp , copy-config , envmon , flash , port-security , stpx , syslog , vlancreate , and vlandelete keywords were added.
	12.2(18)SE	The ipmulticast, msdp, ospf [cisco-specific errors lsa rate-limit retransmit state-change], pim [invalid-pim-message neighbor-change rp-mapping-change], and tty keywords were added.
	12.2(25)SE	The storm-control trap-rate value keywords were added.
	12.2(37)SE	The errdisable notification-rate value keywords were added.
	12.2(46)SE	The dot1x [auth-fail-vlan guest-vlan no-auth-fail-vlan no-guest-vlan] keywords were added.

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

When supported, use the snmp-server enable traps command to enable sending of traps or informs.

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to send VTP traps to the NMS:

Switch(config) # snmp-server enable traps vtp

You can verify your setting by entering the **show vtp status** or the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.
	snmp-server host	Specifies the host that receives SNMP traps.

snmp-server host

Use the **snmp-server host** global configuration command on the switch stack or on a standalone switch to specify the recipient (host) of a Simple Network Management Protocol (SNMP) notification operation. Use the **no** form of this command to remove the specified host.

snmp-server host host-addr [informs | traps] [version {1 | 2c | 3 {auth | noauth | priv}] [vrf
vrf-instance] {community-string [notification-type]}

no snmp-server host *host-addr* [**informs** | **traps**] [**version** {**1** | **2c** | **3** {**auth** | **noauth** | **priv**}] [**vrf** *vrf-instance*] *community-string*

Syntax Description	host-addr	Name or Internet address of the host (the targeted recipient).
	udp-port port	(Optional) Configure the User Datagram Protocol (UDP) port number of the host to receive the traps. The range is 0 to 65535.
	informs traps	(Optional) Send SNMP traps or informs to this host.
	version 1 2c 3	(Optional) Version of the SNMP used to send the traps.
		These keywords are supported:
		1 —SNMPv1. This option is not available with informs.
		2c—SNMPv2C.
		3 —SNMPv3. These optional keywords can follow the Version 3 keyword:
		• auth (Optional). Enables Message Digest 5 (MD5) and Secure Hash Algorithm (SHA) packet authentication.
		• noauth (Default). The noAuthNoPriv security level. This is the default if the [auth noauth priv] keyword choice is not specified.
		• priv (Optional). Enables Data Encryption Standard (DES) packet encryption (also called <i>privacy</i>).
		Note The priv keyword is available only when the cryptographic (encrypted) software image is installed.
	vrf vrf-instance	(Optional) Virtual private network (VPN) routing instance and name for this host.

community-string	you ca recom	ord-like community string sent with the notification operation. Though an set this string by using the snmp-server host command, we mend that you define this string by using the snmp-server community configuration command before using the snmp-server host and.
	Note	The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.

notification-type	(Optional) Type of notification to be sent to the host. If no type is specified, all notifications are sent. The notification type can be one or more of the these keywords:
	• bgp —Send Border Gateway Protocol (BGP) state change traps. This keyword is available only when the IP services image is installed on the stack master.
	• bridge —Send SNMP Spanning Tree Protocol (STP) bridge MIB traps.
	• cluster —Send cluster member status traps.
	• config —Send SNMP configuration traps.
	• copy-config —Send SNMP copy configuration traps.
	• entity— Send SNMP entity traps.
	• envmon —Send environmental monitor traps.
	• errdisable—Send SNMP errdisable notifications.
	• flash —Send SNMP FLASH notifications.
	• fru-ctrl —Send entity FRU control traps. In the switch stack, this trap refers to the insertion or removal of a switch in the stack.
	• hsrp—Send SNMP Hot Standby Router Protocol (HSRP) traps.
	• ipmulticast —Send SNMP IP multicast routing traps.
	• mac-notification—Send SNMP MAC notification traps.
	• msdp —Send SNMP Multicast Source Discovery Protocol (MSDP) traps.
	• ospf—Send Open Shortest Path First (OSPF) traps.
	• pim—Send SNMP Protocol-Independent Multicast (PIM) traps.
	• port-security —Send SNMP port-security traps.
	• rtr —Send SNMP Response Time Reporter traps.
	• snmp —Send SNMP-type traps.
	• storm-control —Send SNMP storm-control traps.
	• stpx —Send SNMP STP extended MIB traps.
	• syslog —Send SNMP syslog traps.
	• tty —Send TCP connection traps.
	• udp-port <i>port</i> —Configure the User Datagram Protocol (UDP) port number of the host to receive the traps. The range is from 0 to 65535.
	• vlan-membership— Send SNMP VLAN membership traps.
	• vlancreate—Send SNMP VLAN-created traps.
	• vlandelete—Send SNMP VLAN-deleted traps.
	• vtp—Send SNMP VLAN Trunking Protocol (VTP) traps.

Though visible in the command-line help strings, the **cpu** keyword is not supported.

Defaults	This command is disabled by default. No notifications are sent.		
	If you enter this command with no keywords, the default is to send all trap types to the host. No informs are sent to this host.		
	If no version keyword is present, the default is Version 1.		
	If Version 3 is selected and no authentication keyword is entered, the default is the noauth (noAuthNoPriv) security level.		

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The bgp , copy-config , flash , port-security , stpx , syslog , vlancreate , and vlandelete keywords were added.
	12.2(18)SE	The ipmulticast , msdp , ospf , and pim keywords were added. The command syntax was changed.
	12.2(25)SE	The storm-control and vrf <i>vrf-instance</i> keywords were added.
	12.2(37)SE	The errdisable notification-rate value keywords were added.

Usage Guidelines

SNMP notifications can be sent as traps or inform requests. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. However, an SNMP entity that receives an inform request acknowledges the message with an SNMP response PDU. If the sender never receives the response, the inform request can be sent again. Thus, informs are more likely to reach their intended destinations.

However, informs consume more resources in the agent and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Traps are also sent only once, but an inform might be retried several times. The retries increase traffic and contribute to a higher overhead on the network.

If you do not enter an **snmp-server host** command, no notifications are sent. To configure the switch to send SNMP notifications, you must enter at least one **snmp-server host** command. If you enter the command with no keywords, all trap types are enabled for the host. To enable multiple hosts, you must enter a separate **snmp-server host** command for each host. You can specify multiple notification types in the command for each host.

If a local user is not associated with a remote host, the switch does not send informs for the **auth** (authNoPriv) and the **priv** (authPriv) authentication levels.

When multiple **snmp-server host** commands are given for the same host and kind of notification (trap or inform), each succeeding command overwrites the previous command. Only the last **snmp-server host** command is in effect. For example, if you enter an **snmp-server host inform** command for a host and then enter another **snmp-server host inform** command for the same host, the second command replaces the first.

The **snmp-server host** command is used with the **snmp-server enable traps** global configuration command. Use the **snmp-server enable traps** command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one **snmp-server enable traps** command and

the **snmp-server host** command for that host must be enabled. Some notification types cannot be controlled with the **snmp-server enable traps** command. For example, some notification types are always enabled. Other notification types are enabled by a different command.

The **no snmp-server host** command with no keywords disables traps, but not informs, to the host. To disable informs, use the **no snmp-server host informs** command.

Examples	This example shows how to configure a unique SNMP community string named <i>comaccess</i> for traps and prevent SNMP polling access with this string through access-list 10:
	Switch(config)# snmp-server community comaccess ro 10 Switch(config)# snmp-server host 172.20.2.160 comaccess Switch(config)# access-list 10 deny any
	This example shows how to send the SNMP traps to the host specified by the name <i>myhost.cisco.com</i> . The community string is defined as <i>comaccess</i> :
	Switch(config)# snmp-server enable traps Switch(config)# snmp-server host myhost.cisco.com comaccess snmp
	This example shows how to enable the switch to send all traps to the host <i>myhost.cisco.com</i> by using the community string <i>public</i> :
	Switch(config)# snmp-server enable traps Switch(config)# snmp-server host myhost.cisco.com public
	You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference , Release 12.2 > File Management Commands > Configuration File Management Commands .
	snmp-server enable traps	Enables SNMP notification for various trap types or inform requests.

snmp trap mac-notification

Use the **snmp trap mac-notification** interface configuration command on the switch stack or on a standalone switch to enable the Simple Network Management Protocol (SNMP) MAC address notification trap on a specific Layer 2 interface. Use the **no** form of this command to return to the default setting.

snmp trap mac-notification {added | removed}

no snmp trap mac-notification {added | removed}

Syntax Description	added	Enable the MAC notification trap whenever a MAC address is added on this interface.
	removed	Enable the MAC notification trap whenever a MAC address is removed from this interface.
Defaults	By default, the	traps for both address addition and address removal are disabled.
Command Modes	Interface config	uration
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines Even though you enable the notification trap for a specific interface by using the snmp mac-notification command, the trap is generated only when you enable the snmp-serve mac-notification and the mac address-table notification global configuration command		on command, the trap is generated only when you enable the snmp-server enable traps
Examples	-	nows how to enable the MAC notification trap when a MAC address is added to a port:
		<pre># interface gigabitethernet1/0/2 if)# snmp trap mac-notification added</pre>
	You can verify y EXEC comman	your settings by entering the show mac address-table notification interface privileged d.

Related Commands	Command	Description
	clear mac address-table notification	Clears the MAC address notification global counters.
	mac address-table notification	Enables the MAC address notification feature.
	show mac address-table notification	Displays the MAC address notification settings for all interfaces or on the specified interface when the interface keyword is appended.
	snmp-server enable traps	Sends the SNMP MAC notification traps when the mac-notification keyword is appended.

spanning-tree backbonefast

Use the **spanning-tree backbonefast** global configuration command on the switch stack or on a standalone switch to enable the BackboneFast feature. Use the **no** form of the command to return to the default setting.

spanning-tree backbonefast

no spanning-tree backbonefast

- Syntax Description This command has no arguments or keywords.
- **Defaults** BackboneFast is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You can configure the BackboneFast feature for rapid PVST+ or for multiple spanning-tree (MST) mode, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

BackboneFast starts when a root port or blocked port on a switch receives inferior BPDUs from its designated switch. An inferior BPDU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPDU, it means that a link to which the switch is not directly connected (an *indirect* link) has failed (that is, the designated switch has lost its connection to the root switch. If there are alternate paths to the root switch, BackboneFast causes the maximum aging time on the interfaces on which it received the inferior BPDU to expire and allows a blocked port to move immediately to the listening state. BackboneFast then transitions the interface to the forwarding state. For more information, see the software configuration guide for this release.

Enable BackboneFast on all supported switches to allow the detection of indirect link failures and to start the spanning-tree reconfiguration sooner.

Examples This example shows how to enable BackboneFast on the switch: Switch(config)# spanning-tree backbonefast You can verify your setting by entering the show spanning-tree summary privileged EXEC command.

Related Commands	Command	Description
	show spanning-tree summary	Displays a summary of the spanning-tree interface states.

spanning-tree bpdufilter

Use the **spanning-tree bpdufilter** interface configuration command on the switch stack or on a standalone switch to prevent an interface from sending or receiving bridge protocol data units (BPDUs). Use the **no** form of this command to return to the default setting.

spanning-tree bpdufilter {disable | enable}

no spanning-tree bpdufilter

Syntax Description	disable	Disable BPDU filtering on the specified interface.
-,	enable	Enable BPDU filtering on the specified interface.
Defaults	BPDU filtering is o	disabled.
Command Modes	Interface configura	ation
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
<u> </u>	Enabling BPDU fil	
Caution	Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can resust spanning-tree loops.	
	• •	nable BPDU filtering on all Port Fast-enabled interfaces by using the spanning-tree r default global configuration command.
		anning-tree bpdufilter interface configuration command to override the setting of portfast bpdufilter default global configuration command.
Examples	This example show	vs how to enable the BPDU filtering feature on a port:
		interface gigabitethernet2/0/1)# spanning-tree bpdufilter enable
	You can verify you	r setting by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .
	spanning-tree portfast (global configuration)	Globally enables the BPDU filtering or the BPDU guard feature on Port Fast-enabled interface or enables the Port Fast feature on all nontrunking interfaces.
	spanning-tree portfast (interface configuration)	Enables the Port Fast feature on an interface and all its associated VLANs.

spanning-tree bpduguard

Use the **spanning-tree bpduguard** interface configuration command on the switch stack or on a standalone switch to put an interface in the error-disabled state when it receives a bridge protocol data unit (BPDU). Use the **no** form of this command to return to the default setting.

spanning-tree bpduguard {disable | enable}

no spanning-tree bpduguard

Syntax Description	disable	Disable BPDU guard on the specified interface.
	enable	Enable BPDU guard on the specified interface.
Defaults	BPDU guard is disab	bled.
Command Modes	Interface configuration	on
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	manually put the inte	ature provides a secure response to invalid configurations because you must erface back in service. Use the BPDU guard feature in a service-provider network be from being included in the spanning-tree topology.
	You can enable the E	BPDU guard feature when the switch is operating in the per-VLAN spanning-tree -PVST+, or the multiple spanning-tree (MST) mode.
		ble BPDU guard on all Port Fast-enabled interfaces by using the spanning-tree default global configuration command.
	-	nning-tree bpduguard interface configuration command to override the setting of ortfast bpduguard default global configuration command.
Examples	Switch(config)# in	how to enable the BPDU guard feature on a port: terface gigabitethernet2/0/1 spanning-tree bpduguard enable
	You can verify your	setting by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .
	spanning-tree portfast (global configuration)	Globally enables the BPDU filtering or the BPDU guard feature on Port Fast-enabled interfaces or enables the Port Fast feature on all nontrunking interfaces.
	spanning-tree portfast (interface configuration)	Enables the Port Fast feature on an interface and all its associated VLANs.

spanning-tree cost

Use the **spanning-tree cost** interface configuration command on the switch stack or on a standalone switch to set the path cost for spanning-tree calculations. If a loop occurs, spanning tree considers the path cost when selecting an interface to place in the forwarding state. Use the **no** form of this command to return to the default setting.

spanning-tree [vlan vlan-id] cost cost

no spanning-tree [vlan vlan-id] cost

Syntax Description	vlan vlan-id(Optional) VLAN range associated with a spanning-tree instance. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.		
	cost	Path cost. The range is 1 to 20000000, with higher values meaning higher costs.	
Defaults	The default path cost values:	cost is computed from the interface bandwidth setting. These are the IEEE default path	
	• 1000 Mb/s—4		
	• 100 Mb/s—	19	
	• 10 Mb/s—1	00	
Command Modes	Interface config	uration	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	The value for the <i>vlan-id</i> variable was changed.	
Usage Guidelines	When you confi	gure the cost, higher values represent higher costs.	
	• •	e an interface with both the spanning-tree vlan <i>vlan-id</i> cost <i>cost</i> command and the cost <i>cost</i> command, the spanning-tree vlan <i>vlan-id</i> cost <i>cost</i> command takes effect.	
Examples	This example sh	nows how to set the path cost to 250 on a port:	
	Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# spanning-tree cost 250		
	This example shows how to set a path cost to 300 for VLANs 10, 12 to 15, and 20:		
	_	Switch(config-if)# spanning-tree vlan 10,12-15,20 cost 300	
	You can verify y EXEC command	your settings by entering the show spanning-tree interface <i>interface-id</i> privileged	

Related Commands	Command	Description
	show spanning-tree interface <i>interface-id</i>	Displays spanning-tree information for the specified interface.
	spanning-tree port-priority	Configures an interface priority.
	spanning-tree vlan priority	Sets the switch priority for the specified spanning-tree instance.

spanning-tree etherchannel guard misconfig

Use the spanning-tree etherchannel guard misconfig global configuration command to display an error message when the switch detects an EtherChannel misconfiguration. Use the no form of this command to disable the feature. spanning-tree etherchannel guard misconfig no spanning-tree etherchannel guard misconfig

- **Syntax Description** This command has no arguments or keywords.
- Defaults EtherChannel guard is enabled on the switch.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(14)EA1	This command was introduced.

Usage Guidelines When the switch detects an EtherChannel misconfiguration, this error message appears:

PM-4-ERR_DISABLE: Channel-misconfig error detected on [chars], putting [chars] in err-disable state.

To show switch ports that are in the misconfigured EtherChannel, use the show interfaces status err-disabled privileged EXEC command. To verify the EtherChannel configuration on a remote device, use the **show etherchannel summary** privileged EXEC command on the remote device.

When a port is in the error-disabled state because of an EtherChannel misconfiguration, you can bring it out of this state by entering the errdisable recovery cause channel-misconfig global configuration command, or you can manually re-enable it by entering the shutdown and no shut down interface configuration commands.

Examples This example shows how to enable the EtherChannel guard misconfiguration feature:

Switch(config) # spanning-tree etherchannel guard misconfig

You can verify your settings by entering the **show spanning-tree summary** privileged EXEC command.

Г

Related Commands	Command	Description
	errdisable recovery cause channel-misconfig	Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.
	show etherchannel summary	Displays EtherChannel information for a channel as a one-line summary per channel-group.
	show interfaces status err-disabled	Displays the interfaces in the error-disabled state.

OL-8552-06

Note Though visible in the command-line help strings, the **no** version of this command is not supported. You cannot disable the extended system ID feature. **Syntax Description** This command has no arguments or keywords. Defaults The extended system ID is enabled. **Command Modes** Global configuration **Command History** Release Modification 12.1(11)AX This command was introduced. **Usage Guidelines** The switch supports the IEEE 802.1t spanning-tree extensions. Some of the bits previously used for the switch priority are now used for the extended system ID (VLAN identifier for the per-VLAN spanning-tree plus [PVST+] and rapid PVST+ or as an instance identifier for the multiple spanning tree [MST]). The spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN or multiple spanning-tree instance. Because the Catalyst 3750 switch stack appears as a single switch to the rest of the network, all switches in the stack use the same bridge ID for a given spanning tree. If the stack master fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the stack master. Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For more information, see the "spanning-tree mst root" and the "spanning-tree vlan" sections. If your network consists of switches that do not support the extended system ID and switches that do support it, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches.

spanning-tree extend system-id

Use the **spanning-tree extend system-id** global configuration command on the switch stack or on a standalone switch to enable the extended system ID feature.

spanning-tree extend system-id

stand s

Related Commands	Command	Description
	show spanning-tree summary	Displays a summary of spanning-tree interface states.
	spanning-tree mst root	Configures the MST root switch priority and timers based on the network diameter.
	spanning-tree vlan priority	Sets the switch priority for the specified spanning-tree instance.

spanning-tree guard

Use the **spanning-tree guard** interface configuration command on the switch stack or on a standalone switch to enable root guard or loop guard on all the VLANs associated with the selected interface. Root guard restricts which interface is allowed to be the spanning-tree root port or the path-to-the root for the switch. Loop guard prevents alternate or root ports from becoming designated ports when a failure creates a unidirectional link. Use the **no** form of this command to return to the default setting.

spanning-tree guard {loop | none | root}

no spanning-tree guard

Syntax Description loop Enable loop guard. none Disable root guard or loop guard. root Enable root guard. Defaults Root guard is disabled. Loop guard is configured according to the spanning-tree loopguard default global configuration command (globally disabled). **Command Modes** Interface configuration **Command History** Release Modification 12.1(11)AX This command was introduced. **Usage Guidelines** You can enable root guard or loop guard when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode. When root guard is enabled, if spanning-tree calculations cause an interface to be selected as the root port, the interface transitions to the root-inconsistent (blocked) state to prevent the customer's switch from becoming the root switch or being in the path to the root. The root port provides the best path from the switch to the root switch. When the no spanning-tree guard or the no spanning-tree guard none command is entered, root guard is disabled for all VLANs on the selected interface. If this interface is in the root-inconsistent (blocked) state, it automatically transitions to the listening state. Do not enable root guard on interfaces that will be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and prevented from reaching the forwarding state. The UplinkFast feature is not available when the switch is operating in the rapid-PVST+ or MST mode. Loop guard is most effective when it is configured on the entire switched network. When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send bridge protocol data units (BPDUs) on root or alternate

Examples

ports. When the switch is operating in MST mode, BPDUs are not sent on nonboundary interfaces if the interface is blocked by loop guard in all MST instances. On a boundary interface, loop guard blocks the interface in all MST instances.

To disable root guard or loop guard, use the **spanning-tree guard none** interface configuration command. You cannot enable both root guard and loop guard at the same time.

You can override the setting of the **spanning-tree loopguard default** global configuration command by using the **spanning-tree guard loop** interface configuration command.

This example shows how to enable root guard on all the VLANs associated with the specified port:

Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree guard root

This example shows how to enable loop guard on all the VLANs associated with the specified port:

Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree guard loop

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description

	show spanning-tree mst interface <i>interface-id</i>	Displays MST information for the specified interface.

spanning-tree loopguard default

Use the **spanning-tree loopguard default** global configuration command on the switch stack or on a standalone switch to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. Use the **no** form of this command to return to the default setting.

spanning-tree loopguard default

no spanning-tree loopguard default

Syntax Description	This command has no arguments or keywords.
--------------------	--

Defaults Loop guard is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You can enable the loop guard feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.

Loop guard is most effective when it is configured on the entire switched network. When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send bridge protocol data units (BPDUs) on root or alternate ports. When the switch is operating in MST mode, BPDUs are not sent on nonboundary interfaces if the interface is blocked by loop guard in all MST instances. On a boundary interface, loop guard blocks the interface in all MST instances.

Loop guard operates only on interfaces that the spanning tree identifies as point-to-point.

You can override the setting of the **spanning-tree loopguard default** global configuration command by using the **spanning-tree guard loop** interface configuration command.

 Examples
 This example shows how to globally enable loop guard:

 Switch(config)# spanning-tree loopguard default

You can verify your settings by entering the show running-config privileged EXEC command.

Г

Related Commands	Command	Description
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.
	spanning-tree guard loop	Enables the loop guard feature on all the VLANs associated with the specified interface.

spanning-tree mode

Use the **spanning-tree mode** global configuration command on the switch stack or on a standalone switch to enable per-VLAN spanning-tree plus (PVST+), rapid PVST+, or multiple spanning tree (MST) on your switch. Use the **no** form of this command to return to the default setting.

spanning-tree mode {mst | pvst | rapid-pvst}

no spanning-tree mode

Syntax Description	mst	Enable MST and Rapid Spanning Tree Protocol (RSTP) (based on IEEE 802.1s and IEEE 802.1w).
	pvst	Enable PVST+ (based on IEEE 802.1D).
	rapid-pvst	Enable rapid PVST+ (based on IEEE 802.1w).
Defaults	The default mod	de is PVST+.
Command Modes	Global configur	ation
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The mst and rapid-pvst keywords were added.
sage Guidelines	All VLANs run	ports PVST+, rapid PVST+, and MSTP, but only one version can be active at any time: PVST+, all VLANs run rapid PVST+, or all VLANs run MSTP. All stack members run n of spanning-tree.
	When you enabl	le the MST mode, RSTP is automatically enabled.
A		
<u> </u>		ing-tree modes can disrupt traffic because all spanning-tree instances are stopped for the and restarted in the new mode.

		Management Commands.

2-703

Syntax Description

spanning-tree mst configuration

Use the **spanning-tree mst configuration** global configuration command on the switch stack or on a standalone switch to enter multiple spanning-tree (MST) configuration mode through which you configure the MST region. Use the **no** form of this command to return to the default settings.

spanning-tree mst configuration

no spanning-tree mst configuration

This command has no arguments or keywords.

Defaults	The default mappin instance (instance 0	g is that all VLANs are mapped to the common and internal spanning-tree (CIST)
	The default name is	an empty string.
	The revision numbe	r is 0.
Command Modes	Global configuration	n
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
	12.2(25)SEC	The instance-id range changed to 1 to 4094.
Usage Guidelines	 configuration comm abort: exits the exit: exits the N instance instan 	 mst configuration command enables the MST configuration mode. These hands are available: MST region configuration mode without applying configuration changes. <i>AST</i> region configuration mode and applies all configuration changes. <i>ce-id</i> vlan vlan-range: maps VLANs to an MST instance. The range for the to 4094. The range for vlan-range is 1 to 4094. You can specify a single VLAN
		LAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs
	• name <i>name</i> : set and is case sens	ts the configuration name. The <i>name</i> string has a maximum length of 32 characters sitive.
	• no : negates the	instance, name, and revision commands or sets them to their defaults.
	• private-vlan: T	hough visible in the command-line help strings, this command is not supported.
	• revision version	n: sets the configuration revision number. The range is 0 to 65535.
	• show [current	pending]: displays the current or pending MST region configuration.
		witch stack supports up to 65 MST instances. The number of VLANs that can be lar MST instance is unlimited.

When you map VLANs to an MST instance, the mapping is incremental, and VLANs specified in the command are added to or removed from the VLANs that were previously mapped. To specify a range, use a hyphen; for example, **instance 1 vlan 1-63** maps VLANs 1 to 63 to MST instance 1. To specify a series, use a comma; for example, **instance 1 vlan 10, 20, 30** maps VLANs 10, 20, and 30 to MST instance 1.

All VLANs that are not explicitly mapped to an MST instance are mapped to the common and internal spanning tree (CIST) instance (instance 0) and cannot be unmapped from the CIST by using the **no** form of the command.

For two or more switches to be in the same MST region, they must have the same VLAN mapping, the same configuration revision number, and the same name.

Examples

This example shows how to enter MST configuration mode, map VLANs 10 to 20 to MST instance 1, name the region *region1*, set the configuration revision to 1, display the pending configuration, apply the changes, and return to global configuration mode:

```
Switch# spanning-tree mst configuration
Switch(config-mst) # instance 1 vlan 10-20
Switch(config-mst)# name region1
Switch(config-mst)# revision 1
Switch(config-mst) # show pending
Pending MST configuration
Name
        [region1]
Revision 1
Instance Vlans Mapped
         _____
0
         1-9,21-4094
1
        10 - 20
_____
Switch(config-mst)# exit
```

Switch(config)#

This example shows how to add VLANs 1 to 100 to the ones already mapped (if any) to instance 2, to move VLANs 40 to 60 that were previously mapped to instance 2 to the CIST instance, to add VLAN 10 to instance 10, and to remove all the VLANs mapped to instance 2 and map them to the CIST instance:

```
Switch(config-mst)# instance 2 vlan 1-100
Switch(config-mst)# no instance 2 vlan 40-60
Switch(config-mst)# instance 10 vlan 10
Switch(config-mst)# no instance 2
```

You can verify your settings by entering the show pending MST configuration command.

Related Commands	Command	Description
	show spanning-tree mst configuration	Displays the MST region configuration.

spanning-tree mst cost

Use the **spanning-tree mst cost** interface configuration command on the switch stack or on a standalone switch to set the path cost for multiple spanning-tree (MST) calculations. If a loop occurs, spanning tree considers the path cost when selecting an interface to put in the forwarding state. Use the **no** form of this command to return to the default setting.

spanning-tree mst instance-id cost cost

no spanning-tree mst instance-id cost

Syntax Description	instance-id	Range of spanning-tree instances. You can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.
	cost	Path cost is 1 to 200000000, with higher values meaning higher costs.
Defaults	The default path cost values:	n cost is computed from the interface bandwidth setting. These are the IEEE default path
	• 1000 Mb/s-	-20000
	• 100 Mb/s—	-200000
	• 10 Mb/s—2	2000000

elated Commands	Command	Description
	show spanning-tree mst interface interface-id	Displays MST information for the specified interface.
	spanning-tree mst port-priority	Configures an interface priority.
	spanning-tree mst priority	Configures the switch priority for the specified spanning-tree instance.

spanning-tree mst forward-time

Use the spanning-tree mst forward-time global configuration command on the switch stack or on a standalone switch to set the forward-delay time for all multiple spanning-tree (MST) instances. The forwarding time specifies how long each of the listening and learning states last before the interface begins forwarding. Use the no form of this command to return to the default setting.

spanning-tree mst forward-time seconds

no spanning-tree mst forward-time

Syntax Description	seconds	Length of the listening and learning states. The range is 4 to 30 seconds.
Defaults	The default is 15 second	ds.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
Usage Guidelines	Changing the spanning	-tree mst forward-time command affects all spanning-tree instances.
Examples	-	w to set the spanning-tree forwarding time to 18 seconds for all MST instances: hing-tree mst forward-time 18
	You can verify your set	ting by entering the show spanning-tree mst privileged EXEC command.
Related Commands	Command	Description
	show spanning-tree m	st Displays MST information.
	spanning-tree mst hel	lo-time Sets the interval between hello bridge protocol data units (BPDUs) sent by root switch configuration messages.
	spanning-tree mst ma	x-age Sets the interval between messages that the spanning tree receives from the root switch.
	spanning-tree mst ma	x-hops Sets the number of hops in a region before the BPDU is discarded.

spanning-tree mst hello-time

Use the **spanning-tree mst hello-time** global configuration command on the switch stack or on a standalone switch to set the interval between hello bridge protocol data units (BPDUs) sent by root switch configuration messages. Use the **no** form of this command to return to the default setting.

spanning-tree mst hello-time seconds

no spanning-tree mst hello-time

Syntax Description		erval between hello BPDUs sent by root switch configuration messages. The ge is 1 to 10 seconds.	
Defaults	The default is 2 seconds.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
Usage Guidelines	After you set the spanning-tree mst max-age <i>seconds</i> global configuration command, if a switch does not receive BPDUs from the root switch within the specified interval, the switch recomputes the spanning-tree topology. The max-age setting must be greater than the hello-time setting. Changing the spanning-tree mst hello-time command affects all spanning-tree instances.		
Examples	This example shows how to (MST) instances:	o set the spanning-tree hello time to 3 seconds for all multiple spanning-tree	
	Switch(config)# spanning-tree mst hello-time 3		
	You can verify your setting	by entering the show spanning-tree mst privileged EXEC command.	
Related Commands	Command	Description	
	show spanning-tree mst	Displays MST information.	
	spanning-tree mst forward-time	Sets the forward-delay time for all MST instances.	
	spanning-tree mst max-a	ge Sets the interval between messages that the spanning tree receives from the root switch.	
	spanning-tree mst max-h	ops Sets the number of hops in a region before the BPDU is discarded.	

spanning-tree mst max-age

Use the **spanning-tree mst max-age** global configuration command on the switch stack or on a standalone switch to set the interval between messages that the spanning tree receives from the root switch. If a switch does not receive a bridge protocol data unit (BPDU) message from the root switch within this interval, it recomputes the spanning-tree topology. Use the **no** form of this command to return to the default setting.

spanning-tree mst max-age seconds

no spanning-tree mst max-age

Syntax Description	seconds	Interval between mes is 6 to 40 seconds.	sages the spanning tree receives from the root switch. The range
Defaults	The default is	s 20 seconds.	
Command Modes	Global configuration		
Command History	Release	Modificati	on
	12.1(14)EA1	This com	nand was introduced.
Usage Guidelines	After you set the spanning-tree mst max-age <i>seconds</i> global configuration command, if a switch does not receive BPDUs from the root switch within the specified interval, the switch recomputes the spanning-tree topology. The max-age setting must be greater than the hello-time setting. Changing the spanning-tree mst max-age command affects all spanning-tree instances.		
Examples	This example (MST) instan		panning-tree max-age to 30 seconds for all multiple spanning-tree
	Switch(config)# spanning-tree mst max-age 30		
	You can verif	y your setting by enteri	ng the show spanning-tree mst privileged EXEC command.
Related Commands	Command		Description
	show spanni	ing-tree mst	Displays MST information.
	spanning-tro	ee mst forward-time	Sets the forward-delay time for all MST instances.
	spanning-tro	ee mst hello-time	Sets the interval between hello BPDUs sent by root switch configuration messages.
	spanning-tro	ee mst max-hops	Sets the number of hops in a region before the BPDU is discarded.

2-709

spanning-tree mst max-hops

Use the **spanning-tree mst max-hops** global configuration command on the switch stack or on a standalone switch to set the number of hops in a region before the bridge protocol data unit (BPDU) is discarded and the information held for an interface is aged. Use the **no** form of this command to return to the default setting.

spanning-tree mst max-hops hop-count

no spanning-tree mst max-hops

Syntax Description	hop-count Nu	mber of hops in a region before the BPDU is discarded. The range is 1 to 255 hops.
Defaults	The default is 20 ho	ops.
Command Modes	Global configuration	n
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.
	12.2(25)SEC	The <i>hop-count</i> range changed to 1 to 255.
Usage Guidelines	set to the maximum count by one and pr	the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count value. When a switch receives this BPDU, it decrements the received remaining hop ropagates the decremented count as the remaining hop count in the generated h discards the BPDU and ages the information held for the interface when the count
	Changing the span	ning-tree mst max-hops command affects all spanning-tree instances.
Examples	This example show instances:	s how to set the spanning-tree max-hops to 10 for all multiple spanning-tree (MST)
	Switch(config)# s	panning-tree mst max-hops 10
	You can verify you	r setting by entering the show spanning-tree mst privileged EXEC command.

Related Commands

Command	Description
show spanning-tree mst	Displays MST information.
spanning-tree mst forward-time	Sets the forward-delay time for all MST instances.
spanning-tree mst hello-time	Sets the interval between hello BPDUs sent by root switch configuration messages.
spanning-tree mst max-age	Sets the interval between messages that the spanning tree receives from the root switch.

spanning-tree mst port-priority

Use the **spanning-tree mst port-priority** interface configuration command on the switch stack or on a standalone switch to configure an interface priority. If a loop occurs, the Multiple Spanning Tree Protocol (MSTP) can find the interface to put in the forwarding state. Use the **no** form of this command to return to the default setting.

spanning-tree mst instance-id port-priority priority

no spanning-tree mst instance-id port-priority

Syntax Description	instance-id	Range of spanning-tree instances. You can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.	
	priority	The range is 0 to 240 in increments of 16. Valid priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. The lower the number, the higher the priority.	
Defaults	The default is 1	28.	
Command Modes	Interface config	uration	
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
	12.2(25)SEC	The <i>instance-id</i> range changed to 1 to 4094.	
Usage Guidelines	and lower priori same priority va	higher priority values (lower numerical values) to interfaces that you want selected first ity values (higher numerical values) that you want selected last. If all interfaces have the ilue, the multiple spanning tree (MST) puts the interface with the lowest interface number ng state and blocks other interfaces.	
	interface config <i>priority</i> interfac	a member of a switch stack, you must use the spanning-tree mst [<i>instance-id</i>] cost <i>cost</i> uration command instead of the spanning-tree mst [<i>instance vlan-id</i>] port-priority be configuration command to select an interface to put in the forwarding state. Assign es to interfaces that you want selected first and higher cost values to interfaces that you tast.	
Examples		nows how to increase the likelihood that the interface associated with spanning-tree d 22 is placed into the forwarding state if a loop occurs:	
	Switch(config)# interface gigabitethernet2/0/2 Switch(config-if)# spanning-tree mst 20,22 port-priority 0		

You can verify your settings by entering the **show spanning-tree mst interface** *interface-id* privileged EXEC command.

elated Commands	Command	Description
	show spanning-tree mst interface <i>interface-id</i>	Displays MST information for the specified interface.
	spanning-tree mst cost	Sets the path cost for MST calculations.
	spanning-tree mst priority	Sets the switch priority for the specified spanning-tree instance.

spanning-tree mst pre-standard

Use the spanning-tree mst pre-standard interface configuration command to configure a port to send only prestandard bridge protocol data units (BPDUs).

spanning-tree mst pre-standard

no spanning-tree mst pre-standard

Syntax Description	This command has no arguments or keywords.
--------------------	--

Command Default The default state is automatic detection of prestandard neighbors.

Command Modes Interface configuration

Command History Modification Release This command was introduced. 12.2(25)SEC

Usage Guidelines The port can accept both prestandard and standard BPDUs. If the neighbor types are mismatched, only

```
the common and internal spanning tree (CIST) runs on this interface.
```

```
Note
       If a switch port is connected to a switch running prestandard Cisco IOS software, you must use the
       spanning-tree mst pre-standard interface configuration command on the port. If you do not configure
       the port to send only prestandard BPDUs, the Multiple STP (MSTP) performance might diminish.
```

When the port is configured to automatically detect prestandard neighbors, the *prestandard* flag always appears in the show spanning-tree mst commands.

Examples This example shows how to configure a port to send only prestandard BPDUs:

Switch(config-if) # spanning-tree mst pre-standard

You can verify your settings by entering the show spanning-tree mst privileged EXEC command.

