CHAPTER 1

Using the Command-Line Interface 1

Information About Using the Command-Line Interface 1

Command Modes 1

Understanding Abbreviated Commands 3

No and Default Forms of Commands 3

CLI Error Messages 3

Configuration Logging 4

Using the Help System 4

How to Use the CLI to Configure Features 5

Configuring the Command History 5

Changing the Command History Buffer Size 5

Recalling Commands 6

Disabling the Command History Feature 6

Enabling and Disabling Editing Features 7

Editing Commands Through Keystrokes 7

Editing Command Lines That Wrap 8

Searching and Filtering Output of show and more Commands 9

Accessing the CLI 10

Accessing the CLI Through a Console Connection or Through Telnet 10

PART I

CleanAir 13

CHAPTER 2

Configuring Cisco CleanAir	15
Finding Feature Information	15
Prerequisites for CleanAir	15
Restrictions for CleanAir	16
Information About CleanAir	17
Cisco CleanAir Components	17
Terms Used in Cisco CleanAir	19
Interference Types that Cisco CleanAir can Detect	19
Interference Device Merging	20
Persistent Devices	21
Persistent Devices Detection	21
Persistent Device Avoidance	21
EDRRM and AQR Update Mode	21
CleanAir High Availability	21
How to Configure CleanAir	22
Enabling CleanAir for 2.4-GHz Band	22
Configuring a CleanAir Alarm for 2.4-GHz Air-Quality and Devices	22
Configuring Interference Reporting for 2.4-GHz Devices	24
Enabling CleanAir for 5-GHz Band	25
Configuring a CleanAir Alarm for 5-GHz Air-Quality and Devices	26
Configuring Interference Reporting for 5-GHz devices	27
Configuring EDRRM for CleanAir-Events	29
Configuring Persistent Device Avoidance	29
Configuring Cisco CleanAir using the Controller GUI	30
Configuring Cisco Spectrum Expert	30
Configuring Spectrum Expert (CLI)	30
Monitoring CleanAir Parameters	32
Monitoring the Interference Devices	34
Configuration Examples for Configuring CleanAir	34
CleanAir FAQs	35
Additional References	37

PART II

Interface and Hardware Component	39
---	-----------

CHAPTER 3

Configuring Interface Characteristics	41
Finding Feature Information	41
Information About Configuring Interface Characteristics	41
Interface Types	41
Port-Based VLANs	42
Switch Ports	42
Routed Ports	43
Switch Virtual Interfaces	44
EtherChannel Port Groups	45
10-Gigabit Ethernet Interfaces	45
Power over Ethernet Ports	45
Using the Switch USB Ports	45
USB Mini-Type B Console Port	46
USB Type A Port	46
Interface Connections	47
Interface Configuration Mode	47
Default Ethernet Interface Configuration	49
Interface Speed and Duplex Mode	50
Speed and Duplex Configuration Guidelines	50
IEEE 802.3x Flow Control	51
Layer 3 Interfaces	51
How to Configure Interface Characteristics	52
Configuring Interfaces	52
Adding a Description for an Interface	53
Configuring a Range of Interfaces	54
Configuring and Using Interface Range Macros	56
Configuring Ethernet Interfaces	57
Setting the Interface Speed and Duplex Parameters	57
Configuring IEEE 802.3x Flow Control	59
Configuring Layer 3 Interfaces	60
Configuring Logical Layer 3 GRE Tunnel Interfaces	62
Configuring SVI Autostate Exclude	63
Shutting Down and Restarting the Interface	64

Configuring the Console Media Type	66
Configuring the USB Inactivity Timeout	67
Monitoring Interface Characteristics	68
Monitoring Interface Status	68
Clearing and Resetting Interfaces and Counters	69
Configuration Examples for Interface Characteristics	69
Adding a Description to an Interface: Example	69
Configuring a Range of Interfaces: Examples	70
Configuring and Using Interface Range Macros: Examples	70
Setting Interface Speed and Duplex Mode: Example	71
Configuring Layer 3 Interfaces: Example	71
Configuring the Console Media Type: Example	71
Configuring the USB Inactivity Timeout: Example	72
Additional References for the Interface Characteristics Feature	72
Feature History and Information for Configuring Interface Characteristics	73

CHAPTER 4**Configuring Auto-MDIX 75**

Prerequisites for Auto-MDIX	75
Restrictions for Auto-MDIX	75
Information about Configuring Auto-MDIX	76
Auto-MDIX on an Interface	76
How to Configure Auto-MDIX	76
Configuring Auto-MDIX on an Interface	76
Example for Configuring Auto-MDIX	77
Additional References	78
Feature History and Information for Auto-MDIX	78

CHAPTER 5**Configuring Ethernet Management Port 79**

Finding Feature Information	79
Prerequisites for Ethernet Management Ports	79
Information about the Ethernet Management Port	79
Ethernet Management Port Direct Connection to a Device	80
Ethernet Management Port Connection to Stack Devices using a Hub	80
Ethernet Management Port and Routing	80

	Supported Features on the Ethernet Management Port	81
	How to Configure the Ethernet Management Port	82
	Disabling and Enabling the Ethernet Management Port	82
	Additional References	83
	Feature Information for Ethernet Management Ports	84
<hr/>		
CHAPTER 6	Configuring LLDP, LLDP-MED, and Wired Location Service	85
	Finding Feature Information	85
	LLDP, LLDP-MED, and Wired Location Service Overview	85
	LLDP	85
	LLDP Supported TLVs	86
	LLDP and Cisco Device Stacks	86
	LLDP-MED	86
	LLDP-MED Supported TLVs	86
	Wired Location Service	88
	Default LLDP Configuration	89
	Restrictions for LLDP	89
	How to Configure LLDP, LLDP-MED, and Wired Location Service	89
	Enabling LLDP	89
	Configuring LLDP Characteristics	91
	Configuring LLDP-MED TLVs	93
	Configuring Network-Policy TLV	94
	Configuring Location TLV and Wired Location Service	97
	Enabling Wired Location Service on the Device	99
	Configuration Examples for LLDP, LLDP-MED, and Wired Location Service	101
	Configuring Network-Policy TLV: Examples	101
	Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service	101
	Additional References for LLDP, LLDP-MED, and Wired Location Service	102
	Feature Information for LLDP, LLDP-MED, and Wired Location Service	103
<hr/>		
CHAPTER 7	Configuring System MTU	105
	Finding Feature Information	105
	Information about the MTU	105
	Restrictions for System MTU	105

- System MTU Value Application 106
- How to Configure MTU Sizes 106
 - Configuring the System MTU 106
 - Configuring Protocol-Specific MTU 107
- Configuration Examples for System MTU 108
- Configuration Examples for System MTU 108
 - Example: Configuring Protocol-Specific MTU 108
 - Example: Configuring the System MTU 109
- Additional References for System MTU 109
- Feature Information for System MTU 110

CHAPTER 8

- Configuring Internal Power Supplies 111**
 - Information About Internal Power Supplies 111
 - How to Configure Internal Power Supplies 111
 - Configuring Internal Power Supply 111
 - Monitoring Internal Power Supplies 112
 - Configuration Examples for Internal Power Supplies 112
 - Additional References 113
 - Feature History and Information for Internal Power Supplies 114

CHAPTER 9

- Configuring PoE 115**
 - Finding Feature Information 115
 - Information about PoE 115
 - Power over Ethernet Ports 115
 - Supported Protocols and Standards 115
 - Powered-Device Detection and Initial Power Allocation 116
 - Power Management Modes 117
 - Cisco Universal Power Over Ethernet 120
- How to Configure PoE 120
 - Configuring a Power Management Mode on a PoE Port 120
 - Enabling Power on Signal/Spare Pairs 122
 - Configuring Power Policing 123
- Monitoring Power Status 125
- Additional References 126

Feature Information for PoE 126

CHAPTER 10**Configuring the Cisco eXpandable Power System (XPS) 2200 127**

Restrictions for Configuring the XPS 2200 127

Information About Configuring the XPS 2200 127

Cisco eXpandable Power System (XPS) 2200 Overview 127

XPS 2200 Power Supply Modes 128

RPS Mode 128

Stack Power Mode 129

Mixed Modes 130

XPS 2200 System Defaults 130

How to Configure the XPS 2200 131

Configuring System Names 131

Configuring XPS Ports 132

Configuring XPS Power Supplies 133

Monitoring and Maintaining the XPS 2200 134

Additional References 134

Feature History and Information for XPS 2200 135

Related Documents 135

Standards 135

MIBs 135

RFCs 135

Technical Assistance 136

CHAPTER 11**Configuring EEE 137**

Information About EEE 137

EEE Overview 137

Default EEE Configuration 137

Restrictions for EEE 137

How to Configure EEE 138

Enabling or Disabling EEE 138

Monitoring EEE 139

Configuration Examples for Configuring EEE 140

Additional References for EEE 140

Feature Information for Configuring EEE 141

PART III

IPv6 143

CHAPTER 12

Configuring MLD Snooping 145

Information About Configuring IPv6 MLD Snooping 145

Understanding MLD Snooping 146

MLD Messages 146

MLD Queries 147

Multicast Client Aging Robustness 147

Multicast Router Discovery 147

MLD Reports 148

MLD Done Messages and Immediate-Leave 148

Topology Change Notification Processing 149

How to Configure IPv6 MLD Snooping 149

Default MLD Snooping Configuration 149

MLD Snooping Configuration Guidelines 150

Enabling or Disabling MLD Snooping on the Switch (CLI) 150

Enabling or Disabling MLD Snooping on a VLAN (CLI) 151

Configuring a Static Multicast Group (CLI) 152

Configuring a Multicast Router Port (CLI) 153

Enabling MLD Immediate Leave (CLI) 153

Configuring MLD Snooping Queries (CLI) 154

Disabling MLD Listener Message Suppression (CLI) 156

Displaying MLD Snooping Information 156

Configuration Examples for Configuring MLD Snooping 157

Configuring a Static Multicast Group: Example 157

Configuring a Multicast Router Port: Example 157

Enabling MLD Immediate Leave: Example 158

Configuring MLD Snooping Queries: Example 158

CHAPTER 13

Configuring IPv6 Unicast Routing 159

Information About Configuring IPv6 Unicast Routing 159

Understanding IPv6 159

IPv6 Addresses	159
Supported IPv6 Unicast Routing Features	160
Unsupported IPv6 Unicast Routing Features	165
IPv6 Feature Limitations	166
IPv6 and Switch Stacks	166
Default IPv6 Configuration	167
Configuring IPv6 Addressing and Enabling IPv6 Routing (CLI)	167
Configuring IPv4 and IPv6 Protocol Stacks (CLI)	170
Configuring Default Router Preference (CLI)	172
Configuring IPv6 ICMP Rate Limiting (CLI)	173
Configuring CEF and dCEF for IPv6	174
Configuring Static Routing for IPv6 (CLI)	175
Enabling IPv6 PBR on an Interface	177
Enabling Local PBR for IPv6	179
Configuring RIP for IPv6 (CLI)	180
Configuring OSPF for IPv6 (CLI)	182
Configuring EIGRP for IPv6	184
Configuring IPv6 Unicast Reverse Path Forwarding	184
Displaying IPv6	185
Configuring DHCP for IPv6 Address Assignment	186
Default DHCPv6 Address Assignment Configuration	186
DHCPv6 Address Assignment Configuration Guidelines	186
Enabling DHCPv6 Server Function (CLI)	186
Enabling DHCPv6 Client Function (CLI)	189
Configuration Examples for IPv6 Unicast Routing	190
Configuring IPv6 Addressing and Enabling IPv6 Routing: Example	190
Configuring Default Router Preference: Example	190
Configuring IPv4 and IPv6 Protocol Stacks: Example	191
Enabling DHCPv6 Server Function: Example	191
Enabling DHCPv6 Client Function: Example	191
Configuring IPv6 ICMP Rate Limiting: Example	192
Configuring Static Routing for IPv6: Example	192
Example: Enabling PBR on an Interface	192
Example: Enabling Local PBR for IPv6	192

Configuring RIP for IPv6: Example 192

Displaying IPv6: Example 193

CHAPTER 14**Implementing IPv6 Multicast 195**

Finding Feature Information 195

Information About Implementing IPv6 Multicast Routing 195

IPv6 Multicast Overview 195

IPv6 Multicast Routing Implementation 196

IPv6 Multicast Listener Discovery Protocol 196

Multicast Queriers and Hosts 196

MLD Access Group 197

Explicit Tracking of Receivers 197

Protocol Independent Multicast 197

PIM-Sparse Mode 197

IPv6 BSR: Configure RP Mapping 198

PIM-Source Specific Multicast 198

Routable Address Hello Option 199

PIM IPv6 Stub Routing 199

Static Mroutes 200

MRIB 200

MFIB 200

MFIB 201

IPv6 Multicast Process Switching and Fast Switching 201

Multiprotocol BGP for the IPv6 Multicast Address Family 202

Implementing IPv6 Multicast 202

Enabling IPv6 Multicast Routing 202

Customizing and Verifying the MLD Protocol 203

Customizing and Verifying MLD on an Interface 203

Implementing MLD Group Limits 204

Configuring Explicit Tracking of Receivers to Track Host Behavior 206

Resetting the MLD Traffic Counters 206

Clearing the MLD Interface Counters 207

Configuring PIM 207

Configuring PIM-SM and Displaying PIM-SM Information for a Group Range 207

Configuring PIM Options	208
Resetting the PIM Traffic Counters	210
Clearing the PIM Topology Table to Reset the MRIB Connection	210
Configuring PIM IPv6 Stub Routing	211
PIM IPv6 Stub Routing Configuration Guidelines	212
Default IPv6 PIM Routing Configuration	212
Enabling IPV6 PIM Stub Routing	212
Monitoring IPv6 PIM Stub Routing	214
Configuring a BSR	214
Configuring a BSR and Verifying BSR Information	215
Sending PIM RP Advertisements to the BSR	215
Configuring BSR for Use Within Scoped Zones	216
Configuring BSR Switches to Announce Scope-to-RP Mappings	217
Configuring SSM Mapping	217
Configuring Static Mroutes	218
Using MFIB in IPv6 Multicast	219
Verifying MFIB Operation in IPv6 Multicast	219
Resetting MFIB Traffic Counters	220

CHAPTER 15

Configuring IPv6 Client IP Address Learning	221
Prerequisites for IPv6 Client Address Learning	221
Information About IPv6 Client Address Learning	221
SLAAC Address Assignment	222
Stateful DHCPv6 Address Assignment	223
Static IP Address Assignment	224
Router Solicitation	224
Router Advertisement	224
Neighbor Discovery	225
Neighbor Discovery Suppression	225
RA Guard	225
RA Throttling	226
Configuring IPv6 Unicast (CLI)	226
Configuring RA Guard Policy (CLI)	227
Applying RA Guard Policy (CLI)	228

Configuring RA Throttle Policy (CLI)	229
Applying RA Throttle Policy on VLAN (CLI)	230
How to Configure IPv6 Neighbor Tracking	231
Configuring IPv6 Snooping (CLI)	233
Configuring IPv6 ND Suppress Policy (CLI)	233
Configuring IPv6 Snooping on VLAN/PortChannel	234
Configuring IPv6 on Switch (CLI)	235
Configuring DHCP Pool (CLI)	236
Configuring Stateless Auto Address Configuration Without DHCP (CLI)	237
Configuring Stateless Auto Address Configuration With DHCP (CLI)	238
Configuring Stateful DHCP Locally (CLI)	239
Configuring Stateful DHCP Externally (CLI)	241
Verifying IPv6 Address Learning Configuration	243
Additional References	244
Feature Information for IPv6 Client Address Learning	245

CHAPTER 16

Configuring IPv6 WLAN Security	247
Prerequisites for IPv6 WLAN Security	247
Restrictions for IPv6 WLAN Security	247
Information About IPv6 WLAN Security	247
How to Configure IPv6 WLAN Security	250
Configuring Local Authentication	250
Creating a Local User	250
Creating a Client VLAN and Interface	250
Configuring a EAP Profile	252
Creating a Local Authentication Model	254
Creating a Client WLAN	256
Configuring Local Authentication with WPA2+AES	257
Configuring External RADIUS Server	261
Configuring RADIUS Authentication Server Host	261
Configuring RADIUS Authentication Server Group	262
Creating a Client VLAN	264
Creating 802.1x WLAN Using an External RADIUS Server	265
Additional References	266

Feature Information for IPv6 WLAN Security 267

CHAPTER 17

Configuring IPv6 ACL 269

Prerequisites for IPv6 ACL 269

Restrictions for IPv6 ACL 269

Information About IPv6 ACL 270

Understanding IPv6 ACLs 270

Types of ACL 271

Per User IPv6 ACL 271

Filter ID IPv6 ACL 271

IPv6 ACLs and Switch Stacks 271

Configuring IPv6 ACLs 271

Default IPv6 ACL Configuration 272

Interaction with Other Features and Switches 272

How To Configure an IPv6 ACL 273

Creating IPv6 ACL 273

Applying an IPv6 to an Interface 276

Creating WLAN IPv6 ACL 278

Verifying IPv6 ACL 278

Displaying IPv6 ACLs 278

Configuration Examples for IPv6 ACL 279

Example: Creating IPv6 ACL 279

Example: Applying IPv6 ACLs 279

Example: Displaying IPv6 ACLs 279

Example: Configuring RA Throttling and NS Suppression 280

Example: Configuring RA Guard Policy 281

Example: Configuring IPv6 Neighbor Binding 282

Additional References 283

Feature Information for IPv6 ACLs 284

CHAPTER 18

Configuring IPv6 Web Authentication 285

Prerequisites for IPv6 Web Authentication 285

Restrictions for IPv6 Web Authentication 285

Information About IPv6 Web Authentication 286

Web Authentication Process	286
How to Configure IPv6 Web Authentication	287
Disabling WPA	287
Enabling Security on the WLAN	288
Enabling a Parameter Map on the WLAN	289
Enabling Authentication List on WLAN	289
Configuring a Global WebAuth WLAN Parameter Map	289
Configuring the WLAN	290
Enabling IPv6 in Global Configuration Mode	292
Verifying IPv6 Web Authentication	292
Verifying the Parameter Map	292
Verifying Authentication List	293
Additional References	294
Feature Information for IPv6 Web Authentication	295

CHAPTER 19

Configuring IPv6 Client Mobility	297
Prerequisites for IPv6 Client Mobility	297
Restrictions For IPv6 Client Mobility	297
Information About IPv6 Client Mobility	298
Using Router Advertisement	298
RA Throttling and NS suppression	299
IPv6 Address Learning	300
Handling Multiple IP Addresses	300
IPv6 Configuration	300
High Availability	301
Verifying IPv6 Client Mobility	301
Monitoring IPv6 Client Mobility	301
Additional References	302
Feature Information For IPv6 Client Mobility	303

CHAPTER 20

Configuring IPv6 Mobility	305
Pre-requisites for IPv6 Mobility	305
Information About IPv6 Mobility	305
Inter Controller Roaming	305

Intra Subnet Roaming with Sticky Anchoring, and Inter Subnet Roaming	306
How to Configure IPv6 Mobility	306
Monitoring IPv6 Mobility	306
Additional References	308
Feature Information for IPv6 Mobility	309

PART IV
IP 311

CHAPTER 21
Configuring HSRP 313

Configuring HSRP	313
Finding Feature Information	313
Information About Configuring HSRP	313
HSRP Overview	313
HSRP Versions	315
Multiple HSRP	316
SSO HSRP	316
HSRP and Switch Stacks	317
Configuring HSRP for IPv6	317
How to Configure HSRP	317
Default HSRP Configuration	317
HSRP Configuration Guidelines	318
Enabling HSRP	318
Configuring HSRP Priority	320
Configuring MHSRP	322
Configuring HSRP Authentication and Timers	328
Enabling HSRP Support for ICMP Redirect Messages	330
Configuring HSRP Groups and Clustering	330
Verifying HSRP	330
Verifying HSRP Configurations	330
Configuration Examples for Configuring HSRP	331
Enabling HSRP: Example	331
Configuring HSRP Priority: Example	331
Configuring MHSRP: Example	331
Configuring HSRP Authentication and Timer: Example	332

Configuring HSRP Groups and Clustering: Example	332
Additional References for Configuring HSRP	333
Feature Information for Configuring HSRP	334

PART V
IP Multicast Routing 335

CHAPTER 22
IP Multicast Routing Technology Overview 337

Finding Feature Information	337
Information About IP Multicast Technology	337
Role of IP Multicast in Information Delivery	337
IP Multicast Routing Protocols	337
Multicast Group Transmission Scheme	338
IP Multicast Boundary	340
IP Multicast Group Addressing	341
IP Class D Addresses	341
IP Multicast Address Scoping	341
Layer 2 Multicast Addresses	343
IP Multicast Delivery Modes	343
Source Specific Multicast	343

CHAPTER 23
Configuring IGMP 345

Finding Feature Information	345
Prerequisites for IGMP and IGMP Snooping	345
Prerequisites for IGMP	345
Prerequisites for IGMP Snooping	346
Restrictions for IGMP and IGMP Snooping	346
Restrictions for Configuring IGMP	346
Restrictions for IGMP Snooping	347
Information About IGMP	347
Role of the Internet Group Management Protocol	347
IGMP Multicast Addresses	348
IGMP Versions	348
IGMP Version 1	348
IGMP Version 2	348

IGMP Version 3	349
IGMPv3 Host Signaling	349
IGMP Versions Differences	349
IGMP Join and Leave Process	351
IGMP Join Process	351
IGMP Leave Process	352
IGMP Snooping	352
Joining a Multicast Group	353
Leaving a Multicast Group	354
Immediate Leave	355
IGMP Configurable-Leave Timer	355
IGMP Report Suppression	355
IGMP Filtering and Throttling	356
Default IGMP Configuration	356
Default IGMP Snooping Configuration	357
Default IGMP Filtering and Throttling Configuration	357
How to Configure IGMP	358
Configuring the Device as a Member of a Group (CLI)	358
Controlling Access to IP Multicast Group (CLI)	359
Changing the IGMP Version (CLI)	361
Modifying the IGMP Host-Query Message Interval (CLI)	363
Changing the IGMP Query Timeout for IGMPv2 (CLI)	364
Changing the Maximum Query Response Time for IGMPv2 (CLI)	366
Configuring the Device as a Statically Connected Member (CLI)	367
Configuring IGMP Profiles (CLI)	369
Applying IGMP Profiles (CLI)	371
Setting the Maximum Number of IGMP Groups (CLI)	372
Configuring the IGMP Throttling Action (CLI)	373
How to Configure IGMP Snooping	375
Enabling IGMP Snooping	375
Enabling or Disabling IGMP Snooping on a VLAN Interface (CLI)	376
Setting the Snooping Method (CLI)	377
Configuring a Multicast Router Port (CLI)	378
Configuring a Host Statically to Join a Group (CLI)	380

Enabling IGMP Immediate Leave (CLI)	381
Configuring the IGMP Leave Timer (CLI)	382
Configuring the IGMP Robustness-Variable (CLI)	384
Configuring the IGMP Last Member Query Count (CLI)	385
Configuring TCN-Related Commands	387
Configuring the IGMP Snooping Querier (CLI)	390
Disabling IGMP Report Suppression (CLI)	392
Monitoring IGMP	394
Monitoring IGMP Snooping Information	394
Monitoring IGMP Filtering and Throttling Configuration	396
Configuration Examples for IGMP	396
Example: Configuring the Device as a Member of a Multicast Group	396
Example: Controlling Access to Multicast Groups	396
Examples: Configuring IGMP Snooping	397
Example: Configuring IGMP Profiles	398
Example: Applying IGMP Profile	398
Example: Setting the Maximum Number of IGMP Groups	398
Example: Interface Configuration as a Routed Port	398
Example: Interface Configuration as an SVI	399
Additional References	399
Feature History and Information for IGMP	400

CHAPTER 24
Configuring IGMP Proxy 401

Finding Feature Information	401
Prerequisites for IGMP Proxy	401
Information about IGMP Proxy	402
IGMP Proxy	402
How to Configure IGMP Proxy	404
Configuring the Upstream UDL Device for IGMP UDLR	404
Configuring the Downstream UDL Device for IGMP UDLR with IGMP Proxy Support	405
Configuration Examples for IGMP Proxy	408
Example: IGMP Proxy Configuration	408
Additional References	409
Feature History and Information for IGMP Proxy	410

CHAPTER 25	Constraining IP Multicast in Switched Ethernet	411
	Finding Feature Information	411
	Prerequisites for Constraining IP Multicast in a Switched Ethernet Network	411
	Information About IP Multicast in a Switched Ethernet Network	412
	IP Multicast Traffic and Layer 2 Switches	412
	CGMP on Catalyst Switches for IP Multicast	412
	IGMP Snooping	413
	Router-Port Group Management Protocol (RGMP)	413
	How to Constrain Multicast in a Switched Ethernet Network	413
	Configuring Switches for IP Multicast	413
	Configuring IGMP Snooping	414
	Enabling CGMP	414
	Configuring IP Multicast in a Layer 2 Switched Ethernet Network	415
	Configuration Examples for Constraining IP Multicast in a Switched Ethernet Network	416
	Example: CGMP Configuration	416
	RGMP Configuration Example	417
	Additional References	417
	Feature History and Information for Constraining IP Multicast in a Switched Ethernet Network	418
CHAPTER 26	Configuring PIM	419
	Finding Feature Information	419
	Prerequisites for PIM	419
	Restrictions for PIM	420
	PIMv1 and PIMv2 Interoperability	420
	Restrictions for Configuring PIM Stub Routing	421
	Restrictions for Configuring Auto-RP and BSR	421
	Restrictions for Auto-RP Enhancement	422
	Information About PIM	423
	Protocol Independent Multicast Overview	423
	PIM Dense Mode	423
	PIM Sparse Mode	424
	Multicast Source Discovery Protocol (MSDP)	424
	Sparse-Dense Mode	425

PIM Versions	425
PIM Stub Routing	426
IGMP Helper	427
Rendezvous Points	427
Auto-RP	428
The Role of Auto-RP in a PIM Network	429
Multicast Boundaries	429
Sparse-Dense Mode for Auto-RP	430
Auto-RP Benefits	430
PIMv2 Bootstrap Router	431
PIM Domain Border	431
Multicast Forwarding	432
Multicast Distribution Source Tree	432
Multicast Distribution Shared Tree	433
Source Tree Advantage	433
Shared Tree Advantage	434
PIM Shared Tree and Source Tree	434
Reverse Path Forwarding	435
RPF Check	436
Default PIM Routing Configuration	437
How to Configure PIM	438
Enabling PIM Stub Routing (CLI)	438
Configuring a Rendezvous Point	440
Manually Assigning an RP to Multicast Groups (CLI)	440
Setting Up Auto-RP in a New Internetwork (CLI)	442
Adding Auto-RP to an Existing Sparse-Mode Cloud (CLI)	445
Preventing Join Messages to False RPs (CLI)	448
Filtering Incoming RP Announcement Messages (CLI)	448
Configuring PIMv2 BSR	450
Defining the PIM Domain Border (CLI)	451
Defining the IP Multicast Boundary (CLI)	452
Configuring Candidate BSRs (CLI)	454
Configuring the Candidate RPs (CLI)	455
Configuring Sparse Mode with Auto-RP (CLI)	457

Delaying the Use of PIM Shortest-Path Tree (CLI)	462
Modifying the PIM Router-Query Message Interval (CLI)	464
Verifying PIM Operations	466
Verifying IP Multicast Operation in a PIM-SM or a PIM-SSM Network	466
Verifying IP Multicast on the First Hop Router	466
Verifying IP Multicast on Routers Along the SPT	467
Verifying IP Multicast Operation on the Last Hop Router	468
Using PIM-Enabled Routers to Test IP Multicast Reachability	472
Configuring Routers to Respond to Multicast Pings	472
Pinging Routers Configured to Respond to Multicast Pings	473
Monitoring and Troubleshooting PIM	474
Monitoring PIM Information	474
Monitoring the RP Mapping and BSR Information	475
Troubleshooting PIMv1 and PIMv2 Interoperability Problems	475
Configuration Examples for PIM	476
Example: Enabling PIM Stub Routing	476
Example: Verifying PIM Stub Routing	476
Example: Manually Assigning an RP to Multicast Groups	477
Example: Configuring Auto-RP	477
Example: Sparse Mode with Auto-RP	477
Example: Defining the IP Multicast Boundary to Deny Auto-RP Information	477
Example: Filtering Incoming RP Announcement Messages	478
Example: Preventing Join Messages to False RPs	478
Example: Configuring Candidate BSRs	478
Example: Configuring Candidate RPs	479
Additional References	479
Feature History and Information for PIM	481

CHAPTER 27**Configuring PIM MIB Extension for IP Multicast 483**

Finding Feature Information	483
Information About PIM MIB Extension for IP Multicast	483
PIM MIB Extensions for SNMP Traps for IP Multicast	483
Benefits of PIM MIB Extensions	484
How to Configure PIM MIB Extension for IP Multicast	484

Enabling PIM MIB Extensions for IP Multicast	484
Configuration Examples for PIM MIB Extensions	486
Example Enabling PIM MIB Extensions for IP Multicast	486
Additional References	486

CHAPTER 28

Configuring MSDP 489

Finding Feature Information	489
489	
Information About Using MSDP to Interconnect Multiple PIM-SM Domains	489
Benefits of Using MSDP to Interconnect Multiple PIM-SM Domains	489
490	
MSDP Message Types	492
SA Messages	492
SA Request Messages	492
SA Response Messages	493
Keepalive Messages	493
SA Message Origination Receipt and Processing	493
SA Message Origination	493
SA Message Receipt	493
SA Message Processing	496
MSDP Peers	496
MSDP MD5 Password Authentication	496
How MSDP MD5 Password Authentication Works	496
Benefits of MSDP MD5 Password Authentication	497
SA Message Limits	497
MSDP Keepalive and Hold-Time Intervals	497
MSDP Connection-Retry Interval	498
Default MSDP Peers	498
MSDP Mesh Groups	499
Benefits of MSDP Mesh Groups	499
SA Origination Filters	500
Use of Outgoing Filter Lists in MSDP	500
Use of Incoming Filter Lists in MSDP	501
TTL Thresholds in MSDP	502

SA Request Messages	502
SA Request Filters	502
How to Use MSDP to Interconnect Multiple PIM-SM Domains	503
Configuring an MSDP Peer	503
Shutting Down an MSDP Peer	504
Configuring MSDP MD5 Password Authentication Between MSDP Peers	505
Troubleshooting Tips	507
Preventing DoS Attacks by Limiting the Number of SA Messages Allowed in the SA Cache from Specified MSDP Peers	507
Adjusting the MSDP Keepalive and Hold-Time Intervals	508
Adjusting the MSDP Connection-Retry Interval	509
Configuring a Default MSDP Peer	510
Configuring an MSDP Mesh Group	511
Controlling SA Messages Originated by an RP for Local Sources	512
Controlling the Forwarding of SA Messages to MSDP Peers Using Outgoing Filter Lists	513
Controlling the Receipt of SA Messages from MSDP Peers Using Incoming Filter Lists	514
Using TTL Thresholds to Limit the Multicast Data Sent in SA Messages	515
Requesting Source Information from MSDP Peers	516
Controlling the Response to Outgoing SA Request Messages from MSDP Peers Using SA Request Filters	517
Including a Bordering PIM Dense Mode Region in MSDP	518
Configuring an Originating Address Other Than the RP Address	519
Monitoring MSDP	520
Clearing MSDP Connections Statistics and SA Cache Entries	522
Enabling SNMP Monitoring of MSDP	523
Troubleshooting Tips	524
Configuration Examples for Using MSDP to Interconnect Multiple PIM-SM Domains	525
Example: Configuring an MSDP Peer	525
Example: Configuring MSDP MD5 Password Authentication	525
Example: Configuring a Default MSDP Peer	526
Example: Configuring MSDP Mesh Groups	528
Additional References	528
Feature History and Information for Multicast Source Discovery Protocol	529

CHAPTER 29

Configuring Wireless Multicast	531
Finding Feature Information	531
Prerequisites for Configuring Wireless Multicast	531
Restrictions for Configuring Wireless Multicast	531
Restrictions for IPv6 Snooping	532
Restrictions for IPv6 RA Guard	532
Information About Wireless Multicast	532
Information About Multicast Optimization	533
IPv6 Global Policies	533
IPv6 RA Guard	534
Information About IPv6 Snooping	534
IPv6 Neighbor Discovery Inspection	534
How to Configure Wireless Multicast	536
Configuring Wireless Multicast-MCMC Mode (CLI)	536
Configuring Wireless Multicast-MCUC Mode (CLI)	537
Configuring IPv6 Snooping (CLI)	538
Configuring IPv6 Snooping Policy (CLI)	539
Configuring Layer 2 Port as Multicast Router Port (CLI)	540
Configuring IPv6 RA Guard (CLI)	540
Configuring Non-IP Wireless Multicast (CLI)	541
Configuring Wireless Broadcast (CLI)	542
Configuring IP Multicast VLAN for WLAN (CLI)	543
Monitoring Wireless Multicast	544
Where to Go Next for Wireless Multicast	545

CHAPTER 30

Configuring SSM	547
Finding Feature Information	547
Prerequisites for Configuring SSM	547
Restrictions for Configuring SSM	548
Information About SSM	549
SSM Components Overview	549
SSM and Internet Standard Multicast (ISM)	549
SSM IP Address Range	550

SSM Operations	550
SSM Mapping	550
Static SSM Mapping	551
DNS-Based SSM Mapping	551
How to Configure SSM	552
Configuring SSM (CLI)	552
Configuring Source Specific Multicast Mapping	554
Configuring Static SSM Mapping (CLI)	554
Configuring DNS-Based SSM Mapping (CLI)	556
Configuring Static Traffic Forwarding with SSM Mapping (CLI)	557
Monitoring SSM	559
Monitoring SSM Mapping	559
Where to Go Next for SSM	560
Additional References	560
Feature History and Information for SSM	561

CHAPTER 31

Configuring Basic IP Multicast Routing	563
Finding Feature Information	563
Prerequisites for Basic IP Multicast Routing	563
Restrictions for Basic IP Multicast Routing	564
Information About Basic IP Multicast Routing	564
Multicast Forwarding Information Base Overview	564
Default IP Multicast Routing Configuration	565
How to Configure Basic IP Multicast Routing	565
Configuring Basic IP Multicast Routing	565
Configuring IP Multicast Forwarding (CLI)	568
Configuring a Static Multicast Route (mroute) (CLI)	569
Configuring Optional IP Multicast Routing Features	571
Defining the IP Multicast Boundary (CLI)	571
Configuring sdr Listener Support	573
Monitoring and Maintaining Basic IP Multicast Routing	575
Clearing Caches, Tables, and Databases	575
Displaying System and Network Statistics	576
Displaying Multicast Peers, Packet Rates and Loss Information, and Path Tracing	578

Configuration Examples for IP Multicast Routing	579
Example: Configuring an IP Multicast Boundary	579
Example: Responding to mrimfno Requests	579
Additional References	579
Feature History and Information for IP Multicast	581

CHAPTER 32**Configuring the Service Discovery Gateway 583**

Finding Feature Information	583
Restrictions for Configuring the Service Discovery Gateway	583
Information about the Service Discovery Gateway and mDNS	584
mDNS	584
mDNS-SD	584
Service Discovery Gateway	585
mDNS Gateway and Subnets	585
Filtering	586
How to Configure the Service Discovery Gateway	587
Configuring the Service List (CLI)	587
Enabling mDNS Gateway and Redistributing Services (CLI)	589
Monitoring Service Discovery Gateway	592
Configuration Examples	592
Example: Specify Alternative Source Interface for Outgoing mDNS Packets	592
Example: Redistribute Service Announcements	592
Example: Disable Bridging of mDNS Packets to Wireless Clients	593
Example: Creating a Service-List, Applying a Filter and Configuring Parameters	593
Example: Enabling mDNS Gateway and Redistributing Services	593
Example: Global mDNS Configuration	594
Example: Interface mDNS Configuration	594
Where to Go Next for Configuring Services Discovery Gateway	594
Additional References	595
Feature History and Information for Services Discovery Gateway	596

CHAPTER 33**IP Multicast Optimization: Optimizing PIM Sparse Mode in a Large IP Multicast Deployment 597**

Prerequisites for Optimizing PIM Sparse Mode in a Large IP Multicast Deployment	597
Information About Optimizing PIM Sparse Mode in a Large IP Multicast Deployment	597

PIM Registering Process	597
PIM Version 1 Compatibility	598
PIM Designated Router	598
PIM Sparse-Mode Register Messages	599
Preventing Use of Shortest-Path Tree to Reduce Memory Requirement	599
PIM Shared Tree and Source Tree	599
Benefit of Preventing or Delaying the Use of the Shortest-Path Tree	600
How to Optimize PIM Sparse Mode in a Large IP Multicast Deployment	601
Optimizing PIM Sparse Mode in a Large Deployment	601
Configuration Examples for Optimizing PIM Sparse Mode in a Large Multicast Deployment	603
Optimizing PIM Sparse Mode in a Large IP Multicast Deployment Example	603
Additional References	603
Feature History and Information for Optimizing PIM Sparse Mode in a Large IP Multicast Deployment	604

CHAPTER 34**IP Multicast Optimization: Multicast Subsecond Convergence 605**

Finding Feature Information	605
Prerequisites for Multicast Subsecond Convergence	605
Restrictions for Multicast Subsecond Convergence	605
Information About Multicast Subsecond Convergence	606
Benefits of Multicast Subsecond Convergence	606
Multicast Subsecond Convergence Scalability Enhancements	606
PIM Router Query Messages	606
Reverse Path Forwarding	606
RPF Checks	607
Triggered RPF Checks	607
RPF Failover	607
Topology Changes and Multicast Routing Recovery	608
How to Configure Multicast Subsecond Convergence	608
Modifying the Periodic RPF Check Interval	608
Configuring PIM RPF Failover Intervals	609
Modifying the PIM Router Query Message Interval	609
Verifying Multicast Subsecond Convergence Configurations	610
Configuration Examples for Multicast Subsecond Convergence	611

Example Modifying the Periodic RPF Check Interval	611
Example Configuring PIM RPF Failover Intervals	612
Modifying the PIM Router Query Message Interval Example	612
Additional References	613
Feature History and Information for Multicast Subsecond Convergence	613

CHAPTER 35

IP Multicast Optimization: IP Multicast Load Splitting across Equal-Cost Paths 615

Finding Feature Information	615
Prerequisites for IP Multicast Load Splitting across Equal-Cost Paths	615
Information About IP Multicast Load Splitting across Equal-Cost Paths	616
Load Splitting Versus Load Balancing	616
Default Behavior for IP Multicast When Multiple Equal-Cost Paths Exist	616
Methods to Load Split IP Multicast Traffic	618
Overview of ECMP Multicast Load Splitting	618
ECMP Multicast Load Splitting Based on Source Address Using the S-Hash Algorithm	618
ECMP Multicast Load Splitting Based on Source and Group Address Using the Basic S-G-Hash Algorithm	618
Predictability As a By-Product of Using the S-Hash and Basic S-G-Hash Algorithms	619
Polarization As a By-Product of Using the S-Hash and Basic S-G-Hash Algorithms	619
ECMP Multicast Load Splitting Based on Source Group and Next-Hop Address	620
Effect of ECMP Multicast Load Splitting on PIM Neighbor Query and Hello Messages for RPF Path Selection	621
Effect of ECMP Multicast Loading Splitting on Assert Processing in PIM-DM and DF Election in Bidir-PIM	621
Effect of ECMP Multicast Load Splitting on the PIM Assert Process in PIM-SM and PIM-SSM	622
ECMP Multicast Load Splitting and Reconvergence When Unicast Routing Changes	623
Use of BGP with ECMP Multicast Load Splitting	623
Use of ECMP Multicast Load Splitting with Static Mroutes	624
Alternative Methods of Load Splitting IP Multicast Traffic	624
How to Load Split IP Multicast Traffic over ECMP	625
Enabling ECMP Multicast Load Splitting	625
Prerequisites for IP Multicast Load Splitting - ECMP	625
Restrictions	626
Enabling ECMP Multicast Load Splitting Based on Source Address	626

Enabling ECMP Multicast Load Splitting Based on Source and Group Address	628
Enabling ECMP Multicast Load Splitting Based on Source Group and Next-Hop Address	630
Configuration Examples for Load Splitting IP Multicast Traffic over ECMP	632
Example Enabling ECMP Multicast Load Splitting Based on Source Address	632
Example Enabling ECMP Multicast Load Splitting Based on Source and Group Address	632
Example Enabling ECMP Multicast Load Splitting Based on Source Group and Next-Hop Address	632
Additional References	633
Feature History and Information for Load Splitting IP Multicast Traffic over ECMP	633

CHAPTER 36**IP Multicast Optimization: SSM Channel Based Filtering for Multicast 635**

Finding Feature Information	635
Prerequisites for SSM Channel Based Filtering for Multicast Boundaries	635
Information About the SSM Channel Based Filtering for Multicast Boundaries Feature	636
Rules for Multicast Boundaries	636
Benefits of SSM Channel Based Filtering for Multicast Boundaries	636
How to Configure SSM Channel Based Filtering for Multicast Boundaries	637
Configuring Multicast Boundaries	637
Configuration Examples for SSM Channel Based Filtering for Multicast Boundaries	638
Configuring the Multicast Boundaries Permitting and Denying Traffic Example	638
Configuring the Multicast Boundaries Permitting Traffic Example	638
Configuring the Multicast Boundaries Denying Traffic Example	639
Additional References	639
Feature History and Information for SSM Channel Based Filtering for Multicast Boundaries	640

CHAPTER 37**IP Multicast Optimization: PIM Dense Mode State Refresh 641**

Finding Feature Information	641
Prerequisite for PIM Dense Mode State Refresh	641
Restrictions on PIM Dense Mode State Refresh	641
Information About PIM Dense Mode State Refresh	642
PIM Dense Mode State Refresh Overview	642
Benefits of PIM Dense Mode State Refresh	642
How to Configure PIM Dense Mode State Refresh	642
Configuring PIM Dense Mode State Refresh	642

Verifying PIM Dense Mode State Refresh Configuration	643
Monitoring and Maintaining PIM DM State Refresh	644
Configuration Examples for PIM Dense Mode State Refresh	644
Originating Processing and Forwarding PIM Dense Mode State Refresh Control Messages Example	644
Processing and Forwarding PIM Dense Mode State Refresh Control Messages Example	645
Additional References	645
Feature History and Information for PIM Dense Mode State Refresh	646

CHAPTER 38**IP Multicast Optimization: IGMP State Limit 647**

Finding Feature Information	647
Prerequisites for IGMP State Limit	647
Restrictions for IGMP State Limit	647
Information About IGMP State Limit	648
IGMP State Limit	648
IGMP State Limit Feature Design	648
Mechanics of IGMP State Limiters	648
How to Configure IGMP State Limit	649
Configuring IGMP State Limiters	649
Configuring Global IGMP State Limiters	649
Configuring Per Interface IGMP State Limiters	650
Configuration examples for IGMP State Limit	651
Configuring IGMP State Limiters Example	651
Additional References	653
Feature History and Information for IGMP State Limit	653

PART VI**Layer 2/3 655**

CHAPTER 39**Configuring Spanning Tree Protocol 657**

Restrictions for STP	657
Information About Spanning Tree Protocol	657
Spanning Tree Protocol	657
Spanning-Tree Topology and BPDUs	658
Bridge ID, Device Priority, and Extended System ID	660

Port Priority Versus Path Cost	661
Spanning-Tree Interface States	661
How a Device or Port Becomes the Root Device or Root Port	664
Spanning Tree and Redundant Connectivity	665
Spanning-Tree Address Management	665
Accelerated Aging to Retain Connectivity	665
Spanning-Tree Modes and Protocols	666
Supported Spanning-Tree Instances	666
Spanning-Tree Interoperability and Backward Compatibility	666
STP and IEEE 802.1Q Trunks	667
Spanning Tree and Device Stacks	667
Default Spanning-Tree Configuration	668
How to Configure Spanning-Tree Features	669
Changing the Spanning-Tree Mode (CLI)	669
Disabling Spanning Tree (CLI)	670
Configuring the Root Device (CLI)	671
Configuring a Secondary Root Device (CLI)	672
Configuring Port Priority (CLI)	673
Configuring Path Cost (CLI)	675
Configuring the Device Priority of a VLAN (CLI)	676
Configuring the Hello Time (CLI)	677
Configuring the Forwarding-Delay Time for a VLAN (CLI)	678
Configuring the Maximum-Aging Time for a VLAN (CLI)	679
Configuring the Transmit Hold-Count (CLI)	680
Monitoring Spanning-Tree Status	681
Additional References for Spanning-Tree Protocol	681
Feature Information for STP	682

CHAPTER 40
Configuring Multiple Spanning-Tree Protocol 683

Finding Feature Information	683
Prerequisites for MSTP	683
Restrictions for MSTP	684
Information About MSTP	685
MSTP Configuration	685

MSTP Configuration Guidelines	685
Root Switch	686
Multiple Spanning-Tree Regions	687
IST, CIST, and CST	687
Operations Within an MST Region	688
Operations Between MST Regions	688
IEEE 802.1s Terminology	689
Illustration of MST Regions	689
Hop Count	690
Boundary Ports	691
IEEE 802.1s Implementation	691
Port Role Naming Change	691
Interoperation Between Legacy and Standard Devices	692
Detecting Unidirectional Link Failure	692
MSTP and Device Stacks	693
Interoperability with IEEE 802.1D STP	693
RSTP Overview	694
Port Roles and the Active Topology	694
Rapid Convergence	695
Synchronization of Port Roles	696
Bridge Protocol Data Unit Format and Processing	697
Topology Changes	698
Protocol Migration Process	699
Default MSTP Configuration	699
How to Configure MSTP Features	700
Specifying the MST Region Configuration and Enabling MSTP (CLI)	700
Configuring the Root Device (CLI)	703
Configuring a Secondary Root Device (CLI)	704
Configuring Port Priority (CLI)	705
Configuring Path Cost (CLI)	707
Configuring the Device Priority (CLI)	708
Configuring the Hello Time (CLI)	709
Configuring the Forwarding-Delay Time (CLI)	710
Configuring the Maximum-Aging Time (CLI)	711

Configuring the Maximum-Hop Count (CLI)	712
Specifying the Link Type to Ensure Rapid Transitions (CLI)	713
Designating the Neighbor Type (CLI)	714
Restarting the Protocol Migration Process (CLI)	716
Additional References for MSTP	717
Feature Information for MSTP	718

CHAPTER 41**Configuring Optional Spanning-Tree Features 719**

Information About Optional Spanning-Tree Features	719
PortFast	719
BPDU Guard	720
BPDU Filtering	720
UplinkFast	721
Cross-Stack UplinkFast	722
How Cross-Stack UplinkFast Works	723
Events That Cause Fast Convergence	724
BackboneFast	725
EtherChannel Guard	727
Root Guard	727
Loop Guard	728
How to Configure Optional Spanning-Tree Features	729
Enabling PortFast (CLI)	729
Enabling BPDU Guard (CLI)	730
Enabling BPDU Filtering (CLI)	732
Enabling UplinkFast for Use with Redundant Links (CLI)	733
Disabling UplinkFast (CLI)	735
Enabling BackboneFast (CLI)	736
Enabling EtherChannel Guard (CLI)	737
Enabling Root Guard (CLI)	738
Enabling Loop Guard (CLI)	739
Monitoring the Spanning-Tree Status	740
Additional References for Optional Spanning Tree Features	741
Feature Information for Optional Spanning-Tree Features	742

CHAPTER 42	Configuring EtherChannels	743
	Finding Feature Information	743
	Restrictions for EtherChannels	743
	Information About EtherChannels	744
	EtherChannel Overview	744
	EtherChannel Modes	745
	EtherChannel on Devices	745
	EtherChannel Link Failover	746
	Channel Groups and Port-Channel Interfaces	746
	Port Aggregation Protocol	747
	PAgP Modes	748
	PAgP Learn Method and Priority	749
	PAgP Interaction with Other Features	750
	Link Aggregation Control Protocol	750
	LACP Modes	750
	LACP and Link Redundancy	751
	LACP Interaction with Other Features	751
	EtherChannel On Mode	751
	Load-Balancing and Forwarding Methods	752
	MAC Address Forwarding	752
	IP Address Forwarding	753
	Load-Balancing Advantages	753
	EtherChannel and Device Stacks	754
	Device Stack and PAgP	754
	Device Stacks and LACP	755
	Default EtherChannel Configuration	755
	EtherChannel Configuration Guidelines	756
	Layer 2 EtherChannel Configuration Guidelines	757
	Layer 3 EtherChannel Configuration Guidelines	758
	Auto-LAG	758
	Auto-LAG Configuration Guidelines	759
	How to Configure EtherChannels	759
	Configuring Layer 2 EtherChannels (CLI)	759

Configuring Layer 3 EtherChannels (CLI)	762
Configuring EtherChannel Load-Balancing (CLI)	764
Configuring EtherChannel Extended Load-Balancing (CLI)	765
Configuring the PAgP Learn Method and Priority (CLI)	766
Configuring LACP Hot-Standby Ports	768
Configuring the LACP Max Bundle Feature (CLI)	768
Configuring LACP Port-Channel Standalone Disable	769
Configuring the LACP Port Channel Min-Links Feature (CLI)	770
Configuring the LACP System Priority (CLI)	771
Configuring the LACP Port Priority (CLI)	772
Configuring LACP Fast Rate Timer	774
Configuring Auto-LAG Globally	775
Configuring Auto-LAG on a Port Interface	776
Configuring Persistence with Auto-LAG	777
Monitoring EtherChannel, PAgP, and LACP Status	777
Configuration Examples for Configuring EtherChannels	778
Configuring Layer 2 EtherChannels: Examples	778
Configuring Layer 3 EtherChannels: Examples	779
Configuring LACP Hot-Standby Ports: Example	780
Configuring Auto LAG: Examples	780
Additional References for EtherChannels	781
Feature Information for EtherChannels	782

CHAPTER 43
Configuring UniDirectional Link Detection 783

Finding Feature Information	783
Restrictions for Configuring UDLD	783
Information About UDLD	784
Modes of Operation	784
Normal Mode	784
Aggressive Mode	784
Methods to Detect Unidirectional Links	785
Neighbor Database Maintenance	785
Event-Driven Detection and Echoing	786
UDLD Reset Options	786

Default UDLD Configuration	786
How to Configure UDLD	787
Enabling UDLD Globally (CLI)	787
Enabling UDLD on an Interface (CLI)	788
Monitoring and Maintaining UDLD	789
Additional References for UDLD	789
Feature Information for UDLD	790

PART VII
Lightweight Access Point 791

CHAPTER 44
Configuring the Device for Access Point Discovery 793

Finding Feature Information	793
Prerequisites for Configuring the Device for Access Point Discovery	793
Restrictions for Configuring the Device for Access Point Discovery	794
Information About Configuring the Device for Access Point Discovery	794
Access Point Communication Protocols	794
Viewing Access Point Join Information	795
Troubleshooting the Access Point Join Process	795
How to Configure Access Point Discovery	796
Configuring the Syslog Server for Access Points (CLI)	796
Monitoring Access Point Join Information (CLI)	796
Configuration Examples for Configuring the Device for Access Point Discovery	797
Displaying the MAC Addresses of all Access Points: Example	797
DHCP Option 43 for Lightweight Cisco Aironet Access Points Configuration Example	799
Configuring AP Pass Through	799
Information About AP Pass Through	799
Configuring AP Pass Through	799

CHAPTER 45
Configuring Data Encryption 801

Finding Feature Information	801
Prerequisites for Configuring Data Encryption	801
Restrictions for Configuring Data Encryption	801
Information About Data Encryption	802
How to Configure Data Encryption	802

Configuring Data Encryption (CLI)	802
Configuration Examples for Configuring Data Encryption	803
Displaying Data Encryption States for all Access Points: Examples	803

CHAPTER 46**Configuring Retransmission Interval and Retry Count 805**

Finding Feature Information	805
Prerequisites for Configuring the Access Point Retransmission Interval and Retry Count	805
Information About Retransmission Interval and Retry Count	806
How to Configure Access Point Retransmission Interval and Retry Count	806
Configuring the Access Point Retransmission Interval and Retry Count (CLI)	806
Viewing CAPWAP Maximum Transmission Unit Information (CLI)	807
Configuration Examples for Configuring Access Point Retransmission Interval and Retry Count	808
Viewing the CAPWAP Retransmission Details: Example	808
Viewing Maximum Transmission Unit Information: Example	808

CHAPTER 47**Configuring Adaptive Wireless Intrusion Prevention System 809**

Finding Feature Information	809
Prerequisites for Configuring wIPS	809
How to Configure wIPS on Access Points	809
Configuring wIPS on an Access Point (CLI)	809
Monitoring wIPS Information	811
Configuration Examples for Configuring wIPS on Access Points	812
Displaying the Monitor Configuration Channel Set: Example	812
Displaying wIPS Information: Examples	812

CHAPTER 48**Configuring Authentication for Access Points 815**

Finding Feature Information	815
Prerequisites for Configuring Authentication for Access Points	815
Restrictions for Configuring Authentication for Access Points	816
Information about Configuring Authentication for Access Points	816
How to Configure Authentication for Access Points	816
Configuring Global Credentials for Access Points (CLI)	816
Configuring Authentication for Access Points (CLI)	818
Configuring the Switch for Authentication (CLI)	820

Configuration Examples for Configuring Authentication for Access Points 822

Displaying the Authentication Settings for Access Points: Examples 822

CHAPTER 49

Converting Autonomous Access Points to Lightweight Mode 823

Finding Feature Information 823

Prerequisites for Converting Autonomous Access Points to Lightweight Mode 823

Information About Autonomous Access Points Converted to Lightweight Mode 824

Reverting from Lightweight Mode to Autonomous Mode 824

Using DHCP Option 43 and DHCP Option 60 824

How Converted Access Points Send Crash Information to the Device 824

Uploading Memory Core Dumps from Converted Access Points 825

Displaying MAC Addresses for Converted Access Points 825

Configuring a Static IP Address for a Lightweight Access Point 825

How to Convert a Lightweight Access Point Back to an Autonomous Access Point 826

Converting a Lightweight Access Point Back to an Autonomous Access Point (CLI) 826

Converting a Lightweight Access Point Back to an Autonomous Access Point (Using the Mode Button and a TFTP Server) 826

Authorizing Access Points (CLI) 827

Disabling the Reset Button on Converted Access Points (CLI) 828

Monitoring the AP Crash Log Information 829

How to Configure a Static IP Address on an Access Point 830

Configuring a Static IP Address on an Access Point (CLI) 830

Recovering the Access Point Using the TFTP Recovery Procedure 831

Configuration Examples for Converting Autonomous Access Points to Lightweight Mode 832

Displaying the IP Address Configuration for Access Points: Example 832

Displaying Access Point Crash File Information: Example 832

CHAPTER 50

Using Cisco Workgroup Bridges 833

Finding Feature Information 833

Information About Cisco Workgroup Bridges and non-Cisco Workgroup bridges 833

Monitoring the Status of Workgroup Bridges 834

Debugging WGB Issues (CLI) 834

Configuration Examples for Configuring Workgroup Bridges 836

WGB Configuration: Example 836

CHAPTER 51	Configuring Probe Request Forwarding	837
	Finding Feature Information	837
	Information About Configuring Probe Request Forwarding	837
	How to Configure Probe Request Forwarding (CLI)	837

CHAPTER 52	Optimizing RFID Tracking	839
	Finding Feature Information	839
	Optimizing RFID Tracking on Access Points	839
	How to Optimize RFID Tracking on Access Points	839
	Optimizing RFID Tracking on Access Points (CLI)	839
	Configuration Examples for Optimizing RFID Tracking	841
	Displaying all the Access Points in Monitor Mode: Example	841

CHAPTER 53	Configuring Country Codes	843
	Finding Feature Information	843
	Prerequisites for Configuring Country Codes	843
	Information About Configuring Country Codes	844
	How to Configure Country Codes (CLI)	844
	Configuration Examples for Configuring Country Codes	847
	Displaying Channel List for Country Codes: Example	847

CHAPTER 54	Configuring Link Latency	849
	Finding Feature Information	849
	Prerequisites for Configuring Link Latency	849
	Restrictions for Configuring Link Latency	849
	Information About Configuring Link Latency	850
	TCP MSS	850
	Link Tests	850
	How to Configure Link Latency	851
	Configuring Link Latency (CLI)	851
	How to Configure TCP MSS	853
	Configuring TCP MSS (CLI)	853
	Performing a Link Test (CLI)	854

Configuration Examples for Configuring Link Latency 855

 Running a Link Test: Example 855

 Displaying Link Latency Information: Example 855

 Displaying TCP MSS Settings: Example 856

CHAPTER 55

Configuring Power over Ethernet 857

Finding Feature Information 857

Information About Configuring Power over Ethernet 857

How to Configure Power over Ethernet 857

 Configuring Power over Ethernet (CLI) 857

Configuration Examples for Configuring Power over Ethernet 858

 Displaying Power over Ethernet Information: Example 858

PART VIII

Mobility 861

CHAPTER 56

Information About Mobility 863

Overview 863

Wired and Wireless Mobility 864

Features of Mobility 864

Sticky Anchoring for Low Latency Roaming 866

Bridge Domain ID and L2/L3 Roaming 866

Link Down Behavior 866

Platform Specific Scale Requirement for the Mobility Controller 866

CHAPTER 57

Mobility Network Elements 869

Mobility Agent 869

Mobility Controller 870

Mobility Oracle 871

Guest Controller 871

CHAPTER 58

Mobility Control Protocols 873

About Mobility Control Protocols 873

Initial Association and Roaming 873

Initial Association 874

Intra Switch Handoff	875
Intra Switch Peer Group Handoff	875
Inter Switch Peer Group Handoff	876
Inter Sub Domain Handoff	877
Inter Mobility Group Handoff	879

CHAPTER 59
Configuring Mobility 881

Configuring Mobility Controller	881
Configuring Converged Access Controllers	881
Creating Peer Groups, Peer Group Member, and Bridge Domain ID (CLI)	881
Configuring Local Mobility Group (CLI)	883
Adding a Peer Mobility Group (CLI)	884
Configuring Optional Parameters for Roaming Behavior	884
Pointing the Mobility Controller to a Mobility Oracle (CLI)	885
Configuring Guest Controller	885
Configuring Guest Anchor	887
Configuring Mobility Agent	887
Configuring Mobility Agent by Pointing to Mobility Controller (CLI)	887
Configuring the Mobility Controller for the Mobility Agent (CLI)	888
Adding a Mobility Controller Role to the Mobility Agent	889
Configuring Optional Parameters on a Mobility Agent (CLI)	889

PART IX
Network Management 891

CHAPTER 60
Configuring Cisco IOS Configuration Engine 893

Finding Feature Information	893
Prerequisites for Configuring the Configuration Engine	893
Restrictions for Configuring the Configuration Engine	894
Information About Configuring the Configuration Engine	894
Cisco Configuration Engine Software	894
Configuration Service	895
Event Service	895
NameSpace Mapper	896
Cisco Networking Services IDs and Device Hostnames	896

ConfigID	896
DeviceID	896
Hostname and DeviceID	897
Hostname, DeviceID, and ConfigID	897
Cisco IOS CNS Agents	897
Initial Configuration	897
Incremental (Partial) Configuration	898
Synchronized Configuration	899
Automated CNS Configuration	899
How to Configure the Configuration Engine	900
Enabling the CNS Event Agent	900
Enabling the Cisco IOS CNS Agent	901
Enabling an Initial Configuration for Cisco IOS CNS Agent	903
Refreshing DeviceIDs	908
Enabling a Partial Configuration for Cisco IOS CNS Agent	910
Monitoring CNS Configurations	911
Additional References	912

CHAPTER 61 Configuring the Cisco Discovery Protocol 915

Finding Feature Information	915
Information About CDP	915
CDP Overview	915
Default CDP Configuration	916
How to Configure CDP	916
Configuring CDP Characteristics	916
Disabling CDP	918
Enabling CDP	919
Disabling CDP on an Interface	921
Enabling CDP on an Interface	922
Monitoring and Maintaining CDP	924
Additional References	925

CHAPTER 62 Configuring Simple Network Management Protocol 927

Finding Feature Information	927
-----------------------------	-----

Prerequisites for SNMP	927
Restrictions for SNMP	929
Information About SNMP	930
SNMP Overview	930
SNMP Manager Functions	930
SNMP Agent Functions	930
SNMP Community Strings	931
SNMP MIB Variables Access	931
SNMP Notifications	932
SNMP ifIndex MIB Object Values	932
Default SNMP Configuration	932
SNMP Configuration Guidelines	933
How to Configure SNMP	933
Disabling the SNMP Agent	933
Configuring Community Strings	935
Configuring SNMP Groups and Users	937
Configuring SNMP Notifications	940
Setting the Agent Contact and Location Information	945
Limiting TFTP Servers Used Through SNMP	946
Configuring Trap Flags for SNMP	948
Enabling SNMP Wireless Trap Notification	950
Monitoring SNMP Status	951
SNMP Examples	951
Additional References	952
Feature History and Information for Simple Network Management Protocol	953

CHAPTER 63

Configuring Service Level Agreements	955
Finding Feature Information	955
Restrictions on SLAs	955
Information About SLAs	956
Cisco IOS IP Service Level Agreements (SLAs)	956
Network Performance Measurement with Cisco IOS IP SLAs	957
IP SLA Responder and IP SLA Control Protocol	957
Response Time Computation for IP SLAs	958

IP SLAs Operation Scheduling	959
IP SLA Operation Threshold Monitoring	959
UDP Jitter	960
How to Configure IP SLAs Operations	961
Default Configuration	961
Configuration Guidelines	961
Configuring the IP SLA Responder	962
Implementing IP SLA Network Performance Measurement	963
Analyzing IP Service Levels by Using the UDP Jitter Operation	967
Analyzing IP Service Levels by Using the ICMP Echo Operation	971
Monitoring IP SLA Operations	974
Monitoring IP SLA Operation Examples	975
Additional References	976

CHAPTER 64**Configuring Local Policies 979**

Finding Feature Information	979
Restrictions for Configuring Local Policies	979
Information About Configuring Local Policies	980
How to Configure Local Policies	981
Configuring Local Policies (CLI)	981
Creating an Interface Template (CLI)	981
Creating a Parameter Map (CLI)	982
Creating a Class Map (CLI)	983
Creating a Policy Map (CLI)	984
Applying a Local Policy for a Device on a WLAN (CLI)	985
Monitoring Local Policies	986
Examples: Local Policies Configuration	987
Additional References for Configuring Local Policies	988
Feature History for Performing Local Policies Configuration	989

CHAPTER 65**Configuring SPAN and RSPAN 991**

Finding Feature Information	991
Prerequisites for SPAN and RSPAN	991
Restrictions for SPAN and RSPAN	992

Information About SPAN and RSPAN	993
SPAN and RSPAN	993
Local SPAN	994
Remote SPAN	995
SPAN and RSPAN Concepts and Terminology	996
SPAN and RSPAN Interaction with Other Features	1001
SPAN and RSPAN and Device Stacks	1002
Flow-Based SPAN	1002
Default SPAN and RSPAN Configuration	1003
Configuration Guidelines	1003
SPAN Configuration Guidelines	1003
RSPAN Configuration Guidelines	1003
FSPAN and FRSPAN Configuration Guidelines	1004
How to Configure SPAN and RSPAN	1004
Creating a Local SPAN Session	1004
Creating a Local SPAN Session and Configuring Incoming Traffic	1007
Specifying VLANs to Filter	1009
Configuring a VLAN as an RSPAN VLAN	1011
Creating an RSPAN Source Session	1013
Specifying VLANs to Filter	1015
Creating an RSPAN Destination Session	1017
Creating an RSPAN Destination Session and Configuring Incoming Traffic	1019
Configuring an FSPAN Session	1021
Configuring an FRSPAN Session	1024
Monitoring SPAN and RSPAN Operations	1027
SPAN and RSPAN Configuration Examples	1027
Example: Configuring Local SPAN	1027
Examples: Creating an RSPAN VLAN	1029
Additional References	1030
Feature History and Information for SPAN and RSPAN	1031

CHAPTER 66

Configuring Packet Capture	1033
Finding Feature Information	1033
Prerequisites for Packet Capture	1033

Prerequisites for Packet Capture	1033
Restrictions for Packet Capture	1034
Restrictions for Packet Capture	1034
Introduction to Packet Capture	1037
Overview of Packet Capture Tool	1037
Information about Wireshark	1037
Wireshark Overview	1037
Capture Points	1037
Attachment Points	1038
Filters	1038
Actions	1039
Storage of Captured Packets to Buffer in Memory	1039
Storage of Captured Packets to a .pcap File	1040
Packet Decoding and Display	1040
Packet Storage and Display	1041
Wireshark Capture Point Activation and Deactivation	1041
Wireshark Features	1042
Guidelines for Wireshark	1043
Default Wireshark Configuration	1046
Information About Embedded Packet Capture	1046
Embedded Packet Capture Overview	1046
Benefits of Embedded Packet Capture	1046
Packet Data Capture	1047
Configuring Packet Capture	1047
How to Configure Wireshark	1047
Defining a Capture Point	1048
Adding or Modifying Capture Point Parameters	1053
Deleting Capture Point Parameters	1055
Deleting a Capture Point	1056
Activating and Deactivating a Capture Point	1058
Clearing the Capture Point Buffer	1061
How to Implement Embedded Packet Capture	1063
Managing Packet Data Capture	1063
Monitoring and Maintaining Captured Data	1065

Monitoring Packet Capture	1066
Configuration Examples for Wireshark	1066
Example: Displaying a Brief Output from a .pcap File	1066
Example: Displaying Detailed Output from a .pcap File	1067
Example: Displaying a Packet Dump Output from a .pcap File.	1068
Example: Displaying Packets from a .pcap File using a Display Filter	1069
Example: Displaying the Number of Packets Captured in a .pcap File	1069
Example: Displaying a Single Packet Dump from a .pcap File	1069
Example: Displaying Statistics of Packets Captured in a .pcap File	1070
Example: Simple Capture and Display	1070
Example: Simple Capture and Store	1071
Example: Using Buffer Capture	1074
Example: Simple Capture and Store of Packets in Egress Direction	1080
Configuration Examples for Embedded Packet Capture	1082
Example: Managing Packet Data Capture	1082
Example: Monitoring and Maintaining Captured Data	1082
Additional References	1084

CHAPTER 67

Configuring Flexible NetFlow	1087
Prerequisites for Flexible NetFlow	1087
Restrictions for Flexible NetFlow	1088
Information About Flexible Netflow	1090
Flexible NetFlow Overview	1090
Wireless Flexible NetFlow Overview	1090
Original NetFlow and Benefits of Flexible NetFlow	1091
Flexible NetFlow Components	1092
Flow Records	1093
Flow Exporters	1097
Flow Monitors	1099
Flow Samplers	1101
Supported Flexible NetFlow Fields	1102
Default Settings	1106
How to Configure Flexible NetFlow	1106
Configuring a Customized Flow Record	1106

- Creating a Flow Exporter 1109
- Creating a Customized Flow Monitor 1112
- Configuring and Enabling Flow SamplingCreating a Flow Sampler 1114
- Applying a Flow to an Interface 1116
- Configuring a Bridged NetFlow on a VLAN 1117
- Configuring Layer 2 NetFlow 1118
- Configuring WLAN to Apply Flow Monitor in Data Link Input/Output Direction 1119
- Configuring WLAN to Apply Flow Monitor in IPV4 and IPV6 Input/Output Direction 1120
- Monitoring Flexible NetFlow 1122
- Configuration Examples for Flexible NetFlow 1122
 - Example: Configuring a Flow 1122
 - Example: Monitoring IPv4 ingress traffic 1123
 - Example: Monitoring IPv4 egress traffic 1124
 - Example: Configuring IPv4 Flexible NetFlow in WLAN (Ingress Direction) 1125
 - Example: Configuring IPv6 and Transport Flag Flexible NetFlow in WLAN (Egress Direction) 1126
 - Example: Configuring IPv6 Flexible NetFlow in WLAN (Both Ingress and Egress Directions) 1127
 - Example: Monitoring wireless ingress traffic 1127
- Additional References 1128
- Feature Information for Flexible NetFlow 1129

PART X

QoS 1131

CHAPTER 68

Configuring QoS 1133

- Finding Feature Information 1133
- Prerequisites for Auto-QoS 1134
- Restrictions for Auto-QoS 1134
- Information About Configuring Auto-QoS 1135
 - Auto-QoS Overview 1135
 - Auto-QoS Compact Overview 1135
 - Auto-QoS Global Configuration Templates 1135
 - Auto-QoS Policy and Class Maps 1136
 - Effects of Auto-QoS on Running Configuration 1136
 - Effects of Auto-QoS Compact on Running Configuration 1136
- How to Configure Auto-QoS 1137

Configuring Auto-QoS (CLI)	1137
Upgrading Auto-QoS (CLI)	1139
Enabling Auto-QoS Compact	1142
Monitoring Auto-QoS	1143
Troubleshooting Auto-QoS	1143
Configuration Examples for Auto-QoS	1143
Example: auto qos trust cos	1143
Example: auto qos trust dscp	1146
Example: auto qos video cts	1149
Example: auto qos video ip-camera	1151
Example: auto qos video media-player	1154
Example: auto qos voip trust	1157
Example: auto qos voip cisco-phone	1160
Example: auto qos voip cisco-softphone	1163
auto qos classify police	1168
auto qos global compact	1172
Where to Go Next for Auto-QoS	1173
Additional References for Auto-QoS	1173
Feature History and Information for Auto-QoS	1174
Finding Feature Information	1174
Prerequisites for QoS	1174
QoS Components	1175
QoS Terminology	1175
Information About QoS	1176
QoS Overview	1176
Modular QoS Command-Line Interface	1176
Wireless QoS Overview	1176
QoS and IPv6 for Wireless	1177
Wired and Wireless Access Supported Features	1178
Supported QoS Features on Wireless Targets	1179
Port Policies	1180
Radio Policies	1183
SSID Policies	1183
Client Policies	1183

Hierarchical QoS	1184
Hierarchical Wireless QoS	1185
QoS Implementation	1186
Layer 2 Frame Prioritization Bits	1187
Layer 3 Packet Prioritization Bits	1188
End-to-End QoS Solution Using Classification	1188
Packet Classification	1188
QoS Wired Model	1190
Ingress Port Activity	1191
Egress Port Activity	1191
Classification	1191
Access Control Lists	1192
Class Maps	1192
Policy Maps	1193
Policing	1194
Token-Bucket Algorithm	1195
Marking	1195
Packet Header Marking	1196
Switch Specific Information Marking	1196
Table Map Marking	1196
Traffic Conditioning	1197
Policing	1198
Shaping	1199
Queueing and Scheduling	1200
Bandwidth	1201
Weighted Tail Drop	1202
Priority Queues	1203
Queue Buffer	1203
Queueing in Wireless	1205
Trust Behavior	1206
Trust Behavior for Wired and Wireless Ports	1206
Port Security on a Trusted Boundary for Cisco IP Phones	1207
Wireless QoS Mobility	1207
Inter-Device Roaming	1208

Intra-Device Roaming	1208
Precious Metal Policies for Wireless QoS	1208
Standard QoS Default Settings	1209
Default Wired QoS Configuration	1209
Default Wireless QoS Configuration	1210
Guidelines for QoS Policies	1211
Restrictions for QoS on Wired Targets	1211
Restrictions for QoS on Wireless Targets	1214
How to Configure QoS	1216
Configuring Class, Policy, and Table Maps	1216
Creating a Traffic Class (CLI)	1216
Creating a Traffic Policy (CLI)	1219
Configuring Client Policies	1223
Configuring Class-Based Packet Marking (CLI)	1224
Configuring Class Maps for Voice and Video (CLI)	1229
Attaching a Traffic Policy to an Interface (CLI)	1230
Applying an SSID or Client Policy on a WLAN (CLI)	1232
Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps (CLI)	1233
Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)	1236
Configuring Table Maps (CLI)	1239
Configuring Trust	1242
Configuring Trust Behavior for Wireless Traffic (CLI)	1242
Configuring QoS Features and Functionality	1243
Configuring Call Admission Control (CLI)	1243
Configuring Bandwidth (CLI)	1250
Configuring Police (CLI)	1252
Configuring Priority (CLI)	1254
Configuring Queues and Shaping	1256
Configuring Egress Queue Characteristics	1256
Configuring Queue Buffers (CLI)	1257
Configuring Queue Limits (CLI)	1259
Configuring Shaping (CLI)	1262
Configuring Precious Metal Policies (CLI)	1263
Monitoring QoS	1265

Configuration Examples for QoS	1267
Examples: Classification by Access Control Lists	1267
Examples: Class of Service Layer 2 Classification	1268
Examples: Class of Service DSCP Classification	1268
Examples: VLAN ID Layer 2 Classification	1268
Examples: Classification by DSCP or Precedence Values	1269
Examples: Hierarchical Classification	1269
Examples: Hierarchical Policy Configuration	1269
Examples: Classification for Voice and Video	1270
Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic	1272
Examples: Configuring Downstream SSID Policy	1272
Examples: Ingress SSID Policies	1273
Examples: Client Policies	1274
Examples: Average Rate Shaping Configuration	1276
Examples: Queue-limit Configuration	1277
Examples: Queue Buffers Configuration	1278
Examples: Policing Action Configuration	1278
Examples: Policer VLAN Configuration	1279
Examples: Policing Units	1280
Examples: Single-Rate Two-Color Policing Configuration	1280
Examples: Dual-Rate Three-Color Policing Configuration	1280
Examples: Table Map Marking Configuration	1281
Example: Table Map Configuration to Retain CoS Markings	1282
Where to Go Next	1282
Additional References for QoS	1282
Feature History and Information for QoS	1284

PART XI

Radio Resource Management 1287

CHAPTER 69

Configuring Radio Resource Management 1289

Finding Feature Information	1289
Prerequisites for Configuring Radio Resource Management	1289
Restrictions for Radio Resource Management	1290
Information About Radio Resource Management	1290

Radio Resource Monitoring	1291
Information About RF Groups	1291
RF Group Leader	1292
RF Group Name	1293
Mobility Controller	1293
Mobility Agent	1294
Information About Rogue Access Point Detection in RF Groups	1294
Transmit Power Control	1295
Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings	1295
Dynamic Channel Assignment	1295
Coverage Hole Detection and Correction	1297
How to Configure RRM	1297
Configuring Advanced RRM CCX Parameters (CLI)	1297
Configuring Neighbor Discovery Type (CLI)	1298
Configuring RF Groups	1299
Configuring RF Group Selection Mode (CLI)	1299
Configuring an RF Group Name (CLI)	1300
Configuring Members in a 802.11 Static RF Group (CLI)	1300
Configuring Transmit Power Control	1301
Configuring the Tx-Power Control Threshold (CLI)	1301
Configuring the Tx-Power Level (CLI)	1302
Configuring 802.11 RRM Parameters	1302
Configuring Advanced 802.11 Channel Assignment Parameters (CLI)	1302
Configuring 802.11 Coverage Hole Detection (CLI)	1304
Configuring 802.11 Event Logging (CLI)	1306
Configuring 802.11 Statistics Monitoring (CLI)	1306
Configuring the 802.11 Performance Profile (CLI)	1308
Configuring Rogue Access Point Detection in RF Groups	1309
Configuring Rogue Access Point Detection in RF Groups (CLI)	1309
Monitoring RRM Parameters and RF Group Status	1310
Monitoring RRM Parameters	1310
Monitoring RF Group Status (CLI)	1311
Examples: RF Group Configuration	1312
Information About ED-RRM	1312

Configuring ED-RRM on the Cisco Wireless LAN Controller (CLI) 1312
 Additional References for Radio Resource Management 1313
 Feature History and Information For Performing Radio Resource Management Configuration 1314

CHAPTER 70 **Configuring Optimized Roaming 1315**
 Information About Optimized Roaming 1315
 Restrictions for Optimized Roaming 1315
 Configuring Optimized Roaming (CLI) 1316

CHAPTER 71 **Configuring Rx SOP 1317**
 Information About Rx-SOP 1317
 Configuring Rx SOP (CLI) 1317

PART XII **Routing 1319**

CHAPTER 72 **Configuring MSDP 1321**
 Finding Feature Information 1321
 Information About Configuring MSDP 1321
 MSDP Overview 1322
 MSDP Operation 1322
 MSDP Benefits 1323
 How to Configure MSDP 1324
 Default MSDP Configuration 1324
 Configuring a Default MSDP Peer 1324
 Caching Source-Active State 1326
 Controlling Source Information that Your Switch Originates 1327
 Redistributing Sources 1327
 Filtering Source-Active Request Messages 1329
 Controlling Source Information that Your Switch Forwards 1331
 Using a Filter 1331
 Using TTL to Limit the Multicast Data Sent in SA Messages 1333
 Controlling Source Information that Your Switch Receives 1334
 Configuring an MSDP Mesh Group 1336
 Shutting Down an MSDP Peer 1337

Including a Bordering PIM Dense-Mode Region in MSDP	1338
Configuring an Originating Address other than the RP Address	1340
Monitoring and Maintaining MSDP	1341
Configuration Examples for Configuring MSDP	1342
Configuring a Default MSDP Peer: Example	1342
Caching Source-Active State: Example	1342
Controlling Source Information that Your Switch Originates: Example	1343
Controlling Source Information that Your Switch Forwards: Example	1343
Controlling Source Information that Your Switch Receives: Example	1343

CHAPTER 73

Configuring IP Unicast Routing	1345
Finding Feature Information	1346
Information About Configuring IP Unicast Routing	1346
Information About IP Routing	1346
Types of Routing	1347
IP Routing and Switch Stacks	1348
Classless Routing	1349
Address Resolution	1350
Proxy ARP	1351
ICMP Router Discovery Protocol	1351
UDP Broadcast Packets and Protocols	1352
Broadcast Packet Handling	1352
IP Broadcast Flooding	1352
How to Configure IP Routing	1353
How to Configure IP Addressing	1354
Default IP Addressing Configuration	1354
Assigning IP Addresses to Network Interfaces	1356
Using Subnet Zero	1357
Disabling Classless Routing	1358
Configuring Address Resolution Methods	1359
Defining a Static ARP Cache	1359
Setting ARP Encapsulation	1361
Enabling Proxy ARP	1362
Routing Assistance When IP Routing is Disabled	1363

Proxy ARP	1363
Default Gateway	1363
ICMP Router Discovery Protocol (IRDP)	1364
Configuring Broadcast Packet Handling	1366
Enabling Directed Broadcast-to-Physical Broadcast Translation	1366
Forwarding UDP Broadcast Packets and Protocols	1368
Establishing an IP Broadcast Address	1369
Flooding IP Broadcasts	1370
Monitoring and Maintaining IP Addressing	1372
How to Configure IP Unicast Routing	1373
Enabling IP Unicast Routing	1373
Example of Enabling IP Routing	1374
What to Do Next	1374
Information About RIP	1374
Summary Addresses and Split Horizon	1375
How to Configure RIP	1375
Default RIP Configuration	1375
Configuring Basic RIP Parameters	1376
Configuring RIP Authentication	1378
Configuring Summary Addresses and Split Horizon	1379
Configuring Split Horizon	1381
Configuration Example for Summary Addresses and Split Horizon	1382
Information About OSPF	1382
OSPF Nonstop Forwarding	1383
OSPF NSF Awareness	1383
OSPF NSF Capability	1383
OSPF Area Parameters	1384
Other OSPF Parameters	1384
LSA Group Pacing	1385
Loopback Interfaces	1385
How to Configure OSPF	1386
Default OSPF Configuration	1386
Configuring Basic OSPF Parameters	1387
Configuring OSPF Interfaces	1389

Configuring OSPF Area Parameters	1391
Configuring Other OSPF Parameters	1393
Changing LSA Group Pacing	1395
Configuring a Loopback Interface	1395
Monitoring OSPF	1396
Configuration Examples for OSPF	1397
Example: Configuring Basic OSPF Parameters	1397
Information About EIGRP	1397
EIGRP Features	1398
EIGRP Components	1398
EIGRP Nonstop Forwarding	1399
EIGRP NSF Awareness	1399
EIGRP NSF Capability	1399
EIGRP Stub Routing	1400
How to Configure EIGRP	1401
Default EIGRP Configuration	1401
Configuring Basic EIGRP Parameters	1403
Configuring EIGRP Interfaces	1404
Configuring EIGRP Route Authentication	1406
Monitoring and Maintaining EIGRP	1408
Information About BGP	1408
BGP Network Topology	1408
Nonstop Forwarding Awareness	1410
Information About BGP Routing	1410
Routing Policy Changes	1410
BGP Decision Attributes	1411
Route Maps	1412
BGP Filtering	1412
Prefix List for BGP Filtering	1413
BGP Community Filtering	1413
BGP Neighbors and Peer Groups	1414
Aggregate Routes	1414
Routing Domain Confederations	1414
BGP Route Reflectors	1414

Route Dampening	1415
How to Configure BGP	1415
Default BGP Configuration	1415
Enabling BGP Routing	1419
Managing Routing Policy Changes	1421
Configuring BGP Decision Attributes	1422
Configuring BGP Filtering with Route Maps	1424
Configuring BGP Filtering by Neighbor	1425
Configuring BGP Filtering by Access Lists and Neighbors	1426
Configuring Prefix Lists for BGP Filtering	1427
Configuring BGP Community Filtering	1428
Configuring BGP Neighbors and Peer Groups	1430
Configuring Aggregate Addresses in a Routing Table	1432
Configuring Routing Domain Confederations	1433
Configuring BGP Route Reflectors	1435
Configuring Route Dampening	1436
Monitoring and Maintaining BGP	1437
Configuration Examples for BGP	1438
Example: Configuring BGP on Routers	1438
Information About ISO CLNS Routing	1440
Connectionless Routing	1440
Information About IS-IS Routing	1440
Nonstop Forwarding Awareness	1441
IS-IS Global Parameters	1441
IS-IS Interface Parameters	1442
How to Configure ISO CLNS Routing	1443
Default IS-IS Configuration	1443
Enabling IS-IS Routing	1444
Configuring IS-IS Global Parameters	1446
Configuring IS-IS Interface Parameters	1449
Monitoring and Maintaining ISO IGRP and IS-IS	1451
Configuration Examples for ISO CLNS Routing	1453
Example: Configuring IS-IS Routing	1453
Information About Multi-VRF CE	1454

Understanding Multi-VRF CE	1454
Network Topology	1455
Packet-Forwarding Process	1455
Network Components	1456
VRF-Aware Services	1456
How to Configure Multi-VRF CE	1456
Default Multi-VRF CE Configuration	1456
Multi-VRF CE Configuration Guidelines	1457
Configuring VRFs	1457
Configuring VRF-Aware Services	1459
Configuring VRF-Aware Services for ARP	1459
Configuring VRF-Aware Services for Ping	1460
Configuring VRF-Aware Services for SNMP	1460
Configuring VRF-Aware Services for uRPF	1461
Configuring VRF-Aware RADIUS	1462
Configuring VRF-Aware Services for Syslog	1462
Configuring VRF-Aware Services for Traceroute	1463
Configuring VRF-Aware Services for FTP and TFTP	1463
Configuring Multicast VRFs	1464
Configuring a VPN Routing Session	1466
Configuring BGP PE to CE Routing Sessions	1467
Monitoring Multi-VRF CE	1469
Configuration Examples for Multi-VRF CE	1469
Multi-VRF CE Configuration Example	1469
Configuring Unicast Reverse Path Forwarding	1473
Protocol-Independent Features	1473
Distributed Cisco Express Forwarding	1474
Information About Cisco Express Forwarding	1474
How to Configure Cisco Express Forwarding	1474
Load-Balancing Scheme for CEF Traffic	1476
Restrictions for Configuring a Load-Balancing Scheme for CEF Traffic	1476
Prerequisites for Configuring a Load-Balancing Scheme for CEF Traffic	1476
CEF Load-Balancing Overview	1476
Per-Destination Load Balancing for CEF Traffic	1477

- Per-Packet Load Balancing for CEF Traffic 1477
- Load-Balancing Algorithms for CEF Traffic 1477
- How to Configure a Load-Balancing for CEF Traffic 1477
- Configuration Examples for CEF Traffic Load-Balancing 1480
- Number of Equal-Cost Routing Paths 1481
 - Information About Equal-Cost Routing Paths 1481
 - How to Configure Equal-Cost Routing Paths 1481
- Static Unicast Routes 1482
 - Information About Static Unicast Routes 1482
 - Configuring Static Unicast Routes 1483
- Default Routes and Networks 1484
 - Information About Default Routes and Networks 1484
 - How to Configure Default Routes and Networks 1485
- Route Maps to Redistribute Routing Information 1485
 - Information About Route Maps 1485
 - How to Configure a Route Map 1486
 - How to Control Route Distribution 1489
- Policy-Based Routing 1491
 - Information About Policy-Based Routing 1491
 - How to Configure PBR 1492
- Filtering Routing Information 1495
 - Setting Passive Interfaces 1495
 - Controlling Advertising and Processing in Routing Updates 1496
 - Filtering Sources of Routing Information 1497
- Managing Authentication Keys 1498
 - Prerequisites 1498
 - How to Configure Authentication Keys 1499
- Monitoring and Maintaining the IP Network 1500

PART XIII

Security 1501

CHAPTER 74

Preventing Unauthorized Access 1503

- Finding Feature Information 1503
- Preventing Unauthorized Access 1503

CHAPTER 75	Controlling Switch Access with Passwords and Privilege Levels	1505
	Finding Feature Information	1505
	Restrictions for Controlling Switch Access with Passwords and Privileges	1505
	Information About Passwords and Privilege Levels	1506
	Default Password and Privilege Level Configuration	1506
	Additional Password Security	1506
	Password Recovery	1506
	Terminal Line Telnet Configuration	1507
	Username and Password Pairs	1507
	Privilege Levels	1507
	How to Control Switch Access with Passwords and Privilege Levels	1508
	Setting or Changing a Static Enable Password	1508
	Protecting Enable and Enable Secret Passwords with Encryption	1510
	Disabling Password Recovery	1511
	Setting a Telnet Password for a Terminal Line	1513
	Configuring Username and Password Pairs	1514
	Setting the Privilege Level for a Command	1516
	Changing the Default Privilege Level for Lines	1518
	Logging into and Exiting a Privilege Level	1519
	Monitoring Switch Access	1520
	Configuration Examples for Setting Passwords and Privilege Levels	1520
	Example: Setting or Changing a Static Enable Password	1520
	Example: Protecting Enable and Enable Secret Passwords with Encryption	1520
	Example: Setting a Telnet Password for a Terminal Line	1520
	Example: Setting the Privilege Level for a Command	1521
	Additional References	1521
CHAPTER 76	Configuring TACACS+	1523
	Finding Feature Information	1523
	Prerequisites for TACACS+	1523
	Information About TACACS+	1525
	TACACS+ and Switch Access	1525
	TACACS+ Overview	1525

TACACS+ Operation	1526
Method List	1527
TACACS+ Configuration Options	1527
TACACS+ Login Authentication	1527
TACACS+ Authorization for Privileged EXEC Access and Network Services	1528
TACACS+ Accounting	1528
Default TACACS+ Configuration	1528
How to Configure TACACS+	1528
Identifying the TACACS+ Server Host and Setting the Authentication Key	1529
Configuring TACACS+ Login Authentication	1530
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services	1533
Starting TACACS+ Accounting	1535
Establishing a Session with a Router if the AAA Server is Unreachable	1536
Monitoring TACACS+	1536

CHAPTER 77
Configuring RADIUS 1537

Finding Feature Information	1537
Prerequisites for Configuring RADIUS	1537
Restrictions for Configuring RADIUS	1538
Information about RADIUS	1539
RADIUS and Switch Access	1539
RADIUS Overview	1539
RADIUS Operation	1540
RADIUS Change of Authorization	1541
Change-of-Authorization Requests	1542
CoA Request Response Code	1544
CoA Request Commands	1545
Stacking Guidelines for Session Termination	1547
Default RADIUS Configuration	1548
RADIUS Server Host	1548
RADIUS Login Authentication	1549
AAA Server Groups	1550
AAA Authorization	1550
RADIUS Accounting	1550

Vendor-Specific RADIUS Attributes	1550
Vendor-Proprietary RADIUS Server Communication	1562
How to Configure RADIUS	1562
Identifying the RADIUS Server Host	1562
Configuring RADIUS Login Authentication	1565
Defining AAA Server Groups	1567
Configuring RADIUS Authorization for User Privileged Access and Network Services	1569
Starting RADIUS Accounting	1570
Configuring Settings for All RADIUS Servers	1572
Configuring the Device to Use Vendor-Specific RADIUS Attributes	1574
Configuring the Device for Vendor-Proprietary RADIUS Server Communication	1575
Configuring CoA on the Device	1577
Monitoring CoA Functionality	1579
Additional References	1580

CHAPTER 78
Configuring Kerberos 1583

Finding Feature Information	1583
Prerequisites for Controlling Switch Access with Kerberos	1583
Information about Kerberos	1584
Kerberos and Switch Access	1584
Kerberos Overview	1584
Kerberos Operation	1586
Authenticating to a Boundary Switch	1586
Obtaining a TGT from a KDC	1587
Authenticating to Network Services	1587
How to Configure Kerberos	1587
Monitoring the Kerberos Configuration	1587
Additional References	1588

CHAPTER 79
Configuring Local Authentication and Authorization 1591

Finding Feature Information	1591
How to Configure Local Authentication and Authorization	1591
Configuring the Switch for Local Authentication and Authorization	1591
Monitoring Local Authentication and Authorization	1594

Additional References 1594

CHAPTER 80

Configuring Secure Shell (SSH) 1595

Finding Feature Information 1595

Prerequisites for Configuring Secure Shell 1595

Restrictions for Configuring Secure Shell 1596

Information about SSH 1596

SSH and Switch Access 1596

SSH Servers, Integrated Clients, and Supported Versions 1597

SSH Configuration Guidelines 1597

Secure Copy Protocol Overview 1598

Secure Copy Protocol 1598

How to Configure SSH 1599

Setting Up the Device to Run SSH 1599

Configuring the SSH Server 1600

Monitoring the SSH Configuration and Status 1602

Additional References 1603

CHAPTER 81

X.509v3 Certificates for SSH Authentication 1605

X.509v3 Certificates for SSH Authentication 1605

Prerequisites for Digital Certificates for SSH Authentication 1605

Restrictions for X.509v3 Certificates for SSH Authentication 1605

Information About X.509v3 Certificates for SSH Authentication 1606

Digital Certificates 1606

Server and User Authentication using X.509v3 1606

How to Configure X.509v3 Certificates for SSH Authentication 1606

Configuring IOS SSH Server to Use Digital Certificates for Sever Authentication 1606

Configuring IOS SSH Server to Verify User's Digital Certificate for User Authentication 1608

Verifying Configuration for Server and User Authentication Using Digital Certificates 1609

Configuration Examples for X.509v3 Certificates for SSH Authentication 1610

Example: Configuring IOS SSH Server to Use Digital Certificates for Server Authentication 1610

Example: Configuring IOS SSH Server to Verify User's Digital Certificate for User Authentication
1610

Additional References for X.509v3 Certificates for SSH Authentication 1611

Feature Information for X.509v3 Certificates for SSH Authentication 1612

CHAPTER 82

Configuring Secure Socket Layer HTTP 1613

- Finding Feature Information 1613
- Information about Secure Sockets Layer (SSL) HTTP 1613
 - Secure HTTP Servers and Clients Overview 1613
 - Certificate Authority Trustpoints 1614
 - CipherSuites 1615
 - Default SSL Configuration 1616
 - SSL Configuration Guidelines 1616
- How to Configure Secure HTTP Servers and Clients 1617
 - Configuring a CA Trustpoint 1617
 - Configuring the Secure HTTP Server 1619
 - Configuring the Secure HTTP Client 1622
- Monitoring Secure HTTP Server and Client Status 1623
- Additional References 1623

CHAPTER 83

Configuring IPv4 ACLs 1625

- Finding Feature Information 1625
- Prerequisites for Configuring IPv4 Access Control Lists 1625
- Restrictions for Configuring IPv4 Access Control Lists 1625
- Information about Network Security with ACLs 1627
 - ACL Overview 1627
 - Access Control Entries 1627
 - ACL Supported Types 1627
 - Supported ACLs 1627
 - ACL Precedence 1628
 - Port ACLs 1628
 - Router ACLs 1629
 - VLAN Maps 1630
 - ACEs and Fragmented and Unfragmented Traffic 1630
 - ACEs and Fragmented and Unfragmented Traffic Examples 1631
- ACLs and Switch Stacks 1631
 - Active Switch and ACL Functions 1631

Stack Member and ACL Functions	1632
Active Switch Failure and ACLs	1632
Standard and Extended IPv4 ACLs	1632
IPv4 ACL Switch Unsupported Features	1632
Access List Numbers	1632
Numbered Standard IPv4 ACLs	1633
Numbered Extended IPv4 ACLs	1634
Named IPv4 ACLs	1634
ACL Logging	1635
Hardware and Software Treatment of IP ACLs	1635
VLAN Map Configuration Guidelines	1636
VLAN Maps with Router ACLs	1637
VLAN Maps and Router ACL Configuration Guidelines	1637
Time Ranges for ACLs	1637
IPv4 ACL Interface Considerations	1638
How to Configure ACLs	1639
Configuring IPv4 ACLs	1639
Creating a Numbered Standard ACL	1639
Creating a Numbered Extended ACL	1641
Creating Named Standard ACLs	1644
Creating Extended Named ACLs	1646
Configuring Time Ranges for ACLs	1647
Applying an IPv4 ACL to a Terminal Line	1649
Applying an IPv4 ACL to an Interface	1650
Creating Named MAC Extended ACLs	1652
Applying a MAC ACL to a Layer 2 Interface	1653
Configuring VLAN Maps	1655
Creating a VLAN Map	1657
Applying a VLAN Map to a VLAN	1658
Monitoring IPv4 ACLs	1659
Configuration Examples for ACLs	1660
Examples: Using Time Ranges with ACLs	1660
Examples: Including Comments in ACLs	1661
IPv4 ACL Configuration Examples	1662

ACLs in a Small Networked Office	1662
Examples: ACLs in a Small Networked Office	1662
Example: Numbered ACLs	1663
Examples: Extended ACLs	1663
Examples: Named ACLs	1664
Examples: Time Range Applied to an IP ACL	1665
Examples: Configuring Commented IP ACL Entries	1665
Examples: ACL Logging	1666
Configuration Examples for ACLs and VLAN Maps	1667
Example: Creating an ACL and a VLAN Map to Deny a Packet	1667
Example: Creating an ACL and a VLAN Map to Permit a Packet	1667
Example: Default Action of Dropping IP Packets and Forwarding MAC Packets	1667
Example: Default Action of Dropping MAC Packets and Forwarding IP Packets	1668
Example: Default Action of Dropping All Packets	1669
Configuration Examples for Using VLAN Maps in Your Network	1669
Example: Wiring Closet Configuration	1669
Example: Restricting Access to a Server on Another VLAN	1670
Example: Denying Access to a Server on Another VLAN	1671
Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs	1671
Example: ACLs and Switched Packets	1671
Example: ACLs and Bridged Packets	1672
Example: ACLs and Routed Packets	1672
Example: ACLs and Multicast Packets	1673
Additional References	1674

CHAPTER 84
Configuring IPv6 ACLs 1677

Finding Feature Information	1677
IPv6 ACLs Overview	1677
Switch Stacks and IPv6 ACLs	1678
Interactions with Other Features and Switches	1678
Restrictions for IPv6 ACLs	1678
Default Configuration for IPv6 ACLs	1679
Configuring IPv6 ACLs	1679
Attaching an IPv6 ACL to an Interface	1683

Monitoring IPv6 ACLs 1685

Additional References 1685

CHAPTER 85

Configuring DHCP 1687

Finding Feature Information 1687

Information About DHCP 1687

DHCP Server 1687

DHCP Relay Agent 1687

DHCP Snooping 1688

Option-82 Data Insertion 1689

Cisco IOS DHCP Server Database 1692

DHCP Snooping Binding Database 1692

DHCP Snooping and Switch Stacks 1693

How to Configure DHCP Features 1694

Default DHCP Snooping Configuration 1694

DHCP Snooping Configuration Guidelines 1695

Configuring the DHCP Server 1695

DHCP Server and Switch Stacks 1695

Configuring the DHCP Relay Agent 1695

Specifying the Packet Forwarding Address 1697

Prerequisites for Configuring DHCP Snooping and Option 82 1699

Enabling DHCP Snooping and Option 82 1700

Enabling the Cisco IOS DHCP Server Database 1703

Monitoring DHCP Snooping Information 1703

Configuring DHCP Server Port-Based Address Allocation 1704

Information About Configuring DHCP Server Port-Based Address Allocation 1704

Default Port-Based Address Allocation Configuration 1704

Port-Based Address Allocation Configuration Guidelines 1704

Enabling the DHCP Snooping Binding Database Agent 1704

Enabling DHCP Server Port-Based Address Allocation 1706

Monitoring DHCP Server Port-Based Address Allocation 1708

Additional References 1709

CHAPTER 86

Configuring IP Source Guard 1711

Finding Feature Information	1711
Information About IP Source Guard	1711
IP Source Guard	1711
IP Source Guard for Static Hosts	1712
IP Source Guard Configuration Guidelines	1713
How to Configure IP Source Guard	1713
Enabling IP Source Guard	1713
Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port	1715
Monitoring IP Source Guard	1717
Additional References	1717

CHAPTER 87**Configuring Dynamic ARP Inspection 1719**

Finding Feature Information	1719
Restrictions for Dynamic ARP Inspection	1719
Understanding Dynamic ARP Inspection	1721
Interface Trust States and Network Security	1722
Rate Limiting of ARP Packets	1723
Relative Priority of ARP ACLs and DHCP Snooping Entries	1724
Logging of Dropped Packets	1724
Default Dynamic ARP Inspection Configuration	1724
Relative Priority of ARP ACLs and DHCP Snooping Entries	1725
Configuring ARP ACLs for Non-DHCP Environments	1725
Configuring Dynamic ARP Inspection in DHCP Environments	1728
Limiting the Rate of Incoming ARP Packets	1730
Performing Dynamic ARP Inspection Validation Checks	1732
Monitoring DAI	1734
Verifying the DAI Configuration	1734
Additional References	1735

CHAPTER 88**Configuring IEEE 802.1x Port-Based Authentication 1737**

Finding Feature Information	1737
Information About 802.1x Port-Based Authentication	1737
Port-Based Authentication Process	1738
Port-Based Authentication Initiation and Message Exchange	1740

Authentication Manager for Port-Based Authentication	1741
Port-Based Authentication Methods	1741
Per-User ACLs and Filter-Ids	1742
Port-Based Authentication Manager CLI Commands	1742
Ports in Authorized and Unauthorized States	1744
Port-Based Authentication and Switch Stacks	1745
802.1x Host Mode	1745
802.1x Multiple Authentication Mode	1746
Multi-auth Per User VLAN assignment	1747
MAC Move	1748
MAC Replace	1749
802.1x Accounting	1749
802.1x Accounting Attribute-Value Pairs	1749
802.1x Readiness Check	1751
Switch-to-RADIUS-Server Communication	1751
802.1x Authentication with VLAN Assignment	1751
802.1x Authentication with Per-User ACLs	1753
802.1x Authentication with Downloadable ACLs and Redirect URLs	1754
Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL	1754
Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs	1755
VLAN ID-based MAC Authentication	1755
802.1x Authentication with Guest VLAN	1755
802.1x Authentication with Restricted VLAN	1756
802.1x Authentication with Inaccessible Authentication Bypass	1757
Inaccessible Authentication Bypass Support on Multiple-Authentication Ports	1757
Inaccessible Authentication Bypass Authentication Results	1758
Inaccessible Authentication Bypass Feature Interactions	1758
802.1x Critical Voice VLAN	1759
802.1x User Distribution	1760
802.1x User Distribution Configuration Guidelines	1760
IEEE 802.1x Authentication with Voice VLAN Ports	1760
IEEE 802.1x Authentication with Port Security	1761
IEEE 802.1x Authentication with Wake-on-LAN	1761
IEEE 802.1x Authentication with MAC Authentication Bypass	1762

Network Admission Control Layer 2 IEEE 802.1x Validation	1763
Flexible Authentication Ordering	1763
Open1x Authentication	1764
Multidomain Authentication	1764
Voice Aware 802.1x Security	1766
Common Session ID	1766
How to Configure 802.1x Port-Based Authentication	1767
Default 802.1x Authentication Configuration	1767
802.1x Authentication Configuration Guidelines	1768
802.1x Authentication	1768
VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass	1769
MAC Authentication Bypass	1770
Maximum Number of Allowed Devices Per Port	1770
Configuring 802.1x Readiness Check	1771
Configuring Voice Aware 802.1x Security	1772
Configuring 802.1x Violation Modes	1774
Configuring 802.1x Authentication	1776
Configuring 802.1x Port-Based Authentication	1777
Configuring the Switch-to-RADIUS-Server Communication	1779
Configuring the Host Mode	1781
Configuring Periodic Re-Authentication	1782
Changing the Quiet Period	1783
Changing the Switch-to-Client Retransmission Time	1785
Setting the Switch-to-Client Frame-Retransmission Number	1786
Setting the Re-Authentication Number	1787
Enabling MAC Move	1788
Enabling MAC Replace	1789
Configuring 802.1x Accounting	1791
Configuring a Guest VLAN	1792
Configuring a Restricted VLAN	1793
Configuring Number of Authentication Attempts on a Restricted VLAN	1795
Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN	1796
Example of Configuring Inaccessible Authentication Bypass	1799

- Configuring 802.1x Authentication with WoL 1800
- Configuring MAC Authentication Bypass 1801
- Configuring 802.1x User Distribution 1802
 - Example of Configuring VLAN Groups 1803
- Configuring NAC Layer 2 802.1x Validation 1803
- Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs 1805
 - Configuring Downloadable ACLs 1805
 - Configuring a Downloadable Policy 1807
- Configuring VLAN ID-based MAC Authentication 1809
- Configuring Flexible Authentication Ordering 1810
- Configuring Open1x 1811
- Disabling 802.1x Authentication on the Port 1813
- Resetting the 802.1x Authentication Configuration to the Default Values 1814
- Monitoring 802.1x Statistics and Status 1815
- Additional References 1816

CHAPTER 89

- Configuring Device Sensor 1819**
 - About Device Sensor 1819
 - MSP-IOS Sensor Device Classifier Interaction 1820
 - Configuring Device Sensor 1821
 - Enabling MSP 1821
 - Enabling Accounting Augmentation 1822
 - Creating a Cisco Discovery Protocol Filter 1822
 - Creating an LLDP Filter 1823
 - Creating a DHCP Filter 1823
 - Applying a Protocol Filter to the Device Sensor Output 1824
 - Tracking TLV Changes 1825
 - Verifying the Device Sensor Configuration 1825
 - Troubleshooting Commands 1826
 - Restrictions for Device Sensor 1826
 - Configuration Examples for the Device Sensor Feature 1826
 - Feature Information for Device Sensor 1827

CHAPTER 90

- Configuring Web-Based Authentication 1829**

Finding Feature Information	1829
Web-Based Authentication Overview	1829
Device Roles	1830
Host Detection	1830
Session Creation	1831
Authentication Process	1831
Local Web Authentication Banner	1832
Web Authentication Customizable Web Pages	1835
Guidelines	1835
Authentication Proxy Web Page Guidelines	1836
Redirection URL for Successful Login Guidelines	1837
Web-based Authentication Interactions with Other Features	1837
Port Security	1837
LAN Port IP	1837
Gateway IP	1837
ACLs	1838
Context-Based Access Control	1838
EtherChannel	1838
How to Configure Web-Based Authentication	1838
Default Web-Based Authentication Configuration	1838
Web-Based Authentication Configuration Guidelines and Restrictions	1839
Configuring the Authentication Rule and Interfaces	1840
Configuring AAA Authentication	1842
Configuring Switch-to-RADIUS-Server Communication	1844
Configuring the HTTP Server	1846
Customizing the Authentication Proxy Web Pages	1847
Specifying a Redirection URL for Successful Login	1849
Configuring the Web-Based Authentication Parameters	1850
Configuring a Web-Based Authentication Local Banner	1851
Removing Web-Based Authentication Cache Entries	1852
Monitoring Web-Based Authentication Status	1853
CHAPTER 91	
Configuring Port-Based Traffic Control	1855
Overview of Port-Based Traffic Control	1855

Finding Feature Information	1856
Information About Storm Control	1856
Storm Control	1856
How Traffic Activity is Measured	1856
Traffic Patterns	1857
How to Configure Storm Control	1858
Configuring Storm Control and Threshold Levels	1858
Information About Protected Ports	1860
Protected Ports	1860
Default Protected Port Configuration	1861
Protected Ports Guidelines	1861
How to Configure Protected Ports	1861
Configuring a Protected Port	1861
Monitoring Protected Ports	1863
Information About Port Blocking	1863
Port Blocking	1863
How to Configure Port Blocking	1863
Blocking Flooded Traffic on an Interface	1863
Monitoring Port Blocking	1865
Prerequisites for Port Security	1865
Restrictions for Port Security	1865
Information About Port Security	1866
Port Security	1866
Types of Secure MAC Addresses	1866
Sticky Secure MAC Addresses	1866
Security Violations	1867
Port Security Aging	1868
Port Security and Switch Stacks	1868
Default Port Security Configuration	1868
Port Security Configuration Guidelines	1869
Overview of Port-Based Traffic Control	1870
How to Configure Port Security	1871
Enabling and Configuring Port Security	1871
Enabling and Configuring Port Security Aging	1876

Finding Feature Information	1878
Information About Storm Control	1878
Storm Control	1878
How Traffic Activity is Measured	1878
Traffic Patterns	1879
How to Configure Storm Control	1879
Configuring Storm Control and Threshold Levels	1879
Finding Feature Information	1882
Information About Protected Ports	1882
Protected Ports	1882
Default Protected Port Configuration	1882
Protected Ports Guidelines	1883
How to Configure Protected Ports	1883
Configuring a Protected Port	1883
Monitoring Protected Ports	1884
Where to Go Next	1884
Additional References	1885
Feature Information	1885
Finding Feature Information	1885
Information About Port Blocking	1886
Port Blocking	1886
How to Configure Port Blocking	1886
Blocking Flooded Traffic on an Interface	1886
Monitoring Port Blocking	1888
Where to Go Next	1888
Additional References	1888
Feature Information	1889
Monitoring Port Security	1889
Configuration Examples for Port Security	1889

CHAPTER 92
Configuring IPv6 First Hop Security 1891

Finding Feature Information	1891
Prerequisites for First Hop Security in IPv6	1891
Restrictions for First Hop Security in IPv6	1892

Information about First Hop Security in IPv6	1892
How to Configure an IPv6 Snooping Policy	1894
How to Attach an IPv6 Snooping Policy to an Interface	1896
How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface	1898
How to Attach an IPv6 Snooping Policy to VLANs Globally	1899
How to Configure the IPv6 Binding Table Content	1900
How to Configure an IPv6 Neighbor Discovery Inspection Policy	1901
How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface	1903
How to Attach an IPv6 Neighbor Discovery Inspection Policy to a Layer 2 EtherChannel Interface	1904
How to Attach an IPv6 Neighbor Discovery Inspection Policy to VLANs Globally	1905
How to Configure an IPv6 Router Advertisement Guard Policy	1906
How to Attach an IPv6 Router Advertisement Guard Policy to an Interface	1908
How to Attach an IPv6 Router Advertisement Guard Policy to a Layer 2 EtherChannel Interface	1909
How to Attach an IPv6 Router Advertisement Guard Policy to VLANs Globally	1911
How to Configure an IPv6 DHCP Guard Policy	1911
How to Attach an IPv6 DHCP Guard Policy to an Interface or a VLAN on an Interface	1914
How to Attach an IPv6 DHCP Guard Policy to a Layer 2 EtherChannel Interface	1915
How to Attach an IPv6 DHCP Guard Policy to VLANs Globally	1916
How to Configure IPv6 Source Guard	1917
How to Attach an IPv6 Source Guard Policy to an Interface	1918
How to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface	1919
How to Configure IPv6 Prefix Guard	1920
How to Attach an IPv6 Prefix Guard Policy to an Interface	1921
How to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface	1922
Configuration Examples for IPv6 First Hop Security	1923
Examples: How to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface	1923
Examples: How to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface	1924
Additional References	1924

CHAPTER 93

Configuring Cisco TrustSec 1927

Information about Cisco TrustSec	1927
Finding Feature Information	1927

Cisco TrustSec Features	1928
Feature Information for Cisco TrustSec	1930

CHAPTER 94**Configuring Control Plane Policing 1931**

Finding Feature Information	1931
Restrictions for CoPP	1931
Information About Control Plane Policing	1932
CoPP Overview	1932
System-Defined Aspects of CoPP	1932
User-Configurable Aspects of CoPP	1934
How to Configure CoPP	1935
Enabling a CPU Queue or Changing the Policer Rate	1935
Disabling a CPU Queue	1937
Setting the Default Policer Rates for All CPU Queues	1938
Examples for Configuring CoPP	1939
Example: Enabling a CPU Queue or Changing the Policer Rate of a CPU Queue	1939
Example: Disabling a CPU Queue	1940
Example: Setting the Default Policer Rates for All CPU Queues	1941
Monitoring CoPP	1942
Additional References for CoPP	1943
Feature History and Information For CoPP	1944

CHAPTER 95**Configuring Wireless Guest Access 1945**

Finding Feature Information	1945
Prerequisites for Guest Access	1945
Restrictions for Guest Access	1946
Information about Wireless Guest Access	1946
Fast Secure Roaming	1946
How to Configure Guest Access	1947
Creating a Lobby Administrator Account	1947
Configuring Guest User Accounts	1948
Configuring Mobility Agent (MA)	1949
Configuring Mobility Controller	1950
Obtaining a Web Authentication Certificate	1952

Displaying a Web Authentication Certificate	1952
Choosing the Default Web Authentication Login Page	1953
Choosing a Customized Web Authentication Login Page from an External Web Server	1954
Assigning Login, Login Failure, and Logout Pages per WLAN	1956
Configuring AAA-Override	1957
Configuring Client Load Balancing	1958
Configuring Preauthentication ACL	1959
Configuring IOS ACL Definition	1960
Configuring Webpassthrough	1961
Configuration Examples for Guest Access	1962
Example: Creating a Lobby Ambassador Account	1962
Example: Obtaining Web Authentication Certificate	1962
Example: Displaying a Web Authentication Certificate	1964
Example: Configuring Guest User Accounts	1964
Example: Configuring Mobility Controller	1965
Example: Choosing the Default Web Authentication Login Page	1965
Example: Choosing a Customized Web Authentication Login Page from an External Web Server	1966
Example: Assigning Login, Login Failure, and Logout Pages per WLAN	1966
Example: Configuring AAA-Override	1967
Example: Configuring Client Load Balancing	1967
Example: Configuring Preauthentication ACL	1967
Example: Configuring IOS ACL Definition	1968
Example: Configuring Webpassthrough	1968
Additional References for Guest Access	1968
Feature History and Information for Guest Access	1969

CHAPTER 96**Managing Rogue Devices 1971**

Finding Feature Information	1971
Information About Rogue Devices	1971
How to Configure Rogue Detection	1976
Configuring Rogue Detection (CLI)	1976
Monitoring Rogue Detection	1977
Examples: Rogue Detection Configuration	1978

Additional References for Rogue Detection	1978
Feature History and Information For Performing Rogue Detection Configuration	1979

CHAPTER 97

Classifying Rogue Access Points	1981
Finding Feature Information	1981
Information About Classifying Rogue Access Points	1981
Restrictions for Classifying Rogue Access Points	1984
How to Classify Rogue Access Points	1985
Configuring Rogue Classification Rules (CLI)	1985
Examples: Classifying Rogue Access Points	1988
Additional References for Classifying Rogue Access Points	1988
Feature History and Information For Classifying Rogue Access Points	1989

CHAPTER 98

Configuring wIPS	1991
Finding Feature Information	1991
Information About wIPS	1991
How to Configure wIPS on an Access Point	1997
Configuring wIPS on an Access Point (CLI)	1997
Monitoring wIPS Information	1998
Examples: wIPS Configuration	1998
Additional References for Configuring wIPS	1998
Feature History for Performing wIPS Configuration	1999

CHAPTER 99

Configuring Intrusion Detection System	2001
Finding Feature Information	2001
Information About Intrusion Detection System	2001
How to Configure Intrusion Detection System	2002
Configuring IDS Sensors	2002
Monitoring Intrusion Detection System	2003

PART XIV

Stack Manager and High Availability	2005
--	-------------

CHAPTER 100

Managing Switch Stacks	2007
Finding Feature Information	2007

Prerequisites for Switch Stacks	2007
Restrictions for Switch Stacks	2007
Information About Switch Stacks	2008
Switch Stack Overview	2008
Supported Features in a Switch Stack	2008
Switch Stack Membership	2009
Changes to Switch Stack Membership	2010
Stack Member Numbers	2010
Stack Member Priority Values	2012
Switch Stack Bridge ID and MAC Address	2012
Persistent MAC Address on the Switch Stack	2012
Active and Standby Switch Election and Reelection	2013
Switch Stack Configuration Files	2014
Offline Configuration to Provision a Stack Member	2015
Effects of Adding a Provisioned Switch to a Switch Stack	2016
Effects of Replacing a Provisioned Switch in a Switch Stack	2017
Effects of Removing a Provisioned Switch from a Switch Stack	2017
Upgrading a Switch Running Incompatible Software	2017
Auto-Upgrade	2017
Auto-Advise	2018
Switch Stack Management Connectivity	2020
Connectivity to the Switch Stack Through an IP Address	2020
Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports	2020
How to Configure a Switch Stack	2021
Enabling the Persistent MAC Address Feature	2021
Assigning a Stack Member Number	2022
Setting the Stack Member Priority Value	2023
Provisioning a New Member for a Switch Stack	2024
Removing Provisioned Switch Information	2025
Displaying Incompatible Switches in the Switch Stack	2026
Upgrading an Incompatible Switch in the Switch Stack	2027
Troubleshooting the Switch Stack	2027
Temporarily Disabling a Stack Port	2027
Reenabling a Stack Port While Another Member Starts	2028

Monitoring the Device Stack	2029
Configuration Examples for Switch Stacks	2030
Switch Stack Configuration Scenarios	2030
Enabling the Persistent MAC Address Feature: Example	2031
Provisioning a New Member for a Switch Stack: Example	2032
show switch stack-ports summary Command Output: Example	2032
Software Loopback: Examples	2033
Software Loopback with Connected Stack Cables: Examples	2034
Software Loopback with no Connected Stack Cable: Example	2035
Finding a Disconnected Stack Cable: Example	2035
Fixing a Bad Connection Between Stack Ports: Example	2036
Additional References for Switch Stacks	2037

CHAPTER 101

Configuring Cisco NSF with SSO	2039
Finding Feature Information	2039
Prerequisites for NSF with SSO	2039
Restrictions for NSF with SSO	2040
Information About NSF with SSO	2040
Overview of NSF with SSO	2040
SSO Operation	2041
NSF Operation	2042
Cisco Express Forwarding	2043
BGP Operation	2043
OSPF Operation	2044
EIGRP Operation	2045
How to Configure Cisco NSF with SSO	2046
Configuring SSO	2046
Configuring SSO Example	2046
Verifying CEF NSF	2047
Configuring BGP for NSF	2048
Verifying BGP NSF	2048
Configuring OSPF NSF	2049
Verifying OSPF NSF	2050
Configuring EIGRP NSF	2051

Verifying EIGRP NSF 2051

CHAPTER 102

Configuring Wireless High Availability 2053

Finding Feature Information 2053

Information about High Availability 2053

Information About Redundancy 2054

 Configuring Redundancy in Access Points 2054

 Configuring Heartbeat Messages 2055

Information about Access Point Stateful Switch Over 2056

Initiating Graceful Switchover 2056

Configuring EtherChannels for High Availability 2056

Configuring LACP 2057

Troubleshooting High Availability 2058

 Access the Standby Console 2058

 Before a Switchover 2059

 After a Switchover 2060

 Monitoring the Device Stack 2061

 LACP Configuration: Example 2061

PART XV

System Management 2065

CHAPTER 103

Administering the Switch 2067

Finding Feature Information 2067

Information About Administering the Device 2067

 System Time and Date Management 2067

 System Clock 2068

 Network Time Protocol 2068

 NTP Stratum 2069

 NTP Associations 2070

 NTP Security 2070

 NTP Implementation 2070

 NTP Version 4 2071

 System Name and Prompt 2071

 Stack System Name and Prompt 2071

Default System Name and Prompt Configuration	2071
DNS	2072
Default DNS Settings	2072
Login Banners	2072
Default Banner Configuration	2072
MAC Address Table	2072
MAC Address Table Creation	2073
MAC Addresses and VLANs	2073
MAC Addresses and Device Stacks	2073
Default MAC Address Table Settings	2074
ARP Table Management	2074
How to Administer the Device	2074
Configuring the Time and Date Manually	2074
Setting the System Clock	2075
Configuring the Time Zone	2075
Configuring Summer Time (Daylight Saving Time)	2076
Configuring a System Name	2080
Setting Up DNS	2081
Configuring a Message-of-the-Day Login Banner	2082
Configuring a Login Banner	2084
Managing the MAC Address Table	2085
Changing the Address Aging Time	2085
Configuring MAC Address Change Notification Traps	2086
Configuring MAC Address Move Notification Traps	2088
Configuring MAC Threshold Notification Traps	2090
Adding and Removing Static Address Entries	2092
Configuring Unicast MAC Address Filtering	2093
Monitoring and Maintaining Administration of the Device	2095
Configuration Examples for Device Administration	2096
Example: Setting the System Clock	2096
Examples: Configuring Summer Time	2096
Example: Configuring a MOTD Banner	2096
Example: Configuring a Login Banner	2097
Example: Configuring MAC Address Change Notification Traps	2097

Example: Configuring MAC Threshold Notification Traps	2097
Example: Adding the Static Address to the MAC Address Table	2097
Example: Configuring Unicast MAC Address Filtering	2098
Additional References for Device Administration	2098
Additional References for Device Administration	2099
Feature History and Information for Device Administration	2100

CHAPTER 104**Performing Device Setup Configuration 2101**

Finding Feature Information	2101
Information About Performing Device Setup Configuration	2101
Device Boot Process	2101
Software Installer Features	2102
Software Boot Modes	2103
Installed Boot Mode	2103
Bundle Boot Mode	2103
Boot Mode for a Switch Stack	2104
Devices Information Assignment	2104
Default Switch Information	2105
DHCP-Based Autoconfiguration Overview	2105
DHCP Client Request Process	2106
DHCP-based Autoconfiguration and Image Update	2107
Restrictions for DHCP-based Autoconfiguration	2107
DHCP Autoconfiguration	2107
DHCP Auto-Image Update	2107
DHCP Server Configuration Guidelines	2108
Purpose of the TFTP Server	2108
Purpose of the DNS Server	2109
How to Obtain Configuration Files	2109
How to Control Environment Variables	2110
Common Environment Variables	2111
Environment Variables for TFTP	2112
Scheduled Reload of the Software Image	2113
How to Perform Device Setup Configuration	2113
Configuring DHCP Autoconfiguration (Only Configuration File)	2113

Configuring DHCP Auto-Image Update (Configuration File and Image)	2115
Configuring the Client to Download Files from DHCP Server	2119
Manually Assigning IP Information to Multiple SVIs	2120
Modifying the Device Startup Configuration	2122
Specifying the Filename to Read and Write the System Configuration	2122
Manually Booting the Switch	2123
Booting the Device in Installed Mode	2124
Booting the Device in Bundle Mode	2125
Booting a Specific Software Image On a Switch Stack	2126
Configuring a Scheduled Software Image Reload	2127
Monitoring Device Setup Configuration	2129
Example: Verifying the Device Running Configuration	2129
Examples: Displaying Software Bootup in Install Mode	2130
Example: Emergency Installation	2132
Configuration Examples for Performing Device Setup	2133
Example: Configuring a Device as a DHCP Server	2133
Example: Configuring DHCP Auto-Image Update	2133
Example: Configuring a Device to Download Configurations from a DHCP Server	2134
Examples: Scheduling Software Image Reload	2134
Additional References For Performing Device Setup	2135
Installing WCM Sub-Package	2136
Benefits	2136
Prerequisites	2136
Restrictions	2136
Installing WCM Sub-Package	2137
Feature History and Information For Performing Device Setup Configuration	2137
<hr/>	
CHAPTER 105	Configuring Right-To-Use Licenses 2139
	Finding Feature Information 2139
	Restrictions for Configuring RTU Licenses 2139
	Information About Configuring RTU Licenses 2140
	Right-To-Use Licensing 2140
	Right-To-Use Image-Based Licenses 2140
	Right-To-Use License States 2140

License Activation for Switch Stacks	2141
Mobility Controller Mode	2141
Right-To-Use AP-Count Licensing	2141
Right-to-Use AP-Count Evaluation Licenses	2142
Right-To-Use Adder AP-Count Rehosting Licenses	2143
How to Configure RTU Licenses	2143
Activating an Imaged Based License	2143
Activating an AP-Count License	2144
Obtaining an Upgrade or Capacity Adder License	2145
Rehosting a License	2146
Changing Mobility Mode	2146
Monitoring and Maintaining RTU Licenses	2148
Configuration Examples for RTU Licensing	2148
Examples: Activating RTU Image Based Licenses	2148
Examples: Displaying RTU Licensing Information	2149
Example: Displaying RTU License Details	2150
Example: Displaying RTU License Mismatch	2152
Example: Displaying RTU Licensing Usage	2152
Additional References for RTU Licensing	2153
Feature History and Information for RTU Licensing	2154
<hr/>	
CHAPTER 106	Configuring Administrator Usernames and Passwords 2155
	Finding Feature Information 2155
	Information About Configuring Administrator Usernames and Passwords 2155
	Configuring Administrator Usernames and Passwords 2156
	Examples: Administrator Usernames and Passwords Configuration 2158
	Additional References for Administrator Usernames and Passwords 2159
	Feature History and Information For Performing Administrator Usernames and Passwords Configuration 2159
<hr/>	
CHAPTER 107	Configuring Aggressive Load Balancing 2161
	Finding Feature Information 2161
	Restrictions for Aggressive Load Balancing 2161
	Information for Configuring Aggressive Load Balancing Parameters 2162

Aggressive Load Balancing	2162
How to Configure Aggressive Load Balancing	2163
Configuring Aggressive Load Balancing (CLI)	2163
Monitoring Aggressive Load Balancing	2164
Additional References for Aggressive Load Balancing	2165
Feature History and Information For Performing Aggressive Load Balancing Configuration	2166

CHAPTER 108**Configuring Client Roaming 2167**

Finding Feature Information	2167
Restrictions for Configuring Client Roaming	2167
Information About Client Roaming	2167
Inter-Subnet Roaming	2169
Voice-over-IP Telephone Roaming	2169
CCX Layer 2 Client Roaming	2169
How to Configure Layer 2 or Layer 3 Roaming	2170
Configuring Layer 2 or Layer 3 Roaming	2170
Configuring CCX Client Roaming Parameters (CLI)	2171
Configuring Mobility Oracle	2173
Configuring Mobility Controller	2173
Configuring Mobility Agent	2176
Monitoring Client Roaming Parameters	2177
Monitoring Mobility Configurations	2177
Additional References for Configuring Client Roaming	2178
Feature History and Information For Performing Client Roaming Configuration	2179

CHAPTER 109**Configuring Application Visibility and Control 2181**

Finding Feature Information	2181
Information About Application Visibility and Control	2181
Supported AVC Class Map and Policy Map Formats	2182
Prerequisites for Application Visibility and Control	2184
Guidelines for Inter-Device Roaming with Application Visibility and Control	2185
Restrictions for Application Visibility and Control	2185
How to Configure Application Visibility and Control	2186
Configuring Application Visibility and Control (CLI)	2186

Creating a Flow Record	2186
Creating a Flow Exporter (Optional)	2189
Creating a Flow Monitor	2190
Creating AVC QoS Policy	2191
Configuring WLAN to Apply Flow Monitor in IPV4 Input/Output Direction	2199
Monitoring Application Visibility and Control	2200
Monitoring Application Visibility and Control (CLI)	2200
Examples: Application Visibility and Control	2201
Examples: Application Visibility Configuration	2201
Examples: Application Visibility and Control QoS Configuration	2202
Example: Configuring QoS Attribute for Local Profiling Policy	2204
Additional References for Application Visibility and Control	2204
Feature History and Information For Application Visibility and Control	2205

CHAPTER 110**Configuring Voice and Video Parameters 2207**

Finding Feature Information	2207
Prerequisites for Voice and Video Parameters	2207
Restrictions for Voice and Video Parameters	2207
Information About Configuring Voice and Video Parameters	2208
Call Admission Control	2208
Static-Based CAC	2209
Load-Based CAC	2209
IOSd Call Admission Control	2209
Expedited Bandwidth Requests	2210
U-APSD	2211
Traffic Stream Metrics	2211
Information About Configuring Voice Prioritization Using Preferred Call Numbers	2212
Information About EDCA Parameters	2212
How to Configure Voice and Video Parameters	2212
Configuring Voice Parameters (CLI)	2212
Configuring Video Parameters (CLI)	2216
Configuring SIP-Based CAC (CLI)	2218
Configuring a Preferred Call Number (CLI)	2220
Configuring EDCA Parameters (CLI)	2221

Monitoring Voice and Video Parameters	2223
Configuration Examples for Voice and Video Parameters	2225
Example: Configuring Voice and Video	2225
Additional References for Voice and Video Parameters	2226
Feature History and Information For Performing Voice and Video Parameters Configuration	2227

CHAPTER 111**Configuring RFID Tag Tracking 2229**

Finding Feature Information	2229
Information About Configuring RFID Tag Tracking	2229
How to Configure RFID Tag Tracking	2229
Configuring RFID Tag Tracking (CLI)	2229
Monitoring RFID Tag Tracking Information	2230
Additional References RFID Tag Tracking	2231
Feature History and Information For Performing RFID Tag Tracking Configuration	2232

CHAPTER 112**Configuring Location Settings 2233**

Finding Feature Information	2233
Information About Configuring Location Settings	2233
How to Configure Location Settings	2234
Configuring Location Settings (CLI)	2234
Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)	2236
Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues (CLI)	2237
Monitoring Location Settings and NMSP Settings	2238
Monitoring Location Settings (CLI)	2238
Monitoring NMSP Settings (CLI)	2238
Examples: Location Settings Configuration	2239
Examples: NMSP Settings Configuration	2239
Additional References for Location Settings	2240
Feature History and Information For Performing Location Settings Configuration	2241

CHAPTER 113**Monitoring Flow Control 2243**

Finding Feature Information	2243
Information About Flow Control	2243
Monitoring Flow Control	2243

Examples: Monitoring Flow Control	2244
Additional References for Monitoring Flow Control	2245
Feature History and Information For Monitoring Flow Control	2245

CHAPTER 114**Configuring SDM Templates 2247**

Finding Feature Information	2247
Information About Configuring SDM Templates	2247
SDM Templates	2247
SDM Templates and Switch Stacks	2249
How to Configure SDM Templates	2249
Configuring SDM Templates	2249
Configuring the Switch SDM Template	2249
Monitoring and Maintaining SDM Templates	2250
Configuration Examples for SDM Templates	2250
Examples: Configuring SDM Templates	2250
Examples: Displaying SDM Templates	2251
Additional References for SDM Templates	2252
Feature History and Information for Configuring SDM Templates	2253

CHAPTER 115**Configuring System Message Logs 2255**

Finding Feature Information	2255
Information About Configuring System Message Logs	2255
System Message Logging	2255
System Log Message Format	2256
Default System Message Logging Settings	2257
Syslog Message Limits	2258
How to Configure System Message Logs	2258
Setting the Message Display Destination Device	2258
Synchronizing Log Messages	2260
Disabling Message Logging	2261
Enabling and Disabling Time Stamps on Log Messages	2262
Enabling and Disabling Sequence Numbers in Log Messages	2263
Defining the Message Severity Level	2264
Limiting Syslog Messages Sent to the History Table and to SNMP	2265

Logging Messages to a UNIX Syslog Daemon	2265
Monitoring and Maintaining System Message Logs	2267
Monitoring Configuration Archive Logs	2267
Configuration Examples for System Message Logs	2267
Example: Stacking System Message	2267
Example: Switch System Message	2267
Additional References for System Message Logs	2268
Feature History and Information For System Message Logs	2269

CHAPTER 116

Configuring Online Diagnostics	2271
Finding Feature Information	2271
Information About Configuring Online Diagnostics	2271
Online Diagnostics	2271
How to Configure Online Diagnostics	2272
Starting Online Diagnostic Tests	2272
Configuring Online Diagnostics	2273
Scheduling Online Diagnostics	2273
Configuring Health-Monitoring Diagnostics	2274
Monitoring and Maintaining Online Diagnostics	2277
Displaying Online Diagnostic Tests and Test Results	2277
Configuration Examples for Online Diagnostic Tests	2277
Examples: Start Diagnostic Tests	2277
Example: Configure a Health Monitoring Test	2278
Examples: Schedule Diagnostic Test	2278
Examples: Displaying Online Diagnostics	2278
Additional References for Online Diagnostics	2279
Feature History and Information for Configuring Online Diagnostics	2280

CHAPTER 117

Managing Configuration Files	2281
Prerequisites for Managing Configuration Files	2281
Restrictions for Managing Configuration Files	2281
Information About Managing Configuration Files	2281
Types of Configuration Files	2281
Configuration Mode and Selecting a Configuration Source	2282

Configuration File Changes Using the CLI	2282
Location of Configuration Files	2282
Copy Configuration Files from a Network Server to the Device	2283
Copying a Configuration File from the Device to a TFTP Server	2283
Copying a Configuration File from the Device to an RCP Server	2283
Copying a Configuration File from the Device to an FTP Server	2285
Copy Configuration Files from a Switch to Another Switch	2286
Configuration Files Larger than NVRAM	2286
Compressing the Configuration File	2286
Storing the Configuration in Flash Memory on Class A Flash File Systems	2287
Loading the Configuration Commands from the Network	2287
Configuring the Device to Download Configuration Files	2287
Network Versus Host Configuration Files	2287
How to Manage Configuration File Information	2288
Displaying Configuration File Information (CLI)	2288
Modifying the Configuration File (CLI)	2289
Copying a Configuration File from the Device to a TFTP Server (CLI)	2290
What to Do Next	2291
Copying a Configuration File from the Device to an RCP Server (CLI)	2291
Examples	2293
What to Do Next	2293
Copying a Configuration File from the Device to the FTP Server (CLI)	2293
Examples	2294
What to Do Next	2295
Copying a Configuration File from a TFTP Server to the Device (CLI)	2295
What to Do Next	2296
Copying a Configuration File from the rcp Server to the Device (CLI)	2296
Examples	2297
What to Do Next	2298
Copying a Configuration File from an FTP Server to the Device (CLI)	2298
Examples	2299
What to Do Next	2300
Maintaining Configuration Files Larger than NVRAM	2300
Compressing the Configuration File (CLI)	2300

Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)	2302
Loading the Configuration Commands from the Network (CLI)	2303
Copying Configuration Files from Flash Memory to the Startup or Running Configuration (CLI)	2304
Copying Configuration Files Between Flash Memory File Systems (CLI)	2305
Copying a Configuration File from an FTP Server to Flash Memory Devices (CLI)	2307
What to Do Next	2308
Copying a Configuration File from an RCP Server to Flash Memory Devices (CLI)	2308
Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)	2309
Re-executing the Configuration Commands in the Startup Configuration File (CLI)	2310
Clearing the Startup Configuration (CLI)	2310
Deleting a Specified Configuration File (CLI)	2311
Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI)	2312
What to Do Next	2313
Configuring the Device to Download Configuration Files	2314
Configuring the Device to Download the Network Configuration File (CLI)	2314
Configuring the Device to Download the Host Configuration File (CLI)	2315
Additional References	2317

CHAPTER 118**Configuration Replace and Configuration Rollback 2319**

Prerequisites for Configuration Replace and Configuration Rollback	2319
Restrictions for Configuration Replace and Configuration Rollback	2320
Information About Configuration Replace and Configuration Rollback	2320
Configuration Archive	2320
Configuration Replace	2321
Configuration Rollback	2322
Configuration Rollback Confirmed Change	2322
Benefits of Configuration Replace and Configuration Rollback	2322
How to Use Configuration Replace and Configuration Rollback	2323
Creating a Configuration Archive (CLI)	2323
Performing a Configuration Replace or Configuration Rollback Operation (CLI)	2325
Monitoring and Troubleshooting the Feature (CLI)	2327
Configuration Examples for Configuration Replace and Configuration Rollback	2329
Creating a Configuration Archive	2329

Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File 2329

Reverting to the Startup Configuration File 2330

Performing a Configuration Replace Operation with the configure confirm Command 2330

Performing a Configuration Rollback Operation 2330

Additional References 2331

CHAPTER 119

Working with the Flash File System 2335

Information About the Flash File System 2335

Displaying Available File Systems 2335

Setting the Default File System 2338

Displaying Information About Files on a File System 2338

Changing Directories and Displaying the Working Directory (CLI) 2339

Creating Directories (CLI) 2340

 Removing Directories 2341

Copying Files 2341

 Copying Files from One Device in a Stack to Another Device in the Same Stack 2342

 Deleting Files 2343

Creating, Displaying and Extracting Files (CLI) 2343

Additional References 2345

CHAPTER 120

Upgrading the Switch Software 2347

Upgrading the Switch Software 2347

CHAPTER 121

Conditional Debug and Radioactive Tracing 2349

Finding Feature Information 2349

Preface

- [Document Conventions, on page cvii](#)
- [Related Documentation, on page cix](#)
- [Obtaining Documentation and Submitting a Service Request, on page cix](#)

Document Conventions

This document uses the following conventions:

Convention	Description
<code>^</code> or <code>Ctrl</code>	Both the <code>^</code> symbol and <code>Ctrl</code> represent the Control (<code>Ctrl</code>) key on a keyboard. For example, the key combination <code>^D</code> or <code>Ctrl-D</code> means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)
bold font	Commands and keywords and user-entered text appear in bold font .
<i>Italic font</i>	Document titles, new or emphasized terms, and arguments for which you supply values are in <i>italic font</i> .
<code>Courier font</code>	Terminal sessions and information the system displays appear in <code>courier font</code> .
Bold Courier font	Bold Courier font indicates text that the user must enter.
[x]	Elements in square brackets are optional.
...	An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.
	A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.
[x y]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
{x y}	Required alternative keywords are grouped in braces and separated by vertical bars.

Convention	Description
[x {y z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.
< >	Nonprinting characters such as passwords are in angle brackets.
[]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

Reader Alert Conventions

This document may use the following conventions for reader alerts:

Note Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Tip Means *the following information will help you solve a problem*.

Caution Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Timesaver Means *the described action saves time*. You can save time by performing the action described in the paragraph.

Warning IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

SAVE THESE INSTRUCTIONS

Related Documentation

Note Before installing or upgrading the device, refer to the device release notes.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/c/en/us/td/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

CHAPTER

1

Using the Command-Line Interface

- [Information About Using the Command-Line Interface, on page 1](#)
- [How to Use the CLI to Configure Features, on page 5](#)

Information About Using the Command-Line Interface

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, an SSH, or by using the browser.

When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the device reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the device reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode .

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.

Table 1: Command Mode Summary

Mode	Access Method	Prompt	Exit Method	About This Mode
User EXEC	Begin a session using Telnet, SSH, or console.	Device>	Enter logout or quit .	Use this mode to <ul style="list-style-type: none"> • Change terminal settings. • Perform basic tests. • Display system information.
Privileged EXEC	While in user EXEC mode, enter the enable command.	Device#	Enter disable to exit.	Use this mode to verify commands that you have entered. Use a password to protect access to this mode.
Global configuration	While in privileged EXEC mode, enter the configure command.	Device(config)#	To exit to privileged EXEC mode, enter exit or end , or press Ctrl-Z .	Use this mode to configure parameters that apply to the entire device.
VLAN configuration	While in global configuration mode, enter the vlan <i>vlan-id</i> command.	Device(config-vlan)#	To exit to global configuration mode, enter the exit command. To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the device startup configuration file.

Mode	Access Method	Prompt	Exit Method	About This Mode
Interface configuration	While in global configuration mode, enter the interface command (with a specific interface).	Device (config-if) #	To exit to global configuration mode, enter exit . To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure parameters for the Ethernet ports.
Line configuration	While in global configuration mode, specify a line with the line vty or line console command.	Device (config-line) #	To exit to global configuration mode, enter exit . To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure parameters for the terminal line.

Understanding Abbreviated Commands

You need to enter only enough characters for the device to recognize the command as unique.

This example shows how to enter the **show configuration** privileged EXEC command in an abbreviated form:

```
Device# show conf
```

No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenab a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your device.

Table 2: Common CLI Error Messages

Error Message	Meaning	How to Get Help
% Ambiguous command: "show con"	You did not enter enough characters for your device to recognize the command.	Reenter the command followed by a question mark (?) without any space between the command and the question mark. The possible keywords that you can enter with the command appear.
% Incomplete command.	You did not enter all of the keywords or values required by this command.	Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.
% Invalid input detected at '^' marker.	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all of the commands that are available in this command mode. The possible keywords that you can enter with the command appear.

Configuration Logging

You can log and view changes to the device configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

Note Only CLI or HTTP changes are logged.

Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

SUMMARY STEPS

1. **help**
2. *abbreviated-command-entry ?*
3. *abbreviated-command-entry <Tab>*
4. **?**
5. *command ?*
6. *command keyword ?*

DETAILED STEPS

	Command or Action	Purpose
Step 1	help Example: Device# help	Obtains a brief description of the help system in any command mode.
Step 2	<i>abbreviated-command-entry ?</i> Example: Device# di? dir disable disconnect	Obtains a list of commands that begin with a particular character string.
Step 3	<i>abbreviated-command-entry <Tab></i> Example: Device# sh conf<tab> Device# show configuration	Completes a partial command name.
Step 4	? Example: Device> ?	Lists all commands available for a particular command mode.
Step 5	<i>command ?</i> Example: Device> show ?	Lists the associated keywords for a command.
Step 6	<i>command keyword ?</i> Example: Device(config)# cdp holdtime ? <10-255> Length of time (in sec) that receiver must keep this packet	Lists the associated arguments for a keyword.

How to Use the CLI to Configure Features

Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

Changing the Command History Buffer Size

By default, the device records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

SUMMARY STEPS

1. **terminal history** [*size number-of-lines*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal history [<i>size number-of-lines</i>] Example: Device# terminal history size 200	Changes the number of command lines that the device records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.

Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

Note The arrow keys function only on ANSI-compatible terminals such as VT100s.

SUMMARY STEPS

1. **Ctrl-P** or use the **up arrow** key
2. **Ctrl-N** or use the **down arrow** key
3. **show history**

DETAILED STEPS

	Command or Action	Purpose
Step 1	Ctrl-P or use the up arrow key	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
Step 2	Ctrl-N or use the down arrow key	Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.
Step 3	show history Example: Device# show history	Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the terminal history global configuration command and the history line configuration command.

Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

SUMMARY STEPS

1. terminal no history

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal no history Example: Device# <code>terminal no history</code>	Disables the feature during the current terminal session in privileged EXEC mode.

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenale it.

SUMMARY STEPS

1. terminal editing
2. terminal no editing

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal editing Example: Device# <code>terminal editing</code>	Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.
Step 2	terminal no editing Example: Device# <code>terminal no editing</code>	Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.

Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

Note The arrow keys function only on ANSI-compatible terminals such as VT100s.

Table 3: Editing Commands

Editing Commands	Description
Ctrl-B or use the left arrow key	Moves the cursor back one character.
Ctrl-F or use the right arrow key	Moves the cursor forward one character.

Ctrl-A	Moves the cursor to the beginning of the command line.
Ctrl-E	Moves the cursor to the end of the command line.
Esc B	Moves the cursor back one word.
Esc F	Moves the cursor forward one word.
Ctrl-T	Transposes the character to the left of the cursor with the character located at the cursor.
Delete or Backspace key	Erases the character to the left of the cursor.
Ctrl-D	Deletes the character at the cursor.
Ctrl-K	Deletes all characters from the cursor to the end of the command line.
Ctrl-U or Ctrl-X	Deletes all characters from the cursor to the beginning of the command line.
Ctrl-W	Deletes the word to the left of the cursor.
Esc D	Deletes from the cursor to the end of the word.
Esc C	Capitalizes at the cursor.
Esc L	Changes the word at the cursor to lowercase.
Esc U	Capitalizes letters from the cursor to the end of the word.
Ctrl-V or Esc Q	Designates a particular keystroke as an executable command, perhaps as a shortcut.
Return key	<p>Scrolls down a line or screen on displays that are longer than the terminal screen can display.</p> <p>Note The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including show command output. You can use the Return and Space bar keystrokes whenever you see the More prompt.</p>
Space bar	Scrolls down one screen.
Ctrl-L or Ctrl-R	Redisplays the current command line if the device suddenly sends a message to your screen.

Editing Command Lines That Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

Note The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

SUMMARY STEPS

1. **access-list**
2. **Ctrl-A**
3. **Return key**

DETAILED STEPS

	Command or Action	Purpose
Step 1	access-list Example: <pre>Device(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 Device(config)# \$ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.25 Device(config)# \$t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Device(config)# \$15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</pre>	Displays the global configuration command entry that extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.
Step 2	Ctrl-A Example: <pre>Device(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.2\$</pre>	Checks the complete syntax. The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right.
Step 3	Return key	Execute the commands. The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the terminal width privileged EXEC command to set the width of your terminal. Use line wrapping with the command history feature to recall and modify previous complex command entries.

Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

SUMMARY STEPS

1. `{show | more} command | {begin | include | exclude} regular-expression`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>{show more} command {begin include exclude} regular-expression</code> Example: <pre>Device# show interfaces include protocol Vlan1 is up, line protocol is up Vlan10 is up, line protocol is down GigabitEthernet1/0/1 is up, line protocol is down GigabitEthernet1/0/2 is up, line protocol is up</pre>	<p>Searches and filters the output.</p> <p>Expressions are case sensitive. For example, if you enter <code> exclude output</code>, the lines that contain output are not displayed, but the lines that contain output appear.</p>

Accessing the CLI

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the active switch. You cannot manage stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

Note We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, use the **session standby ios** privileged EXEC command from the active switch to access the IOS console of the standby switch. To debug a specific stack member, use the **session switch stack-member-number** privileged EXEC command from the active switch to access the diagnostic shell of the stack member. For more information about these commands, see the switch command reference.

To debug a specific stack member, you can start a CLI session from the stack master by using the **session stack-member-number** privileged EXEC command. The stack member number is appended to the system prompt. For example, `Switch-2#` is the prompt for stack member 2 where the system prompt for the stack master is `Switch`. Only the **show** and **debug** commands are available in a CLI session to a specific stack member. You can also use the **remote command stack-member-number LINE** privileged EXEC command on the stack master to enable debugging on a member switch without first starting a session.

Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the device console or connect a PC to the Ethernet management port and then power on the device, as described in the hardware installation guide that shipped with your device.

If your device is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your device must first be configured for this type of access.

You can use one of these methods to establish a connection with the device:

Procedure

- Connect the device console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the device hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The device must have network connectivity with the Telnet or SSH client, and the device must have an enable secret password configured.
 - The device supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
 - The device supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for CleanAir

You can configure Cisco CleanAir only on CleanAir-enabled access points.

Only Cisco CleanAir-enabled access points using the following access point modes can perform Cisco CleanAir spectrum monitoring:

- **Local**—In this mode, each Cisco CleanAir-enabled access point radio provides air quality and interference detection reports for the current operating channel only.
- **Monitor**—When Cisco CleanAir is enabled in monitor mode, the access point provides air quality and interference detection reports for all monitored channels.

The following options are available:

- All— All channels
- DCA—Channel selection governed by the DCA list
- Country—All channel legal within a regulatory domain

Note The access point does not participate in AQ HeatMap in Prime Infrastructure.

- SE-Connect—This mode enables a user to connect a Spectrum Expert application running on an external Microsoft Windows XP or Vista PC to a Cisco CleanAir-enabled access point in order to display and analyze detailed spectrum data. The Spectrum Expert application connects directly to the access point, bypassing the device. An access point in SE-Connect mode does not provide any Wi-Fi, RF, or spectrum data to the device. All CleanAir system functionality is suspended while the AP is in this mode, and no clients are served. This mode is intended for remote troubleshooting only. Up to three active Spectrum Expert connections are possible.

Restrictions for CleanAir

- Access points in monitor mode do not transmit Wi-Fi traffic or 802.11 packets. They are excluded from radio resource management (RRM) planning and are not included in the neighbor access point list. IDR clustering depends on the device's ability to detect neighboring in-network access points. Correlating interference device detections from multiple access points is limited between monitor-mode access points.
- Cisco recommends a ratio of 1 monitor mode access point for every 5 local mode access points, this may also vary based on the network design and expert guidance for best coverage.
- Spectrum Expert (Windows XP laptop client) and AP should be pingable, otherwise; it will not work.

Information About CleanAir

Cisco CleanAir is a spectrum intelligence solution designed to proactively manage the challenges of a shared wireless spectrum. All of the users of the shared spectrum can be seen (both native devices and foreign interferers). It also enables the network to act upon this information. For example, the interfering device can be manually removed or the system can automatically change the channel away from the interference.

A Cisco CleanAir system consists of CleanAir-enabled access points, wireless controller modules, mobility controllers, mobility anchors and next generation switches. The access points join the mobility controller directly or through the mobility anchor. They collect information about all devices that operate in the industrial, scientific, and medical (ISM) bands, identify and evaluate the information as a potential interference source, and forward it to the device. The device controls the access points, collects spectrum data, and forwards information to Cisco Prime Infrastructure (PI) or a Cisco Mobility Services Engine (MSE) upon request.

Any networking configurations can be performed only on the mobility controller, configurations cannot be performed in the MA mode. However, any radio level CleanAir configurations can be done using mobility anchor.

For every device operating in the unlicensed band, Cisco CleanAir tells what it is, where it is, how it is impacting the wireless network, and what actions should be taken. It simplifies RF.

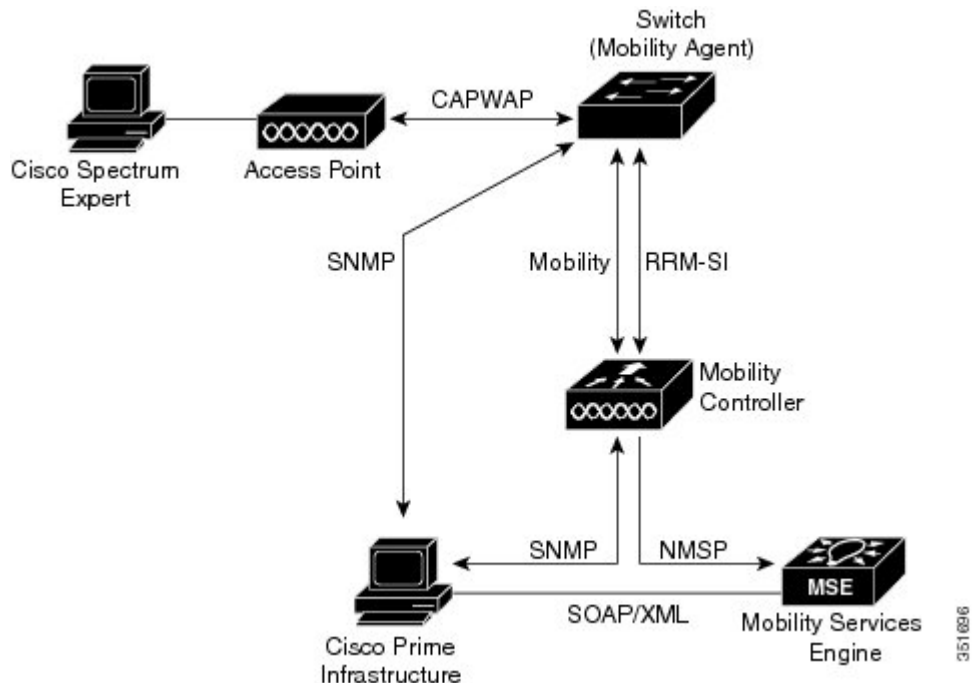

Wireless LAN systems operate in unlicensed 2.4-GHz and 5-GHz ISM bands. Many devices like microwave ovens, cordless phones, and Bluetooth devices also operate in these bands and can negatively affect the Wi-Fi operations.

Some of the most advanced WLAN services, such as voice over wireless and IEEE 802.11n radio communications, could be significantly impaired by the interference caused by other legal users of the ISM bands. The integration of Cisco CleanAir functionality addresses this problem of radio frequency (RF) interference.

Cisco CleanAir Components

The basic Cisco CleanAir architecture consists of Cisco CleanAir-enabled APs and device. Cisco Prime Infrastructure (PI), Mobility Services Engine (MSE) and Cisco Spectrum Expert are optional system components. Cisco PI and MSE provide user interfaces for advanced spectrum capabilities such as historic charts, tracking interference devices, location services and impact analysis.

Figure 1: Cisco CleanAir Solution

An access point equipped with Cisco CleanAir technology collects information about non-Wi-Fi interference sources, processes it, and forwards it to the MA. The access point sends AQR and IDR reports to the controller.

The mobility controller (MC) controls and configures CleanAir-capable access points, collects and processes spectrum data, and provides it to the PI and/or the MSE. The MC provides local user interfaces (GUI and CLI) to configure basic CleanAir features and services and display current spectrum information. The MC also does detection, merging and mitigation of interference devices using RRM TPC and DCM. For details on Interference Device Merging, see [Interference Device Merging, on page 20](#).

Cisco PI provides advanced user interfaces for CleanAir that include feature enabling and configuration, consolidated display information, historic AQ records and reporting engines. PI also shows charts of interference devices, AQ trends, and alerts.

Cisco MSE is required for location and historic tracking of interference devices, and provides coordination and consolidation of interference reports across multiple controllers. MSE also provides adaptive Wireless Intrusion Prevention System (WIPS) service that provides comprehensive over-the-air threat detection, location and mitigation. MSE also merges all the interference data.

To obtain detailed spectrum data that can be used to generate RF analysis plots similar to those provided by a spectrum analyzer, you can configure a Cisco CleanAir-enabled access point to connect directly to a Microsoft Windows XP or Vista PC running the Cisco Spectrum Expert application.

The device performs the following tasks in a Cisco CleanAir system:

- Configures Cisco CleanAir capabilities on the access point.
- Provides interfaces (CLI, and SNMP) for configuring Cisco CleanAir features and retrieving data.
- Displays spectrum data.
- Collects and processes AQRs from the access point and stores them in the air quality database. AQRs contains information about the total interference from all identified sources represented by Air Quality Index (AQI) and summary for the most severe interference categories. The CleanAir system can also

include unclassified interference information under per interference type reports which enable you to take action in cases where the interference due to unclassified interfering devices is frequent.

- Collects and processes Interference Device Reports (IDRs) from the access point and stores them in the interference device database.
- Forwards spectrum data to Prime Infrastructure and the MSE.

Terms Used in Cisco CleanAir

Table 4: CleanAir-related Terms

Term	Description
AQI	Air Quality Index. The AQI is an indicator of air quality, based on the air pollutants. An AQI of 0 is bad and an AQI > 85 is good.
AQR	Air Quality Report. AQRs contain information about the total interference from all identified sources represented by AQI and summary of the most severe interference categories. AQRs are sent every 15 minutes to the Mobility Controller and every 30 seconds in the Rapid mode.
DC	Duty Cycle. Percentage of time that the channel is utilized by a device.
EDRRM	EDRRM Event Driven RRM. EDRRM allows an access point in distress to bypass normal RRM intervals and immediately change channels.
IDR	Interference Device Reports that the access point sends to the controller.
ISI	Interference Severity Index. The ISI is an indicator of the severity of the interference.
MA	Mobility Agent. An MA is either an access switch that has a wireless module running on it or an MC with an internal MA running on it. An MA is the wireless component that maintains client mobility state machine for a mobile client that is connected to an access point to the device that the MA is running on.
MC	Mobility Controller. An MC provides mobility management services for inter-peer group roaming events. The MC provides a central point of contact for management and sends the configuration to all the mobility agents under its sub-domain of their mobility configuration, peer group membership and list of members.
RSSI	Received Signal Strength Indicator. RSSI is a measurement of the power present in a received radio signal. It is the power at which an access point sees the interferer device.

Interference Types that Cisco CleanAir can Detect

Cisco CleanAir can detect interference, report on the location and severity of the interference, and recommend different mitigation strategies. Two such mitigation strategies are persistent device avoidance and spectrum event-driven RRM. New

Wi-Fi chip-based RF management systems share these characteristics:

- Any RF energy that cannot be identified as a Wi-Fi signal is reported as noise.
- Noise measurements that are used to assign a channel plan tend to be averaged over a period of time to avoid instability or rapid changes that can be disruptive to certain client devices.
- Averaging measurements reduces the resolution of the measurement. As such, a signal that disrupts clients might not look like it needs to be mitigated after averaging.

- All RF management systems available today are reactive in nature.

Cisco CleanAir is different and can positively identify not only the source of the noise but also its location and potential impact to a WLAN. Having this information allows you to consider the noise within the context of the network and make intelligent and, where possible, proactive decisions. For CleanAir, two types of interference events are common:

- Persistent interference
- Spontaneous interference

Persistent interference events are created by devices that are stationary in nature and have intermittent but largely repeatable patterns of interference. For example, consider the case of a microwave oven located in a break room. Such a device might be active for only 1 or 2 minutes at a time. When operating, however, it can be disruptive to the performance of the wireless network and associated clients. Using Cisco CleanAir, you can positively identify the device as a microwave oven rather than indiscriminate noise. You can also determine exactly which part of the band is affected by the device, and because you can locate it, you can understand which access points are most severely affected. You can then use this information to direct RRM in selecting a channel plan that avoids this source of interference for the access points within its range. Because this interference is not active for a large portion of the day, existing RF management applications might attempt to again change the channels of the affected access points. Persistent device avoidance is unique, however, in that it remains in effect as long as the source of interference is periodically detected to refresh the persistent status. The Cisco CleanAir system knows that the microwave oven exists and includes it in all future planning. If you move either the microwave oven or the surrounding access points, the algorithm updates RRM automatically.

Note Spectrum event-driven RRM can be triggered only by Cisco CleanAir-enabled access points in local mode.

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

In the case of Bluetooth devices, Cisco CleanAir-enabled access points can detect and report interference only if the devices are actively transmitting. Bluetooth devices have extensive power save modes. For example, interference can be detected when data or voice is being streamed between the connected devices.

Interference Device Merging

The Interference Devices (ID) messages are processed on a Mobility Controller (MC). The Mobility Anchor (MA) forwards the ID messages from APs and hence they are processed on the MC. The MC has visibility of the neighbor information across APs connected to different MAs.

ID merging logic requires AP neighbor information. Neighbor information is obtained from the RRM module. This api only gives neighbor information to the APs directly connected to MC.

Currently the AP neighbor list on MA is synced to MC once every 3 minutes; hence the AP neighbor list obtained by this api could be at most 3 mins old. This delay results in delay in merging of Devices as they

are discovered. The subsequent periodic merge will pick up the updated neighbor information and merge is performed

Persistent Devices

Some interference devices such as outdoor bridges and Microwave Ovens only transmit when needed. These devices can cause significant interference to the local WLAN due to short duration and periodic operation remain largely undetected by normal RF management metrics. With CleanAir the RRM DCA algorithm can detect, measure, register and remember the impact and adjust the DCA algorithm. This minimizes the use of channels affected by the persistent devices in the channel plan local to the interference source. Cisco CleanAir detects and stores the persistent device information in the device and this information is used to mitigate interfering channels.

Persistent Devices Detection

CleanAir-capable Monitor Mode access point collects information about persistent devices on all configured channels and store the information in controller. Local/Bridge mode AP detects interference devices on the serving channels only.

Persistent Device Avoidance

When a Persistent Device (PD) is detected in the CleanAir module, it is reported to the RRM module on the MA. This information is used in the channel selection by the subsequent EDRRM Event Driven RRM (ED-RRM) signal sent to the RRM module.

EDRRM and AQR Update Mode

EDRRM is a feature that allows an access point that is in distress to bypass normal RRM intervals and immediately change channels. A CleanAir access point always monitors AQ and reports the AQ every 15 minutes. AQ only reports classified interference devices. The key benefit of EDRRM is very fast action time. If an interfering device is operating on an active channel and causes enough AQ degradation to trigger an EDRRM, then no clients will be able to use that channel or the access point. You must remove the access point from the channel. EDRRM is not enabled by default, you must first enable CleanAir and then enable EDRRM.

AQRs are only available on the MC. The mode configuration and timers are held in Radio Control Block (RCB) on MA (for APs connected to MA). There is no change to the current API available for EMS/NMS. No change is required for directly connected APs as RCB (spectrum config and timers) is available locally. For remote APs (APs connected to MA), three new control messages are added. These three messages are for enable, restart timer and disable rapid update mode for a given AP MAC address and slot.

Related Topics

[Configuring EDRRM for CleanAir-Events](#), on page 29

CleanAir High Availability

CleanAir configuration (network and radio) is stateful during the switchover. On the MC, Embedded Instrumentation Core (EICORE) provides the sync on network configurations across active and standby nodes. The radio configurations are synced using the HA Infrastructre. The CleanAir configurations on MA are pulled from the MC upon joining. The network configuration is not stored in the EICORE on MA, hence it is synced using HA Infrastructure.

CleanAir Data (AQ and IDR) reports are not stateful, that is, the standby and active nodes are not synced. On switchover, the APs send the reports to the current active slot. The RRM Client (HA Infra Client) is used for CleanAir HA sync.

How to Configure CleanAir

Enabling CleanAir for 2.4-GHz Band

SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz cleanair`
3. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ap dot11 24ghz cleanair Example: Device(config)# <code>ap dot11 24ghz cleanair</code> Device(config)# <code>no ap dot11 24ghz cleanair</code>	Enables the CleanAir feature on 802.11b network. Add no in the command to disable CleanAir on the 802.11b network.
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring a CleanAir Alarm for 5-GHz Air-Quality and Devices

SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 5ghz cleanair alarm air-quality threshold threshold_value`
3. `ap dot11 5ghz cleanair alarm device {canopy | cont-tx | dect-like | inv | jammer | nonstd | radar | report | superag | tdd-tx | video | wimax-fixed | wimax-mobile}`
4. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ap dot11 5ghz cleanair alarm air-quality threshold <i>threshold_value</i> Example: Device(config)# <code>ap dot11 5ghz cleanair alarm air-quality threshold 50</code>	Configures the alarm for the threshold value for air-quality for all the 5-GHz devices. Add the No form of the command to disable the alarm.

	Command or Action	Purpose
Step 3	<p>ap dot11 5ghz cleanair alarm device{canopy cont-tx dect-like inv jammer nonstd radar report superag tdd-tx video wimax-fixed wimax-mobile}</p> <p>Example:</p> <pre>Device(config)#ap dot11 5ghz cleanair alarm device</pre>	<p>Configures the alarm for the 5-GHz devices. Add the no form of the command to disable the alarm.</p> <ul style="list-style-type: none"> • canopy—Canopy devices. • cont-tx—Continuous Transmitter. • dect-like—Digital Enhanced Cordless Communication (DECT) like phone. • fh—802.11 frequency hopping devices. • inv—Devices using spectrally inverted WiFi signals. • jammer—Jammer. • nonstd—Devices using non-standard WiFi channels. • radar—Radars. • report—Interference device reporting. • superag—802.11 SuperAG devices. • tdd-tx—TDD Transmitter. • video—Video cameras. • wimax-fixed—WiMax Fixed. • wimax-mobile—WiMax Mobile.
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</p>

Configuring Interference Reporting for 5-GHz devices

SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 5ghz cleanair device**{canopy | cont-tx | dect-like | inv | jammer | nonstd | radar | report | superag | tdd-tx | video | wimax-fixed | wimax-mobile}
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	ap dot11 5ghz cleanair device {canopy cont-tx dect-like inv jammer nonstd radar report superag tdd-tx video wimax-fixed wimax-mobile} Example: Device (config) # ap dot11 5ghz cleanair device canopy Device (config) # ap dot11 5ghz cleanair device cont-tx Device (config) # ap dot11 5ghz cleanair device dect-like Device (config) # ap dot11 5ghz cleanair device inv Device (config) # ap dot11 5ghz cleanair device jammer Device (config) # ap dot11 5ghz cleanair device nonstd Device (config) # ap dot11 5ghz cleanair device radar Device (config) # ap dot11 5ghz cleanair device report Device (config) # ap dot11 5ghz cleanair device superag Device (config) # ap dot11 5ghz cleanair device tdd-tx Device (config) # ap dot11 5ghz cleanair device video Device (config) # ap dot11 5ghz cleanair device wimax-fixed Device (config) # ap dot11 5ghz cleanair device wimax-mobile	Configures the 5-GHz interference devices to report to the device. Add the no form of the command to disable interference device reporting. <ul style="list-style-type: none"> • canopy—Canopy devices • cont-tx—Continuous Transmitter • dect-like—Digital Enhanced Cordless Communication (DECT) like phone • fh—802.11 frequency hopping devices • inv—Devices using spectrally inverted WiFi signals • jammer—Jammer • nonstd—Devices using non-standard WiFi channels • radar—Radars • report—Interference device reporting • superag—802.11 SuperAG devices • tdd-tx—TDD Transmitter • video—Video cameras • wimax-fixed—WiMax Fixed • wimax-mobile—WiMax Mobile
Step 3	end Example: Device (config) # end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring EDRRM for CleanAir-Events

SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 {24ghz | 5ghz} rrm channel cleanair-event`
3. `ap dot11 {24ghz | 5ghz} rrm channel cleanair-event [sensitivity {high | low | medium}]`
4. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ap dot11 {24ghz 5ghz} rrm channel cleanair-event Example: Device(config)# <code>ap dot11 24ghz rrm channel cleanair-event</code> Device(config)# <code>no ap dot11 24ghz rrm channel cleanair-event</code>	Enables EDRRM cleanair-event. Add the no form of the command to disable EDRRM.
Step 3	ap dot11 {24ghz 5ghz} rrm channel cleanair-event [sensitivity {high low medium}] Example: Device(config)# <code>ap dot11 24ghz rrm channel cleanair-event sensitivity high</code>	Configures the EDRRM sensitivity of cleanair-event. <ul style="list-style-type: none"> • High—Specifies the most sensitivity to non Wi-Fi interference as indicated by the air quality (AQ) value. • Low—Specifies the least sensitivity to non Wi-Fi interference as indicated by the AQ value. • Medium—Specifies medium sensitivity to non Wi-Fi interference as indicated by the AQ value.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Persistent Device Avoidance

SUMMARY STEPS

1. `configure terminal`

2. `ap dot11 {24ghz | 5ghz} rrm channel device`
3. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ap dot11 {24ghz 5ghz} rrm channel device Example: Device(config)# <code>ap dot11 24ghz rrm channel device</code>	Enables the persistent non Wi-Fi device avoidance in the 802.11 channel assignment. Add the no form of the command to disable the persistent device avoidance.
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Cisco CleanAir using the Controller GUI

Configuring Cisco Spectrum Expert

Configuring Spectrum Expert (CLI)

Before you begin

- Spectrum Expert (Windows XP laptop client) and access point should be pingable, otherwise; it will not work.
- Prior to establishing a connection between the Spectrum Expert console and the access point, make sure that IP address routing is properly configured and the network spectrum interface (NSI) ports are open in any intervening firewalls.
- The access point must be a TCP server listening on ports 37540 for 2.4-GHz and 37550 for 5-GHz frequencies. These ports must be opened for the spectrum expert application to connect to the access point using the NSI protocol.
- You can view the NSI key from the device CLI by using the **show ap name *ap_name* config dot11 {24ghz | 5ghz}** command.

Step 1 To configure the access point for SE-Connect mode, enter this command:

```
ap name ap_name mode se-connect
```

Example:

```
Device#ap name Cisco_AP3500 mode se-connect
```

Step 2

When prompted to reboot the access point, enter **Y**.

Step 3

To view the NSI key for the access point, enter this command:

```
show ap name ap_name config dot11 {24ghz | 5ghz}
```

Example:

```
Device#show ap name Cisco_AP3500 config dot11 24ghz
```

```
<snippet>
```

```
CleanAir Management Information
```

```

CleanAir Capable                : Yes
CleanAir Management Admin State  : Enabled
CleanAir Management Operation State : Up
CleanAir NSI Key                 : 274F1F9B1A5206683FAF57D87BFFBC9B
CleanAir Sensor State           : Configured

```

```
<snippet>
```

What to do next

On the Windows PC, download Cisco Spectrum Expert:

- Access the Cisco Software Center from this URL: <http://www.cisco.com/cisco/software/navigator.html>
- Click **Product > Wireless > Cisco Spectrum Intelligence > Cisco Spectrum Expert > Cisco Spectrum Expert Wi-Fi**, and then download the Spectrum Expert 4.1.11 executable (*.exe) file.
- Run the Spectrum Expert application on the PC.
- When the Connect to Sensor dialog box appears, enter the IP address of the access point, choose the access point radio, and enter the 16-byte network spectrum interface (NSI) key to authenticate. The Spectrum Expert application opens a TCP/IP connection directly to the access point using the NSI protocol.

When an access point in SE-Connect mode joins a device, it sends a Spectrum Capabilities notification message, and the device responds with a Spectrum Configuration Request. The request contains the 16-byte random NSI key generated by the device for use in NSI authentication. The device generates one key per access point, which the access point stores until it is rebooted.

Note You can establish up to three Spectrum Expert console connections per access point radio.

- Verify that the Spectrum Expert console is connected to the access point by selecting the Slave Remote Sensor text box in the bottom right corner of the Spectrum Expert application. If the two devices are connected, the IP address of the access point appears in this text box.
- Use the Spectrum Expert application to view and analyze spectrum data from the access point.

Monitoring CleanAir Parameters

You can monitor CleanAir parameters using the following commands:

Table 5: Commands for Monitoring CleanAir

Commands	Description
show ap dot11 24ghz cleanair air-quality summary	Displays CleanAir Air Quality (AQ) data for 2.4-GHz band
show ap dot11 24ghz cleanair air-quality worst	Displays CleanAir Air Quality (AQ) worst data for 2.4-GHz band
show ap dot11 24ghz cleanair config	Displays CleanAir Configuration for 2.4-GHz band
show ap dot11 24ghz cleanair device type all	Displays all CleanAir Interferers for 2.4-GHz band
show ap dot11 24ghz cleanair device type bt-discovery	Displays CleanAir Interferers of type BT Discovery for 2.4-GHz band
show ap dot11 24ghz cleanair device type bt-link	Displays CleanAir Interferers of type BT Link for 2.4-GHz band
show ap dot11 24ghz cleanair device type canopy	Displays CleanAir Interferers of type Canopy for 2.4-GHz band
show ap dot11 24ghz cleanair device type cont-tx	Displays CleanAir Interferers of type Continuous transmitter for 2.4-GHz band
show ap dot11 24ghz cleanair device type dect-like	Displays CleanAir Interferers of type DECT Like for 2.4-GHz band
show ap dot11 24ghz cleanair device type fh	Displays CleanAir Interferers of type 802.11FH for 2.4-GHz band
show ap dot11 24ghz cleanair device type inv	Displays CleanAir Interferers of type WiFi Inverted for 2.4-GHz band
show ap dot11 24ghz cleanair device type jammer	Displays CleanAir Interferers of type Jammer for 2.4-GHz band
show ap dot11 24ghz cleanair device type mw-oven	Displays CleanAir Interferers of type MW Oven for 2.4-GHz band
show ap dot11 24ghz cleanair device type nonstd	Displays CleanAir Interferers of type WiFi Inv. Ch for 2.4-GHz band
show ap dot11 24ghz cleanair device type persistent	Displays CleanAir Interferers of type Persistent for 2.4-GHz band
show ap dot11 24ghz cleanair device type superag	Displays CleanAir Interferers of type SuperAG for 2.4-GHz band

Commands	Description
show ap dot11 24ghz cleanair device type tdd-tx	Displays CleanAir Interferers of type TDD Transmit for 2.4-GHz band
show ap dot11 24ghz cleanair device type video	Displays CleanAir Interferers of type Video Camera for 2.4-GHz band
show ap dot11 24ghz cleanair device type wimax-fixed	Displays CleanAir Interferers of type WiMax Fixed for 2.4-GHz band
show ap dot11 24ghz cleanair device type wimax-mobile	Displays CleanAir Interferers of type WiMax Mobile for 2.4-GHz band
show ap dot11 24ghz cleanair device type xbox	Displays CleanAir Interferers of type Xbox for 2.4-GHz band
show ap dot11 24ghz cleanair device type zigbee	Displays CleanAir Interferers of type zigbee for 2.4-GHz band
show ap dot11 5ghz cleanair air-quality summary	Displays CleanAir Air Quality (AQ) data for 5-GHz band
show ap dot11 5ghz cleanair air-quality worst	Displays CleanAir Air Quality (AQ) worst data for 5-GHz band
show ap dot11 5ghz cleanair config	Displays CleanAir Configuration for 5-GHz band
show ap dot11 5ghz cleanair device type all	Displays all CleanAir Interferers for 5-GHz band
show ap dot11 5ghz cleanair device type canopy	Displays CleanAir Interferers of type Canopy for 5-GHz band
show ap dot11 5ghz cleanair device type cont-tx	Displays CleanAir Interferers of type Continuous TX for 5-GHz band
show ap dot11 5ghz cleanair device type dect-like	Displays CleanAir Interferers of type DECT Like for 5-GHz band
show ap dot11 5ghz cleanair device type inv	Displays CleanAir Interferers of type WiFi Inverted for 5-GHz band
show ap dot11 5ghz cleanair device type jammer	Displays CleanAir Interferers of type Jammer for 5-GHz band
show ap dot11 5ghz cleanair device type nonstd	Displays CleanAir Interferers of type WiFi Inv. Ch for 5-GHz band
show ap dot11 5ghz cleanair device type persistent	Displays CleanAir Interferers of type Persistent for 5-GHz band
show ap dot11 5ghz cleanair device type superag	Displays CleanAir Interferers of type SuperAG for 5-GHz band
show ap dot11 5ghz cleanair device type tdd-tx	Displays CleanAir Interferers of type TDD Transmit for 5-GHz band

Commands	Description
show ap dot11 5ghz cleanair device type video	Displays CleanAir Interferers of type Video Camera for 5-GHz band
show ap dot11 5ghz cleanair device type wimax-fixed	Displays CleanAir Interferers of type WiMax Fixed for 5-GHz band
show ap dot11 5ghz cleanair device type wimax-mobile	Displays CleanAir Interferers of type WiMax Mobile for 5-GHz band

Monitoring the Interference Devices

When a CleanAir-enabled access point detects interference devices, detections of the same device from multiple sensors are merged together to create clusters. Each cluster is given a unique ID. Some devices conserve power by limiting the transmit time until actually needed which results in the spectrum sensor to temporarily stop detecting the device. This device is then correctly marked as down. A down device is correctly removed from the spectrum database. In cases when all the interferer detections for a specific devices are reported, the cluster ID is kept alive for an extended period of time to prevent possible device detection bouncing. If the same device is detected again, it is merged with the original cluster ID and the device detection history is preserved.

For example, some bluetooth headsets operate on battery power. These devices employ methods to reduce power consumption, such as turning off the transmitter when not actually needed. Such devices can appear to come and go from the classification. To manage these devices, CleanAir keeps the cluster IDs longer and they are remerged into a single record upon detection. This process smoothens the user records and accurately represents the device history.

Configuration Examples for Configuring CleanAir

Enabling CleanAir on 2.4-GHz Band and an Access Point: Example

This example shows how to enable CleanAir on the 2.4-GHz band and an access point operating in the channel:

```
Device#configure terminal
Device(config)#ap dot11 24ghz cleanair
Device(config)#exit
Device#ap name TAP1 dot11 24ghz cleanair
Device#end
```

Configuring a CleanAir Alarm for 2.4-GHz Air-Quality and Devices: Example

This example shows how to configure a CleanAir Alarm for 2.4-GHz Air-Quality threshold of 50 dBm and an Xbox device:

```
Device#configure terminal
Device(config)#ap dot11 24ghz cleanair alarm air-quality threshold 50
Device(config)#ap dot11 24ghz cleanair alarm device xbox
Device(config)#end
```

Configuring Interference Reporting for 5-GHz Devices: Example

This example shows how to configure interference reporting for 5-GHz devices:

```
Device#configure terminal
Device(config)#ap dot11 5ghz cleanair alarm device xbox
Device(config)#end
```

Configuring EDRRM for CleanAir-Events: Example

This example shows how to enable an EDRRM cleanair-event in the 2.4-GHz band and configure high sensitivity to non Wi-Fi interference:

```
Device#configure terminal
Device(config)#ap dot11 24ghz rrm channel cleanair-event
Device(config)#ap dot11 24ghz rrm channel cleanair-event sensitivity high
Device(config)#end
```

Configuring Persistent Device Avoidance: Example

This example shows how to enable persistent non Wi-Fi device avoidance in the 2.4-GHz band:

```
Device#configure terminal
Device(config)#ap dot11 24ghz rrm channel device
Device(config)#end
```

Configuring an Access Point for SE-Connect Mode: Example

This example shows how to configure an access point in the SE-Connect mode:

```
Device#ap name Cisco_AP3500 mode se-connect
```

CleanAir FAQs

Q. How do I check if my MC is up?

A. To check if the MC is up, use the command: **show wireless mobility summary**.

This example shows how to display the mobility summary:

```
Device#show wireless mobility summary

Mobility Controller Summary:
Mobility Role                : Mobility Controller
Mobility Protocol Port       : 16666
Mobility Group Name          : MG-AK
Mobility Oracle              : Disabled
Mobility Oracle IP Address   : 0.0.0.0
DTLS Mode                    : Enabled
Mobility Domain ID for 802.11r : 0x39b2
Mobility Keepalive Interval  : 10
Mobility Keepalive Count     : 3
Mobility Control Message DSCP Value : 48
Mobility Domain Member Count : 2
Link Status is Control Link Status : Data Link Status
Controllers configured in the Mobility Domain:
IP                Public IP        Group Name        Multicast IP    Link Status
-----
```

9.6.136.10 - MG-AK 0.0.0.0 UP : UP

- Q.** Multiple access points detect the same interference device, however, the device shows them as separate clusters or different suspected devices clustered together. Why does this happen?
- A.** Access points must be RF neighbors for the device to consider the merging of devices that are detected by these access points. The access point takes time to establish neighbor relationships. A few minutes after the device reboots or a change in the RF group and similar events, clustering will not be very accurate.
- Q.** Can I merge two monitor mode access points using a device?
- A.** No, you cannot merge two monitor mode access points using a device. You can merge the monitor mode access points only using MSE.
- Q.** How do I view neighbor access points?
- A.** To view neighbor access points, use the command: **show ap ap_name auto-rf dot11 {24ghz | 5ghz}**

This example shows how to display the neighbor access points:

```
Device#show ap name AS-5508-5-AP3 auto-rf dot11 24ghz
```

```

AP 24B6.5734.C570 slot 0      : -48 dBm on 11 (10.0.0.2)
```

```
<snippet>
```

- Q.** What are the debug commands available for CleanAir?
- A.** The debug commands for CleanAir are:
- ```
debug cleanair {all | error | event | internal-event | nmsp | packet}
debug rrm {all | channel | detail | error | group | ha | manager | message | packet
| power | prealarm | profile | radar | rf-change | scale | spectrum}
```
- Q.** Why are CleanAir Alarms not generated for interferer devices?
- A.** Verify that the access points are CleanAir-capable and CleanAir is enabled both on the access point and the device.
- Q.** Can the Cisco Catalyst 3850 Series Switches function as a Mobility Agent (MA)?
- A.** Yes, the Cisco Catalyst 3850 Series Switches can function as an MA.
- Q.** Are CleanAir configurations available on the MA?
- A.** From Release 3.3 SE, CleanAir configurations are available on the MA. You can use the following two CleanAir commands on the MA:
- **show ap dot11 5ghz cleanair config**

- `show ap dot11 24ghz cleanair config`

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring Interface Characteristics

### Interface Types

This section describes the different types of interfaces supported by the device. The rest of the chapter describes configuration procedures for physical interface characteristics.

---

**Note** The stack ports on the rear of the stacking-capable devices are not Ethernet ports and cannot be configured.

---

## Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN. VLANs can be formed with ports across the stack.

To configure VLANs, use the **vlan** *vlan-id* global configuration command to enter VLAN configuration mode. The VLAN configurations for normal-range VLANs (VLAN IDs 1 to 1005) are saved in the VLAN database. If VTP is version 1 or 2, to configure extended-range VLANs (VLAN IDs 1006 to 4094), you must first set VTP mode to transparent. Extended-range VLANs created in transparent mode are not added to the VLAN database but are saved in the device running configuration. With VTP version 3, you can create extended-range VLANs in client or server mode. These VLANs are saved in the VLAN database.

In a switch stack, the VLAN database is downloaded to all switches in a stack, and all switches in the stack build the same VLAN database. The running configuration and the saved configuration are the same for all switches in a stack.

Add ports to a VLAN by using the **switchport** interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and, if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

## Switch Ports

Switch ports are Layer 2-only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port or a trunk port. You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to set the switchport mode by negotiating with the port on the other end of the link. switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the **switchport** interface configuration commands.

## Access Ports

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives a tagged packet (Inter-Switch Link [ISL] or IEEE 802.1Q tagged), the packet is dropped, and the source address is not learned.

The types of access ports supported are:

- Static access ports are manually assigned to a VLAN (or through a RADIUS server for use with IEEE 802.1x).

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.

## Trunk Ports

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if VTP knows of the VLAN and if the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

## Tunnel Ports

Tunnel ports are used in IEEE 802.1Q tunneling to segregate the traffic of customers in a service-provider network from other customers who are using the same VLAN number. You configure an asymmetric link from a tunnel port on a service-provider edge switch to an IEEE 802.1Q trunk port on the customer switch. Packets entering the tunnel port on the edge switch, already IEEE 802.1Q-tagged with the customer VLANs, are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag), containing a VLAN ID unique in the service-provider network, for each customer. The double-tagged packets go through the service-provider network keeping the original customer VLANs separate from those of other customers. At the outbound interface, also a tunnel port, the metro tag is removed, and the original VLAN numbers from the customer network are retrieved.

Tunnel ports cannot be trunk ports or access ports and must belong to a VLAN unique to each customer.

## Routed Ports

A routed port is a physical port that acts like a port on a router; it does not have to be connected to a router. A routed port is not associated with a particular VLAN, as is an access port. A routed port behaves like a regular router interface, except that it does not support VLAN subinterfaces. Routed ports can be configured with a Layer 3 routing protocol. A routed port is a Layer 3 interface only and does not support Layer 2 protocols, such as DTP and STP.

Configure routed ports by putting the interface into Layer 3 mode with the **no switchport** interface configuration command. Then assign an IP address to the port, enable routing, and assign routing protocol characteristics by using the **ip routing** and **router protocol** global configuration commands.

**Note** Entering a **no switchport** interface configuration command shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost.

The number of routed ports that you can configure is not limited by software. However, the interrelationship between this number and the number of other features being configured might impact CPU performance because of hardware limitations.

---

**Note** The IP Base image supports static routing and the Routing Information Protocol (RIP). For full Layer 3 routing or for fallback bridging, you must enable the IP Services image on the standalone device, or the active device.

---

## Switch Virtual Interfaces

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing or bridging function in the system. You can associate only one SVI with a VLAN. You configure an SVI for a VLAN only to route between VLANs or to provide IP host connectivity to the device. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote device administration. Additional SVIs must be explicitly configured.

---

**Note** You cannot delete interface VLAN 1.

---

SVIs provide IP host connectivity only to the system. SVIs are created the first time that you enter the **vlan** interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address.

You can also use the interface range command to configure existing VLAN SVIs within the range. The commands entered under the interface range command are applied to all existing VLAN SVIs within the range. You can enter the command **interface range create vlan x - y** to create all VLANs in the specified range that do not already exist. When the VLAN interface is created, **interface range vlan id** can be used to configure the VLAN interface.

Although the switch stack or device supports a total of 1005 VLANs and SVIs, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations.

When you create an SVI, it does not become active until it is associated with a physical port.

### SVI Autostate Exclude

The line state of an SVI with multiple ports on a VLAN is in the *up* state when it meets these conditions:

- The VLAN exists and is active in the VLAN database on the device
- The VLAN interface exists and is not administratively down.
- At least one Layer 2 (access or trunk) port exists, has a link in the *up* state on this VLAN, and is in the spanning-tree forwarding state on the VLAN.

---

**Note** The protocol link state for VLAN interfaces come up when the first switchport belonging to the corresponding VLAN link comes up and is in STP forwarding state.

---

The default action, when a VLAN has multiple ports, is that the SVI goes down when all ports in the VLAN go down. You can use the SVI autostate exclude feature to configure a port so that it is not included in the SVI line-state up-or-down calculation. For example, if the only active port on the VLAN is a monitoring port,

you might configure `autostate exclude` on that port so that the VLAN goes down when all other ports go down. When enabled on a port, **autostate exclude** applies to all VLANs that are enabled on that port.

The VLAN interface is brought up when one Layer 2 port in the VLAN has had time to converge (transition from STP listening-learning state to forwarding state). This prevents features such as routing protocols from using the VLAN interface as if it were fully operational and minimizes other problems, such as routing black holes.

## EtherChannel Port Groups

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between devices or between devices and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port, group multiple access ports into one logical access port, group multiple tunnel ports into one logical tunnel port, or group multiple routed ports into one logical routed port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), and the Port Aggregation Protocol (PAgP), which operate only on physical ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 3 interfaces, you manually create the logical interface by using the **interface port-channel** global configuration command. Then you manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command. For Layer 2 interfaces, use the **channel-group** interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together.

## 10-Gigabit Ethernet Interfaces

A 10-Gigabit Ethernet interface operates only in full-duplex mode. The interface can be configured as a switched or routed port.

For more information about the Cisco TwinGig Converter Module, see the device hardware installation guide and your transceiver module documentation.

## Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the device senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

## Using the Switch USB Ports

The device has two USB ports on the front panel — a USB mini-Type B console port and a USB Type A port.

## USB Mini-Type B Console Port

The device has the following console ports:

- USB mini-Type B console connection
- RJ-45 console port

Console output appears on devices connected to both ports, but console input is active on only one port at a time. By default, the USB connector takes precedence over the RJ-45 connector.

**Note** Windows PCs require a driver for the USB port. See the hardware installation guide for driver installation instructions.

Use the supplied USB Type A-to-USB mini-Type B cable to connect a PC or other device to the device. The connected device must include a terminal emulation application. When the device detects a valid USB connection to a powered-on device that supports host functionality (such as a PC), input from the RJ-45 console is immediately disabled, and input from the USB console is enabled. Removing the USB connection immediately reenables input from the RJ-45 console connection. An LED on the device shows which console connection is in use.

### Console Port Change Logs

At software startup, a log shows whether the USB or the RJ-45 console is active. Each device in a stack issues this log. Every device always first displays the RJ-45 media type.

In the sample output, Device 1 has a connected USB console cable. Because the bootloader did not change to the USB console, the first log from Device 1 shows the RJ-45 console. A short time later, the console changes and the USB console log appears. Device 2 and Device 3 have connected RJ-45 console cables.

```
switch-stack-1
*Mar 1 00:01:00.171: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
*Mar 1 00:01:00.431: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.

switch-stack-2
*Mar 1 00:01:09.835: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.

switch-stack-3
*Mar 1 00:01:10.523: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

When the USB cable is removed or the PC de-activates the USB connection, the hardware automatically changes to the RJ-45 console interface:

```
switch-stack-1
Mar 1 00:20:48.635: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

You can configure the console type to always be RJ-45, and you can configure an inactivity timeout for the USB connector.

## USB Type A Port

The USB Type A port provides access to external USB flash devices, also known as thumb drives or USB keys. The port supports Cisco USB flash drives with capacities from 128 MB to 8 GB (USB devices with port densities of 128 MB, 256 MB, 1 GB, 4 GB, 8 GB are supported). You can use standard Cisco IOS

command-line interface (CLI) commands to read, write, erase, and copy to or from the flash device. You can also configure the device to boot from the USB flash drive.

## Interface Connections

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device. With a standard Layer 2 device, ports in different VLANs have to exchange information through a router. By using the device with routing enabled, when you configure both VLAN 20 and VLAN 30 with an SVI to which an IP address is assigned, packets can be sent from Host A to Host B directly through the device with no need for an external router.

**Figure 2: Connecting VLANs with the Switch**

**Note** Devices running the LAN Base image support configuring only 16 static routes on SVIs.

When the IP Services image is running on the device or the active device, the device uses two methods to forward traffic between interfaces: routing and fallback bridging. If the IP Base image is on the device or the active device, only basic routing (static routing and RIP) is supported. Whenever possible, to maintain high performance, forwarding is done by the device hardware. However, only IPv4 packets with Ethernet II encapsulation are routed in hardware. Non-IP traffic and traffic with other encapsulation methods are fallback-bridged by hardware.

- The routing function can be enabled on all SVIs and routed ports. The device routes only IP traffic. When IP routing protocol parameters and address configuration are added to an SVI or routed port, any IP traffic received from these ports is routed.
- Fallback bridging forwards traffic that the device does not route or traffic belonging to a nonroutable protocol, such as DECnet. Fallback bridging connects multiple VLANs into one bridge domain by bridging between two or more SVIs or routed ports. When configuring fallback bridging, you assign SVIs or routed ports to bridge groups with each SVI or routed port assigned to only one bridge group. All interfaces in the same group belong to the same bridge domain.

## Interface Configuration Mode

The device supports these interface types:

- Physical ports—device ports and routed ports

- VLANs—switch virtual interfaces
- Port channels—EtherChannel interfaces

You can also configure a range of interfaces.

To configure a physical interface (port), specify the interface type, stack member number (only stacking-capable switches), module number, and device port number, and enter interface configuration mode.

- Type—Gigabit Ethernet (gigabitethernet or gi) for 10/100/1000 Mb/s Ethernet ports, 10-Gigabit Ethernet (tengigabitethernet or te) for 10,000 Mb/s, or small form-factor pluggable (SFP) module Gigabit Ethernet interfaces (gigabitethernet or gi).
- Stack member number—The number that identifies the device within the stack. The device number range is 1 to 9 and is assigned the first time the device initializes. The default device number, before it is integrated into a device stack, is 1. When a device has been assigned a stack member number, it keeps that number until another is assigned to it.

You can use the switch port LEDs in Stack mode to identify the stack member number of a device.

- Module number—The module or slot number on the device: switch (downlink) ports are 0, and uplink ports are 1.
- Port number—The interface number on the device. The 10/100/1000 port numbers always begin at 1, starting with the far left port when facing the front of the device, for example, gigabitethernet1/0/1 or gigabitethernet1/0/8.

On a device with SFP uplink ports, the module number is 1 and the port numbers restart. For example, if the device has 24 10/100/1000 ports, the SFP module ports are gigabitethernet1/1/1 through gigabitethernet1/1/4 or tengigabitethernet1/1/1 through tengigabitethernet1/1/4.

You can identify physical interfaces by physically checking the interface location on the device. You can also use the **show** privileged EXEC commands to display information about a specific interface or all the interfaces on the switch. The remainder of this chapter primarily provides physical interface configuration procedures.

These are examples of how to identify interfaces on a stacking-capable device:

- To configure 10/100/1000 port 4 on a standalone device, enter this command:

```
Device(config)# interface gigabitethernet1/0/4
```

- To configure 10-Gigabit Ethernet port 1 on a standalone device, enter this command:

```
Device(config)# interface tengigabitethernet1/0/1
```

- To configure 10-Gigabit Ethernet port on stack member 3, enter this command:

```
Device(config)# interface tengigabitethernet3/0/1
```

- To configure the first SFP module (uplink) port on a standalone device, enter this command:

```
Device(config)# interface gigabitethernet1/1/1
```

## Default Ethernet Interface Configuration

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

This table shows the Ethernet interface default configuration, including some features that apply only to Layer 2 interfaces.

**Table 6: Default Layer 2 Ethernet Interface Configuration**

| Feature                                                       | Default Setting                                                                 |
|---------------------------------------------------------------|---------------------------------------------------------------------------------|
| Operating mode                                                | Layer 2 or switching mode ( <b>switchport</b> command).                         |
| Allowed VLAN range                                            | VLANs 1– 4094.                                                                  |
| Default VLAN (for access ports)                               | VLAN 1 (Layer 2 interfaces only).                                               |
| Native VLAN (for IEEE 802.1Q trunks)                          | VLAN 1 (Layer 2 interfaces only).                                               |
| VLAN trunking                                                 | Switchport mode dynamic auto (supports DTP) (Layer 2 interfaces only).          |
| Port enable state                                             | All ports are enabled.                                                          |
| Port description                                              | None defined.                                                                   |
| Speed                                                         | Autonegotiate. (Not supported on the 10-Gigabit interfaces.)                    |
| Duplex mode                                                   | Autonegotiate. (Not supported on the 10-Gigabit interfaces.)                    |
| Flow control                                                  | Flow control is set to <b>receive: off</b> . It is always off for sent packets. |
| EtherChannel (PAgP)                                           | Disabled on all Ethernet ports.                                                 |
| Port blocking (unknown multicast and unknown unicast traffic) | Disabled (not blocked) (Layer 2 interfaces only).                               |
| Broadcast, multicast, and unicast storm control               | Disabled.                                                                       |
| Protected port                                                | Disabled (Layer 2 interfaces only).                                             |
| Port security                                                 | Disabled (Layer 2 interfaces only).                                             |
| Port Fast                                                     | Disabled.                                                                       |

| Feature                   | Default Setting                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto-MDIX                 | Enabled.<br><br><b>Note</b> The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MDIX is enabled on the switch port. |
| Power over Ethernet (PoE) | Enabled (auto).                                                                                                                                                                                                                                                                                                             |

## Interface Speed and Duplex Mode

Ethernet interfaces on the switch operate at 10, 100, 1000, or 10,000 Mb/s and in either full- or half-duplex mode. In full-duplex mode, two stations can send and receive traffic at the same time. Normally, 10-Mb/s ports operate in half-duplex mode, which means that stations can either receive or send traffic.

Switch models include Gigabit Ethernet (10/100/1000-Mb/s) ports, 10-Gigabit Ethernet ports, and small form-factor pluggable (SFP) module slots supporting SFP modules.

## Speed and Duplex Configuration Guidelines

When configuring an interface speed and duplex mode, note these guidelines:

- The 10-Gigabit Ethernet ports do not support the speed and duplex features. These ports operate only at 10,000 Mb/s and in full-duplex mode.
- Gigabit Ethernet (10/100/1000-Mb/s) ports support all speed options and all duplex options (auto, half, and full). However, Gigabit Ethernet ports operating at 1000 Mb/s do not support half-duplex mode.
- For SFP module ports, the speed and duplex CLI options change depending on the SFP module type:
  - The 1000BASE-*x* (where *x* is -BX, -CWDM, -LX, -SX, and -ZX) SFP module ports support the **nonegotiate** keyword in the **speed** interface configuration command. Duplex options are not supported.
  - The 1000BASE-T SFP module ports support the same speed and duplex options as the 10/100/1000-Mb/s ports.
- If both ends of the line support autonegotiation, we highly recommend the default setting of **auto** negotiation.
- If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do not use the **auto** setting on the supported side.
- When STP is enabled and a port is reconfigured, the device can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures.

---

**Caution** Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

---

## IEEE 802.3x Flow Control

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

---

**Note** Flow control is not supported on Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches.

---

---

**Note** The switch ports can receive, but not send, pause frames.

---

You use the **flowcontrol** interface configuration command to set the interface's ability to **receive** pause frames to **on**, **off**, or **desired**. Prior to Cisco IOS XE Everest 16.6.4 release, the default state is **off**. Starting Cisco IOS XE Everest 16.6.4 release, the default state is **on**.

When set to **desired**, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.

These rules apply to flow control settings on the device:

- **receive on** (or **desired**): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.
- **receive off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

## Layer 3 Interfaces

The device supports these types of Layer 3 interfaces:

- **SVIs**: You should configure SVIs for any VLANs for which you want to route traffic. SVIs are created when you enter a VLAN ID following the **interface vlan** global configuration command. To delete an SVI, use the **no interface vlan** global configuration command. You cannot delete interface VLAN 1.

---

**Note** When you create an SVI, it does not become active until it is associated with a physical port.

---

When configuring SVIs, you can also configure SVI autostate exclude on a port in the SVI to exclude that port from being included in determining SVI line-state status.

- Routed ports: Routed ports are physical ports configured to be in Layer 3 mode by using the **no switchport** interface configuration command.
- Layer 3 EtherChannel ports: EtherChannel interfaces made up of routed ports.

A Layer 3 device can have an IP address assigned to each routed port and SVI.

There is no defined limit to the number of SVIs and routed ports that can be configured in a device or in a device stack. However, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might have an impact on CPU usage because of hardware limitations. If the device is using its maximum hardware resources, attempts to create a routed port or SVI have these results:

- If you try to create a new routed port, the device generates a message that there are not enough resources to convert the interface to a routed port, and the interface remains as a switchport.
- If you try to create an extended-range VLAN, an error message is generated, and the extended-range VLAN is rejected.
- If the device is notified by VLAN Trunking Protocol (VTP) of a new VLAN, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the **show vlan** user EXEC command shows the VLAN in a suspended state.
- If the device attempts to boot up with a configuration that has more VLANs and routed ports than hardware can support, the VLANs are created, but the routed ports are shut down, and the device sends a message that this was due to insufficient hardware resources.

All Layer 3 interfaces require an IP address to route traffic. This procedure shows how to configure an interface as a Layer 3 interface and how to assign an IP address to an interface.

---

**Note** If the physical port is in Layer 2 mode (the default), you must enter the **no switchport** interface configuration command to put the interface into Layer 3 mode. Entering a **no switchport** command disables and then re-enables the interface, which might generate messages on the device to which the interface is connected. Furthermore, when you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration

---

# How to Configure Interface Characteristics

## Configuring Interfaces

These general instructions apply to all interface configuration processes.

### Procedure

|        | Command or Action  | Purpose                                                        |
|--------|--------------------|----------------------------------------------------------------|
| Step 1 | enable<br>Example: | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> <code>enable</code>                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                  | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>interface</b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet1/0/1</code><br>Device(config-if)# | Identifies the interface type, the device number (only on stacking-capable switches), and the number of the connector.<br><br><b>Note</b> You do not need to add a space between the interface type and the interface number. For example, in the preceding line, you can specify either <b>gigabitethernet 1/0/1</b> , <b>gigabitethernet1/0/1</b> , <b>gi 1/0/1</b> , or <b>gi1/0/1</b> . |
| <b>Step 4</b> | Follow each <b>interface</b> command with the interface configuration commands that the interface requires.              | Defines the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter <b>end</b> to return to privileged EXEC mode.                                                                                                                                                              |
| <b>Step 5</b> | <b>interface range</b> or <b>interface range macro</b>                                                                   | (Optional) Configures a range of interfaces.<br><br><b>Note</b> Interfaces configured in a range must be the same type and must be configured with the same feature options.                                                                                                                                                                                                                |
| <b>Step 6</b> | <b>show interfaces</b>                                                                                                   | Displays a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.                                                                                                                                                                                                                         |

## Adding a Description for an Interface

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `description string`
5. `end`
6. `show interfaces interface-id description`
7. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                      | Purpose                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                          | Enables privileged EXEC mode. Enter your password if prompted.                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                  | Enters global configuration mode.                                                                       |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br><br>Device(config)# <b>interface gigabitethernet1/0/2</b>   | Specifies the interface for which you are adding a description, and enter interface configuration mode. |
| <b>Step 4</b> | <b>description <i>string</i></b><br><b>Example:</b><br><br>Device(config-if)# <b>description Connects to Marketing</b> | Adds a description (up to 240 characters) for an interface.                                             |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Device(config-if)# <b>end</b>                                                     | Returns to privileged EXEC mode.                                                                        |
| <b>Step 6</b> | <b>show interfaces <i>interface-id</i> description</b>                                                                 | Verifies your entry.                                                                                    |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>  | (Optional) Saves your entries in the configuration file.                                                |

## Configuring a Range of Interfaces

To configure multiple interfaces with the same configuration parameters, use the **interface range** global configuration command. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface range** {*port-range* | **macro** *macro\_name*}
4. **end**
5. **show interfaces** [*interface-id*]
6. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>interface range</b> { <i>port-range</i>   <b>macro</b> <i>macro_name</i> }<br><b>Example:</b><br><pre>Device(config)# interface range macro</pre> | <p>Specifies the range of interfaces (VLANs or physical ports) to be configured, and enter interface-range configuration mode.</p> <ul style="list-style-type: none"> <li>• You can use the <b>interface range</b> command to configure up to five port ranges or a previously defined macro.</li> <li>• The <b>macro</b> variable is explained in the <a href="#">Configuring and Using Interface Range Macros, on page 56</a>.</li> <li>• In a comma-separated <i>port-range</i>, you must enter the interface type for each entry and enter spaces before and after the comma.</li> <li>• In a hyphen-separated <i>port-range</i>, you do not need to re-enter the interface type, but you must enter a space before the hyphen.</li> </ul> <p><b>Note</b> Use the normal configuration commands to apply the configuration parameters to all interfaces in the range. Each command is executed as it is entered.</p> |
| Step 4 | <b>end</b><br><b>Example:</b>                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|               | Command or Action                                                                                                 | Purpose                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
|               | Device(config)# <b>end</b>                                                                                        |                                                            |
| <b>Step 5</b> | <b>show interfaces</b> [ <i>interface-id</i> ]<br><b>Example:</b><br>Device# <b>show interfaces</b>               | Verifies the configuration of the interfaces in the range. |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.   |

## Configuring and Using Interface Range Macros

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface range macro** global configuration command string, you must use the **define interface-range** global configuration command to define the macro.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **define interface-range** *macro\_name interface-range*
4. **interface range macro** *macro\_name*
5. **end**
6. **show running-config | include define**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                 | Purpose                                                        |
|---------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global configuration mode.                              |
| <b>Step 3</b> | <b>define interface-range</b> <i>macro_name interface-range</i>                   | Defines the interface-range macro, and save it in NVRAM.       |

|               | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Device(config)# define interface-range enet_list gigabitethernet1/0/1 - 2</pre>                             | <ul style="list-style-type: none"> <li>The <i>macro_name</i> is a 32-character maximum character string.</li> <li>A macro can contain up to five comma-separated interface ranges.</li> <li>Each <i>interface-range</i> must consist of the same port type.</li> </ul> <p><b>Note</b> Before you can use the <b>macro</b> keyword in the <b>interface range macro</b> global configuration command string, you must use the <b>define interface-range</b> global configuration command to define the macro.</p> |
| <b>Step 4</b> | <p><b>interface range macro</b> <i>macro_name</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface range macro enet_list</pre> | <p>Selects the interface range to be configured using the values saved in the interface-range macro called <i>macro_name</i>.</p> <p>You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro.</p>                                                                                                                                                                                                                                                   |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                 | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 6</b> | <p><b>show running-config   include define</b></p> <p><b>Example:</b></p> <pre>Device# show running-config   include define</pre>       | <p>Shows the defined interface range macro configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>           | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Configuring Ethernet Interfaces

### Setting the Interface Speed and Duplex Parameters

#### SUMMARY STEPS

1. enable
2. configure terminal

3. `interface interface-id`
4. `speed {10 | 100 | 1000 | 2500 | 5000 | 10000 | auto [10 | 100 | 1000 | 2500 | 5000 | 10000] | nonegotiate}`
5. `duplex {auto | full | half}`
6. `end`
7. `show interfaces interface-id`
8. `copy running-config startup-config`
9. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet1/0/3</code>                                                                  | Specifies the physical interface to be configured, and enter interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>speed {10   100   1000   2500   5000   10000   auto [10   100   1000   2500   5000   10000]   nonegotiate}</b><br><b>Example:</b><br>Device(config-if)# <code>speed 10</code> | Enter the appropriate speed parameter for the interface: <ul style="list-style-type: none"> <li>• Enter <b>10, 100, 1000 2500, 5000, or 10000</b> to set a specific speed for the interface.</li> <li>• Enter <b>auto</b> to enable the interface to autonegotiate speed with the connected device. If you specify a speed and also set the <b>auto</b> keyword, the port autonegotiates only at the specified speeds.</li> <li>• The <b>nonegotiate</b> keyword is available only for SFP module ports. SFP module ports operate only at 1000 Mb/s but can be configured to not negotiate if connected to a device that does not support autonegotiation.</li> </ul> |
| <b>Step 5</b> | <b>duplex {auto   full   half}</b><br><b>Example:</b><br>Device(config-if)# <code>duplex half</code>                                                                             | This command is not available on a 10-Gigabit Ethernet interface.<br><br>Enter the duplex parameter for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|               | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                              | Enable half-duplex mode (for interfaces operating only at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 Mb/s.<br><br>You can configure the duplex setting when the speed is set to <b>auto</b> . |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br><br>Device(config-if)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                           |
| <b>Step 7</b> | <b>show interfaces</b> <i>interface-id</i><br><br><b>Example:</b><br><br>Device# <b>show interfaces gigabitethernet1/0/3</b> | Displays the interface speed and duplex mode configuration.                                                                                                                                                                                |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>    | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                   |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>    | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                   |

## Configuring IEEE 802.3x Flow Control

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **flowcontrol** {receive} {on | off | desired}
4. **end**
5. **show interfaces** *interface-id*
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                | Purpose                          |
|---------------|--------------------------------------------------|----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b> | Enters global configuration mode |

|               | Command or Action                                                                                                                    | Purpose                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                              |                                                                                            |
| <b>Step 2</b> | <code>interface interface-id</code><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet1/0/1</code>                | Specifies the physical interface to be configured, and enter interface configuration mode. |
| <b>Step 3</b> | <code>flowcontrol {receive} {on   off   desired}</code><br><b>Example:</b><br>Device(config-if)# <code>flowcontrol receive on</code> | Configures the flow control mode for the port.                                             |
| <b>Step 4</b> | <code>end</code><br><b>Example:</b><br>Device(config-if)# <code>end</code>                                                           | Returns to privileged EXEC mode.                                                           |
| <b>Step 5</b> | <code>show interfaces interface-id</code><br><b>Example:</b><br>Device# <code>show interfaces gigabitethernet1/0/1</code>            | Verifies the interface flow control settings.                                              |
| <b>Step 6</b> | <code>copy running-config startup-config</code><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>        | (Optional) Saves your entries in the configuration file.                                   |

## Configuring Layer 3 Interfaces

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface {gigabitethernet interface-id} | {vlan vlan-id} | {port-channel port-channel-number}`
4. `no switchport`
5. `ip address ip_address subnet_mask`
6. `no shutdown`
7. `end`
8. `show interfaces [interface-id]`
9. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                    | Purpose                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                            | Enables privileged EXEC mode. Enter your password if prompted.                                           |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                    | Enters global configuration mode.                                                                        |
| Step 3 | <b>interface</b> { <b>gigabitethernet</b> <i>interface-id</i> }   { <b>vlan</b> <i>vlan-id</i> }<br>  { <b>port-channel</b> <i>port-channel-number</i> }<br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet1/0/2</b> | Specifies the interface to be configured as a Layer 3 interface, and enter interface configuration mode. |
| Step 4 | <b>no switchport</b><br><b>Example:</b><br>Device(config-if)# <b>no switchport</b>                                                                                                                                                   | For physical ports only, enters Layer 3 mode.                                                            |
| Step 5 | <b>ip address</b> <i>ip_address subnet_mask</i><br><b>Example:</b><br>Device(config-if)# <b>ip address 192.20.135.21 255.255.255.0</b>                                                                                               | Configures the IP address and IP subnet.                                                                 |
| Step 6 | <b>no shutdown</b><br><b>Example:</b><br>Device(config-if)# <b>no shutdown</b>                                                                                                                                                       | Enables the interface.                                                                                   |
| Step 7 | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                                                                                                                       | Returns to privileged EXEC mode.                                                                         |
| Step 8 | <b>show interfaces</b> [ <i>interface-id</i> ]                                                                                                                                                                                       | Verifies the configuration.                                                                              |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring Logical Layer 3 GRE Tunnel Interfaces

### Before you begin

Generic Routing Encapsulation (GRE) is a tunneling protocol used to encapsulate network layer protocols inside virtual point-to-point links. A GRE tunnel only provides encapsulation and not encryption.

#### Attention

Beginning in Cisco IOS XE Release 3.7.2E, GRE tunnels are supported on the hardware on Cisco Catalyst switches. When GRE is configured without tunnel options, packets are hardware-switched. When GRE is configured with tunnel options (such as key, checksum, etc.), packets are switched in the software. A maximum of 10 GRE tunnels are supported.

#### Note

Other features like Access Control Lists (ACL) and Quality of Service (QoS) are not supported for the GRE tunnels.

To configure a GRE tunnel, perform this task:

### SUMMARY STEPS

1. **interface tunnel** *number*
2. **ip address***ip\_address**subnet\_mask*
3. **tunnel source**{*ip\_address* | *type\_number*}
4. **tunnel destination**{*host\_name* | *ip\_address*}
5. **tunnel mode gre ip**
6. **end**

### DETAILED STEPS

|               | Command or Action                                                                                     | Purpose                                  |
|---------------|-------------------------------------------------------------------------------------------------------|------------------------------------------|
| <b>Step 1</b> | <b>interface tunnel</b> <i>number</i><br><b>Example:</b><br>Device(config)# <b>interface tunnel</b> 2 | Enables tunneling on the interface.      |
| <b>Step 2</b> | <b>ip address</b> <i>ip_address</i> <i>subnet_mask</i><br><b>Example:</b>                             | Configures the IP address and IP subnet. |

|               | Command or Action                                                                                                                                 | Purpose                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
|               | Device(config)# <b>ip address 100.1.1.1 255.255.255.0</b>                                                                                         |                                    |
| <b>Step 3</b> | <b>tunnel source</b> { <i>ip_address</i>   <i>type_number</i> }<br><br><b>Example:</b><br>Device(config)# <b>tunnel source 10.10.10.1</b>         | Configures the tunnel source.      |
| <b>Step 4</b> | <b>tunnel destination</b> { <i>host_name</i>   <i>ip_address</i> }<br><br><b>Example:</b><br>Device(config)# <b>tunnel destination 10.10.10.2</b> | Configures the tunnel destination. |
| <b>Step 5</b> | <b>tunnel mode gre ip</b><br><br><b>Example:</b><br>Device(config)# <b>tunnel mode gre ip</b>                                                     | Configures the tunnel mode.        |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                   | Exist configuration mode.          |

## Configuring SVI Autostate Exclude

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport autostate exclude**
5. **end**
6. **show running config interface** *interface-id*
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                     | Purpose                                                        |
|---------------|---------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Device> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global configuration mode.                              |

|               | Command or Action                                                                                                 | Purpose                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> gigabitethernet1/0/2  | Specifies a Layer 2 interface (physical port or port channel), and enter interface configuration mode. |
| <b>Step 4</b> | <b>switchport autostate exclude</b><br><b>Example:</b><br>Device(config-if)# <b>switchport autostate exclude</b>  | Excludes the access or trunk port when defining the status of an SVI line state (up or down)           |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                    | Returns to privileged EXEC mode.                                                                       |
| <b>Step 6</b> | <b>show running config interface</b> <i>interface-id</i>                                                          | (Optional) Shows the running configuration.<br>Verifies the configuration.                             |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                               |

## Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** {vlan *vlan-id*} | { **gigabitethernet***interface-id*} | {**port-channel** *port-channel-number*}
4. **shutdown**
5. **no shutdown**
6. **end**
7. **show running-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                      | Purpose                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                              | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                      | Enters global configuration mode.                              |
| Step 3 | <b>interface {vlan <i>vlan-id</i>}   {gigabitethernet <i>interface-id</i>}   {port-channel <i>port-channel-number</i>}</b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet1/0/2</b> | Selects the interface to be configured.                        |
| Step 4 | <b>shutdown</b><br><b>Example:</b><br>Device(config-if)# <b>shutdown</b>                                                                                                                               | Shuts down an interface.                                       |
| Step 5 | <b>no shutdown</b><br><b>Example:</b><br>Device(config-if)# <b>no shutdown</b>                                                                                                                         | Restarts an interface.                                         |
| Step 6 | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                                                                                         | Returns to privileged EXEC mode.                               |
| Step 7 | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                                                                                                    | Verifies your entries.                                         |

## Configuring the Console Media Type

Follow these steps to set the console media type to RJ-45. If you configure the console as RJ-45, USB console operation is disabled, and input comes only through the RJ-45 connector.

This configuration applies to all switches in a stack.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line console 0**
4. **media-type rj45**
5. **end**
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                        | Purpose                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                | Enables privileged EXEC mode. Enter your password if prompted.                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>        | Enters the global configuration mode.                                                                                                                    |
| <b>Step 3</b> | <b>line console 0</b><br><b>Example:</b><br>Device(config)# <b>line console 0</b>        | Configures the console and enters line configuration mode.                                                                                               |
| <b>Step 4</b> | <b>media-type rj45</b><br><b>Example:</b><br>Device(config-line)# <b>media-type rj45</b> | Configures the console media type to be only RJ-45 port. If you do not enter this command and both types are connected, the USB port is used by default. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                              | Returns to privileged EXEC mode.                                                                                                                         |

|        | Command or Action                                                                                                       | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring the USB Inactivity Timeout

The configurable inactivity timeout reactivates the RJ-45 console port if the USB console port is activated but no input activity occurs on it for a specified time period. When the USB console port is deactivated due to a timeout, you can restore its operation by disconnecting and reconnecting the USB cable.

**Note** The configured inactivity timeout applies to all devices in a stack. However, a timeout on one device does not cause a timeout on other devices in the stack.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `line console 0`
4. `usb-inactivity-timeout timeout-minutes`
5. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |
| Step 3 | <b>line console 0</b><br><b>Example:</b><br>Device(config)# <code>line console 0</code> | Configures the console and enters line configuration mode.     |

|               | Command or Action                                                                                                                | Purpose                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>usb-inactivity-timeout</b> <i>timeout-minutes</i><br><b>Example:</b><br>Device(config-line)# <b>usb-inactivity-timeout 30</b> | Specify an inactivity timeout for the console port. The range is 1 to 240 minutes. The default is to have no timeout configured. |
| <b>Step 5</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                | (Optional) Saves your entries in the configuration file.                                                                         |

## Monitoring Interface Characteristics

### Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces.

**Table 7: Show Commands for Interfaces**

| Command                                                                 | Purpose                                                                                                                                                            |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show interfaces</b> <i>interface-id</i> <b>status</b> [err-disabled] | Displays interface status or a list of interfaces in the error-disabled state.                                                                                     |
| <b>show interfaces</b> [ <i>interface-id</i> ] <b>switchport</b>        | Displays administrative and operational status of switching (nonrouting) ports. You can use this command to find out if a port is in routing or in switching mode. |
| <b>show interfaces</b> [ <i>interface-id</i> ] <b>description</b>       | Displays the description configured on an interface or all interfaces and the interface status.                                                                    |
| <b>show ip interface</b> [ <i>interface-id</i> ]                        | Displays the usability status of all interfaces configured for IP routing or the specified interface.                                                              |
| <b>show interface</b> [ <i>interface-id</i> ] <b>stats</b>              | Displays the input and output packets by the switching path for the interface.                                                                                     |
| <b>show interfaces</b> <i>interface-id</i>                              | (Optional) Displays speed and duplex on the interface.                                                                                                             |
| <b>show interfaces transceiver dom-supported-list</b>                   | (Optional) Displays Digital Optical Monitoring (DOM) status on the connect SFP modules.                                                                            |
| <b>show interfaces transceiver properties</b>                           | (Optional) Displays temperature, voltage, or amount of current on the interface.                                                                                   |

| Command                                                                                                                 | Purpose                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>show interfaces</b> [ <i>interface-id</i> ] [{ <b>transceiver properties</b>   <b>detail</b> }] <i>module number</i> | Displays physical and operational status about an SFP module.                                                             |
| <b>show running-config interface</b> [ <i>interface-id</i> ]                                                            | Displays the running configuration in RAM for the interface.                                                              |
| <b>show version</b>                                                                                                     | Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images. |
| <b>show controllers ethernet-controller</b> <i>interface-id phy</i>                                                     | Displays the operational state of the auto-MDIX feature on the interface.                                                 |

## Clearing and Resetting Interfaces and Counters

Table 8: Clear Commands for Interfaces

| Command                                                                     | Purpose                                                   |
|-----------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>clear counters</b> [ <i>interface-id</i> ]                               | Clears interface counters.                                |
| <b>clear interface</b> <i>interface-id</i>                                  | Resets the hardware logic on an interface.                |
| <b>clear line</b> [ <i>number</i>   <b>console 0</b>   <i>vtty number</i> ] | Resets the hardware logic on an asynchronous serial line. |

**Note** The **clear counters** privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the **show interface** privileged EXEC command.