Related Commands	Command	Description
	show spanning-tree mst instance-id	Displays multiple spanning-tree (MST) information,
		including the <i>prestandard</i> flag, for the specified interface.

spanning-tree mst priority

Use the **spanning-tree mst priority** global configuration command on the switch stack or on a standalone switch to set the switch priority for the specified spanning-tree instance. Use the **no** form of this command to return to the default setting.

spanning-tree mst instance-id priority priority

no spanning-tree mst instance-id priority

Syntax Description	instance-id		ee instances. You can specify a single instance, a range of y a hyphen, or a series of instances separated by a comma. The
	priority	the likelihood that th	y for the specified spanning-tree instance. This setting affects e switch is selected as the root switch. A lower value increases he switch is selected as the root switch.
		8192, 12288, 16384,	40 in increments of 4096. Valid priority values are 0, 4096, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 1440. All other values are rejected.
Defaults	The default is 3	2768.

spanning-tree mst root

Use the **spanning-tree mst root** global configuration command on the switch stack or on a standalone switch to configure the multiple spanning-tree (MST) root switch priority and timers based on the network diameter. Use the **no** form of this command to return to the default settings.

spanning-tree mst instance-id root {primary | secondary} [diameter net-diameter
 [hello-time seconds]]

no spanning-tree mst instance-id root

Syntax Description	instance-id	Range of spanning-tree instances. You can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.		
	root primary	Force this switch to be the root switch.		
	root secondary	Set this switch to be the root switch should the primary root switch fail.		
	diameter net-diameter	(Optional) Set the maximum number of switches between any two end stations. The range is 2 to 7. This keyword is available only for MST instance 0.		
	hello-time seconds	(Optional) Set the interval between hello bridge protocol data units (BPDUs) sent by the root switch configuration messages. The range is 1 to 10 seconds. This keyword is available only for MST instance 0.		
Defaults	The primary root switch	priority is 24576.		
	The secondary root switch priority is 28672.			
	The hello time is 2 seconds.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.1(14)EA1	This command was introduced.		
Usage Guidelines	When you enter the spar	nst <i>instance-id</i> root command only on backbone switches. Ining-tree mst <i>instance-id</i> root command, the software tries to set a high		
		this switch the root of the spanning-tree instance. Because of the extended		

When you enter the **spanning-tree mst** *instance-id* **root secondary** command, because of support for the extended system ID, the software changes the switch priority from the default value (32768) to 28672. If the root switch fails, this switch becomes the next root switch (if the other switches in the network use the default switch priority of 32768 and are therefore unlikely to become the root switch).

Examples This example shows how to configure the switch as the root switch for instance 10 with a network diameter of 4:

Switch(config) # spanning-tree mst 10 root primary diameter 4

This example shows how to configure the switch as the secondary root switch for instance 10 with a network diameter of 4:

Switch(config)# spanning-tree mst 10 root secondary diameter 4

You can verify your settings by entering the **show spanning-tree mst** *instance-id* privileged EXEC command.

Related Commands	Command	Description
	show spanning-tree mst instance-id	Displays MST information for the specified instance.
	spanning-tree mst forward-time	Sets the forward-delay time for all MST instances.
	spanning-tree mst hello-time	Sets the interval between hello BPDUs sent by root switch configuration messages.
	spanning-tree mst max-age	Sets the interval between messages that the spanning tree receives from the root switch.
	spanning-tree mst max-hops	Sets the number of hops in a region before the BPDU is discarded.

spanning-tree port-priority

Use the **spanning-tree port-priority** interface configuration command on the switch stack or on a standalone switch to configure an interface priority. If a loop occurs, spanning tree can find the interface to put in the forwarding state. Use the **no** form of this command to return to the default setting.

spanning-tree [vlan vlan-id] port-priority priority

no spanning-tree [vlan vlan-id] port-priority

Syntax Description	vlan vlan-id	(Optional) VLAN range associated with a spanning-tree instance. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.		
	priority	Number from 0 to 240, in increments of 16. Valid values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. The lower the number, the higher the priority.		
Defaults	The default is 1	28.		
Command Modes	Interface config	uration		
Command History	Release	Modification		
-	12.1(11)AX	This command was introduced.		
	12.1(14)EA1	The value for the <i>vlan-id</i> variable was changed. The priority range values changed.		
Usage Guidelines	VLAN 1. You can set the	<i>lan-id</i> is omitted, the command applies to the spanning-tree instance associated with priority on a VLAN that has no interfaces assigned to it. The setting takes effect when		
	you assign the interface to the VLAN. If you configure an interface with both the spanning-tree vlan <i>vlan-id</i> port-priority <i>priority</i> command and the spanning-tree port-priority <i>priority</i> command, the spanning-tree vlan <i>vlan-id</i> port-priority <i>priority</i> command takes effect.			
	interface config interface config	s a member of a switch stack, you must use the spanning-tree [vlan <i>vlan-id</i>] cost <i>cost</i> uration command instead of the spanning-tree [vlan <i>vlan-id</i>] port-priority <i>priority</i> uration command to select an interface to put in the forwarding state. Assign lower cost that you want selected first and higher cost values that you want selected last.		

spanning-tree cost

spanning-tree vlan priority

Examples Related Commands	This example shows how to increase the likelihood that a port will be put in the forwarding state if a loop occurs:			
	<pre>Switch(config)# interface gigabitethernet2/0/2 Switch(config-if)# spanning-tree vlan 20 port-priority 0 This example shows how to set the port-priority value on VLANs 20 to 25: Switch(config-if)# spanning-tree vlan 20-25 port-priority 0</pre>			
				You can verify your settings by EXEC command.
	Command	Description		
		show spanning-tree interface <i>interface-id</i>	Displays spanning-tree information for the specified interface.	

Sets the path cost for spanning-tree calculations.

Sets the switch priority for the specified spanning-tree instance.

spanning-tree portfast (global configuration)

Use the **spanning-tree portfast** global configuration command on the switch stack or on a standalone switch to globally enable bridge protocol data unit (BPDU) filtering on Port Fast-enabled interfaces, the BPDU guard feature on Port Fast-enabled interfaces, or the Port Fast feature on all nontrunking interfaces. The BPDU filtering feature prevents the switch interface from sending or receiving BPDUs. The BPDU guard feature puts Port Fast-enabled interfaces that receive BPDUs in an error-disabled state. Use the **no** form of this command to return to the default settings.

spanning-tree portfast {bpdufilter default | bpduguard default | default}

no spanning-tree portfast {bpdufilter default | bpduguard default | default }

Syntax Description	bpdufilter default	Globally enable BPDU filtering on Port Fast-enabled interfaces and prevent the switch interface connected to end stations from sending or receiving BPDUs.	
	bpduguard default	Globally enable the BPDU guard feature on Port Fast-enabled interfaces and place the interfaces that receive BPDUs in an error-disabled state.	
	default	Globally enable the Port Fast feature on all nontrunking interfaces. When the Port Fast feature is enabled, the interface changes directly from a blocking state to a forwarding state without making the intermediate spanning-tree state changes.	
Defaults	The BPDU filtering, th are individually config	ne BPDU guard, and the Port Fast features are disabled on all interfaces unless they gured.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines		eatures when the switch is operating in the per-VLAN spanning-tree plus (PVST+) nultiple spanning-tree (MST) mode.	
	BPDU filtering on into state). The interfaces s BPDUs. You should g interfaces do not recei	e portfast bpdufilter default global configuration command to globally enable erfaces that are Port Fast-enabled (the interfaces are in a Port Fast-operational still send a few BPDUs at link-up before the switch begins to filter outbound lobally enable BPDU filtering on a switch so that hosts connected to switch we BPDUs. If a BPDU is received on a Port Fast-enabled interface, the interface trational status and BPDU filtering is disabled.	
	You can override the spanning-tree portfast bpdufilter default global configuration command by using the spanning-tree bdpufilter interface configuration command.		

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

Use the **spanning-tree portfast bpduguard default** global configuration command to globally enable BPDU guard on interfaces that are in a Port Fast-operational state. In a valid configuration, Port Fast-enabled interfaces do not receive BPDUs. Receiving a BPDU on a Port Fast-enabled interface signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the interface in the error-disabled state. The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

You can override the **spanning-tree portfast bpduguard default** global configuration command by using the **spanning-tree bdpuguard** interface configuration command.

Use the **spanning-tree portfast default** global configuration command to globally enable the Port Fast feature on all nontrunking interfaces. Configure Port Fast only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation. A Port Fast-enabled interface moves directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-delay time.

You can override the **spanning-tree portfast default** global configuration command by using the **spanning-tree portfast** interface configuration command. You can use the **no spanning-tree portfast default** global configuration command to disable Port Fast on all interfaces unless they are individually configured with the **spanning-tree portfast** interface configuration command.

Examples This example shows how to globally enable the BPDU filtering feature:

Switch(config)# spanning-tree portfast bpdufilter default

This example shows how to globally enable the BPDU guard feature:

Switch(config) # spanning-tree portfast bpduguard default

This example shows how to globally enable the Port Fast feature on all nontrunking interfaces: Switch(config)# spanning-tree portfast default

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .
	spanning-tree bpdufilter	Prevents an interface from sending or receiving BPDUs.
	spanning-tree bpduguard	Puts an interface in the error-disabled state when it receives a BPDU.
	spanning-tree portfast (interface configuration)	Enables the Port Fast feature on an interface in all its associated VLANs.

spanning-tree portfast (interface configuration)

Use the **spanning-tree portfast** interface configuration command on the switch stack or on a standalone switch to enable the Port Fast feature on an interface in all its associated VLANs. When the Port Fast feature is enabled, the interface changes directly from a blocking state to a forwarding state without making the intermediate spanning-tree state changes. Use the **no** form of this command to return to the default setting.

spanning-tree portfast [disable | trunk]

no spanning-tree portfast

Syntax Description	on disable (Optional) Disable the Port Fast feature on the specified interface.			
Cyntax Desonption	trunk (Optional) Enable the Port Fast feature on a trunking interface.			
Defaults	The Port Fast feature is disabled on all interfaces; however, it is automatically enabled on dynamic-access ports.			
Command Modes	Interface config	guration		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	could cause a da	e only on interfaces that connect to end stations; otherwise, an accidental topology loop ta packet loop and disrupt switch and network operation.		
	To enable Port Fast on trunk ports, you must use the spanning-tree portfast trunk interface			
	configuration command. The spanning-tree portfast command is not supported on trunk ports.			
	You can enable this feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.			
	This feature affects all VLANs on the interface.			
		th the Port Fast feature enabled is moved directly to the spanning-tree forwarding state adard forward-time delay.		
	Port Fast featur	e spanning-tree portfast default global configuration command to globally enable the e on all nontrunking interfaces. However, the spanning-tree portfast interface ommand can override the global setting.		
	Port Fast on an	e the spanning-tree portfast default global configuration command, you can disable interface that is not a trunk interface by using the spanning-tree portfast disable guration command.		

Examples

This example shows how to enable the Port Fast feature on a port: Switch(config)# interface gigabitethernet2/0/2 Switch(config-if)# spanning-tree portfast

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .
	spanning-tree bpdufilter	Prevents an interface from sending or receiving bridge protocol data units (BPDUs).
	spanning-tree bpduguard	Puts an interface in the error-disabled state when it receives a BPDU.
	spanning-tree portfast (global configuration)	Globally enables the BPDU filtering or the BPDU guard feature on Port Fast-enabled interfaces or enables the Port Fast feature on all nontrunking interfaces.

spanning-tree transmit hold-count

Use the **spanning-tree transmit hold-count** global configuration command to configure the number of bridge protocol data units (BPDUs) sent every second. Use the **no** form of this command to return to the default setting.

spanning-tree transmit hold-count [value]

no spanning-tree transmit hold-count [value]

Syntax Description	value (C	Optional) Number of BPDUs sent every second. The range is 1 to 20.	
Defaults	The default is 6.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEC	This command was introduced.	
Usage Guidelines	switch is in rapid-per-	nit hold-count value can have a significant impact on CPU utilization when the -VLAN spanning-tree plus (rapid-PVST+) mode. Decreasing this value might slow We recommend using the default setting.	
Examples	This example shows	how to set the transmit hold count to 8:	
·	Switch(config)# spanning-tree transmit hold-count 8		
	You can verify your s	setting by entering the show spanning-tree mst privileged EXEC command.	
Related Commands	Command	Description	
	show spanning-tree	mst Displays the multiple spanning-tree (MST) region configuration and status, including the transmit hold count.	

spanning-tree uplinkfast

Use the **spanning-tree uplinkfast** global configuration command on the switch stack or on a standalone switch to accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself. Use the **no** form of this command to return to the default setting.

spanning-tree uplinkfast [max-update-rate pkts-per-second]

no spanning-tree uplinkfast [max-update-rate]

Syntax Description	max-update-rate pkts-	per-second	(Optional) The number of packets per second at which update packets are sent. The range is 0 to 32000.	
Defaults	UplinkFast is disabled. The update rate is 150 p	backets per sec	ond.	
Command Modes	Global configuration			
Command History	Release	Modificatio	n	
	12.1(11)AX	This comma	and was introduced.	
	12.1(14)EA1	The max-u	pdate-rate keyword was added.	
Usage Guidelines	Use this command only	on access swi	tches.	
	You can configure the UplinkFast feature for rapid PVST+ or for multiple spanning-tree (MST) mode, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.			
	When you enable UplinkFast, it is enabled for the entire switch and cannot be enabled for individual VLANs.			
	When you enable or disable UplinkFast, cross-stack UplinkFast (CSUF) also is automatically enabled or disabled on all nonstack port interfaces. CSUF accelerates the choice of a new root port when a link or switch fails or when spanning tree reconfigures itself.			
	When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduces the chance that a switch will become the root switch.			
	When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.			
			ot port has failed, UplinkFast immediately changes to an alternate directly to forwarding state. During this time, a topology change	

	the backup interfaces (in the blocked guard is also enabled, all the backup	rfaces that will be used by the UplinkFast feature. With UplinkFast, d state) replace the root port in the case of a failure. However, if root o interfaces used by the UplinkFast feature are placed in the d prevented from reaching the forwarding state.		
	If you set the max-update-rate to 0, station-learning frames are not generated, so the span topology converges more slowly after a loss of connectivity.			
Examples	Switch(config)# spanning-tree uplinkfast			
Related Commands	Command	ing the show spanning-tree summary privileged EXEC command. Description		
	show spanning-tree summary	Displays a summary of the spanning-tree interface states.		

Forces this switch to be the root switch.

spanning-tree vlan root primary

spanning-tree vlan

Use the **spanning-tree vlan** global configuration command on the switch stack or on a standalone switch to configure spanning tree on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

spanning-tree vlan vlan-id [forward-time seconds | hello-time seconds | max-age seconds |
 priority priority | root {primary | secondary} [diameter net-diameter
 [hello-time seconds]]]

no spanning-tree vlan *vlan-id* [forward-time | hello-time | max-age | priority | root]

Syntax Description	vlan-id	VLAN range associated with a spanning-tree instance. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	forward-time seconds	(Optional) Set the forward-delay time for the specified spanning-tree instance. The forwarding time specifies how long each of the listening and learning states last before the interface begins forwarding. The range is 4 to 30 seconds.
	hello-time seconds	(Optional) Set the interval between hello bridge protocol data units (BPDUs) sent by the root switch configuration messages. The range is 1 to 10 seconds.
	max-age seconds	(Optional) Set the interval between messages the spanning tree receives from the root switch. If a switch does not receive a BPDU message from the root switch within this interval, it recomputes the spanning-tree topology. The range is 6 to 40 seconds.
	priority priority	(Optional) Set the switch priority for the specified spanning-tree instance. This setting affects the likelihood that a standalone switch or a switch in the stack is selected as the root switch. A lower value increases the probability that the switch is selected as the root switch.
		The range is 0 to 61440 in increments of 4096. Valid priority values are 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.
	root primary	(Optional) Force this switch to be the root switch.
	root secondary	(Optional) Set this switch to be the root switch should the primary root switch fail.
	diameter net-diameter	(Optional) Set the maximum number of switches between any two end stations. The range is 2 to 7.

Defaults

Spanning tree is enabled on all VLANs.

The forward-delay time is 15 seconds.

The hello time is 2 seconds.

The max-age is 20 seconds.

The primary root switch priority is 24576. The secondary root switch priority is 28672.

Command Modes Global configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The value for the <i>vlan-id</i> variable was changed.

Usage Guidelines

nes Disabling the STP causes the VLAN to stop participating in the spanning-tree topology. Interfaces that are administratively down remain down. Received BPDUs are forwarded like other multicast frames. The VLAN does not detect and prevent loops when STP is disabled.

You can disable the STP on a VLAN that is not currently active and verify the change by using the **show running-config** or the **show spanning-tree vlan** *vlan-id* privileged EXEC command. The setting takes effect when the VLAN is activated.

When disabling or re-enabling the STP, you can specify a range of VLANs that you want to disable or enable.

When a VLAN is disabled and then enabled, all assigned VLANs continue to be its members. However, all spanning-tree bridge parameters are returned to their previous settings (the last setting before the VLAN was disabled).

You can enable spanning-tree options on a VLAN that has no interfaces assigned to it. The setting takes effect when you assign interfaces to it.

When setting the **max-age** *seconds*, if a switch does not receive BPDUs from the root switch within the specified interval, it recomputes the spanning-tree topology. The **max-age** setting must be greater than the **hello-time** setting.

The **spanning-tree vlan** *vlan-id* **root** command should be used only on backbone switches.

When you enter the **spanning-tree vlan** *vlan-id* **root** command, the software checks the switch priority of the current root switch for each VLAN. Because of the extended system ID support, the switch sets the switch priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN. If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value.)

When you enter the **spanning-tree vlan** *vlan-id* **root secondary** command, because of support for the extended system ID, the software changes the switch priority from the default value (32768) to 28672. If the root switch should fail, this switch becomes the next root switch (if the other switches in the network use the default switch priority of 32768, and therefore, are unlikely to become the root switch).

Examples	This example	shows how	to disable	the STP	on	VLAN 5:
----------	--------------	-----------	------------	---------	----	---------

Switch(config)# no spanning-tree vlan 5

You can verify your setting by entering the **show spanning-tree** privileged EXEC command. In this instance, VLAN 5 does not appear in the list.

This example shows how to set the spanning-tree forwarding time to 18 seconds for VLANs 20 and 25: Switch(config) # spanning-tree vlan 20,25 forward-time 18

This example shows how to set the spanning-tree hello-delay time to 3 seconds for VLANs 20 to 24: Switch(config) # spanning-tree vlan 20-24 hello-time 3

This example shows how to set spanning-tree max-age to 30 seconds for VLAN 20:

Switch(config) # spanning-tree vlan 20 max-age 30

This example shows how to reset the **max-age** parameter to the default value for spanning-tree instance 100 and 105 to 108:

Switch(config) # no spanning-tree vlan 100, 105-108 max-age

This example shows how to set the spanning-tree priority to 8192 for VLAN 20:

Switch(config) # spanning-tree vlan 20 priority 8192

This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

Switch(config)# spanning-tree vlan 10 root primary diameter 4

This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

Switch(config)# spanning-tree vlan 10 root secondary diameter 4

You can verify your settings by entering the **show spanning-tree vlan** *vlan-id* privileged EXEC command.

Command	Description	
show spanning-tree vlan	Displays spanning-tree information.	
spanning-tree cost	Sets the path cost for spanning-tree calculations.	
spanning-tree guard	Enables the root guard or the loop guard feature for all the VLAN associated with the selected interface.	
spanning-tree port-priority	Sets an interface priority.	
spanning-tree portfast (global configuration)	d Globally enables the BPDU filtering or the BPDU guard feature of Port Fast-enabled interfaces or enables the Port Fast feature on al nontrunking interfaces.	
spanning-tree portfast (interface configuration)		
spanning-tree uplinkfast	Enables the UplinkFast feature, which accelerates the choice of a new root port.	

Related Commands C

speed

Use the **speed** interface configuration command on the switch stack or on a standalone switch to specify the speed of a 10/100 Mb/s or 10/100/1000 Mb/s port. Use the **no** or **default** form of this command to return the port to its default value.

speed {10 | 100 | 1000 | auto [10 | 100 | 1000] | nonegotiate}

no speed

Syntax Description	10	Port runs at 10 Mb/s.
, ,	100	Port runs at 100 Mb/s.
	1000	Port runs at 1000 Mb/s. This option is valid and visible only on 10/100/1000 Mb/s-ports.
	auto	Port automatically detects the speed it should run at based on the port at the other end of the link. If you use the 10 , 100 , or 1000 keywords with the auto keyword, the port only autonegotiates at the specified speeds.
	nonegotiate	Autonegotiation is disabled, and the port runs at 1000 Mb/s. (The 1000BASE-T SFP does not support the nonegotiate keyword.)
Defaults	The default is a	uto.
Command Modes	Interface config	guration
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(20)SE1	Support for the 10, 100, and 1000 keywords with the auto keyword was added.
Usage Guidelines	You cannot con	figure speed on the 10-Gigabit Ethernet ports.
		000BASE-T SFP modules, if an SFP module port is connected to a device that does not gotiation, you can configure the speed to not negotiate (nonegotiate).
	setting and then	et to auto , the switch negotiates with the device at the other end of the link for the speed a forces the speed setting to the negotiated value. The duplex setting remains as ach end of the link, which could result in a duplex setting mismatch.
	settings. If one	the line support autonegotiation, we highly recommend the default autonegotiation interface supports autonegotiation and the other end does not, do use the auto setting on ide, but set the duplex and speed on the other side.
<u> </u>		tterface speed and duplex mode configuration might shut down and re-enable the the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.

ExamplesThis example shows how to set the speed on a port to 100 Mb/s:
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed 100This example shows how to set a port to autonegotiate at only 10 Mb/s:
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto 10This example shows how to set a port to autonegotiate at only 10 or 100 Mb/s:
Switch(config-if)# speed auto 10This example shows how to set a port to autonegotiate at only 10 or 100 Mb/s:
Switch(config)# interface gigabitethernet1/0/1
Switch(config)# interface gigabitethernet1/0/1
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto 10 100You can verify your settings by entering the show interfaces privileged EXEC command.

Related Commands	nds Command Description	
	duplex	Specifies the duplex mode of operation.
	show interfaces	Displays the statistical information specific to all interfaces or to a specific interface.

srr-queue bandwidth limit

Use the **srr-queue bandwidth limit** interface configuration command on the switch stack or on a standalone switch to limit the maximum output on a port. Use the **no** form of this command to return to the default setting.

srr-queue bandwidth limit weight1

no srr-queue bandwidth limit

Syntax Description	weight1	Percentage of the port speed to which the port should be limited. The range is 10 to 90.		
Defaults	The port is not rate limited and is set to 100 percent.			
Command Modes	Interface confi	guration		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	to 80 percent of rate in increment	re this command to 80 percent, the port is idle 20 percent of the time. The line rate drops of the connected speed. These values are not exact because the hardware adjusts the line ents of six. I is not available on a 10-Gigabit Ethernet interface.		
Note		eue default settings are suitable for most situations. You should change them only when rough understanding of the egress queues and if these settings do not meet your quality S) solution.		
Examples	This example a	shows how to limit a port to 800 Mb/s:		
		g)# interface gigabitethernet2/0/1 g-if)# srr-queue bandwidth limit 80		
	You can verify EXEC comma	your settings by entering the show mls qos interface [<i>interface-id</i>] queueing privileged nd.		

Related Commands C

Command	Description
mls qos queue-set output buffers	Allocates buffers to the queue-set.
mls qos srr-queue output cos-map	Maps class of service (CoS) values to egress queue or maps CoS values to a queue and to a threshold ID.
mls qos srr-queue output dscp-map	Maps Differentiated Services Code Point (DSCP) values to an egress queue or maps DSCP values to a queue and to a threshold ID.
mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation for the queue-set.
queue-set	Maps a port to a queue-set.
show mls qos interface queueing	Displays QoS information.
srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

srr-queue bandwidth shape

Use the **srr-queue bandwidth shape** interface configuration command on the switch stack or on a standalone switch to assign the shaped weights and to enable bandwidth shaping on the four egress queues mapped to a port. Use the **no** form of this command to return to the default setting.

srr-queue bandwidth shape weight1 weight2 weight3 weight4

no srr-queue bandwidth shape

Syntax Description	weight1 weight2 weight3 weight4	Specify the weights to specify the percentage of the port that is shaped. The inverse ratio (1/weight) specifies the shaping bandwidth for this queue. Separate each value with a space. The range is 0 to 65535.		
Defaults	Weight1 is set to 25.	Weight2, weight3, and weight4 are set to 0, and these queues are in shared mode.		
Command Modes	Interface configurati	on		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	Isage Guidelines In shaped mode, the queues are guaranteed a percentage of the bandwidth, and that amount. Shaped traffic does not use more than the allocated bandwidth eve shaping to smooth bursty traffic or to provide a smoother output over time.			
	The shaped mode overrides the shared mode.			
If you configure a shaped queue weight to 0 by using the srr-queue bandwidth shape inter- configuration command, this queue participates in shared mode. The weight specified with t srr-queue bandwidth shape command is ignored, and the weights specified with the srr-queue bandwidth share interface configuration command for a queue come into effect.				
	When configuring queues for the same port for both shaping and sharing, make sure that you configute the lowest numbered queue for shaping.			
	This command is no	t available on a 10-Gigabit Ethernet interface.		
Note		fault settings are suitable for most situations. You should change them only when understanding of the egress queues and if these settings do not meet your QoS		
Examples	the weight ratios for	how to configure the queues for the same port for both shaping and sharing. Because queues 2, 3, and 4 are set to 0, these queues operate in shared mode. The bandwidth s 1/8, which is 12.5 percent. Queue 1 is guaranteed this bandwidth and limited to it;		

it does not extend its slot to the other queues even if the other queues have no traffic and are idle. Queues 2, 3, and 4 are in shared mode, and the setting for queue 1 is ignored. The bandwidth ratio allocated for the queues in shared mode is 4/(4+4+4), which is 33 percent:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth shape 8 0 0 0
Switch(config-if)# srr-queue bandwidth share 4 4 4 4
```

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** privileged EXEC command.

Related Commands	Command	Description	
	mls qos queue-set output buffers	Allocates buffers to a queue-set.	
	mls qos srr-queue output cos-map	Maps class of service (CoS) values to an egress queue or maps CoS values to a queue and to a threshold ID.	
	mls qos srr-queue output dscp-map	Maps Differentiated Services Code Point (DSCP) values to an egress queue or maps DSCP values to a queue and to a threshold ID.	
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.	
	priority-queue	Enables the egress expedite queue on a port.	
	queue-set	Maps a port to a queue-set.	
	show mls qos interface queueing	Displays quality of service (QoS) information.	
	srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.	

srr-queue bandwidth share

Use the **srr-queue bandwidth share** interface configuration command on the switch stack or on a standalone switch to assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port. The ratio of the weights is the ratio of frequency in which the shaped round robin (SRR) scheduler dequeues packets from each queue. Use the **no** form of this command to return to the default setting.

srr-queue bandwidth share weight1 weight2 weight3 weight4

no srr-queue bandwidth share

Syntax Description	weight1 weight2 weight3 weight4	The ratios of <i>weight1</i> , <i>weight2</i> , <i>weight3</i> , and <i>weight4</i> specify the ratio of the frequency in which the SRR scheduler dequeues packets. Separate each value with a space. The range is 1 to 255.
Defaults	Weight1, weight2, w	weight3, and weight4 are 25 (1/4 of the bandwidth is allocated to each queue).
ommand Modes	Interface configurati	ion
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
lsage Guidelines	In shared mode, the bandwidth is guaran	of each weight is meaningless, and only the ratio of parameters is used. queues share the bandwidth among them according to the configured weights. The teed at this level but not limited to it. For example, if a queue empties and does no e link, the remaining queues can expand into the unused bandwidth and share it
	configuration comm srr-queue bandwid	haped queue weight to 0 by using the srr-queue bandwidth shape interface and, this queue participates in SRR shared mode. The weight specified with the th shape command is ignored, and the weights specified with the srr-queue iterface configuration command for a queue take effect.
	When configuring que the lowest numbered	ueues for the same port for both shaping and sharing, make sure that you configure I queue for shaping.
 Note	• •	fault settings are suitable for most situations. You should change them only when understanding of the egress queues and if these settings do not meet your QoS

Examples

This example shows how to configure the weight ratio of the SRR scheduler running on an egress port. Four queues are used. The bandwidth ratio allocated for each queue in shared mode is 1/(1+2+3+4), 2/(1+2+3+4), 3/(1+2+3+4), and 4/(1+2+3+4), which is 10 percent, 20 percent, 30 percent, and 40 percent for queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth of queue 1, twice the bandwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth share 1 2 3 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** privileged EXEC command.

Related Commands	Command	Description

	srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.	

stack-mac persistent timer

Use the **stack-mac persistent timer** global configuration command on the switch stack to enable the persistent MAC address feature. When this feature is enabled, if the stack master changes, the stack MAC address does not change for approximately 4 minutes, for an indefinite time period, or for a configured time value. If the previous stack master rejoins the stack during this period, the stack continues to use its MAC address as the stack MAC address, even if it is now a stack member. Use the **no** form of this command to disable the persistent MAC address feature.

stack-mac persistent timer [0 | time-value]

no stack-mac persistent timer

Syntax Description	0 (Optional) Enter to continue using the MAC address of the current stack master after a new stack master takes over.			
	time-value	(Optional) Set the time period in minutes before the stack MAC address changes to that of the new stack master. The range is 1 to 60 minutes. When no value is entered, the default is 4 minutes. We recommend that you configure an explicit value for this command.		
Command Default	Persistent MAC ac	ldress is disabled. The MAC address of the stack is always that of the stack master.		
	When the command is entered with no value, the default time before the MAC address changes is four minutes. We recommend that you configure an explicit value for this command			
Command Mada-	Global configurati	on		
Command Modes	Ciobal comiguian			
Command Modes	Release	Modification		

When persistent MAC address is enabled, the stack MAC address does not change for a time period. During that time, if the previous stack master rejoins the stack as a stack member, the stack retains its MAC address for as long as that switch is in the stack. If the previous stack master does not rejoin the stack during the specified time period, the switch stack takes the MAC address of the new stack master as the stack MAC address.

Beginning with Cisco IOS Release 12.2(35)SE, you can set the time period to be from 0 to 60 minutes.

- If you enter the command with no value, the default delay is 4 minutes.
- If you enter **0**, the stack continues to use the current stack MAC address until you enter the **no stack-mac persistent timer** command.
- If you enter a time delay of 1 to 60 minutes, the stack MAC address of the previous stack master is used until the configured time period expires or until you enter the **no stack-mac persistent timer** command.

Note

When you enter the **stack-mac persistent timer** command with or without keywords, a message appears warning that traffic might be lost if the old master MAC address appears elsewhere in the network domain. You should use this feature cautiously.

If you enter the **no stack-mac persistent timer** command after a switchover, before the time expires, the switch stack moves to the current stack master MAC address.

If the whole stack reloads, when it comes back up, the MAC address of the stack master is the stack MAC address.

Examples

This example shows how to configure the persistent MAC address feature, with the warning messages for each configuration. It also shows how to verify the configuration:

```
Switch(config) # stack-mac persistent timer
WARNING: Use of an explicit timer value with the command is recommended
WARNING: Default value of 4 minutes is being used.
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC \ensuremath{\mathsf{MAC}}
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.
Switch(config) # stack-mac persistent timer 0
WARNING: Stack MAC persistency timer value of 0 means that, after a
WARNING: master switchover, the current stack-mac will continue
WARNING: to be used indefinitely.
WARNING: The Network Administrators must make sure that the old
WARNING: stack-mac does not appear elsewhere in this network
WARNING: domain. If it does, user traffic may be blackholed.
Switch(config) # stack-mac persistent timer 7
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.
Switch(config)# end
Switch# show switch
Switch/Stack Mac Address : 0016.4727.a900
Mac persistency wait time: 7 mins
```

				H/W	Current
Switch#	Role	Mac Address	Priority	Version	State
*1	Master	0016.4727.a900	1	0	Ready

You can verify your settings by entering either of two privileged EXEC commands:

- **show running-config**—If enabled, stack-mac persistent timer and the time in minutes appears in the output.
- **show switch**—If enabled, Mac persistency wait time and the number of minutes appears in the output.

Related Commands	Command	Description
	show running-config	Displays the current operating configuration, including stack MAC persistency wait time if persistent MAC address is configured. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .
	show switch	Displays information related to the switch stack, including stack MAC persistency wait time if persistent MAC address is enabled.

storm-control

Use the **storm-control** interface configuration command on the switch stack or on a standalone switch to enable broadcast, multicast, or unicast storm control and to set threshold levels on an interface. Use the **no** form of this command to return to the default setting.

storm-control {{broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps
pps [pps-low]} | {action {shutdown | trap}}

no storm-control {{broadcast | multicast | unicast} level} | {action {shutdown | trap}}

Syntax Description	broadcast	Enable broadcast storm control on the interface.
	multicast	Enable multicast storm control on the interface.
	unicast	Enable unicast storm control on the interface.
	level level [level-low]	Specify the rising and falling suppression levels as a percentage of total bandwidth of the port.
		• <i>level</i> —Rising suppression level, up to two decimal places. The range is 0.00 to 100.00. Block the flooding of storm packets when the value specified for <i>level</i> is reached.
		• <i>level-low</i> —(Optional) Falling suppression level, up to two decimal places. The range is 0.00 to 100.00. This value must be less than or equal to the rising suppression value. If you do not configure a falling suppression level, it is set to the rising suppression level.
	level bps bps [bps-low]	Specify the rising and falling suppression levels as a rate in bits per second at which traffic is received on the port.
		• <i>bps</i> —Rising suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. Block the flooding of storm packets when the value specified for <i>bps</i> is reached.
		• <i>bps-low</i> —(Optional) Falling suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. This value must be equal to or less than the rising suppression value.
		You can use metric suffixes such as k, m, and g for large number thresholds.

	level pps pps [pps-low]	Specify the rising and falling suppression levels as a rate in packets per second at which traffic is received on the port.
		• <i>pps</i> —Rising suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. Block the flooding of storm packets when the value specified for <i>pps</i> is reached.
		• <i>pps-low</i> —(Optional) Falling suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. This value must be equal to or less than the rising suppression value.
		You can use metric suffixes such as k, m, and g for large number thresholds.
	action {shutdown	Action taken when a storm occurs on a port. The default action is to filter traffic and to not send an Simple Network Management Protocol (SNMP) trap.
	trap}	The keywords have these meanings:
		• shutdown —Disables the port during a storm.
		• trap —Sends an SNMP trap when a storm occurs.

	Release12.1(11)AX12.2(25)SEThe storm-contr rate in packets p received.When specified limit is placed o unicast traffic or less than 100 pe	Modification This command was introduced. The level level [.level] options were replaced with the level {level [level-low] pps pps [pps-low] bps bps [bps-low] } action {shutdown trap}} options. ol suppression level can be entered as a percentage of total bandwidth of the port, as a per second at which traffic is received, or as a rate in bits per second at which traffic is as a percentage of total bandwidth, a suppression value of 100 percent means that no n the specified traffic type. A value of level 0 0 means that all broadcast, multicast, or a that port is blocked. Storm control is enabled only when the rising suppression level i rcent. If no other storm-control configuration is specified, the default action is to filter

The trap and shutdown options are independent of each other.

	packet storm is detected, you must use the no shutdown interface configuration command to bring th interface out of this state. If you do not specify the shutdown action, specify the action as trap (the switch generates a trap when a storm is detected).	e
	When a storm occurs and the action is to filter traffic, if the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. If the fallin suppression level is specified, the switch blocks traffic until the traffic rate drops below this level.	
	 Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces. 	
	When a broadcast storm occurs and the action is to filter traffic, the switch blocks only broadcast traff	ic.
	For more information, see the software configuration guide for this release.	
Examples	This example shows how to enable broadcast storm control with a 75.5-percent rising suppression level Switch(config-if) # storm-control broadcast level 75.5	el:
	This example shows how to enable unicast storm control on a port with a 87-percent rising suppression level and a 65-percent falling suppression level:	n
	Switch(config-if)# storm-control unicast level 87 65	
	This example shows how to enable multicast storm control on a port with a 2000-packets-per-second rising suppression level and a 1000-packets-per-second falling suppression level:	
	Switch(config-if)# storm-control multicast level pps 2k 1k	
	This example shows how to enable the shutdown action on a port:	
	Switch(config-if)# storm-control action shutdown	
	You can verify your settings by entering the show storm-control privileged EXEC command.	

If you configure the action to be taken as shutdown (the port is error-disabled during a storm) when a

Related Commands	Command	Description
	show storm-control	Displays broadcast, multicast, or unicast storm control settings on all
		interfaces or on a specified interface.

switch priority

Use the **switch priority** global configuration command on the stack master to change the stack member priority value.

switch stack-member-number priority new-priority-value

Syntax Description	stack-member-number	Specify the current stack member number. The range is 1 to 9.
	priority <i>new-priority-val</i>	<i>ue</i> Specify the new stack member priority value. The range is 1 to 15.
Defaults	The default priority value	is 1.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Examples		stack master immediately. to change the priority value of stack member 6 to 9:
	Switch(config)# switch 6 priority 9 Changing the Switch Priority of Switch Number 6 to 9 Do you want to continue?[confirm]	
Related Commands	Command	Description
	reload	Reloads the stack member and puts a configuration change into effect.
	session	Accesses a specific stack member.
	switch renumber	Changes the stack member number.
	switch renumber show switch	

switch provision

Use the **switch provision** global configuration command on the stack master to provision (to supply a configuration to) a new switch before it joins the switch stack. Use the **no** form of this command to delete all configuration information associated with the removed switch (a stack member that has left the stack).

switch stack-member-number provision type

no switch stack-member-number provision

Syntax Description	stack-member-number	Specify the stack member number. The range is 1 to 9.
	provision type	Specify the switch type of the new switch before it joins the stack.
		For <i>type</i> , enter the model number of a supported switch that is listed in the command-line help strings.
Defaults	The switch is not provision	ned.
Command Modes	Global configuration	
Command History	Release	Modification
	10.0(00) 05	
Isano Guidalinos		This command was introduced.
Jsage Guidelines	To avoid receiving an error using the no form of this of To change the switch type	r message, you must remove the specified switch from the switch stack before command to delete a provisioned configuration. , you must also remove the specified switch from the switch stack. You can number of a provisioned switch that is physically present in the switch stack
Jsage Guidelines	To avoid receiving an error using the no form of this of To change the switch type change the stack member if you do not also change If the switch type of the pr configuration on the stack	r message, you must remove the specified switch from the switch stack before command to delete a provisioned configuration. , you must also remove the specified switch from the switch stack. Usage Guidelines	To avoid receiving an error using the no form of this of To change the switch type change the stack member if you do not also change If the switch type of the pr configuration on the stack and adds it to the stack. The Provisioned information a	r message, you must remove the specified switch from the switch stack before command to delete a provisioned configuration. , you must also remove the specified switch from the switch stack. You can number of a provisioned switch that is physically present in the switch stack the switch type. rovisioned switch does not match the switch type in the provisioned , the switch stack applies the default configuration to the provisioned switch ne switch stack displays a message when it applies the default configuration. ppears in the running configuration of the switch stack. When you enter the tup-config privileged EXEC command, the provisioned configuration is saved

Examples

This example shows how to provision a Catalyst 3750G-12S switch with a stack member number of 2 for the switch stack. The **show running-config** command output shows the interfaces associated with the provisioned switch:

```
Switch(config)# switch 2 provision WS-C3750G-12S
Switch(config)# end
Switch# show running-config | include switch 2
!
interface GigabitEthernet2/0/1
!
interface GigabitEthernet2/0/2
!
interface GigabitEthernet2/0/3
<output truncated>
```

You also can enter the **show switch** user EXEC command to display the provisioning status of the switch stack.

This example shows how to delete all configuration information about a stack member 5 when the switch is removed from the stack:

Switch(config) # no switch 5 provision

You can verify that the provisioned switch is added to or removed from the running configuration by entering the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.
	show switch	Displays information about the switch stack and its stack members.

switch renumber

Use the **switch renumber** global configuration command on the stack master to change the stack member number.

switch current-stack-member-number renumber new-stack-member-number

Syntax Description	current-stack-member-number	Specify the current stack member number. The range is 1 to 9.
	renumber new-stack-member-number	Specify the new stack member number for the stack member. The range is 1 to 9.
Defaults	The default stack member numbe	er is 1.

switchport

L

Use the **switchport** interface configuration command with no keywords on the switch stack or on a standalone switch to put an interface that is in Layer 3 mode into Layer 2 mode for Layer 2 configuration. Use the **no** form of this command to put an interface in Layer 3 mode.

switchport

no switchport

Use the **no switchport** command (without parameters) to set the interface to the routed-interface status and to erase all Layer 2 configurations. You must use this command before assigning an IP address to a routed port.

Syntax Description This command has no arguments or keywords.

Defaults By default, all interfaces are in Layer 2 mode.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(20)SE	Previous configuration information on an interface is removed when the interface changes between Layer 2 mode and Layer 3 mode or between Layer 3 mode and Layer 2 mode.

Usage Guidelines

Entering the **no switchport** command shuts the port down and then re-enables it, which might generate messages on the device to which the port is connected.

In Release 12.2(20)SE and later, when you put an interface that is in Layer 2 mode into Layer 3 mode (or the reverse), the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

Note

If an interface is configured as a Layer 3 interface, you must first enter this **switchport** command with no keywords to configure the interface as a Layer 2 port. Then you can enter additional switchport commands with keywords, as shown on the pages that follow.

Examples

This example shows how to cause an interface to cease operating as a Layer 2 port and become a Cisco-routed port:

Switch(config-if) # no switchport

This example shows how to cause the port interface to cease operating as a Cisco-routed port and convert to a Layer 2 switched interface:

Switch(config-if) # switchport

Note

The **switchport** command without keywords is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

You can verify the switchport status of an interface by entering the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show interfaces switchport	Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

switchport access

Use the **switchport access** interface configuration command on the switch stack or on a standalone switch to configure a port as a static-access or dynamic-access port. If the switchport mode is set to **access**, the port operates as a member of the specified VLAN. If set to **dynamic**, the port starts discovery of VLAN assignment based on the incoming packets it receives. Use the **no** form of this command to reset the access mode to the default VLAN for the switch.

switchport access vlan {vlan-id | dynamic}

no switchport access vlan

Syntax Description	vlan vlan-id	Configure the interface as a static access port with the VLAN ID of the access mode VLAN; the range is 1 to 4094.
	vlan dynamic	Specify that the access mode VLAN is dependent on the VLAN Membership Policy Server (VMPS) protocol. The port is assigned to a VLAN based on the source MAC address of a host (or hosts) connected to the port. The switch sends every new MAC address received to the VMPS server to get the VLAN name to which the dynamic-access port should be assigned. If the port already has a VLAN assigned and the source has already been approved by the VMPS, the switch forwards the packet to the VLAN.
Defaults	The default access platform or interfac	VLAN and trunk interface native VLAN is a default VLAN corresponding to the the bardware.
	A dynamic-access p it receives.	port is initially a member of no VLAN and receives its assignment based on the packet

Command History	Interface configura Release 12.1(11)AX The no switchport the device.	Modification This command was introduced.
Command History	Interface configura Release 12.1(11)AX The no switchport the device. The port must be in	Modification This command was introduced. access command resets the access mode VLAN to the appropriate default VLAN for

These restrictions apply to dynamic-access ports:

- The software implements the VLAN Query Protocol (VQP) client, which can query a VMPS such as a Catalyst 6000 series switch. The Catalyst 3750 switches are not VMPS servers. The VMPS server must be configured before a port is configured as dynamic.
- Use dynamic-access ports only to connect end stations. Connecting them to switches or routers (that use bridging protocols) can cause a loss of connectivity.
- Configure the network so that STP does not put the dynamic-access port into an STP blocking state. The Port Fast feature is automatically enabled on dynamic-access ports.
- Dynamic-access ports can only be in one VLAN and do not use VLAN tagging.
- Dynamic-access ports cannot be configured as
 - Members of an EtherChannel port group (dynamic-access ports cannot be grouped with any other port, including other dynamic ports).
 - Source or destination ports in a static address entry.
 - Monitor ports.

Examples This example shows how to change a switched port interface that is operating in access mode to operate in VLAN 2 instead of the default VLAN:

Switch(config-if) # switchport access vlan 2

You can verify your setting by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command and examining information in the Administrative Mode and Operational Mode rows.

Related Commands	Command	Description
	show interfaces switchport	Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
	switchport mode	Configures the VLAN membership mode of a port.

switchport autostate exclude

Use the **switchport autostate exclude** interface configuration command to exclude an interface from the VLAN interface (switch virtual interface) line-state up or down calculation. Use the **no** form of this command to return to the default setting.

switchport autostate exclude

	no switchport	autostate exclude
Syntax Description	This command has	no arguments or keywords.
Defaults	All ports in the VL	AN are included in the VLAN interface link-up calculation.
Command Modes	Interface configuration	
Command History	Release	Modification
,	12.2(46)SE	This command was introduced.
Usage Guidelines	Enter the switchpo	rt autostate exclude command on a Layer 2 access or trunk port belonging to an SVI.
	A VLAN interface (SVI) is up if ports are forwarding traffic in the associated VLAN. When all p a VLAN are down or blocking, the SVI is down. For the SVI line state to be up, at least one po VLAN must be up and forwarding. You can use the switchport autostate exclude command to a port from the SVI interface line-state up-or-down calculation. For example, you might exclude monitoring port from the calculations so that the VLAN is not considered up when only the mo port is active.	
	When you enter the VLANs that are en	e switchport autostate exclude command on a port, the command applies to all abled on the port.
		autostate mode of an interface by entering the show interface interface-id ged EXEC command. If the mode has not been set, the autostate mode does not
Examples	This example show	s how to configure autostate exclude on an interface and to verify the configuration:
	Switch(config-if) Switch(config-if) Switch# show inter Name: Gi1/0/1 Switchport: Enabl Administrative Mc Operational Mode:	face gigabitethernet1/0/1 switchport led ode: dynamic auto : down runking Encapsulation: negotiate

Related Commands

Command	Description
show interfaces [interface-id] switchport	Displays the administrative and operational status of a switching (nonrouting) port, including autostate mode, if set.
show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

switchport backup interface

Use the **switchport backup interface** interface configuration command on a Layer 2 interface on the switch stack or on a standalone switch to configure Flex Links, a pair of interfaces that provide backup to each other. Use the **no** form of this command to remove the Flex Links configuration.

- switchport backup interface [FastEthernet interface-id | GigabitEthernet interface-id |
 Port-channel interface-id | TenGigabitEthernet interface-id] {mmu primary vlan
 interface-id | multicast fast-convergence | preemption {delay delay-time | mode} | prefer
 vlan vlan-id}
- no switchport backup interface [FastEthernet interface-id | GigabitEthernet interface-id |
 Port-channel interface-id | TenGigabitEthernet interface-id] {mmu primary vlan
 interface-id | multicast fast-convergence | preemption {delay delay-time | mode} | prefer
 vlan vlan-id}

Syntax Description	FastEthernet	FastEthernet IEEE 802.3 port name. Valid range is 0 to 9.
	GigabitEthernet	GigabitEthernet IEEE 802.3z port name. Valid range is 0 to 9.
	Port-channel	Ethernet Channel of interface. Valid range is 0 to 48.
	TenGigabitEthernet	Ten Gigabit Ethernet port name. Valid range is 0 to 9.
	interface-id	Specify that the Layer 2 interface to act as a backup link to the interface being configured. The interface can be a physical interface or port channel. The port-channel range is 1 to 48.
	mmu	MAC-address move update. Configure the MAC move update (MMU) for a backup interface pair.
	primary vlan vlan-id	The VLAN ID of the private-VLAN primary VLAN; valid range is 1 to 4,094.
	multicast	Multicast Fast-convergence parameter.
	fast-convergence	
	preemption	Configure a preemption scheme for a backup interface pair.
	delay delay-time	(Optional) Specify a preemption delay; the valid values are 1 to 300 seconds.
	mode	Specify a preemption mode as bandwidth, forced, or off.
	prefer vlan vlan-id	Specify that VLANs are carried on the backup interfaces of a Flex Link pair. VLAN ID range is 1 to 4,094.
	off	(Optional) Specify that no preemption occurs from backup to active.
	delay delay-time	(Optional) Specify a preemption delay; the valid values are 1 to 300 seconds.

Defaults

The default is to have no Flex Links defined. Preemption mode is off. No preemption occurs. Preemption delay is set to 35 seconds.

Command Modes Interface configuration

Release	Modification
12.2(20)SE	This command was introduced.
12.2(25)SEE	Added preemption, mode, forced, bandwidth, off, and delay keywords.
12.2(37)SE	Added prefer vlan keyword.
12.2(44)SE	The multicast , fast-convergence , delay , mode , prefer , and vlan keywords were added.
interface is in standb interface being confi backup link. The feat	figured, one link acts as the primary interface and forwards traffic, while the other by mode, ready to begin forwarding traffic if the primary link shuts down. The gured is referred to as the active link; the specified interface is identified as the ture provides an alternative to the Spanning Tree Protocol (STP), allowing users to l retain basic link redundancy.
	s available only for Layer 2 interfaces.
• You can configu	re only one Flex Link backup link for any active link, and it must be a different ne active interface.
	belong to only one Flex Link pair. An interface can be a backup link for only one ctive link cannot belong to another Flex Link pair.
the active link. H	bes not have to be the same type (Fast Ethernet or Gigabit Ethernet, for instance) as However, you should configure both Flex Links with similar characteristics so that hos or changes in behavior if the standby link begins to forward traffic.
port channels (E	hks can be a port that belongs to an EtherChannel. However, you can configure two therChannel logical interfaces) as Flex Links, and you can configure a port channel interface as Flex Links, with either the port channel or the physical interface as the
•	ared on the switch, Flex Links do not participate in STP in all valid VLANs. If STP e sure that there are no loops in the configured topology.
This example shows	how to configure two interfaces as Flex Links:
	rface fastethernet1/0/1 witchport backup interface fastethernet1/0/2
This example shows	how to configure the Fast Ethernet interface to always preempt the backup:
Switch# configure Switch(conf)# inte	terminal rface fastethernet1/0/1 witchport backup interface fastethernet1/0/2 preemption forced
This example shows	how to configure the Fast Ethernet interface preemption delay time:
	rface fastethernet1/0/1 witchport backup interface fastethernet1/0/2 preemption delay 150

This example shows how to configure the Fast Ethernet interface as the MMU primary VLAN:

```
Switch# configure terminal
Switch(conf)# interface fastethernet1/0/1
Switch(conf-if)# switchport backup interface fastethernet1/0/2 mmu primary vlan 1021
Switch(conf-if)# end
```

You can verify your setting by entering the **show interfaces switchport backup** privileged EXEC command.

The following example shows how to configure preferred VLANs:

```
Switch(config) # interface gigabitethernet 1/0/6
Switch(config-if) # switchport backup interface gigabitethernet 1/0/8 prefer vlan
60,100-120
```

You can verify your setting by entering the **show interfaces switchport backup** privileged EXEC command.

In the following example, VLANs 60, and 100 to 120 are configured on the switch:

```
Switch(config)# interface gigabitEthernet 1/0/6
Switch(config-if)# switchport backup interface gigabitEthernet 1/0/8 prefer vlan
60,100-120
```

When both interfaces are up, Gi1/0/6 forwards traffic for VLANs 1 to 50, and Gi1/0/8 forwards traffic for VLANs 60 and 100 to 120.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface Backup Interface State
```

GigabitEthernet1/0/6 GigabitEthernet1/0/8 Active Up/Backup Up

```
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Link interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface Gi1/0/6 goes down, Gi1/0/8 carries all VLANs of the Flex Link pair.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet1/0/6 GigabitEthernet1/0/8 Active Down/Backup Up
```

Vlans Preferred on Active Interface: 1-50 Vlans Preferred on Backup Interface: 60, 100-120

L

When a Flex Link interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi1/0/6 comes up, VLANs preferred on this interface are blocked on the peer interface Gi1/0/8 and forwarded on Gi1/0/6.

Switch# show interfaces switchport backup Switch Backup Interface Pairs: Active Interface Backup Interface State GigabitEthernet1/0/6 GigabitEthernet1/0/8 Active Up/Backup Up

Vlans Preferred on Active Interface: 1-50 Vlans Preferred on Backup Interface: 60, 100-120

The following example shows how to configure multicast fast-convergence on interface Gi1/0/11:

```
Switch# configure terminal
Switch(config)# interface gigabitEthernet 1/0/11
Switch(config-if)# switchport backup interface gigabitEthernet 1/0/12 multicast
fast-convergence
Switch(config-if)# end
```

You can verify your setting by entering the **show interfaces switchport backup detail** privileged EXEC command.

```
Switch# show interfaces switchport backup detail

Switch Backup Interface Pairs:

Active Interface Backup Interface State

GigabitEthernet1/0/11 GigabitEthernet1/0/12 Active Up/Backup Standby

Preemption Mode : off

Multicast Fast Convergence : On

Bandwidth : 1000000 Kbit (Gi1/0/11), 1000000 Kbit (Gi1/0/12)

Mac Address Move Update Vlan : auto
```

Related Commands	Command	Description
		Displays the configured Flex Links and their status on the switch or
	switchport backup	for the specified interface.

switchport block

Use the **switchport block** interface configuration command on the switch stack or on a standalone switch to prevent unknown multicast or unicast packets from being forwarded. Use the **no** form of this command to allow forwarding unknown multicast or unicast packets.

switchport block {multicast | unicast}

no switchport block {multicast | unicast}

Syntax Description	multicast	Specify that unknown multicast traffic should be blocked.
	unicast	Specify that unknown unicast traffic should be blocked.
Defaults	Unknown multicast and un	nicast traffic is not blocked.
Command Modes	Interface configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	By default, all traffic with unknown MAC addresses is sent to all ports. You can block unknown or unicast traffic on protected or nonprotected ports. If unknown multicast or unicast traffic blocked on a protected port, there could be security issues. Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports explicitly configure it.	
		at blocking packets, see the software configuration guide for this release.
Examples	This example shows how t Switch(config-if)# swit	o block unknown multicast traffic on an interface: chport block multicast
	You can verify your setting command.	g by entering the show interfaces <i>interface-id</i> switchport privileged EXEC
Related Commands	Command	Description
	show interfaces switchpo	Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.

switchport host

Use the **switchport host** interface configuration command on the switch stack or on a standalone switch to optimize a Layer 2 port for a host connection. The **no** form of this command has no affect on the system.

switchport host

Syntax Description	This command has no arguments or keywords.	
Defaults	The default is for the	ne port to not be optimized for a host connection.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	To optimize the port for a host connection, the switchport host command sets switch port mode to access, enables spanning tree Port Fast, and disables channel grouping. Only an end station can accept this configuration. Because spanning tree Port Fast is enabled, you should enter the switchport host command only on ports that are connected to a single host. Connecting other switches, hubs, concentrators, or bridges to a fast-start port can cause temporary spanning-tree loops.	
	Enable the switchp	ort host command to decrease the time that it takes to start up packet forwarding.

You can verify your setting by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

Related Commands	Command	Description
	show interfaces switchport	Displays the administrative and operational status of a switching
		(nonrouting) port, including switchport mode.

switchport mode

Use the **switchport mode** interface configuration command on the switch stack or on a standalone switch to configure the VLAN membership mode of a port. Use the **no** form of this command to reset the mode to the appropriate default for the device.

switchport mode {access | dot1q-tunnel | dynamic {auto | desirable} | private-vlan | trunk}

no switchport mode {access | dot1q-tunnel | dynamic | trunk}

Syntax Description	access	Set the port to access mode (either static-access or dynamic-access depending on the setting of the switchport access vlan interface configuration command). The port is set to access unconditionally and operates as a nontrunking, single VLAN interface that sends and receives nonencapsulated (non-tagged) frames. An access port can be assigned to only one VLAN.
	dot1q-tunnel	Set the port as an IEEE 802.1Q tunnel port.
	dynamic auto	Set the interface trunking mode dynamic parameter to auto to specify that the interface convert the link to a trunk link. This is the default switchport mode.
	dynamic desirable	Set the interface trunking mode dynamic parameter to desirable to specify that the interface actively attempt to convert the link to a trunk link.
	private-vlan	See the switchport mode private-vlan command.
	trunk	Set the port to trunk unconditionally. The port is a trunking VLAN Layer 2 interface. The port sends and receives encapsulated (tagged) frames that identify the VLAN of origination. A trunk is a point-to-point link between two switches or between a switch and a router.
	The default mode is d	lynamic auto.

Defaults Command Modes Command History Usage Guidelines	Release 12.1(11)AX 12.2(20)SE 12.2(25)SE A configuration that a configure the port in a and trunk configuration When you enter access convert the link into a When you enter trunt	Modification This command was introduced. The private-vlan keyword was added. The dot1q-tunnel keyword was added. uses the access, dot1q-tunnel, or trunk keywords takes effect only when you the appropriate mode by using the switchport mode command. The static-access on are saved, but only one configuration is active at a time. ss mode, the interface changes to permanent nontrunking mode and negotiates to the static set of the static set

When you enter **dynamic auto** mode, the interface converts the link to a trunk link if the neighboring interface is set to **trunk** or **desirable** mode.

When you enter **dynamic desirable** mode, the interface becomes a trunk interface if the neighboring interface is set to **trunk**, **desirable**, or **auto** mode.

To autonegotiate trunking, the interfaces must be in the same VLAN Trunking Protocol (VTP) domain. Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations. To avoid this, you should configure interfaces connected to devices that do not support DTP to not forward DTP frames, which turns off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking to a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

When you enter dot1q-tunnel, the port is set unconditionally as an IEEE 802.1Q tunnel port.

Access ports, trunk ports, and tunnel ports are mutually exclusive.

Any IEEE 802.1Q encapsulated IP packets received on a tunnel port can be filtered by MAC access control lists (ACLs), but not by IP ACLs. This is because the switch does not recognize the protocol inside the IEEE 802.1Q header. This restriction applies to router ACLs, port ACLs, and VLAN maps.

Configuring a port as an IEEE 802.1Q tunnel port has these limitations:

- IP routing and fallback bridging are not supported on tunnel ports.
- Tunnel ports do not support IP ACLs.
- If an IP ACL is applied to a trunk port in a VLAN that includes tunnel ports, or if a VLAN map is applied to a VLAN that includes tunnel ports, packets received from the tunnel port are treated as non-IP packets and are filtered with MAC access lists.
- Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports.

For more information about configuring IEEE 802.1Q tunnel ports, see the software configuration guide for this release.

The IEEE 802.1x feature interacts with switchport modes in these ways:

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- If you try to enable IEEE 802.1x on a port set to **dynamic auto** or **dynamic desirable**, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to **dynamic auto** or **dynamic desirable**, the port mode is not changed.
- If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

This example shows how to configure a port as an IEEE 802.1Q tunnel port:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport mode dot1q-tunnel

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command and examining information in the Administrative Mode and Operational Mode rows.

Related Commands	Command	Description
	show interfaces switchport	Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
	switchport access	Configures a port as a static-access or dynamic-access port.
	switchport trunk	Configures the trunk characteristics when an interface is in trunking mode.

switchport mode private-vlan

Use the **switchport mode private-vlan** interface configuration command on the switch stack or on a standalone switch to configure a port as a promiscuous or host private VLAN port. Use the **no** form of this command to reset the mode to the appropriate default for the device.

switchport mode private-vlan {host | promiscuous}

no switchport mode private-vlan

	host	Configure the interface as a private-VLAN host port. Host ports belong to private-VLAN secondary VLANs and are either community ports or isolated ports, depending on the VLAN that they belong to.	
	promiscuous	Configure the interface as a private-VLAN promiscuous port. Promiscuous ports are members of private-VLAN primary VLANs.	
Defaults	The default private-VLAN mode is neither host nor promiscuous.		
	The default switch	port mode is dynamic auto .

We strongly recommend that you enable spanning tree Port Fast and bridge-protocol-data-unit (BPDU) guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence.

If you configure a port as a private-VLAN host port and you do not configure a valid private-VLAN association by using the **switchport private-vlan host-association** interface configuration command, the interface becomes inactive.

If you configure a port as a private-VLAN promiscuous port and you do not configure a valid private VLAN mapping by using the **switchport private-vlan mapping** interface configuration command, the interface becomes inactive.

Examples

This example shows how to configure an interface as a private-VLAN host port and associate it to primary VLAN 20. The interface is a member of secondary isolated VLAN 501 and primary VLAN 20.

Note

When you configure a port as a private VLAN host port, you should also enable BPDU guard and Port Fast by using the **spanning-tree portfast bpduguard default** global configuration command and the **spanning-tree portfast** interface configuration command.

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 20 501
Switch(config-if)# end
```

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 20 501-503
Switch(config-if)# end
```

You can verify private VLAN switchport mode by using the **show interfaces** *interface-id* **switchport** privileged EXEC command.

Related Commands	Command	Description
	private-vlan	Configures a VLAN as a community, isolated, or primary VLAN or associates a primary VLAN with secondary VLANs.
	show interfaces switchport	Displays the administrative and operational status of a switching (nonrouting) port, including private VLAN configuration.
	switchport private-vlan	Configures private VLAN associations and mappings between primary and secondary VLANs on an interface.

switchport nonegotiate

Use the **switchport nonegotiate** interface configuration command on the switch stack or on a standalone switch to specify that Dynamic Trunking Protocol (DTP) negotiation packets are not sent on the Layer 2 interface. The switch does not engage in DTP negotiation on this interface. Use the **no** form of this command to return to the default setting.

switchport nonegotiate

no switchport nonegotiate

Syntax Description	This command has no arguments or keywords.	
Defaults	The default is to us	e DTP negotiation to learn the trunking status.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	delinesThe no form of the switchport nonegotiate command removes nonegotiate status.This command is valid only when the interface switchport mode is access or trunk (configured by using the switchport mode access or the switchport mode trunk interface configuration command). This command returns an error if you attempt to execute it in dynamic (auto or desirable) mode.Internetworking devices that do not support DTP might forward DTP frames improperly and cause misconfigurations. To avoid this, you should turn off DTP by using the switchport no negotiate command to configure the interfaces connected to devices that do not support DTP to not forward DTF frames.When you enter the switchport nonegotiate interface. The device does or does not trunk according to the mode parameter: access or trunk.	
		ntend to trunk across those links, use the switchport mode access interface ommand to disable trunking.
	 To enable trunking on a device that does not support DTP, use the switchport mode switchport nonegotiate interface configuration commands to cause the interface to be but to not generate DTP frames. 	

Examples This example shows how to cause a port to refrain from negotiating trunking mode and to act as a trunk or access port (depending on the mode set):

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport nonegotiate

You can verify your setting by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

Related Commands	Command	Description
	show interfaces switchport	Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
	switchport mode	Configures the VLAN membership mode of a port.

switchport port-security

Use the **switchport port-security** interface configuration command without keywords on the switch stack or on a standalone switch to enable port security on the interface. Use the keywords to configure secure MAC addresses, sticky MAC address learning, a maximum number of secure MAC addresses, or the violation mode. Use the **no** form of this command to disable port security or to set the parameters to their default states.

- switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}}] |
 mac-address sticky [mac-address | vlan {vlan-id | {access | voice}}]] [maximum value [vlan
 {vlan-list | {access | voice}}]]
- **no switchport port-security [mac-address** *mac-address* [**vlan** {*vlan-id* | {**access** | **voice**}}] | **mac-address sticky** [*mac-address* | **vlan** {*vlan-id* | {**access** | **voice**}}]] [**maximum** *value* [**vlan** {*vlan-list* | {**access** | **voice**}}]]

switchport port-security [aging] [violation {protect | restrict | shutdown | shutdown vlan}]

no switchport port-security [aging] [violation {protect | restrict | shutdown | shutdown vlan}]

Syntax Description	aging	(Optional) See the switchport port-security aging command.
	mac-address mac-address	(Optional) Specify a secure MAC address for the interface by entering a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value configured.
	vlan vlan-id	(Optional) On a trunk port only, specify the VLAN ID and the MAC address. If no VLAN ID is specified, the native VLAN is used.
	vlan access	(Optional) On an access port only, specify the VLAN as an access VLAN.
	vlan voice	(Optional) On an access port only, specify the VLAN as a voice VLAN.
		Note The voice keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.
	mac-address sticky [<i>mac-address</i>]	(Optional) Enable the interface for <i>sticky learning</i> by entering only the mac-address sticky keywords. When sticky learning is enabled, the interface adds all secure MAC addresses that are dynamically learned to the running configuration and converts these addresses to sticky secure MAC addresses.
		(Optional) Enter a mac-address to specify a sticky secure MAC address.
	maximum value	(Optional) Set the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. For more information, see the sdm prefer global configuration command. This number represents the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.
		The default setting is 1.

vlan [vlan-list]	(Optional) For trunk ports, you can set the maximum number of secur MAC addresses on a VLAN. If the vlan keyword is not entered, the default value is used.		
	• vlan —set a per-VLAN maximum value.		
	• vlan <i>vlan-list</i> —set a per-VLAN maximum value on a range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.		
violation	(Optional) Set the security violation mode or the action to be taken if port security is violated. The default is shutdown .		
protect	Set the security violation protect mode. In this mode, when the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.		
	Note We do not recommend configuring the protect mode on a trun port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached it maximum limit.		
restrict	Set the security violation restrict mode. In this mode, when the numb of secure MAC addresses reaches the limit allowed on the port, packe with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog messag is logged, and the violation counter increments.		
shutdown	Set the security violation shutdown mode. In this mode, the interface error-disabled when a violation occurs and the port LED turns off. A SNMP trap is sent, a syslog message is logged, and the violation count increments. When a secure port is in the error-disabled state, you car bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command, or you can manual re-enable it by entering the shutdown and no shut down interface configuration commands.		
shutdown vlan	Set the security violation mode to per-VLAN shutdown. In this mode only the VLAN on which the violation occurred is error-disabled.		

MAC addresses is 1.

The default violation mode is **shutdown**.

Sticky learning is disabled.

Command Modes Interface configuration

Defaults

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The sticky and vlan keywords were added.
	12.2(25)SEB	The access and voice keywords were added.
	12.2(35)SE	The shutdown vlan keyword was added

Usage Guidelines

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot be a private VLAN port.
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.
- You cannot configure static secure or sticky secure MAC addresses in the voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.
- Voice VLAN is supported only on access ports and not on trunk ports.
- When you enter a maximum secure address value for an interface, if the new value is greater than the previous value, the new value overrides the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.
- The switch does not support port security aging of sticky secure MAC addresses.

A security violation occurs when the maximum number of secure MAC addresses are in the address table and a station whose MAC address is not in the address table attempts to access the interface or when a station whose MAC address is configured as a secure MAC address on another secure port attempts to access the interface.

When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause** *psecure-violation* global configuration command. You can manually re-enable the port by entering the **shutdown** and **no shut down** interface configuration commands or by using the **clear errdisable interface** privileged EXEC command.

Setting a maximum number of addresses to one and configuring the MAC address of an attached device ensures that the device has the full bandwidth of the port.

When you enter a maximum secure address value for an interface, this occurs:

- If the new value is greater than the previous value, the new value overrides the previously configured value.
- If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

Sticky secure MAC addresses have these characteristics:

- When you enable sticky learning on an interface by using the **switchport port-security mac-address sticky** interface configuration command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses and adds all sticky secure MAC addresses to the running configuration.
- If you disable sticky learning by using the **no switchport port-security mac-address sticky** interface configuration command or the running configuration is removed, the sticky secure MAC addresses remain part of the running configuration but are removed from the address table. The addresses that were removed can be dynamically reconfigured and added to the address table as dynamic addresses.
- When you configure sticky secure MAC addresses by using the **switchport port-security mac-address sticky** *mac-address* interface configuration command, these addresses are added to the address table and the running configuration. If port security is disabled, the sticky secure MAC addresses remain in the running configuration.
- If you save the sticky secure MAC addresses in the configuration file, when the switch restarts or the interface shuts down, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost. If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.
- If you disable sticky learning and enter the **switchport port-security mac-address sticky** *mac-address* interface configuration command, an error message appears, and the sticky secure MAC address is not added to the running configuration.