## Configuration Examples for Interface Characteristics

### Adding a Description to an Interface: Example

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# description Connects to Marketing
Device(config-if)# end
Device# show interfaces gigabitethernet1/0/2 description
Interface Status Protocol Description
Gi1/0/2 admin down down Connects to Marketing
```

## Configuring a Range of Interfaces: Examples

This example shows how to use the **interface range** global configuration command to set the speed to 100 Mb/s on ports 1 to 4 on switch 1:

```
Device# configure terminal
Device(config)# interface range gigabitethernet1/0/1 - 4
Device(config-if-range)# speed 100
```

This example shows how to use a comma to add different interface type strings to the range to enable Gigabit Ethernet ports 1 to 3 and 10-Gigabit Ethernet ports 1 and 2 to receive flow-control pause frames:

```
Device# configure terminal
Device(config)# interface range gigabitethernet1/0/1 - 3 , tengigabitethernet1/0/1 - 2
Device(config-if-range)# flowcontrol receive on
```

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

## Configuring and Using Interface Range Macros: Examples

This example shows how to define an interface-range named *enet\_list* to include ports 1 and 2 on switch 1 and to verify the macro configuration:

```
Device# configure terminal
Device(config)# define interface-range enet_list gigabitethernet1/0/1 - 2
Device(config)# end
Device# show running-config | include define
define interface-range enet_list GigabitEthernet1/0/1 - 2
```

This example shows how to create a multiple-interface macro named *macrol*:

```
Device# configure terminal
Device(config)# define interface-range macrol gigabitethernet1/0/1 - 2, gigabitethernet1/0/5
- 7, tengigabitethernet1/0/1 -2
Device(config)# end
```

This example shows how to enter interface-range configuration mode for the interface-range macro *enet\_list*:

```
Device# configure terminal
Device(config)# interface range macro enet_list
Device(config-if-range)#
```

This example shows how to delete the interface-range macro *enet\_list* and to verify that it was deleted.

```
Device# configure terminal
Device(config)# no define interface-range enet_list
Device(config)# end
Device# show run | include define
```

```
Device#
```

## Setting Interface Speed and Duplex Mode: Example

This example shows how to set the interface speed to 100 Mb/s and the duplex mode to half on a 10/100/1000 Mb/s port:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/3
Device(config-if)# speed 10
Device(config-if)# duplex half
```

This example shows how to set the interface speed to 100 Mb/s on a 10/100/1000 Mb/s port:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# speed 100
```

## Configuring Layer 3 Interfaces: Example

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport
Device(config-if)# ip address 192.20.135.21 255.255.255.0
Device(config-if)# no shutdown
```

## Configuring the Console Media Type: Example

This example disables the USB console media type and enables the RJ-45 console media type.

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# media-type rj45
```

This configuration terminates any active USB console media type in the stack. A log shows that this termination has occurred. This example shows that the console on switch 1 reverted to RJ-45.

```
*Mar 1 00:25:36.860: %USB_CONSOLE-6-CONFIG_DISABLE: Console media-type USB disabled by
system configuration, media-type reverted to RJ45.
```

At this point no switches in the stack allow a USB console to have input. A log entry shows when a console cable is attached. If a USB console cable is connected to switch 2, it is prevented from providing input.

```
*Mar 1 00:34:27.498: %USB_CONSOLE-6-CONFIG_DISALLOW: Console media-type USB is disallowed
by system configuration, media-type remains RJ45. (switch-stk-2)
```

This example reverses the previous configuration and immediately activates any USB console that is connected.

```
Device# configure terminal
```

```
Device(config)# line console 0
Device(config-line)# no media-type rj45
```

## Configuring the USB Inactivity Timeout: Example

This example configures the inactivity timeout to 30 minutes:

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# usb-inactivity-timeout 30
```

To disable the configuration, use these commands:

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# no usb-inactivity-timeout
```

If there is no (input) activity on a USB console port for the configured number of minutes, the inactivity timeout setting applies to the RJ-45 port, and a log shows this occurrence:

```
*Mar 1 00:47:25.625: %USB_CONSOLE-6-INACTIVITY_DISABLE: Console media-type USB disabled
due to inactivity, media-type reverted to RJ45.
```

At this point, the only way to reactivate the USB console port is to disconnect and reconnect the cable.

When the USB cable on the switch has been disconnected and reconnected, a log similar to this appears:

```
*Mar 1 00:48:28.640: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

## CHAPTER 4

# Configuring Auto-MDIX

---

- [Prerequisites for Auto-MDIX, on page 75](#)
- [Restrictions for Auto-MDIX, on page 75](#)
- [Information about Configuring Auto-MDIX, on page 76](#)
- [How to Configure Auto-MDIX, on page 76](#)
- [Example for Configuring Auto-MDIX, on page 77](#)
- [Additional References, on page 78](#)
- [Feature History and Information for Auto-MDIX, on page 78](#)

## Prerequisites for Auto-MDIX

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

Automatic medium-dependent interface crossover (auto-MDIX) is enabled by default.

Auto-MDIX is supported on all 10/100/1000-Mb/s and on 10/100/1000BASE-TX small form-factor pluggable (SFP)-module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

## Restrictions for Auto-MDIX

The device might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the device through a crossover cable. This is regardless of whether auto-MDIX is enabled on the switch port.

# Information about Configuring Auto-MDIX

## Auto-MDIX on an Interface

When automatic medium-dependent interface crossover (auto-MDIX) is enabled on an interface, the interface automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting devices without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other devices or repeaters. With auto-MDIX enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.

This table shows the link states that result from auto-MDIX settings and correct and incorrect cabling.

**Table 9: Link Conditions and Auto-MDIX Settings**

| Local Side Auto-MDIX | Remote Side Auto-MDIX | With Correct Cabling | With Incorrect Cabling |
|----------------------|-----------------------|----------------------|------------------------|
| On                   | On                    | Link up              | Link up                |
| On                   | Off                   | Link up              | Link up                |
| Off                  | On                    | Link up              | Link up                |
| Off                  | Off                   | Link up              | Link down              |

## How to Configure Auto-MDIX

### Configuring Auto-MDIX on an Interface

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **speed auto**
5. **duplex auto**
6. **end**
7. **copy running-config startup-config**

#### DETAILED STEPS

|        | Command or Action                    | Purpose                                                        |
|--------|--------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                 | Purpose                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
|               | Device> <b>enable</b>                                                                                             |                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                 | Enters global configuration mode                                                           |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet1/0/1</b>  | Specifies the physical interface to be configured, and enter interface configuration mode. |
| <b>Step 4</b> | <b>speed auto</b><br><b>Example:</b><br>Device(config-if)# <b>speed auto</b>                                      | Configures the interface to autonegotiate speed with the connected device.                 |
| <b>Step 5</b> | <b>duplex auto</b><br><b>Example:</b><br>Device(config-if)# <b>duplex auto</b>                                    | Configures the interface to autonegotiate duplex mode with the connected device.           |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                    | Returns to privileged EXEC mode.                                                           |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                   |

## Example for Configuring Auto-MDIX

This example shows how to enable auto-MDIX on a port:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
```

```

Device(config-if) # speed auto
Device(config-if) # duplex auto
Device(config-if) # mdix auto
Device(config-if) # end

```

| Cisco IOS XE 3.2SE | This feature was introduced. |

## CHAPTER 5

# Configuring Ethernet Management Port

---

- [Finding Feature Information, on page 79](#)
- [Prerequisites for Ethernet Management Ports, on page 79](#)
- [Information about the Ethernet Management Port, on page 79](#)
- [How to Configure the Ethernet Management Port, on page 82](#)
- [Additional References, on page 83](#)
- [Feature Information for Ethernet Management Ports, on page 84](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Ethernet Management Ports

When connecting a PC to the Ethernet management port, you must first assign an IP address.

## Information about the Ethernet Management Port

The Ethernet management port, also referred to as the *Gi0/0* or *GigabitEthernet0/0* port, is a VRF (VPN routing/forwarding) interface to which you can connect a PC. You can use the Ethernet management port instead of the device console port for network management. When managing a device stack, connect the PC to the Ethernet management port on a stack member.

## Ethernet Management Port Direct Connection to a Device

**Figure 3: Connecting a Switch to a PC**

This figure displays how to connect the Ethernet management port to the PC for a device or a standalone

## Ethernet Management Port Connection to Stack Devices using a Hub

In a stack with only stack devices, all the Ethernet management ports on the stack members are connected to a hub to which the PC is connected. The active link is from the Ethernet management port on the active switch through the hub, to the PC. If the active device fails and a new active device is elected, the active link is now from the Ethernet management port on the new active device to the PC.

**Figure 4: Connecting a Device Stack to a PC**

This figure displays how a PC uses a hub to connect to a device stack.

|   |                 |   |     |
|---|-----------------|---|-----|
| 1 | Switch stack    | 3 | Hub |
| 2 | Management port | 4 | PC  |

## Ethernet Management Port and Routing

By default, the Ethernet management port is enabled. The device cannot route packets from the Ethernet management port to a network port, and the reverse. Even though the Ethernet management port does not support routing, you may need to enable routing protocols on the port.

**Figure 5: Network Example with Routing Protocols Enabled**

Enable routing protocols on the Ethernet management port when the PC is multiple hops away from the device and the packets must pass through multiple Layer 3 devices to reach the PC.

In the above figure, if the Ethernet management port and the network ports are associated with the same routing process, the routes are propagated as follows:

- The routes from the Ethernet management port are propagated through the network ports to the network.
- The routes from the network ports are propagated through the Ethernet management port to the network.

Because routing is not supported between the Ethernet management port and the network ports, traffic between these ports cannot be sent or received. If this happens, data packet loops occur between the ports, which disrupt the device and network operation. To prevent the loops, configure route filters to avoid routes between the Ethernet management port and the network ports.

## Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup (only in switch stacks)
- Network Assistant
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SNMP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
  - Speed—10 Mb/s, 100 Mb/s, 1000 Mb/s, and autonegotiation
  - Duplex mode—Full, half, and autonegotiation
  - Loopback detection
- Cisco Discovery Protocol (CDP)
- DHCP relay agent

- IPv4 access control lists (ACLs)
- Routing protocols

**Caution** Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the device might fail.

# How to Configure the Ethernet Management Port

## Disabling and Enabling the Ethernet Management Port

### SUMMARY STEPS

1. `configure terminal`
2. `interface gigabitethernet0/0`
3. `shutdown`
4. `no shutdown`
5. `exit`
6. `show interfaces gigabitethernet0/0`

### DETAILED STEPS

|               | Command or Action                                                                                                         | Purpose                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Step 1</b> | <code>configure terminal</code><br><b>Example:</b><br>Device# <code>configure terminal</code>                             | Enters global configuration mode.                  |
| <b>Step 2</b> | <code>interface gigabitethernet0/0</code><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet0/0</code> | Specifies the Ethernet management port in the CLI. |
| <b>Step 3</b> | <code>shutdown</code><br><b>Example:</b><br>Device(config-if)# <code>shutdown</code>                                      | Disables the Ethernet management port.             |
| <b>Step 4</b> | <code>no shutdown</code><br><b>Example:</b><br>Device(config-if)# <code>no shutdown</code>                                | Enables the Ethernet management port.              |
| <b>Step 5</b> | <code>exit</code><br><b>Example:</b>                                                                                      | Exits interface configuration mode.                |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device(config-if) # <b>exit</b>                                                                                       |                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>show interfaces gigabitethernet0/0</b><br><br><b>Example:</b><br>Device# <b>show interfaces gigabitethernet0/0</b> | Displays the link status.<br><br>To find out the link status to the PC, you can monitor the LED for the Ethernet management port. The LED is green (on) when the link is active, and the LED is off when the link is down. The LED is amber when there is a POST failure. |

### What to do next

Proceed to manage or configure your switch using the Ethernet management port. Refer to the *Network Management Configuration Guide (Catalyst 3850 Switches)*.

# Configuring LLDP, LLDP-MED, and Wired Location Service

---

- [Finding Feature Information, on page 85](#)
- [LLDP, LLDP-MED, and Wired Location Service Overview, on page 85](#)
- [How to Configure LLDP, LLDP-MED, and Wired Location Service, on page 89](#)
- [Configuration Examples for LLDP, LLDP-MED, and Wired Location Service, on page 101](#)
- [Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service, on page 101](#)
- [Additional References for LLDP, LLDP-MED, and Wired Location Service, on page 102](#)
- [Feature Information for LLDP, LLDP-MED, and Wired Location Service, on page 103](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## LLDP, LLDP-MED, and Wired Location Service Overview

### LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, switches, and controllers). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the device supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol

runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

## LLDP Supported TLVs

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

## LLDP and Cisco Device Stacks

A device stack appears as a single device in the network. Therefore, LLDP discovers the device stack, not the individual stack members.

## LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as devices. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management and location information. By default, all LLDP-MED TLVs are enabled.

## LLDP-MED Supported TLVs

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV

Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and has enabled.

- Network policy TLV

Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect to any device, obtain its VLAN number, and then start communicating with the call control.

By defining a network-policy profile TLV, you can create a profile for voice and voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

- Power management TLV

Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows devices and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

LLDP-MED also supports an extended power TLV to advertise fine-grained power requirements, end-point power priority, and end-point and network connectivity-device power status. LLDP is enabled and power is applied to a port, the power TLV determines the actual power requirement of the endpoint device so that the system power budget can be adjusted accordingly. The device processes the requests and either grants or denies power based on the current power budget. If the request is granted, the switch updates the power budget. If the request is denied, the device turns off power to the port, generates a syslog message, and updates the power budget. If LLDP-MED is disabled or if the endpoint does not support the LLDP-MED power TLV, the initial allocation value is used throughout the duration of the connection.

You can change power settings by entering the **power inline** {**auto** [**max** *max-wattage*] | **never** | **static** [**max** *max-wattage*]} interface configuration command. By default the PoE interface is in **auto** mode; If no value is specified, the maximum is allowed (30 W).

- Inventory management TLV

Allows an endpoint to send detailed inventory information about itself to the device, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- Location TLV

Provides location information from the device to the endpoint device. The location TLV can send this information:

- Civic location information

Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

- ELIN location information

Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

- Geographic location information

Provides the geographical details of a switch location such as latitude, longitude, and altitude of a switch.

- custom location

Provides customized name and value of a switch location.

## Wired Location Service

The device uses the location service feature to send location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired device or controller. The device notifies the MSE of device link up and link down events through the Network Mobility Services Protocol (NMSP) location and attachment notifications.

The MSE starts the NMSP connection to the device, which opens a server port. When the MSE connects to the device there are a set of message exchanges to establish version compatibility and service exchange information followed by location information synchronization. After connection, the device periodically sends location and attachment notifications to the MSE. Any link up or link down events detected during an interval are aggregated and sent at the end of the interval.

When the device determines the presence or absence of a device on a link-up or link-down event, it obtains the client-specific information such as the MAC address, IP address, and username. If the client is LLDP-MED- or CDP-capable, the device obtains the serial number and UDI through the LLDP-MED location TLV or CDP.

Depending on the device capabilities, the device obtains this client information at link up:

- Slot and port specified in port connection
- MAC address specified in the client MAC address
- IP address specified in port connection
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *new*
- Serial number, UDI
- Model number
- Time in seconds since the device detected the association

Depending on the device capabilities, the device obtains this client information at link down:

- Slot and port that was disconnected
- MAC address
- IP address
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *delete*
- Serial number, UDI
- Time in seconds since the device detected the disassociation

When the device shuts down, it sends an attachment notification with the state *delete* and the IP address before closing the NMSP connection to the MSE. The MSE interprets this notification as disassociation for all the wired clients associated with the device.

If you change a location address on the device, the device sends an NMSP location notification message that identifies the affected ports and the changed address information.

## Default LLDP Configuration

Table 10: Default LLDP Configuration

| Feature                              | Default Setting                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| LLDP global state                    | Disabled                                                                                         |
| LLDP holdtime (before discarding)    | 120 seconds                                                                                      |
| LLDP timer (packet update frequency) | 30 seconds                                                                                       |
| LLDP reinitialization delay          | 2 seconds                                                                                        |
| LLDP tlv-select                      | Disabled to send and receive all TLVs                                                            |
| LLDP interface state                 | Disabled                                                                                         |
| LLDP receive                         | Disabled                                                                                         |
| LLDP transmit                        | Disabled                                                                                         |
| LLDP med-tlv-select                  | Disabled to send all LLDP-MED TLVs. When LLDP is globally enabled, LLDP-MED-TLV is also enabled. |

## Restrictions for LLDP

- If the interface is configured as a tunnel port, LLDP is automatically disabled.
- If you first configure a network-policy profile on an interface, you cannot apply the **switchport voice vlan** command on the interface. If the **switchport voice vlan *vlan-id*** is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.
- You cannot configure static secure MAC addresses on an interface that has a network-policy profile.

# How to Configure LLDP, LLDP-MED, and Wired Location Service

## Enabling LLDP

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **lldp run**

4. `interface interface-id`
5. `lldp transmit`
6. `lldp receive`
7. `end`
8. `show lldp`
9. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                | Purpose                                                                                         |
|---------------|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                          | Enters global configuration mode.                                                               |
| <b>Step 3</b> | <b>lldp run</b><br><b>Example:</b><br>Device (config)# <code>lldp run</code>                                     | Enables LLDP globally on the device.                                                            |
| <b>Step 4</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device (config)# <code>interface gigabitethernet2/0/1</code> | Specifies the interface on which you are enabling LLDP, and enter interface configuration mode. |
| <b>Step 5</b> | <b>lldp transmit</b><br><b>Example:</b><br>Device(config-if)# <code>lldp transmit</code>                         | Enables the interface to send LLDP packets.                                                     |
| <b>Step 6</b> | <b>lldp receive</b><br><b>Example:</b><br>Device(config-if)# <code>lldp receive</code>                           | Enables the interface to receive LLDP packets.                                                  |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b>                                                                                    | Returns to privileged EXEC mode.                                                                |

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device(config-if)# <b>end</b>                                                                                     |                                                          |
| <b>Step 8</b> | <b>show lldp</b><br><b>Example:</b><br>Device# <b>show lldp</b>                                                   | Verifies the configuration.                              |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to send and receive.

**Note** Steps 2 through 5 are optional and can be performed in any order.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **lldp holdtime *seconds***
4. **lldp reinit *delay***
5. **lldp timer *rate***
6. **lldp tlv-select**
7. **interface *interface-id***
8. **lldp med-tlv-select**
9. **end**
10. **show lldp**
11. **copy running-config startup-config**

|               | Command or Action                | Purpose                                                        |
|---------------|----------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                    | Purpose                                                                                                                                                                                           |
|---------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> <b>enable</b>                                                                                                |                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                    | Enters global configuration mode.                                                                                                                                                                 |
| <b>Step 3</b> | <b>lldp holdtime seconds</b><br><b>Example:</b><br>Device (config)# <b>lldp holdtime 120</b>                         | (Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.<br><br>The range is 0 to 65535 seconds; the default is 120 seconds. |
| <b>Step 4</b> | <b>lldp reinit delay</b><br><b>Example:</b><br>Device (config)# <b>lldp reinit 2</b>                                 | (Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.<br><br>The range is 2 to 5 seconds; the default is 2 seconds.                                              |
| <b>Step 5</b> | <b>lldp timer rate</b><br><b>Example:</b><br>Device (config)# <b>lldp timer 30</b>                                   | (Optional) Sets the sending frequency of LLDP updates in seconds.<br><br>The range is 5 to 65534 seconds; the default is 30 seconds.                                                              |
| <b>Step 6</b> | <b>lldp tlv-select</b><br><b>Example:</b><br>Device (config)# <b>tlv-select</b>                                      | (Optional) Specifies the LLDP TLVs to send or receive.                                                                                                                                            |
| <b>Step 7</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device (config)# <b>interface gigabitethernet2/0/1</b>           | Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.                                                                                                   |
| <b>Step 8</b> | <b>lldp med-tlv-select</b><br><b>Example:</b><br>Device (config-if)# <b>lldp med-tlv-select inventory management</b> | (Optional) Specifies the LLDP-MED TLVs to send or receive.                                                                                                                                        |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b>                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                  |

|                | Command or Action                                                                                                 | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device (config-if)# <b>end</b>                                                                                    |                                                          |
| <b>Step 10</b> | <b>show lldp</b><br><b>Example:</b><br>Device# <b>show lldp</b>                                                   | Verifies the configuration.                              |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring LLDP-MED TLVs

By default, the device only sends LLDP packets until it receives LLDP-MED packets from the end device. It then sends LLDP packets with MED TLVs, as well. When the LLDP-MED entry has been aged out, it again only sends LLDP packets.

By using the **lldp** interface configuration command, you can configure the interface not to send the TLVs listed in the following table.

**Table 11: LLDP-MED TLVs**

| LLDP-MED TLV         | Description                       |
|----------------------|-----------------------------------|
| inventory-management | LLDP-MED inventory management TLV |
| location             | LLDP-MED location TLV             |
| network-policy       | LLDP-MED network policy TLV       |
| power-management     | LLDP-MED power management TLV     |

Follow these steps to enable a TLV on an interface:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **lldp med-tlv-select**
5. **end**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                 | Purpose                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                             | Enters global configuration mode.                                                               |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br><br>Device (config)# <b>interface</b><br><b>gigabitethernet2/0/1</b>   | Specifies the interface on which you are enabling LLDP, and enter interface configuration mode. |
| <b>Step 4</b> | <b>lldp med-tlv-select</b><br><b>Example:</b><br><br>Device(config-if)# <b>lldp med-tlv-select</b><br><b>inventory management</b> | Specifies the TLV to enable.                                                                    |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Device(config-if)# <b>end</b>                                                                | Returns to privileged EXEC mode.                                                                |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>             | (Optional) Saves your entries in the configuration file.                                        |

## Configuring Network-Policy TLV

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **network-policy profile *profile number***

4. `{voice | voice-signaling} vlan [vlan-id {cos cvalue | dscp dvalue}] | [[dot1p {cos cvalue | dscp dvalue}] | none | untagged]`
5. `exit`
6. `interface interface-id`
7. `network-policy profile number`
8. `lldp med-tlv-select network-policy`
9. `end`
10. `show network-policy profile`
11. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                                                         | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 3 | <p><code>network-policy profile profile number</code></p> <p><b>Example:</b></p> <pre>Device(config)# network-policy profile 1</pre>                                                                                                   | Specifies the network-policy profile number, and enter network-policy configuration mode. The range is 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 4 | <p><code>{voice   voice-signaling} vlan [vlan-id {cos cvalue   dscp dvalue}]   [[dot1p {cos cvalue   dscp dvalue}]   none   untagged]</code></p> <p><b>Example:</b></p> <pre>Device(config-network-policy)# voice vlan 100 cos 4</pre> | <p>Configures the policy attributes:</p> <ul style="list-style-type: none"> <li>• <b>voice</b>—Specifies the voice application type.</li> <li>• <b>voice-signaling</b>—Specifies the voice-signaling application type.</li> <li>• <b>vlan</b>—Specifies the native VLAN for voice traffic.</li> <li>• <i>vlan-id</i>—(Optional) Specifies the VLAN for voice traffic. The range is 1 to 4094.</li> <li>• <b>cos cvalue</b>—(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</li> <li>• <b>dscp dvalue</b>—(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</li> </ul> |

|                | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                              | <ul style="list-style-type: none"> <li>• <b>dot1p</b>—(Optional) Configures the telephone to use IEEE 802.1p priority tagging and use VLAN 0 (the native VLAN).</li> <li>• <b>none</b>—(Optional) Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.</li> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> </ul> |
| <b>Step 5</b>  | <b>exit</b><br><b>Example:</b><br>Device(config)# <b>exit</b>                                                                | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 6</b>  | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device (config)# <b>interface</b> gigabitethernet2/0/1            | Specifies the interface on which you are configuring a network-policy profile, and enter interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 7</b>  | <b>network-policy</b> <i>profile number</i><br><b>Example:</b><br>Device(config-if)# <b>network-policy</b> 1                 | Specifies the network-policy profile number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b>  | <b>lldp med-tlv-select network-policy</b><br><b>Example:</b><br>Device(config-if)# <b>lldp med-tlv-select network-policy</b> | Specifies the network-policy TLV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 9</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 10</b> | <b>show network-policy profile</b><br><b>Example:</b>                                                                        | Verifies the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                       | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device# <code>show network-policy profile</code>                                                                        |                                                          |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring Location TLV and Wired Location Service

Beginning in privileged EXEC mode, follow these steps to configure location information for an endpoint and to apply it to an interface.

### SUMMARY STEPS

1. **configure terminal**
2. **location** {**admin-tag** *string* | **civic-location identifier** {*id* | *host*} | **elin-location** *string identifier id* | **custom-location identifier** {*id* | *host*} | **geo-location identifier** {*id* | *host*}}
3. **exit**
4. **interface** *interface-id*
5. **location** {**additional-location-information** *word* | **civic-location-id** {*id* | *host*} | **elin-location-id** *id* | **custom-location-id** {*id* | *host*} | **geo-location-id** {*id* | *host*}}
6. **end**
7. Use one of the following:
  - **show location admin-tag** *string*
  - **show location civic-location identifier** *id*
  - **show location elin-location identifier** *id*
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                              |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>location</b> { <b>admin-tag</b> <i>string</i>   <b>civic-location identifier</b> { <i>id</i>   <i>host</i> }   <b>elin-location</b> <i>string identifier id</i>   <b>custom-location identifier</b> { <i>id</i>   <i>host</i> }   <b>geo-location identifier</b> { <i>id</i>   <i>host</i> }}<br><b>Example:</b> | Specifies the location information for an endpoint. <ul style="list-style-type: none"> <li>• <b>admin-tag</b>—Specifies an administrative tag or site information.</li> <li>• <b>civic-location</b>—Specifies civic location information.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Step 4</b> | <p><b>interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Device (config)# interface gigabitethernet2/0/1</pre>                                                                                                                                                                                                                                          | Specifies the interface on which you are configuring the location information, and enter interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <p><b>location {additional-location-information <i>word</i>   civic-location-id {<i>id</i>   <i>host</i>}   elin-location-id <i>id</i>   custom-location-id {<i>id</i>   <i>host</i>}   geo-location-id {<i>id</i>   <i>host</i>} }</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# location elin-location-id 1</pre>                                           | <p>Enters location information for an interface:</p> <ul style="list-style-type: none"> <li>• <b>additional-location-information</b>—Specifies additional information for a location or place.</li> <li>• <b>civic-location-id</b>—Specifies global civic location information for an interface.</li> <li>• <b>elin-location-id</b>—Specifies emergency location information for an interface.</li> <li>• <b>custom-location-id</b>—Specifies custom location information for an interface.</li> <li>• <b>geo-location-id</b>—Specifies geo-spatial location information for an interface.</li> <li>• <b>host</b>—Specifies the host location identifier.</li> <li>• <b><i>word</i></b>—Specifies a word or phrase with additional location information.</li> <li>• <b><i>id</i></b>—Specifies the ID for the civic, ELIN, custom, or geo location. The ID range is 1 to 4095.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                | Purpose                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>end</b><br><b>Example:</b><br><pre>Device(config-if)# end</pre>                                                                                                                                                                                                                                                                                                                                                                                               | Returns to privileged EXEC mode.                         |
| Step 7 | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show location admin-tag</b> <i>string</i></li> <li>• <b>show location civic-location identifier</b> <i>id</i></li> <li>• <b>show location elin-location identifier</b> <i>id</i></li> </ul> <b>Example:</b><br><pre>Device# show location admin-tag</pre> OR<br><pre>Device# show location civic-location identifier</pre> OR<br><pre>Device# show location elin-location identifier</pre> | Verifies the configuration.                              |
| Step 8 | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>                                                                                                                                                                                                                                                                                                                                            | (Optional) Saves your entries in the configuration file. |

## Enabling Wired Location Service on the Device

### Before you begin

For wired location to function, you must first enter the **ip device tracking** global configuration command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **nmsp notification interval** {attachment | location} *interval-seconds*
4. **end**
5. **show network-policy profile**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>nmsp notification interval {attachment   location} interval-seconds</b><br><b>Example:</b><br>Device(config)# <b>nmsp notification interval location 10</b> | Specifies the NMSP notification interval.<br><b>attachment</b> —Specifies the attachment notification interval.<br><b>location</b> —Specifies the location notification interval.<br><i>interval-seconds</i> —Duration in seconds before the device sends the MSE the location or attachment updates. The range is 1 to 30; the default is 30. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                               |
| <b>Step 5</b> | <b>show network-policy profile</b><br><b>Example:</b><br>Device# <b>show network-policy profile</b>                                                            | Verifies the configuration.                                                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                              | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                       |

# Configuration Examples for LLDP, LLDP-MED, and Wired Location Service

## Configuring Network-Policy TLV: Examples

This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```
configure terminal
(config)# network-policy 1
(config-network-policy)# voice vlan 100 cos 4
(config-network-policy)# exit
(config)# interface gigabitethernet1/0/1
(config-if)# network-policy profile 1
(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
config-network-policy)# voice vlan dot1p cos 4
config-network-policy)# voice vlan dot1p dscp 34
```

## Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service

Commands for monitoring and maintaining LLDP, LLDP-MED, and wired location service.

| Command                                        | Description                                                                                                                                                       |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clear lldp counters</code>               | Resets the traffic counters to zero.                                                                                                                              |
| <code>clear lldp table</code>                  | Deletes the LLDP neighbor information table.                                                                                                                      |
| <code>clear nmosp statistics</code>            | Clears the NMSP statistic counters.                                                                                                                               |
| <code>show lldp</code>                         | Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface. |
| <code>show lldp entry <i>entry-name</i></code> | Displays information about a specific neighbor.<br>You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.                    |

| Command                                                              | Description                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show lldp interface</b> [ <i>interface-id</i> ]                   | Displays information about interfaces with LLDP enabled.<br><br>You can limit the display to a specific interface.                                                                                                                                               |
| <b>show lldp neighbors</b> [ <i>interface-id</i> ] [ <b>detail</b> ] | Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID.<br><br>You can limit the display to neighbors of a specific interface or expand the display for more detailed information. |
| <b>show lldp traffic</b>                                             | Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.                                                                                                                         |
| <b>show location admin-tag</b> <i>string</i>                         | Displays the location information for the specified administrative tag or site.                                                                                                                                                                                  |
| <b>show location civic-location identifier</b> <i>id</i>             | Displays the location information for a specific global civic location.                                                                                                                                                                                          |
| <b>show location elin-location identifier</b> <i>id</i>              | Displays the location information for an emergency location                                                                                                                                                                                                      |
| <b>show network-policy profile</b>                                   | Displays the configured network-policy profiles.                                                                                                                                                                                                                 |
| <b>show nmsp</b>                                                     | Displays the NMSP information                                                                                                                                                                                                                                    |

## Feature Information for LLDP, LLDP-MED, and Wired Location Service

| Release            | Modification                 |
|--------------------|------------------------------|
| Cisco IOS XE 3.2SE | This feature was introduced. |

## CHAPTER 7

# Configuring System MTU

- [Finding Feature Information](#), on page 105
- [Information about the MTU](#), on page 105
- [How to Configure MTU Sizes](#), on page 106
- [Configuration Examples for System MTU](#), on page 108
- [Configuration Examples for System MTU](#), on page 108
- [Additional References for System MTU](#), on page 109
- [Feature Information for System MTU](#), on page 110

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information about the MTU

The default maximum transmission unit (MTU) size for frames received and sent on all device interfaces is 1500 bytes.

## Restrictions for System MTU

When configuring the system MTU values, follow these guidelines:

- The device does not support the MTU on a per-interface basis.
- If you enter the **system mtu bytes** global configuration command, the command affects all the switched and routed ports on the switch.

## System MTU Value Application

In a switch stack, the MTU values applied to member switches depends upon the stack configuration. The following stack configurations are supported:

This table shows how the MTU values are applied.

*Table 12: MTU Values*

| Configuration                     | system mtu command                                                                                                                                               | ip mtu command                                                                                                                                                                              | ipv6 mtu command                                                                                                                                                                                     |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standalone switch or switch stack | You can enter the <b>system mtu</b> command on a switch or switch stack, but system MTU value does not take effect.<br><br>The range is from 1500 to 9198 bytes. | Use the <b>ip mtu bytes</b> command.<br><br>The range is from 68 up to the system MTU value (in bytes).<br><br><b>Note</b> The IP MTU value is the applied value, not the configured value. | Use the <b>ipv6 mtu bytes</b> command.<br><br>The range is from 1280 to the system jumbo MTU value (in bytes).<br><br><b>Note</b> The IPv6 MTU value is the applied value, not the configured value. |

The upper limit of the IP or IPv6 MTU value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command in the command reference for this release.

## How to Configure MTU Sizes

### Configuring the System MTU

Follow these steps to change the MTU size for switched and routed packets:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **system mtu bytes**
4. **end**
5. **copy running-config startup-config**
6. **reload**
7. **show system mtu**

## DETAILED STEPS

|        | Command or Action                                                                                                     | Purpose                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                         | Enables privileged EXEC mode. Enter your password if prompted.                               |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                 | Enters global configuration mode.                                                            |
| Step 3 | <b>system mtu bytes</b><br><b>Example:</b><br><br>Device(config)# <b>system mtu 1900</b>                              | (Optional) Changes the MTU size for all Gigabit Ethernet and 10-Gigabit Ethernet interfaces. |
| Step 4 | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                             |
| Step 5 | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b> | Saves your entries in the configuration file.                                                |
| Step 6 | <b>reload</b><br><b>Example:</b><br><br>Device# <b>reload</b>                                                         | Reloads the operating system.                                                                |
| Step 7 | <b>show system mtu</b><br><b>Example:</b><br><br>Device# <b>show system mtu</b>                                       | Verifies your settings.                                                                      |

## Configuring Protocol-Specific MTU

To override system MTU values on routed interfaces, configure protocol-specific MTU under each routed interface.

Beginning in privileged EXEC mode, follow these steps to change the MTU size for routed ports:

## SUMMARY STEPS

1. **configure terminal**
2. **interface interface**
3. **ip mtu bytes**
4. **ipv6 mtu bytes**
5. **end**

6. `copy running-config startup-config`
7. `show system mtu`

#### DETAILED STEPS

|               | Command or Action                                                                                                       | Purpose                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                 | Enters global configuration mode.             |
| <b>Step 2</b> | <b>interface <i>interface</i></b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet0/0</code>       | Enters interface configuration mode.          |
| <b>Step 3</b> | <b>ip mtu <i>bytes</i></b><br><b>Example:</b><br>Device(config-if)# <code>ip mtu 68</code>                              | Changes the IPv4 MTU size                     |
| <b>Step 4</b> | <b>ipv6 mtu <i>bytes</i></b><br><b>Example:</b><br>Device(config-if)# <code>ipv6 mtu 1280</code>                        | (Optional) Changes the IPv6 MTU size.         |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <code>end</code>                                                    | Returns to privileged EXEC mode.              |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | Saves your entries in the configuration file. |
| <b>Step 7</b> | <b>show system mtu</b><br><b>Example:</b><br>Device# <code>show system mtu</code>                                       | Verifies your settings.                       |

## Configuration Examples for System MTU

## Configuration Examples for System MTU

### Example: Configuring Protocol-Specific MTU

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 0/0
```

```
Switch(config-if)# ip mtu 900
Switch(config-if)# ipv6 mtu 1286
Switch(config-if)# end
```

## Example: Configuring the System MTU

```
Switch# configure terminal
Switch(config)# system mtu 1600
Switch(config)# exit
```

## CHAPTER 8

# Configuring Internal Power Supplies

- [Information About Internal Power Supplies](#) , on page 111
- [How to Configure Internal Power Supplies](#), on page 111
- [Monitoring Internal Power Supplies](#), on page 112
- [Configuration Examples for Internal Power Supplies](#), on page 112
- [Additional References](#), on page 113
- [Feature History and Information for Internal Power Supplies](#), on page 114

## Information About Internal Power Supplies

See the device installation guide for information about the power supplies.

## How to Configure Internal Power Supplies

### Configuring Internal Power Supply

You can use the **power supply** EXEC command to configure and manage the internal power supply on the device. The device does not support the **no power supply** EXEC command.

Follow these steps beginning in user EXEC mode:

#### SUMMARY STEPS

1. **power supply** *switch\_number* **slot**{A | B} { **off** | **on** }
2. **show environment power**

#### DETAILED STEPS

|        | Command or Action                                                                                                                                         | Purpose                                                                                                                                                                                                                                        |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>power supply</b> <i>switch_number</i> <b>slot</b> {A   B} { <b>off</b>   <b>on</b> }<br><b>Example:</b><br><br>Device# <b>power supply 1 slot A on</b> | Sets the specified power supply to <b>off</b> or <b>on</b> by using one of these keywords: <ul style="list-style-type: none"><li>• <b>A</b> —Selects the power supply in slot A.</li><li>• <b>B</b> —Selects power supply in slot B.</li></ul> |

|               | Command or Action                                                                                     | Purpose                                                                                                                                                                                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                       | <p><b>Note</b> Power supply slot B is the closest to the outer edge of the device.</p> <ul style="list-style-type: none"> <li>• <b>off</b> —Set the power supply off.</li> <li>• <b>on</b> —Set the power supply on.</li> </ul> <p>By default, the device power supply is <b>on</b>.</p> |
| <b>Step 2</b> | <p><b>show environment power</b></p> <p><b>Example:</b></p> <pre>Device# show environment power</pre> | Verifies your settings.                                                                                                                                                                                                                                                                  |

## Monitoring Internal Power Supplies

Table 13: Show Commands for Power Supplies

| Command                                                                           | Purpose                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show environment power</b> [ <b>all</b>   <b>switch</b> <i>switch_number</i> ] | <p>(Optional) Displays the status of the internal power supplies for each device in the stack or for the specified device. The range is 1 to 9, depending on the device member numbers in the stack.</p> <p>The device keywords are available only on stacking-capable devices.</p> |

## Configuration Examples for Internal Power Supplies

This example shows how to set the power supply in slot A to off:

```
Device# power supply 1 slot A off
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
Continue? (yes/[no]): yes
Device#
Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
Device#
```

This example shows how to set the power supply in slot A to on:

```
Device# power supply 1 slot A on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the **show env power** command:

```
Device# show env power
```

```

SW PID Serial# Status Sys Pwr PoE Pwr Watts

1A PWR-C1-715WAC LIT161010UE OK Good Good 715
1B Not Present

```

Device#

**Table 14: show env power Status Descriptions**

| Field          | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| OK             | The power supply is present and power is good.                                         |
| Not Present    | No power supply is installed.                                                          |
| No Input Power | The power supply is present but there is no input power.                               |
| Disabled       | The power supply and input power are present, but power supply is switched off by CLI. |
| Not Responding | The power supply is not recognizable or is faulty.                                     |
| Failure-Fan    | The power supply fan is faulty.                                                        |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information about PoE

### Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the device senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

### Supported Protocols and Standards

The device uses these protocols and standards to support PoE:

- CDP with power consumption—The powered device notifies the device of the amount of power it is consuming. The device does not reply to the power-consumption messages. The device can only supply power to or remove power from the PoE port.
- Cisco intelligent power management—The powered device and the device negotiate through power-negotiation CDP messages for an agreed-upon power-consumption level. The negotiation allows a high-power Cisco powered device, which consumes more than 7 W, to operate at its highest power mode. The powered device first boots up in low-power mode, consumes less than 7 W, and negotiates to obtain enough power to operate in high-power mode. The device changes to high-power mode only when it receives confirmation from the device.

High-power devices can operate in low-power mode on devices that do not support power-negotiation CDP.

Cisco intelligent power management is backward-compatible with CDP with power consumption; the device responds according to the CDP message that it receives. CDP is not supported on third-party powered devices; therefore, the device uses the IEEE classification to determine the power usage of the device.

- IEEE 802.3af—The major features of this standard are powered-device discovery, power administration, disconnect detection, and optional powered-device power classification. For more information, see the standard.
- The Cisco UPOE feature provides the capability to source up to 60 W of power (2 x 30 W) over both signal and spare pairs of the RJ-45 Ethernet cable by using the Layer-2 power negotiation protocols such as CDP or LLDP. An LLDP and CDP request of 30 W and higher in presence of the 4-wire Cisco Proprietary spare-pair power TLV can provide power on the spare pair.

### Related Topics

[Cisco Universal Power Over Ethernet](#), on page 120

## Powered-Device Detection and Initial Power Allocation

The device detects a Cisco pre-standard or an IEEE-compliant powered device when the PoE-capable port is in the no-shutdown state, PoE is enabled (the default), and the connected device is not being powered by an AC adaptor.

After device detection, the device determines the device power requirements based on its type:

- The initial power allocation is the maximum amount of power that a powered device requires. The device initially allocates this amount of power when it detects and powers the powered device. As the device receives CDP messages from the powered device and as the powered device negotiates power levels with the device through CDP power-negotiation messages, the initial power allocation might be adjusted.
- The device classifies the detected IEEE device within a power consumption class. Based on the available power in the power budget, the device determines if a port can be powered. [Table 15: IEEE Power Classifications](#), on page 116 lists these levels.

**Table 15: IEEE Power Classifications**

| Class                    | Maximum Power Level Required from the Device |
|--------------------------|----------------------------------------------|
| 0 (class status unknown) | 15.4 W                                       |
| 1                        | 4 W                                          |

| Class | Maximum Power Level Required from the Device   |
|-------|------------------------------------------------|
| 2     | 7 W                                            |
| 3     | 15.4 W                                         |
| 4     | 30 W (For IEEE 802.3at Type 2 powered devices) |

The device monitors and tracks requests for power and grants power only when it is available. The device tracks its power budget (the amount of power available on the device for PoE). The device performs power-accounting calculations when a port is granted or denied power to keep the power budget up to date.

After power is applied to the port, the device uses CDP to determine the *CDP-specific* power consumption requirement of the connected Cisco powered devices, which is the amount of power to allocate based on the CDP messages. The device adjusts the power budget accordingly. This does not apply to third-party PoE devices. The device processes a request and either grants or denies power. If the request is granted, the device updates the power budget. If the request is denied, the device ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. Powered devices can also negotiate with the device for more power.

With PoE+, powered devices use IEEE 802.3at and LLDP power with media dependent interface (MDI) type, length, and value descriptions (TLVs), Power-via-MDI TLVs, for negotiating power up to 30 W. Cisco pre-standard devices and Cisco IEEE powered devices can use CDP or the IEEE 802.3at power-via-MDI power negotiation mechanism to request power levels up to 30 W.

---

**Note** The initial allocation for Class 0, Class 3, and Class 4 powered devices is 15.4 W. When a device starts up and uses CDP or LLDP to send a request for more than 15.4 W, it can be allocated up to the maximum of 30 W.

---

---

**Note** The CDP-specific power consumption requirement is referred to as the *actual* power consumption requirement in the software configuration guides and command references.

---

If the device detects a fault caused by an undervoltage, overvoltage, overtemperature, oscillator-fault, or short-circuit condition, it turns off power to the port, generates a syslog message, and updates the power budget and LEDs.

The PoE feature operates the same whether or not the device is a stack member. The power budget is per device and independent of any other device in the stack. Election of a new active device does not affect PoE operation. The active device keeps track of the PoE status for all devices and ports in the stack and includes the status in output displays.

The stacking-capable device also supports StackPower, which allows the power supplies to share the load across multiple systems in a stack when you connect the devices with power stack cables. You can manage the power supplies of up to four stack members as a one large power supply.

## Power Management Modes

The device supports these PoE modes:

- **auto**—The device automatically detects if the connected device requires power. If the device discovers a powered device connected to the port and if the device has enough power, it grants power, updates the power budget, turns on power to the port on a first-come, first-served basis, and updates the LEDs. For LED information, see the hardware installation guide.

If the device has enough power for all the powered devices, they all come up. If enough power is available for all powered devices connected to the device, power is turned on to all devices. If there is not enough available PoE, or if a device is disconnected and reconnected while other devices are waiting for power, it cannot be determined which devices are granted or are denied power.

If granting power would exceed the system power budget, the device denies power, ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. After power has been denied, the device periodically rechecks the power budget and continues to attempt to grant the request for power.

If a device being powered by the device is then connected to wall power, the device might continue to power the device. The device might continue to report that it is still powering the device whether the device is being powered by the device or receiving power from an AC power source.

If a powered device is removed, the device automatically detects the disconnect and removes power from the port. You can connect a nonpowered device without damaging it.

You can specify the maximum wattage that is allowed on the port. If the IEEE class maximum wattage of the powered device is greater than the configured maximum value, the device does not provide power to the port. If the device powers a powered device, but the powered device later requests through CDP messages more than the configured maximum value, the device removes power to the port. The power that was allocated to the powered device is reclaimed into the global power budget. If you do not specify a wattage, the device delivers the maximum value. Use the **auto** setting on any PoE port. The auto mode is the default setting.

- **static**—The device pre-allocates power to the port (even when no powered device is connected) and guarantees that power will be available for the port. The device allocates the port configured maximum wattage, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed to be powered when it is connected to the static port. The port no longer participates in the first-come, first-served model.

However, if the powered-device IEEE class is greater than the maximum wattage, the device does not supply power to it. If the device learns through CDP messages that the powered device is consuming more than the maximum wattage, the device shuts down the powered device.

If you do not specify a wattage, the device pre-allocates the maximum value. The device powers the port only if it discovers a powered device. Use the **static** setting on a high-priority interface.

- **never**—The device disables powered-device detection and never powers the PoE port even if an unpowered device is connected. Use this mode only when you want to make sure that power is never applied to a PoE-capable port, making the port a data-only port.

For most situations, the default configuration (auto mode) works well, providing plug-and-play operation. No further configuration is required. However, perform this task to configure a PoE port for a higher priority, to make it data only, or to specify a maximum wattage to disallow high-power powered devices on a port.

Stacking-capable devices also support StackPower, which allows device power supplies to share the load across multiple systems in a stack by connecting up to four devices with power stack cables.

## Power Monitoring and Power Policing

When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the maximum amount allocated, also referred to as the *cutoff-power value*.

When PoE is enabled, the device senses the real-time power consumption of the powered device. The device monitors the real-time power consumption of the connected powered device; this is called *power monitoring* or *power sensing*. The device also polices the power usage with the *power policing* feature.

Power monitoring is backward-compatible with Cisco intelligent power management and CDP-based power consumption. It works with these features to ensure that the PoE port can supply power to the powered device.

The device senses the real-time power consumption of the connected device as follows:

1. The device monitors the real-time power consumption on individual ports.
2. The device records the power consumption, including peak power usage. The device reports the information through the CISCO-POWER-ETHERNET-EXT-MIB.
3. If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated to the device. The maximum power consumption is also referred to as the *cutoff power* on a PoE port.

If the device uses more than the maximum power allocation on the port, the device can either turn off power to the port, or the device can generate a syslog message and update the LEDs (the port LED is now blinking amber) while still providing power to the device based on the device configuration. By default, power-usage policing is disabled on all PoE ports.

If error recovery from the PoE error-disabled state is enabled, the device automatically takes the PoE port out of the error-disabled state after the specified amount of time.

If error recovery is disabled, you can manually re-enable the PoE port by using the **shutdown** and **no shutdown** interface configuration commands.

4. If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the PoE port, which could adversely affect the device.

## Power Consumption Values

You can configure the initial power allocation and the maximum power allocation on a port. However, these values are only the configured values that determine when the device should turn on or turn off power on the PoE port. The maximum power allocation is not the same as the actual power consumption of the powered device. The actual cutoff power value that the device uses for power policing is not equal to the configured power value.

When power policing is enabled, the device polices the power usage *at the switch port*, which is greater than the power consumption of the device. When you are manually set the maximum power allocation, you must consider the power loss over the cable from the switch port to the powered device. The cutoff power is the sum of the rated power consumption of the powered device and the worst-case power loss over the cable.

We recommend that you enable power policing when PoE is enabled on your device. For example, if policing is disabled and you set the cutoff-power value by using the **power inline auto max 6300** interface configuration command, the configured maximum power allocation on the PoE port is 6.3 W (6300 mW). The device provides power to the connected devices on the port if the device needs up to 6.3 W. If the CDP-power negotiated value or the IEEE classification value exceeds the configured cutoff value, the device does not provide power to the connected device. After the device turns on power on the PoE port, the device does not police the real-time power consumption of the device, and the device can consume more power than the

maximum allocated amount, which could adversely affect the device and the devices connected to the other PoE ports.

Because a standalone device supports internal power supplies, the total amount of power available for the powered devices varies depending on the power supply configuration.

- If a power supply is removed and replaced by a new power supply with less power and the device does not have enough power for the powered devices, the device denies power to the PoE ports in auto mode in descending order of the port numbers. If the device still does not have enough power, the device then denies power to the PoE ports in static mode in descending order of the port numbers.
- If the new power supply supports more power than the previous one and the device now has more power available, the device grants power to the PoE ports in static mode in ascending order of the port numbers. If it still has power available, the device then grants power to the PoE ports in auto mode in ascending order of the port numbers.

The stacking-capable device also supports StackPower, which allows power supplies to share the load across multiple systems in a stack by connecting the devices with power stack cables. You can collectively manage the power supplies of up to four stack members as a one large power supply.

## Cisco Universal Power Over Ethernet

Cisco Universal Power Over Ethernet (Cisco UPOE) is a Cisco proprietary technology that extends the IEEE 802.3at PoE standard to provide the capability to source up to 60 W of power over standard Ethernet cabling infrastructure (Class D or better) by using the spare pair of an RJ-45 cable (wires 4,5,7,8) with the signal pair (wires 1,2,3,6). Power on the spare pair is enabled when the switch port and end device mutually identify themselves as Cisco UPOE-capable using CDP or LLDP and the end device requests for power to be enabled on the spare pair. When the spare pair is powered, the end device can negotiate up to 60 W of power from the switch using CDP or LLDP.

If the end device is PoE-capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for Cisco UPOE, a 4-pair forced mode configuration automatically enables power on both signal and spare pairs from the switch port.

## How to Configure PoE

### Configuring a Power Management Mode on a PoE Port

**Note**

When you make PoE configuration changes, the port being configured drops power. Depending on the new configuration, the state of the other PoE ports, and the state of the power budget, the port might not be powered up again. For example, port 1 is in the auto and on state, and you configure it for static mode. The device removes power from port 1, detects the powered device, and repowers the port. If port 1 is in the auto and on state and you configure it with a maximum wattage of 10 W, the device removes power from the port and then redetects the powered device. The device repowers the port only if the powered device is a class 1, class 2, or a Cisco-only powered device.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **power inline** {**auto** [**max** *max-wattage*] | **never** | **static** [**max** *max-wattage*]}
5. **end**
6. **show power inline** [*interface-id* | **module** *switch-number*]
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Pre-allocate (reserve) power for a port before the device discovers the powered device. The device reserves power for this port even when no device is connected and guarantees that power will be provided upon device detection.</li> </ul> <p>The device allocates power to a port configured in static mode before it allocates power to a port configured in auto mode.</p> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 6</b> | <b>show power inline</b> [ <i>interface-id</i>   <b>module</b> <i>switch-number</i> ]<br><b>Example:</b><br>Device# <b>show power inline</b> | Displays PoE status for a device or a device stack, for the specified interface, or for a specified stack member.<br><br>The <b>module</b> <i>switch-number</i> keywords are supported only on stacking-capable devices.                                                                                                                                                                                                                                                |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                            | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                |

## Enabling Power on Signal/Spare Pairs

**Note** Do not enter this command if the end device cannot source inline power on the spare pair or if the end device supports the CDP or LLDP extensions for Cisco UPOE.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **power inline four-pair forced**
4. **end**

### DETAILED STEPS

|               | Command or Action                            | Purpose                           |
|---------------|----------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                              | Purpose                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                        |                                                                                        |
| <b>Step 2</b> | <code>interface interface-id</code><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet2/0/1</code>          | Specifies the physical port to be configured, and enters interface configuration mode. |
| <b>Step 3</b> | <code>power inline four-pair forced</code><br><b>Example:</b><br>Device(config-if)# <code>power inline four-pair forced</code> | Enables power on both signal and spare pairs from a switch port.                       |
| <b>Step 4</b> | <code>end</code><br><b>Example:</b><br>Device(config-if)# <code>end</code>                                                     | Returns to privileged EXEC mode.                                                       |

## Configuring Power Policing

By default, the device monitors the real-time power consumption of connected powered devices. You can configure the device to police the power usage. By default, policing is disabled.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `power inline police [action {log | errdisable}]`
5. `exit`
6. Use one of the following:
  - `errdisable detect cause inline-power`
  - `errdisable recovery cause inline-power`
  - `errdisable recovery interval interval`
7. `exit`
8. Use one of the following:
  - `show power inline police`
  - `show errdisable recovery`
9. `copy running-config startup-config`

### DETAILED STEPS

|               | Command or Action                      | Purpose                                                        |
|---------------|----------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <code>enable</code><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet2/0/1</b>                                                                                                                                  | Specifies the physical port to be configured, and enter interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>power inline police [action {log   errdisable}]</b><br><b>Example:</b><br>Device(config-if)# <b>power inline police</b>                                                                                                                 | <p>If the real-time power consumption exceeds the maximum power allocation on the port, configures the device to take one of these actions:</p> <ul style="list-style-type: none"> <li>• <b>power inline police</b>—Shuts down the PoE port, turns off power to it, and puts it in the error-disabled state.</li> </ul> <p><b>Note</b> You can enable error detection for the PoE error-disabled cause by using the <b>errdisable detect cause inline-power</b> global configuration command. You can also enable the timer to recover from the PoE error-disabled state by using the <b>errdisable recovery cause inline-power interval interval</b> global configuration command.</p> <ul style="list-style-type: none"> <li>• <b>power inline police action errdisable</b>—Turns off power to the port if the real-time power consumption exceeds the maximum power allocation on the port.</li> <li>• <b>power inline police action log</b>—Generates a syslog message while still providing power to the port.</li> </ul> <p>If you do not enter the <b>action log</b> keywords, the default action shuts down the port and puts the port in the error-disabled state.</p> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config-if)# <b>exit</b>                                                                                                                                                                           | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>errdisable detect cause inline-power</b></li> <li>• <b>errdisable recovery cause inline-power</b></li> <li>• <b>errdisable recovery interval interval</b></li> </ul> | <p>(Optional) Enables error recovery from the PoE error-disabled state, and configures the PoE recover mechanism variables.</p> <p>By default, the recovery interval is 300 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|               | Command or Action                                                                                                                                                                                                                                                              | Purpose                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Device(config)# errdisable detect cause inline-power</pre> <pre>Device(config)# errdisable recovery cause inline-power</pre> <pre>Device(config)# errdisable recovery interval 100</pre>                                                           | For <b>interval</b> <i>interval</i> , specifies the time in seconds to recover from the error-disabled state. The range is 30 to 86400. |
| <b>Step 7</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config)# exit</pre>                                                                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                        |
| <b>Step 8</b> | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show power inline police</b></li> <li>• <b>show errdisable recovery</b></li> </ul> <p><b>Example:</b></p> <pre>Device# show power inline police</pre> <pre>Device# show errdisable recovery</pre> | Displays the power monitoring status, and verify the error recovery settings.                                                           |
| <b>Step 9</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                                                                                                  | (Optional) Saves your entries in the configuration file.                                                                                |

## Monitoring Power Status

Table 16: Show Commands for Power Status

| Command                                                                                  | Purpose                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show env power switch</b><br>[ <i>switch-number</i> ]                                 | (Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch.<br><br>The range is 1 to 9, depending on the switch member numbers in the stack. These keywords are available only on stacking-capable switches. |
| <b>show power inline</b> [ <i>interface-id</i>  <br><b>module</b> <i>switch-number</i> ] | Displays PoE status for a switch or switch stack, for an interface, or for a specific switch in the stack.                                                                                                                                                               |
| <b>show power inline police</b>                                                          | Displays the power policing data.                                                                                                                                                                                                                                        |

## CHAPTER 10

# Configuring the Cisco eXpandable Power System (XPS) 2200

---

This module contains the following sections:

- [Restrictions for Configuring the XPS 2200, on page 127](#)
- [Information About Configuring the XPS 2200, on page 127](#)
- [How to Configure the XPS 2200, on page 131](#)
- [Monitoring and Maintaining the XPS 2200, on page 134](#)
- [Additional References, on page 134](#)

## Restrictions for Configuring the XPS 2200

- When using the XPS power supplies in the RPS mode for backing up switch power supplies, the smallest power supply in the XPS must be greater than the largest power supply in a switch connected to an XPS port in RPS mode.
- In RPS mode, each XPS power supply can back up one and only one switch power supply, regardless of the size.
- If you remove a power supply from the power stack (from a switch or the XPS), be sure that removing it does not deplete available power enough to cause load shedding.

## Information About Configuring the XPS 2200

### Cisco eXpandable Power System (XPS) 2200 Overview

The Cisco eXpandable Power System (XPS) 2200 is a standalone power system that you can connect to Catalyst switches. The XPS 2200 can provide backup power to connected devices that experience a power supply failure or, in a Catalyst switch power stack, it can supply additional power to the power stack budget. The XPS 2200 power ports and internal power supplies can operate in redundant power supply (RPS) mode or stack power (SP) mode.

Stack-power mode is used only on stacking-capable switches in a power stack. With no XPS, a power stack operates in ring topology with a maximum of four switches in the stack. If you merge two stacks, the total

number of switches cannot exceed four. When an XPS is in the power stack, you can connect up to nine switches in the stack plus the XPS, providing power budgets to power stack members similar to stack-power ring topology operation.

All Catalyst switches connected to an XPS on SP ports are part of the same power stack, and all power from the XPS and the switch is shared across all switches in the stack. Power sharing is the default mode, but the XPS supports the same stack power modes that are supported in a ring topology (strict and nonstrict power-sharing or redundant modes).

When two power supplies are present, the system can operate in mixed mode, where one power supply operates in RPS mode and the other in SP mode. You can configure the ports and power supplies for the way that you plan to use the XPS 2200.

The XPS 2000 has nine power ports that can operate in an RPS role or in an automatic stack power (Auto-SP) role (the default), where mode of operation is determined by the type of switch connected to the port. You can also use the CLI to force the mode to be RPS for stackable switches.

- When a Catalyst switch running the LAN base image, or a Catalyst (nonstackable) switch is connected to the port, the mode is RPS, and the XPS 2200 acts as a backup if the switch power supply goes down.
- When a Catalyst (stackable) switch running the IP base or IP services license is connected to the port, the mode is SP, which enables the switch to be part of the stack power system.

You configure the XPS through any switch connected to a power port. You can use any XPS port for configuration, and you can configure any port from any switch connected to the XPS. If you enter XPS configuration commands on more than one switch, the last configuration applied takes effect.

Although all XPS configuration is done through a switch, the XPS 2200 also runs its own software. You can upgrade this software through the XPS Service Port.

## XPS 2200 Power Supply Modes

The XPS has two power supplies that can also be in either RPS or SP mode.

In SP mode, all SP ports on the XPS belong to the same power stack. When a power stack includes an XPS, the stack topology is a star topology and consists of up to nine member switches plus the XPS 2200. The XPS power supply or power supplies that are in SP mode are considered in the power budgeting. If both XPS power supplies are in RPS mode, the power stack consists only of the switches connected to XPS ports in SP mode, and the power budget is determined by the power supplies in these switches.

If there is a power supply role mismatch, for example, if an XPS port is configured for RPS and both power supplies are in SP mode, the XPS detects the mismatch, and an error message is sent.

### RPS Mode

When both XPS power supplies are in RPS mode, the XPS can back up two power supply failures for switch power supplies of equal value or less. The smallest power supply in the XPS must be greater than the largest power supply in a switch connected to an XPS port in RPS mode.

If only one supply is in RPS mode, the XPS can back up only one power supply, even when the failed power supply is much smaller. For example, if an XPS 1100 W power supply is in RPS mode and two 350 W switch power supplies fail, the XPS can back up only one of the switch power supplies.

When one XPS power supply in RPS mode is backing up a switch power supply and another switch power supply fails, a message appears that the XPS backup is not available. When the failed power supply comes up, the XPS becomes available to back up other power supplies.

If the XPS is backing up two failed power supplies in a single switch (both XPS power supplies in RPS mode), the XPS is not available to back up other switch power supplies until both of the failed supplies are repaired or replaced.

In mixed mode, with one power supply in RPS mode and one in SP mode, if two power supplies in a single switch fail, because the XPS can back up only one of them, it denies power to both power supplies, and the switch shuts down. This occurs only in mixed power mode.

If a switch is connected to a port configured as RPS, but neither of the power supplies is RPS, the RPS port configuration is rejected and the XPS attempts to add the switch to a power stack. If the switch is not capable of operating in SP mode (is not a stackable switch), the port is disabled.

Ports in RPS mode have a configurable priority. The default priority is based on the XPS port number, with port 1 as the highest priority port. A higher priority port has a higher precedence for backup than a lower priority port. If a switch connected to a higher priority port has a power supply failure while a switch connected to a low priority port is being backed up, the XPS drops power to the low priority port to supply power to the high priority port.

## Stack Power Mode

Stack-power mode is used only on Catalyst switches in a power stack. With no XPS, a power stack operates in ring topology with a maximum of four switches in the stack. When an XPS is in the power stack, you can connect up to nine switches in the stack plus the XPS, providing power budgets to power stack members similar to stack-power ring topology operation.

All Catalyst switches connected to an XPS on SP ports are part of the same power stack, and all power from the XPS and the switches is shared across all switches in the stack. Power sharing is the default mode, but the XPS supports the same stack power modes that are supported in a ring topology (strict and nonstrict power-sharing or redundant modes).

The XPS uses neighbor discovery to create the power stack. When it discovers a Catalyst switch on an unconfigured port, it marks the port as an SP port, and the switch joins the power stack. The XPS notifies the switch, begins the power-budgeting process, and assigns budgets to each switch in the power stack based on their requirements, priorities, current power allocations, and the stack aggregate power capability.

The XPS sends the power budget to each switch. If not enough input power is available to provide every switch with its maximum requested power, power is distributed based on priority. Switches with the highest priority receive required power first, followed by any powered devices that have already been allocated power, in order of their priority. Any remaining power is distributed equally through the stack.

The RPS port priority (1 through 9) does not affect stack power priority. Each switch participating in stack power has its own system priority and a high and low priority for devices connected to its ports. These priorities are used for stack power, as is the case in a ring topology. You configure stack power priority for the system and for high and low-priority ports by using the **power-priority switch**, **power-priority high**, and **power-priority low** commands in switch stack power configuration mode. If a system or set of powered devices are using the default priority, the XPS automatically assigns a priority (1 through 27), with lower MAC addresses receiving higher priorities.

There are four power stack modes: power sharing, strict power sharing, redundant, or strict redundant. You configure the power stack mode by using the **mode {power-sharing | redundant} [strict]** command in power-stack configuration mode. The **power-sharing** or **redundant** configurations affect the power budgeting aspect of the stack; **strict** or non-strict affects the actions of the PoE application when a budget reduction does not result in load shedding.

- In power sharing modes (strict or nonstrict), the stack power budget is the cumulative capacity of all the power supplies in the stack (minus 30 W reserved power). This is the default.

- In redundant modes (strict or nonstrict), the stack power budget is the total available power (minus 30 W) after the capacity of the largest power supply in the power stack is subtracted. Redundant mode guarantees that no switch or powered device loses power or experiences load sheds if a single power supply fails, but load sheds can occur if more than one power supply fails.
- In strict modes, if a loss of input power results in reduced power budgets but does not result in any hardware load shedding, the XPS automatically begins denying power to low-priority powered devices and then the high-priority powered devices until the amount of allocated power is less than or equal to the amount of available PoE power.
- In nonstrict modes, in the event of a power reduction, the amount of allocated power is allowed to fall under budget.

For example, a system with a total PoE budget (available power) of 400 W can allocate 390 W of the budget (allocated power) to powered devices. The allocated power of a device is the maximum amount of power that the device needs. The actual power consumption (consumed power) for a set of powered devices is usually not equal to the allocated power. In this example, the actual power might be approximately 200 W. If a power loss in the stack reduces the available power to 210 W, this amount is enough to sustain the power being consumed by the powered devices, but less than the worst-case allocated power, which would put the system *under budget*. In strict mode, the stack would immediately deny power to powered devices until the allocated power was 210 W or less. In nonstrict mode, no action is taken, and the state is allowed to persist. In nonstrict mode if the actual power consumption becomes more than 210 W, this triggers a load shed and can result in the loss of power to all powered devices or switches with the lowest priority level.

## Mixed Modes

The XPS 2200 can also operate in mixed mode, where some ports connected to switches are RPS and others are SP. At least one power supply must be an RPS power supply in this configuration. The power supply in the XPS can back up only one switch power supply and the XPS supply must be greater than the largest power supply in a switch connected to an XPS port in RPS mode.

Switches connected to SP ports belong to a single power stack. If the SP switches have a large enough power budget, an SP power supply is not required on the XPS. When an XPS power supply is configured, its power is added to the power pool shared by the power stack.

## XPS 2200 System Defaults

The default role for a port is Auto-SP, where the power mode is determined by the switch connected to the port (RPS for Catalyst running the LAN base image, or SP for Catalyst switches running the IP base or IP services image).

The default for the XPS power supply A (PS1) is RPS mode. The default for power supply B (PS2) is SP mode.

The default mode for all ports and power supplies is enabled.

On ports configured for RPS, the default priority is the same as the port number.

# How to Configure the XPS 2200

You can configure the XPS from any switch connected to an XPS port. If you enter XPS configuration commands on more than one switch, the last configuration applied takes effect. Only the switch and port name are saved in the switch configuration file.

## Configuring System Names

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `power xps switch-number name {name | serialnumber}`
4. `power xps switch-number port {name | hostname | serialnumber}`
5. `end`
6. `show env xps system`
7. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre> | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                               |
| Step 2 | <code>configure terminal</code>                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <code>power xps switch-number name {name   serialnumber}</code>                | <p><b>Note</b> The <i>switch-number</i> appears only on Catalyst switches and represents the switch number in the data stack, a value from 1 to 9.</p> <p>Configures a name for the XPS 2200 system.</p> <ul style="list-style-type: none"> <li>• <i>name</i>—Enter a name for the XPS 2000 port. The name can have up to 20 characters.</li> <li>• <b>serialnumber</b>—Use the serial number of the XPS 2200 as the system name.</li> </ul> |
| Step 4 | <code>power xps switch-number port {name   hostname   serialnumber}</code>     | <p><b>Note</b> The <i>switch-number</i> appears only on Catalyst switches and represents the device number in the data stack, a value from 1 to 9.</p> <p>Configures a name for an XPS 2200 port connected to the device.</p>                                                                                                                                                                                                                |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                        |
|---------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                       | <ul style="list-style-type: none"> <li>• <i>name</i>—Enter a name for the XPS 2000 port.</li> <li>• <b>serialnumber</b>—Use the serial number of the device connected to the port.</li> <li>• <b>hostname</b>—Use the hostname of the device connected to the port.</li> </ul> |
| <b>Step 5</b> | <b>end</b>                                                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                               |
| <b>Step 6</b> | <b>show env xps system</b>                                                                                            | Verifies the configured name of the system and ports.                                                                                                                                                                                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                       |

5. **show env xps port**

### DETAILED STEPS

|               | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                    | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>power xps <i>switch-number</i> port {<i>number</i>   <b>connected</b>} mode {<b>disable</b>   <b>enable</b>}</b> | <p><b>Note</b> The <i>switch-number</i> appears only on Catalyst switches and represents the switch number in the data stack, a value from 1 to 9.</p> <p>Sets the port to be enabled or disabled.</p> <ul style="list-style-type: none"> <li>• <i>number</i>—Enter the XPS 2200 port number. The range is 1 to 9.</li> <li>• <b>connected</b>—Enter this keyword if you do not know the port number to which the switch is connected.</li> </ul> |

|        | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        |                                                                                                                                                          | <ul style="list-style-type: none"> <li>• <b>mode disable</b>—Disable (shut down) the XPS port.</li> </ul> <p><b>Note</b> Disabling an XPS port is like removing the cable and appears the same in the <b>show</b> command outputs. If the physical cable is connected, you can still use the <b>enable</b> keyword to enable the port.</p> <ul style="list-style-type: none"> <li>• <b>mode enable</b>—Enable the XPS port. This is the default.</li> </ul>                                                                                                                                                                                      |
| Step 3 | <b>power xps</b> <i>switch-number</i> <b>port</b> { <i>number</i>   <b>connected</b> } <b>role</b> { <b>auto</b>   <b>rps</b> }                          | <p><b>Note</b> The <i>switch-number</i> represents the switch number in the data stack, a value from 1 to 9.</p> <p>Sets the role of the XPS port.</p> <ul style="list-style-type: none"> <li>• <b>role auto</b>—The port mode is determined by the switch connected to the port. This is the default.</li> <li>• <b>role RPS</b>—The XPS acts as a back up if the switch power supply fails. At least one RPS power supply must be in RPS mode for this configuration.</li> </ul>                                                                                                                                                               |
| Step 4 | <b>power xps</b> <i>switch-number</i> <b>port</b> { <i>number</i>   <b>connected</b> } <b>priority</b> <i>port-priority</i><br><b>Example:</b><br>Device | <p><b>Note</b> The <i>switch-number</i> represents the switch number in the data stack, a value from 1 to 9.</p> <p>Sets the RPS priority of the port, where higher priority ports take precedence over low priority ports if multiple power supplies fail. This command takes effect only when the port mode is RPS. When the port mode is stack power, you set priority by using the stack power commands.</p> <ul style="list-style-type: none"> <li>• <b>priority</b> <i>port-priority</i>—Set the RPS priority of the port. The range is 1 to 9, with 1 being the highest priority. The default priority is the XPS port number.</li> </ul> |
| Step 5 | <b>show env xps port</b>                                                                                                                                 | Verifies the XPS configuration of the port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring XPS Power Supplies

### SUMMARY STEPS

1. **enable**
2. **power xps** *switch-number* **supply** {**A** | **B**} **mode** {**rps** | **sp**}
3. **power xps** *switch-number* **supply** {**A** | **B**} {**on** | **off**}
4. **end**
5. **show env xps power**

## DETAILED STEPS

|        | Command or Action                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>            | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>power xps <i>switch-number</i> supply {A   B} mode {rps   sp}</b> | <b>Note</b> The <i>switch-number</i> represents the switch number in the data stack, a value from 1 to 9.<br><br>Sets the XPS power supply mode. <ul style="list-style-type: none"> <li>• <b>supply {A   B}</b>—Select the power supply to configure. Power supply A is on the left (labeled PS1) and power supply B (PS2) is on the right.</li> <li>• <b>mode rps</b>—Set the power supply mode to RPS, to back up connected switches. This is the default setting for power supply A (PS1).</li> <li>• <b>mode sp</b>—Set the power supply mode to stack power (SP), to participate in the power stack. This is the default setting for power supply B (PS2).</li> </ul> |
| Step 3 | <b>power xps <i>switch-number</i> supply {A   B} {on   off}</b>      | <b>Note</b> The <i>switch-number</i> represents the switch number in the data stack, a value from 1 to 9.<br><br>Sets the XPS power supply to be on or off. The default is for both power supplies to be on.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 4 | <b>end</b>                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 5 | <b>show env xps power</b>                                            | Displays the status of the XPS power supplies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Monitoring and Maintaining the XPS 2200

| Command                    | Purpose                                               |
|----------------------------|-------------------------------------------------------|
| <b>show env xps system</b> | Verifies the configured name of the system and ports. |
| <b>show env xps port</b>   | Verifies the XPS configuration of the port.           |
| <b>show env xps power</b>  | Displays the status of the XPS power supplies.        |

## CHAPTER 11

# Configuring EEE

---

- [Information About EEE, on page 137](#)
- [Restrictions for EEE, on page 137](#)
- [How to Configure EEE, on page 138](#)
- [Monitoring EEE, on page 139](#)
- [Configuration Examples for Configuring EEE, on page 140](#)
- [Additional References for EEE, on page 140](#)
- [Feature Information for Configuring EEE, on page 141](#)

## Information About EEE

### EEE Overview

Energy Efficient Ethernet (EEE) is an IEEE 802.3az standard that is designed to reduce power consumption in Ethernet networks during idle periods.

### Default EEE Configuration

EEE is disabled by default.

## Restrictions for EEE

EEE has the following restrictions:

- Changing the EEE configuration resets the interface because the device has to restart Layer 1 autonegotiation.
- You might want to enable the Link Layer Discovery Protocol (LLDP) for devices that require longer wakeup times before they are able to accept data on their receive paths. Doing so enables the device to negotiate for extended system wakeup times from the transmitting link partner.
- EEE is not supported on TenGigabit Ethernet and Multigigabit Ethernet ports.

# How to Configure EEE

You can enable or disable EEE on an interface that is connected to an EEE-capable link partner.

## Enabling or Disabling EEE

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **power efficient-ethernet auto**
4. **no power efficient-ethernet auto**
5. **end**
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                        | Purpose                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                        | Enters global configuration mode.                                                                                              |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>        | Specifies the interface to be configured, and enter interface configuration mode.                                              |
| <b>Step 3</b> | <b>power efficient-ethernet auto</b><br><b>Example:</b><br>Device(config-if)# <b>power efficient-ethernet auto</b>       | Enables EEE on the specified interface. When EEE is enabled, the device advertises and autonegotiates EEE to its link partner. |
| <b>Step 4</b> | <b>no power efficient-ethernet auto</b><br><b>Example:</b><br>Device(config-if)# <b>no power efficient-ethernet auto</b> | Disables EEE on the specified interface.                                                                                       |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b>                                                                                            | Returns to privileged EXEC mode.                                                                                               |

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device(config-if)# <b>end</b>                                                                                     |                                                          |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Monitoring EEE

*Table 18: Commands for Displaying EEE Settings*

| Command                                                    | Purpose                                                      |
|------------------------------------------------------------|--------------------------------------------------------------|
| <b>show eee capabilities interface</b> <i>interface-id</i> | Displays EEE capabilities for the specified interface.       |
| <b>show eee status interface</b> <i>interface-id</i>       | Displays EEE status information for the specified interface. |
| <b>show eee counters interface</b> <i>interface-id</i>     | Displays EEE counters for the specified interface.           |

Following are examples of the **show eee** commands

```
Switch#show eee capabilities interface gigabitEthernet2/0/1
Gi2/0/1
EEE(efficient-ethernet): yes (100-Tx and 1000T auto)
Link Partner : yes (100-Tx and 1000T auto)

ASIC/Interface : EEE Capable/EEE Enabled

Switch#show eee status interface gigabitEthernet2/0/1
Gi2/0/1 is up
EEE(efficient-ethernet): Operational
Rx LPI Status : Low Power
Tx LPI Status : Low Power
Wake Error Count : 0

ASIC EEE STATUS
Rx LPI Status : Receiving LPI
Tx LPI Status : Transmitting LPI
Link Fault Status : Link Up
Sync Status : Code group synchronization with data stream intact

Switch#show eee counters interface gigabitEthernet2/0/1

LP Active Tx Time (10us) : 66649648
LP Transitioning Tx : 462
LP Active Rx Time (10us) : 64911682
LP Transitioning Rx : 153
```

Examples for Catalyst Digital Building Series Switches

```
Switch#show eee capabilities interface gig1/0/1
Gi1/0/1
```

```

EEE(efficient-ethernet): yes (100-Tx and 1000T auto)
Link Partner : no

Switch#show eee status int gig1/0/1
Gig1/0/1 is up
EEE(efficient-ethernet): Disagreed
Rx LPI Status : None
Tx LPI Status : None
Wake Error Count : 0

```

## Configuration Examples for Configuring EEE

This example shows how to enable EEE for an interface:

```

Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# power efficient-ethernet auto

```

This example shows how to disable EEE for an interface:

```

Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# no power efficient-ethernet auto

```

## Additional References for EEE

## Information About Configuring IPv6 MLD Snooping

---

**Note** To use IPv6 MLD Snooping, the switch must be running the LAN Base image.

---

You can use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP Version 6 (IPv6) multicast data to clients and routers in a switched network on the switch. Unless otherwise noted, the term switch refers to a standalone switch and to a switch stack.

---

**Note** Stacking is supported only on Catalyst 2960-X switches running the LAN base image.

---

---

**Note** To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

On switches running the LAN Base feature set, the routing template is not supported.

---

---

**Note** For complete syntax and usage information for the commands used in this chapter, see the command reference for this release or the Cisco IOS documentation referenced in the procedures.

---

## Understanding MLD Snooping

In IP Version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on the links that are directly attached to the routers and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD Version 1 (MLDv1) is equivalent to IGMPv2, and MLD Version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol Version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

### Note

The switch does not support MLDv2 enhanced snooping, which sets up IPv6 source and destination multicast address-based forwarding.

MLD snooping can be enabled or disabled globally or per VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

According to IPv6 multicast standards, the switch derives the MAC multicast address by performing a logical-OR of the four low-order octets of the switch MAC address with the MAC address of 33:33:00:00:00:00. For example, the IPv6 MAC address of FF02:DEAD:BEEF:1:3 maps to the Ethernet MAC address of 33:33:00:01:00:03.

A multicast packet is unmatched when the destination IPv6 address does not match the destination MAC address. The switch forwards the unmatched packet in hardware based the MAC address table. If the destination MAC address is not in the MAC address table, the switch floods the packet to all ports in the same VLAN as the receiving port.

## MLD Messages

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQs).
- Multicast Listener Reports are the equivalent of IGMPv2 reports
- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPv2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.

## MLD Queries

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast group address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

---

**Note** When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 2960, 2960-S, 2960-C, 2960-X or 2960-CX switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

---

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

## Multicast Client Aging Robustness

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

## Multicast Router Discovery

Like IGMP snooping, MLD snooping performs multicast router discovery, with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If there are multiple routers on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).
- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.

- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether or not MLD snooping is enabled on the switch.
- After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).

## MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address is entered in the VLAN MLD database. Then all IPv6 multicast traffic to the group within the VLAN is forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

## MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (which would be the case when there are multiple clients for a group on the same port) and a Done message is received on a port, an MASQ is generated on that port. The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the **ipv6 mld snooping last-listener-query count** global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If there are no reports sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the **ipv6 mld snooping last-listener-query-interval** global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

When Immediate Leave is not enabled and a port receives an MLD Done message, the switch generates MASQs on the port and sends them to the IPv6 multicast address for which the Done message was sent. You can optionally configure the number of MASQs that are sent and the length of time the switch waits for a response before deleting the port from the multicast group.

When you enable MLDv1 Immediate Leave, the switch immediately removes a port from a multicast group when it detects an MLD Done message on that port. You should only use the Immediate-Leave feature when there is a single receiver present on every port in the VLAN. When there are multiple clients for a multicast group on the same port, you should not enable Immediate-Leave in a VLAN.

## Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the **ipv6 mld snooping tcn query solicit** global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the **ipv6 mld snooping tcn flood query count** global configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This is same as done in IGMP snooping.

# How to Configure IPv6 MLD Snooping

## Default MLD Snooping Configuration

*Table 19: Default MLD Snooping Configuration*

| Feature                          | Default Setting                                                                                                                                            |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MLD snooping (Global)            | Disabled.                                                                                                                                                  |
| MLD snooping (per VLAN)          | Enabled. MLD snooping must be globally enabled for VLAN MLD snooping to take place.                                                                        |
| IPv6 Multicast addresses         | None configured.                                                                                                                                           |
| IPv6 Multicast router ports      | None configured.                                                                                                                                           |
| MLD snooping Immediate Leave     | Disabled.                                                                                                                                                  |
| MLD snooping robustness variable | Global: 2; Per VLAN: 0.<br><b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.              |
| Last listener query count        | Global: 2; Per VLAN: 0.<br><b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.              |
| Last listener query interval     | Global: 1000 (1 second); VLAN: 0.<br><b>Note</b> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global interval. |

| Feature                  | Default Setting |
|--------------------------|-----------------|
| TCN query solicit        | Disabled.       |
| TCN query count          | 2.              |
| MLD listener suppression | Disabled.       |

## MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the **ipv6 mld snooping** global configuration command for the configuration to take effect.
- When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.
- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch.
- The maximum number of multicast entries allowed on the switch or switch stack is determined by the configured SDM template.
- The maximum number of address entries allowed for the switch or switch stack is 4000.

## Enabling or Disabling MLD Snooping on the Switch (CLI)

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. That is, MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis or for a range of VLANs, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

Beginning in privileged EXEC mode, follow these steps to globally enable MLD snooping on the switch:

### Procedure

|               | Command or Action                                                                               | Purpose                           |
|---------------|-------------------------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br><br>Device# <code>configure terminal</code> | Enters global configuration mode. |

|               | Command or Action                                                                                                             | Purpose                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Step 2</b> | <b>ipv6 mld snooping</b><br><b>Example:</b><br><br>Device(config)# <b>ipv6 mld snooping</b>                                   | Enables MLD snooping on the switch.                     |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                               | Returns to privileged EXEC mode.                        |
| <b>Step 4</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device(config)# <b>copy running-config startup-config</b> | (Optional) Save your entries in the configuration file. |
| <b>Step 5</b> | <b>reload</b><br><b>Example:</b><br><br>Device(config)# <b>reload</b>                                                         | Reload the operating system.                            |

## Enabling or Disabling MLD Snooping on a VLAN (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLD snooping on a VLAN.

### Procedure

|               | Command or Action                                                                           | Purpose                                                                            |
|---------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>       | Enters global configuration mode.                                                  |
| <b>Step 2</b> | <b>ipv6 mld snooping</b><br><b>Example:</b><br><br>Device(config)# <b>ipv6 mld snooping</b> | Enables MLD snooping on the switch.                                                |
| <b>Step 3</b> | <b>ipv6 mld snooping vlan</b> <i>vlan-id</i><br><b>Example:</b>                             | Enables MLD snooping on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |

|               | Command or Action                                                                      | Purpose                                                                            |
|---------------|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
|               | Device(config)# <code>ipv6 mld snooping vlan 1</code>                                  | <b>Note</b> MLD snooping must be globally enabled for VLAN snooping to be enabled. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping vlan 1</code> | Returns to privileged EXEC mode.                                                   |

## Configuring a Static Multicast Group (CLI)

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

Beginning in privileged EXEC mode, follow these steps to add a Layer 2 port as a member of a multicast group:

### Procedure

|               | Command or Action                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                                  | Enters global configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> static <i>ipv6_multicast_address</i> interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping vlan 1 static FF12::3 interface gigabitethernet 0/1</code> | Configures a multicast group with a Layer 2 port as a member of a multicast group: <ul style="list-style-type: none"> <li>• <i>vlan-id</i> is the multicast group VLAN ID. The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• <i>ipv6_multicast_address</i> is the 128-bit group IPv6 address. The address must be in the form specified in RFC 2373.</li> <li>• <i>interface-id</i> is the member port. It can be a physical interface or a port channel (1 to 48).</li> </ul> |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <code>show ipv6 mld snooping address</code></li> <li>• <code>show ipv6 mld snooping address vlan <i>vlan-id</i></code></li> </ul>                                     | Verifies the static member port and the IPv6 address.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|  | Command or Action                                                                                                                              | Purpose |
|--|------------------------------------------------------------------------------------------------------------------------------------------------|---------|
|  | <b>Example:</b><br><br>Device# <code>show ipv6 mld snooping address</code><br><br>or<br><br>Device# <code>show ipv6 mld snooping vlan 1</code> |         |

## Configuring a Multicast Router Port (CLI)

**Note** Static connections to multicast routers are supported only on switch ports.

Beginning in privileged EXEC mode, follow these steps to add a multicast router port to a VLAN:

### Procedure

|               | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b><br><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping vlan 1 mrouter interface gigabitethernet 0/2</code> | Specifies the multicast router VLAN ID, and specify the interface to the multicast router. <ul style="list-style-type: none"> <li>• The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• The interface can be a physical interface or a port channel. The port-channel range is 1 to 48.</li> </ul> |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>show ipv6 mld snooping mrouter [ vlan <i>vlan-id</i> ]</b><br><br><b>Example:</b><br>Device# <code>show ipv6 mld snooping mrouter vlan 1</code>                                                       | Verifies that IPv6 MLD snooping is enabled on the VLAN interface.                                                                                                                                                                                                                                          |

## Enabling MLD Immediate Leave (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLDv1 Immediate Leave:

## Procedure

|               | Command or Action                                                                                                                                        | Purpose                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                  | Enters global configuration mode.                               |
| <b>Step 2</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> immediate-leave</b><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping vlan 1 immediate-leave</code> | Enables MLD Immediate Leave on the VLAN interface.              |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                        | Returns to privileged EXEC mode.                                |
| <b>Step 4</b> | <b>show ipv6 mld snooping vlan <i>vlan-id</i></b><br><b>Example:</b><br>Device# <code>show ipv6 mld snooping vlan 1</code>                               | Verifies that Immediate Leave is enabled on the VLAN interface. |

## Configuring MLD Snooping Queries (CLI)

Beginning in privileged EXEC mode, follow these steps to configure MLD snooping query characteristics for the switch or for a VLAN:

## Procedure

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                              | Enters global configuration mode.                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>ipv6 mld snooping robustness-variable <i>value</i></b><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping robustness-variable 3</code> | (Optional) Sets the number of queries that are sent before switch will deletes a listener (port) that does not respond to a general query. The range is 1 to 3; the default is 2.                                                   |
| <b>Step 3</b> | <b>ipv6 mld snooping vlan <i>vlan-id</i> robustness-variable <i>value</i></b><br><b>Example:</b>                                                     | (Optional) Sets the robustness variable on a VLAN basis, which determines the number of general queries that MLD snooping sends before aging out a multicast address when there is no MLD report response. The range is 1 to 3; the |

|                | Command or Action                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device(config)# <code>ipv6 mld snooping vlan 1 robustness-variable 3</code>                                                                                                                                       | default is 0. When set to 0, the number used is the global robustness variable value.                                                                                                                                                                                               |
| <b>Step 4</b>  | <b>ipv6 mld snooping last-listener-query-count</b> <i>count</i><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping last-listener-query-count 7</code>                                                  | (Optional) Sets the number of MASQs that the switch sends before aging out an MLD client. The range is 1 to 7; the default is 2. The queries are sent 1 second apart.                                                                                                               |
| <b>Step 5</b>  | <b>ipv6 mld snooping vlan</b> <i>vlan-id</i><br><b>last-listener-query-count</b> <i>count</i><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping vlan 1 last-listener-query-count 7</code>             | (Optional) Sets the last-listener query count on a VLAN basis. This value overrides the value configured globally. The range is 1 to 7; the default is 0. When set to 0, the global count value is used. Queries are sent 1 second apart.                                           |
| <b>Step 6</b>  | <b>ipv6 mld snooping last-listener-query-interval</b> <i>interval</i><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping last-listener-query-interval 2000</code>                                      | (Optional) Sets the maximum response time that the switch waits after sending out a MASQ before deleting a port from the multicast group. The range is 100 to 32,768 thousands of a second. The default is 1000 (1 second).                                                         |
| <b>Step 7</b>  | <b>ipv6 mld snooping vlan</b> <i>vlan-id</i><br><b>last-listener-query-interval</b> <i>interval</i><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping vlan 1 last-listener-query-interval 2000</code> | (Optional) Sets the last-listener query interval on a VLAN basis. This value overrides the value configured globally. The range is 0 to 32,768 thousands of a second. The default is 0. When set to 0, the global last-listener query interval is used.                             |
| <b>Step 8</b>  | <b>ipv6 mld snooping tcn query solicit</b><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping tcn query solicit</code>                                                                                 | (Optional) Enables topology change notification (TCN) solicitation, which means that VLANs flood all IPv6 multicast traffic for the configured number of queries before sending multicast data to only those ports requesting to receive it. The default is for TCN to be disabled. |
| <b>Step 9</b>  | <b>ipv6 mld snooping tcn flood query count</b> <i>count</i><br><b>Example:</b><br>Device(config)# <code>ipv6 mld snooping tcn flood query count 5</code>                                                          | (Optional) When TCN is enabled, specifies the number of TCN queries to be sent. The range is from 1 to 10; the default is 2.                                                                                                                                                        |
| <b>Step 10</b> | <b>end</b>                                                                                                                                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                    |
| <b>Step 11</b> | <b>show ipv6 mld snooping querier</b> [ <i>vlan</i> <i>vlan-id</i> ]<br><b>Example:</b><br>Device(config)# <code>show ipv6 mld snooping querier vlan 1</code>                                                     | (Optional) Verifies that the MLD snooping querier information for the switch or for the VLAN.                                                                                                                                                                                       |

## Disabling MLD Listener Message Suppression (CLI)

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

Beginning in privileged EXEC mode, follow these steps to disable MLD listener message suppression:

### Procedure

|               | Command or Action                                                                                                                                             | Purpose                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                       | Enter global configuration mode.                              |
| <b>Step 2</b> | <b>no ipv6 mld snooping listener-message-suppression</b><br><b>Example:</b><br>Device(config)# <code>no ipv6 mld snooping listener-message-suppression</code> | Disable MLD message suppression.                              |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                             | Return to privileged EXEC mode.                               |
| <b>Step 4</b> | <b>show ipv6 mld snooping</b><br><b>Example:</b><br>Device# <code>show ipv6 mld snooping</code>                                                               | Verify that IPv6 MLD snooping report suppression is disabled. |

## Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display IPv6 group address multicast entries for a VLAN configured for MLD snooping.

*Table 20: Commands for Displaying MLD Snooping Information*

| Command                                                     | Purpose                                                                                                                                                                                                                                                |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ipv6 mld snooping [ vlan <i>vlan-id</i> ]</code> | Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN.<br><br>(Optional) Enter <b>vlan <i>vlan-id</i></b> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |

| Command                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ipv6 mld snooping mrouter</b><br>[ <b>vlan</b> <i>vlan-id</i> ]                                                 | Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.<br><br>(Optional) Enters <b>vlan</b> <i>vlan-id</i> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.                                                                             |

## Configuration Examples for Configuring MLD Snooping

### Configuring a Static Multicast Group: Example

This example shows how to statically configure an IPv6 multicast group:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 2 static FF12::3 interface gigabitethernet
1/0/1
Device(config)# end
```

### Configuring a Multicast Router Port: Example

This example shows how to add a multicast router port to VLAN 200:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet
```

```
0/2
Device(config)# exit
```

## Enabling MLD Immediate Leave: Example

This example shows how to enable MLD Immediate Leave on VLAN 130:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 130 immediate-leave
Device(config)# exit
```

## Configuring MLD Snooping Queries: Example

This example shows how to set the MLD snooping global robustness variable to 3:

```
Device# configure terminal
Device(config)# ipv6 mld snooping robustness-variable 3
Device(config)# exit
```

This example shows how to set the MLD snooping last-listener query count for a VLAN to 3:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 200 last-listener-query-count 3
Device(config)# exit
```

This example shows how to set the MLD snooping last-listener query interval (maximum response time) to 2000 (2 seconds):

```
Device# configure terminal
Device(config)# ipv6 mld snooping last-listener-query-interval 2000
Device(config)# exit
```

# CHAPTER 13

## Configuring IPv6 Unicast Routing

- [Information About Configuring IPv6 Unicast Routing, on page 159](#)
- [Configuring DHCP for IPv6 Address Assignment, on page 186](#)
- [Configuration Examples for IPv6 Unicast Routing, on page 190](#)

### Information About Configuring IPv6 Unicast Routing

This chapter describes how to configure IPv6 unicast routing on the switch.

**Note** To use all IPv6 features in this chapter, the switch or stack master must be running the IP services feature set. Switches running the IP base feature set support IPv6 static routing, RIP for IPv6, and OSPF. Switches running the LAN base feature set support only IPv6 host functionality.

### Understanding IPv6

IPv4 users can move to IPv6 and receive services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For information about how Cisco Systems implements IPv6, go to:

[http://www.cisco.com/en/US/products/ps6553/products\\_ios\\_technology\\_home.html](http://www.cisco.com/en/US/products/ps6553/products_ios_technology_home.html)

For information about IPv6 and other features in this chapter

- See the *Cisco IOS IPv6 Configuration Library*.
- Use the Search field on Cisco.com to locate the Cisco IOS software documentation. For example, if you want information about static routes, you can enter *Implementing Static Routes for IPv6* in the search field to learn about static routes.

### IPv6 Addresses

The switch supports only IPv6 unicast addresses. It does not support site-local unicast addresses, or anycast addresses.

The IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons in the format: n:n:n:n:n:n:n:n. This is an example of an IPv6 address:

```
2031:0000:130F:0000:0000:09C0:080F:130B
```

For easier implementation, leading zeros in each field are optional. This is the same address without leading zeros:

```
2031:0:130F:0:0:9C0:80F:130B
```

You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only once in each address:

```
2031:0:130F::09C0:080F:130B
```

For more information about IPv6 address formats, address types, and the IPv6 packet header, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

In the “Information About Implementing Basic Connectivity for IPv6” chapter, these sections apply to the switch:

- IPv6 Address Formats
- IPv6 Address Type: Unicast
- IPv6 Address Type: Multicast
- IPv6 Address Output Display
- Simplified IPv6 Packet Header

## Supported IPv6 Unicast Routing Features

These sections describe the IPv6 protocol features supported by the switch:

The switch provides IPv6 routing capability over Routing Information Protocol (RIP) for IPv6, and Open Shortest Path First (OSPF) Version 3 Protocol. It supports up to 16 equal-cost routes and can simultaneously forward IPv4 and IPv6 frames at line rate.

### 128-Bit Wide Unicast Addresses

The switch supports aggregatable global unicast addresses and link-local unicast addresses. It does not support site-local unicast addresses.

- Aggregatable global unicast addresses are IPv6 addresses from the aggregatable global unicast prefix. The address structure enables strict aggregation of routing prefixes and limits the number of routing table entries in the global routing table. These addresses are used on links that are aggregated through organizations and eventually to the Internet service provider.

These addresses are defined by a global routing prefix, a subnet ID, and an interface ID. Current global unicast address allocation uses the range of addresses that start with binary value 001 (2000::/3). Addresses with a prefix of 2000::/3(001) through E000::/3(111) must have 64-bit interface identifiers in the extended unique identifier (EUI)-64 format.

- Link local unicast addresses can be automatically configured on any interface by using the link-local prefix FE80::/10(1111 1110 10) and the interface identifier in the modified EUI format. Link-local addresses are used in the neighbor discovery protocol (NDP) and the stateless autoconfiguration process.

Nodes on a local link use link-local addresses and do not require globally unique addresses to communicate. IPv6 routers do not forward packets with link-local source or destination addresses to other links.

For more information, see the section about IPv6 unicast addresses in the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## DNS for IPv6

IPv6 supports Domain Name System (DNS) record types in the DNS name-to-address and address-to-name lookup processes. The DNS AAAA resource record types support IPv6 addresses and are equivalent to an A address record in IPv4. The switch supports DNS resolution for IPv4 and IPv6.

## Path MTU Discovery for IPv6 Unicast

The switch supports advertising the system maximum transmission unit (MTU) to IPv6 nodes and path MTU discovery. Path MTU discovery allows a host to dynamically discover and adjust to differences in the MTU size of every link along a given data path. In IPv6, if a link along the path is not large enough to accommodate the packet size, the source of the packet handles the fragmentation.

## ICMPv6

The Internet Control Message Protocol (ICMP) in IPv6 generates error messages, such as ICMP destination unreachable messages, to report errors during processing and other diagnostic functions. In IPv6, ICMP packets are also used in the neighbor discovery protocol and path MTU discovery.

## Neighbor Discovery

The switch supports NDP for IPv6, a protocol running on top of ICMPv6, and static neighbor entries for IPv6 stations that do not support NDP. The IPv6 neighbor discovery process uses ICMP messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), to verify the reachability of the neighbor, and to keep track of neighboring routers.

The switch supports ICMPv6 redirect for routes with mask lengths less than 64 bits. ICMP redirect is not supported for host routes or for summarized routes with mask lengths greater than 64 bits.

Neighbor discovery throttling ensures that the switch CPU is not unnecessarily burdened while it is in the process of obtaining the next hop forwarding information to route an IPv6 packet. The switch drops any additional IPv6 packets whose next hop is the same neighbor that the switch is actively trying to resolve. This drop avoids further load on the CPU.

## Default Router Preference

The switch supports IPv6 default router preference (DRP), an extension in router advertisement messages. DRP improves the ability of a host to select an appropriate router, especially when the host is multihomed and the routers are on different links. The switch does not support the Route Information Option in RFC 4191.

An IPv6 host maintains a default router list from which it selects a router for traffic to offlink destinations. The selected router for a destination is then cached in the destination cache. NDP for IPv6 specifies that routers that are reachable or probably reachable are preferred over routers whose reachability is unknown or suspect. For reachable or probably reachable routers, NDP can either select the same router every time or cycle through the router list. By using DRP, you can configure an IPv6 host to prefer one router over another, provided both are reachable or probably reachable.

For more information about DRP for IPv6, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## IPv6 Stateless Autoconfiguration and Duplicate Address Detection

The switch uses stateless autoconfiguration to manage link, subnet, and site addressing changes, such as management of host and mobile IP addresses. A host autonomously configures its own link-local address, and booting nodes send router solicitations to request router advertisements for configuring interfaces.

For more information about autoconfiguration and duplicate address detection, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## IPv6 Applications

The switch has IPv6 support for these applications:

- Ping, traceroute, Telnet, and TFTP
- Secure Shell (SSH) over an IPv6 transport
- HTTP server access over IPv6 transport
- DNS resolver for AAAA over IPv4 transport
- Cisco Discovery Protocol (CDP) support for IPv6 addresses

For more information about managing these applications, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## DHCP for IPv6 Address Assignment

DHCPv6 enables DHCP servers to pass configuration parameters, such as IPv6 network addresses, to IPv6 clients. The address assignment feature manages non-duplicate address assignment in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple prefix pools. Additional options, such as default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface, on multiple interfaces, or the server can automatically find the appropriate pool.

For more information and to configure these features, see the *Cisco IOS IPv6 Configuration Guide*.

This document describes only the DHCPv6 address assignment. For more information about configuring the DHCPv6 client, server, or relay agent functions, see the “Implementing DHCP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Static Routes for IPv6

Static routes are manually configured and define an explicit route between two networking devices. Static routes are useful for smaller networks with only one path to an outside network or to provide security for certain types of traffic in a larger network.

For more information about static routes, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Policy-Based Routing for IPv6

Policy-based routing (PBR) gives you a flexible means of routing packets by allowing you to configure a defined policy for traffic flows, which lessens reliance on routes derived from routing protocols. Therefore, PBR gives you more control over routing by extending and complementing the existing mechanisms provided by routing protocols. PBR allows you to set the IPv6 precedence. For a simple policy, you can use any one of these tasks; for a complex policy, you can use all of them. It also allows you to specify a path for certain traffic, such as priority traffic over a high-cost link.

PBR for IPv6 may be applied to both forwarded and originated IPv6 packets. For forwarded packets, PBR for IPv6 will be implemented as an IPv6 input interface feature, supported in the following forwarding paths:

- Process
- Cisco Express Forwarding (formerly known as CEF)
- Distributed Cisco Express Forwarding

Policies can be based on the IPv6 address, port numbers, protocols, or packet size.

PBR allows you to perform the following tasks:

- Classify traffic based on extended access list criteria. Access lists, then, establish the match criteria.
- Set IPv6 precedence bits, giving the network the ability to enable differentiated classes of service.
- Route packets to specific traffic-engineered paths; you might need to route them to allow a specific quality of service (QoS) through the network.

PBR allows you to classify and mark packets at the edge of the network. PBR marks a packet by setting precedence value. The precedence value can be used directly by devices in the network core to apply the appropriate QoS to a packet, which keeps packet classification at your network edge.

For enabling PBR for IPv6, see the *Enabling Local PBR for IPv6* section.

For enabling IPv6 PBR for an interface, see the *Enabling IPv6 PBR on an Interface* section.

## RIP for IPv6

Routing Information Protocol (RIP) for IPv6 is a distance-vector protocol that uses hop count as a routing metric. It includes support for IPv6 addresses and prefixes and the all-RIP-routers multicast group address FF02::9 as the destination address for RIP update messages.

For more information about RIP for IPv6, see the “Implementing RIP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## OSPF for IPv6

The switch running the IP Base feature set supports Open Shortest Path First (OSPF) for IPv6, a link-state protocol for IP. For more information, see *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring HSRP for IPv6

HSRP provides routing redundancy for routing IPv6 traffic not dependent on the availability of any single router. IPv6 hosts learn of available routers through IPv6 neighbor discovery router advertisement messages. These messages are multicast periodically or are solicited by hosts.

An HSRP IPv6 group has a virtual MAC address that is derived from the HSRP group number and a virtual IPv6 link-local address that is, by default, derived from the HSRP virtual MAC address. Periodic messages are sent for the HSRP virtual IPv6 link-local address when the HSRP group is active. These messages stop after a final one is sent when the group leaves the active state.

---

**Note** When configuring HSRP for IPv6, you must enable HSRP version 2 (HSRPv2) on the interface.

---

## EIGRP IPv6

Switches support the Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6. It is configured on the interfaces on which it runs and does not require a global IPv6 address. Switches running IP Lite only support EIGRPv6 stub routing.

Before running, an instance of EIGRP IPv6 requires an implicit or explicit router ID. An implicit router ID is derived from a local IPv6 address, so any IPv6 node always has an available router ID. However, EIGRP IPv6 might be running in a network with only IPv6 nodes and therefore might not have an available IPv6 router ID.

For more information about EIGRP for IPv6, see the “Implementing EIGRP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### EIGRPv6 Stub Routing

The EIGRPv6 stub routing feature, reduces resource utilization by moving routed traffic closer to the end user.

In a network using EIGRPv6 stub routing, the only allowable route for IPv6 traffic to the user is through a switch that is configured with EIGRPv6 stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRPv6 stub routing, you need to configure the distribution and remote routers to use EIGRPv6 and to configure only the switch as a stub. Only specified routes are propagated from the switch. The switch responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In the figure given below, switch B is configured as an EIGRPv6 stub router. Switches A and C are connected to the rest of the WAN. Switch B advertises connected, static, redistribution, and summary routes to switch A and C. Switch B does not advertise any routes learned from switch A (and the reverse).

**Figure 6: EIGRP Stub Router Configuration**

For more information about EIGRPv6 stub routing, see “Implementing EIGRP for IPv6” section of the *Cisco IOS IP Configuration Guide, Volume 2 of 3: Routing Protocols, Release 12.4*.

## SNMP and Syslog Over IPv6

To support both IPv4 and IPv6, IPv6 network management requires both IPv6 and IPv4 transports. Syslog over IPv6 supports address data types for these transports.

SNMP and syslog over IPv6 provide these features:

- Support for both IPv4 and IPv6
- IPv6 transport for SNMP and to modify the SNMP agent to support traps for an IPv6 host
- SNMP- and syslog-related MIBs to support IPv6 addressing
- Configuration of IPv6 hosts as trap receivers

For support over IPv6, SNMP modifies the existing IP transport mapping to simultaneously support IPv4 and IPv6. These SNMP actions support IPv6 transport management:

- Opens User Datagram Protocol (UDP) SNMP socket with default settings
- Provides a new transport mechanism called `SR_IPV6_TRANSPORT`
- Sends SNMP notifications over IPv6 transport
- Supports SNMP-named access lists for IPv6 transport
- Supports SNMP proxy forwarding using IPv6 transport
- Verifies SNMP Manager feature works with IPv6 transport

For information on SNMP over IPv6, including configuration procedures, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

For information about syslog over IPv6, including configuration procedures, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## HTTP(S) Over IPv6

The HTTP client sends requests to both IPv4 and IPv6 HTTP servers, which respond to requests from both IPv4 and IPv6 HTTP clients. URLs with literal IPv6 addresses must be specified in hexadecimal using 16-bit values between colons.

The accept socket call chooses an IPv4 or IPv6 address family. The accept socket is either an IPv4 or IPv6 socket. The listening socket continues to listen for both IPv4 and IPv6 signals that indicate a connection. The IPv6 listening socket is bound to an IPv6 wildcard address.

The underlying TCP/IP stack supports a dual-stack environment. HTTP relies on the TCP/IP stack and the sockets for processing network-layer interactions.

Basic network connectivity (**ping**) must exist between the client and the server hosts before HTTP connections can be made.

For more information, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Unsupported IPv6 Unicast Routing Features

The switch does not support these IPv6 features:

- IPv6 virtual private network (VPN) routing and forwarding (VRF) table support

- IPv6 packets destined to site-local addresses
- Tunneling protocols, such as IPv4-to-IPv6 or IPv6-to-IPv4
- The switch as a tunnel endpoint supporting IPv4-to-IPv6 or IPv6-to-IPv4 tunneling protocols
- IPv6 unicast reverse-path forwarding
- IPv6 Web Cache Communication Protocol (WCCP)

## IPv6 Feature Limitations

Because IPv6 is implemented in switch hardware, some limitations occur due to the IPv6 compressed addresses in the hardware memory. These hardware limitations result in some loss of functionality and limits some features.

These are feature limitations.

- The switch cannot forward SNAP-encapsulated IPv6 packets in hardware. They are forwarded in software.
- The switch cannot apply QoS classification on source-routed IPv6 packets in hardware.

## IPv6 and Switch Stacks

The switch supports IPv6 forwarding across the stack and IPv6 host functionality on the stack master. The stack master runs the IPv6 unicast routing protocols and computes the routing tables. They receive the tables and create hardware IPv6 routes for forwarding. The stack master also runs all IPv6 applications.

### Note

To route IPv6 packets in a stack, all switches in the stack should be running the IP Base feature set.

If a new switch becomes the stack master, it recomputes the IPv6 routing tables and distributes them to the member switches. While the new stack master is being elected and is resetting, the switch stack does not forward IPv6 packets. The stack MAC address changes, which also changes the IPv6 address. When you specify the stack IPv6 address with an extended unique identifier (EUI) by using the **ipv6 address ipv6-prefix/prefix length eui-64** interface configuration command, the address is based on the interface MAC address. See the [Configuring IPv6 Addressing and Enabling IPv6 Routing \(CLI\), on page 167](#).

If you configure the persistent MAC address feature on the stack and the stack master changes, the stack MAC address does not change for approximately 4 minutes.

These are the functions of IPv6 stack master and members:

- Stack master:
  - runs IPv6 routing protocols
  - generates routing tables
  - distributes routing tables to stack members that use dCEFv6
  - runs IPv6 host functionality and IPv6 applications
- Stack member (must be running the IP services feature set):
  - receives CEFv6 routing tables from the stack master

- programs the routes into hardware

---

**Note** IPv6 packets are routed in hardware across the stack if the packet does not have exceptions (IPv6 Options) and the switches in the stack have not run out of hardware resources.

---

- flushes the CEFv6 tables on master re-election

## Default IPv6 Configuration

*Table 21: Default IPv6 Configuration*

| Feature         | Default Setting                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| SDM template    | Advance desktop. Default is advanced template                                                                                               |
| IPv6 routing    | Disabled globally and on all interfaces                                                                                                     |
| CEFv6 or dCEFv6 | Disabled (IPv4 CEF and dCEF are enabled by default)<br><b>Note</b> When IPv6 routing is enabled, CEFv6 and dCEF6 are automatically enabled. |
| IPv6 addresses  | None configured                                                                                                                             |

## Configuring IPv6 Addressing and Enabling IPv6 Routing (CLI)

This section describes how to assign IPv6 addresses to individual Layer 3 interfaces and to globally forward IPv6 traffic on the switch.

Before configuring IPv6 on the switch, consider these guidelines:

- Not all features discussed in this chapter are supported by the switch. See the [Unsupported IPv6 Unicast Routing Features, on page 165](#).
- In the **ipv6 address** interface configuration command, you must enter the *ipv6-address* and *ipv6-prefix* variables with the address specified in hexadecimal using 16-bit values between colons. The *prefix-length* variable (preceded by a slash [/]) is a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

To forward IPv6 traffic on an interface, you must configure a global IPv6 address on that interface. Configuring an IPv6 address on an interface automatically configures a link-local address and activates IPv6 for the interface. The configured interface automatically joins these required multicast groups for that link:

- solicited-node multicast group FF02:0:0:0:1:ff00::/104 for each unicast address assigned to the interface (this address is used in the neighbor discovery process.)
- all-nodes link-local multicast group FF02::1

- all-routers link-local multicast group FF02::2

To remove an IPv6 address from an interface, use the **no ipv6 address** *ipv6-prefix/prefix length eui-64* or **no ipv6 address** *ipv6-address link-local* interface configuration command. To remove all manually configured IPv6 addresses from an interface, use the **no ipv6 address** interface configuration command without arguments. To disable IPv6 processing on an interface that has not been explicitly configured with an IPv6 address, use the **no ipv6 enable** interface configuration command. To globally disable IPv6 routing, use the **no ipv6 unicast-routing** global configuration command.

For more information about configuring IPv6 routing, see the “Implementing Addressing and Basic Connectivity for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

Beginning in privileged EXEC mode, follow these steps to assign an IPv6 address to a Layer 3 interface and enable IPv6 routing:

### Procedure

|               | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 2</b> | <b>sdm prefer dual-ipv4-and-ipv6 { advanced   vlan }</b><br><b>Example:</b><br>Device(config)# <code>sdm prefer dual-ipv4-and-ipv6 default</code> | Selects an SDM template that supports IPv4 and IPv6. <ul style="list-style-type: none"> <li>• <b>advanced</b>—Sets the switch to the default template to balance system resources.</li> <li>• <b>vlan</b>—Maximizes VLAN configuration on the switch with no routing supported in hardware.</li> </ul> <b>Note</b> Advanced is available at all license levels. VLAN template is available only in LAN Base license. |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>reload</b><br><b>Example:</b><br>Device# <code>reload</code>                                                                                   | Reloads the operating system.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>configure terminal</b><br><b>Example:</b>                                                                                                      | Enters global configuration mode after the switch reloads.                                                                                                                                                                                                                                                                                                                                                           |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                | Device# <b>configure terminal</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b>  | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Enters interface configuration mode, and specifies the Layer 3 interface to configure. The interface can be a physical interface, a switch virtual interface (SVI), or a Layer 3 EtherChannel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 7</b>  | <b>no switchport</b><br><b>Example:</b><br>Device(config-if)# <b>no switchport</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Removes the interface from Layer 2 configuration mode (if it is a physical interface).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 8</b>  | Use one of the following: <ul style="list-style-type: none"> <li>• <b>ipv6 address</b> <i>ipv6-prefix/prefix length eui-64</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address/prefix length</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address link-local</i></li> <li>• <b>ipv6 enable</b></li> <li>• <b>ipv6 address</b> <i>WORD</i></li> <li>• <b>ipv6 address</b> <i>autoconfig</i></li> <li>• <b>ipv6 address</b> <i>dhcp</i></li> </ul> <b>Example:</b><br>Device(config-if)# <b>ipv6 address</b><br>2001:0DB8:c18:1::/64 <b>eui 64</b><br><br>Device(config-if)# <b>ipv6 address</b><br>2001:0DB8:c18:1::/64<br><br>Device(config-if)# <b>ipv6 address</b> 2001:0DB8:c18:1::<br><b>link-local</b><br><br>Device(config-if)# <b>ipv6 enable</b> | <ul style="list-style-type: none"> <li>• Specifies a global IPv6 address with an extended unique identifier (EUI) in the low-order 64 bits of the IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address. This enables IPv6 processing on the interface.</li> <li>• Manually configures an IPv6 address on the interface.</li> <li>• Specifies a link-local address on the interface to be used instead of the link-local address that is automatically configured when IPv6 is enabled on the interface. This command enables IPv6 processing on the interface.</li> <li>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</li> </ul> |
| <b>Step 9</b>  | <b>exit</b><br><b>Example:</b><br>Device(config-if)# <b>exit</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 10</b> | <b>ip routing</b><br><b>Example:</b><br>Device(config)# <b>ip routing</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Enables IP routing on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                | Command or Action                                                                                                             | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 11</b> | <b>ipv6 unicast-routing</b><br><b>Example:</b><br>Device(config)# <b>ipv6 unicast-routing</b>                                 | Enables forwarding of IPv6 unicast data packets.         |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                   | Returns to privileged EXEC mode.                         |
| <b>Step 13</b> | <b>show ipv6 interface <i>interface-id</i></b><br><b>Example:</b><br>Device# <b>show ipv6 interface gigabitethernet 1/0/1</b> | Verifies your entries.                                   |
| <b>Step 14</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>             | (Optional) Saves your entries in the configuration file. |

## Configuring IPv4 and IPv6 Protocol Stacks (CLI)

Beginning in privileged EXEC mode, follow these steps to configure a Layer 3 interface to support both IPv4 and IPv6 and to enable IPv6 routing.

### Note

To disable IPv6 processing on an interface that has not been configured with an IPv6 address, use the **no ipv6 enable** interface configuration command.

### SUMMARY STEPS

1. **configure terminal**
2. **ip routing**
3. **ipv6 unicast-routing**
4. **interface *interface-id***
5. **no switchport**
6. **ip address *ip-address mask* [secondary]**
7. Use one of the following:
  - **ipv6 address *ipv6-prefix/prefix length eui-64***
  - **ipv6 address *ipv6-address/prefix length***
  - **ipv6 address *ipv6-address link-local***

- `ipv6 enable`
  - `ipv6 address WORD`
  - `ipv6 address autoconfig`
  - `ipv6 address dhcp`
8. `end`
  9. Use one of the following:
    - `show interface interface-id`
    - `show ip interface interface-id`
    - `show ipv6 interface interface-id`
  10. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                | Purpose                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Switch# <code>configure terminal</code>                          | Enters global configuration mode.                                                      |
| <b>Step 2</b> | <b>ip routing</b><br><b>Example:</b><br>Switch(config)# <code>ip routing</code>                                  | Enables routing on the switch.                                                         |
| <b>Step 3</b> | <b>ipv6 unicast-routing</b><br><b>Example:</b><br>Switch(config)# <code>ipv6 unicast-routing</code>              | Enables forwarding of IPv6 data packets on the switch.                                 |
| <b>Step 4</b> | <b>interface interface-id</b><br><b>Example:</b><br>Switch(config)# <code>interface gigabitethernet 1/0/1</code> | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| <b>Step 5</b> | <b>no switchport</b><br><b>Example:</b><br>Switch(config-if)# <code>no switchport</code>                         | Removes the interface from Layer 2 configuration mode (if it is a physical interface). |
| <b>Step 6</b> | <b>ip address ip-address mask [secondary]</b><br><b>Example:</b>                                                 | Specifies a primary or secondary IPv4 address for the interface.                       |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                | Switch(config-if)# <b>ip address</b> 10.1.2.3 255.255.255                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b>  | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>ipv6 address</b> <i>ipv6-prefix/prefix length</i> <b>eui-64</b></li> <li>• <b>ipv6 address</b> <i>ipv6-address/prefix length</i></li> <li>• <b>ipv6 address</b> <i>ipv6-address</i> <b>link-local</b></li> <li>• <b>ipv6 enable</b></li> <li>• <b>ipv6 address</b><i>WORD</i></li> <li>• <b>ipv6 address</b><i>autoconfig</i></li> <li>• <b>ipv6 address</b><i>dhcp</i></li> </ul> | <ul style="list-style-type: none"> <li>• Specifies a global IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address.</li> <li>• Specifies a link-local address on the interface to be used instead of the automatically configured link-local address when IPv6 is enabled on the interface.</li> <li>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</li> </ul> <p><b>Note</b> To remove all manually configured IPv6 addresses from an interface, use the <b>no ipv6 address</b> interface configuration command without arguments.</p> |
| <b>Step 8</b>  | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config)# end</pre>                                                                                                                                                                                                                                                                                                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 9</b>  | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show interface</b> <i>interface-id</i></li> <li>• <b>show ip interface</b> <i>interface-id</i></li> <li>• <b>show ipv6 interface</b> <i>interface-id</i></li> </ul>                                                                                                                                                                                                                | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 10</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Switch# copy running-config startup-config</pre>                                                                                                                                                                                                                                                                                                                                   | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring Default Router Preference (CLI)

Router advertisement messages are sent with the default router preference (DRP) configured by the **ipv6 nd router-preference** interface configuration command. If no DRP is configured, RAs are sent with a medium preference.

A DRP is useful when two routers on a link might provide equivalent, but not equal-cost routing, and policy might dictate that hosts should prefer one of the routers.

For more information about configuring DRP for IPv6, see the “Implementing IPv6 Addresses and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

Beginning in privileged EXEC mode, follow these steps to configure a DRP for a router on an interface.

### Procedure

|               | Command or Action                                                                                                                                 | Purpose                                                                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>                                                       | Enters global configuration mode.                                                                              |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br><br>Device(config)# <code>interface gigabitethernet 1/0/1</code>                       | Enters interface configuration mode and identifies the Layer 3 interface on which you want to specify the DRP. |
| <b>Step 3</b> | <b>ipv6 nd router-preference {high   medium   low}</b><br><b>Example:</b><br><br>Device(config-if)# <code>ipv6 nd router-preference medium</code> | Specifies a DRP for the router on the switch interface.                                                        |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <code>end</code>                                                                             | Returns to privileged EXEC mode.                                                                               |
| <b>Step 5</b> | <b>show ipv6 interface</b><br><b>Example:</b><br><br>Device# <code>show ipv6 interface</code>                                                     | Verifies the configuration.                                                                                    |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <code>copy running-config startup-config</code>                       | (Optional) Saves your entries in the configuration file.                                                       |

## Configuring IPv6 ICMP Rate Limiting (CLI)

ICMP rate limiting is enabled by default with a default interval between error messages of 100 milliseconds and a bucket size (maximum number of tokens to be stored in a bucket) of 10.

Beginning in privileged EXEC mode, follow these steps to change the ICMP rate-limiting parameters:

## Procedure

|               | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>ipv6 icmp error-interval interval [bucketsize]</b><br><b>Example:</b><br>Device(config)# <code>ipv6 icmp error-interval 50 20</code> | Configures the interval and bucket size for IPv6 ICMP error messages: <ul style="list-style-type: none"> <li>• <i>interval</i>—The interval (in milliseconds) between tokens being added to the bucket. The range is from 0 to 2147483647 milliseconds.</li> <li>• <i>bucketsize</i>—(Optional) The maximum number of tokens stored in the bucket. The range is from 1 to 200.</li> </ul> |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 4</b> | <b>show ipv6 interface [interface-id]</b><br><b>Example:</b><br>Device# <code>show ipv6 interface gigabitethernet 1/0/1</code>          | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>                 | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                  |

## Configuring CEF and dCEF for IPv6

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology to improve network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. It is less CPU-intensive than fast-switching route-caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. IPv4 CEF and dCEF are enabled by default. IPv6 CEF and dCEF are disabled by default, but automatically enabled when you configure IPv6 routing.

IPv6 CEF and dCEF are automatically disabled when IPv6 routing is unconfigured. IPv6 CEF and dCEF cannot be disabled through configuration. You can verify the IPv6 state by entering the **show ipv6 cef** privileged EXEC command.

To route IPv6 unicast packets, you must first globally configure forwarding of IPv6 unicast packets by using the **ipv6 unicast-routing** global configuration command, and you must configure an IPv6 address and IPv6 processing on an interface by using the **ipv6 address** interface configuration command.

For more information about configuring CEF and dCEF, see *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring Static Routing for IPv6 (CLI)

Before configuring a static IPv6 route, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on at least one Layer 3 interface by configuring an IPv6 address on the interface.

For more information about configuring static IPv6 routing, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <p><b>ipv6 route <i>ipv6-prefix/prefix length</i> {<i>ipv6-address</i>   <i>interface-id</i> [<i>ipv6-address</i>]} [<i>administrative distance</i>]</b></p> <p><b>Example:</b></p> <pre>Device(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130</pre> | <p>Configures a static IPv6 route.</p> <ul style="list-style-type: none"> <li>• <i>ipv6-prefix</i>—The IPv6 network that is the destination of the static route. It can also be a hostname when static host routes are configured.</li> <li>• <i>/prefix length</i>—The length of the IPv6 prefix. A decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.</li> <li>• <i>ipv6-address</i>—The IPv6 address of the next hop that can be used to reach the specified network. The IPv6 address of the next hop need not be directly connected; recursion is done to find the IPv6 address of the directly connected next hop. The address must be in the form documented in RFC 2373, specified in hexadecimal using 16-bit values between colons.</li> <li>• <i>interface-id</i>—Specifies direct static routes from point-to-point and broadcast interfaces. With point-to-point interfaces, there is no need to specify the IPv6 address of the next hop. With broadcast interfaces, you should always specify the IPv6 address of the next hop, or ensure that the specified prefix is assigned to the link, specifying a link-local address as</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>the next hop. You can optionally specify the IPv6 address of the next hop to which packets are sent.</p> <p><b>Note</b> You must specify an <i>interface-id</i> when using a link-local address as the next hop (the link-local next hop must also be an adjacent router).</p> <ul style="list-style-type: none"> <li>• <i>administrative distance</i>—(Optional) An administrative distance. The range is 1 to 254; the default value is 1, which gives static routes precedence over any other type of route except connected routes. To configure a floating static route, use an administrative distance greater than that of the dynamic routing protocol.</li> </ul>                                                                                                                                            |
| <b>Step 3</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                                                                                                                                                                                                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show ipv6 static</b> [ <i>ipv6-address</i>   <i>ipv6-prefix/prefix length</i> ] [<b>interface</b> <i>interface-id</i> ] [<b>detail</b>][<b>recursive</b>] [<b>detail</b>]</li> <li>• <b>show ipv6 route static</b> [<i>updated</i>]</li> </ul> <p><b>Example:</b></p> <pre>Device# show ipv6 static 2001:0DB8::/32 interface gigabitethernet2/0/1</pre> <p>or</p> <pre>Device# show ipv6 route static</pre> | <p>Verifies your entries by displaying the contents of the IPv6 routing table.</p> <ul style="list-style-type: none"> <li>• <b>interface</b> <i>interface-id</i>—(Optional) Displays only those static routes with the specified interface as an egress interface.</li> <li>• <b>recursive</b>—(Optional) Displays only recursive static routes. The <b>recursive</b> keyword is mutually exclusive with the <b>interface</b> keyword, but it can be used with or without the IPv6 prefix included in the command syntax.</li> <li>• <b>detail</b>—(Optional) Displays this additional information: <ul style="list-style-type: none"> <li>• For valid recursive routes, the output path set, and maximum resolution depth.</li> <li>• For invalid routes, the reason why the route is not valid.</li> </ul> </li> </ul> |
| <b>Step 5</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                                                                                                                                                                                                                                                                                                            | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Enabling IPv6 PBR on an Interface

To enable Policy-Based Routing (PBR) for IPv6, you must create a route map that specifies the packet match criteria and desired policy-route action. Then you associate the route map on the required interface. All packets arriving on the specified interface that match the match clauses will be subject to PBR.

In PBR, the **set vrf** command decouples the virtual routing and forwarding (VRF) instance and interface association and allows the selection of a VRF based on access control list (ACL)-based classification using existing PBR or route-map configurations. It provides a single router with multiple routing tables and the ability to select routes based on ACL classification. The router classifies packets based on ACL, selects a routing table, looks up the destination address, and then routes the packet.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **route-map** *map-tag* [**permit** | **deny**] [*sequence-number*]
4. Do one of the following:
  - **match length** *minimum-length maximum-length*
  - **match ipv6 address** {*prefix-list prefix-list-name* | *access-list-name*}
5. Do one of the following:
  - **set ipv6 precedence** *precedence-value*
  - **set ipv6 next-hop** *global-ipv6-address* [*global-ipv6-address...*]
  - **set interface** *type number* [...*type number*]
  - **set ipv6 default next-hop** *global-ipv6-address* [*global-ipv6-address...*]
  - **set default interface** *type number* [...*type number*]
  - **set vrf** *vrf-name*
6. **exit**
7. **interface** *type number*
8. **ipv6 policy route-map** *route-map-name*
9. **end**

### DETAILED STEPS

|        | Command or Action                                                          | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal | Enters global configuration mode.                                                                                  |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Step 3</b> | <p><b>route-map</b> <i>map-tag</i> [<b>permit</b>   <b>deny</b>] [<i>sequence-number</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# route-map rip-to-ospf permit</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing, and enters route-map configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>match length</b> <i>minimum-length maximum-length</i></li> <li>• <b>match ipv6 address</b> {<i>prefix-list prefix-list-name</i>   <i>access-list-name</i>}</li> </ul> <p><b>Example:</b></p> <pre>Device(config-route-map)# match length 3 200</pre> <p><b>Example:</b></p> <pre>Device(config-route-map)# match ipv6 address marketing</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Specifies the match criteria.</p> <ul style="list-style-type: none"> <li>• You can specify any or all of the following: <ul style="list-style-type: none"> <li>• Matches the Level 3 length of the packet.</li> <li>• Matches a specified IPv6 access list.</li> <li>• If you do not specify a <b>match</b> command, the route map applies to all packets.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 5</b> | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>set ipv6 precedence</b> <i>precedence-value</i></li> <li>• <b>set ipv6 next-hop</b> <i>global-ipv6-address</i> [<i>global-ipv6-address...</i>]</li> <li>• <b>set interface</b> <i>type number</i> [<i>...type number</i>]</li> <li>• <b>set ipv6 default next-hop</b> <i>global-ipv6-address</i> [<i>global-ipv6-address...</i>]</li> <li>• <b>set default interface</b> <i>type number</i> [<i>...type number</i>]</li> <li>• <b>set vrf</b> <i>vrf-name</i></li> </ul> <p><b>Example:</b></p> <pre>Device(config-route-map)# set ipv6 precedence 1</pre> <p><b>Example:</b></p> <pre>Device(config-route-map)# set ipv6 next-hop 2001:DB8:2003:1::95</pre> <p><b>Example:</b></p> <pre>Device(config-route-map)# set interface GigabitEthernet 0/0/1</pre> <p><b>Example:</b></p> <pre>Device(config-route-map)# set ipv6 default next-hop 2001:DB8:2003:1::95</pre> <p><b>Example:</b></p> <pre>Device(config-route-map)# set default interface GigabitEthernet 0/0/0</pre> | <p>Specifies the action or actions to take on the packets that match the criteria.</p> <ul style="list-style-type: none"> <li>• You can specify any or all of the following: <ul style="list-style-type: none"> <li>• Sets precedence value in the IPv6 header.</li> <li>• Sets next hop to which to route the packet (the next hop must be adjacent).</li> <li>• Sets output interface for the packet.</li> <li>• Sets next hop to which to route the packet, if there is no explicit route for this destination.</li> <li>• Sets output interface for the packet, if there is no explicit route for this destination.</li> <li>• Sets VRF instance selection within a route map for a policy-based routing VRF selection.</li> </ul> </li> </ul> |

|               | Command or Action                                                                                                             | Purpose                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Device(config-route-map)# set vrf vrfname                                                                  |                                                                                                |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br>Device(config-route-map)# exit                                                              | Exits route-map configuration mode and returns to global configuration mode.                   |
| <b>Step 7</b> | <b>interface</b> <i>type number</i><br><b>Example:</b><br>Device(config)# interface FastEthernet 1/0                          | Specifies an interface type and number, and places the router in interface configuration mode. |
| <b>Step 8</b> | <b>ipv6 policy route-map</b> <i>route-map-name</i><br><b>Example:</b><br>Device(config-if)# ipv6 policy-route-map interactive | Identifies a route map to use for IPv6 PBR on an interface.                                    |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                                       | Exits interface configuration mode and returns to privileged EXEC mode.                        |

## Enabling Local PBR for IPv6

Packets that are generated by the device are not normally policy routed. Perform this task to enable local IPv6 policy-based routing (PBR) for such packets, indicating which route map the device should use.

To enable Local PBR for IPv6, perform this procedure:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 local policy route-map** *route-map-name*
4. **end**

### DETAILED STEPS

|               | Command or Action                                         | Purpose                                                           |
|---------------|-----------------------------------------------------------|-------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode.<br>Enter your password if prompted. |

|               | Command or Action                                                                                                                                      | Purpose                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>                                                            | Enters global configuration mode.                        |
| <b>Step 3</b> | <b>ipv6 local policy route-map</b> <i>route-map-name</i><br><b>Example:</b><br><br>Device(config)# <code>ipv6 local policy route-map pbr-src-90</code> | Configures IPv6 PBR for packets generated by the device. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <code>end</code>                                                                                  | Returns to privileged EXEC mode.                         |

## Configuring RIP for IPv6 (CLI)

Before configuring the switch to run IPv6 RIP, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on any Layer 3 interfaces on which IPv6 RIP is to be enabled.

For more information about configuring RIP routing for IPv6, see the “Implementing RIP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com,

### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                                                                       |
|---------------|------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>                            | Enters global configuration mode.                                                                                                             |
| <b>Step 2</b> | <b>ipv6 router rip</b> <i>name</i><br><b>Example:</b><br><br>Device(config)# <code>ipv6 router rip cisco</code>        | Configures an IPv6 RIP routing process, and enters router configuration mode for the process.                                                 |
| <b>Step 3</b> | <b>maximum-paths</b> <i>number-paths</i><br><b>Example:</b><br><br>Device(config-router)# <code>maximum-paths 6</code> | (Optional) Define the maximum number of equal-cost routes that IPv6 RIP can support. The range is from 1 to 32, and the default is 16 routes. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b>                                                                                         | Returns to global configuration mode.                                                                                                         |

|               | Command or Action                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|               | Device(config-router)# <b>exit</b>                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 5</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> gigabitethernet 1/0/1                                                                                                                                                                                                                 | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>ipv6 rip</b> <i>name</i> <b>enable</b><br><b>Example:</b><br>Device(config-if)# <b>ipv6 rip</b> cisco <b>enable</b>                                                                                                                                                                                                            | Enables the specified IPv6 RIP routing process on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 7</b> | <b>ipv6 rip</b> <i>name</i> <b>default-information</b> { <b>only</b>   <b>originate</b> }<br><b>Example:</b><br>Device(config-if)# <b>ipv6 rip</b> cisco <b>default-information</b> <b>only</b>                                                                                                                                   | (Optional) Originates the IPv6 default route (::/0) into the RIP routing process updates sent from the specified interface.<br><br><b>Note</b> To avoid routing loops after the IPv6 default route (::/0) is originated from any interface, the routing process ignores all default routes received on any interface.<br><br><ul style="list-style-type: none"> <li>• <b>only</b>—Select to originate the default route, but suppress all other routes in the updates sent on this interface.</li> <li>• <b>originate</b>—Select to originate the default route in addition to all other routes in the updates sent on this interface.</li> </ul> |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                                                                                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 9</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>show ipv6 rip</b> [<i>name</i>] [<b>interface</b><i>interface-id</i>] [<b>database</b>] [<b>next-hops</b>]</li> <li>• <b>show ipv6 rip</b></li> </ul> <b>Example:</b><br>Device# <b>show ipv6 rip</b> cisco <b>interface</b> gigabitethernet2/0/1<br><br>or | <ul style="list-style-type: none"> <li>• Displays information about current IPv6 RIP processes.</li> <li>• Displays the current contents of the IPv6 routing table.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                | Command or Action                                                                                                       | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device# <code>show ipv6 rip</code>                                                                                      |                                                          |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring OSPF for IPv6 (CLI)

You can customize OSPF for IPv6 for your network. However, the defaults for OSPF in IPv6 are set to meet the requirements of most customers and features.

Follow these guidelines:

- Be careful when changing the defaults for IPv6 commands. Changing the defaults might adversely affect OSPF for the IPv6 network.
- Before you enable IPv6 OSPF on an interface, you must enable routing by using the **ip routing** global configuration command, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** global configuration command, and enable IPv6 on Layer 3 interfaces on which you are enabling IPv6 OSPF.

For more information about configuring OSPF routing for IPv6, see the “Implementing OSPF for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Procedure

|               | Command or Action                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>ipv6 router ospf process-id</b><br><b>Example:</b><br>Device(config)# <code>ipv6 router ospf 21</code>                                                                                   | Enables OSPF router configuration mode for the process. The process ID is the number assigned administratively when enabling the OSPF for IPv6 routing process. It is locally assigned and can be a positive integer from 1 to 65535.                                                                                                                                                      |
| <b>Step 3</b> | <b>area area-id range {ipv6-prefix/prefix length} [advertise   not-advertise] [cost cost]</b><br><b>Example:</b><br>Device(config)# <code>area .3 range 2001:0DB8::/32 not-advertise</code> | (Optional) Consolidates and summarizes routes at an area boundary. <ul style="list-style-type: none"> <li>• <i>area-id</i>—Identifier of the area about which routes are to be summarized. It can be specified as either a decimal value or as an IPv6 prefix.</li> <li>• <i>ipv6-prefix/prefix length</i>—The destination IPv6 network and a decimal value that shows how many</li> </ul> |

|               | Command or Action                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                                                     | <p>of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark (/) must precede the decimal value.</p> <ul style="list-style-type: none"> <li>• <b>advertise</b>—(Optional) Sets the address range status to advertise and generate a Type 3 summary link-state advertisement (LSA).</li> <li>• <b>not-advertise</b>—(Optional) Sets the address range status to DoNotAdvertise. The Type 3 summary LSA is suppressed, and component networks remain hidden from other networks.</li> <li>• <b>cost cost</b>—(Optional) Sets the metric or cost for this summary route, which is used during OSPF SPF calculation to determine the shortest paths to the destination. The value can be 0 to 16777215.</li> </ul> |
| <b>Step 4</b> | <p><b>maximum paths</b> <i>number-paths</i></p> <p><b>Example:</b></p> <pre>Device(config)# maximum paths 16</pre>                                                                  | (Optional) Defines the maximum number of equal-cost routes to the same destination that IPv6 OSPF should enter in the routing table. The range is from 1 to 32, and the default is 16 paths.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# exit</pre>                                                                                                        | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 6</b> | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet 1/0/1</pre>                                                       | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b> | <p><b>ipv6 ospf</b> <i>process-id</i> <b>area</b> <i>area-id</i> [<b>instance</b> <i>instance-id</i>]</p> <p><b>Example:</b></p> <pre>Device(config-if)# ipv6 ospf 21 area .3</pre> | <p>Enables OSPF for IPv6 on the interface.</p> <ul style="list-style-type: none"> <li>• <b>instance</b> <i>instance-id</i>—(Optional) Instance identifier.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 8</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 9</b> | Use one of the following:                                                                                                                                                           | <ul style="list-style-type: none"> <li>• Displays information about OSPF interfaces.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                        |

## Configuring EIGRP for IPv6

Before configuring the switch to run IPv6 EIGRP, enable routing by entering the **ip routing global configuration** command, enable the forwarding of IPv6 packets by entering the **ipv6 unicast-routing global configuration** command, and enable IPv6 on any Layer 3 interfaces on which you want to enable IPv6 EIGRP.

To set an explicit router ID, use the **show ipv6 eigrp** command to see the configured router IDs, and then use the **router-id** command.

As with EIGRP IPv4, you can use EIGRPv6 to specify your EIGRP IPv6 interfaces and to select a subset of those as passive interfaces. Use the **passive-interface** command to make an interface passive, and then use the **no passive-interface** command on selected interfaces to make them active. EIGRP IPv6 does not need to be configured on a passive interface.

For more configuration procedures, see the “Implementing EIGRP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

## Configuring IPv6 Unicast Reverse Path Forwarding

The unicast Reverse Path Forwarding (unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

- Unicast RPF is supported only in IP services.
- Do not configure Unicast RPF if the switch is in a mixed hardware stack combining more than one switch type.

For detailed IP unicast RPF configuration information, see the *Other Security Features* chapter in the *Cisco IOS Security Configuration Guide, Release 12.4*.

## Displaying IPv6

For complete syntax and usage information on these commands, see the Cisco IOS command reference publications.

**Table 22: Command for Monitoring IPv6**

| Command                                        | Purpose                                                  |
|------------------------------------------------|----------------------------------------------------------|
| <b>show ipv6 access-list</b>                   | Displays a summary of access lists.                      |
| <b>show ipv6 cef</b>                           | Displays Cisco Express Forwarding for IPv6.              |
| <b>show ipv6 interface</b> <i>interface-id</i> | Displays IPv6 interface status and configuration.        |
| <b>show ipv6 mtu</b>                           | Displays IPv6 MTU per destination cache.                 |
| <b>show ipv6 neighbors</b>                     | Displays IPv6 neighbor cache entries.                    |
| <b>show ipv6 ospf</b>                          | Displays IPv6 OSPF information.                          |
| <b>show ipv6 prefix-list</b>                   | Displays a list of IPv6 prefix lists.                    |
| <b>show ipv6 protocols</b>                     | Displays a list of IPv6 routing protocols on the switch. |
| <b>show ipv6 rip</b>                           | Displays IPv6 RIP routing protocol status.               |
| <b>show ipv6 rip</b>                           | Displays IPv6 RIP routing protocol status.               |
| <b>show ipv6 route</b>                         | Displays IPv6 route table entries.                       |
| <b>show ipv6 routers</b>                       | Displays the local IPv6 routers.                         |
| <b>show ipv6 static</b>                        | Displays IPv6 static routes.                             |
| <b>show ipv6 traffic</b>                       | Displays IPv6 traffic statistics.                        |

**Table 23: Command for Displaying EIGRP IPv6 Information**

| Command                                                        | Purpose                                                          |
|----------------------------------------------------------------|------------------------------------------------------------------|
| <b>show ipv6 eigrp</b> [ <i>as-number</i> ] <i>interface</i>   | Displays information about interfaces configured for EIGRP IPv6. |
| <b>show ipv6 eigrp</b> [ <i>as-number</i> ] <i>neighbor</i>    | Displays the neighbors discovered by EIGRP IPv6.                 |
| <b>show ipv6 interface</b> [ <i>as-number</i> ] <i>traffic</i> | Displays the number of EIGRP IPv6 packets sent and received.     |

| Command                                                                                                                                                                          | Purpose                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <code>show ipv6 eigrptopology [as-number   ipv6-address]</code><br><code>[active   all-links   detail-links   pending   summary</code><br><code>  zero-successors   Base]</code> | Displays EIGRP entries in the IPv6 topology table. |

## Configuring DHCP for IPv6 Address Assignment

This section describes only the DHCPv6 address assignment. For more information about configuring the DHCPv6 client, server, or relay agent functions, see the “Implementing DHCP for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### Default DHCPv6 Address Assignment Configuration

By default, no DHCPv6 features are configured on the switch.

### DHCPv6 Address Assignment Configuration Guidelines

When configuring DHCPv6 address assignment, consider these guidelines:

- In the procedures, the specified interface must be one of these Layer 3 interfaces:
  - DHCPv6 IPv6 routing must be enabled on a Layer 3 interface.
  - SVI: a VLAN interface created by using the **interface vlan** *vlan\_id* command.
  - EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the **interface port-channel** *port-channel-number* command.
- The switch can act as a DHCPv6 client, server, or relay agent. The DHCPv6 client, server, and relay function are mutually exclusive on an interface.
- The DHCPv6 client, server, or relay agent runs only on the master switch. When there is a stack master re-election, the new master switch retains the DHCPv6 configuration. However, the local RAM copy of the DHCP server database lease information is not retained.

### Enabling DHCPv6 Server Function (CLI)

Use the **no** form of the DHCP pool configuration mode commands to change the DHCPv6 pool characteristics. To disable the DHCPv6 server function on an interface, use the **no ipv6 dhcp server** interface configuration command.

Beginning in privileged EXEC mode, follow these steps to enable the DHCPv6 server function on an interface.

## Procedure

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>ipv6 dhcp pool <i>poolname</i></b><br><b>Example:</b><br>Device(config)# <b>ipv6 dhcp pool 7</b>                                                                                              | Enters DHCP pool configuration mode, and define the name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).                                                                                                                                                                                               |
| <b>Step 3</b> | <b>address prefix <i>IPv6-prefix</i> {lifetime} {<i>tl tl</i>   infinite}</b><br><b>Example:</b><br>Device(config-dhcpv6)# <b>address prefix 2001:1000::0/64 lifetime 3600</b>                   | (Optional) Specifies an address prefix for address assignment.<br><br>This address must be in hexadecimal, using 16-bit values between colons.<br><br><b>lifetime <i>tl tl</i></b> —Specifies a time interval (in seconds) that an IPv6 address prefix remains in the valid state. The range is 5 to 4294967295 seconds. Specify <b>infinite</b> for no time interval. |
| <b>Step 4</b> | <b>link-address <i>IPv6-prefix</i></b><br><b>Example:</b><br>Device(config-dhcpv6)# <b>link-address 2001:1002::0/64</b>                                                                          | (Optional) Specifies a link-address IPv6 prefix.<br><br>When an address on the incoming interface or a link-address in the packet matches the specified IPv6 prefix, the server uses the configuration information pool.<br><br>This address must be in hexadecimal, using 16-bit values between colons.                                                               |
| <b>Step 5</b> | <b>vendor-specific <i>vendor-id</i></b><br><b>Example:</b><br>Device(config-dhcpv6)# <b>vendor-specific 9</b>                                                                                    | (Optional) Enters vendor-specific configuration mode and specifies a vendor-specific identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295.                                                                                                                                                                    |
| <b>Step 6</b> | <b>suboption number {address <i>IPv6-address</i>   ascii <i>ASCII-string</i>   hex <i>hex-string</i>}</b><br><b>Example:</b><br>Device(config-dhcpv6-vs)# <b>suboption 1 address 1000:235D::</b> | (Optional) Enters a vendor-specific suboption number. The range is 1 to 65535. Enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.                                                                                                                                                                                              |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b>                                                                                                                                                                   | Returns to DHCP pool configuration mode.                                                                                                                                                                                                                                                                                                                               |

|                | Command or Action                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device (config-dhcpv6-vs) # <b>exit</b>                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br>Device (config-dhcpv6) # <b>exit</b>                                                                                                                                                | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 9</b>  | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device (config) # <b>interface</b> gigabitethernet 1/0/1                                                                                                   | Enters interface configuration mode, and specifies the interface to configure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 10</b> | <b>ipv6 dhcp server</b> [ <i>poolname</i>   <b>automatic</b> ] [ <b>rapid-commit</b> ] [ <b>preference value</b> ] [ <b>allow-hint</b> ]<br><b>Example:</b><br>Device (config-if) # <b>ipv6 dhcp server automatic</b> | Enables DHCPv6 server function on an interface. <ul style="list-style-type: none"> <li>• <b>poolname</b>—(Optional) User-defined name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).</li> <li>• <b>automatic</b>—(Optional) Enables the system to automatically determine which pool to use when allocating addresses for a client.</li> <li>• <b>rapid-commit</b>—(Optional) Allows two-message exchange method.</li> <li>• <b>preference value</b>—(Optional) Configures the preference value carried in the preference option in the advertise message sent by the server. The range is from 0 to 255. The preference value default is 0.</li> <li>• <b>allow-hint</b>—(Optional) Specifies whether the server should consider client suggestions in the SOLICIT message. By default, the server ignores client hints.</li> </ul> |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Device (config) # <b>end</b>                                                                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 12</b> | Do one of the following: <ul style="list-style-type: none"> <li>• <b>show ipv6 dhcp pool</b></li> <li>• <b>show ipv6 dhcp interface</b></li> </ul> <b>Example:</b><br>Device# <b>show ipv6 dhcp pool</b><br>or        | <ul style="list-style-type: none"> <li>• Verifies DHCPv6 pool configuration.</li> <li>• Verifies that the DHCPv6 server function is enabled on an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                | Command or Action                                                                                                       | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device# <code>show ipv6 dhcp interface</code>                                                                           |                                                          |
| <b>Step 13</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Enabling DHCPv6 Client Function (CLI)

This task explains how to enable the DHCPv6 client on an interface.

### Procedure

|               | Command or Action                                                                                                                                | Purpose                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                          | Enters global configuration mode.                                                                                                                                     |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet 1/0/1</code>                          | Enters interface configuration mode, and specifies the interface to configure.                                                                                        |
| <b>Step 3</b> | <b>ipv6 address dhcp [rapid-commit]</b><br><b>Example:</b><br>Device(config-if)# <code>ipv6 address dhcp rapid-commit</code>                     | Enables the interface to acquire an IPv6 address from the DHCPv6 server.<br><b>rapid-commit</b> —(Optional) Allow two-message exchange method for address assignment. |
| <b>Step 4</b> | <b>ipv6 dhcp client request [vendor-specific]</b><br><b>Example:</b><br>Device(config-if)# <code>ipv6 dhcp client request vendor-specific</code> | (Optional) Enables the interface to request the vendor-specific option.                                                                                               |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                | Returns to privileged EXEC mode.                                                                                                                                      |

|               | Command or Action                                                                                     | Purpose                                                     |
|---------------|-------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <b>Step 6</b> | <b>show ipv6 dhcp interface</b><br><br><b>Example:</b><br><br>Device# <b>show ipv6 dhcp interface</b> | Verifies that the DHCPv6 client is enabled on an interface. |

## Configuration Examples for IPv6 Unicast Routing

### Configuring IPv6 Addressing and Enabling IPv6 Routing: Example

This example shows how to enable IPv6 with both a link-local address and a global address based on the IPv6 prefix 2001:0DB8:c18:1::/64. The EUI-64 interface ID is used in the low-order 64 bits of both addresses. Output from the **show ipv6 interface EXEC** command is included to show how the interface ID (20B:46FF:FE2F:D940) is appended to the link-local prefix FE80::/64 of the interface.

```
Device(config)# ipv6 unicast-routing
Device(config)# interface gigabitethernet1/0/11
Device(config-if)# no switchport
Device(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Device(config-if)# end
Device# show ipv6 interface gigabitethernet1/0/11
GigabitEthernet1/0/11 is up, line protocol is up
 IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
 Global unicast address(es):
 2001:0DB8:c18:1:20B:46FF:FE2F:D940, subnet is 2001:0DB8:c18:1::/64 [EUI]
 Joined group address(es):
 FF02::1
 FF02::2
 FF02::1:FF2F:D940
 MTU is 1500 bytes
 ICMP error messages limited to one every 100 milliseconds
 ICMP redirects are enabled
 ND DAD is enabled, number of DAD attempts: 1
 ND reachable time is 30000 milliseconds
 ND advertised reachable time is 0 milliseconds
 ND advertised retransmit interval is 0 milliseconds
 ND router advertisements are sent every 200 seconds
 ND router advertisements live for 1800 seconds
 Hosts use stateless autoconfig for addresses.
```

### Configuring Default Router Preference: Example

This example shows how to configure a DRP of *high* for the router on an interface.

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 nd router-preference high
Device(config-if)# end
```

## Configuring IPv4 and IPv6 Protocol Stacks: Example

This example shows how to enable IPv4 and IPv6 routing on an interface.

```
Device(config)# ip routing
Device(config)# ipv6 unicast-routing
Device(config)# interface fastethernet1/0/11
Device(config-if)# no switchport
Device(config-if)# ip address 192.168.99.1 255.255.255.0
Device(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Device(config-if)# end
```

## Enabling DHCPv6 Server Function: Example

This example shows how to configure a pool called *engineering* with an IPv6 address prefix:

```
Device# configure terminal
Device(config)# ipv6 dhcp pool engineering
Device(config-dhcpv6)# address prefix 2001:1000::0/64
Device(config-dhcpv6)# end
```

This example shows how to configure a pool called *testgroup* with three link-addresses and an IPv6 address prefix:

```
Device# configure terminal
Device(config)# ipv6 dhcp pool testgroup
Device(config-dhcpv6)# link-address 2001:1001::0/64
Device(config-dhcpv6)# link-address 2001:1002::0/64
Device(config-dhcpv6)# link-address 2001:2000::0/48
Device(config-dhcpv6)# address prefix 2001:1003::0/64
Device(config-dhcpv6)# end
```

This example shows how to configure a pool called *350* with vendor-specific options:

```
Device# configure terminal
Device(config)# ipv6 dhcp pool 350
Device(config-dhcpv6)# address prefix 2001:1005::0/48
Device(config-dhcpv6)# vendor-specific 9
Device(config-dhcpv6-vs)# suboption 1 address 1000:235D::1
Device(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone"
Device(config-dhcpv6-vs)# end
```

## Enabling DHCPv6 Client Function: Example

This example shows how to acquire an IPv6 address and to enable the rapid-commit option:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ipv6 address dhcp rapid-commit
```

## Configuring IPv6 ICMP Rate Limiting: Example

This example shows how to configure an IPv6 ICMP error message interval of 50 milliseconds and a bucket size of 20 tokens.

```
Device(config)#ipv6 icmp error-interval 50 20
```

## Configuring Static Routing for IPv6: Example

This example shows how to configure a floating static route to an interface with an administrative distance of 130:

```
Device(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130
```

## Example: Enabling PBR on an Interface

In the following example, a route map named pbr-dest-1 is created and configured, specifying packet match criteria and desired policy-route action. PBR is then enabled on GigabitEthernet interface 0/0/1.

```
ipv6 access-list match-dest-1
 permit ipv6 any 2001:DB8:2001:1760::/32
route-map pbr-dest-1 permit 10
 match ipv6 address match-dest-1
 set interface GigabitEthernet 0/0/0
interface GigabitEthernet0/0/1
 ipv6 policy-route-map interactive
```

## Example: Enabling Local PBR for IPv6

In the following example, packets with a destination IPv6 address that match the IPv6 address range allowed by access list pbr-src-90 are sent to the device at IPv6 address 2001:DB8:2003:1::95:

```
ipv6 access-list src-90
 permit ipv6 host 2001:DB8:2003::90 2001:DB8:2001:1000::/64
route-map pbr-src-90 permit 10
 match ipv6 address src-90
 set ipv6 next-hop 2001:DB8:2003:1::95
ipv6 local policy route-map pbr-src-90
```

## Configuring RIP for IPv6: Example

This example shows how to enable the RIP routing process *cisco* with a maximum of eight equal-cost routes and to enable it on an interface:

```
Device(config)# ipv6 router rip cisco
Device(config-router)# maximum-paths 8
Device(config)# exit
Device(config)# interface gigabitethernet2/0/11
```

```
Device(config-if)# ipv6 rip cisco enable
```

## Displaying IPv6: Example

This is an example of the output from the **show ipv6 interface** privileged EXEC command:

```
Device# show ipv6 interface
Vlan1 is up, line protocol is up
 IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
 Global unicast address(es):
 3FFE:C000:0:1:20B:46FF:FE2F:D940, subnet is 3FFE:C000:0:1::/64 [EUI]
 Joined group address(es):
 FF02::1
 FF02::2
 FF02::1:FF2F:D940
 MTU is 1500 bytes
 ICMP error messages limited to one every 100 milliseconds
 ICMP redirects are enabled
 ND DAD is enabled, number of DAD attempts: 1
 ND reachable time is 30000 milliseconds
 ND advertised reachable time is 0 milliseconds
 ND advertised retransmit interval is 0 milliseconds
 ND router advertisements are sent every 200 seconds
 ND router advertisements live for 1800 seconds
<output truncated>
```

## CHAPTER 14

# Implementing IPv6 Multicast

- [Finding Feature Information, on page 195](#)
- [Information About Implementing IPv6 Multicast Routing, on page 195](#)
- [Implementing IPv6 Multicast, on page 202](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Implementing IPv6 Multicast Routing

This chapter describes how to implement IPv6 multicast routing on the switch.

Traditional IP communication allows a host to send packets to a single host (unicast transmission) or to all hosts (broadcast transmission). IPv6 multicast provides a third scheme, allowing a host to send a single data stream to a subset of all hosts (group transmission) simultaneously.

## IPv6 Multicast Overview

An IPv6 multicast group is an arbitrary group of receivers that want to receive a particular data stream. This group has no physical or geographical boundaries--receivers can be located anywhere on the Internet or in any private network. Receivers that are interested in receiving data flowing to a particular group must join the group by signaling their local switch. This signaling is achieved with the MLD protocol.

Switches use the MLD protocol to learn whether members of a group are present on their directly attached subnets. Hosts join multicast groups by sending MLD report messages. The network then delivers data to a potentially unlimited number of receivers, using only one copy of the multicast data on each subnet. IPv6 hosts that wish to receive the traffic are known as group members.

Packets delivered to group members are identified by a single multicast group address. Multicast packets are delivered to a group using best-effort reliability, just like IPv6 unicast packets.

The multicast environment consists of senders and receivers. Any host, regardless of whether it is a member of a group, can send to a group. However, only members of a group can listen to and receive the message.

A multicast address is chosen for the receivers in a multicast group. Senders use that address as the destination address of a datagram to reach all members of the group.

Membership in a multicast group is dynamic; hosts can join and leave at any time. There is no restriction on the location or number of members in a multicast group. A host can be a member of more than one multicast group at a time.

How active a multicast group is, its duration, and its membership can vary from group to group and from time to time. A group that has members may have no activity.

## IPv6 Multicast Routing Implementation

The Cisco IOS software supports the following protocols to implement IPv6 multicast routing:

- MLD is used by IPv6 switches to discover multicast listeners (nodes that want to receive multicast packets destined for specific multicast addresses) on directly attached links. There are two versions of MLD: MLD version 1 is based on version 2 of the Internet Group Management Protocol (IGMP) for IPv4, and MLD version 2 is based on version 3 of the IGMP for IPv4. IPv6 multicast for Cisco IOS software uses both MLD version 2 and MLD version 1. MLD version 2 is fully backward-compatible with MLD version 1 (described in RFC 2710). Hosts that support only MLD version 1 will interoperate with a switch running MLD version 2. Mixed LANs with both MLD version 1 and MLD version 2 hosts are likewise supported.
- PIM-SM is used between switches so that they can track which multicast packets to forward to each other and to their directly connected LANs.
- PIM in Source Specific Multicast (PIM-SSM) is similar to PIM-SM with the additional ability to report interest in receiving packets from specific source addresses (or from all but the specific source addresses) to an IP multicast address.

## IPv6 Multicast Listener Discovery Protocol

To start implementing multicasting in the campus network, users must first define who receives the multicast. The MLD protocol is used by IPv6 switches to discover the presence of multicast listeners (for example, nodes that want to receive multicast packets) on their directly attached links, and to discover specifically which multicast addresses are of interest to those neighboring nodes. It is used for discovering local group and source-specific group membership.

The MLD protocol provides a means to automatically control and limit the flow of multicast traffic throughout your network with the use of special multicast queriers and hosts.

## Multicast Queriers and Hosts

A multicast querier is a network device, such as a switch, that sends query messages to discover which network devices are members of a given multicast group.

A multicast host is a receiver, including switches, that send report messages to inform the querier of a host membership.

A set of queriers and hosts that receive multicast data streams from the same source is called a multicast group. Queriers and hosts use MLD reports to join and leave multicast groups and to begin receiving group traffic.

MLD uses the Internet Control Message Protocol (ICMP) to carry its messages. All MLD messages are link-local with a hop limit of 1, and they all have the switch alert option set. The switch alert option implies an implementation of the hop-by-hop option header.

## MLD Access Group

The MLD access group provides receiver access control in Cisco IOS IPv6 multicast switches. This feature limits the list of groups a receiver can join, and it allows or denies sources used to join SSM channels.

## Explicit Tracking of Receivers

The explicit tracking feature allows a switch to track the behavior of the hosts within its IPv6 network. This feature also enables the fast leave mechanism to be used with MLD version 2 host reports.

## Protocol Independent Multicast

Protocol Independent Multicast (PIM) is used between switches so that they can track which multicast packets to forward to each other and to their directly connected LANs. PIM works independently of the unicast routing protocol to perform send or receive multicast route updates like other protocols. Regardless of which unicast routing protocols are being used in the LAN to populate the unicast routing table, Cisco IOS PIM uses the existing unicast table content to perform the Reverse Path Forwarding (RPF) check instead of building and maintaining its own separate routing table.

You can configure IPv6 multicast to use either PIM-SM or PIM-SSM operation, or you can use both PIM-SM and PIM-SSM together in your network.

## PIM-Sparse Mode

IPv6 multicast provides support for intradomain multicast routing using PIM-SM. PIM-SM uses unicast routing to provide reverse-path information for multicast tree building, but it is not dependent on any particular unicast routing protocol.

PIM-SM is used in a multicast network when relatively few switches are involved in each multicast and these switches do not forward multicast packets for a group, unless there is an explicit request for the traffic. PIM-SM distributes information about active sources by forwarding data packets on the shared tree. PIM-SM initially uses shared trees, which requires the use of an RP.

Requests are accomplished via PIM joins, which are sent hop by hop toward the root node of the tree. The root node of a tree in PIM-SM is the RP in the case of a shared tree or the first-hop switch that is directly connected to the multicast source in the case of a shortest path tree (SPT). The RP keeps track of multicast groups and the hosts that send multicast packets are registered with the RP by that host's first-hop switch.

As a PIM join travels up the tree, switches along the path set up multicast forwarding state so that the requested multicast traffic will be forwarded back down the tree. When multicast traffic is no longer needed, a switch sends a PIM prune up the tree toward the root node to prune (or remove) the unnecessary traffic. As this PIM prune travels hop by hop up the tree, each switch updates its forwarding state appropriately. Ultimately, the forwarding state associated with a multicast group or source is removed.

A multicast data sender sends data destined for a multicast group. The designated switch (DR) of the sender takes those data packets, unicast-encapsulates them, and sends them directly to the RP. The RP receives these encapsulated data packets, de-encapsulates them, and forwards them onto the shared tree. The packets then

follow the (\*, G) multicast tree state in the switches on the RP tree, being replicated wherever the RP tree branches, and eventually reaching all the receivers for that multicast group. The process of encapsulating data packets to the RP is called registering, and the encapsulation packets are called PIM register packets.

## IPv6 BSR: Configure RP Mapping

PIM switches in a domain must be able to map each multicast group to the correct RP address. The BSR protocol for PIM-SM provides a dynamic, adaptive mechanism to distribute group-to-RP mapping information rapidly throughout a domain. With the IPv6 BSR feature, if an RP becomes unreachable, it will be detected and the mapping tables will be modified so that the unreachable RP is no longer used, and the new tables will be rapidly distributed throughout the domain.

Every PIM-SM multicast group needs to be associated with the IP or IPv6 address of an RP. When a new multicast sender starts sending, its local DR will encapsulate these data packets in a PIM register message and send them to the RP for that multicast group. When a new multicast receiver joins, its local DR will send a PIM join message to the RP for that multicast group. When any PIM switch sends a (\*, G) join message, the PIM switch needs to know which is the next switch toward the RP so that G (Group) can send a message to that switch. Also, when a PIM switch is forwarding data packets using (\*, G) state, the PIM switch needs to know which is the correct incoming interface for packets destined for G, because it needs to reject any packets that arrive on other interfaces.

A small set of switches from a domain are configured as candidate bootstrap switches (C-BSRs) and a single BSR is selected for that domain. A set of switches within a domain are also configured as candidate RPs (C-RPs); typically, these switches are the same switches that are configured as C-BSRs. Candidate RPs periodically unicast candidate-RP-advertisement (C-RP-Adv) messages to the BSR of that domain, advertising their willingness to be an RP. A C-RP-Adv message includes the address of the advertising C-RP, and an optional list of group addresses and mask length fields, indicating the group prefixes for which the candidacy is advertised. The BSR then includes a set of these C-RPs, along with their corresponding group prefixes, in bootstrap messages (BSMs) it periodically originates. BSMs are distributed hop-by-hop throughout the domain.

Bidirectional BSR support allows bidirectional RPs to be advertised in C-RP messages and bidirectional ranges in the BSM. All switches in a system must be able to use the bidirectional range in the BSM; otherwise, the bidirectional RP feature will not function.

## PIM-Source Specific Multicast

PIM-SSM is the routing protocol that supports the implementation of SSM and is derived from PIM-SM. However, unlike PIM-SM where data from all multicast sources are sent when there is a PIM join, the SSM feature forwards datagram traffic to receivers from only those multicast sources that the receivers have explicitly joined, thus optimizing bandwidth utilization and denying unwanted Internet broadcast traffic. Further, instead of the use of RP and shared trees, SSM uses information found on source addresses for a multicast group. This information is provided by receivers through the source addresses relayed to the last-hop switches by MLD membership reports, resulting in shortest-path trees directly to the sources.

In SSM, delivery of datagrams is based on (S, G) channels. Traffic for one (S, G) channel consists of datagrams with an IPv6 unicast source address S and the multicast group address G as the IPv6 destination address. Systems will receive this traffic by becoming members of the (S, G) channel. Signaling is not required, but receivers must subscribe or unsubscribe to (S, G) channels to receive or not receive traffic from specific sources.

MLD version 2 is required for SSM to operate. MLD allows the host to provide source information. Before SSM can run with MLD, SSM must be supported in the Cisco IOS IPv6 switch, the host where the application is running, and the application itself.

## Routable Address Hello Option

When an IPv6 interior gateway protocol is used to build the unicast routing table, the procedure to detect the upstream switch address assumes the address of a PIM neighbor is always same as the address of the next-hop switch, as long as they refer to the same switch. However, it may not be the case when a switch has multiple addresses on a link.

Two typical situations can lead to this situation for IPv6. The first situation can occur when the unicast routing table is not built by an IPv6 interior gateway protocol such as multicast BGP. The second situation occurs when the address of an RP shares a subnet prefix with downstream switches (note that the RP switch address has to be domain-wide and therefore cannot be a link-local address).

The routable address hello option allows the PIM protocol to avoid such situations by adding a PIM hello message option that includes all the addresses on the interface on which the PIM hello message is advertised. When a PIM switch finds an upstream switch for some address, the result of RPF calculation is compared with the addresses in this option, in addition to the PIM neighbor's address itself. Because this option includes all the possible addresses of a PIM switch on that link, it always includes the RPF calculation result if it refers to the PIM switch supporting this option.

Because of size restrictions on PIM messages and the requirement that a routable address hello option fits within a single PIM hello message, a limit of 16 addresses can be configured on the interface.

## PIM IPv6 Stub Routing

The PIM stub routing feature reduces resource usage by moving routed traffic closer to the end user.

In a network using PIM stub routing, the only allowable route for IPv6 traffic to the user is through a switch that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IPv6 multicast routing and configure only the switch as a PIM stub router. The switch does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the switch. The switch uplink port cannot be used with SVIs.

You must also configure EIGRP stub routing when configuring PIM stub routing on the switch. For more information, see the [EIGRPv6 Stub Routing, on page 164](#) section.

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM assert and designated router election mechanisms are not supported on the PIM passive interfaces. Only the non-redundant access router topology is supported by the PIM stub feature. By using a non-redundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

In the figure shown below, Switch A routed uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source. See the [Configuring PIM IPv6 Stub Routing, on page 211](#) section for more information.

Figure 7: PIM Stub Router Configuration

## Static Mroutes

IPv6 static mroutes behave much in the same way as IPv4 static mroutes used to influence the RPF check. IPv6 static mroutes share the same database as IPv6 static routes and are implemented by extending static route support for RPF checks. Static mroutes support equal-cost multipath mroutes, and they also support unicast-only static routes.

## MRIB

The Multicast Routing Information Base (MRIB) is a protocol-independent repository of multicast routing entries instantiated by multicast routing protocols (routing clients). Its main function is to provide independence between routing protocols and the Multicast Forwarding Information Base (MFIB). It also acts as a coordination and communication point among its clients.

Routing clients use the services provided by the MRIB to instantiate routing entries and retrieve changes made to routing entries by other clients. Besides routing clients, MRIB also has forwarding clients (MFIB instances) and special clients such as MLD. MFIB retrieves its forwarding entries from MRIB and notifies the MRIB of any events related to packet reception. These notifications can either be explicitly requested by routing clients or spontaneously generated by the MFIB.

Another important function of the MRIB is to allow for the coordination of multiple routing clients in establishing multicast connectivity within the same multicast session. MRIB also allows for the coordination between MLD and routing protocols.

## MFIB

The MFIB is a platform-independent and routing-protocol-independent library for IPv6 software. Its main purpose is to provide a Cisco IOS platform with an interface with which to read the IPv6 multicast forwarding table and notifications when the forwarding table changes. The information provided by the MFIB has clearly defined forwarding semantics and is designed to make it easy for the platform to translate to its specific hardware or software forwarding mechanisms.

When routing or topology changes occur in the network, the IPv6 routing table is updated, and those changes are reflected in the MFIB. The MFIB maintains next-hop address information based on the information in the IPv6 routing table. Because there is a one-to-one correlation between MFIB entries and routing table entries, the MFIB contains all known routes and eliminates the need for route cache maintenance that is associated with switching paths such as fast switching and optimum switching.

## MFIB

**Note** Distributed MFIB has its significance only in a stacked environment where the Master distributes the MFIB information to the other stack members. In the following section the line cards are nothing but the member switches in the stack.

MFIB (MFIB) is used to switch multicast IPv6 packets on distributed platforms. MFIB may also contain platform-specific information on replication across line cards. The basic MFIB routines that implement the core of the forwarding logic are common to all forwarding environments.

MFIB implements the following functions:

- Relays data-driven protocol events generated in the line cards to PIM.
- Provides an MFIB platform application program interface (API) to propagate MFIB changes to platform-specific code responsible for programming the hardware acceleration engine. This API also includes entry points to switch a packet in software (necessary if the packet is triggering a data-driven event) and to upload traffic statistics to the software.

The combination of MFIB and MRIB subsystems also allows the switch to have a "customized" copy of the MFIB database in each line card and to transport MFIB-related platform-specific information from the RP to the line cards.

## IPv6 Multicast Process Switching and Fast Switching

A unified MFIB is used to provide both fast switching and process switching support for PIM-SM and PIM-SSM in IPv6 multicast. In process switching, the IOS daemon must examine, rewrite, and forward each packet. The packet is first received and copied into the system memory. The switch then looks up the Layer 3 network address in the routing table. The Layer 2 frame is then rewritten with the next-hop destination address and sent to the outgoing interface. The IOSd also computes the cyclic redundancy check (CRC). This switching method is the least scalable method for switching IPv6 packets.

IPv6 multicast fast switching allows switches to provide better packet forwarding performance than process switching. Information conventionally stored in a route cache is stored in several data structures for IPv6 multicast switching. The data structures provide optimized lookup for efficient packet forwarding.

In IPv6 multicast forwarding, the first packet is fast-switched if the PIM protocol logic allows it. In IPv6 multicast fast switching, the MAC encapsulation header is precomputed. IPv6 multicast fast switching uses the MFIB to make IPv6 destination prefix-based switching decisions. In addition to the MFIB, IPv6 multicast fast switching uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all MFIB entries.

The adjacency table is populated as adjacencies are discovered. Each time an adjacency entry is created (such as through ARP), a link-layer header for that adjacent node is precomputed and stored in the adjacency table. Once a route is determined, it points to a next hop and corresponding adjacency entry. It is subsequently used for encapsulation during switching of packets.

A route might have several paths to a destination prefix, such as when a switch is configured for simultaneous load balancing and redundancy. For each resolved path, a pointer is added for the adjacency corresponding to the next-hop interface for that path. This mechanism is used for load balancing across several paths.

## Multiprotocol BGP for the IPv6 Multicast Address Family

The multiprotocol BGP for the IPv6 multicast address family feature provides multicast BGP extensions for IPv6 and supports the same features and functionality as IPv4 BGP. IPv6 enhancements to multicast BGP include support for an IPv6 multicast address family and network layer reachability information (NLRI) and next hop (the next switch in the path to the destination) attributes that use IPv6 addresses.

Multicast BGP is an enhanced BGP that allows the deployment of interdomain IPv6 multicast. Multiprotocol BGP carries routing information for multiple network layer protocol address families; for example, IPv6 address family and for IPv6 multicast routes. The IPv6 multicast address family contains routes used for RPF lookup by the IPv6 PIM protocol, and multicast BGP IPv6 provides for interdomain transport of the same. Users must use multiprotocol BGP for IPv6 multicast when using IPv6 multicast with BGP because the unicast BGP learned routes will not be used for IPv6 multicast.

Multicast BGP functionality is provided through a separate address family context. A subsequent address family identifier (SAFI) provides information about the type of the network layer reachability information that is carried in the attribute. Multiprotocol BGP unicast uses SAFI 1 messages, and multiprotocol BGP multicast uses SAFI 2 messages. SAFI 1 messages indicate that the routes are only usable for IP unicast, but not IP multicast. Because of this functionality, BGP routes in the IPv6 unicast RIB must be ignored in the IPv6 multicast RPF lookup.

A separate BGP routing table is maintained to configure incongruent policies and topologies (for example, IPv6 unicast and multicast) by using IPv6 multicast RPF lookup. Multicast RPF lookup is very similar to the IP unicast route lookup.

No MRIB is associated with the IPv6 multicast BGP table. However, IPv6 multicast BGP operates on the unicast IPv6 RIB when needed. Multicast BGP does not insert or update routes into the IPv6 unicast RIB.

## Implementing IPv6 Multicast

### Enabling IPv6 Multicast Routing

Beginning in privileged EXEC mode, follow these steps:

#### Procedure

|               | Command or Action                                                                                      | Purpose                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b>                                                                              | Enter global configuration mode.                                                                                                                   |
| <b>Step 2</b> | <b>ipv6 multicast-routing</b><br><br><b>Example:</b><br>Device (config)# <b>ipv6 multicast-routing</b> | Enables multicast routing on all IPv6-enabled interfaces and enables multicast forwarding for PIM and MLD on all enabled interfaces of the switch. |
| <b>Step 3</b> | <b>copy running-config startup-config</b>                                                              | (Optional) Save your entries in the configuration file.                                                                                            |

# Customizing and Verifying the MLD Protocol

## Customizing and Verifying MLD on an Interface

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|        | Command or Action                                                                                                                                                                                                                                             | Purpose                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b>                                                                                                                                                                                                                                     | Enters global configuration mode.                                                                                                                                  |
| Step 2 | <b>interface</b> <i>type number</i><br><b>Example:</b><br><br>(config)# <b>interface</b> GigabitEthernet 1/0/1                                                                                                                                                | Specifies an interface type and number, and places the switch in interface configuration mode.                                                                     |
| Step 3 | <b>ipv6 mld join-group</b> [ <i>group-address</i> ] [ <b>include</b>   <b>exclude</b> ] { <i>source-address</i>   <b>source-list</b> [ <i>acl</i> ]}<br><b>Example:</b><br><br>(config-if) # <b>ipv6 mld join-group</b> FF04::10                              | Configures MLD reporting for a specified group and source.                                                                                                         |
| Step 4 | <b>ipv6 mld access-group</b> <i>access-list-name</i><br><b>Example:</b><br><br>(config-if) # <b>ipv6 access-list</b> acc-grp-1                                                                                                                                | Allows the user to perform IPv6 multicast receiver access control.                                                                                                 |
| Step 5 | <b>ipv6 mld static-group</b> [ <i>group-address</i> ] [ <b>include</b>   <b>exclude</b> ] { <i>source-address</i>   <b>source-list</b> [ <i>acl</i> ]}<br><b>Example:</b><br><br>(config-if) # <b>ipv6 mld static-group</b> ff04::10<br><b>include</b> 100::1 | Statically forwards traffic for the multicast group onto a specified interface and cause the interface to behave as if a MLD joiner were present on the interface. |
| Step 6 | <b>ipv6 mld query-max-response-time</b> <i>seconds</i><br><b>Example:</b><br><br>(config-if) # <b>ipv6 mld query-max-response-time</b> 20                                                                                                                     | Configures the maximum response time advertised in MLD queries.                                                                                                    |
| Step 7 | <b>ipv6 mld query-timeout</b> <i>seconds</i><br><b>Example:</b><br><br>(config-if) # <b>ipv6 mld query-timeout</b> 130                                                                                                                                        | Configures the timeout value before the switch takes over as the querier for the interface.                                                                        |
| Step 8 | <b>exit</b><br><b>Example:</b>                                                                                                                                                                                                                                | Enter this command twice to exit interface configuration mode and enter privileged EXEC mode.                                                                      |

|                | Command or Action                                                                                                                                                                                                                                             | Purpose                                                                                                    |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
|                | <code>(config-if) # exit</code>                                                                                                                                                                                                                               |                                                                                                            |
| <b>Step 9</b>  | <b>show ipv6 mld groups</b> [ <b>link-local</b> ] [ <i>group-name</i>   <i>group-address</i> ] [ <i>interface-type interface-number</i> ] [ <b>detail</b>   <b>explicit</b> ]<br><b>Example:</b><br><code># show ipv6 mld groups GigabitEthernet 1/0/1</code> | Displays the multicast groups that are directly connected to the switch and that were learned through MLD. |
| <b>Step 10</b> | <b>show ipv6 mld groups summary</b><br><b>Example:</b><br><code># show ipv6 mld groups summary</code>                                                                                                                                                         | Displays the number of (*, G) and (S, G) membership reports present in the MLD cache.                      |
| <b>Step 11</b> | <b>show ipv6 mld interface</b> [ <i>type number</i> ]<br><b>Example:</b><br><code># show ipv6 mld interface GigabitEthernet 1/0/1</code>                                                                                                                      | Displays multicast-related information about an interface.                                                 |
| <b>Step 12</b> | <b>debug ipv6 mld</b> [ <i>group-name</i>   <i>group-address</i>   <i>interface-type</i> ]<br><b>Example:</b><br><code># debug ipv6 mld</code>                                                                                                                | Enables debugging on MLD protocol activity.                                                                |
| <b>Step 13</b> | <b>debug ipv6 mld explicit</b> [ <i>group-name</i>   <i>group-address</i> ]<br><b>Example:</b><br><code># debug ipv6 mld explicit</code>                                                                                                                      | Displays information related to the explicit tracking of hosts.                                            |
| <b>Step 14</b> | <b>copy running-config startup-config</b>                                                                                                                                                                                                                     | (Optional) Save your entries in the configuration file.                                                    |

## Implementing MLD Group Limits

Per-interface and global MLD limits operate independently of each other. Both per-interface and global MLD limits can be configured on the same switch. The number of MLD limits, globally or per interface, is not configured by default; the limits must be configured by the user. A membership report that exceeds either the per-interface or the global state limit is ignored.

### Implementing MLD Group Limits Globally

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 mld** [*vrf vrf-name*] **state-limit** *number*

#### 4. copy running-config startup-config

##### DETAILED STEPS

|        | Command or Action                                                                                                       | Purpose                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device# <b>enable</b>                                                               | Enters global configuration mode.                       |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                       | Enters global configuration mode.                       |
| Step 3 | <b>ipv6 mld [vrf vrf-name] state-limit number</b><br><b>Example:</b><br>Device(config)# <b>ipv6 mld state-limit 300</b> | Limits the number of MLD states globally.               |
| Step 4 | <b>copy running-config startup-config</b>                                                                               | (Optional) Save your entries in the configuration file. |

#### Implementing MLD Group Limits per Interface

##### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ipv6 mld limit number [except]access-list**
5. **copy running-config startup-config**

##### DETAILED STEPS

|        | Command or Action                                                                 | Purpose                           |
|--------|-----------------------------------------------------------------------------------|-----------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device# <b>enable</b>                         | Enters global configuration mode. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                            | Purpose                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>interface type</b> <i>number</i><br><b>Example:</b><br>Device(config) # <b>interface GigabitEthernet 1/0/1</b>                            | Specifies an interface type and number, and places the switch in interface configuration mode. |
| <b>Step 4</b> | <b>ipv6 mld limit</b> <i>number</i> [ <b>except</b> ] <i>access-list</i><br><b>Example:</b><br>Device(config-if) # <b>ipv6 mld limit 100</b> | Limits the number of MLD states on a per-interface basis.                                      |
| <b>Step 5</b> | <b>copy running-config startup-config</b>                                                                                                    | (Optional) Save your entries in the configuration file.                                        |

## Configuring Explicit Tracking of Receivers to Track Host Behavior

The explicit tracking feature allows a switch to track the behavior of the hosts within its IPv6 network and enables the fast leave mechanism to be used with MLD version 2 host reports.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                     | Purpose                                                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b>                                                                                                             | Enter global configuration mode.                                                               |
| <b>Step 2</b> | <b>interface type</b> <i>number</i><br><b>Example:</b><br>(config) # <b>interface GigabitEthernet 1/0/1</b>                           | Specifies an interface type and number, and places the switch in interface configuration mode. |
| <b>Step 3</b> | <b>ipv6 mld explicit-tracking</b> <i>access-list-name</i><br><b>Example:</b><br>(config-if) # <b>ipv6 mld explicit-tracking list1</b> | Enables explicit tracking of hosts.                                                            |
| <b>Step 4</b> | <b>copy running-config startup-config</b>                                                                                             | (Optional) Save your entries in the configuration file.                                        |

## Resetting the MLD Traffic Counters

Beginning in privileged EXEC mode, follow these steps.

### Procedure

|               | Command or Action                                                                   | Purpose                          |
|---------------|-------------------------------------------------------------------------------------|----------------------------------|
| <b>Step 1</b> | <b>clear ipv6 mld traffic</b><br><b>Example:</b><br># <b>clear ipv6 mld traffic</b> | Resets all MLD traffic counters. |

|               | Command or Action                                                                     | Purpose                                                 |
|---------------|---------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Step 2</b> | <b>show ipv6 mld traffic</b><br><b>Example:</b><br><pre># show ipv6 mld traffic</pre> | Displays the MLD traffic counters.                      |
| <b>Step 3</b> | <b>copy running-config startup-config</b>                                             | (Optional) Save your entries in the configuration file. |

## Clearing the MLD Interface Counters

Beginning in privileged EXEC mode, follow these steps.

### Procedure

|               | Command or Action                                                                                                           | Purpose                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Step 1</b> | <b>clear ipv6 mld counters <i>interface-type</i></b><br><b>Example:</b><br><pre># clear ipv6 mld counters Ethernet1/0</pre> | Clears the MLD interface counters.                      |
| <b>Step 2</b> | <b>copy running-config startup-config</b>                                                                                   | (Optional) Save your entries in the configuration file. |

## Configuring PIM

This section explains how to configure PIM.

### Configuring PIM-SM and Displaying PIM-SM Information for a Group Range

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                                                             | Purpose                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b>                                                                                                                                                     | Enter global configuration mode.                                                 |
| <b>Step 2</b> | <b>ipv6 pim rp-address <i>ipv6-address</i>[<i>group-access-list</i>]</b><br><b>Example:</b><br><pre>(config) # ipv6 pim rp-address 2001:DB8::01:800:200E:8C6C acc-grp-1</pre> | Configures the address of a PIM RP for a particular group range.                 |
| <b>Step 3</b> | <b>exit</b><br><b>Example:</b><br><pre>(config) # exit</pre>                                                                                                                  | Exits global configuration mode, and returns the switch to privileged EXEC mode. |

|                | Command or Action                                                                                                                                                                                       | Purpose                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Step 4</b>  | <b>show ipv6 pim interface</b> [state-on] [state-off]<br>[type-number]<br><b>Example:</b><br><br># show ipv6 pim interface                                                                              | Displays information about interfaces configured for PIM.                                               |
| <b>Step 5</b>  | <b>show ipv6 pim group-map</b> [group-name   group-address]<br>  [group-range   group-mask] [info-source {bsr   default<br>  embedded-rp   static}]<br><b>Example:</b><br><br># show ipv6 pim group-map | Displays an IPv6 multicast group mapping table.                                                         |
| <b>Step 6</b>  | <b>show ipv6 pim neighbor</b> [detail] [interface-type<br>interface-number   count]<br><b>Example:</b><br><br># show ipv6 pim neighbor                                                                  | Displays the PIM neighbors discovered by the Cisco IOS software.                                        |
| <b>Step 7</b>  | <b>show ipv6 pim range-list</b> [config] [rp-address   rp-name]<br><b>Example:</b><br><br># show ipv6 pim range-list                                                                                    | Displays information about IPv6 multicast range lists.                                                  |
| <b>Step 8</b>  | <b>show ipv6 pim tunnel</b> [interface-type interface-number]<br><b>Example:</b><br><br># show ipv6 pim tunnel                                                                                          | Displays information about the PIM register encapsulation and de-encapsulation tunnels on an interface. |
| <b>Step 9</b>  | <b>debug ipv6 pim</b> [group-name   group-address   interface<br>interface-type   bsr   group   mvpn   neighbor]<br><b>Example:</b><br><br># debug ipv6 pim                                             | Enables debugging on PIM protocol activity.                                                             |
| <b>Step 10</b> | <b>copy running-config startup-config</b>                                                                                                                                                               | (Optional) Save your entries in the configuration file.                                                 |

## Configuring PIM Options

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action         | Purpose                          |
|---------------|---------------------------|----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b> | Enter global configuration mode. |

|         | Command or Action                                                                                                                                                                               | Purpose                                                                                                  |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Step 2  | <b>ipv6 pim spt-threshold infinity</b> [ <b>group-list</b> <i>access-list-name</i> ]<br><b>Example:</b><br><pre>(config) # ipv6 pim spt-threshold infinity group-list acc-grp-1</pre>           | Configures when a PIM leaf switch joins the SPT for the specified groups.                                |
| Step 3  | <b>ipv6 pim accept-register</b> { <b>list</b> <i>access-list</i>   <b>route-map</b> <i>map-name</i> }<br><b>Example:</b><br><pre>(config) # ipv6 pim accept-register route-map reg-filter</pre> | Accepts or rejects registers at the RP.                                                                  |
| Step 4  | <b>interface</b> <i>type number</i><br><b>Example:</b><br><pre>(config) # interface GigabitEthernet 1/0/1</pre>                                                                                 | Specifies an interface type and number, and places the switch in interface configuration mode.           |
| Step 5  | <b>ipv6 pim dr-priority</b> <i>value</i><br><b>Example:</b><br><pre>(config-if) # ipv6 pim dr-priority 3</pre>                                                                                  | Configures the DR priority on a PIM switch.                                                              |
| Step 6  | <b>ipv6 pim hello-interval</b> <i>seconds</i><br><b>Example:</b><br><pre>(config-if) # ipv6 pim hello-interval 45</pre>                                                                         | Configures the frequency of PIM hello messages on an interface.                                          |
| Step 7  | <b>ipv6 pim join-prune-interval</b> <i>seconds</i><br><b>Example:</b><br><pre>(config-if) # ipv6 pim join-prune-interval 75</pre>                                                               | Configures periodic join and prune announcement intervals for a specified interface.                     |
| Step 8  | <b>exit</b><br><b>Example:</b><br><pre>(config-if) # exit</pre>                                                                                                                                 | Enter this command twice to exit interface configuration mode and enter privileged EXEC mode.            |
| Step 9  | <b>ipv6 pim join-prune statistic</b> [ <i>interface-type</i> ]<br><b>Example:</b><br><pre>(config-if) # show ipv6 pim join-prune statistic</pre>                                                | Displays the average join-prune aggregation for the most recently aggregated packets for each interface. |
| Step 10 | <b>copy running-config startup-config</b>                                                                                                                                                       | (Optional) Save your entries in the configuration file.                                                  |

## Resetting the PIM Traffic Counters

If PIM malfunctions or in order to verify that the expected number of PIM packets are received and sent, the user can clear PIM traffic counters. Once the traffic counters are cleared, the user can enter the `show ipv6 pim traffic` command to verify that PIM is functioning correctly and that PIM packets are being received and sent correctly.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                       | Purpose                                                 |
|---------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Step 1</b> | <b>clear ipv6 pim traffic</b><br><b>Example:</b><br><pre># clear ipv6 pim traffic</pre> | Resets the PIM traffic counters.                        |
| <b>Step 2</b> | <b>show ipv6 pim traffic</b><br><b>Example:</b><br><pre># show ipv6 pim traffic</pre>   | Displays the PIM traffic counters.                      |
| <b>Step 3</b> | <b>copy running-config startup-config</b>                                               | (Optional) Save your entries in the configuration file. |

## Clearing the PIM Topology Table to Reset the MRIB Connection

No configuration is necessary to use the MRIB. However, users may in certain situations want to clear the PIM topology table in order to reset the MRIB connection and verify MRIB information.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                                                                     | Purpose                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Step 1</b> | <b>clear ipv6 pim topology</b> [ <i>group-name</i>   <i>group-address</i> ]<br><b>Example:</b><br><pre># clear ipv6 pim topology FF04::10</pre>                                       | Clears the PIM topology table.                             |
| <b>Step 2</b> | <b>show ipv6 mrib client</b> [ <i>filter</i> ] [ <i>name</i> { <i>client-name</i>   <i>client-name</i> : <i>client-id</i> }]<br><b>Example:</b><br><pre># show ipv6 mrib client</pre> | Displays multicast-related information about an interface. |
| <b>Step 3</b> | <b>show ipv6 mrib route</b> { <i>link-local</i>   <i>summary</i>   [ <i>sourceaddress-or-name</i>   *] [ <i>groupname-or-address</i> [ <i>prefix-length</i> ]]]<br><b>Example:</b>    | Displays the MRIB route information.                       |

|                | Command or Action                                                                                                                                                                                                     | Purpose                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|                | <pre># show ipv6 mrib route</pre>                                                                                                                                                                                     |                                                                                                                       |
| <b>Step 4</b>  | <p><b>show ipv6 pim topology</b> [<i>groupname-or-address</i> [<i>sourceaddress-or-name</i>]   <b>link-local</b>   <b>route-count</b> [<b>detail</b>]]</p> <p><b>Example:</b></p> <pre># show ipv6 pim topology</pre> | Displays PIM topology table information for a specific group or all groups.                                           |
| <b>Step 5</b>  | <p><b>debug ipv6 mrib client</b></p> <p><b>Example:</b></p> <pre># debug ipv6 mrib client</pre>                                                                                                                       | Enables debugging on MRIB client management activity.                                                                 |
| <b>Step 6</b>  | <p><b>debug ipv6 mrib io</b></p> <p><b>Example:</b></p> <pre># debug ipv6 mrib io</pre>                                                                                                                               | Enables debugging on MRIB I/O events.                                                                                 |
| <b>Step 7</b>  | <p><b>debug ipv6 mrib proxy</b></p> <p><b>Example:</b></p> <pre># debug ipv6 mrib proxy</pre>                                                                                                                         | Enables debugging on MRIB proxy activity between the switch processor and line cards on distributed switch platforms. |
| <b>Step 8</b>  | <p><b>debug ipv6 mrib route</b> [<i>group-name</i>   <i>group-address</i>]</p> <p><b>Example:</b></p> <pre># debug ipv6 mrib route</pre>                                                                              | Displays information about MRIB routing entry-related activity.                                                       |
| <b>Step 9</b>  | <p><b>debug ipv6 mrib table</b></p> <p><b>Example:</b></p> <pre># debug ipv6 mrib table</pre>                                                                                                                         | Enables debugging on MRIB table management activity.                                                                  |
| <b>Step 10</b> | <b>copy running-config startup-config</b>                                                                                                                                                                             | (Optional) Save your entries in the configuration file.                                                               |

## Configuring PIM IPv6 Stub Routing

The PIM Stub routing feature supports multicast routing between the distribution layer and the access layer. It supports two types of PIM interfaces, uplink PIM interfaces, and PIM passive interfaces. A routed interface configured with the PIM passive mode does not pass or forward PIM control traffic, it only passes and forwards MLD traffic.

## PIM IPv6 Stub Routing Configuration Guidelines

- Before configuring PIM stub routing, you must have IPv6 multicast routing configured on both the stub router and the central router. You must also have PIM mode (sparse-mode) configured on the uplink interface of the stub router.
- The PIM stub router does not route the transit traffic between the distribution routers. Unicast (EIGRP) stub routing enforces this behavior. You must configure unicast stub routing to assist the PIM stub router behavior. For more information, see the [EIGRPv6 Stub Routing, on page 164](#) section.
- Only directly connected multicast (MLD) receivers and sources are allowed in the Layer 2 access domains. The PIM protocol is not supported in access domains.
- The redundant PIM stub router topology is not supported.

## Default IPv6 PIM Routing Configuration

This table displays the default IPv6 PIM routing configuration for the Device.

**Table 24: Default Multicast Routing Configuration**

| Feature                           | Default Setting             |
|-----------------------------------|-----------------------------|
| Multicast routing                 | Disabled on all interfaces. |
| PIM version                       | Version 2.                  |
| PIM mode                          | No mode is defined.         |
| PIM stub routing                  | None configured.            |
| PIM RP address                    | None configured.            |
| PIM domain border                 | Disabled.                   |
| PIM multicast boundary            | None.                       |
| Candidate BSRs                    | Disabled.                   |
| Candidate RPs                     | Disabled.                   |
| Shortest-path tree threshold rate | 0 kb/s.                     |
| PIM router query message interval | 30 seconds.                 |

## Enabling IPv6 PIM Stub Routing

### Before you begin

PIM stub routing is disabled in IPv6 by default. Beginning in privileged EXEC mode, follow these steps to enable PIM stub routing on an interface.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. `ipv6 multicast pim-passive-enable`
4. `interface interface-id`
5. `ipv6 pim`
6. `ipv6 pim {bsr} | {dr-priority | value} | {hello-interval | seconds} | {join-prune-interval | seconds} | {passive}`
7. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                               | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 3 | <p><code>ipv6 multicast pim-passive-enable</code></p> <p><b>Example:</b></p> <pre>Device(config-if)# ipv6 multicast pim-passive-enable</pre> | Enables IPv6 Multicast PIM routing on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 4 | <p><code>interface interface-id</code></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet 9/0/6</pre>                 | <p>Specifies the interface on which you want to enable PIM stub routing, and enters interface configuration mode.</p> <p>The specified interface must be one of the following:</p> <ul style="list-style-type: none"> <li>• A routed port—A physical port that has been configured as a Layer 3 port by entering the <b>no switchport</b> interface configuration command. You will also need to enable IP PIM sparse mode on the interface, and join the interface as a statically connected member to an MLD static group.</li> <li>• An SVI—A VLAN interface created by using the <b>interface vlan vlan-id</b> global configuration command. You will also need to enable IP PIM sparse mode on the VLAN, join the VLAN as a statically connected member to an MLD static group, and then enable MLD snooping on the VLAN, the MLD static group, and physical interface.</li> </ul> <p>These interfaces must have IPv6 addresses assigned to them.</p> |

|               | Command or Action                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>ipv6 pim</b><br><b>Example:</b><br><pre>Device(config-if)# ipv6 pim</pre>                                                                                                                                                                     | Enables the PIM on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <b>ipv6 pim {bsr}   {dr-priority   value}   {hello-interval   seconds}   {join-prune-interval   seconds}   {passive}</b><br><b>Example:</b><br><pre>Device(config-if)# ipv6 pim bsr dr-priority hello-interval join-prune-interval passive</pre> | Configures the various PIM stub features on the interface.<br>Enter <b>bsr</b> to configure BSR on a PIM switch<br>Enter <b>dr-priority</b> to configure the DR priority on a PIM switch.<br>Enter <b>hello-interval</b> to configure the frequency of PIM hello messages on an interface.<br>Enter <b>join-prune-interval</b> to configure periodic join and prune announcement intervals for a specified interface.<br>Enter <b>passive</b> to configure the PIM in the passive mode. |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config-if)# end</pre>                                                                                                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Monitoring IPv6 PIM Stub Routing

Table 25: PIM Stub Configuration show Commands

| Command                                                                      | Purpose                                                                                |
|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>show ipv6 pim interface</b><br><pre>Device# show ipv6 pim interface</pre> | Displays the PIM stub that is enabled on each interface.                               |
| <b>show ipv6 mld groups</b><br><pre>Device# show ipv6 mld groups</pre>       | Displays the interested clients that have joined the specific multicast source group.  |
| <b>show ipv6 mroute</b><br><pre>Device# show ipv6 mroute</pre>               | Verifies that the multicast stream forwards from the source to the interested clients. |

## Configuring a BSR

The tasks included here are described below.

## Configuring a BSR and Verifying BSR Information

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|        | Command or Action                                                                                                                                                                                                            | Purpose                                                                                        |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Step 1 | <code>configure terminal</code>                                                                                                                                                                                              | Enter global configuration mode.                                                               |
| Step 2 | <code>ipv6 pim bsr candidate bsr<br/>ipv6-address[hash-mask-length] [priority priority-value]</code><br><b>Example:</b><br><br><code>(config) # ipv6 pim bsr candidate bsr<br/>2001:DB8:3000:3000::42 124 priority 10</code> | Configures a switch to be a candidate BSR.                                                     |
| Step 3 | <code>interface type number</code><br><b>Example:</b><br><br><code>(config) # interface GigabitEthernet 1/0/1</code>                                                                                                         | Specifies an interface type and number, and places the switch in interface configuration mode. |
| Step 4 | <code>ipv6 pim bsr border</code><br><b>Example:</b><br><br><code>(config-if) # ipv6 pim bsr border</code>                                                                                                                    | Specifies an interface type and number, and places the switch in interface configuration mode. |
| Step 5 | <code>exit</code><br><b>Example:</b><br><br><code>(config-if) # exit</code>                                                                                                                                                  | Enter this command twice to exit interface configuration mode and enter privileged EXEC mode.  |
| Step 6 | <code>show ipv6 pim bsr {election   rp-cache   candidate-rp}</code><br><b>Example:</b><br><br><code>(config-if) # show ipv6 pim bsr election</code>                                                                          | Displays information related to PIM BSR protocol processing.                                   |
| Step 7 | <code>copy running-config startup-config</code>                                                                                                                                                                              | (Optional) Save your entries in the configuration file.                                        |

## Sending PIM RP Advertisements to the BSR

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|        | Command or Action               | Purpose                          |
|--------|---------------------------------|----------------------------------|
| Step 1 | <code>configure terminal</code> | Enter global configuration mode. |

|               | Command or Action                                                                                                                                                                                                                                                                               | Purpose                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>ipv6 pim bsr candidate rp</b> <i>ipv6-address</i> [ <b>group-list</b> <i>access-list-name</i> ] [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>seconds</i> ]<br><br><b>Example:</b><br><br><pre>(config) # ipv6 pim bsr candidate rp 2001:DB8:3000:3000::42 priority 0</pre> | Sends PIM RP advertisements to the BSR.                                                        |
| <b>Step 3</b> | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br><br><pre>(config) # interface GigabitEthernet 1/0/1</pre>                                                                                                                                                                         | Specifies an interface type and number, and places the switch in interface configuration mode. |
| <b>Step 4</b> | <b>ipv6 pim bsr border</b><br><br><b>Example:</b><br><br><pre>(config-if) # ipv6 pim bsr border</pre>                                                                                                                                                                                           | Configures a border for all BSMs of any scope on a specified interface.                        |
| <b>Step 5</b> | <b>copy running-config startup-config</b>                                                                                                                                                                                                                                                       | (Optional) Save your entries in the configuration file.                                        |

## Configuring BSR for Use Within Scoped Zones

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                    | Purpose                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b>                                                                                                                                                                                                                                                                            | Enter global configuration mode.                                                               |
| <b>Step 2</b> | <b>ipv6 pim bsr candidate rp</b> <i>ipv6-address</i> [ <i>hash-mask-length</i> ] [ <b>priority</b> <i>priority-value</i> ]<br><br><b>Example:</b><br><br><pre>(config) # ipv6 pim bsr candidate bsr 2001:DB8:1:1:4</pre>                                                                             | Configures a switch to be a candidate BSR.                                                     |
| <b>Step 3</b> | <b>ipv6 pim bsr candidate rp</b> <i>ipv6-address</i> [ <b>group-list</b> <i>access-list-name</i> ] [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>seconds</i> ]<br><br><b>Example:</b><br><br><pre>(config) # ipv6 pim bsr candidate rp 2001:DB8:1:1:1 group-list list scope 6</pre> | Configures the candidate RP to send PIM RP advertisements to the BSR.                          |
| <b>Step 4</b> | <b>interface</b> <i>type number</i><br><br><b>Example:</b>                                                                                                                                                                                                                                           | Specifies an interface type and number, and places the switch in interface configuration mode. |

|               | Command or Action                                                                                                                        | Purpose                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
|               | <code>(config-if) # interface GigabitEthernet 1/0/1</code>                                                                               |                                                                         |
| <b>Step 5</b> | <b>ipv6 multicast boundary scope</b> <i>scope-value</i><br><b>Example:</b><br><code>(config-if) # ipv6 multicast boundary scope 6</code> | Configures a multicast boundary on the interface for a specified scope. |
| <b>Step 6</b> | <b>copy running-config startup-config</b>                                                                                                | (Optional) Save your entries in the configuration file.                 |

## Configuring BSR Switches to Announce Scope-to-RP Mappings

IPv6 BSR switches can be statically configured to announce scope-to-RP mappings directly instead of learning them from candidate-RP messages. A user might want to configure a BSR switch to announce scope-to-RP mappings so that an RP that does not support BSR is imported into the BSR. Enabling this feature also allows an RP positioned outside the enterprise's BSR domain to be learned by the known remote RP on the local candidate BSR switch.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                                                                                                                                         | Purpose                                                                              |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b>                                                                                                                                                                                                                                 | Enter global configuration mode.                                                     |
| <b>Step 2</b> | <b>ipv6 pim bsr announced rp</b> <i>ipv6-address</i> [ <b>group-list</b> <i>access-list-name</i> ] [ <b>priority</b> <i>priority-value</i> ]<br><b>Example:</b><br><code>(config)# ipv6 pim bsr announced rp<br/>2001:DB8:3000:3000::42 priority 0</code> | Announces scope-to-RP mappings directly from the BSR for the specified candidate RP. |
| <b>Step 3</b> | <b>copy running-config startup-config</b>                                                                                                                                                                                                                 | (Optional) Save your entries in the configuration file.                              |

## Configuring SSM Mapping

When the SSM mapping feature is enabled, DNS-based SSM mapping is automatically enabled, which means that the switch will look up the source of a multicast MLD version 1 report from a DNS server.

You can use either DNS-based or static SSM mapping, depending on your switch configuration. If you choose to use static SSM mapping, you can configure multiple static SSM mappings. If multiple static SSM mappings are configured, the source addresses of all matching access lists will be used.

**Note** To use DNS-based SSM mapping, the switch needs to find at least one correctly configured DNS server, to which the switch may be directly attached.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                                                   | Purpose                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b>                                                                                                                                           | Enter global configuration mode.                                                 |
| <b>Step 2</b> | <b>ipv6 mld ssm-map enable</b><br><b>Example:</b><br><br>(config) # <b>ipv6 mld ssm-map enable</b>                                                                  | Enables the SSM mapping feature for groups in the configured SSM range.          |
| <b>Step 3</b> | <b>no ipv6 mld ssm-map query dns</b><br><b>Example:</b><br><br>(config) # <b>no ipv6 mld ssm-map query dns</b>                                                      | Disables DNS-based SSM mapping.                                                  |
| <b>Step 4</b> | <b>ipv6 mld ssm-map static <i>access-list source-address</i></b><br><b>Example:</b><br><br>(config-if) # <b>ipv6 mld ssm-map static SSM_MAP_ACL_2 2001:DB8:1::1</b> | Configures static SSM mappings.                                                  |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><br>(config-if) # <b>exit</b>                                                                                                     | Exits global configuration mode, and returns the switch to privileged EXEC mode. |
| <b>Step 6</b> | <b>show ipv6 mld ssm-map [<i>source-address</i>]</b><br><b>Example:</b><br><br>(config-if) # <b>show ipv6 mld ssm-map</b>                                           | Displays SSM mapping information.                                                |
| <b>Step 7</b> | <b>copy running-config startup-config</b>                                                                                                                           | (Optional) Save your entries in the configuration file.                          |

## Configuring Static Mroutes

Static multicast routes (mroutes) in IPv6 can be implemented as an extension of IPv6 static routes. You can configure your switch to use a static route for unicast routing only, to use a static multicast route for multicast RPF selection only, or to use a static route for both unicast routing and multicast RPF selection.

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action         | Purpose                          |
|---------------|---------------------------|----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b> | Enter global configuration mode. |

|        | Command or Action                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p><b>ipv6 route</b> {<i>ipv6-prefix / prefix-length ipv6-address   interface-type interface-number ipv6-address</i>} [<i>administrative-distance</i>] [<i>administrative-multicast-distance   unicast   multicast</i>] [<b>tag tag</b>]</p> <p><b>Example:</b></p> <pre>(config) # ipv6 route 2001:DB8::/64 6::6 100</pre> | Establishes static IPv6 routes. The example shows a static route used for both unicast routing and multicast RPF selection. |
| Step 3 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre># exit</pre>                                                                                                                                                                                                                                                                 | Exits global configuration mode, and returns the switch to privileged EXEC mode.                                            |
| Step 4 | <p><b>show ipv6 mroute</b> [<i>link-local   group-name   group-address [source-address   source-name]</i>] [<b>summary</b>] [<b>count</b>]</p> <p><b>Example:</b></p> <pre># show ipv6 mroute ff07::1</pre>                                                                                                                 | Displays the contents of the IPv6 multicast routing table.                                                                  |
| Step 5 | <p><b>show ipv6 mroute</b> [<i>link-local   group-name   group-address</i>] <b>active</b> [<i>kpbs</i>]</p> <p><b>Example:</b></p> <pre>(config-if) # show ipv6 mroute active</pre>                                                                                                                                         | Displays the active multicast streams on the switch.                                                                        |
| Step 6 | <p><b>show ipv6 rpf</b> [<i>ipv6-prefix</i>]</p> <p><b>Example:</b></p> <pre>(config-if) # show ipv6 rpf 2001::1:1:2</pre>                                                                                                                                                                                                  | Checks RPF information for a given unicast host address and prefix.                                                         |
| Step 7 | <b>copy running-config startup-config</b>                                                                                                                                                                                                                                                                                   | (Optional) Save your entries in the configuration file.                                                                     |

## Using MFIB in IPv6 Multicast

Multicast forwarding is automatically enabled when IPv6 multicast routing is enabled.

### Verifying MFIB Operation in IPv6 Multicast

Beginning in privileged EXEC mode, follow these steps:

#### Procedure

|        | Command or Action                                                                                                                                                                       | Purpose                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| Step 1 | <p><b>show ipv6 mfib</b> [<b>linkscope</b>   <b>verbose</b>   <i>group-address-name   ipv6-prefix / prefix-length   source-address-name   count   interface   status   summary</i>]</p> | Displays the forwarding entries and interfaces in the IPv6 MFIB. |

|               | Command or Action                                                                                                                                                                                                               | Purpose                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br><pre># show ipv6 mfib</pre>                                                                                                                                                                                  |                                                                                           |
| <b>Step 2</b> | <b>show ipv6 mfib</b> [all   linkscope   group-name   group-address [source-name   source-address]] <b>count</b><br><b>Example:</b><br><pre># show ipv6 mfib ff07::1</pre>                                                      | Displays the contents of the IPv6 multicast routing table.                                |
| <b>Step 3</b> | <b>show ipv6 mfib interface</b><br><b>Example:</b><br><pre># show ipv6 mfib interface</pre>                                                                                                                                     | Displays information about IPv6 multicast-enabled interfaces and their forwarding status. |
| <b>Step 4</b> | <b>show ipv6 mfib status</b><br><b>Example:</b><br><pre># show ipv6 mfib status</pre>                                                                                                                                           | Displays general MFIB configuration and operational status.                               |
| <b>Step 5</b> | <b>show ipv6 mfib summary</b><br><b>Example:</b><br><pre># show ipv6 mfib summary</pre>                                                                                                                                         | Displays summary information about the number of IPv6 MFIB entries and interfaces.        |
| <b>Step 6</b> | <b>debug ipv6 mfib</b> [group-name   group-address] [adjacency   db   fs   init   interface   mrib [detail]   nat   pak   platform   ppr   ps   signal   table]<br><b>Example:</b><br><pre># debug ipv6 mfib FF04::10 pak</pre> | Enables debugging output on the IPv6 MFIB.                                                |

## Resetting MFIB Traffic Counters

Beginning in privileged EXEC mode, follow these steps:

### Procedure

|               | Command or Action                                                                                                                                                | Purpose                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <b>Step 1</b> | <b>clear ipv6 mfib counters</b> [group-name   group-address [source-address   source-name]]<br><b>Example:</b><br><pre># clear ipv6 mfib counters FF04::10</pre> | Resets all active MFIB traffic counters. |

## Prerequisites for IPv6 Client Address Learning

Before configuring IPv6 client address learning, configure the wireless clients to support IPv6.

### Related Topics

[Configuring RA Guard Policy \(CLI\)](#), on page 227

## Information About IPv6 Client Address Learning

Client Address Learning is configured on device to learn the wireless client's IPv4 and IPv6 address and clients transition state maintained by the device on an association, re-association, de-authentication and timeout.

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static Configuration

For all of these methods, the IPv6 client always sends neighbor solicitation DAD (Duplicate Address Detection) request to ensure there is no duplicate IP address on the network. The device snoops the client's NDP and DHCPv6 packets to learn about its client IP addresses.

## SLAAC Address Assignment

The most common method for IPv6 client address assignment is Stateless Address Auto-Configuration (SLAAC). SLAAC provides simple plug-and-play connectivity where clients self-assign an address based on the IPv6 prefix. This process is achieved

Stateless Address Auto-Configuration (SLAAC) is configured as follows:

- Host sends a router solicitation message.
- Hosts wait for a Router Advertisement message.
- Hosts take the first 64 bits of the IPv6 prefix from the Router Advertisement message and combine it with the 64 bit EUI-64 address (in the case of ethernet, this is created from the MAC Address) to create a global unicast message. The host also uses the source IP address, in the IP header, of the Router Advertisement message, as its default gateway.
- Duplicate Address Detection is performed by IPv6 clients in order to ensure that random addresses that are picked do not collide with other clients.
- The choice of algorithm is up to the client and is often configurable.

The last 64 bits of the IP v6 address can be learned based on the following 2 algorithms:

- EUI-64 which is based on the MAC address of the interface, or
- Private addresses that are randomly generated.

**Figure 8: SLAAC Address Assignment**

The following Cisco IOS configuration commands from a Cisco-capable IPv6 router are used to enable SLAAC addressing and router advertisements:

```
ipv6 unicast-routing
interface Vlan20
```

```

description IPv6-SLAAC
ip address 192.168.20.1 255.255.255.0
ipv6 address FE80:DB8:0:20::1 linklocal
ipv6 address 2001:DB8:0:20::1/64
ipv6 enable
end

```

## Stateful DHCPv6 Address Assignment

**Figure 9: Stateful DHCPv6 Address Assignment**

The use of DHCPv6 is not required for IPv6 client connectivity if SLAAC is already deployed. There are two modes of operation for DHCPv6 called Stateless and Stateful.

The DHCPv6 Stateless mode is used to provide clients with additional network information that is not available in the router advertisement, but not an IPv6 address as this is already provided by SLAAC. This information can include the DNS domain name, DNS server(s), and other DHCP vendor-specific options. This interface configuration is for a Cisco IOS IPv6 router implementing stateless DHCPv6 with SLAAC enabled:

```

ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateless
ip address 192.168.20.1 255.255.255.0
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPPPOOL
ipv6 address 2001:DB8:0:20::1/64
end

```

The DHCPv6 Stateful option, also known as managed mode, operates similarly to DHCPv4 in that it assigns unique addresses to each client instead of the client generating the last 64 bits of the address as in SLAAC. This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on a local Device:

```

ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20

```

```

description IPv6-DHCP-Stateful
ip address 192.168.20.1 255.255.255.0
ipv6 address 2001:DB8:0:20::1/64
ipv6 nd prefix 2001:DB8:0:20::/64 no-advertise
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPOOL
end

```

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on an external DHCP server:

```

ipv6 unicast-routing
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateful
ip address 192.168.20.1 255.255.255.0
ipv6 address 2001:DB8:0:20::1/64
ipv6 nd prefix 2001:DB8:0:20::/64 no-advertise
ipv6 nd managed-config-flag
ipv6 nd other-config-flag
ipv6 dhcp_relay destination 2001:DB8:0:20::2
end

```

## Static IP Address Assignment

Statically configured address on a client.

## Router Solicitation

A Router Solicitation message is issued by a host controller to facilitate local routers to transmit Router Advertisement from which it can obtain information about local routing or perform Stateless Auto-configuration. Router Advertisements are transmitted periodically and the host prompts with an immediate Router Advertisement using a Router Solicitation such as - when it boots or following a restart operation.

#### Related Topics

- [Configuring IPv6 ND Suppress Policy \(CLI\), on page 233](#)

## Router Advertisement

A Router Advertisement message is issued periodically by a router or in response to a Router Solicitation message from a host. The information contained in these messages is used by hosts to perform Stateless Auto-configuration and to modify its routing table.

## Neighbor Discovery

IPv6 Neighbor Discovery is a set of messages and processes that determine relationships between neighboring nodes. Neighbor Discovery replaces ARP, ICMP Router Discovery, and ICMP Redirect used in IPv4.

IPv6 Neighbor Discovery inspection analyzes neighbor discovery messages in order to build a trusted binding table database, and IPv6 neighbor discovery packets that do not comply are dropped. The neighbor binding table in the switch tracks each IPv6 address and its associated MAC address. Clients are expired from the table according to Neighbor Binding timers.

### Related Topics

[Configuring IPv6 ND Suppress Policy \(CLI\)](#), on page 233

## Neighbor Discovery Suppression

The IPv6 addresses of wireless clients are cached by the device. When the device receives an NS multicast looking for an IPv6 address, and if the target address is known to the device and belongs to one of its clients, the device will reply with an NA message on behalf of the client. The result of this process generates the equivalent of the Address Resolution Protocol (ARP) table of IPv4 but is more efficient - uses generally fewer messages.

---

**Note** The device acts like proxy and respond with NA, only when the **ipv6 nd suppress** command is configured

---

If the device does not have the IPv6 address of a wireless client, the device will not respond with NA and forward the NS packet to the wireless side. To resolve this, an NS Multicast Forwarding knob is provided. If this knob is enabled, the device gets the NS packet for the IPv6 address that it does not have (cache miss) and forwards it to the wireless side. This packet reaches the intended wireless client and the client replies with NA.

This cache miss scenario occurs rarely, and only very few clients which do not implement complete IPv6 stack may not advertise their IPv6 address during NDP.

## RA Guard

IPv6 clients configure IPv6 addresses and populate their router tables based on IPv6 router advertisement (RA) packets. The RA guard feature is similar to the RA guard feature of wired networks. RA guard increases the security of the IPv6 network by dropping the unwanted or rogue RA packets that come from wireless clients. If this feature is not configured, malicious IPv6 wireless clients announce themselves as the router for the network often with high priority, which would take higher precedence over legitimate IPv6 routers.

RA-Guard also examines the incoming RA's and decides whether to switch or block them based solely on information found in the message or in the switch configuration. The information available in the frames received is useful for RA validation:

- Port on which the frame is received
- IPv6 source address

- Prefix list

The following configuration information created on the switch is available to RA-Guard to validate against the information found in the received RA frame:

- Trusted/Untrusted ports for receiving RA-guard messages
- Trusted/Untrusted IPv6 source addresses of RA-sender
- Trusted/Untrusted Prefix list and Prefix ranges
- Router Preference

RA guard occurs at the device. You can configure the device to drop RA messages at the device. All IPv6 RA messages are dropped, which protects other wireless clients and upstream wired network from malicious IPv6 clients.

```
//Create a policy for RA Guard//
ipv6 nd raguard policy raguard-router
trusted-port
device-role router

//Applying the RA Guard Policy on port/interface//
interface tengigabitethernet1/0/1 (Katana)
interface gigabitethernet1/0/1 (Edison)

ipv6 nd raguard attach-policy raguard-router
```

- [Applying RA Throttle Policy on VLAN \(CLI\)](#), on page 230

## RA Throttling

RA throttling allows the controller to enforce limits to RA packets headed toward the wireless network. By enabling RA throttling, routers that send many RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity. If a client sends an RS packet, an RA is sent back to the client. This RA is allowed through the controller and unicast to the client. This process ensures that the new clients or roaming clients are not affected by the RA throttling.

## Configuring IPv6 Unicast (CLI)

IPv6 unicasting must always be enabled on the switch and the controller. IPv6 unicast routing is disabled.

**Before you begin**

To enable the forwarding of IPv6 unicast datagrams, use the **ipv6 unicast-routing** command in global configuration mode. To disable the forwarding of IPv6 unicast datagrams, use the **no** form of this command.

**SUMMARY STEPS**

1. **configure terminal**
2. **ipv6 unicast routing**

**DETAILED STEPS**

|               | Command or Action                                                                                    | Purpose                                         |
|---------------|------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>              | Enters the global configuration mode.           |
| <b>Step 2</b> | <b>ipv6 unicast routing</b><br><b>Example:</b><br>Device (config)# <code>ipv6 unicast routing</code> | enable the forwarding of IPv6 unicast datagrams |

## Configuring RA Guard Policy (CLI)

Configure RA Guard policy on the device to add IPv6 client addresses and populate the router table based on IPv6 router advertisement packets.

**SUMMARY STEPS**

1. **configure terminal**
2. **ipv6 nd rguard policy rguard-router**
3. **trustedport**
4. **device-role router**
5. **exit**

**DETAILED STEPS**

|               | Command or Action                                                                       | Purpose                                                                         |
|---------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                                           |
| <b>Step 2</b> | <b>ipv6 nd rguard policy rguard-router</b><br><b>Example:</b>                           | Defines the RA guard policy name and enters RA guard policy configuration mode. |

|               | Command or Action                                                                           | Purpose                                                                            |
|---------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
|               | Device(config)# ipv6 nd rguard policy rguard-router                                         |                                                                                    |
| <b>Step 3</b> | <b>trustedport</b><br><b>Example:</b><br>Device(config-ra-guard)# trustedport               | (Optional) Specifies that this policy is being applied to trusted ports.           |
| <b>Step 4</b> | <b>device-role router</b><br><b>Example:</b><br>Device(config-ra-guard)# device-role router | Specifies the role of the device attached to the port.                             |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config-ra-guard)# exit                             | Exits RA guard policy configuration mode and returns to global configuration mode. |

## How to Configure IPv6 Neighbor Tracking

Perform this task to provide fine tuning for the life cycle of an entry in the binding table for the IPv6 Device Tracking feature. For IPv6 device tracking to work, the binding table needs to be populated.

**Note** A single IPv6 client can have multiple IPv6 addresses at any given time. When you execute the command **show ipv6 neighbor binding mac mac\_address**, these addresses display the state as `REACHABLE` in the IPv6 neighbor binding table for that client's MAC address. If there is no control activity on these addresses for 300 seconds, they move to `STALE` state and become unusable by the client thereafter.

**ipv6 neighbor tracking** command is used to send periodic probes (default time period is 300 seconds) to all IPv6 clients to ensure that the client's IPv6 address(s) do not age out and move to `STALE` state. These probes are sent from the switch with a source IP address of all zeros which is a Duplicate address detection (DAD) probe.