Examples

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
```

This example shows how to configure a secure MAC address and a VLAN ID on a port:

```
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 1000.2000.3000 vlan 3
```

This example shows how to enable sticky learning and to enter two sticky secure MAC addresses on a port:

```
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.4141
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.000f
```

This example show how to configure a port to shut down only the VLAN if a violation occurs:

```
Switch(config)# interface gigabitethernet 2/0/2
Switch(config)# switchport port-security violation shutdown vlan
```

You can verify your settings by using the **show port-security** privileged EXEC command.

Related Commands	Command	Description
	clear port-security	Deletes from the MAC address table a specific type of secure address or all the secure addresses on the switch or an interface.
	show port-security address	Displays all the secure addresses configured on the switch.
	<pre>show port-security interface interface-id</pre>	Displays port security configuration for the switch or for the specified interface.

switchport port-security aging

Use the **switchport port-security aging** interface configuration command on the switch stack or on a standalone switch to set the aging time and type for secure address entries or to change the aging behavior for secure addresses on a particular port. Use the **no** form of this command to disable port security aging or to set the parameters to their default states.

switchport port-security aging {static | time time | type {absolute | inactivity}}}

no switchport port-security aging {static | time | type}

Syntax Description	static	Enable aging for statically configured secure addresses on this port.		
	time time	Specify the aging time for this port. The range is 0 to 1440 minutes. If the time is 0, aging is disabled for this port.		
	type	Set the aging type.		
	absolute	Set absolute aging type. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.		
	inactivity	Set the inactivity aging type. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.		
Defaults	The port security	aging feature is disabled. The default time is 0 minutes.		
	The default aging type is absolute.			
	00	The default static aging behavior is disabled.		
Command History	Release	Modification		
communa motory	12.1(11)AX	This command was introduced.		
Usage Guidelines	To enable secure a port.	address aging for a particular port, set the aging time to a value other than 0 for that		
	To allow limited time access to particular secure addresses, set the aging type as absolute . When the aging time lapses, the secure addresses are deleted.			
	To allow continuous access to a limited number of secure addresses, set the aging type as inactivity . This removes the secure address when it become inactive, and other addresses can become secure.			

Examples	This example sets the aging time as 2 hours for absolute aging for all the secure addresses on the port:
	Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)# switchport port-security aging time 120
	This example sets the aging time as 2 minutes for inactivity aging type with aging enabled for configured secure addresses on the port:
	Switch(config)# interface gigabitethernet1/0/2 Switch(config-if)# switchport port-security aging time 2 Switch(config-if)# switchport port-security aging type inactivity Switch(config-if)# switchport port-security aging static
	This example shows how to disable aging for configured secure addresses:
	<pre>Switch(config)# interface gigabitethernet1/0/2 Switch(config-if)# no switchport port-security aging static</pre>
Deleted Commonds	Command Description

Related Commands	Command	Description
	show port-security	Displays the port security settings defined for the port.
	switchport port-security	Enables port security on a port, restricts the use of the port to a user-defined group of stations, and configures secure MAC addresses.

switchport priority extend

Use the **switchport priority extend** interface configuration command on the switch stack or on a standalone switch to set a port priority for the incoming untagged frames or the priority of frames received by the IP phone connected to the specified port. Use the **no** form of this command to return to the default setting.

switchport priority extend {cos value | trust}

no switchport priority extend

Syntax Description	cos value	Set the IP phone port to override the IEEE 802.1p priority received from the PC or the attached device with the specified class of service (CoS) value. The range is 0 to 7. Seven is the highest priority. The default is 0.
	trust	Set the IP phone port to trust the IEEE 802.1p priority received from the PC or the attached device.
Defaults	The default por	rt priority is set to a CoS value of 0 for untagged frames received on the port.
Command Modes	Interface config	guration
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	packets to instr the Cisco IP Ph the configuration interfaces.)	LAN is enabled, you can configure the switch to send the Cisco Discovery Protocol (CDP) ruct the IP phone how to send data packets from the device attached to the access port on none. You must enable CDP on the switch port connected to the Cisco IP Phone to send on to the Cisco IP Phone. (CDP is enabled by default globally and on all switch
	You should cor Layer 2 ports.	nfigure voice VLAN on switch access ports. You can configure a voice VLAN only on

switchport private-vlan

Use the **switchport private-vlan** interface configuration command on the switch stack or on a standalone switch to define a private-VLAN association for an isolated or community port or a mapping for a promiscuous port. Use the **no** form of this command to remove the private-VLAN association or mapping from the port.

switchport private-vlan {association {host primary-vlan-id secondary-vlan-id | mapping
 primary-vlan-id {add | remove} secondary-vlan-list} | host-association primary-vlan-id
 secondary-vlan-id [mapping primary-vlan-id {add | remove} secondary-vlan-list}

no switchport private-vlan {association {host | mapping} | host-association | mapping

Syntax Description	association	Define a private-VLAN association for a port.	
	host	Define a private-VLAN association for a community or isolated host port.	
	<i>primary-vlan-id</i> The VLAN ID of the private-VLAN primary VLAN. The range is from 1001 and 1006 to 4094.		
	secondary-vlan-id	The VLAN ID of the private-VLAN secondary (isolated or community) VLAN. The range is from 2 to 1001 and 1006 to 4094.	
	mapping	Define private-VLAN mapping for a promiscuous port.Associate secondary VLANs to the primary VLAN.	
	add		
	remove	Clear the association between secondary VLANs and the primary VLAN.	
	secondary-vlan-list	One or more secondary (isolated or community) VLANs to be mapped to the primary VLAN.	
	host-association	Define a private-VLAN association for a community or isolated host port.	
Command History	Interface configuratio	Modification	
,	12.2(20)SE	This command was introduced.	
Usage Guidelines	 Private-VLAN association or mapping has no effect on the port unless the port has been configured as a private-VLAN host or promiscuous port by using the switchport mode private-vlan {host promiscuous} interface configuration command. If the port is in private-VLAN host or promiscuous mode but the VLANs do not exist, the command is allowed, but the port is made inactive. 		
	The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.		

You can map a promiscuous port to only one primary VLAN. If you enter the **switchport private-vlan mapping** command on a promiscuous port that is already mapped to a primary and secondary VLAN, the primary VLAN mapping is overwritten.

You can add or remove secondary VLANs from promiscuous port private-VLAN mappings by using the **add** and **remove** keywords.

Entering the **switchport private-vlan association host** command has the same effect as entering the **switchport private-vlan host-association** interface configuration command.

Entering the **switchport private-vlan association mapping** command has the same effect as entering the **switchport private-vlan mapping** interface configuration command.

Examples

This example shows how to configure an interface as a private VLAN host port and associate it with primary VLAN 20 and secondary VLAN 501:

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 20 501
Switch(config-if)# end
```

This example shows how to configure an interface as a private-VLAN promiscuous port and map it to a primary VLAN and secondary VLANs:

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 20 501-502
Switch(config-if)# end
```

You can verify private-VLAN mapping by using the **show interfaces private-vlan mapping** privileged EXEC command. You can verify private VLANs and interfaces configured on the switch stack by using the **show vlan private-vlan** privileged EXEC command.

Related Commands	Command	Description
	show interfaces private-vlan mapping	Displays private VLAN mapping information for VLAN SVIs.
	show vlan private-vlan	Displays all private VLAN relationships or types configured on the switch stack.

Г

switchport protected

Use the **switchport protected** interface configuration command on the switch stack or on a standalone switch to isolate unicast, multicast, and broadcast traffic at Layer 2 from other protected ports on the same switch. Use the **no** form of this command to disable protection on the port.

switchport protected

no switchport protected

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

Defaults No protected port is defined. All ports are nonprotected.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines The switchport protection feature is local to the switch; communication between protected ports on the same switch is possible only through a Layer 3 device. To prevent communication between protected ports on different switches, you must configure the protected ports for unique VLANs on each switch and configure a trunk link between the switches. A protected port is different from a secure port.

A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

Port monitoring does not work if both the monitor and monitored ports are protected ports.

Examples This example shows how to enable a protected port on an interface:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport protected

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

Syntax Description	Command	Description
	show interfaces switchport	Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
	switchport block	Prevents unknown multicast or unicast traffic on the interface.

switchport trunk

Use the **switchport trunk** interface configuration command on the switch stack or on a standalone switch to set the trunk characteristics when the interface is in trunking mode. Use the **no** form of this command to reset a trunking characteristic to the default.

switchport trunk {allowed vlan vlan-list | encapsulation {dot1q | isl | negotiate} | native vlan
vlan-id | pruning vlan vlan-list}

no switchport trunk {allowed vlan | encapsulation | native vlan | {pruning vlan}

Syntax Description	allowed vlan vlan-list	Set the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the following <i>vlan-list</i> format. The none keyword is not valid. The default is all .
	encapsulation dot1q	Set the encapsulation format on the trunk port to IEEE 802.1Q. With this format, the switch supports simultaneous tagged and untagged traffic on a port.
	encapsulation isl	Set the encapsulation format on the trunk port to Inter-Switch Link (ISL). The switch encapsulates all received and sent packets with an ISL header and filters native frames received from an ISL trunk port.
	encapsulation negotiate	Specify that if Dynamic Inter-Switch Link (DISL) and Dynamic Trunking Protocol (DTP) negotiation do not resolve the encapsulation format, ISL is the selected format.
	native vlan vlan-id	Set the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094.
	pruning vlan vlan-list	Set the list of VLANs that are eligible for VTP pruning when in trunking mode. The all keyword is not valid.

The *vlan-list* format is **all** | **none** | [**add** | **remove** | **except**] *vlan-atom* [,*vlan-atom*...] where:

- **all** specifies all VLANs from 1 to 4094. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.
- **none** means an empty list. This keyword is not allowed on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLANs (VLAN IDs greater than 1005) are valid in some cases.

Note You can add extended-range VLANs to the allowed VLAN list, but not to the pruning-eligible VLAN list.

Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

• **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

-	

Note You can remove extended-range VLANs from the allowed VLAN list, but you cannot remove them from the pruning-eligible list.

Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs. (VLANs are added except the ones specified.) Valid IDs are from 1 to 1005. Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.
- *vlan-atom* is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

DefaultsThe default encapsulation is negotiate.VLAN 1 is the default native VLAN ID on the port.The default for all VLAN lists is to include all VLANs.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The allowed vlan <i>vlan-list</i> add, remove, and except keywords were modified to accept the VLAN1 and VLANs 1002 to 1005 values.
Usago Guidolinos	<u>-</u>	

Usage Guidelines En

Encapsulation:

- The **switchport trunk encapsulation** command is supported only for platforms and interface hardware that can support both ISL and IEEE 802.1Q formats.
- You cannot configure one end of the trunk as an IEEE 802.1Q trunk and the other end as an ISL or nontrunk port. However, you can configure one port as an ISL trunk and a different port on the same switch as an IEEE 802.1Q trunk.
- If you enter the **negotiate** keywords and DTP negotiation does not resolve the encapsulation format, ISL is the selected format. The **no** form of the command resets the trunk encapsulation format to the default.
- The **no** form of the **encapsulation** command resets the encapsulation format to the default.

Native VLANs:

- All untagged traffic received on an IEEE 802.1Q trunk port is forwarded with the native VLAN configured for the port.
- If a packet has a VLAN ID that is the same as the sending-port native VLAN ID, the packet is sent without a tag; otherwise, the switch sends the packet with a tag.
- The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.

Allowed VLAN:

- To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.
- The no form of the allowed vlan command resets the list to the default list, which allows all VLANs.

Trunk pruning:

- The pruning-eligible list applies only to trunk ports.
- Each trunk port has its own eligibility list.
- If you do not want a VLAN to be pruned, remove it from the pruning-eligible list. VLANs that are pruning-ineligible receive flooded traffic.
- VLAN 1, VLANs 1002 to 1005, and extended-range VLANs (VLANs 1006 to 4094) cannot be pruned.

Examples

This example shows how to cause a port configured as a switched interface to encapsulate in IEEE 802.1Q trunking format regardless of its default trunking format in trunking mode:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk encapsulation dot1g
```

This example shows how to configure VLAN 3 as the default for the port to send all untagged traffic:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk native vlan 3
```

This example shows how to add VLANs 1, 2, 5, and 6 to the allowed list:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk allowed vlan add 1,2,5,6
```

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

switchport voice vlan

Use the **switchport voice vlan** interface configuration command on the switch stack or on a standalone switch to configure voice VLAN on the port. Use the **no** form of this command to return to the default setting.

switchport voice vlan {vlan-id | dot1p | none | untagged}

no switchport voice vlan

Syntax Description	vlan-id	Specify the VLAN to be used for voice traffic. The range is 1 to 4094. By default, the IP phone forwards the voice traffic with an IEEE 802.1Q priority of 5.		
	dot1p	p Configure the telephone to use IEEE 802.1p priority tagging and uses VLAN 0 (the native VLAN). By default, the Cisco IP phone forwards the voice traffic with an IEEE 802.1p priority of 5.		
	none	Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.		
	untagged	Configure the telephone to send untagged voice traffic. This is the default for the telephone.		
Defaults	The switch d	efault is not to automatically configure the telephone (none).		
	The telephon	e default is not to tag frames.		
Command Modes	Interface configuration

When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.

You cannot configure static secure MAC addresses in the voice VLAN.

A voice-VLAN port cannot be a private-VLAN port.

The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

Examples

This example shows how to configure VLAN 2 as the voice VLAN for the port:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport voice vlan 2

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

Related Commands	Command	Description
	show interfaces interface-id switchport	Displays the administrative and operational status of a switching (nonrouting) port.
	switchport priority extend	Decides how the device connected to the specified port handles priority traffic received on its incoming port.

system env temperature threshold yellow

Use the **system env temperature threshold yellow** global configuration command on the switch stack or on a standalone switch to configure the difference between the yellow and red temperature thresholds which determines the value of yellow threshold. Use the no form of this command to return to the default value.

system env temperature threshold yellow value

no system env temperature threshold yellow value

Syntax Description	value	Specify the difference between the yellow and red threshold values (in Celsius). The range is 10 to 25. The default value is 10.

Defaults These are the default values:

Table 2-38Default Values for the Temperature Thresholds

Switch	Difference between Yellow and Red	Red ¹
Catalyst 3750G-48TS	10°C	66°C
Catalyst 3750G-48PS	10°C	68°C
Catalyst 3750G-24TS-1U	10°C	65°C
Catalyst 3750G-24PS	10°C	61°C

1. You cannot configure the red temperature threshold.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SE	This command was introduced.

Usage Guidelines Though visible on all switches, this command is only valid on these switches:

- Catalyst 3750G-48TS
- Catalyst 3750G-48PS
- Catalyst 3750G-24TS-1U
- Catalyst 3750G-24PS

You cannot configure the green and red thresholds but can configure the yellow threshold. Use the **system env temperature threshold yellow** *value* global configuration command to specify the difference between the yellow and red thresholds and to configure the yellow threshold. For example, if

the red threshold is 66 degrees C and you want to configure the yellow threshold as 51 degrees C, set the difference between the thresholds as 15 by using the **system env temperature threshold yellow 15** command.

No	The internal temperature sensor in the switch measures the internal system temperature and might vary ±5 degrees C.
Examples	This example sets 15 as the difference between the yellow and red thresholds: Switch(config) # system env temperature threshold yellow 15 Switch(config) #
Related Comman	Command Description show env temperature status Displays the temperature status and threshold levels.

system mtu

Use the **system mtu** global configuration command on the switch stack or on a standalone switch to set the maximum packet size or maximum transmission unit (MTU) size for Gigabit Ethernet ports, for routed ports, or for Fast Ethernet (10/100) ports. Use the **no** form of this command to restore the global MTU value to its default value.

system mtu {bytes | jumbo bytes | routing bytes}

no system mtu

Syntax Description	bytes	Set the system MTU for ports that are set to 10 or 100 Mb/s. The range is 1500 to 1998 bytes. This is the maximum MTU received at 10/100-Mb/s Ethernet switch ports.	
	jumbo bytes	Set the system jumbo MTU for Gigabit Ethernet ports operating at 1000 Mb/s or greater. The range is 1500 to 9000 bytes. This is the maximum MTU received at the physical port for Gigabit Ethernet ports.	
	routing bytes	Set the maximum MTU for routed packets. You can also set the maximum MTU to be advertised by the routing protocols that support the configured MTU size. The range is 1500 bytes to the system MTU value. The system routing MTU is the maximum MTU for routed packets and is also the maximum MTU that the switch advertises in routing updates for protocols such as OSPF.	
Defaults		ze for all ports is 1500 bytes. However, if you configure a different value for the onfigured value becomes the default MTU size for routed ports when it is applied eset.	
Command Modes	Global configuration	1	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.2(25)SEC	The bytes range is now 1500 to 1998.	
	12.2(25)SED	The routing <i>bytes</i> keywords were added.	
Usage Guidelines	When you use this command to change the system MTU or jumbo MTU size, you must reset the switch before the new configuration takes effect. The system mtu routing command does not require a switch reset to take effect.		
	The system MTU setting is saved in the switch environmental variable in NVRAM and becomes effective when the switch reloads. Unlike the system MTU routing configuration, the MTU settings you enter with the system mtu and system mtu jumbo commands are not saved in the switch IOS configuration file, even if you enter the copy running-config startup-config privileged EXEC		

command. Therefore, if you use TFTP to configure a new switch by using a backup configuration file and want the system MTU to be other than the default, you must explicitly configure the **system mtu** and **system mtu jumbo** settings on the new switch and then reload the switch.

Gigabit Ethernet ports operating at 1000 Mb/s are not affected by the **system mtu** command, and 10/100-Mb/s ports are not affected by the **system mtu jumbo** command.

You can use the system mtu routing command to configure the MTU size on routed ports.

Note

You cannot configure a routing MTU size that exceeds the system MTU size. If you change the system MTU size to a value smaller than the currently configured routing MTU size, the configuration change is accepted, but not applied until the next switch reset. When the configuration change takes effect, the routing MTU size defaults to the new system MTU size.

If you enter a value that is outside the range for the specific type of switch, the value is not accepted.

Note

The switch does not support setting the MTU on a per-interface basis.

The size of frames that can be received by the switch CPU is limited to 1998 bytes, regardless of the value entered with the **system mtu** command. Although forwarded or routed frames are usually not received by the CPU, some packets (for example, control traffic, SNMP, Telnet, and routing protocols) are sent to the CPU.

Because the switch does not fragment packets, it drops:

- switched packets larger than the packet size supported on the *egress* interface
- routed packets larger than the routing MTU value

For example, if the **system mtu** value is 1998 bytes and the **system mtu jumbo** value is 5000 bytes, packets up to 5000 bytes can be received on interfaces operating at 1000 Mb/s. However, although a packet larger than 1998 bytes can be received on an interface operating at 1000 Mb/s, if its destination interface is operating at 10 or 100 Mb/s, the packet is dropped.

Examples This example shows how to set the maximum jumbo packet size for Gigabit Ethernet ports operating at 1000 Mb/s or greater to 1800 bytes:

Switch(config)# system mtu jumbo 1800
Switch(config)# exit
Switch# reload

You can verify your setting by entering the show system mtu privileged EXEC command.

Related Commands	Command	Description
	show system mtu	Displays the packet size set for Fast Ethernet, Gigabit
		Ethernet, and routed ports.

test cable-diagnostics tdr

Use the **test cable-diagnostics tdr** privileged EXEC command on the switch stack or on a standalone switch to run the Time Domain Reflector (TDR) feature on an interface.

test cable-diagnostics tdr interface interface-id

Syntax Description	interface-id	Specify the interface on which to run TDR.	
Defaults	There is no default.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10/100 ports, 10-Gigabit module ports, or on SFP module ports. For more information about TDR, see the software configuration guide for this release.		
	-	y using the test cable-diagnostics tdr interface <i>interface-id</i> command, use the tics tdr interface <i>interface-id</i> privileged EXEC command to display the results.	
Examples	This example shows	how to run TDR on an interface:	
		-diagnostics tdr interface gigabitethernet1/0/2	
	A TDR test can take	n interface Gi 1/0/2 e a few seconds to run on an interface	
		agnostics tdr' to read the TDR results.	
	If you enter the test cable-diagnostics tdr interface <i>interface-id</i> command on an interface that has a link status of up and a speed of 10 or 100 Mb/s, these messages appear:		
	Switch# test cable TDR test on Gi 1/0/S TDR test started on A TDR test can take	-diagnostics tdr interface gigabitethernet1/0/3 9 will affect link state and traffic n interface Gi1/0/3 e a few seconds to run on an interface agnostics tdr' to read the TDR results.

con2 / WS-C3550-24 / 2.2.2.2 :
        Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows the Layer 2 path when the switch cannot find the destination port for the source MAC address:

Switch# traceroute mac 0000.0011.1111 0000.0201.0201 Error:Source Mac address not found. Layer2 trace aborted.

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```
Switch# traceroute mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace aborted.
```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

Switch# traceroute mac 0000.0201.0601 0100.0201.0201 Invalid destination mac address

This example shows the Layer 2 path when source and destination switches belong to multiple VLANs:

Switch# traceroute mac 0000.0201.0601 0000.0201.0201 Error:Mac found on multiple vlans. Layer2 trace aborted.

Related Commands	Command	Description
	traceroute mac ip	Displays the Layer 2 path taken by the packets from the specified source IP
		address or hostname to the specified destination IP address or hostname.

traceroute mac ip

Use the **traceroute mac ip** privileged EXEC command on the switch stack or on a standalone switch to display the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname.

traceroute mac ip {source-ip-address | source-hostname} {destination-ip-address |
 destination-hostname} [detail]

	destination-hosti	iame { [detail]		
Syntax Description	source-ip-address	Specify the IP address of the source switch as a 32-bit quantity in		
		dotted-decimal format.		
	destination-ip-address	Specify the IP address of the destination switch as a 32-bit quantity in dotted-decimal format.		
	source-hostname	Specify the IP hostname of the source switch.		
	destination-hostname	Specify the IP hostname of the destination switch.		
	detail	(Optional) Specify that detailed information appears.		
Defaults	There is no default.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.1(14)EA1	This command was introduced.		
Usage Guidelines		function properly, Cisco Discovery Protocol (CDP) must be enabled on all the		
	switches in the network. Do not disable CDP.When the switch detects an device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.			
	The maximum number of hops identified in the path is ten.			
	The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.			
	• If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.			
		not exist, the switch sends an ARP query and tries to resolve the IP address. st be in the same subnet. If the IP address is not resolved, the path is not or message appears.		

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

```
Switch# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac .....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C3750-12T / 2.2.6.6 :
        Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
        Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
        Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
        Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

Switch# traceroute mac ip con6 con2 Translating IP to mac 2.2.66.66 => 0000.0201.0601 2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6 con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3 con5 (2.2.5.5) : Gi0/0/3 => Gi0/1 con1 (2.2.1.1) : Gi0/0/1 => Gi0/2 con2 (2.2.2.2) : Gi0/0/2 => Fa0/1 Destination 0000.0201.0201 found on con2 Layer 2 trace completed

This example shows the Layer 2 path when ARP cannot associate the source IP address with the corresponding MAC address:

```
Switch# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace aborted.
```

Related Commands

Command	Description
traceroute mac	Displays the Layer 2 path taken by the packets from the specified source MAC
	address to the specified destination MAC address.

trust

Use the **trust** policy-map class configuration command on the switch stack or on a standalone switch to define a trust state for traffic classified through the **class** policy-map configuration or the **class-map** global configuration command. Use the **no** form of this command to return to the default setting.

trust [cos | dscp | ip-precedence]

no trust [cos | dscp | ip-precedence]

Syntax Description	cos	(Optional) Classify an ingress packet by using the packet class of service (CoS) value. For an untagged packet, the port default CoS value is used.	
	dscp(Optional) Classify an ingress packet by using the packet Differentiated Code Point (DSCP) values (most significant 6 bits of 8-bit service-type is a non-IP packet, the packet CoS value is used if the packet is tagged. If the is untagged, the default port CoS value is used to map CoS to DSCP.		
	ip-precedence	(Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the port default CoS value is used to map CoS to DSCP.	
Defaults	The action is not	trusted. If no keyword is specified when the command is entered, the default is dscp .	
Command Modes	Policy-map class configuration		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	traffic. For examp	d to distinguish the quality of service (QoS) trust behavior for certain traffic from other ole, incoming traffic with certain DSCP values can be trusted. You can configure a class I trust the DSCP values in the incoming traffic.	
	Trust values set with this command supersede trust values set with the mls qos trust interface configuration command.		
	The trust command is mutually exclusive with set policy-map class configuration command within the same policy map.		
	If you specify trust cos , QoS uses the received or default port CoS value and the CoS-to-DSCP map to generate a DSCP value for the packet.		
	If you specify trust dscp , QoS uses the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP value for the packet is derived from the CoS-to-DSCP map.		

If you specify **trust ip-precedence**, QoS uses the IP precedence value from the ingress packet and the IP-precedence-to-DSCP map. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP for the packet is derived from the CoS-to-DSCP map.

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Examples

This example shows how to define a port trust state to trust incoming DSCP values for traffic classified with *class1*:

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	police	Defines a policer for classified traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays QoS policy maps.

udld

Use the **udld** global configuration command on the switch stack or on a standalone switch to enable aggressive or normal mode in the UniDirectional Link Detection (UDLD) and to set the configurable message timer time. Use the **no** form of the command to disable aggressive or normal mode UDLD on all fiber-optic ports.

udld {aggressive | enable | message time message-timer-interval}

no udld {aggressive | enable | message}

Syntax Description	aggressive	Enable UDLD in aggressive mode on all fiber-optic interfaces.
	enable	Enable UDLD in normal mode on all fiber-optic interfaces.
	message time message-timer-interval	Configure the period of time between UDLD probe messages on ports that are in the advertisement phase and are determined to be bidirectional. The range is 1 to 90 seconds.
Defaults	UDLD is disabled on all The message timer is set	
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SEC	The range for the <i>message-timer-interval</i> was changed from 7 to 90 seconds to 1 to 90 seconds.
Usage Guidelines	UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links. For information about normal and aggressive modes, see the "Understanding UDLD" section in the software configuration guide for this release. If you change the message time between probe packets, you are making a trade-off between the detection speed and the CPU load. By decreasing the time, you can make the detection-response faster but increase the load on the CPU.	
		ber-optic interfaces only. Use the udld interface configuration command to nterface types.

udld

udld

You can use these commands to reset an interface shut down by UDLD:

- The udld reset privileged EXEC command to reset all interfaces shut down by UDLD
- The shutdown and no shutdown interface configuration commands
- The **no udld enable** global configuration command followed by the **udld** {**aggressive** | **enable**} global configuration command to re-enable UDLD globally
- The **no udld port** interface configuration command followed by the **udld port** or **udld port** aggressive interface configuration command to re-enable UDLD on the specified interface
- The **errdisable recovery cause udld** and **errdisable recovery interval** *interval* global configuration commands to automatically recover from the UDLD error-disabled state

Examples	This example shows how to enable UDL	D on all fiber-optic interfaces:
----------	--------------------------------------	----------------------------------

Switch(config) # udld enable

You can verify your setting by entering the show udld privileged EXEC command.

Related Commands	Command	Description
	show udld	Displays UDLD administrative and operational status for all ports or the specified port.
	udld port	Enables UDLD on an individual interface or prevents a fiber-optic interface from being enabled by the udld global configuration command.
	udld reset	Resets all interfaces shut down by UDLD and permits traffic to again pass through.

udld port

Use the **udld port** interface configuration command on the switch stack or on a standalone switch to enable the UniDirectional Link Detection (UDLD) on an individual interface or prevent a fiber-optic interface from being enabled by the **udld** global configuration command. Use the **no** form of this command to return to the **udld** global configuration command setting or to disable UDLD if entered for a nonfiber-optic port.

udld port [aggressive]

no udld port [aggressive]

Syntax Description	aggressive	Enable UDLD in aggressive mode on the specified interface.	
Defaults	-	rfaces, UDLD is not enabled, not in aggressive mode, and not disabled. For this interfaces enable UDLD according to the state of the udld enable or udld aggressive on command.	
	On nonfiber-optic interfaces, UDLD is disabled.		
Command Modes	Interface configura	tion	
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.2(20)SE	The disable keyword was removed.	
Usage Guidelines	another switch.	port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of	
	UDLD supports two modes of operation: normal (the default) and aggressive. In normal detects unidirectional links due to misconnected interfaces on fiber-optic connections. In mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twi and due to misconnected interfaces on fiber-optic links. For information about normal ar modes, see the "Configuring UDLD" chapter in the software configuration guide for this		
	To enable UDLD in normal mode, use the udld port interface configuration command. To enable UDLD in aggressive mode, use the udld port aggressive interface configuration command.		
	Use the no udld port command on fiber-optic ports to return control of UDLD to the udld enable global configuration command or to disable UDLD on nonfiber-optic ports.		
	Use the udld port aggressive command on fiber-optic ports to override the setting of the udld enable or udld aggressive global configuration command. Use the no form on fiber-optic ports to remove this setting and to return control of UDLD enabling to the udld global configuration command or to disable UDLD on nonfiber-optic ports.		

You can use these commands to reset an interface shut down by UDLD:

- The udld reset privileged EXEC command to reset all interfaces shut down by UDLD
- The shutdown and no shutdown interface configuration commands
- The **no udld enable** global configuration command followed by the **udld** {**aggressive** | **enable**} global configuration command to re-enable UDLD globally
- The **no udld port** interface configuration command followed by the **udld port or udld port aggressive** interface configuration command to re-enable UDLD on the specified interface
- The errdisable recovery cause udld and errdisable recovery interval *interval* global configuration commands to automatically recover from the UDLD error-disabled state

ExamplesThis example shows how to enable UDLD on an port:Switch(config)# interface gigabitethernet6/0/1Switch(config-if)# udld port

This example shows how to disable UDLD on a fiber-optic interface despite the setting of the **udld** global configuration command:

Switch(config)# interface gigabitethernet6/0/1
Switch(config-if)# no udld port

You can verify your settings by entering the **show running-config** or the **show udld** *interface* privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.
	show udld	Displays UDLD administrative and operational status for all ports or the specified port.
	udld	Enables aggressive or normal mode in UDLD or sets the configurable message timer time.
	udld reset	Resets all interfaces shut down by UDLD and permits traffic to again pass through.

udld reset

Use the **udld reset** privileged EXEC command to reset all interfaces disabled by the UniDirectional Link Detection (UDLD) and permit traffic to begin passing through them again (though other features, such as spanning tree, Port Aggregation Protocol (PAgP), and Dynamic Trunking Protocol (DTP) still have their normal effects, if enabled).

udld reset

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

 Release
 Modification

 12.1(11)AX
 This command was introduced.

Usage Guidelines If the interface configuration is still enabled for UDLD, these ports begin to run UDLD again and are disabled for the same reason if the problem has not been corrected.

Examples This example shows how to reset all interfaces disabled by UDLD:

Switch# **udld reset** 1 ports shutdown by UDLD were reset.

You can verify your setting by entering the show udld privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .
	show udld	Displays UDLD administrative and operational status for all ports or the specified port.
	udld	Enables aggressive or normal mode in UDLD or sets the configurable message timer time.
	udld port	Enables UDLD on an individual interface or prevents a fiber-optic interface from being enabled by the udld global configuration command.

vlan (global configuration)

Use the **vlan** global configuration command on the switch stack or on a standalone switch to add a VLAN and to enter the config-vlan mode. Use the **no** form of this command to delete the VLAN. Configuration information for normal-range VLANs (VLAN IDs 1 to 1005) is always saved in the VLAN database. When VLAN Trunking Protocol (VTP) mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005), and the VTP mode, domain name, and the VLAN configuration are saved in the switch running configuration file. You can save configurations in the switch startup configuration file by entering the **copy running-config startup-config** privileged EXEC command.

vlan vlan-id

no vlan vlan-id

Syntax Description ID of the VLAN to be added and configured. For *vlan-id*, the range is 1 to 4094. You vlan-id can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens. Defaults This command has no default settings. **Command Modes** Global configuration Modification **Command History** Release 12.1(11)AX This command was introduced. **Usage Guidelines** You must use the vlan vlan-id global configuration command to add extended-range VLANs (VLAN IDs 1006 to 4094). Before configuring VLANs in the extended range, you must use the **vtp transparent** global configuration or VLAN configuration command to put the switch in VTP transparent mode. Extended-range VLANs are not learned by VTP and are not added to the VLAN database, but when VTP mode is transparent, VTP mode and domain name and all VLAN configurations are saved in the running configuration, and you can save them in the switch startup configuration file. When you save the VLAN and VTP configurations in the startup configuration file and reboot the switch, the configuration is selected in these ways: If both the VLAN database and the configuration file show the VTP mode as transparent and the VTP domain names match, the VLAN database is ignored. The VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database. If the VTP mode is server, or if the startup VTP mode or domain names do not match the VLAN ٠ database, the VTP mode and the VLAN configuration for the first 1005 VLANs use the VLAN database information. If you try to create an extended-range VLAN when the switch is not in VTP transparent mode, the VLAN is rejected, and you receive an error message.

If you enter an invalid VLAN ID, you receive an error message and do not enter config-vlan mode.

Entering the **vlan** command with a VLAN ID enables config-vlan mode. When you enter the VLAN ID of an existing VLAN, you do not create a new VLAN, but you can modify VLAN parameters for that VLAN. The specified VLANs are added or modified when you exit the config-vlan mode. Only the **shutdown** command (for VLANs 1 to 1005) takes effect immediately.

These configuration commands are available in config-vlan mode. The **no** form of each command returns the characteristic to its default state.

Note

Although all commands are visible, the only VLAN configuration commands that are supported on extended-range VLANs are **mtu** *mtu-size*, **private-vlan**, and **remote-span**. For extended-range VLANs, all other characteristics must remain at the default state.

- **are** *are-number*: defines the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7. If no value is entered, 0 is assumed to be the maximum.
- backupcrf: specifies the backup CRF mode. This keyword applies only to TrCRF VLANs.
 - enable backup CRF mode for this VLAN.
 - disable backup CRF mode for this VLAN (the default).
- **bridge** {*bridge-number*| **type**}: specifies the logical distributed source-routing bridge, the bridge that interconnects all logical rings having this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs. The range is 0 to 15. The default bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs. The **type** keyword applies only to TrCRF VLANs and is one of these:
 - **srb** (source-route bridging)
 - srt (source-route transparent) bridging VLAN
- exit: applies changes, increments the VLAN database revision number (VLANs 1 to 1005 only), and exits config-vlan mode.
- **media**: defines the VLAN media type. See Table 2-39 for valid commands and syntax for different media types.

The switch supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other switches. These VLANs are locally suspended.

- **ethernet** is Ethernet media type (the default).
- fddi is FDDI media type.
- fd-net is FDDI network entity title (NET) media type.
- tokenring is Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP Version 2 (v) mode is enabled.
- tr-net is Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.
- **mtu** *mtu-size*: specifies the maximum transmission unit (MTU) (packet size in bytes). The range is 1500 to 18190. The default is 1500 bytes.

- **name** *vlan-name*: names the VLAN with an ASCII string from 1 to 32 characters that must be unique within the administrative domain. The default is *VLANxxxx* where *xxxx* represents four numeric digits (including leading zeros) equal to the VLAN ID number.
- no: negates a command or returns it to the default setting.
- **parent** *parent-vlan-id*: specifies the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005. The default parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.
- **private-vlan**: configure the VLAN as a private VLAN community, isolated, or primary VLAN or configure the association between private-VLAN primary and secondary VLANs. For more information, see the **private-vlan** command.
- **remote-span**: configure the VLAN as a Remote SPAN (RSPAN) VLAN. When the RSPAN feature is added to an existing VLAN, the VLAN is first deleted and is then recreated with the RSPAN feature. Any access ports are deactivated until the RSPAN feature is removed. If VTP is enabled, the new RSPAN VLAN is propagated by VTP for VLAN-IDs that are lower than 1024. Learning is disabled on the VLAN. See the **remote-span** command for more information.
- **ring** *ring-number*: defines the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095. The default for Token Ring VLANs is 0. For FDDI VLANs, there is no default.
- **said** *said-value*: specifies the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain. The default value is 100000 plus the VLAN ID number.
- **shutdown**: shuts down VLAN switching on the VLAN. This command takes effect immediately. Other commands take effect when you exit config-vlan mode.
- state: specifies the VLAN state:
 - active means the VLAN is operational (the default).
 - suspend means the VLAN is suspended. Suspended VLANs do not pass packets.
- **ste** *ste-number*: defines the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7.
- **stp type**: defines the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLANs. For FDDI-NET VLANs, the default STP type is **ieee**. For Token Ring-NET VLANs, the default STP type is **ibm**. For FDDI and Token Ring VLANs, the default is no type specified.
 - ieee for IEEE Ethernet STP running source-route transparent (SRT) bridging.
 - ibm for IBM STP running source-route bridging (SRB).
 - **auto** for STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).
- **tb-vlan1** *tb-vlan1-id* and **tb-vlan2** *tb-vlan2-id*: specifies the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. If no value is specified, 0 (no transitional bridging) is assumed.

Media Type

Ethernet	name vlan-name, media ethernet , state { suspend active }, said said-value, mtu mtu-size, remote-span , tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id

Table 2-39 Valid Commands and Syntax for Different Media Types

Valid Syntax

Table 2-40 describes the rules for configuring VLANs.

Configuration	Rule
VTP v2 mode is enabled, and you are configuring a TrCRF VLAN	Specify a parent VLAN ID of a TrBRF that already exists in the database.
media type.	Specify a ring number. Do not leave this field blank.
	Specify unique ring numbers when TrCRF VLANs have the same parent VLAN ID. Only one backup concentrator relay function (CRF) can be enabled.
VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type.	Do not specify a backup CRF.

Configuration	Rule
VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type.	Specify a bridge number. Do not leave this field blank.
VTP v1 mode is enabled.	No VLAN can have an STP type set to auto.
	This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs.
Add a VLAN that requires translational bridging (values are	The translational bridging VLAN IDs that are used must already exist in the database.
not set to zero).	The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet).
	The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring).
	If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring).

Table 2-40	VLAN Configuration Rules (continued)
------------	--------------------------------------

Examples

This example shows how to add an Ethernet VLAN with default media characteristics. The default includes a *vlan-name* of *VLANxxx*, where *xxxx* represents four numeric digits (including leading zeros) equal to the VLAN ID number. The default **media** option is **ethernet**; the **state** option is **active**. The default *said-value* variable is 100000 plus the VLAN ID; the *mtu-size* variable is 1500; the **stp-type** option is **ieee**. When you enter the **exit** config-vlan configuration command, the VLAN is added if it did not already exist; otherwise, this command does nothing.

This example shows how to create a new VLAN with all default characteristics and enter config-vlan mode:

Switch(config)# vlan 200
Switch(config-vlan)# exit
Switch(config)#

This example shows how to create a new extended-range VLAN with all the default characteristics, to enter config-vlan mode, and to save the new VLAN in the switch startup configuration file:

```
Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config
```

You can verify your setting by entering the show vlan privileged EXEC command.

Related Commands	Command	Description
	show vlan	Displays the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) in the administrative domain.
	vlan (VLAN configuration)	Configures normal-range VLANs in the VLAN database.

vlan (VLAN configuration)

Use the **vlan** VLAN configuration command on the switch stack or on a standalone switch to configure VLAN characteristics for a normal-range VLAN (VLAN IDs 1 to 1005) in the VLAN database. You access VLAN configuration mode by entering the **vlan database** privileged EXEC command. Use the **no** form of this command without additional parameters to delete a VLAN. Use the **no** form with parameters to change its configured characteristics.

- vlan vlan-id [are are-number] [backupcrf {enable | disable}] [bridge bridge-number |
 type {srb | srt}] [media {ethernet | fddi | fdi-net | tokenring | tr-net}] [mtu mtu-size]
 [name vlan-name] [parent parent-vlan-id] [ring ring-number] [said said-value]
 [state {suspend | active}] [ste ste-number] [stp type {ieee | ibm | auto}]
 [tb-vlan1 tb-vlan1-id] [tb-vlan2 tb-vlan2-id]
- no vlan vlan-id [are are-number] [backupcrf {enable | disable}] [bridge bridge-number |
 type {srb | srt}] [media {ethernet | fddi | fdi-net | tokenring | tr-net}] [mtu mtu-size]
 [name vlan-name] [parent parent-vlan-id] [ring ring-number] [said said-value]
 [state {suspend | active}] [ste ste-number] [stp type {ieee | ibm | auto}]
 [tb-vlan1 tb-vlan1-id] [tb-vlan2 tb-vlan2-id]

Extended-range VLANs (with VLAN IDs from 1006 to 4094) cannot be added or modified by using these commands. To add extended-range VLANs, use the **vlan (global configuration)** command to enter config-vlan mode.

Note

The switch supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other switches. These VLANs are locally suspended.

Syntax Description	vlan-id	ID of the configured VLAN. The range is 1 to 1005 and must be unique within the administrative domain. Do not enter leading zeros.
	are are-number	(Optional) Specify the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. If no value is entered, 0 is assumed to be the maximum.
	<pre>backupcrf {enable disable}</pre>	(Optional) Specify the backup CRF mode. This keyword applies only to TrCRF VLANs.
		• enable backup CRF mode for this VLAN.
		• disable backup CRF mode for this VLAN.
	<pre>bridge bridge-number type {srb srt}</pre>	(Optional) Specify the logical distributed source-routing bridge, the bridge that interconnects all logical rings having this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs.
		The range is 0 to 15.
		The type keyword applies only to TrCRF VLANs and is one of these:
		• srb (source-route bridging)
		• srt (source-route transparent) bridging VLAN

media {ethernet fddi fd-net tokenring tr-net}	(Optional) Specify the VLAN media type. Table 2-41 lists the valid syntax for each media type.	
	• ethernet is Ethernet media type (the default).	
	• fddi is FDDI media type.	
	• fd-net is FDDI network entity title (NET) media type.	
	• tokenring is Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP v2 mode is enabled.	
	• tr-net is Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.	
mtu mtu-size	(Optional) Specify the maximum transmission unit (MTU) (packet size in bytes). The range is 1500 to 18190.	
name vlan-name	(Optional) Specify the VLAN name, an ASCII string from 1 to 32 characters that must be unique within the administrative domain.	
parent parent-vlan-id	(Optional) Specify the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005.	
ring ring-number	(Optional) Specify the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095.	
said said-value	(Optional) Enter the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain.	
<pre>state {suspend active}</pre>	(Optional) Specify the VLAN state:	
	• If active , the VLAN is operational.	
	• If suspend , the VLAN is suspended. Suspended VLANs do not pass packets.	
ste ste-number	(Optional) Specify the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13.	
stp type {ieee ibm auto}	(Optional) Specify the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLAN.	
	• ieee for IEEE Ethernet STP running source-route transparent (SRT) bridging.	
	• ibm for IBM STP running source-route bridging (SRB).	
	• auto for STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).	
tb-vlan1 <i>tb-vlan1-id</i> and tb-vlan2 <i>tb-vlan2-id</i>	(Optional) Specify the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. Zero is assumed if no value is specified.	