There are a few clients which do not respond to DAD probes and hence age out after 300 seconds. Follow the steps below to configure IPv6 Neighbor Tracking.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 neighbor tracking [retry-interval value]**
4. **interface vlan vlan-id**
5. **ipv6 enable**
6. **exit**
7. **vlan configuration vlan\_list**
8. **ipv6 snooping [attach-policy policy\_name]**
9. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> enable                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                                       | Enters global configuration mode.                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>ipv6 neighbor tracking [retry-interval value]</b><br><b>Example:</b><br><br>Device(config)# ipv6 neighbor tracking                                | Tracks entries in the binding table.                                                                                                                                                                                                                           |
| <b>Step 4</b> | <b>interface vlan vlan-id</b><br><b>Example:</b><br><br>Device(config)# interface vlan 1810                                                          | Enters interface configuration mode, and enters the VLAN to which the IP information is assigned. The range is 1 to 4094.                                                                                                                                      |
| <b>Step 5</b> | <b>ipv6 enable</b><br><b>Example:</b><br><br>Device(config-if)# ipv6 vlan                                                                            | Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.                                                                                                                                                            |
| <b>Step 6</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config-if)# exit                                                                                        | Exits interface configuration mode.                                                                                                                                                                                                                            |
| <b>Step 7</b> | <b>vlan configuration vlan_list</b><br><b>Example:</b><br><br>Device(config)# vlan configuration 1815                                                | Specifies the VLANs to which the IPv6 Snooping policy will be attached ; enters the VLAN interface configuration mode.                                                                                                                                         |
| <b>Step 8</b> | <b>ipv6 snooping [attach-policy policy_name]</b><br><b>Example:</b><br><br>Device(config-vlan-config)# ipv6 snooping<br>attach-policy example_policy | Attaches the IPv6 Snooping policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the attach-policy option is not used. The default policy is, security-level guard, device-role node, protocol ndp and dhcp. |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br><br>Device(config-vlan-config)# end                                                                                 | Exits configuration mode.                                                                                                                                                                                                                                      |

# Configuring IPv6 Snooping (CLI)

IPv6 snooping must always be enabled on the switch and the controller.

## Before you begin

Enable IPv6 on the client machine.

## SUMMARY STEPS

1. **vlan configuration 1**
2. **ipv6 snooping**
3. **ipv6 nd suppress**
4. **exit**

## DETAILED STEPS

|        | Command or Action                                                                          | Purpose                                                               |
|--------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Step 1 | <b>vlan configuration 1</b><br><b>Example:</b><br>Device(config)# vlan configuration 1     | Enters Vlan configuration mode.                                       |
| Step 2 | <b>ipv6 snooping</b><br><b>Example:</b><br>Device(config-vlan)# ipv6 snooping              | Enables IPv6 snooping on the Vlan.                                    |
| Step 3 | <b>ipv6 nd suppress</b><br><b>Example:</b><br>Device(config-vlan-config)# ipv6 nd suppress | Enables the IPv6 ND suppress on the Vlan.                             |
| Step 4 | <b>exit</b><br><b>Example:</b><br>Device(config-vlan-config)# exit                         | Saves the configuration and comes out of the Vlan configuration mode. |

# Configuring IPv6 ND Suppress Policy (CLI)

The IPv6 neighbor discovery (ND) multicast suppress feature stops as many ND multicast neighbor solicit (NS) messages as possible by dropping them (and responding to solicitations on behalf of the targets) or

converting them into unicast traffic. This feature runs on a layer 2 switch or a wireless controller and is used to reduce the amount of control traffic necessary for proper link operations.

When an address is inserted into the binding table, an address resolution request sent to a multicast address is intercepted, and the device either responds on behalf of the address owner or, at layer 2, converts the request into a unicast message and forwards it to its destination.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 nd suppress policy**

## DETAILED STEPS

|               | Command or Action                                                                             | Purpose                                                                               |
|---------------|-----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device(config)# enable                                    | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                    | Enters the global configuration mode.                                                 |
| <b>Step 3</b> | <b>ipv6 nd suppress policy</b><br><b>Example:</b><br>Device (config)# ipv6 nd suppress policy | Defines the ND suppress policy name and enters ND suppress policy configuration mode. |

# Configuring IPv6 Snooping on VLAN/PortChannel

Neighbor Discover (ND) suppress can be enabled or disabled on either the VLAN or a switchport.

## Before you begin

## SUMMARY STEPS

1. **vlan config901**
2. **ipv6 nd suppress**
3. **end**

4. `interface gi1/0/1`
5. `ipv6 nd suppress`
6. `end`

### DETAILED STEPS

|        | Command or Action                                                                   | Purpose                                                                 |
|--------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Step 1 | <b>vlan config901</b><br><b>Example:</b><br>Device(config)# vlan config901          | Creates a VLAN and enter the VLAN configuration mode                    |
| Step 2 | <b>ipv6 nd suppress</b><br><b>Example:</b><br>Device(config-vlan)# ipv6 nd suppress | Applies the IPv6 nd suppress on VLAN.                                   |
| Step 3 | <b>end</b><br><b>Example:</b><br>Device(config-vlan)# end                           | Exits vlan configuration mode and enters the global configuration mode. |
| Step 4 | <b>interface gi1/0/1</b><br><b>Example:</b><br>Device (config)# interface gi1/0/1   | Creates a gigabitethernet port interface.                               |
| Step 5 | <b>ipv6 nd suppress</b><br><b>Example:</b><br>Device(config-vlan)# ipv6 nd suppress | Applies the IPv6 nd suppress on the interface.                          |
| Step 6 | <b>end</b><br><b>Example:</b><br>Device(config-vlan)# end                           | Exits vlan configuration mode and enters the global configuration mode. |

## Configuring IPv6 on Switch (CLI)

Use this configuration example to configure IPv6 on an interface.

### Before you begin

Enable IPv6 on the client and IPv6 support on the wired infrastructure.

### SUMMARY STEPS

1. `interface vlan 1`
2. `ip address fe80::1 link-local`
3. `ipv6 enable`
4. `end`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                | Purpose                                                               |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| <b>Step 1</b> | <b>interface vlan 1</b><br><b>Example:</b><br>Device(config)# interface vlan 1                                                                                                                                                                                                                                   | Creates a interface and enters interface configuration mode.          |
| <b>Step 2</b> | <b>ip address fe80::1 link-local</b><br><b>Example:</b><br>Device(config-if)# ip address 198.51.100.1<br>255.255.255.0<br>Device(config-if)# ipv6 address fe80::1<br>link-local<br>Device(config-if)# ipv6 address<br>2001:DB8:0:1:FFFF:1234::5/64<br>Device(config-if)# ipv6 address<br>2001:DB8:0:0:E000::F/64 | Configures IPv6 address on the interface using the link-local option. |
| <b>Step 3</b> | <b>ipv6 enable</b><br><b>Example:</b><br>Device(config)# ipv6 enable                                                                                                                                                                                                                                             | (Optional) Enables IPv6 on the interface.                             |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                                                                                                                                                                                             | Exits from the interface mode.                                        |

## Configuring DHCP Pool (CLI)

## SUMMARY STEPS

1. **ipv6 dhcp pool Vlan21**
2. **address prefix 2001:DB8:0:1:FFFF:1234::/64 lifetime 300 10**
3. **dns-server 2001:100:0:1::1**
4. **domain-name example.com**
5. **end**

## DETAILED STEPS

|               | Command or Action                                                                        | Purpose                                                                                        |
|---------------|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>ipv6 dhcp pool Vlan21</b><br><b>Example:</b><br>Device(config)# ipv6 dhcp pool vlan1  | Enters the configuration mode and configures the IPv6 DHCP pool on the Vlan.                   |
| <b>Step 2</b> | <b>address prefix 2001:DB8:0:1:FFFF:1234::/64<br/>lifetime 300 10</b><br><b>Example:</b> | Enters the configuration-dhcp mode and configures the address pool and its lifetime on a Vlan. |

|               | Command or Action                                                                                           | Purpose                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|               | Device(config-dhcpv6)# address prefix<br>2001:DB8:0:1:FFFF:1234::/64 lifetime 300 10                        |                                                                                                                     |
| <b>Step 3</b> | <b>dns-server 2001:100:0:1::1</b><br><br><b>Example:</b><br>Device(config-dhcpv6)# dns-server 2001:20:21::1 | Configures the DNS servers for the DHCP pool.                                                                       |
| <b>Step 4</b> | <b>domain-name example.com</b><br><br><b>Example:</b><br>Device(config-dhcpv6)# domain-name example.com     | Configures the domain name to complete unqualified host names.                                                      |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# end                                                    | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring Stateful DHCP Locally (CLI)

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on a local Device

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 unicast-routing**
3. **ipv6 dhcp pool IPv6\_DHCPPPOOL**
4. **address prefix 2001:DB8:0:1:FFFF:1234::/64**
5. **dns-server 2001:100:0:1::1**
6. **domain-name example.com**

7. **exit**
8. **interface v1an1**
9. **description IPv6-DHCP-Stateful**
10. **ipv6 address 2001:DB8:0:20::1/64**
11. **ip address 192.168.20.1 255.255.255.0**
12. **ipv6 nd prefix 2001:db8::/64 no-advertise**
13. **ipv6 nd managed-config-flag**
14. **ipv6 nd other-config-flag**
15. **ipv6 dhcp server IPv6\_DHCPPPOOL**

## DETAILED STEPS

|               | Command or Action                                                                                                                                     | Purpose                                                                      |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                                 | Enters the global configuration mode.                                        |
| <b>Step 2</b> | <b>ipv6 unicast-routing</b><br><b>Example:</b><br><br>Device(config)# <b>ipv6 unicast-routing</b>                                                     | Configures IPv6 for unicasting.                                              |
| <b>Step 3</b> | <b>ipv6 dhcp pool IPv6_DHCPPPOOL</b><br><b>Example:</b><br><br>Device (config)# <b>ipv6 dhcp pool IPv6_DHCPPPOOL</b>                                  | Enters the configuration mode and configures the IPv6 DHCP pool on the VLAN. |
| <b>Step 4</b> | <b>address prefix 2001:DB8:0:1:FFFF:1234::/64</b><br><b>Example:</b><br><br>Device (config-dhcpv6)# <b>address prefix 2001:DB8:0:1:FFFF:1234::/64</b> | Specifies the address range to provide in the pool.                          |
| <b>Step 5</b> | <b>dns-server 2001:100:0:1::1</b><br><b>Example:</b><br><br>Device (config-dhcpv6)# <b>dns-server 2001:100:0:1::1</b>                                 | Provides the DNS server option to DHCP clients.                              |
| <b>Step 6</b> | <b>domain-name example.com</b><br><b>Example:</b><br><br>Device (config-dhcpv6)# <b>domain-name example.com</b>                                       | Provides the domain name option to DHCP clients.                             |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br><br>Device (config-dhcpv6)# <b>exit</b>                                                                             | Returns to the previous mode.                                                |
| <b>Step 8</b> | <b>interface v1an1</b><br><b>Example:</b>                                                                                                             | Enters the interface mode to configure the stateful DHCP.                    |

|                | Command or Action                                                                                                                       | Purpose                                                                                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
|                | Device (config)# interface vlan 1                                                                                                       |                                                                                                              |
| <b>Step 9</b>  | <b>description IPv6-DHCP-Stateful</b><br><b>Example:</b><br>Device (config-if)# description IPv6-DHCP-Stateful                          | Enter description for the stateful IPv6 DHCP.                                                                |
| <b>Step 10</b> | <b>ipv6 address 2001:DB8:0:20::1/64</b><br><b>Example:</b><br>Device (config-if)# ipv6 address<br>2001:DB8:0:20::1/64                   | Enters the IPv6 address for the stateful IPv6 DHCP.                                                          |
| <b>Step 11</b> | <b>ip address 192.168.20.1 255.255.255.0</b><br><b>Example:</b><br>Device (config-if)# ip address 192.168.20.1<br>255.255.255.0         | Enters the IPv6 address for the stateful IPv6 DHCP.                                                          |
| <b>Step 12</b> | <b>ipv6 nd prefix 2001:db8::/64 no-advertise</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd prefix 2001:db8::/64<br>no-advertise | Configures the IPv6 routing prefix advertisement that must not be advertised.                                |
| <b>Step 13</b> | <b>ipv6 nd managed-config-flag</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd managed-config-flag                                | Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for address configuration.     |
| <b>Step 14</b> | <b>ipv6 nd other-config-flag</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd other-config-flag                                    | Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for non-address configuration. |
| <b>Step 15</b> | <b>ipv6 dhcp server IPv6_DHCPOOL</b><br><b>Example:</b><br>Device (config-if)# ipv6 dhcp server IPv6_DHCPOOL                            | Configures the DHCP server on the interface.                                                                 |

## Configuring Stateful DHCP Externally (CLI)

This interface configuration is for a Cisco IOS IPv6 router implementing stateful DHCPv6 on an external DHCP server.

**SUMMARY STEPS**

1. **configure terminal**

2. `ipv6 unicast-routing`
3. `dns-server 2001:100:0:1::1`
4. `domain-name example.com`
5. `exit`
6. `interface vlan1`
7. `description IPv6-DHCP-Stateful`
8. `ipv6 address 2001:DB8:0:20::1/64`
9. `ip address 192.168.20.1 255.255.255.0`
10. `ipv6 nd prefix 2001:db8::/64 no-advertise`
11. `ipv6 nd managed-config-flag`
12. `ipv6 nd other-config-flag`
13. `ipv6 dhcp relaydestination 2001:DB8:0:20::2`

## DETAILED STEPS

|               | Command or Action                                                                                                           | Purpose                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                     | Enters the global configuration mode.                     |
| <b>Step 2</b> | <b>ipv6 unicast-routing</b><br><b>Example:</b><br>Device(config)# <code>ipv6 unicast-routing</code>                         | Configures the IPv6 for unicasting.                       |
| <b>Step 3</b> | <b>dns-server 2001:100:0:1::1</b><br><b>Example:</b><br>Device (config-dhcpv6)# <code>dns-server 2001:100:0:1::1</code>     | Provides the DNS server option to DHCP clients.           |
| <b>Step 4</b> | <b>domain-name example.com</b><br><b>Example:</b><br>Device (config-dhcpv6)# <code>domain-name example.com</code>           | Provides the domain name option to DHCP clients.          |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device (config-dhcpv6)# <code>exit</code>                                                 | Returns to the previous mode.                             |
| <b>Step 6</b> | <b>interface vlan1</b><br><b>Example:</b><br>Device (config)# <code>interface vlan 1</code>                                 | Enters the interface mode to configure the stateful DHCP. |
| <b>Step 7</b> | <b>description IPv6-DHCP-Stateful</b><br><b>Example:</b><br>Device (config-if)# <code>description IPv6-DHCP-Stateful</code> | Enter description for the stateful IPv6 DHCP.             |

|         | Command or Action                                                                                                                            | Purpose                                                                                                      |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Step 8  | <b>ipv6 address 2001:DB8:0:20::1/64</b><br><b>Example:</b><br>Device (config-if)# ipv6 address<br>2001:DB8:0:20::1/64                        | Enters the IPv6 address for the stateful IPv6 DHCP.                                                          |
| Step 9  | <b>ip address 192.168.20.1 255.255.255.0</b><br><b>Example:</b><br>Device (config-if)# ip address 192.168.20.1<br>255.255.255.0              | Enters the IPv6 address for the stateful IPv6 DHCP.                                                          |
| Step 10 | <b>ipv6 nd prefix 2001:db8::/64 no-advertise</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd prefix 2001:db8::/64<br>no-advertise      | Configures the IPv6 routing prefix advertisement that must not be advertised.                                |
| Step 11 | <b>ipv6 nd managed-config-flag</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd managed-config-flag                                     | Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for address configuration.     |
| Step 12 | <b>ipv6 nd other-config-flag</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd other-config-flag                                         | Configures IPv6 interfaces neighbor discovery to allow the hosts to uses DHCP for non-address configuration. |
| Step 13 | <b>ipv6 dhcp_relaydestination 2001:DB8:0:20::2</b><br><b>Example:</b><br>Device (config-if)# ipv6 dhcp_relay destination<br>2001:DB8:0:20::2 | Configures the DHCP server on the interface.                                                                 |

## Feature Information for IPv6 Client Address Learning

This table lists the features in this module and provides links to specific configuration information:

| Feature                                    | Release            | Modification                 |
|--------------------------------------------|--------------------|------------------------------|
| IPv6 Client Address Learning Functionality | Cisco IOS XE 3.2SE | This feature was introduced. |

## CHAPTER 16

# Configuring IPv6 WLAN Security

- [Prerequisites for IPv6 WLAN Security, on page 247](#)
- [Restrictions for IPv6 WLAN Security, on page 247](#)
- [Information About IPv6 WLAN Security, on page 247](#)
- [How to Configure IPv6 WLAN Security, on page 250](#)
- [Additional References , on page 266](#)
- [Feature Information for IPv6 WLAN Security, on page 267](#)

## Prerequisites for IPv6 WLAN Security

A client VLAN must be mapped to the WLAN configured on the device

## Restrictions for IPv6 WLAN Security

### RADIUS Server Support

- If multiple RADIUS servers are configured for redundancy, the user database must be identical in all the servers for the backup to work properly.

### Radius ACS Support

- You must configure RADIUS on both your Cisco Secure Access Control Server (ACS) and your device
- RADIUS is supported on Cisco Secure ACS version 3.2 and later releases.

## Information About IPv6 WLAN Security

### Information About RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a client/server protocol that provides centralized security for users attempting to gain management access to a network. It serves as a back-end database similar to Local EAP and provides authentication and accounting services.

- **Authentication**—The process of verifying users when they attempt to log into the device

Users must enter a valid username and password for the device to authenticate users to the RADIUS server. If multiple databases are configured, then specify the sequence in which the backend database must be tried.

- **Accounting**— The process of recording user actions and changes.

Whenever a user successfully executes an action, the RADIUS accounting server logs the changed attributes, the user ID of the person who made the change, the remote host where the user is logged in, the date and time when the command was executed, the authorization level of the user, and a description of the action performed and the values provided. If the RADIUS accounting server is unreachable, the users can continue their sessions uninterrupted.

**User Datagram Protocol**— RADIUS uses User Datagram Protocol (UDP) for its transport. It maintains a database and listens on UDP port 1812 for incoming authentication requests and UDP port 1813 for incoming accounting requests. The device, which requires access control, acts as the client and requests AAA services from the server. The traffic between the device and the server is encrypted by an algorithm defined in the protocol and a shared secret key configured on both devices.

Configures multiple RADIUS accounting and authentication servers. For example, you can have one central RADIUS authentication server but several RADIUS accounting servers in different regions. If you configure multiple servers of the same type and the first one fails or becomes unreachable, the controller automatically tries the second one, then the third one if necessary, and so on.

When RADIUS method is configured for the WLAN, the device will use the RADIUS method configured for the WLAN. When the WLAN is configured to use local EAP, the RADIUS method configured on the WLAN points to Local. The WLAN must also be configured with the name of the local EAP profile to use.

If no RADIUS method is configured in the WLAN, the device will use the default RADIUS method defined in global mode.

### Information About Local EAP

Local EAP is an authentication method that allows users and wireless clients to be authenticated locally. It is designed for use in remote offices that maintain connectivity to wireless clients when the back-end system is disrupted or the external authentication server goes down. When you enable local EAP, the device serves as the authentication server and the local user database, which removes dependence on an external authentication server. Local EAP retrieves user credentials from the local user database or the LDAP back-end database to authenticate users. Local EAP supports LEAP, EAP-FAST, EAP-TLS, PEAPv0/MSCHAPv2, and PEAPv1/GTC authentication between the controller and wireless clients.

Without an EAP profile name being provided, or if a name was provided for an EAP profile that does not exist, then EAP by default allows no EAP method for local authentication.

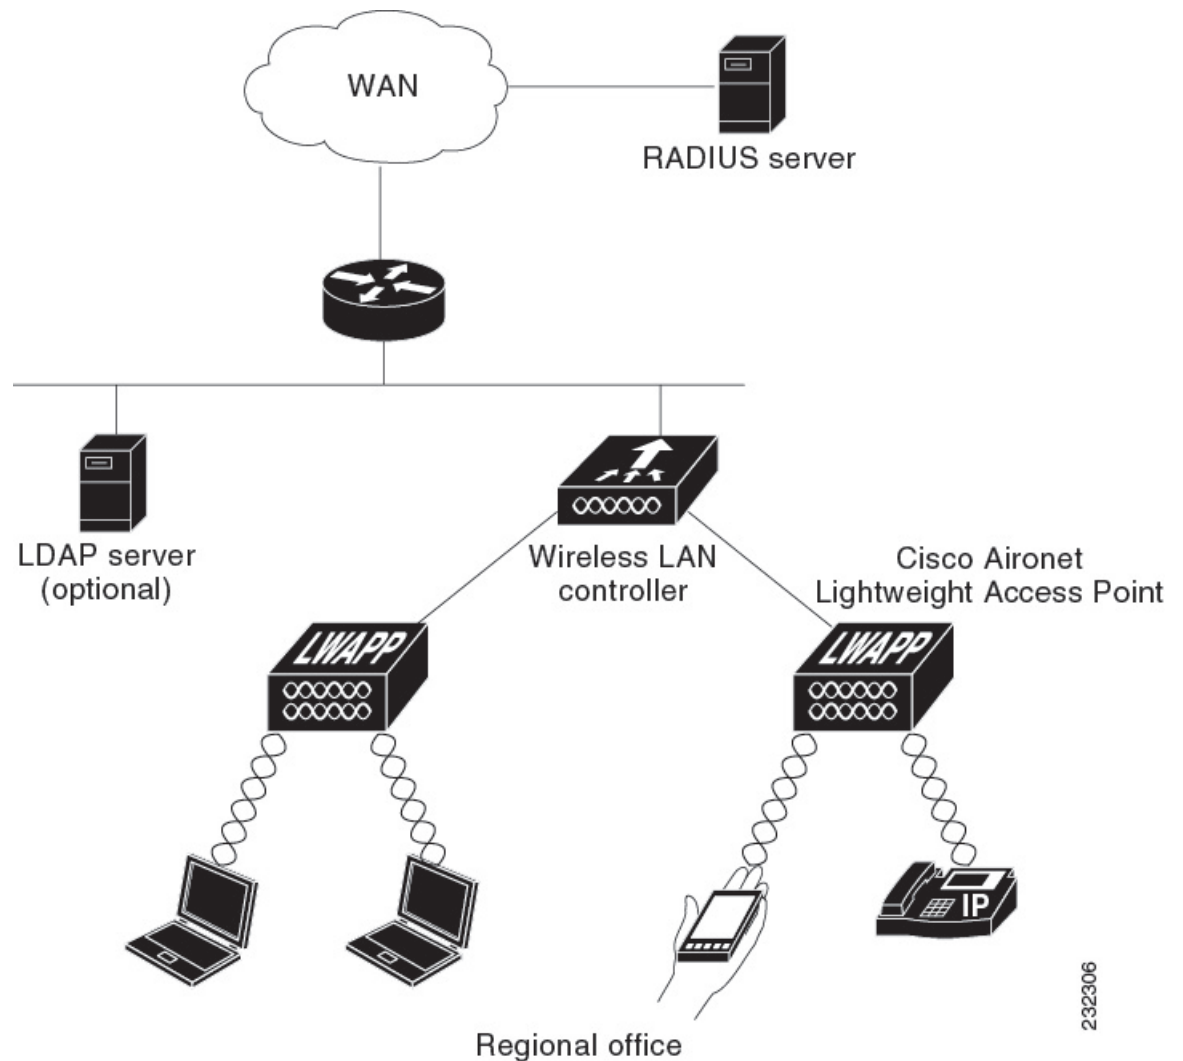

#### Note

The LDAP back-end database supports these local EAP methods: EAP-TLS, EAP-FAST/GTC, and PEAPv1/GTC. LEAP, EAP-FAST/MSCHAPv2, and PEAPv0. MSCHAPv2 is supported only if the LDAP server is set up to return a clear-text password.

**Note** Device support Local EAP authentication against external LDAP databases such as Microsoft Active Directory and Novell's eDirectory. For more information about configuring the controller for Local EAP authentication against Novell's eDirectory, see the *Configure Unified Wireless Network for Authentication Against Novell's eDirectory Database* whitepaper.

# How to Configure IPv6 WLAN Security

## Configuring Local Authentication

### Creating a Local User

#### SUMMARY STEPS

1. `configure terminal`
2. `username aaa_test`
3. `password 0 aaa_test`
4. `end`

#### DETAILED STEPS

|               | Command or Action                                                                                                        | Purpose                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <code>configure terminal</code><br><b>Example:</b><br>Device# <code>configure terminal</code>                            | Enters global command mode.                                                                                             |
| <b>Step 2</b> | <code>username aaa_test</code><br><b>Example:</b><br>Device(config)# <code>username aaa_test</code>                      | Creates a username.                                                                                                     |
| <b>Step 3</b> | <code>password 0 aaa_test</code><br><b>Example:</b><br>Device(config)# <code>usernameaaa_test password 0 aaa_test</code> | Assigns a password for the username.                                                                                    |
| <b>Step 4</b> | <code>end</code><br><b>Example:</b><br>Device(config)# <code>end</code>                                                  | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

```
Device# configure terminal
Device(config)# username aaa_test password 0 aaa_test
Device(config)# end
```

## Creating an Client VLAN and Interface

#### SUMMARY STEPS

1. `configure terminal`

2. **vlan**
3. **exit**
4. **interface vlan vlan\_ID**
5. **ip address**
6. **ipv6 address**
7. **end**

## DETAILED STEPS

|               | Command or Action                                                                                      | Purpose                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                      | Enters global command mode.                                                                                             |
| <b>Step 2</b> | <b>vlan</b><br><b>Example:</b><br>Device(config)# <b>vlan 137</b>                                      | Creates a VLAN.                                                                                                         |
| <b>Step 3</b> | <b>exit</b><br><b>Example:</b><br>Device (config-vlan)# <b>exit</b>                                    | Exits VLAN configuration mode.                                                                                          |
| <b>Step 4</b> | <b>interface vlan vlan_ID</b><br><b>Example:</b><br>Device (config)# <b>interface vlan 137</b>         | Associates the VLAN to an interface.                                                                                    |
| <b>Step 5</b> | <b>ip address</b><br><b>Example:</b><br>Device(config-if)# <b>ip address 10.7.137.10 255.255.255.0</b> | Assigns an IP address to the VLAN interface.                                                                            |
| <b>Step 6</b> | <b>ipv6 address</b><br><b>Example:</b><br>Device(config-if)# <b>ipv6 address 2001:db8::20:1/64</b>     | Assigns an IPv6 address to the VLAN interface.                                                                          |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                            | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

### Example

```
Device# configure terminal
Device(config)# vlan 137
Device(config-vlan)#exit
Device(config)#interface vlan 137
Device(config-if)#ip address 10.7.137.10 255.255.255.0
```

```
Device(config-if)#ipv6 address 2001:db8::20:1/64
Device(config-if)#end
```

## Configuring a EAP Profile

### SUMMARY STEPS

1. **eap profile name**
2. **method leap**
3. **method tls**
4. **method peap**
5. **method mschap2**
6. **method md5**
7. **method gtc**
8. **method fast profile my-fast**
9. **description my\_local leap profile**
10. **exit**
11. **eap method fast profile myFast**
12. **authority-id [identity|information]**
13. **local-key 0 key-name**
14. **pac-password 0 password**
15. **end**

### DETAILED STEPS

|               | Command or Action                                                                      | Purpose                                    |
|---------------|----------------------------------------------------------------------------------------|--------------------------------------------|
| <b>Step 1</b> | <b>eap profile name</b><br><b>Example:</b><br>Device(config)# eap profile wcm_eap_prof | Creates a EAP profile.                     |
| <b>Step 2</b> | <b>method leap</b><br><b>Example:</b><br>Device(config-eap-profile)# method leap       | Configures EAP-LEAP method on the profile. |
| <b>Step 3</b> | <b>method tls</b><br><b>Example:</b><br>Device(config-eap-profile)# method tls         | Configures EAP-TLS method on the profile.  |
| <b>Step 4</b> | <b>method peap</b><br><b>Example:</b><br>Device(config-eap-profile)# method peap       | Configures PEAP method on the profile.     |

|         | Command or Action                                                                                                                                                                                                        | Purpose                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Step 5  | <b>method mschapv2</b><br><b>Example:</b><br>Device(config-eap-profile)# method mschapv2                                                                                                                                 | Configures EAP-MSCHAPV2 method on the profile.                         |
| Step 6  | <b>method md5</b><br><b>Example:</b><br>Device(config-eap-profile)# method md5                                                                                                                                           | Configures EAP-MD5 method on the profile.                              |
| Step 7  | <b>method gtc</b><br><b>Example:</b><br>Device(config-eap-profile)# method gtc                                                                                                                                           | Configures EAP-GTC method on the profile.                              |
| Step 8  | <b>method fast profile my-fast</b><br><b>Example:</b><br>Device(config-eap-profile)# eap method fast<br>profile my-fast<br>Device (config-eap-profile)#description my_local<br>eap profile                               | Creates a EAP profile named my-fast.                                   |
| Step 9  | <b>description my_local eap profile</b><br><b>Example:</b><br>Device (config-eap-profile)#description my_local<br>eap profile                                                                                            | Provides a description for the local profile.                          |
| Step 10 | <b>exit</b><br><b>Example:</b><br>Device (config-eap-profile)# exit                                                                                                                                                      | Exits the eap-profile configuration mode.                              |
| Step 11 | <b>eap method fast profile myFast</b><br><b>Example:</b><br>Device (config)# eap method fast profile myFast                                                                                                              | Configures the EAP method profile.                                     |
| Step 12 | <b>authority-id [identity information]</b><br><b>Example:</b><br>Device(config-eap-method-profile)# authority-id<br>identity my_identity<br>Device(config-eap-method-profile)#authority-id<br>information my_information | Configure the authority ID and information for the EAP method profile. |
| Step 13 | <b>local-key 0 key-name</b><br><b>Example:</b><br>Device(config-eap-method-profile)# local-key 0<br>test                                                                                                                 | Configures the local server key.                                       |
| Step 14 | <b>pac-password 0 password</b><br><b>Example:</b>                                                                                                                                                                        | Configures the PAC password for manual PAC provisioning.               |

|                | Command or Action                                               | Purpose                                                                                                                 |
|----------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|                | Device(config-eap-method-profile)# pac-password 0 test          |                                                                                                                         |
| <b>Step 15</b> | <b>end</b><br><br><b>Example:</b><br>Device(config)# <b>end</b> | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

### Example

```

Device(config)#eap profile wcm_eap_prof
Device(config-eap-profile)#method leap
Device(config-eap-profile)#method tls
Device(config-eap-profile)#method peap
Device(config-eap-profile)#method mschapv2
Device(config-eap-profile)#method md5
Device(config-eap-profile)#method gtc
Device(config-eap-profile)#eap method fast profile my-fast
Device (config-eap-profile)#description my_local eap profile
Device(config-eap-profile)# exit
Device (config)# eap method fast profile myFast
Device(config-eap-method-profile)#authority-id identity my_identity
Device(config-eap-method-profile)#authority-id information my_information
Device(config-eap-method-profile)#local-key 0 test
Device(config-eap-method-profile)#pac-password 0 test
Device(config-eap-method-profile)# end

```

## Creating a Local Authentication Model

### SUMMARY STEPS

1. **aaa new-model**
2. **authentication dot1x default local**
3. **dot1x method\_list local**
4. **aaa authentication dot1x dot1x\_name local**
5. **aaa authorization credential-download name local**
6. **aaa local authentication auth-name authorization authorization-name**
7. **session ID**
8. **dot1x system-auth-control**

### DETAILED STEPS

|               | Command or Action                                                            | Purpose                             |
|---------------|------------------------------------------------------------------------------|-------------------------------------|
| <b>Step 1</b> | <b>aaa new-model</b><br><br><b>Example:</b><br>Device(config)# aaa new-model | Creates a AAA authentication model. |

|        | Command or Action                                                                                                                                                            | Purpose                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Step 2 | <b>authentication dot1x default local</b><br><b>Example:</b><br>Device(config)# aaa authentication dot1x default local                                                       | Implies that the dot1x must use the default local RADIUS when no other method is found. |
| Step 3 | <b>dot1x method_list local</b><br><b>Example:</b><br>Device(config)# aaa authentication dot1x wcm_local local                                                                | Assigns the local authentication for wcm_local method list.                             |
| Step 4 | <b>aaa authentication dot1x dot1x_name local</b><br><b>Example:</b><br>Device(config)# aaa authentication dot1x aaa_auth local                                               | Configures the local authentication for the dot1x method.                               |
| Step 5 | <b>aaa authorization credential-download name local</b><br><b>Example:</b><br>Device(config)# aaa authorization credential-download wcm_author local                         | Configures local database to download EAP credentials from Local/RADIUS/LDAP.           |
| Step 6 | <b>aaa local authentication auth-name authorization authorization-name</b><br><b>Example:</b><br>Device(config)# aaa local authentication wcm_local authorization wcm_author | Selects local authentication and authorization.                                         |
| Step 7 | <b>session ID</b><br><b>Example:</b><br>Device(config)# aaa session-id common                                                                                                | Configures a session ID for AAA.                                                        |
| Step 8 | <b>dot1x system-auth-control</b><br><b>Example:</b><br>Device(config)# dot1x system-auth-control                                                                             | Enables dot.1x system authentication control.                                           |

### Example

```

Device(config)# aaa new-model
Device(config)# aaa authentication dot1x default local
Device(config)# aaa authentication dot1x wcm-local local
Device(config)# aaa authentication dot1x aaa_auth local
Device(config)# aaa authorization credential-download wcm_author local
Device(config)# aaa local authentication wcm_local authorization wcm_author
Device(config)# aaa session-id common
Device(config)# dot1x system-auth-control

```

## Creating a Client WLAN

**Note** This example uses 802.1x with dynamic WEP. You can use any other security mechanism supported by the wireless client and configurable on the device

### SUMMARY STEPS

1. **configure terminal**
2. **wlan wlan name <identifier> SSID**
3. **broadcast-ssid**
4. **no security wpa**
5. **security dot1x**
6. **security dot1x authentication-list wcm-local**
7. **local-auth wcm\_eap\_prof**
8. **client vlan 137**
9. **no shutdown**
10. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                | Purpose                                                                   |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                          | Enters global command mode.                                               |
| <b>Step 2</b> | <b>wlan wlan name &lt;identifier&gt; SSID</b><br><b>Example:</b><br>Device(config)# <code>wlan wlanProfileName 1 ngwcSSID</code> | Creates a WLAN.                                                           |
| <b>Step 3</b> | <b>broadcast-ssid</b><br><b>Example:</b><br>Device(config-wlan)# <code>broadcast-ssid</code>                                     | Configures to broadcast the SSID on a WLAN.                               |
| <b>Step 4</b> | <b>no security wpa</b><br><b>Example:</b><br>Device(config-wlan)# <code>no security wpa</code>                                   | Disables the wpa for WLAN to enable 802.1x.                               |
| <b>Step 5</b> | <b>security dot1x</b><br><b>Example:</b><br>Device(config-wlan)# <code>security dot1x</code>                                     | Configures the 802.1x encryption security for the WLAN.                   |
| <b>Step 6</b> | <b>security dot1x authentication-list wcm-local</b><br><b>Example:</b>                                                           | Configures the server group mapping to the WLAN for dot1x authentication. |

|                | Command or Action                                                                                     | Purpose                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|                | Device(config-wlan)# security dot1x authentication-list wcm-local                                     |                                                                                                                         |
| <b>Step 7</b>  | <b>local-auth wcm_eap_prof</b><br><b>Example:</b><br>Device (config-wlan)# local-auth wcm_eap_profile | Configures the eap profile on the WLAN for local authentication.                                                        |
| <b>Step 8</b>  | <b>client vlan 137</b><br><b>Example:</b><br>Device(config-wlan)# client vlan 137                     | Associates the VLAN to a WLAN.                                                                                          |
| <b>Step 9</b>  | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# no shutdown                             | Enables the WLAN.                                                                                                       |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                  | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

### Example

```
Device# config terminal
Device(config)#wlan wlanProfileName 1 ngwcSSID
Device(config-wlan)#broadcast-ssid
Device(config-wlan)#no security wpa
Device(config-wlan)#security dot1x
Device(config-wlan)#security dot1x authentication-list wcm-local
Device (config-wlan)# local-auth wcm_eap_prof
Device(config-wlan)#client vlan 137
Device(config-wlan)#no shutdown
Device(config-wlan)#end
Device#
```

## Configuring Local Authentication with WPA2+AES

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new model**
3. **dot1x system-auth-control**
4. **aaa authentication dot1x default local**
5. **aaa local authorization credential-download default local**
6. **aaa local authentication default authorization default**
7. **eap profile wcm\_eap\_profile**
8. **method leap**

## 9. end

## DETAILED STEPS

|               | Command or Action                                                                                                                                                       | Purpose                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                 | Enters global command mode.                                                                                             |
| <b>Step 2</b> | <b>aaa new model</b><br><b>Example:</b><br>Device(config)# <code>aaa new-model</code>                                                                                   | Creates a AAA authentication model.                                                                                     |
| <b>Step 3</b> | <b>dot1x system-auth-control</b><br><b>Example:</b><br>Device(config)# <code>dot1x system-auth-control</code>                                                           | Enables dot1x system authentication control.                                                                            |
| <b>Step 4</b> | <b>aaa authentication dot1x default local</b><br><b>Example:</b><br>Device(config)# <code>aaa authentication dot1x default local</code>                                 | Configures the local authentication for the default dot1x method.                                                       |
| <b>Step 5</b> | <b>aaa local authorization credential-download default local</b><br><b>Example:</b><br>Device(config)# <code>aaa authorization credential-download default local</code> | Configures default database to download EAP credentials from local server.                                              |
| <b>Step 6</b> | <b>aaa local authentication default authorization default</b><br><b>Example:</b><br>Device(config)# <code>aaa local authentication default authorization default</code> | Selects the default local authentication and authorization.                                                             |
| <b>Step 7</b> | <b>eap profile wcm_eap_profile</b><br><b>Example:</b><br>Device(config)# <code>eap profile wcm_eap_profile</code>                                                       | Creates an EAP profile.                                                                                                 |
| <b>Step 8</b> | <b>method leap</b><br><b>Example:</b><br>Device(config)# <code>method leap</code>                                                                                       | Configures EAP-LEAP method on the profile.                                                                              |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                       | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

```
Device# configure terminal
Device(config)# aaa new-model
```

```

Device(config)# dot1x system-auth-control
Device(config)# aaa authentication dot1x default local
Device(config)# aaa authorization credential-download default local
Device(config)# aaa local authentication default authorization default
Device(config)# eap profile wcm_eap_profile
Device(config)# method leap
Device(config)# end

```

## Creating Client VLAN for WPA2+AES

Create a VLAN for the WPA2+AES type of local authentication. This VLAN is later mapped to a WLAN.

### SUMMARY STEPS

1. **configure terminal**
2. **vlan *vlan\_ID***
3. **exit**
4. **interface vlan *vlan\_ID***
5. **ip address**
6. **ipv6 address**
7. **exit**

### DETAILED STEPS

|        | Command or Action                                                                                          | Purpose                                     |
|--------|------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                          | Enters global command mode.                 |
| Step 2 | <b>vlan <i>vlan_ID</i></b><br><b>Example:</b><br>Device (config)# <b>vlan 105</b>                          | Creates a VLAN.                             |
| Step 3 | <b>exit</b><br><b>Example:</b><br>Device (config-vlan)# <b>exit</b>                                        | Exits from the VLAN mode.                   |
| Step 4 | <b>interface vlan <i>vlan_ID</i></b><br><b>Example:</b><br>Device(config)# <b>interface vlan 105</b>       | Associates the VLAN to the interface.       |
| Step 5 | <b>ip address</b><br><b>Example:</b><br>Device(config-if)# <b>ip address 10.8.105.10<br/>255.255.255.0</b> | Assigns IP address to the VLAN interface.   |
| Step 6 | <b>ipv6 address</b><br><b>Example:</b><br>Device(config-if)# <b>ipv6 address 2001:db8::10:1/64</b>         | Assigns IPv6 address to the VLAN interface. |

|               | Command or Action                                          | Purpose                        |
|---------------|------------------------------------------------------------|--------------------------------|
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Device (config-if)# exit | Exits from the interface mode. |

```

Device# configure terminal
Device(config)# vlan105
Device (config-vlan)# exit
Device (config)# interface vlan 105
Device(config-if)#ip address 10.8.105.10 255.255.255.0
Device(config-if)#ipv6 address 2001:db8::10:1/64
Device(config-if)#exit
Device(config)#

```

## Creating WLAN for WPA2+AES

Create a WLAN and map it to the client VLAN created for WPA2+AES.

### SUMMARY STEPS

1. **configure terminal**
2. **wlan wpa2-aes-wlan 1 wpa2-aes-wlan**
3. **client vlan 105**
4. **local-auth wcm\_eap\_profile**
5. **security dot1x authentication-list default**
6. **no shutdown**
7. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                         | Purpose                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                         | Enters global command mode.       |
| <b>Step 2</b> | <b>wlan wpa2-aes-wlan 1 wpa2-aes-wlan</b><br><b>Example:</b><br>Device(config)#wlan wpa2-aes-wlan 1 wpa2-aes-wlan<br>Device(config-wlan)# | Creates a WLAN.                   |
| <b>Step 3</b> | <b>client vlan 105</b><br><b>Example:</b><br>Device(config-wlan)#client vlan 105<br>Device(config-wlan)#                                  | Maps the WLAN to the client VLAN. |

|        | Command or Action                                                                                                                      | Purpose                                                                                                             |
|--------|----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>local-auth wcm_eap_profile</b><br><b>Example:</b><br>Device(config-wlan)#local-auth wcm_eap_profile                                 | Creates and sets the EAP profile on the WLAN.                                                                       |
| Step 5 | <b>security dot1x authentication-list default</b><br><b>Example:</b><br>Device(config-wlan)#security dot1x authentication-list default | Uses the default dot1x authentication list.                                                                         |
| Step 6 | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)#no shutdown<br>Device(config-wlan)#                                       | Enables the WLAN.                                                                                                   |
| Step 7 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                   | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

```

Device# configure terminal
Device(config)#wlan wpa2-aes-wlan 1 wpa2-aes-wlan
Device(config-wlan)#client vlan 105
Device(config-wlan)#local-auth wcm_eap_profile
Device(config-wlan)#security dot1x authentication-list default
Device(config-wlan)#no shutdown
Device(config-wlan)# exit

```

## Configuring External RADIUS Server

### Configuring RADIUS Authentication Server Host

#### SUMMARY STEPS

1. **configure terminal**
2. **radius server One**
3. **address ipv4 address auth-portauth\_port\_number acct-port acct\_port\_number**
4. **address ipv6 address auth-portauth\_port\_number acct-port acct\_port\_number**
5. **key 0cisco**
- 6.

#### DETAILED STEPS

|        | Command or Action                                                                 | Purpose                     |
|--------|-----------------------------------------------------------------------------------|-----------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global command mode. |

|               | Command or Action                                                                                                                                                                                       | Purpose                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Step 2</b> | <b>radius server One</b><br><b>Example:</b><br>Device (config)# radius server One                                                                                                                       | Creates a radius server.                           |
| <b>Step 3</b> | <b>address ipv4 address auth-port auth_port_number<br/>acct-port acct_port_number</b><br><b>Example:</b><br>Device (config-radius-server)# address ipv4<br>10.10.10.10 auth-port 1812 acct-port 1813    | Configures the IPv4 address for the radius server. |
| <b>Step 4</b> | <b>address ipv6 address auth-port auth_port_number<br/>acct-port acct_port_number</b><br><b>Example:</b><br>Device (config-radius-server)# address ipv6<br>2001:db8::25:2 auth-port 1812 acct-port 1813 | Configures the IPv6 address for the radius server. |
| <b>Step 5</b> | <b>key 0 cisco</b><br><b>Example:</b><br>Device (config-radius-server)# key 0 cisco                                                                                                                     | <b>exit</b>                                        |
| <b>Step 6</b> | <b>Example:</b><br>Device (config-radius-server)# exit                                                                                                                                                  | Exits from the radius server mode.                 |

```

Device# configure terminal
Device (config)# radius server One
Device (config-radius-server)# address ipv4 10.10.10.10 auth-port 1812 acct-port 1813
Device (config-radius-server)# address ipv6 2001:db8::25:2 auth-port 1812 acct-port 1813
Device (config-radius-server)# key 0 cisco
Device (config-radius-server)# exit

```

## Configuring RADIUS Authentication Server Group

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **aaa group server radius wcm\_rad**
4. **server <ip address>auth-port1812acct-port1813**
5. **aaa authentication dot1x method\_list group wcm\_rad**
6. **dot1x system-auth-control**
7. **aaa session-idcommon**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                                                                                                                                  | Enters global command mode.                                                                                                         |
| <b>Step 2</b> | <b>aaa new-model</b><br><b>Example:</b><br>Device(config)# <code>aaa new-model</code>                                                                                                                                                                                                                                                    | Creates a AAA authentication model.                                                                                                 |
| <b>Step 3</b> | <b>aaa group server radius wcm_rad</b><br><b>Example:</b><br>Device(config)# <code>aaa group server radius wcm_rad</code><br>Device(config-sg-radius)#                                                                                                                                                                                   | Creates an radius server-group.                                                                                                     |
| <b>Step 4</b> | <b>server &lt;ip address&gt;auth-port1812acct-port1813</b><br><b>Example:</b><br>Device(config-sg-radius)# <code>server One auth-port 1812 acct-port 1813</code><br>Device(config-sg-radius)# <code>server Two auth-port 1812 acct-port 1813</code><br>Device(config-sg-radius)# <code>server Three auth-port 1812 acct-port 1813</code> | Adds servers to the radius group created in Step 3. Configures the UDP port for RADIUS accounting server and authentication server. |
| <b>Step 5</b> | <b>aaa authentication dot1x method_list group wcm_rad</b><br><b>Example:</b><br>Device(config)# <code>aaa authentication dot1x method_list group wcm_rad</code>                                                                                                                                                                          | Maps the method list to the radius group.                                                                                           |
| <b>Step 6</b> | <b>dot1x system-auth-control</b><br><b>Example:</b><br>Device(config)# <code>dot1x system-auth-control</code>                                                                                                                                                                                                                            | Enables the system authorization control for the radius group.                                                                      |
| <b>Step 7</b> | <b>aaa session-idcommon</b><br><b>Example:</b><br>Device(config)# <code>aaa session-id common</code>                                                                                                                                                                                                                                     | Ensures that all session IDs information sent out, from the radius group, for a given call are identical.                           |

```

Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa group server radius wcm_rad
Device(config-sg-radius)# server One auth-port 1812 acct-port 1813
Device(config-sg-radius)# server Two auth-port 1812 acct-port 1813
Device(config-sg-radius)# server Three auth-port 1812 acct-port 1813
Device(config)# aaa authentication dot1x method_list group wcm_rad
Device(config)# dot1x system-auth-control
Device(config)# aaa session-id common
Device(config)#

```

### DETAILED STEPS

|               | Command or Action                                                                                                | Purpose                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                | Enters global command mode.                             |
| <b>Step 2</b> | <b>wlan ngwc-1x&lt;ssid&gt;ngwc-1x</b><br><b>Example:</b><br>Device(config)# <b>wlan ngwc_8021x 2 ngwc_8021x</b> | Creates a new WLAN for 802.1x authentication.           |
| <b>Step 3</b> | <b>broadcast-ssid</b><br><b>Example:</b><br>Device(config-wlan)# <b>broadcast-ssid</b>                           | Configures to broadcast the SSID on WLAN.               |
| <b>Step 4</b> | <b>no security wpa</b><br><b>Example:</b><br>Device(config-wlan)# <b>no security wpa</b>                         | Disables the WPA for WLAN to enable 802.1x.             |
| <b>Step 5</b> | <b>security dot1x</b><br><b>Example:</b><br>Device(config-wlan)# <b>security dot1x</b>                           | Configures the 802.1x encryption security for the WLAN. |

|               | Command or Action                                                                                                                       | Purpose                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b> | <b>security dot1x authentication-list wcm-rad</b><br><b>Example:</b><br>Device(config-wlan)# security dot1x authentication-list wcm-rad | Configures the server group mapping to the WLAN for dot1x authentication.                                               |
| <b>Step 7</b> | <b>client vlan 137</b><br><b>Example:</b><br>Device(config-wlan)# client vlan 137                                                       | Associates the VLAN to a WLAN.                                                                                          |
| <b>Step 8</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# no shutdown                                                               | Enables the WLAN.                                                                                                       |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                    | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit the global configuration mode. |

### Example

```

Device# configure terminal
Device(config)#wlan ngwc_8021x 2 ngwc_8021x
Device(config-wlan)# broadcast-ssid
Device(config-wlan)# no security wpa
Device(config-wlan)# security dot1x
Device(config-wlan)# security dot1x authentication-list wcm-rad
Device(config-wlan)# client vlan 137
Device(config-wlan)# no shutdown
Device(config-wlan)# end

```

- [Configuration Examples for IPv6 ACL, on page 279](#)
- [Additional References, on page 283](#)
- [Feature Information for IPv6 ACLs, on page 284](#)

## Prerequisites for IPv6 ACL

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running the IP base feature set.

## Restrictions for IPv6 ACL

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The device supports most of the Cisco IOS-supported IPv6 ACLs with some exceptions:

- The device does not support matching on these keywords: **flowlabel**, **routing header**, and **undetermined-transport**.
- The device does not support reflexive ACLs (the **reflect** keyword).
- The device does not apply MAC-based ACLs on IPv6 frames.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the device checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.

- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the device does not allow the ACE to be added to the ACL that is currently attached to the interface

## Information About IPv6 ACL

An access control list (ACL) is a set of rules used to limit access to a particular interface (for example, if you want to restrict a wireless client from pinging the management interface of the controller). ACLs are configured on the device and applied to the management interface, the AP-manager interface, any of the dynamic interfaces, or a WLAN to control data traffic to and from wireless clients or to the controller central processing unit (CPU) to control all traffic destined for the CPU.

You can also create a preauthentication ACL for web authentication. Such an ACL is used to allow certain types of traffic before authentication is complete.

IPv6 ACLs support the same options as IPv4 ACLs including source, destination, source and destination ports.

---

**Note** You can enable only IPv4 traffic in your network by blocking IPv6 traffic. That is, you can configure an IPv6 ACL to deny all IPv6 traffic and apply it on specific or all WLANs.

---

## Understanding IPv6 ACLs

A switch supports two types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.
- IPv6 port ACLs are supported on inbound traffic on Layer 2 interfaces only. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

A switch running the IP base feature set supports only input router IPv6 ACLs. It does not support port ACLs or output IPv6 router ACLs.

---

**Note** If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take effect.

---

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

- When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, packets received on the ports to

which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

---

**Note** If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

---

## Types of ACL

### Per User IPv6 ACL

For the per-user ACL, the full access control entries (ACE) as the text strings are configured on the ACS.

The ACE is not configured on the Controller. The ACE is sent to the device in the `ACCESS-Accept` attribute and applies it directly for the client. When a wireless client roams into an foreign device, the ACEs are sent to the foreign device as an AAA attribute in the mobility Handoff message. Output direction, using per-user ACL is not supported.

### Filter ID IPv6 ACL

For the filter-Id ACL, the full ACEs and the `acl name(filter-id)` is configured on the device and only the `filter-id` is configured on the ACS. The `filter-id` is sent to the device in the `ACCESS-Accept` attribute, and the device looks up the `filter-id` for the ACEs, and then applies the ACEs to the client. When the client L2 roams to the foreign device, only the `filter-id` is sent to the foreign device in the mobility Handoff message. Output filtered ACL, using per-user ACL is not supported. The foreign device has to configure the `filter-id` and ACEs beforehand.

## IPv6 ACLs and Switch Stacks

The stack master supports IPv6 ACLs in hardware and distributes the IPv6 ACLs to the stack members.

---

**Note** For full IPv6 functionality in a switch stack, all stack members must be running the IP services feature set.

---

If a new switch takes over as stack master, it distributes the ACL configuration to all stack members. The member switches sync up the configuration distributed by the new stack master and flush out entries that member switches sync up the configuration distributed by the new stack master and flush out entries that are not required.

When an ACL is modified, attached to, or detached from an interface, the stack master distributes the change to all stack members.

## Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

**Before you begin**

Before configuring IPv6 ACLs, you must select one of the dual IPv4 and IPv6 SDM templates.

**SUMMARY STEPS**

1. Create an IPv6 ACL, and enter IPv6 access list configuration mode.
2. Configure the IPv6 ACL to block (deny) or pass (permit) traffic.
3. Apply the IPv6 ACL to the interface where the traffic needs to be filtered.
4. Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                                           | <b>Purpose</b> |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| <b>Step 1</b> | Create an IPv6 ACL, and enter IPv6 access list configuration mode.                                                                                 |                |
| <b>Step 2</b> | Configure the IPv6 ACL to block (deny) or pass (permit) traffic.                                                                                   |                |
| <b>Step 3</b> | Apply the IPv6 ACL to the interface where the traffic needs to be filtered.                                                                        |                |
| <b>Step 4</b> | Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied. |                |

**Default IPv6 ACL Configuration**

There are no IPv6 ACLs configured or applied.

**Interaction with Other Features and Switches**

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.
- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, for any additional configured ACLs, packets are dropped to the CPU, and the ACLs are applied in software. When the hardware is full a message is printed to the console indicating the ACL has been unloaded and the packets will be dropped on the interface.

**Note** Only packets of the same type as the ACL that could not be added (ipv4, ipv6, MAC) will be dropped on the interface.

# How To Configure an IPv6 ACL

## Creating IPv6 ACL

Beginning in privileged EXEC mode, follow these steps to create an IPv6 ACL:

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 access-list *acl\_name***
3. **{deny|permit} protocol**
4. **{deny|permit} tcp**
5. **{deny|permit} udp**
6. **{deny|permit} icmp**
7. **end**
8. **show ipv6 access-list**
9. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|  |                   | <p>which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).</p> <ul style="list-style-type: none"> <li>• Enter any as an abbreviation for the IPv6 prefix <code>::/0</code>.</li> <li>• For <code>host source-ipv6-address</code> or <code>destination-ipv6-address</code>, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.</li> <li>• (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are <code>lt</code> (less than), <code>gt</code> (greater than), <code>eq</code> (equal), <code>neq</code> (not equal), and <code>range</code>.</li> </ul> <p>If the operator follows the <code>source-ipv6-prefix/prefix-length</code> argument, it must match the source port. If the operator follows the <code>destination-ipv6-prefix/prefix-length</code> argument, it must match the destination port.</p> <ul style="list-style-type: none"> <li>• (Optional) The <code>port-number</code> is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.</li> <li>• (Optional) Enter <code>dscp</code> value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</li> <li>• (Optional) Enter <code>fragments</code> to check noninitial fragments. This keyword is visible only if the protocol is <code>ipv6</code>.</li> <li>• (Optional) Enter <code>log</code> to cause an logging message to be sent to the console about the packet that matches the entry. Enter <code>log-input</code> to include the input interface in the log entry. Logging is supported only for router ACLs.</li> <li>• (Optional) Enter <code>routing</code> to specify that IPv6 packets be routed.</li> <li>• (Optional) Enter <code>sequence</code> value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295</li> <li>• (Optional) Enter <code>time-range</code> name to specify the time range that applies to the deny or permit statement.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>{deny permit} tcp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} tcp {source-ipv6-prefix/prefix-length   any   hostsource-ipv6-address} [operator [port-number]]{destination-ipv6-prefix/prefix-length   any   hostdestination-ipv6-address} [operator [port-number]][ack] [dscp value][established] [fin] [log][log-input] [neq {port  protocol}] [psh] [range{port   protocol}] [rst][routing] [sequence value] [syn] [time-range name][urg]</pre> | <p>(Optional) Define a TCP access list and the access conditions.</p> <p>Enter tcp for Transmission Control Protocol. The parameters are the same as those described in Step 3, with these additional optional parameters:</p> <ul style="list-style-type: none"> <li>• ack—Acknowledgment bit set.</li> <li>• established—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.</li> <li>• fin—Finished bit set; no more data from sender.</li> <li>• neq {port   protocol}—Matches only packets that are not on a given port number.</li> <li>• psh—Push function bit set.</li> <li>• range {port   protocol}—Matches only packets in the port number range.</li> <li>• rst—Reset bit set.</li> <li>• syn—Synchronize bit set.</li> <li>• urg—Urgent pointer bit set.</li> </ul> |
| Step 5 | <p><b>{deny permit} udp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} udp {source-ipv6-prefix/prefix-length   any   hostsource-ipv6-address} [operator [port-number]]{destination-ipv6-prefix/prefix-length   any   hostdestination-ipv6-address} [operator [port-number]][dscp value] [log][log-input] [neq {port  protocol}] [range {port  protocol}] [routing][sequence value][time-range name]</pre>                                                  | <p>(Optional) Define a UDP access list and the access conditions.</p> <p>Enter udp for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the operator [port] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 6 | <p><b>{deny permit} icmp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} icmp {source-ipv6-prefix/prefix-length   any   hostsource-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length   any   hostdestination-ipv6-address} [operator [port-number]][icmp-type [icmp-code]  icmp-message] [dscpvalue] [log] [log-input] [routing] [sequence value][time-range name]</pre>                                                        | <p>(Optional) Define an ICMP access list and the access conditions.</p> <p>Enter icmp for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 3a, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• icmp-type—Enter to filter by ICMP message type, a number from 0 to 255.</li> </ul>                                                                                                                                                                                                                                                                                                                                                         |

|               | Command or Action                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                    | <ul style="list-style-type: none"> <li>icmp-code—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.</li> <li>icmp-message—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                        | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                                                                                                          |
| <b>Step 8</b> | <b>show ipv6 access-list</b><br><b>Example:</b><br>show ipv6 access-list                           | Verify the access list configuration.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>copy running-config startup-config | (Optional) Save your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                      |

## Applying an IPv6 to an Interface

This section describes how to apply IPv6 ACLs to network interfaces. You can apply an IPv6 ACL to outbound or inbound traffic on layer 2 and Layer 3 interfaces. You can apply IPv6 ACLs only to inbound management traffic on Layer 3 interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

### SUMMARY STEPS

1. **configure terminal**
2. **interface interface\_id**
3. **no switchport**
4. **ipv6 address ipv6\_address**
5. **ipv6 traffic-filter acl\_name**
6. **end**
7. **show running-config interface tenGigabitEthernet 1/0/3**
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                            | Purpose                           |
|---------------|----------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>interface interface_id</b><br><b>Example:</b><br>Device# <code>interface interface-id</code>                                                                                                                                                                                                                                                                             | Identifies a Layer 2 interface (for port ACLs) or Layer 3 Switch Virtual interface (for router ACLs) on which to apply an access list, and enters interface configuration mode.                                       |
| <b>Step 3</b> | <b>no switchport</b><br><b>Example:</b><br>Device# <code>no switchport</code>                                                                                                                                                                                                                                                                                               | Changes the interface from Layer 2 mode (the default) to Layer 3 mode (only if applying a router ACL).                                                                                                                |
| <b>Step 4</b> | <b>ipv6 address ipv6_address</b><br><b>Example:</b><br>Device# <code>ipv6 address ipv6-address</code>                                                                                                                                                                                                                                                                       | Configures an IPv6 address on a Layer 3 interface (for router ACLs).<br><b>Note</b> This command is not required on Layer 2 interfaces or if the interface has already been configured with an explicit IPv6 address. |
| <b>Step 5</b> | <b>ipv6 traffic-filter acl_name</b><br><b>Example:</b><br>Device# <code>ipv6 traffic-filter access-list-name {in   out}</code>                                                                                                                                                                                                                                              | Applies the access list to incoming or outgoing traffic on the interface.                                                                                                                                             |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                                                                                                                                                                                           | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                   |
| <b>Step 7</b> | <b>show running-config interface tenGigabitEthernet 1/0/3</b><br><b>Example:</b><br>Device# <code>show running-config interface tenGigabitEthernet 1/0/3</code><br>.....<br>.....<br>Building configuration ....<br>.....<br>Current configuration : 98 bytes<br>!<br>interface TenGigabitEthernet1/0/3<br>switchport mode trunk<br>ipv6 traffic-filter MyFilter out<br>end | Shows the configuration summary.                                                                                                                                                                                      |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><code>copy running-config startup-config</code>                                                                                                                                                                                                                                                             | (Optional) Saves your entries in the configuration file.                                                                                                                                                              |

## Creating WLAN IPv6 ACL

### SUMMARY STEPS

1. `ipv6 traffic-filter acl acl_name`
2. `ipv6 traffic-filter acl web`

### DETAILED STEPS

|               | Command or Action                                                                                                                           | Purpose                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| <b>Step 1</b> | <code>ipv6 traffic-filter acl <i>acl_name</i></code><br><b>Example:</b><br>Device(config-wlan)# ipv6 traffic-filter acl < <i>acl_name</i> > | Creates a named WLAN ACL.                  |
| <b>Step 2</b> | <code>ipv6 traffic-filter acl web</code><br><b>Example:</b><br>Device(config-wlan)# ipv6 traffic-filter acl web < <i>acl_name-preauth</i> > | Creates a pre-authentication for WLAN ACL. |

```
Device(config-wlan)# ipv6 traffic-filter acl <acl_name>
Device(config-wlan)#ipv6 traffic-filter acl web <acl_name-preauth>
```

## Verifying IPv6 ACL

### Displaying IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands.

#### Procedure

|               | Command or Action                                                                                                                  | Purpose                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Step 1</b> | <code>show access-list</code><br><b>Example:</b><br>Device# show access-lists                                                      | Displays all access lists configured on the device                             |
| <b>Step 2</b> | <code>show ipv6 access-list <i>acl_name</i></code><br><b>Example:</b><br>Device# show ipv6 access-list [ <i>access-list-name</i> ] | Displays all configured IPv6 access list or the access list specified by name. |

# Configuration Examples for IPv6 ACL

## Example: Creating IPv6 ACL

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny -all condition is at the end of each IPv6 access list.

**Note** Logging is supported only on Layer 3 interfaces.

```
Device(config)# ipv6 access-list CISCO
Device(config-ipv6-acl)# deny tcp any any gt 5000
Device (config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Device(config-ipv6-acl)# permit icmp any any
Device(config-ipv6-acl)# permit any any
```

## Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

```
Device(config)# interface TenGigabitEthernet 1/0/3

Device(config-if)# no switchport
Device(config-if)# ipv6 address 2001::/64 eui-64
Device(config-if)# ipv6 traffic-filter CISCO out
```

## Example: Displaying IPv6 ACLs

This is an example of the output from the **show access-lists** privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Device #show access-lists
Extended IP access list hello
10 permit ip any any
IPv6 access list ipv6
permit ipv6 any any sequence 10
```

This is an example of the output from the **show ipv6 access-lists** privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Device# show ipv6 access-list
IPv6 access list inbound
permit tcp any any eq bgp (8 matches) sequence 10
permit tcp any any eq telnet (15 matches) sequence 20
permit udp any any sequence 30

IPv6 access list outbound
deny udp any any sequence 10
deny tcp any any eq telnet sequence 20
```

## Example: Configuring RA Throttling and NS Suppression

This task describes how to create an RA throttle policy in order to help the power-saving wireless clients from being disturbed by frequent unsolicited periodic RA's. The unsolicited multicast RA is throttled by the controller.

### Before you begin

Enable IPv6 on the client machine.

### SUMMARY STEPS

1. `configure terminal`
2. `ipv6 nd ra-throttler policy Mythrottle`
3. `throttle-period 20`
4. `max-through 5`
5. `allow at-least 3 at-most 5`
6. `switch (config)# vlan configuration 100`
7. `ipv6 nd suppress`
8. `ipv6 nd ra-th attach-policy attach-policy_name`
9. `end`

### DETAILED STEPS

|        | Command or Action                                                                                                                        | Purpose                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                  | Enters global configuration mode.                                                                                        |
| Step 2 | <b>ipv6 nd ra-throttler policy Mythrottle</b><br><b>Example:</b><br>Device (config)# <code>ipv6 nd ra-throttler policy Mythrottle</code> | Creates a RA throttler policy called Mythrottle.                                                                         |
| Step 3 | <b>throttle-period 20</b><br><b>Example:</b><br>Device (config-nd-ra-throttle)# <code>throttle-period 20</code>                          | Determines the time interval segment during which throttling applies.                                                    |
| Step 4 | <b>max-through 5</b><br><b>Example:</b><br>Device (config-nd-ra-throttle)# <code>max-through 5</code>                                    | Determines how many initial RA's are allowed.                                                                            |
| Step 5 | <b>allow at-least 3 at-most 5</b><br><b>Example:</b><br>Device (config-nd-ra-throttle)# <code>allow at-least 3 at-most 5</code>          | Determines how many RA's are allowed after the initial RAs have been transmitted, until the end of the interval segment. |

|        | Command or Action                                                                                                                                    | Purpose                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>switch (config)# vlan configuration 100</b><br><b>Example:</b><br>Device (config)# vlan configuration 100                                         | Creates a per vlan configuration.                                                                                   |
| Step 7 | <b>ipv6 nd suppress</b><br><b>Example:</b><br>Device (config)# ipv6 nd suppress                                                                      | Disables the neighbor discovery on the Vlan.                                                                        |
| Step 8 | <b>ipv6 nd ra-th attach-policy attach-policy_name</b><br><b>Example:</b><br>Device (config)# ipv6 nd ra-throttle attach-policy<br>attach-policy_name | Enables the router advertisement throttling.                                                                        |
| Step 9 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                          | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Example: Configuring RA Guard Policy

### SUMMARY STEPS

1. **ipv6 nd rguard policy MyPolicy**
2. **trusted-port**
3. **device-role router**
4. **interface tenGigabitEthernet 1/0/1**
5. **ipv6 nd rguard attach-policy MyPolicy**
6. **vlan configuration 19-21, 23**
7. **ipv6 nd suppress**
8. **ipv6 snooping**
9. **ipv6 nd rguard attach-policy MyPolicy**
10. **ipv6 nd ra-throttler attach-policy Mythrottle**

### DETAILED STEPS

|        | Command or Action                                                                                           | Purpose                                                   |
|--------|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Step 1 | <b>ipv6 nd rguard policy MyPolicy</b><br><b>Example:</b><br>Device (config)# ipv6 nd rguard policy MyPolicy |                                                           |
| Step 2 | <b>trusted-port</b><br><b>Example:</b><br>Device (config-nd-rguard)# trusted-port                           | Configures the trusted port for the policy created above. |

|                | Command or Action                                                                                                                                                      | Purpose                                                                         |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>Step 3</b>  | <b>device-role router</b><br><b>Example:</b><br>Device (config-nd-raguard)# device-role [host monitor router switch]<br>Device (config-nd-raguard)# device-role router | Defines the trusted device that can send RAs to the trusted port created above. |
| <b>Step 4</b>  | <b>interface tenGigabitEthernet 1/0/1</b><br><b>Example:</b><br>Device (config)# interface tenGigabitEthernet 1/0/1                                                    | Configures the interface to the trusted device.                                 |
| <b>Step 5</b>  | <b>ipv6 nd raguard attach-policy MyPolicy</b><br><b>Example:</b><br>Device (config-if)# ipv6 nd raguard attach-policy Mypolicy                                         | Configures and attaches the policy to trust the RA's received from the port.    |
| <b>Step 6</b>  | <b>vlan configuration 19-21,23</b><br><b>Example:</b><br>Device (config)# vlan configuration 19-21,23                                                                  | Configures the wireless client vlans.                                           |
| <b>Step 7</b>  | <b>ipv6 nd suppress</b><br><b>Example:</b><br>Device (config-vlan-config)# ipv6 nd suppress                                                                            | Suppresses the ND messages over wireless.                                       |
| <b>Step 8</b>  | <b>ipv6 snooping</b><br><b>Example:</b><br>Device (config-vlan-config)# ipv6 snooping                                                                                  | Captures IPv6 traffic.                                                          |
| <b>Step 9</b>  | <b>ipv6 nd raguard attach-policy MyPolicy</b><br><b>Example:</b><br>Device (config-vlan-config)# ipv6 nd raguard attach-policy Mypolicy                                | Attaches the RA Guard policy to the wireless client vlans.                      |
| <b>Step 10</b> | <b>ipv6 nd ra-throttler attach-policy Mythrottle</b><br><b>Example:</b><br>Device (config-vlan-config)#ipv6 nd ra-throttler attach-policy Mythrottle                   | Attaches the RA throttling policy to the wireless client vlans.                 |

## Example: Configuring IPv6 Neighbor Binding

### SUMMARY STEPS

1. `ipv6 neighbor binding [vlan ]19 2001:db8::25:4 interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                     | Purpose                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>ipv6 neighbor binding [vlan ]19 2001:db8::25:4<br/>interface tenGigabitEthernet 1/0/3 aaa.bbb.ccc</b><br><br><b>Example:</b><br>Device (config)# ipv6 neighbor binding vlan 19<br>2001:db8::25:4 interface tenGigabitEthernet 1/0/3<br>aaa.bbb.ccc | Sets and validates the neighbor 2001:db8::25:4 only valid when transmitting on VLAN 19 through interface te1/0/3 with the source mac-address as aaa.bbb.ccc. |

## Prerequisites for IPv6 Web Authentication

The following configurations must be in place before you start with IPv6 Web Authentication:

- IPv6 Device Tracking.
- IPv6 DHCP Snooping.
- Disable security of type 802.1x on the wlan.
- Each WLAN must have a vlan associated to it.
- Change the default wlan setting from **shutdown** to **no shutdown**.

## Information About IPv6 Web Authentication

Web authentication is a Layer 3 security feature and the device disallows IP traffic (except DHCP and DNS -related packets) from a particular client until it supplies a valid username and password. It is a simple authentication method without the need for a supplicant or client utility. Web authentication is typically used by customers who deploy a guest-access network. Traffic from both, HTTP and HTTPS, page is allowed to display the login page.

---

**Note** Web authentication does not provide data encryption and is typically used as simple guest access for either a hot spot or campus atmosphere, where connectivity is always a factor.

---

A WLAN is configured as **security webauth** for web based authentication. The device supports the following types of web based authentication:

- Web Authentication – The client enters the credentials in a web page which is then validated by the Wlan controller.
- Web Consent – The Wlan controller presents a policy page with Accept/Deny buttons. Click Accept button to access the network.

---

**Note** Maximum consecutive Web Auth sessions supported in device is 40 per second.

---

A Wlan is typically configured for open authentication, that is without Layer 2 authentication, when web-based authentication mechanism is used.

## Web Authentication Process

The following events occur when a WLAN is configured for web authentication:

- The user opens a web browser and enters a URL address, for example, *http://www.example.com*. The client sends out a DNS request for this URL to get the IP address for the destination. The device bypasses the DNS request to the DNS server, which in turn responds with a DNS reply that contains the IP address of the destination *www.example.com*. This, in turn, is forwarded to the wireless clients.
- The client then tries to open a TCP connection with the destination IP address. It sends out a TCP SYN packet destined to the IP address of *www.example.com*.
- The device has rules configured for the client and cannot act as a proxy for *www.example.com*. It sends back a TCP SYN-ACK packet to the client with source as the IP address of *www.example.com*. The client sends back a TCP ACK packet in order to complete the three-way TCP handshake and the TCP connection is fully established.
- The client sends an HTTP GET packet destined to *www.example.com*. The device intercepts this packet and sends it for redirection handling. The HTTP application gateway prepares an HTML body and sends it back as the reply to the HTTP GET requested by the client. This HTML makes the client go to the default web-page of the device, for example, *http://<Virtual-Server-IP>/login.html*.
- The client closes the TCP connection with the IP address, for example, *www.example.com*.

- If the client wants to go to virtual IP, the client tries to open a TCP connection with the virtual IP address of the device. It sends a TCP SYN packet for virtual IP to the device.
- The device responds back with a TCP SYN-ACK and the client sends back a TCP ACK to the device in order to complete the handshake.
- The client sends an HTTP GET for */login.html* destined to virtual IP in order to request for the login page.
- This request is allowed to the web server of the device, and the server responds with the default login page. The client receives the login page in the browser window where the user can log in.

# How to Configure IPv6 Web Authentication

## Disabling WPA

### Before you begin

Disable 802.1x. A typical web authentication does not use Layer 2 security. Use this configuration to remove Layer 2 security.

### SUMMARY STEPS

1. `configure terminal`
2. `wlan test1 2 test1`
3. `no security wpa`

### DETAILED STEPS

|        | Command or Action                                                                                   | Purpose                               |

| Step 1 | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre> | Enters the global configuration mode. |

|               | Command or Action                                                                  | Purpose                                  |
|---------------|------------------------------------------------------------------------------------|------------------------------------------|
| <b>Step 2</b> | <b>wlan test1 2 test1</b><br><b>Example:</b><br>Device(config)# wlan test1 2 test1 | Creates a WLAN and assign an SSID to it. |
| <b>Step 3</b> | <b>no security wpa</b><br><b>Example:</b><br>Device(config-wlan)# no security wpa  | Disables the WPA support for Wlan.       |

**What to do next**

Enable the following:

- Security Web Authentication.
- Parameter Local.
- Authentication List.

## Configuring the WLAN

**Before you begin**

- The WLAN must have a Vlan associated with it. By default, a new Wlan is always associated with Vlan 1, which can be changed as per the configuration requirements.
- Configure and enable the WLAN to *no shutdown*. By default, the Wlan is configured with the *shutdown* parameter and is disabled.

**SUMMARY STEPS**

1. **wlan 1**
2. **client vlan interface ID**
3. **security web-auth authentication list webauthlistlocal**

4. `security web-auth parameter-map global`
5. `no security wpa`
6. `no shutdown`
7. `end`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                         | Purpose                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>wlan</b> <i>l</i><br><b>Example:</b><br>Device(config-wlan)# wlan 1 name vicweb ssid vicweb                                                                            | Creates a wlan and assign an SSID to it.                                                                            |
| <b>Step 2</b> | <b>client vlan</b> <i>interface ID</i><br><b>Example:</b><br>Device(config-wlan)# client vlan VLAN0136                                                                    | Assigns the client to vlan interface.                                                                               |
| <b>Step 3</b> | <b>security web-auth authentication list</b><br><b>webauthlistlocal</b><br><b>Example:</b><br>Device(config-wlan)# security web-auth authentication-list webauthlistlocal | Configures web authentication for the wlan.                                                                         |
| <b>Step 4</b> | <b>security web-auth parameter-map global</b><br><b>Example:</b><br>Device(config-wlan)# security web-auth parameter-map global                                           | Configures the parameter map on the wlan.                                                                           |
| <b>Step 5</b> | <b>no security wpa</b><br><b>Example:</b><br>Device(config-wlan)# no security wpa                                                                                         | Configures the security policy for a wlan. This enables the wlan.                                                   |
| <b>Step 6</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan)# no shutdown                                                                                                 | Configures and enables the Wlan.                                                                                    |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                               | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Feature Information for IPv6 Web Authentication

This table lists the features in this module and provides links to specific configuration information:

| Feature                               | Release            | Modification                 |
|---------------------------------------|--------------------|------------------------------|
| IPv6 Web Authentication Functionality | Cisco IOS XE 3.2SE | This feature was introduced. |

## CHAPTER 19

# Configuring IPv6 Client Mobility

- [Prerequisites for IPv6 Client Mobility, on page 297](#)
- [Restrictions For IPv6 Client Mobility, on page 297](#)
- [Information About IPv6 Client Mobility, on page 298](#)
- [Verifying IPv6 Client Mobility, on page 301](#)
- [Monitoring IPv6 Client Mobility, on page 301](#)
- [Additional References, on page 302](#)
- [Feature Information For IPv6 Client Mobility, on page 303](#)

## Prerequisites for IPv6 Client Mobility

To enable wireless IPv6 client connectivity, the underlying wired network must support IPv6 routing and an address assignment mechanism such as SLAAC or DHCPv6. The device must have L2 adjacency to the IPv6 router, and the VLAN needs to be tagged when the packets enter the device. APs do not require connectivity on an IPv6 network, as all traffic is encapsulated inside the IPv4 CAPWAP tunnel between the AP and device.

## Restrictions For IPv6 Client Mobility

- When using the IPv6 Client Mobility, clients must support IPv6 with either static stateless auto configuration (such as Windows XP clients) or stateful DHCPv6 IP addressing (such as Windows 7 clients).
- To allow smooth operation of stateful DHCPv6 IP addressing, you must have a switch or router that supports the DHCP for IPv6 feature (such as the device) that is configured to act like a DHCPv6 server, or you need a dedicated server such as a Windows 2008 server with a built-in DHCPv6 server. Cisco Catalyst 3850 switch and Cisco Catalyst 5700 switch can act as (internal) a DHCPv6 server.

---

**Note** To load the SDM IPv6 template in the Cisco Catalyst 3850 switch, enter the **sdm prefer dual-ipv4** and **v6 default** command and then reset the switch.

---

# Information About IPv6 Client Mobility

The Device supports IPv6 mobility for IPv6-only or dual-stack nodes. The IPv6 Client Mobility is divided into:

- Link Layer and
- Network Layer

The link layer is handled by the 802.11 protocol which enables the client to roam to any AP in the same BSS (basic service set) identified by the same SSID without losing the link layer connectivity.

However, link layer mobility is not enough to make wireless client Layer 3 applications continue to work seamlessly while roaming. Cisco IOSd's wireless mobility module uses mobility tunneling to retain seamless connectivity for the client's Layer 3 PoP (point of presence) when the client roams across different subnets on different switches.

IPv6 is the next-generation network layer Internet protocol intended to replace IPv4 in the TCP/IP suite of protocols. This new version increases the internet global address space to accommodate users and applications that require unique global IP addresses. IPv6 incorporates 128-bit source and destination addresses, which provide significantly more addresses than the 32-bit IPv4 addresses.

To support IPv6 clients across controllers, ICMPv6 messages must be dealt with specially to ensure the IPv6 client remains on the same Layer 3 network. The device keep track of IPv6 clients by intercepting the ICMPv6 messages to provide seamless mobility and protect the network from network attacks. The NDP (neighbor discovery packets) packets are converted from multicast to unicast and delivered individually per client. This unique solution ensures that Neighbor Discovery and Router Advertisement packets are not leaked across Vlans. Clients can receive specific Neighbor Discovery and Router Advertisement packets ensuring correct IPv6 addressing and avoids unnecessary multicast traffic.

The configuration for IPv6 mobility is the same as IPv4 mobility and requires no separate software on the client side to achieve seamless roaming. The device must be part of the same mobility group. Both IPv4 and IPv6 client mobility are enabled by default.

IPv6 client mobility is used for the following:

- Retaining the client IPv6 multiple addresses in Layer-2 and Layer-3 roaming.
- IPv6 Neighbor Discovery Protocol (NDP) packet management.
- Client IPv6 addresses learning.

## Using Router Advertisement

The Neighbor Discovery Protocol(NDP) operates in the link-layer and is responsible for the discovery of other nodes on the link. It determines the link-layer addresses of other nodes, finds the available routers, and maintains reachability information about the paths to other active neighbor nodes.

Router Advertisement (RA) is one of the IPv6 Neighbor Discovery Protocol (NDP) packets that is used by the hosts to discover available routers, acquire the network prefix to generate the IPv6 addresses, link MTU, and so on. The routers send RA on a regular basis, or in response to hosts Router Solicitation messages.

IPv6 wireless client mobility manages the IPv6 RA packet. The converged access device forwards the link-local all-nodes multicast RA packets to the local and roaming wireless nodes mapped on same VLAN the RA was received on.

Figure 1 illustrates the link-local all-nodes mcast RA forwarding issue in the wireless node mobility.

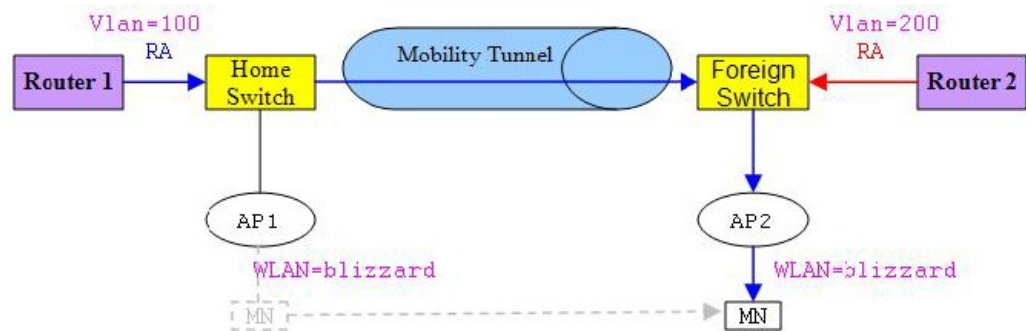

**Figure 11: Roaming Client Receiving Invalid RA from Router 2**

334007

Figure 2 illustrates how a roaming client “MN” receives RA from VLAN 200 in a foreign switch and how it acquires a new IP address and breaks into L3 mobility's point of presence.

## IPv6 Address Learning

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static configuration

For these methods, the IPv6 client always sends NS DAD (duplicate address detection) to ensure that there is no duplicated IP address on the network. The device snoops the clients NDP and DHCPv6 packets to learn about its client IP addresses and then updates the controllers database. The database then informs the controller for the clients new IP address.

## Handling Multiple IP Addresses

In the case when the new IP address is received after RUN state, whether an addition or removal, the controller updates the new IP addresses on its local database for display purposes. Essentially, the IPv6 uses the existing or same PEM state machine code flow as in IPv4. When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller will include all the available IP addresses, IPv4 and IPv6, in the API/SPI interface to the external entities.

An IPv6 client can acquire multiple IP addresses from stack for different purposes. For example, a link-local address for link local traffic, and a routable unique local or global address.

When the client is in the DHCP request state and the controller receives the first IP address notification from the database for either an IPv4 or IPv6 address, the PEM moves the client into the RUN state.

When a new IP address is received after the RUN state, either for addition or removal, the controller updates the new IP addresses on its local database for display purposes.

When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller provides the available IP addresses, both IPv4 and IPv6, to the external entities.

## IPv6 Configuration

The device supports IPv6 client as seamlessly as the IPv4 clients. The administrator must manually configure the Vlans to enable the IPV6, IPv6's snooping and throttling functionality. This will enable the NDP packets to throttle between the device and its various clients

### Related Topics

## High Availability

The switch will sync with the wireless clients when the clients IP address is hard to learn. When a switchover happens, the IPv6 neighbor binding table is synced to standby state. However, the wireless client will itself disassociate and reassociate to a new active state once the switchover is complete and the neighbor binding table is updated with latest information for that client.

If, during the reassociation, the client moves to another AP then the original entry in the binding table is marked as down for sometime and will be aged-out.

For the new entries joining the switch from another AP, the new IP address is learned and notified to the controller's database.

**Note** This feature is available only for the Cisco Catalyst 3850 Switch.

- [Feature Information for IPv6 Mobility, on page 309](#)

## Pre-requisites for IPv6 Mobility

The mobility and its related infrastructure must be configured and ready for use.

## Information About IPv6 Mobility

Mobility, or roaming, is a wireless LAN client's ability to maintain its association seamlessly from one access point to another securely and with as little latency as possible. This section explains how mobility works when devices are included in a wireless network.

When a wireless client associates and authenticates to an access point, the access point's device places an entry for that client in its client database. This entry includes the client's MAC and IP addresses, security context and associations, quality of service (QoS) contexts, the WLAN, and the associated access point. The device uses this information to forward frames and manage traffic to and from the wireless client.

When the wireless client moves its association from one access point to another, the device simply updates the client database with the newly associated access point. If necessary, new security context and associations are established as well. The process becomes more complicated, however, when a client roams from an access point joined to one device to an access point joined to a different device. It also varies based on whether the devices are operating on the same subnet.

## Inter Controller Roaming

When the client associates to an access point joined to a new device, the new device exchanges mobility messages with the original device, and the client database entry is moved to the new device if sticky anchoring is disabled.

**Related Topics**

[Monitoring IPv6 Mobility](#), on page 306

## Intra Subnet Roaming with Sticky Anchoring, and Inter Subnet Roaming

Inter-subnet roaming is similar to inter-controller roaming in that the device exchange mobility messages on the client roam. However, instead of moving the client database entry to the new device, the original device marks the client with an "Anchor" entry in its own client database. The database entry is copied to the new device client database and marked with a "Foreign" entry in the new device. The roam remains transparent to the wireless client, and the client maintains its original IP address.

In inter-subnet roaming, WLANs on both anchor and foreign device need to have the same network access privileges and no source-based routing or source-based firewalls in place. Otherwise, the clients may have network connectivity issues after the handoff.

For more information on configuring mobility see, the Cisco 5700 Wireless LAN Controller Mobility Configuration Guide, Cisco IOS XE, Release 3.2SE.

# CHAPTER 21

## Configuring HSRP

---

- [Configuring HSRP](#) , on page 313

### Configuring HSRP

This chapter describes how to use Hot Standby Router Protocol (HSRP) to provide routing redundancy for routing IP traffic without being dependent on the availability of any single router.

You can also use a version of HSRP in Layer 2 mode to configure a redundant command switch to take over cluster management if the cluster command switch fails.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Information About Configuring HSRP

#### HSRP Overview

HSRP is Cisco's standard method of providing high network availability by providing first-hop redundancy for IP hosts on an IEEE 802 LAN configured with a default gateway IP address. HSRP routes IP traffic without relying on the availability of any single router. It enables a set of router interfaces to work together to present the appearance of a single virtual router or default gateway to the hosts on a LAN. When HSRP is configured on a network or segment, it provides a virtual Media Access Control (MAC) address and an IP address that is shared among a group of configured routers. HSRP allows two or more HSRP-configured routers to use the MAC address and IP network address of a virtual router. The virtual router does not exist; it represents the common target for routers that are configured to provide backup to each other. One of the routers is selected to be the active router and another to be the standby router, which assumes control of the group MAC address and IP address should the designated active router fail.

---

**Note** Routers in an HSRP group can be any router interface that supports HSRP, including routed ports and switch virtual interfaces (SVIs).

---

HSRP provides high network availability by providing redundancy for IP traffic from hosts on networks. In a group of router interfaces, the active router is the router of choice for routing packets; the standby router is the router that takes over the routing duties when an active router fails or when preset conditions are met.

HSRP is useful for hosts that do not support a router discovery protocol and cannot switch to a new router when their selected router reloads or loses power. When HSRP is configured on a network segment, it provides a virtual MAC address and an IP address that is shared among router interfaces in a group of router interfaces running HSRP. The router selected by the protocol to be the active router receives and routes packets destined for the group's MAC address. For  $n$  routers running HSRP, there are  $n + 1$  IP and MAC addresses assigned.

HSRP detects when the designated active router fails, and a selected standby router assumes control of the Hot Standby group's MAC and IP addresses. A new standby router is also selected at that time. Devices running HSRP send and receive multicast UDP-based hello packets to detect router failure and to designate active and standby routers. When HSRP is configured on an interface, Internet Control Message Protocol (ICMP) redirect messages are automatically enabled for the interface.

You can configure multiple Hot Standby groups among switches and switch stacks that are operating in Layer 3 to make more use of the redundant routers. To do so, specify a group number for each Hot Standby command group you configure for an interface. For example, you might configure an interface on switch 1 as an active router and one on switch 2 as a standby router and also configure another interface on switch 2 as an active router with another interface on switch 1 as its standby router.

The following figure shows a segment of a network configured for HSRP. Each router is configured with the MAC address and IP network address of the virtual router. Instead of configuring hosts on the network with the IP address of Router A, you configure them with the IP address of the virtual router as their default router. When Host C sends packets to Host B, it sends them to the MAC address of the virtual router. If for any reason, Router A stops transferring packets, Router B responds to the virtual IP address and virtual MAC address and becomes the active router, assuming the active router duties. Host C continues to use the IP address of the virtual router to address packets destined for Host B, which Router B now receives and sends to Host B. Until Router A resumes operation, HSRP allows Router B to provide uninterrupted service to users on Host C's segment that need to communicate with users on Host B's segment and also continues to perform its normal function of handling packets between the Host A segment and Host B.

Figure 13: Typical HSRP Configuration

You can configure multiple Hot Standby groups among switches and switch stacks that are operating in Layer 3 to make more use of the redundant routers. To do so, specify a group number for each Hot Standby command group you configure for an interface. For example, you might configure an interface on switch 1 as an active router and one on switch 2 as a standby router and also configure another interface on switch 2 as an active router with another interface on switch 1 as its standby router.

## HSRP Versions

Cisco IOS XE Release 3.3SE and later support these Hot Standby Router Protocol (HSRP) versions:

The switch supports these HSRP versions:

- HSRPv1- Version 1 of the HSRP, the default version of HSRP. It has these features:
  - The HSRP group number can be from 0 to 255.
  - HSRPv1 uses the multicast address 224.0.0.2 to send hello packets, which can conflict with Cisco Group Management Protocol (CGMP) leave processing. You cannot enable HSRPv1 and CGMP at the same time; they are mutually exclusive.
- HSRPv2- Version 2 of the HSRP has these features:
  - HSRPv2 uses the multicast address 224.0.0.102 to send hello packets. HSRPv2 and CGMP leave processing are no longer mutually exclusive, and both can be enabled at the same time.
  - HSRPv2 has a different packet format than HRSPv1.
  - The HSRP group number can be from 0 to 4095.

A switch running HSRPv1 cannot identify the physical router that sent a hello packet because the source MAC address of the router is the virtual MAC address.

HSRPv2 has a different packet format than HSRPv1. A HSRPv2 packet uses the type-length-value (TLV) format and has a 6-byte identifier field with the MAC address of the physical router that sent the packet.

If an interface running HSRPv1 gets an HSRPv2 packet, the type field is ignored.

## Multiple HSRP

The switch supports Multiple HSRP (MHSRP), an extension of HSRP that allows load sharing between two or more HSRP groups. You can configure MHSRP to achieve load-balancing and to use two or more standby groups (and paths) from a host network to a server network.

In the figure below, half the clients are configured for Router A, and half the clients are configured for Router B. Together, the configuration for Routers A and B establishes two HSRP groups. For group 1, Router A is the default active router because it has the assigned highest priority, and Router B is the standby router. For group 2, Router B is the default active router because it has the assigned highest priority, and Router A is the standby router. During normal operation, the two routers share the IP traffic load. When either router becomes unavailable, the other router becomes active and assumes the packet-transfer functions of the router that is unavailable.

**Note** For MHSRP, you need to enter the **standby preempt** interface configuration command on the HSRP interfaces so that if a router fails and then comes back up, preemption restores load sharing.

**Figure 14: MSHRP Load Sharing**

## SSO HSRP

SSO HSRP alters the behavior of HSRP when a device with redundant Route Processors (RPs) is configured for stateful switchover (SSO) redundancy mode. When an RP is active and the other RP is standby, SSO enables the standby RP to take over if the active RP fails.

With this functionality, HSRP SSO information is synchronized to the standby RP, allowing traffic that is sent using the HSRP virtual IP address to be continuously forwarded during a switchover without a loss of data or a path change. Additionally, if both RPs fail on the active HSRP device, then the standby HSRP device takes over as the active HSRP device.

The feature is enabled by default when the redundancy mode of operation is set to SSO.

## HSRP and Switch Stacks

HSRP hello messages are generated by the stack master. If an HSRP-active stack master fails, a flap in the HSRP active state might occur. This is because HSRP hello messages are not generated while a new stack master is elected and initialized, and the standby router might become active after the stack master fails.

## Configuring HSRP for IPv6

Switches running the IP Services and IP Base feature set support the Hot Standby Router Protocol (HSRP) for IPv6. HSRP provides routing redundancy for routing IPv6 traffic not dependent on the availability of any single router. IPv6 hosts learn of available routers through IPv6 neighbor discovery router advertisement messages. These messages are multicast periodically or are solicited by hosts.

An HSRP IPv6 group has a virtual MAC address that is derived from the HSRP group number and a virtual IPv6 link-local address that is, by default, derived from the HSRP virtual MAC address.

Periodic messages are sent for the HSRP virtual IPv6 link-local address when the HSRP group is active. These messages stop after a final one is sent when the group leaves the active state.

---

**Note** When configuring HSRP for IPv6, you must enable HSRP version 2 (HSRPv2) on the interface.

---

## How to Configure HSRP

### Default HSRP Configuration

*Table 28: Default HSRP Configuration*

| Feature                          | Default Setting                                                       |
|----------------------------------|-----------------------------------------------------------------------|
| HSRP version                     | Version 1                                                             |
| HSRP groups                      | None configured                                                       |
| Standby group number             | 0                                                                     |
| Standby MAC address              | System assigned as: 0000.0c07.acXX, where XX is the HSRP group number |
| Standby priority                 | 100                                                                   |
| Standby delay                    | 0 (no delay)                                                          |
| Standby track interface priority | 10                                                                    |
| Standby hello time               | 3 seconds                                                             |
| Standby holdtime                 | 10 seconds                                                            |

## HSRP Configuration Guidelines

- HSRPv2 and HSRPv1 are mutually exclusive. HSRPv2 is not interoperable with HSRPv1 on an interface and the reverse.
- In the procedures, the specified interface must be one of these Layer 3 interfaces:
  - Routed port: A physical port configured as a Layer 3 port by entering the **no switchport** command in interface configuration mode.
  - SVI: A VLAN interface created by using the **interface vlan** *vlan\_id* in global configuration mode, and by default a Layer 3 interface.
  - Etherchannel port channel in Layer 3 mode: A port-channel logical interface created by using the **interface port-channel** *port-channel-number* in global configuration mode, and binding the Ethernet interface into the channel group.
- All Layer 3 interfaces must have IP addresses assigned to them.
- 
- If you change the HSRP version on an interface, each HSRP group resets because it now has a new virtual MAC address.
- Only on mixed stacks of Catalyst switches:
  - HSRP for IPv4 and HSRP for IPv6 are mutually exclusive. You cannot enable both at the same time.
  - When configuring group numbers for HSRPv2 and HSRP, you must use group numbers in ranges that are multiples of 256. Valid ranges are 0 to 255, 256 to 511, 512 to 767, 3840 to 4095, and so on.
  - Examples of valid and invalid group numbers:
    - If you configure groups with the numbers 2, 150, and 225, you cannot configure another group with the number 3850. It is not in the range of 0 to 255.
    - If you configure groups with the numbers 520, 600, and 700, you cannot configure another group with the number 900. It is not in the range of 512 to 767.

---

**Note** HSRP millisecond timers are not supported.

---

## Enabling HSRP

The **standby ip** interface configuration command activates HSRP on the configured interface. If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the address is learned through the standby function. You must configure at least one Layer 3 port on the LAN with the designated address. Configuring an IP address always overrides another designated address currently in use.

When the **standby ip** command is enabled on an interface and proxy ARP is enabled, if the interface's Hot Standby state is active, proxy ARP requests are answered using the Hot Standby group MAC address. If the interface is in a different state, proxy ARP responses are suppressed.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **standby version** { 1 | 2 }
4. **standby** [*group-number*] **ip** [*ip-address* [**secondary**]]
5. **end**
6. **show standby** [*interface-id* [*group*]]
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Switch(config)# <b>configure terminal</b>                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Switch(config)# <b>interface</b> gigabitethernet1/0/1                                        | Enters interface configuration mode, and enter the Layer 3 interface on which you want to enable HSRP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>standby version</b> { 1   2 }<br><b>Example:</b><br>Switch(config-if)# <b>standby version</b> 1                                                      | (Optional) Configures the HSRP version on the interface.<br><br><ul style="list-style-type: none"> <li>• 1- Selects HSRPv1.</li> <li>• 2- Selects HSRPv2.</li> </ul> If you do not enter this command or do not specify a keyword, the interface runs the default HSRP version, HSRP v1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 4 | <b>standby</b> [ <i>group-number</i> ] <b>ip</b> [ <i>ip-address</i> [ <b>secondary</b> ]]<br><b>Example:</b><br>Switch(config-if)# <b>standby</b> 1 ip | Creates (or enable) the HSRP group using its number and virtual IP address.<br><br><ul style="list-style-type: none"> <li>• (Optional) <b>group-number</b>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <b>ip-address</b>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul> |

|        | Command or Action                                                                                                 | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>end</b><br><b>Example:</b><br>Switch(config-if)# <b>end</b>                                                    | Returns to privileged EXEC mode                          |
| Step 6 | <b>show standby</b> [ <i>interface-id</i> [ <i>group</i> ]]<br><b>Example:</b><br>Switch # <b>show standby</b>    | Verifies the configuration of the standby groups.        |
| Step 7 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Switch# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring HSRP Priority

The **standby priority**, **standby preempt**, and **standby track** interface configuration commands are all used to set characteristics for finding active and standby routers and behavior regarding when a new active router takes over.

When configuring HSRP priority, follow these guidelines:

- Assigning a priority allows you to select the active and standby routers. If preemption is enabled, the router with the highest priority becomes the active router. If priorities are equal, the current active router does not change.
- The highest number (1 to 255) represents the highest priority (most likely to become the active router).
- When setting the priority, preempt, or both, you must specify at least one keyword (**priority**, **preempt**, or both)
- The priority of the device can change dynamically if an interface is configured with the **standby track** command and another interface on the router goes down.
- The **standby track** interface configuration command ties the router hot standby priority to the availability of its interfaces and is useful for tracking interfaces that are not configured for HSRP. When a tracked interface fails, the hot standby priority on the device on which tracking has been configured decreases by 10. If an interface is not tracked, its state changes do not affect the hot standby priority of the configured device. For each interface configured for hot standby, you can configure a separate list of interfaces to be tracked
- The **standby track interface-priority** interface configuration command specifies how much to decrement the hot standby priority when a tracked interface goes down. When the interface comes back up, the priority is incremented by the same amount.
- When multiple tracked interfaces are down and *interface-priority* values have been configured, the configured priority decrements are cumulative. If tracked interfaces that were not configured with priority values fail, the default decrement is 10, and it is noncumulative.
- When routing is first enabled for the interface, it does not have a complete routing table. If it is configured to preempt, it becomes the active router, even though it is unable to provide adequate routing services. To solve this problem, configure a delay time to allow the router to update its routing table.

Beginning in privileged EXEC mode, use one or more of these steps to configure HSRP priority characteristics on an interface:

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **standby** [*group-number*] **priority***priority*
4. **standby** [*group-number*] **preempt** [**delay** [*minimumseconds*] [**reloadseconds**] [*syncseconds*]]
5. **standby** [*group-number*] **track** *type number* [*interface-priority*]
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Configuring MHSRP

To enable MHSRP and load-balancing, you configure two routers as active routers for their groups, with virtual routers as standby routers as shown in the *MHSRP Load Sharing* figure in the Multiple HSRP section. You need to enter the **standby preempt** interface configuration command on each HSRP interface so that if a router fails and comes back up, the preemption occurs and restores load-balancing.

Router A is configured as the active router for group 1, and Router B is configured as the active router for group 2. The HSRP interface for Router A has an IP address of 10.0.0.1 with a group 1 standby priority of 110 (the default is 100). The HSRP interface for Router B has an IP address of 10.0.0.2 with a group 2 standby priority of 110.

Group 1 uses a virtual IP address of 10.0.0.3 and group 2 uses a virtual IP address of 10.0.0.4.

### Configuring Router A

#### SUMMARY STEPS

1. **configure terminal**

2. **interface** *type number*
3. **no switchport**
4. **ip address** *ip-address mask*
5. **standby** [*group-number*] **ip** [*ip-address* [**secondary**]]
6. **standby** [*group-number*] **priority** *priority*
7. **standby** [*group-number*] **preempt** [**delay** [*minimum seconds*] [**reload** *seconds*] [**sync** *seconds*]]
8. **standby** [*group-number*] **ip** [*ip-address* [**secondary**]]
9. **standby** [*group-number*] **preempt** [**delay** [*minimum seconds*] [**reload** *seconds*] [**sync** *seconds*]]
10. **end**
11. **show running-config**
12. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Switch # <b>configure terminal</b>                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Switch (config)# <b>interface</b> <b>gigabitethernet1/0/1</b>                                           | Configures an interface type and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>no switchport</b><br><br><b>Example:</b><br>Switch (config)# <b>no switchport</b>                                                                                  | Switches an interface that is in Layer 2 mode into Layer 3 mode for Layer 3 configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>ip address</b> <i>ip-address mask</i><br><br><b>Example:</b><br>Switch (config-if)# <b>10.0.0.1 255.255.255.0</b>                                                  | Specifies an IP address for an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b> | <b>standby</b> [ <i>group-number</i> ] <b>ip</b> [ <i>ip-address</i> [ <b>secondary</b> ]]<br><br><b>Example:</b><br>Switch (config-if)# <b>standby 1 ip 10.0.0.3</b> | Creates the HSRP group using its number and virtual IP address. <ul style="list-style-type: none"> <li>• (Optional) <i>group-number</i>- The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</li> <li>• (Optional on all but one interface) <i>ip-address</i>- The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</li> <li>• (Optional) <b>secondary</b>- The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are</li> </ul> |

If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 9</b>  | <p><b>standby</b> [<i>group-number</i>] <b>preempt</b> [<b>delay</b> [<i>minimum seconds</i>] [<b>reload</b> <i>seconds</i>] [<b>sync</b> <i>seconds</i>]]</p> <p><b>Example:</b></p> <pre>Switch(config-if)# standby 2 preempt delay 300</pre> | <p>Configures the router to <b>preempt</b>, which means that when the local router has a higher priority than the active router, it becomes the active router.</p> <ul style="list-style-type: none"> <li>(Optional) <b>group-number</b>-The group number to which the command applies.</li> <li>(Optional) <b>delay minimum</b>—Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> <li>(Optional) <b>delay reload</b>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> <li>(Optional) <b>delay sync</b>—Set to cause the local router to postpone taking over the active role so that IP redundancy clients can reply (either with an ok or wait reply) for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> </ul> <p>Use the <b>no</b> form of the command to restore the default values.</p> |
| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Switch(config-if)# end</pre>                                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 11</b> | <b>show running-config</b>                                                                                                                                                                                                                      | Verifies the configuration of the standby groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 12</b> | <b>copy running-config startup-config</b>                                                                                                                                                                                                       | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring Router B

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *type number*
3. **no switchport**
4. **ip address** *ip-address mask*
5. **standby** [*group-number*] **ip** [*ip-address*] [**secondary**]

6. **standby** [*group-number*] **priority** *priority*
7. **standby** [*group-number*] **preempt** [**delay** [*minimum seconds*] [**reload** *seconds*] [**sync** *seconds*] ]
8. **standby** [*group-number*] **ip** [*ip-address* [**secondary**] ]
9. **standby** [*group-number*] **preempt** [**delay** [*minimum seconds*] [**reload** *seconds*] [**sync** *seconds*] ]
10. **end**
11. **show running-config**
12. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring HSRP Authentication and Timers

You can optionally configure an HSRP authentication string or change the hello-time interval and holdtime.

When configuring these attributes, follow these guidelines:

- The authentication string is sent unencrypted in all HSRP messages. You must configure the same authentication string on all routers and access servers on a cable to ensure interoperability. Authentication mismatch prevents a device from learning the designated Hot Standby IP address and timer values from other routers configured with HSRP.
- Routers or access servers on which standby timer values are not configured can learn timer values from the active or standby router. The timers configured on an active router always override any other timer settings.

- All routers in a Hot Standby group should use the same timer values. Normally, the *holdtime* is greater than or equal to 3 times the *hellotime*.

Beginning in privileged EXEC mode, use one or more of these steps to configure HSRP authentication and timers on an interface:

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **standby** [*group-number*] **authentication** *string*
4. **standby** [*group-number*] **timers** *hellotime holdtime*
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Switch # <b>configure terminal</b>                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 2 | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Switch(config) # <b>interface gigabitethernet1/0/1</b>                                         | Enters interface configuration mode, and enter the HSRP interface on which you want to set priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>standby</b> [ <i>group-number</i> ] <b>authentication</b> <i>string</i><br><b>Example:</b><br>Switch(config-if) # <b>standby 1 authentication word</b> | (Optional) <b>authentication string</b> —Enter a string to be carried in all HSRP messages. The authentication string can be up to eight characters in length; the default string is <b>cisco</b> .<br>(Optional) <i>group-number</i> —The group number to which the command applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 4 | <b>standby</b> [ <i>group-number</i> ] <b>timers</b> <i>hellotime holdtime</i><br><b>Example:</b><br>Switch(config-if) # <b>standby 1 timers 5 15</b>     | (Optional) Configure the time between hello packets and the time before other routers declare the active router to be down.<br><br><ul style="list-style-type: none"> <li>• <i>group-number</i>—The group number to which the command applies.</li> <li>• <i>hellotime</i> —Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over).</li> <li>• <i>holdtime</i>—Set to cause the local router to postpone taking over the active role after a reload for the number of seconds shown. The range is 0 to 3600 seconds (1 hour); the default is 0 (no delay before taking over after a reload).</li> </ul> |

|               | Command or Action                                                   | Purpose                                                  |
|---------------|---------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Switch(config-if) # end</pre> | Returns to privileged EXEC mode.                         |
| <b>Step 6</b> | <b>show running-config</b>                                          | Verifies the configuration of the standby groups.        |
| <b>Step 7</b> | <b>copy running-config startup-config</b>                           | (Optional) Saves your entries in the configuration file. |

## Enabling HSRP Support for ICMP Redirect Messages

ICMP redirect messages are automatically enabled on interfaces configured with HSRP. ICMP is a network layer Internet protocol that provides message packets to report errors and other information relevant to IP processing. ICMP provides diagnostic functions, such as sending and directing error packets to the host. This feature filters outgoing ICMP redirect messages through HSRP, in which the next hop IP address might be changed to an HSRP virtual IP address. For more information, see the Cisco IOS IP Configuration Guide, Release 12.4.

## Configuring HSRP Groups and Clustering

When a device is participating in an HSRP standby routing and clustering is enabled, you can use the same standby group for command switch redundancy and HSRP redundancy. Use the **cluster standby-group** *HSRP-group-name* [**routing-redundancy**] global configuration command to enable the same HSRP standby group to be used for command switch and routing redundancy. If you create a cluster with the same HSRP standby group name without entering the **routing-redundancy** keyword, HSRP standby routing is disabled for the group.

## Verifying HSRP

### Verifying HSRP Configurations

From privileged EXEC mode, use this command to display HSRP settings:

```
show standby [interface-id [group]] [brief] [detail]
```

You can display HSRP information for the whole switch, for a specific interface, for an HSRP group, or for an HSRP group on an interface. You can also specify whether to display a concise overview of HSRP information or detailed HSRP information. The default display is **detail**. If there are a large number of HSRP groups, using the **show standby** command without qualifiers can result in an unwieldy display.