Table 2-41 shows the valid syntax options for different media types.

media type.	Specify a ring number. Do not leave this field blank.	
	Specify unique ring numbers when TrCRF VLANs have the same parent VLAN ID. Only one backup concentrator relay function (CRF) can be enabled.	
VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type.	Do not specify a backup CRF.	

...

...

Configuration	Rule Specify a bridge number. Do not leave this field blank.	
VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type.		
VTP v1 mode is enabled.	No VLAN can have an STP type set to auto.	
	This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs.	
Add a VLAN that requires translational bridging (values are	The translational bridging VLAN IDs that are used must already exist in the database.	
not set to zero).	The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet).	
	The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring).	
	If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring).	

Table 2-42 VLAN Configuration Rules (continued)

.

Defaults

The ARE value is 7.

Backup CRF is disabled.

The bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs.

The media type is ethernet.

The default mtu size is 1500 bytes.

The *vlan-name* variable is *VLANxxxx*, where *xxxx* represents four numeric digits (including leading zeros) equal to the VLAN ID number.

The parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For TrCRF VLANs, you must specify a parent VLAN ID. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.

The ring number for Token Ring VLANs is 0. For FDDI VLANs, there is no default.

The said value is 100000 plus the VLAN ID.

The state is active.

The STE value is 7.

The STP type is **ieee** for FDDI-NET and **ibm** for Token Ring-NET VLANs. For FDDI and Token Ring VLANs, the default is no type specified.

The *tb-vlan1-id* and *tb-vlan2-id* variables are zero (no translational bridging).

Command Modes VLAN configuration

History R	elease	Modification
12	2.1(11)AX	This command was introduced.
	ou can only us 1005.	e this command mode for configuring normal-range VLANs, that is, VLAN IDs 1
	configure ext mmand.	tended-range VLANs (VLAN IDs 1006 to 4094), use the vlan global configuration
in it	the switch run	ation is always saved in the VLAN database. If VTP mode is transparent, it is also saved uning configuration file, along with the VTP mode and domain name. You can then save startup configuration file by using the copy running-config startup-config privileged d.
	•	VLAN and VTP configuration in the startup configuration file and reboot the switch, the selected in these ways:
•	VTP domain	VLAN database and the configuration file show the VTP mode as transparent and the n names match, the VLAN database is ignored. The VTP and VLAN configurations in configuration file are used. The VLAN database revision number remains unchanged in database.
•		mode is server, or if the startup VTP mode or domain names do not match the VLAN e VTP mode and the VLAN configuration for the first 1005 VLANs use VLAN database .
Tł	ne following a	re the results of using the no vlan commands:
•		o vlan <i>vlan-id</i> form is used, the VLAN is deleted. Deleting VLANs automatically resets other parent VLANs and translational bridging parameters that see the deleted VLAN.
•	the default (o vlan <i>vlan-id</i> bridge form is used, the VLAN source-routing bridge number returns to 0). The vlan <i>vlan-id</i> bridge command is used only for FDDI-NET and Token Ring-NET l is ignored in other VLAN types.
•	Changing th for the type and translat	o vlan <i>vlan-id</i> media form is used, the media type returns to the default (ethernet). The VLAN media type (including the no form) resets the VLAN MTU to the default MTU (unless the mtu keyword is also present in the command). It also resets the VLAN parent ional bridging VLAN to the default (unless the parent , tb-vlan1 , or tb-vlan2 are also the command).
•		o vlan <i>vlan-id</i> mtu form is used, the VLAN MTU returns to the default for the applicable ia type. You can also modify the MTU by using the media keyword.
•		o vlan <i>vlan-id</i> name <i>vlan-name</i> form is used, the VLAN name returns to the default Vxxxx, where xxxx represent four numeric digits [including leading zeros] equal to the number).
•	parent VLA	o vlan <i>vlan-id</i> parent form is used, the parent VLAN returns to the default (0). The N resets to the default if the parent VLAN is deleted or if the media keyword changes ype or the VLAN type of the parent VLAN.
•	When the n default (0).	o vlan vlan-id ring form is used, the VLAN logical ring number returns to the
•		o vlan <i>vlan-id</i> said form is used, the VLAN SAID returns to the default (100,000 plus (D))

- When the no vlan vlan-id state form is used, the VLAN state returns to the default (active).
- When the **no vlan** *vlan-id* **stp type** form is used, the VLAN spanning-tree type returns to the default (ieee).
- When the **no vlan** *vlan-id* **tb-vlan1** or **no***-id* **tb-vlan2** form is used, the VLAN translational bridge VLAN (or VLANs, if applicable) returns to the default (0). Translational bridge VLANs must be a different VLAN type than the affected VLAN, and if two are specified, the two must be different VLAN types from each other. A translational bridge VLAN resets to the default if the translational bridge VLAN is deleted, if the **media** keyword changes the VLAN type, or if the **media** keyword changes the VLAN.
- **Examples**This example shows how to add an Ethernet VLAN with default media characteristics. The default
includes a *vlan-name* of *VLANxxx*, where *xxxx* represents four numeric digits (including leading zeros)
equal to the VLAN ID number. The default **media** option is **ethernet**; the **state** option is **active**. The
default *said-value* variable is 100000 plus the VLAN ID; the *mtu-size* variable is 1500; the **stp-type**
option is **ieee**. When you enter the **exit** or **apply** vlan configuration command, the VLAN is added if it
did not already exist; otherwise, this command does nothing.

Switch(vlan)# vlan 2 VLAN 2 added: Name: VLAN0002 Switch(vlan)# exit APPLY completed. Exiting....

This example shows how to modify an existing VLAN by changing its name and MTU size:

Switch(vlan) # no vlan name engineering mtu 1200

You can verify your settings by entering the show vlan privileged EXEC command.

Related Commands	Command	Description
	show vlan	Displays the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) in the administrative domain.
	vlan (global configuration)	Enters config-vlan mode for configuring normal-range and extended-range VLANs.

L

vlan access-map

Use the **vlan access-map** global configuration command on the switch stack or on a standalone switch to create or modify a VLAN map entry for VLAN packet filtering. This entry changes the mode to the VLAN access-map configuration. Use the **no** form of this command to delete a VLAN map entry. Use the **vlan filter** interface configuration command to apply a VLAN map to one or more VLANs.

vlan access-map name [number]

no vlan access-map name [number]

Syntax Description	name	Name of the VLAN map.		
	<i>number</i> (Optional) The sequence number of the map entry that you want to create or modify (0 to 65535). If you are creating a VLAN map and the sequence number is not specified, it is automatically assigned in increments of 10, starting from 10. This number is the sequence to insert to, or delete from, a VLAN access-map entry.			
Defaults	There are no	VLAN map entries and no VLAN maps applied to a VLAN.		
Command Modes	Global confi	guration		
Command History	Release	Modification		
	12.1(11)AX			
Usage Guidelines	the mode to command to	nfiguration mode, use this command to create or modify a VLAN map. This entry changes VLAN access-map configuration, where you can use the match access-map configuration specify the access lists for IP or non-IP traffic to match and use the action command to set atch causes the packet to be forwarded or dropped.		
	In VLAN access-map configuration mode, these commands are available:			
	• action:	sets the action to be taken (forward or drop).		
	• default	: sets a command to its defaults		
	• exit: ex	its from VLAN access-map configuration mode		
	• match:	sets the values to match (IP address or MAC address).		
	• no : neg	ates a command or set its defaults		
	When you d	o not specify an entry number (sequence number), it is added to the end of the map.		
	There can be	e only one VLAN map per VLAN and it is applied as packets are received by a VLAN.		
	You can use entry.	the no vlan access-map <i>name</i> [<i>number</i>] command with a sequence number to delete a single		

In global configuration mode, use the **vlan filter** interface configuration command to apply the map to one or more VLANs.

For more information about VLAN map entries, see the software configuration guide for this release.

Examples This example shows how to create a VLAN map named *vac1* and apply matching conditions and actions to it. If no other entries already exist in the map, this will be entry 10.

Switch(config) # vlan access-map vac1
Switch(config-access-map) # match ip address acl1
Switch(config-access-map) # action forward

This example shows how to delete VLAN map *vac1*:

Switch(config) # no vlan access-map vac1

Related Commands	Command	Description
	action	Sets the action for the VLAN access map entry.
	match (access-map configuration)	Sets the VLAN map to match packets against one or more access lists.
	show vlan access-map	Displays information about a particular VLAN access map or all VLAN access maps.
	vlan filter	Applies the VLAN access map to one or more VLANs.

vlan database

Use the **vlan database** privileged EXEC command on the switch stack or on a standalone switch to enter VLAN configuration mode. From this mode, you can add, delete, and modify VLAN configurations for normal-range VLANs and globally propagate these changes by using the VLAN Trunking Protocol (VTP). Configuration information is saved in the VLAN database.

vlan database

Note	

VLAN configuration mode is only valid for VLAN IDs 1 to 1005.

Syntax Description	This command has no arguments or keywords. No default is defined.		
Defaults			
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	 extended-range VLANs (VLAN IDs 1006 to 4094), use the vlan (global configuration) command enter config-vlan mode. You can also configure VLAN IDs 1 to 1005 by using the vlan global configuration command. To return to the privileged EXEC mode from the VLAN configuration mode, enter the exit command 		
Note	or modify VLAN or exit command	node is different from other modes because it is session-oriented. When you add, delete, I parameters, the changes are not applied until you exit the session by entering the apply . When the changes are applied, the VTP configuration version is incremented. You can e changes to the VTP database by entering abort .	
	When you are in using these comr	VLAN configuration mode, you can access the VLAN database and make changes by nands:	
		es subcommands to add, delete, or modify values associated with a single VLAN. For ation, see the vlan (VLAN configuration) command.	
	• vtn: accossor	s subcommends to perform VTD administrative functions. For more information, see the	

• **vtp**: accesses subcommands to perform VTP administrative functions. For more information, see the **vtp** (VLAN configuration) command.

When you have modified VLAN or VTP parameters, you can use these editing buffer manipulation commands:

- **abort**: exits the mode without applying the changes. The VLAN configuration that was running before you entered VLAN configuration mode continues to be used.
- **apply**: applies current changes to the VLAN database, increments the database configuration revision number, propagates it throughout the administrative domain, and remains in VLAN configuration mode.

You	cannot use this command when the switch is in VTP client mode.

- **exit**: applies all configuration changes to the VLAN database, increments the database configuration number, propagates it throughout the administrative domain, and returns to privileged EXEC mode.
- no: negates a command or set its defaults; valid values are vlan and vtp.
- **reset**: abandons proposed changes to the VLAN database, resets the proposed database to the implemented VLAN database on the switch, and remains in VLAN configuration mode.
- show: displays VLAN database information.
- **show changes** [*vlan-id*]: displays the differences between the VLAN database on the switch and the proposed VLAN database for all normal-range VLAN IDs (1 to 1005) or the specified VLAN ID (1 to 1005).
- **show current** [*vlan-id*]: displays the VLAN database on the switch or on a selected VLAN (1 to 1005).
- **show proposed** [*vlan-id*]: displays the proposed VLAN database or a selected VLAN (1 to 1005) from the proposed database. The proposed VLAN database is not the running configuration until you use the **exit** or **apply** VLAN configuration command.

You can verify that VLAN database changes have been made or aborted by using the **show vlan** privileged EXEC command. This output is different from the **show** VLAN database configuration command output.

Examples

This example shows how to enter the VLAN configuration mode from the privileged EXEC mode and to display VLAN database information:

Switch# vlan database Switch(vlan)# show

State: Operational

MTU: 1500

```
WIECH(VIAN)# Show
VLAN ISL Id: 1
Name: default
Media Type: Ethernet
VLAN 802.10 Id: 100001
State: Operational
MTU: 1500
Translational Bridged VLAN: 1002
Translational Bridged VLAN: 1003
VLAN ISL Id: 2
Name: VLAN0002
Media Type: Ethernet
VLAN 802.10 Id: 100002
```

L

```
VLAN ISL Id: 1002
Name: fddi-default
Media Type: FDDI
VLAN 802.10 Id: 101002
State: Operational
MTU: 1500
Bridge Type: SRB
Ring Number: 0
Translational Bridged VLAN: 1
Translational Bridged VLAN: 1003
```

<output truncated>

This is an example of output from the show changes command:

Switch(vlan) # **show changes**

```
DELETED:

VLAN ISL Id: 4

Name: VLAN0004

Media Type: Ethernet

VLAN 802.10 Id: 100004

State: Operational

MTU: 1500

MODIFIED:

VLAN ISL Id: 7

Current State: Operational

Modified State: Suspended
```

This example shows how to display the differences between VLAN 7 in the current database and the proposed database.

```
Switch(vlan) # show changes 7
```

MODIFIED: VLAN ISL Id: 7 Current State: Operational Modified State: Suspended

This is an example of output from the **show current 20** command. It displays only VLAN 20 of the current database.

```
Switch(vlan)# show current 20
VLAN ISL Id: 20
Name: VLAN0020
Media Type: Ethernet
VLAN 802.10 Id: 100020
State: Operational
MTU: 1500
```

Related Commands	Command	Description
	show vlan	Displays the parameters for all configured VLANs in the administrative domain.
	shutdown vlan	Shuts down (suspends) local traffic on the specified VLAN.
	vlan (global configuration)	Enters config-vlan mode for configuring normal-range and extended-range VLANs.

vlan dot1q tag native

Use the **vlan dot1q tag native** global configuration command on the switch stack or on a standalone switch to enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports. Use the **no** form of this command to return to the default setting.

vlan dot1q tag native

no vlan dot1q tag native

Syntax Description	This command h	has no arguments	or keywords.
--------------------	----------------	------------------	--------------

Defaults The IEEE 802.1Q native VLAN tagging is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)EA1	This command was introduced.

Usage Guidelines

When enabled, native VLAN packets going out all IEEE 802.1Q trunk ports are tagged.

When disabled, native VLAN packets going out all IEEE 802.1Q trunk ports are not tagged.

You can use this command with the IEEE 802.1Q tunneling feature. This feature operates on an edge switch of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and tagging the tagged packets. You must use IEEE 802.1Q trunk ports for sending packets to the service-provider network. However, packets going through the core of the service-provider network might also be carried on IEEE 802.1Q trunks. If the native VLANs of an IEEE 802.1Q trunks match the native VLAN of a tunneling port on the same switch, traffic on the native VLAN is not tagged on the sending trunk port. This command ensures that native VLAN packets on all IEEE 802.1Q trunk ports are tagged.

For more information about IEEE 802.1Q tunneling, see the software configuration guide for this release.

Examples

This example shows how to enable IEEE 802.1Q tagging on native VLAN frames:

Switch# configure terminal Switch (config)# vlan dot1q tag native Switch (config)# end

You can verify your settings by entering the show vlan dot1q tag native privileged EXEC command.

Related Commands	Command	Description
	show vlan dot1q tag native	Displays IEEE 802.1Q native VLAN tagging status.

vlan filter

Use the **vlan filter** global configuration command on the switch stack or on a standalone switch to apply a VLAN map to one or more VLANs. Use the **no** form of this command to remove the map.

vlan filter mapname vlan-list {list | all}

no vlan filter *mapname* **vlan-list** {*list* | **all**}

Syntax Description	тарпате	Name of the VLAN map entry.		
	list	The list of one or more VLANs in the form tt, uu-vv, xx, yy-zz, where spaces around commas and dashes are optional. The range is 1 to 4094.		
	all	Remove the filter from all VLANs.		
Defaults	There are no VLAN	filters.		
Command Modes	Global configuration	n		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines		y dropping too many packets and disabling connectivity in the middle of the ss, we recommend that you completely define the VLAN access map before applying		
	For more information	on about VLAN map entries, see the software configuration guide for this release.		
Examples	This example applies VLAN map entry <i>map1</i> to VLANs 20 and 30:			
	Switch(config)# vlan filter map1 vlan-list 20, 30			
	This example shows how to delete VLAN map entry mac1 from VLAN 20:			
	Switch(config)# nc	o vlan filter map1 vlan-list 20		
	You can verify your	settings by entering the show vlan filter privileged EXEC command.		

Related Commands	Command	Description
	show vlan access-map	Displays information about a particular VLAN access map or all VLAN access maps.
	show vlan filter	Displays information about all VLAN filters or about a particular VLAN or VLAN access map.
	vlan access-map	Creates a VLAN map entry for VLAN packet filtering.

vmps reconfirm (privileged EXEC)

Use the **vmps reconfirm** privileged EXEC command on the switch stack or on a standalone switch to immediately send VLAN Query Protocol (VQP) queries to reconfirm all dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS).

vmps reconfirm

Syntax Description	This command has no argu	uments or keywords.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Examples	This example shows how to immediately send VQP queries to the VMPS: Switch# vmps reconfirm You can verify your setting by entering the show vmps privileged EXEC command and examining the VMPS Action row of the Reconfirmation Status section. The show vmps command shows the result of the last time the assignments were reconfirmed either because the reconfirmation timer expired or because the vmps reconfirm command was entered.	
Related Commands	Command	Description
	show vmps	Displays VQP and VMPS information.
	vmps reconfirm (global configuration)	Changes the reconfirmation interval for the VQP client.

vmps reconfirm (global configuration)

Use the **vmps reconfirm** global configuration command on the switch stack or on a standalone switch to change the reconfirmation interval for the VLAN Query Protocol (VQP) client. Use the **no** form of this command to return to the default setting.

vmps reconfirm interval

no vmps reconfirm

Syntax Description	interval		erval for VQP client queries to the VLAN Membership Policy reconfirm dynamic VLAN assignments. The range is 1 to 120
Defaults	The default reco	nfirmation interval is	60 minutes.
Command Modes	Global configura	ation	
Command History	Release	Modification	n
	12.1(11)AX	This comma	and was introduced.
Examples	-	ows how to set the VQ # vmps reconfirm 20	QP client to reconfirm dynamic VLAN entries every 20 minutes:
	•••	your setting by entering the Reconfirm Interval	g the show vmps privileged EXEC command and examining row.
Related Commands	Command		Description
	show vmps		Displays VQP and VMPS information.
	vmps reconfirm	n (privileged EXEC)	Sends VQP queries to reconfirm all dynamic VLAN assignments with the VMPS.

vmps retry

Use the **vmps retry** global configuration command on the switch stack or on a standalone switch to configure the per-server retry count for the VLAN Query Protocol (VQP) client. Use the **no** form of this command to return to the default setting.

vmps retry count

no vmps retry

Syntax Description		Sumber of attempts to contact the VLAN Membership Policy Server (VMPS) by the lient before querying the next server in the list. The range is 1 to 10.
Defaults	The default retry of	count is 3.
Command Modes	Global configurati	on
Command History	Release 12.1(11)AX	Modification This command was introduced.
Examples	This example show	ws how to set the retry count to 7:
		vmps retry 7 ur setting by entering the show vmps privileged EXEC command and examining Server Retry Count row.
Related Commands	Command	Description
	show vmps	Displays VQP and VMPS information.

vmps server

Use the **vmps server** global configuration command on the switch stack or on a standalone switch to configure the primary VLAN Membership Policy Server (VMPS) and up to three secondary servers. Use the **no** form of this command to remove a VMPS server.

vmps server ipaddress [primary]

no vmps server [*ipaddress*]

Syntax Description	<i>ipaddress</i> IP address or hostname of the primary or secondary VMPS servers. If you hostname, the Domain Name System (DNS) server must be configured.			
	primary	(Optional) Decides whether primary or secondary VMPS servers are being configured.		
Defaults	No primary or	secondary VMPS servers are defined.		
Command Modes	Global configu	iration		
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	The first server entered is automatically selected as the primary server whether or not primary is entered. The first server address can be overridden by using primary in a subsequent command.			
	If a member switch in a cluster configuration does not have an IP address, the cluster does not use the VMPS server configured for that member switch. Instead, the cluster uses the VMPS server on the command switch, and the command switch proxies the VMPS requests. The VMPS server treats the cluster as a single switch and uses the IP address of the command switch to respond to requests.			
	delete all serve	e no form without specifying the <i>ipaddress</i> , all configured servers are deleted. If you ers when dynamic-access ports are present, the switch cannot forward packets from new se ports because it cannot query the VMPS.		
Examples	-	shows how to configure the server with IP address 191.10.49.20 as the primary VMPS vers with IP addresses 191.10.49.21 and 191.10.49.22 are configured as secondary		
	Switch(config)# vmps server 191.10.49.20 primary Switch(config)# vmps server 191.10.49.21 Switch(config)# vmps server 191.10.49.22			
	This example s	shows how to delete the server with IP address 191.10.49.21:		
	Switch(config)# no vmps server 191.10.49.21			

You can verify your setting by entering the **show vmps** privileged EXEC command and examining information in the VMPS Domain Server row.

Related Commands	Command	Description
	show vmps	Displays VQP and VMPS information.

vtp (global configuration)

Use the **vtp** global configuration command on the switch stack or on a standalone switch to set or modify the VLAN Trunking Protocol (VTP) configuration characteristics. Use the **no** form of this command to remove the settings or to return to the default settings.

vtp {domain domain-name | file filename | interface name [only] | mode {client | server | transparent} | password password | pruning | version number}

no vtp {file | interface | mode | password | pruning | version}

Syntax Description	domain domain-name	Specify the VTP domain name, an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the switch. The domain name is case sensitive.
	file filename	Specify the Cisco IOS file system file where the VTP VLAN configuration is stored.
	interface name	Specify the name of the interface providing the VTP ID updated for this device.
	only	(Optional) Use only the IP address of this interface as the VTP IP updater.
	mode	Specify the VTP device mode as client, server, or transparent.
	client	Place the switch in VTP client mode. A switch in VTP client mode is enabled for VTP, and can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on the switch. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.
	server	Place the switch in VTP server mode. A switch in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on the switch. The switch can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot.
	transparent	Place the switch in VTP transparent mode. A switch in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The switch receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.
		When VTP mode is transparent, the mode and domain name are saved in the switch running configuration file, and you can save them in the switch startup configuration file by entering the copy running-config startup config privileged EXEC command.
	password password	Set the administrative domain password for the generation of the 16-byte secret value used in MD5 digest calculation to be sent in VTP advertisements and to validate received VTP advertisements. The password can be an ASCII string from 1 to 32 characters. The password is case sensitive.
	pruning	Enable VTP pruning on the switch.
	version number	Set VTP version to Version 1 or Version 2.

Defaults	The default filename is <i>flash:vlan.dat</i> .				
	The default mode is server mode. No domain name or password is defined.				
					No password is con
	Pruning is disabled				
		The default version is Version 1.			
Command Modes	Global configuration	on			
Command History	Release	Modification			
-	12.1(11)AX	This command was introduced.			
Usage Guidelines	When you save VTP mode, domain name, and VLAN configurations in the switch startup configuration file and reboot the switch, the VTP and VLAN configurations are selected by these conditions:				
	• If both the VLAN database and the configuration file show the VTP mode as transparent and the VTP domain names match, the VLAN database is ignored. The VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.				
	• If the startup VTP mode is server mode, or the startup VTP mode or domain names do not match the VLAN database, VTP mode and VLAN configuration for the first 1005 VLANs are selected by VLAN database information, and VLANs greater than 1005 are configured from the switch configuration file.				
	The vtp file <i>filename</i> cannot be used to load a new database; it renames only the file in which the existing database is stored.				
	Follow these guidelines when configuring a VTP domain name:				
	no-managemen occur to the loo receives the fir name by using it resets its con	n the no-management-domain state until you configure a domain name. While in the nt-domain state, the switch does not send any VTP advertisements even if changes cal VLAN configuration. The switch leaves the no-management-domain state after it rst VTP summary packet on any port that is trunking or after you configure a domain the vtp domain command. If the switch receives its domain from a summary packet, affiguration revision number to 0. After the switch leaves the no-management-domain be configured to re-enter it until you clear the NVRAM and reload the software.			
	• Domain names are case-sensitive.				
	• After you configure a domain name, it cannot be removed. You can only reassign it to a different domain.				

Follow these guidelines when setting VTP mode:

- The **no vtp mode** command returns the switch to VTP server mode.
- The **vtp mode server** command is the same as **no vtp mode** except that it does not return an error if the switch is not in client or transparent mode.
- If the receiving switch is in client mode, the client switch changes its configuration to duplicate the configuration of the server. If you have switches in client mode, be sure to make all VTP or VLAN configuration changes on a switch in server mode. If the receiving switch is in server mode or transparent mode, the switch configuration is not changed.
- Switches in transparent mode do not participate in VTP. If you make VTP or VLAN configuration changes on a switch in transparent mode, the changes are not propagated to other switches in the network.
- If you change the VTP or VLAN configuration on a switch that is in server mode, that change is propagated to all the switches in the same VTP domain.
- The **vtp mode transparent** command disables VTP from the domain but does not remove the domain from the switch.
- The VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file.
- If extended-range VLANs are configured on the switch and you attempt to set the VTP mode to server or client, you receive an error message, and the configuration is not allowed.
- VTP can be set to either server or client mode only when dynamic VLAN creation is disabled.

Follow these guidelines when setting a VTP password:

- Passwords are case sensitive. Passwords should match on all switches in the same domain.
- When you use the **no vtp password** form of the command, the switch returns to the no-password state.

Follow these guidelines when setting VTP pruning:

- VTP pruning removes information about each pruning-eligible VLAN from VTP updates if there are no stations belonging to that VLAN.
- If you enable pruning on the VTP server, it is enabled for the entire management domain for VLAN IDs 1 to 1005.
- Only VLANs in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when setting the VTP version:

- Toggling the Version 2 (v2) mode state modifies parameters of certain default VLANs.
- Each VTP switch automatically detects the capabilities of all the other VTP devices. To use Version 2, all VTP switches in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 mode.
- If all switches in a domain are VTP Version 2-capable, you need only to configure Version 2 on one switch; the version number is then propagated to the other Version-2 capable switches in the VTP domain.
- If you are using VTP in a Token Ring environment, VTP Version 2 must be enabled.

- If you are configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, you must use Version 2.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use Version 1.

You cannot save password, pruning, and version configurations in the switch configuration file.

Examples This example shows how to rename the filename for VTP configuration storage to *vtpfilename*: Switch(config) # vtp file vtpfilename This example shows how to clear the device storage filename: Switch(config) # no vtp file vtpconfig Clearing device storage filename. This example shows how to specify the name of the interface providing the VTP updater ID for this device: Switch(config) # vtp interface gigabitethernet This example shows how to set the administrative domain for the switch: Switch(config) # vtp domain OurDomainName This example shows how to place the switch in VTP transparent mode: Switch(config) # vtp mode transparent This example shows how to configure the VTP domain password: Switch(config) # vtp password ThisIsOurDomain'sPassword This example shows how to enable pruning in the VLAN database: Switch(config) # vtp pruning Pruning switched ON This example shows how to enable Version 2 mode in the VLAN database: Switch(config) # vtp version 2 You can verify your settings by entering the show vtp status privileged EXEC command. **Related Commands** Command Description show vtp status Displays the VTP statistics for the switch and general information about the VTP management domain status. vtp (VLAN Configures VTP domain-name, password, pruning, version, and mode.

L

configuration)

vtp (VLAN configuration)

Use the **vtp** VLAN configuration command on the switch stack or on a standalone switch to configure VLAN Trunking Protocol (VTP) characteristics. You access VLAN configuration mode by entering the **vlan database** privileged EXEC command. Use the **no** form of this command to return to the default settings, disable the characteristic, or remove the password.

vtp {domain domain-name | password password | pruning | v2-mode | {server | client |
 transparent}}

no vtp {client | password | pruning | transparent | v2-mode}

Syntax Description	domain domain-name	Set the VTP domain name by entering an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the switch. The
	password password	domain name is case sensitive. Set the administrative domain password for the generation of the 16-byte secret value used in MD5 digest calculation to be sent in VTP advertisements and to validate received VTP advertisements. The password can be an ASCII string from 1 to 32 characters. The password is case sensitive.
	pruning	Enable pruning in the VTP administrative domain. VTP pruning causes information about each pruning-eligible VLAN to be removed from VTP updates if there are no stations belonging to that VLAN.
	v2-mode	Enable VLAN Trunking Protocol (VTP) Version 2 in the administrative domains.
	client	Place the switch in VTP client mode. A switch in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.
	server	Place the switch in VTP server mode. A switch in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The switch can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot.
	transparent	Place the switch in VTP transparent mode. A switch in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The switch receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.

Defaults

The default mode is server mode.

No domain name is defined.

No password is configured.

Pruning is disabled.

VTP Version 2 (v2 mode) is disabled.

Command Modes VLAN configuration

Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	file, and you can sa	transparent, the mode and domain name are saved in the switch running configuration we the configuration in the switch startup configuration file by using the copy artup-config privileged EXEC command.	
	Follow these guidelines when setting the VTP mode:		
	• The no vtp client and no vtp transparent forms of the command return the switch to VTP server mode.		
	-	command is the same as no vtp client or no vtp transparent except that it does not if the switch is not in client or transparent mode.	
	configuration of VLAN configu	s switch is in client mode, the client switch changes its configuration to duplicate the of the server. If you have switches in client mode, make sure to make all VTP or aration changes on a switch in server mode. If the receiving switch is in server mode mode, the switch configuration is not changed.

	• The vtp transp the switch.	parent command disables VTP from the domain but does not remove the domain from	
		e must be transparent for you to add extended-range VLANs or for the VTP and the trations to be saved in the running configuration file.	
		nge VLANs are configured on the switch and you attempt to set the VTP mode to t, you receive an error message and the configuration is not allowed.	
	• VTP can be set	t to either server or client mode only when dynamic VLAN creation is disabled.	
Note	VTP configuration	in VLAN configuration mode is saved in the VLAN database when applied.	

OL-8552-06

Follow these guidelines when configuring a VTP domain name:

- The switch is in the no-management-domain state until you configure a domain name. While in the no-management-domain state, the switch does not send any VTP advertisements even if changes occur to the local VLAN configuration. The switch leaves the no-management-domain state after receiving the first VTP summary packet on any port that is currently trunking or after configuring a domain name with the **vtp domain** command. If the switch receives its domain from a summary packet, it resets its configuration revision number to zero. After the switch leaves the no-management-domain state, it can never be configured to reenter it until you clear the NVRAM and reload the software.
- Domain names are case sensitive.
- After you configure a domain name, it cannot be removed. You can reassign it only to a different domain.

Follow these guidelines when configuring a VTP password:

- Passwords are case sensitive. Passwords should match on all switches in the same domain.
- When the **no vtp password** form of the command is used, the switch returns to the no-password state.

Follow these guidelines when enabling VTP pruning:

- If you enable pruning on the VTP server, it is enabled for the entire management domain.
- Only VLANs included in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when enabling VTP Version 2 (v2-mode):

- Toggling the version (v2-mode) state modifies certain parameters of certain default VLANs.
- Each VTP switch automatically detects the capabilities of all the other VTP devices. To use VTP Version 2, all VTP switches in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 (no vtp v2-mode).
- If all switches in a domain are VTP Version 2-capable, you need only to enable VTP Version 2 on one switch; the version number is then propagated to the other Version-2 capable switches in the VTP domain.
- If you are using VTP in a Token Ring environment or configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, VTP Version 2 (v2-mode) must be enabled.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use VTP Version 1.

Examples

This example shows how to place the switch in VTP transparent mode: Switch(vlan)# **vtp transparent** Setting device to VTP TRANSPARENT mode.

This example shows how to set the administrative domain for the switch:

Switch(vlan) # vtp domain OurDomainName Changing VTP domain name from cisco to OurDomainName

This example shows how to configure the VTP domain password:

```
Switch(vlan)# vtp password private
Setting device VLAN database password to private.
```

This example shows how to enable pruning in the proposed new VLAN database:

Switch(vlan)# **vtp pruning** Pruning switched ON

This example shows how to enable v2 mode in the proposed new VLAN database:

Switch(vlan) # **vtp v2-mode** V2 mode enabled.

You can verify your settings by entering the show vtp status privileged EXEC command.

Related Commands	Command	Description
	show vtp status	Displays the VTP statistics for the switch and general information about the VTP management domain status.
	<mark>switchport trunk</mark> pruning	Configures the VLAN pruning-eligible list for ports in trunking mode.
	vtp (global configuration)	Configures the VTP filename, interface, domain name, and mode.

Catalyst 3750 Switch Bootloader Commands

This appendix describes the bootloader commands on the Catalyst 3750 switch. Unless otherwise noted, the term *switch* refers to a standalone switch and to a switch stack.

During normal bootloader operation, you are not presented with the bootloader command-line prompt. You gain access to the bootloader command line if the switch is set to manually boot up, if an error occurs during power-on self test (POST) DRAM testing, or if an error occurs while loading the operating system (a corrupted Cisco IOS image). You can also access the bootloader if you have lost or forgotten the switch password.

The default switch configuration allows an end user with physical access to the switch to recover from a lost password by interrupting the bootup process while the switch is powering up and then entering a new password. The password recovery disable feature allows the system administrator to protect access to the switch password by disabling part of this functionality and allowing the user to interrupt the bootup process only by agreeing to set the system back to the default configuration. With password recovery disabled, the user can still interrupt the bootup process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted. For more information, see the software configuration guide for this release.

You can access the bootloader through a switch console connection at 9600 bps.

Unplug the switch power cord, and press the switch **Mode** button while reconnecting the power cord. You can release the **Mode** button a second or two after the LED above port 1X goes off. You should then see the bootloader *Switch*: prompt.The bootloader performs low-level CPU initialization, performs POST, and loads a default operating system image into memory.

Γ

boot

Use the **boot** bootloader command to load and boot up an executable image and to enter the command-line interface.

boot [**-post** | **-n** | **-p** | *flag*] *filesystem:/file-url* ...

Syntax Description	-post	(Optional) Run the loaded image with an extended or comprehensive power-on self-test (POST). Using this keyword causes POST to take longer to complete.
	-n	(Optional) Pause for the Cisco IOS debugger immediately after launching.
	-р	(Optional) Pause for the JTAG debugger right after loading the image.
	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	(Optional) Path (directory) and name of a bootable image. Separate image names with a semicolon.
Defaults	variable. If this can by performi	npts to automatically boot up the system by using information in the BOOT environment variable is not set, the switch attempts to load and execute the first executable image it ng a recursive, depth-first search throughout the flash file system. In a depth-first search ach encountered subdirectory is completely searched before continuing the search in the ry.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	the system by u	the boot command without any arguments, the switch attempts to automatically boot up sing the information in the BOOT environment variable, if any. If you supply an image <i>e-url</i> variable, the boot command attempts to boot up the specified image.
	•	ootloader boot command options, they are executed immediately and apply only to the der session. These settings are not saved for the next bootup operation.
	Filenames and o	directory names are case sensitive.
Examples	This example sh	nows how to boot up the switch using the <i>new-image.bin</i> image:
	switch: boot f	lash:/new-images/new-image.bin
	After entering the	his command, you are prompted to start the setup program.

Related Commands	Command	Description
	set	Sets the BOOT environment variable to boot a specific image when the
		BOOT keyword is appended to the command.

A-3

cat

Use the **cat** bootloader command to display the contents of one or more files.

cat filesystem:/file-url ...

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	Path (directory) and name of the files to display. Separate each filename with a space.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		directory names are case sensitive.
	If you specify	a list of files, the contents of each file appears sequentially.
Examples	This example s	shows how to display the contents of two files:
	version_suffi version_direc image_name: c ios_image_fil total_image_f	
Related Commands	Command	Description

ommands	Command	Description
	more	Displays the contents of one or more files.
	type	Displays the contents of one or more files.