#### Example

```
Switch #show standby
VLAN1 - Group 1
Local state is Standby, priority 105, may preempt
Hellotime 3 holdtime 10
Next hello sent in 00:00:02.182
Hot standby IP address is 172.20.128.3 configured
Active router is 172.20.128.1 expires in 00:00:09
Standby router is local
```

```

Standby virtual mac address is 0000.0c07.ac01
Name is bbb

VLAN1 - Group 100
Local state is Standby, priority 105, may preempt
Hellotime 3 holdtime 10
Next hello sent in 00:00:02.262
Hot standby IP address is 172.20.138.51 configured
Active router is 172.20.128.1 expires in 00:00:09
Active router is local
Standby router is unknown expired
Standby virtual mac address is 0000.0c07.ac64
Name is test

```

## Configuration Examples for Configuring HSRP

### Enabling HSRP: Example

This example shows how to activate HSRP for group 1 on an interface. The IP address used by the hot standby group is learned by using HSRP.

**Note** This procedure is the minimum number of steps required to enable HSRP. Other configurations are optional.

```

Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby 1 ip
Switch(config-if) # end
Switch # show standby

```

### Configuring HSRP Priority: Example

This example activates a port, sets an IP address and a priority of 120 (higher than the default value), and waits for 300 seconds (5 minutes) before attempting to become the active router:

```

Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby ip 172.20.128.3
Switch(config-if) # standby priority 120 preempt delay 300
Switch(config-if) # end
Switch # show standby

```

### Configuring MHSRP: Example

This example shows how to enable the MHSRP configuration shown in the figure *MHSRP Load Sharing*

#### Router A Configuration

```

Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport

```

```
Switch(config-if) # ip address 10.0.0.1 255.255.255.0
Switch(config-if) # standby ip 10.0.0.3
Switch(config-if) # standby 1 priority 110
Switch(config-if) # standby 1 preempt
Switch(config-if) # standby 2 ip 10.0.0.4
Switch(config-if) # standby 2 preempt
Switch(config-if) # end
```

### Router B Configuration

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # ip address 10.0.0.2 255.255.255.0
Switch(config-if) # standby ip 10.0.0.3
Switch(config-if) # standby 1 preempt
Switch(config-if) # standby 2 ip 10.0.0.4
Switch(config-if) # standby 1 priority 110
Switch(config-if) # standby 2 preempt
Switch(config-if) # end
```

## Configuring HSRP Authentication and Timer: Example

This example shows how to configure word as the authentication string required to allow Hot Standby routers in group 1 to interoperate:

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby 1 authentication word
Switch(config-if) # end
```

This example shows how to set the timers on standby group 1 with the time between hello packets at 5 seconds and the time after which a router is considered down to be 15 seconds:

```
Switch # configure terminal
Switch(config) # interface gigabitethernet1/0/1
Switch(config-if) # no switchport
Switch(config-if) # standby 1 ip
Switch(config-if) # standby 1 timers 5 15
Switch(config-if) # end
```

## Configuring HSRP Groups and Clustering: Example

This example shows how to bind standby group my\_hsrp to the cluster and enable the same HSRP group to be used for command switch redundancy and router redundancy. The command can only be executed on the cluster command switch. If the standby group name or number does not exist, or if the switch is a cluster member switch, an error message appears.

```
Switch # configure terminal
Switch(config) # cluster standby-group my_hsrp routing-redundancy
Switch(config-if) # end
```

# IP Multicast Routing Technology Overview

---

- [Finding Feature Information, on page 337](#)
- [Information About IP Multicast Technology, on page 337](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Information About IP Multicast Technology

### Role of IP Multicast in Information Delivery

IP multicast is a bandwidth-conserving technology that reduces traffic by delivering a single stream of information simultaneously to potentially thousands of businesses and homes. Applications that take advantage of multicast include video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

IP multicast routing enables a host (source) to send packets to a group of hosts (receivers) anywhere within the IP network by using a special form of IP address called the IP multicast group address. The sending host inserts the multicast group address into the IP destination address field of the packet and IP multicast routers and multilayer switches forward incoming IP multicast packets out all interfaces that lead to the members of the multicast group. Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message.

## IP Multicast Routing Protocols

The software supports the following protocols to implement IP multicast routing:

- IGMP is used between hosts on a LAN and the routers (and multilayer devices) on that LAN to track the multicast groups of which hosts are members. To participate in IP multicasting, multicast hosts, routers, and multilayer devices must have the Internet Group Management Protocol (IGMP) operating.
- Protocol Independent Multicast (PIM) is used between routers so that they can track which multicast packets to forward to each other and to their directly connected LANs.
- IGMP Snooping is used for multicasting in a Layer 2 switching environment. It helps reduce the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices.

This figure shows where these protocols operate within the IP multicast environment.

**Figure 15: IP Multicast Routing Protocols**

According to IPv4 multicast standards, the MAC destination multicast address begins with 0100:5e and is appended by the last 23 bits of the IP address. For example, if the IP destination address is 239.1.1.39, the MAC destination address is 0100:5e01:0127.

A multicast packet is unmatched when the destination IPv4 address does not match the destination MAC address. The device forwards the unmatched packet in hardware based upon the MAC address table. If the destination MAC address is not in the MAC address table, the device floods the packet to the all port in the same VLAN as the receiving port.

## Multicast Group Transmission Scheme

IP communication consists of hosts that act as senders and receivers of traffic as shown in the first figure. Senders are called sources. Traditional IP communication is accomplished by a single host source sending packets to another single host (unicast transmission) or to all hosts (broadcast transmission). IP multicast provides a third scheme, allowing a host to send packets to a subset of all hosts (multicast transmission). This subset of receiving hosts is called a multicast group. The hosts that belong to a multicast group are called group members.

Multicast is based on this group concept. A multicast group is an arbitrary number of receivers that join a group in order to receive a particular data stream. This multicast group has no physical or geographical boundaries--the hosts can be located anywhere on the Internet or on any private internetwork. Hosts that are interested in receiving data from a source to a particular group must join that group. Joining a group is accomplished by a host receiver by way of the Internet Group Management Protocol (IGMP).

In a multicast environment, any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group can receive packets sent to that group. Multicast packets are delivered to a group using best-effort reliability, just like IP unicast packets.

Unicast transmission—One host sends and the other receives.

Broadcast transmission—One sender to all receivers.

Multicast transmission—One sender to a group of receivers.

In the next figure, the receivers (the designated multicast group) are interested in receiving the video data stream from the source. The receivers indicate their interest by sending an IGMP host report to the routers in the network. The routers are then responsible for delivering the data from the source to the receivers. The routers use Protocol Independent Multicast (PIM) to dynamically create a multicast distribution tree. The video data stream will then be delivered only to the network segments that are in the path between the source and the receivers.

[Defining the IP Multicast Boundary \(CLI\)](#), on page 452

[Example: Configuring an IP Multicast Boundary](#), on page 579

## IP Multicast Boundary

As shown in the figure, address scoping defines domain boundaries so that domains with RPs that have the same IP address do not leak into each other. Scoping is performed on the subnet boundaries within large domains and on the boundaries between the domain and the Internet.

**Figure 16: Address Scoping at Boundaries**

You can set up an administratively scoped boundary on an interface for multicast group addresses using the **ip multicast boundary** command with the *access-list* argument. A standard access list defines the range of addresses affected. When a boundary is set up, no multicast data packets are allowed to flow across the boundary from either direction. The boundary allows the same multicast group address to be reused in different administrative domains.

The Internet Assigned Numbers Authority (IANA) has designated the multicast address range 239.0.0.0 to 239.255.255.255 as the administratively scoped addresses. This range of addresses can be reused in domains administered by different organizations. They would be considered local, not globally unique.

You can configure the **filter-autorp** keyword to examine and filter Auto-RP discovery and announcement messages at the administratively scoped boundary. Any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary access control list (ACL) are removed. An Auto-RP group range announcement is permitted and passed by the boundary only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

[Example: Configuring an IP Multicast Boundary](#), on page 579

## IP Multicast Group Addressing

A multicast group is identified by its multicast group address. Multicast packets are delivered to that multicast group address. Unlike unicast addresses that uniquely identify a single host, multicast IP addresses do not identify a particular host. To receive the data sent to a multicast address, a host must join the group that address identifies. The data is sent to the multicast address and received by all the hosts that have joined the group indicating that they wish to receive traffic sent to that group. The multicast group address is assigned to a group at the source. Network administrators who assign multicast group addresses must make sure the addresses conform to the multicast address range assignments reserved by the Internet Assigned Numbers Authority (IANA).

### IP Class D Addresses

IP multicast addresses have been assigned to the IPv4 Class D address space by IANA. The high-order four bits of a Class D address are 1110. Therefore, host group addresses can be in the range 224.0.0.0 to 239.255.255.255. A multicast address is chosen at the source (sender) for the receivers in a multicast group.

**Note** The Class D address range is used only for the group address or destination address of IP multicast traffic. The source address for multicast datagrams is always the unicast source address.

## IP Multicast Address Scoping

The multicast address range is subdivided to provide predictable behavior for various address ranges and for address reuse within smaller domains. The table provides a summary of the multicast address ranges. A brief summary description of each range follows.

**Table 30: Multicast Address Range Assignments**

| Name                          | Range                        | Description                                                                                                                            |
|-------------------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Reserved Link-Local Addresses | 224.0.0.0 to 224.0.0.255     | Reserved for use by network protocols on a local network segment.                                                                      |
| Globally Scoped Addresses     | 224.0.1.0 to 238.255.255.255 | Reserved to send multicast data between organizations and across the Internet.                                                         |
| Source Specific Multicast     | 232.0.0.0 to 232.255.255.255 | Reserved for use with the SSM datagram delivery model where data is forwarded only to receivers that have explicitly joined the group. |

| Name                  | Range                        | Description                                                                                                                    |
|-----------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| GLOP Addresses        | 233.0.0.0 to 233.255.255.255 | Reserved for statically defined addresses by organizations that already have an assigned autonomous system (AS) domain number. |
| Limited Scope Address | 239.0.0.0 to 239.255.255.255 | Reserved as administratively or limited scope addresses for use in private multicast domains.                                  |

### Reserved Link-Local Addresses

The IANA has reserved the range 224.0.0.0 to 224.0.0.255 for use by network protocols on a local network segment. Packets with an address in this range are local in scope and are not forwarded by IP routers. Packets with link local destination addresses are typically sent with a time-to-live (TTL) value of 1 and are not forwarded by a router.

Within this range, reserved link-local addresses provide network protocol functions for which they are reserved. Network protocols use these addresses for automatic router discovery and to communicate important routing information. For example, Open Shortest Path First (OSPF) uses the IP addresses 224.0.0.5 and 224.0.0.6 to exchange link-state information.

IANA assigns single multicast address requests for network protocols or network applications out of the 224.0.1.xxx address range. Multicast routers forward these multicast addresses.

### Globally Scoped Addresses

Addresses in the range 224.0.1.0 to 238.255.255.255 are called globally scoped addresses. These addresses are used to send multicast data between organizations across the Internet. Some of these addresses have been reserved by IANA for use by multicast applications. For example, the IP address 224.0.1.1 is reserved for Network Time Protocol (NTP).

### Source Specific Multicast Addresses

Addresses in the range 232.0.0.0/8 are reserved for Source Specific Multicast (SSM) by IANA. In Cisco IOS software, you can use the `ip pim ssm` command to configure SSM for arbitrary IP multicast addresses also. SSM is an extension of Protocol Independent Multicast (PIM) that allows for an efficient data delivery mechanism in one-to-many communications. SSM is described in the [IP Multicast Delivery Modes, on page 343](#) section.

### GLOP Addresses

GLOP addressing (as proposed by RFC 2770, GLOP Addressing in 233/8) proposes that the 233.0.0.0/8 range be reserved for statically defined addresses by organizations that already have an AS number reserved. This practice is called GLOP addressing. The AS number of the domain is embedded into the second and third octets of the 233.0.0.0/8 address range. For example, AS 62010 is written in hexadecimal format as F23A. Separating the two octets F2 and 3A results in 242 and 58 in decimal format. These values result in a subnet of 233.242.58.0/24 that would be globally reserved for AS 62010 to use.

### Limited Scope Addresses

The range 239.0.0.0 to 239.255.255.255 is reserved as administratively or limited scoped addresses for use in private multicast domains. These addresses are constrained to a local group or organization. Companies, universities, and other organizations can use limited scope addresses to have local multicast applications that will not be forwarded outside their domain. Routers typically are configured with filters to prevent multicast

traffic in this address range from flowing outside an autonomous system (AS) or any user-defined domain. Within an AS or domain, the limited scope address range can be further subdivided so that local multicast boundaries can be defined.

---

**Note** Network administrators may use multicast addresses in this range, inside a domain, without conflicting with others elsewhere in the Internet.

---

## Layer 2 Multicast Addresses

Historically, network interface cards (NICs) on a LAN segment could receive only packets destined for their burned-in MAC address or the broadcast MAC address. In IP multicast, several hosts need to be able to receive a single data stream with a common destination MAC address. Some means had to be devised so that multiple hosts could receive the same packet and still be able to differentiate between several multicast groups. One method to accomplish this is to map IP multicast Class D addresses directly to a MAC address. Using this method, NICs can receive packets destined to many different MAC address.

Cisco Group Management Protocol (CGMP) is used on routers connected to Catalyst switches to perform tasks similar to those performed by IGMP. CGMP is necessary for those Catalyst switches that cannot distinguish between IP multicast data packets and IGMP report messages, both of which are addressed to the same group address at the MAC level.

## IP Multicast Delivery Modes

IP multicast delivery modes differ only for the receiver hosts, not for the source hosts. A source host sends IP multicast packets with its own IP address as the IP source address of the packet and a group address as the IP destination address of the packet.

### Source Specific Multicast

Source Specific Multicast (SSM) is a datagram delivery model that best supports one-to-many applications, also known as broadcast applications. SSM is a core network technology for the Cisco implementation of IP multicast targeted for audio and video broadcast application environments.

For the SSM delivery mode, an IP multicast receiver host must use IGMP Version 3 (IGMPv3) to subscribe to channel (S,G). By subscribing to this channel, the receiver host is indicating that it wants to receive IP multicast traffic sent by source host S to group G. The network will deliver IP multicast packets from source host S to group G to all hosts in the network that have subscribed to the channel (S, G).

SSM does not require group address allocation within the network, only within each source host. Different applications running on the same source host must use different SSM groups. Different applications running on different source hosts can arbitrarily reuse SSM group addresses without causing any excess traffic on the network.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Prerequisites for IGMP and IGMP Snooping

### Prerequisites for IGMP

- Before performing the tasks in this module, you should be familiar with the concepts explained in the "IP Multicast Routing Technology Overview" module.
- The tasks in this module assume that IP multicast has been enabled and that the Protocol Independent Multicast (PIM) interfaces have been configured using the tasks described in the "Configuring Basic IP Multicast Routing" module.

## Prerequisites for IGMP Snooping

Observe these guidelines when configuring the IGMP snooping querier:

- Configure the VLAN in global configuration mode.
- Configure an IP address on the VLAN interface. When enabled, the IGMP snooping querier uses the IP address as the query source address.
- If there is no IP address configured on the VLAN interface, the IGMP snooping querier tries to use the configured global IP address for the IGMP querier. If there is no global IP address specified, the IGMP querier tries to use the VLAN device virtual interface (SVI) IP address (if one exists). If there is no SVI IP address, the device uses the first available IP address configured on the device. The first IP address available appears in the output of the **show ip interface** privileged EXEC command. The IGMP snooping querier does not generate an IGMP general query if it cannot find an available IP address on the device.
- The IGMP snooping querier supports IGMP Versions 1 and 2.
- When administratively enabled, the IGMP snooping querier moves to the nonquerier state if it detects the presence of a multicast router in the network.
- When it is administratively enabled, the IGMP snooping querier moves to the operationally disabled state under these conditions:
  - IGMP snooping is disabled in the VLAN.
  - PIM is enabled on the SVI of the corresponding VLAN.

## Restrictions for IGMP and IGMP Snooping

### Restrictions for Configuring IGMP

The following are the restrictions for configuring IGMP:

- The device supports IGMP Versions 1, 2, and 3.

---

**Note** For IGMP Version 3, only IGMP Version 3 BISS (Basic IGMPv3 Snooping Support) is supported.

---

- IGMP Version 3 uses new membership report messages that might not be correctly recognized by older IGMP snooping devices.
- IGMPv3 can operate with both ISM and SSM. In ISM, both exclude and include mode reports are applicable. In SSM, only include mode reports are accepted by the last-hop router. Exclude mode reports are ignored.
- IGMP filtering and throttling is not supported under the WLAN.
- You cannot have a device stack containing a mix of Catalyst 3850 and Catalyst 3650 devices.

**Related Topics**

[Changing the IGMP Version\(CLI\)](#), on page 361

[IGMP Versions](#), on page 348

## Restrictions for IGMP Snooping

The following are the restrictions for IGMP snooping:

- The device supports IGMPv3 snooping based only on the destination multicast IP address. It does not support snooping based on a source IP address or proxy report.
- IGMPv3 join and leave messages are not supported on devices running IGMP filtering or Multicast VLAN registration (MVR).
- IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.
- The IGMP configurable leave time is only supported on hosts running IGMP Version 2. IGMP version 2 is the default version for the device.

The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.

- The IGMP throttling action restriction can be applied only to Layer 2 ports. You can use **ip igmp max-groups action replace** interface configuration command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

When the maximum group limitation is set to the default (no maximum), entering the **ip igmp max-groups action {deny | replace}** command has no effect.

If you configure the throttling action and set the maximum group limitation after an interface has added multicast entries to the forwarding table, the forwarding-table entries are either aged out or removed, depending on the throttling action.

**Related Topics**

[IGMP Versions](#), on page 348

## Information About IGMP

### Role of the Internet Group Management Protocol

IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. Enabling PIM on an interface also enables IGMP. IGMP provides a means to automatically control and limit the flow of multicast traffic throughout your network with the use of special multicast queriers and hosts.

- A querier is a network device, such as a router, that sends query messages to discover which network devices are members of a given multicast group.
- A host is a receiver, including routers, that sends report messages (in response to query messages) to inform the querier of a host membership. Hosts use IGMP messages to join and leave multicast groups.

Hosts identify group memberships by sending IGMP messages to their local multicast device. Under IGMP, devices listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

## IGMP Multicast Addresses

IP multicast traffic uses group addresses, which are Class D IP addresses. The high-order four bits of a Class D address are 1110. Therefore, host group addresses can be in the range 224.0.0.0 to 239.255.255.255.

Multicast addresses in the range 224.0.0.0 to 224.0.0.255 are reserved for use by routing protocols and other network control traffic. The address 224.0.0.0 is guaranteed not to be assigned to any group.

IGMP packets are transmitted using IP multicast group addresses as follows:

- IGMP general queries are destined to the address 224.0.0.1 (all systems on a subnet).
- IGMP group-specific queries are destined to the group IP address for which the device is querying.
- IGMP group membership reports are destined to the group IP address for which the device is reporting.
- IGMPv2 leave-group messages are destined to the address 224.0.0.2 (all devices on a subnet).
- IGMPv3 membership reports are destined to the address 224.0.0.22; all IGMPv3-capable multicast devices must listen to this address.

### Related Topics

[Configuring the Device as a Member of a Group \(CLI\)](#), on page 358

[Example: Configuring the Device as a Member of a Multicast Group](#), on page 396

## IGMP Versions

The device supports IGMP version 1, IGMP version 2, and IGMP version 3. These versions are interoperable on the device. For example, if IGMP snooping is enabled and the querier's version is IGMPv2, and the device receives an IGMPv3 report from a host, then the device can forward the IGMPv3 report to the multicast router.

An IGMPv3 device can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature.

### Related Topics

[Changing the IGMP Version \(CLI\)](#), on page 361

[Restrictions for Configuring IGMP](#), on page 346

[Restrictions for IGMP Snooping](#), on page 347

## IGMP Version 1

IGMP version 1 (IGMPv1) primarily uses a query-response model that enables the multicast router and multilayer device to find which multicast groups are active (have one or more hosts interested in a multicast group) on the local subnet. IGMPv1 has other processes that enable a host to join and leave a multicast group. For more information, see RFC 1112.

## IGMP Version 2

IGMPv2 extends IGMP functionality by providing such features as the IGMP leave process to reduce leave latency, group-specific queries, and an explicit maximum query response time. IGMPv2 also adds the capability

for routers to elect the IGMP querier without depending on the multicast protocol to perform this task. For more information, see RFC 2236.

**Note** IGMP version 2 is the default version for the device.

## IGMP Version 3

The device supports IGMP version 3.

An IGMPv3 device supports Basic IGMPv3 Snooping Support (BISS), which includes support for the snooping features on IGMPv1 and IGMPv2 switches and for IGMPv3 membership report messages. BISS constrains the flooding of multicast traffic when your network includes IGMPv3 hosts. It constrains traffic to approximately the same set of ports as the IGMP snooping feature on IGMPv2 or IGMPv1 hosts.

An IGMPv3 device can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature.

## IGMPv3 Host Signaling

IGMPv3 is the third version of the IETF standards track protocol in which hosts signal membership to last-hop devices of multicast groups. IGMPv3 introduces the ability for hosts to signal group membership that allows filtering capabilities with respect to sources. A host can signal either that it wants to receive traffic from all sources sending to a group except for some specific sources (a mode called EXCLUDE) or that it wants to receive traffic only from some specific sources sending to the group (a mode called INCLUDE).

IGMPv3 can operate with both ISM and SSM. In ISM, both EXCLUDE and INCLUDE mode reports are accepted by the last-hop router. In SSM, only INCLUDE mode reports are accepted by the last-hop router.

## IGMP Versions Differences

There are three versions of IGMP, as defined by Request for Comments (RFC) documents of the Internet Engineering Task Force (IETF). IGMPv2 improves over IGMPv1 by adding the ability for a host to signal desire to leave a multicast group and IGMPv3 improves over IGMPv2 mainly by adding the ability to listen to multicast originating from a set of source IP addresses only.

*Table 31: IGMP Versions*

| IGMP Version | Description                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IGMPv1       | Provides the basic query-response mechanism that allows the multicast device to determine which multicast groups are active and other processes that enable hosts to join and leave a multicast group. RFC 1112 defines the IGMPv1 host extensions for IP multicasting.                                    |
| IGMPv2       | Extends IGMP, allowing such capabilities as the IGMP leave process, group-specific queries, and an explicit maximum response time field. IGMPv2 also adds the capability for devices to elect the IGMP querier without dependence on the multicast protocol to perform this task. RFC 2236 defines IGMPv2. |

**Note** By default, enabling a PIM on an interface enables IGMPv2 on that device. IGMPv2 was designed to be as backward compatible with IGMPv1 as possible. To accomplish this backward compatibility, RFC 2236 defined special interoperability rules. If your network contains legacy IGMPv1 hosts, you should be familiar with these operability rules. For more information about IGMPv1 and IGMPv2 interoperability, see RFC 2236, Internet Group Management Protocol, Version 2 .

### Devices That Run IGMPv1

IGMPv1 devices send IGMP queries to the “all-hosts” multicast address of 224.0.0.1 to solicit multicast groups with active multicast receivers. The multicast receivers also can send IGMP reports to the device to notify it that they are interested in receiving a particular multicast stream. Hosts can send the report asynchronously or in response to the IGMP queries sent by the device. If more than one multicast receiver exists for the same multicast group, only one of these hosts sends an IGMP report message; the other hosts suppress their report messages.

In IGMPv1, there is no election of an IGMP querier. If more than one device on the segment exists, all the devices send periodic IGMP queries. IGMPv1 has no special mechanism by which the hosts can leave the group. If the hosts are no longer interested in receiving multicast packets for a particular group, they simply do not reply to the IGMP query packets sent from the device. The device continues sending query packets. If the device does not hear a response in three IGMP queries, the group times out and the device stops sending multicast packets on the segment for the group. If the host later wants to receive multicast packets after the timeout period, the host simply sends a new IGMP join to the device, and the device begins to forward the multicast packet again.

If there are multiple devices on a LAN, a designated router (DR) must be elected to avoid duplicating multicast traffic for connected hosts. PIM devices follow an election process to select a DR. The PIM device with the highest IP address becomes the DR.

The DR is responsible for the following tasks:

- Sending PIM register and PIM Join and Prune messages toward the rendezvous point (RP) to inform it about host group membership.
- Sending IGMP host-query messages.
- Sending host-query messages by default every 60 seconds in order to keep the IGMP overhead on hosts and networks very low.

### Devices That Run IGMPv2

IGMPv2 improves the query messaging capabilities of IGMPv1.

The query and membership report messages in IGMPv2 are identical to the IGMPv1 messages with two exceptions:

- IGMPv2 query messages are broken into two categories: general queries (identical to IGMPv1 queries) and group-specific queries.
- IGMPv1 membership reports and IGMPv2 membership reports have different IGMP type codes.

IGMPv2 also enhances IGMP by providing support for the following capabilities:

- Querier election process--Provides the capability for IGMPv2 devices to elect the IGMP querier without having to rely on the multicast routing protocol to perform the process.
- Maximum Response Time field--A new field in query messages permits the IGMP querier to specify the maximum query-response time. This field permits the tuning of the query-response process to control response burstiness and to fine-tune leave latencies.
- Group-Specific Query messages--Permits the IGMP querier to perform the query operation on a specific group instead of all groups.
- Leave-Group messages--Provides hosts with a method of notifying devices on the network that they wish to leave the group.

Unlike IGMPv1, in which the DR and the IGMP querier are typically the same device, in IGMPv2 the two functions are decoupled. The DR and the IGMP querier are selected based on different criteria and may be different devices on the same subnet. The DR is the device with the highest IP address on the subnet, whereas the IGMP querier is the device with the lowest IP address.

Query messages are used to elect the IGMP querier as follows:

1. When IGMPv2 devices start, they each multicast a general query message to the all-systems group address of 224.0.0.1 with their interface address in the source IP address field of the message.
2. When an IGMPv2 device receives a general query message, the device compares the source IP address in the message with its own interface address. The device with the lowest IP address on the subnet is elected the IGMP querier.
3. All devices (excluding the querier) start the query timer, which is reset whenever a general query message is received from the IGMP querier. If the query timer expires, it is assumed that the IGMP querier has gone down, and the election process is performed again to elect a new IGMP querier.

By default, the timer is two times the query interval.

## IGMP Join and Leave Process

### IGMP Join Process

When a host wants to join a multicast group, the host sends one or more unsolicited membership reports for the multicast group it wants to join. The IGMP join process is the same for IGMPv1 and IGMPv2 hosts.

In IGMPv3, the join process for hosts proceeds as follows:

- When a host wants to join a group, it sends an IGMPv3 membership report to 224.0.0.22 with an empty EXCLUDE list.
- When a host wants to join a specific channel, it sends an IGMPv3 membership report to 224.0.0.22 with the address of the specific source included in the INCLUDE list.
- When a host wants to join a group excluding particular sources, it sends an IGMPv3 membership report to 224.0.0.22 excluding those sources in the EXCLUDE list.

---

**Note** If some IGMPv3 hosts on a LAN wish to exclude a source and others wish to include the source, then the device will send traffic for the source on the LAN (that is, inclusion trumps exclusion in this situation).

---

## IGMP Leave Process

The method that hosts use to leave a group varies depending on the version of IGMP in operation.

### IGMPv1 Leave Process

There is no leave-group message in IGMPv1 to notify the devices on the subnet that a host no longer wants to receive the multicast traffic from a specific group. The host simply stops processing traffic for the multicast group and ceases responding to IGMP queries with IGMP membership reports for the group. As a result, the only way IGMPv1 devices know that there are no longer any active receivers for a particular multicast group on a subnet is when the devices stop receiving membership reports. To facilitate this process, IGMPv1 devices associate a countdown timer with an IGMP group on a subnet. When a membership report is received for the group on the subnet, the timer is reset. For IGMPv1 devices, this timeout interval is typically three times the query interval (3 minutes). This timeout interval means that the device may continue to forward multicast traffic onto the subnet for up to 3 minutes after all hosts have left the multicast group.

### IGMPv2 Leave Process

IGMPv2 incorporates a leave-group message that provides the means for a host to indicate that it wishes to stop receiving multicast traffic for a specific group. When an IGMPv2 host leaves a multicast group, if it was the last host to respond to a query with a membership report for that group, it sends a leave-group message to the all-devices multicast group (224.0.0.2).

### IGMPv3 Leave Process

IGMPv3 enhances the leave process by introducing the capability for a host to stop receiving traffic from a particular group, source, or channel in IGMP by including or excluding sources, groups, or channels in IGMPv3 membership reports.

## IGMP Snooping

Layer 2 devices can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN device to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the device receives an IGMP report from a host for a particular multicast group, the device adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

---

**Note** For more information on IP multicast and IGMP, see RFC 1112 and RFC 2236.

---

The multicast router (which could be a device with the IP services feature set on the active device) sends out periodic general queries to all VLANs. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry. The device creates one entry per VLAN in the IGMP snooping IP multicast forwarding table for each group from which it receives an IGMP join request.

The device supports IP multicast group-based bridging, instead of MAC-addressed based groups. With multicast MAC address-based groups, if an IP address being configured translates (aliases) to a previously

configured MAC address or to any reserved multicast MAC addresses (in the range 224.0.0.xxx), the command fails. Because the device uses IP multicast groups, there are no address aliasing issues.

The IP multicast groups learned through IGMP snooping are dynamic. However, you can statically configure multicast groups by using the **ip igmp snooping vlan *vlan-id* static *ip\_address* interface *interface-id*** global configuration command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings.

You can configure an IGMP snooping querier to support IGMP snooping in subnets without multicast interfaces because the multicast traffic does not need to be routed.

If a port spanning-tree, a port group, or a VLAN ID change occurs, the IGMP snooping-learned multicast groups from this port on the VLAN are deleted.

These sections describe IGMP snooping characteristics:

## Joining a Multicast Group

**Figure 17: Initial IGMP Join Message**

When a host connected to the device wants to join an IP multicast group and it is an IGMP version 2 client, it sends an unsolicited IGMP join message, specifying the IP multicast group to join. Alternatively, when the device receives a general query from the router, it forwards the query to all ports in the VLAN. IGMP version 1 or version 2 hosts wanting to join the multicast group respond by sending a join message to the device. The device CPU creates a multicast forwarding-table entry for the group if it is not already present. The CPU also adds the interface where the join message was received to the forwarding-table entry. The host associated with that interface receives multicast traffic for that multicast group.

Router A sends a general query to the device, which forwards the query to ports 2 through 5, all of which are members of the same VLAN. Host 1 wants to join multicast group 224.1.2.3 and multicasts an IGMP membership report (IGMP join message) to the group. The device CPU uses the information in the IGMP report to set up a forwarding-table entry that includes the port numbers connected to Host 1 and to the router.

**Table 32: IGMP Snooping Forwarding Table**

| Destination Address | Type of Packet | Ports |
|---------------------|----------------|-------|
| 224.1.2.3           | IGMP           | 1, 2  |

The device hardware can distinguish IGMP information packets from other packets for the multicast group. The information in the table tells the switching engine to send frames addressed to the 224.1.2.3 multicast IP address that are not IGMP packets to the router and to the host that has joined the group.

**Figure 18: Second Host Joining a Multicast Group**

If another host (for example, Host 4) sends an unsolicited IGMP join message for the same group, the CPU receives that message and adds the port number of Host 4 to the forwarding table. Because the forwarding table directs IGMP messages only to the CPU, the message is not flooded to other ports on the device. Any known multicast traffic is forwarded to the group and not to the CPU.

**Table 33: Updated IGMP Snooping Forwarding Table**

| Destination Address | Type of Packet | Ports   |
|---------------------|----------------|---------|
| 224.1.2.3           | IGMP           | 1, 2, 5 |

[Example: Configuring the Device as a Member of a Multicast Group](#), on page 396

## Leaving a Multicast Group

The router sends periodic multicast general queries, and the device forwards these queries through all ports in the VLAN. Interested hosts respond to the queries. If at least one host in the VLAN wants to receive multicast traffic, the router continues forwarding the multicast traffic to the VLAN. The device forwards multicast group traffic only to those hosts listed in the forwarding table for that IP multicast group maintained by IGMP snooping.

When hosts want to leave a multicast group, they can silently leave, or they can send a leave message. When the device receives a leave message from a host, it sends a group-specific query to learn if any other devices connected to that interface are interested in traffic for the specific multicast group. The device then updates the forwarding table for that MAC group so that only those hosts interested in receiving multicast traffic for the group are listed in the forwarding table. If the router receives no reports from a VLAN, it removes the group for the VLAN from its IGMP cache.

## Immediate Leave

The device uses IGMP snooping Immediate Leave to remove from the forwarding table an interface that sends a leave message without the device sending group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Immediate Leave ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are simultaneously in use.

Immediate Leave is only supported on IGMP version 2 hosts. IGMP version 2 is the default version for the device.

---

**Note** You should use the Immediate Leave feature only on VLANs where a single host is connected to each port. If Immediate Leave is enabled on VLANs where more than one host is connected to a port, some hosts may be dropped inadvertently.

---

## IGMP Configurable-Leave Timer

You can configure the time that the device waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 32767 milliseconds.

### Related Topics

[Configuring the IGMP Leave Timer \(CLI\)](#), on page 382

## IGMP Report Suppression

---

**Note** IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

---

The device uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP report suppression is enabled (the default), the device sends the first IGMP report from all hosts for a group to all the multicast routers. The device does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the device forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers.

If the multicast router query also includes requests for IGMPv3 reports, the device forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression, all IGMP reports are forwarded to the multicast routers.

## IGMP Filtering and Throttling

In some environments, for example, metropolitan or multiple-dwelling unit (MDU) installations, you might want to control the set of multicast groups to which a user on a device port can belong. You can control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan. You might also want to limit the number of multicast groups to which a user on a device port can belong.

With the IGMP filtering feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual device ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a device port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing. You can also set the maximum number of IGMP groups that a Layer 2 interface can join.

IGMP filtering controls only group-specific query and membership reports, including join and leave reports. It does not control general IGMP queries. IGMP filtering has no relationship with the function that directs the forwarding of IP multicast traffic. The filtering feature operates in the same manner whether CGMP or MVR is used to forward the multicast traffic.

IGMP filtering applies only to the dynamic learning of IP multicast group addresses, not static configuration.

With the IGMP throttling feature, you can set the maximum number of IGMP groups that a Layer 2 interface can join. If the maximum number of IGMP groups is set, the IGMP snooping forwarding table contains the maximum number of entries, and the interface receives an IGMP join report, you can configure an interface to drop the IGMP report or to replace the randomly selected multicast entry with the received IGMP report.

---

**Note** IGMPv3 join and leave messages are not supported on devices running IGMP filtering.

---

## Default IGMP Configuration

This table displays the default IGMP configuration for the device.

*Table 34: Default IGMP Configuration*

| Feature                                            | Default Setting                         |
|----------------------------------------------------|-----------------------------------------|
| Multilayer device as a member of a multicast group | No group memberships are defined.       |
| Access to multicast groups                         | All groups are allowed on an interface. |
| IGMP version                                       | Version 2 on all interfaces.            |
| IGMP host-query message interval                   | 60 seconds on all interfaces.           |
| IGMP query timeout                                 | 60 seconds on all interfaces.           |
| IGMP maximum query response time                   | 10 seconds on all interfaces.           |
| Multilayer device as a statically connected member | Disabled.                               |

# How to Configure IGMP

## Configuring the Device as a Member of a Group (CLI)

You can configure the device as a member of a multicast group and discover multicast reachability in a network. If all the multicast-capable routers and multilayer devices that you administer are members of a multicast group, pinging that group causes all of these devices to respond. The devices respond to ICMP echo-request packets addressed to a group of which they are members. Another example is the multicast trace-route tools provided in the software.

**Caution** Performing this procedure might impact the CPU performance because the CPU will receive all data traffic for the group address.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip igmp join-group** *group-address*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                                                           | Purpose                                                                                                         |
|--------|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                   | Enables privileged EXEC mode. Enter your password if prompted.                                                  |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>           | Enters the global configuration mode.                                                                           |
| Step 3 | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> | Specifies the interface on which you want to enable multicast routing, and enters interface configuration mode. |

|               | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                    |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>gigabitethernet 1/0/1</code>                                                                                                      |                                                                                                                                                                                                            |
| <b>Step 4</b> | <p><b>ip igmp join-group</b> <i>group-address</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip igmp join-group 225.2.2.2</pre> | <p>Configures the device to join a multicast group.</p> <p>By default, no group memberships are defined.</p> <p>For <i>group-address</i>, specify the multicast IP address in dotted decimal notation.</p> |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                           |
| <b>Step 6</b> | <p><b>show ip igmp interface</b> [<i>interface-id</i>]</p> <p><b>Example:</b></p> <pre>Device# show ip igmp interface</pre>             | Verifies your entries.                                                                                                                                                                                     |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>           | (Optional) Saves your entries in the configuration file.                                                                                                                                                   |

## Controlling Access to IP Multicast Group (CLI)

The device sends IGMP host-query messages to find which multicast groups have members on attached local networks. The device then forwards to these group members all packets addressed to the multicast group. You can place a filter on each interface to restrict the multicast groups that hosts on the subnet serviced by the interface can join.

To limit the number of joins on the interface, configure the port for the filter which associates with the IGMP profile.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp profile**

4. **permit**
5. **exit**
6. **interface** *interface-id*
7. **ip igmp filter** *filter\_number*
8. **end**
9. **show ip igmp interface** [*interface-id*]
10. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                          | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                     | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ip igmp profile</b><br><b>Example:</b><br><pre>Device(config)# ip igmp profile 10 Device(config-igmp-profile)# ?</pre> | Enters an IGMP filter profile number from 1 to 4294967295.<br><br>For additional information about configuring IGMP filter profiles, see <a href="#">Configuring IGMP Profiles (CLI)</a> , on page 369.                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>permit</b><br><b>Example:</b><br><pre>Device(config-igmp-profile)# permit 229.9.9.0</pre>                              | Enters an IGMP profile configuration action. The following IGMP profile configuration actions are supported: <ul style="list-style-type: none"> <li>• <b>deny</b>—Matching IP addresses are denied.</li> <li>• <b>exit</b>—Exits from the IGMP profile configuration mode.</li> <li>• <b>no</b>—Negates a command or set its defaults.</li> <li>• <b>permit</b>—Matching addresses are permitted.</li> <li>• <b>range</b>—Adds a range to the set.</li> </ul> |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><pre>Device(config-igmp-profile)# exit</pre>                                            | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                | Command or Action                                                                                                     | Purpose                                                                                                                                                                          |
|----------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br><pre>Device(config)# interface gigabitethernet 1/0/1</pre> | Specifies the interface to be configured, and enters interface configuration mode.                                                                                               |
| <b>Step 7</b>  | <b>ip igmp filter</b> <i>filter_number</i><br><b>Example:</b><br><pre>Device(config-if)# ip igmp filter 10</pre>      | Specifies the IGMP filter profile number.<br><br>For additional information about applying IGMP filter profiles, see <a href="#">Applying IGMP Profiles (CLI)</a> , on page 371. |
| <b>Step 8</b>  | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                 |
| <b>Step 9</b>  | <b>show ip igmp interface</b> [ <i>interface-id</i> ]<br><b>Example:</b><br><pre>Device# show ip igmp interface</pre> | Verifies your entries.                                                                                                                                                           |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                         |

## Changing the IGMP Version(CLI)

By default, the switch uses IGMP Version 2, which provides features such as the IGMP query timeout and the maximum query response time.

All systems on the subnet must support the same version. The switch does not automatically detect Version 1 systems and switch to Version 1. You can mix Version 1 and Version 2 hosts on the subnet because Version 2 routers or switches always work correctly with IGMPv1 hosts.

Configure the switch for Version 1 if your hosts do not support Version 2.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*

4. `ip igmp version {1 | 2 | 3 }`
5. `end`
6. `show ip igmp interface [interface-id]`
7. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                        |
|--------|------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                 |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                          |
| Step 3 | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet 1/0/1</code> | Specifies the interface to be configured, and enters the interface configuration mode.                                                                                                                                                                                                                                                         |
| Step 4 | <b>ip igmp version {1   2   3 }</b><br><b>Example:</b><br>Device(config-if)# <code>ip igmp version 2</code>      | Specifies the IGMP version that the switch uses.<br><b>Note</b> If you change to Version 1, you cannot configure the <b>ip igmp query-interval</b> or the <b>ip igmp query-max-response-time</b> interface configuration commands.<br><br>To return to the default setting, use the <b>no ip igmp version</b> interface configuration command. |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                               |

## Modifying the IGMP Host-Query Message Interval (CLI)

The device periodically sends IGMP host-query messages to discover which multicast groups are present on attached networks. These messages are sent to the all-hosts multicast group (224.0.0.1) with a time-to-live (TTL) of 1. The device sends host-query messages to refresh its knowledge of memberships present on the network. If, after some number of queries, the software discovers that no local hosts are members of a multicast group, the software stops forwarding multicast packets to the local network from remote origins for that group and sends a prune message upstream toward the source.

The device elects a PIM designated router (DR) for the LAN (subnet). The designated router is responsible for sending IGMP host-query messages to all hosts on the LAN. In sparse mode, the designated router also sends PIM register and PIM join messages toward the RP router. With IGMPv2, the DR is the router or multilayer device with the highest IP address. With IGMPv1, the DR is elected according to the multicast routing protocol that runs on the LAN.

This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip igmp query-interval seconds`
5. `end`
6. `show ip igmp interface [interface-id]`
7. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                        |
|--------|--------------------------------------------------------------------------------|----------------------------------------------------------------|

| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b><br><b>gigabitethernet 1/0/1</b>      | Specifies the interface on which you want to enable multicast routing, and enters interface configuration mode.                                                                                                                            |
| <b>Step 4</b> | <b>ip igmp query-interval</b> <i>seconds</i><br><b>Example:</b><br>Device(config-if)# <b>ip igmp</b><br><b>query-interval 75</b> | Configures the frequency at which the designated router sends IGMP host-query messages.<br><br>By default, the designated router sends IGMP host-query messages every 60 seconds to keep the IGMP overhead very low on hosts and networks. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>show ip igmp interface</b> [ <i>interface-id</i> ]<br><b>Example:</b><br>Device# <b>show ip igmp interface</b>                | Verifies your entries.                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                   |

## Changing the IGMP Query Timeout for IGMPv2 (CLI)

If you are using IGMPv2, you can specify the period of time before the device takes over as the querier for the interface. By default, the device waits twice the query interval period controlled by the **ip igmp query-interval** interface configuration command. After that time, if the device has received no queries, it becomes the querier.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*

4. `ip igmp querier-timeout seconds`
5. `end`
6. `show ip igmp interface [interface-id]`
7. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                      | Purpose                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                       | Enables privileged EXEC mode. Enter your password if prompted.                                                     |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                  | Enters the global configuration mode.                                                                              |
| Step 3 | <b>interface interface-id</b><br><b>Example:</b><br><pre>Device(config)# interface gigabitethernet 1/0/1</pre>         | Specifies the interface on which you want to enable multicast routing, and enters interface configuration mode.    |
| Step 4 | <b>ip igmp querier-timeout seconds</b><br><b>Example:</b><br><pre>Device(config-if)# ip igmp querier-timeout 120</pre> | Specifies the IGMP query timeout.<br>The default is 60 seconds (twice the query interval). The range is 60 to 300. |
| Step 5 | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                        | Returns to privileged EXEC mode.                                                                                   |
| Step 6 | <b>show ip igmp interface [interface-id]</b><br><b>Example:</b><br><pre>Device# show ip igmp interface</pre>           | Verifies your entries.                                                                                             |
| Step 7 | <b>copy running-config startup-config</b><br><b>Example:</b>                                                           | (Optional) Saves your entries in the configuration file.                                                           |

|  | Command or Action                                       | Purpose |
|--|---------------------------------------------------------|---------|
|  | Device# <code>copy running-config startup-config</code> |         |

## Changing the Maximum Query Response Time for IGMPv2 (CLI)

If you are using IGMPv2, you can change the maximum query response time advertised in IGMP queries. The maximum query response time enables the device to quickly detect that there are no more directly connected group members on a LAN. Decreasing the value enables the device to prune groups faster.

This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip igmp query-max-response-time seconds`
5. `end`
6. `show ip igmp interface [interface-id]`
7. `copy running-config startup-config`

### DETAILED STEPS

|               | Command or Action                                                                                                | Purpose                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                          | Enters the global configuration mode.                                                                                       |
| <b>Step 3</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet 1/0/1</code> | Specifies the interface on which you want to enable multicast routing, and enters interface configuration mode.             |
| <b>Step 4</b> | <b>ip igmp query-max-response-time seconds</b><br><b>Example:</b><br>Device(config-if)# <code>ip igmp</code>     | Changes the maximum query response time advertised in IGMP queries.<br><br>The default is 10 seconds. The range is 1 to 25. |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | <code>query-max-response-time 15</code>                                                                                 |                                                          |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 6</b> | <b>show ip igmp interface [interface-id]</b><br><b>Example:</b><br>Device# <code>show ip igmp interface</code>          | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring the Device as a Statically Connected Member (CLI)

At various times, either there is not a group member on a network segment or a host that cannot report its group membership by using IGMP. However, you may want multicast traffic to be sent to that network segment. The following commands are used to pull multicast traffic down to a network segment:

- **ip igmp join-group**—The device accepts the multicast packets in addition to forwarding them. Accepting the multicast packets prevents the device from fast switching.
- **ip igmp static-group**—The device does not accept the packets itself, but only forwards them. This method enables fast switching. The outgoing interface appears in the IGMP cache, but the device itself is not a member, as evidenced by lack of an L (local) flag in the multicast route entry.

This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip igmp static-group group-address`
5. `end`
6. `show ip igmp interface [interface-id]`
7. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                                               | Purpose                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                       | Enables privileged EXEC mode. Enter your password if prompted.                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                               | Enters the global configuration mode.                                                                           |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface</b><br><b>gigabitethernet 1/0/1</b>                     | Specifies the interface on which you want to enable multicast routing, and enters interface configuration mode. |
| <b>Step 4</b> | <b>ip igmp static-group <i>group-address</i></b><br><b>Example:</b><br>Device(config-if)# <b>ip igmp static-group</b><br><b>239.100.100.101</b> | Configures the device as a statically connected member of a group.<br><br>By default, this feature is disabled. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                     | Returns to privileged EXEC mode.                                                                                |
| <b>Step 6</b> | <b>show ip igmp interface [<i>interface-id</i>]</b><br><b>Example:</b><br>Device# <b>show ip igmp interface</b><br><b>gigabitethernet 1/0/1</b> | Verifies your entries.                                                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                               | (Optional) Saves your entries in the configuration file.                                                        |

## Configuring IGMP Profiles (CLI)

Follow these steps to create an IGMP profile:

This task is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp profile** *profile number*
4. **permit | deny**
5. **range** *ip multicast address*
6. **end**
7. **show ip igmp profile** *profile number*
8. **show running-config**
9. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                   | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                           | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>ip igmp profile</b> <i>profile number</i><br><b>Example:</b><br>Device(config)# <b>ip igmp profile 3</b> | Assigns a number to the profile you are configuring, and enters IGMP profile configuration mode. The profile number range is 1 to 4294967295. When you are in IGMP profile configuration mode, you can create the profile by using these commands: <ul style="list-style-type: none"> <li>• <b>deny</b>—Specifies that matching addresses are denied; this is the default.</li> <li>• <b>exit</b>—Exits from igmp-profile configuration mode.</li> <li>• <b>no</b>—Negates a command or returns to its defaults.</li> <li>• <b>permit</b>—Specifies that matching addresses are permitted.</li> <li>• <b>range</b>—Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with a start and an end address.</li> </ul> |

|               | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                            | The default is for the device to have no IGMP profiles configured.<br><br><b>Note</b> To delete a profile, use the <b>no ip igmp profile <i>profile number</i></b> global configuration command.                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>permit   deny</b><br><br><b>Example:</b><br><br>Device(config-igmp-profile)# <b>permit</b>                              | (Optional) Sets the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 5</b> | <b>range <i>ip multicast address</i></b><br><br><b>Example:</b><br><br>Device(config-igmp-profile)# <b>range 229.9.9.0</b> | Enters the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address.<br><br>You can use the <b>range</b> command multiple times to enter multiple addresses or ranges of addresses.<br><br><b>Note</b> To delete an IP multicast address or range of IP multicast addresses, use the <b>no range <i>ip multicast address</i></b> IGMP profile configuration command. |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b> | <b>show ip igmp profile <i>profile number</i></b><br><br><b>Example:</b><br><br>Device# <b>show ip igmp profile 3</b>      | Verifies the profile configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 8</b> | <b>show running-config</b><br><br><b>Example:</b><br><br>Device# <b>show running-config</b>                                | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>  | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Applying IGMP Profiles (CLI)

To control access as defined in an IGMP profile, you have to apply the profile to the appropriate interfaces. You can apply IGMP profiles only to Layer 2 access ports; you cannot apply IGMP profiles to routed ports or SVIs. You cannot apply profiles to ports that belong to an EtherChannel port group. You can apply a profile to multiple interfaces, but each interface can have only one profile applied to it.

Follow these steps to apply an IGMP profile to a switch port:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip igmp filter profile number`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                               | Purpose                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                 | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                         | Enters the global configuration mode.                                                                                                                                                                                     |
| Step 3 | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet1/0/1</code> | Specifies the physical interface, and enters interface configuration mode. The interface must be a Layer 2 port that does not belong to an EtherChannel port group.                                                       |
| Step 4 | <b>ip igmp filter profile number</b><br><b>Example:</b><br>Device(config-if)# <code>ip igmp filter 321</code>   | Applies the specified IGMP profile to the interface. The range is 1 to 4294967295.<br><b>Note</b> To remove a profile from an interface, use the <b>no ip igmp filter profile number</b> interface configuration command. |
| Step 5 | <b>end</b><br><b>Example:</b>                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                          |

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device(config-if)# <b>end</b>                                                                                     |                                                          |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Setting the Maximum Number of IGMP Groups (CLI)

Follow these steps to set the maximum number of IGMP groups that a Layer 2 interface can join:

### Before you begin

This restriction can be applied to Layer 2 ports only; you cannot set a maximum number of IGMP groups on routed ports or SVIs. You also can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **ip igmp max-groups *number***
5. **end**
6. **show running-config interface *interface-id***
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                         | Purpose                                                        |
|---------------|-----------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>              | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                                                |                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet1/0/2</code>                                 | Specifies the interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or a EtherChannel interface.                                                          |
| <b>Step 4</b> | <b>ip igmp max-groups</b> <i>number</i><br><b>Example:</b><br>Device(config-if)# <code>ip igmp max-groups 20</code>                                    | Sets the maximum number of IGMP groups that the interface can join. The range is 0 to 4294967294. The default is to have no maximum set.<br><br><b>Note</b> The device supports a maximum number of 4096 Layer 2 IGMP groups and 2048 Layer 3 IGMP groups. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>show running-config interface</b> <i>interface-id</i><br><b>Example:</b><br>Device# <code>show running-config interface gigabitethernet1/0/1</code> | Verifies your entries.                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>                                | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                   |

## Configuring the IGMP Throttling Action (CLI)

After you set the maximum number of IGMP groups that a Layer 2 interface can join, you can configure an interface to replace the existing group with the new group for which the IGMP report was received.

Follow these steps to configure the throttling action when the maximum number of entries is in the forwarding table:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`

4. `ip igmp max-groups action {deny | replace}`
5. `end`
6. `show running-config interface interface-id`
7. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                        | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                   | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <p><b>interface interface-id</b></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet 1/0/1</pre>                          | Specifies the physical interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or an EtherChannel interface. The interface cannot be a trunk port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 4 | <p><b>ip igmp max-groups action {deny   replace}</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip igmp max-groups action replace</pre> | <p>When an interface receives an IGMP report and the maximum number of entries is in the forwarding table, specifies the action that the interface takes:</p> <ul style="list-style-type: none"> <li>• <b>deny</b>—Drops the report. If you configure this throttling action, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out and the maximum number of entries is in the forwarding table, the device drops the next IGMP report received on the interface.</li> <li>• <b>replace</b>—Replaces the existing group with the new group for which the IGMP report was received. If you configure this throttling action, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the device replaces a randomly selected entry with the received IGMP report.</li> </ul> <p>To prevent the device from removing the forwarding-table entries, you can configure the IGMP throttling action before an interface adds entries to the forwarding table.</p> |

|               | Command or Action                                                                                                                                          | Purpose                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                            | <b>Note</b> To return to the default action of dropping the report, use the <b>no ip igmp max-groups action</b> interface configuration command. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                | Returns to privileged EXEC mode.                                                                                                                 |
| <b>Step 6</b> | <b>show running-config interface <i>interface-id</i></b><br><b>Example:</b><br>Device# <b>show running-config interface</b><br><b>gigabitethernet1/0/1</b> | Verifies your entries.                                                                                                                           |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                          | (Optional) Saves your entries in the configuration file.                                                                                         |

## How to Configure IGMP Snooping

### Enabling IGMP Snooping

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping**
4. **bridge-domain *bridge-id***
5. **ip igmp snooping**
6. **end**

#### DETAILED STEPS

|               | Command or Action                                         | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>              | Enters global configuration mode.                                                                                  |

## Enabling or Disabling IGMP Snooping on a VLAN Interface (CLI)

|               | Command or Action                                                                                          | Purpose                                                                                                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                    |                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ip igmp snooping</b><br><b>Example:</b><br>Device(config)# <code>ip igmp snooping</code>                | Globally enables IGMP snooping after it has been disabled.                                                                                                                                                                              |
| <b>Step 4</b> | <b>bridge-domain <i>bridge-id</i></b><br><b>Example:</b><br>Device(config)# <code>bridge-domain 100</code> | (Optional) Enters bridge domain configuration mode.                                                                                                                                                                                     |
| <b>Step 5</b> | <b>ip igmp snooping</b><br><b>Example:</b><br>Device(config-bdomain)# <code>ip igmp snooping</code>        | (Optional) Enables IGMP snooping on the bridge domain interface being configured. <ul style="list-style-type: none"> <li>• Required only if IGMP snooping was previously explicitly disabled on the specified bridge domain.</li> </ul> |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-bdomain)# <code>end</code>                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                        |

## Enabling or Disabling IGMP Snooping on a VLAN Interface (CLI)

Follow these steps to enable IGMP snooping on a VLAN interface:

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip igmp snooping vlan vlan-id`
4. `end`
5. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                               | Purpose                                                        |
|---------------|-----------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>                    | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                       |                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <p><b>ip igmp snooping vlan <i>vlan-id</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping vlan 7</pre>  | <p>Enables IGMP snooping on the VLAN interface. The VLAN ID range is 1 to 1001 and 1006 to 4094.</p> <p>IGMP snooping must be globally enabled before you can enable VLAN snooping.</p> <p><b>Note</b> To disable IGMP snooping on a VLAN interface, use the <b>no ip igmp snooping vlan <i>vlan-id</i></b> global configuration command for the specified VLAN number.</p> |
| <b>Step 4</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                    |

## Setting the Snooping Method (CLI)

Multicast-capable router ports are added to the forwarding table for every Layer 2 multicast entry. The device learns of the ports through one of these methods:

- Snooping on IGMP queries, Protocol-Independent Multicast (PIM) packets
- Statically connecting to a multicast router port using the **ip igmp snooping mrouter** global configuration command

Beginning in privileged EXEC mode, follow these steps to alter the method in which a VLAN interface accesses a multicast router:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping vlan *vlan-id* mrouter interface {GigabitEthernet | Port-Channel | TenGigabitEthernet}**
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                         | Purpose                                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                         | Enters the global configuration mode.                                                                              |
| <b>Step 3</b> | <b>ip igmp snooping vlan <i>vlan-id</i> mrouter interface {GigabitEthernet   Port-Channel   TenGigabitEthernet}</b><br><b>Example:</b><br>Device(config)# <b>ip igmp snooping</b><br><b>vlan 1 mrouter interface GigabitEthernet1/0/3</b> | Enables IGMP snooping on a VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.                                  |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                                                               | Returns to privileged EXEC mode.                                                                                   |
| <b>Step 5</b> | <b>show ip igmp snooping</b><br><b>Example:</b><br>Device# <b>show ip igmp snooping</b>                                                                                                                                                   | Verifies the configuration.                                                                                        |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                                                                                                         | (Optional) Saves your entries in the configuration file.                                                           |

## Configuring a Multicast Router Port (CLI)

Perform these steps to add a multicast router port (enable a static connection to a multicast router) on the device.

**Note** Static connections to multicast routers are supported only on device ports.

## SUMMARY STEPS

1. enable
2. configure terminal
3. ip igmp snooping vlan *vlan-id* mrouter interface *interface-id*
4. end
5. show ip igmp snooping mrouter [vlan *vlan-id*]
6. copy running-config startup-config

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                             | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 3 | <p><b>ip igmp snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping vlan 5 mrouter interface gigabitethernet1/0/1</pre> | <p>Specifies the multicast router VLAN ID and the interface to the multicast router.</p> <ul style="list-style-type: none"> <li>• The VLAN ID range is 1 to 1001 and 1006 to 4094.</li> <li>• The interface can be a physical interface or a port channel. The port-channel range is 1 to 128.</li> </ul> <p><b>Note</b> To remove a multicast router port from the VLAN, use the <b>no ip igmp snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b> global configuration command.</p> |
| Step 4 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 5 | <p><b>show ip igmp snooping mrouter [vlan <i>vlan-id</i>]</b></p> <p><b>Example:</b></p> <pre>Device# show ip igmp snooping mrouter vlan 5</pre>                                                          | Verifies that IGMP snooping is enabled on the VLAN interface.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring a Host Statically to Join a Group (CLI)

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure a host on an interface.

Follow these steps to add a Layer 2 port as a member of a multicast group:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip igmp snooping vlan vlan-id static ip_address interface interface-id`
4. `end`
5. `show ip igmp snooping groups`
6. `copy running-config startup-config`

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                                                                                                                                 | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                         | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>ip igmp snooping vlan <i>vlan-id</i> static <i>ip_address</i> interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <code>ip igmp snooping vlan 105 static 230.0.0.1 interface gigabitethernet1/0/1</code> | Statically configures a Layer 2 port as a member of a multicast group: <ul style="list-style-type: none"> <li>• <i>vlan-id</i> is the multicast group VLAN ID. The range is 1 to 1001 and 1006 to 4094.</li> <li>• <i>ip-address</i> is the group IP address.</li> <li>• <i>interface-id</i> is the member port. It can be a physical interface or a port channel (1 to 128).</li> </ul> |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                       | <b>Note</b> To remove the Layer 2 port from the multicast group, use the <b>no ip igmp snooping vlan <i>vlan-id</i> static mac-address interface <i>interface-id</i></b> global configuration command. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                       |
| <b>Step 5</b> | <b>show ip igmp snooping groups</b><br><b>Example:</b><br><br>Device# <b>show ip igmp snooping groups</b>             | Verifies the member port and the IP address.                                                                                                                                                           |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                                                                                                                               |

## Enabling IGMP Immediate Leave (CLI)

When you enable IGMP Immediate Leave, the device immediately removes a port when it detects an IGMP Version 2 leave message on that port. You should use the Immediate-Leave feature only when there is a single receiver present on every port in the VLAN.

**Note** Immediate Leave is supported only on IGMP Version 2 hosts. IGMP Version 2 is the default version for the device.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping vlan *vlan-id* immediate-leave**
4. **end**
5. **show ip igmp snooping vlan *vlan-id***
6. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                                                         | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                                 | Enters the global configuration mode.                                                                                                                                                                                  |

## Configuring the IGMP Leave Timer (CLI)

You can configure the leave time globally or on a per-VLAN basis. Follow these steps to enable the IGMP configurable-leave timer:

## SUMMARY STEPS

1. enable
2. configure terminal
3. ip igmp snooping last-member-query-interval *time*
4. ip igmp snooping vlan *vlan-id* last-member-query-interval *time*
5. end
6. show ip igmp snooping
7. copy running-config startup-config

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                              | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                         | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 3 | <p><b>ip igmp snooping last-member-query-interval <i>time</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping last-member-query-interval 1000</pre>                              | <p>Configures the IGMP leave timer globally. The range is 100 to 32767 milliseconds.</p> <p>The default leave time is 1000 milliseconds.</p> <p><b>Note</b> To globally reset the IGMP leave timer to the default setting, use the <b>no ip igmp snooping last-member-query-interval</b> global configuration command.</p>                                                                                                    |
| Step 4 | <p><b>ip igmp snooping vlan <i>vlan-id</i> last-member-query-interval <i>time</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping vlan 210 last-member-query-interval 1000</pre> | <p>(Optional) Configures the IGMP leave time on the VLAN interface. The range is 100 to 32767 milliseconds.</p> <p><b>Note</b> Configuring the leave time on a VLAN overrides the globally configured timer.</p> <p><b>Note</b> To remove the configured IGMP leave-time setting from the specified VLAN, use the <b>no ip igmp snooping vlan <i>vlan-id</i> last-member-query-interval</b> global configuration command.</p> |
| Step 5 | <p><b>end</b></p> <p><b>Example:</b></p>                                                                                                                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                              |

|               | Command or Action                                                                                                 | Purpose                                                  |

**Configuring the IGMP Robustness-Variable (CLI)**

Use the following procedure to configure the IGMP robustness variable on the device.

The robustness variable is the integer used by IGMP snooping during calculations for IGMP messages. The robustness variable provides fine tuning to allow for expected packet loss.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip igmp snooping robustness-variable** *count*
4. **ip igmp snooping vlan** *vlan-id* **robustness-variable** *count*
5. **end**
6. **show ip igmp snooping**
7. **copy running-config startup-config**

## Configuring the IGMP Last Member Query Count (CLI)

To configure the number of times the device sends IGMP group-specific or group-source-specific (with IGMP version 3) query messages in response to receiving a group-specific or group-source-specific leave message, use this command.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip igmp snooping last-member-query-count` *count*
4. `ip igmp snooping vlan` *vlan-id* `last-member-query-count` *count*
5. `end`

6. `show ip igmp snooping`
7. `copy running-config startup-config`

|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                    |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                 | Enters the global configuration mode.                                                                                                                                                                                 |
| <b>Step 3</b> | <b>ip igmp snooping last-member-query-count <i>count</i></b><br><b>Example:</b><br>Device(config)# <code>ip igmp snooping last-member-query-count 3</code>                              | Configures the IGMP last member query count. The range is 1 to 7 messages. The default is 2 messages.                                                                                                                 |
| <b>Step 4</b> | <b>ip igmp snooping vlan <i>vlan-id</i> last-member-query-count <i>count</i></b><br><b>Example:</b><br>Device(config)# <code>ip igmp snooping vlan 100 last-member-query-count 3</code> | (Optional) Configures the IGMP last member query count on the VLAN interface. The range is 1 to 7 messages.<br><b>Note</b> Configuring the last member query count on a VLAN overrides the globally configured timer. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                      |
| <b>Step 6</b> | <b>show ip igmp snooping</b><br><b>Example:</b><br>Device# <code>show ip igmp snooping</code>                                                                                           | (Optional) Displays the configured IGMP last member query count.                                                                                                                                                      |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>                                                                 | (Optional) Saves your entries in the configuration file.                                                                                                                                                              |

## Configuring TCN-Related Commands

### Controlling the Multicast Flooding Time After a TCN Event (CLI)

You can configure the number of general queries by which multicast data traffic is flooded after a topology change notification (TCN) event. If you set the TCN flood query count to 1 the flooding stops after receiving 1 general query. If you set the count to 7, the flooding continues until 7 general queries are received. Groups are relearned based on the general queries received during the TCN event.

Some examples of TCN events are when the client location is changed and the receiver is on same port that was blocked but is now forwarding, and when a port goes down without sending a leave message.

Follow these steps to configure the TCN flood query count:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping tcn flood query count** *count*
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

#### DETAILED STEPS

|        | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                        | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                     |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                | Enters the global configuration mode.                                                                                                                                                                                                                                                                              |
| Step 3 | <b>ip igmp snooping tcn flood query count</b> <i>count</i><br><b>Example:</b><br>Device(config)# <b>ip igmp snooping tcn flood query count</b> 3 | Specifies the number of IGMP general queries for which the multicast traffic is flooded.<br>The range is 1 to 10. The default, the flooding query count is 2.<br><b>Note</b> To return to the default flooding query count, use the <b>no ip igmp snooping tcn flood query count</b> global configuration command. |
| Step 4 | <b>end</b><br><b>Example:</b>                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                   |

## Recovering from Flood Mode (CLI)

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device(config)# <b>end</b>                                                                                        |                                                          |
| <b>Step 5</b> | <b>show ip igmp snooping</b><br><b>Example:</b><br>Device# <b>show ip igmp snooping</b>                           | Verifies the TCN settings.                               |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Recovering from Flood Mode (CLI)

When a topology change occurs, the spanning-tree root sends a special IGMP leave message (also known as global leave) with the group multicast address 0.0.0.0. However, you can enable the device to send the global leave message whether it is the spanning-tree root or not. When the router receives this special leave, it immediately sends general queries, which expedite the process of recovering from the flood mode during the TCN event. Leaves are always sent if the device is the spanning-tree root regardless of this configuration.

Follow these steps to enable sending of leave messages:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip igmp snooping tcn query solicit**
4. **end**
5. **show ip igmp snooping**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                 | Purpose                                                        |
|---------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters the global configuration mode.                          |

|        | Command or Action                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>ip igmp snooping tcn query solicit</b><br><b>Example:</b><br><pre>Device(config)# ip igmp snooping tcn query solicit</pre> | Sends an IGMP leave message (global leave) to speed the process of recovering from the flood mode caused during a TCN event. By default, query solicitation is disabled.<br><b>Note</b> To return to the default query solicitation, use the <b>no ip igmp snooping tcn query solicit</b> global configuration command. |
| Step 4 | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                        |
| Step 5 | <b>show ip igmp snooping</b><br><b>Example:</b><br><pre>Device# show ip igmp snooping</pre>                                   | Verifies the TCN settings.                                                                                                                                                                                                                                                                                              |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>         | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                |

### Disabling Multicast Flooding During a TCN Event (CLI)

When the device receives a TCN, multicast traffic is flooded to all the ports until 2 general queries are received. If the device has many ports with attached hosts that are subscribed to different multicast groups, this flooding might exceed the capacity of the link and cause packet loss. Follow these steps to control TCN flooding:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **no ip igmp snooping tcn flood**
5. **end**
6. **show ip igmp snooping**
7. **copy running-config startup-config**

#### DETAILED STEPS

|        | Command or Action                | Purpose                                                        |
|--------|----------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                  | Purpose                                                                                                                                                                                                                                                                                   |
|---------------|--------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> <b>enable</b>                                                                                              |                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                  | Enters the global configuration mode.                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>  | Specifies the interface to be configured, and enters interface configuration mode.                                                                                                                                                                                                        |
| <b>Step 4</b> | <b>no ip igmp snooping tcn flood</b><br><b>Example:</b><br>Device(config-if)# <b>no ip igmp snooping tcn flood</b> | Disables the flooding of multicast traffic during a spanning-tree TCN event.<br><br>By default, multicast flooding is enabled on an interface.<br><b>Note</b> To re-enable multicast flooding on an interface, use the <b>ip igmp snooping tcn flood</b> interface configuration command. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                          |
| <b>Step 6</b> | <b>show ip igmp snooping</b><br><b>Example:</b><br>Device# <b>show ip igmp snooping</b>                            | Verifies the TCN settings.                                                                                                                                                                                                                                                                |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>  | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                  |

## Configuring the IGMP Snooping Querier (CLI)

Follow these steps to enable the IGMP snooping querier feature in a VLAN:

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **ip igmp snooping querier**
4. **ip igmp snooping querier address** *ip\_address*
5. **ip igmp snooping querier query-interval** *interval-count*
6. **ip igmp snooping querier tcn query** [**count** *count* | **interval** *interval*]
7. **ip igmp snooping querier timer expiry** *timeout*
8. **ip igmp snooping querier version** *version*
9. **end**
10. **show ip igmp snooping vlan** *vlan-id*
11. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                                 | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                            | Enters the global configuration mode.                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>ip igmp snooping querier</b><br><b>Example:</b><br><pre>Device(config)# ip igmp snooping querier</pre>                                                        | Enables the IGMP snooping querier.                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>ip igmp snooping querier address</b> <i>ip_address</i><br><b>Example:</b><br><pre>Device(config)# ip igmp snooping querier address 172.16.24.1</pre>          | (Optional) Specifies an IP address for the IGMP snooping querier. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.<br><b>Note</b> The IGMP snooping querier does not generate an IGMP general query if it cannot find an IP address on the device. |
| <b>Step 5</b> | <b>ip igmp snooping querier query-interval</b> <i>interval-count</i><br><b>Example:</b><br><pre>Device(config)# ip igmp snooping querier query-interval 30</pre> | (Optional) Sets the interval between IGMP queriers. The range is 1 to 18000 seconds.                                                                                                                                                                                                                                   |

|                | Command or Action                                                                                                                                                                                 | Purpose                                                                                                                                          |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <p><b>ip igmp snooping querier tcn query</b> [<i>count count</i>   <i>interval interval</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping querier tcn query interval 20</pre> | (Optional) Sets the time between Topology Change Notification (TCN) queries. The count range is 1 to 10. The interval range is 1 to 255 seconds. |
| <b>Step 7</b>  | <p><b>ip igmp snooping querier timer expiry</b> <i>timeout</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping querier timer expiry 180</pre>                                    | (Optional) Sets the length of time until the IGMP querier expires. The range is 60 to 300 seconds.                                               |
| <b>Step 8</b>  | <p><b>ip igmp snooping querier version</b> <i>version</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp snooping querier version 2</pre>                                                | (Optional) Selects the IGMP version number that the querier feature uses. Select 1 or 2.                                                         |
| <b>Step 9</b>  | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                           | Returns to privileged EXEC mode.                                                                                                                 |
| <b>Step 10</b> | <p><b>show ip igmp snooping vlan</b> <i>vlan-id</i></p> <p><b>Example:</b></p> <pre>Device# show ip igmp snooping vlan 30</pre>                                                                   | (Optional) Verifies that the IGMP snooping querier is enabled on the VLAN interface. The VLAN ID range is 1 to 1001 and 1006 to 4094.            |
| <b>Step 11</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                     | (Optional) Saves your entries in the configuration file.                                                                                         |

## Disabling IGMP Report Suppression (CLI)

Follow these steps to disable IGMP report suppression:

### SUMMARY STEPS

1. enable
2. configure terminal
3. no ip igmp snooping report-suppression

4. end
5. show ip igmp snooping
6. copy running-config startup-config

## DETAILED STEPS

|        | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                         | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                 | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>no ip igmp snooping report-suppression</b><br><b>Example:</b><br>Device(config)# no ip igmp snooping report-suppression | <p>Disables IGMP report suppression. When report suppression is disabled, all IGMP reports are forwarded to the multicast routers.</p> <p>IGMP report suppression is enabled by default.</p> <p>When IGMP report suppression is enabled, the device forwards only one IGMP report per multicast router query.</p> <p><b>Note</b> To re-enable IGMP report suppression, use the <b>ip igmp snooping report-suppression</b> global configuration command.</p> |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 5 | <b>show ip igmp snooping</b><br><b>Example:</b><br>Device# show ip igmp snooping                                           | Verifies that IGMP report suppression is disabled.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config                 | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                    |

# Monitoring IGMP

You can display specific statistics, such as the contents of IP routing tables, caches, and databases.

**Note** This release does not support per-route statistics.

You can display information to learn resource usage and solve network problems. You can also display information about node reachability and discover the routing path that packets of your device are taking through the network.

You can use any of the privileged EXEC commands in the following table to display various routing statistics.

*Table 37: Commands for Displaying System and Network Statistics*

| Command                                                                                    | Purpose                                                                                                     |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>ping</b> [ <i>group-name</i>   <i>group-address</i> ]                                   | Sends an ICMP Echo Request to a multicast group address.                                                    |
| <b>show ip igmp filter</b>                                                                 | Displays IGMP filter information.                                                                           |
| <b>show ip igmp groups</b> [ <i>type-number</i>   <i>detail</i> ]                          | Displays the multicast groups that are directly connected to the device and that were learned through IGMP. |
| <b>show ip igmp interface</b> [ <i>type number</i> ]                                       | Displays multicast-related information about an interface.                                                  |
| <b>show ip igmp membership</b> [ <i>name/group address</i>   <b>all</b>   <b>tracked</b> ] | Displays IGMP membership information for forwarding.                                                        |
| <b>show ip igmp profile</b> [ <i>profile_number</i> ]                                      | Displays IGMP profile information.                                                                          |
| <b>show ip igmp ssm-mapping</b> [ <i>hostname/IP address</i> ]                             | Displays IGMP SSM mapping information.                                                                      |
| <b>show ip igmp static-group</b> { <b>class-map</b> [ <b>interface</b> [ <i>type</i> ] ]   | Displays static group information.                                                                          |
| <b>show ip igmp vrf</b>                                                                    | Displays the selected VPN routing/forwarding instance by name.                                              |

## Monitoring IGMP Snooping Information

You can display IGMP snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for IGMP snooping.

Table 38: Commands for Displaying IGMP Snooping Information

| Command                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ip igmp snooping detail</code>                                                  | Displays the operational state information.                                                                                                                                                                                                                                                                                                                                |
| <code>show ip igmp snooping groups [ count   [vlan<br/>vlan-id [A.B.C.D   count ] ]</code> | Displays multicast table information for the device or about a specific parameter: <ul style="list-style-type: none"> <li>• <b>count</b>—Displays the total number of groups.</li> <li>• <b>vlan</b>—Displays group information by VLAN ID.</li> </ul>                                                                                                                     |
| <code>show ip igmp snooping igmpv2-tracking</code>                                         | Displays the IGMP snooping tracking. <p><b>Note</b> This command displays group and IP address entries only for wireless multicast IGMP joins and not for wired IGMP joins. Wireless IP multicast must be enabled for this command to display.</p>                                                                                                                         |
| <code>show ip igmp snooping mrouter [vlan vlan-id]</code>                                  | Displays information on dynamically learned and manually configured multicast router interfaces. <p><b>Note</b> When you enable IGMP snooping, the device automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.</p> <p>(Optional) Enter <b>vlan vlan-id</b> to display information for a single VLAN.</p> |
| <code>show ip igmp snooping querier [ detail   vlan<br/>vlan-id]</code>                    | Displays information about the IP address and receiving port for the most-recently received IGMP query messages in the VLAN. <p>(Optional) Enter <b>detail</b> to display the detailed IGMP querier information in a VLAN.</p> <p>(Optional) Enter <b>vlan vlan-id</b> to display information for a single VLAN.</p>                                                       |
| <code>show ip igmp snooping [vlan vlan-id [ detail ] ]</code>                              | Displays the snooping configuration information for all VLANs on the device or for a specified VLAN. <p>(Optional) Enter <b>vlan vlan-id</b> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</p>                                                                                                                                |
| <code>show ip igmp snooping wireless mgid</code>                                           | Displays wireless-related events.                                                                                                                                                                                                                                                                                                                                          |

## Monitoring IGMP Filtering and Throttling Configuration

You can display IGMP profile characteristics, and you can display the IGMP profile and maximum group configuration for all interfaces on the device or for a specified interface. You can also display the IGMP throttling configuration for all interfaces on the device or for a specified interface.

*Table 39: Commands for Displaying IGMP Filtering and Throttling Configuration*

| Command                                                   | Purpose                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ip igmp profile [profile number]</code>        | Displays the specified IGMP profile or all the IGMP profiles defined on the device.                                                                                                                                                                     |
| <code>show running-config [interface interface-id]</code> | Displays the configuration of the specified interface or the configuration of all interfaces on the device, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface. |

## Configuration Examples for IGMP

### Example: Configuring the Device as a Member of a Multicast Group

This example shows how to enable the device to join multicast group 255.2.2.2:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip igmp join-group 255.2.2.2
Device(config-if)#
```

#### Related Topics

- [Configuring the Device as a Member of a Group \(CLI\)](#), on page 358
- [Joining a Multicast Group](#), on page 353
- [IGMP Multicast Addresses](#), on page 348

### Example: Controlling Access to Multicast Groups

To limit the number of joins on the interface, configure the port for filter which associates with the IGMP profile.

```
Device# configure terminal
Device(config)# ip igmp profile 10
Device(config-igmp-profile)# ?
```

```
IGMP profile configuration commands:
deny matching addresses are denied
exit Exit from igmp profile configuration mode
no Negate a command or set its defaults
permit matching addresses are permitted
```

```
range add a range to the set

Device(config-igmp-profile)# range 172.16.5.1
Device(config-igmp-profile)# exit
Device(config)#
Device(config)# interface gigabitEthernet 2/0/10
Device(config-if)# ip igmp filter 10
```

## Examples: Configuring IGMP Snooping

This example shows how to enable a static connection to a multicast router:

```
Device# configure terminal
Device(config)# ip igmp snooping vlan 200 mrouter interface gigabitEthernet1/0/2
Device(config)# end
```

This example shows how to statically configure a host on a port:

```
Device# configure terminal
Device(config)# ip igmp snooping vlan 105 static 224.2.4.12 interface gigabitEthernet1/0/1
Device(config)# end
```

This example shows how to enable IGMP Immediate Leave on VLAN 130:

```
Device# configure terminal
Device(config)# ip igmp snooping vlan 130 immediate-leave
Device(config)# end
```

This example shows how to set the IGMP snooping querier source address to 10.0.0.64:

```
Device# configure terminal
Device(config)# ip igmp snooping querier 10.0.0.64
Device(config)# end
```

This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

```
Device# configure terminal
Device(config)# ip igmp snooping querier query-interval 25
Device(config)# end
```

This example shows how to set the IGMP snooping querier timeout to 60 seconds:

```
Device# configure terminal
Device(config)# ip igmp snooping querier timer expiry 60
Device(config)# end
```

This example shows how to set the IGMP snooping querier feature to Version 2:

```
Device# configure terminal
Device(config)# no ip igmp snooping querier version 2
```

```
Device(config)# end
```

## Example: Configuring IGMP Profiles

This example shows how to create IGMP profile 4 allowing access to the single IP multicast address and how to verify the configuration. If the action was to deny (the default), it would not appear in the **show ip igmp profile** output display.

```
Device(config)# ip igmp profile 4
Device(config-igmp-profile)# permit
Device(config-igmp-profile)# range 229.9.9.0
Device(config-igmp-profile)# end
Device# show ip igmp profile 4
IGMP Profile 4
 permit
 range 229.9.9.0 229.9.9.0
```

## Example: Applying IGMP Profile

This example shows how to apply IGMP profile 4 to a port:

```
Device(config)# interface gigabitEthernet1/0/2
Device(config-if)# ip igmp filter 4
Device(config-if)# end
```

## Example: Setting the Maximum Number of IGMP Groups

This example shows how to limit to 25 the number of IGMP groups that a port can join:

```
Device(config)# interface gigabitEthernet1/0/2
Device(config-if)# ip igmp max-groups 25
Device(config-if)# end
```

## Example: Interface Configuration as a Routed Port

This example shows how to configure an interface on the device as a routed port. This configuration is required on the interface for several IP multicast routing configuration procedures that require running the **no switchport** command.

```
Device configure terminal
Device(config)# interface GigabitEthernet1/0/9
Device(config-if)# description interface to be use as routed port
Device(config-if)# no switchport
Device(config-if)# ip address 20.20.20.1 255.255.255.0
Device(config-if)# ip pim sparse-dense-mode
Device(config-if)# ip igmp join-group 224.1.2.3 source 15.15.15.2
Device(config-if)# end
Device# configure terminal
Device# show run interface gigabitEthernet 1/0/9

Current configuration : 166 bytes
!
```

```

interface GigabitEthernet1/0/9
 no switchport
 ip address 20.20.20.1 255.255.255.0
 ip pim sparse-dense-mode
 ip igmp static-group 224.1.2.3 source 15.15.15.2
end

```

## Example: Interface Configuration as an SVI

This example shows how to configure an interface on the device as an SVI. This configuration is required on the interface for several IP multicast routing configuration procedures that require running the **no switchport** command.

```

Device(config)# interface vlan 150
Device(config-if)# ip address 20.20.20.1 255.255.255.0
Device(config-if)# ip pim sparse-dense-mode
Device(config-if)# ip igmp join-group 224.1.2.3 source 15.15.15.2
Device(config-if)# end
Device# configure terminal
Device(config)# ip igmp snooping vlan 20 static 224.1.2.3
interface gigabitEthernet 1/0/9
Device# show run interface vlan 150

Current configuration : 137 bytes
!
interface Vlan150
 ip address 20.20.20.1 255.255.255.0
 ip pim sparse-dense-mode
 ip igmp static-group 224.1.2.3 source 15.15.15.2
end

```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for IGMP Proxy

- All devices on the IGMP UDL have the same subnet address. If all devices on the UDL cannot have the same subnet address, the upstream device must be configured with secondary addresses to match all of the subnets to which the downstream devices are attached.
- IP multicast is enabled and the PIM interfaces are configured.

---

**Note** Use the following guidelines when configuring PIM interfaces for IGMP proxy:

- Use PIM sparse mode (PIM-SM) when the interface is operating in a sparse-mode region and you are running static RP, bootstrap (BSR), or Auto-RP with the Auto-RP listener capability.
  - Use PIM sparse-dense mode when the interface is running in a sparse-dense mode region and you are running Auto-RP without the Auto-RP listener capability.
  - Use PIM dense mode (PIM-DM) when the interface is operating in dense mode and is, thus, participating in a dense-mode region.
  - Use PIM-DM with the proxy-register capability when the interface is receiving source traffic from a dense-mode region that needs to reach receivers that are in a sparse-mode region.
- 

## Information about IGMP Proxy

### IGMP Proxy

An IGMP proxy enables hosts in a unidirectional link routing (UDLR) environment that are not directly connected to a downstream router to join a multicast group sourced from an upstream network.

The figure below illustrates a sample topology that shows two UDLR scenarios:

- Traditional UDL routing scenario--A UDL device with directly connected receivers.
- IGMP proxy scenario--UDL device without directly connected receivers.

---

**Note** IGMP UDLs are needed on the upstream and downstream devices.

---

### Scenario 1--Traditional UDLR Scenario (UDL Device with Directly Connected Receivers)

For scenario 1, no IGMP proxy mechanism is needed. In this scenario, the following sequence of events occurs:

1. User 2 sends an IGMP membership report requesting interest in group G.
2. Router B receives the IGMP membership report, adds a forwarding entry for group G on LAN B, and proxies the IGMP report to Router A, which is the UDLR upstream device.
3. The IGMP report is then proxied across the Internet link.
4. Router A receives the IGMP proxy and maintains a forwarding entry on the unidirectional link.

### Scenario 2--IGMP Proxy Scenario (UDL Device without Directly Connected Receivers)

For scenario 2, the IGMP proxy mechanism is needed to enable hosts that are not directly connected to a downstream device to join a multicast group sourced from an upstream network. In this scenario, the following sequence of events occurs:

1. User 1 sends an IGMP membership report requesting interest in group G.
2. Router C sends a PIM Join message hop-by-hop to the RP (Router B).
3. Router B receives the PIM Join message and adds a forwarding entry for group G on LAN B.
4. Router B periodically checks its mroute table and proxies the IGMP membership report to its upstream UDL device across the Internet link.
5. Router A creates and maintains a forwarding entry on the unidirectional link (UDL).

In an enterprise network, it is desirable to be able to receive IP multicast traffic via satellite and forward the traffic throughout the network. With unidirectional link routing (UDLR) alone, scenario 2 would not be

possible because receiving hosts must be directly connected to the downstream device, Router B. The IGMP proxy mechanism overcomes this limitation by creating an IGMP report for (\*, G) entries in the multicast forwarding table. To make this scenario functional, therefore, you must enable IGMP report forwarding of proxied (\*, G) multicast static route (mroute) entries (using the **ip igmp mroute-proxy** command) and enable the mroute proxy service (using the **ip igmp proxy-service** command) on interfaces leading to PIM-enabled networks with potential members.

**Note** Because PIM messages are not forwarded upstream, each downstream network and the upstream network have a separate domain.

## How to Configure IGMP Proxy

### Configuring the Upstream UDL Device for IGMP UDLR

Perform this task to configure the upstream UDL device for IGMP UDLR.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip igmp unidirectional-link**
5. **end**

#### DETAILED STEPS

|               | Command or Action                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Device> enable                                                                                          | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>interface <i>type number</i></b><br><b>Example:</b><br>Device(config)# interface gigabitethernet 0/0/0                  | Enters interface configuration mode. <ul style="list-style-type: none"> <li>• For the <i>type</i> and <i>number</i> arguments, specify the interface to be used as the UDL on the downstream device for IGMP UDLR.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>ip igmp unidirectional-link</b><br><b>Example:</b><br>Device(config-if)# ip igmp unidirectional-link                    | Configures IGMP on the interface to be unidirectional for IGMP UDLR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config-if)# exit                                                                  | Exits interface configuration mode and returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 6</b> | <b>interface <i>type number</i></b><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/0                  | Enters interface configuration mode. <ul style="list-style-type: none"> <li>• For the <i>type</i> and <i>number</i> arguments, select an interface that is facing the nondirectly connected hosts.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <b>ip igmp mroute-proxy <i>type number</i></b><br><b>Example:</b><br>Device(config-if)# ip igmp mroute-proxy loopback<br>0 | Enables IGMP report forwarding of proxied (*, G) multicast static route (mroute) entries. <ul style="list-style-type: none"> <li>• This step is performed to enable the forwarding of IGMP reports to a proxy service interface for all (*, G) forwarding entries in the multicast forwarding table.</li> <li>• In this example, the <b>ip igmp mroute-proxy</b> command is configured on Gigabit Ethernet interface 1/0/0 to request that IGMP reports be sent to loopback interface 0 for all groups in the mroute table that are forwarded to Gigabit Ethernet interface 1/0/0.</li> </ul> |
| <b>Step 8</b> | <b>exit</b><br><b>Example:</b><br>Device(config-if)# exit                                                                  | Exits interface configuration mode and returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|         | Command or Action                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <p><b>interface</b> <i>type number</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface loopback 0</pre>                                                                     | <p>Enters interface configuration mode for the specified interface.</p> <ul style="list-style-type: none"> <li>In this example, loopback interface 0 is specified.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 10 | <p><b>ip igmp helper-address udl</b> <i>interface-type interface-number</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip igmp helper-address udl gigabitethernet 0/0/0</pre> | <p>Configures IGMP helping for UDLR.</p> <ul style="list-style-type: none"> <li>This step allows the downstream device to helper IGMP reports received from hosts to an upstream device connected to a UDL associated with the interface specified for the <i>interface-type</i> and <i>interface-number</i> arguments.</li> <li>In the example topology, IGMP helping is configured over loopback interface 0 on the downstream device. Loopback interface 0, thus, is configured to helper IGMP reports from hosts to an upstream device connected to Gigabit Ethernet interface 0/0/0.</li> </ul>                                                                                                                                                                                                                                                                                                  |
| Step 11 | <p><b>ip igmp proxy-service</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip igmp proxy-service</pre>                                                                        | <p>Enables the mroute proxy service.</p> <ul style="list-style-type: none"> <li>When the mroute proxy service is enabled, the device periodically checks the static mroute table for (*, G) forwarding entries that match interfaces configured with the <b>ip igmp mroute-proxy</b> command (see Step 7) based on the IGMP query interval. Where there is a match, one IGMP report is created and received on this interface.</li> </ul> <p><b>Note</b> The <b>ip igmp proxy-service</b> command is intended to be used with the <b>ip igmp helper-address</b> (UDL) command.</p> <ul style="list-style-type: none"> <li>In this example, the <b>ip igmp proxy-service</b> command is configured on loopback interface 0 to enable the forwarding of IGMP reports out the interface for all groups on interfaces registered through the <b>ip igmp mroute-proxy</b> command (see Step 7).</li> </ul> |
| Step 12 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# end</pre>                                                                                                            | <p>Ends the current configuration session and returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 13 | <p><b>show ip igmp interface</b></p> <p><b>Example:</b></p> <pre>Device# show ip igmp interface</pre>                                                                                 | <p>(Optional) Displays multicast-related information about an interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|         | Command or Action                                                          | Purpose                                                                                                                               |
|---------|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Step 14 | <b>show ip igmp udldr</b><br><b>Example:</b><br>Device# show ip igmp udldr | (Optional) Displays UDLR information for directly connected multicast groups on interfaces that have a UDL helper address configured. |

# Configuration Examples for IGMP Proxy

## Example: IGMP Proxy Configuration

The following example shows how to configure the upstream UDL device for IGMP UDLR and the downstream UDL device for IGMP UDLR with IGMP proxy support.

### Upstream Device Configuration

```
interface gigabitethernet 0/0/0
ip address 10.1.1.1 255.255.255.0
ip pim dense-mode
!
interface gigabitethernet 1/0/0
ip address 10.2.1.1 255.255.255.0
ip pim dense-mode
ip igmp unidirectional-link
!
interface gigabitethernet 2/0/0

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Constraining IP Multicast in a Switched Ethernet Network

Before using the tasks in this module, you should be familiar with the concepts described in the “IP Multicast Technology Overview” module.

# Information About IP Multicast in a Switched Ethernet Network

## IP Multicast Traffic and Layer 2 Switches

The default behavior for a Layer 2 switch is to forward all multicast traffic to every port that belongs to the destination LAN on the switch. This behavior reduces the efficiency of the switch, whose purpose is to limit traffic to the ports that need to receive the data. This behavior requires a constraining mechanism to reduce unnecessary multicast traffic, which improves switch performance.

Cisco Group Management Protocol (CGMP), Router Group Management Protocol (RGMP), and IGMP snooping efficiently constrain IP multicast in a Layer 2 switching environment.

- CGMP and IGMP snooping are used on subnets that include end users or receiver clients.
- RGMP is used on routed segments that contain only routers, such as in a collapsed backbone.
- RGMP and CGMP cannot interoperate. However, Internet Group Management Protocol (IGMP) can interoperate with CGMP and RGMP snooping.

## CGMP on Catalyst Switches for IP Multicast

CGMP is a Cisco-developed protocol used on device connected to Catalyst switches to perform tasks similar to those performed by IGMP. CGMP is necessary for those Catalyst switches that do not distinguish between IP multicast data packets and IGMP report messages, both of which are addressed to the same group address at the MAC level. The switch can distinguish IGMP packets, but would need to use software on the switch, greatly impacting its performance.

You must configure CGMP on the multicast device and the Layer 2 switches. The result is that, with CGMP, IP multicast traffic is delivered only to those Catalyst switch ports that are attached to interested receivers. All other ports that have not explicitly requested the traffic will not receive it unless these ports are connected to a multicast router. Multicast router ports must receive every IP multicast data packet.

Using CGMP, when a host joins a multicast group, it multicasts an unsolicited IGMP membership report message to the target group. The IGMP report is passed through the switch to the router for normal IGMP processing. The router (which must have CGMP enabled on this interface) receives the IGMP report and processes it as it normally would, but also creates a CGMP Join message and sends it to the switch. The Join message includes the MAC address of the end station and the MAC address of the group it has joined.

The switch receives this CGMP Join message and then adds the port to its content-addressable memory (CAM) table for that multicast group. All subsequent traffic directed to this multicast group is then forwarded out the port for that host.

The Layer 2 switches are designed so that several destination MAC addresses could be assigned to a single physical port. This design allows switches to be connected in a hierarchy and also allows many multicast destination addresses to be forwarded out a single port.

The device port also is added to the entry for the multicast group. Multicast device must listen to all multicast traffic for every group because IGMP control messages are also sent as multicast traffic. The rest of the multicast traffic is forwarded using the CAM table with the new entries created by CGMP.

### Related Topics

[Example: CGMP Configuration](#), on page 416

## IGMP Snooping

IGMP snooping is an IP multicast constraining mechanism that runs on a Layer 2 LAN switch. IGMP snooping requires the LAN switch to examine, or “snoop,” some Layer 3 information (IGMP Join/Leave messages) in the IGMP packets sent between the hosts and the router. When the switch receives the IGMP host report from a host for a particular multicast group, the switch adds the port number of the host to the associated multicast table entry. When the switch hears the IGMP Leave group message from a host, the switch removes the table entry of the host.

Because IGMP control messages are sent as multicast packets, they are indistinguishable from multicast data at Layer 2. A switch running IGMP snooping must examine every multicast data packet to determine if it contains any pertinent IGMP control information. IGMP snooping implemented on a low-end switch with a slow CPU could have a severe performance impact when data is sent at high rates. The solution is to implement IGMP snooping on high-end switches with special application-specific integrated circuits (ASICs) that can perform the IGMP checks in hardware. CGMP is a better option for low-end switches without special hardware.

## Router-Port Group Management Protocol (RGMP)

CGMP and IGMP snooping are IP multicast constraining mechanisms designed to work on routed network segments that have active receivers. They both depend on IGMP control messages that are sent between the hosts and the routers to determine which switch ports are connected to interested receivers.

Switched Ethernet backbone network segments typically consist of several routers connected to a switch without any hosts on that segment. Because routers do not generate IGMP host reports, CGMP and IGMP snooping will not be able to constrain the multicast traffic, which will be flooded to every port on the VLAN. Routers instead generate Protocol Independent Multicast (PIM) messages to Join and Prune multicast traffic flows at a Layer 3 level.

Router-Port Group Management Protocol (RGMP) is an IP multicast constraining mechanism for router-only network segments. RGMP must be enabled on the routers and on the Layer 2 switches. A multicast router indicates that it is interested in receiving a data flow by sending an RGMP Join message for a particular group. The switch then adds the appropriate port to its forwarding table for that multicast group--similar to the way it handles a CGMP Join message. IP multicast data flows will be forwarded only to the interested router ports. When the router no longer is interested in that data flow, it sends an RGMP Leave message and the switch removes the forwarding entry.

If there are any routers that are not RGMP-enabled, they will continue to receive all multicast data.

# How to Constrain Multicast in a Switched Ethernet Network

## Configuring Switches for IP Multicast

If you have switching in your multicast network, consult the documentation for the switch you are working with for information about how to configure IP multicast.

## Configuring IGMP Snooping

No configuration is required on the router. Consult the documentation for the switch you are working with to determine how to enable IGMP snooping and follow the provided instructions.

## Enabling CGMP

CGMP is a protocol used on devices connected to Catalyst switches to perform tasks similar to those performed by IGMP. CGMP is necessary because the Catalyst switch cannot distinguish between IP multicast data packets and IGMP report messages, which are both at the MAC level and are addressed to the same group address.

### Note

- CGMP should be enabled only on 802 or ATM media, or LAN emulation (LANE) over ATM.
- CGMP should be enabled only on devices connected to Catalyst switches.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip cgmp** [**proxy** | **router-only**]
5. **end**
6. **clear ip cgmp** [*interface-type interface-number*]

### DETAILED STEPS

|               | Command or Action                                                                                           | Purpose                                                                                                                                                                                                                                                    |
|---------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                  | Enters global configuration mode.                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>interface</b> <i>type number</i><br><b>Example:</b><br>Device(config)# interface ethernet 1              | Selects an interface that is connected to hosts on which IGMPv3 can be enabled.                                                                                                                                                                            |
| <b>Step 4</b> | <b>ip cgmp</b> [ <b>proxy</b>   <b>router-only</b> ]<br><b>Example:</b><br>Device(config-if)# ip cgmp proxy | Enables CGMP on an interface of a device connected to a Cisco Catalyst 5000 family switch. <ul style="list-style-type: none"> <li>• The <b>proxy</b> keyword enables the CGMP proxy function. When enabled, any device that is not CGMP-capable</li> </ul> |

|               | Command or Action                                                                                           | Purpose                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                             | will be advertised by the proxy router. The proxy router advertises the existence of other non-CGMP-capable devices by sending a CGMP Join message with the MAC address of the non-CGMP-capable device and group address of 0000.0000.0000. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# end                                                     | Ends the current configuration session and returns to EXEC mode.                                                                                                                                                                            |
| <b>Step 6</b> | <b>clear ip cgmp</b> [ <i>interface-type interface-number</i> ]<br><b>Example:</b><br>Device# clear ip cgmp | (Optional) Clears all group entries from the caches of Catalyst switches.                                                                                                                                                                   |

## Configuration Examples for Constraining IP Multicast in a Switched Ethernet Network

### Example: CGMP Configuration

The following example is for a basic network environment where multicast source(s) and multicast receivers are in the same VLAN. The desired behavior is that the switch will constrain the multicast forwarding to those ports that request the multicast stream.

A 4908G-L3 router is connected to the Catalyst 4003 on port 3/1 in VLAN 50. The following configuration is applied on the GigabitEthernet1 interface. Note that there is no **ip multicast-routing** command configured because the router is not routing multicast traffic across its interfaces.

```
interface GigabitEthernet1
 ip address 192.168.50.11 255.255.255.0
 ip pim dense-mode
 ip cgmp
```

# Configuring PIM

---

- [Finding Feature Information, on page 419](#)
- [Prerequisites for PIM, on page 419](#)
- [Restrictions for PIM, on page 420](#)
- [Information About PIM, on page 423](#)
- [How to Configure PIM, on page 438](#)
- [Verifying PIM Operations, on page 466](#)
- [Monitoring and Troubleshooting PIM, on page 474](#)
- [Configuration Examples for PIM, on page 476](#)
- [Additional References, on page 479](#)
- [Feature History and Information for PIM, on page 481](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Prerequisites for PIM

- Before you begin the PIM configuration process, decide which PIM mode to use. This is based on the applications you intend to support on your network. Use the following guidelines:
  - In general, if the application is one-to-many or many-to-many in nature, then PIM-SM can be used successfully.
  - For optimal one-to-many application performance, SSM is appropriate but requires IGMP version 3 support.
- Before you configure PIM stub routing, check that you have met these conditions:

- You must have IP multicast routing configured on both the stub router and the central router. You must also have PIM mode (dense-mode, sparse-mode, or sparse-dense-mode) configured on the uplink interface of the stub router.
- You must also configure either Enhanced Interior Gateway Routing Protocol (EIGRP) stub routing or Open Shortest Path First (OSPF) stub routing on the device.
- The PIM stub router does not route the transit traffic between the distribution routers. Unicast (EIGRP) stub routing enforces this behavior. You must configure unicast stub routing to assist the PIM stub router behavior.

---

**Note** For information about EIGRP or OSPF configurations, see the *Catalyst 3850 Routing Configuration Guide, Release 3SE*.

---

## Restrictions for PIM

The following are the restrictions for configuring PIM:

- PIM is not supported when running the LAN Base feature set.
- Bidirectional PIM is not supported.

## PIMv1 and PIMv2 Interoperability

To avoid misconfiguring multicast routing on your device, review the information in this section.

The Cisco PIMv2 implementation provides interoperability and transition between Version 1 and Version 2, although there might be some minor problems.

You can upgrade to PIMv2 incrementally. PIM Versions 1 and 2 can be configured on different routers and multilayer devices within one network. Internally, all routers and multilayer devices on a shared media network must run the same PIM version. Therefore, if a PIMv2 device detects a PIMv1 device, the Version 2 device downgrades itself to Version 1 until all Version 1 devices have been shut down or upgraded.

PIMv2 uses the BSR to discover and announce RP-set information for each group prefix to all the routers and multilayer devices in a PIM domain. PIMv1, together with the Auto-RP feature, can perform the same tasks as the PIMv2 BSR. However, Auto-RP is a standalone protocol, separate from PIMv1, and is a proprietary Cisco protocol. PIMv2 is a standards track protocol in the IETF.

---

**Note** We recommend that you use PIMv2. The BSR function interoperates with Auto-RP on Cisco routers and multilayer devices.

---

When PIMv2 devices interoperate with PIMv1 devices, Auto-RP should have already been deployed. A PIMv2 BSR that is also an Auto-RP mapping agent automatically advertises the RP elected by Auto-RP. That is, Auto-RP sets its single RP on every router or multilayer device in the group. Not all routers and devices in the domain use the PIMv2 hash function to select multiple RPs.

Dense-mode groups in a mixed PIMv1 and PIMv2 region need no special configuration; they automatically interoperate.

Sparse-mode groups in a mixed PIMv1 and PIMv2 region are possible because the Auto-RP feature in PIMv1 interoperates with the PIMv2 RP feature. Although all PIMv2 devices can also use PIMv1, we recommend that the RPs be upgraded to PIMv2. To ease the transition to PIMv2, we recommend:

- Using Auto-RP throughout the region.
- Configuring sparse-dense mode throughout the region.

If Auto-RP is not already configured in the PIMv1 regions, configure Auto-RP.

#### Related Topics

[PIM Versions](#), on page 425

## Restrictions for Configuring PIM Stub Routing

- The IP services image contains complete multicast routing.
- Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM protocol is not supported in access domains.
- In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a device that is configured with PIM stub routing.
- The redundant PIM stub router topology is not supported. Only the nonredundant access router topology is supported by the PIM stub feature.
- PIM stub routing is supported when running the IP Base and IP Services feature sets.

## Restrictions for Configuring Auto-RP and BSR

Take into consideration your network configuration, and the following restrictions when configuring Auto-RP and BSR:

#### Restrictions for Configuring Auto-RP

The following are restrictions for configuring Auto-RP (if used in your network configuration):

- Auto-RP is not supported when running the LAN Base feature set.
- If you configure PIM in sparse mode or sparse-dense mode and do not configure Auto-RP, you must manually configure an RP.
- If routed interfaces are configured in sparse mode, Auto-RP can still be used if all devices are configured with a manual RP address for the Auto-RP groups.
- If routed interfaces are configured in sparse mode and you enter the **ip pim autorp listener** global configuration command, Auto-RP can still be used even if all devices are not configured with a manual RP address for the Auto-RP groups.

### Restrictions for Configuring BSR

The following are the restrictions for configuring BSR (if used in your network configuration):

- Configure the candidate BSRs as the RP-mapping agents for Auto-RP.
- For group prefixes advertised through Auto-RP, the PIMv2 BSR mechanism should not advertise a subrange of these group prefixes served by a different set of RPs. In a mixed PIMv1 and PIMv2 domain, have backup RPs serve the same group prefixes. This prevents the PIMv2 DRs from selecting a different RP from those PIMv1 DRs, due to the longest match lookup in the RP-mapping database.

### Restrictions and Guidelines for Configuring Auto-RP and BSR

The following are restrictions for configuring Auto-RP and BSR (if used in your network configuration):

- If your network is all Cisco routers and multilayer devices, you can use either Auto-RP or BSR.
- If you have non-Cisco routers in your network, you must use BSR.
- If you have Cisco PIMv1 and PIMv2 routers and multilayer devices and non-Cisco routers, you must use both Auto-RP and BSR. If your network includes routers from other vendors, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 device. Ensure that no PIMv1 device is located in the path a between the BSR and a non-Cisco PIMv2 device.

---

**Note** There are two approaches to using PIMv2. You can use Version 2 exclusively in your network or migrate to Version 2 by employing a mixed PIM version environment.

---

- Because bootstrap messages are sent hop-by-hop, a PIMv1 device prevents these messages from reaching all routers and multilayer devices in your network. Therefore, if your network has a PIMv1 device in it and only Cisco routers and multilayer devices, it is best to use Auto-RP.
- If you have a network that includes non-Cisco routers, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 router or multilayer device. Ensure that no PIMv1 device is on the path between the BSR and a non-Cisco PIMv2 router.
- If you have non-Cisco PIMv2 routers that need to interoperate with Cisco PIMv1 routers and multilayer devices, both Auto-RP and a BSR are required. We recommend that a Cisco PIMv2 device be both the Auto-RP mapping agent and the BSR.

# Information About PIM

## Protocol Independent Multicast Overview

The Protocol Independent Multicast (PIM) protocol maintains the current IP multicast service mode of receiver-initiated membership. PIM is not dependent on a specific unicast routing protocol; it is IP routing protocol independent and can leverage whichever unicast routing protocols are used to populate the unicast routing table, including Enhanced Interior Gateway Routing Protocol (EIGRP), Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), and static routes. PIM uses unicast routing information to perform the multicast forwarding function.

Although PIM is called a multicast routing protocol, it actually uses the unicast routing table to perform the reverse path forwarding (RPF) check function instead of building up a completely independent multicast routing table. Unlike other routing protocols, PIM does not send and receive routing updates between routers.

PIM is defined in RFC 4601, Protocol Independent Multicast - Sparse Mode (PIM-SM)

PIM can operate in dense mode or sparse mode. The router can also handle both sparse groups and dense groups at the same time (sparse-dense mode). The mode determines how the router populates its multicast routing table and how the router forwards multicast packets it receives from its directly connected LANs.

For information about PIM forwarding (interface) modes, see the following sections:

## PIM Dense Mode

PIM dense mode (PIM-DM) uses a push model to flood multicast traffic to every corner of the network. This push model is a method for delivering data to the receivers without the receivers requesting the data. This method is efficient in certain deployments in which there are active receivers on every subnet in the network.

In dense mode, a router assumes that all other routers want to forward multicast packets for a group. If a router receives a multicast packet and has no directly connected members or PIM neighbors present, a prune message is sent back to the source. Subsequent multicast packets are not flooded to this router on this pruned branch. PIM builds source-based multicast distribution trees.

PIM-DM initially floods multicast traffic throughout the network. Routers that have no downstream neighbors prune back the unwanted traffic. This process repeats every 3 minutes.

Routers accumulate state information by receiving data streams through the flood and prune mechanism. These data streams contain the source and group information so that downstream routers can build up their multicast forwarding table. PIM-DM supports only source trees--that is, (S,G) entries--and cannot be used to build a shared distribution tree.

---

**Note** Dense mode is not often used and its use is not recommended. For this reason it is not specified in the configuration tasks in related modules.

---

## PIM Sparse Mode

PIM sparse mode (PIM-SM) uses a pull model to deliver multicast traffic. Only network segments with active receivers that have explicitly requested the data will receive the traffic.

Unlike dense mode interfaces, sparse mode interfaces are added to the multicast routing table only when periodic Join messages are received from downstream routers, or when a directly connected member is on the interface. When forwarding from a LAN, sparse mode operation occurs if an RP is known for the group. If so, the packets are encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense mode fashion. If the multicast traffic from a specific source is sufficient, the first hop router of the receiver may send Join messages toward the source to build a source-based distribution tree.

PIM-SM distributes information about active sources by forwarding data packets on the shared tree. Because PIM-SM uses shared trees (at least, initially), it requires the use of a rendezvous point (RP). The RP must be administratively configured in the network. See the [Rendezvous Points, on page 427](#) section for more information.

In sparse mode, a router assumes that other routers do not want to forward multicast packets for a group, unless there is an explicit request for the traffic. When hosts join a multicast group, the directly connected routers send PIM Join messages toward the RP. The RP keeps track of multicast groups. Hosts that send multicast packets are registered with the RP by the first hop router of that host. The RP then sends Join messages toward the source. At this point, packets are forwarded on a shared distribution tree. If the multicast traffic from a specific source is sufficient, the first hop router of the host may send Join messages toward the source to build a source-based distribution tree.

Sources register with the RP and then data is forwarded down the shared tree to the receivers. The edge routers learn about a particular source when they receive data packets on the shared tree from that source through the RP. The edge router then sends PIM (S,G) Join messages toward that source. Each router along the reverse path compares the unicast routing metric of the RP address to the metric of the source address. If the metric for the source address is better, it will forward a PIM (S,G) Join message toward the source. If the metric for the RP is the same or better, then the PIM (S,G) Join message will be sent in the same direction as the RP. In this case, the shared tree and the source tree would be considered congruent.

If the shared tree is not an optimal path between the source and the receiver, the routers dynamically create a source tree and stop traffic from flowing down the shared tree. This behavior is the default behavior in software. Network administrators can force traffic to stay on the shared tree by using the **ip pim spt-threshold infinity** command.

PIM-SM scales well to a network of any size, including those with WAN links. The explicit join mechanism prevents unwanted traffic from flooding the WAN links.

## Multicast Source Discovery Protocol (MSDP)

Multicast Source Discovery Protocol (MSDP) is used for inter-domain source discovery when PIM SM is used. Each PIM administrative domain has its own RP. In order for the RP in one domain to signal new sources to the RP in the other domain, MSDP is used.

When RP in a domain receives a PIM register message for a new source, with MSDP configured it sends a new source-active (SA) message to all its MSDP peers in other domains. Each intermediate MSDP peer floods this SA message away from the originating RP. The MSDP peers install this SA message in their MSDP sa-cache. If the RPs in other domains have any join requests for the group in the SA message (indicated by the presence of a (\*,G) entry with non empty outgoing interface list), the domain is interested in the group, and the RP triggers an (S,G) join toward the source.

## Sparse-Dense Mode

If you configure either sparse mode or dense mode on an interface, then sparseness or denseness is applied to the interface as a whole. However, some environments might require PIM to run in a single region in sparse mode for some groups and in dense mode for other groups.

An alternative to enabling only dense mode or only sparse mode is to enable sparse-dense mode. In this case, the interface is treated as dense mode if the group is in dense mode; the interface is treated in sparse mode if the group is in sparse mode. You must have an RP if the interface is in sparse-dense mode and you want to treat the group as a sparse group.

If you configure sparse-dense mode, the idea of sparseness or denseness is applied to the groups for which the router is a member.

Another benefit of sparse-dense mode is that Auto-RP information can be distributed in a dense mode; yet, multicast groups for user groups can be used in a sparse mode manner. Therefore there is no need to configure a default RP at the leaf routers.

When an interface is treated in dense mode, it is populated in the outgoing interface list of a multicast routing table when either of the following conditions is true:

- Members or DVMRP neighbors are on the interface.
- There are PIM neighbors and the group has not been pruned.

When an interface is treated in sparse mode, it is populated in the outgoing interface list of a multicast routing table when either of the following conditions is true:

- Members or DVMRP neighbors are on the interface.
- An explicit Join message has been received by a PIM neighbor on the interface.

## PIM Versions

PIMv2 includes these improvements over PIMv1:

- A single, active rendezvous point (RP) exists per multicast group, with multiple backup RPs. This single RP compares to multiple active RPs for the same group in PIMv1.
- A bootstrap router (BSR) provides a fault-tolerant, automated RP discovery and distribution function that enables routers and multilayer devices to dynamically learn the group-to-RP mappings.
- Sparse mode and dense mode are properties of a group, as opposed to an interface.

---

**Note** We strongly recommend using sparse-dense mode as opposed to either sparse mode or dense mode only.

---

- PIM join and prune messages have more flexible encoding for multiple address families.
- A more flexible hello packet format replaces the query packet to encode current and future capability options.
- Register messages sent to an RP specify whether they are sent by a border router or a designated router.
- PIM packets are no longer inside IGMP packets; they are standalone packets.

[PIMv1 and PIMv2 Interoperability](#), on page 420

## PIM Stub Routing

The PIM stub routing feature, available in all of the device software images, reduces resource usage by moving routed traffic closer to the end user.

The PIM stub routing feature supports multicast routing between the distribution layer and the access layer. It supports two types of PIM interfaces, uplink PIM interfaces, and PIM passive interfaces. A routed interface configured with the PIM passive mode does not pass or forward PIM control traffic, it only passes and forwards IGMP traffic.

In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a device that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IP multicast routing and configure only the device as a PIM stub router. The device does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the device. The device uplink port cannot be used with SVIs. If you need PIM for an SVI uplink port, you should upgrade to the IP Services feature set.

---

**Note** You must also configure EIGRP stub routing when configuring PIM stub routing on the device

---

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM asset and designated router election mechanisms are not supported on the PIM passive interfaces. Only the nonredundant access router topology is supported by the PIM stub feature. By using a nonredundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

### **Figure 19: PIM Stub Router Configuration**

In the following figure, the Device A routed uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source 200.1.1.3.

### Related Topics

- [Enabling PIM Stub Routing \(CLI\), on page 438](#)
- [Example: Enabling PIM Stub Routing, on page 476](#)
- [Example: Verifying PIM Stub Routing, on page 476](#)
- [Restrictions for Configuring PIM Stub Routing, on page 421](#)

## IGMP Helper

PIM stub routing moves routed traffic closer to the end user and reduces network traffic. You can also reduce traffic by configuring a stub router (switch) with the IGMP helper feature.

You can configure a stub router (switch) with the **ip igmp helper-address** *ip-address* interface configuration command to enable the switch to send reports to the next-hop interface. Hosts that are not directly connected to a downstream router can then join a multicast group sourced from an upstream network. The IGMP packets from a host wanting to join a multicast stream are forwarded upstream to the next-hop device when this feature is configured. When the upstream central router receives the helper IGMP reports or leaves, it adds or removes the interfaces from its outgoing interface list for that group.

## Rendezvous Points

A rendezvous point (RP) is a role that a device performs when operating in Protocol Independent Multicast (PIM) Sparse Mode (SM). An RP is required only in networks running PIM SM. In the PIM-SM model, only network segments with active receivers that have explicitly requested multicast data will be forwarded the traffic. This method of delivering multicast data is in contrast to PIM Dense Mode (PIM DM). In PIM DM, multicast traffic is initially flooded to all segments of the network. Routers that have no downstream neighbors or directly connected receivers prune back the unwanted traffic.

An RP acts as the meeting place for sources and receivers of multicast data. In a PIM-SM network, sources must send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree. By default, when the first hop device of the receiver learns about the source, it will send a Join message directly to the source, creating a source-based distribution tree from the source to the receiver. This source tree does not include the RP unless the RP is located within the shortest path between the source and receiver.

In most cases, the placement of the RP in the network is not a complex decision. By default, the RP is needed only to start new sessions with sources and receivers. Consequently, the RP experiences little overhead from traffic flow or processing. In PIM version 2, the RP performs less processing than in PIM version 1 because sources must only periodically register with the RP to create state.

**Related Topics**

- [Configuring the Candidate RPs \(CLI\)](#), on page 455
- [Configuring a Rendezvous Point](#), on page 440
- [Example: Configuring Candidate RPs](#), on page 479

**Auto-RP**

In the first version of PIM-SM, all leaf routers (routers directly connected to sources or receivers) were required to be manually configured with the IP address of the RP. This type of configuration is also known as static RP configuration. Configuring static RPs is relatively easy in a small network, but it can be laborious in a large, complex network.

Following the introduction of PIM-SM version 1, Cisco implemented a version of PIM-SM with the Auto-RP feature. Auto-RP automates the distribution of group-to-RP mappings in a PIM network. Auto-RP has the following benefits:

- Configuring the use of multiple RPs within a network to serve different groups is easy.
- Auto-RP allows load splitting among different RPs and arrangement of RPs according to the location of group participants.
- Auto-RP avoids inconsistent, manual RP configurations that can cause connectivity problems.

Multiple RPs can be used to serve different group ranges or serve as backups to each other. For Auto-RP to work, a router must be designated as an RP-mapping agent, which receives the RP-announcement messages from the RPs and arbitrates conflicts. The RP-mapping agent then sends the consistent group-to-RP mappings to all other routers. Thus, all routers automatically discover which RP to use for the groups they support.

---

**Note** If you configure PIM in sparse mode or sparse-dense mode and do not configure Auto-RP, you must statically configure an RP.

---

---

**Note** If router interfaces are configured in sparse mode, Auto-RP can still be used if all routers are configured with a static RP address for the Auto-RP groups.

---

To make Auto-RP work, a router must be designated as an RP mapping agent, which receives the RP announcement messages from the RPs and arbitrates conflicts. The RP mapping agent then sends the consistent group-to-RP mappings to all other routers by dense mode flooding. Thus, all routers automatically discover which RP to use for the groups they support. The Internet Assigned Numbers Authority (IANA) has assigned two group addresses, 224.0.1.39 and 224.0.1.40, for Auto-RP. One advantage of Auto-RP is that any change to the RP designation must be configured only on the routers that are RPs and not on the leaf routers. Another advantage of Auto-RP is that it offers the ability to scope the RP address within a domain. Scoping can be achieved by defining the time-to-live (TTL) value allowed for the Auto-RP advertisements.

Each method for configuring an RP has its own strengths, weaknesses, and level of complexity. In conventional IP multicast network scenarios, we recommend using Auto-RP to configure RPs because it is easy to configure, well-tested, and stable. The alternative ways to configure an RP are static RP, Auto-RP, and bootstrap router.

**Related Topics**

- [Setting Up Auto-RP in a New Internetwork \(CLI\)](#), on page 442

[Example: Configuring Auto-RP](#), on page 477

[Example: Sparse Mode with Auto-RP](#), on page 477

[Restrictions for Configuring Auto-RP and BSR](#), on page 421

[Restrictions for Auto-RP Enhancement](#), on page 422

## The Role of Auto-RP in a PIM Network

Auto-RP automates the distribution of group-to-rendezvous point (RP) mappings in a PIM network. To make Auto-RP work, a device must be designated as an RP mapping agent, which receives the RP announcement messages from the RPs and arbitrates conflicts. The RP mapping agent then sends the consistent group-to-RP mappings to all other devices by way of dense mode flooding.

Thus, all routers automatically discover which RP to use for the groups they support. The Internet Assigned Numbers Authority (IANA) has assigned two group addresses, 224.0.1.39 and 224.0.1.40, for Auto-RP.

The mapping agent receives announcements of intention to become the RP from Candidate-RPs. The mapping agent then announces the winner of the RP election. This announcement is made independently of the decisions by the other mapping agents.

## Multicast Boundaries

Administratively-scoped boundaries can be used to limit the forwarding of multicast traffic outside of a domain or subdomain. This approach uses a special range of multicast addresses, called administratively-scoped addresses, as the boundary mechanism. If you configure an administratively-scoped boundary on a routed interface, multicast traffic whose multicast group addresses fall in this range cannot enter or exit this interface, which provides a firewall for multicast traffic in this address range.

**Note** Multicast boundaries and TTL thresholds control the scoping of multicast domains; however, TTL thresholds are not supported by the device. You should use multicast boundaries instead of TTL thresholds to limit the forwarding of multicast traffic outside of a domain or a subdomain.

**Figure 20: Administratively-Scoped Boundaries**

The following figure shows that Company XYZ has an administratively-scoped boundary set for the multicast address range 239.0.0.0/8 on all routed interfaces at the perimeter of its network. This boundary prevents any multicast traffic in the range 239.0.0.0 through 239.255.255.255 from entering or leaving the network. Similarly, the engineering and marketing departments have an administratively-scoped boundary of 239.128.0.0/16 around the perimeter of their networks. This boundary prevents multicast traffic in the range of 239.128.0.0 through 239.128.255.255 from entering or leaving their respective networks.

You can define an administratively-scoped boundary on a routed interface for multicast group addresses. A standard access list defines the range of addresses affected. When a boundary is defined, no multicast data packets are allowed to flow across the boundary from either direction. The boundary allows the same multicast group address to be reused in different administrative domains.

The IANA has designated the multicast address range 239.0.0.0 to 239.255.255.255 as the administratively-scoped addresses. This range of addresses can then be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

You can configure the **filter-autorp** keyword to examine and filter Auto-RP discovery and announcement messages at the administratively scoped boundary. Any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary access control list (ACL) are removed. An Auto-RP group range announcement is permitted and passed by the boundary only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

## Sparse-Dense Mode for Auto-RP

A prerequisite of Auto-RP is that all interfaces must be configured in sparse-dense mode using the **ip pim sparse-dense-mode** interface configuration command. An interface configured in sparse-dense mode is treated in either sparse mode or dense mode of operation, depending on which mode the multicast group operates. If a multicast group has a known RP, the interface is treated in sparse mode. If a group has no known RP, by default the interface is treated in dense mode and data will be flooded over this interface. (You can prevent dense-mode fallback; see the module “Configuring Basic IP Multicast.”)

To successfully implement Auto-RP and prevent any groups other than 224.0.1.39 and 224.0.1.40 from operating in dense mode, we recommend configuring a “sink RP” (also known as “RP of last resort”). A sink RP is a statically configured RP that may or may not actually exist in the network. Configuring a sink RP does not interfere with Auto-RP operation because, by default, Auto-RP messages supersede static RP configurations. We recommend configuring a sink RP for all possible multicast groups in your network, because it is possible for an unknown or unexpected source to become active. If no RP is configured to limit source registration, the group may revert to dense mode operation and be flooded with data.

## Auto-RP Benefits

Auto-RP uses IP multicast to automate the distribution of group-to-RP mappings to all Cisco routers and multilayer devices in a PIM network. Auto-RP has these benefits:

- Easy to use multiple RPs within a network to serve different group ranges.
- Provides load splitting among different RPs and arrangement of RPs according to the location of group participants.
- Avoids inconsistent, manual RP configurations on every router and multilayer device in a PIM network, which can cause connectivity problems.

## Benefits of Auto-RP in a PIM Network

- Auto-RP allows any change to the RP designation to be configured only on the devices that are RPs, not on the leaf routers.
- Auto-RP offers the ability to scope the RP address within a domain.

## PIMv2 Bootstrap Router

PIMv2 Bootstrap Router (BSR) is another method to distribute group-to-RP mapping information to all PIM routers and multilayer devices in the network. It eliminates the need to manually configure RP information in every router and device in the network. However, instead of using IP multicast to distribute group-to-RP mapping information, BSR uses hop-by-hop flooding of special BSR messages to distribute the mapping information.

The BSR is elected from a set of candidate routers and devices in the domain that have been configured to function as BSRs. The election mechanism is similar to the root-bridge election mechanism used in bridged LANs. The BSR election is based on the BSR priority of the device contained in the BSR messages that are sent hop-by-hop through the network. Each BSR device examines the message and forwards out all interfaces only the message that has either a higher BSR priority than its BSR priority or the same BSR priority, but with a higher BSR IP address. Using this method, the BSR is elected.

The elected BSR sends BSR messages with a TTL of 1. Neighboring PIMv2 routers or multilayer devices receive the BSR message and multicast it out all other interfaces (except the one on which it was received) with a TTL of 1. In this way, BSR messages travel hop-by-hop throughout the PIM domain. Because BSR messages contain the IP address of the current BSR, the flooding mechanism enables candidate RPs to automatically learn which device is the elected BSR.

Candidate RPs send candidate RP advertisements showing the group range for which they are responsible to the BSR, which stores this information in its local candidate-RP cache. The BSR periodically advertises the contents of this cache in BSR messages to all other PIM devices in the domain. These messages travel hop-by-hop through the network to all routers and devices, which store the RP information in the BSR message in their local RP cache. The routers and devices select the same RP for a given group because they all use a common RP hashing algorithm.

## PIM Domain Border

As IP multicast becomes more widespread, the chance of one PIMv2 domain bordering another PIMv2 domain increases. Because two domains probably do not share the same set of RPs, BSR, candidate RPs, and candidate BSRs, you need to constrain PIMv2 BSR messages from flowing into or out of the domain. Allowing messages to leak across the domain borders could adversely affect the normal BSR election mechanism and elect a single BSR across all bordering domains and comingle candidate RP advertisements, resulting in the election of RPs in the wrong domain.

## Multicast Forwarding

Forwarding of multicast traffic is accomplished by multicast-capable routers. These routers create distribution trees that control the path that IP multicast traffic takes through the network in order to deliver traffic to all receivers.

Multicast traffic flows from the source to the multicast group over a distribution tree that connects all of the sources to all of the receivers in the group. This tree may be shared by all sources (a shared tree) or a separate distribution tree can be built for each source (a source tree). The shared tree may be one-way or bidirectional.

Before describing the structure of source and shared trees, it is helpful to explain the notations that are used in multicast routing tables. These notations include the following:

- (S,G) = (unicast source for the multicast group G, multicast group G)
- (\*,G) = (any source for the multicast group G, multicast group G)

The notation of (S,G), pronounced “S comma G,” enumerates a shortest path tree where S is the IP address of the source and G is the multicast group address.

Shared trees are (\*,G) and the source trees are (S,G) and always rooted at the sources.

### Multicast Distribution Source Tree

The simplest form of a multicast distribution tree is a source tree. A source tree has its root at the source host and has branches forming a spanning tree through the network to the receivers. Because this tree uses the shortest path through the network, it is also referred to as a shortest path tree (SPT).

The figure shows an example of an SPT for group 224.1.1.1 rooted at the source, Host A, and connecting two receivers, Hosts B and C.

Using standard notation, the SPT for the example shown in the figure would be (192.168.1.1, 224.1.1.1).

The (S,G) notation implies that a separate SPT exists for each individual source sending to each group—which is correct.

## Multicast Distribution Shared Tree

Unlike source trees that have their root at the source, shared trees use a single common root placed at some chosen point in the network. This shared root is called a rendezvous point (RP).

The following figure shows a shared tree for the group 224.2.2.2 with the root located at Router D. This shared tree is unidirectional. Source traffic is sent towards the RP on a source tree. The traffic is then forwarded down the shared tree from the RP to reach all of the receivers (unless the receiver is located between the source and the RP, in which case it will be serviced directly).

Figure 21: Shared Tree

In this example, multicast traffic from the sources, Hosts A and D, travels to the root (Router D) and then down the shared tree to the two receivers, Hosts B and C. Because all sources in the multicast group use a common shared tree, a wildcard notation written as (\*, G), pronounced “star comma G,” represents the tree. In this case, \* means all sources, and G represents the multicast group. Therefore, the shared tree shown in the figure would be written as (\*, 224.2.2.2).

Both source trees and shared trees are loop-free. Messages are replicated only where the tree branches. Members of multicast groups can join or leave at any time; therefore the distribution trees must be dynamically updated. When all the active receivers on a particular branch stop requesting the traffic for a particular multicast group, the routers prune that branch from the distribution tree and stop forwarding traffic down that branch. If one receiver on that branch becomes active and requests the multicast traffic, the router will dynamically modify the distribution tree and start forwarding traffic again.

## Source Tree Advantage

Source trees have the advantage of creating the optimal path between the source and the receivers. This advantage guarantees the minimum amount of network latency for forwarding multicast traffic. However, this optimization comes at a cost. The routers must maintain path information for each source. In a network that has thousands of sources and thousands of groups, this overhead can quickly become a resource issue on the routers. Memory consumption from the size of the multicast routing table is a factor that network designers must take into consideration.

## Shared Tree Advantage

Shared trees have the advantage of requiring the minimum amount of state in each router. This advantage lowers the overall memory requirements for a network that only allows shared trees. The disadvantage of shared trees is that under certain circumstances the paths between the source and receivers might not be the optimal paths, which might introduce some latency in packet delivery. For example, in the figure above the shortest path between Host A (source 1) and Host B (a receiver) would be Router A and Router C. Because we are using Router D as the root for a shared tree, the traffic must traverse Routers A, B, D and then C. Network designers must carefully consider the placement of the rendezvous point (RP) when implementing a shared tree-only environment.

In unicast routing, traffic is routed through the network along a single path from the source to the destination host. A unicast router does not consider the source address; it considers only the destination address and how to forward the traffic toward that destination. The router scans through its routing table for the destination address and then forwards a single copy of the unicast packet out the correct interface in the direction of the destination.

In multicast forwarding, the source is sending traffic to an arbitrary group of hosts that are represented by a multicast group address. The multicast router must determine which direction is the upstream direction (toward the source) and which one is the downstream direction (or directions) toward the receivers. If there are multiple downstream paths, the router replicates the packet and forwards it down the appropriate downstream paths (best unicast route metric)--which is not necessarily all paths. Forwarding multicast traffic away from the source, rather than to the receiver, is called Reverse Path Forwarding (RPF). RPF is described in the following section.

## PIM Shared Tree and Source Tree

By default, members of a group receive data from senders to the group across a single data-distribution tree rooted at the RP.

**Figure 22: Shared Tree and Source Tree (Shortest-Path Tree)**

The following figure shows this type of shared-distribution tree. Data from senders is delivered to the RP for distribution to group members joined to the shared tree.

If the data rate warrants, leaf routers (routers without any downstream connections) on the shared tree can use the data distribution tree rooted at the source. This type of distribution tree is called a shortest-path tree.

or source tree. By default, the software devices to a source tree upon receiving the first data packet from a source.

This process describes the move from a shared tree to a source tree:

1. A receiver joins a group; leaf Router C sends a join message toward the RP.
2. The RP puts a link to Router C in its outgoing interface list.
3. A source sends data; Router A encapsulates the data in a register message and sends it to the RP.
4. The RP forwards the data down the shared tree to Router C and sends a join message toward the source. At this point, data might arrive twice at Router C, once encapsulated and once natively.
5. When data arrives natively (unencapsulated) at the RP, it sends a register-stop message to Router A.
6. By default, reception of the first data packet prompts Router C to send a join message toward the source.
7. When Router C receives data on (S, G), it sends a prune message for the source up the shared tree.
8. The RP deletes the link to Router C from the outgoing interface of (S, G). The RP triggers a prune message toward the source.

Join and prune messages are sent for sources and RPs. They are sent hop-by-hop and are processed by each PIM device along the path to the source or RP. Register and register-stop messages are not sent hop-by-hop. They are sent by the designated router that is directly connected to a source and are received by the RP for the group.

Multiple sources sending to groups use the shared tree. You can configure the PIM device to stay on the shared tree.

The change from shared to source tree happens when the first data packet arrives at the last-hop router. This change depends upon the threshold that is configured by using the **ip pim spt-threshold** global configuration command.

The shortest-path tree requires more memory than the shared tree but reduces delay. You may want to postpone its use. Instead of allowing the leaf router to immediately move to the shortest-path tree, you can specify that the traffic must first reach a threshold.

You can configure when a PIM leaf router should join the shortest-path tree for a specified group. If a source sends at a rate greater than or equal to the specified kbps rate, the multilayer switch triggers a PIM join message toward the source to construct a source tree (shortest-path tree). If the traffic rate from the source drops below the threshold value, the leaf router switches back to the shared tree and sends a prune message toward the source.

You can specify to which groups the shortest-path tree threshold applies by using a group list (a standard access list). If a value of 0 is specified or if the group list is not used, the threshold applies to all groups.

## Reverse Path Forwarding

In unicast routing, traffic is routed through the network along a single path from the source to the destination host. A unicast router does not consider the source address; it considers only the destination address and how to forward the traffic toward that destination. The router scans through its routing table for the destination network and then forwards a single copy of the unicast packet out the correct interface in the direction of the destination.

In multicast forwarding, the source is sending traffic to an arbitrary group of hosts that are represented by a multicast group address. The multicast router must determine which direction is the upstream direction (toward the source) and which one is the downstream direction (or directions) toward the receivers. If there are multiple downstream paths, the router replicates the packet and forwards it down the appropriate downstream paths (best unicast route metric)--which is not necessarily all paths. Forwarding multicast traffic away from the source, rather than to the receiver, is called Reverse Path Forwarding (RPF). RPF is an algorithm used for forwarding multicast datagrams.

Protocol Independent Multicast (PIM) uses the unicast routing information to create a distribution tree along the reverse path from the receivers towards the source. The multicast routers then forward packets along the distribution tree from the source to the receivers. RPF is a key concept in multicast forwarding. It enables routers to correctly forward multicast traffic down the distribution tree. RPF makes use of the existing unicast routing table to determine the upstream and downstream neighbors. A router will forward a multicast packet only if it is received on the upstream interface. This RPF check helps to guarantee that the distribution tree will be loop-free.

## RPF Check

When a multicast packet arrives at a router, the router performs an RPF check on the packet. If the RPF check succeeds, the packet is forwarded. Otherwise, it is dropped.

For traffic flowing down a source tree, the RPF check procedure works as follows:

1. The router looks up the source address in the unicast routing table to determine if the packet has arrived on the interface that is on the reverse path back to the source.
2. If the packet has arrived on the interface leading back to the source, the RPF check succeeds and the packet is forwarded out the interfaces present in the outgoing interface list of a multicast routing table entry.
3. If the RPF check in Step 2 fails, the packet is dropped.

The figure shows an example of an unsuccessful RPF check.

**Figure 23: RPF Check Fails**

As the figure illustrates, a multicast packet from source 151.10.3.21 is received on serial interface 0 (S0). A check of the unicast route table shows that S1 is the interface this router would use to forward unicast data to 151.10.3.21. Because the packet has arrived on interface S0, the packet is discarded.

The figure shows an example of a successful RPF check.

Figure 24: RPF Check Succeeds

In this example, the multicast packet has arrived on interface S1. The router refers to the unicast routing table and finds that S1 is the correct interface. The RPF check passes, and the packet is forwarded.

PIM uses both source trees and RP-rooted shared trees to forward datagrams. The RPF check is performed differently for each:

- If a PIM router or multilayer device has a source-tree state (that is, an (S, G) entry is present in the multicast routing table), it performs the RPF check against the IP address of the source of the multicast packet.
- If a PIM router or multilayer device has a shared-tree state (and no explicit source-tree state), it performs the RPF check on the RP address (which is known when members join the group).

DVMRP and dense-mode PIM use only source trees and use RPF.

**Note** DVMRP is not supported on the device.

Sparse-mode PIM uses the RPF lookup function to decide where it needs to send joins and prunes:

- (S, G) joins (which are source-tree states) are sent toward the source.
- (\*,G) joins (which are shared-tree states) are sent toward the RP.

## Default PIM Routing Configuration

This table displays the default PIM routing configuration for the device.

Table 40: Default Multicast Routing Configuration

| Feature           | Default Setting             |
|-------------------|-----------------------------|
| Multicast routing | Disabled on all interfaces. |
| PIM version       | Version 2.                  |
| PIM mode          | No mode is defined.         |
| PIM stub routing  | None configured.            |
| PIM RP address    | None configured.            |
| PIM domain border | Disabled.                   |

| Feature                           | Default Setting |
|-----------------------------------|-----------------|
| PIM multicast boundary            | None.           |
| Candidate BSRs                    | Disabled.       |
| Candidate RPs                     | Disabled.       |
| Shortest-path tree threshold rate | 0 kb/s.         |
| PIM router query message interval | 30 seconds.     |

## How to Configure PIM

### Enabling PIM Stub Routing (CLI)

This procedure is optional.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip pim passive`
5. `end`
6. `show ip pim interface`
7. `show ip igmp groups detail`
8. `show ip mroute`
9. `show running-config`
10. `copy running-config startup-config`

#### DETAILED STEPS

|        | Command or Action                                                                             | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <code>enable</code><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <code>configure terminal</code><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|         | Command or Action                                                                                                     | Purpose                                                                                                        |
|---------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Step 3  | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br><pre>Device(config)# interface gigabitethernet 1/0/1</pre> | Specifies the interface on which you want to enable PIM stub routing, and enters interface configuration mode. |
| Step 4  | <b>ip pim passive</b><br><b>Example:</b><br><pre>Device(config-if)# ip pim passive</pre>                              | Configures the PIM stub feature on the interface.                                                              |
| Step 5  | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                               |
| Step 6  | <b>show ip pim interface</b><br><b>Example:</b><br><pre>Device# show ip pim interface</pre>                           | (Optional) Displays the PIM stub that is enabled on each interface.                                            |
| Step 7  | <b>show ip igmp groups detail</b><br><b>Example:</b><br><pre>Device# show ip igmp groups detail</pre>                 | (Optional) Displays the interested clients that have joined the specific multicast source group.               |
| Step 8  | <b>show ip mroute</b><br><b>Example:</b><br><pre>Device# show ip mroute</pre>                                         | (Optional) Displays the IP multicast routing table.                                                            |
| Step 9  | <b>show running-config</b><br><b>Example:</b><br><pre>Device# show running-config</pre>                               | Verifies your entries.                                                                                         |
| Step 10 | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                       |

## Configuring a Rendezvous Point

You must have a rendezvous point (RP), if the interface is in sparse-dense mode and if you want to handle the group as a sparse group. You can use these methods:

- By manually assigning an RP to multicast groups.
- As a standalone, Cisco-proprietary protocol separate from PIMv1, which includes:
  - Setting up Auto-RP in a new internetwork
  - Adding Auto-RP to an existing sparse-mode cloud
  - Preventing join messages to false RPs
  - Filtering incoming RP announcement messages
- By using a standards track protocol in the Internet Engineering Task Force (IETF), which includes configuring PIMv2 BSR .

---

**Note** You can use Auto-RP, BSR, or a combination of both, depending on the PIM version that you are running and the types of routers in your network. For information about working with different PIM versions in your network, see [PIMv1 and PIMv2 Interoperability](#), on page 420.

---

**Related Topics**

- [Configuring the Candidate RPs \(CLI\)](#), on page 455
- [Rendezvous Points](#), on page 427

## Manually Assigning an RP to Multicast Groups (CLI)

If the rendezvous point (RP) for a group is learned through a dynamic mechanism (such as Auto-RP or BSR), you need not perform this task for that RP.

Senders of multicast traffic announce their existence through register messages received from the source first-hop router (designated router) and forwarded to the RP. Receivers of multicast packets use RPs to join a multicast group by using explicit join messages.

---

**Note** RPs are not members of the multicast group; they serve as a *meeting place* for multicast sources and group members.

---

You can configure a single RP for multiple groups defined by an access list. If there is no RP configured for a group, the multilayer device responds to the group as dense and uses the dense-mode PIM techniques.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim rp-address** *ip-address* [*access-list-number*] [**override**]
4. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                             | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 3 | <b>ip pim rp-address</b> <i>ip-address</i> [ <i>access-list-number</i> ]<br>[ <b>override</b> ]<br><b>Example:</b><br>Device(config)# <b>ip pim rp-address</b><br><b>10.1.1.1 20 override</b> | Configures the address of a PIM RP.<br>By default, no PIM RP address is configured. You must configure the IP address of RPs on all routers and multilayer devices (including the RP).<br><b>Note</b> If there is no RP configured for a group, the device treats the group as dense, using the dense-mode PIM techniques.<br>A PIM device can be an RP for more than one group. Only one RP address can be used at a time within a PIM domain. The access list conditions specify for which groups the device is an RP. <ul style="list-style-type: none"> <li>• For <i>ip-address</i>, enter the unicast address of the RP in dotted-decimal notation.</li> <li>• (Optional) For <i>access-list-number</i>, enter an IP standard access list number from 1 to 99. If no access list is configured, the RP is used for all groups.</li> <li>• (Optional) The <b>override</b> keyword indicates that if there is a conflict between the RP configured with this command and one learned by Auto-RP or BSR, the RP configured with this command prevails.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>} <i>source</i> [<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# <b>access-list</b> 25 <b>permit</b> 10.5.0.1 255.224.0.0</pre> | <p>Creates a standard access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, enter the access list number specified in Step 2.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>• The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>source</i>, enter the multicast group address for which the RP should be used.</li> <li>• (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p>The access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 5</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# <b>end</b></pre>                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# <b>show running-config</b></pre>                                                                                                                              | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# <b>copy running-config startup-config</b></pre>                                                                                                | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Setting Up Auto-RP in a New Internetwork (CLI)

If you are setting up Auto-RP in a new internetwork, you do not need a default RP because you configure all the interfaces for sparse-dense mode.

**Note** Omit Step 3 in the following procedure, if you want to configure a PIM router as the RP for the local group.

## SUMMARY STEPS

1. **enable**
2. **show running-config**
3. **configure terminal**
4. **ip pim send-rp-announce** *interface-id* **scope** *tvl* **group-list** *access-list-number* **interval** *seconds*
5. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
6. **ip pim send-rp-discovery** *scope* *tvl*
7. **end**
8. **show running-config**
9. **show ip pim rp mapping**
10. **show ip pim rp**
11. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                           | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b> | Verifies that a default RP is already configured on all PIM devices and the RP in the sparse-mode network. It was previously configured with the <b>ip pim rp-address</b> global configuration command.<br><br><b>Note</b> This step is not required for sparse-dense-mode environments.<br><br>The selected RP should have good connectivity and be available across the network. Use this RP for the global groups (for example, 224.x.x.x and other global groups). Do not reconfigure the group address range that this RP serves. RPs dynamically discovered through Auto-RP take precedence over statically configured RPs. Assume that it is desirable to use a second RP for the local groups. |
| Step 3 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>   | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|               | Command or Action                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <p><b>ip pim send-rp-announce</b> <i>interface-id</i> <b>scope</b> <i>tll</i> <b>group-list</b> <i>access-list-number</i> <b>interval</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip pim send-rp-announce gigabitethernet 1/0/5 scope 20 group-list 10 interval 120</pre> | <p>Configures another PIM device to be the candidate RP for local groups.</p> <ul style="list-style-type: none"> <li>For <i>interface-id</i>, enter the interface type and number that identifies the RP address. Valid interfaces include physical ports, port channels, and VLANs.</li> <li>For <b>scope</b> <i>tll</i>, specify the time-to-live value in hops. Enter a hop count that is high enough so that the RP-announce messages reach all mapping agents in the network. There is no default setting. The range is 1 to 255.</li> <li>For <b>group-list</b> <i>access-list-number</i>, enter an IP standard access list number from 1 to 99. If no access list is configured, the RP is used for all groups.</li> <li>For <b>interval</b> <i>seconds</i>, specify how often the announcement messages must be sent. The default is 60 seconds. The range is 1 to 16383.</li> </ul> |
| <b>Step 5</b> | <p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>} <i>source</i> [<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 10 permit 10.10.0.0</pre>                                                                                       | <p>Creates a standard access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, enter the access list number specified in Step 3.</li> <li>The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>For <i>source</i>, enter the multicast group address range for which the RP should be used.</li> <li>(Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p><b>Note</b> Recall that the access list is always terminated by an implicit deny statement for everything.</p>                                                                                   |
| <b>Step 6</b> | <p><b>ip pim send-rp-discovery</b> <i>scope</i> <i>tll</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip pim send-rp-discovery scope 50</pre>                                                                                                                                               | <p>Finds a device whose connectivity is not likely to be interrupted, and assign it the role of RP-mapping agent.</p> <p>For <b>scope</b> <i>tll</i>, specify the time-to-live value in hops to limit the RP discovery packets. All devices within the hop count from the source device receive the Auto-RP discovery messages. These messages tell other devices which group-to-RP mapping to use to avoid conflicts (such as</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                | Command or Action                                                                                                 | Purpose                                                                              |
|----------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|                |                                                                                                                   | overlapping group-to-RP ranges). There is no default setting. The range is 1 to 255. |
| <b>Step 7</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                     |
| <b>Step 8</b>  | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                                               |
| <b>Step 9</b>  | <b>show ip pim rp mapping</b><br><b>Example:</b><br>Device# <b>show ip pim rp mapping</b>                         | Displays active RPs that are cached with associated multicast routing entries.       |
| <b>Step 10</b> | <b>show ip pim rp</b><br><b>Example:</b><br>Device# <b>show ip pim rp</b>                                         | Displays the information cached in the routing table.                                |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                             |

## Adding Auto-RP to an Existing Sparse-Mode Cloud (CLI)

This section contains suggestions for the initial deployment of Auto-RP into an existing sparse-mode cloud to minimize disruption of the existing multicast infrastructure.

This procedure is optional.

### SUMMARY STEPS

1. **enable**

2. **show running-config**
3. **configure terminal**
4. **ip pim send-rp-announce** *interface-id* **scope** *ttl* **group-list** *access-list-number* **interval** *seconds*
5. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
6. **ip pim send-rp-discovery** *scope* *ttl*
7. **end**
8. **show running-config**
9. **show ip pim rp mapping**
10. **show ip pim rp**
11. **copy running-config startup-config**

**Preventing Join Messages to False RPs (CLI)**

Determine whether the **ip pim accept-rp** command was previously configured throughout the network by using the **show running-config** privileged EXEC command. If the **ip pim accept-rp** command is not configured on any device, this problem can be addressed later. In those routers or multilayer devices already configured with the **ip pim accept-rp** command, you must enter the command again to accept the newly advertised RP.

To accept all RPs advertised with Auto-RP and reject all other RPs by default, use the **ip pim accept-rp auto-rp** global configuration command.

This procedure is optional.

[Example: Preventing Join Messages to False RPs](#), on page 478

**Filtering Incoming RP Announcement Messages (CLI)**

You can add configuration commands to the mapping agents to prevent a maliciously configured router from masquerading as a candidate RP and causing problems.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim rp-announce-filter rp-list *access-list-number* group-list *access-list-number***
4. **access-list *access-list-number* {deny | permit} source [*source-wildcard*]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## Configuring PIMv2 BSR

The process for configuring PIMv2 BSR may involve the following optional tasks:

- Defining the PIM domain border
- Defining the IP multicast boundary
- Configuring candidate BSRs
- Configuring candidate RPs

**Defining the PIM Domain Border (CLI)**

Perform the following steps to configure the PIM domain border. This procedure is optional.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip pim bsr-border`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

[PIM Domain Border](#), on page 431

**Defining the IP Multicast Boundary (CLI)**

You define a multicast boundary to prevent Auto-RP messages from entering the PIM domain. You create an access list to deny packets destined for 224.0.1.39 and 224.0.1.40, which carry Auto-RP information.

This procedure is optional.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* **deny** *source* [*source-wildcard*]
4. **interface** *interface-id*
5. **ip multicast boundary** *access-list-number*
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

**DETAILED STEPS**

## Configuring the Candidate RPs (CLI)

You can configure one or more candidate RPs. Similar to BSRs, the RPs should also have good connectivity to other devices and be in the backbone portion of the network. An RP can serve the entire IP multicast address space or a portion of it. Candidate RPs send candidate RP advertisements to the BSR.

This procedure is optional.

**Before you begin**

When deciding which devices should be RPs, consider these options:

- In a network of Cisco routers and multilayer devices where only Auto-RP is used, any device can be configured as an RP.
- In a network that includes only Cisco PIMv2 routers and multilayer devices and with routers from other vendors, any device can be used as an RP.
- In a network of Cisco PIMv1 routers, Cisco PIMv2 routers, and routers from other vendors, configure only Cisco PIMv2 routers and multilayer devices as RPs.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip pim rp-candidate** *interface-id* [**group-list** *access-list-number*]
4. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

**DETAILED STEPS**

## Configuring Sparse Mode with Auto-RP(CLI)

#### Before you begin

- An interface configured in sparse-dense mode is treated in either sparse mode or dense mode of operation, depending on the mode in which the multicast group operates. You must decide how to configure your interfaces.

- All access lists that are needed when Auto-RP is configured should be configured prior to beginning the configuration task.

**Note**

- If a group has no known RP and the interface is configured to be sparse-dense mode, the interface is treated as if it were in dense mode, and data is flooded over the interface. To avoid this data flooding, configure the Auto-RP listener and then configure the interface as sparse mode.
- When configuring Auto-RP, you must either configure the Auto-RP listener feature (Step 5) and specify sparse mode (Step 7) or specify sparse-dense mode (Step 8).
- When you configure sparse-dense mode, dense mode failover may result in a network dense-mode flood. To avoid this condition, use PIM sparse mode with the Auto-RP listener feature.

Follow this procedure to configure auto- rendezvous point (Auto-RP). Auto-RP can also be optionally used with anycast RP.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip multicast-routing [distributed]**
4. Either perform Steps 5 through 7 or perform Steps 6 and 8.
5. **ip pim autorp listener**
6. **interface** *type number*
7. **ip pim sparse-mode**
8. **ip pim sparse-dense-mode**
9. **exit**
10. Repeat Steps 1 through 9 on all PIM interfaces.
11. **ip pim send-rp-announce** *{interface-type interface-number | ip-address}* **scope** *tvl-value* [**group-list** *access-list*] [**interval** *seconds*] [**bidir**]
12. **ip pim send-rp-discovery** [*interface-type interface-number*] **scope** *tvl-value* [**interval** *seconds*]
13. **ip pim rp-announce-filter** *rp-list* *access-list* **group-list** *access-list*
14. **no ip pim dm-fallback**
15. **interface** *type number*
16. **ip multicast boundary** *access-list* [**filter-autorp**]
17. **end**
18. **show ip pim autorp**
19. **show ip pim rp** [**mapping**] [*rp-address*]
20. **show ip igmp groups** [*group-name | group-address*] *interface-type interface-number*] [**detail**]
21. **show ip mroute** [*group-address | group-name*] [*source-address | source-name*] [*interface-type interface-number*] [**summary**] [**count**] [**active** *kpbs*]

**DETAILED STEPS**

| <b>Step 18</b> | <b>show ip pim autorp</b><br><b>Example:</b><br>Device# show ip pim autorp                                                                                                                                   | (Optional) Displays the Auto-RP information.                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 19</b> | <b>show ip pim rp [mapping] [rp-address]</b><br><b>Example:</b><br>Device# show ip pim rp mapping                                                                                                            | (Optional) Displays RPs known in the network and shows how the device learned about each RP.                                                                                                                                                                                                                                                                                                |
| <b>Step 20</b> | <b>show ip igmp groups [group-name   group-address   interface-type interface-number] [detail]</b><br><b>Example:</b><br>Device# show ip igmp groups                                                         | (Optional) Displays the multicast groups having receivers that are directly connected to the device and that were learned through Internet Group Management Protocol (IGMP). <ul style="list-style-type: none"> <li>• A receiver must be active on the network at the time that this command is issued in order for receiver information to be present on the resulting display.</li> </ul> |
| <b>Step 21</b> | <b>show ip mroute [group-address   group-name] [source-address   source-name] [interface-type interface-number] [summary] [count] [active kbps]</b><br><b>Example:</b><br>Device# show ip mroute cbone-audio | (Optional) Displays the contents of the IP multicast routing (mroute) table.                                                                                                                                                                                                                                                                                                                |

## Delaying the Use of PIM Shortest-Path Tree (CLI)

Perform these steps to configure a traffic rate threshold that must be reached before multicast routing is switched from the source tree to the shortest-path tree.

This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list access-list-number {deny | permit} source [source-wildcard]**
4. **ip pim spt-threshold {kbps | infinity} [group-list access-list-number]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                                                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 3 | <b>access-list</b> <i>access-list-number</i> { <b>deny</b>   <b>permit</b> } <i>source</i> [ <i>source-wildcard</i> ]<br><b>Example:</b><br><pre>Device(config)# access-list 16 permit 225.0.0.0 0.255.255.255</pre> | <p>Creates a standard access list.</p> <ul style="list-style-type: none"> <li>For <i>access-list-number</i>, the range is 1 to 99.</li> <li>The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>For <i>source</i>, specify the multicast group to which the threshold will apply.</li> <li>(Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p>The access list is always terminated by an implicit deny statement for everything.</p>                                                                                |
| Step 4 | <b>ip pim spt-threshold</b> { <i>kbps</i>   <b>infinity</b> } [ <b>group-list</b> <i>access-list-number</i> ]<br><b>Example:</b><br><pre>Device(config)# ip pim spt-threshold infinity group-list 16</pre>           | <p>Specifies the threshold that must be reached before moving to shortest-path tree (spt).</p> <ul style="list-style-type: none"> <li>For <i>kbps</i>, specify the traffic rate in kilobits per second. The default is 0 kbps.</li> </ul> <p><b>Note</b> Because of device hardware limitations, 0 kbps is the only valid entry even though the range is 0 to 4294967.</p> <ul style="list-style-type: none"> <li>Specify <b>infinity</b> if you want all sources for the specified group to use the shared tree, never switching to the source tree.</li> <li>(Optional) For <b>group-list</b> <i>access-list-number</i>, specify the access list created in Step 2. If the value is 0 or if the group list is not used, the threshold applies to all groups.</li> </ul> |

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Modifying the PIM Router-Query Message Interval (CLI)

PIM routers and multilayer devices send PIM router-query messages to find which device will be the designated router (DR) for each LAN segment (subnet). The DR is responsible for sending IGMP host-query messages to all hosts on the directly connected LAN.

With PIM DM operation, the DR has meaning only if IGMPv1 is in use. IGMPv1 does not have an IGMP querier election process, so the elected DR functions as the IGMP querier. With PIM-SM operation, the DR is the device that is directly connected to the multicast source. It sends PIM register messages to notify the RP that multicast traffic from a source needs to be forwarded down the shared tree. In this case, the DR is the device with the highest IP address.

This procedure is optional.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip pim query-interval** *seconds*
5. **end**
6. **show ip igmp interface** [*interface-id*]
7. **copy running-config startup-config**

# Verifying PIM Operations

## Verifying IP Multicast Operation in a PIM-SM or a PIM-SSM Network

When you verify the operation of IP multicast in a PIM-SM network environment or in a PIM-SSM network environment, a useful approach is to begin the verification process on the last hop router, and then continue the verification process on the routers along the SPT until the first hop router has been reached. The goal of the verification is to ensure that IP multicast traffic is being routed properly through an IP multicast network.

Perform the following optional tasks to verify IP multicast operation in a PIM-SM or a PIM-SSM network. The steps in these tasks help to locate a faulty hop when sources and receivers are not operating as expected.

**Note** If packets are not reaching their expected destinations, you might want consider disabling IP multicast fast switching, which would place the router in process switching mode. If packets begin reaching their proper destinations after IP multicast fast switching has been disabled, then the issue most likely was related to IP multicast fast switching.

## Verifying IP Multicast on the First Hop Router

Enter these commands on the first hop router to verify IP multicast operations on the first hop router:

### SUMMARY STEPS

1. `enable`
2. `show ip mroute [group-address]`
3. `show ip mroute active [kb/s]`

| <b>Step 3</b> | <p><b>show ip mroute active</b> [<i>kb/s</i>]</p> <p><b>Example:</b></p> <pre>Device# show ip mroute active Active IP Multicast Sources - sending &gt;= 4 kbps  Group: 239.1.2.3, (?)   Source: 10.0.0.1 (?)     Rate: 20 pps/4 kbps(1sec), 4 kbps(last 30 secs), 4 kbps(life avg)</pre> | <p>Displays information about active multicast sources sending to groups. The output of this command provides information about the multicast packet rate for active sources.</p> <p><b>Note</b> By default, the output of the <b>show ip mroute</b> command with the <b>active</b> keyword displays information about active sources sending traffic to groups at a rate greater than or equal to 4 kb/s. To display information about active sources sending low-rate traffic to groups (that is, traffic less than 4 kb/s), specify a value of 1 for the <i>kb/s</i> argument. Specifying a value of 1 for this argument displays information about active sources sending traffic to groups at a rate equal to or greater than 1 kb/s, which effectively displays information about all possible active source traffic.</p> |

## Verifying IP Multicast on Routers Along the SPT

Enter these commands on routers along the SPT to verify IP multicast operations on routers along the SPT in a PIM-SM or PIM-SSM network:

### SUMMARY STEPS

1. **enable**
2. **show ip mroute** [*group-address*]
3. **show ip mroute active**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                 | Purpose                                                                        |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                          | Enables privileged EXEC mode. Enter your password if prompted.                 |
| <b>Step 2</b> | <p><b>show ip mroute</b> [<i>group-address</i>]</p> <p><b>Example:</b></p> <pre>Device# show ip mroute 239.1.2.3 (*, 239.1.2.3), 00:17:56/00:03:02, RP 172.16.0.1, flags: S</pre> | Confirms the RPF neighbor towards the source for a particular group or groups. |

## Verifying IP Multicast Operation on the Last Hop Router

Enter these commands on the last hop router to verify IP multicast operations on the last hop router:

### SUMMARY STEPS

1. **enable**
2. **show ip igmp groups**
3. **show ip pim rp mapping**
4. **show ip mroute**
5. **show ip interface** [*type number*]
6. **show ip mfib**
7. **show ip pim interface count**
8. **show ip mroute count**
9. **show ip mroute active** [*kb/s*]

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Step 5</b> | <p><b>show ip interface</b> [<i>type number</i>]</p> <p><b>Example:</b></p> <pre>Device# show ip interface GigabitEthernet 0/0/0 GigabitEthernet0/0 is up, line protocol is up Internet address is 172.31.100.2/24 Broadcast address is 255.255.255.255 Address determined by setup command MTU is 1500 bytes Helper address is not set Directed broadcast forwarding is disabled Multicast reserved groups joined: 224.0.0.1 224.0.0.22 224.0.0.13 224.0.0.5 224.0.0.6 Outgoing access list is not set Inbound access list is not set Proxy ARP is enabled Local Proxy ARP is disabled Security level is default Split horizon is enabled ICMP redirects are always sent ICMP unreachable are always sent ICMP mask replies are never sent IP fast switching is enabled IP fast switching on the same interface is disabled IP Flow switching is disabled IP CEF switching is disabled IP Fast switching turbo vector IP multicast fast switching is enabled IP multicast distributed fast switching is disabled IP route-cache flags are Fast Router Discovery is disabled IP output packet accounting is disabled IP access violation accounting is disabled TCP/IP header compression is disabled RTP/IP header compression is disabled Policy routing is disabled Network address translation is disabled WCCP Redirect outbound is disabled WCCP Redirect inbound is disabled WCCP Redirect exclude is disabled BGP Policy Mapping is disabled</pre> | <p>Verifies that multicast fast switching is enabled for optimal performance on the outgoing interface on the last hop router.</p> <p><b>Note</b> Using the <b>no ip mroute-cache</b> interface command disables IP multicast fast-switching. When IP multicast fast switching is disabled, packets are forwarded through the process-switched path.</p> |
| <b>Step 6</b> | <p><b>show ip mfib</b></p> <p><b>Example:</b></p> <pre>Device# show ip mfib</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Displays the forwarding entries and interfaces in the IP Multicast Forwarding Information Base (MFIB).</p>                                                                                                                                                                                                                                            |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7 | <p><b>show ip pim interface count</b></p> <p><b>Example:</b></p> <pre>Device# show ip pim interface count  State: * - Fast Switched, D - Distributed Fast Switched        H - Hardware Switching Enabled Address      Interface      FS Mpackets In/Out 172.31.100.2  GigabitEthernet0/0/0  * 4122/0 10.1.0.1     GigabitEthernet1/0/0  * 0/3193</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Confirms that multicast traffic is being forwarded on the last hop router.                                                                                                                                |
| Step 8 | <p><b>show ip mroute count</b></p> <p><b>Example:</b></p> <pre>Device# show ip mroute count IP Multicast Statistics 6 routes using 4008 bytes of memory 3 groups, 1.00 average sources per group Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second Other counts: Total/RPF failed/Other drops(OIF-null, rate-limit etc)  Group: 239.1.2.3, Source count: 1, Packets forwarded: 3165, Packets received: 3165   RP-tree: Forwarding: 0/0/0/0, Other: 0/0/0   Source: 10.0.0.1/32, Forwarding: 3165/20/28/4, Other: 0/0/0  Group: 224.0.1.39, Source count: 1, Packets forwarded: 21, Packets received: 120   Source: 172.16.0.1/32, Forwarding: 21/1/48/0, Other: 120/0/99  Group: 224.0.1.40, Source count: 1, Packets forwarded: 10, Packets received: 10   Source: 172.16.0.1/32, Forwarding: 10/1/48/0, Other: 10/0/0</pre> | Confirms that multicast traffic is being forwarded on the last hop router.                                                                                                                                |
| Step 9 | <p><b>show ip mroute active [kb/s]</b></p> <p><b>Example:</b></p> <pre>Device# show ip mroute active Active IP Multicast Sources - sending &gt;= 4 kbps</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Displays information about active multicast sources sending traffic to groups on the last hop router. The output of this command provides information about the multicast packet rate for active sources. |

|  | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <pre>Group: 239.1.2.3, (?) Source: 10.0.0.1 (?) Rate: 20 pps/4 kbps(1sec), 4 kbps(last 50 secs), 4 kbps(life avg)</pre> | <p><b>Note</b> By default, the output of the <b>show ip mroute</b> command with the <b>active</b> keyword displays information about active sources sending traffic to groups at a rate greater than or equal to 4 kb/s. To display information about active sources sending low-rate traffic to groups (that is, traffic less than 4 kb/s), specify a value of 1 for the <i>kb/s</i> argument. Specifying a value of 1 for this argument displays information about active sources sending traffic to groups at a rate equal to or greater than 1 kb/s, which effectively displays information about all possible active source traffic.</p> |

## Using PIM-Enabled Routers to Test IP Multicast Reachability

If all the PIM-enabled routers and access servers that you administer are members of a multicast group, pinging that group causes all routers to respond, which can be a useful administrative and debugging tool.

To use PIM-enabled routers to test IP multicast reachability, perform the following tasks:

### Configuring Routers to Respond to Multicast Pings

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip igmp join-group** *group-address*
5. Repeat Step 3 and Step 4 for each interface on the router participating in the multicast network.
6. **end**

#### DETAILED STEPS

|               | Command or Action                                                 | Purpose                                                        |
|---------------|-------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <pre>enable Example: Device&gt; enable</pre>                      | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <pre>configure terminal Example: Device# configure terminal</pre> | Enters global configuration mode.                              |
| <b>Step 3</b> | <pre>interface type number</pre>                                  | Enters interface configuration mode.                           |

|               | Command or Action                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Device(config)# <b>interface</b> gigabitethernet 1/0/0                                                   | For the <i>type</i> and <i>number</i> arguments, specify an interface that is directly connected to hosts or is facing hosts.                                                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>ip igmp join-group</b> <i>group-address</i><br><b>Example:</b><br>Device(config-if)# <b>ip igmp join-group</b> 225.2.2.2 | (Optional) Configures an interface on the router to join the specified group.<br><br>For the purpose of this task, configure the same group address for the <i>group-address</i> argument on all interfaces on the router participating in the multicast network.<br><br><b>Note</b> With this method, the router accepts the multicast packets in addition to forwarding them. Accepting the multicast packets prevents the router from fast switching. |
| <b>Step 5</b> | Repeat Step 3 and Step 4 for each interface on the router participating in the multicast network.                           | --                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                              | Ends the current configuration session and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                              |

## Pinging Routers Configured to Respond to Multicast Pings

on a router to initiate a ping test to the routers configured to respond to multicast pings. This task is used to test IP multicast reachability in a network.

### SUMMARY STEPS

1. **enable**
2. **ping** *group-address*

### DETAILED STEPS

|               | Command or Action                                                                    | Purpose                                                                                                            |
|---------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                            | Enables privileged EXEC mode. Enter your password if prompted.                                                     |
| <b>Step 2</b> | <b>ping</b> <i>group-address</i><br><b>Example:</b><br>Device# <b>ping</b> 225.2.2.2 | Pings an IP multicast group address.<br><br>A successful response indicates that the group address is functioning. |

# Monitoring and Troubleshooting PIM

## Monitoring PIM Information

Use the privileged EXEC commands in the following table to monitor your PIM configurations.

**Table 41: PIM Monitoring Commands**

| Command                                                                                                                                                                                                         | Purpose                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip pim all-vrfs tunnel</b> [ <b>tunnel</b> <i>tunnel_number</i>   <b>verbose</b> ]                                                                                                                      | Displays all VRFs.                                                                                                           |
| <b>show ip pim autorp</b>                                                                                                                                                                                       | Displays global auto-RP information.                                                                                         |
| <b>show ip pim boundary</b>                                                                                                                                                                                     | Displays information about mroutes filtered by administratively scoped IPv4 multicast boundaries configured on an interface. |
| <b>show ip pim interface</b>                                                                                                                                                                                    | Displays information about interfaces configured for Protocol Independent Multicast (PIM).                                   |
| <b>show ip pim neighbor</b>                                                                                                                                                                                     | Displays the PIM neighbor information.                                                                                       |
| <b>show ip pim rp</b> [ <i>group-name</i>   <i>group-address</i> ]                                                                                                                                              | Displays RP routers associated with a sparse-mode multicast group. This command is available in all software images.         |
| <b>show ip pim tunnel</b> [ <b>tunnel</b>   <b>verbose</b> ]                                                                                                                                                    | Displays information about Protocol Independent Multicast (PIM) tunnel interfaces                                            |
| <b>show ip pim vrf</b> { <b>word</b> { <b>all-vrfs</b>   <b>autorp</b>   <b>boundary</b>   <b>bsr-router</b>   <b>interface</b>   <b>mdt</b>   <b>neighbor</b>   <b>rp</b>   <b>rp-hash</b>   <b>tunnel</b> } } | Displays the VPN routing/forwarding instance.                                                                                |
| <b>show ip igmp groups detail</b>                                                                                                                                                                               | Displays the interested clients that have joined the specific multicast source group.                                        |

## Monitoring the RP Mapping and BSR Information

Use the privileged EXEC mode in the following table to verify the consistency of group-to-RP mappings:

**Table 42: RP Mapping Monitoring Commands**

| Command                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip pim rp</b> [ <i>hostname</i> or <i>IP address</i>   <b>mapping</b> [ <i>hostname</i> or <i>IP address</i>   <b>elected</b>   <b>in-use</b> ]   <b>metric</b> [ <i>hostname</i> or <i>IP address</i> ] ] | <p>Displays all available RP mappings and metrics. This tells you how the device learns of the RP (through the BSR or the Auto-RP mechanism).</p> <ul style="list-style-type: none"> <li>• (Optional) For the <i>hostname</i>, specify the IP name of the group about which to display RPs.</li> <li>• (Optional) For the <i>IP address</i>, specify the IP address of the group about which to display RPs.</li> <li>• (Optional) Use the <b>mapping</b> keyword to display all group-to-RP mappings of which the Cisco device is aware (either configured or learned from Auto-RP).</li> <li>• (Optional) Use the <b>metric</b> keyword to display the RP RPF metric.</li> </ul> |
| <b>show ip pim rp-hash</b> <i>group</i>                                                                                                                                                                            | <p>Displays the RP that was selected for the specified group. That is, on a PIMv2 router or multilayer device, confirms that the same RP is the one that a PIMv1 system chooses. For <i>group</i>, enter the group address for which to display RP information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                |

Use the privileged EXEC commands in the following table to monitor BSR information:

**Table 43: BSR Monitoring Commands**

| Command                       | Purpose                                     |
|-------------------------------|---------------------------------------------|
| <b>show ip pim bsr</b>        | Displays information about the elected BSR. |
| <b>show ip pim bsr-router</b> | Displays information about the BSRv2.       |

## Troubleshooting PIMv1 and PIMv2 Interoperability Problems

When debugging interoperability problems between PIMv1 and PIMv2, check these in the order shown:

1. Verify RP mapping with the **show ip pim rp-hash** privileged EXEC command, making sure that all systems agree on the same RP for the same group.
2. Verify interoperability between different versions of DRs and RPs. Make sure that the RPs are interacting with the DRs properly (by responding with register-stops and forwarding decapsulated data packets from registers).

# Configuration Examples for PIM

## Example: Enabling PIM Stub Routing

In this example, IP multicast routing is enabled, Switch A PIM uplink port 25 is configured as a routed uplink port with **sparse-dense-mode** enabled. PIM stub routing is enabled on the VLAN 100 interfaces and on Gigabit Ethernet port 20.

```
Device(config)# ip multicast-routing distributed
Device(config)# interface GigabitEthernet3/0/25
Device(config-if)# no switchport
Device(config-if)# ip address 3.1.1.2 255.255.255.0
Device(config-if)# ip pim sparse-dense-mode
Device(config-if)# exit
Device(config)# interface vlan100
Device(config-if)# ip pim passive
Device(config-if)# exit
Device(config)# interface GigabitEthernet3/0/20
Device(config-if)# ip pim passive
Device(config-if)# exit
Device(config)# interface vlan100
Device(config-if)# ip address 100.1.1.1 255.255.255.0
Device(config-if)# ip pim passive
Device(config-if)# exit
Device(config)# interface GigabitEthernet3/0/20
Device(config-if)# no switchport
Device(config-if)# ip address 10.1.1.1 255.255.255.0
Device(config-if)# ip pim passive
Device(config-if)# end
```

### Related Topics

[Enabling PIM Stub Routing \(CLI\)](#), on page 438

[PIM Stub Routing](#), on page 426

## Example: Verifying PIM Stub Routing

To verify that PIM stub is enabled for each interface, use the **show ip pim interface** privileged EXEC command:

```
Device# show ip pim interface
Address Interface Ver/ Nbr Query DR DR
Mode Count Intvl Prior
3.1.1.2 GigabitEthernet3/0/25 v2/SD 1 30 1 3.1.1.2
100.1.1.1 Vlan100 v2/P 0 30 1 100.1.1.1
10.1.1.1 GigabitEthernet3/0/20 v2/P 0 30 1 10.1.1.1
```

## Example: Manually Assigning an RP to Multicast Groups

This example shows how to configure the address of the RP to 147.106.6.22 for multicast group 225.2.2.2 only:

```
Device(config)# access-list 1 permit 225.2.2.2 0.0.0.0
Device(config)# ip pim rp-address 147.106.6.22 1
```

### Related Topics

[Manually Assigning an RP to Multicast Groups \(CLI\)](#), on page 440

## Example: Configuring Auto-RP

This example shows how to send RP announcements out all PIM-enabled interfaces for a maximum of 31 hops. The IP address of port 1 is the RP. Access list 5 describes the group for which this device serves as RP:

```
Device(config)# ip pim send-rp-announce gigabitethernet1/0/1 scope 31 group-list 5
Device(config)# access-list 5 permit 224.0.0.0 15.255.255.255
```

[Auto-RP](#), on page 428

## Example: Sparse Mode with Auto-RP

The following example configures sparse mode with Auto-RP:

```
ip multicast-routing
ip pim autorp listener
ip pim send-rp-announce Loopback0 scope 16 group-list 1
ip pim send-rp-discovery Loopback1 scope 16
no ip pim dm-fallback
access-list 1 permit 239.254.2.0 0.0.0.255
access-list 1 permit 239.254.3.0 0.0.0.255
.
.
.
access-list 10 permit 224.0.1.39
access-list 10 permit 224.0.1.40
access-list 10 permit 239.254.2.0 0.0.0.255
access-list 10 permit 239.254.3.0 0.0.0.255
```

### Related Topics

[Setting Up Auto-RP in a New Internetwork \(CLI\)](#), on page 442

[Auto-RP](#), on page 428

## Example: Defining the IP Multicast Boundary to Deny Auto-RP Information

This example shows a portion of an IP multicast boundary configuration that denies Auto-RP information:

```
Device(config)# access-list 1 deny 224.0.1.39
```

### Example: Filtering Incoming RP Announcement Messages

```
Device(config)# access-list 1 deny 224.0.1.40
Device(config)# access-list 1 permit all
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip multicast boundary 1
```

#### Related Topics

[Defining the IP Multicast Boundary \(CLI\)](#), on page 452

[Multicast Boundaries](#), on page 429

## Example: Filtering Incoming RP Announcement Messages

This example shows a sample configuration on an Auto-RP mapping agent that is used to prevent candidate RP announcements from being accepted from unauthorized candidate RPs:

```
Device(config)# ip pim rp-announce-filter rp-list 10 group-list 20
Device(config)# access-list 10 permit host 172.16.5.1
Device(config)# access-list 10 permit host 172.16.2.1
Device(config)# access-list 20 deny 239.0.0.0 0.0.255.255
Device(config)# access-list 20 permit 224.0.0.0 15.255.255.255
```

The mapping agent accepts candidate RP announcements from only two devices, 172.16.5.1 and 172.16.2.1. The mapping agent accepts candidate RP announcements from these two devices only for multicast groups that fall in the group range of 224.0.0.0 to 239.255.255.255. The mapping agent does not accept candidate RP announcements from any other devices in the network. Furthermore, the mapping agent does not accept candidate RP announcements from 172.16.5.1 or 172.16.2.1 if the announcements are for any groups in the 239.0.0.0 through 239.255.255.255 range. This range is the administratively scoped address range.

## Example: Preventing Join Messages to False RPs

If all interfaces are in sparse mode, use a default-configured RP to support the two well-known groups 224.0.1.39 and 224.0.1.40. Auto-RP uses these two well-known groups to collect and distribute RP-mapping information. When this is the case and the `ip pim accept-rp auto-rp` command is configured, another `ip pim accept-rp` command accepting the RP must be configured as follows:

```
Device(config)# ip pim accept-rp 172.10.20.1 1
Device(config)# access-list 1 permit 224.0.1.39
Device(config)# access-list 1 permit 224.0.1.40
```

## Example: Configuring Candidate BSRs

This example shows how to configure a candidate BSR, which uses the IP address 172.21.24.18 on a port as the advertised BSR address, uses 30 bits as the hash-mask-length, and has a priority of 10.

```
Device(config)# interface gigabitethernet1/0/2
```

```
Device(config-if)# ip address 172.21.24.18 255.255.255.0
Device(config-if)# ip pim sparse-dense-mode
Device(config-if)# ip pim bsr-candidate gigabitethernet1/0/2 30 10
```

## Example: Configuring Candidate RPs

This example shows how to configure the device to advertise itself as a candidate RP to the BSR in its PIM domain. Standard access list number 4 specifies the group prefix associated with the RP that has the address identified by a port. That RP is responsible for the groups with the prefix 239.

```
Device(config)# ip pim rp-candidate gigabitethernet1/0/2 group-list 4
Device(config)# access-list 4 permit 239.0.0.0 0.255.255.255
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About PIM MIB Extension for IP Multicast

### PIM MIB Extensions for SNMP Traps for IP Multicast

Protocol Independent Multicast (PIM) is an IP multicast routing protocol used for routing multicast data packets to multicast groups. RFC 2934 defines the PIM MIB for IPv4, which describes managed objects that enable users to remotely monitor and configure PIM using Simple Network Management Protocol (SNMP).

PIM MIB extensions introduce the following new classes of PIM notifications:

- neighbor-change--This notification results from the following conditions:
  - A router's PIM interface is disabled or enabled (using the **ip pim** command in interface configuration mode)
  - A router's PIM neighbor adjacency expires (defined in RFC 2934)
- rp-mapping-change--This notification results from a change in the rendezvous point (RP) mapping information due to either Auto-RP messages or bootstrap router (BSR) messages.

- invalid-pim-message--This notification results from the following conditions:
  - An invalid (\*, G) Join or Prune message is received by the device (for example, when a router receives a Join or Prune message for which the RP specified in the packet is not the RP for the multicast group)
  - An invalid PIM register message is received by the device (for example, when a router receives a register message from a multicast group for which it is not the RP)

#### Related Topics

[Enabling PIM MIB Extensions for IP Multicast](#), on page 484

[Example Enabling PIM MIB Extensions for IP Multicast](#), on page 486

## Benefits of PIM MIB Extensions

PIM MIB extensions:

- Allow users to identify changes in the multicast topology of their network by detecting changes in the RP mapping.
- Provide traps to monitor the PIM protocol on PIM-enabled interfaces.
- Help users identify routing issues when multicast neighbor adjacencies expire on a multicast interface.
- Enable users to monitor RP configuration errors (for example, errors due to flapping in dynamic RP allocation protocols like Auto-RP).

# How to Configure PIM MIB Extension for IP Multicast

## Enabling PIM MIB Extensions for IP Multicast

Perform this task to enable PIM MIB extensions for IP multicast.

#### Note

- The pimInterfaceVersion object was removed from RFC 2934 and, therefore, is no longer supported in software.
- The following MIB tables are not supported in Cisco software:
  - pimIpMRouteTable
  - pimIpMRouteNextHopTable

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server enable traps pim** [**neighbor-change** | **rp-mapping-change** | **invalid-pim-message**]
4. **snmp-server host** *host-address* [**traps** | **informs**] *community-string* **pim**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>snmp-server enable traps pim [neighbor-change   rp-mapping-change   invalid-pim-message]</b><br><b>Example:</b><br><pre>Device(config)# snmp-server enable traps pim neighbor-change</pre> | Enables a device to send PIM notifications. <ul style="list-style-type: none"> <li>• <b>neighbor-change</b> --This keyword enables notifications indicating when a device's PIM interface is disabled or enabled, or when a device's PIM neighbor adjacency expires.</li> <li>• <b>rp-mapping-change</b> --This keyword enables notifications indicating a change in RP mapping information due to either Auto-RP messages or BSR messages.</li> <li>• <b>invalid-pim-message</b> --This keyword enables notifications for monitoring invalid PIM protocol operations (for example, when a device receives a join or prune message for which the RP specified in the packet is not the RP for the multicast group or when a device receives a register message from a multicast group for which it is not the RP).</li> </ul> |
| Step 4 | <b>snmp-server host <i>host-address</i> [traps   informs] <i>community-string</i> pim</b><br><b>Example:</b><br><pre>Device(config)# snmp-server host 10.10.10.10 traps public pim</pre>      | Specifies the recipient of a PIM SNMP notification operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# Configuration Examples for PIM MIB Extensions

## Example Enabling PIM MIB Extensions for IP Multicast

The following example shows how to configure a router to generate notifications indicating that a PIM interface of the router has been enabled. The first line configures PIM traps to be sent as SNMP v2c traps to the host with IP address 10.0.0.1. The second line configures the router to send the neighbor-change class of trap notification to the host.

```
snmp-server host 10.0.0.1 traps version 2c public pim
snmp-server enable traps pim neighbor-change
interface ethernet0/0
 ip pim sparse-dense-mode
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Using MSDP to Interconnect Multiple PIM-SM Domains

### Benefits of Using MSDP to Interconnect Multiple PIM-SM Domains

- Allows a rendezvous point (RP) to dynamically discover active sources outside of its domain.
- Introduces a more manageable approach for building multicast distribution trees between multiple domains.

MSDP is a mechanism to connect multiple PIM-SM domains. The purpose of MSDP is to discover multicast sources in other PIM domains. The main advantage of MSDP is that it reduces the complexity of interconnecting multiple PIM-SM domains by allowing PIM-SM domains to use an interdomain source tree (rather than a common shared tree). When MSDP is configured in a network, RPs exchange source information with RPs in other domains. An RP can join the interdomain source tree for sources that are sending to groups for which it has receivers. The RP can do that because it is the root of the shared tree within its domain, which has branches to all points in the domain where there are active receivers. When a last-hop device learns of a new source outside the PIM-SM domain (through the arrival of a multicast packet from the source down the shared tree), it then can send a join toward the source and join the interdomain source tree.

---

**Note** If the RP either has no shared tree for a particular group or a shared tree whose outgoing interface list is null, it does not send a join to the source in another domain.

---

When MSDP is enabled, an RP in a PIM-SM domain maintains MSDP peering relationships with MSDP-enabled devices in other domains. This peering relationship occurs over a TCP connection, where primarily a list of sources sending to multicast groups is exchanged. MSDP uses TCP (port 639) for its peering connections. As with BGP, using point-to-point TCP peering means that each peer must be explicitly configured. The TCP connections between RPs, moreover, are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism provided by PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the RP of the domain.

The figure illustrates MSDP operating between two MSDP peers. PIM uses MSDP as the standard mechanism to register a source with the RP of a domain.

Figure 25: MSDP Running Between RP Peers

When MSDP is implemented, the following sequence of events occurs:

1. When a PIM designated device (DR) registers a source with its RP as illustrated in the figure, the RP sends a Source-Active (SA) message to all of its MSDP peers.

**Note**

The DR sends the encapsulated data to the RP only once per source (when the source goes active). If the source times out, this process happens again when it goes active again. This situation is different from the periodic SA message that contains all sources that are registered to the originating RP. Those SA messages are MSDP control packets, and, thus, do not contain encapsulated data from active sources.

1. The SA message identifies the source address, the group that the source is sending to, and the address or the originator ID of the RP, if configured.
2. Each MSDP peer that receives the SA message floods the SA message to all of its peers downstream from the originator. In some cases (such as the case with the RPs in PIM-SM domains B and C in the figure), an RP may receive a copy of an SA message from more than one MSDP peer. To prevent looping, the RP consults the BGP next-hop database to determine the next hop toward the originator of the SA message. If both MBGP and unicast BGP are configured, MBGP is checked first, and then unicast BGP. That next-hop neighbor is the RPF-peer for the originator. SA messages that are received from the originator on any interface other than the interface to the RPF peer are dropped. The SA message flooding process, therefore, is referred to as peer-RPF flooding. Because of the peer-RPF flooding mechanism, BGP or MBGP must be running in conjunction with MSDP.

1. When an RP receives an SA message, it checks to see whether there are any members of the advertised groups in its domain by checking to see whether there are interfaces on the group's (\*, G) outgoing interface list. If there are no group members, the RP does nothing. If there are group members, the RP sends an (S, G) join toward the source. As a result, a branch of the interdomain source tree is constructed across autonomous system boundaries to the RP. As multicast packets arrive at the RP, they are then forwarded down its own shared tree to the group members in the RP's domain. The members' DRs then have the option of joining the rendezvous point tree (RPT) to the source using standard PIM-SM procedures.
2. The originating RP continues to send periodic SA messages for the (S, G) state every 60 seconds for as long as the source is sending packets to the group. When an RP receives an SA message, it caches the SA message. Suppose, for example, that an RP receives an SA message for (172.16.5.4, 228.1.2.3) from originating RP 10.5.4.3. The RP consults its mroute table and finds that there are no active members for group 228.1.2.3, so it passes the SA message to its peers downstream of 10.5.4.3. If a host in the domain then sends a join to the RP for group 228.1.2.3, the RP adds the interface toward the host to the outgoing interface list of its (\*, 228.1.2.3) entry. Because the RP caches SA messages, the device will have an entry for (172.16.5.4, 228.1.2.3) and can join the source tree as soon as a host requests a join.

---

**Note** In all current and supported software releases, caching of MSDP SA messages is mandatory and cannot be manually enabled or disabled. By default, when an MSDP peer is configured, the **ip multicast cache-sa-state** command will automatically be added to the running configuration.

---

## MSDP Message Types

There are four basic MSDP message types, each encoded in their own Type, Length, and Value (TLV) data format.

### SA Messages

SA messages are used to advertise active sources in a domain. In addition, these SA messages may contain the initial multicast data packet that was sent by the source.

SA messages contain the IP address of the originating RP and one or more (S, G) pairs being advertised. In addition, the SA message may contain an encapsulated data packet.

---

**Note** For more information about SA messages, see the [SA Message Origination Receipt and Processing, on page 493](#) section.

---

### SA Request Messages

SA request messages are used to request a list of active sources for a specific group. These messages are sent to an MSDP SA cache that maintains a list of active (S, G) pairs in its SA cache. Join latency can be reduced by using SA request messages to request the list of active sources for a group instead of having to wait up to 60 seconds for all active sources in the group to be readvertised by originating RPs.

## SA Response Messages

SA response messages are sent by the MSDP peer in response to an SA request message. SA response messages contain the IP address of the originating RP and one or more (S, G) pairs of the active sources in the originating RP's domain that are stored in the cache.

## Keepalive Messages

Keepalive messages are sent every 60 seconds in order to keep the MSDP session active. If no keepalive messages or SA messages are received for 75 seconds, the MSDP session is reset.

## SA Message Origination Receipt and Processing

The section describes SA message origination, receipt, and processing in detail.

### SA Message Origination

SA messages are triggered by an RP (assuming MSDP is configured) when any new source goes active within a local PIM-SM domain. A local source is a source that is directly connected to the RP or is the first-hop DR that has registered with it. An RP originates SA messages only for local sources in its PIM-SM domain; that is, for local sources that register with it.

---

**Note** A local source is denoted by the A flag being set in the (S, G) mroute entry on the RP (which can be viewed in the output of the **show ip mroute** command). This flag indicates that the source is a candidate for advertisement by the RP to other MSDP peers.

---

When a source is in the local PIM-SM domain, it causes the creation of (S, G) state in the RP. New sources are detected by the RP either by the receipt of a register message or the arrival of the first (S, G) packet from a directly connected source. The initial multicast packet sent by the source (either encapsulated in the register message or received from a directly connected source) is encapsulated in the initial SA message.

### SA Message Receipt

SA messages are only accepted from the MSDP RPF peer that is in the best path back toward the originator. The same SA message arriving from other MSDP peers must be ignored or SA loops can occur. Deterministically selecting the MSDP RPF peer for an arriving SA message requires knowledge of the MSDP topology. However, MSDP does not distribute topology information in the form of routing updates. MSDP infers this information by using (M)BGP routing data as the best approximation of the MSDP topology for the SA RPF check mechanism. An MSDP topology, therefore, must follow the same general topology as the BGP peer topology. Besides a few exceptions (such as default MSDP peers and MSDP peers in MSDP mesh groups), MSDP peers, in general should also be (M)BGP peers.

#### How RPF Check Rules Are Applied to SA Messages

The rules that apply to RPF checks for SA messages are dependent on the BGP peerings between the MSDP peers:

- Rule 1: Applied when the sending MSDP peer is also an interior (M)BGP peer.
- Rule 2: Applied when the sending MSDP peer is also an exterior (M)BGP peer.

- Rule 3: Applied when the sending MSDP peer is not an (M)BGP peer.

RPF checks are not performed in the following cases:

- If the sending MSDP peer is the only MSDP peer, which would be the case if only a single MSDP peer or a default MSDP peer is configured.
- If the sending MSDP peer is a member of a mesh group.
- If the sending MSDP peer address is the RP address contained in the SA message.

### How the Software Determines the Rule to Apply to RPF Checks

The software uses the following logic to determine which RPF rule to apply to RPF checks:

- Find the (M)BGP neighbor that has the same IP address as the sending MSDP peer.
  - If the matching (M)BGP neighbor is an internal BGP (iBGP) peer, apply Rule 1.
  - If the matching (M)BGP neighbor is an external BGP (eBGP) peer, apply Rule 2.
  - If no match is found, apply Rule 3.

The implication of the RPF check rule selection is as follows: The IP address used to configure an MSDP peer on a device must match the IP address used to configure the (M)BGP peer on the same device.

### Rule 1 of RPF Checking of SA Messages in MSDP

Rule 1 of RPF checking in MSDP is applied when the sending MSDP peer is also an i(M)BGP peer. When Rule 1 is applied, the RPF check proceeds as follows:

1. The peer searches the BGP Multicast Routing Information Base (MRIB) for the best path to the RP that originated the SA message. If a path is not found in the MRIB, the peer then searches the Unicast Routing Information Base (URIB). If a path is still not found, the RPF check fails.
2. If the previous search succeeds (that is, the best path is found), the peer then determines the address of the BGP neighbor for this best path, which will be the address of the BGP neighbor that sent the peer the path in BGP update messages.

---

**Note** The BGP neighbor address is not the same as the next-hop address in the path. Because i(M)BGP peers do not update the next-hop attribute of a path, the next-hop address usually is not the same as the address of the BGP peer that sent us the path.

---

---

**Note** The BGP neighbor address is not necessarily the same as the BGP ID of the peer that sent the peer the path.

---

1. If the IP address of the sending MSDP peer is the same as the BGP neighbor address (that is, the address of the BGP peer that sent the peer the path), then the RPF check succeeds; otherwise it fails.

### Implications of Rule 1 of RPF Checking on MSDP

The MSDP topology must mirror the (M)BGP topology. In general, wherever there is an i(M)BGP peer connection between two devices, an MSDP peer connection should be configured. More specifically, the IP

address of the far-end MSDP peer connection must be the same as the far-end i(M)BGP peer connection. The addresses must be the same because the BGP topology between i(M)BGP peers inside an autonomous system is not described by the AS path. If it were always the case that i(M)BGP peers updated the next-hop address in the path when sending an update to another i(M)BGP peer, then the peer could rely on the next-hop address to describe the i(M)BGP topology (and hence the MSDP topology). However, because the default behavior for i(M)BGP peers is to not update the next-hop address, the peer cannot rely on the next-hop address to describe the (M)BGP topology (MSDP topology). Instead, the i(M)BGP peer uses the address of the i(M)BGP peer that sent the path to describe the i(M)BGP topology (MSDP topology) inside the autonomous system.

---

**Tip** Care should be taken when configuring the MSDP peer addresses to make sure that the same address is used for both i(M)BGP and MSDP peer addresses.

---

### Rule 2 of RPF Checking of SA Messages in MSDP

Rule 2 of RPF checking in MSDP is applied when the sending MSDP peer is also an e(M)BGP peer. When Rule 2 is applied, the RPF check proceeds as follows:

1. The peer searches the BGP MRIB for the best path to the RP that originated the SA message. If a path is not found in the MRIB, the peer then searches the URIB. If a path is still not found, the RPF check fails.
2. If the previous search succeeds (that is, the best path is found), the peer then examines the path. If the first autonomous system in the best path to the RP is the same as the autonomous system of the e(M)BGP peer (which is also the sending MSDP peer), then the RPF check succeeds; otherwise it fails.

### Implications of Rule 2 of RPF Checking on MSDP

The MSDP topology must mirror the (M)BGP topology. In general, wherever there is an e(M)BGP peer connection between two devices, an MSDP peer connection should be configured. As opposed to Rule 1, the IP address of the far-end MSDP peer connection does not have to be the same as the far-end e(M)BGP peer connection. The reason that the addresses do not have to be identical is that BGP topology between two e(M)BGP peers is not described by the AS path.

### Rule 3 of RPF Checking of SA Messages in MSDP

Rule 3 of RPF checking is applied when the sending MSDP peer is not a (M)BGP peer at all. When Rule 3 is applied, the RPF check proceeds as follows:

1. The peer searches the BGP MRIB for the best path to the RP that originated the SA message. If a path is not found in the MRIB, the peer then searches the URIB. If a path is still not found, the RPF check fails.
2. If the previous search succeeds (that is, the best path to the RP that originated the SA message is found), the peer then searches the BGP MRIB for the best path to the MSDP peer that sent the SA message. If a path is not found in the MRIB, the peer then searches the URIB. If a path is still not found, the RPF check fails.

---

**Note** The autonomous system of the MSDP peer that sent the SA is the origin autonomous system, which is the last autonomous system in the AS path to the MSDP peer.

---

1. If the first autonomous system in the best path to the RP is the same as the autonomous system of the sending MSDP peer, then the RPF check succeeds; otherwise it fails.

## SA Message Processing

The following steps are taken by an MSDP peer whenever it processes an SA message:

1. Using the group address G of the (S, G) pair in the SA message, the peer locates the associated (\*, G) entry in the mroute table. If the (\*, G) entry is found and its outgoing interface list is not null, then there are active receivers in the PIM-SM domain for the source advertised in the SA message.
2. The MSDP peer then creates an (S, G) entry for the advertised source.
3. If the (S, G) entry did not already exist, the MSDP peer immediately triggers an (S, G) join toward the source in order to join the source tree.
4. The peer then floods the SA message to all other MSDP peers with the exception of:
  - The MSDP peer from which the SA message was received.
  - Any MSDP peers that are in the same MSDP mesh group as this device (if the peer is a member of a mesh group).

---

**Note** SA messages are stored locally in the device's SA cache.

---

## MSDP Peers

Like BGP, MSDP establishes neighbor relationships with other MSDP peers. MSDP peers connect using TCP port 639. The lower IP address peer takes the active role of opening the TCP connection. The higher IP address peer waits in LISTEN state for the other to make the connection. MSDP peers send keepalive messages every 60 seconds. The arrival of data performs the same function as the keepalive message and keeps the session from timing out. If no keepalive messages or data is received for 75 seconds, the TCP connection is reset.

## MSDP MD5 Password Authentication

The MSDP MD5 password authentication feature is an enhancement to support Message Digest 5 (MD5) signature protection on a TCP connection between two MSDP peers. This feature provides added security by protecting MSDP against the threat of spoofed TCP segments being introduced into the TCP connection stream.

### Related Topics

- [Configuring MSDP MD5 Password Authentication Between MSDP Peers](#), on page 505
- [Example: Configuring MSDP MD5 Password Authentication](#), on page 525

## How MSDP MD5 Password Authentication Works

Developed in accordance with RFC 2385, the MSDP MD5 password authentication feature is used to verify each segment sent on the TCP connection between MSDP peers. The **ip msdp password peer** command is used to enable MD5 authentication for TCP connections between two MSDP peers. When MD5 authentication

is enabled between two MSDP peers, each segment sent on the TCP connection between the peers is verified. MD5 authentication must be configured with the same password on both MSDP peers; otherwise, the connection between them will not be made. Configuring MD5 authentication causes the Cisco IOS software to generate and verify the MD5 digest of every segment sent on the TCP connection.

## Benefits of MSDP MD5 Password Authentication

- Protects MSDP against the threat of spoofed TCP segments being introduced into the TCP connection stream.
- Uses the industry-standard MD5 algorithm for improved reliability and security.

## SA Message Limits

The **ip msdp sa-limit** command is used to limit the overall number of SA messages that a device can accept from specified MSDP peers. When the **ip msdp sa-limit** command is configured, the device maintains a per-peer count of SA messages stored in the SA cache and will ignore new messages from a peer if the configured SA message limit for that peer has been reached.

The **ip msdp sa-limit** command was introduced as a means to protect an MSDP-enabled device from denial of service (DoS) attacks. We recommended that you configure SA message limits for all MSDP peerings on the device. An appropriately low SA limit should be configured on peerings with a stub MSDP region (for example, a peer that may have some further downstream peers but that will not act as a transit for SA messages across the rest of the Internet). A high SA limit should be configured for all MSDP peerings that act as transits for SA messages across the Internet.

## MSDP Keepalive and Hold-Time Intervals

The **ip msdp keepalive** command is used to adjust the interval at which an MSDP peer will send keepalive messages and the interval at which the MSDP peer will wait for keepalive messages from other peers before declaring them down.

Once an MSDP peering session is established, each side of the connection sends a keepalive message and sets a keepalive timer. If the keepalive timer expires, the local MSDP peer sends a keepalive message and restarts its keepalive timer; this interval is referred to as the keepalive interval. The *keepalive-interval* argument is used to adjust the interval for which keepalive messages will be sent. The keepalive timer is set to the value specified for the *keepalive-interval* argument when the peer comes up. The keepalive timer is reset to the value of the *keepalive-interval* argument whenever an MSDP keepalive message is sent to the peer and reset when the timer expires. The keepalive timer is deleted when an MSDP peering session is closed. By default, the keepalive timer is set to 60 seconds.

---

**Note** The value specified for the *keepalive-interval* argument must be less than the value specified for the *holdtime-interval* argument and must be at least one second.

---

The hold-time timer is initialized to the value of the *hold-time-interval* argument whenever an MSDP peering connection is established, and is reset to the value of the *hold-time-interval* argument whenever an MSDP keepalive message is received. The hold-time timer is deleted whenever an MSDP peering connection is closed. By default, the hold-time interval is set to 75 seconds.

Use the *hold-time-interval* argument to adjust the interval at which the MSDP peer will wait for keepalive messages from other peers before declaring them down.

## MSDP Connection-Retry Interval

You can adjust the interval at which all MSDP peers will wait after peering sessions are reset before attempting to reestablish the peering sessions. This interval is referred to as the connection-retry interval. By default, MSDP peers will wait 30 seconds after the session is reset before attempting to reestablish sessions with other peers. The modified configured connection-retry interval applies to all MSDP peering sessions on the device.

## Default MSDP Peers

A stub autonomous system also might want to have MSDP peerings with more than one RP for the sake of redundancy. For example, SA messages cannot just be accepted from multiple default peers, because there is no RPF check mechanism. Instead, SA messages are accepted from only one peer. If that peer fails, SA messages are then accepted from the other peer. The underlying assumption here, of course, is that both default peers are sending the same SA messages.

The figure illustrates a scenario where default MSDP peers might be used. In the figure, a customer that owns Device B is connected to the Internet through two Internet service providers (ISPs), one that owns Device A and the other that owns Device C. They are not running BGP or MBGP between them. In order for the customer to learn about sources in the ISP domain or in other domains, Device B identifies Device A as its default MSDP peer. Device B advertises SA messages to both Device A and Device C, but accepts SA messages either from Device A only or Device C only. If Device A is the first default peer in the configuration, it will be used if it is up and running. Only if Device A is not running will Device B accept SA messages from Device C.

The ISP will also likely use a prefix list to define which prefixes it will accept from the customer device. The customer will define multiple default peers, each having one or more prefixes associated with it.

The customer has two ISPs to use. The customer defines both ISPs as default peers. As long as the first default peer identified in the configuration is up and running, it will be the default peer and the customer will accept all SA messages it receives from that peer.

Figure 26: Default MSDP Peer Scenario

Device B advertises SAs to Device A and Device C, but uses only Device A or Device C to accept SA messages. If Device A is first in the configuration, it will be used if it is up and running. Only when Device A is not running will Device B accept SAs from Device C. This is the behavior without a prefix list.

If you specify a prefix list, the peer will be a default peer only for the prefixes in the list. You can have multiple active default peers when you have a prefix list associated with each. When you do not have any prefix lists, you can configure multiple default peers, but only the first one is the active default peer as long as the device has connectivity to this peer and the peer is alive. If the first configured peer goes down or the connectivity to this peer goes down, the second configured peer becomes the active default, and so on.

## MSDP Mesh Groups

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity between one another. In other words, each of the MSDP peers in the group must have an MSDP peering relationship (MSDP connection) to every other MSDP peer in the group. When an MSDP mesh group is configured between a group of MSDP peers, SA message flooding is reduced. Because when an MSDP peer in the group receives an SA message from another MSDP peer in the group, it assumes that this SA message was sent to all the other MSDP peers in the group. As a result, it is not necessary for the receiving MSDP peer to flood the SA message to the other MSDP peers in the group.

#### Related Topics

[Configuring an MSDP Mesh Group](#), on page 511

[Example: Configuring MSDP Mesh Groups](#), on page 528

## Benefits of MSDP Mesh Groups

- Optimizes SA flooding--MSDP mesh groups are particularly useful for optimizing SA flooding when two or more peers are in a group.

- Reduces the amount of SA traffic across the Internet--When MSDP mesh groups are used, SA messages are not flooded to other mesh group peers.
- Eliminates RPF checks on arriving SA messages--When an MSDP mesh group is configured, SA messages are always accepted from mesh group peers.

## SA Origination Filters

By default, an RP that is configured to run MSDP will originate SA messages for all local sources for which it is the RP. Local sources that register with an RP, therefore, will be advertised in SA messages, which in some cases is not desirable. For example, if sources inside a PIM-SM domain are using private addresses (for example, network 10.0.0.0/8), you should configure an SA origination filter to restrict those addresses from being advertised to other MSDP peers across the Internet.

To control what sources are advertised in SA messages, you can configure SA origination filters on an RP. By creating SA origination filters, you can control the sources advertised in SA messages as follows:

- You can configure an RP to prevent the device from advertising local sources in SA messages. The device will still forward SA messages from other MSDP peers in the normal fashion; it will just not originate any SA messages for local sources.
- You can configure the device to only originate SA messages for local sources sending to specific groups that match (S, G) pairs defined in the extended access list. All other local sources will not be advertised in SA messages.
- You can configure the device to only originate SA messages for local sources sending to specific groups that match AS paths defined in an AS-path access list. All other local sources will not be advertised in SA messages.
- You can configure the device to only originate SA messages for local sources that match the criteria defined in the route map. All other local sources will not be advertised in SA messages.
- You configure an SA origination filter that includes an extended access list, an AS-path access list, and route map, or a combination thereof. In this case, all conditions must be true before any local sources are advertised in SA messages.

## Use of Outgoing Filter Lists in MSDP

By default, an MSDP-enabled device forwards all SA messages it receives to all of its MSDP peers. However, you can prevent SA messages from being forwarded to MSDP peers by creating outgoing filter lists. Outgoing filter lists apply to all SA messages, whether locally originated or received from another MSDP peer, whereas SA origination filters apply only to locally originated SA messages. For more information about enabling a filter for MSDP SA messages originated by the local device, see the [Controlling SA Messages Originated by an RP for Local Sources, on page 512](#) section.

By creating an outgoing filter list, you can control the SA messages that a device forwards to a peer as follows:

- You can filter all outgoing SA messages forwarded to a specified MSDP peer by configuring the device to stop forwarding its SA messages to the MSDP peer.
- You can filter a subset of outgoing SA messages forwarded to a specified MSDP peer based on (S, G) pairs defined in an extended access list by configuring the device to only forward SA messages to the

MSDP peer that match the (S, G) pairs permitted in an extended access list. The forwarding of all other SA messages to the MSDP peer will be stopped.

- You can filter a subset of outgoing SA messages forwarded to a specified MSDP peer based on match criteria defined in a route map by configuring the device to only forward SA messages that match the criteria defined in the route map. The forwarding of all other SA messages to the MSDP peer will be stopped.
- You can filter a subset of outgoing SA messages from a specified peer based on the announcing RP address contained in the SA message by configuring the device to filter outgoing SA messages based on their origin, even after an SA message has been transmitted across one or more MSDP peers. The forwarding of all other SA messages to the MSDP peer will be stopped.
- You can configure an outgoing filter list that includes an extended access list, a route map, and either an RP access list or an RP route map. In this case, all conditions must be true for the MSDP peer to forward the outgoing SA message.

**Caution**

Arbitrary filtering of SA messages can result in downstream MSDP peers being starved of SA messages for legitimate active sources. Care, therefore, should be taken when using these sorts of filters. Normally, outgoing filter lists are used only to reject undesirable sources, such as sources using private addresses.

## Use of Incoming Filter Lists in MSDP

By default, an MSDP-enabled device receives all SA messages sent to it from its MSDP peers. However, you can control the source information that a device receives from its MSDP peers by creating incoming filter lists.

By creating incoming filter lists, you can control the incoming SA messages that a device receives from its peers as follows:

- You can filter all incoming SA messages from a specified MSDP peer by configuring the device to ignore all SA messages sent to it from the specified MSDP peer.
- You can filter a subset of incoming SA messages from a specified peer based on (S, G) pairs defined in an extended access list by configuring the device to only receive SA messages from the MSDP peer that match the (S, G) pairs defined in the extended access list. All other incoming SA messages from the MSDP peer will be ignored.
- You can filter a subset of incoming SA request messages from a specified peer based on match criteria defined in a route map by configuring the device to only receive SA messages that match the criteria defined in the route map. All other incoming SA messages from the MSDP peer will be ignored.
- You can filter a subset of incoming SA messages from a specified peer based on both (S, G) pairs defined in an extended access list and on match criteria defined in a route map by configuring the device to only receive incoming SA messages that both match the (S, G) pairs defined in the extended access list and match the criteria defined in the route map. All other incoming SA messages from the MSDP peer will be ignored.
- You can filter a subset of incoming SA messages from a specified peer based on the announcing RP address contained in the SA message by configuring the device to filter incoming SA messages based on their origin, even after the SA message may have already been transmitted across one or more MSDP peers.

- You can configure an incoming filter list that includes an extended access list, a route map, and either an RP access list or an RP route map. In this case, all conditions must be true for the MSDP peer to receive the incoming SA message.

**Caution**

Arbitrary filtering of SA messages can result in downstream MSDP peers being starved of SA messages for legitimate active sources. Care, therefore, should be taken when using these sorts of filters. Normally, incoming filter lists are used only to reject undesirable sources, such as sources using private addresses.

## TTL Thresholds in MSDP

The time-to-live (TTL) value provides a means to limit the number of hops a packet can take before being dropped. The **ip multicast ttl-threshold** command is used to specify a TTL for data-encapsulated SA messages sent to specified MSDP peers. By default, multicast data packets in SA messages are sent to an MSDP peer, provided the TTL value of the packet is greater than 0, which is standard TTL behavior.

In general, a TTL-threshold problem can be introduced by the encapsulation of a source's initial multicast packet in an SA message. Because the multicast packet is encapsulated inside of the unicast SA message (whose TTL is 255), its TTL is not decremented as the SA message travels to the MSDP peer. Furthermore, the total number of hops that the SA message traverses can be drastically different than a normal multicast packet because multicast and unicast traffic may follow completely different paths to the MSDP peer and hence the remote PIM-SM domain. As a result, encapsulated packets can end up violating TTL thresholds. The solution to this problem is to configure a TTL threshold that is associated with any multicast packet that is encapsulated in an SA message sent to a particular MSDP peer using the **ip multicast ttl-threshold** command. The **ip msdp ttl-threshold** command prevents any multicast packet whose TTL in the IP header is less than the TTL value specified for the *ttl-value* argument from being encapsulated in SA messages sent to that peer.

## SA Request Messages

You can configure a noncaching device to send SA request messages to one or more specified MSDP peers.

If a noncaching RP has an MSDP peer that is caching SAs, you can reduce the join latency for a noncaching peer by enabling the noncaching peer to send SA request messages. When a host requests a join to a particular group, the noncaching RP sends an SA request message to its caching peers. If a peer has cached source information for the group in question, it sends the information to the requesting RP with an SA response message. The requesting RP uses the information in the SA response but does not forward the message to any other peers. If a noncaching RP receives an SA request, it sends an error message back to the requestor.

**Note**

In all current and supported software releases, caching of MSDP SA messages is mandatory and cannot be manually enabled or disabled. By default, when an MSDP peer is configured, the configured commands are automatically added to the running configuration.

## SA Request Filters

By default, a device honors all outgoing SA request messages from its MSDP peers; that is, it sends cached source information to requesting MSDP peers in SA response messages. You can control the outgoing SA

request messages that a device will honor from specified peers by creating an SA request filter. An SA request filter controls the outgoing SA requests that the device will honor from MSDP peers as follows:

- You can filter all SA request messages from a specified peer by configuring the device to ignore all SA requests from the specified MSDP peer.
- You can filter a subset of SA request messages from a specified peer based on groups defined in a standard access list by configuring the device to honor only SA request messages from the MSDP peer that match the groups defined in a standard access list. SA request messages from the specified peer for other groups will be ignored.

## How to Use MSDP to Interconnect Multiple PIM-SM Domains

The first task is required; all other tasks are optional.

### Configuring an MSDP Peer

**Note** By enabling an MSDP peer, you implicitly enable MSDP.

#### Before you begin

- IP multicast routing must be enabled and PIM-SM must be configured.
- With the exception of a single MSDP peer, default MSDP peer, and MSDP mesh group scenarios, all MSDP peers must be configured to run BGP prior to being configured for MSDP.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp peer** *{peer-name| peer-address}* [*connect-source type number*] [**remote-as** *as-number*]
4. **ip msdp description** *{peer-name| peer-address}* *text*
5. **end**

## Shutting Down an MSDP Peer

Perform this optional task to shut down an MSDP peer.

If you are configuring several MSDP peers and you do not want any of the peers to go active until you have finished configuring all of them, you can shut down each peer, configure each peer, and later bring each peer up. You might also want to shut down an MSDP session without losing the configuration for that MSDP peer.

**Note**

When an MSDP peer is shut down, the TCP connection is terminated and not restarted until the peer is brought back up using the **no ip msdp shutdown** command (for the specified peer).

**Before you begin**

MSDP is running and the MSDP peers must be configured.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip msdp shutdown** *{peer-name | peer-address}*
4. Repeat Step 3 to shut down additional MSDP peers.
5. **end**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                     | <b>Purpose</b>                                                                                                        |

## Troubleshooting Tips

If a device has a password configured for an MSDP peer but the MSDP peer does not, a message such as the following will appear on the console while the devices attempt to establish an MSDP session between them:

```
%TCP-6-BADAUTH: No MD5 digest from [peer's IP address]:11003 to [local router's IP address]:179
```

Similarly, if the two devices have different passwords configured, a message such as the following will appear on the console:

```
%TCP-6-BADAUTH: Invalid MD5 digest from [peer's IP address]:11004 to [local router's IP address]:179
```

The **debug ip tcp transactions** command is used to display information on significant TCP transactions such as state changes, retransmissions, and duplicate packets. In the context of monitoring or troubleshooting MSDP MD5 password authentication, use the **debug ip tcp transactions** command to verify that the MD5 password is enabled and that the keepalive message is received by the MSDP peer.

## Preventing DoS Attacks by Limiting the Number of SA Messages Allowed in the SA Cache from Specified MSDP Peers

Perform this optional (but highly recommended) task to limit the overall number of SA messages that the device can accept from specified MSDP peers. Performing this task protects an MSDP-enabled device from distributed denial-of-service (DoS) attacks.

**Note** We recommend that you perform this task for all MSDP peerings on the device.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp sa-limit** *{peer-address | peer-name} sa-limit*
4. Repeat Step 3 to configure SA limits for additional MSDP peers.
5. **exit**
6. **show ip msdp count** *[as-number]*
7. **show ip msdp peer** *[peer-address | peer-name]*
8. **show ip msdp summary**

| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                                                 | Enters global configuration mode.                                                                                                                                                              |
| <b>Step 3</b> | <b>ip msdp sa-limit</b> { <i>peer-address</i>   <i>peer-name</i> } <i>sa-limit</i><br><b>Example:</b><br><br>Device(config)# ip msdp sa-limit 192.168.10.1 100 | Limits the number of SA messages allowed in the SA cache from the specified MSDP.                                                                                                              |
| <b>Step 4</b> | Repeat Step 3 to configure SA limits for additional MSDP peers.                                                                                                | --                                                                                                                                                                                             |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config)# exit                                                                                                     | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                           |
| <b>Step 6</b> | <b>show ip msdp count</b> [ <i>as-number</i> ]<br><b>Example:</b><br><br>Device# show ip msdp count                                                            | (Optional) Displays the number of sources and groups originated in MSDP SA messages and the number of SA messages from an MSDP peer in the SA cache.                                           |
| <b>Step 7</b> | <b>show ip msdp peer</b> [ <i>peer-address</i>   <i>peer-name</i> ]<br><b>Example:</b><br><br>Device# show ip msdp peer                                        | (Optional) Displays detailed information about MSDP peers.<br><b>Note</b> The output of this command displays the number of SA messages received from MSDP peers that are stored in the cache. |
| <b>Step 8</b> | <b>show ip msdp summary</b><br><b>Example:</b><br><br>Device# show ip msdp summary                                                                             | (Optional) Displays MSDP peer status.<br><b>Note</b> The output of this command displays a per-peer "SA Count" field that displays the number of SAs stored in the cache.                      |

## Adjusting the MSDP Keepalive and Hold-Time Intervals

Perform this optional task to adjust the interval at which an MSDP peer will send keepalive messages and the interval at which the MSDP peer will wait for keepalive messages from other peers before declaring them down. By default, it may take as long as 75 seconds for an MSDP peer to detect that a peering session with another MSDP peer has gone down. In network environments with redundant MSDP peers, decreasing the hold-time interval can expedite the reconvergence time of MSDP peers in the event that an MSDP peer fails.

**Note** We recommend that you do not change the command defaults for the **ip msdp keepalive** command, because the command defaults are in accordance with RFC 3618, *Multicast Source Discovery Protocol*. If your network environment requires that you modify the defaults, you must configure the same time values for the *keepalive-interval* and *hold-time-interval* arguments on both ends of the MSDP peering session.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp keepalive** *{peer-address | peer-name} keepalive-interval hold-time-interval*
4. Repeat Step 3 to adjust the keepalive message interval for additional MSDP peers.
5. **exit**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                       | Purpose                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                              | Enters global configuration mode.                                                                                                                                                                |
| <b>Step 3</b> | <b>ip msdp keepalive</b> <i>{peer-address   peer-name} keepalive-interval hold-time-interval</i><br><b>Example:</b><br>Device(config)# ip msdp keepalive 10.1.1.3 40 55 | Configures the interval at which an MSDP peer will send keepalive messages and the interval at which the MSDP peer will wait for keepalive messages from other peers before declaring them down. |
| <b>Step 4</b> | Repeat Step 3 to adjust the keepalive message interval for additional MSDP peers.                                                                                       | --                                                                                                                                                                                               |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                                                  | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                             |

## Adjusting the MSDP Connection-Retry Interval

Perform this optional task to adjust the interval at which MSDP peers will wait after peering sessions are reset before attempting to reestablish the peering sessions. In network environments where fast recovery of SA messages is required, such as in trading floor network environments, you may want to decrease the connection-retry interval to a time value less than the default value of 30 seconds.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip msdp timer** *connection-retry-interval*
4. **exit**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                             | <b>Purpose</b>                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                           | Enters global configuration mode.                                                                                                             |
| <b>Step 3</b> | <b>ip msdp timer</b> <i>connection-retry-interval</i><br><b>Example:</b><br>Device# ip msdp timer 45 | Configures the interval at which MSDP peers will wait after peering sessions are reset before attempting to reestablish the peering sessions. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                               | Exits global configuration mode and returns to privileged EXEC mode.                                                                          |

## Configuring a Default MSDP Peer

Perform this optional task to configure a default MSDP peer.

**Before you begin**

An MSDP default peer must be a previously configured MSDP peer. Before configuring a default MSDP peer, you must first configure an MSDP peer.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip msdp default-peer** *{peer-address | peer-name}* [**prefix-list** *list*]
4. **exit**

## DETAILED STEPS

## Configuring an MSDP Mesh Group

Perform this optional task to configure an MSDP mesh group.

**Note** You can configure multiple mesh groups per device.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp mesh-group** *mesh-name* *{peer-address | peer-name}*
4. Repeat Step 3 to add MSDP peers as members of the mesh group.
5. **exit**

## Controlling SA Messages Originated by an RP for Local Sources

Perform this task to control SA messages originated by an RP by enabling a filter to restrict which registered sources are advertised in SA messages.

**Note** For best practice information related to configuring MSDP SA message filters, see the [Multicast Source Discovery Protocol SA Filter Recommendations](#) tech note.

## SUMMARY STEPS

1. enable

2. `configure terminal`
3. `ip msdp redistribute [list access-list] [asn as-access-list] [route-map map-name]`
4. `exit`

### DETAILED STEPS

| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                               | Enters global configuration mode.                                                                                  |
| Step 3 | <b>ip msdp sa-filter in</b> <i>{peer-address   peer-name}</i> [ <b>list</b> <i>access-list</i> ] [ <b>route-map</b> <i>map-name</i> ] [ <b>rp-list</b> <i>access-list</i>   <b>rp-route-map</b> <i>map-name</i> ]<br><b>Example:</b><br>Device(config)# ip msdp sa-filter in 192.168.1.3 | Enables a filter for incoming MSDP SA messages.                                                                    |
| Step 4 | Repeat Step 3 to configure incoming filter lists for additional MSDP peers.                                                                                                                                                                                                              | --                                                                                                                 |
| Step 5 | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                                                                                                                                                                   | Exits global configuration mode and returns to privileged EXEC mode.                                               |

## Using TTL Thresholds to Limit the Multicast Data Sent in SA Messages

Perform this optional task to establish a time to live (TTL) threshold to limit the multicast data sent in SA messages.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp ttl-threshold** *{peer-address | peer-name}* *ttl-value*
4. **exit**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                | Purpose                                                                                                                                                                                                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> enable                                                                                                                           | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                                                                   | Enters global configuration mode.                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>ip msdp ttl-threshold</b> <i>{peer-address   peer-name} ttl-value</i><br><b>Example:</b><br><br><b>Example:</b><br><br>Device(config)# ip msdp ttl-threshold 192.168.1.5<br>8 | Sets a TTL value for MSDP messages originated by the local device.<br><br>• By default, multicast data packets in SA messages are sent to an MSDP peer, provided the TTL value of the packet is greater than 0, which is standard TTL behavior. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config)# exit                                                                                                                       | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                            |

## Requesting Source Information from MSDP Peers

Perform this optional task to enable a device to request source information from MSDP peers.