сору

Use the **copy** bootloader command to copy a file from a source to a destination.

copy [-**b** *block-size*] *filesystem:/source-file-url filesystem:/destination-file-url*

Syntax Description	-b block-size	(Optional) This option is used only for internal development and testing.
	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	Isource-file-url	Path (directory) and filename (source) to be copied.
	Idestination-file-url	Path (directory) and filename of the destination.
Defaults	The default block size	is 4 KB.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	Directory names are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.Filenames are limited to 45 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.If you are copying a file to a new directory, the directory must already exist.	
	If you are copying a m	e to a new uncertory, the uncertory must aneady exist.
Examples	This example show how	w to copy a file at the root:
Examples	-	w to copy a file at the root: est1.text flash:test4.text
Examples	switch: copy flash:t	
Examples	<pre>switch: copy flash:t File "flash:test1.te</pre>	est1.text flash:test4.text
Examples Related Commands	<pre>switch: copy flash:t File "flash:test1.te</pre>	est1.text flash:test4.text xt" successfully copied to "flash:test4.text"

delete

Use the **delete** bootloader command to delete one or more files from the specified file system.

delete *filesystem:***/***file-url* ...

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.	
	lfile-url	Path (directory) and filename to delete. Separate each filename with a space.	
Command Modes	Bootloader		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines		lirectory names are case sensitive. npts you for confirmation before deleting each file.	
Examples	This example sh	lows how to delete two files:	
	Are you sure y File "flash:te Are you sure y	<pre>flash:test2.text flash:test5.text ou want to delete "flash:test2.text" (y/n)?y st2.text" deleted ou want to delete "flash:test5.text" (y/n)?y st2.text" deleted</pre>	
	You can verify that the files were deleted by entering the dir flash: bootloader command.		
Related Commands	Command	Description	
	сору	Copies a file from a source to a destination.	

dir

Use the **dir** bootloader command to display a list of files and directories on the specified file system.

dir filesystem:/file-url ...

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	(Optional) Path (directory) and directory name whose contents you want to display. Separate each directory name with a space.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Directory names	are case sensitive.
Examples	This example sho switch: dir fla Directory of fl	
	_

Related Commands

s Command	Description
mkdir	Creates one or more directories.
rmdir	Removes one or more directories.

flash_init

Use the **flash_init** bootloader command to initialize the flash file system.

flash_init

Defaults The flash file system is automatically initialized during normal system operation.

```
Command Modes Bootloader
```

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines During the normal bootup process, the flash file system is automatically initialized.

Use this command to manually initialize the flash file system. For example, you use this command during the recovery procedure for a lost or forgotten password.

format

Use the **format** bootloader command to format the specified file system and destroy all data in that file system.

format filesystem:

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
ommand Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Jsage Guidelines		
<u>_!\</u>		d with care; it destroys all data on the file system and renders your system unusab

Use the **fsck** bootloader command to check the file system for consistency.

fsck [-test | -f] filesystem:

Syntax Description	-test	(Optional) Initialize the file system code and perform extra POST on flash memory. An extensive, nondestructive memory test is performed on every byte that makes up the file system.
	-f	(Optional) Initialize the file system code and perform a fast file consistency check. Cyclic redundancy checks (CRCs) in the flashfs sectors are not checked.
	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
Defaults	No file systen	n check is performed.
Command Modes	Bootloader	
Command History	Release	Modification
Command History	Release 12.1(11)AX	Modification This command was introduced.
Command History Usage Guidelines	12.1(11)AX	

help

Use the **help** bootloader command to display the available commands.

 help

 Syntax Description
 This command has no arguments or keywords.

 Command Modes
 Bootloader

 Command History
 Release
 Modification

 12.1(11)AX
 This command was introduced.

 Usage Guidelines
 You can also use the question mark (?) to display a list of available bootloader commands.

memory

Use the **memory** bootloader command to display memory heap utilization information.

memory

Syntax Description This command has no arguments or keywords.

Command Modes Bootloader

 Release
 Modification

 12.1(11)AX
 This command was introduced.

Examples

This example shows how to display memory heap utilization information:

switch: memory
Text: 0x00700000 - 0x0071cf24 (0x0001cf24 bytes)
Rotext: 0x00000000 - 0x0000000 (0x00000000 bytes)
Data: 0x0071cf24 - 0x00723a0c (0x00006ae8 bytes)
Bss: 0x0072529c - 0x00746f94 (0x0001cf8 bytes)
Stack: 0x00746f94 - 0x00756f94 (0x00010000 bytes)
Heap: 0x00756f98 - 0x00800000 (0x000a9068 bytes)
Bottom heap utilization is 22 percent.
Tex here stiller is 0 second.

Top heap utilization is 0 percent. Total heap utilization is 22 percent. Total bytes: 0xa9068 (692328) Bytes used: 0x26888 (157832) Bytes available: 0x827e0 (534496)

Alternate heap utilization is 0 percent. Total alternate heap bytes: 0x6fd000 (7327744) Alternate heap bytes used: 0x0 (0) Alternate heap bytes available: 0x6fd000 (7327744)

Table A-2 describes the fields in the display.

Table A-2 memory Field Descriptions

Field	Description	
Text	Beginning and ending address of the text storage area.	
Rotext	Beginning and ending address of the read-only text storage area. This part of the data segment is grouped with the Text entry.	
Data	Beginning and ending address of the data segment storage area.	
Bss	Beginning and ending address of the block started by symbol (Bss) storage area. It is initialized to zero.	

Γ

Field	Description
Stack	Beginning and ending address of the area in memory allocated to the software to store automatic variables, return addresses, and so forth.
Неар	Beginning and ending address of the area in memory that memory is dynamically allocated to and freed from.

Use the **mkdir** bootloader command to create one or more new directories on the specified file system. **mkdir** *filesystem:/directory-url* ...

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	Idirectory-url	Name of the directories to create. Separate each directory name with a space.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	•	e case sensitive. e limited to 45 characters between the slashes (/); the name cannot contain control deletes, slashes, quotes, semicolons, or colons.
Examples	switch: mkdir fla:	s how to make a directory called Saved_Configs: sh:Saved_Configs Saved_Configs" created
	This example shows switch: mkdir flag	s how to make two directories: sh:Saved_Configs1 flash:Test Saved_Configs1" created
	You can verify that	the directory was created by entering the dir <i>filesystem</i> : bootloader command.
Related Commands	Command	Description

Commanus	Commanu	Description
	dir	Displays a list of files and directories on the specified file system.
	rmdir	Removes one or more directories from the specified file system.

mkdir

more

Use the **more** bootloader command to display the contents of one or more files.

more filesystem:/file-url ...

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	Path (directory) and name of the files to display. Separate each filename with a space.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		ectory names are case sensitive. t of files, the contents of each file appears sequentially.
Examples	This example show	vs how to display the contents of two files:
	version_suffix: : version_directory c3750-ipservices- image_name: c3750 ios_image_file_s: total_image_file	-mz.122-25.SEB D-ipservices-mz.122-25.SEB.bin ize: 6398464
	HHO_end: BAUD=57600 MANUAL_BOOT=no	
Related Commands	Command	Description

elated Commands	Command	Description	
	cat	Displays the contents of one or more files.	
	type	Displays the contents of one or more files.	

rename

Use the **rename** bootloader command to rename a file.

rename filesystem:/source-file-url filesystem:/destination-file-url

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	Isource-file-url	Original path (directory) and filename.
	Idestination-file-url	New path (directory) and filename.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Filenames and directo	bry names are case sensitive.
	•	imited to 45 characters between the slashes (/); the name cannot contain control letes, slashes, quotes, semicolons, or colons.
	Filenames are limited slashes, quotes, semic	to 45 characters; the name cannot contain control characters, spaces, deletes, colons, or colons.
Examples	-	a file named <i>config.text</i> being renamed to <i>config1.text</i> :
		e file was renamed by entering the dir <i>filesystem</i> : bootloader command.
	-	
Related Commands	Command	Description
	сору	Copies a file from a source to a destination.

reset

Use the **reset** bootloader command to perform a hard reset on the system. A hard reset is similar to power-cycling the switch, clearing the processor, registers, and memory.

reset

Syntax Description This command has no arguments or keywords.

Command Modes Bootloader

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Examples This example shows how to reset the system: switch: reset Are you sure you want to reset the system (y/n)?y System resetting...

Related Commands	Command	Description
	boot	Loads and boots up an executable image and enters the command-line interface.

rmdir

Use the **rmdir** bootloader command to remove one or more empty directories from the specified file system.

rmdir *filesystem:/directory-url* ...

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
Syntax Description	Idirectory-url	Path (directory) and name of the empty directories to remove. Separate each directory name with a space.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	Directory names are case sensitive and limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons. Before removing a directory, you must first delete all the files in the directory.	
	e	ots you for confirmation before deleting each directory.
Examples	This example sho switch: rmdir f	ws how to remove a directory: lash:Test
	You can verify that the directory was deleted by entering the dir <i>filesystem</i> : bootloader command.	
Related Commands	Command	Description
	dir	Displays a list of files and directories on the specified file system.
	mkdir	Creates one or more new directories on the specified file system.

set

Use the **set** bootloader command to set or display environment variables, which can be used to control the bootloader or any other software running on the switch.

set variable value

Syntax Description	variable value	Use one of these keywords for variable and value:
		MANUAL_BOOT —Decides whether the switch automatically or manually boots up.
		Valid values are 1, yes, 0, and no. If it is set to no or 0, the bootloader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the bootloader mode.
		BOOT <i>filesystem:/file-url</i> —A semicolon-separated list of executable files to try to load and execute when automatically booting up.
		If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot up the first bootable file that it can find in the flash file system.
		ENABLE_BREAK —Decides whether the automatic bootup process can be interrupted by using the Break key on the console.
		Valid values are 1, yes, on, 0, no, and off. If it is set to 1, yes, or on, you can interrupt the automatic bootup process by pressing the Break key on the console after the flash file system has initialized.
		HELPER <i>filesystem:/file-url</i> —A semicolon-separated list of loadable files to dynamically load during the bootloader initialization. Helper files extend or patch the functionality of the bootloader.
		PS1 <i>prompt</i> —A string that is used as the command-line prompt in bootloader mode.
		CONFIG_FILE flash: <i>/file-url</i> —The filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.
		BAUD <i>rate</i> —The rate in bits per second (bps) used for the console. The Cisco IOS software inherits the baud rate setting from the bootloader and continues to use this value unless the configuration file specifies another setting. The range is from 0 to 4294967295 bps. Valid values are 50, 75, 110, 150, 300, 600, 1200, 1800, 2000, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 56000, 57600, 115200, and 128000.
		The most commonly used values are 300, 1200, 2400, 9600, 19200, 57600, and 115200.
		HELPER_CONFIG_FILE <i>filesystem:lfile-url</i> —The name of the configuration file to be used by the Cisco IOS helper image. If this is not set, the file specified by the CONFIG_FILE environment variable is used by all versions of Cisco IOS that are loaded, including the helper image. This variable is used only for internal development and testing.

Defaults

The environment variables have these default values:
MANUAL_BOOT: No (0)
BOOT: Null string
ENABLE_BREAK: No (Off or 0) (the automatic bootup process cannot be interrupted by pressing the Break key on the console).
HELPER: No default value (helper files are not automatically loaded).
PS1: switch:
CONFIG_FILE: config.text
BAUD: 9600 bps
HELPER_CONFIG_FILE: No default value (no helper configuration file is specified).
SWITCH_NUMBER: 1
SWITCH_PRIORITY: 1

Note

Environment variables that have values are stored in the flash file system in various files. The format of these files is that each line contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not listed in this file; it has a value if it is listed in the file even if the value is a null string. A variable that is set to a null string (for example, "") is a variable with a value. Many environment variables are predefined and have default values.

Command Modes Bootloader

Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	Environment variables are case sensitive and must be entered as documented.			
	Environment varia	Environment variables that have values are stored in flash memory outside of the flash file system.		
	Under normal circumstances, it is not necessary to alter the setting of the environment variables.			
	The MANUAL_BOOT environment variable can also be set by using the boot manual global configuration command.			
	The BOOT enviror configuration com	ment variable can also be set by using the boot system <i>filesystem</i> : <i>lfile-url</i> global mand.		
	The ENABLE_BR configuration com	EAK environment variable can also be set by using the boot enable-break global mand.		
	The HELPER environment variable can also be set by using the boot helper <i>filesystem</i> : <i>lfile-url</i> global configuration command.			
	The CONFIG_FIL global configuration	E environment variable can also be set by using the boot config-file flash: <i>lfile-url</i> on command.		
		NFIG_FILE environment variable can also be set by using the boot helper-config-file global configuration command.		

The HELPER_CONFIG_FILE environment variable can also be set by using the **boot helper-config-file** *filesystem:/file-url* global configuration command.

The SWITCH_NUMBER environment variable can also be set by using the **switch** *current-stack-member-number* **renumber** *new-stack-member-number* global configuration command.

The SWITCH_PRIORITY environment variable can also be set by using the **switch** *stack-member-number* **priority** *priority-number* global configuration command.

The bootloader prompt string (PS1) can be up to 120 printable characters except the equal sign (=).

Examples This example shows how to change the bootloader prompt: switch: set PS1 loader: loader:

You can verify your setting by using the set bootloader command.

Related Commands	Command	Description
	unset	Resets one or more environment variables to its previous setting.

type

Use the type bootloader command to display the contents of one or more files.

type filesystem:/file-url ...

Displays the contents of one or more files.

more

unset

Use the **unset** bootloader command to reset one or more environment variables.

unset variable ...

Syntax Description	variable	Use one of these keywords for <i>variable</i> :
		MANUAL_BOOT —Decides whether the switch automatically or manually boots up.
		BOOT —Resets the list of executable files to try to load and execute when automatically booting up. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot up the first bootable file that it can find in the flash file system.
		ENABLE_BREAK —Decides whether the automatic bootup process can be interrupted by using the Break key on the console after the flash file system has been initialized.
		HELPER —A semicolon-separated list of loadable files to dynamically load during the bootloader initialization. Helper files extend or patch the functionality of the bootloader.
		PS1 —A string that is used as the command-line prompt in bootloader mode.
		CONFIG_FILE —Resets the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.
		BAUD —Resets the rate in bits per second (bps) used for the console. The Cisco IOS software inherits the baud rate setting from the bootloader and continues to use this value unless the configuration file specifies another setting.
		HELPER_CONFIG_FILE —Resets the name of the configuration file to be used by the Cisco IOS helper image. If this is not set, the file specified by the CONFIG_FILE environment variable is used by all versions of Cisco IOS that are loaded, including the helper image. This variable is used only for internal development and testing.
Command Modes	Bootloader	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines

Under normal circumstances, it is not necessary to alter the setting of the environment variables.

The MANUAL_BOOT environment variable can also be reset by using the **no boot manual** global configuration command.

The BOOT environment variable can also be reset by using the **no boot system** global configuration command.

The ENABLE_BREAK environment variable can also be reset by using the **no boot** enable-break global configuration command.

The HELPER environment variable can also be reset by using the **no boot helper** global configuration command.

The CONFIG_FILE environment variable can also be reset by using the **no boot config-file** global configuration command.

The HELPER_CONFIG_FILE environment variable can also be reset by using the **no boot helper-config-file** global configuration command.

The bootloader prompt string (PS1) can be up to 120 printable characters except the equal sign (=).

Examples This example shows how to reset the prompt string to its previous setting:

switch: unset PS1
switch:

This example shows how to display the bootloader version:

switch: version

C3750 Boot Loader (C3750-HBOOT-M) Version 12.1(11)AX Compiled Wed 21-Feb-02 14:58 by devgoyal

Catalyst 3750 Switch Debug Commands

This appendix describes the **debug** privileged EXEC commands that have been created or changed for use with the Catalyst 3750 switch. These commands are helpful in diagnosing and resolving internetworking problems and should be enabled only under the guidance of Cisco technical support staff.

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use the **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use the **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

debug auto qos

Use the **debug auto qos** privileged EXEC command to enable debugging of the automatic quality of service (auto-QoS) feature. Use the **no** form of this command to disable debugging.

debug auto qos

no debug auto qos

- Syntax Description This command has no keywords or arguments.
- **Defaults** Auto-QoS debugging is disabled.
- Command Modes Privileged EXEC

 Release
 Modification

 12.1(14)EA1
 This command was introduced.

 12.2(18)SE
 The debug auto qos command replaced the debug autoqos command.

Usage Guidelines To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging *before* you enable auto-QoS. You enable debugging by entering the **debug auto qos** privileged EXEC command.

The undebug auto qos command is the same as the no debug auto qos command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Examples

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled:

Switch# debug auto qos AutoQoS debugging is on Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# auto qos voip cisco-phone 21:29:41: mls qos map cos-dscp 0 8 16 26 32 46 48 56 21:29:41: mls qos 21:29:42: no mls qos srr-queue input cos-map 21:29:42: no mls qos srr-queue output cos-map 21:29:42: mls qos srr-queue input cos-map 21:29:42: mls qos srr-queue input cos-map queue 1 threshold 3 0 21:29:42: mls qos srr-queue input cos-map queue 1 threshold 2 1

Related Commands	Command	Description
	auto qos voip	Configures auto-QoS for voice over IP (VoIP) within a QoS domain.
	show auto qos	Displays the initial configuration that is generated by the automatic auto-QoS feature
	show debugging	Displays information about the types of debugging that are enabled.

debug backup

Use the **debug backup** privileged EXEC command to enable debugging of the Flex Links backup interface. Use the **no** form of this command to disable debugging.

debug backup {all | errors | events | vlan-load-balancing}

no debug backup {all | errors | events | vlan-load-balancing}

Syntax Description	all	Display all backup interface debug messages.
	errors	Display backup interface error or exception debug messages.
	events	Display backup interface event debug messages.
	vlan-load- balancing	Display backup interface VLAN load balancing.
Defaults	Backup interface de	ebugging is disabled.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
	12.2(37)SE	Added vlan-load-balancing keyword.
Usage Guidelines		up command is the same as the no debug backup command.
	member, you can st EXEC command. T also can use the ren	ebugging, it is enabled only on the stack master. To enable debugging on a stack art a session from the stack master by using the session <i>switch-number</i> privileged hen enter the debug command at the command-line prompt of the stack member. You note command <i>stack-member-number LINE</i> privileged EXEC command on the stack able debugging on a member switch without first starting a session.

debug cluster

Use the **debug cluster** privileged EXEC command to enable debugging of cluster-specific events. Use the **no** form of this command to disable debugging.

debug cluster {discovery | events | extended | hsrp | http | ip [packet] | members | nat | neighbors | platform | snmp | vqpxy}

no debug cluster {discovery | events | extended | hsrp | http | ip [packet] | members | nat | neighbors | platform | snmp | vqpxy}

Syntax Description	diagonary	Display alustan discovery dahug magagaga
	discovery	Display cluster discovery debug messages.
	events	Display cluster event debug messages.
	extended	Display extended discovery debug messages.
	hsrp	Display the Hot Standby Router Protocol (HSRP) debug messages.
	http	Display Hypertext Transfer Protocol (HTTP) debug messages.
	ip [packet]	Display IP or transport packet debug messages.
	members	Display cluster member debug messages.
	nat	Display Network Address Translation (NAT) debug messages.
	neighbors	Display cluster neighbor debug messages.
	platform	Display platform-specific cluster debug messages.
	snmp	Display Simple Network Management Protocol (SNMP) debug messages.
	vqpxy	Display VLAN Query Protocol (VQP) proxy debug messages.
Command Modes	Privileged EXEC

	show cluster members	Displays information about cluster members when executed on the command switch.

debug dot1x

Use the **debug dot1x** privileged EXEC command to enable debugging of the IEEE 802.1x authentication feature. Use the **no** form of this command to disable debugging.

debug dot1x {all | errors | events | feature | packets | registry | state-machine}

no debug dot1x {all | errors | events | feature | packets | registry | state-machine}

Syntax Description	all	Display all IEEE 802.1x authentication debug messages.
	errors	Display IEEE 802.1x error debug messages.
events Display IEEE 802.1x event debug messages.		Display IEEE 802.1x event debug messages.
feature D		Display IEEE 802.1x feature debug messages.
	packets	Display IEEE 802.1x packet debug messages.
	registry	Display IEEE 802.1x registry invocation debug messages.
	state-machine	Display state-machine related-events debug messages.

Though visible in the command-line help strings, the **redundancy** keyword is not supported.

Defaults Debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The authsm , backend , besm , core , and reauthsm keywords were removed. The errors , events , packets registry , and state-machine keywords were added.
	12.2(25)SEE	The feature keyword was added.

Usage Guidelines

nes The **undebug dot1x** command is the same as the **no debug dot1x** command.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show dot1x	Displays IEEE 802.1xstatistics, administrative status, and operational status for the switch or for the specified port.

debug dtp

Use the **debug dtp** privileged EXEC command to enable debugging of the Dynamic Trunking Protocol (DTP) activity. Use the **no** form of this command to disable debugging.

debug dtp {aggregation | all | decision | events | oserrs | packets | queue | states | timers}

no debug dtp {aggregation | all | decision | events | oserrs | packets | queue | states | timers}

Syntax Description	aggregation	Display DTP user-message aggregation debug messages.
	all	Display all DTP debug messages.
	decision	Display the DTP decision-table debug messages.
	events	Display the DTP event debug messages.
	oserrs	Display DTP operating system-related error debug messages.
	packets	Display DTP packet-processing debug messages.
	queue	Display DTP packet-queueing debug messages.
	states	Display DTP state-transition debug messages.
	timers	Display DTP timer-event debug messages.
Defaults	Debugging is disabl	ed.

Note	Though visible in	the command-line help strings, the linecard keyword is not supported.			
Defaults	Debugging is dis	abled.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(11)AX	This command was introduced.			
Usage Guidelines	If you do not specify a keyword, all debug messages appear.				
	The undebug etherchannel command is the same as the no debug etherchannel command.				
	When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session <i>switch-number</i> privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.				

debug etherchannel

Use the **debug etherchannel** privileged EXEC command to enable debugging of the EtherChannel/PAgP shim. This shim is the software module that is the interface between the Port Aggregation Protocol (PAgP) software module and the port manager software module. Use the **no** form of this command to disable debugging.

debug etherchannel [all | detail | error | event | idb]

no debug etherchannel [all | detail | error | event | idb]

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show etherchannel	Displays EtherChannel information for the channel.

debug ilpower

Use the **debug ilpower** privileged EXEC command to enable debugging of the power controller and Power over Ethernet (PoE) system. Use the **no** form of this command to disable debugging.

debug ilpower {cdp | controller | event | ha | port | powerman | registries}

no debug ilpower {cdp | controller | event | ha | port | powerman | registries}

Syntax Description	cdp	Display PoE Cisco Discovery Protocol (CDP) debug messages.
	controller	Display PoE controller debug messages.
	event	Display PoE event debug messages.
	ha	Display PoE high-availability messages.
	port	Display PoE port manager debug messages.
	powerman	Display PoE power management debug messages.
	registries	Display PoE registries debug messages.
Defaults	Debugging is disabled.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(25)SE	The cdp , ha , and powerman keywords were added.
	This command is supported only on PoE-capable switches. When you enable debugging, it is enabled only on the stack master. To enable debugging on a stace member, you can start a session from the stack master by using the session <i>switch-number</i> privilege EXEC command. Then enter the debug command at the command-line prompt of the stack member, also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the se master switch to enable debugging on a member switch without first starting a session.	
Usage Guidelines	When you enable debuggir member, you can start a se EXEC command. Then enter also can use the remote con	ng, it is enabled only on the stack master. To enable debugging on a stack ession from the stack master by using the session <i>switch-number</i> privileged er the debug command at the command-line prompt of the stack member. You mmand <i>stack-member-number LINE</i> privileged EXEC command on the stack
Usage Guidelines Related Commands	When you enable debuggir member, you can start a se EXEC command. Then enter also can use the remote con	ng, it is enabled only on the stack master. To enable debugging on a stack ession from the stack master by using the session <i>switch-number</i> privileged er the debug command at the command-line prompt of the stack member. debug mac-notification

Use the **debug mac-notification** privileged EXEC command to enable debugging of MAC notification events. Use the **no** form of this command to disable debugging.

debug mac-notification

no debug mac-notification

- **Defaults** Debugging is disabled.
- Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines The **undebug mac-notification** command is the same as the **no debug mac-notification** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Commands Command Description show debugging Displays information about the types of debugging that are enabled. show mac Displays the MAC address notification information for all interfaces or the specified interface. notification Displays the mac

debug matm

Use the **debug matm** privileged EXEC command to enable debugging of platform-independent MAC address management. Use the **no** form of this command to disable debugging.

debug matm

no debug matm

Syntax Description	This command has no	o arguments or keywords.
--------------------	---------------------	--------------------------

Defaults Debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines The **undebug matm** command is the same as the **no debug matm** command.

Related Commands	Command	Description
	debug platform matm	Displays information about platform-dependent MAC address management.
	show debugging	Displays information about the types of debugging that are enabled.

debug matm move update

Use the **debug matm move update** privileged EXEC command to enable debugging of MAC address-table move update message processing.

debug matm move update

no debug matm move update

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** Debugging is disabled.
- Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(25)SED	This command was introduced.

Usage Guidelines The **undebug matm move update** command is the same as the **no debug matm move update** command.

Related Commands	Command	Description
	mac address-table move update { receive transmit }	Configures MAC address-table move update feature on the switch.
	show debugging	Displays information about the types of debugging that are enabled.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

debug monitor

Use the **debug monitor** privileged EXEC command to enable debugging of the Switched Port Analyzer (SPAN) feature. Use the **no** form of this command to disable debugging.

debug monitor {all | errors | idb-update | info | list | notifications | platform | requests | snmp}

no debug monitor {all | errors | idb-update | info | list | notifications | platform | requests | snmp}

Syntax Description	all	Display all SPAN debug messages.
	errors	Display detailed SPAN error debug messages.
	idb-update	Display SPAN interface description block (IDB) update-trace debug messages.
	info	Display SPAN informational-tracing debug messages.
	list	Display SPAN port and VLAN-list tracing debug messages.
	notifications	Display SPAN notification debug messages.
	platform	Display SPAN platform-tracing debug messages.
	requests	Display SPAN request debug messages.
	snmp	Display SPAN and Simple Network Management Protocol (SNMP) tracing debug messages.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug mo	nitor command is the same as the no debug monitor command.
	When you enable member, you can EXEC command.	debugging, it is enabled only on the stack master. To enable debugging on a stack start a session from the stack master by using the session <i>switch-number</i> privileged Then enter the debug command at the command-line prompt of the stack member. You emote command <i>stack-member-number LINE</i> privileged EXEC command on the stack

master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show monitor	Displays information about all SPAN and remote SPAN (RSPAN) sessions on the switch.

debug mvrdbg

Use the **debug mvrdbg** privileged EXEC command to enable debugging of Multicast VLAN Registration (MVR). Use the **no** form of this command to disable debugging.

debug mvrdbg {all | events | igmpsn | management | ports}

no debug mvrdbg {all | events | igmpsn | management | ports}

Syntax Description	all	Display all MVR activity debug messages.
	events	Display MVR event-handling debug messages.
	igmpsn	Display MVR Internet Group Management Protocol (IGMP) snooping-activity
		debug messages.
	management	Display MVR management-activity debug messages.
	ports	Display MVR port debug messages.
Defaults	Debugging is disabl	ed.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug mvrdbg command is the same as the no debug mvrdbg command.	
	When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session <i>switch-number</i> privileged EXEC command. debug platform acl

Use the **debug platform acl** privileged EXEC command to enable debugging of the access control list (ACL) manager. Use the **no** form of this command to disable debugging.

debug platform acl {all | exit | label | main | racl | stack | vacl | vlmap | warn}

no debug platform acl {all | exit | label | main | racl | stack | vacl | vlmap | warn}

Usage Guidelines	When you en member, you EXEC comm also can use t	g platform acl command is the same as the no debug platform acl command. able debugging, it is enabled only on the stack master. To enable debugging on a stack can start a session from the stack master by using the session <i>switch-number</i> privileged and. Then enter the debug command at the command-line prompt of the stack member. You he remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack is to enable debugging on a member switch without first starting a session.
	12.1(11)AX	This command was introduced.
Command History	Release	Modification
Command Modes	Privileged E2	КЕС
Defaults	Debugging is	disabled.
	warn	Display ACL warning-related debug messages.
	vlmap	Display ACL VLAN-map-related debug messages.
	vacl	Display VLAN ACL-related debug messages.
	stack	Display ACL stack-related debug messages.
	racl	Display router ACL related debug messages.
	main	Display the main or important ACL debug messages.
	exit label	Display ACL exit-related debug messages. Display ACL label-related debug messages.

debug platform backup interface

Use the **debug platform backup interface** privileged EXEC command to enable debugging of the Flex Links platform backup interface. Use the **no** form of this command to disable debugging.

debug platform backup interface

no debug platform backup interface

Syntax Description	This command has no arguments or keywords.
--------------------	--

Defaults Platform backup interface debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(20)SE	This command was introduced.

Usage GuidelinesThe undebug platform backup interface command is the same as the no platform debug backup
interface command.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform cli-redirection main

Use the **debug platform cli-redirection main** privileged EXEC command to enable debugging of the main (important) command-line interface (CLI) redirection events. Use the **no** form of this command to disable debugging.

debug platform cli-redirection main

no debug platform cli-redirection main

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** Debugging is disabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines The undebug platform cli-redirection main command is the same as the no debug platform cli-redirection main command.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform configuration

Use the **debug platform configuration** privileged EXEC command to enable debugging of configuration file activity across the stack. Use the **no** form of this command to disable debugging.

debug platform configuration {all | reception | transmission}

no debug platform configuration {all | reception | transmission}

Syntax Description	all	Display debug messages for all configuration file transmission and reception events throughout the stack.
	reception	Display debug messages for configuration file reception from other stack members.
	transmission	Display debug messages for configuration file transmission to other stack members.
Defaults	Debugging is di	sabled.
Command Modes	Privileged EXE	2
Command History	Release	Modification
	12.1(11)AX	This command was introduced.

debug platform cpu-queues

Use the **debug platform cpu-queues** privileged EXEC command to enable debugging of platform central processing unit (CPU) receive queues. Use the **no** form of this command to disable debugging.

debug platform cpu-queues {broadcast-q | cbt-to-spt-q | cpuhub-q | host-q | icmp-q | igmp-snooping-q | layer2-protocol-q | logging-q | remote-console-q | routing-protocol-q | rpffail-q | software-fwd-q | stp-q }

no debug platform cpu-queues {broadcast-q | cbt-to-spt-q | cpuhub-q | host-q | icmp-q | igmp-snooping-q | layer2-protocol-q | logging-q | remote-console-q | routing-protocol-q | rpffail-q | software-fwd-q | stp-q}

Syntax Description	broadcast-q	Display debug messages about packets received by the broadcast queue.
	cbt-to-spt-q	Display debug messages about packets received by the core-based tree to shortest-path tree (cbt-to-spt) queue.
	cpuhub-q	Display debug messages about packets received by the CPU heartbeat queue.
	host-q	Display debug messages about packets received by the host queue.
	icmp-q	Display debug messages about packets received by the Internet Control Message Protocol (ICMP) queue.
	igmp-snooping-q	Display debug messages about packets received by the Internet Group Management Protocol (IGMP)-snooping queue.
	layer2-protocol-q	Display debug messages about packets received by the Layer 2 protocol queue.
	logging-q	Display debug messages about packets received by the logging queue.
	remote-console-q	Display debug messages about packets received by the remote console queue.
	routing-protocol-q	Display debug messages about packets received by the routing protocol queue.
	rpffail-q	Display debug messages about packets received by the reverse path forwarding (RFP) failure queue.
	software-fwd-q	Debug packets received by the software forwarding queue.
	stp-q	Debug packets received by the Spanning Tree Protocol (STP) queue.

Defaults Debugging is disabled.

Command Modes Privileged EXEC

 Release
 Modification

 12.1(11)AX
 This command was introduced.

Usage Guidelines The undebug platform cpu-queues command is the same as the no debug platform cpu-queues command.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform device-manager

Use the **debug platform device-manager** privileged EXEC command to enable debugging of the platform-dependent device manager. Use the **no** form of this command to disable debugging.

debug platform device-manager {all | device-info | poll | port-download | trace}

no debug platform device-manager {all | device-info | poll | port-download | trace}

Syntax Description		
-,	all	Display all platform device manager debug messages.
	device-info	Display platform device manager device structure debug messages.
	poll	Display platform device manager 1-second poll debug messages.
	port-download	Display platform device manager remote procedure call (RPC) usage debug messages.
	trace	Trace platform device manager function entry and exit debug messages.
Defaults	Debugging is disa	bled.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.

debug platform frontend-controller

Use the **debug platform frontend-controller** privileged EXEC command to enable debugging of front-end controller activity. Use the **no** form of this command to disable debugging.

debug platform frontend-controller {all | image | led | manager | poe | register | thermal}

no debug platform frontend-controller {all | image | led | manager | poe | register | thermal}

Syntax Description	all	Display all the debug messages for front-end controller.
	image	Display Image Manager debug messages.
	led	Display LED debug messages.
	manager	Display front-end-controller manager debug messages.
	рое	Display Power over Ethernet (PoE) debug messages.
	register	Display Register Access debug messages.
	thermal	Display thermal debug messages.
Defaults	Debugging is d	isabled.
Command Modes	Privileged EXE	.C
Command History	Release	Modification
	12.2(20)SE3	This command was introduced.
	This command	
Usage Guidelines	This command	is only supported on Power over Ethernet switches.
Usage Guidelines	The undebug p	is only supported on Power over Ethernet switches. Platform frontend-controller command is the same as the no debug platform roller command.

Related Commands	Command	Description
	show platform frontend-controller	Displays counter and status information for the front-end controller manager and subordinate applications, and displays the hardware and software information for the front-end controller.
	show debugging	Displays information about the types of debugging that are enabled.

debug platform ip arp inspection

Use the **debug platform ip arp inspection** privileged EXEC command to debug dynamic Address Resolution Protocol (ARP) inspection events. Use the **no** form of this command to disable debugging.

debug platform ip arp inspection {all | error | event | packet | rpc}

no debug platform ip arp inspection {all | error | event | packet | rpc}

Syntax Description		
Syntax Description	all	Display all dynamic ARP inspection debug messages.
	error	Display dynamic ARP inspection error debug messages.
	event	Display dynamic ARP inspection event debug messages.
	packet	Display dynamic ARP inspection packet-related debug messages.
	грс	Display dynamic ARP inspection remote procedure call (RPC) request debug messages.
Defaults	Debugging is disa	bled.

debug platform ip igmp snooping

Use the **debug platform ip igmp snooping** privileged EXEC command to enable debugging of platform-dependent Internet Group Management Protocol (IGMP) snooping. Use the **no** form of this command to disable debugging.