**Note** Because SA caching is enabled by default and cannot be explicitly enabled or disabled in earlier Cisco software releases, performing this task is seldom needed.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp sa-request** *{peer-address | peer-name}*
4. Repeat Step 3 to specify that the device send SA request messages to additional MSDP caching peers.
5. **exit**

## DETAILED STEPS

|               | Command or Action | Purpose                       |
|---------------|-------------------|-------------------------------|
| <b>Step 1</b> | <b>enable</b>     | Enables privileged EXEC mode. |

|               | Command or Action                                                                                                                          | Purpose                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
|               | <b>Example:</b><br>Device> enable                                                                                                          | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                 | Enters global configuration mode.                                                  |
| <b>Step 3</b> | <b>ip msdp sa-request</b> { <i>peer-address</i>   <i>peer-name</i> }<br><b>Example:</b><br>Device(config)# ip msdp sa-request 192.168.10.1 | Specifies that the device send SA request messages to the specified MSDP peer.     |
| <b>Step 4</b> | Repeat Step 3 to specify that the device send SA request messages to additional MSDP caching peers.                                        | --                                                                                 |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                     | Exits global configuration mode and returns to privileged EXEC mode.               |

## Controlling the Response to Outgoing SA Request Messages from MSDP Peers Using SA Request Filters

Perform this optional task to control the outgoing SA request messages that the device will honor from MSDP peers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp filter-sa-request** {*peer-address* | *peer-name*} [**list access-list**]
4. Repeat Step 3 to configure SA request filters for additional MSDP peers.
5. **exit**

### DETAILED STEPS

|               | Command or Action                                  | Purpose                                                                                                          |
|---------------|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>       | Enters global configuration mode.                                                                                |

|               | Command or Action                                                                                                                                                                         | Purpose                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
|               | Device# configure terminal                                                                                                                                                                |                                                                                                                               |
| <b>Step 3</b> | <b>ip msdp filter-sa-request</b> { <i>peer-address</i>   <i>peer-name</i> } [ <i>list access-list</i> ]<br><b>Example:</b><br>Device(config)# ip msdp filter sa-request 172.31.2.2 list 1 | Enables a filter for outgoing SA request messages.<br><b>Note</b> Only one SA request filter can be configured per MSDP peer. |
| <b>Step 4</b> | Repeat Step 3 to configure SA request filters for additional MSDP peers.                                                                                                                  | --                                                                                                                            |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                                                                    | Exits global configuration mode and returns to privileged EXEC mode.                                                          |

## Including a Bordering PIM Dense Mode Region in MSDP

Perform this optional task to configure a border device to send SA messages for sources active in a PIM dense mode (PIM-DM) region.

You can have a device that borders a PIM-SM region and a PIM-DM region. By default, sources in the PIM-DM domain are not included in MSDP. You can configure this border device to send SA messages for sources active in the PIM-DM domain. If you do so, it is very important to also configure the **ip msdp redistribute** command to control what local sources from the PIM-DM domain are advertised. Not configuring this command can result in the (S, G) state remaining long after a source in the PIM-DM domain has stopped sending. For configuration information, see the [Controlling SA Messages Originated by an RP for Local Sources, on page 512](#) section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp border sa-address** *type number*
4. **exit**

### DETAILED STEPS

|               | Command or Action                                  | Purpose                                                                                                               |
|---------------|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>       | Enters global configuration mode.                                                                                     |

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                             |

|               | Device# configure terminal                                                                                                                  |                                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | <b>ip msdp border sa-address</b> <i>type number</i><br><b>Example:</b><br>Device(config)# ip msdp border sa-address<br>gigabitethernet0/0/0 | Configures the device on the border between a PIM-SM and PIM-DM domain to originate SA messages for active sources in the PIM-DM domain. <ul style="list-style-type: none"> <li>• The IP address of the interface is used as the originator ID, which is the RP field in the SA message.</li> </ul> |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                      | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                |

## Configuring an Originating Address Other Than the RP Address

Perform this optional task to allow an MSDP speaker that originates an SA message to use the IP address of its interface as the RP address in the SA message.

You can also change the originator ID for any one of the following reasons:

- If you configure multiple devices in an MSDP mesh group for Anycast RP.
- If you have a device that borders a PIM-SM domain and a PIM-DM domain. If a device borders a PIM-SM domain and a PIM-DM domain and you want to advertise active sources within the PIM-DM domain, configure the RP address in SA messages to be the address of the originating device's interface.

### Before you begin

MSDP is enabled and the MSDP peers are configured. For more information about configuring MSDP peers, see the [Configuring an MSDP Peer, on page 503](#) section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip msdp originator-id** *type number*
4. **exit**

### DETAILED STEPS

|               | Command or Action                                  | Purpose                                                                                                            |
|---------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                       | Purpose                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>                                             | Enters global configuration mode.                                                                 |
| <b>Step 3</b> | <b>ip msdp originator-id</b> <i>type number</i><br><b>Example:</b><br><br>Device(config)# <code>ip msdp originator-id ethernet 1</code> | Configures the RP address in SA messages to be the address of the originating device's interface. |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config)# <code>exit</code>                                                                 | Exits global configuration mode and returns to privileged EXEC mode.                              |

## Monitoring MSDP

Perform this optional task to monitor MSDP SA messages, peers, state, and peer status.

### SUMMARY STEPS

1. **enable**
2. **debug ip msdp** [*peer-address* | *peer-name*] [**detail**] [**routes**]
3. **debug ip msdp resets**
4. **show ip msdp count** [*as-number*]
5. **show ip msdp peer** [*peer-address* | *peer-name*]
6. **show ip msdp sa-cache** [*group-address* | *source-address* | *group-name* | *source-name*] [*as-number*]
7. **show ip msdp summary**

### DETAILED STEPS

**Step 1**    **enable**

**Example:**

```
Device# enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2**    **debug ip msdp** [*peer-address* | *peer-name*] [**detail**] [**routes**]

Use this command to debug MSDP activity.

Use the optional *peer-address* or *peer-name* argument to specify for which peer debug events are logged.

The following is sample output from the **debug ip msdp** command:

**Example:**

```

Device# debug ip msdp
MSDP debugging is on
Device#
MSDP: 224.150.44.254: Received 1388-byte message from peer
MSDP: 224.150.44.254: SA TLV, len: 1388, ec: 115, RP: 172.31.3.92
MSDP: 224.150.44.254: Peer RPF check passed for 172.31.3.92, used EMBGP peer
MSDP: 224.150.44.250: Forward 1388-byte SA to peer
MSDP: 224.150.44.254: Received 1028-byte message from peer
MSDP: 224.150.44.254: SA TLV, len: 1028, ec: 85, RP: 172.31.3.92
MSDP: 224.150.44.254: Peer RPF check passed for 172.31.3.92, used EMBGP peer
MSDP: 224.150.44.250: Forward 1028-byte SA to peer
MSDP: 224.150.44.254: Received 1388-byte message from peer
MSDP: 224.150.44.254: SA TLV, len: 1388, ec: 115, RP: 172.31.3.111
MSDP: 224.150.44.254: Peer RPF check passed for 172.31.3.111, used EMBGP peer
MSDP: 224.150.44.250: Forward 1388-byte SA to peer
MSDP: 224.150.44.250: Received 56-byte message from peer
MSDP: 224.150.44.250: SA TLV, len: 56, ec: 4, RP: 192.168.76.241

MSDP: 224.150.44.254: Received 32-byte message from peer
MSDP: 224.150.44.254: SA TLV, len: 32, ec: 2, RP: 172.31.3.78
MSDP: 224.150.44.254: Peer RPF check passed for 172.31.3.78, used EMBGP peer
MSDP: 224.150.44.250: Forward 32-byte SA to peer

```

**Step 3** **debug ip msdp resets**

Use this command to debug MSDP peer reset reasons.

**Example:**

```
Device# debug ip msdp resets
```

**Step 4** **show ip msdp count** [*as-number*]

Use this command to display the number of sources and groups originated in MSDP SA messages and the number of SA messages from an MSDP peer in the SA cache. The **ip msdp cache-sa-state** command must be configured for this command to produce any output.

The following is sample output from the **show ip msdp count** command:

**Example:**

```

Device# show ip msdp count
SA State per Peer Counters, <Peer>: <# SA learned>
 192.168.4.4: 8
SA State per ASN Counters, <asn>: <# sources>/<# groups>
 Total entries: 8
 ? : 8/8

```

**Step 5** **show ip msdp peer** [*peer-address* | *peer-name*]

Use this command to display detailed information about MSDP peers.

Use the optional *peer-address* or *peer-name* argument to display information about a particular peer.

The following is sample output from the **show ip msdp peer** command:

**Example:**

```

Device# show ip msdp peer 192.168.4.4
MSDP Peer 192.168.4.4 (?), AS 64512 (configured AS)
 Connection status:
 State: Up, Resets: 0, Connection source: Loopback0 (2.2.2.2)
 Uptime(Downtime): 00:07:55, Messages sent/received: 8/18
 Output messages discarded: 0
 Connection and counters cleared 00:08:55 ago
 SA Filtering:
 Input (S,G) filter: none, route-map: none
 Input RP filter: none, route-map: none
 Output (S,G) filter: none, route-map: none
 Output RP filter: none, route-map: none
 SA-Requests:
 Input filter: none
 Peer ttl threshold: 0
 SAs learned from this peer: 8
 Input queue size: 0, Output queue size: 0
 MD5 signature protection on MSDP TCP connection: not enabled

```

**Step 6** `show ip msdp sa-cache [group-address | source-address | group-name | source-name] [as-number]`

Use this command to display the (S, G) state learned from MSDP peers.

The following is sample output from the `show ip msdp sa-cache` command:

**Example:**

```

Device# show ip msdp sa-cache
MSDP Source-Active Cache - 8 entries
(10.44.44.5, 239.232.1.0), RP 192.168.4.4, BGP/AS 64512, 00:01:20/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.1), RP 192.168.4.4, BGP/AS 64512, 00:01:20/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.2), RP 192.168.4.4, BGP/AS 64512, 00:01:19/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.3), RP 192.168.4.4, BGP/AS 64512, 00:01:19/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.4), RP 192.168.4.4, BGP/AS 64512, 00:01:19/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.5), RP 192.168.4.4, BGP/AS 64512, 00:01:19/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.6), RP 192.168.4.4, BGP/AS 64512, 00:01:19/00:05:32, Peer 192.168.4.4
(10.44.44.5, 239.232.1.7), RP 192.168.4.4, BGP/AS 64512, 00:01:19/00:05:32, Peer 192.168.4.4

```

**Step 7** `show ip msdp summary`

Use this command to display MSDP peer status.

The following is sample output from the `show ip msdp summary` command:

**Example:**

```

Device# show ip msdp summary
MSDP Peer Status Summary
Peer Address AS State Uptime/ Reset SA Peer Name
 AS State Downtime Count Count
192.168.4.4 4 Up 00:08:05 0 8 ?

```

## Clearing MSDP Connections Statistics and SA Cache Entries

Perform this optional task to clear MSDP connections, statistics, and SA cache entries.

## SUMMARY STEPS

1. `enable`
2. `clear ip msdp peer [peer-address | peer-name]`
3. `clear ip msdp statistics [peer-address | peer-name]`
4. `clear ip msdp sa-cache [group-address]`

## DETAILED STEPS

|        | Command or Action                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                             | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                    |
| Step 2 | <p><code>clear ip msdp peer [peer-address   peer-name]</code></p> <p><b>Example:</b></p> <pre>Device# clear ip msdp peer</pre>             | <p>Clears the TCP connection to the specified MSDP peer and resets all MSDP message counters.</p>                                                                                                                                                                                                                                                                                                            |
| Step 3 | <p><code>clear ip msdp statistics [peer-address   peer-name]</code></p> <p><b>Example:</b></p> <pre>Device# clear ip msdp statistics</pre> | <p>Clears the statistics counters for the specified MSDP peer and resets all MSDP message counters.</p>                                                                                                                                                                                                                                                                                                      |
| Step 4 | <p><code>clear ip msdp sa-cache [group-address]</code></p> <p><b>Example:</b></p> <pre>Device# clear ip msdp sa-cache</pre>                | <p>Clears SA cache entries.</p> <ul style="list-style-type: none"> <li>• If the <code>clear ip msdp sa-cache</code> is specified with the optional <code>group-address</code> argument or <code>source-address</code> argument, all SA cache entries are cleared.</li> <li>• Use the optional <code>group-address</code> argument to clear all SA cache entries associated with a specific group.</li> </ul> |

## Enabling SNMP Monitoring of MSDP

Perform this optional task to enable Simple Network Management Protocol (SNMP) monitoring of MSDP.

### Before you begin

- SNMP and MSDP is configured on your devices.
- In each PIM-SM domain there should be a device that is configured as the MSDP speaker. This device must have SNMP and the MSDP MIB enabled.

**Note**

- All MSDP-MIB objects are implemented as read-only.
- The Requests table is not supported in Cisco's implementation of the MSDP MIB.
- The msdpEstablished notification is not supported in Cisco's implementation of the MSDP MIB.

**SUMMARY STEPS**

1. **enable**
2. **snmp-server enable traps msdp**
3. **snmp-server host** *host* [**traps** | **informs**] [**version** {**1** | **2c** | **3** [**auth** | **priv** | **noauth**]}] *community-string* [**udp-port** *port-number*] **msdp**
4. **exit**

**DETAILED STEPS**

|               | Command or Action                                                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> enable                                                                                                                                                                                                                                                                  | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                                                                                          |
| <b>Step 2</b> | <b>snmp-server enable traps msdp</b><br><b>Example:</b><br><br>Device# snmp-server enable traps msdp                                                                                                                                                                                                                    | Enables the sending of MSDP notifications for use with SNMP.<br><br><b>Note</b> The <b>snmp-server enable traps msdp</b> command enables both traps and informs. |
| <b>Step 3</b> | <b>snmp-server host</b> <i>host</i> [ <b>traps</b>   <b>informs</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> [ <b>auth</b>   <b>priv</b>   <b>noauth</b> ]}] <i>community-string</i> [ <b>udp-port</b> <i>port-number</i> ] <b>msdp</b><br><b>Example:</b><br><br>Device# snmp-server host examplehost msdp | Specifies the recipient (host) for MSDP traps or informs.                                                                                                        |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config)# exit                                                                                                                                                                                                                                                              | Exits global configuration mode and returns to privileged EXEC mode.                                                                                             |

**Troubleshooting Tips**

You can compare the results of MSDP MIB notifications to the output from the software by using the **show ip msdp summary** and **show ip msdp peer** commands on the appropriate device. You can also compare the results of these commands to the results from SNMP Get operations. You can verify SA cache table entries using the **show ip msdp sa-cache** command. Additional troubleshooting information, such as the local address of the connection, the local port, and the remote port, can be obtained using the output from the **debug ip msdp** command.

# Configuration Examples for Using MSDP to Interconnect Multiple PIM-SM Domains

## Example: Configuring an MSDP Peer

The following example shows how to establish MSDP peering connections between three MSDP peers:

### Device A

```
!
interface Loopback 0
 ip address 10.220.8.1 255.255.255.255
!
ip msdp peer 10.220.16.1 connect-source Loopback0
ip msdp peer 10.220.32.1 connect-source Loopback0
!
```

### Device B

```
!
interface Loopback 0
 ip address 10.220.16.1 255.255.255.255
!
ip msdp peer 10.220.8.1 connect connect-source Loopback0
ip msdp peer 10.220.32.1 connect connect-source Loopback0
!
```

### Device C

```
!
interface Loopback 0
 ip address 10.220.32.1 255.255.255.255
!
ip msdp peer 10.220.8.1 connect 10.220.8.1 connect-source Loopback0
ip msdp peer 10.220.16.1 connect 10.220.16.1 connect-source Loopback0
!
```

## Example: Configuring MSDP MD5 Password Authentication

The following example shows how to enable MD5 password authentication for TCP connections between two MSDP peers:

**Device A**

```
!
ip msdp peer 10.3.32.154
ip msdp password peer 10.3.32.154 0 test
!
```

**Device B**

```
!
ip msdp peer 10.3.32.153
ip msdp password peer 10.3.32.153 0 test
!
```

## Example: Configuring a Default MSDP Peer

The figure illustrates a scenario where default MSDP peers might be used. In the figure, a customer that owns Device B is connected to the internet through two ISPs, one that owns Device A and the other that owns Device C. They are not running (M)BGP between them. In order for the customer to learn about sources in the ISP domain or in other domains, Device B identifies Device A as its default MSDP peer. Device B advertises SA messages to both Device A and Device C, but accepts SA messages either from Device A only or Device C only. If Device A is the first default peer in the configuration, it will be used if it is up and running. Only if Device A is not running will Device B accept SA messages from Device C.

The ISP will also likely use a prefix list to define which prefixes it will accept from the customer device. The customer will define multiple default peers, each having one or more prefixes associated with it.

The customer has two ISPs to use. The customer defines both ISPs as default peers. As long as the first default peer identified in the configuration is up and running, it will be the default peer and the customer will accept all SA messages it receives from that peer.

Figure 27: Default MSDP Peer Scenario

Device B advertises SAs to Device A and Device C, but uses only Device A or Device C to accept SA messages. If Device A is first in the configuration file, it will be used if it is up and running. Only when Device A is not running will Device B accept SAs from Device C. This is the behavior without a prefix list.

If you specify a prefix list, the peer will be a default peer only for the prefixes in the list. You can have multiple active default peers when you have a prefix list associated with each. When you do not have any prefix lists, you can configure multiple default peers, but only the first one is the active default peer as long as the device has connectivity to this peer and the peer is alive. If the first configured peer goes down or the connectivity to this peer goes down, the second configured peer becomes the active default, and so on.

The following example shows a partial configuration of Device A and Device C in the figure. Each of these ISPs may have more than one customer using default peering, like the customer in the figure. In that case, they may have similar configurations. That is, they will only accept SAs from a default peer if the SA is permitted by the corresponding prefix list.

### Device A Configuration

```
ip msdp default-peer 10.1.1.1
ip msdp default-peer 10.1.1.1 prefix-list site-b ge 32
ip prefix-list site-b permit 10.0.0.0/8
```

### Device C Configuration

```
ip msdp default-peer 10.1.1.1 prefix-list site-b ge 32
ip prefix-list site-b permit 10.0.0.0/8
```

## Example: Configuring MSDP Mesh Groups

The following example shows how to configure three devices to be fully meshed members of an MSDP mesh group:

### Device A Configuration

```
ip msdp peer 10.2.2.2
ip msdp peer 10.3.3.3
ip msdp mesh-group test-mesh-group 10.2.2.2
ip msdp mesh-group test-mesh-group 10.3.3.3
```

### Device B Configuration

```
ip msdp peer 10.1.1.1
ip msdp peer 10.3.3.3
ip msdp mesh-group test-mesh-group 10.1.1.1
ip msdp mesh-group test-mesh-group 10.3.3.3
```

### Device C Configuration

```
ip msdp peer 10.1.1.1
ip msdp peer 10.2.2.2

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Wireless Multicast

- The IP multicast routing must be enabled and the PIM version and PIM mode must be configured. The default routes should be available in the device. After performing these tasks, the device can then forward multicast packets and can populate its multicast routing table.
- To participate in IP multicasting, the multicast hosts, routers, and multilayer switches must have IGMP operating.
- When enabling multicast mode on the , a CAPWAP multicast group address should also be configured. Access points listen to the CAPWAP multicast group using IGMP.

## Restrictions for Configuring Wireless Multicast

The following are the restrictions for configuring IP multicast routing:

- Access points in monitor mode, sniffer mode, or rogue detector mode do not join the CAPWAP multicast group address.
- The CAPWAP multicast group configured on the should be different for different devices.
- Multicast routing should not be enabled for the management interface.

## Restrictions for IPv6 Snooping

The IPv6 snooping feature is not supported on Etherchannel ports.

## Restrictions for IPv6 RA Guard

- The IPv6 RA Guard feature does not offer protection in environments where IPv6 traffic is tunneled.
- This feature is supported only in hardware when the ternary content addressable memory (TCAM) is programmed.
- This feature can be configured on a switch port interface in the ingress direction.
- This feature supports host mode and router mode.
- This feature is supported only in the ingress direction; it is not supported in the egress direction.
- This feature is not supported on EtherChannel and EtherChannel port members.
- This feature is not supported on trunk ports with merge mode.
- This feature is supported on auxiliary VLANs and private VLANs (PVLANS). In the case of PVLANS, primary VLAN features are inherited and merged with port features.
- Packets dropped by the IPv6 RA Guard feature can be spanned.
- If the **platform ipv6 acl icmp optimize neighbor-discovery command** is configured, the IPv6 RA Guard feature cannot be configured and an error message will be displayed. This command adds default global Internet Control Message Protocol (ICMP) entries that will override the RA guard ICMP entries.

## Information About Wireless Multicast

If the network supports packet multicasting, the multicast method that the device uses can be configured. The device performs multicasting in two modes:

- Unicast mode—The device unicasts every multicast packet to every access point associated to the device. This mode is inefficient but might be required on networks that do not support multicasting.
- Multicast mode—The device sends multicast packets to a CAPWAP multicast group. This method reduces overhead on the device processor and shifts the work of packet replication to the network, which is much more efficient than the unicast method.

When the multicast mode is enabled and the device receives a multicast packet from the wired LAN, the device encapsulates the packet using CAPWAP and forwards the packet to the CAPWAP multicast group address. The device always uses the management VLAN for sending multicast packets. Access points in the

multicast group receive the packet and forward it to all the BSSIDs mapped to the VLAN on which clients receive multicast traffic.

The device supports all the capabilities of v1 including Multicast Listener Discovery (MLD) v1 snooping but the v2 and v3 capabilities are limited. This feature keeps track of and delivers IPv6 multicast flows to the clients that request them. To support IPv6 multicast, global multicast mode should be enabled.

Internet Group Management Protocol (IGMP) snooping is introduced to better direct multicast packets. When this feature is enabled, the device snooping gathers IGMP reports from the clients, processes them, creates unique multicast group IDs (MGIDs) based on the Layer 3 multicast address and the VLAN number, and sends the IGMP reports to the IGMP querier. The device then updates the access point MGID table on the access point with the client MAC address. When the device receives multicast traffic for a particular multicast group, it forwards it to all the access points, but only those access points that have active clients listening or subscribed to that multicast group send multicast traffic on that particular WLAN. IP packets are forwarded with an MGID that is unique for an ingress VLAN and the destination multicast group. Layer 2 multicast packets are forwarded with an MGID that is unique for the ingress VLAN.

MGID is a 14-bit value filled in the 16-bit reserved field of wireless information in CAPWAP header. The remaining 2 bits should be set to zero.

## Information About Multicast Optimization

Multicast used to be based on the group of the multicast addresses and the VLAN as one entity, MGID. With the VLAN group, duplicate packets might increase. Using the VLAN group feature, every client listens to the multicast stream on a different VLAN. As a result, the device creates different MGIDs for each multicast address and VLAN. Therefore, in a worst case situation, the upstream router sends one copy for each VLAN, which results in as many copies as the number of VLANs in the group. Because the WLAN remains the same for all clients, multiple copies of the multicast packet are sent over the wireless network. To suppress the duplication of a multicast stream on the wireless medium between the device and the access points, the multicast optimization feature can be used.

Multicast optimization enables you to create a multicast VLAN that can be used for multicast traffic. One of the VLANs in the device can be configured as a multicast VLAN where multicast groups are registered. The clients are allowed to listen to a multicast stream on the multicast VLAN. The MGID is generated using the multicast VLAN and multicast IP addresses. If multiple clients on different VLANs of the same WLAN are listening to a single multicast IP address, a single MGID is generated. The device makes sure that all multicast streams from the clients on this VLAN group always go out on the multicast VLAN to ensure that the upstream router has one entry for all the VLANs of the VLAN group. Only one multicast stream hits the VLAN group even if the clients are on different VLANs. Therefore, the multicast packets that are sent out over the network is just one stream.

## IPv6 Global Policies

IPv6 global policies provide storage and access policy database services. IPv6 ND inspection and IPv6 RA guard are IPv6 global policies features. Every time an ND inspection or RA guard is configured globally, the

policy attributes are stored in the software policy database. The policy is then applied to an interface, and the software policy database entry is updated to include this interface to which the policy is applied.

## IPv6 RA Guard

The IPv6 RA Guard feature provides support for allowing the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network device platform. RAs are used by devices to announce themselves on the link. The IPv6 RA Guard feature analyzes these RAs and filters out RAs that are sent by unauthorized devices. In host mode, all RA and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 (L2) device with the information found in the received RA frame. Once the L2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

## Information About IPv6 Snooping

### IPv6 Neighbor Discovery Inspection

The IPv6 Neighbor Discovery Inspection, or IPv6 "snooping," feature bundles several Layer 2 IPv6 first-hop security features, including IPv6 Address Glean and IPv6 Device Tracking. IPv6 neighbor discovery (ND) inspection operates at Layer 2, or between Layer 2 and Layer 3, and provides IPv6 features with security and scalability. This feature mitigates some of the inherent vulnerabilities for the neighbor discovery mechanism, such as attacks on duplicate address detection (DAD), address resolution, device discovery, and the neighbor cache.

IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables and analyzes ND messages in order to build a trusted binding table. IPv6 ND messages that do not have valid bindings are dropped. An ND message is considered trustworthy if its IPv6-to-MAC mapping is verifiable.

When IPv6 ND inspection is configured on a target (which varies depending on platform target support and may include device ports, switch ports, Layer 2 interfaces, Layer 3 interfaces, and VLANs), capture instructions are downloaded to the hardware to redirect the ND protocol and Dynamic Host Configuration Protocol (DHCP) for IPv6 traffic up to the switch integrated security features (SISF) infrastructure in the routing device. For ND traffic, messages such as NS, NA, RS, RA, and REDIRECT are directed to SISF. For DHCP, UDP messages sourced from port 546 or 547 are redirected.

IPv6 ND inspection registers its "capture rules" to the classifier, which aggregates all rules from all features on a given target and installs the corresponding ACL down into the platform-dependent modules. Upon receiving redirected traffic, the classifier calls all entry points from any registered feature (for the target on which the traffic is being received), including the IPv6 ND inspection entry point. This entry point is the last to be called, so any decision (such as drop) made by another feature supersedes the IPv6 ND inspection decision.

### IPv6 ND Inspection

IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database, and IPv6 neighbor discovery messages that do not have valid bindings are dropped. A neighbor discovery message is considered trustworthy if its IPv6-to-MAC mapping is verifiable.

This feature mitigates some of the inherent vulnerabilities for the neighbor discovery mechanism, such as attacks on duplicate address detection (DAD), address resolution, device discovery, and the neighbor cache.

## IPv6 Device Tracking

IPv6 device tracking provides IPv6 host liveness tracking so that a neighbor table can be immediately updated when an IPv6 host disappears.

### *IPv6 First-Hop Security Binding Table*

The IPv6 First-Hop Security Binding Table recovery mechanism feature enables the binding table to recover in the event of a device reboot. A database table of IPv6 neighbors connected to the device is created from information sources such as ND snooping. This database, or binding, table is used by various IPv6 guard features to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.

This mechanism enables the binding table to recover in the event of a device reboot. The recovery mechanism will block any data traffic sourced from an unknown source; that is, a source not already specified in the binding table and previously learned through ND or DHCP gleaning. This feature recovers the missing binding table entries when the resolution for a destination address fails in the destination guard. When a failure occurs, a binding table entry is recovered by querying the DHCP server or the destination host, depending on the configuration.

### Recovery Protocols and Prefix Lists

The IPv6 First-Hop Security Binding Table Recovery Mechanism feature introduces the capability to provide a prefix list that is matched before the recovery is attempted for both DHCP and NDP.

If an address does not match the prefix list associated with the protocol, then the recovery of the binding table entry will not be attempted with that protocol. The prefix list should correspond to the prefixes that are valid for address assignment in the Layer 2 domain using the protocol. The default is that there is no prefix list, in which case the recovery is attempted for all addresses. The command to associate a prefix list to a protocol is **protocol {dhcp | ndp} [prefix-list *prefix-list-name*]**.

### *IPv6 Device Tracking*

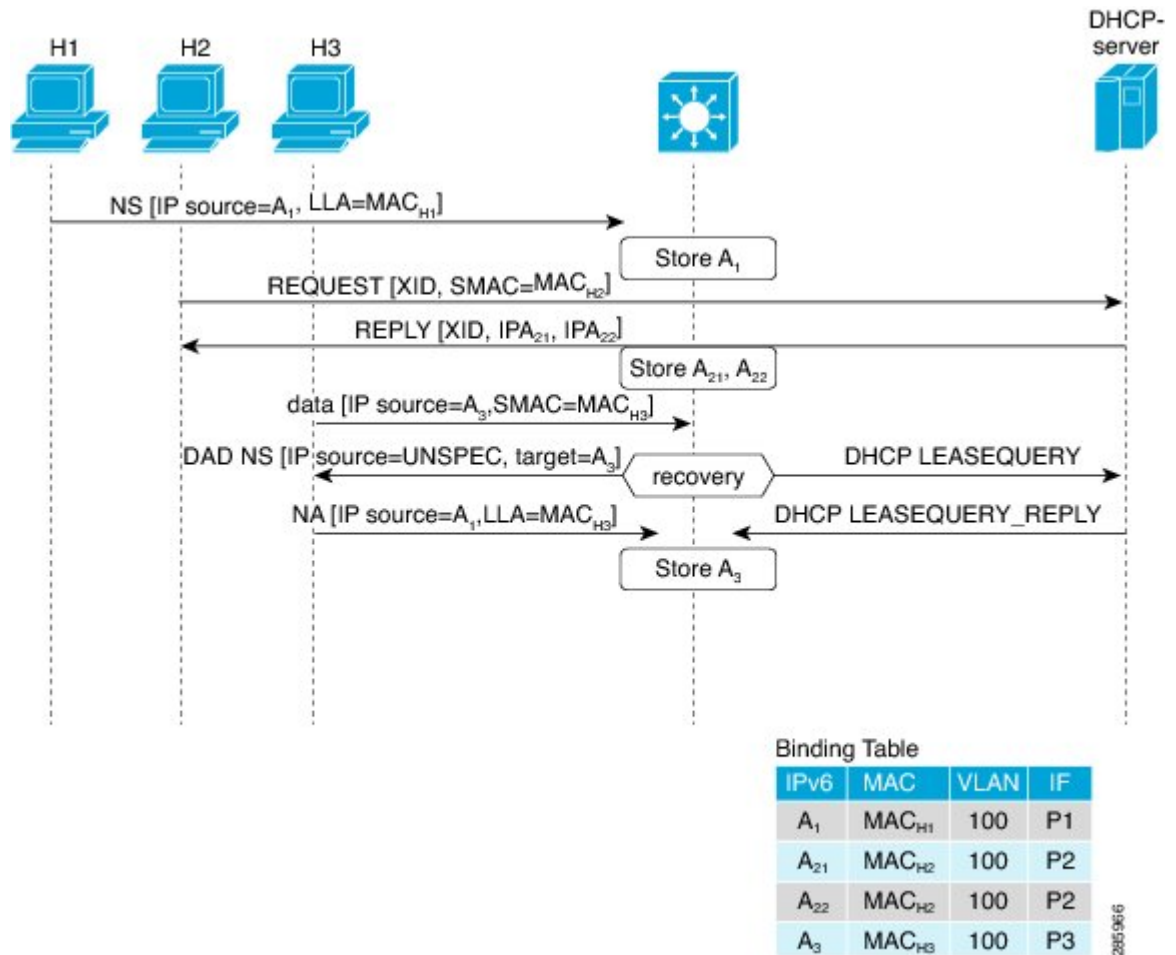

IPv6 device tracking provides IPv6 host liveness tracking so that a neighbor table can be immediately updated when an IPv6 host disappears.

## IPv6 Address Glean

IPv6 address glean is the foundation for many other IPv6 features that depend on an accurate binding table. It inspects ND and DHCP messages on a link to glean addresses, and then populates the binding table with these addresses. This feature also enforces address ownership and limits the number of addresses any given node is allowed to claim.

The following figure shows how IPv6 address glean works.

Figure 28: IPv6 Address Glean

# How to Configure Wireless Multicast

## Configuring Wireless Multicast-MCMC Mode (CLI)

### SUMMARY STEPS

1. enable
2. configure terminal
3. wireless multicast
4. ap capwap multicast ipaddr
5. end

## DETAILED STEPS

|        | Command or Action                                                                                                                                                       | Purpose                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                    |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                       | Enters global command mode.                                                                                                                                           |
| Step 3 | <b>wireless multicast</b><br><b>Example:</b><br>Device(config)# <b>wireless multicast</b><br>Device(config)# <b>no wireless multicast</b>                               | Enables the multicast traffic for wireless clients. The default value is disable. Add <b>no</b> in the command to disable the multicast traffic for wireless clients. |
| Step 4 | <b>ap capwap multicast ipaddr</b><br><b>Example:</b><br>Device(config)# <b>ap capwap multicast 231.1.1.1</b><br>Device(config)# <b>no ap capwap multicast 231.1.1.1</b> | Enables the forwarding mode in multicast. Add <b>no</b> in the command to disable the multicast mode.                                                                 |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                             | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode.                                                                      |

|        | Command or Action                                                                       | Purpose               |
|--------|-----------------------------------------------------------------------------------------|-----------------------|
| Step 3 | <b>ipv6 mld snooping</b><br><b>Example:</b><br>Device(config)# <b>ipv6 mld snooping</b> | Enables MLD snooping. |

## Configuring IPv6 Snooping Policy (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 snooping policy** *policy-name*
4. **security-level guard**
5. **device-role node**
6. **protocol** {**dhcp** | **ndp**}

### DETAILED STEPS

|        | Command or Action                                                                                                         | Purpose                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                         | Enters global command mode.                                                                                        |
| Step 3 | <b>ipv6 snooping policy</b> <i>policy-name</i><br><b>Example:</b><br>Device(config)# <b>ipv6 snooping policy mypolicy</b> | Configures an IPv6 snooping policy with a name.                                                                    |
| Step 4 | <b>security-level guard</b><br><b>Example:</b><br>Device(config-ipv6-snooping)# <b>security-level guard</b>               | Configures security level to inspect and drop any unauthorized messages.                                           |
| Step 5 | <b>device-role node</b><br><b>Example:</b><br>Device(config-ipv6-snooping)# <b>device-role node</b>                       | Configures the role of the device, which is a node, to the attached port.                                          |
| Step 6 | <b>protocol</b> { <b>dhcp</b>   <b>ndp</b> }<br><b>Example:</b><br>Device(config-ipv6-snooping)# <b>protocol ndp</b>      | Sets the protocol to glean addresses in DHCP or NDP packets.                                                       |

## Configuring Layer 2 Port as Multicast Router Port (CLI)

### SUMMARY STEPS

1. enable
2. configure terminal
3. `ipv6 mld snooping vlan vlan-id mrouter interface Port-channel port-channel-interface-number`

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                        | Purpose                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                        | Enters global command mode.                                                                                        |
| Step 3 | <b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface Port-channel <i>port-channel-interface-number</i></b><br><b>Example:</b><br>Device(config)# <b>ipv6 mld snooping vlan 2 mrouter interface Port-channel 22</b> | Configures a Layer 2 port as a Multicast router port. The VLAN is the client VLAN.                                 |

## Configuring IPv6 RA Guard (CLI)

### SUMMARY STEPS

1. enable
2. configure terminal
3. `ipv6 nd raguard policy policy-name`
4. trusted-port
5. device-role {host | monitor | router | switch}

### DETAILED STEPS

|        | Command or Action                                         | Purpose                                                                                                            |
|--------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                          | Purpose                                           |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                    | Enters global command mode.                       |
| Step 3 | <b>ipv6 nd raguard policy <i>policy-name</i></b><br><b>Example:</b><br>Device(config)# <code>ipv6 nd raguard policy myraguardpolicy</code> | Configures a policy for RA Guard.                 |
| Step 4 | <b>trusted-port</b><br><b>Example:</b><br>Device(config-nd-raguard)# <code>trusted-port</code>                                             | Sets up a trusted port.                           |
| Step 5 | <b>device-role {host   monitor   router   switch}</b><br><b>Example:</b><br>Device(config-nd-raguard)# <code>device-role router</code>     | Sets the role of the device attached to the port. |

## Configuring Non-IP Wireless Multicast (CLI)

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `wireless multicast non-ip`
4. `wireless multicast non-ip vlanid`
5. `end`

### DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                                                                                                                                                                        |
|--------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                             |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters global command mode.                                                                                                                                                                                    |
| Step 3 | <b>wireless multicast non-ip</b><br><b>Example:</b>                                     | Enables non-IP multicast in all VLANs. Default value is <b>enable</b> . Wireless multicast must be enabled for the traffic to pass. Add <b>no</b> in the command to disable the non-IP multicast in all VLANs. |

|               | Command or Action                                                                                                                                                                  | Purpose                                                                                                                                                                                                                               |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device(config) # <b>wireless multicast non-ip</b><br>Device(config) # <b>no wireless multicast non-ip</b>                                                                          |                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>wireless multicast non-ip</b> <i>vlanid</i><br><b>Example:</b><br>Device(config) # <b>wireless multicast non-ip</b> 5<br>Device(config) # <b>no wireless multicast non-ip</b> 5 | Enables non-IP multicast per VLAN. Default value is <b>enable</b> . Both wireless multicast and wireless multicast non-IP must be enabled for traffic to pass. Add <b>no</b> in the command to disable the non-IP multicast per VLAN. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config) # <b>end</b>                                                                                                                       | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode.                                                                                                                                      |

## Configuring Wireless Broadcast (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **wireless broadcast**
4. **wireless broadcast vlan** *vlanid*
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                           | Enters global command mode.                                                                                                                                                                                         |
| <b>Step 3</b> | <b>wireless broadcast</b><br><b>Example:</b><br>Device(config) # <b>wireless broadcast</b><br>Device(config) # <b>no wireless broadcast</b> | Enables broadcast packets for wireless clients. Default value is disable. Enabling <b>wireless broadcast</b> enables broadcast traffic for each VLAN. Add <b>no</b> in the command to disable broadcasting packets. |
| <b>Step 4</b> | <b>wireless broadcast vlan</b> <i>vlanid</i><br><b>Example:</b>                                                                             | Enables broadcast packets for single VLAN. Default value is <b>enable</b> . Wireless broadcast must be enabled for                                                                                                  |

|               | Command or Action                                                                                       | Purpose                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|               | Device(config)# <b>wireless broadcast vlan 3</b><br>Device(config)# <b>no wireless broadcast vlan 3</b> | broadcasting. Add <b>no</b> in the command to disable the broadcast traffic for each VLAN.       |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                             | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode. |

## Configuring IP Multicast VLAN for WLAN (CLI)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **wlan *wlan\_name***
4. **shutdown**
5. **ip multicast vlan {*vlan\_name* *vlan\_id*}**
6. **no shutdown**
7. **end**

### DETAILED STEPS

|               | Command or Action                                                                     | Purpose                                                                                                             |
|---------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>     | Enters global command mode.                                                                                         |
| <b>Step 3</b> | <b>wlan <i>wlan_name</i></b><br><b>Example:</b><br>Device(config)# <b>wlan test 1</b> | Enters the configuration mode to configure various parameters in the WLAN.                                          |
| <b>Step 4</b> | <b>shutdown</b><br><b>Example:</b><br>Device(config-wlan)# <b>shutdown</b>            | Disables WLAN.                                                                                                      |
| <b>Step 5</b> | <b>ip multicast vlan {<i>vlan_name</i> <i>vlan_id</i>}</b><br><b>Example:</b>         | Configures multicast VLAN for WLAN. Add <b>no</b> in the command to disable the multicast VLAN for WLAN.            |

|               | Command or Action                                                                                       | Purpose                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|               | Device(config-wlan) # <b>ip multicast vlan 5</b><br>Device(config-wlan) # <b>no ip multicast vlan 5</b> |                                                                                                  |
| <b>Step 6</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-wlan) # <b>no shutdown</b>                       | Enables the disabled WLAN.                                                                       |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config) # <b>end</b>                                            | Exits the configuration mode. Alternatively, press <b>Ctrl-Z</b> to exit the configuration mode. |

## Monitoring Wireless Multicast

*Table 44: Commands for Monitoring Wireless Multicast*

| Commands                                                               | Description                                                                                                                                    |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show wireless multicast</b>                                         | Displays the multicast status and IP multicast mode, each VLAN's broadcast and non-IP multicast status. Also displays the mDNS bridging state. |
| <b>show wireless multicast group summary</b>                           | Displays all (Source, Group and VLAN) lists and the corresponding MGID value.                                                                  |
| <b>show wireless multicast [source source] group group vlan vlanid</b> | Displays details of the given (S,G,V) and shows all of the clients associated with it and their MC2UC status.                                  |
| <b>show ip igmp snooping wireless mcast-spi-count</b>                  | Displays statistics of the number of multicast SPIs per MGID sent between IOS and the Wireless Controller Module.                              |
| <b>show ip igmp snooping wireless mgid</b>                             | Displays the MGID mappings.                                                                                                                    |
| <b>show ip igmp snooping igmpv2-tracking</b>                           | Displays the client-to-SGV mappings and SGV-to-client mappings.                                                                                |
| <b>show ip igmp snooping querier vlan vlanid</b>                       | Displays IGMP querier information for the specified VLAN.                                                                                      |
| <b>show ip igmp snooping querier detail</b>                            | Displays detailed IGMP querier information of all the VLANs.                                                                                   |
| <b>show ipv6 mld snooping querier vlan vlanid</b>                      | Displays MLD querier information for the specified VLAN.                                                                                       |
| <b>show ipv6 mld snooping wireless mgid</b>                            | Displays MGIDs for IPv6 multicast group.                                                                                                       |

## Where to Go Next for Wireless Multicast

You can configure the following:

- IGMP
- PIM
- SSM
- IP Multicast Routing
- Service Discovery Gateway

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring SSM

The following are the prerequisites for configuring source-specific multicast (SSM) and SSM mapping:

- Before you configure SSM mapping, you must perform the following tasks:
  - Enable IP multicast routing.
  - Enable PIM sparse mode.
  - Configure SSM.
- Before you configure static SSM mapping, you must configure access control lists (ACLs) that define the group ranges to be mapped to source addresses.

- Before you can configure and use SSM mapping with DNS lookups, you need to add records to a running DNS server. If you do not already have a DNS server running, you need to install one.

---

**Note** You can use a product such as *Cisco Network Registrar* to add records to a running DNS server.

---

## Restrictions for Configuring SSM

The following are the restrictions for configuring SSM:

- To run SSM with IGMPv3, SSM must be supported in the Cisco IOS router, the host where the application is running, and the application itself.
- Existing applications in a network predating SSM will not work within the SSM range unless they are modified to support (S, G) channel subscriptions. Therefore, enabling SSM in a network may cause problems for existing applications if they use addresses within the designated SSM range.
- IGMP Snooping—IGMPv3 uses new membership report messages that might not be correctly recognized by older IGMP snooping devices.
- Address management is still necessary to some degree when SSM is used with Layer 2 switching mechanisms. Cisco Group Management Protocol (CGMP), IGMP snooping, or Router-Port Group Management Protocol (RGMP) support only group-specific filtering, not (S, G) channel-specific filtering. If different receivers in a switched network request different (S, G) channels sharing the same group, they do not benefit from these existing mechanisms. Instead, both receivers receive all (S, G) channel traffic and filter out the unwanted traffic on input. Because SSM can re-use the group addresses in the SSM range for many independent applications, this situation can lead to decreased traffic filtering in a switched network. For this reason, it is important to use random IP addresses from the SSM range for an application to minimize the chance for re-use of a single address within the SSM range between different applications. For example, an application service providing a set of television channels should, even with SSM, use a different group for each television (S, G) channel. This setup guarantees that multiple receivers to different channels within the same application service never experience traffic aliasing in networks that include Layer 2 devices.
- In PIM-SSM, the last hop router will continue to periodically send (S, G) join messages if appropriate (S, G) subscriptions are on the interfaces. Therefore, as long as receivers send (S, G) subscriptions, the shortest path tree (SPT) state from the receivers to the source will be maintained, even if the source is not sending traffic for longer periods of time (or even never).

The opposite situation occurs with PIM-SM, where (S, G) state is maintained only if the source is sending traffic and receivers are joining the group. If a source stops sending traffic for more than 3 minutes in PIM-SM, the (S, G) state is deleted and only reestablished after packets from the source arrive again through the RPT (rendezvous point tree). Because no mechanism in PIM-SSM notifies a receiver that a source is active, the network must maintain the (S, G) state in PIM-SSM as long as receivers are requesting receipt of that channel.

The following are the restrictions for configuring SSM mapping:

- The SSM Mapping feature does not share the benefit of full SSM. SSM mapping takes a group G join from a host and identifies this group with an application associated with one or more sources, therefore,

it can only support one such application per group G. Nevertheless, full SSM applications may still share the same group also used in SSM mapping.

- Enable IGMPv3 with care on the last hop router when you rely solely on SSM mapping as a transition solution for full SSM. When you enable both SSM mapping and IGMPv3 and the hosts already support IGMPv3 (but not SSM), the hosts send IGMPv3 group reports. SSM mapping does not support these IGMPv3 group reports, and the router does not correctly associate sources with these reports.

## Information About SSM

The source-specific multicast (SSM) feature is an extension of IP multicast in which datagram traffic is forwarded to receivers from only those multicast sources that the receivers have explicitly joined. For multicast groups configured for SSM, only SSM distribution trees (no shared trees) are created.

This section describes how to configure source-specific multicast (SSM). For a complete description of the SSM commands in this section, refer to the *IP Multicast Command Reference*. To locate documentation for other commands that appear in this chapter, use the command reference master index, or search online.

## SSM Components Overview

SSM is a datagram delivery model that best supports one-to-many applications, also known as broadcast applications. SSM is a core networking technology for the Cisco implementation of IP multicast solutions targeted for audio and video broadcast application environments. The device supports the following components that support SSM implementation:

- Protocol independent multicast source-specific mode (PIM-SSM)

PIM-SSM is the routing protocol that supports the implementation of SSM and is derived from PIM sparse mode (PIM-SM).

- Internet Group Management Protocol version 3 (IGMPv3)

## SSM and Internet Standard Multicast (ISM)

The current IP multicast infrastructure in the Internet and many enterprise intranets is based on the PIM-SM protocol and Multicast Source Discovery Protocol (MSDP). These protocols have the limitations of the Internet Standard Multicast (ISM) service model. For example, with ISM, the network must maintain knowledge about which hosts in the network are actively sending multicast traffic.

The ISM service consists of the delivery of IP datagrams from any source to a group of receivers called the multicast host group. The datagram traffic for the multicast host group consists of datagrams with an arbitrary IP unicast source address (S) and the multicast group address (G) as the IP destination address. Systems receive this traffic by becoming members of the host group. Membership in a host group simply requires signaling the host group through IGMP version 1, 2, or 3.

In SSM, delivery of datagrams is based on (S, G) channels. In both SSM and ISM, no signaling is required to become a source. However, in SSM, receivers must subscribe or unsubscribe to (S, G) channels to receive or not receive traffic from specific sources. In other words, receivers can receive traffic only from (S, G) channels to which they are subscribed, whereas in ISM, receivers need not know the IP addresses of sources from which they receive their traffic. The proposed standard approach for channel subscription signaling uses IGMP and includes modes membership reports, which are supported only in IGMP version 3.

## SSM IP Address Range

SSM can coexist with the ISM service by applying the SSM delivery model to a configured subset of the IP multicast group address range. Cisco IOS software allows SSM configuration for the IP multicast address range of 224.0.0.0 through 239.255.255.255. When an SSM range is defined, existing IP multicast receiver applications do not receive any traffic when they try to use an address in the SSM range (unless the application is modified to use an explicit (S, G) channel subscription).

## SSM Operations

An established network, in which IP multicast service is based on PIM-SM, can support SSM services. SSM can also be deployed alone in a network without the full range of protocols required for interdomain PIM-SM (for example, MSDP, Auto-RP, or bootstrap router [BSR]) if only SSM service is needed.

If SSM is deployed in a network already configured for PIM-SM, only the last-hop routers support SSM. Routers that are not directly connected to receivers do not require support for SSM. In general, these not-last-hop routers must only run PIM-SM in the SSM range and might need additional access control configuration to suppress MSDP signalling, registering, or PIM-SM shared tree operations from occurring within the SSM range.

Use the `ip pim ssm` global configuration command to configure the SSM range and to enable SSM. This configuration has the following effects:

- For groups within the SSM range, (S, G) channel subscriptions are accepted through IGMPv3 include-mode membership reports.
- PIM operations within the SSM range of addresses change to PIM-SSM, a mode derived from PIM-SM. In this mode, only PIM (S, G) join and prune messages are generated by the router, and no (S, G) rendezvous point tree (RPT) or (\*, G) RPT messages are generated. Incoming messages related to RPT operations are ignored or rejected, and incoming PIM register messages are immediately answered with register-stop messages. PIM-SSM is backward-compatible with PIM-SM unless a router is a last-hop router. Therefore, routers that are not last-hop routers can run PIM-SM for SSM groups (for example, if they do not yet support SSM).
- No MSDP source-active (SA) messages within the SSM range are accepted, generated, or forwarded.

## SSM Mapping

In a typical set-top box (STB) deployment, each TV channel uses one separate IP multicast group and has one active server host sending the TV channel. A single server can send multiple TV channels, but each to a different group. In this network environment, if a router receives an IGMPv1 or IGMPv2 membership report for a particular group, the report addresses the well-known TV server for the TV channel associated with the multicast group.

When SSM mapping is configured, if a router receives an IGMPv1 or IGMPv2 membership report for a particular group, the router translates this report into one or more channel memberships for the well-known sources associated with this group.

When the router receives an IGMPv1 or IGMPv2 membership report for a group, the router uses SSM mapping to determine one or more source IP addresses for the group. SSM mapping then translates the membership report as an IGMPv3 report and continues as if it had received an IGMPv3 report. The router then sends PIM joins and continues to be joined to these groups as long as it continues to receive the IGMPv1 or IGMPv2 membership reports, and the SSM mapping for the group remains the same.

SSM mapping enables the last hop router to determine the source addresses either by a statically configured table on the router or through a DNS server. When the statically configured table or the DNS mapping changes, the router leaves the current sources associated with the joined groups.

## Static SSM Mapping

With static SSM mapping, you can configure the last hop router to use a static map to determine the sources that are sending to groups. Static SSM mapping requires that you configure ACLs to define group ranges. After configuring the ACLs to define group ranges, you can then map the groups permitted by those ACLs to sources by using the `ip igmp ssm-map static` global configuration command.

You can configure static SSM mapping in smaller networks when a DNS is not needed or to locally override DNS mappings. When configured, static SSM mappings take precedence over DNS mappings.

## DNS-Based SSM Mapping

You can use DNS-based SSM mapping to configure the last hop router to perform a reverse DNS lookup to determine sources sending to groups. When DNS-based SSM mapping is configured, the router constructs a domain name that includes the group address and performs a reverse lookup into the DNS. The router looks up IP address resource records and uses them as the source addresses associated with this group. SSM mapping supports up to 20 sources for each group. The router joins all sources configured for a group.

**Figure 29: DNS-Based SSM Mapping**

The following figure displays DNS-based SSM

mapping. The SSM mapping mechanism that enables the last hop router to join multiple sources for a group can provide source redundancy for a TV broadcast. In this context, the last hop router provides redundancy using SSM mapping to simultaneously join two video sources for the same TV channel. However, to prevent the last hop

router from duplicating the video traffic, the video sources must use a server-side switchover mechanism. One video source is active, and the other backup video source is passive. The passive source waits until an active source failure is detected before sending the video traffic for the TV channel. Thus, the server-side switchover mechanism ensures that only one of the servers is actively sending video traffic for the TV channel.

To look up one or more source addresses for a group that includes G1, G2, G3, and G4, you must configure these DNS records on the DNS server:

```
G4.G3.G2.G1 [multicast-domain] [timeout] IN A source-address-1
IN A source-address-2
IN A source-address-n
```

See your DNS server documentation for more information about configuring DNS resource records.

## How to Configure SSM

For a complete description of the source-specific multicast (SSM) commands in this section, see the *IP Multicast Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*. To locate documentation for other commands that appear in this chapter, use the command reference master index, or search online.

### Configuring SSM (CLI)

Follow these steps to configure SSM:

This procedure is optional.

#### Before you begin

If you want to use an access list to define the Source Specific Multicast (SSM) range, configure the access list before you reference the access list in the **ip pim ssm** command.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim ssm** [**default** | **range** *access-list*]
4. **interface** *type number*
5. **ip pim** {**sparse-mode** | **sparse-dense-mode**}
6. **ip igmp version 3**
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                        | Purpose                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                | Enables privileged EXEC mode. Enter your password if prompted.                                                               |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                        | Enters the global configuration mode.                                                                                        |
| Step 3 | <b>ip pim ssm [default   range <i>access-list</i>]</b><br><b>Example:</b><br>Device(config)# <b>ip pim ssm range 20</b>  | Defines the SSM range of IP multicast addresses.                                                                             |
| Step 4 | <b>interface <i>type number</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>         | Selects an interface that is connected to hosts on which IGMPv3 can be enabled, and enters the interface configuration mode. |
| Step 5 | <b>ip pim {sparse-mode   sparse-dense-mode}</b><br><b>Example:</b><br>Device(config-if)# <b>ip pim sparse-dense-mode</b> | Enables PIM on an interface. You must use either sparse mode or sparse-dense mode.                                           |
| Step 6 | <b>ip igmp version 3</b><br><b>Example:</b><br>Device(config-if)# <b>ip igmp version 3</b>                               | Enables IGMPv3 on this interface. The default version of IGMP is set to Version 2.                                           |
| Step 7 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                              | Returns to privileged EXEC mode.                                                                                             |
| Step 8 | <b>show running-config</b><br><b>Example:</b>                                                                            | Verifies your entries.                                                                                                       |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device# <code>show running-config</code>                                                                                |                                                          |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring Source Specific Multicast Mapping

The Source Specific Multicast (SSM) mapping feature supports SSM transition when supporting SSM on the end system is impossible or unwanted due to administrative or technical reasons. You can use SSM mapping to leverage SSM for video delivery to legacy STBs that do not support IGMPv3 or for applications that do not use the IGMPv3 host stack.

### Configuring Static SSM Mapping (CLI)

Follow these steps to configure static SSM Mapping:

For additional information on SSM mapping, see the IP Multicast CG Library, Cisco IOS XE Release 3SE (Catalyst 3850 Switches).

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip igmp ssm-map enable`
4. `no ip igmp ssm-map query dns`
5. `ip igmp ssm-map static access-list source-address`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

#### DETAILED STEPS

|               | Command or Action                                               | Purpose                                                        |
|---------------|-----------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>                    | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>ip igmp ssm-map enable</b><br><b>Example:</b><br>Device(config)# <code>ip igmp ssm-map enable</code>                                                  | Enables SSM mapping for groups in the configured SSM range.<br><b>Note</b> By default, this command enables DNS-based SSM mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>no ip igmp ssm-map query dns</b><br><b>Example:</b><br>Device(config)# <code>no ip igmp ssm-map query dns</code>                                      | (Optional) Disables DNS-based SSM mapping.<br><b>Note</b> Disable DNS-based SSM mapping if you only want to rely on static SSM mapping. By default, the <b>ip igmp ssm-map</b> command enables DNS-based SSM mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b> | <b>ip igmp ssm-map static</b> <i>access-list source-address</i><br><b>Example:</b><br>Device(config)# <code>ip igmp ssm-map static 11 172.16.8.11</code> | Configures static SSM mapping. <ul style="list-style-type: none"> <li>The ACL supplied for the <i>access-list</i> argument defines the groups to be mapped to the source IP address entered for the <i>source-address</i> argument.</li> </ul> <b>Note</b> You can configure additional static SSM mappings. If additional SSM mappings are configured and the router receives an IGMPv1 or IGMPv2 membership report for a group in the SSM range, the device determines the source addresses associated with the group by walking each configured <b>ip igmp ssm-map static</b> command. The device associates up to 20 sources per group.<br><br>Repeat Step to configure additional static SSM mappings, if required. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 7</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                                                | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b>                                                                                             | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|  | Command or Action                                       | Purpose |
|--|---------------------------------------------------------|---------|
|  | Device# <code>copy running-config startup-config</code> |         |

## Configuring DNS-Based SSM Mapping (CLI)

To configure DNS-based SSM mapping, you need to create a DNS server zone or add records to an existing zone. If the routers that are using DNS-based SSM mapping are also using DNS for other purposes, you should use a normally configured DNS server. If DNS-based SSM mapping is the only DNS implementation being used on the router, you can configure a false DNS setup with an empty root zone or a root zone that points back to itself.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip igmp ssm-map enable`
4. `ip igmp ssm-map query dns`
5. `ip domain multicast domain-prefix`
6. `ip name-server server-address1 [server-address2...server-address6]`
7. Repeat Step 6 to configure additional DNS servers for redundancy, if required.
8. `end`
9. `show running-config`
10. `copy running-config startup-config`

### DETAILED STEPS

|               | Command or Action                                                                                                   | Purpose                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                      | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                 | Enters the global configuration mode.                          |
| <b>Step 3</b> | <p><code>ip igmp ssm-map enable</code></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp ssm-map enable</pre> | Enables SSM mapping for groups in a configured SSM range.      |

|         | Command or Action                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                      |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4  | <p><b>ip igmp ssm-map query dns</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip igmp ssm-map query dns</pre>                                                             | <p>(Optional) Enables DNS-based SSM mapping.</p> <ul style="list-style-type: none"> <li>By default, the <b>ip igmp ssm-map</b> command enables DNS-based SSM mapping. Only the <b>no</b> form of this command is saved to the running configuration.</li> </ul> <p><b>Note</b> Use this command to reenables DNS-based SSM mapping if DNS-based SSM mapping is disabled.</p> |
| Step 5  | <p><b>ip domain multicast</b> <i>domain-prefix</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip domain multicast ssm-map.cisco.com</pre>                                  | <p>(Optional) Changes the domain prefix used for DNS-based SSM mapping.</p> <ul style="list-style-type: none"> <li>By default, the software uses the ip-addr.arpa domain prefix.</li> </ul>                                                                                                                                                                                  |
| Step 6  | <p><b>ip name-server</b> <i>server-address1</i><br/>[<i>server-address2...server-address6</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# ip name-server 10.48.81.21</pre> | Specifies the address of one or more name servers to use for name and address resolution.                                                                                                                                                                                                                                                                                    |
| Step 7  | Repeat Step 6 to configure additional DNS servers for redundancy, if required.                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                              |
| Step 8  | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                             |
| Step 9  | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                                                                 | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                       |
| Step 10 | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                   | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                     |

## Configuring Static Traffic Forwarding with SSM Mapping (CLI)

Follow these steps to configure static traffic forwarding with SSM mapping on the last hop router:

## SUMMARY STEPS

1. enable
2. configure terminal
3. interface *interface-id*
4. ip igmp static-group *group-address* source ssm-map
5. end
6. show running-config
7. copy running-config startup-config

## DETAILED STEPS

|        | Command or Action                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                           | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                               |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                   | Enters the global configuration mode.                                                                                                                                                                                                                                                        |
| Step 3 | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# interface<br>gigabitethernet 1/0/1                                                | Selects an interface on which to statically forward traffic for a multicast group using SSM mapping, and enters interface configuration mode.<br><br><b>Note</b> Static forwarding of traffic with SSM mapping works with either DNS-based SSM mapping or statically configured SSM mapping. |
| Step 4 | <b>ip igmp static-group <i>group-address</i> source ssm-map</b><br><b>Example:</b><br>Device(config-if)# ip igmp<br>static-group 239.1.2.1 source<br>ssm-map | Configures SSM mapping to statically forward a (S, G) channel from the interface.<br><br>Use this command if you want to statically forward SSM traffic for certain groups. Use DNS-based SSM mapping to determine the source addresses of the channels.                                     |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                             |
| Step 6 | <b>show running-config</b><br><b>Example:</b>                                                                                                                | Verifies your entries.                                                                                                                                                                                                                                                                       |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device# <code>show running-config</code>                                                                                |                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Monitoring SSM

Use the privileged EXEC commands in the following table to monitor SSM.

*Table 45: Commands for Monitoring SSM*

| Command                                 | Purpose                                                                                                        |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>show ip igmp groups detail</code> | Displays the (S, G) channel subscription through IGMPv3.                                                       |
| <code>show ip mroute</code>             | Displays whether a multicast group supports SSM service or whether a source-specific host report was received. |

## Monitoring SSM Mapping

Use the privileged EXEC commands in the following table to monitor SSM mapping.

*Table 46: SSM Mapping Monitoring Commands*

| Command                                                                                                                                          | Purpose                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Device# <code>show ip igmp ssm-mapping</code>                                                                                                    | Displays information about SSM mapping.                                                                                                          |
| Device# <code>show ip igmp ssm-mapping group-address</code>                                                                                      | Displays the sources that SSM mapping uses for a particular group.                                                                               |
| Device# <code>show ip igmp groups</code> [ <i>group-name</i>   <i>group-address</i>   <i>interface-type interface-number</i> ] [ <i>detail</i> ] | Displays the multicast groups with receivers that are directly connected to the router and that were learned through IGMP.                       |
| Device# <code>show host</code>                                                                                                                   | Displays the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses. |

| Command                                          | Purpose                                                                   |
|--------------------------------------------------|---------------------------------------------------------------------------|
| Device# <code>debug ip igmp group-address</code> | Displays the IGMP packets received and sent and IGMP host-related events. |

## Where to Go Next for SSM

You can configure the following:

- IGMP
- Wireless Multicast
- PIM
- IP Multicast Routing
- Service Discovery Gateway

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Prerequisites for Basic IP Multicast Routing

The following are the prerequisites for configuring basic IP multicast routing:

- To use this feature, the device or must be running the IP services feature set. The IP Services image contains complete multicast routing.
- You must configure the PIM version and the PIM mode in order to perform IP multicast routing. The switch populates its multicast routing table and forwards multicast packets it receives from its directly connected LANs according to the mode setting. You can configure an interface to be in the PIM dense mode, sparse mode, or sparse-dense mode.
- Enabling PIM on an interface also enables IGMP operation on that interface. (To participate in IP multicasting, the multicast hosts, routers, and multilayer device must have IGMP operating. )

If you enable PIM on multiple interfaces, when most of these interfaces are not on the outgoing interface list, and IGMP snooping is disabled, the outgoing interface might not be able to sustain line rate for multicast traffic because of the extra replication.

## Restrictions for Basic IP Multicast Routing

The following are the restrictions for IP multicast routing:

- IP multicast routing is not supported on switches running the LAN base feature set.
- High-availability support for Layer 3 multicast routing is not supported.
- You cannot have a device stack containing a mix of Catalyst 3850 and Catalyst 3650 devices.

## Information About Basic IP Multicast Routing

IP multicasting is an efficient way to use network resources, especially for bandwidth-intensive services such as audio and video. IP multicast routing enables a host (source) to send packets to a group of hosts (receivers) anywhere within the IP network by using a special form of IP address called the IP multicast group address.

The sending host inserts the multicast group address into the IP destination address field of the packet, and IP multicast routers and multilayer devices forward incoming IP multicast packets out all interfaces that lead to members of the multicast group. Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message.

---

**Note** For complete syntax and usage information for the commands used in this chapter, see the *IP Multicast Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*. For information on configuring the Multicast Source Discovery Protocol (MSDP), see the *Catalyst 3850 Routing Configuration Guide*.

## Multicast Forwarding Information Base Overview

The device uses the Multicast Forwarding Information Base (MFIB) architecture and the Multicast Routing Information Base (MRIB) for IP multicast.

The MFIB architecture provides both modularity and separation between the multicast control plane (Protocol Independent Multicast [PIM] and Internet Group Management Protocol [IGMP]) and the multicast forwarding plane (MFIB). This architecture is used in Cisco IOS IPv6 multicast implementations.

MFIB itself is a multicast routing protocol independent forwarding engine; that is, it does not depend on PIM or any other multicast routing protocol. It is responsible for:

- Forwarding multicast packets
- Registering with the MRIB to learn the entry and interface flags set by the control plane
- Handling data-driven events that must be sent to the control plane
- Maintaining counts, rates, and bytes of received, dropped, and forwarded multicast packets

The MRIB is the communication channel between MRIB clients. Examples of MRIB clients are PIM, IGMP, the multicast routing (mroute) table, and the MFIB.

## Default IP Multicast Routing Configuration

This table displays the default IP multicast routing configuration.

**Table 47: Default IP Multicast Routing Configuration**

| Feature                           | Default Setting             |
|-----------------------------------|-----------------------------|
| Multicast routing                 | Disabled on all interfaces. |
| PIM version                       | Version 2.                  |
| PIM mode                          | No mode is defined.         |
| PIM stub routing                  | None configured.            |
| PIM RP address                    | None configured.            |
| PIM domain border                 | Disabled.                   |
| PIM multicast boundary            | None.                       |
| Candidate BSRs                    | Disabled.                   |
| Candidate RPs                     | Disabled.                   |
| Shortest-path tree threshold rate | 0 kb/s.                     |
| PIM router query message interval | 30 seconds.                 |

## How to Configure Basic IP Multicast Routing

### Configuring Basic IP Multicast Routing

By default, multicast routing is disabled, and there is no default mode setting.

This procedure is required.

### Before you begin

You must configure the PIM version and the PIM mode. The switch populates its multicast routing table and forwards multicast packets it receives from its directly connected LANs according to the mode setting.

In populating the multicast routing table, dense-mode interfaces are always added to the table. Sparse-mode interfaces are added to the table only when periodic join messages are received from downstream devices or when there is a directly connected member on the interface. When forwarding from a LAN, sparse-mode operation occurs if there is an RP known for the group. If so, the packets are encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense-mode fashion. If the multicast traffic from a specific source is sufficient, the receiver's first-hop router might send join messages toward the source to build a source-based distribution tree.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip multicast-routing**
4. **interface *interface-id***
5. **ip pim {dense-mode | sparse-mode | sparse-dense-mode}**
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

### DETAILED STEPS

## Configuring IP Multicast Forwarding (CLI)

You can use the following procedure to configure IPv4 Multicast Forwarding Information Base (MFIB) interrupt-level IP multicast forwarding of incoming packets or outgoing packets on the device.

**Note** After you have enabled IP multicast routing by using the **ip multicast-routing** command, IPv4 multicast forwarding is enabled. Because IPv4 multicast forwarding is enabled by default, you can use the **no** form of the **ip mfib** command to disable IPv4 multicast forwarding.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip mfib**
4. **exit**
5. **show running-config**
6. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                                                       | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                                                                              |

|        | Command or Action                                                                                                 | Purpose                                                  |

## Configuring a Static Multicast Route (mroute) (CLI)

You can use the following procedure to configure static mroutes. Static mroutes are similar to unicast static routes but differ in the following ways:

- Static mroutes are used to calculate RPF information, not to forward traffic.
- Static mroutes cannot be redistributed.

Static mroutes are strictly local to the device on which they are defined. Because Protocol Independent Multicast (PIM) does not have its own routing protocol, there is no mechanism to distribute static mroutes throughout the network. Consequently, the administration of static mroutes tends to be more complicated than the administration of unicast static routes.

When static mroutes are configured, they are stored on the device in a separate table referred to as the static mroute table. When configured, the **ip mroute** command enters a static mroute into the static mroute table for the source address or source address range specified for the source-address and mask arguments. Sources that match the source address or that fall in the source address range specified for the source-address argument will RPF to either the interface associated with the IP address specified for the *rpf-address* argument or the local interface on the device specified for the *interface-type* and *interface-number* arguments. If an IP address is specified for the *rpf-address* argument, a recursive lookup is done from the unicast routing table on this address to find the directly connected neighbor.

If there are multiple static mroutes configured, the device performs a longest-match lookup of the mroute table. When the mroute with the longest match (of the source-address) is found, the search terminates and the information in the matching static mroute is used. The order in which the static mroutes are configured is not important.

The administrative distance of an mroute may be specified for the optional distance argument. If a value is not specified for the distance argument, the distance of the mroute defaults to zero. If the static mroute has the same distance as another RPF source, the static mroute will take precedence. There are only two exceptions to this rule: directly connected routes and the default unicast route.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip mroute [vrf vrf-name] source-address mask { fallback-lookup {global | vrf vrf-name } [protocol] {rpf-address | interface-type interface-number}} [distance]**
4. **exit**
5. **show running-config**
6. **copy running-config startup-config**

| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring Optional IP Multicast Routing Features

### Defining the IP Multicast Boundary (CLI)

You define a multicast boundary to prevent Auto-RP messages from entering the PIM domain. You create an access list to deny packets destined for 224.0.1.39 and 224.0.1.40, which carry Auto-RP information.

This procedure is optional.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `access-list access-list-number deny source [source-wildcard]`
4. `interface interface-id`
5. `ip multicast boundary access-list-number`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

#### DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p><b>access-list</b> <i>access-list-number</i> <b>deny</b> <i>source</i><br/>[<i>source-wildcard</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 12 deny 224.0.1.39 access-list 12 deny 224.0.1.40</pre> | <p>Creates a standard access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, the range is 1 to 99.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched.</li> <li>• For <i>source</i>, enter multicast addresses 224.0.1.39 and 224.0.1.40, which carry Auto-RP information.</li> <li>• (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> <p>The access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 4</b> | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet 1/0/1</pre>                                                                                              | Specifies the interface to be configured, and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <p><b>ip multicast boundary</b> <i>access-list-number</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip multicast boundary 12</pre>                                                                                | Configures the boundary, specifying the access list you created in Step 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 7</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                                                                                                            | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                                              | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Configuring sdr Listener Support****Enabling sdr Listener Support (CLI)**

By default, the device does not listen to session directory advertisements.

This procedure is optional.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip sap listen**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                    | <b>Purpose</b>                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                           | Enters the global configuration mode.                                                                              |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b><br><b>gigabitethernet 1/0/1</b> | Specifies the interface to be enabled for sdr, and enters interface configuration mode.                            |
| <b>Step 4</b> | <b>ip sap listen</b><br><b>Example:</b>                                                                                     | Enables the device software to listen to session directory announcements.                                          |

## Limiting How Long an sdr Cache Entry Exists (CLI)

|               | Command or Action                                                                                                 | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device(config-if)# <b>ip sap listen</b>                                                                           |                                                          |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                    | Returns to privileged EXEC mode.                         |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Limiting How Long an sdr Cache Entry Exists (CLI)

By default, entries are never deleted from the sdr cache. You can limit how long the entry remains active so that if a source stops advertising SAP information, old advertisements are not unnecessarily kept.

This procedure is optional.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip sap cache-timeout** *minutes*
4. **end**
5. **show running-config**
6. **show ip sap**
7. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                         | Purpose                                                                                                            |
|---------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                 | Enters the global configuration mode.                                                                                                                                                                                            |
| Step 3 | <b>ip sap cache-timeout <i>minutes</i></b><br><b>Example:</b><br>Device(config)# <code>ip sap cache-timeout 30</code>   | Limits how long a Session Announcement Protocol (SAP) cache entry stays active in the cache.<br><br>By default, entries are never deleted from the cache.<br><br>For <i>minutes</i> , the range is 1 to 1440 minutes (24 hours). |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                 |
| Step 5 | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                                                                                                                                                                                           |
| Step 6 | <b>show ip sap</b><br><b>Example:</b><br>Device# <code>show ip sap</code>                                               | Displays the SAP cache.                                                                                                                                                                                                          |
| Step 7 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                         |

# Monitoring and Maintaining Basic IP Multicast Routing

## Clearing Caches, Tables, and Databases

You can remove all contents of a particular cache, table, or database. Clearing a cache, table, or database might be necessary when the contents of the particular structure are or suspected to be invalid.

You can use any of the privileged EXEC commands in the following table to clear IP multicast caches, tables, and databases.

**Table 48: Commands for Clearing Caches, Tables, and Databases**

| Command                                                                                                                                                                                                              | Purpose                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>clear ip igmp group</b> { <b>group</b> [ <i>hostname</i>   <i>IP address</i> ]   <b>vrf name group</b> [ <i>hostname</i>   <i>IP address</i> ] }                                                                  | Deletes entries from the IGMP cache.                                                  |
| <b>clear ip mfib</b> { <b>counters</b> [ <i>group</i>   <i>source</i> ]   <b>global counters</b> [ <i>group</i>   <i>source</i> ]   <b>vrf *</b> }                                                                   | Clears all active IPv4 Multicast Forwarding Information Base (MFIB) traffic counters. |
| <b>clear ip mrm</b> { <b>status-report</b> [ <i>source</i> ] }                                                                                                                                                       | IP multicast routing clear commands.                                                  |
| <b>clear ip mroute</b> { *   [ <i>hostname</i>   <i>IP address</i> ]   <b>vrf name group</b> [ <i>hostname</i>   <i>IP address</i> ] }                                                                               | Deletes entries from the IP multicast routing table.                                  |
| <b>clear ip msdp</b> { <b>peer</b>   <b>sa-cache</b>   <b>statistics</b>   <b>vrf</b> }                                                                                                                              | Clears the Multicast Source Discovery Protocol (MSDP) cache.                          |
| <b>clear ip multicast</b> { <b>limit</b>   <b>redundancy statistics</b> }                                                                                                                                            | Clears the IP multicast information.                                                  |
| <b>clear ip pim</b> { <b>df</b> [ <i>int</i>   <b>rp</b> <i>rp address</i> ]   <b>interface</b>   <b>rp-mapping</b> [ <i>rp address</i> ]   <b>vrf vpn name</b> { <b>df</b>   <b>interface</b>   <b>rp-mapping</b> } | Clears the PIM cache.                                                                 |
| <b>clear ip sap</b> [ <i>group-address</i>   “ <i>session-name</i> ” ]                                                                                                                                               | Deletes the Session Directory Protocol Version 2 cache or an sdr cache entry.         |

## Displaying System and Network Statistics

You can display specific statistics, such as the contents of IP routing tables, caches, and databases.

**Note** This release does not support per-route statistics.

You can display information to learn resource usage and solve network problems. You can also display information about node reachability and discover the routing path that packets of your device are taking through the network.

You can use any of the privileged EXEC commands in the following table to display various routing statistics.

**Table 49: Commands for Displaying System and Network Statistics**

| Command                                                  | Purpose                                                  |
|----------------------------------------------------------|----------------------------------------------------------|
| <b>ping</b> [ <i>group-name</i>   <i>group-address</i> ] | Sends an ICMP Echo Request to a multicast group address. |
| <b>show ip igmp filter</b>                               | Displays IGMP filter information.                        |

| Command                                                                                                                                                                                      | Purpose                                                                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>show ip igmp groups</b><br>[ <i>group-name</i>   <i>group-address</i>   <i>type-number</i> ]                                                                                              | Displays the multicast groups that are directly connected to the device and that were learned through IGMP. |
| <b>show ip igmp interface</b> [ <i>type number</i> ]                                                                                                                                         | Displays multicast-related information about an interface.                                                  |
| <b>show ip igmp profile</b> [ <i>profile_number</i> ]                                                                                                                                        | Displays IGMP profile information.                                                                          |
| <b>show ip igmp ssm-mapping</b> [ <i>hostname/IP address</i> ]                                                                                                                               | Displays IGMP SSM mapping information.                                                                      |
| <b>show ip igmp static-group</b> { <b>class-map</b> [ <b>interface</b> [ <i>type</i> ] ]}                                                                                                    | Displays static group information.                                                                          |
| <b>show ip igmp membership</b> [ <i>name/group address</i>   <b>all</b>   <b>tracked</b> ]                                                                                                   | Displays IGMP membership information for forwarding.                                                        |
| <b>show ip igmp vrf</b>                                                                                                                                                                      | Displays the selected VPN Routing/Forwarding instance by name.                                              |
| <b>show ip mfib</b> [ <i>type number</i> ]                                                                                                                                                   | Displays the IP multicast forwarding information base.                                                      |
| <b>show ip mrrib</b> { <b>client</b>   <b>route</b>   <b>vrf</b> }                                                                                                                           | Displays the multicast routing information base.                                                            |
| <b>show ip mrm</b> { <b>interface</b>   <b>manager</b>   <b>status-report</b> }                                                                                                              | Displays the IP multicast routing monitor information.                                                      |
| <b>show ip mroute</b> [ <i>group-name</i>   <i>group-address</i> ]<br>[ <i>source</i> ] [ <b>count</b>   <b>interface</b>   <b>proxy</b>   <b>pruned</b>   <b>summary</b>   <b>verbose</b> ] | Displays the contents of the IP multicast routing table.                                                    |
| <b>show ip msdp</b> { <b>count</b>   <b>peer</b>   <b>rpf-peer</b>   <b>sa-cache</b>   <b>summary</b>   <b>vrf</b> }                                                                         | Displays the Multicast Source Discovery Protocol (MSDP) information.                                        |
| <b>show ip multicast</b> [ <b>interface</b>   <b>limit</b>   <b>mpls</b>   <b>redundancy</b>   <b>vrf</b> ]                                                                                  | Displays global multicast information.                                                                      |
| <b>show ip pim all-vrfs</b> { <b>tunnel</b> }                                                                                                                                                | Display all VRFs.                                                                                           |
| <b>show ip pim autorp</b>                                                                                                                                                                    | Display global auto-RP information.                                                                         |
| <b>show ip pim boundary</b> [ <i>type number</i> ]                                                                                                                                           | Displays boundary information.                                                                              |
| <b>show ip pim bsr-router</b>                                                                                                                                                                | Display bootstrap router information (version 2).                                                           |
| <b>show ip pim interface</b> [ <i>type number</i> ] [ <b>count</b>   <b>detail</b>   <b>df</b>   <b>stats</b> ]                                                                              | Displays information about interfaces configured for PIM. This command is available in all software images. |
| <b>show ip pim neighbor</b> [ <i>type number</i> ]                                                                                                                                           | Lists the PIM neighbors discovered by the device. This command is available in all software images.         |

| Command                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ip pim mdt [ bgp ]</code>                          | Displays multicast tunnel information.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>show ip pim rp [group-name   group-address]</code>      | Displays the RP routers associated with a sparse-mode multicast group. This command is available in all software images.                                                                                                                                                                                                                                                                                                       |
| <code>show ip pim rp-hash [group-name   group-address]</code> | Displays the RP to be chosen based upon the group selected.                                                                                                                                                                                                                                                                                                                                                                    |
| <code>show ip pim tunnel [ tunnel   verbose ]</code>          | Displays the registered tunnels.                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>show ip pim vrf name</code>                             | Displays VPN routing and forwarding instances.                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>show ip rpf {source-address   name}</code>              | <p>Displays how the device is doing Reverse-Path Forwarding (that is, from the unicast routing table, DVMRP routing table, or static mroutes).</p> <p>Command parameters include:</p> <ul style="list-style-type: none"> <li>• <i>Host name or IP address</i>—IP name or group address.</li> <li>• <b>Select</b>—Group-based VRF select information.</li> <li>• <b>vrf</b>—Selects VPN Routing/Forwarding instance.</li> </ul> |
| <code>show ip sap [group   “session-name”   detail]</code>    | <p>Displays the Session Announcement Protocol (SAP) Version 2 cache.</p> <p>Command parameters include:</p> <ul style="list-style-type: none"> <li>• <i>A.B.C.D</i>—IP group address.</li> <li>• <i>WORD</i>—Session name (in double quotes).</li> <li>• <b>detail</b>—Session details.</li> </ul>                                                                                                                             |

## Displaying Multicast Peers, Packet Rates and Loss Information, and Path Tracing

You can use the privileged EXEC commands in the following table to monitor IP multicast routers, packets, and paths.

*Table 50: Commands for Displaying Multicast Peers, Packet Rates and Loss Information, and Path Tracing*

| Command                                            | Purpose                                                                                                        |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>mrinfo { [hostname   address]   vrf }</code> | Queries a multicast router or multilayer device about which neighboring multicast devices are peering with it. |
| <code>mstat { [hostname   address]   vrf }</code>  | Displays IP multicast packet rate and information loss.                                                        |

| Command                                            | Purpose                                                                                                    |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>mtrace { [hostname   address]   vrf }</code> | Traces the path from a source to a destination branch for a multicast distribution tree for a given group. |

## Configuration Examples for IP Multicast Routing

### Example: Configuring an IP Multicast Boundary

This example shows how to set up a boundary for all administratively-scoped addresses:

```
Device(config)# access-list 1 deny 239.0.0.0 0.255.255.255
Device(config)# access-list 1 permit 224.0.0.0 15.255.255.255
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip multicast boundary 1
```

### Example: Responding to mriinfo Requests

The software answers mriinfo requests sent by mrouted systems and Cisco routers and multilayer devices. The software returns information about neighbors through DVMRP tunnels and all the routed interfaces. This information includes the metric (always set to 1), the configured TTL threshold, the status of the interface, and various flags. You can also use the **mriinfo** privileged EXEC command to query the router or device itself, as in this example:

```
Device# mriinfo
 171.69.214.27 (mm1-7kd.cisco.com) [version cisco 11.1] [flags: PMS]:
 171.69.214.27 -> 171.69.214.26 (mm1-r7kb.cisco.com) [1/0/pim/querier]
 171.69.214.27 -> 171.69.214.25 (mm1-45a.cisco.com) [1/0/pim/querier]
 171.69.214.33 -> 171.69.214.34 (mm1-45c.cisco.com) [1/0/pim]
 171.69.214.137 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
 171.69.214.203 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
 171.69.214.18 -> 171.69.214.20 (mm1-45e.cisco.com) [1/0/pim]
 171.69.214.18 -> 171.69.214.19 (mm1-45c.cisco.com) [1/0/pim]
 171.69.214.18 -> 171.69.214.17 (mm1-45a.cisco.com) [1/0/pim]
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Configuring the Service Discovery Gateway

The following are restrictions for configuring the Service Discovery Gateway:

- The Service Discovery Gateway does not support topologies with multiple hops. All network segments must be connected directly to it. The Service Discovery Gateway can learn services from all connected segments to build its cache and respond to requests acting as a proxy.
- The use of third-party mDNS servers or applications are not supported with this feature.

# Information about the Service Discovery Gateway and mDNS

## mDNS

mDNS was defined to achieve zero configuration, with zero configuration being defined as providing the following features:

- Addressing—Allocating IP addresses to hosts
- Naming—Using names to refer to hosts instead of IP addresses
- Service discovery—Finding services automatically on the network

With mDNS, network users no longer have to assign IP addresses, assign host names, or type in names to access services on the network. Users only need to ask to see what network services are available, and choose from a list.

With mDNS, *addressing* is accomplished through the use of DHCP/DHCPv6 or IPv4 and IPv6 Link Local scoped addresses. The benefit of zero-configuration occurs when no infrastructure services such as DHCP or DNS are present and self-assigned link-local addressing can be used. The client can then select a random IPv4 address in the link-local range (169.254.0.0/24) or use its IPv6 link-local address (FE80::/10) for communication.

With mDNS, *naming* (name-to-address translation on a local network using mDNS) queries are sent over the local network using link-local scoped IP multicast. Because these DNS queries are sent to a multicast address (IPv4 address 224.0.0.251 or IPv6 address FF02::FB), no single DNS server with global knowledge is required to answer the queries. When a service or device sees a query for any service it is aware of, it provides a DNS response with the information from its cache.

With mDNS, *service discovery* is accomplished by browsing. An mDNS query is sent out for a given service type and domain, and any device that is aware of matching services replies with service information. The result is a list of available services for the user to choose from.

The mDNS protocol (mDNS-RFC), together with DNS Service Discovery (DNS-SD-RFC) achieves the zero-configuration addressing, naming, and service discovery.

## mDNS-SD

Multicast DNS Service Discovery (mDNS-SD) uses DNS protocol semantics and multicast over well-known multicast addresses to achieve zero configuration service discovery. DNS packets are sent to and received on port 5353 using a multicast address of 224.0.0.251 and its IPv6 equivalent FF02::FB.

Because mDNS uses a link-local multicast address, its scope is limited to a single physical or logical LAN. If the networking reach needs to be extended to a distributed campus or to a wide-area environment consisting of many different networking technologies, mDNS gateway is implemented. An mDNS gateway provides a transport for mDNS packets across Layer 3 boundaries by filtering, caching, and redistributing services from one Layer 3 domain to another.

### mDNS-SD Considerations for Wireless Clients

- mDNS packets can be sent out of Layer 3 interfaces that might not have an IP address.
- Packets with mDNS multicast IP and multicast MAC are sent on a multicast CAPWAP tunnel, if multicast-multicast mode is enabled. A multicast CAPWAP tunnel is a special CAPWAP tunnel used

for reducing the number of copies of multicast packet that are required to be generated for each AP CAPWAP tunnel. Sending packets on the multicast CAPWAP tunnel requires the outer IP header to be destined to the multicast CAPWAP tunnel's address, which all APs are subscribed to.

- All mDNS packet handling is done at a foreign switch for roamed clients. A foreign switch is the new switch that a roamed wireless client is actually attached to, which is called the point of attachment.

## Service Discovery Gateway

The Service Discovery Gateway feature enables multicast Domain Name System (mDNS) to operate across Layer 3 boundaries (different subnets). An mDNS gateway provides transport for service discovery across Layer 3 boundaries by filtering, caching, and redistributing services from one Layer 3 domain (subnet) to another. Prior to implementation of this feature, mDNS was limited in scope to within a subnet because of the use of link-local scoped multicast addresses. This feature enhances Bring Your Own Device (BYOD).

## mDNS Gateway and Subnets

You need to enable an mDNS gateway for service discovery to operate across subnets. You can enable mDNS gateway for a device or for an interface.

**Note** You need to configure service routing globally before configuring at the interface level.

After the device or interface is enabled, you can redistribute service discovery information across subnets. You can create service policies and apply filters on either incoming service discovery information (called IN-bound filtering) or outgoing service discovery information (called OUT-bound filtering).

**Note** If redistribution is enabled globally, global configuration is given higher priority than interface configuration.

### *Figure 30: Sample Networking Scenario*

For example, if the mDNS gateway functionality is enabled on the router in this figure, then service information can be sent from one subnet to another and vice-versa. For example, the printer and fax service information being advertised in the network with IP address 192.0.2.6 are redistributed to the network with IP address 198.51.100.4. The printer and fax service information in the network with IP address 192.0.2.6 is learned by

mDNS-enabled hosts and devices in the other network.

## Filtering

After configuring the mDNS gateway and subnets, you can filter services that you want to redistribute. While creating a service list, the **permit** or **deny** command options are used:

- The **permit** command option allows you to permit or transport specific service list information.
- The **deny** option allows you to deny service list information that is available to be transported to other subnets.

You need to include a sequence number when using the **permit** or **deny** command option. The same service list name can be associated with multiple sequence numbers and each sequence number will be mapped to a rule.

**Note** If no filters are configured, then the default action is to deny service list information to be transported through the device or interface.

Query is another option provided when creating service lists. You can create queries using a service list. If you want to browse for a service, then active queries can be used. This function is helpful to keep the records refreshed in the cache.

**Note** Active queries can only be used globally and cannot be used at the interface level.

A service end-point (such as a printer or fax) sends unsolicited announcements when a service starts up. After that, it sends unsolicited announcements whenever a network change event occurs (such as an interface coming up or going down). The device always respond to queries.

After creating a service list and using the **permit** or **deny** command options, you can filter using match statements (commands) based on *service-instance*, *service-type*, or *message-type* (announcement or query).

# How to Configure the Service Discovery Gateway

## Configuring the Service List (CLI)

This procedure describes how to create a service list, apply a filter for the service list, and configure parameters for the service list name.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service-list mdns-sd *service-list-name* {deny *sequence-number* | permit *sequence-number* | query}**
4. **match message-type {announcement | any | query}**
5. **match service-instance { *LINE* }**
6. **match service-type { *LINE* }**
7. **end**

### DETAILED STEPS

| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters the global configuration mode.                                                                                 |

|               | Command or Action                                                                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p><b>service-list mdns-sd</b> <i>service-list-name</i> {<b>deny</b> <i>sequence-number</i>   <b>permit</b> <i>sequence-number</i>   <b>query</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# <b>service-list mdns-sd s11 permit 3</b></pre> <pre>Device(config)# <b>service-list mdns-sd s14 query</b></pre> | <p>Enters mDNS service discovery service list mode. In this mode, you can:</p> <ul style="list-style-type: none"> <li>• Create a service list and apply a filter on the service list according to the <b>permit</b> or <b>deny</b> option applied to the sequence number.</li> <li>• Create a service list and associate a query for the service list name if the <b>query</b> option is used.</li> </ul> <p><b>Note</b> The sequence number sets the priority of the rule. A rule with a lower sequence number is selected first and the service announcement or query is allowed or denied accordingly. You define the sequence number as per your network requirements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <p><b>match message-type</b> {<b>announcement</b>   <b>any</b>   <b>query</b>}</p> <p><b>Example:</b></p> <pre>Device(config-mdns-sd-sl)# <b>match message-type announcement</b></pre>                                                                                                                             | <p>(Optional) Sets the message type to match. You can match the following message types:</p> <ul style="list-style-type: none"> <li>• announcement</li> <li>• any</li> <li>• query</li> </ul> <p>These commands configure the parameters for the service list name that is created in step 2.</p> <p>If the <b>match message-type</b> is an announcement, then the service list rule only allows service advertisements or announcements for the device. If the <b>match message-type</b> is a query, then only a query from the client for a certain service in the network is allowed.</p> <p>Multiple service maps of the same name with different sequence numbers can be created and the evaluation of the filters will be ordered on the sequence number. Service lists are an ordered sequence of individual statements, each one has a permit or deny result. Evaluation of service list consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is stopped once the first statement match is found and an action permit/deny associated with the statement match is performed. The default action after scanning through the entire list is to deny.</p> <p><b>Note</b> You cannot use the <b>match</b> command if you have used the <b>query</b> option in the previous step. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option.</p> |

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>match service-instance</b> { <i>LINE</i> }</p> <p><b>Example:</b></p> <pre>Device(config-mdns-sd-sl)## match service-instance servInst 1</pre> | <p>(Optional) Sets the service instance to match.</p> <p>This command configures the parameters for the service list name that is created in step 2.</p> <p><b>Note</b> You cannot use the <b>match</b> command if you have used the <b>query</b> option in the previous step. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option.</p>                      |
| Step 6 | <p><b>match service-type</b> { <i>LINE</i> }</p> <p><b>Example:</b></p> <pre>Device(config-mdns-sd-sl)# match service-type _ipp._tcp</pre>           | <p>(Optional) Sets the value of the mDNS service type string to match.</p> <p>This command configures the parameters for the service list name that is created in step 2.</p> <p><b>Note</b> You cannot use the <b>match</b> command if you have used the <b>query</b> option in the previous step. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option.</p> |
| Step 7 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-mdns-sd-sl)# end</pre>                                                                   | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                        |

**What to do next**

Proceed to enable the mDNS gateway and redistribution of services.

## Enabling mDNS Gateway and Redistributing Services (CLI)

After enabling mDNS gateway for a device, you can apply filters (apply IN-bound filtering or OUT-bound filtering) and active queries by using **service-policy** and **service-policy-query** commands, respectively. You can redistribute services and service announcements using the **redistribute mdns-sd** command, and set some part of the system memory for cache using the **cache-memory-max** command.

**Note** By default, mDNS gateway is disabled on all interfaces.

**SUMMARY STEPS**

1. **enable**

2. **configure terminal**
3. **service-routing mdns-sd**
4. **service-policy *service-policy-name* {IN | OUT}**
5. **redistribute mdns-sd**
6. **cache-memory-max *cache-config-percentage***
7. **service-policy-query *service-list-query-name* *service-list-query-periodicity***
8. **exit**
9. **wireless multicast**
10. **no wireless mdns-bridging**
11. **end**

|               | Command or Action                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 3</b> | <b>service-routing mdns-sd</b><br><b>Example:</b><br>Device (config)# <b>service-routing mdns-sd</b>                                       | Enables mDNS gateway functionality for a device and enters multicast DNS configuration (config-mdns) mode. <p><b>Note</b> This command enables the mDNS function globally.</p> <p><b>Note</b> Enter the <b>service-routing mdns-sd source-interface <i>if-name</i></b> command in either global-config or interface-config mode, to specify an alternate source interface for outgoing mDNS packets, so its IP address can be used when there is none configured on the outgoing interface.</p> |
| <b>Step 4</b> | <b>service-policy <i>service-policy-name</i> {IN   OUT}</b><br><b>Example:</b><br>Device (config-mdns)# <b>service-policy serv-poll IN</b> | (Optional) For a service list, applies a filter on incoming service discovery information (IN-bound filtering) or outgoing service discovery information (OUT-bound filtering).                                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b> | <b>redistribute mdns-sd</b><br><b>Example:</b>                                                                                             | (Optional) Redistributes services or service announcements across subnets.                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device (config-mdns)# <b>redistribute mdns-sd</b>                                                                                                                                                   | <b>Note</b> If redistribution is enabled globally, global configuration is given higher priority than interface configuration.                                                                                         |
| <b>Step 6</b>  | <b>cache-memory-max</b> <i>cache-config-percentage</i><br><b>Example:</b><br>Device (config-mdns)# <b>cache-memory-max 20</b>                                                                       | (Optional) Sets some part of the system memory (in percentage) for cache.<br><b>Note</b> By default, 10 percent of the system memory is set aside for cache. You can override the default value by using this command. |
| <b>Step 7</b>  | <b>service-policy-query</b> <i>service-list-query-name</i><br><i>service-list-query-periodicity</i><br><b>Example:</b><br>Device (config-mdns)# <b>service-policy-query</b><br><b>sl-query1 100</b> | (Optional) Configures service list-query periodicity.                                                                                                                                                                  |
| <b>Step 8</b>  | <b>exit</b><br><b>Example:</b><br>Device (config-mdns)# <b>exit</b>                                                                                                                                 | (Optional) Returns to global configuration mode.                                                                                                                                                                       |
| <b>Step 9</b>  | <b>wireless multicast</b><br><b>Example:</b><br>Device (config)# <b>wireless multicast</b>                                                                                                          | (Optional) Enables wireless Ethernet multicast support.                                                                                                                                                                |
| <b>Step 10</b> | <b>no wireless mdns-bridging</b><br><b>Example:</b><br>Device (config)# <b>no wireless mdns-bridging</b>                                                                                            | (Optional) Disables bridging of mDNS packets to wireless clients.                                                                                                                                                      |
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                       |

## Monitoring Service Discovery Gateway

*Table 51: Monitoring Service Discovery Gateway*

| Command                                                                                                          | Purpose                                                                                                             |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>show mdns requests [detail   name record-name   type record-type [ name record-name]]</code>               | This command displays information for outstanding mDNS requests, including record name and record type information. |
| <code>show mdns cache [interface type number   name record-name [type record-type]   type record-type]</code>    | This command displays mDNS cache information.                                                                       |
| <code>show mdns statistics {all   service-list list-name   service-policy {all   interface type number }}</code> | This command displays mDNS statistics.                                                                              |

## Configuration Examples

### Example: Specify Alternative Source Interface for Outgoing mDNS Packets

The following example displays how to specify an alternate source interface for outgoing mDNS packets, so its IP address can be used when there is none configured on the outgoing interface.

```
Device(config)# service-routing mdns-sd
Device(config-mdns)# source-interface if-name
```

### Example: Redistribute Service Announcements

The following example displays how to redistribute service announcements received on one interface over all the interfaces or over a specific interface.

```
Device(config)# service-routing mdns-sd
Device(config-mdns)# Redistribute mdns-sd if-name
```

## Example: Disable Bridging of mDNS Packets to Wireless Clients

The following example displays how to disable bridging of mDNS packets to wireless clients.

```
Device(config)# wireless multicast
Device(config)# no wireless mdns-bridging
```

## Example: Creating a Service-List, Applying a Filter and Configuring Parameters

The following example shows the creation of a service-list s11. The **permit** command option is being applied on sequence number 3 and all services with message-type announcement are filtered and available for transport across various subnets associated with the device.

```
Device# configure terminal
Device(config)# service-list mdns-sd s11 permit 3
Device(config-mdns-sd-s1) #match message-type announcement
Device(config-mdns) # exit
```

## Example: Enabling mDNS Gateway and Redistributing Services

The following example shows how to enable an mDNS gateway for a device and enable redistribution of services across subnets. IN-bound filtering is applied on the service-list serv-poll. Twenty percent of system memory is made available for cache and service-list-query periodicity is configured at 100 seconds.

```
Device# configure terminal
Device# service-routing mdns-sd
Device(config-mdns) # service-policy serv-poll IN
Device(config-mdns) # redistribute mdns-sd
Device(config-mdns) # cache-memory-max 20
Device(config-mdns) # service-policy-query sl-query1 100
Device(config-mdns) # exit
```

## Example: Global mDNS Configuration

The following example displays how to globally configure mDNS.

```
Device# configure terminal
Device(config)# service-list mdns-sd mypermit-all permit 10
Device(config-mdns-sd-s1)# exit
Device(config)# service-list mdns-sd querier query
Device(config-mdns-sd-s1)# service-type _dns._udp
Device(config-mdns-sd-s1)# end
Device# configure terminal
Device(config)# service-routing mdns-sd
Device(config-mdns)# service-policy mypermit-all IN
Device(config-mdns)# service-policy mypermit-all OUT
```

## Example: Interface mDNS Configuration

The following example displays how to configure mDNS for an interface.

```
Device(config)#interface Vlan136
Device(config-if)# description *** Mgmt VLAN ***
Device(config-if)# ip address 9.7.136.10 255.255.255.0
Device(config-if)# ip helper-address 9.1.0.100
Device(config-if)# service-routing mdns-sd
Device(config-if-mdns-sd)# service-policy mypermit-all IN
Device(config-if-mdns-sd)# service-policy mypermit-all OUT
Device(config-if-mdns-sd)# service-policy-query querier 60
```

## Where to Go Next for Configuring Services Discovery Gateway

You can configure the following:

- IGMP

- Wireless Multicast
- PIM
- SSM
- IP Multicast Routing

- [Feature History and Information for Optimizing PIM Sparse Mode in a Large IP Multicast Deployment, on page 604](#)

## Prerequisites for Optimizing PIM Sparse Mode in a Large IP Multicast Deployment

- You must have PIM sparse mode running in your network.
- If you plan to use a group list to control to which groups the shortest-path tree (SPT) threshold applies, you must have configured your access list before performing the task.

## Information About Optimizing PIM Sparse Mode in a Large IP Multicast Deployment

### PIM Registering Process

IP multicast sources do not use a signaling mechanism to announce their presence. Sources just send their data into the attached network, as opposed to receivers that use Internet Group Management Protocol (IGMP) to announce their presence. If a source sends traffic to a multicast group configured in PIM sparse mode (PIM-SM), the Designated Router (DR) leading toward the source must inform the rendezvous point (RP) about the presence of this source. If the RP has downstream receivers that want to receive the multicast traffic (natively) from this source and has not joined the shortest path leading toward the source, then the DR must

send the traffic from the source to the RP. The PIM registering process, which is individually run for each (S, G) entry, accomplishes these tasks between the DR and RP.

The registering process begins when a DR creates a new (S, G) state. The DR encapsulates all the data packets that match the (S, G) state into PIM register messages and unicasts those register messages to the RP.

If an RP has downstream receivers that want to receive register messages from a new source, the RP can either continue to receive the register messages through the DR or join the shortest path leading toward the source. By default, the RP will join the shortest path, because delivery of native multicast traffic provides the highest throughput. Upon receipt of the first packet that arrives natively through the shortest path, the RP will send a register-stop message back to the DR. When the DR receives this register-stop message, it will stop sending register messages to the RP.

If an RP has no downstream receivers that want to receive register messages from a new source, the RP will not join the shortest path. Instead, the RP will immediately send a register-stop message back to the DR. When the DR receives this register-stop message, it will stop sending register messages to the RP.

Once a routing entry is established for a source, a periodic reregistering takes place between the DR and RP. One minute before the multicast routing table state times out, the DR will send one dataless register message to the RP each second that the source is active until the DR receives a register-stop message from the RP.

This action restarts the timeout time of the multicast routing table entry, typically resulting in one reregistering exchange every 2 minutes. Reregistering is necessary to maintain state, to recover from lost state, and to keep track of sources on the RP. It will take place independently of the RP joining the shortest path.

## PIM Version 1 Compatibility

If an RP is running PIM Version 1, it will not understand dataless register messages. In this case, the DR will not send dataless register messages to the RP. Instead, approximately every 3 minutes after receipt of a register-stop message from the RP, the DR encapsulates the incoming data packets from the source into register messages and sends them to the RP. The DR continues to send register messages until it receives another register-stop message from the RP. The same behavior occurs if the DR is running PIM Version 1.

When a DR running PIM Version 1 encapsulates data packets into register messages for a specific (S, G) entry, the entry is process-switched, not fast-switched or hardware-switched. On platforms that support these faster paths, the PIM registering process for an RP or DR running PIM Version 1 may lead to periodic out-of-order packet delivery. For this reason, we recommend upgrading your network from PIM Version 1 to PIM Version 2.

## PIM Designated Router

Devices configured for IP multicast send PIM hello messages to determine which device will be the designated router (DR) for each LAN segment (subnet). The hello messages contain the device's IP address, and the device with the highest IP address becomes the DR.

The DR sends Internet Group Management Protocol (IGMP) host query messages to all hosts on the directly connected LAN. When operating in sparse mode, the DR sends source registration messages to the rendezvous point (RP).

By default, multicast devices send PIM router query messages every 30 seconds. By enabling a device to send PIM hello messages more often, the device can discover unresponsive neighbors more quickly. As a result, the device can implement failover or recovery procedures more efficiently. It is appropriate to make this change only on redundant devices on the edge of the network.

## PIM Sparse-Mode Register Messages

Dataless register messages are sent at a rate of one message per second. Continuous high rates of register messages might occur if a DR is registering bursty sources (sources with high data rates) and if the RP is not running PIM Version 2.

By default, PIM sparse-mode register messages are sent without limiting their rate. Limiting the rate of register messages will limit the load on the DR and RP, at the expense of dropping those register messages that exceed the set limit. Receivers may experience data packet loss within the first second in which packets are sent from bursty sources.

## Preventing Use of Shortest-Path Tree to Reduce Memory Requirement

Understanding PIM shared tree and source tree will help you understand how preventing the use of the shortest-path tree can reduce memory requirements.

### PIM Shared Tree and Source Tree

By default, members of a group receive data from senders to the group across a single data-distribution tree rooted at the RP.

**Figure 31: Shared Tree and Source Tree (Shortest-Path Tree)**

The following figure shows this type of shared-distribution tree. Data from senders is delivered to the RP for distribution to group members joined to the shared tree.

If the data rate warrants, leaf routers (routers without any downstream connections) on the shared tree can use the data distribution tree rooted at the source. This type of distribution tree is called a shortest-path tree or source tree. By default, the software devices to a source tree upon receiving the first data packet from a source.

This process describes the move from a shared tree to a source tree:

1. A receiver joins a group; leaf Router C sends a join message toward the RP.
2. The RP puts a link to Router C in its outgoing interface list.

3. A source sends data; Router A encapsulates the data in a register message and sends it to the RP.
4. The RP forwards the data down the shared tree to Router C and sends a join message toward the source. At this point, data might arrive twice at Router C, once encapsulated and once natively.
5. When data arrives natively (unencapsulated) at the RP, it sends a register-stop message to Router A.
6. By default, reception of the first data packet prompts Router C to send a join message toward the source.
7. When Router C receives data on (S, G), it sends a prune message for the source up the shared tree.
8. The RP deletes the link to Router C from the outgoing interface of (S, G). The RP triggers a prune message toward the source.

Join and prune messages are sent for sources and RPs. They are sent hop-by-hop and are processed by each PIM device along the path to the source or RP. Register and register-stop messages are not sent hop-by-hop. They are sent by the designated router that is directly connected to a source and are received by the RP for the group.

Multiple sources sending to groups use the shared tree. You can configure the PIM device to stay on the shared tree.

The change from shared to source tree happens when the first data packet arrives at the last-hop router. This change depends upon the threshold that is configured by using the **ip pim spt-threshold** global configuration command.

The shortest-path tree requires more memory than the shared tree but reduces delay. You may want to postpone its use. Instead of allowing the leaf router to immediately move to the shortest-path tree, you can specify that the traffic must first reach a threshold.

You can configure when a PIM leaf router should join the shortest-path tree for a specified group. If a source sends at a rate greater than or equal to the specified kbps rate, the multilayer switch triggers a PIM join message toward the source to construct a source tree (shortest-path tree). If the traffic rate from the source drops below the threshold value, the leaf router switches back to the shared tree and sends a prune message toward the source.

You can specify to which groups the shortest-path tree threshold applies by using a group list (a standard access list). If a value of 0 is specified or if the group list is not used, the threshold applies to all groups.

### Related Topics

[Delaying the Use of PIM Shortest-Path Tree \(CLI\)](#), on page 462

## Benefit of Preventing or Delaying the Use of the Shortest-Path Tree

The switch from shared to source tree happens upon the arrival of the first data packet at the last hop device (Router C in [PIM Shared Tree and Source Tree](#), on page 434). This switch occurs because the **ip pim spt-threshold** command controls that timing, and its default setting is 0 kbps.

The shortest-path tree requires more memory than the shared tree, but reduces delay. You might want to prevent or delay its use to reduce memory requirements. Instead of allowing the leaf device to move to the shortest-path tree immediately, you can prevent use of the SPT or specify that the traffic must first reach a threshold.

You can configure when a PIM leaf device should join the shortest-path tree for a specified group. If a source sends at a rate greater than or equal to the specified *kbps* rate, the device triggers a PIM Join message toward the source to construct a source tree (shortest-path tree). If the **infinity** keyword is specified, all sources for the specified group use the shared tree, never switching to the source tree.

# How to Optimize PIM Sparse Mode in a Large IP Multicast Deployment

## Optimizing PIM Sparse Mode in a Large Deployment

Consider performing this task if your deployment of IP multicast is large.

Steps 3, 5, and 6 in this task are independent of each other and are therefore considered optional. Any one of these steps will help optimize PIM sparse mode. If you are going to perform Step 5 or 6, you must perform Step 4. Step 6 applies only to a designated router; changing the PIM query interval is only appropriate on redundant routers on the edge of the PIM domain.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip pim register-rate-limit** *rate*
4. **ip pim spt-threshold** *{kbps| infinity}***[group-list** *access-list***]**
5. **interface** *type number*
6. **ip pim query-interval** *period* **[msec]**

### DETAILED STEPS