- debug platform ip igmp snooping {all | di | error | event | group | mgmt | pak | retry | rpc | warn}
- debug platform ip igmp snooping pak {*ip-address* | error | ipopt | leave| query | report | rx | svi | tx}

debug platform ip igmp snooping rpc [cfg | l3mm | misc | vlan]

no debug platform ip igmp snooping {all | di | error | event | group | mgmt | pak | retry | rpc | warn}

Syntax Description	all	Display all IGMP snooping debug messages.
	di	Display IGMP snooping destination index (di) coordination remote procedure call (RPC) debug messages.
	error	Display IGMP snooping error messages.
	event	Display IGMP snooping event debug messages.
	group	Display IGMP snooping group debug messages.
	mgmt	Display IGMP snooping management debug messages.
	pak { <i>ip-address</i> error ipopt leave query report rx svi tx}	Display IGMP snooping packet event debug messages. The keywords have these meanings:
		• <i>ip-address</i> —IP address of the IGMP group.
		• error—Display IGMP snooping packet error debug messages.
		• ipopt —Display IGMP snooping IP bridging options debug messages.
		• leave—Display IGMP snooping leave debug messages.
		• query —Display IGMP snooping query debug messages.
		• report —Display IGMP snooping report debug messages.
		• rx —Display IGMP snooping received packet debug messages.
		• svi —Display IGMP snooping switched virtual interface (SVI) packet debug messages.
		• tx —Display IGMP snooping sent packet debug messages.
	retry	Display IGMP snooping retry debug messages.

	rpc [cfg l3mm misc vlan]	Display IGMP snooping remote procedure call (RPC) event debug messages. The keywords have these meanings:
		• cfg—(Optional) Display IGMP snooping RPC debug messages.
		• I3mm —(Optional) IGMP snooping Layer 3 multicast router group RPC debug messages.
		• misc—(Optional) IGMP snooping miscellaneous RPC debug messages.
		• vlan—(Optional) IGMP snooping VLAN assert RPC debug messages.
	warn	Display IGMP snooping warning messages.
Defaults	Debugging is disabled.

debug platform ip multicast

Use the **debug platform ip multicast** privileged EXEC command to enable debugging of IP multicast routing. Use the **no** form of this command to disable debugging.

debug platform ip multicast {all | mdb | mdfs-rp-retry | midb | mroute-rp | resources | retry | rpf-throttle | snoop-events | software-forward | swidb-events | vlan-locks}

no debug platform ip multicast {all | mdb | mdfs-rp-retry | midb | mroute-rp | resources | retry | rpf-throttle | snoop-events | software-forward | swidb-events | vlan-locks}

Syntax Description	all	Display all platform IP-multicast event debug messages.
		Note Using this command can degrade the performance of the switch.
	mdb	Display IP-multicast debug messages for multicast distributed fast switching (MDFS) multicast descriptor block (mdb) events.
	mdfs-rp-retry	Display IP-multicast MDFS rendezvous point (RP) retry event debug messages.
	midb	Display IP-multicast MDFS multicast interface descriptor block (MIDB) debug messages.
	mroute-rp	Display IP-multicast RP event debug messages.
	resources	Display IP-multicast hardware resource debug messages.
	retry	Display IP-multicast retry processing event debug messages.
	rpf-throttle	Display IP-multicast reverse path forwarding (RPF) throttle event debug messages.
	snoop-events	Display IP-multicast IGMP snooping event debug messages.
	software-forward	Display IP-multicast software forwarding event debug messages.
	swidb-events	Display IP-multicast MDFS software interface descriptor block (swidb) or global event debug messages.
	vlan-locks	Display IP-multicast VLAN lock and unlock event debug messages.
Defaults	Debugging is disable	d.
Command Modes	Privileged EXEC	
Command History	Release	Modification

Usage Guidelines The **undebug platform ip multicast** command is the same as the **no debug platform ip multicast** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform ip unicast

Use the **debug platform ip unicast** privileged EXEC command to enable debugging of platform-dependent IP unicast routing. Use the **no** form of this command to disable debugging.

debug platform ip unicast {adjacency | all | arp | dhcp | errors | events | interface | mpath | registries | retry | route | rpc | standby | statistics}

no debug platform ip unicast {adjacency | all | arp | dhcp | errors | events | interface | mpath | registries | retry | route | rpc | standby | statistics}

Syntax Description	adjacency	Display IP unicast routing adjacency programming event debug messages.
Syntax Description		Display all platform IP unicast routing debug messages.
	an	
		Note Using this command can degrade the performance of the switch.
	arp	Display IP unicast routing Address Resolution Protocol (ARP) and ARP throttling debug messages.
	dhcp	Display IP unicast routing DHCP dynamic address-related event debug messages.
	errors	Display all IP unicast routing error debug messages, including resource allocation failures.
	events	Display all IP unicast routing event debug messages, including registry and miscellaneous events.
	interface	Display IP unicast routing interface event debug messages.
	mpath	Display IP unicast routing multi-path adjacency programming event debug messages (present when performing equal or unequal cost routing).
	registries	Display IP unicast routing forwarding information database (FIB), adjacency add, update, and delete registry event debug messages.
	retry	Display IP unicast routing reprogram FIBs with ternary content addressable memory (TCAM) allocation failure debug messages.
	route	Display IP unicast routing FIB TCAM programming event debug messages.
	rpc	Display IP unicast routing Layer 3 unicast remote procedure call (RPC) interaction debug messages.
	standby	Display IP unicast routing standby event debug messages, helpful in troubleshooting Hot Standby Routing Protocol (HSRP) issues.
	statistics	Display IP unicast routing statistics gathering-related event debug messages.
Defaults	Debugging is	s disabled.
Command Modes	Privileged E	XEC
Command Modes	Privileged Ež Release	Modification

Usage Guidelines The **undebug platform ip unicast** command is the same as the **no debug platform ip unicast** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform ip wccp

Use the **debug platform ip wccp** privileged EXEC command to enable debugging of Web Cache Communication Protocol (WCCP). Use the **no** form of this command to disable debugging.

debug platform ip wccp {acl | event | odm | trace}

no debug platform ip wccp {acl | event | odm | trace}

This command is available only if your switch is running the IP services image, formerly known as the enhanced multilayer image (EMI).

Syntax Description	acl	Display WCCP access control lists (ACLs).
	event	Display WCCP event debug messages.
	odm	Display WCCP OD merge VMRs.
	trace	Trace WCCP execution.
Defaults	Debugging is d	isabled.
Command Modes	Privileged EXE	.C
Command History	Release	Modification
	12.2(37)SE	This command was introduced.
Usage Guidelines	The undebug p	latform ip wccp command is the same as the no debug platform ip wccp command.

debug platform phy

Use the **debug platform phy** privileged EXEC command to enable debugging of PHY driver information. Use the **no** form of this command to disable debugging.

- debug platform phy {automdix | cablediag | dual-purpose | flcd {configure | ipc | iter | trace} |
 flowcontrol | forced | init-seq | link-status | read | sfp | show-controller | speed | write |
 xenpak}
- no debug platform phy {automdix | cablediag | dual-purpose | flcd { configure | ipc | iter | trace } | flowcontrol | forced | init-seq | link-status | read | sfp | show-controller | speed | write | xenpak }

ntax Description	automdix	Display PHY automatic medium-dependent interface crossover (auto-MDIX debug messages.
	cablediag	Display PHY cable-diagnostic debug messages.
	dual-purpose	Display PHY dual-purpose event debug messages.
	flcd {configure ipc	Display PHY FLCD debug messages. The keywords have these meanings:
	iter trace}	• configure —Display PHY configure debug messages.
		• ipc —Display Interprocess Communication Protocol (IPC) debug messages.
		• iter—Display iter debug messages.
		• trace —Display trace debug messages.
	flowcontrol	Display PHY flowcontrol debug messages.
	forced	Display PHY forced-mode debug messages.
	init-seq	Display PHY initialization-sequence debug messages.
	link-status	Display PHY link-status debug messages.
	read	Display PHY-read debug messages.
	sfp	Display PHY small form-factor pluggable (SFP) modules debug messages
	show-controller	Display PHY show-controller debug messages.
	speed	Display PHY speed-change debug messages.
	write	Display PHY-write debug messages.
	xenpak	Display PHY XENPAK debug messages

Defaults Debug

Debugging is disabled.

Command Modes Privileged EXEC

Release Modification 12.1(11)AX This command was introduced. 12.1(14)EA1 The automdix keyword was added.

Catalyst 3750 Switch Command Reference

Usage Guidelines The **undebug platform phy** command is the same as the **no debug platform phy** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform pm

Use the **debug platform pm** privileged EXEC command to enable debugging of the platform-dependent port manager software module. Use the **no** form of this command to disable debugging.

- debug platform pm {all | counters | errdisable | etherchnl | exceptions | hpm-events | idb-events | if-numbers | ios-events | link-status | platform | pm-events | pm-span | pm-vectors [detail] | rpc [general | oper-info | state | vectors | vp-events] | soutput-vectors | stack-manager | sync | vlans}
- no debug platform pm {all | counters | errdisable | etherchnl | exceptions | hpm-events | idb-events | if-numbers | ios-events | link-status | platform | pm-events | pm-span | pm-vectors [detail] | rpc [general | oper-info | state | vectors | vp-events] | soutput-vectors | stack-manager | sync | vlans}

ntax Description	all	Display all port-manager debug messages.
	counters	Display counters for remote procedure call (RPC) debug messages.
	errdisable	Display error-disabled related-events debug messages.
	etherchnl	Display EtherChannel related-events debug messages.
	exceptions	Display system exception debug messages.
	hpm-events	Display platform port-manager event debug messages.
	idb-events	Display interface descriptor block (IDB) related-events debug messages.
	if-numbers	Display interface-number translation-event debug messages.
	ios-events	Display Cisco IOS event debug messages.
	link-status	Display interface link-detection event debug messages.
	platform	Display port-manager function-event debug messages.
	pm-events	Display port manager event debug messages.
	pm-span	Display port manager Switched Port Analyzer (SPAN) event debug messages.
	pm-vectors [detail]	Display port-manager vector-related-event debug messages. The keyword has this meaning:
		• detail —Display vector-function details.
	rpc [general oper-info state	Display RPC related-event debug messages. The keywords have these meanings:
	vectors vp-events]	• general—(Optional) Display RPC general events.
		• oper-info —(Optional) Display operational- and informational-related RPC messages.
		• state —(Optional) Display administrative- and operational-related RPC messages.
		• vectors—(Optional) Display vector-related RPC messages.
		• vp-events —(Optional) Display virtual ports related-events RP messages.
	soutput-vectors	Display IDB output vector event debug messages.

	sync	Display operational synchronization and VLAN line-state event debug
		messages.
	vlans	Display VLAN creation and deletion event debug messages.
Defaults	Debugging is disabled	1.

debug platform tcam

Use the **debug platform tcam** privileged EXEC command to enable debugging of ternary content addressable memory (TCAM) access and lookups. Use the **no** form of this command to disable debugging.

- debug platform tcam {log | read | search | write}
- debug platform tcam log l2 {acl {input | output} | local | qos}
- debug platform tcam log l3 {acl {input | output} | ipv6 {acl {input | output} | local | qos | secondary} | local | qos | secondary}
- debug platform tcam read {reg | ssram | tcam}
- debug platform tcam search
- debug platform tcam write {forw-ram | reg | tcam}
- no debug platform tcam {log | read | search | write}
- no debug platform tcam log l2 {acl {input | output} | local | qos}
- no debug platform tcam log l3 {acl {input | output} | ipv6 {acl {input | output} | local | qos | secondary} | local | qos | secondary}
- no debug platform tcam read {reg | ssram | tcam}
- no debug platform tcam search
- no debug platform tcam write {forw-ram | reg | tcam}

Syntax Description	log l2 {acl {input output} local qos}	Display Layer 2 field-based CAM look-up type debug messages. The keywords have these meanings:
		• acl {input output}—Display input or output ACL look-up debug messages.
		• local —Display local forwarding look-up debug messages.
		• qos —Display classification and quality of service (QoS) look-up debug messages.

	l3 {acl {input output} ipv6 {acl {input output} local qos secondary} local qos secondary}	Display Layer 3 field-based CAM look-up type debug messages. The keywords have these meanings:
		• acl {input output}—Display input or output ACL look-up debug messages.
		• ipv6 { acl { input output } local qos secondary }—Display IPv6-based look-up debug messages. Options include displaying input or output ACL look-up, local forwarding look-up, classification and QoS look-up, or secondary forwarding look-up debug messages.
		• local —Display local forwarding look-up debug messages.
		• qos —Display classification and quality of service (QoS) look-up debug messages.
		 secondary—Display secondary forwarding look-up debug messages.
	read {reg ssram tcam}	Display TCAM-read debug messages. The keywords have these meanings:
		• reg —Display TCAM-register read debug messages.
		• ssram —Display synchronous static RAM (SSRAM)-read debug messages.
		• tcam—Display TCAM-read debug messages.
	search	Display supervisor-initiated TCAM-search results debug messages.
	write {forw-ram reg tcam}	Display TCAM-write debug messages. The keywords have these meanings:
		forw-ram—Display forwarding-RAM write debug messages.
		reg—Display TCAM-register write debug messages.
		tcam—Display TCAM-write debug messages.
Defaults	Debugging is disabled.

debug pm

Use the **debug pm** privileged EXEC command to enable debugging of port manager (PM) activity. The port manager is a state machine that controls all the logical and physical interfaces. All features, such as VLANs, UniDirectional Link Detection (UDLD), and so forth, work with the port manager to provide switch functions. Use the **no** form of this command to disable debugging.

debug pm {all | assert | card | etherchnl | hatable | messages | port | redundancy | registry | sm | span | split | vlan | vp }

no debug pm {all | assert | card | etherchnl | hatable | messages | port | redundancy | registry | sm | span | split | vlan | vp }

Syntax Description	all	Display all PM debug messages.
	assert	Display assert debug messages.
	card	Display line-card related-events debug messages.
	etherchnl	Display EtherChannel related-events debug messages.
	hatable	Display Host Access Table events debug messages.
	messages	Display PM debug messages.
	port	Display port related-events debug messages.
	redundancy	Display redundancy debug messages.
	registry	Display PM registry invocation debug messages.
	sm	Display state-machine related-events debug messages.
	span	Display spanning-tree related-events debug messages.
	split	Display split-processor debug messages.
	vlan	Display VLAN related-events debug messages.
	vp	Display virtual port related-events debug messages.

Though visible in the command-line help strings, the scp and pvlan keywords are not supported.

Defaults

Debugging is disabled.

Command Modes Privileged EXEC

Com

nmand History	Release	Modification	
	12.1(11)AX	This command was introduced.	
	12.1(14)EA1	The hatable keyword was added.	

Usage Guidelines

The **undebug pm** command is the same as the **no debug pm** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug port-security

debug port-security

no debug port-security

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

- **Defaults** Debugging is disabled.
- Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines The **undebug port-security** command is the same as the **no debug port-security** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show port-security	Displays port-security settings for an interface or for the switch.

debug qos-manager

Use the **debug qos-manager** privileged EXEC command to enable debugging of the quality of service (QoS) manager software. Use the **no** form of this command to disable debugging.

debug qos-manager {all | event | verbose}

no debug qos-manager {all | event | verbose}

Syntax Description	all	Display all QoS-manager debug messages.	
	event	Display QoS-manager related-event debug messages.	
	verbose	Display QoS-manager detailed debug messages.	
Defaults	Debugging is disabled.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(11)AX	This command was introduced.	
Usage Guidelines	The undebug qos-manager command is the same as the no debug qos-manager command.		
	When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session <i>switch-number</i> privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.		
Related Commands	Command	Description	

debug spanning-tree

Use the **debug spanning-tree** privileged EXEC command to enable debugging of spanning-tree activities. Use the **no** form of this command to disable debugging.

- debug spanning-tree {all | backbonefast | bpdu | bpdu-opt | config | csuf/csrt | etherchannel |
 events | exceptions | general | mstp | pvst+ | root | snmp | switch | synchronization |
 uplinkfast}
- no debug spanning-tree {all | backbonefast | bpdu | bpdu-opt | config | csuf/csrt | etherchannel | events | exceptions | general | mstp | pvst+ | root | snmp | switch | synchronization | uplinkfast}

Syntax Description	all	Display all spanning-tree debug messages.
	backbonefast	Display BackboneFast-event debug messages.
	bpdu	Display spanning-tree bridge protocol data unit (BPDU) debug messages.
	bpdu-opt	Display optimized BPDU handling debug messages.
	config	Display spanning-tree configuration change debug messages.
	csuf/csrt	Display cross-stack UplinkFast and cross-stack rapid transition activity debug messages.
	etherchannel	Display EtherChannel-support debug messages.
	events	Display spanning-tree topology event debug messages.
	exceptions	Display spanning-tree exception debug messages.
	general	Display general spanning-tree activity debug messages.
	mstp	Debug Multiple Spanning Tree Protocol events.
	pvst+	Display per-VLAN spanning-tree plus (PVST+) event debug messages.
	root	Display spanning-tree root-event debug messages.
	snmp	Display spanning-tree Simple Network Management Protocol (SNMP) handling debug messages.
	synchronization	Display the spanning-tree synchronization event debug messages.
	switch	Display switch shim command debug messages. This shim is the software module that is the interface between the generic Spanning Tree Protocol (STP) code and the platform-specific code of various switch platforms.
	uplinkfast	Display UplinkFast-event debug messages.

Defaults Debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The mstp and csuf/csrt keywords were added.
Usage Guidelines	The undebug spanning-tree command is the same as the no debug spanning-tree command.	
	member, you can start a EXEC command. Then also can use the remote	gging, it is enabled only on the stack master. To enable debugging on a stack a session from the stack master by using the session <i>switch-number</i> privileged enter the debug command at the command-line prompt of the stack member. You command <i>stack-member-number LINE</i> privileged EXEC command on the stack e debugging on a member switch without first starting a session.
Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tree	Displays spanning-tree state information.

debug spanning-tree backbonefast

Use the **debug spanning-tree backbonefast** privileged EXEC command to enable debugging of spanning-tree BackboneFast events. Use the **no** form of this command to disable debugging.

debug spanning-tree backbonefast [detail | exceptions]

no debug spanning-tree backbonefast [detail | exceptions]

Syntax Description	detail (0	Optional) Display detailed BackboneFast debug messages.
	exceptions ((Optional) Display spanning-tree BackboneFast-exception debug messages.
Defaults	Debugging is disabl	ed.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug spanr backbonefast comm	ing-tree backbonefast command is the same as the no debug spanning-tree nand.
	When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session <i>switch-number</i> privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.	
Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tre	e Displays spanning-tree state information.

debug spanning-tree bpdu

Use the **debug spanning-tree bpdu** privileged EXEC command to enable debugging of sent and received spanning-tree bridge protocol data units (BPDUs). Use the **no** form of this command to disable debugging.

debug spanning-tree bpdu [receive | transmit]

no debug spanning-tree bpdu [receive | transmit]

Syntax Description	receive (C	Optional) Display the nonoptimized path for received BPDU debug messages.
	transmit (C	Optional) Display the nonoptimized path for sent BPDU debug messages.
Defaults	Debugging is disable	ed.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug spann command .	ing-tree bpdu command is the same as the no debug spanning-tree bpdu
	When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session <i>switch-number</i> privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.	
Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tree	Displays spanning-tree state information.

debug spanning-tree bpdu-opt

Use the **debug spanning-tree bpdu-opt** privileged EXEC command to enable debugging of optimized spanning-tree bridge protocol data units (BPDUs) handling. Use the **no** form of this command to disable debugging.

debug spanning-tree bpdu-opt [detail | packet]

no debug spanning-tree bpdu-opt [detail | packet]

Syntax Description	detail (Optional) Display detailed optimized BPDU-handling debug messages.
	packet (Optional) Display packet-level optimized BPDU-handling debug messages.
Defaults	Debugging is disabl	ed.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug spanr command.	ning-tree bpdu-opt command is the same as the no debug spanning-tree bpdu-opt
	member, you can sta EXEC command. Th also can use the rem	ebugging, it is enabled only on the stack master. To enable debugging on a stack art a session from the stack master by using the session <i>switch-number</i> privileged hen enter the debug command at the command-line prompt of the stack member. You ote command <i>stack-member-number LINE</i> privileged EXEC command on the stack able debugging on a member switch without first starting a session.
Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tre	e Displays spanning-tree state information.

B-85

debug spanning-tree mstp

Use the **debug spanning-tree mstp** privileged EXEC command to enable debugging of the Multiple Spanning Tree Protocol (MSTP) software. Use the **no** form of this command to disable debugging.

debug spanning-tree mstp {all | boundary | bpdu-rx | bpdu-tx | errors | flush | init | migration | pm | proposals | region | roles | sanity_check | sync | tc | timers}

no debug spanning-tree mstp {all | boundary | bpdu-rx | bpdu-tx | errors | flush | init | migration | pm | proposals | region | roles | sanity_check | sync | tc | timers}

Syntax Description	all	Enable all the debugging messages.
	boundary	Debug flag changes at these boundaries:
		• An multiple spanning-tree (MST) region and a single spanning-tree region running Rapid Spanning Tree Protocol (RSTP)
		• An MST region and a single spanning-tree region running 802.1D
		• An MST region and another MST region with a different configuration
	bpdu-rx	Debug the received MST bridge protocol data units (BPDUs).
	bpdu-tx	Debug the sent MST BPDUs.
	errors	Debug MSTP errors.
	flush	Debug the port flushing mechanism.
	init	Debug the initialization of the MSTP data structures.
	migration	Debug the protocol migration state machine.
	pm	Debug MSTP port manager events.
	proposals	Debug handshake messages between the designated switch and the root switch.
	region	Debug the region synchronization between the switch processor (SP) and the route processor (RP).
	roles	Debug MSTP roles.
	sanity_check	Debug the received BPDU sanity check messages.
	sync	Debug the port synchronization events.
	tc	Debug topology change notification events.
	timers	Debug the MSTP timers for start, stop, and expire events.
efaults	Debugging is di	sabled.
ommand Modes	Privileged EXE	С
Command History	Release	Modification
	12.1(14)EA1	This command was introduced.

Usage Guidelines The undebug spanning-tree mstp command is the same as the no debug spanning-tree mstp command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tree	Displays spanning-tree state information.

B-87

debug spanning-tree switch

Use the **debug spanning-tree switch** privileged EXEC command to enable debugging of the software interface between the Spanning Tree Protocol (STP) software module and the port manager software module. Use the **no** form of this command to disable debugging.

debug spanning-tree switch {all | errors | flush | general | helper | pm | rx {decode | errors | interrupt | process } | state | tx [decode] | uplinkfast }

no debug spanning-tree switch {all | errors | flush | general | helper | pm | rx {decode | errors | interrupt | process } | state | tx [decode] | uplinkfast }

all	Display all spanning-tree switch debug messages.
	Display an spanning tree switch debug messages.
errors	Display debug messages for the interface between the spanning-tree software module and the port manager software module.
flush	Display debug messages for the shim flush operation.
general	Display general event debug messages.
helper	Display spanning-tree helper-task debug messages. Helper tasks handle bulk spanning-tree updates.
pm	Display port-manager event debug messages.
rx	Display received bridge protocol data unit (BPDU) handling debug messages. The keywords have these meanings:
	• decode —Display decoded received packets.
	• errors—Display receive error debug messages.
	• interrupt—Display interrupt service request (ISR) debug messages.
	• process—Display process receive BPDU debug messages.
state	Display spanning-tree port state change debug messages;
tx [decode]	Display sent BPDU handling debug messages. The keyword has this meaning:
	• decode —(Optional) Display decoded sent packets.
uplinkfast	Display uplinkfast packet transmission debug messages.
	isabled.
	flush general helper pm rx state tx [decode] uplinkfast

Command Modes Privileged EXEC

(

Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.1(14)EA1	The flush and uplinkfast keywords were added.

Usage Guidelines The **undebug spanning-tree switch** command is the same as the **no debug spanning-tree switch** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tree	Displays spanning-tree state information.

B-89

debug spanning-tree uplinkfast

Use the **debug spanning-tree uplinkfast** privileged EXEC command to enable debugging of spanning-tree UplinkFast events. Use the **no** form of this command to disable debugging.

debug spanning-tree uplinkfast [exceptions]

no debug spanning-tree uplinkfast [exceptions]

Syntax Description	exceptions (O	ptional) Display spanning-tree UplinkFast-exception debug messages.
Defaults	Debugging is disabled	1.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug spanni uplinkfast command.	ng-tree uplinkfast command is the same as the no debug spanning-tree
	When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session <i>switch-number</i> privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.	
Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show spanning-tree	Displays spanning-tree state information.

debug sw-vlan

Use the **debug sw-vlan** privileged EXEC command to enable debugging of VLAN manager activities. Use the **no** form of this command to disable debugging.

debug sw-vlan {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | management | mapping | notification | packets | redundancy | registries | vtp}

no debug sw-vlan {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | management | mapping | notification | packets | redundancy | registries | vtp}

Syntax Description	badpmcookies	Display debug messages for VLAN manager incidents of bad port manager cookies.
	cfg-vlan {bootup cli}	Display config-vlan debug messages. The keywords have these meanings:
		• bootup —Display messages when the switch is booting up.
		• cli —Display messages when the command-line interface (CLI) is in config-vlan mode.
	events	Display debug messages for VLAN manager events.
	ifs	See the debug sw-vlan ifs command.
	management	Display debug messages for VLAN manager management of internal VLANs.
	mapping	Display debug messages for VLAN mapping.
	notification	See the debug sw-vlan notification command.
	packets	Display debug messages for packet handling and encapsulation processes.
	redundancy	Display debug messages for VTP VLAN redundancy.
	registries	Display debug messages for VLAN manager registries.
	vtp	See the debug sw-vlan vtp command.
Defaults	Debugging is disabled.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug sw-vlan co	ommand is the same as the no debug sw-vlan command.
	member, you can start a EXEC command. Then e also can use the remote c	ging, it is enabled only on the stack master. To enable debugging on a stack session from the stack master by using the session <i>switch-number</i> privileged nter the debug command at the command-line prompt of the stack member. You command <i>stack-member-number LINE</i> privileged EXEC command on the stack debugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show vlan	Displays the parameters for all configured VLANs or one VLAN (if the VLAN name or ID is specified) in the administrative domain.
	show vtp	Displays general information about VTP management domain, status, and counters.

debug sw-vlan ifs

Use the **debug sw-vlan ifs** privileged EXEC command to enable debugging of the VLAN manager IOS file system (IFS) error tests. Use the **no** form of this command to disable debugging.

debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}

```
no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

Syntax Description	open {read write}	Display VLAN manager IFS file-open operation debug messages. The keywords have these meanings:
		• read —Display VLAN manager IFS file-read operation debug messages.
		• write—Display VLAN manager IFS file-write operation debug messages.
	read {1 2 3 4}	Display file-read operation debug messages for the specified error test (1, 2, 3, or 4).
	write	Display file-write operation debug messages.
Defaults	Debugging is disabled	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	-	ifs command is the same as the no debug sw-vlan ifs command.
	member, you can start EXEC command. Ther also can use the remot	agging, it is enabled only on the stack master. To enable debugging on a stack a session from the stack master by using the session <i>switch-number</i> privileged a enter the debug command at the command-line prompt of the stack member. You e command <i>stack-member-number LINE</i> privileged EXEC command on the stack e debugging on a member switch without first starting a session.

When selecting the file read operation, Operation 1 reads the file header, which contains the header verification word and the file version number. Operation 2 reads the main body of the file, which contains most of the domain and VLAN information. Operation 3 reads type length version (TLV) descriptor structures. Operation 4 reads TLV data.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show vlan	Displays the parameters for all configured VLANs or one VLAN (if the VLAN name or ID is specified) in the administrative domain.

debug sw-vlan notification

Use the **debug sw-vlan notification** privileged EXEC command to enable debugging of the activation and deactivation of Inter-Link Switch (ISL) VLAN IDs. Use the **no** form of this command to disable debugging.

debug sw-vlan notification {accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}

no debug sw-vlan notification {accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}

Syntax Description	accfwdchange	Display debug messages for VLAN manager notification of aggregated access interface spanning-tree forward changes.
	allowedvlancfgchange	Display debug messages for VLAN manager notification of changes to the allowed VLAN configuration.
	fwdchange	Display debug messages for VLAN manager notification of spanning-tree forwarding changes.
	linkchange	Display debug messages for VLAN manager notification of interface link-state changes.
	modechange	Display debug messages for VLAN manager notification of interface mode changes.
	pruningcfgchange	Display debug messages for VLAN manager notification of changes to the pruning configuration.
	statechange	Display debug messages for VLAN manager notification of interface state changes.
Defaults	Debugging is disabled.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug sw-vlan n e command.	otification command is the same as the no debug sw-vlan notification
	member, you can start a s EXEC command. Then en also can use the remote c	ging, it is enabled only on the stack master. To enable debugging on a stack session from the stack master by using the session <i>switch-number</i> privileged neter the debug command at the command-line prompt of the stack member. You ommand <i>stack-member-number LINE</i> privileged EXEC command on the stack lebugging on a member switch without first starting a session.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show vlan	Displays the parameters for all configured VLANs or one VLAN (if the VLAN name or ID is specified) in the administrative domain.

debug sw-vlan vtp

Use the **debug sw-vlan vtp** privileged EXEC command to enable debugging of the VLAN Trunking Protocol (VTP) code. Use the **no** form of this command to disable debugging.

debug sw-vlan vtp {events | packets | pruning [packets | xmit] | redundancy | xmit}

no debug sw-vlan vtp {events | packets | pruning | redundancy | xmit}

Syntax Description	events	Display debug messages for general-purpose logic flow and detailed VTP messages generated by the VTP_LOG_RUNTIME macro in the VTP code.
	packets	Display debug messages for the contents of all incoming VTP packets that have been passed into the VTP code from the IOS VTP platform-dependent layer, except for pruning packets.
	pruning [packets xmit]	Display debug messages generated by the pruning segment of the VTP code. The keywords have these meanings:
		• packets —(Optional) Display debug messages for the contents of all incoming VTP pruning packets that have been passed into the VTP code from the IOS VTP platform-dependent layer.
		• xmit —(Optional) Display debug messages for the contents of all outgoing VTP packets that the VTP code requests the IOS VTP platform-dependent layer to send.
	redundancy	Display debug messages for VTP redundancy.
	xmit	Display debug messages for the contents of all outgoing VTP packets that the VTP code requests the IOS VTP platform-dependent layer to send, except for pruning packets.
Defaults	Debugging is disabled.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
-	12.1(11)AX	This command was introduced.
Usage Guidelines	When you enable debugg member, you can start a s EXEC command. Then en	p command is the same as the no debug sw-vlan vtp command. ing, it is enabled only on the stack master. To enable debugging on a stack ession from the stack master by using the session <i>switch-number</i> privileged ter the debug command at the command-line prompt of the stack member. You ommand <i>stack-member-number LINE</i> privileged EXEC command on the stack
		ebugging on a member switch without first starting a session.

If no further parameters are entered after the **pruning keyword**, VTP pruning debugging messages appear. They are generated by the VTP_PRUNING_LOG_NOTICE, VTP_PRUNING_LOG_INFO, VTP_PRUNING_LOG_DEBUG, VTP_PRUNING_LOG_ALERT, and VTP_PRUNING_LOG_WARNING macros in the VTP pruning code.

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show vtp	Displays general information about VTP management domain, status, and
		counters.

debug udld

Use the **debug udld** privileged EXEC command to enable debugging of the UniDirectional Link Detection (UDLD) feature. Use the **no** form of this command to disable UDLD debugging.

debug udld {events | packets | registries}

no debug udld {events | packets | registries}

Syntax Description	events	Display debug messages for UDLD process events as they occur.
,	packets	Display debug messages for the UDLD process as it receives packets from the packet queue and tries to send them at the request of the UDLD protocol code.
	registries	Display debug messages for the UDLD process as it processes registry calls from the UDLD process-dependent module and other feature modules.
Defaults	Debugging is d	isabled.
	20008811818	
Command Modes	Privileged EXE	C
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	The undebug u	dld command is the same as the no debug udld command.
	member, you ca EXEC comman also can use the	ble debugging, it is enabled only on the stack master. To enable debugging on a stack an start a session from the stack master by using the session <i>switch-number</i> privileged d. Then enter the debug command at the command-line prompt of the stack member. You remote command <i>stack-member-number LINE</i> privileged EXEC command on the stack o enable debugging on a member switch without first starting a session.
	For debug udle	l events, these debugging messages appear:
	• General UI	DLD program logic flow
	• State mach	ine state changes
	Program ac	ctions for the set and clear ErrDisable state
	• Neighbor c	ache additions and deletions
	• Processing	of configuration commands

For debug udld packets, these debugging messages appear:

- General packet processing program flow on receipt of an incoming packet
- Indications of the contents of the various pieces of packets received (such as type length versions [TLVs]) as they are examined by the packet reception code
- Packet transmission attempts and the outcome

For debug udld registries, these categories of debugging messages appear:

- Sub-block creation
- Fiber-port status changes
- State change indications from the port manager software
- MAC address registry calls

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.
	show udld	Displays UDLD administrative and operational status for all ports or the specified port.

debug vqpc

Use the **debug vqpc** privileged EXEC command to enable debugging of the VLAN Query Protocol (VQP) client. Use the **no** form of this command to disable debugging.

debug vqpc [all | cli | events | learn | packet]

no debug vqpc [all | cli | events | learn | packet]

Syntax Description	all	(Optional) Display all VQP client debug messages.
	cli	(Optional) Display the VQP client command-line interface (CLI) debug
		messages.
	events	(Optional) Display VQP client event debug messages.
	learn	(Optional) Display VQP client address learning debug messages.
	packet	(Optional) Display VQP client packet information debug messages.
Defaults	Debugging is disab	led.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines	When you enable d member, you can st EXEC command. T also can use the ren	e command is the same as the no debug vqpc command. ebugging, it is enabled only on the stack master. To enable debugging on a stack cart a session from the stack master by using the session <i>switch-number</i> privileged then enter the debug command at the command-line prompt of the stack member. You note command <i>stack-member-number LINE</i> privileged EXEC command on the stack able debugging on a member switch without first starting a session.
Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

debug platform wireless-controller

Use the **debug platform wireless-controller** privileged EXEC command to enable debugging of the internal wireless LAN controller on a Catalyst 3750G Integrated Wireless LAN Controller Switch. Use the **no** form of this command to disable debugging.

debug platform wireless-controller {all | packets | session | sm | wcp}

no debug platform wireless-controller $\{all \mid packets \mid session \mid sm \mid wcp\}$

	11	
Syntax Description	all	Display all wireless controller debug messages.
	packets	Display Wireless LAN Control Protocol (WCP) packet debug messages.
	session	Display wireless controller session debug messages.
	sm	Display wireless controller state machine debug messages.
	wcp	Display all WCP debug messages.
Defaults	Debugging is disabled.

Catalyst 3750 Switch Show Platform Commands

This appendix describes the **show platform** privileged EXEC commands that have been created or changed for use with the Catalyst 3750 switch. These commands display information helpful in diagnosing and resolving internetworking problems and should be used only under the guidance of Cisco technical support staff.

show platform acl

Use the **show platform acl** privileged EXEC command to display platform-dependent access control list (ACL) manager information.

show platform acl {interface interface-id | label label-number [detail] | statistics asic-number |
usage asic-number [summary] | vlan vlan-id} [| {begin | exclude | include} expression]

yntax Description	interface interface-id	Display per-interface ACL manager information for the specified interface. The interface can be a physical interface or a VLAN.
	label label-number [detail]	Display per-label ACL manager information. The <i>label-number</i> range is 0 to 255. The keyword has this meaning:
		• detail —(Optional) Display detailed ACL manager label information.
	statistics asic-number	Display per-ASIC ACL manager information. The <i>asic-number</i> is the port ASIC number, either 0 or 1.
	usage asic-number	Display per-ASIC ACL usage information. The keyword has this meaning:
	[summary]	• summary —(Optional) Display usage information in a brief format.
	vlan vlan-id	Display per-VLAN ACL manager information. The <i>vlan-id</i> range is from 1 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

C-3

show platform backup interface

Use the **show platform backup interface** privileged EXEC command to display platform-dependent backup information used in a Flex Links configuration.

show platform backup interface [interface-id | dummyQ] [| {begin | exclude | include}
expression]

Syntax Description	interface-id	(Optional) Display backup information for all interfaces or the specified interface. The interface can be a physical interface or a port channel.
	dummyQ	(Optional) Display dummy queue information.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command History	Balassa	Modification
Command History	Release 12.2(20)SE	Modification This command was introduced.
Command History Usage Guidelines	12.2(20)SE You should use this representative whil representative asks	This command was introduced. s command only when you are working directly with a technical support te troubleshooting a problem. Do not use this command unless a technical

show platform configuration

Use the **show platform configuration** privileged EXEC command to display platform-dependent configuration-manager related information.

show platform configuration {config-output | default | running | startup} [| {begin | exclude | include} expression]

Suntay Decorintion	config output	Display the output of the last auto-configuration application.		
Syntax Description	config-output default			
		Display whether or not the system is running the default configuration.		
	running	Display a snapshot of the backed-up running configuration on the local switch.		
	startup	Display a snapshot of the backed-up startup configuration on the local switch.		
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .		
	exclude include <i>expression</i> Privileged EXEC	(Optional) Display excludes lines that match the <i>expression</i> .		
		(Optional) Display includes lines that match the specified <i>expression</i> . Expression in the output to use as a reference point.		
Command Modes				
Command History	Release	Modification		

Usage Guidelines You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

show platform etherchannel

Use the **show platform etherchannel** privileged EXEC command to display platform-dependent EtherChannel information.

show platform etherchannel {flags | time-stamps} [| {begin | exclude | include} expression]

Syntax Description	flags	Display EtherChannel port flags.
	time-stamps	Display EtherChannel time stamps.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command Modes	Privileged EXEC	Modification

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

show platform forward

Use the **show platform forward** privileged EXEC command for an interface to specify how the hardware would forward a frame that matches the specified parameters.

show platform forward interface-id [vlan vlan-id] src-mac dst-mac [l3protocol-id] [ipv6 | sap |
snap] [cos cos] [ip src-ip dst-ip [frag field] [dscp dscp] {l4protocol-id | icmp icmp-type
icmp-code | igmp igmp-version igmp-type | sctp src-port dst-port | tcp src-port dst-port flags |
udp src-port dst-port] [| {begin | exclude | include} expression]

Syntax Description	interface-id	The input physical interface, the port on which the packet comes in to the switch (including type, stack member, module, and port number).
	vlan vlan-id	(Optional) Input VLAN ID. The range is 1 to 4094. If not specified, and the input interface is not a routed port, the default is 1.
	src-mac	48-bit source MAC address.
	dst-mac	48-bit destination MAC address.
	l3protocol-id	(Optional) The Layer 3 protocol used in the packet. The number is a value 0 to 65535.
	ipv6	(Optional) IPv6 frame. This keyword is available only if the switch stack is running the advanced IP services image.
	sap	(Optional) Service access point (SAP) encapsulation type.
	snap	(Optional) Subnetwork Access Protocol (SNAP) encapsulation type.
	cos cos	(Optional) Class of service (CoS) value of the frame. The range is 0 to 7.
	ip src-ip dst-ip	(Optional, but required for IP packets) Source and destination IP addresses in dotted decimal notation.
	frag field	(Optional) The IP fragment field for a fragmented IP packet. The range is 0 to 65535.
	dscp dscp	(Optional) Differentiated Services Code Point (DSCP) field in the IP header. The range is 0 to 63.
	l4protocol-id	The numeric value of the Layer 4 protocol field in the IP header. The range is 0 to 255. For example, 47 is generic routing encapsulation (GRE), and 89 is Open Shortest Path First (OSPF). If the protocol is TCP, User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), or Internet Group Management Protocol (IGMP), you should use the appropriate keyword instead of a numeric value.
	icmp icmp-type icmp-code	ICMP parameters. The <i>icmp-type</i> and <i>icmp-code</i> ranges are 0 to 255.
	igmp igmp-version igmp-type	IGMP parameters. The <i>igmp-version</i> range is 1 to 15; the <i>igmp-type</i> range is 0 to 15.
	sctp src-port dst-port	Stream Control Transmission Protocol (SCTP) parameters. The ranges for the SCTP source and destination ports are 0 to 65535.
	tcp src-port dst-port flags	TCP parameters: TCP source port, destination port, and the numeric value of the TCP flags byte in the header. The <i>src-port</i> and <i>dst-port</i> ranges are 0 to 65535. The flag range is 0 to 1024.
	udp src-port dst-port	UDP parameters. The <i>src-port</i> and <i>dst-port</i> ranges are 0 to 65535.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .

	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
	12.2(25)SEB	The ipv6 keyword was added.
Usage Guidelines		command only when you are working directly with a technical support e troubleshooting a problem. Do not use this command unless a technical support you to do so.
	-	e sensitive. For example, if you enter exclude output , the lines that contain <i>output</i> he lines that contain <i>Output</i> appear.
Examples	-	e show platform forward command output displays and what they mean, see the chapter of the software configuration guide for this release.

show platform frontend-controller

Use the **show platform frontend-controller** privileged EXEC command to display counter and status information for the front-end controller manager and subordinate applications and to display the hardware and software information for the front-end controller.

show platform frontend-controller {buffer | generic | manager number | subordinate number |
version number} [| {begin | exclude | include} expression]

This command is supported only on Catalyst 3750G-48TS, 3750G-48PS, 3750G-24TS-1U, and 3750G-24PS switches.

Syntax Description	buffer	Display the last 1024 bytes sent from the manager to the subordinate and the reverse.	
	generic	Display the generic counters that do not specifically apply to the manager or subordinate.	
	manager number	Display the counters for the manager and the subordinate specified by <i>number</i> . See the "Usage Guidelines" section for the <i>number</i> range.	
	subordinate number	Display the subordinate status and the counters for the subordinate specified by <i>number</i> . See the "Usage Guidelines" section for the <i>number</i> range.	
	version number	Display the hardware and software version information for the subordinate status specified by <i>number</i> . See the "Usage Guidelines" section for the <i>number</i> range.	
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .	
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .	
	include	(Optional) Display includes lines that match the specified <i>expression</i> .	
	expression	Expression in the output to use as a reference point.	
Command History	Release	Modification	
ooniniana motory	12.2(20)SE3	This command was introduced.	
Usage Guidelines		-48TS and 3750G-48PS switches, the subordinate number range is 0 to 2.	
	On the Catalyst 3750G-24TS-1U and 3750G-24PS switches, the subordinate number range is 0 to 1.		
	You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.		
	-	nsitive. For example, if you enter exclude output , the lines that contain <i>output</i> ines that contain <i>Output</i> appear.	

show platform ip igmp snooping

Use the **show platform ip igmp snooping** privileged EXEC command to display platform-dependent Internet Group Management Protocol (IGMP) snooping information.

show platform ip igmp snooping {all | control [di] | counters | flood [vlan vlan-id] | group
ip-address | hardware | retry [count | local [count] | remote [count]]} [| {begin | exclude |
include} expression]

Syntax Description	all	Display all IGMP snooping platform IP multicast information.
	control [di]	Display IGMP snooping control entries. The keyword has this meaning:
		• di —(Optional) Display IGMP snooping control destination index entries.
	counters	Display IGMP snooping counters.
	flood [vlan vlan-id]	Display IGMP snooping flood information. The keyword has this meaning:
		• vlan <i>vlan-id</i> —(Optional) Display flood information for the specified VLAN. The range is 1 to 4094.
	group ip-address	Display the IGMP snooping multicast group information, where <i>ip-address</i> is the IP address of the group.
	hardware	Display IGMP snooping information loaded into hardware.
	retry [count local [count]	Display IGMP snooping retry information. The keywords have these meanings:
		• count —(Optional) Display only the retry count.
		• local—(Optional) Display local retry entries.
	remote [count]	Display remote entries. The keyword has this meaning:
		• count —(Optional) Display only the remote count.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes Privile

Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

show platform ip multicast

Use the **show platform ip multicast** privileged EXEC command to display platform-dependent IP multicast tables and other information.

show platform ip multicast {acl-full-infol counters | groups | hardware [detail] | interfaces |
 locks | mdfs-routes | mroute-retry | retry | vrf | trace} [| {begin | exclude | include}
 expression]

Syntax Description	acl-full-info	Display IP multicast routing access-control list (ACL) information, in
	aci-iun-inio	particular the number of outgoing VLANs for which router ACLs at the
	counters	output cannot be applied in hardware.
		Display IP multicast counters and statistics.
	groups	Display IP multicast routes per group.
	hardware [detail]	Display IP multicast routes loaded into hardware. The optional detail keyword is used to show port members in the destination index and route index.
	interfaces locks mdfs-routes	Display IP multicast interfaces.
		Display IP multicast destination-index locks.
		Display multicast distributed fast switching (MDFS) IP multicast routes.
	mroute-retry	Display the IP multicast route retry queue.
	retry	Display the IP multicast routes in the retry queue.
	vrf	Display the VPN routing and forwarding instance.
	trace begin exclude include	Display the IP multicast trace buffer.
		(Optional) Display begins with the line that matches the expression.
		(Optional) Display excludes lines that match the <i>expression</i> .
		(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
•	12.1(11)AX	This command was introduced.
	12.2(40)SE	The vrf keyword was added.
Usage Guidelines		ommand only when you are working directly with a technical support roubleshooting a problem. Do not use this command unless a technical support u to do so.

show platform ip unicast

Use the **show platform ip unicast** privileged EXEC command to display platform-dependent IP unicast routing information.

Syntax Description	adjacency	Display the platform adjacency database.
	cef-idb	Display platform information corresponding to Cisco Express Forwarding (CEF) interface descriptor block.
	counts	Display the current counts for the Layer 3 unicast databases.
	dhcp	Display the DHCP system dynamic addresses.
	failed {adjacency	Display the hardware resource failures. The keywords have these meanings
	arp [<i>A</i> . <i>B</i> . <i>C</i> . <i>D</i>] route }	• adjacency —Display the adjacency entries that failed to be programmed in hardware.
		• arp —Display the Address Resolution Protocol (ARP) deletions because of failure and because of retries.
		• <i>A.B.C.D</i> —(Optional) Prefix of the ARP entries to display.
		• route —Display the route entries that failed to be programmed in hardware.
	loadbalance	Display the platform loadbalance database.
	mpaths	Display the Layer 3 unicast routing multipath adjacency database.
	proxy	Display the platform proxy ARP database.
	route	Display the platform route database.
	standby	Display the platform standby information.
	statistics	Display the Layer 3 unicast routing accumulated statistics.
	table	Display the platform IP version 4 (IPv4) information.
	trace	Display the platform event trace logs.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Though visible in the command-line help strings, the proxy and table keywords are not supported.

Command Modes Priv

Privileged EXEC

	12.1(11)AX	This command was introduced.
	-	

Usage Guidelines You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

show platform ip unicast vrf compaction

Use the **show platform ip unicast vrf compaction** privileged EXEC command to display the compaction request queues and compaction status.

show platform ip unicast vrf compaction [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command Modes Command History	Privileged EXEC	Modification

representative asks you to do so.

C-15

show platform ip unicast vrf tcam-label

Use the show platform ip unicast vrf tcam-label privileged EXEC command to display PBR and VRF-Lite labels and the number of labels in use by PBR.

show platform ip unicast vrf tcam-label [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes		
Command Wodes	Privileged EXEC	
Command History	Release	Modification

Usage Guidelines		command only when you are working directly with a technical support troubleshooting a problem. Do not use this command unless a technical support

show platform ip wccp

Use the **show platform ip wccp** privileged EXEC command to display platform-dependent Web Cache Communication Protocol (WCCP) information.

show platform ip wccp {detail | label} [| {begin | exclude | include} expression]

This command is available only if your switch is running the IP services image, formerly known as the enhanced multilayer image (EMI).

Syntax Description	detail	Display the platform WCCP details.
	label	Display the platform WCCP labels.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(37)SE	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

C-17

show platform ipc trace

Use the **show platform ipc trace** privileged EXEC command to display platform-dependent Interprocess Communication (IPC) Protocol trace log information.

show platform ipc trace [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		s command only when you are working directly with a technical support le troubleshooting a problem. Do not use this command unless a technical support s you to do so.
	Expressions are ca	se sensitive. For example, if you enter exclude output, the lines that contain output

do not appear, but the lines that contain Output appear.

show platform ipv6 unicast

Use the **show platform ipv6 unicast** privileged EXEC command to display platform-dependent IPv6 unicast routing information. This command is available only if the stack is running the advanced IP services image.

show platform ipv6 unicast {adjacency [ipv6-prefix] | backwalk {adjacency | loadbalance } |
compress ipv6-prefix/prefix length | interface | loadbalance | mpath | retry {adjacency |
route} | route [ipv6-prefix/prefix length | tcam] [detail] | statistics | table [detail] | trace}
[| {begin | exclude | include} expression]

Syntax Description	adjacency	Display IPv6 adjacency information for the switch or for the specified IPv6 network.
	ipv6-prefix	(Optional) The IPv6 network to be displayed. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	backwalk {adjacency	Display IPv6 backwalk information.
	loadbalance}	• adjacency —Display adjacency backwalk information.
		• loadbalance—Display backwalk load balance information.
	compress	Display IPv6 prefix compression information.
	ipv6-prefix/prefix	• <i>ipv6-prefix</i> —The IPv6 network.
	length	• <i>/prefix length</i> —The length of the IPv6 network prefix. A decimal value from 0 to 128 that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.
	interface	Display IPv6 interface information.
	loadbalance	Display IPv6 loadbalance information
	mpath	Display IPv6 multipath information
	retry {adjacency	Display IPv6 retry information.
	route}	• adjacency —Display IPv6 adjacency retry information.
		• route—Display IPv6 route retry information.
	route	Display IPv6 route information.
	tcam	(Optional) Display the IPv6 TCAM route table information.
	detail	(Optional) Display detailed IPv6 route information.
	statistics	Display IPv6 accumulated statistics.
	table	Display IPv6 unicast table information.
	trace	Display IPv6 unicast traces.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SEA	This command was introduced.
Usage Guidelines		command only when you are working directly with a technical support e troubleshooting a problem. Do not use this command unless a technical support you to do so.
		e sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i> he lines that contain <i>Output</i> appear.

show platform layer4op

Use the **show platform layer4op** privileged EXEC command to display platform-dependent Layer 4 operator information.

Syntax Description	acl	Display access control list (ACL) Layer 4 operators information.
	<pre>pacl [port-asic]</pre>	Display port ACL Layer 4 operators information. The keyword has this meaning:
		• <i>port-asic</i> —(Optional) Port ASIC number.
	qos [port-asic]	Display quality of service (QoS) Layer 4 operators information. The keyword has this meaning:
		• <i>port-asic</i> —(Optional) QoS port ASIC number.
	and-or	Display AND-OR registers information.
	map	Display select map information.
	or-and	Display OR-AND registers information.
	vcu	Display value compare unit (VCU) register information.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification

This command was introduced.

Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

12.1(11)AX

show platform mac-address-table

Use the **show platform mac-address-table** privileged EXEC command to display platform-dependent MAC address table information.

show platform mac-address-table [aging-array | hash-table | mac-address mac-address] [vlan
vlan-id]] [| {begin | exclude | include} expression]

Syntax Description	aging-array	(Optional) Display the MAC address table aging array.
	hash-table	(Optional) Display the MAC address table hash table.
	mac-address mac-address	(Optional) Display the MAC address table MAC address information, where <i>mac-address</i> is the 48-bit hardware address.
	vlan vlan-id	(Optional) Display information for the specified VLAN. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

show platform messaging

Use the **show platform messaging** privileged EXEC command to display platform-dependent application and performance message information.

show platform messaging {application [incoming | outgoing | summary] | hiperf
[class-number]} [| {begin | exclude | include} expression]

Syntax Description	application [incoming outgoing summary]	Display application message information. The keywords have these meanings:
		• incoming —(Optional) Display only information about incoming application messaging requests.
		• outgoing —(Optional) Display only information about incoming application messaging requests.
		• summary —(Optional) Display summary information about all application messaging requests.
	hiperf [class-number]	Display outgoing high-performance message information. Specify the <i>class-number</i> option to display information about high-performance messages for this class number. The range is 0 to 36.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

show platform monitor

Use the **show platform monitor** privileged EXEC command to display platform-dependent Switched Port Analyzer (SPAN) information.

show platform monitor [session session-number] [| {begin | exclude | include} expression]

Syntax Description	session session-number	(Optional) Display SPAN information for the specified SPAN session. The range is 1 to 66.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	Modification
	12.1(11)AX	This command was introduced.

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

show platform mvr table

Use the **show platform mvr table** privileged EXEC command to display the platform-dependent Multicast VLAN Registration (MVR) multi-expansion descriptor (MED) group mapping table.

show platform mvr table [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		s command only when you are working directly with a technical support le troubleshooting a problem. Do not use this command unless a technical support you to do so.
	Expressions are ca	se sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i>

do not appear, but the lines that contain Output appear.

show platform pm

Use the **show platform pm** privileged EXEC command to display platform-dependent port-manager information.

show platform pm {counters | group-masks | idbs {active-idbs | deleted-idbs} | if-numbers |
 link-status | platform-block | port-info interface-id | stack-view | vlan {info | line-state}
 [| {begin | exclude | include} expression]

Syntax Description	counters	Display module counters information.
,	group-masks	Display EtherChannel group masks information.
	idbs {active-idbs deleted-idbs}	Display interface data block (IDB) information. The keywords have these meanings:
		• active-idbs—Display active IDB information.
		• deleted-idbs —Display deleted and leaked IDB information.
	if-numbers	Display interface numbers information.
	link-status	Display local port link status information.
	platform-block	Display platform port block information.
	port-info interface-id	Display port administrative and operation fields for the specified interface.
	stack-view	Display status information for the stack.
	vlan {info line-state}	Display platform VLAN information. The keywords have these meanings:
		• info —Display information for active VLANs.
		• line-state —Display line-state information.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		mand only when you are working directly with your technical support bleshooting a problem. Do not use this command unless your technical suppor o do so.

show platform port-asic

Use the **show platform port-asic** privileged EXEC command to display platform-dependent port ASIC register information.

show platform port-asic {cpu-queue-map-table [asic number | port number [asic number]] | dest-map index number | etherchannel-info [asic number | port number [asic number]] | exception [asic number | port number [asic number]] | global-status [asic number | port number [asic number]] | learning [asic number | port number [asic number]] | mac-info [asic number | port number [asic number]] | mvid [asic number] | packet-info-ram [asic number | index number [asic number]] | port-info [asic number | port number [asic number]] | prog-parser [asic number | port number [asic number]] | receive {buffer-queue | port-fifo | supervisor-sram} [asic number | port number [asic number]]| span [vlan-id [asic number] | [asic number] stack {control | dest-map | learning | messages | mvid | prog-parser | span | stats [asic number | port number [asic number]} stats {drop | enqueue | miscellaneous | supervisor } [asic number | port number [asic number]]| transmit {port-fifo | queue | supervisor-sram } [asic number | port number [asic number]] vct [asic number | port number [asic number]] version} [| { **begin** | **exclude** | **include** } *expression*]

Syntax Description	cpu-queue-map-table [asic <i>number</i> port <i>number</i>	Display the CPU queue-map table entries. The keywords have these meanings:
	[asic number]]	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
		• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27.
	dest-map index number	Display destination-map information for the specified index. The range is 0 to 65535.
	etherchannel-info [asic number port number [asic number]]	Display the contents of the EtherChannel information register. The keywords have these meanings:
		• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
		• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

exception [asic number port number [asic number]]	Display the exception-index register information. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
global-status [asic number port number [asic number]]	Display global and interrupt status. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
learning [asic number port number [asic number]]	Display entries in the learning cache. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
mac-info [asic number port number [asic number]]	Display the contents of the MAC information register. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
mvid [asic number]	Display the mapped VLAN ID table. The keyword has this meaning:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
packet-info-ram [asic number index number [asic number]]	Display the packet information RAM. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• index <i>number</i> —(Optional) Display information for the specified packet RAM index number and ASIC number. The range is 0 to 63.

port-info [asic number port number [asic number]]	Display port information register values. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
prog-parser [asic number port number [asic number]]	Display the programmable parser tables. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
receive {buffer-queue port-fifo	Display receive information. The keywords have these meanings:
<pre>supervisor-sram { [asic number port number [asic number]]</pre>	• buffer-queue —Display the buffer queue information.
port number [asic number]]	• port-fifo —Display the port-FIFO information.
	• supervisor-sram —Display the supervisor static RAM (SRAM) information.
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
span [vlan-id asic number]	Display the Switched Port Analyzer (SPAN)-related information. The keywords have these meanings:
	• <i>vlan-id</i> —(Optional) Display information for the specified VLAN. The range is 0 to 1023.
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.

stack {control dest-map learning messages mvid	Display stack-related information. The keywords have these meanings:
prog-parser span stats [asic	• control —Display stack control-status register information.
number port number [asic number]}	• dest-map —Display destination-map information.
- ,	• learning —Display entries in the learning-cache.
	• messages —Display the stack-message register information.
	• mvid —Display entries in the mapped VLAN-ID table.
	• prog-parser —Display the programmable parser tables.
	• span —Display SPAN-related information.
	• stats —Display raw statistics for the port ASIC.
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
stats {drop enqueue miscellaneous supervisor } [asic	Display raw statistics for the port ASIC. The keywords have these meanings:
number port number [asic	• drop —Display drop statistics.
number]]	• enqueue—Display enqueue statistics.
	• miscellaneous—Display miscellaneous statistics.
	• supervisor —Display supervisor statistics.
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
transmit {port-fifo queue	Display transmit information. The keywords have these meanings:
<pre>supervisor-sram { [asic number port number [asic number]]</pre>	• port-fifo —Display the contents of the port-FIFO information register.
	• queue —Display the contents of the queue information register.
	• supervisor-sram—Display supervisor SRAM information.
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

vct [asic number port number [asic number]]	Display the VLAN compression table entries for the specified ASIC or for the specified port and ASIC. The keywords have these meanings:
	• asic <i>number</i> —(Optional) Display information for the specified ASIC. The range is 0 to 1.
	• port <i>number</i> —(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
version	Display version and device type information for port ASICs.
begin	(Optional) Display begins with the line that matches the <i>expression</i> .
exclude	(Optional) Display excludes lines that match the <i>expression</i> .
include	(Optional) Display includes lines that match the specified <i>expression</i> .
expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

show platform port-security

Use the **show platform port-security** privileged EXEC command to display platform-dependent port-security information.

show platform port-security [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.
Usage Guidelines		s command only when you are working directly with your technical support e troubleshooting a problem. Do not use this command unless your technical support

show platform qos

Use the **show platform qos** privileged EXEC command to display platform-dependent quality of service (QoS) information.

show platform qos {label asic number | policer {parameters asic number |
 port alloc number asic number}} [| {begin | exclude | include} expression]

Syntax Description	label asic number	Display QoS label maps for the specified ASIC.
		(Optional) For asic <i>number</i> , the range is 0 to 1.
	policer { parameters asic <i>na</i> port alloc <i>number</i> asic <i>num</i>	
		• parameters asic <i>number</i> —Display parameter information for the specified ASIC. The range is 0 to 1.
		• port alloc <i>number</i> asic <i>number</i> —Display port allocation information for the specified port and ASIC. The port allocation range is 0 to 25. The ASIC range is 0 to 1.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release M	odification
	12.1(11)AX Th	is command was introduced.
Usage Guidelines		d only when you are working directly with your technical support hooting a problem. Do not use this command unless your technical support o so.

show platform resource-manager

Use the **show platform resource-manager** privileged EXEC command to display platform-dependent resource-manager information.

show platform resource-manager {dm [index number] | erd [index number] |
mad [index number] | med [index number] | mod | msm {hash-table [vlan vlan-id] |
mac-address mac-address [vlan vlan-id]} | sd [index number] |
vld [index number]} [| {begin | exclude | include} expression]

Syntax Description	dm [index number]	Display the destination map. The keyword has this meaning:
		• index <i>number</i> —(Optional) Display the specified index. The range is 0 to 65535.
	erd [index number]	Display the equal-cost-route descriptor table for the specified index. The keyword has this meaning:
		• index <i>number</i> —(Optional) Display the specified index. The range is 0 to 65535.
	mad [index number]	Display the MAC-address descriptor table for the specified index. The keyword has this meaning:
		• index <i>number</i> —(Optional) Display the specified index. The range is 0 to 65535.
	med [index number]	Display the multi-expansion descriptor table for the specified index. The keyword has this meaning:
		• index <i>number</i> —(Optional) Display the specified index. The range is 0 to 65535.
	mod	Display the resource-manager module information.
	msm {hash-table [vlan vlan-id]	Display the MAC-address descriptor table and the station descriptor table information. The keywords have these meanings:
	mac-address mac-address [vlan	• hash-table [vlan <i>vlan-id</i>]—Display the hash table for all VLANs or the specified VLAN. The range is 1 to 4094.
	vlan-id]}	• mac-address <i>mac-address</i> [vlan <i>vlan-id</i>]—Display the MAC-address descriptor table for the specified MAC address represented by the 48-bit hardware address for all VLANs or the specified VLAN. The range is 1 to 4094.
	sd [index number]	Display the station descriptor table for the specified index. The keyword has this meaning:
		• index <i>number</i> —(Optional) Display the specified index. The range is 0 to 65535.
	vld [index number]	Display the VLAN-list descriptor table for the specified index. The keyword has this meaning:
		• index <i>number</i> —(Optional) Display the specified index. The range is 0 to 65535.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .

	include	(Optional) Display includes lines that match the specified expression.		
	expression	Expression in the output to use as a reference point.		
Command Modes Privileged EXEC				
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines		command only when you are working directly with your technical support troubleshooting a problem. Do not use this command unless your technical support		

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

C-35

show platform snmp counters

Use the **show platform snmp counters** privileged EXEC command to display platform-dependent Simple Network Management Protocol (SNMP) counter information.

show platform snmp counters [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the <i>expression</i> .			
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .			
	include	(Optional) Display includes lines that match the specified <i>expression</i> .			
	expression	Expression in the output to use as a reference point.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(11)AX	This command was introduced.			
Usage Guidelines	You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.				
	Expressions are case	e sensitive. For example, if you enter exclude output, the lines that contain <i>output</i>			

show platform spanning-tree

Use the **show platform spanning-tree** privileged EXEC command to display platform-dependent spanning-tree information.

show platform spanning-tree synchronization [detail | vlan vlan-id] [| {begin | exclude |
 include} expression]

Syntax Description	synchronization [detail vlan	Display spanning-tree state synchronization information. The keywords have these meanings:
	vlan-id]	• detail —(Optional) Display detailed spanning-tree information.
		• vlan <i>vlan-id</i> —(Optional) Display VLAN switch spanning-tree information for the specified VLAN. The range is 1 to 4094.
	begin	(Optional) Display begins with the line that matches the expression.
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

show platform stp-instance

Use the **show platform stp-instance** privileged EXEC command to display platform-dependent spanning-tree instance information.

show platform stp-instance vlan-id [| {begin | exclude | include} expression]

Syntax Description			
, ,	vlan-id	Display spanning-tree instance information for the specified VLAN. The range is 1 to 4094.	
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .	
	exclude	(Optional) Display excludes lines that match the expression.	
	include	(Optional) Display includes lines that match the specified expression.	
	expression	Expression in the output to use as a reference point.	
Command History	Release	Modification	
Command History	Release 12.1(14)EA1	Modification This command was introduced.	

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

show platform stack-manager

Use the **show platform stack-manager** privileged EXEC command to display platform-dependent switch-stack information.

show platform stack-manager {all | counters | trace [sdp [reverse] | state [reverse]]}
[| {begin | exclude | include} expression]

Syntax Description	all	Display all information for the entire switch stack.		
	counters	Display the stack manager counters.		
	trace [sdp [reverse]]	Display trace information. The keywords have these meanings:		
		• sdp—(Optional) Display Stack Discovery Protocol (SDP) information.		
		• reverse —(Optional) Display trace information in reverse chronological order (from recent to older chronological sequence).		
	trace [state [reverse]]	Display trace information. The keywords have these meanings:		
		• state —(Optional) Display stack state machine information.		
		• reverse —(Optional) Display trace information in reverse chronological order (from recent to older chronological sequence).		
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .		
	exclude (Optional) Display excludes lines that match the <i>expression</i> .			
	I include(Optional) Display includes lines that match the specified expression.			
	<i>expression</i> Expression in the output to use as a reference point.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.1(11)AX	This command was introduced.		
Usage Guidelines	Usage Guidelines You should use this command only when you are working directly with your terpresentative while troubleshooting a problem. Do not use this command unles representative asks you to do so.			
	Expressions are case sen	sitive. For example, if you enter exclude output, the lines that contain output		

These are the states displayed in the summary information about the switch stack:

• Waiting—The stage when a switch is booting up and waiting for communication from other switches in the stack. The switch has not yet determined whether it is a stack master or not.

Stack members not participating in a stack master election remain in the waiting state until the stack master is elected and ready.

- Initializing—The stage when a switch has determined whether it is the stack master or not. If the switch is not the stack master, it is receiving its system- and interface-level configuration from the stack master and loading it.
- Ready—The stage when the stack member has completed loading the system- and interface-level configuration and is ready to forward traffic.
- Master Re-Init—The stage immediately after a stack master re-election and a different stack member is elected stack master. The new stack master is re-initializing its configuration. This state applies only to the new stack master.
- Ver Mismatch—The stage of a switch in version mismatch (VM) mode. VM mode is when a switch joining the switch stack has a different stack protocol minor version number from the stack master.

A typical state transition for a stack member (including a stack master) booting up is Waiting -> Initializing -> Ready.

A typical state transition for a stack member becoming a stack master after a stack master election is Ready -> Master Re-Init -> Ready.

A typical state transition for a stack member in version mismatch (VM) mode is Waiting -> Ver Mismatch.

show platform tb

Use the **show platform tb** privileged EXEC command to display platform-dependent trusted-boundary information during a stack master change to a new stack master.

show platform tb [| {begin | exclude | include} expression]

Syntax Description	begin	(Optional) Display begins with the line that matches the expression.	
	exclude	(Optional) Display excludes lines that match the expression.	
	include	(Optional) Display includes lines that match the specified expression.	
	expression	Expression in the output to use as a reference point.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(14)EA1	This command was introduced.	
Usage Guidelines	You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.		
	Expressions are case sensitive. For example, if you enter l exclude output , the lines that contain <i>output</i> do not appear, but the lines that contain <i>Output</i> appear.		
Examples	This is an exampl	e of output from the show platform tb command:	
	Switch# show pl Print TB sub-blo (Fa1/0/2) device /* current inte	ock information	
	Current master switch:(Yes) /* Is this switch the current master switch? */		
	New elected master $$:(No) /* Is the master switch-over occurred and this is the new master switch? */		
	Master ready :(No) /* Is the Master switch in ready state? */		
	HULC TB process /* Is the TB pla	on :(No) atform process currently running? */	
	/* Is the CDP st all the TB enab	r ON :(No)(360 secs) table timer running? After the CDP stable timer expired, CDP neighbors of led interfaces will be verified to make sure the replacement of IP phone happen during the master switch-over. */	

Print TB residue trust ports information
/* The interfaces with TB enabled right before master switch-over. */
Print port CDP neighbor information
/* Is the CDP message still received after switch-over? */
HULC TB is not detecting CDP events
/* Currently, this switch is not detecting any CDP event. */

show platform tcam

Use the **show platform tcam** privileged EXEC command to display platform-dependent ternary content addressable memory (TCAM) driver information.

- show platform tcam {handle number | log-results | table {acl | all | equal-cost-route | ipv6 {acl | qos | secondary } local | mac-address | multicast-expansion | qos | secondary | station | vlan-list } | usage } [asic number [detail [invalid]] | [index number [detail [invalid]] | invalid | num number [detail [invalid]] | [invalid] | [invalid] | [num number [detail [invalid]] | invalid]] [| {begin | exclude | include } expression]
- show platform tcam table acl [asic number [detail [invalid]] | [index number [detail [invalid]] |
 invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]]
 | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table all [asic number [detail [invalid]] | [index number [detail [invalid]] |
 invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]]
 | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table equal-cost-route [asic number [detail [invalid]] | [index number [detail [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table ipv6 {acl | qos | secondary } [asic number [detail [invalid]] | [index number [detail [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table local [asic number [detail [invalid]] | [index number [detail [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table mac-address [asic number [detail [invalid]] | [index number [detail
 [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail
 [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table multicast-expansion [asic number [detail [invalid]] | [index number [detail [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table qos [asic number [detail [invalid]] | [index number [detail [invalid]] |
 invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail [invalid]]
 | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table secondary [asic number [detail [invalid]] | [index number [detail
 [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail
 [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table station [asic number [detail [invalid]] | [index number [detail
 [invalid]] | invalid | num number [detail [invalid]] | invalid] | [num number [detail
 [invalid]] | invalid]] [| {begin | exclude | include} expression]
- show platform tcam table vlan-list [[asic number [detail [invalid]] | [index number [detail
 [invalid]] | invalid | num number [detail [invalid]] | invalid] | [invalid] | [num number [detail
 [invalid]] | invalid]] [| {begin | exclude | include} expression]

Syntax Description	handle number	Display the TCAM handle. The range is 0 to 4294967295.
	log-results	Display the TCAM log results.
	table {acl all equal-cost-route ipv6 {acl qos secondary} local mac-address multicast-expansion qos secondary station vlan-list}	Display lookup and forwarding table information. The keywords have these meanings:
		• acl —Display the access-control list (ACL) table.
		• all —Display all the TCAM tables.
		• equal-cost-route—Display the equal-cost-route table.
		• ipv6—Display IPv6 information.
		- acl—Display the IPv6 ACL-table information.
		- qos—Display the IPv6 QoS-table information.
		 secondary—Display the IPv6 secondary-table information.
		• local —Display the local table.
		• mac-address—Display the MAC-address table.
		• multicast-expansion —Display the IPv6 multicast-expansion table.
		• qos —Display the QoS table.
		• secondary —Display the secondary table.
		• station —Display the station table.
		• vlan-list —Display the VLAN list table.
	usage	Display the CAM and forwarding table usage.
	[[asic number [detail [invalid]] [index number [detail [invalid]] invalid num number [detail [invalid]] invalid] [invalid] [num number [detail [invalid]] invalid]]	Display information. The keywords have these meanings:
		• asic <i>number</i> —Display information for the specified ASIC device ID. The range is 0 to 15.
		• detail [invalid]—(Optional) Display valid or invalid details.
		• index <i>number</i> —(Optional) Display information for the specified TCAM table index. The range is 0 to 32768.
		• num <i>number</i> —(Optional) Display information for the specified TCAM table number. The range is 0 to 32768.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .
	include	(Optional) Display includes lines that match the specified <i>expression</i> .
	expression	Expression in the output to use as a reference point.

<u>)</u> Note

Though visible in the command-line help strings, the **usage** keyword is not supported.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(11)AX	This command was introduced.

Usage Guidelines You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

show platform vlan

Use the **show platform vlan** privileged EXEC command to display platform-dependent VLAN information.

Syntax Description	misc	Display miscellaneous VLAN module information.		
	mvid	Display the mapped VLAN ID (MVID) allocation information.		
	prune	Display the stack pruning database. Display the VLAN lock module-wise reference counts.		
	refcount			
	rpc {receive Display remote procedure call (RPC) messages. The keywords have these meanings:			
		• receive —Display received information.		
	• transmit —Display sent information.			
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .		
	exclude	(Optional) Display excludes lines that match the <i>expression</i> .		
	include	(Optional) Display includes lines that match the specified expression.		
	expression	Expression in the output to use as a reference point.		
Command Modes	Privileged EXEC			
	Release	Modification		
Command History	Release 12.1(11)AX	Modification This command was introduced.		

show platform wireless-controller

Use the **show platform wireless-controller** privileged EXEC command to display information about the internal wireless controller in a Catalyst 3750G Integrated Wireless LAN Controller Switch.

show platform wireless-controller [management-info | status | summary] [switch-number]
 [| {begin | exclude | include} expression]

Syntax Description	management-info	(Optional) Display information about the management interface of the wireless controller.
	status	(Optional) Display wireless controller status information.
	summary	(Optional) Display wireless controller summary information.
	switch-number	(Optional) Display wireless controller information for the specified stack member. The range is from 1 to 9.
	begin	(Optional) Display begins with the line that matches the <i>expression</i> .
	exclude	(Optional) Display excludes lines that match the expression.
	include	(Optional) Display includes lines that match the specified expression.
	expression	Expression in the output to use as a reference point.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(25)FZ	This command was introduced.

Usage Guidelines

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

Enter the **show platform wireless-controller** commands to determine the stack number of the switch or switches in the stack that contain the integrated wireless LAN controller. The command outputs also display the MAC address and IP address of the controller to be used in accessing and configuring the controller.

This command applies only to the Catalyst 3750G Wireless Controller Switch.

Examples

Lyampies	with no keywords:	with no keywords:				
	Switch# show platform wireless-controller					
	Wireless Controller in Switch 2	Wireless Controller in Switch 2				
	Operational Status of the Controller	: operational				
	Service VLAN	: 4095				
	Service Port Mac Address	: 000b.8540.3783				
		: 127.0.1.2				
	Management IP Address	: 22.2.2.2				
	Management VLAN	: 7				
	Software Version	: 3.3.0.3				
	Keepalive Version(controller/switch)	: 1/1				
		: 0				
	Controller accepts http/https	: 0/1				
	Controller's Status Line	: up				
	Watchdog resets of Controller	: 0				
	Controller resets total	: 0				
	Unacknowledged control messages	: 0				
	Wireless Controller in Switch 3					
	Operational Status of the Controller	: operational				
		: 4095				
		: 000b.8540.33e3				
		: 127.0.1.3				
	Management IP Address	: 8.8.8.8				
	Management VLAN	: 8				
	Software Version	: 3.3.0.3				
	Keepalive Version(controller/switch)	: 1/1				
	Keepalives Missed	: 0				
	Controller accepts http/https	: 0/1				
	Controller's Status Line	: up				
	Watchdog resets of Controller	: 0				
	Controller resets total	: 0				
	Unacknowledged control messages	: 0				
	This is an example of output from the show	v platform wireless-controller management-info command:				
	Switch# show platform wireless-contro	oller management-info				

This is an example of output from the show platform wireless-controller privileged EXEC command

SWI	LUCII#	snow practorm	wireless-concrotter	manage	ement	Into		
SW	vlan	ip	gateway	http	https	mac	version	
2	7	22.2.2.2/24	22.2.2.1	0	1	000b.8540.3783	3.3.0.3	
3	8	8.8.8.8/24	8.8.8.1	0	1	000b.8540.33e3	3.3.0.3	

This is an example of output from the show platform wireless-controller status command:

Switch#	show	platform	wireless-controller	status	1
---------	------	----------	---------------------	--------	---

Switch	Service IP	Management IP	SW Version	Status
+	+	+	+	
2	127.0.1.2	22.2.2.2	3.3.0.3	operational
3	127.0.1.3	8.8.8.8	3.3.0.3	operational

This is an example of output from the show platform wireless-controller summary command:

Switch# show platform wireless-controller summary

Switch	Status	State
2	up	operational
3	up	operational
